The Sacramento District of CAL-AM's Northern Division has estimated the demand for the West Placer Service Area, and the projected water demands are presented in Table 15-3. Demand estimates include projected growth for the West Placer Service Area.[17] In addition to demand estimates for the West Placer Service Area, Table 15-3 presents a comparison of the estimated water supply for the area.

As shown in Table 15-3, the Northern Division Sacramento District of CAL-AM has estimated that the PCWA water supplies to the West Placer Service Area will meet the estimated demand from the Service Area through the year 2040. CAL-AM expects that the contract between CAL-AM and PCWA will be renegotiated if CAL-AM requires additional water.

Table 15-3
West Placer Service Area Supply and Demand Comparison (AFY)

	2025	2030	2035	2040
West Placer Service Area Demand	2,262	2,357	2,913	3,361
West Placer Service Area Water Supply	2,262	2,357	2,913	3,361
Surplus	0	0	0	0

Source: California American Water Company, 2020 UWMP [Tables 4-2 and 6-6], 2021.

[16] Placer County Water Agency and California-American Water Company. *Agreement Between Placer County Water Agency and California American Water for Water Supply*. July 6, 2015.
[17] California American Water Company, Sacramento Main District. *2020 Urban Water Management Plan*. June 2021.

The PCWA's 2020 UWMP shows in Chapter 7 that PCWA has sufficient water supplies through the projected buildout conditions during a series of multiple dry-year conditions. Therefore, CAL-AM is anticipated to have sufficient water supplies to meet the demands of the West Placer Service Area until at least 2040.

The CAL-AM current water supply agreement with PCWA, signed in December 2021, guarantees a water supply up to 2.236 million gallons per day (mgd). The new contract increased CAL-AM's guaranteed supply to cover the service area's current demand needs. Historically, PCWA has allowed CAL-AM to purchase as much water as needed to meet West Placer's demand, resulting in CAL-AM occasionally purchasing more water than what is guaranteed in the contract. As noted above, CAL-AM will renegotiate the contract with PCWA as demand increases up to the PCWA's projected CAL-AM buildout demand. The projected water supply shown in Table 15-3, above, is considered a firm supply, meaning available during all dry year scenarios, as the assumption can be made that the guaranteed amount in the supply contract will be renegotiated to match the service area's demand.

PCWA Water Supply and Projected Demand

The PCWA planned for CAL-AM's West Placer demand in the PCWA 2020 UWMP. According to the PCWA 2020 UWMP, the general area of CAL-AM's West Placer service area is anticipated to grow, resulting in an expanded wholesale agreement with CAL-AM. The PCWA's 2020 UWMP Notification Letter, dated November 20, 2020, included the specific amount of wholesale water PCWA plans on selling to CAL-AM, as shown in Table 15-4.

Table 15-4
CAL-AM's Water Demand Used in PCWA's 2020 UWMP (AFY)

	Current	2025	2030	2035	2040	Buildout
CAL-AM	1,021	1,178	1,404	1,684	1,965	2,385
Placer Vineyards	--	1,688	3,376	5,064	6,752	8,440
Total	1,021	2,866	4,780	6,748	8,717	10,825

Source: PCWA 2020 UWMP Notification Letter, 2020.

The PCWA 2020 UWMP also analyzed PCWA's ability to provide water for average, single dry year, and five consecutive dry years scenarios. The results of the analysis show that PCWA has sufficient water supply to support the projected buildout demand during all scenarios.

Water Supply Reliability

During previous single- and multiple-dry years, CAL-AM has maintained the ability to supply 100 percent of average/normal water year supply to the West Placer Service Area through distributions from the PCWA. Under existing agreements, CAL-AM anticipates that PCWA will continue to have sufficient water supplies through projected buildout conditions, including the West Placer Service Area, during a series of multiple-dry-year conditions.[18]

Although CAL-AM anticipates meeting all water demand under single- and multiple-dry years, CAL-AM maintains a Water Shortage Contingency Plan. Should water supplies be insufficient to meet average demand, CAL-AM has the authority to implement voluntary conservation measures following notification of the California Public Utilities Commission (CPUC) of the need for such measures. Should further water conservation measures be needed, CAL-AM would request

[18] California American Water Company, Sacramento Main District. *2020 Urban Water Management Plan*. June 2021.

authorization from the CPUC to implement mandatory conservation measures. The request for authorization to the CPUC from CAL-AM would include the percent reduction needed by CAL-AM and would specify the measures needed to achieve such reductions.[19]

Water Quality

The PCWA provides the West Placer Service Area with high-quality surface water, which originates in Folsom Lake. Disinfection by-product formation and pressure variations have recently been reduced, which has improved water quality in the service area.[20]

Water Delivery Infrastructure

Water distribution in the West Placer Service Area is administered by CAL-AM.[21] An existing 16-inch water line currently extends along Walerga Road and a 24-inch water line currently extends along Baseline Road in the project site vicinity. An existing 24-inch main is located within PFE Road in the vicinity of the off-site affordable housing parcel. The existing line, and new proposed water line connections, will be discussed in Impact 15-6 of this chapter.

Wastewater Conveyance and Treatment

The project site is located outside of existing Placer County Sewer Service Area (CSA) or Districts. Thus, the entitlements for the proposed project include a request for annexation into CSA 28, Zone 173, for sanitary sewer service, subject to approval by the Placer County Board of Supervisors. Therefore, the sections below discuss the sewer services currently provided by the Placer County Sewer Service Area within the project area.

Wastewater Conveyance

Sewer services in the project area are provided by the Placer County Department of Public Works, Environmental Engineering and Utilities Division. Placer County operates 47 sewer pump stations, approximately 300 miles of sewer piping, and more than 560 septic tank effluent pump systems. The existing sewer pipeline system within unincorporated areas of the County in the project vicinity are located within CSA 28, Zone 173, and are owned and maintained by Placer County. The DCWPCP noted that soil conditions and potential problems related to groundwater pollution in the Plan area would constrain the use of private sewer systems for some development areas within the DCWPCP. In particular, the DCWPCP noted that, at the time that the DCWPCP was prepared, the Placer County Environmental Health Department required that all developments with lot sizes less than seven acres must be connected to public sewer systems. As such, the DCWPCP anticipated that developments in the eastern portion of the Plan area would be connected to a public sewer system, which would include conveyance infrastructure. The South Placer Wastewater Authority (SPWA) South Placer Regional Wastewater 2020 Systems Evaluation provides an overview of the sewer infrastructure within south Placer County, including the DCWPCP area.

Wastewater Treatment

Sewer treatment for the Placer CSA 28, Zone 173, is provided at the Dry Creek Wastewater Treatment Plant (WWTP), which is located within the southern edge of the City of Roseville, approximately two miles southeast of the project site. The Dry Creek WWTP is owned by the City

---

19 California American Water Company, Sacramento Main District. *2020 Urban Water Management Plan*. June 2021.
20 *Ibid.*
21 Placer County Water Agency and California American Water Company. *Agreement Between Placer County Water Agency and California American Water for Water Supply.* July 6, 2015.

of Roseville and treats wastewater from areas of the City of Roseville, the City of Rocklin, and the Town of Loomis, as well as nearby areas within unincorporated portions of Placer County.

Under the Dry Creek WWTP's National Pollutant Discharge Elimination System (NPDES) Permit, Number CA0079502, the Dry Creek WWTP has a permitted average dry weather flow (ADWF) of 18 mgd and a peak wet-weather flow (PWWF) of 45 mgd.[22] As of 2016, the Dry Creek WWTP was operating at approximately 50 percent of the WWTP's permitted flow, with an ADWF of 8.5 mgd, and a PWWF under 25 mgd.[23] Of the 8.5 mgd of ADWF being treated at the Dry Creek WWTP in 2016, approximately 65 percent, or 5.5 mgd, originated from the City of Roseville.[24]

Tertiary-level treatment at the Dry Creek WWTP consists of screening, primary clarification, aeration, secondary clarification, filtering, and disinfection. Recycled water from the Dry Creek WWTP is used to irrigate four golf courses, several area parks, and some areas of public street landscaping.[25] Treated wastewater from the Dry Creek WWTP that is not used for irrigation purposes is discharged to Dry Creek. Residual solids from the treatment process are transported to the Western Placer Waste Management Authority (WPWMA) sanitary landfill or are transferred to a City-approved vendor for off-site land application.

The City of Roseville owns and operates the Dry Creek WWTP on behalf of the City's Regional Partners, which consist of the City of Roseville, the South Placer Municipal Utility District, and portions of unincorporated Placer County. Pursuant to the Operations Agreement among the Regional Partners, upon reaching 75 percent capacity at the WWTP, capacity improvements must be initiated. As discussed above, the Dry Creek WWTP operated at approximately 8.5 mgd ADWF in 2016, out of a permitted capacity of 18 mgd. Although the Dry Creek WWTP operated below its permitted capacity in the past, buildout demand of the Dry Creek WWTP's service area is estimated to reach approximately 21 mgd. Thus, improvements to the Dry Creek WWTP are likely to be needed prior to buildout of the Dry Creek WWTP's service area. Demand from new development is currently accommodated at the WWTP on a first-come-first-served basis.[26]

Wastewater Collection Infrastructure

Wastewater collection in the West Placer Service Area is provided by the Placer County Department of Public Works Environmental Engineering and Utilities Division. Wastewater collection infrastructure within the project area currently includes County-maintained existing eight-inch "Sewer B" gravity lines within Walerga Road, an existing eight-inch sewer line to the south of the project site, and an existing Dry Creek/West Placer Community Facilities District (CFD) #1 sewer lift station located east of Walerga Road and south of Dry Creek, approximately 0.53-mile to the south.

In the vicinity of the off-site affordable housing parcel, an eight-inch sewer main within PFE Road would be constructed pursuant to the RVSP, as part of the Silver Sage subdivision and PFE Road/Watt Avenue intersection off-site improvements, where the sewer line in PFE Road would be extended from the Glen Willow subdivision site immediately east of Silver Sage to Watt Avenue. The approved Frisvold Property Project, located immediately to the east of the off-site affordable housing parcel, would extend the PFE Road sewer main along its frontage to Watt

25 *Ibid.*
26 *Ibid*.

Avenue, if such improvements have not already been constructed as part of the future expansion of the PFE Road/Watt Avenue intersection.

The existing and proposed wastewater collection infrastructure will be discussed further in Impact 15-6 of this chapter.

Solid Waste

Solid waste collection services in the project area are provided by Recology Auburn Placer, under contract with Placer County. Recology provides curbside collection of mixed waste (garbage and recyclables), green waste, and some universal and household hazardous wastes by appointment. The mixed waste collected by Recology is delivered to the WPWMA Materials Recovery Facility (MRF), where waste is processed, recyclables are recovered, and residuals are disposed. The MRF is located near SR 65, between Roseville and Lincoln, at the corner of Athens Avenue and Fiddyment Road. Recovered materials from the MRF are sold throughout the world, helping to conserve natural resources. Non-recyclable materials are sent to the Western Regional Sanitary Landfill (WRSL) for disposal, which is co-located at the MRF site. The current space available, together with recovery efforts by the MRF, will help to delay the WRSL from reaching capacity.

The WPWMA is a regional agency established in 1978 through a Joint Exercise of Powers Agreement between the County of Placer and the cities of Roseville, Rocklin, and Lincoln to acquire, own, operate, and maintain a sanitary landfill site and all related improvements.[27]

The WPWMA designed and built the MRF to divert recyclable materials from being disposed at the landfill. The MRF also processes source separated food waste, wood waste and green waste and accepts separated recyclables, including electronics and other universal wastes (e.g., batteries and fluorescent lamps), at the recycling drop-off and buy-back center. The compost portion of the MRF has an annual processing capacity of 82,000 tons (averaged over the year and does not account for seasonal peaks). The MRF is permitted to have up to 75,000 cubic yards (approximately 37,500 tons) of compost material at the facility at any one time.

Residual waste from the MRF is transported to the WRSL. The WPWMA owns and oversees all operations on-site – the WRSL, MRF, compost facility, and Permanent Household Hazardous Waste Collection Facility (PHHWCF). A private firm, under contract with WPWMA, manages the day-to-day operation of the facilities. The landfill is specified as a Class II/Class III non-hazardous site. Hazardous waste from households and Conditionally Exempt Small Quantity Generators is accepted at the PHHWCF.

Permit Limits and Site Constraints

The 291-acre WRSL is permitted to accept 1,900 tons per day and 624 vehicles per day. Between January 1, and November 9, 2021, the landfill received an average of 862.14 tons of waste per day, serving 144 vehicles. The WRSL has a permitted design capacity of 36,350,000 cubic yards and, as of December 2021, has a remaining capacity of 22,690,011 cubic yards. Under current land use and development conditions, the WRSL has a permitted lifespan extending to 2058.[28]

---

[27] Western Placer Waste Management Authority. *About the WPWMA*. Available at: https://wpwma.ca.gov/about-us/. Accessed July 2025.

[28] Placer County Department of Public Works, Environmental Engineering Division (Solid Waste). *EIR Guidance Document*. August 2022.

The MRF has a permitted processing limit of 1,750 tons per day.[29] On average, the MRF received 884.86 tons of material per day between January 1 and November 9, 2021. While the permitted processing limit remains the same, the MRF expanded in 2007, increasing its processing capacity of municipal solid waste and construction and demolition debris to 2,200 tons per day.[30] Currently, the MRF is being upgraded to further increase processing capacity. These upgrades will increase recyclable material recovery including organic material and are anticipated to extend the landfill capacity through 2110.

The compost portion of the facility has an annual processing capacity of 82,000 tons (averaged over the year, excluding seasonal peaks). The facility is permitted to have up to 75,000 cubic yards (approximately 37,500 tons) of compost material at any one time.

Gas, Electric, and Telecommunication Infrastructure

The Sacramento Municipal Utility District (SMUD) would provide electric services to the project site. SMUD is a community-owned electric utility which generates, transmits, and distributes electricity to a 900-square-mile territory that includes Sacramento County and parts of Placer County, and Yolo County. SMUD is one of the ten largest publicly owned utilities in the U.S.

Natural gas services in the project area are provided by PG&E. PG&E is one of the largest providers of electricity and natural gas throughout Placer County. PG&E is a San Francisco based, private company, publicly regulated by the California Public Utilities Commission and provides electricity and natural gas to the majority of Northern California. PG&E has ample resources to meet a wide range of projected growth; however, when the time comes, additional improvements to the facilities may be required to meet future growth demands.

Existing electrical and telecommunication distribution lines are located along Baseline Road and Vineyard Road in the project vicinity. Additionally, a 30-inch PG&E gas transmission line is located along the north side of Baseline Road within an existing easement, which would remain as is with implementation of the proposed project.

15.3 REGULATORY CONTEXT

The following discussion contains a summary of regulatory controls pertaining to public services and utilities, including State and local laws and ordinances.

Federal Regulations

The federal environmental laws and policies relevant to public services and utilities are primarily related to water quality, which is addressed in Chapter 12, Hydrology and Water Quality, of this EIR.

State Regulations

The following are applicable State regulations related to the proposed project.

[29] California Department of Resources Recycling and Recovery (CalRecycle). *Western Placer Waste Mgmt Authority MRF (31-AA-0001)*. Available at: https://www2.calrecycle.ca.gov/SolidWaste/SiteActivity/Details/2537?siteID=2269. Accessed March 2026.

[30] Placer County Department of Public Works, Environmental Engineering Division (Solid Waste). *EIR Guidance Document*. August 2022.

Uniform Fire Code

The Uniform Fire Code with the State of California Amendments contains regulations relating to construction, maintenance, and use of buildings. Topics addressed in the California Fire Code (CFC) include fire department access, fire hydrants, automatic sprinkler systems, fire alarm systems, fire and explosion hazards safety, hazardous materials storage and use, provisions intended to protect and assist fire responders, industrial processes, and many other general and specialized fire-safety requirements for new and existing buildings and the surrounding premises. The Fire Code contains specialized technical regulations related to fire and life safety.

California Health and Safety Code

State fire regulations are set forth in Sections 15000 et seq. of the California Health and Safety Code, include regulations for building standards (as also set forth in the California Building Code), fire protection and notification systems, fire protection devices such as extinguishers and smoke alarms, high-rise building and childcare facility standards, and fire suppression training.

Proposition 1A/Senate Bill 50

Proposition 1A/Senate Bill (SB) 50 (Chapter 407, Statutes of 1998) is a school construction measure primarily for modernization and rehabilitation of older school facilities and construction of new school facilities. Proposition 1A/SB 50 implemented significant fee reforms by amending the laws governing developer fees and school mitigation.

- Establishes the base (statutory) amount (indexed for inflation) of allowable developer fees at $1.93 per square foot for residential construction and $0.31 per sf for commercial construction.
- Prohibits school districts, cities, and counties from imposing school impact mitigation fees or other requirements in excess of or in addition to those provided in the statute.

Proposition 1A/SB 50 also prohibits local agencies from using the inadequacy of school facilities as a basis for denying or conditioning approvals of any "[…] legislative or adjudicative act […] involving […] the planning, use, or development of real property" (Government Code 65996(b)). Moreover, for CEQA purposes, the development fees authorized by SB 50 are deemed to be "full and complete school facilities mitigation" for impact caused by new development (Government Code 65996(b)).

Additionally, a local agency cannot require participation in a Mello-Roos for school facilities; however, the statutory fee is reduced by the amount of any voluntary participation in a Mello-Roos. Satisfaction of the Proposition 1A/SB 50 statutory requirements by a developer is deemed to be "full and complete mitigation." The law identifies certain circumstances under which the statutory fee can be exceeded, including preparation and adoption of a "needs analysis," eligibility for State funding, and satisfaction of two of four requirements (post-January 1, 2000) identified in the law including: year-round enrollment, general obligation bond measure on the ballot over the last four years that received 50 percent plus one of the votes cast, 20 percent of the classes in portable classrooms, or specified outstanding debt. Assuming a district qualifies for exceeding the statutory fee, the law establishes ultimate fee caps of 50 percent of costs where the State makes a 50 percent match, or 100 percent of costs where the State match is unavailable. District certification of payment of the applicable fee is required before the County can issue the building permit.

Quimby Act

California Government Code Section 66477, Subdivision Map Act, referred to as the Quimby Act, permits local jurisdictions to require the dedication of land and/or the payment of in-lieu fees solely for park and recreation purposes. The required dedication and/or fees are based upon the residential density, parkland cost, and other factors. Land dedication and fees collected pursuant to the Quimby Act may be used for acquisition, improvement, and expansion of park, playground, and recreational facilities or the development of public school grounds.

California Green Building Code

The 2022 California Green Building Standards Code, otherwise known as the CALGreen Code (California Code of Regulations [CCR] Title 24, Part 11) is a portion of the California Building Standards Code (CBSC), which became effective on January 1, 2023. The CBSC is adopted every three years by the Building Standards Commission (BSC).

The purpose of the CALGreen Code is to improve public health, safety, and general welfare by enhancing the design and construction of buildings through the use of building concepts having a reduced negative impact or positive environmental impact and encouraging sustainable construction practices. The CALGreen standards regulate the method of use, properties, performance, types of materials used in construction, alteration repair, improvement and rehabilitation of a structure or improvement to property. The provisions of the code apply to the planning, design, operation, construction, use, and occupancy of every newly constructed building or structure throughout California. Requirements of the current CALGreen Code include, but are not limited to, the following measures:

- Mandatory reduction in indoor water use through compliance with specified flow rates for plumbing fixtures and fittings;
- Mandatory reduction in outdoor water use through compliance with a local water efficient landscaping ordinance or the California Department of Water Resources' (DWR's) Model Water Efficient Landscape Ordinance (MWELO);
- 65 percent of construction and demolition waste must be diverted from landfills;
- Mandatory inspections of energy systems to ensure optimal working efficiency;
- Inclusion of electric vehicle (EV) charging stations or designated spaces capable of supporting future charging stations; and
- Low-pollutant-emitting exterior and interior finish materials, such as paints, carpets, vinyl flooring, and particle boards.

The CALGreen standards also include voluntary efficiency measures that are provided at two tiers and implemented at the discretion of local agencies and applicants. According to Section A4.602 of Appendix A4 of the CALGreen Code, CALGreen's Tier 1 standards call for a 15 percent improvement in energy requirements, stricter water conservation, 65 percent diversion of construction and demolition waste, 10 percent recycled content in building materials, 20 percent permeable paving, 20 percent cement reduction, and cool/solar-reflective roofs. CALGreen's more rigorous Tier 2 standards call for a 30 percent improvement in energy requirements, stricter water conservation, 80 percent diversion of construction and demolition waste, 15 percent recycled content in building materials, 30 percent permeable paving, 25 percent cement reduction, and cool/solar-reflective roofs. Placer County does not require compliance with Tier 1 or Tier 2 CALGreen standards at this time.

Assembly Bill 1327

Assembly Bill (AB) 1327, the Solid Waste Reuse and Recycling Access Act of 1991 requires jurisdictions to adopt ordinances requiring development projects to provide adequate storage area for collection and removal of recyclable materials. Placer County adopted such an ordinance (Municipal Code Section 8.16.080).

Assembly Bill 1881

AB 1881, the Water Conservation in Landscaping Act of 2006 required DWR to update the Model Efficient Landscape Ordinance. Furthermore, AB 1881 required local agencies to adopt the updated model ordinance or an equivalent ordinance by January 1, 2010. If local jurisdictions failed to adopt the updated model ordinance or an equivalent by January 1, 2010, the DWR's updated model ordinance would automatically be adopted by statute. Placer County adopted its Water Efficient Landscape Ordinance (WELO) in October 2017.

Senate Bill 1016

Enacted in 2007, SB 1016 amended portions of the California Integrated Waste Management Act, allowing the California Integrated Waste Management Board (CIWMB) to use per capita disposal as an indicator in evaluating compliance with the requirements of AB 939. Jurisdictions track and report their per capita disposal rates to CalRecycle.

Senate Bill 1383

SB 1383 (2016) directed the California Air Resources Board (CARB) to approve and start implementing a Short-Lived Climate Pollutant (SLCP) strategy to reduce statewide emissions of SLCPs in 2018. Because methane is a SLCP produced from the decomposition of organic waste in landfills, the bill established targets to achieve a statewide 50-percent reduction in the 2014 organic waste disposal level by 2022 and to achieve a 75-percent reduction in the 2014 organic waste disposal level by 2025.

The Western Placer Waste Management Authority (WPWMA) Materials Recovery Facility (MRF) accepts source separated organic wastes, recovers organic wastes, recovers organic waste from the mixed waste stream and recycles or composts materials as appropriate. Upgrades to the facility are underway to ensure SB 1383 organic waste recovery levels are achieved. These upgrades are anticipated to be complete by 2025. Additionally, Recology, under contract with the County, provides certain organic waste collection services to businesses, including paper, cardboard, and food waste collection.

Further, where a local jurisdiction has not adopted a more stringent construction and demolition (C&D) ordinance, California Building Standards Code (Title 24) requires construction activities to implement Sections 4.408 and 5.408 of the CALGreen Code. The WPWMA MRF accepts mixed and separated construction debris for recycling. Contractors may also separate and self-haul debris to a recycler of their choice. Verification of diversion is required as part of the building permit process. Recology, under contract with the County, provides debris box collection services to aid in the separation of recyclable debris. Current C&D diversion rates are found at: https://wpwma.ca.gov/#.

Senate Bill 610 and Senate Bill 221

In 2001, the California Legislature enacted two pieces of legislation relevant to environmental review focused on the water consumption associated with large development projects. SB 610 (Chapter 643, Statutes of 2001; Section 21151.9 of the Public Resources Code (PRC) and

Section 10910 et seq. of the Water Code) requires the preparation of water supply assessments (WSAs) for large developments. Government Code section 66473.7(a)(1), created through SB 221 requires an affirmative written verification of sufficient water supply for subdivisions of more than 500 units. SB 221 is designed as a "fail-safe" mechanism to ensure that collaboration on finding the needed water supplies to serve a new large subdivision occurs early in the planning process.

As stated in CEQA Guidelines Section 15155, which reflects SB 610 requirements, any residential development exceeding 500 dwelling units is considered a "water-demand project" and is required to prepare a WSA. The proposed project includes 212 new single-family detached homes and 220 multi-family units, totaling 432 residences on-site. Thus, neither a water supply verification under SB 221 nor a WSA under SB 610 is required for the proposed project.

Urban Water Management Planning Act

In 1983, the California Legislature enacted the Urban Water Management Planning Act (Water Code Sections 10610 – 10656). The Act requires that every urban water supplier that provides water to 3,000 or more customers, or that provides over 3,000 acre-feet of water annually shall prepare and adopt an UWMP within a year of becoming an urban water supplier and update the plan at least once every five years. The Act specifies the content that is to be included in an UWMP, and states that urban water suppliers should make every effort to ensure the appropriate level of reliability in its water service sufficient to meet the needs of its various categories of customers during normal, dry, and multiple-dry years. The Act also states that the management of urban water demands and the efficient use of water shall be actively pursued to protect both the people of the State and their water resources. The Sacramento Main District of CAL-AM prepared and adopted an UWMP in 2020.[31]

California Integrated Waste Management Act – Assembly Bill 939

AB 939, the California Integrated Waste Management Act of 1989, contains requirements to minimize solid waste disposal in California landfills, prioritizing source reduction, recycling, composting and environmentally safe transformation and land disposal. According to AB 939, all cities and counties are required to divert 25 percent of all solid waste from landfill facilities by January 1, 1995, and 50 percent by January 1, 2000. AB 939 requires that counties prepare Integrated Waste Management Plans to implement these landfill diversion goals and prepare and adopt Source Reduction and Recycling Elements (SRRE). The SSRE must establish a program for managing and reducing waste generated in the jurisdiction to meet the 50 percent waste diversion mandate. Cities and counties that do not meet this mandate are subject to $10,000-per-day fines. The Five-year Review of Placer County's Countywide Integrated Waste Management Plan was approved by CalRecycle in October 2023.

Local Regulations

The following are applicable local regulations related to the proposed project.

Placer County General Plan

The relevant goals and policies from the PCGP related to public services and utilities are presented below.

[31] California American Water Company, Sacramento Main District. *2020 Urban Water Management Plan*. June 2021.

Public Facilities and Services Element

Goal 4.A To ensure the timely development of public facilities and the maintenance of specified service levels for these facilities.

Policy 4.A.1 Where new development requires the construction of new public facilities, the new development shall fund its fair share of the construction. The County shall require dedication of land within newly developing areas for public facilities, where necessary.

Policy 4.A.2 The County shall ensure through the development review process that adequate public facilities and services are available to serve new development. The County shall not approve new development where existing facilities are inadequate unless the following conditions are met:

a. The applicant can demonstrate that all necessary public facilities will be installed or adequately financed (through fees or other means); and
b. The facilities improvements are consistent with applicable facility plans approved by the County or with agency plans where the County is a participant.
c. The facilities improvements are designed and built to the current standards of the agency providing service.

Goal 4.B To ensure that adopted facility and service standards are achieved and maintained through the use of equitable funding methods.

Policy 4.B.1 The County shall require that new development pay its fair share of the cost of all existing facilities it uses based on the demand for these facilities attributable to the new development; exceptions may be made when new development generates significant public benefits (e.g., low income housing, needed health facilities) and when alternative sources of funding can be identified to offset foregone revenues.

Policy 4.B.2 The County shall require that new development pay the cost of upgrading existing public facilities or construction of new facilities that are needed to serve the new development; exceptions may be made when new development generates significant public benefits (e.g., low income housing, needed health facilities) and when alternative sources of funding can be identified to offset foregone revenues.

Policy 4.B.3 The County shall require, to the extent legally possible, that new development pay the cost of providing public services that are needed to serve the new development; exceptions

may be made when new development generates significant public benefits (e.g., low income housing, needed health facilities) and when alternative sources of funding can be identified to offset foregone revenues. This includes working with the cities to require new development within city limits to mitigate impacts on Countywide facilities and services.

Goal 4.C To ensure the availability of an adequate and safe water supply and the maintenance of high quality water in water bodies and aquifers used as sources of domestic supply.

Policy 4.C.1 The County shall require proponents of new development to demonstrate the availability of a long-term, reliable water supply. The County shall require written certification from the service provider that either existing services are available or needed improvements will be made prior to occupancy. Where the County will approve groundwater as the domestic water source, test wells, appropriate testing, and/or report(s) from qualified professionals will be required substantiating the long-term availability of suitable groundwater.

Policy 4.C.2 The County shall approve new development based on the following guidelines for water supply:

a. Urban and suburban development should rely on public water systems using surface supply.
b. Rural communities should rely on public water systems. In cases where parcels are larger than those defined as suburban and no public water system exists or can be extended to the property, individual wells may be permitted.
c. Agricultural areas should rely on public water systems where available, otherwise individual water wells are acceptable.

Policy 4.C.6 The County shall promote efficient water use and reduced water demand by:

a. Requiring water-conserving design and equipment in new construction;
b. Encouraging water-conserving landscaping and other conservation measures;
c. Encouraging retrofitting existing development with water-conserving devices; and,
d. Encouraging water-conserving agricultural irrigation practices.

Goal 4.D The County shall require wastewater conveyance and treatment facilities that are sufficient to serve the Placer County General Plan proposed density of

residential, commercial, and public/institutional uses in a way which protects the public and environment from adverse water quality or health impacts.

Policy 4.D.2 The County shall require developments outside of an existing sewer service area and needing new connections to public conveyance and treatment facilities to be annexed into the sewer service area providing service.

Policy 4.D.4 The County shall require developments needing new connections to construct wastewater conveyance facilities which are sized and located to provide sewer service based on permitted densities and applicable sewer shed area. Wastewater conveyance systems shall be designed for gravity flow. Where gravity conveyance systems are not feasible, the agency providing service may approve pumping service where a site specific engineering analysis demonstrates the long-term cost effectiveness of pumped facilities.

Policy 4.D.5 The County shall require developments needing new connections to pay their fair share of the cost for future public wastewater facilities which support development based on the Placer County General Plan. The fair share will be based on the demand for these facilities attributable to the new development.

Policy 4.D.6 The County shall promote efficient water use and reduced wastewater system demand by:

a. Requiring water-conserving design and equipment in new construction as required in California law (AB 1881);
b. Encouraging retrofitting with water-conserving devices; and
c. Designing wastewater systems to minimize inflow and infiltration.

Policy 4.D.10 The County shall require all public wastewater facilities to be designed and built to the current standards of the agency providing service.

Goal 4.G To ensure the safe and efficient disposal or recycling of solid waste generated in Placer County.

Policy 4.G.1 The County shall require all new urban/suburban development, excluding rural development, to include provisions for solid waste collection.

Policy 4.G.2 The County shall promote maximum use of solid waste source reduction, recycling, composting, and environmentally-safe transformation of wastes.

Policy 4.G.7 The County shall require that all new development complies with applicable provisions of the Placer County Integrated Waste Management Plan.

Goal 4.H To provide adequate law enforcement services to deter crime and to meet the growing demand for services associated with increasing population and commercial/industrial development in the County.

Policy 4.H.1 Within the County's overall budgetary constraints, the County shall strive to maintain the following staffing ratios (expressed as the ratio of officers to population):

a. 1:1,000 for unincorporated areas
b. 1:7 for jail population
c. 1:16,000 total county population for court and civil officers

Policy 4.H.2 The County Sheriff shall strive to maintain the following average response times for emergency calls for service:

a. 6 minutes in urban areas
b. 8 minutes in suburban areas
c. 15 minutes in rural areas
d. 20 minutes in remote areas

Policy 4.H.4 The County shall require new development to develop or fund sheriff facilities that, at a minimum, maintain the above standards.

Policy 4.H.5 The County shall consider public safety issues in all aspects of commercial and residential project design, including crime prevention through environmental design.

Goal 4.I To protect residents of and visitors to Placer County from injury and loss of life and to protect property and watershed resources from fires.

Policy 4.I.2 The County shall encourage local fire protection agencies in the County to maintain the following standards (expressed as average response times to emergency calls):

a. 4 minutes in urban areas
b. 6 minutes in suburban areas
c. 10 minutes in rural areas

Policy 4.I.3 The County shall require new development to develop or fund fire protection facilities, personnel, and operations and

maintenance that, at a minimum, maintains the above service level standards.

Policy 4.I.9 The County shall ensure that all proposed developments are reviewed for compliance with fire safety standards by responsible local fire agencies per the Uniform Fire Code and other County and local ordinances.

Recreation and Cultural Resources Element

Goal 5.A To develop and maintain a system of conveniently located, properly-designed parks and recreational facilities to serve the needs of present and future residents, employees, and visitors.

Policy 5.A.1 The County shall strive to achieve and maintain a standard of 10 acres of improved parkland per 1,000 population. The standard shall be comprised of the following:

- 5 acres of improved active parkland per 1,000 population
- 5 acres of passive recreation area or open space per 1,000 population

Policy 5.A.3 The County shall require new development to provide a minimum of 5 acres of improved parkland and 5 acres of passive recreation area or open space for every 1,000 new residents of the area covered by the development. The park classification system shown in Table 5-1 (see Table 15-5) should be used as a guide to the type of the facilities to be developed in achieving these standards.

Table 15-5
Park Classification System

Park Type	Use Description	Desirable Site Characteristics
Mini-Park (2 acres or less)	Specialized facilities that serve a concentrated or limited population or specific group, such as children or senior citizens.	Within neighborhoods and close to high-density housing or housing for the elderly.
Neighborhood Park (2 to 15 acres)	Area for intense recreational activities, such as field games, court games, playground apparatus, skating, picnicking.	Easily-accessible to neighborhood population (geographically centered with safe walking and bike access).
Community Park (15 or more acres)	Area of diverse environmental quality. May include areas suited for intense recreational activities. May be an area of natural quality for outdoor recreation, such as walking, viewing, and picnicking. May be any combination of the above,	May include natural features, such as water bodies. Easily-accessible to neighborhood served.

(Continues on next page)

Table 15-5
Park Classification System

Park Type	Use Description	Desirable Site Characteristics
	depending on site suitability and community need.	
Linear Park	Area developed for one or more modes of travel, such as hiking, biking, horseback riding, or crosscountry skiing.	Built or natural corridors, such as utility rights-of-way, that link other elements of the recreation system or community facilities, such as school, libraries, commercial areas, and other park areas.
Special Use	Areas for specialized or single-purpose recreational activities such as golf courses, nature centers, marinas, arenas, outdoor theaters, downhill ski areas, or areas that preserve, maintain, and interpret buildings, sites, and objects of archaeological significance. Also boulevards and parkways.	
Conservancy Areas	Protection and management of the natural/cultural environment with recreation use as a secondary objective.	Variable, depending on the resource being protected.

Policy 5.A.4 The County shall consider the use of the following open space areas as passive parks to be applied to the requirement for 5 acres of passive park area for every 1,000 residents.

- Floodways
- Protected riparian corridors and stream environment zones
- Protected wildlife corridors
- Greenways with the potential for trail development
- Open water (e.g., ponds, lakes, and reservoirs)
- Protected woodland areas
- Protected sensitive habitat areas providing that interpretive displays are provided (e.g., wetlands and habitat for rare, threatened or endangered species)

Buffer areas are not considered as passive park areas if such areas are delineated by setbacks within private property. Where such areas are delineated by public easements or are held as common areas with homeowner/property owner access or public access, they

will be considered as passive park areas provided that there are opportunities for passive recreational use.

Policy 5.A.5 The County shall require the dedication of land and/or payment of fees, in accordance with state law (Quimby Act and the Mitigation Fee Act) to ensure funding for the acquisition and development of public recreation facilities. The fees are to be set and adjusted as necessary to provide for a level of funding that meets the actual cost to provide for all of the public parkland and park development needs generated by new development.

Dry Creek-West Placer Community Plan

The relevant goals and policies from the DCWPCP related to public services and utilities are presented below.

Community Development Element: The Land Use Plan

Policy 4 To subject new developments with potential for adverse fiscal and other impacts on the delivery of essential public services to an "impact analysis" so as to avoid unreasonable financial burdens on the community and other affected local governmental agencies to ensure the continued availability of essential public services.

Policy 8 Residential areas should be located where a full range of services and facilities can be provided most efficiently and economically.

Policy 43 To allow for continued increased commercial and residential development only where all public services can be provided in an adequate and timely manner.

Policy 44 The rate of development and location of projects shall not exceed the capacity of the community, special districts and utility companies to provide all needed services and facilities in an orderly and economic manner.

Community Development Element: Community Design Element

Goal 6 It is a goal to create residential development which allows the following elements: human interaction, bicycle and pedestrian circulation, an appropriate relationship to the existing development in the area, and the creation of a neighborhood identity and//or focus (i.e. parks, schools, natural open space areas, creek site of historical or archaeological significance, etc.

Goal 8 A major goal of the plan is to utilize and improve the Dry Creek environs as a focal point of existing and new neighborhoods to be created in the area through the placement of park facilities, roadway, trails, interpretive areas, visibility, etc.

Policy 17 Require the construction of bicycle, pedestrian, and equestrian trails as provided in this Plan and use the policies of the Placer County Bikeways Master Plan in determining routes and trail type for areas not depicted on the Plan Trails map but still required to satisfy the policies of this Plan.

Policy 18 Utility lines shall be installed underground to ensure minimum disruption to the environment and as little disturbance as possible to vegetation, particularly in scenic corridors.

Community Development Element: Public Services

Goal 1 Public service and facilities must be available to serve the needs created by the present and future development which occurs in the plan area.

Goal 2 Maintain the most feasible and acceptable balance between adequate public services, costs of providing those services and projected demand.

Goal 3 Prevent the commitment of land use through premature public service facility construction.

Goal 4 Make urban services available only to those lands which, under the Land Use plan, will need them.

Goal 5 Ensure that the rate of development shall not exceed the capacity of County, community, special districts (including school districts), and utility companies to provide all needed public services in a timely, orderly, and economically feasible manner.

Policy 1 Coordination of city, county, and district public works planning and land use planning are essential. A major problem is to design major water, sewer and road extensions, intended to serve urban areas, in such a way that they do not also serve intervening non-urban areas, and thereby encourage their urbanization.

Policy 3 Discourage over-development of facilities, services, and systems in advance of demand to ensure that no inequitable financial burden is imposed and to prevent the commitment of land use through premature public facility construction.

Policy 4 Ensure that adequate services will be available for proposed development before granting approvals.

Policy 7 Consider mitigation measures from new development to reduce impacts on local services, i.e., schools, parks, etc.

Goal To provide sewage disposal facilities which will serve the Dry Creek-West Placer Area's proposed density of residential, commercial, industrial, and

public uses in a way which protects the public from adverse water quality or health impacts.

Policy 1 — Require all new commercial, industrial, institutional, and residential subdivisions to install and connect to a public sewer system.

Community Development Element: Parks and Recreation

Goal 1 — To provide a variety of park and recreation facilities adequate to meet the needs of present and future residents of the Dry Creek Area.

Policy 1 — To provide future park facilities in accordance with park standards and location guidelines as set forth in this plan.

Policy 5 — To encourage private recreation facilities within residential developments (as required in planned unit developments) to off-set the demand for public facilities.

Policy 6 — To require the dedication of land and/or payment of fees, in accordance with state law (Quimby Act) to ensure funding for the acquisition and development of public recreation facilities.

Policy 9 — To encourage compatible recreational use of riparian areas along streams and creeks in the same area where feasible.

Policy 12 — To require the development of a regional trail system which provides an alternative mode of transportation. This trail system should be designed to provide access to separated trails without requiring the trail to be done by automobile or by pedestrians traveling adjacent to motor vehicles which may be traveling at speeds in excess of 25 m.p.h.

Environmental Resources Management Element: Open Space

Goal 8 — A community trail system shall be developed to:

a. Provide safe, pleasant, convenient travel by foot, horse or bicycle within the Community Plan area.
b. Provide recreational opportunities to residents of the Community Plan area.
c. Connect local trails to regional trail systems.
d. Establish an off-street, non-vehicular community trail system which links school facilities, parks and recreation, community

Policy 11 — Open spaces should be linked visually and physically to form a system of open spaces. Where appropriate, trails shall connect open space areas. Dedication of easements shall be encouraged and in many cases required as lands are developed and built.

Dry Creek Greenway Regional Vision Plan

In 2011, the Placer County Board of Supervisors adopted The Dry Creek Greenway Regional Vision (Vision Plan), a proposed regional open space greenway and park system that protects the natural waterways, riparian corridors, natural and cultural resources and sensitive habitat lands. The Vision Plan area consists of Dry Creek and its major tributaries including Miners Ravine, Secret Ravine, Strap Ravine, Antelope Creek, Cirby Creek, Clover Valley Creek, and Linda Creek. The Vision Plan includes a coordinated multi-jurisdiction management strategy to address hiking, biking, equestrian trails and public access, habitat preservation, flood control, and water quality. The concept of the Vision Plan is for a connected open space system linking the Dry Creek Parkway with Folsom Lake State Recreation Area and the uplands of the watershed. The Vision Plan consists of the following objectives:

- Preserve and enhance riparian and aquatic habitats;
- Conserve and protect significant historic, cultural and scenic resources;
- Connect the Dry Creek Parkway to the Folsom Lake State Recreation Area;
- Provide for the management of Greenway resources;
- Provide active and passive recreation opportunities;
- Preserve floodwater conveyance capacity and reduce property damage due to flooding;
- Work with existing plans and policies;
- Secure funding to sustain and complete the Greenway;
- Function as a local and regional asset; and
- Facilitate land use planning and management within the Greenway.

Placer County Code

Sections from the Placer County Code related to fire protection services and park and recreational facilities are discussed below.

Development Fees for Fire Protection

Article 15.36, Development Fees for Fire Protection, of the Placer County Code requires new development within the unincorporated areas of the County to pay a development fee to the relevant fire protection agency for the benefit of the owners or residents of the development. The responsibility for compliance with the requirements of Government Code Section 66000 et seq., and for the collection, receipting, and management of fees collected from new development projects shall rest with the serving fire protection agency.

Parks and Recreational Facilities Fees

Article 15.34, Parks and Recreational Facilities Fees, of the Placer County Code requires payment of parks and recreational facility fees to implement the goals and objectives of the PCGP and mitigate impacts caused by new developments. The purpose of the park and recreation facilities impact fee is to provide funding for expansion of parkland and recreation facilities required to serve new development in unincorporated Placer County. Payment of fees is required prior to the issuance of building permits or at the earliest time permitted by law.

Section 16.08.100 of the Placer County Code requires that as a condition of approval for a final subdivision or parcel map, a portion of such land must be dedicated for park or recreational purposes, a fee paid in lieu thereof, or a combination of both. The portion to be dedicated must be sufficient to provide five acres of parkland per 1,000 residents of the subdivision. In addition,

while not included in the Placer County Code, General Plan Policy 5.A.1 sets a standard of five acres of passive recreation area or open space per 1,000 residents.

Placer County Water Efficient Landscape Ordinance

The Placer County Landscape Design Guidelines incorporate the County's WELO. The County's WELO established water efficiency requirements for developments throughout the County based on the number of landscaped areas included in proposed development projects, and whether the project involves new development or renovation type activities. Water use efficiency in the WELO is to be achieved through the use of drought tolerant plantings, and proper landscaping, as well as specific requirements for irrigation systems. The specific requirements for water use efficiency in landscaping would be confirmed during design reviews for proposed projects. Specifically, the WELO requires applications to include Landscape Packages, which would present water budgets, soil management reports, grading plans, landscape design plans, irrigation plans and other information related to the overall design of landscaping within projects.

15.4 IMPACTS AND MITIGATION MEASURES

The section below describes the standards of significance and methodology used to analyze and determine the proposed project's potential impacts related to public services and utilities. A discussion of the project's impacts, as well as mitigation measures where necessary, is also presented.

Standards of Significance

Consistent with Appendix G of the CEQA Guidelines and the County's Initial Study Checklist, determination of significant impacts is based on whether the proposed project would do any of the following:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, to maintain acceptable service ratios, response times or other performance objectives for any of the public services:
    - Fire protection;
    - Police protection;
    - Schools;
    - Parks;
    - Other public facilities;
    - Maintenance of public facilities, including roads;
- Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated;
- Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment;
- Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects;
- Have insufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years;

- Result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments;
- Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals; or
- Fail to comply with federal, State, and local management and reduction statutes and regulations related to solid waste.

Impacts related to storm drainage facilities are addressed in Chapter 12, Hydrology and Water Quality, of this EIR.

It is important to note that, in addressing public service demand issues under CEQA, the appropriate focus is on the environmental effects of whatever steps might be necessary to achieve or maintain adequate service. For example, if proposed new development would create an increased demand for law enforcement or fire protection services, an EIR should inquire as to whether new or expanded physical facilities may be required to provide such service. The "impacts" addressed under CEQA are the physical effects of providing service, not any possible failure to provide adequate service under applicable standards. (See *City of Hayward v. Board of Trustees of the Cal. State University* (2015) 242 Cal.App.4th 833, 843 ["[t]he need for additional fire protection services is not an environmental impact that CEQA requires a project proponent to mitigate"]; *Goleta Union School Dist. v. Regents of Univ. of Cal.* (1995) 37 Cal.App.4th 1025, 1031–1034 [school overcrowding attributable to new development is not an environmental effect subject to CEQA, though the physical effects of new facility construction to serve new students would be]; and CEQA Guidelines, § 15131, subd. (a) ["[e]conomic or social effects of a project shall not be treated as significant effects on the environment"].)

The focus of CEQA on physical impacts, however, does prevent a county or city from requiring new development to take the steps needed to ensure adequate public services, such as law enforcement service. Such steps are simply beyond the scope of CEQA. They should instead be imposed under some other body of State statutory law (e.g., the Planning and Zoning Law [Gov. Code, § 65300 et seq.] or the Subdivision Map Act [Gov. Code, § 66410 et seq.]) or under a local government's broad police power under the California Constitution. (See Cal. Const., Art. XI, § 7; *Candid Enterprises, Inc. v. Grossmont Union High School Dist.* (1985) 39 Cal.3d 878, 885.)

It is also important to understand that special legal principles apply to impacts to school facilities. According to Government Code Section 65996, the development fees authorized by Senate Bill 50 (1998) (described earlier) are deemed to be "full and complete school facilities mitigation" for impact caused by new development. The legislation also recognized the need for the fee to be adjusted periodically to keep pace with inflation. The legislation indicated that in January 2000, and every two years thereafter, the State Allocation Board would increase the maximum fees according to the adjustment for inflation in the statewide index for school construction.

Section 65996 also prohibits public agencies from using CEQA or "any other provision of state or local law" to deny approval of "a legislative or adjudicative act, or both, involving, but not limited to, the planning, use, or development of real property or any change in governmental organization or reorganization" on the basis of the project's impacts on school facilities.

Method of Analysis

To determine the potential for the project to result in substantial adverse impacts associated with the provision of new or altered government facilities, relevant public services and utilities planning documents were reviewed, including, but not limited to, the PCGP, the Placer County General Plan EIR, the DCWPCP, the Placer County LAFCo Municipal Service Review for Fire and Emergency Services, the California American Water Company's Sacramento Main District 2020 UWMP, and direct communication with service providers. In addition, a Preliminary Water Report (see Appendix I), and a Wastewater Report (see Appendix J) were prepared to assess project-specific impacts related to the proposed water supply and sewer services that would be provided to the project. The methods of analysis used in the Preliminary Water Report and Wastewater Report are described in further detail below.

Preliminary Water Report

The purpose of the Preliminary Water Report prepared for the proposed project was to provide a feasibility study of the proposed project, which is anticipated to be constructed over five phases, and the phased water supply improvements associated with the project.

As part of the Preliminary Water Report, a hydraulic model was developed for the proposed project using the EPANET (Version 2.2) program, and was run for two different scenarios. Scenario 1 analyzed the peak-day demand of the ultimate buildout conditions with the fire flow considered. Scenario 2 demonstrated the peak-hour demand of the ultimate buildout without the additional fire flow demand on the system. The project's peak water demand assumptions were based off of CAL-AM standards.

Wastewater Report

The Wastewater Report prepared for the proposed project evaluated the ability of the existing wastewater conveyance infrastructure in the project vicinity to accommodate the wastewater generated by operations of the proposed project, as well as that generated by other properties within the overall sewer shed area.

Pipe sizes required to serve the service area were determined using the requirements of the Placer County Land Development Manual, and Manning's Equation, as well as a Manning's Roughness Coefficient of 0.013, were used to calculate the capacity of typical pipe diameters flowing at 70 percent full. The Wastewater Report used a demand factor of 380 gallons per day per equivalent dwelling unit (gpd/EDU) for single-family residential development and 260 gpd/EDU for multi-family residential development, with a safety factor of 2.0, and corresponding peaking factors. In addition, the following methodology was used:

1. The report included an analysis of the proposed sewer collection system needed to provide sewer service to the 212 new on-site single-family detached homes and 220 on-site multi-family units, for a total of 432 on-site EDUs. In addition, the report included an analysis of the system's capability to provide expanded sewer service to the additional properties within the sewer shed boundary surrounding the project site. Therefore, the overall sewer shed analyzed within the Wastewater Report prepared for the proposed project consisted of 1,388 on- and off-site EDUs.
2. The Wastewater Report evaluated capacity of the existing emergency wastewater storage tanks at the Dry Creek/West Placer CFD #1 lift station to serve the proposed project, accounting for other users served prior to development of the proposed project.

The 22 potential ADUs that could be developed on-site could be accommodated within the pipe sizes required to serve the service area. Thus, the additional units, if included, would not be anticipated to alter the conclusions of the Wastewater Report prepared for the project by King Engineering.

The off-site 10-inch sewer main in Walerga Road (from manholes KC11-05 to KC11-08) may experience surcharging during PWWF, if allowed by the district. If the district does not allow surcharging, upsizing approximately 960 linear feet of 10-inch sewer main to 12-inch sewer main will be required.

The on-site eight-inch sewer main (from manholes KC11-01 to KC11-05) interior to Phase 4 of the project site may experience surcharging during PWWF, if allowed by the district. If the district does not allow surcharging, upsizing approximately 1,545 linear feet of eight-inch sewer main to 10-inch sewer main will be required.

Project-Specific Impacts and Mitigation Measures

The following discussion of impacts is based on the implementation of the proposed project in comparison with the standards of significance identified above. In most cases, potential environmental impacts associated with the proposed project and the 22 on-site ADUs would not differ. Thus, unless otherwise noted, the below project-specific analysis applies to both the proposed project and the on-site ADUs. A separate analysis of impacts associated with the off-site affordable housing parcel is also provided below. In addition, the off-site sewer lift station improvements area is located within Dry Creek Community Park and the improvements would be limited to providing an underground tank for additional emergency sewer storage capacity. As such, the off-site sewer lift station improvements would not result in increased demand for public services or utilities in the DCWPCP area, and, as a result, the off-site sewer lift station improvements are not discussed further within the impact analyses presented below. However, a discussion of the required improvements necessary to serve the proposed project is included under Impact 15-6 related to wastewater infrastructure.

15-1 Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental services and/or facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection services. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to resulting in substantial adverse physical impacts associated with the provision of new or physically altered fire protection facilities associated with development of the proposed project and potential future development of the off-site affordable housing parcel.

Proposed Project

The proposed project would include annexation into the Dry Creek Zone of Benefit (CSA 28, Zone 165) for provision of fire protection services to the site. Given that fire protection and emergency medical services within Zone 165 are the responsibility of Placer County,

the requested annexation would be subject to approval by the County Board of Supervisors.

Fire protection services for the project site would be provided by PCFD by way of Station 100, located at 8350 Cook Riolo Road. Station 100 is located approximately 1.8 miles from the project site. In addition, two new fire stations are proposed as part of the Placer Vineyards Specific Plan, to the west across Walerga Road. Pursuant to Policy 4.4.2, the County maintains an average response time goal of six minutes for suburban areas.

As previously mentioned, CAL FIRE is responsible for providing emergency services in Placer County and has stated their ability to serve future planned growth in the Dry Creek area, and still maintain compliance with established safety response times. As is currently the case, incidents will occur where the City of Roseville (Roseville) Fire Department is called upon to provide mutual aid at or near the project area to send the closest available unit to an emergency incident, regardless of jurisdictional boundaries. In that spirit of cooperation to provide the fastest and highest level of service to the surrounding area, Roseville Fire Department has signed onto a Closest Resource Agreement (CRA) with PCFD and other surrounding fire departments to provide mutual aid between all participating fire departments. As outlined in the CRA, Roseville can adjust the amount of reciprocal coverage by setting draw-down levels, or withdraw from the CRA entirely. Timing and triggers for public service improvements occur when impacts associated with additional development exceeds established safety standards, which is not the case for the proposed project. As residential units are constructed and fire impact fees are collected, projects are required to pay their fair share towards existing and planned fire protection improvements, which will address the project's impacts to fire services for all safety providers and increase the County's ability to serve unincorporated areas, in addition to continuing to provide reciprocal aid to the City of Roseville and surrounding local governments.

PCFD collects a Fire Facilities Fee specific to fire services for each sub area within the PCFD service area. The development impact fee is calculated based on a "fair share portion" of anticipated capital needs through 2060. Currently, the PCFD's Fire Facilities Fee for the 2025-2026 fiscal year is $1.05 per sf of residential development. Final improvement plans for the proposed project would be subject to review by the PCFD as part of the County's approval process in order to ensure compliance with fire and safety standards.

Although implementation of the proposed project would increase the amount of building space within the project site, all structures included in the proposed project would be constructed consistent with the CBSC and CFC. In compliance with the CBC (specifically Section 903.2.1.3, Group A-3), the design of the residences would include the installation and use of automatic fire sprinklers, and fire alarm systems would be incorporated pursuant to CFC requirements. Such features would reduce the potential for fires to occur within the proposed structures, which would reduce the demand for fire protection services from the project site.

In addition, given the proximity of the project site to Station 100, the response time to the project site is anticipated to be within the achievable response time goal. As such, response times for the proposed project would be consistent with General Plan Policy

4.I.2, and the proposed project would not require the provision of new or physically altered fire service facilities.

Off-Site Affordable Housing Parcel

As discussed throughout this EIR, the proposed RVSP amendment and rezone would result in a maximum development potential of 120 affordable income-restricted units within the off-site affordable housing parcel. While the baseline development potential for the proposed affordable housing parcel consists of 3,750 sf of commercial uses, plus the 39 density reserve units, the RVSP EIR analyzed development of the off-site affordable housing parcel with 60 High-Density Residential (HDR) units prior to rezoning of the parcel to Commercial uses in the 2015 Amendment. As discussed under Impact 14-13 of the RVSP EIR, development of the RVSP would result in a minor increase in fire protection personnel required to serve the development. However, the RVSP EIR included Mitigation Measure 14-13a, which requires the RVSP applicant to establish a special benefit assessment district or other funding mechanism to assure adequate funding for the ongoing maintenance and operation of fire protection and related services, including the costs for services required to satisfy Placer County Fire Department staffing requirements.

With respect to the 120 affordable income-restricted units associated with the off-site affordable housing parcel, fire protection services would be provided by PCFD by way of Station 100. The project applicant would be required to pay the applicable PCFD Fire Facilities Fee for residential development. It should be noted that Mitigation Measure 14-13a included in the RVSP EIR is beyond the scope of current CEQA requirements, as courts have since clarified that funding for public services is not an environmental concern pursuant to CEQA (*City of Hayward v. Board of Trustees of the California State University* [1st Dist. June 28, 2012] Cal App 4th [Case Nos. A13412, A132424, A131413, A132423]). Therefore, at such time the off-site affordable housing parcel gets developed, the project would be required to fund the fair share of such fees required to provide the additional staffing required to serve the off-site affordable housing parcel as a condition of approval, and RVSP EIR Mitigation Measure 14-13a is not applied in this EIR. In addition, final improvement plans for the affordable housing units would be subject to review by the PCFD as part of the County's approval process in order to ensure compliance with fire and safety standards. Thus, potential future development of the off-site affordable housing parcel would not require the provision of new or physically altered fire service facilities.

Conclusion

Given that the proposed project and potential future buildout of the off-site affordable housing parcel would not increase population such that PCFD would require new or altered facilities, the proposed project would not result in a need for new, or improvements to existing, fire protection facilities, construction of which could cause significant environmental impacts. Therefore, a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

15-2 Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental services and/or facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for law enforcement services. Based on the analysis below, and with implementation of mitigation for the off-site affordable housing parcel, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to resulting in substantial adverse physical impacts associated with the provision of new or physically altered law enforcement facilities associated with development of the proposed project and the off-site affordable housing parcel.

Proposed Project

The proposed project is located within the jurisdiction of and would be provided services by the PCSO. As described above, the proposed project would be served by the South Placer Substation located in Loomis at the intersection of Horseshoe Bar Road and I-80, approximately 12 miles to the northeast of the project site. In addition, limited law enforcement services may be provided by the PCSO's community service station located southeast of the project site. Furthermore, the West Placer Sheriff's Station is located at 5750 West Oaks Boulevard in Rocklin, approximately eight miles to the northwest. The West Placer Sheriff's Station operates a limited number of patrols, and limited County services will be available in early 2026, with plans to expand.

The threshold for this impact, as derived from Appendix G of the CEQA Guidelines, is related to whether the project would result in substantial adverse physical impacts associated with the provision of new or physically altered sheriff facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios or performance objectives.

New or physically altered law enforcement facilities would not be needed to adequately serve the proposed project. In addition, though response times are dependent upon the location of patrol officers at the time of the emergency call, on average, response times to the project site would be anticipated to be within the Placer County General Plan's eight-minute response time standard for suburban areas. Thus, the proposed project would not require the provision of new or physically altered law enforcement facilities.

Off-Site Affordable Housing Parcel

As discussed above, the RVSP EIR analyzed development of the off-site affordable housing parcel with 60 HDR units prior to rezoning of the parcel to Commercial uses. As discussed under Impact 14-14 of the RVSP EIR, development of the RVSP would result in an increase in personnel, equipment, and resources required to serve the development. Similar to the proposed project, new or physically altered law enforcement facilities would not be needed to adequately serve the proposed 120 affordable income-restricted units within the off-site affordable housing parcel, and response times to the off-site affordable housing parcel are anticipated to be within the Placer County General Plan's eight-minute response time standard for suburban areas. Nonetheless, the RVSP EIR included

Mitigation Measure 14-14a, which requires the RVSP applicant to establish a special benefit assessment district or other funding mechanism to assure adequate funding for the ongoing maintenance and operation of law enforcement services, with funding responsibilities imposed on residential and commercial properties within the RVSP area, including the costs for services required to satisfy the staffing standards set forth above and General Plan standards now in existence or as later amended. Mitigation Measure 14-14a included in the RVSP EIR is beyond the scope of current CEQA requirements, as courts have since clarified that funding for public services is not an environmental concern pursuant to CEQA (*City of Hayward v. Board of Trustees of the California State University* [1st Dist. June 28, 2012] Cal App 4th [Case Nos. A13412, A132424, A131413, A132423]). Therefore, at such time the off-site affordable housing parcel gets developed, the project would be required to fund the fair share of such fees required to provide the additional staffing and equipment required to serve the off-site affordable housing parcel as a condition of approval, and RVSP EIR Mitigation Measure 14-14a is not applied in this EIR.

In addition, in accordance with PCGP Policy 4.H.5, the RVSP EIR included Mitigation Measure 14-14b, which requires implementation of crime prevention through environmental design to identify design features that encourage criminal activity and identify solutions to mitigate problematic designs. At such time the off-site affordable housing parcel gets developed, RVSP EIR Mitigation Measure 14-14b, which has been incorporated into this EIR as Mitigation Measure 15-2, would be required. Thus, potential future development of the off-site affordable housing parcel would not require the provision of new or physically altered law enforcement facilities.

Conclusion

Based on the above, the proposed project and potential future development of the off-site affordable housing parcel would not result in a need for new, or improvements to existing, sheriff protection facilities, construction of which could cause significant environmental impacts. Nevertheless, the off-site affordable housing parcel is located within the overall RVSP area for which the RVSP EIR included mitigation measures intended to be implemented by all future development to reduce impacts related to law enforcement facilities. Thus, the impact herein is determined to be ***significant*** as a means to incorporate the applicable RVSP mitigation measure into this EIR and ensure the applicable RVSP EIR mitigation measure is implemented for the off-site affordable housing parcel. Therefore, should development of the off-site affordable housing parcel occur, implementation of Mitigation Measure 14-14b of the RVSP EIR would be required to ensure a significant impact does not occur. The referenced RVSP mitigation measure is incorporated into this EIR as Mitigation Measure 15-2 below.

Mitigation Measure(s)

Implementation of the following mitigation measure would reduce the above potential impact to a *less-than-significant* level.

Off-Site Affordable Housing Parcel

15-2 *Implement RVSP EIR Mitigation Measure 14-14b:*

Potential crime problems dealing with circulation systems and structures may be reduced by utilizing the concepts of Crime Prevention Through Environmental Design. Development design shall consider the effect on

features that could encourage criminal activity and work to eliminate such features. Coordination with the Sheriff's Department shall be required during design stages of all development within the Plan Area. Approval of final subdivision maps shall require Sheriff's Department review, including written approval, relating to safety in design.

15-3 Result in substantial adverse physical impacts associated with the provision of new or physically altered school services and/or facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or performance objectives. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to resulting in substantial adverse physical impacts associated with the provision of new or physically altered school facilities associated with development of the proposed project and the off-site affordable housing parcel.

Proposed Project

The proposed project would construct 212 new single-family residential units, 220 new multi-family units, and potentially up to 22 ADUs within the CJUSD, DCJESD, and RJUHSD school districts. The assumption was made that the ADUs would not be occupied by residents with school-aged children. Therefore, this discussion focuses on impacts associated with the 432 new residences associated with the proposed project. Overall, the proposed project would construct 110 single-family residential units and 220 multi-family units within the CJUSD, and 102 single-family residential units within the DCJESD and RJUHSD. Based on the student generation rates provided by the CJUSD, DCJESD and the RJUHSD,[32,33,34] the proposed project is expected to generate 123 students in kindergarten through grade eight and 36 students in grades nine through 12 (see Table 15-6).

As shown in Table 15-6, the proposed project would not increase the student population over the available capacity of the schools. In addition, according to SB 50, payment of the necessary school impact fees for the project would be considered full and satisfactory CEQA mitigation. As discussed previously, proposition 1A/SB 50 prohibits local agencies from using the inadequacy of school facilities as a basis for denying or conditioning approvals of any "[…] legislative or adjudicative act […] involving […] the planning, use, or development of real property" (Government Code 65996[b]).

To the extent that the school districts may need additional facilities to accommodate students from the project site as the project gradually builds out over time, the districts will control what it needs to build and when new construction would be necessary. The County is not in a position to speculate about what steps the districts would take (see PRC Section 21151.8 [school districts are CEQA lead agencies for school projects]).

Notably, CEQA Guidelines Section 15314 provide a categorical exemption for "minor additions to existing schools within existing school grounds where the addition does not increase original student capacity by more than 25 percent or ten classrooms, whichever is less. The addition of portable classrooms is included in this exemption." Whether the districts would need to obtain new classrooms to educate an increased student population from new development within the district's boundaries would be dependent on ongoing facility needs estimates and student population projections, which are subject to change over time based on factors such as changing birth rates and other social and economic factors. Thus, development of the proposed project would not require the provision of new or physically altered school facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or performance objectives.

Off-Site Affordable Housing Parcel

Development of the off-site affordable housing parcel would result in 120 multi-family units within the CJUSD. Based on the student generation rates provided by the CJUSD, the 120 multi-family residential units are expected to generate 39 students in kindergarten through grade eight and 18 students in grades nine through 12 (see Table 15-7).

As shown in Table 15-7, development of the off-site affordable housing parcel would not increase the student population over the available capacity of the schools. In addition, as shown in Table 15-8, the number of students generated by the off-site affordable housing development in combination with the students generated by the proposed project would not increase the student population over the available capacity of the schools.

Table 15-7
Off-Site Affordable Housing Parcel:
Enrollment, Capacity, and Student Generation by School

According to SB 50, payment of the necessary school impact fees for the project would be considered full and satisfactory CEQA mitigation. While the RVSP EIR included Mitigation Measure 14-12a, which requires payment of statutory school impact fees, such mitigation is beyond the scope of current CEQA requirements, as courts have since clarified that funding for public services is not an environmental concern pursuant to CEQA (*City of Hayward v. Board of Trustees of the California State University* [1st Dist. June 28, 2012] Cal App 4th [Case Nos. A13412, A132424, A131413, A132423]). Therefore, the off-site affordable housing parcel would be required to pay school impact fees as a condition of approval, and RVSP EIR Mitigation Measure 14-12a is not applied in this EIR. Thus, potential future development of the off-site affordable housing parcel would not require the provision of new or physically altered school facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or performance objectives.

Conclusion

Based on the above, the proposed project and potential future development of the off-site affordable housing parcel would not result in any reasonably foreseeable substantial adverse physical impacts associated with the provision of new or physically altered governmental services and/or facilities, the construction of which could cause significant environmental impacts, to maintain acceptable service ratios, response times, or performance objectives for maintenance of schools, and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

15-4 Result in an increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated, or include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to resulting in substantial adverse physical impacts associated with the provision of new or physically altered recreational facilities associated with development of the proposed project and the off-site affordable housing parcel.

Proposed Project

As noted above, the project would include the construction of 432 residential units, and, based on an average of 2.54 persons per household used for the *Placer County Park and Recreation Facilities Fee Study* (Fee Study), would be anticipated to house approximately 1,098 new residents on the project site.[35] The 22 ADUs are also conservatively assumed to generate an additional estimated 56 on-site residents for the purpose of calculating required parkland. Such residents could increase demand on existing parks and

[35] Placer County. *Placer County Park and Recreation Facilities Fee Study.* September 2003.

recreational facilities, potentially requiring provision of new facilities or expansion of existing facilities. As noted in Chapter 13 of this EIR, current regional housing profiles identify an average household size of 2.94 persons per household for the DCWPCP area.[36] However, the 2.54 persons per household figure is used in this analysis in order to maintain consistency with the Fee Study.

Both the PCGP and the DCWPCP require dedication of land and/or payment of fees in accordance with State law to ensure funding for the acquisition and development of public recreation facilities. Consistent with goals and policies in the PCGP and the DCWPCP, Section 16.08.100 of the Placer County Code requires dedication of land for park or recreational purposes, or a fee paid in lieu thereof, or a combination of both, as a condition of approval for final subdivision or parcel maps. The land areas required for dedication may be up to an amount equivalent to the land necessary to provide five acres of parkland per 1,000 residents of the proposed subdivision.

The proposed project would include development of a public, 2.1-acre neighborhood park in the Placer Creek Residential Phase 2 development (Lot PARK-1). Additional park areas would be provided in pockets along Placer Creek. The proposed project would include approximately 9.9 acres of open space bisected by “Placer Creek” and situated between the Placer Creek Residential Phase 3 and 4 neighborhoods (Lot 5/Lot OS-1). The open space area would be preserved as natural open space by virtue of the underlying zoning and an open space easement to be recorded with the final map. Placer Creek Residential parks, trails and open space would be open to the public.

The Estia Dry Creek development would feature an extensive internal pedestrian circulation system that would provide connectivity to project amenities and the surrounding community. A 3,537-sf community center building would include a club room, two fitness rooms, a dog washing facility, and leasing offices with associated lounge, break room, and storage areas. An outdoor pool with patios and grill areas would be located adjacent to the community center. Additional amenities would include a centrally located dog park, and car washing stations. The on-site amenities and recreational facilities associated with the Estia Dry Creek development would be private.

Additionally, the proposed project would include an approximately 1,300-foot-long Class I meandering trail along the Baseline Road frontage, and an approximately 2,300-foot-long Class I meandering trail along the southern/eastern Walerga Road frontage. Placer Creek Residential Phase 4 would also include an approximately 1,600-foot-long extension of the existing trail within the open space portion of the project site. An approximately 1,600-foot-long Class I trail on the southern side of Placer Creek would be connected to the stubbed path north of the three existing Sun Valley Oaks homes fronting White Mill Crescent Road at Vineyard Road. From the proposed trail, a pedestrian bridge would go over to Placer Creek and connect to a trail south of Phase 3, ultimately connecting to N Street within the Placer Creek Residential Phase 3 neighborhood.

In addition, the proposed project aims to implement minor enhancements within the abandoned Old Walerga Road corridor, which bisects the project site and existing residential development to the west of the project site within the broader Placer Vineyards area. The corridor is privately owned and encumbered by existing public utility easements;

[36] ESRI Business Analyst. *Housing Profile, DCWPCP Area*. January 2026.

accordingly, any proposed enhancements would be subject to landowner consent, utility coordination, and applicable approvals, and would not be implemented absent such consent. Proposed enhancements would be limited to areas previously disturbed by the former roadway and may include linkages on the north side to the planned Class I trail along Baseline Road and on the south side to Town Center Drive, limited pavement surface treatments (such as slurry seal or comparable non-structural applications), signage, and striping to accommodate pedestrians and bicyclists. If implemented, the improvements to the Old Walerga Road corridor would enhance connectivity of local residents to nearby retail and commercial centers, provide additional safety for pedestrians and cyclists, support multimodal access, and contribute to the overall functionality and integration of the local trail network.

Based on the County's requirement of five acres of parkland per 1,000 residents (Section 16.08.100 of the Placer County Code and General Plan Policy 5.A.1), the proposed project would be required to provide a minimum of approximately 5.36 acres of parkland (0.005 acres/resident X 1,072 estimated residents), and with the inclusion of 22 ADUs, would require 5.64 acres of parkland. Thus, by providing 2.1 acres of neighborhood park area, the proposed project would not meet the park requirements and payment of an in-lieu fee would be required. Where a combination of land and fees is required, the total value of the dedication would not exceed the cost of providing fully developed park land and recreational facilities. Given that the project would include development of park land and payment of fees to meet the demand created by future residents, the project would not be anticipated to substantially increase demand on existing or future parks or recreational facilities in the surrounding area. Furthermore, pursuant to Article 15.34 of the Placer County Code, the project applicant would be required to pay a parks and recreational facility fee. The purpose of the park and recreation facilities impact fee is to provide funding for expansion of park land and recreation facilities required to serve new development in unincorporated Placer County.

In addition to requiring a minimum of five acres of active parkland per 1,000 residents, General Plan Policy 5.A.1 sets a standard of five acres of passive recreation area or open space per 1,000 residents. Using the calculations noted above, a minimum of approximately 5.64 acres of passive recreation area or open space would be required for the proposed project. Because the project would include approximately 9.9 acres of open space areas, the project would comply with General Plan Policy 5.A.1 related to the provision of passive recreation area or open space.

Based on the above, the proposed project would not result in an increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of such facilities would occur or be accelerated.

Off-Site Affordable Housing Parcel

Development of the off-site affordable housing parcel would include the construction of a maximum of 120 multi-family residential units, and, based on an average of 2.54 persons per household used for the *Placer County Park and Recreation Facilities Fee Study* (Fee Study), would be anticipated to house approximately 305 new residents on the off-site parcel.[37] Based on the County's requirement of five acres of parkland and five acres of open space per 1,000 residents (Section 16.08.100 of the Placer County Code and

[37] Placer County. *Placer County Park and Recreation Facilities Fee Study.* September 2003.

General Plan Policy 5.A.1), development of the off-site affordable housing parcel would be required to provide a minimum of approximately 1.5 acres of parkland and 1.5 acres of open space (0.005 acres/resident X 305 estimated residents). As discussed throughout this EIR, site-specific development plans, designs, or proposals for the off-site affordable housing parcel are not available at this time. However, similar to the proposed project, the project applicant would be required to pay an in-lieu fee if the required park and open space area is not provided, and the applicant would be required to pay a parks and recreational facility fee. Thus, potential future development of the off-site affordable housing parcel would not result in an increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of such facilities would occur or be accelerated.

Conclusion

Based on the above, the proposed project and potential future development of the off-site affordable housing parcel would not result in an increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated, or include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment, and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

15-5 Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental services and/or facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or performance objectives for maintenance of public facilities, including roads, or for other government services. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to resulting in substantial adverse physical impacts associated with the provision of new or physically altered roads or other public facilities associated with development of the proposed project and the off-site affordable housing parcel.

Proposed Project and Off-Site Affordable Housing Parcel

The following section describes the potential adverse physical effects related to the maintenance and construction of County roads, library facilities, and other public facilities and services associated with the proposed project and the off-site affordable housing parcel.

Roads

The proposed project would result in the construction of 212 new single-family residences, 220 multi-family units, a potential of either up to 22 on-site ADUs or 120 off-site affordable housing units, and associated infrastructure, including a private internal road network that

would connect to the public roadway system (Baseline Road, Walerga Road, Vineyard Road, and potentially Watt Avenue and PFE Road).

All internal and frontage roadway improvements included in the proposed project would be funded by the project applicant, and all private streets within Phase 1 would be maintained by the property owner or property owner's association, and Phases 3 and 4 would be maintained by the neighborhood homeowner's association (HOA). Phase 2 proposes to create or annex into a CSA to fund County maintenance of the onsite subdivision roads. In addition, the project applicant would be required by the County to pay a Traffic Impact Fee. The Traffic Impact Fee, along with other Development Impact Fees levied by the County, is intended to fund and sustain necessary improvements resulting from new development, such as road widening, signalization of intersections, and bridge replacements.

In addition, as discussed throughout this EIR, site-specific development plans, designs, or proposals for the off-site affordable housing parcel are not available at this time. However, development of the off-site affordable housing parcel would similarly connect to a public roadway system and internal and frontage roadway improvements would be funded by the future applicant/developer. The future applicant/developer would also be required to pay the Traffic Impact Fee, along with other Development Impact Fees, to minimize any adverse physical impacts associated with maintenance of existing County roads or construction of new County road facilities.

While project-generated traffic could result in an incremental increase in maintenance of County roads in the project area, such an increase would be negligible. Currently, the County uses gasoline tax and federal and State funding for transportation infrastructure maintenance. Payment of Traffic Impact Fees by the applicant prior to the issuance of building permits for the proposed project, as well as payment of applicable taxes by future project residents, would minimize any adverse physical impacts associated with maintenance of existing County roads or construction of new County road facilities.

Libraries and Other Public Facilities and Services

Placer County maintains public facilities such as public libraries and community buildings, which could potentially be used by residents of the proposed project. In addition, the residents could potentially use public facilities in the nearby City of Roseville. However, given the size of the proposed development compared to the existing population of Placer County and the City of Roseville, any additional demand generated by the proposed project and the off-site affordable housing parcel would be relatively minor and is not likely to result in the need to alter existing facilities or construct new facilities. Furthermore, the project applicant would be required to pay a Public Facilities Impact Fee to the County prior to issuance of building permits for the proposed project on a per unit basis. Public Facilities Impact Fees are used to construct or expand a range of facilities, including facilities for general administration, jails and public protection, health and human services, public works, and agriculture. A list of the specific facilities to be constructed is included in the County's Multi-Year Capital Plan.

Conclusion

Based on the above, the proposed project and potential future development of the off-site affordable housing parcel would not result in substantial adverse physical impacts

associated with the provision of new or physically altered governmental services and/or facilities, the construction of which could cause significant environmental impacts, to maintain acceptable service ratios, response times, or performance objectives for maintenance of public facilities, including roads, or for other government services. Thus, a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

15-6 Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects. Based on the analysis below, and with implementation of mitigation for the off-site affordable housing parcel, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to requiring or resulting in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects, associated with development of the proposed project and the off-site affordable housing parcel.

Proposed Project

The following sections describe the water, wastewater treatment, electric power, natural gas, and telecommunications facilities improvements that would be necessary to serve the proposed project, including 22 on-site ADUs.

Water Supply Infrastructure

The Estia Dry Creek development would include construction of a 12-inch loop system. In addition, the proposed project would include four- to 12-inch internal water lines for domestic water service and fire/hydrant connections. Internal water lines would connect to an existing 16-inch line in Walerga Road.

According to the Preliminary Water Report prepared for the proposed project, CAL-AM standards require water pressure to be greater than 50 psi and lower than 80 psi without fire demand added. The minimum pressure is reduced to 20 psi when fire demand is included. In addition, CAL-AM requires that maximum velocity is five feet per second with maximum hour flow and without fire demand added, and 10 feet per second with maximum day flow and fire demand included. According to the hydraulic modeling conducted as part of the Preliminary Water Report prepared for the proposed project, the proposed project would operate within CAL-AM's required conditions. As such, the new 12-inch loop system and four- to 12-inch internal water lines would be consistent with CAL-AM's minimum sizing requirements for public water lines.

In addition, all water utility improvements would be required to comply with all applicable local and State codes. CAL-AM has not identified any sizing deficiencies in the water

supply infrastructure located upstream of the project site. Thus, the existing water supply infrastructure is sufficiently sized to accommodate the increased demand from the proposed project, and the project would not require the construction of new or expanded water conveyance infrastructure beyond the improvements noted above.

The proposed on-site water conveyance infrastructure would be designed to meet standard residential fire flow requirements. The water system throughout the site would include residential hook-ups and hydrant connections, and each unit connection would provide fire flows necessary for a residential fire sprinkler system in addition to the domestic water service. All necessary water conveyance infrastructure would be financed by the project applicant.

To ensure that maintenance and upgrades to water conveyance infrastructure are properly financed, CAL-AM charges customers for capacity based on the required meter size and additional components. The proposed project would be required to pay all relevant CAL-AM fees, which would help to ensure that CAL-AM would maintain sufficient capacity and infrastructure to serve the proposed project.[38] Given compliance with all applicable rules and regulations, including payment of necessary fees, CAL-AM would be capable of providing service to the project.

While the use of recycled water is encouraged, an adequate supply of recycled water is not currently available. If recycled water was currently available, retailer or service provider is not currently available, nor is there any economically practical way to develop a storage facility on the property needed to pressurize a recycled water distribution system.

Wastewater Conveyance Infrastructure

The proposed project would be served by the Dry Creek WWTP. Flows would be conveyed through existing eight-inch “Sewer B” gravity lines within Walerga Road to the Dry Creek WWTP. Eight-inch sanitary sewer lines would be included throughout the project site and would connect to an existing eight-inch sewer line to the south of the project site. The proposed project would include the development of an eight-inch sewer line either extending under Placer Creek or within Walerga Road in order to route sewer flows to the south (see Figure 15-2). The alternative routing within Walerga Road would avoid surcharging the existing 8-inch sewer line within Phase 4 (Q Street), but would require additional excavation within Walerga Road. Alternatively, the surcharging could be avoided by upsizing those parts of the existing sewer system on- and off-site. All sewer improvements would be consistent with the South Placer Regional Wastewater and Recycled Water Systems Evaluation. Pumped sewer lots are not proposed as part of the multi-family Estia Dry Creek development, as the lots would have gravity sewer service.

The existing Dry Creek/West Placer CFD #1 lift station is located east of Walerga Road and south of Dry Creek within Dry Creek Community Park, approximately 0.53-mile to the south. Based on existing EDU counts to the CFD #1 lift station, with 3,924 ultimate EDUs and 1,228 existing EDUs, the proposed project is expected to contribute 432 EDUs, or approximately 15 percent of the total new EDUs anticipated to connect to the CFD #1 lift station. According to the Wastewater Report prepared for the proposed project, the emergency storage required for the proposed project would be 45,930 gallons.

[38] Placer County Water Agency and California American Water Company. *Agreement Between Placer County Water Agency and California American Water for Water Supply*. July 6, 2015.

Figure 15-2
Sewer Routing

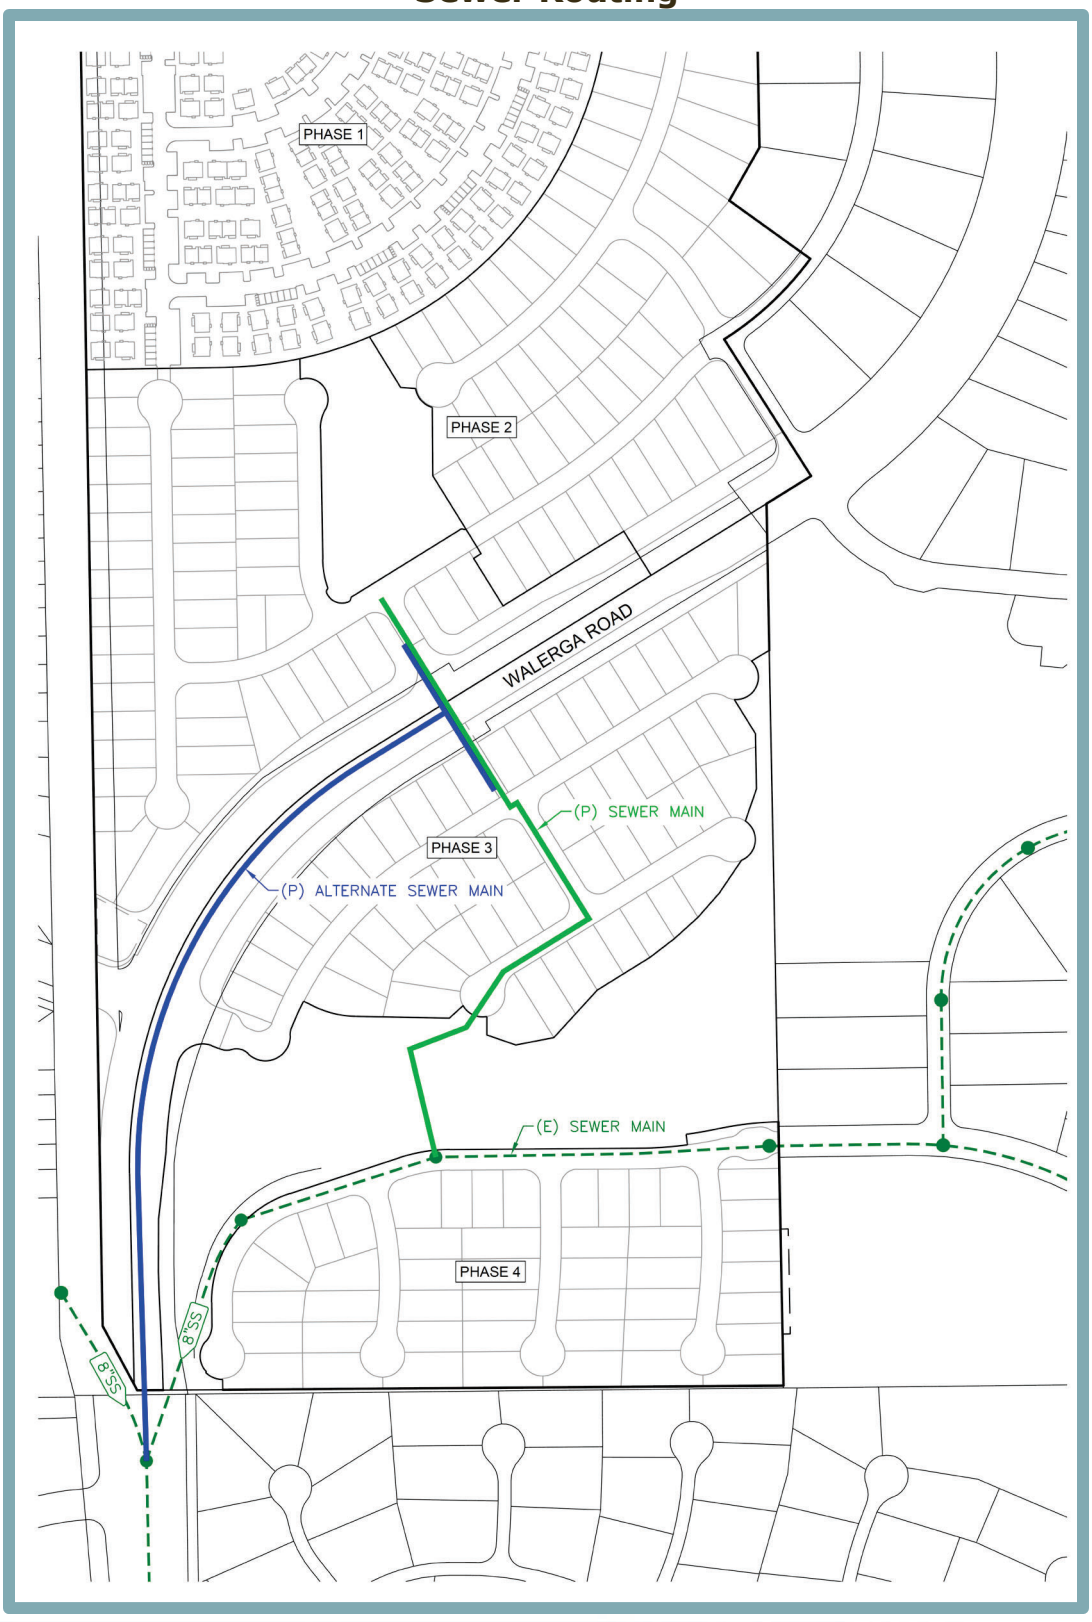

*Figure not OCR compatible

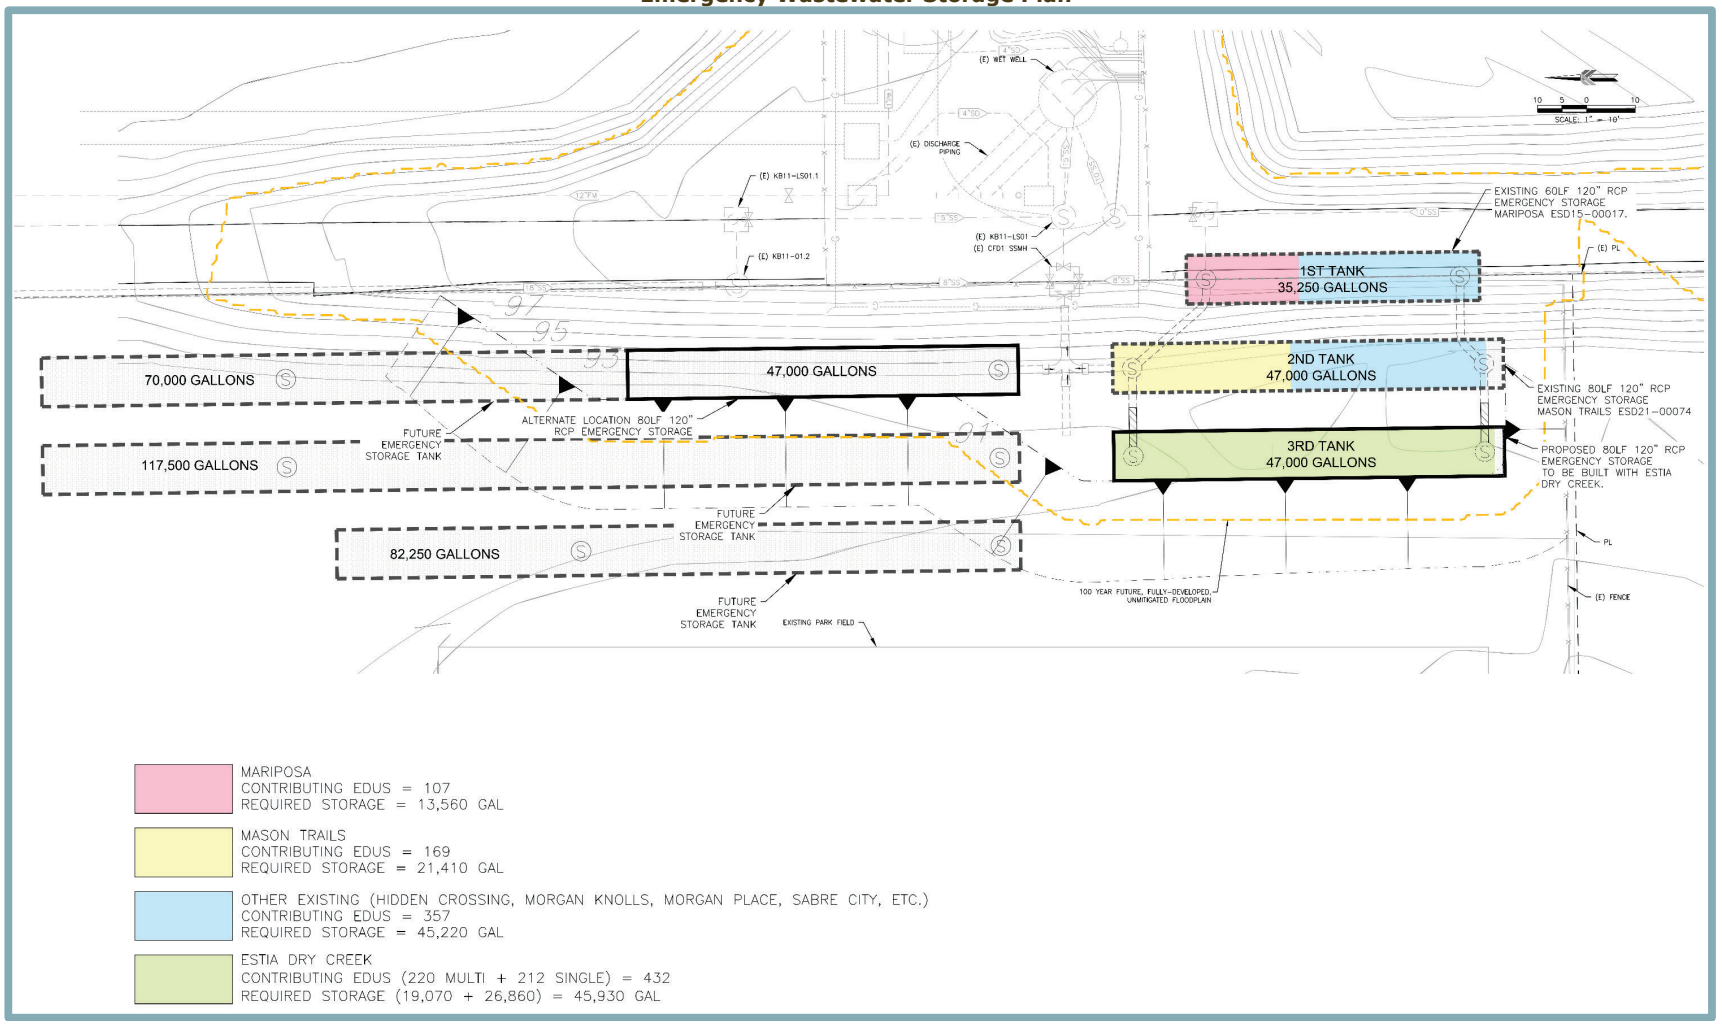
The Mariposa and Mason Trails developments within the RVSP have already built two storage tanks with 35,250 gallons and 47,000 gallons of emergency storage at the CFD #1 lift station. The combined emergency storage required for the aforementioned projects and the proposed project would total 126,120 gallons, which is not accommodated by the 82,250 gallons of storage provided by the two existing underground tanks. Other developments have used the storage capacity of the existing underground tanks prior to development of the proposed project. Therefore, the proposed project is required to increase the emergency storage capacity at the existing lift station.

As shown in Figure 15-3, the Emergency Wastewater Storage Plan would include a third 47,000-gallon tank to be developed as part of the proposed project. The potential environmental effects associated with the lift station improvements are analyzed throughout this EIR.



The project site is not currently located within an area that receives sewer service from the County. In order for Placer County to obtain ownership of the proposed sewer system and provide maintenance of the proposed infrastructure, the project site areas must be annexed into CSA 28, Zone 173. Such an annexation would require approval by the Placer County Board of Supervisors. Upon approval of the annexation, the proposed project would be subject to the County's sewer connection fees. Pursuant to Section 13.12.350 of the Placer County Code, the current sewer connection fees for the project area are approximately $11,270 per EDU.

A portion of each connection fee would be distributed to the City of Roseville for ongoing and future upgrades to the Dry Creek WWTP. The remainder of each fee is used by the County for system upgrades and ongoing maintenance. In addition, future residents of the proposed project would be subject to payment of a monthly sewer fee to the County to fund ongoing provision of sewer services. The current monthly sewer fee as of July 2025 is $48.27 per EDU.

Electricity, Natural Gas, and Telecommunications Infrastructure

The project site is currently within the service area of SMUD for electric service, and PG&E for natural gas service. The proposed project would include new connections to existing electrical, natural gas, and telecommunications infrastructure located in the project vicinity, such as the existing electrical and telecommunication lines currently maintained along Baseline Road to the north of the project site and Vineyard Road to the southeast of the project site. A 30-inch PG&E gas transmission line is located along the north side of Baseline Road within an existing easement. The proposed project would not include improvements within the existing PG&E easement. In addition, Consolidated Communications and Comcast would provide fiber communication and internet services to the proposed project. Given the proximity of existing electricity and natural gas lines to the project site, substantial extension of new infrastructure would not be required. In accordance with County Code, overhead utility lines along the project frontages would be required to be undergrounded.

Figure 15-3
Emergency Wastewater Storage Plan

* Figure not OCR Compatible

Given that the majority of the project site is currently anticipated for development with residential uses according to the DCWPCP, such utilities have been designed to accommodate additional demand associated with buildout of the site. While the proposed project would result in development of the site at an increased density relative to what has been anticipated based on the site's land use and zoning designations, upsizing or upgrading of the existing dry utilities is not anticipated in order to serve the project.

Off-Site Affordable Housing Parcel

The following sections describe the water, wastewater treatment, electric power, natural gas, and telecommunications facilities improvements that would be necessary to serve the off-site affordable housing parcel.

Water Supply Infrastructure

As discussed throughout this EIR, site-specific development plans, designs, or proposals for the off-site affordable housing parcel are not available at this time. However, development of the off-site affordable housing parcel would similarly be required to connect to a public water system. Existing infrastructure in the vicinity of the off-site affordable housing parcel would be used to provide water service to the site. The approved Frisvold Property Project, which is located to the east of the off-site affordable housing parcel, would extend a 24-inch water main within PFE Road to the eastern boundary of the off-site affordable parcel. At such time the off-site affordable housing parcel gets developed, RVSP EIR Mitigation Measure 14-1a, which has been incorporated into this EIR as Mitigation Measure 15-6(a), would be required.

Development of the off-site affordable housing parcel would be subject to all relevant CAL-AM fees, which would help to ensure that CAL-AM would maintain sufficient capacity and infrastructure to serve the parcel. Payment of the connection fees required pursuant to RVSP EIR Mitigation Measure 14-1a would offset maintenance of the water main extensions included as part of the RVSP. In addition, because development of the off-site affordable housing parcel would install new water pipelines, the development would be subject to Mitigation Measure 14-4a of the RVSP, which has been incorporated into this EIR as Mitigation Measure 12-2(h). As such, future potential development of the off-site affordable housing parcel would not require major relocation or expansion of any water infrastructure, the construction of which could cause significant environmental effects.

Wastewater Conveyance Infrastructure

As discussed throughout this EIR, site-specific development plans, designs, or proposals for the off-site affordable housing parcel are not available at this time. However, development of the off-site affordable housing parcel would similarly be required to connect to a public wastewater conveyance system. As discussed in the RVSP EIR, the on-site collection system within the RVSP would include six-inch-diameter to 15-inch-diameter sewer mains. Trunk sewer mains would be located within larger arterial roadways, and smaller collector mains would be located within the collector and residential roadways and would direct all on- and off-site sewage to an on-site pump station. An existing pump station and force main east of Walerga Road and north of PFE Road have been designed to accept wastewater flows from the RVSP area for conveyance to the Dry Creek WWTP.

In the vicinity of the off-site affordable housing parcel, an eight-inch sewer main within PFE Road would be constructed pursuant to the RVSP, as part of the Silver Sage subdivision and PFE Road/Watt Avenue intersection off-site improvements, where the sewer line in PFE Road would be extended from the Glen Willow subdivision site immediately east of Silver Sage to Watt Avenue. The approved Frisvold Property Project, located immediately to the east of the off-site affordable housing parcel, would extend the PFE Road sewer main constructed as part of the Silver Sage subdivision along its frontage to Watt Avenue, if such improvements have not already been constructed as part of the future expansion of the PFE Road/Watt Avenue intersection. If none of the aforementioned projects construct the required RVSP sewer improvements, such improvements would be developed with the off-site affordable housing parcel.

All RVSP area flows would be directed to the Dry Creek WWTP by the RVSP pump station and a minimum 12-inch diameter force main located south of Dry Creek, crossing Walerga Road, as well as through the existing Dry Creek/West Placer CFD #1 force main. The RVSP EIR included Mitigation Measures 14-3a and 14-3b to ensure that sufficient pump station and force main capacity exists to serve full buildout of the RVSP in conjunction with the Placer Vineyards development. The aforementioned mitigation measures would not be applicable to the off-site affordable housing parcel on a project-specific level. Similar to the proposed project, the potential future development of the off-site affordable housing parcel would also be subject to the County's sewer connection fees. Lastly, because development of the off-site affordable housing parcel would install new wastewater pipelines, the development would be subject to Mitigation Measure 14-4a of the RVSP, which has been incorporated into this EIR as Mitigation Measure 12-2(h). As such, existing infrastructure in the vicinity of the off-site affordable housing parcel would be used to provide wastewater service to the off-site affordable housing development, and potential future development of the off-site affordable housing parcel would not require major relocation or expansion of any wastewater infrastructure, the construction of which could cause significant environmental effects.

Electricity, Natural Gas, and Telecommunications Infrastructure

The off-site affordable housing parcel is currently within the service area of SMUD for electric service, and PG&E for natural gas service. Development of the off-site affordable housing parcel would include new connections to existing electrical natural gas, and telecommunications infrastructure located in the project vicinity. The parcel could be served by existing supply infrastructure, connecting near the corner of Watt Avenue and PFE Road. In addition, Consolidated Communications and Comcast would provide fiber communication and internet services to the off-site affordable housing parcel. Given the proximity of existing electricity and natural gas lines to the project site, substantial extension of new infrastructure would not be required. In accordance with County Code, overhead utility lines along the parcel frontages would be required to be undergrounded.

Given that the off-site affordable housing parcel is currently anticipated for development with residential uses according to the RVSP, such utilities have been designed to accommodate additional demand associated with buildout of the site. While the future potential development of the off-site affordable housing parcel would result in development of the site at an increased density relative to what has been anticipated based on the site's land use and zoning designations, and what was assumed for the site as part of the RVSP

EIR, upsizing or upgrading of the existing dry utilities is not anticipated in order to serve the off-site affordable housing development.

Conclusion

Adequate water and wastewater conveyance infrastructure would be provided within the project site and within off-site areas. The proposed project and potential future development of the off-site affordable housing parcel would be subject to water connection fees through CAL-AM, as well as the County's sewer connection fee. Funds from the required fees would be used for maintenance and upkeep of the water and wastewater systems. With development of the proposed project, other expansions to the water or wastewater infrastructure in the project area would not be required.

Based on the above, the proposed project would not require or result in the relocation or construction of new or expanded water, storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects. Nevertheless, the off-site affordable housing parcel is located within the overall RVSP area for which the RVSP EIR included mitigation measures intended to be implemented by all future development to pay fees and reduce the potential for pipelines to leak within the RVSP area. Thus, the impact herein is determined to be ***significant*** as a means to incorporate the applicable RVSP mitigation measures into this EIR and ensure the applicable RVSP EIR mitigation measures are implemented for the off-site affordable housing parcel. At such time the off-site affordable housing parcel gets developed, implementation of Mitigation Measures 14-1a and 14-4a of the RVSP EIR would be required to ensure a significant impact does not occur. The referenced RVSP mitigation measures are incorporated into this EIR as Mitigation Measures 15-6(a) and 12-2(h).

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level.

Off-Site Affordable Housing Parcel

15-6(a) *Implement RVSP EIR Mitigation Measure 14-1a:*

Payment of the connection fees is intended to act to offset future maintenance of the planned water main extensions. Construction of the lines to the appropriate standards is intended to ensure the transmission mains are in a condition suitable for operation and maintenance by Cal-Am in the future, provide a reliable resource to the area, and provide a source of water for adjoining uses not included in the project.

15-6(b) *Implement the following Mitigation Measure set forth in this EIR:*

- *12-2(f) Implement RVSP EIR Mitigation Measure 14-4a:*

  To reduce the potential for any of the proposed water or recycled water supply or wastewater transmission pipelines to leak and affect service and environmental conditions of surrounding areas, Placer County standards specify material type; wall thicknesses;

connection methods, including coupling information; backfill material type and placement methods; and installation location relative to other utilities. Adhering to these standards will reduce the likelihood that the project pipelines would affect adjacent or sensitive areas. However, in areas where the groundwater table is close to the pipeline, additional measures may be needed to protect groundwater quality, including more robust pipe joint details, use of fusible C-900/905 pipe sections, pipe wrap, or cathodic protection.

15-7 Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years. Based on the analysis below, and with implementation of mitigation for the off-site affordable housing parcel, the impact is *less than significant*.

The following discussion includes an analysis of water supplies available to serve the proposed project and the off-site affordable housing parcel.

Proposed Project

The proposed project would include development of a total of 220 multi-family units, 212 single-family units, and a potential 22 ADUs on the project site, as well as the development of a 2.2-acre neighborhood park, a community center, and various associated improvements. Thus, the project would result in increased demand for water supplies relative to existing conditions. As discussed in Chapter 13, Land Use and Planning/Population and Housing, of this EIR, the proposed project would house an estimated maximum of approximately 1,312 residents. CAL-AM has established a per capita per day water usage target of 173 gallons per capita per day (gcpd).[39] Based on the per capita per day water usage estimate for CAL-AM customers of 173 gcpd and the project's estimated population of 1,312 residents, the project would be anticipated to result in a total daily water demand of approximately 226,976 gpd, which equates to approximately 82.84 million gallons per year or 254.2 AFY.[40]

Demand estimates for future development within the West Placer Service Area within the CAL-AM 2020 UWMP are based on growth estimates for the region and service area, including buildout estimates from the DCWPCP. The site is currently zoned for residential uses and, thus, increased water demand associated with buildout of the site has been accounted for in regional planning efforts. Table 15-9 presents the water demand that could be generated from buildout of the project site under the site's current zoning designations compared to water demand associated with buildout of the proposed project.

As shown in the table, the proposed project would increase total water demand by approximately 185,110 gpd, or 207.3 AFY, compared to buildout of the site per the existing zoning designation.

[39] California American Water Company, Sacramento Main District. *2020 Urban Water Management Plan*. June 2021.
[40] *Ibid.*

Table 15-9
Project Site Buildout Water Demand

Scenario	Size (units)[1]	Population[2]	Demand Rate (gcpd)	Total Water Demand (gpd)
Buildout Per Existing Zoning Designations	81	242	173	41,866
Buildout of Proposed Project	454	1,312	173	226,976
Net Change	**+373**	**+1,088**	**--**	**+185,110**

1 Unit number estimated based on buildout of the 80.1-acre Rural-Low Density (1-2.3 acre minimum) designated land within the project site (80.1 acres / 1 acre = 81 units).

2 Based on average household size of 2.94 persons/household for single- and multi-family units and 1.91 persons/household for ADUs (see Chapter 13, Land Use and Planning/Population and Housing, of this EIR).

Source: CAL-AM 2020 UWMP, 2021.

As set forth in Section 6.1.2 of PCWA's 2020 UWMP, PCWA has the following sources of surface water:

- Water purchased from the PG&E from the Yuba and Bear Rivers under the 1982 Zone 3 Contract Purchase Agreement (25,000 AFY) and the February 27, 2015, Water Supply Agreement (100,400 AFY);
- Water stored in its Middle Fork Project (MFP) under water rights permits 13856 and 13858 (120,000 AFY);
- Central Valley Project (CVP) water under CVP Repayment Contract 14-06-200-5082A-IR1-P from the American River (35,000 AFY); and
- Surface water from various small creeks under pre-1914 water rights (S000959 [40 cubic feet per second maximum], S000967 [amount unstated], S010397 [amount unstated], and S010398 [amount unstated]).

In Section 6.2 of the PCWA UWMP, PCWA projects a total water supply of 295,800 AFY in 2040 (including 5,000 AFY of groundwater and 7,000 AFY of recycled water) and a total of 297,800 AFY at buildout (including 5,000 AFY of groundwater and 9,000 AFY of recycled water). The calculations assume 3,400 AFY from PCWA's Pre-1914 Appropriative Rights.

With regard to groundwater usage, Section 6.1.1.3 of the UWMP states that "PCWA has not used any groundwater in the past five years. PCWA's last use of groundwater was in August 2014. The proposed Regional University development plans to construct one new well and the proposed Placer Ranch development plans to construct two new wells. Therefore, PCWA is anticipating an increase of groundwater supply for single-dry year between 2025-2040 from 2,000 gpm to 5,000 gpm."

As discussed previously, in 2016, CAL-AM and PCWA entered into a wholesale water supply agreement, which includes an agreement that PCWA will supply CAL-AM with surface water through December 2034.[41] CAL-AM expects that the contract between CAL-AM and PCWA will be renegotiated if CAL-AM requires additional water. Therefore, as shown in Table 15-3 above, CAL-AM has estimated that the PCWA water supplies to the

41 Placer County Water Agency and California-American Water Company. *Agreement Between Placer County Water Agency and California American Water for Water Supply*. July 6, 2015.

West Placer Service Area will meet the estimated demand from the Service Area through the year 2040. In addition, PCWA planned for CAL-AM's West Placer demand in the PCWA 2020 UWMP. According to the PCWA 2020 UWMP, the general area of CAL-AM's West Placer service area is anticipated to grow, resulting in an expanded wholesale agreement with CAL-AM. Specifically, the PCWA's 2020 UWMP Notification Letter, dated November 20, 2020, included the specific amount of wholesale water PCWA plans on selling to CAL-AM, as shown in Table 15-4, above. The comparison of CAL-AM's demand projections and PCWA's wholesale projections for the West Placer Service Area are shown in Table 15-10.

Table 15-10
Comparison of PCWA and CAL-AM Water Projections for the West Placer Service Area (AFY)

	2025	2030	2035	2040
PCWA Wholesale Projection	2,866	4,780	6,748	8,717
CAL-AM Demand Projection	2,262	2,357	2,913	3,361
Surplus	604	2,423	3,835	5,356

Sources:
- ***PCWA 2020 UWMP Notification Letter, 2020.***
- ***CAL-AM 2020 UWMP, 2021.***

As shown in the table, PCWA has conservatively estimated that CAL-AM's water demands for the West Placer Service Area would be greater than the demand projections included in the CAL-AM 2020 UWMP. As such, the anticipated increase in water demand of approximately 207.3 AFY that would result from implementation of the proposed project could be accommodated by the 604 AFY surplus anticipated by PCWA for the West Placer Service Area. By the year 2040, the surplus is anticipated to increase to approximately 5,356 AFY.

In addition to the water consumption associated with occupation of the residential units within the proposed project, the proposed landscaped and park areas would require irrigation water. The Placer County Landscape Design Guidelines provide recommendations and requirements for new landscaping within the County,[42] which are compliant with the State's Water Conservation in Landscaping Act, and the County's WELO.[43] New developments with landscaped areas equal to or greater than 500 sf must comply with the County's water efficient landscaping requirements. The proposed project would be subject to the County's water efficient landscaping requirements.

Requirements for establishing water efficient landscaping include the use of compost and mulch, installation of climate adapted plants, restrictions on turf areas, and requirements for irrigation systems. Compliance with the County's WELO would be ensured during the design review process through submission of a landscape package to the County for review and approval. The landscape package would include water budget calculations, a soil management report, landscape design plan, irrigation design plan, and other documents related to the proposed landscaping, irrigation, and grading plans. Compliance

[42] Placer County Planning Services Division. *Placer County Landscape Design Guidelines*. Adopted May 7, 2013.
[43] Placer County. *Water Efficient Landscape Ordinance*. Available at: https://www.placer.ca.gov/3394/Water-Efficient-Landscape-Ordinance. Accessed March 2026.

with the County's WELO would ensure that irrigation water consumption is minimized and occurs in compliance with the County's standards.

With respect to the conceptual landscape plans provided at this time, the proposed project would include a landscaped corridor along the project frontage on the south side of Baseline Road. Trees and shrubs would be planted throughout the Estia Dry Creek development and along both sides of Walerga Road within the project site and along the boundary of the 2.2-acre neighborhood park. Within the Phase 4 development, native tree plantings would be provided along the Class I trail on the southern side of Placer Creek. Preliminary landscaping designs for roadway and park areas have been drafted in compliance with the County's WELO. The proposed park has been designed with integrated turf, hardscapes, and other landscaping. The use of hardscapes and other landscaping allows for the reduction of turf throughout the proposed park areas, which would limit the amount of irrigation water needed for turf within the project site.

In addition, during previous single- and multiple-dry years, CAL-AM has maintained the ability to supply 100 percent of average/normal water year supply to the West Placer Service Area through distributions from the PCWA. Under existing agreements, CAL-AM anticipates that PCWA will continue to have sufficient water supplies through projected buildout conditions, including the West Placer Service Area, during a series of multiple-dry-year conditions.[44]

Although CAL-AM anticipates meeting all water demand under single- and multiple-dry years, CAL-AM maintains a Water Shortage Contingency Plan. Should water supplies be insufficient to meet average demand, CAL-AM has the authority to implement voluntary conservation measures following notification of the CPUC of the need for such measures. Should further water conservation measures be needed, CAL-AM would request authorization from the CPUC to implement mandatory conservation measures. The request for authorization to the CPUC from CAL-AM would include the percent reduction needed by CAL-AM and would specify the measures needed to achieve such reductions.[45]

Off-Site Affordable Housing Parcel

As discussed above, the RVSP EIR evaluated buildout of the off-site affordable housing parcel with 60 HDR units, and concluded that sufficient water supplies are available to serve the entire RVSP area. According to the RVSP EIR, development of 60 HDR units within the parcel would result in a total maximum day demand of 47,400 gpd, or approximately 53 AFY. While potential future development of the off-site affordable housing parcel could result in the development of 120 HDR units, for an anticipated demand of approximately 106 AFY, the anticipated increase in water demand associated with the additional 60 units that would result from implementation of the off-site affordable housing development could be accommodated by the 604 AFY surplus anticipated by PCWA for the West Placer Service Area. Furthermore, the increased demand of 53 AFY that would result from the additional 60 units from what was analyzed in the RVSP EIR in combination with the 257.61 AFY that would result from implementation of the proposed project could be accommodated by the 604 AFY surplus. Nonetheless, at such time the

[44] California American Water Company, Sacramento Main District. *2020 Urban Water Management Plan*. June 2021.
[45] *Ibid.*

off-site affordable housing parcel gets developed, RVSP EIR Mitigation Measure 14-1b, which has been incorporated into this EIR as Mitigation Measure 15-7, would be required.

Pursuant to Mitigation Measure 14-1b, prior to the recordation of any final subdivision map, the project applicant shall obtain a written certification from the water service provider that either existing services are available for the off-site affordable housing parcel or that needed improvements will be in place prior to occupancy. In addition, while site-specific development plans, designs, or proposals for the off-site affordable housing parcel are not available at this time, similar to the proposed project, landscaping associated with the future potential development of the off-site affordable housing parcel would be subject to the Placer County Landscape Design Guidelines, which are compliant with the State's Water Conservation in Landscaping Act, and the County's WELO.

Conclusion

Based on the above, sufficient water supplies would be available to available to serve the proposed project, the off-site affordable housing parcel, and other reasonably foreseeable future development during normal, dry, and multiple dry years. Nevertheless, the off-site affordable housing parcel is located within the overall RVSP area for which the RVSP EIR included mitigation measures intended to be implemented by all future development and ensure availability of water supplies. Thus, the impact herein is determined to be ***significant*** as a means to incorporate the applicable RVSP mitigation measures into this EIR and ensure the applicable RVSP EIR mitigation measures are implemented for the off-site affordable housing parcel. Therefore, at such time the off-site affordable housing parcel gets developed, implementation of Mitigation Measure 14-1b of the RVSP EIR would be required to ensure a significant impact does not occur. The referenced RVSP mitigation measure is incorporated into this EIR as Mitigation Measure 15-7 below.

Mitigation Measure(s)

Implementation of the following mitigation measure would reduce the above potential impact to a *less-than-significant* level.

Off-Site Affordable Housing Parcel

15-7 *Implement RVSP EIR Mitigation Measure 14-1b:*

Prior to approval of any small lot tentative subdivision map, the County shall comply with Government Code Section 66473.7 or make a factual showing or impose conditions similar to those required by Section 66473.7, as appropriate to the size of the subdivision. Prior to the recordation of any final subdivision map or prior to County approval or any similar approval or entitlement required for nonresidential uses, the Applicant shall obtain a written certification from the water service provider that either existing services are available or that needed improvements will be in place prior to occupancy.

15-8 Result in a determination by the wastewater treatment provider which serves or may serve the project that it does not have adequate capacity to serve the project's projected demand in addition to the provider's existing commitments. Based on the analysis below, and with implementation of mitigation for the off-site affordable housing parcel, the impact is *less than significant*.

The following discussion includes an analysis of wastewater treatment required to serve the proposed project and the off-site affordable housing parcel.

Proposed Project

Wastewater from the existing sewer lift station would ultimately be routed to, and treated at, the Dry Creek WWTP, which is operated by the City of Roseville. The Dry Creek WWTP discharges tertiary treated effluent to Dry Creek under an existing NPDES permit. The NPDES permit includes Waste Discharge Requirements, which include stringent effluent limitations for ammonia, aluminum, cadmium, carbon tetrachloride, cyanide, dibromochloromethane, dichlorobromomethane, iron, manganese, mercury, total chlorine residual, and zinc. Dry Creek WWTP is currently in compliance with all existing permitting, and, thus, effluent meets the Regional Water Quality Control Board (RWQCB) requirements within the NPDES permit. By permitting the Dry Creek WWTP for a maximum ADWF of 18 mgd and a PWWF of 45 mgd, the RWQCB has determined that the Dry Creek WWTP can treat the foregoing volume of wastewater without exceeding the NPDES discharge requirements.

According to the Wastewater Report prepared for the proposed project, the proposed project is anticipated to result in a total of 432 EDUs, and the design average flow for pipes is 380 gallons per day per residential single-family EDU and 260 gallons per day per residential multi-family EDU. Therefore, according to King Engineering, the wastewater generation estimates anticipated for the proposed project would be approximately 0.14 mgd ADWF and 0.50 mgd PWWF.[46] Wastewater generated by the proposed project could be adequately accommodated by the Dry Creek WWTP's currently available permitted ADWF of 18 mgd and PWWF of 45 mgd. In addition, wastewater generated by the 22 ADUs would not be anticipated to exceed the WWTP's available capacity. Capacity for the additional wastewater is not reserved within the WWTP; rather, capacity is available on a first-come, first-served basis. In addition, as discussed above, a portion of the sewer connection fee for each EDU would be distributed to the City of Roseville for ongoing and future upgrades to the Dry Creek WWTP, and future residents of the proposed project would be subject to payment of a monthly sewer fee to the County to fund the ongoing provision of sewer services. Thus, the proposed project would not result in a determination by the wastewater treatment provider which serves or may serve the project that it does not have adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

[46] Paul, Micah, Staff Engineer, King Engineering. Personal communication [email] with Nick Pappani, Vice President, Raney Planning and Management, Inc. October 13, 2025.

Off-Site Affordable Housing Parcel

According to the RVSP EIR, the 60 HDR units within the off-site affordable housing parcel would result in a total flow of 7,800 gpd, or 0.0078 mgd. The doubling in units associated with development of the off-site affordable housing parcel would result in an ADWF of 0.0156 mgd and PWWF of 0.061 mgd. Wastewater generated by future development of off-site affordable housing parcel, in combination with the proposed project's 0.5 mgd PWWF for a total of 0.561 mgd PWWF, could be adequately accommodated by the Dry Creek WWTP's currently available permitted ADWF of 18 mgd and PWWF of 45 mgd. However, based on the County's "first-come, first-served," basis for wastewater service, Placer County shall secure written certification from the service provider that existing services are available or needed improvements will be made prior to occupancy, prior to approval of future tentative maps. As such, at such time the off-site affordable housing parcel gets developed, RVSP EIR Mitigation Measure 14-5a, which has been incorporated into this EIR as Mitigation Measure 15-8, would be required. Mitigation Measure 14-5a would ensure that potential future development of the off-site affordable housing parcel would not result in a determination by the wastewater treatment provider which serves or may serve the parcel that it does not have adequate capacity to serve the projected demand in addition to the provider's existing commitments.

Conclusion

Based on the above, the proposed project and potential future development of the off-site affordable housing parcel, would not result in a determination by the wastewater treatment provider which serves or may serve the project that it does not have adequate wastewater treatment capacity to serve the project's projected demand in addition to the provider's existing commitments. Nevertheless, at such time the off-site affordable housing parcel gets developed, implementation of Mitigation Measure 14-5a of the RVSP EIR would be required to ensure a ***significant*** impact does not occur. The referenced RVSP mitigation measure is incorporated into this EIR as Mitigation Measure 15-8 below.

Mitigation Measure(s)

Implementation of the following mitigation measure would reduce the above potential impact to a *less-than-significant* level.

Off-Site Affordable Housing Parcel

15-8 *Implement RVSP EIR Mitigation Measure 14-5a:*

Commitments from the wastewater treatment provider to receive anticipated flows from the specific plan area at the Dry Creek WWTP shall be secured by Placer County prior to County approval of improvement plans for wastewater collection and transmission infrastructure.

15-9 Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals, or conflict with federal, State, and local management and reduction statutes and regulations related to solid waste. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of solid waste capacity required to serve the proposed project and the off-site affordable housing parcel and compliance with federal, State, and local management and reduction statutes and regulations related to solid waste.

Proposed Project

Most solid waste collected in unincorporated Placer County is delivered to the WPWMA MRF where waste is processed, recyclables are recovered, and residuals are disposed. The proposed project would generate solid waste associated with construction activities as well as from future residents of the proposed project. Construction debris would be disposed of in accordance with applicable federal, State, and local regulations and standards. Solid waste collection services would be provided by Recology Auburn Placer.

As described above, as of December 2021 the currently permitted 291-acre WRSL has a remaining capacity of 22,690,011 cubic yards, the current average daily throughput is 862.14 tons (January 1 through November 9, 2021), and the permitted lifespan extends to 2058.[47] The MRF has a permitted processing limit of 1,750 tons per day and 1,014 vehicles per day. While the permitted processing limit remains the same, the MRF expanded in 2007, increasing its processing capacity of municipal solid waste and construction and demolition debris to 2,200 tons per day.[48] The average daily tonnage received at the MRF between January 1, and November 9, 2021 was 884.86 tons, serving 661.7 vehicles, which is notably less than the permitted amounts. Considering the remaining permitted daily capacity at the MRF averages 865 tons, the MRF has a remaining annual capacity of at least 315,725 tons.

According to the U.S. EPA's report, *Estimating 2003 Building-Related Construction and Demolition Materials Amounts*, residential construction activities generate an average of 4.39 lbs/sf of waste.[49] The proposed project would include construction of 220 single-story multi-family units, 212 single-family residential units, and 22 ADUs; however, the total building square footage of the future units is currently unknown. Therefore, for analysis purposes, each single-family unit was conservatively estimated to include 2,500 sf of building space, each multi-family unit was estimated to include 1,000 sf of building space, and each potential ADU was estimated to include 750 sf of building space. As such, the proposed project could result in a total buildout square footage of 766,500 sf, construction of which would produce approximately 3,364,935 lbs (1,682 tons) of construction waste (4.39 lbs/sf X 766,500 sf).

---

47 Placer County Department of Public Works, Environmental Engineering Division (Solid Waste). *EIR Guidance Document*. August 2022.

48 *Ibid.*

49 U.S. Environmental Protection Agency. *Estimating 2003 Building-Related Construction and Demolition Materials Amounts.* 2009.

The construction waste estimate presented above represents a conservative analysis of the maximum potential waste production from construction of the proposed project. The CALGreen Code requires at least 65 percent diversion of construction waste for projects permitted after January 1, 2017. As such, a minimum of approximately 1,093 tons of waste would be diverted away from landfill disposal during construction. Considering the applicable CALGreen Code requirements, buildout of the proposed project would be anticipated to produce up to 589 tons of waste. Construction waste generation represents a short-term increase in waste generation. The WRSL is permitted to accept 693,500 tons per year. Therefore, construction waste associated with the proposed project would represent approximately 0.08 percent of the WRSL's total annual permitted capacity.

During operation of the project, the future residents would produce solid waste that would be collected by Recology and transferred to the WRSL. Operational solid waste generation from the proposed 212 single-family residences has been estimated based on an average waste generation rate for single-family residential development of 10.2 pounds per unit per day.[50] In addition, operational solid waste generation from the proposed 220 multi-family units and 22 ADUs has been estimated based on an average waste generation rate for multi-family residential development of 8.6 pounds per unit per day.[51] As such, the proposed project could produce approximately 4,244 pounds of solid waste per day. A total of 4,244 pounds of solid waste per day would equate to approximately 774.53 tons per year, or 0.12 percent of the WRSL's annual permitted capacity. A contribution of a maximum of 0.12 percent of the WRSL's total annual permitted capacity would not be considered a substantial amount of waste, and the WRSL has adequate capacity to accept such waste. Furthermore, the project site is currently designated for residential development by the PCGP and the DCWPCP. While the proposed project would result in more intensive uses than what is currently anticipated to be developed on site, development of the site and the associated solid waste generation has been generally anticipated by the County as part of the DCWPCP. Therefore, the project would not be considered to contribute significant amounts of waste to the WRSL, and the WRSL has sufficient capacity to handle the increase in waste anticipated to be generated by implementation of the proposed project.

Off-Site Affordable Housing Parcel

According to the RVSP EIR, construction activities would result in a less-than-significant impact related to exceeding landfill capacity. With respect to operational waste, according to the RVSP EIR, development of 60 HDR units on the off-site affordable housing parcel would result in an estimated 994 pounds of solid waste per day. Thus, a doubling in units associated with development of the off-site affordable housing parcel would result in approximately 1,888 pounds of solid waste per day. A total of 1,888 pounds of solid waste per day would equate to approximately 345 tons per year, or 0.05 percent of the WRSL's annual permitted capacity. The proposed project in combination with the off-site affordable housing parcel would result in a maximum of approximately 1,120 tons of solid waste per year, or approximately 0.17 percent of the WRSL's permitted capacity. A contribution of a maximum of 0.17 percent of the WRSL's total annual permitted capacity would not be considered a substantial amount of waste, and the WRSL has adequate capacity to accept such waste. Therefore, the off-site affordable housing parcel would not be considered to

[50] California Department of Resources Recycling and Recovery. *Estimated Solid Waste Generation Rates*. Available at: https://www2.calrecycle.ca.gov/WasteCharacterization/General/Rates. Accessed July 2025.
[51] *Ibid.*

contribute significant amounts of waste to the WRSL, and the WRSL has sufficient capacity to handle the increase in waste anticipated to be generated by potential future development of the off-site affordable housing parcel.

Conclusion

Based on the above, construction and operation of the proposed project and the off-site affordable housing parcel would not generate solid waste in excess of State or local standards or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals. In addition, the project would not conflict with applicable federal, State, and local management and reduction statutes and regulations related to solid waste. Thus, a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

Cumulative Impacts and Mitigation Measures

As defined in Section 15355 of the CEQA Guidelines, "cumulative impacts" refers to two or more individual effects which, when considered together, are considerable, compound, or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. For further detail related to the cumulative setting of the proposed project, refer to Chapter 20, Statutorily Required Sections, of this EIR.

15-10 Cumulative impacts to public services. Based on the analysis below, the cumulative impact is *less than significant*.

Potential cumulative impacts related to fire and law enforcement protection services, schools, public services and government facilities, and parks and recreation are discussed below.

Fire Protection Services

Neither the Placer County General Plan EIR nor the DCWPCP EIR identified cumulative impacts related to fire protection. Rather, impacts were determined to be reduced to less-than-significant levels through implementation of the goals and policies included in the General Plan and DCWPCP. Such policies require provision of adequate funding and an adequate water supply as a component of new development approval.

As discussed above, the response times to the proposed project and the off-site affordable housing parcel would be consistent with General Plan Policy 4.4.2, and CAL FIRE would be capable of serving the project site and the off-site affordable housing parcel with existing equipment and facilities. In addition, the project and off-site affordable housing parcel development would be required to pay a Fire Facilities Fee to PCFD. The development impact fee is calculated based on a "fair share portion" of anticipated capital needs through 2060. Furthermore, development within the project site and the off-site affordable housing parcel, as well as other future development throughout Placer County and the DCWPCP area, would be required to comply with all applicable regulations imposed by PCFD and the CFC, as adopted by Section 15.04.510 of the Placer County

Code. Based on the above, the proposed project and the off-site affordable housing parcel would result in a less-than-significant cumulative impact related to fire protection services.

Law Enforcement Services

Neither the Placer County General Plan EIR nor the DCWPCP EIR identified cumulative impacts related to law enforcement services. Rather, impacts were determined to be reduced to less-than-significant levels through implementation of the goals and policies included in the General Plan and DCWPCP. Policy 4.H.1 of the PCGP sets a response time goal of eight minutes for suburban areas such as the DCWPCP area.

Though response times are dependent upon the location of patrol officers at the time of the emergency call, on average, response times to the project site and the off-site affordable housing parcel would be anticipated to be within the PCGP's eight-minute response time standard for suburban areas. As a result, the proposed project and the off-site affordable housing parcel development would not result in a need for new, or improvements to existing, sheriff protection facilities, construction of which could cause significant environmental impacts. Similar to the proposed project and the off-site affordable housing parcel development, other future development within the region would be required to address impacts related to sheriff protection services on a project-by-project basis. Based on the above, the proposed project and the off-site affordable housing parcel, in combination with future development occurring under buildout of Placer County, would have a less-than-significant impact to sheriff protection services.

Schools

Cumulative buildout within the County and surrounding area could result in overcrowding at schools in the area. However, each individual development would be required to pay SB 50 school impact fees, similar to the proposed project and the off-site affordable housing parcel development, which would contribute to the facilitation of school expansions to serve the needs of the area. Furthermore, according to SB 50, payment of the necessary school impact fees for the project would be considered full and satisfactory CEQA mitigation. Proposition 1A/SB 50 prohibits local agencies from using the inadequacy of school facilities as a basis for denying or conditioning approvals of any "[…] legislative or adjudicative act […] involving […] the planning, use, or development of real property" (Government Code 65996[b]).

The 2023 DCJESD School Facilities Master Plan anticipated cumulative development in the area, including, but not limited to, the Creekview Ranch, The Ranch, the Mill Creek (listed as Providence Park) projects, as well as the portion of the proposed project within the DCJESD.[52] As discussed therein, based on anticipated students from planned development in Placer County, an additional 10 classrooms will need to be added to the Creekview Ranch School by the 2026/2027 school year. However, according to the School Facilities Master Plan, payment of development fees, in combination with other funding sources, would be sufficient to ensure sufficient school facilities are available to serve all existing and reasonably foreseeable development.

[52] Dry Creek Joint Elementary School District. *School Facilities Master Plan* [pg. 18]. March 2025.

In addition, The Ranch Project includes a one-acre school expansion site (Lot A2) and a pick-up/drop-off access area (Lot A1) and road to provide a second access point to the school's east side. The DCJESD plans to use Lot A2 to expand school facilities of the Creekview Ranch School, which could include, but not be limited to, portable classrooms, outdoor recreation space, etc. The DCJESD plans to add new permanent classrooms on Lot A2 to increase school capacity. The designation of Lots A1 and A2 for use by the Creekview Ranch School would further mitigate cumulative impacts associated with increases in student population within the DCJESD.

As noted above, to the extent that CJUSD, DCJESD, or RJUHSD may need additional facilities to accommodate students from the project site, the districts will control what is needed to build and when new construction would be necessary. Whether the districts would need to obtain additional new classrooms to educate an increased student population from new development within the district's boundaries would be dependent on ongoing facility needs estimates and student population projections, which are subject to change over time based on factors such as changing birth rates and other social and economic factors.

Therefore, the proposed project and the off-site affordable housing parcel development, in combination with future development occurring under buildout of Placer County, would result in a less-than-significant cumulative impact related to the need for new, or improvements to existing, school facilities.

Parks and Recreation

The proposed project would include the provision of an on-site public 2.1-acre neighborhood park and would not result in an increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of such facilities would occur or be accelerated. Pursuant to Article 15.34 of the Placer County Code, future development projects within unincorporated Placer County, including the proposed project and the off-site affordable housing parcel, would be required to pay a parks and recreational facility fee. The purpose of the park and recreation facilities impact fee is to provide funding for expansion of parkland and recreation facilities required to serve new development in unincorporated Placer County. Future development within the DCWPCP would similarly be required to comply with the County's park land dedication/in-lieu fee standards. Therefore, the proposed project and the off-site affordable housing parcel development, in combination with future buildout in the County, would result in a less-than-significant cumulative impact related to parks and recreation.

Public Facilities and Government Services

As discussed above, while project-generated traffic could result in an incremental increase in maintenance of County roads in the project area, such an increase would be negligible. Similarly, given the size of the proposed development, any additional demand on libraries or other public facilities and services generated by the proposed project would be relatively minor, and is not likely to result in the need for alteration of existing facilities or the construction of new facilities. The proposed project and the off-site affordable housing parcel development, as well as other development in the unincorporated County, would be required by the County to pay Development Impact Fees, which would help to fund and sustain public facilities and services, including public roads, within Placer

County. The proposed project and the off-site affordable housing parcel development, in combination with future development occurring under buildout of the DCWPCP, would result in a less-than-significant cumulative impact.

Conclusion

Based on the above, the proposed project and the off-site affordable housing parcel, in combination with future development occurring under buildout of the DCWPCP, would result in a ***less-than-significant*** cumulative impact related to public services.

Mitigation Measure(s)

None required.

15-11 Increase in demand for utilities and service systems associated with the proposed project, in combination with future buildout in the DCWPCP area. Based on the analysis below, the project's incremental contribution to this significant cumulative impact is *less than cumulatively considerable*.

The following discussion provides an analysis of the proposed project's and the off-site affordable housing parcel's contribution to cumulative impacts related to the increased demand for utilities and service systems within the project area.

Water Supply

CAL-AM anticipates that cumulative development within CAL-AM's West Placer Service Area, which encompasses the DCWPCP area, including the project site, would result in increased water demand from the West Placer Service Area, as shown in Table 15-10 above. As shown in the table, demand in the West Placer Service Area is anticipated to change from 2,262 AFY to 2,357 AFY between 2025 and 2030, resulting in an increase of 95 AFY. By the year 2040, cumulative demand is anticipated to increase to 3,361 AFY. Table 15-10 demonstrates that the anticipated growth in demand could be accommodated by available supplies, with an annual surplus of at least 604 AFY in 2025. By the year 2040, the surplus is anticipated to increase to approximately 5,356 AFY. As discussed previously, because CAL-AM anticipates supply surpluses for the West Placer Service area of at least 604 AFY, the proposed project's anticipated demand increase of an estimated 257.61 AFY, in combination with the off-site affordable housing parcel demand of approximately 106 AFY, could be accommodated by CAL-AM supplies. The cumulative impact from past, present, and probable future projects would be less than significant, and the proposed project's incremental impact would be less than cumulatively considerable.

Wastewater Conveyance and Treatment

Wastewater from the project site, off-site affordable housing parcel, and other areas in the DCWPCP, City of Roseville, and Placer County are treated at the Dry Creek WWTP. Thus, the geographic setting for cumulative wastewater impacts is the Dry Creek WWTP service area.

With regard to the capacity of wastewater conveyance infrastructure, as discussed above, the Emergency Wastewater Storage Plan would include a third 47,000-gallon

tank to be developed as part of the proposed project. Similar to the proposed project, future development projects throughout the project region would be required to evaluate project-specific impacts on wastewater conveyance infrastructure, such as the CFD #1 lift station or upsizing existing sewer pipes to avoid potential surcharging at buildout, and provide upgrades to the system, or implement project-specific mitigation, as necessary, to ensure any potential impacts are reduced to a less-than-significant level, where possible. Additionally, the option to develop an eight-inch sewer main within Walerga Road to route sewer flows to the south would avoid surcharging the existing onsite 8-inch sewer line within Phase 4 (Q Street). Sewer pipelines would be sized accordingly to ensure that surcharging would not occur downstream of the proposed project under peak design flow conditions. To avoid surcharging existing sewer pipelines, the project may need to upgrade the existing system where necessary to accommodate sewer buildout capacity conditions. This would create impacts along some of Walerga Road between the project location and the CFD #1 lift station. Upgrades to the system would benefit the broader sewer shed, minimizing future physical impacts, and may participate in fair share fees of the sewer shed. In addition, Placer County shall secure written certification from the service provider that existing services are available or needed improvements will be made prior to occupancy, prior to approval of future tentative maps associated with the off-site affordable housing parcel. Therefore, wastewater flows associated with the proposed project, off-site affordable housing parcel, and other cumulative development would potentially create capacity issues within the downstream wastewater conveyance system, and upsizing of existing sewer lines may be required.

As noted under Impact 15-8 above, the Dry Creek WWTP currently has adequate capacity to serve the project's anticipated demand in addition to the WWTP's existing commitments. However, the WWTP's permitted ADWF capacity of 18 mgd would not be sufficient to accommodate the wastewater anticipated to be generated due to full buildout of the WWTP service area, which is estimated to reach approximately 21 mgd. Thus, improvements to the Dry Creek WWTP are likely to be needed prior to buildout of the Dry Creek WWTP's service area, and the combined impact of cumulative development within the service area would be significant.

Utility providers employ various programs and mechanisms to support provision of services to new development; for example, Placer County has adopted development fees consistent with State law to facilitate the provision of public services for projects consistent with the buildout of the General Plan, and various utility providers charge connection fees and recoup costs of new infrastructure, including wastewater treatment infrastructure, through standard billings for services. Accordingly, the proposed project and the off-site affordable housing parcel would be subject to payment of the County's sewer connection fees. The County's sewer connection fees are currently approximately $11,132 per EDU, a portion of which would be distributed to the City of Roseville for ongoing and future upgrades to the Dry Creek WWTP. Payment of sewer connection fees would allow for capacity expansion of the Dry Creek WWTP as necessary to serve cumulative buildout of the WWTP's service area, including the project site. According to CEQA Section 15130(a)(3), paying a "fair share fee" is permissible as effective mitigation for cumulative impacts if the fees are part of a reasonable plan of actual mitigation that the relevant agency commits to implementing. Therefore, the proposed project's and the off-site affordable housing parcel's contribution to the significant cumulative impact related to wastewater treatment facilities would be less than cumulatively considerable.

Electricity, Natural Gas, and Telecommunications Facilities

Environmental effects associated with the construction of new or expanded electricity, natural gas, and telecommunications facilities would primarily be project-specific, rather than cumulative. As noted under Impact 15-6 above, while the project and the off-site affordable housing parcel would include new connections to existing electrical, natural gas, and telecommunications infrastructure located in the project vicinity, substantial extension of existing off-site infrastructure would not be required. Therefore, the proposed project and off-site affordable housing parcel would result in a less than cumulatively considerable impact related to construction of new or expanded electricity, natural gas, and telecommunications facilities.

Solid Waste

As noted previously, solid waste collection services for the proposed project would be provided by Recology Auburn Placer; disposal and recycling would be provided by the WRSL and WPWMA MRF. With the current space available and the recovery efforts by the MRF, the WRSL is anticipated to operate through 2058.[53] Development of the project site with low-density residential development, which would generate solid waste, was anticipated by the DCWPCP.

Although the proposed project includes redesignation and rezoning of the project site, the project would not be anticipated to result in significantly more intense waste generation than was previously anticipated for the project site in the DCWPCP and, thus, regional solid waste planning efforts. In addition, as discussed above, the WRSL has adequate capacity to accept waste from the off-site affordable housing parcel. As such, the incremental increase in demand for solid waste collection and disposal services that would result from implementation of the proposed project and off-site affordable housing parcel has generally been anticipated by regional solid waste providers, the DCWPCP, and the PCGP. Therefore, the cumulative impacts from past, present, and probable future projects to solid waste would be less than significant, and the proposed project's and off-site affordable housing parcel's incremental contribution would be considered less than cumulatively considerable.

Conclusion

Based on the above, adequate water supplies exist to accommodate cumulative growth of the West Placer Service Area, including growth within the DCWPCP and increased demand due to operation of the proposed project and off-site affordable housing parcel. In addition, the proposed project and off-site affordable housing parcel would not be anticipated to result in significantly more intense solid waste generation than was previously anticipated in the DCWPCP and RVSP. The proposed project and off-site affordable housing parcel would not result in any significant cumulative impacts related to electrical, natural gas, and telecommunications infrastructure.

Given that improvements to the Dry Creek WWTP are likely to be needed prior to buildout of the Dry Creek WWTP's service area, the combined impact of cumulative development related to wastewater treatment would be significant. However, the proposed project and off-site affordable housing parcel would be subject to applicable utility fees used to fund

[53] Placer County Department of Public Works, Environmental Engineering Division (Solid Waste). *EIR Guidance Document*. August 2022.

upgrades to the Dry Creek WWTP and would not result in substantially increased demand for wastewater treatment services relative to buildout of the project site and off-site affordable housing parcel according to the current DCWPCP land use designations. Thus, the project's and off-site affordable housing parcel's impact would be minimized to the maximum extent feasible such that the project's incremental contribution to the significant cumulative impact would be ***less than cumulatively considerable***.

Mitigation Measure(s)

None required.

16. TRANSPORTATION

16. TRANSPORTATION

16.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County for an approximately four-acre parcel off-site within the Riolo Vineyards Specific Plan (RVSP), which could develop a maximum of 120 affordable income-restricted units.

The Transportation chapter of the EIR discusses the existing transportation and circulation facilities within the project vicinity, as well as applicable policies and guidelines used to evaluate operation of such facilities. Where development of the proposed project, including the off-site sewer lift station improvements and affordable housing component, would conflict with applicable policies or guidelines, mitigation measures are identified. The information contained within this chapter is primarily based on a Vehicle Miles Traveled (VMT) Memorandum[1] (VMT Memorandum) (see Appendix K of this EIR) and a Local Transportation Analysis (LTA)[2] (see Appendix L) prepared for the proposed project by Kimley-Horn. Additional information was sourced from the Placer County General Plan (PCGP),[3] the PCGP EIR,[4] the Dry Creek-West Placer Community Plan (DCWPCP),[5] the RVSP,[6] and the RVSP EIR.[7] The Transportation and Circulation Element of the DCWPCP was updated in August 2011.

As discussed further below, the current California Environmental Quality Act (CEQA) Guidelines require lead agencies such as Placer County to use VMT, rather than Level of Service (LOS), as the primary metric for assessing transportation impacts under CEQA (CEQA Guidelines Section 15064.3). However, consistent with the County of Placer Transportation Study Guidelines (November 2020), both a VMT analysis and LOS analysis were prepared for the proposed project. Pursuant to CEQA Guidelines Section 15064.3, impact significance in this chapter is based upon VMT, whereas the results of the LOS analysis presented in the LTA will be used by Placer County to address consistency with PCGP and the DCWPCP Transportation Element goals and policies related to transportation, including adopted LOS policies.

16.2 EXISTING ENVIRONMENTAL SETTING

The section below describes the physical and operational characteristics of the existing transportation system within the study area, including the surrounding roadway network and transit, bicycle, and pedestrian facilities.

Existing Roadways

The existing major roadways within the vicinity of the project site and off-site affordable housing parcel are shown in Figure 16-1 and summarized below.

Baseline Road

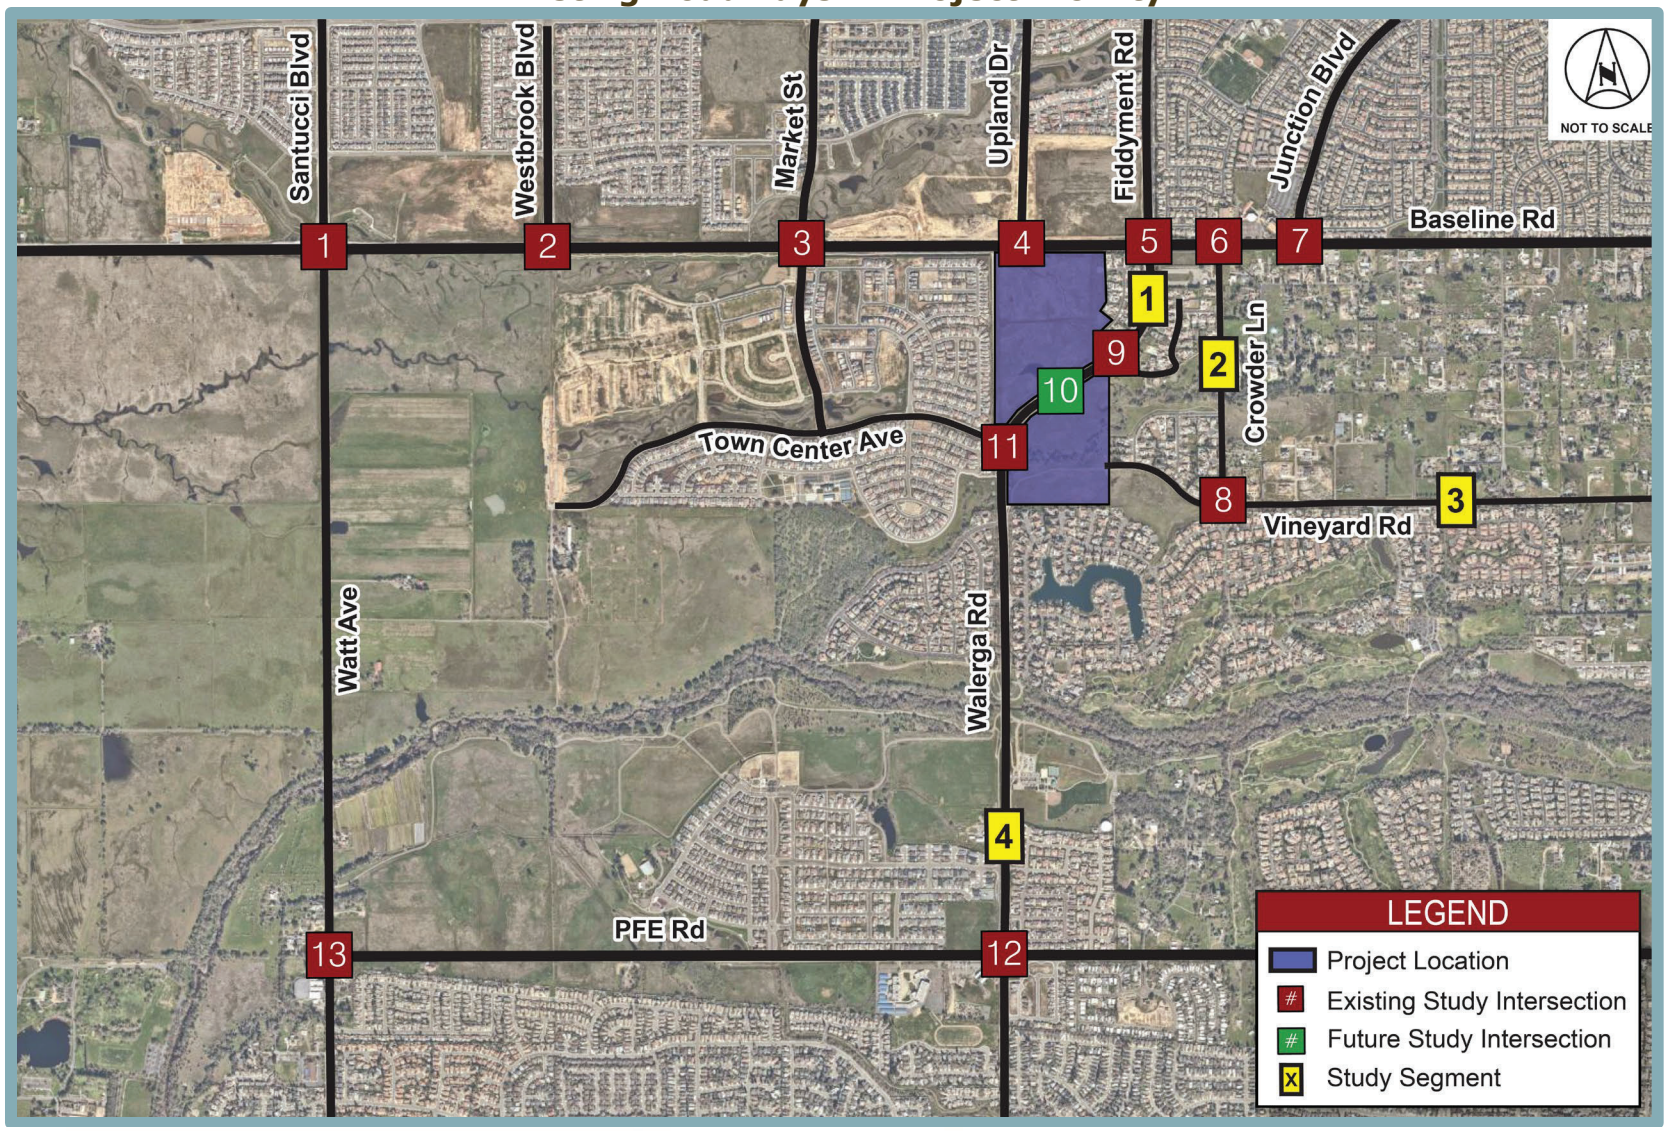
Baseline Road is an east-west arterial roadway that provides access to the project site. Located north of the project site, Baseline Road has two lanes in each direction. The posted speed limit on Baseline Road is 45 miles per hour (mph) and the design speed is 65 mph. Pedestrian or bicycle facilities are not provided along the portion of the roadway immediately north of the project site, although such facilities do occur along the roadway further to the east of the site. Baseline Road provides vehicle access to minor arterials, major collectors, and residential and commercial areas east of Santucci Boulevard.

Walerga Road

Walerga Road is a north-south four-lane minor arterial that connects Baseline Road to Sacramento County, as well as providing vehicle access to the project site and local roadways. North of Baseline Road, Walerga Road transitions to Fiddyment Road. Sidewalks and bike lanes are located near intersections along Walerga Road where the roadway runs adjacent to existing single-family residences. Where the roadway bisects the project site, which does not currently include existing residences, such facilities do not currently exist. The posted speed limit along Walerga Road is 50 mph and the roadway has a design speed of 65 mph.

Crowder Lane

Crowder Lane is a north-south two-lane minor collector that connects Baseline Road to Vineyard Road to the east of the project site. Sidewalks associated with existing residential development exist along the western side of the roadway. The posted speed limit along Crowder Lane is 35 mph and the design speed is 50 mph.



Vineyard Road

Vineyard Road is an east-west two-lane major collector that provides vehicle access to the project site, local roadways, and residential driveways. Sidewalks and a bike lane are provided along the north and south sides of Vineyard Road at the project site access, but end at Crowder Lane. Vineyard Road intersects with Cook Riolo Road to the west and Foothills Boulevard to the east. The posted speed limit on Vineyard Road is 45 mph and the design speed is 55 mph.

PFE Road

PFE Road is an east-west rural collector located south of the project site that bounds the off-site affordable housing parcel to the south. The roadway intersects with both Walerga Road and Watt Avenue. PFE Road offers vehicle access to arterial and local roadways, and residential driveways in the area. PFE Road has a posted speed limit of 45 mph and the design speed is 55 mph.

Figure 16-1
Existing Roadways in Project Vicinity

* Figure not OCR Compatible

Watt Avenue

Watt Avenue is a north-south major arterial that connects Baseline Road with Sacramento County, where the roadway transitions from two to four lanes. Watt Avenue bounds the off-site affordable housing parcel to the west. In the vicinity of the off-site affordable housing parcel, Watt Avenue is a two-lane roadway. Watt Avenue links western Placer County with Interstate 80 (I-80), and has a posted speed limit of 45 mph and a design speed of 65 mph.

Nearby Intersections

The following intersections are located in the general project vicinity, within the jurisdictions of Placer County or the City of Roseville:

1. Baseline Road at Santucci Boulevard/Watt Avenue (City of Roseville);
2. Baseline Road at Westbrook Boulevard (City of Roseville);
3. Baseline Road at Market Street (City of Roseville);
4. Baseline Road at Project Access/Upland Drive (City of Roseville);
5. Baseline Road at Fiddyment Road/Walerga Road (City of Roseville);
6. Baseline Road at Crowder Lane (City of Roseville);
7. Baseline Road at Junction Boulevard (City of Roseville);
8. Vineyard Road at Crowder Lane (Placer County);
9. Walerga Road at Springhill Drive (Placer County);
10. Walerga Road at Project Access (Placer County);
11. Walerga Road at Town Center Drive (Placer County);
12. Walerga Road at PFE Road (Placer County); and
13. Watt Avenue at PFE Road (Placer County).

Operations of the aforementioned intersections are evaluated in the project-specific LOS analysis presented in the LTA and will otherwise be used by the County in the project review process to address consistency with PCGP and the DCWPCP Transportation Element goals and policies related to LOS.

Pedestrian, Bicycle and Transit Facilities

The sections below describe the existing pedestrian, bicycle and transit facilities located within the vicinity of the project site and the off-site affordable housing parcel.

Sidewalks and Pathways

Existing sidewalks do not occur within the project site or off-site affordable housing parcel. Wellbrook Place at the northeast corner of the project site includes a sidewalk that ends at the site's eastern boundary. As previously discussed, sidewalks are currently located along portions of Walerga Road, including at the southernmost corner of the northern portion of the site at the intersection of Walerga Road and Town Center Avenue. Portions of Baseline Road to the east and west of the project site frontage also include existing sidewalks; such facilities are not present along the project site's northern boundary.

The DCWPCP notes that the County's associated planning documents do not specify the location of future pedestrian facilities; however, subdivisions and development projects within the DCWPCP are required to provide such facilities along their frontages as part of the County's approval process.

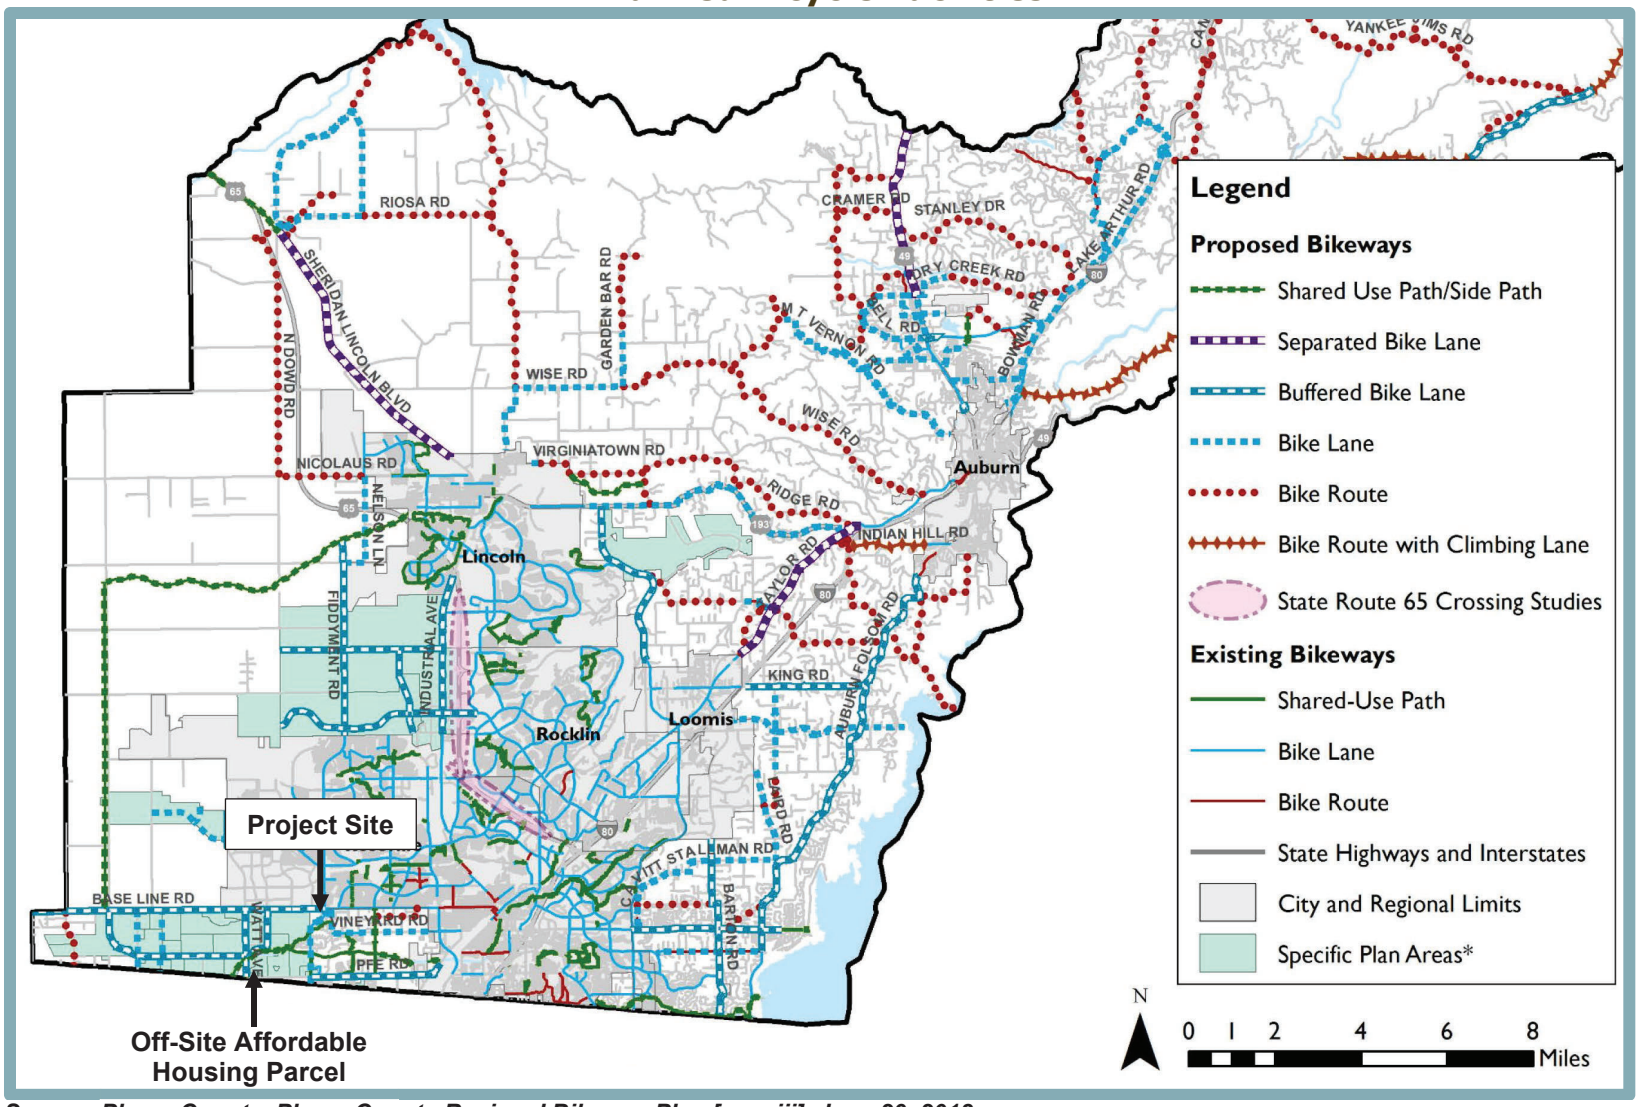
Bicycle Facilities and Trails

The Placer County Regional Bikeway Plan provides information regarding the regional system of bikeways for transportation and recreation purposes. The regional bikeway plan was approved by the Placer County Transportation Planning Agency (PCTPA) Board in 2018 and subsequently adopted by the Placer County Board of Supervisors. The Placer County Regional Bikeway Plan includes the following system classifications:

- Class I Bikeway (Bike Path) provides a completely separated facility designed for the exclusive use of cycles and pedestrians.
- Class II Bikeway (Bike Lane) provides on-road striped lanes with signs and pavement markings and legends with restricted travel to motor vehicles and pedestrians. Through travel by motor vehicles or pedestrians is prohibited, but crossflows by pedestrians and motorists is permitted.
- Class III Bikeway (Bike Route) provides on-street routes designated by signs or permanent markings and shared with pedestrians and motorists.
- Class IV Bikeway (Separated Bikeway) is a bikeway for the exclusive use of bicycles similar to a Class II facility, but includes a separation between the bike facility and through vehicular traffic. Separation facilities may include flexible posts, inflexible physical barriers, striping or on-street parking. Class IV facilities also allow for two-way bicycle traffic.

The southern portion of the site includes a paved multi-purpose trail which extends from Vineyard Road to the east to Walerga Road to the west. Outside of the project site boundaries, the nearest existing bicycle facilities to the project site include Class II bike lanes on Baseline Road and Walerga Road. As described in the Placer County Regional Bikeway Plan and presented in Figure 16-2, a Class II bike lane is planned along Walerga Road where the roadway bisects the project site. The bike lane has been partially constructed as part of the existing single-family residential development. The Placer County Regional Bikeway Plan also anticipated construction of the existing paved multi-purpose trail that connects to Vineyard Road.

With respect to the off-site affordable housing parcel, Watt Avenue and PFE Road include future bike lanes in the vicinity of the parcel associated with the future widening.



Transit System

Transit service in the vicinity of the project site is provided by Roseville Transit. Roseville Transit Route D includes a stop approximately 0.70-mile east of the project site along Junction Boulevard near Baseline Road. Route D traverses the western neighborhoods of Roseville and connects to the Roseville Civic Center junction, which provides connections to commuter buses. Future transit routes have been identified in the immediate vicinity of the project site as part of planned inter-regional services, as shown in Figure 16-3 from the Transit Master Plan for the Placer Vineyards Specific Plan (PVSP).[8]

With respect to the off-site affordable housing parcel, Sacramento Regional Transit (SacRT) includes a bus stop along Route 19 at Watt Avenue and Elverta Road, approximately 0.96-mile south of the parcel down Watt Avenue. SacRT Route 19 runs seven days a week, from approximately 6:00 AM through 8:45 PM on Monday through Friday, and 7:00 AM to 7:00 PM on weekends and holidays.[9]

* Figure not OCR Compatible

Figure 16-3
Planned Transit Facilities

Source: Placer County. Placer Vineyards Transit Master Plan [Figure 3]. March 2014.

* Figure not OCR Compatible

Planned transit routes associated with the PVSP would also include improvements in the vicinity of the off-site affordable housing parcel. For example, the PVSP Transit Master Plan includes a future bus stop at Watt Avenue and Dyer Lane, located approximately 0.40-mile north of the off-site affordable housing parcel. In addition, as shown in Figure 16-3, the PVSP Transit Master Plan also includes a new inter-regional route that would run along Watt Avenue, west of the off-site affordable housing parcel.

Furthermore, the PCTPA has designated the Western Placer Consolidated Transportation Service Agency as the Consolidated Transportation Service Agency to serve western Placer County. As defined by State law, a Consolidated Transportation Service Agency is an agency that coordinates and/or provides transportation services for a particular region, including services for the elderly and individuals with disabilities who cannot use conventional transit services.

Since June 2008, the Consolidated Transportation Service Agency has developed a public/private partnership with Transit Operator Working Group, Seniors First, and its key partners, to run three pilot programs that are intended to serve elderly persons and persons with disabilities who are unable to use conventional public transit services.

Vehicle Miles Traveled

Pursuant to CEQA Guidelines Section 15064.3, VMT is the primary metric used to identify transportation impacts under CEQA. VMT is a metric that accounts for the number of vehicle trips generated and the length or distance of those trips. VMT does not directly measure traffic operations; instead, VMT is a measure of transportation network use and efficiency, especially when expressed as a function of population (i.e., VMT per capita). For residential projects, such as the proposed project, Placer County considers household or home-based VMT per capita, which is the sum of trip lengths originating from home, divided by the number of residents. VMT per capita tends to increase as land use density decreases and travel becomes more reliant on the use of single-passenger vehicles.

In response to Senate Bill (SB) 743, which updated the CEQA Guidelines to include new transportation metrics, Placer County developed the Placer County VMT Estimation Tool for use in evaluating local development projects. The Placer County VMT Estimation Tool is based on data from the regional travel demand model, and is an interactive web-based map that estimates a project's VMT metrics based on the VMT performance of adjacent existing development. The Placer County VMT Estimation Tool divides Placer County into Traffic Analysis Zones (TAZs) with generally similar rates of VMT. To use the Placer County VMT Estimation Tool, the project must be generally consistent in size and land use type (i.e., density, mix of uses, transit accessibility, etc.) with the surrounding built environment.[10] Based on the Placer County VMT Estimation Tool, the existing VMT in unincorporated Placer County is 30.43 VMT per capita.

16.3 REGULATORY CONTEXT

Existing transportation policies, laws, and regulations that would apply to the proposed project are summarized below and provide a context for the impact discussion related to the project's consistency with the applicable regulatory conditions.

Federal plans, policies, regulations, or laws related to transportation and circulation are not directly applicable to the proposed project. Rather, the analysis presented herein focuses on State

[10] Placer County. *County of Placer Transportation Study Guidelines*. Revised May 2021.

and local regulations, which govern the regulatory environment related to transportation and circulation at the project level.

State Regulations

The following are the State environmental regulations relevant to transportation.

Senate Bill 743

SB 743, enacted in 2013, created Public Resources Code (PRC) Section 21099, which directed the Governor's Office of Land Use and Climate Innovation (LCI) (formerly known as the Office of Planning and Research [OPR]) and the Secretary of the Natural Resources Agency to establish criteria for determining the significance of transportation impacts of projects within transit priority areas, with the option of creating new statewide criteria. The significance criteria for transit priority areas were to promote the reduction of greenhouse gas (GHG) emissions, the development of multimodal transportation networks, and a diversity of land uses. In developing the new criteria, LCI and the Secretary were to recommend potential metrics that included, but were not limited to, VMT, VMT per capita, automobile trip generation rates, or automobile trips generated. Section 21099 further provided that, once the CEQA Guidelines had been updated as required by the statute, "automobile delay, as described solely by level of service [LOS] or similar measures of vehicular capacity or traffic congestion shall not be considered a significant impact on the environment pursuant to [CEQA], except in locations specifically identified in the guidelines, if any."

Consistent with these directives, the Natural Resources Agency promulgated CEQA Guidelines Section 15064.3, which became effective in late 2018. It provides that "[g]enerally, vehicle miles traveled is the most appropriate measure of transportation impacts," with VMT referring to "the amount and distance of automobile travel attributable to a project. Other relevant considerations may include the effects of the project on transit and non-motorized travel." Rather than limit its scope only to transit priority areas, the section changed the approach to assessing transportation impacts under CEQA all over the State. Thus, LOS ceased to be a valid criterion or factor for assessing the significance of transportation impacts under CEQA as of late 2018. (See *Citizens for Positive Growth & Preservation v. City of Sacramento* (2019) 43 Cal.App.5th 609, 625-626.) Agencies were required to start using VMT as the basis for environmental analysis in environmental documents issued for public review starting on July 1, 2020 (CEQA Guidelines Section 15064[c], referencing Section 15007).

Technical Advisory on Evaluating Transportation Impacts in CEQA

In December of 2018, LCI published the Technical Advisory on Evaluation of Transportation Impacts in CEQA (Technical Advisory), which is a nonbinding guidance document to provide advice and recommendations regarding assessment of VMT, thresholds of significance, and mitigation measures. The Technical Advisory is intended to be a resource for the public to use at their discretion, and the LCI does not enforce any part of the recommendations contained therein. The Technical Advisory includes recommendations regarding methodology, screening thresholds, and recommended thresholds per land use type.

Vehicle Miles Traveled-Focused Transportation Impact Study Guide

In May of 2020, the California Department of Transportation (Caltrans) adopted the Vehicle Miles Traveled-Focused Transportation Impact Study Guide (TISG) to provide direction to lead agencies regarding compliance with SB 743. The TISG replaces the Caltrans' 2002 Guide for the

Preparation of Traffic Impact Studies and is for use with local land use projects, not for transportation projects on the State Highway System. The objectives of the TISG are to provide:[11]

a) Guidance in determining when a lead agency for a land use project or plan should analyze possible impacts to the State Highway System, including its users.
b) An update to the Guide for the Preparation of Traffic Impact Studies (Caltrans, 2002) that is consistent with SB 743 and the CEQA Guidelines adopted on December 28, 2018.
c) Guidance for Caltrans land use review that supports State land use goals, State planning priorities, and GHG emission reduction goals.
d) Statewide consistency in identifying land use projects' possible transportation impacts to the State Highway System and to identify potential non-capacity increasing mitigation measures.
e) Recommendations for early coordination during the planning phase of a land use project to reduce the time, cost, and/or frequency of preparing a Transportation Impact Study or other indicated analysis.

Caltrans has jurisdiction over State highways. Therefore, Caltrans controls all construction, modification, and maintenance of State highways, and any improvements to such roadways require Caltrans approval.

Local Regulations

The following are the local environmental goals, policies, and regulations relevant to transportation.

Placer County General Plan

The following goals and policies from the PCGP are applicable to the proposed project.

Transportation and Circulation Element

Goal 3.A To provide for the long-range planning and development of the County's roadway system to ensure the safe and efficient movement of people and goods.

Policy 3.A.1 The County shall plan, design, and regulate roadways in accordance with the functional classification system described in Part I of this Policy Document and reflected in the Circulation Plan Diagram.

Policy 3.A.2 Streets and roads shall be dedicated, widened, and constructed according to the roadway design and access standards generally defined in Section I of this Policy Document and, more specifically in community plans, specific plans, and the County's Highway Deficiencies Report (SCR 93). Exceptions to these standards may be considered due to environmental, geographical, historical, or other similar limiting factors. An exception may be permitted only upon determination by the Public Works

[11] California Department of Transportation. *Vehicle Miles Traveled-Focused Transportation Impact Study Guide*. May 20, 2020.

Director that safe and adequate public access and circulation are preserved.

Policy 3.A.3 The County shall require that roadway rights-of-way be wide enough to accommodate the travel lanes needed to carry long-range forecasted traffic volumes (beyond 2010), as well as any planned bikeways and required drainage, utilities, landscaping, and suitable separations. Minimum right-of-way criteria for each class of roadway in the County are specified in Part I of this Policy Document.

Policy 3.A.11 The County shall require an analysis of the effects of traffic from all land development projects. Each such project shall construct or fund improvements necessary to mitigate the effects of traffic from the project consistent with Policy 3.A.7. Such improvements may include a fair share of improvements that provide benefits to others.

Policy 3.A.13 The County shall assess fees on new development sufficient to cover the fair share portion of that development's impacts on the local and regional transportation system. Exceptions may be made when new development generates significant public benefits (e.g., low income housing, needed health facilities) and when alternative sources of funding can be identified to offset foregone revenues.

Goal 3.C To maximize the efficient use of transportation facilities so as to: 1) reduce travel demand on the County's roadway system; 2) reduce the amount of investment required in new or expanded facilities; 3) reduce the quantity of emissions of pollutants from automobiles; and 4) increase the energy-efficiency of the transportation system.

Policy 3.C.1 The County shall promote the use of transportation systems management (TSM) programs that divert automobile commute trips to transit, walking, and bicycling.

Policy 3.C.4 During the development review process, the County shall require that proposed projects meet adopted Trip Reduction Ordinance (TRO) requirements.

Goal 3.D To provide a safe, comprehensive, and integrated system of facilities for non-motorized transportation.

Policy 3.D.1 The County shall promote the development of a comprehensive and safe system of recreational and commuter bicycle routes that provides connections between the County's major employment and housing areas and between its existing and planned bikeways.

Policy 3.D.5 The County shall continue to require developers to finance and install pedestrian walkways, equestrian trails, and multi-purpose paths in new development, as appropriate.

Policy 3.D.8 The CDRA Engineering and Surveying Division and the Department of Public Works shall view all transportation improvements as opportunities to improve safety, access, and mobility for all travelers and recognize cycling, pedestrian, and transit modes as integral elements of the transportation system.

Policy 3.D.11 The County shall work to achieve equality of convenience and choice among all modes of transportation – pedestrian, cycling, transit and motor vehicles, through a balanced and interconnected transportation system.

Dry Creek-West Placer Community Plan

The following goals and policies from the DCWPCP are applicable to the proposed project.

Community Development Element: Population and Housing

Goal 1 Provide sound and adequate housing to all residents at desirable locations including consideration of transportation facilities, school facilities and proximity to major employment centers.

Policy 1 Encourage residential development in areas which provide an adequate and accessible transportation network and which reduce commuting distances to areas of employment.

Community Development Element: Community Design Element

Policy 16 Require the dedication of sufficient road right-of-way as outlined in the Circulation Element and as needed to provide all roadside amenities required herein.

Policy 17 Require the construction of bicycle, pedestrian, and equestrian trails as provided in this Plan and use the policies of the Placer County Bikeways Master Plan in determining routes and trail type for areas not depicted on the Plan Trails map but still required to satisfy the policies of this Plan.

Transportation and Circulation Element

Goal 5 The road network within the Community Plan area shall be coordinated with road networks of adjacent jurisdictions.

Policy 6 The rights-of-way for roads shall be wide enough to accommodate roadways, trails, bikeways, drainage, public utilities, landscaping/vegetation, and suitable separation between facilities. Minimum right-of-way widths are shown in the following table for roadways within the Community Plan area (summarized as Table 16-1):

Table 16-1
Roadway Right-of-Way Standards

Roadway	Right-of-Way
Baseline Road (Sutter County line to Walerga Road/Fiddyment Road)	106 feet
Antelope Road	100 feet
PFE Road (Watt Avenue to Walerga Road)	64 feet
PFE Road (Antelope Road to City of Roseville)	100 feet
Watt Avenue	130 feet
Walerga Road	106 feet
All Other 2 Lane Roads	60 feet

The County may modify these right-of-way standards at their discretion, and may elect to exclude landscaped areas, sidewalks, utilities, and other roadway appurtenances from the defined public right-of-way.

Policy 7 Street lighting, traffic signals, and signage shall be kept to a minimum.

Policy 8 Off-street vehicular parking shall be provided for all new development.

Policy 13 Community Plan area roadways shall be designed and maintained to encourage safe, alternative forms of transportation that contribute to a rural atmosphere (such as walking, biking, horseback riding, etc.). Roadways which provide access to the linear "parkway" along Dry Creek and residential areas shall be designed to discourage through traffic. Alignment, width, signage, etc., shall all be appropriate for a minor residential street rather than a major arterial.

Policy 14 As development of the Community Plan area occurs, public dedication of rights-of-way shall be required for the roads, trails, and bikeways identified in this Community Plan. Construction of such roads, trails, and bikeways shall be required as conditions of approval placed on land development project approvals.

Policy 18 Land development projects shall be designed to minimize the number of access points onto major roadways.

Policy 19 Adequate safety precautions shall be provided at major intersections. Such precautions may include crossing guards, signalization, and other measures to improve the safety for pedestrians and reduce the risk of accidents.

Policy 20 A full environmental analysis under the California Environmental Quality Act at a project level shall be

undertaken, and public hearings shall be held prior to approval of the widening of any road scheduled for expansion under this Community Plan.

County of Placer Transportation Study Guidelines

The County of Placer Transportation Study Guidelines were published in November 2020. The Guidelines are intended to provide a clear and consistent technical approach to preparing Transportation Studies in Placer County. They establish analysis techniques for transportation studies based on the current state-of-the-practice in transportation planning and engineering. For example, the Guidelines set forth a number of thresholds for use in analyses within the County, including VMT thresholds per region. The significance thresholds for Western Placer County and recommended VMT metric used to measure VMT are described by land use type. Recommended thresholds for East Placer County (unincorporated areas from Donner Summit to the east, including the Tahoe Basin) were adopted by Placer County on June 22, 2021.

Placer County Transportation Planning Agency

The PCTPA is the State-designated Regional Transportation Planning Agency for Placer County and is responsible for making decisions about the County's transportation system. In addition to developing and adopting the regional transportation plans and strategies, the PCTPA also allocates the local transportation fund and has entered into a Memorandum of Understanding with Caltrans and the Sacramento Area Council of Governments (SACOG) to govern federal transportation planning and programming in Placer County. The PCTPA has also been involved in preparation of the following transportation planning documents.

Placer County Regional Bikeway Plan

In June 2018, Placer County adopted the Regional Bikeway Plan 2018 Update (Regional Bikeway Plan). The Regional Bikeway Plan identifies a vision and goals for bicycling, a network of bikeways to connect the County, and supportive programs and practices to encourage bicycling. The vision statement for the Regional Bikeway Plan is to promote safe, convenient, and enjoyable bicycling by establishing a comprehensive system of bikeways that link the communities of Placer County.[12] The Regional Bikeway Plan develops a regional system of bikeways that connects the six incorporated cities and numerous unincorporated community areas. As shared-use paths are expanded across the County, they will continue to provide scenic recreational routes as well as key longer-distance regional connections.

Placer Vineyards Transit Master Plan

In March 2014, the County adopted the final Transit Master Plan for the PVSP. The Master Plan satisfies transit-related requirements contained in the development agreement associated with the PVSP, and includes plans for the following: an internal transit system to be implemented as the PVSP is constructed; an ADA dial-a-ride service; commuter service to be provided to the City of Sacramento's downtown area; and regional service with connections to the Watt Avenue Light Rail Station in Sacramento County, Regional University, Galleria Mall, and other regional centers.

Placer County Short Range Transit Plan

In August 2018, the County adopted the Placer County Short Range Transit Plan (SRTP) for the Placer County Transit program, which serves western Placer County. The SRTP is intended to provide a detailed business plan to guide the Placer County Transit program in establishing

[12] Placer County. *Placer County Regional Bikeway Plan*. June 29, 2018.

service strategies, improvement priorities, and implementation sequencing over the 2018 through 2025 planning period. The SRTP includes a review of demographics and transit needs, a series of surveys and ridership counts conducted for all Placer County Transit services, a review of the effectiveness and efficiency of existing services, analysis of a wide range of transit options, and the results of public input processes.

The SRTP was prepared jointly with the development of parallel SRTPs for Roseville Transit, Auburn Transit, and the Western Placer Consolidated Transit Service Agency.[13]

Funding Sources/Fee Programs

In April 1996, the Placer County Board of Supervisors adopted the Countywide Traffic Impact Fee Program, which required new development within the County to reduce impacts to the roadway system by paying traffic impact fees. The collected fees, in addition to other funding sources, make it possible for the County to construct roads and other transportation facilities and improvements needed to accommodate new development. The fee was last updated in June 2025. The County's fee program and Capital Improvement Program (CIP) are divided into 11 districts, and the project site is located within the Dry Creek Benefit District. Current study area improvements included in the fee program located in the area are noted in Table 16-2.

Table 16-2
Dry Creek CIP Improvements

Street	Existing Number of Lanes	Location	Description
Cook Riolo Road	Two Lanes	PFE Road to Baseline Road	Roundabouts/intersection improvements
Dyer Lane	Two Lanes	Baseline Road to 16th Street/ Placer Vineyards Road	Widen to four lanes
Locust Road	Two Lanes	Sacramento County line to 18th Street	Widen to four lanes
North Antelope Road	Two Lanes	Sacramento County line to PFE Road	Widen to five lanes
		at PFE Road	Signal/intersection improvements
PFE Road	Two Lanes	North Antelope Road to City of Roseville	Widen to five lanes
		Walerga Road to Cook Riolo Road	Traffic-calming/control measures
		Watt Avenue to Walerga Road	Widen to four lanes
Placer Vineyards Road	Two Lanes	Sacramento County line to Baseline Road	Widen to four lanes
Vineyard Road	Two Lanes	at Brady Lane	Intersection improvements
Walerga Road	Four Lanes	Baseline Road to Sacramento County line	Widen to six lanes
		at Town Center Avenue	Signal/intersection improvements*

(continued on next page)

[13] Placer County Transportation Planning Agency. *Placer County Transit Short Range Transit Plan 2018-2025*. August 9, 2018.

Table 16-2
Dry Creek CIP Improvements

Street	Existing Number of Lanes	Location	Description
Watt Avenue	Two Lanes	Just south of Sacramento County line to Baseline Road	Widen to six lanes
		Bridge replacement at Dry Creek (Phase 1)	Construct four-lane bridge
		Bridge replacement at Dry Creek (Phase 2)	Widen from four lanes to six lanes
		at A Street	Signal/intersection improvements
		at Dyer Lane	Signal/intersection improvements
		at East Town Center Drive	Signal/intersection improvements
		at Oak Street	Signal/intersection improvements
		at PFE Road	Signal/intersection improvements

* Completed Project

Source: Placer County, Countywide Capital Improvement Programs, June 10, 2025.

Other fee programs deal with specific areas of the County or are linked to particular development. For example, Placer County and the City of Roseville have adopted a City-County Traffic Fee. The South Placer Regional Transportation Authority (SPRTA) State Route (SR) 65 Joint Powers Authority (JPA) fee addresses improvements to SR 65 and a Tier 2 Placer Parkway Fee. In addition, the City of Roseville administers a separate CIP Program that funds City transportation improvements. The current City of Roseville CIP addresses Year 2035 conditions.

16.4 IMPACTS AND MITIGATION MEASURES

This section describes the standards of significance and methodology used to analyze and determine the proposed project's potential impacts related to transportation.

Standards of Significance

Consistent with Appendix G of the CEQA Guidelines, the proposed project would be considered to result in a significant adverse impact on the environment related to transportation if the project would result in any of the following:

- Conflict with a program, plan, ordinance, or policy, except LOS, addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities;
- Substantially increase hazards to vehicle safety due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment);
- Result in inadequate emergency access or access to nearby uses; or
- Result in VMT which exceeds an applicable threshold of significance, except as provided in CEQA Guidelines Section 15064.3, subdivision (b).

Table 16-3 lists the criteria to be applied in assessing transportation-related CEQA impacts. The below criteria are copied from the County of Placer Transportation Study Guidelines. A project would result in significant CEQA impacts if any of the listed criteria are triggered.

Table 16-3
CEQA Impact Significance Criteria

Analysis	Component	Significance Criteria
VMT	Roadway	The project would result in a VMT-related impact per the applicable threshold of significance in Table 2 of Placer County Transportation Study Guidelines and VMT impact analysis results.
Multi-Modal Plan Consistency	Transit Service and Facilities	The project physically disrupts an existing transit service or facility or interferes with implementation of a planned transit service or facility.
		The project results in increased travel time for buses that adversely affects on-time performance.
		The project results in increased transit ridership demands that result in passenger loads that exceed vehicle loading standards.
		The project results in increased potential for safety conflicts involving transit vehicles and other modes of travel.
	Bicycle Facilities	The project physically disrupts an existing bicycle facility or interferes with implementation of a planned bicycle facility.
		The project results in a significant increase in bicyclists on a facility that does not have adequate bicycle facilities, such that conflicts between bicyclists and other travel modes are likely to increase.
	Pedestrian Facilities	The project fails to provide accessible and safe pedestrian connections between buildings and to adjacent streets and transit facilities.
		The project physically disrupts an existing pedestrian facility or interferes with implementation of a planned pedestrian facility.
		The project results in an increased presence of vehicles and/or pedestrians on a facility that does not have adequate pedestrian facilities, such that conflicts between pedestrians and other travel modes are likely to increase.
	General Plan Consistency	The project conflicts or creates inconsistencies with General Plan policies, except an LOS policy.
Hazard & Safety Impact	Roadway Design and Users	The project would create a condition that does not meet current design standards.
		The project would substantially increase hazards to vehicle safety due to geometric design features (e.g., sharp curves or dangerous intersections).
		The project introduces incompatible users (e.g., farm equipment) to a roadway or transportation facility not intended for those users.
	State Highway Facilities	The project results in queueing at off-ramps resulting in slow or stopped traffic past the off-ramp gore point.
		Project is determined to negatively affect safety of the State highway facility.

Source: Placer County Transportation Study Guidelines, 2020.

Vehicle Miles Traveled Standard of Significance

On December 1, 2020, with the passage of Resolution 2020-250, the Placer County Board of Supervisors adopted VMT thresholds of significance, screening criteria, and Transportation Study Guidelines for analyzing transportation impacts under CEQA. Table 16-4 summarizes the VMT thresholds of significance for Western Placer County.

Table 16-4
VMT Thresholds of Significance by Project Type for Western Placer County

Land Use/Project Type	Recommended Metric	Threshold of Significance
Residential	Household or Home-based VMT per Capita	15 Percent Below Unincorporated County Baseline
Commercial Retail	Total VMT	Zero Net Increase
Office Employment	Work VMT per Employee	15 Percent Below Unincorporated County Baseline
Industrial/Agricultural Employment	Work VMT per Employee	
Hotel/Campground	VMT per Room or per Site	

Source: Placer County Transportation Study Guidelines, 2020.

Based on the table, for the proposed project, a VMT impact would be considered less than significant if the household or home-based VMT per capita is determined to be 15 percent below the unincorporated County Baseline.

Method of Analysis

The analysis methodology provided in the VMT Memorandum and LTA (see Appendices K and L, respectively) prepared for the proposed project by Kimley-Horn are discussed below.

VMT Memorandum

Kimley-Horn estimated VMT per capita associated with the proposed project by using the Placer County VMT Estimation Tool, which is an interactive web-based tool that estimates a project's VMT based on the VMT performance of adjacent existing development. The Placer County VMT Estimation Tool is based on data from SACOG's SACSIM19 regional travel demand model.

The proposed project components were input into the Placer County VMT Estimation Tool, including the project site location, development type, and development intensity (220 duplex units and 212 single-family units within the project site, and 120 affordable housing units at the off-site affordable housing parcel) to estimate the average household VMT per resident based on residential uses already within the travel demand model.

The 22 accessory dwelling units (ADUs) proposed as part of development within the project site would meet the County's definition and screening criteria for affordable housing. Therefore, the 22 ADUs were presumed to have a less-than-significant VMT impact without the need for further quantitative analysis by the VMT Memorandum. The 120 affordable housing units at the off-site affordable housing parcel would also meet the County's screening criteria; nevertheless, VMT for the units was quantified as part of the VMT Memorandum.

Local Transportation Analysis

The LTA prepared for the proposed project included an evaluation of the trips that could be generated by the proposed project for both existing conditions plus the project and the cumulative conditions, as well as a vehicle queuing analysis.

Trip Generation

The projected number of trips generated by the proposed project was approximated using data included in the Trip Generation Manual, 11th Edition, published by the Institute of Transportation Engineers (ITE). ITE Land Use Code 210 (Single-Family Detached Housing) was used to approximate single-family home trips, and ITE Land Use Code 220 (Multi-Family Housing [Low-

Rise]) was used to approximate the home trips associated with the multi-family units, affordable housing units, and the potential ADUs. The trip generation estimate is conservative because the total includes estimated trips from both the off-site affordable housing parcel and the ADUs; in actuality, only one of the two affordable housing options studied in this EIR would be implemented.

Table 16-5 presents the project trip generation estimates. As shown in the table, the project is anticipated to generate a total of 4,519 weekday trips, including 312 trips during the AM peak hour and 402 during the PM peak hour. If included, the ADUs would result in the addition of 216 weekday trips, 30 AM peak hour trips, and 30 PM peak hour trips, for a total of 4,735 daily trips (including 342 AM peak hour trips and 432 PM peak hour trips).

Collision History

Collision data sourced from the Safe Transportation Research and Education Center at UC Berkeley was evaluated for seven of the study intersections (Intersections #1, #2, #5, #7, #11, #12, and #13 shown in Figure 16-1 above). The collision data was combined with the calculated intersection entering average daily traffic (ADT) to develop an existing intersection crash rate. The calculated crash rates for the studied intersections were then compared to Caltrans collision data for similar intersections. The collision summary covered the years 2021 through 2025 and included rear-end, broadside, sideswipe, head-on, overturning, hit-object, and other types of accidents.

Project-Specific Impacts and Mitigation Measures

The following discussion of impacts on the transportation system is based on implementation of the proposed project, as well as the two affordable housing options analyzed throughout this EIR, in comparison to the existing conditions and the standards of significance presented above. Each impact is followed by recommended mitigation to reduce the identified impacts, if needed. The analysis of traffic operations, specifically intersection and roadway LOS, is not required pursuant to CEQA Guidelines Section 15064.3(a), as congestion and intersection operations do not constitute a transportation impact under CEQA. Placer County staff will separately review LOS for the project's consistency with PCGP and DCWPCP LOS policies.

In most cases, potential environmental impacts associated with the proposed project and the 22 on-site ADUs would not differ. Thus, unless otherwise noted, the below analysis applies to both the proposed project and the on-site ADUs. In addition, the off-site sewer lift station improvements area is located within Dry Creek Regional Park and the improvements would be limited to providing an underground tank for additional emergency sewer storage capacity. As such, the off-site sewer lift station improvements would not result in any operational transportation impacts, and, as a result, the off-site sewer lift station improvements are not discussed further within the operational impact analyses presented below.

16-1 Conflict with a program, plan, ordinance, or policy, except LOS, addressing the circulation system during construction activities. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The potential for the proposed project and off-site sewer lift station improvements area, as well as the off-site affordable housing parcel, to conflict with a program, plan, ordinance, or policy, with the exception of LOS standards, addressing the circulation system during construction activities is addressed separately below.

Table 16-5
Proposed Project Trip Generation

Land Use (ITE Code)	Dwelling Units	Daily Trips	Weekday AM Peak Hour					Weekday PM Peak Hour				
			Total Trips	In		Out		Total Trips	In		Out	
				Percent	Trips	Percent	Trips		Percent	Trips	Percent	Trips
Phase 1 – Multi-Family Housing (Low-Rise) (220)	220	1,486	91	24	22	76	69	115	63	73	37	42
Phase 2 – Single-Family Detached Housing (210)	110	1,102	81	25	20	75	61	109	63	68	37	41
Phase 3 – Single-Family Detached Housing (210)	55	582	43	25	11	75	32	57	63	36	37	21
Phase 4 – Single-Family Detached Housing (210)	47	504	37	25	9	75	28	49	63	31	37	18
Affordable Housing – Multi-Family Housing (Low-Rise) (220)	120	845	60	24	14	76	46	72	63	45	37	27
Total Project Trips:		**4,519**	**312**	**--**	**76**	**--**	**236**	**402**	**--**	**253**	**--**	**149**
ADUs – Multi-Family Housing (Low-Rise) (220)	22	216	30	24	7	76	23	30	63	19	37	11
Total Project Trips with ADUs:		**4,735**	**342**	**--**	**83**	**--**	**259**	**432**	**--**	**272**	**--**	**160**

Source: Kimley-Horn, June 2026.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Construction activities associated with the proposed project would include use of construction equipment, including vehicles removing or delivering fill material, bulldozers, and other heavy machinery, as well as building materials delivery, and construction worker commutes. The transport of heavy construction equipment to the site, haul truck trips, and construction worker commutes could affect the local roadway network. Construction workers typically arrive before the morning peak hour and leave before the evening peak hours of the traditional commute time periods. Deliveries of building material (lumber, concrete, asphalt, etc.) would also normally occur outside of the traditional commute time periods. In addition, any truck traffic to the site would follow designated truck routes, and project construction would likely stage any large vehicles (i.e., earth- moving equipment, cranes, etc.) on the site prior to beginning site work and remove such vehicles at project completion. However, detailed information related to the construction schedule during site development, or a construction management plan, is not available. As a result, construction activities could include disruptions to the transportation network near the project site and off-site sewer lift station improvements area.

In addition to the construction of structures and internal roadways, the proposed project would also include on-site roadway improvements, including the following: a new driveway located along Baseline Road; an emergency vehicle access (EVA) route to the Estia Dry Creek development; a new roadway off of Walerga Road between Springhill Drive and Town Center Avenue; new street extensions from Wellbrook Place, Bridgestone Crescent Road to the east, and Springhill Drive; an extension of Vineyard Road, which currently terminates at the southern entry to the Sun Valley Oaks subdivision at White Mill Crescent Road, to the west; an EVA for Phase 3 connecting to Walerga Road across from the new Phase 2 access; and an EVA route for Phase 4 at the southwest corner of the site. The proposed project would also include off-site improvements, including the off-site sewer lift station improvements, as well as roadway improvements to Baseline Road at Crowder Lane, Baseline Road at St. Clare Church, and a median curb restriction on Walerga Road at the Project Access/Springhill Drive intersection. In addition, the proposed project would include the reconfiguration of Walerga Road and Baseline Road. The frontage improvements along Walerga Road would include the following: two, seven-foot-wide bike lanes; three, 12-foot-wide travel lanes in each direction; a Class I trail or sidewalk; and a 13- to 24-foot-wide center landscaped median. The project would widen Baseline Road along its frontage to accommodate one half of a six-lane cross section with seven-foot-wide bike lanes on both sides of the street, along with curb and gutter improvements. Lastly, as discussed in Chapter 15, Public Services and Utilities, the proposed project includes an option to develop an eight-inch sewer line within Walerga Road in order to route sewer flows to the south.

The proposed project would also likely require nighttime work for the construction of roadway and utility improvements to minimize daytime traffic circulation impacts on Walerga Road and Baseline Road, as the roads have a high volume of traffic during the daytime. Nighttime work would be short-term and is expected to last approximately one to two weeks at three different locations and would occur at varying times.

Nonetheless, the proposed improvements discussed above would directly influence the transportation network near the site during construction. Therefore, the proposed project

could result in daytime and nighttime roadway or lane closures that adversely affect residents in the project area.

Off-Site Affordable Housing Parcel

The potential future development of the off-site affordable housing parcel does not include any site-specific development plans, designs, or proposals at this time. Future construction activities associated with such residential development would include the use of construction equipment, including vehicles removing or delivering fill material, bulldozers, and other heavy machinery, as well as building materials delivery, and construction worker commutes. The transport of heavy construction equipment to the off-site affordable housing parcel, haul truck trips, and construction worker commutes could affect the local roadway networks in the vicinity. In addition, should buildout of the off-site affordable housing parcel occur, signalization of the Watt Avenue/PFE Road intersection would be required, which could affect the two roadways. Installation of a traffic signal at this intersection is also required for RVSP buildout; thus, the timing of the respective developments may dictate the party responsible for constructing this signal.

Similar to the proposed project, the RVSP EIR concluded that construction within the off-site affordable housing parcel would temporarily add trips to the local roadway network during periods of construction. Preparation and implementation of construction traffic management plans for on- and off-site construction activities to reduce impacts to a less-than-significant level during the various phases of RVSP construction was required by RVSP EIR Mitigation Measure 9-1a, which has been incorporated into this EIR as Mitigation Measure 16-1(b).

Conclusion

Based on the above, without proper planning of on-site construction activities, construction traffic could interfere with existing roadway operations during the construction phase, which could result in a risk to public safety. Therefore, project traffic related to construction activities could result in a ***significant*** impact.

Mitigation Measure(s)

Implementation of the following mitigation measure would reduce the above potential impact to a *less-than-significant* level by ensuring that construction traffic would not interfere with existing roadway operations.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

16-1(a) *The Improvement Plans shall include a signing and striping plan and shall include all on- and off-site traffic control devices. At least two weeks prior to the commencement of construction, a construction signing and traffic control plan shall be provided to the Engineering and Surveying Division and Department of Public Works for review and approval. The construction signing and traffic control plan shall include (but not be limited to) items such as:*

- *Guidance on the number and size of trucks per day entering and leaving the project site;*
- *Identification of arrival/departure times that would minimize traffic impacts;*

- *Approved truck circulation patterns;*
- *Locations of staging areas;*
- *Locations of employee parking and methods to encourage carpooling and use of alternative transportation;*
- *Methods for partial/complete street closures (e.g., timing, signage, location and duration restrictions);*
- *Criteria for use of flaggers and other traffic controls;*
- *Preservation of safe and convenient passage for bicyclists and pedestrians through/around construction areas;*
- *Monitoring for roadbed damage and timing for completing repairs;*
- *Limitations on construction activity during peak/holiday weekends and special events;*
- *Preservation of emergency vehicle access;*
- *Coordination of construction activities with construction of other projects that occur concurrently in the Dry Creek-West Placer Community Plan (DCWPCP) to minimize potential additive construction traffic disruptions, avoid duplicative efforts (e.g., multiple occurrences if similar signage), and maximize effectiveness of traffic mitigation measures (e.g., joint employee alternative transportation programs);*
- *Removing traffic obstructions during emergency evacuation events; and*
- *Providing a point of contact for DCWPCP residents and guests to obtain construction information, have questions answered, and convey complaints.*

The construction signing and traffic control plan shall be developed such that the following minimum set of performance standards is achieved throughout project construction. Additional performance standards are anticipated to be developed once details of project construction are better known.

- *All construction employees shall park in designated lots owned by the project applicant or on private lots otherwise arranged for by the project applicant.*
- *Roadways shall be maintained clear of debris (e.g., rocks) that could otherwise impede travel and impact public safety.*

Off-Site Affordable Housing Parcel

16-1(b) *Implement RVSP EIR Mitigation Measure 9-1a:*

Prior to improvement plan approval, including roadway improvements and the offsite water and sewer line improvements, a Construction Traffic Management Plan shall be prepared to the satisfaction of the Placer County Public Works Department. The purpose of the plan is to provide for vehicular, pedestrian, equestrian, and bicycle safety, and to minimize adverse LOS, including neighborhood traffic impacts during project construction. This plan shall include the following components:

1. *A striping and signing plan including offsite traffic control devices, shall be prepared by the Applicant and shall be reviewed and approved by the County Traffic Engineer;*
2. *An analysis of traffic volumes on roadways where one-way traffic control would be required, if any, to determine whether the hours of such control should be limited;*
3. *Provision of flag persons as necessary to facilitate traffic flow through construction areas;*
4. *Arranging construction schedules to begin and end during off-peak hours, as necessary and feasible as approved by Placer County; and*
5. *A community relations program to be implemented prior to and during the construction period.*

The Applicant shall implement the Construction Traffic Management Plan.

16-2 Conflict with a program, plan, ordinance, or policy, except LOS, addressing the circulation system, including transit, roadway bicycle, and pedestrian facilities, during operations. Based on the analysis below, the impact is *less than significant*.

The following discussion is an analysis of potential impacts to existing or planned pedestrian facilities, bicycle facilities, or transit facilities and services within the vicinity of the project site associated with the proposed project and development of the off-site affordable housing parcel.

Proposed Project

The following discussion focuses on whether the proposed project would result in impacts to existing or planned pedestrian facilities, bicycle facilities, or transit facilities and services within the vicinity of the project site.

Pedestrian System

Existing sidewalks do not occur within the project site. Wellbrook Place at the northeast corner of the site includes a sidewalk that ends at the site's eastern boundary. As previously discussed, sidewalks are currently located along portions of Walerga Road, including at the southernmost corner of the northern portion of the site at the intersection of Walerga Road and Town Center Avenue. In addition, as previously discussed, sidewalks are located along portions of Baseline Road. Consistent with the design standards established within the DCWPCP, the proposed project would include an eight-foot separated sidewalk along the project frontages on Baseline Road and Walerga Road. The Placer Creek Residential neighborhoods would be served by an internal roadway system, which would include sidewalks on each side of the new internal residential roadways. The proposed project would also include an approximately 1,300-foot-long Class I meandering trail along the Baseline Road frontage, and an approximately 2,300-foot-long Class I meandering trail along the southern/eastern Walerga Road frontage. Additionally, the project would extend an existing trail north of Vineyard Road, just north of Phase 4.

In addition, the proposed project aims to implement minor enhancements within the abandoned Old Walerga Road corridor, which bisects the project site and existing residential development to the west of the project site within the broader Placer Vineyards area. The corridor is privately owned and encumbered by existing public utility easements; accordingly, any proposed enhancements would be subject to landowner consent, utility coordination, and applicable approvals, and would not be implemented absent such consent. Proposed enhancements would be limited to areas previously disturbed by the former roadway and may include linkages on the north side to the planned Class I trail along Baseline Road and on the south side to Town Center Drive, limited pavement surface treatments (such as slurry seal or comparable non-structural applications), signage, and striping to accommodate pedestrians and bicyclists. If implemented, the improvements to the Old Walerga Road corridor would enhance connectivity of local residents to nearby retail and commercial centers, provide additional safety for pedestrians and cyclists, support multimodal access, and contribute to the overall functionality and integration of the local trail network.

Overall, the proposed project would provide new pedestrian connections to existing pedestrian facilities in the site vicinity. The proposed on- and off-site pedestrian improvements would not physically disrupt an existing pedestrian facility, nor interfere with implementation of a planned pedestrian facility. As such, development of the proposed project would not adversely affect pedestrian facilities.

Bicycle Facilities

As previously discussed, the southern portion of the site includes a paved multi-purpose trail extending from Vineyard Road to Walerga Road. The nearest existing bicycle facilities to the project site include Class II bike lanes on Baseline Road and Walerga Road. As described in the Placer County Regional Bikeway Plan and presented in Figure 16-2, a Class II bike lane is proposed as part of the project along Walerga Road where the roadway bisects the project site. The bike lane has been partially constructed as part of the existing single-family residential development in the site vicinity. The Placer County Regional Bikeway Plan also anticipated construction of the existing shared use path that connects to Vineyard Road.

As part of improving bicycle access in the project vicinity, the proposed project would include the construction of a seven-foot Class II bike lane on the south side of Baseline Road and the east and west sides of Walerga Road along the project site frontage. The proposed frontage improvements for the reconfiguration of Walerga Road would also include the new travel lanes, either a Class I trail or sidewalk, and center landscaped median discussed above.

Overall, the proposed project would provide new bicycle connections to existing bicycle facilities, which would be consistent with what was anticipated in the Placer County Regional Bikeway Plan. The proposed on- and off-site improvements would not physically disrupt an existing bicycle facility, nor interfere with implementation of a planned bicycle facility. As such, development of the proposed project would not adversely affect bicycle facilities.

Transit System

According to the LTA, Roseville Transit service operates on fixed routes in Roseville with connections to Placer County Transit and SacRT. Roseville Transit services Route D with a stop approximately 0.70-mile east of the project site at Baseline Road and Woodcreek Oaks Boulevard. Route D traverses the western neighborhoods of the City of Roseville and connects to the Civic Center Junction, which provides connections to commuter buses. Roseville Transit also services Route R with a stop at Foothills Boulevard at Main Street/Baseline Road, approximately three miles east from the project site. The project site is located approximately 5.9 miles away from the Louis Orlando Transit Center at the Orlando Avenue/Louis Lane intersection, which houses regional transit Route 10: Auburn/Light Rail (bus) and Route 60: Placer Commuter Express (vanpool).

Development of the proposed project is not anticipated to conflict with the goals, policies, and objectives found in the PCTPA SRTP. Additionally, the proposed project would not include features that would conflict with existing or planned transit services, such as the planned inter-regional services included in the PVSP Transit Master Plan (see Figure 16-3). Therefore, development and operation of the proposed project would not adversely affect transit service and facilities.

Off-Site Affordable Housing Parcel

With respect to the off-site affordable housing parcel, Watt Avenue includes an existing buffered bike lane in the vicinity of the parcel. PFE Road does not have existing bicycle facilities. The closest bus stop to the off-site affordable housing parcel is a SacRT Route 19 stop at Watt Avenue and Elverta Road, approximately 0.96-mile south of the site down Watt Avenue.

The Placer County Regional Bikeway Plan identifies planned Class II bike lanes on PFE Road, but not sections of PFE Road within the RVSP area. The RVSP identifies planned pedestrian facilities as part of the ultimate cross-sections of Watt Avenue and PFE Road, including seven-foot Class II bike lanes along both roadways and a Class I trail that would be eight feet wide along PFE Road and 10 feet along Watt Avenue. Any future residential development within the off-site affordable housing parcel would require sidewalks as part of their frontage improvements. The County would require the future applicant to construct frontage improvements, including any planned bicycle and/or pedestrian facility improvements. Further, any alterations to existing bicycle and pedestrian facilities proposed at the time of development would be required to comply with all applicable Placer County and RVSP policies and design standards. Compliance with such would ensure that future development of the off-site affordable housing parcel would not conflict with adopted policies, plans, or programs supporting alternative transportation.

As discussed under Impact 9-18 of the RVSP EIR, the 933 residential units anticipated for the RVSP area would generate an increased demand for new transit services. The RVSP EIR concluded that, if transit services were not provided to the RVSP area, an unmet transit need would likely occur prior to buildout of the Specific Plan. Such unmet transit needs are defined by PCTPA and are reviewed on a regular basis. To meet a potential unmet transit need, Placer County would need to provide a reasonable amount of transit service to the RVSP area. Therefore, the RVSP EIR included Mitigation Measure 9-18a, which required the creation of a Community Service Area (CSA) to cover transit service and fund the cost of transit services and any related capital costs for buses, passenger

amenities, and facilities. In compliance with RVSP Mitigation Measure 9-18a, Transit CSA 28 Zone of Benefit 224 was established for the RVSP in October 2017.[14] Based on the conclusions of the RVSP EIR, because a CSA for transit service has been implemented, impacts associated with the RVSP on transit service would be less than significant.

Conclusion

Based on the above, the proposed project would not conflict with adopted policies, plans, or programs supporting alternative transportation (i.e., bus turnouts, bicycle lanes, bicycle racks, public transit, pedestrian facilities, etc.). Thus, the project would result in a ***less-than-significant*** impact to pedestrian, bicycle, and transit facilities.

Mitigation Measure(s)

None required.

16-3 Substantially increase hazards to vehicle safety due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment). Based on the analysis below, the impact is *less than significant*.

The following discussion evaluates whether development at the project site and the off-site affordable housing parcel would substantially increase hazards to vehicle safety due to a geometric design feature or incompatible uses.

Proposed Project

The proposed project would not include any new sharp curves or dangerous intersections and would not be located in the vicinity of any such roadway features. In fact, based on the collision data reviewed as part of the LTA, the majority of the examined intersections had calculated existing intersection crash rates below the Statewide average crash rate (see Table 16-6). The Watt Avenue/PFE Road intersection (Intersection #13) is located immediately adjacent to the off-site affordable housing parcel and, thus, is discussed in further detail below.

Table 16-6
Intersection Crash Rate Summary

ID	Intersection	Statewide Average Crash Rate	Intersection Actual Crash Rate
1	Baseline Road at Santucci Boulevard/Watt Avenue	0.33	0.22
2	Baseline Road at Westbrook Boulevard	0.28	0.03
5	Baseline Road at Fiddyment Road/Walerga Road	0.33	0.20
7	Baseline Road at Junction Boulevard	0.28	0.09
11	Walerga Road at Town Center Avenue	0.28	0.05
12	Walerga Road at PFE Road	0.33	0.24
13	Watt Avenue at PFE Road	0.11	0.28

Source: Kimley-Horn, June 2026.

[14] Placer County Board of Supervisors. *Resolution No. 2017-206: A Resolution Establishing Zone of Benefit No. 224 Within County Service Area 28 and Establishing An Assessment on Parcels Within Said Zone (Riolo Vineyard) to Provide Transit Services*. October 24, 2017.

The proposed widening of Walerga Road would ultimately include the construction of two, seven-foot-wide bike lanes, three 12-foot-wide travel lanes in each direction, a Class I trail or sidewalk, and a 13- to 24-foot-wide center landscaped median. As part of the proposed project, Baseline Road would be widened along its frontage to accommodate one half of a six-lane cross section that consists of a 14-foot-wide median, a 12-foot wide and two 11-foot-wide travel lanes in each direction, seven-foot-wide bike lanes on both sides of the street, along with curb and gutter improvements. The proposed improvements are intended, in part, to provide safe pedestrian and cyclist circulation in the project area.

All internal roadways and frontage improvements would be designed consistent with applicable Placer County standards, which would be confirmed during improvement plan review. Furthermore, the proposed project would not introduce incompatible uses, such as farm equipment or heavy-duty truck traffic, to area roadways during operations. Potential impacts related to project construction traffic are discussed under Impact 16-1 above.

The proposed project would include a number of other roadway improvements that would help to safely accommodate project-related increases in traffic on the local roadway system. The roadway improvements include:

- Restricting northbound left turns from Crowder Lane onto Baseline Road through a mountable raised median, newly installed left-turn/U-turn lane at Baseline Road near the existing entry to the St. Clare Catholic Church parking lot, and appropriate signage on Crowder Lane; and
- Restricting eastbound left turns and westbound left turns from Springhill Drive to Walerga Road by installing a median curb restriction. (Left-turns in will still be permitted at Springhill Road.)

Both of the above improvements would include coordination with the City of Roseville to implement the required modifications at the Baseline Road/Fiddyment Road/Walerga Road intersection to accommodate U-turns (signage, signal timing, etc.). Overall, the proposed project would not substantially increase hazards to vehicle safety due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).

Off-Site Affordable Housing Parcel

The potential future development of the off-site affordable housing parcel does not include any site-specific development plans, designs, or proposals at this time. As such, the potential for development on the off-site affordable housing parcel to substantially increase hazards to vehicle safety due to a geometric design feature cannot be specifically evaluated at this time. However, all new developments that occur within the County are required to comply with all applicable design standards as part of constructing or modifying the transportation system. For example, RVSP Circulation Goal #1 and Policy 1 are related to creating a safe and efficient transportation network capable of meeting increased traffic demands for all modes of travel, and RVSP Circulation Policy 6 is related to using roadway design to regulate speed and manage traffic. In addition, PCGP Policy 3.A.2 requires all streets and roads to be constructed in accordance with General Plan, community plan, and specific plan standards.

The collision data reviewed as part of the LTA revealed seven collisions at the Watt Avenue/PFE Road intersection located immediately southwest of the off-site affordable housing parcel within the five-year period (2021 through 2025), including rear-end, broadside, and hit-object collisions. As shown in Table 16-6, the total calculated existing intersection crash rate was 0.28 crashes per million entering vehicles, which is higher than the total average crash rate for similar intersections (0.11 crashes per million entering vehicles) and the Statewide average crash rate for such intersections (0.21 crashes per million entering vehicles). However, the LTA concluded that signalization of the intersection would improve roadway safety for all roadway users. Signalization of the Watt Avenue/PFE Road intersection is required for RVSP buildout, or should the off-site affordable housing option be implemented as part of the proposed project.

Conclusion

Based on the above, the proposed project would not substantially increase hazards to vehicle safety due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment), and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

16-4 Result in inadequate emergency access or access to nearby uses. Based on the analysis below, the impact is *less than significant*.

Several factors determine whether a site has sufficient access for emergency vehicles, including the following:

1. Number of access points (both public and emergency access only);
2. Width of access points;
3. Width of internal roadways; and
4. Length of dead-end roadways.

The following discussion evaluates emergency access for the proposed project and off-site affordable housing parcel, separately.

Proposed Project

Emergency vehicle access to the proposed project would be provided at multiple locations. A temporary EVA to the Estia Dry Creek development would be through future Phase 2 by way of a non-signalized Walerga Road intersection (EVA only) located between Springhill Drive and the existing signalized access (i.e., Town Center Avenue) to the Placer Vineyards Property 1A development to the southwest of the site. The ultimate Estia Dry Creek EVA would use the Phase 2 subdivision roadways and connections to Walerga Road, including an additional Walerga Road connection by way of Springhill Road.

Access to the Placer Creek Residential Phase 2 neighborhood would be provided by a Springhill Drive extension and a new roadway off of Walerga Road between Springhill Drive and Town Center Avenue. Both access points would allow for right-in egress and right-out egress controlled by a median in Walerga Road. Left-turns out of the subdivision would be restricted, but lefts-turns in would still be permitted at Springhill Road.

Access to the Placer Creek Residential Phase 3 neighborhood would be from a new eastern/fourth leg of the existing signalized intersection at Walerga Road and Town Center Avenue, and an EVA is proposed from Walerga Road to M Street, opposite the new Phase 2 access on Walerga Road.

Access to the southern Phase 4 Placer Creek Residential neighborhood would be from the western extension of Vineyard Road, which currently terminates at the project site, just west of the southern entry to the Sun Valley Oaks subdivision at White Mill Crescent Road. An EVA for Phase 4 is proposed from Q Court to Walerga Road in the southwest corner of the project site, in the same location as the existing encroachment for Sewer and Emergency Access.

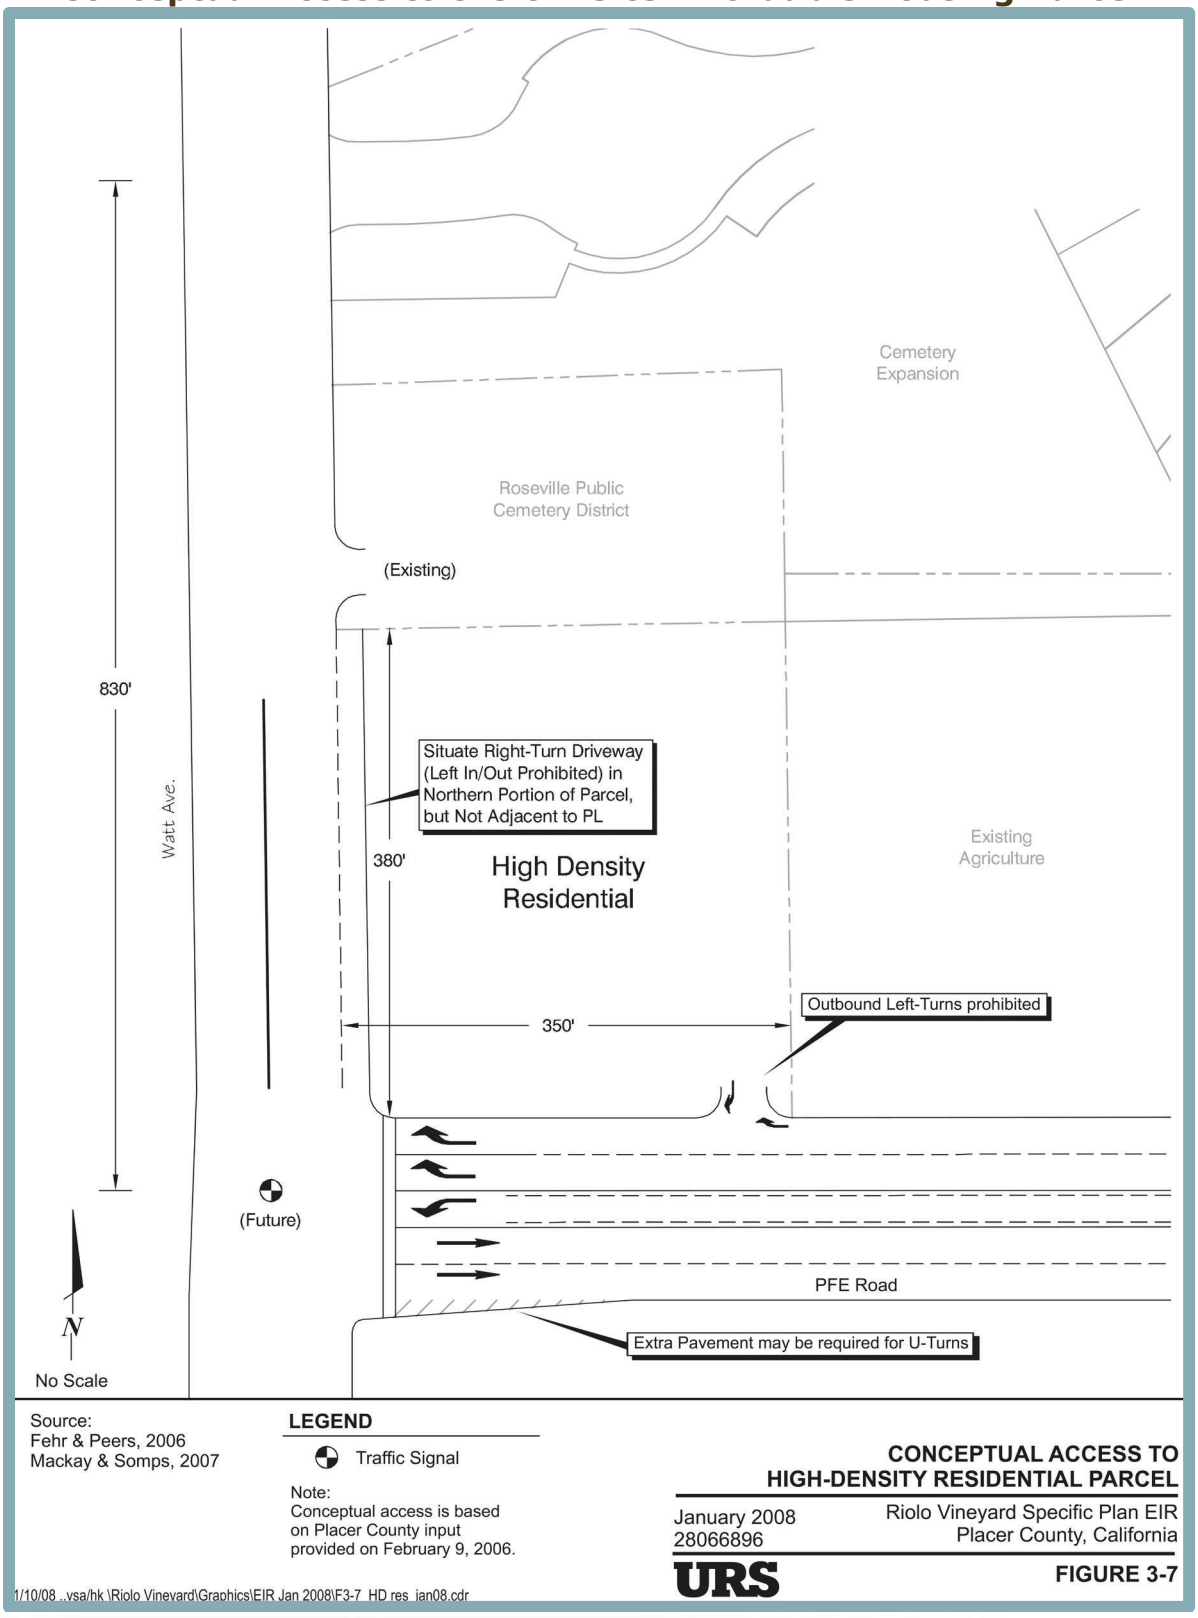
The Phase 1 project entry from Baseline Road, the entry to Placer Creek Residential Phase 3 from Walerga Road, and the Placer Creek Residential Phase 4 entry on Vineyard Road would all include access gates. The proposed gated access points would be required to comply with the emergency vehicle access conditions established by Section 15.04.580 of the Placer County Code, which includes requirements for gated entrances to automatically open from the interior without the use of a special code or device for first responders. As discussed in Chapter 3, Project Description, of this EIR, the pedestrian gates would be located at the project entries for Phases 3 and 4 and would remain unlocked during daylight hours.

Off-Site Affordable Housing Parcel

The potential future development of the off-site affordable housing parcel does not include any site-specific development plans, designs, or proposals. The final design of access routes to the off-site affordable housing parcel, including emergency access, would be subject to updated study and determined by the County at the time that specific plans are received. Thus, the adequacy of specific emergency access routes cannot be analyzed at this time.

Nonetheless, the RVSP EIR included conceptual access designs to the off-site affordable housing parcel within Figure 3-7 (reproduced herein as Figure 16-4). As shown in the figure, the off-site affordable housing parcel was anticipated for residential uses, consistent with the potential development associated with the proposed project.

The RVSP also anticipated restricted left turns from the off-site affordable housing parcel, as well as a signal at the intersection of Watt Avenue and PFE Road. As discussed above, should buildout of the off-site affordable housing parcel occur, signalization of the Watt Avenue/PFE Road intersection would be required, consistent with the RVSP. Because installation of a traffic signal at the Watt Avenue/PFE Road intersection is required for RVSP buildout, the timing of the respective developments may dictate the party responsible for constructing this signal.



Conclusion

Based on the above, the proposed project would not result in inadequate emergency access or access to nearby uses, and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

Figure 16-4
Conceptual Access to the Off-Site Affordable Housing Parcel

* Figure not OCR Compatible

16-5 Result in VMT which exceeds an applicable threshold of significance, except as provided in CEQA Guidelines Section 15064.3, subdivision (b). Based on the analysis below, the impact is *less than significant*.

The following discussion evaluates whether the development of the proposed project and/or the off-site affordable housing parcel would result in VMT which exceeds an applicable threshold of significance.

Proposed Project and Off-Site Affordable Housing Parcel

Table 16-7 summarizes the results of the VMT analysis prepared for the proposed project. According to the VMT Memorandum, the unincorporated County baseline VMT per capita is 30.43. As discussed previously, pursuant to County guidance, residential projects that generate VMT per capita at 15 percent less than the unincorporated County baseline average may be considered to have a less-than-significant VMT impact. Therefore, the VMT threshold applied to the proposed project is 15 percent less than 30.43, or 25.86 VMT per capita.

Table 16-7
VMT Analysis Results

	Per Capita VMT			
Site	Unincorporated Placer County Average	15 Percent Reduction Goal	Project Generated Rate	Placer County Goal Met?
Project Site	30.43	25.86	18.98	Yes
Off-Site Affordable Housing Parcel	30.43	25.86	21.46	Yes

Source: Kimley-Horn, October 2025.

According to the VMT Memorandum prepared for the proposed project and as shown in Table 16-7, the results of the Placer County VMT Estimation Tool determined that the VMT per capita for the proposed project would be 18.98 for development within the project site and 21.46 for the off-site affordable housing parcel, which are both below the 25.86 VMT per capita threshold.

While the off-site affordable housing parcel was evaluated using the County's VMT evaluation tool, the site also meets the County's definition and screening criteria for affordable housing. Therefore, because the affordable housing parcel meets at least one of the screening criteria set by the County, future development of the off-site affordable housing parcel could be presumed to have a less-than-significant impact related to VMT without the need for further quantitative analysis.

Given that the per-capita VMT associated with the proposed project would achieve the applicable VMT reduction goal, the proposed project would not conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b), and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

Cumulative Impacts and Mitigation Measures

For further detail related to the cumulative setting of the proposed project, refer to Chapter 20, Statutorily Required Sections, of this EIR.

Increased traffic volumes on local roadway facilities under cumulative conditions would not substantially alter performance related to bicycle facilities, pedestrian facilities, transit facilities and services, and emergency vehicle access. Rather, impacts to such facilities under Cumulative Plus Project conditions would be similar to those discussed above under Impacts 16-2, 16-3, and 16-4. In addition, construction activities associated with the project would be complete prior to the cumulative analysis year. Therefore, such topics are not discussed further in the cumulative analysis presented herein.

Similarly, the VMT impact analysis for Existing Plus Project conditions included under Impact 16-5 would also apply to Cumulative Plus Project conditions. The VMT significance threshold compares project-generated VMT per service population to that of existing local and regional development. The VMT comparison is useful because the comparison provides information regarding how the project aligns with long-term environmental goals related to VMT established based on existing development levels as recommended by the LCI Technical Advisory. The Technical Advisory indicates that VMT efficiency metrics, such as VMT per service population, may not be appropriate for CEQA cumulative analysis because they employ a denominator. Instead, the Technical Advisory recommends that an impact finding from an efficiency-based project-specific VMT analysis (i.e., Existing Plus Project conditions) would imply an identical impact finding for a cumulative VMT analysis.[15] An example provided by LCI explains that a project that falls below an efficiency-based threshold that is aligned with long-term environmental goals and relevant plans would have no cumulative impact distinct from the project impact. A similar determination is made in the Placer County Transportation Study Guidelines.[16] Therefore, a cumulative analysis of VMT is not presented in this section as the conclusion would remain identical to that presented under Impact 16-5.

17. Tribal Cultural Resources

17. TRIBAL CULTURAL RESOURCES

17.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County an approximately four-acre parcel off-site within the Riolo Vineyards Specific Plan (RVSP) which could develop a maximum of 120 affordable income-restricted units.

The Tribal Cultural Resources chapter of the EIR addresses known and unknown tribal cultural resources in the vicinity of the project site and off-site sewer lift station improvements area, as well as the off-site affordable housing parcel. Pursuant to Public Resources Code (PRC) Section 21074, tribal cultural resources are defined as sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either included or determined to be eligible for inclusion in the California Register of Historical Resources, or included in a local register of historical resources as defined in subdivision (k) of PRC Section 5020.1. This chapter summarizes the existing setting with respect to tribal cultural resources, identifies thresholds of significance, evaluates potential project impacts to such resources, and sets forth mitigation measures. The impact discussions and mitigation measures presented in each technical section apply to both the project site and the off-site sewer lift station improvements area, unless otherwise noted.

Information presented in this chapter is primarily drawn from a Sacred Lands File (SLF) search conducted by the California Native American Heritage Commission (NAHC), and Native American consultation pursuant to Assembly Bill (AB) 52 and Senate Bill (SB) 18, as well as the Cultural and Paleontological Resources Assessment prepared by Natural Investigations Company.[1] This chapter also includes information from the Placer County General Plan (PCGP),[2] the PCGP EIR,[3] RVSP EIR,[4] and the Dry Creek-West Placer Community Plan (DCWPCP).[5]

17.2 EXISTING ENVIRONMENTAL SETTING

A detailed overview of the project area's cultural history is included in Chapter 8, Cultural Resources, of this EIR. The sections below provide an ethnographic overview of tribal history within the project area, as well as an overview of the tribal outreach and consultation conducted for the proposed project, and any known tribal cultural resources within the area.

Ethnographic Overview of the Project Area

The project site is located in lands historically occupied by the Nisenan (also known as the Southern Maidu). Prior to Euro-American contact, Nisenan territory included the southern extent of the Sacramento Valley, east of the Sacramento River between the North Fork Yuba River and Cosumnes River on the north and south, respectively, and extended east into the foothills of the Sierra Nevada. Neighboring groups included the Plains Miwok to the south, Southern Patwin to the west across the Sacramento River beyond the Yolo Basin, and Konkow and Maidu to the north. Three Maiduan languages, Konkow, Maiduan, and Nisenan, are regarded as a subgroup of Penutian stock. Ethnographers have also distinguished three Nisenan dialects: Northern Hill, Southern Hill, and Valley.

The Nisenan established central villages and smaller satellite villages along the main watercourses in their territories. Valley Nisenan villages were generally located on low, natural rises along streams and rivers or on gentle, south-facing slopes; Hill Nisenan villages were located on ridges and large flats along major streams. Semi-permanent or winter villages, as well as seasonally occupied campsites, were used at various times during the seasonal round of subsistence activities associated with hunting, fishing, and gathering plant resources. Historically, a Nisenan village, known as *Pitsokut* or *Pich-u-gut,* was located in the Roseville area, and may have been at the location of a habitation site recorded along Dry Creek.

Village population is reported as ranging from 15 to over 500 individuals, with the number of residences ranging from 40 to 50 in larger villages, and only three to seven in smaller villages. Traditional village structures included semisubterranean or aboveground conical, circular, or dome-shaped houses, as well as acorn granaries, winter grinding houses, ceremonial or dance houses, and sweathouses. Nisenan mortuary practices included cremation and burial in a separate cemetery area.

Like the majority of Native Californians, the Nisenan relied on acorns as a staple food, which were collected in the fall and then stored in granaries. The Nisenan were seasonally mobile hunter-gatherers who also relied on a wide range of abundant natural resources that were available in their territories. Large and small mammals, such as pronghorn antelope, deer, tule elk, black bear, cottontail, and jackrabbit, among other species, were hunted by individuals or by communal groups. Game birds, waterfowl, and fish, particularly salmon, were also important components of the Nisenan diet. In addition to acorns, plant resources included pine nuts, buckeye nuts, hazelnuts, fruits, berries, seeds, and underground tubers.

Similar to other California Native American groups, the Nisenan employed a variety of tools, implements, and enclosures for hunting and collecting natural resources. The bow and arrow, snares, traps, nets, and enclosures or blinds were used for hunting land mammals and birds. For fishing, the Nisenan made canoes from tule, balsa, or logs, and used harpoons, hooks, nets, and basketry traps. To collect plant resources, the Nisenan used sharpened digging sticks, long poles for dislodging acorns and pinecones, and a variety of woven tools (seed beaters, burden baskets, and carrying nets).

Foods were processed with a variety of tools, such as bedrock mortars, cobblestone pestles, anvils, and portable stone or wooden mortars that were used to grind or mill acorns and seeds. Tools and implements included knives, anvils, leaching baskets and bowls, woven parching trays, and woven strainers and winnowers. Prior to processing, the acorns were stored in the village granaries. The Nisenan and neighboring groups participated in an extensive east-west trade

network between the coast and the Great Basin. From coastal groups marine shell (*Olivella* and abalone) and steatite moved eastward, while salt and obsidian traveled westward from the Sierras and Great Basin. Basketry, an important trade item, moved in both directions.

The traditional culture and lifeways of the Nisenan who inhabited the fertile plains between Sacramento and the Sierra foothills were disrupted beginning in the early 1800s. Although Spanish explorers entered Nisenan territory as early as 1808, records do not exist of the forced movement of Nisenan to the missions. During the Mexican period, native peoples were affected by land grant settlements and decimated by foreign disease epidemics that swept through the densely populated Central Valley. An epidemic that swept the Sacramento Valley in 1833 caused the death of an estimated 75 percent of the Valley Nisenan population, wiping out entire villages.

In the heart of Nisenan territory, the discovery of gold in 1848 at Sutter's Mill on the American River near Coloma had a devastating impact on the remaining Nisenan, as well as other groups of Native Americans in the Central Valley and along the Sierra Nevada foothills. By 1850, with their lands, resources, and way of life being overrun by the steady influx of non-native people during the Gold Rush, surviving Nisenan moved to the foothills and mountains, or labored for the growing ranching, farming, and mining industries in the area. Today, Nisenan descendants reside on the Auburn, Berry Creek, Chico, Enterprise, Greenville, Mooretown, Shingle Springs, and Susanville rancherias, as well as on the Round Valley Reservation.

The United Auburn Indian Community (UAIC) is a federally recognized Tribe comprised of both Miwok and Maidu (Nisenan) Indians and are traditionally and culturally affiliated with the project area. The Tribe possesses the expertise concerning tribal cultural resources in the area and are contemporary stewards of their culture and the landscapes. The Tribal community represents the continuity and endurance of their ancestors by maintaining their connection to their history and culture. The Tribe's goal is to ensure the preservation and continuance of their cultural heritage for current and future generations.

NAHC Sacred Lands File Search

Natural Investigations Company contacted the NAHC requesting a search of the SLF for tribal cultural resources within or near the project area, which includes the project site and the off-site sewer lift station improvements area. The results of the search returned by the NAHC on January 14, 2025, were negative for Native American cultural resources in the project vicinity.

Tribal Consultation

Pursuant to AB 52 and SB 18, on January 22, 2025, Placer County sent invitations to consult to tribes who requested notification of proposed projects within the geographic area. Specifically, combined AB 52 and SB 18 notification letters were sent to the Ione Band of Miwok Indians, the UAIC, the Washoe Tribe of Nevada and California, and the Colfax-Todds Valley Consolidated Tribe. In addition, SB 18 specific notification letters were sent to the Shingle Springs Band of Miwok Indians, T'Si-Akim Maidu, and Wilton Rancheria. A response was received from the UAIC on February 4, 2025. The UAIC provided a sensitivity map to the County showing where they would like to monitor during on-site construction. This monitoring requirement has been incorporated into this chapter as mitigation.

On May 7, 2026, Placer County initiated tribal consultation pursuant to AB 52 and SB 18 specifically for the off-site sewer lift station improvements area and the off-site affordable housing parcel. The UAIC requested site-specific mitigation measures for the off-site sewer lift station

location, The tribal cultural awareness training and inadvertent discoveries measure requested for the off-site sewer lift station improvements area has been incorporated into this chapter as mitigation. The Tribe did not request any additional mitigation for the off-site affordable housing parcel.

Known Tribal Cultural Resources

As discussed above, the NAHC SLF results indicated that recorded Native American sacred sites or traditional cultural properties are not known to exist within the project site. One previously recorded site (P-31-000203) is mapped as being directly adjacent to the western border of the off-site sewer lift station improvements area and is described below.

P-31-000203– Precontact-Era Site

P-31-000203 is identified as a small precontact occupation site comprised of one white petrified wood projectile point, ochre, and manos. The site was first recorded in 1965 and was updated in 1991, during which one unifacial Greenstone flake with possible utilized chippage was identified; the update did not include mention of the previously found artifacts. A subsequent update of the site occurred in 1999, during which a fragment of a small andesitic cobble mano and a uniface metavolcanic cobble chopper were located. Further differences from the 1991 update were not noted. During the intensive pedestrian survey completed by Natural Investigations Company, the presence of P-31-000203 was not indicated and the location of the resource therefore could not be confirmed. In addition, the off-site sewer lift station improvements area is heavily utilized by recreational activities, a Community Park is adjacent to the west, and a previously landscaped grass area adjacent to the south was being regraded during the survey. The 1999 update of P-31-000203 mentioned that the site was disced regularly.

No new tribal cultural resources were identified in the project site or the off-site sewer lift station improvements area during cultural resource investigations.

17.3 REGULATORY CONTEXT

Federal, State, and local governments have developed laws and regulations designed to protect significant tribal cultural resources that may be affected by actions that they undertake or regulate. The following section contains a summary of basic federal and State laws governing preservation of tribal cultural resources of national, regional, State, and local significance.

Federal Regulations

The following are the federal environmental laws and policies relevant to cultural resources.

Section 106 for the National Historical Preservation Act of 1966

Federal regulations for cultural resources are governed primarily by Section 106 of the National Historic Preservation Act (NHPA) of 1966. Section 106 of NHPA requires federal agencies to take into account the effects of their undertakings on historic properties and affords the Advisory Council on Historic Preservation a reasonable opportunity to comment on such undertakings. The Council's implementing regulations, "Protection of Historic Properties," are found in Title 36 of the Code of Federal Regulations (CFR) Part 800. The goal of the Section 106 review process is to offer a measure of protection to sites, which are determined eligible for listing on the National Register of Historic Places (NRHP). The criteria for determining NRHP eligibility are found in 36 CFR Part 60. Amendments to the NHPA (1986 and 1992) and subsequent revisions to the implementing regulations have, among other things, strengthened the provisions for Native American consultation and participation in the Section 106 review process. While federal agencies

must follow federal regulations, most projects by private developers and landowners do not require this level of compliance. Federal regulations only come into play in the private sector if a project requires a federal permit or uses federal funding.

State Regulations

The following are the State environmental laws and policies relevant to tribal cultural resources.

Assembly Bill 52

AB 52 adds tribal cultural resources to the categories of cultural resources in CEQA, which had formerly been limited to historic, archaeological, and paleontological resources. "Tribal cultural resources," pursuant to PRC Section 21074(a), are defined as either:

> (1) Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:
>
> (A) Included or determined to be eligible for inclusion in the California Register of Historical Resources.
> (B) Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.
>
> (2) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. In applying the criteria set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.

Under AB 52 (PRC Section 21084.2), a project that may cause a substantial adverse change in the significance of a tribal cultural resource is defined as a project that may have a significant effect on the environment. Where a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document must discuss the impact and whether feasible alternatives or mitigation measures could avoid or substantially lessen the impact. AB 52 (PRC Section 21080.3.1) requires lead agencies to provide notice to tribes that are traditionally and culturally affiliated with the geographic area of a proposed project if they have requested notice of projects proposed within that area. If the tribe(s) requests consultation within 30 days upon receipt of the notice, the lead agency must consult with the tribe(s). Consultation may include discussing the type of environmental review necessary, the significance of tribal cultural resources, the significance of the project's impacts on the tribal cultural resources, and alternatives and mitigation measures recommended by the tribe(s).

Senate Bill 18

SB 18, signed into law in September 2004, requires local (city and county) governments to consult with California Native American tribes when adopting or substantially amending a general plan, or designating land as open space, in order to aid in the protection of traditional tribal cultural places ("cultural places"). According to the Office of Land Use and Climate Innovation (LCI), formerly the Office of Planning and Research, moreover, this consultation requirement also applies to the adoption or substantial amendments of specific plans (defined in Government Code Section 65450 et seq.). (See LCI, *Tribal Consultation Guidelines*, p. 3 [2005]). The intent of SB 18 is to provide California Native American tribes an opportunity to participate in local land use decisions at an early planning stage, for the purpose of protecting, or mitigating impacts to, cultural places. The consultation and notice requirements apply to adoption and amendment of both

general plans (defined in Government Code Section 65300 et seq.) and specific plans (defined in Government Code Section 65450 et seq.). The proposed project includes a General Plan Amendment and, thus, is subject to SB 18 consultation requirements.

Public Resources Code Section 5024.1(c)

According to PRC Section 5024.1(c), a resource may be listed as a historical resource in the California Register of Historical Resources if the resource meets any of the following NRHP criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
(2) Is associated with the lives of persons important in our past.
(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
(4) Has yielded, or may be likely to yield, information important in prehistory or history.

Local Regulations

The following are the local government's environmental policies that are intended to protect tribal cultural resources by mitigating the potential impacts of new development in areas containing important tribal cultural resources.

Placer County General Plan

The PCGP policies relating to the protection of tribal cultural resources that are applicable to the proposed project are presented below.

Recreation and Cultural Resources

Goal 5.D To identify, protect, and enhance Placer County's important historical, archeological, paleontological, and cultural sites and their contributing environment.

Policy 5.D.3 The County shall solicit the views of the Native American Heritage Commission, State Office of Historic Preservation, North Central Information Center, and/or the local Native American community in cases where development may result in disturbance to sites containing evidence of Native American activity and/or to sites of cultural importance.

Policy 5.D.7 The County shall require that discretionary development projects are designed to avoid potential impacts to significant paleontological or cultural resources whenever possible. Unavoidable impacts, whenever possible, shall be reduced to a less than significant level and/or shall be mitigated by extracting maximum recoverable data. Determinations of impacts, significance, and mitigation shall be made by qualified archaeological (in consultation with recognized local Native American groups), historical, or paleontological consultants, depending on the type of resource in question.

17.4 IMPACTS AND MITIGATION MEASURES

The following section describes the standards of significance and methodology used to analyze and determine the proposed project's potential impacts related to tribal cultural resources. In addition, a discussion of the project's impacts, as well as mitigation measures where necessary, is also presented.

Standards of Significance

Consistent with PRC Section 21084.2, Appendix G of the CEQA Guidelines, and Placer County's Environmental Checklist, an impact related to tribal cultural resources is considered significant if the proposed project would:

- Cause a substantial adverse change in the significance of a tribal cultural resource, defined in PRC Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:
    - Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in PRC Section 5020.1(k); or
    - A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of PRC Section 5024.1. In applying the criteria set forth in subdivision (c) of PRC Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Method of Analysis

The impact analysis contained in this chapter is primarily based on a SLF search conducted by the NAHC and Native American consultation pursuant to AB 52 and SB 18, as well as a Cultural and Paleontological Resources Assessment prepared by Natural Investigations Company. The Cultural and Paleontological Resources Assessment addresses the project area, which included the project site and the off-site sewer lift station improvements area, but did not include the off-site affordable housing parcel, which has been subject to environmental review as part of the County's review and approval of the RVSP. The methods of analysis are described in further detail below.

Native American Tribal Consultation

Pursuant to AB 52 and SB 18, on January 22, 2025, Placer County sent invitations to consult to tribes who requested notification of proposed projects within this geographic area. Specifically, combined AB 52/SB 18 notification letters were sent to the Ione Band of Miwok Indians, the UAIC, the Washoe Tribe of Nevada and California, and the Colfax-Todds Valley Consolidated Tribe. In addition, SB 18 specific notification letters were sent to the Shingle Springs Band of Miwok Indians, T'Si-Akim Maidu, and Wilton Rancheria. A response was received from the UAIC on February 4, 2025. Following a site visit, the UAIC provided a sensitivity map to the County showing where they would like to monitor during on-site construction. This monitoring requirement has been incorporated into this chapter as mitigation.

On May 7, 2026, Placer County re-opened AB 52 and SB 18 consultation by sending follow-up invitations to consult to the same tribes to address the off-site sewer lift station and off-site affordable housing parcel. A response was received from the UAIC on May 15, 2026. Following a site visit of the off-site sewer lift station location, the Tribe provided supplemental mitigation

measures specific to the off-site location. These measures have been incorporated into this chapter as mitigation. The Tribe did not request to survey the off-site affordable housing parcel within the RVSP, nor did the Tribe request any site-specific mitigation associated with the parcel.

As noted previously, Natural Investigations Company contacted the California NAHC to request a search of the SLF for the traditional cultural resources within or near the project site and off-site sewer lift station improvements area. The SLF is populated by members of the Native American community who have knowledge about the locations of tribal cultural resources. The results of the SLF search, dated January 14, 2025, were negative, which indicates that known Native American cultural resources do not exist within or near the project site and off-site sewer lift station improvements area.

Cultural Resources Study

Preparation of the Cultural and Paleontological Resources Assessment included a cultural resources records search, consultation with NAHC, paleontological resource analysis, and intensive pedestrian survey of the project site and off-site sewer lift station improvements area. As noted above, the Cultural and Paleontological Resources Assessment addresses the project area, which included the project site and the off-site sewer lift station improvements area, but did not include the off-site affordable housing parcel.

Records Search Methods

Cultural resource literature searches of the project area were completed at the North Central Information Center (NCIC) of the California Historical Resources Information System (CHRIS) at California State University, Sacramento, on February 8, 2025 for the project site and on June 16, 2025 for the off-site sewer lift station improvements area. The record searches were conducted to determine the extent of previous surveys within a 0.25-mile radius of the project site and off-site sewer lift station improvements area, and whether previously documented pre-contact or historic archaeological sites, architectural resources, or traditional cultural properties exist within the project area. In addition to the official records and maps for archaeological sites and surveys in Placer County, Natural Investigations Company reviewed several historic references and other cultural archival sources, which are detailed in Chapter 8, Cultural Resources, of this EIR.

Field Survey Methods

Natural Investigations Company conducted an intensive pedestrian survey of the project site on January 1, 2025. Natural Investigations Company also conducted an intensive pedestrian survey of the off-site sewer lift station improvements area on June 16, 2025. All portions of the project areas were surveyed intensively using transects spaced at 15 meters apart or less. During the pedestrian survey, all visible ground surface within the project area was carefully examined for cultural material (e.g., flaked stone tools, toolmaking debris, stone milling tools, or fire-affected rock), soil discoloration that might indicate the presence of a cultural midden, soil depressions and features indicative of the former presence of structures or buildings (e.g., postholes, foundations), or historic-era debris (e.g., metal, glass, ceramics). Ground disturbances (e.g., animal burrows, drainages, dirt roads, etc.) were visually inspected. A digital camera was used to take photographs of the project areas, a Munsell® Soil Color Chart was used to record soil color, and a handheld BE-3300-GPS global positioning system (GPS) unit with sub-meter accuracy was used to record locational data. As discussed above, Natural Investigations Company attempted to identify the location of P-31-000203 during the field survey of the off-site sewer lift station improvements area. However, the presence of P-31-000203 was not identified and the location of the resource therefore could not be confirmed.

Project-Specific Impacts and Mitigation Measures

The following discussion of impacts is based on implementation of the proposed project and off-site sewer lift station improvements, as well as the two affordable housing options analyzed throughout this EIR, in comparison with the standards of significance identified above. In most cases, potential environmental impacts associated with the proposed project and the potential 22 on-site ADUs would not differ. Thus, unless otherwise noted, the below analysis applies to both the proposed project and the on-site ADUs.

17-1 Cause a substantial adverse change in the significance of a tribal cultural resource, defined in PRC Section 21074. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could cause a substantial adverse change in the significance of a tribal cultural resource, as defined in PRC Section 21074.

According to PRC Section 21074, tribal cultural resources are sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe, or are resources determined by the lead agency to be significant pursuant to criteria set forth in Section 5024.1, subdivision (c). The criteria set forth in PRC Section 5024.1, subdivision (c), includes resources that are associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage, resources associated with the lives of historically important persons, resources that embody the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values, or resources that have yielded, or may be likely to yield, information important in precontact history or history. Potential impacts to tribal cultural resources associated with the proposed project, off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel are discussed below.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to cause a substantial adverse change in the significance of a tribal cultural resource, as defined in PRC Section 21074, would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

As noted previously, records searches of the NAHC SLF failed to indicate the presence of tribal cultural resources within or near the project site or the proposed off-site sewer lift station improvements area. However, based on a records search of the CHRIS, one small precontact-era occupation site, P-31-000203, has been previously recorded directly adjacent to the off-site sewer lift station improvements area. Natural Investigations Company conducted an intensive pedestrian survey of the entire mapped location of P-31-000203 to determine the presence or absence of cultural materials. The intensive pedestrian survey did not indicate the presence of P-31-000203 and the location of the resource therefore could not be confirmed.

While known tribal cultural resources have not been recorded within the project site, and the previously recorded site (P-31-000203) adjacent to the off-site sewer lift station improvements area was not located during the field survey conducted for the Cultural and Paleontological Resources Assessment, the Cultural and Paleontological Resources Assessment determined that the soil formations in the project area date back to periods of known human occupation. In addition, a tributary of Dry Creek runs through the project site, and the off-site sewer lift station improvements area is located immediately south of Dry Creek. Because the project area is located in lands historically occupied by the Nisenan, and the Nisenan established villages along main watercourses in their territories, the proximity of the project site and off-site sewer lift station improvements area to Dry Creek indicate the potential presence of tribal cultural resources. Therefore, the project site and off-site sewer lift station improvements area have the potential to contain buried resources, and previously undiscovered tribal cultural resources could potentially occur within areas where construction is proposed as part of the proposed project.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel was not included in the NAHC SLF search or CHRIS search conducted as a part of the Cultural and Paleontological Resources Assessment. As such, the parcel was not evaluated for the presence of tribal cultural resources. However, the off-site affordable housing parcel is located within the RVSP. Pursuant to the RVSP EIR, a NAHC SLF search was conducted for the RVSP area that did not indicate the presence of recorded tribal cultural resources. In addition, while the construction of the proposed affordable units does not include any site-specific development plans, designs, or proposals at this time, potential future development of the off-site parcel would be subject to County review and compliance with the applicable requirements described in the PCGP and RVSP. It is worth noting that the County offered supplemental AB 52 and SB 18 consultation for the off-site affordable housing parcel at the same time as the offer to consult for the off-site sewer lift station improvements area. While the UAIC requested a site visit and ultimately site-specific mitigation measures for the off-site sewer lift station location, the Tribe did not request a site visit nor any additional mitigation for the off-site affordable housing parcel.

Therefore, at such time the off-site affordable housing parcel gets developed, the future developer would be required to comply with PCGP policies related to tribal cultural resources, including Policy 5.D.3, which requires contact with the NAHC and the local Native American community where development may result in disturbance to sites containing evidence of Native American activity and/or sites of cultural importance. Compliance with PCGP Policy 5.D.7 would also be required, requiring that development projects be designed to avoid potential impacts to significant paleontological or cultural resources, include mitigation where applicable, and initiate consultation with a qualified consultant. Additionally, the off-site affordable housing parcel would be required to comply with Mitigation Measures 7-1b, 7-1c, and 7-2a of the RVSP EIR, which require compliance with recommendations of a qualified archaeologist if cultural resources are exposed during construction, subsurface testing, and data recovery excavation, as applicable to the site.

At such time the off-site affordable housing parcel gets developed, the future developer would be required to comply with the RVSP Mitigation Measures 7-1b, 7-1c, and 7-2a, in order to reduce potential impacts to tribal cultural resources to a less-than-significant level.

Conclusion

Based on the above, without inclusion of appropriate measures reflecting tribal consultation carried out by the County with the UAIC to account for unanticipated discoveries of potential subsurface tribal cultural resources as well as the sensitive Dry Creek Corridor, and the mitigation measures required by the RVSP EIR for the off-site affordable housing parcel, the proposed project could cause a substantial adverse change in the significance of a tribal cultural resource, as defined in PRC Section 21074, during project construction, and a ***significant*** impact could occur. The referenced RVSP mitigation measures are incorporated into this EIR as Mitigation Measures 8-2(d), 8-2(e), and 8-3(d), as shown below.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level.

Project Site and Off-Site Sewer Lift Station Improvements Area

17-1(a) *The following language shall be noted on project Improvement Plans, subject to review and approval by the Placer County Community Development Resource Agency:*

If any suspected Tribal Cultural Resources (TCRs) or resources of cultural significance to the UAIC, including, but not limited to, features, anthropogenic/cultural soils, cultural belongings or objects (artifacts), shell, bone, shaped stones or bone, or ash/charcoal deposits are discovered by any person during construction activities, including ground disturbing activities, all work shall pause immediately within 100 feet of the find, or an agreed upon distance based on the project area and nature of the find. Work shall cease in and within the immediate vicinity of the find regardless of whether the construction is being actively monitored by a Tribal Monitor, cultural resources specialist, or professional archaeologist.

A Tribal Representative and the Placer County Community Development Resource Agency shall be immediately notified, and the Tribal Representative, in coordination with the Placer County Community Development Resource Agency, shall determine if the find is a TCR (PRC Section 21074) and the Tribal Representative shall make recommendations for further evaluation and treatment as necessary.

<u>Treatment and Documentation:</u>

The culturally affiliated Tribe shall consult with the Placer County Community Development Resource Agency to (1) identify the boundaries of the new TCR and (2) if feasible, identify appropriate preservation in place and avoidance measures, including redesign or adjustments to the existing construction process, and long-term management, or 3) if avoidance is infeasible, identify a reburial location in proximity of the find where no future disturbance is anticipated. Permanent curation of TCRs shall not take place unless approved in writing by the culturally affiliated Tribe.

The construction contractor(s) shall provide secure, on-site storage for culturally sensitive soils or objects that are components of TCRs that are found or recovered during construction. Only Tribal Representatives shall have access to the storage. Storage size shall be determined by the nature of the TCR and can range from a small lock box to a conex box (shipping container). A secure (locked), fenced area can also provide adequate on-site storage if larger amounts of material must be stored.

The construction contractor(s) and Placer County shall facilitate the respectful reburial of the culturally sensitive soils or objects. This includes providing a reburial location that is consistent with the Tribe's preferences, excavation of the reburial location, and assisting with the reburial, upon request.

Any discoveries shall be documented on a Department of Parks and Recreation (DPR) 523 form within two weeks of the discovery and submitted to the appropriate CHRIS center in a timely manner. The DPR 523 forms shall be completed and submitted to the CHRIS center by the project archaeologist. If the project does not require an archaeologist, the DPR forms shall be completed and submitted to the CHRIS by the UAIC. If completed by the project archaeologist, the UAIC shall have an opportunity to review the completed forms.

Work at the TCR discovery location shall not resume until authorization is granted by Placer County in coordination with the culturally affiliated Tribe.

If articulated or disarticulated human remains, or human remains in any state of decomposition or skeletal completeness, are discovered during construction activities, the Placer County Coroner and the culturally affiliated Tribe shall be contacted immediately. Upon determination by the Placer County Coroner that the find is Native American in origin, the Native American Heritage Commission will assign the Most Likely Descendent who will work with the project proponent to define appropriate treatment and disposition of the burials.

17-1(b) *The following language shall be noted on project Improvement Plans, subject to review and approval by the Placer County Community Development Resource Agency:*

The project proponent or their construction contractor shall comply with the following measure to assist with identification of TCRs at the earliest possible time during project-related earthmoving activities:

- *The project proponent shall contact the UAIC Tribal Historic Preservation Officer (THPO) (thpo@auburnrancheria.com) at least two months prior to project ground-disturbing activities to retain the services of a UAIC Certified Tribal Monitor(s). The duration of the construction schedule and Tribal Monitoring shall be determined at this time.*

- *A contracted Tribal Monitor(s) shall monitor all ground disturbing activities (e.g., vegetation removal, grading, and/or other ground disturbing activities; note: fill activities are excluded from this requirement) in the mapped area and 50' buffer provided by the UAIC to the County on June 26, 2025 (confidential map provided to the County and subsequently to the applicant). All ground-disturbing activities in the mapped area provided by the UAIC to the County on June 26, 2025, shall be subject to Tribal Monitoring unless otherwise determined unnecessary by the UAIC.*
- *Specific to the off-site sewer lift station location, a contracted Tribal Monitor(s) shall monitor initial clearing and grubbing for the entire footprint of disturbance.*
- *Tribal Monitors or Tribal Representatives shall have the authority to direct that work be temporarily paused, diverted, or slowed within 100 feet of the immediate impact area if sites, cultural soils, or objects of potential significance are identified. The temporary pause/diversion shall be of an adequate duration for the Tribal Representative to examine the resource.*
- *Appropriate treatment of TCRs may include, but is not limited to:*

    A. *Recordation of the resource(s);*
    B. *Avoidance and preservation of the resource(s); and/or*
    C. *Recovery and reburial of the resource(s) onsite or in a feasible off-site location in a designated area subject to no future disturbance. The location of the reburial shall be acceptable to the UAIC.*

- *To track the implementation of this measure, the Tribal Monitor(s) shall document field-monitoring activities on a Tribal Monitor log.*
- *The Tribal Monitor(s) shall wear the appropriate safety equipment while on the construction site.*
- *The Tribal Monitor, in consultation with the UAIC THPO and the project proponent, shall determine a mutual end or reduction to the on-site monitoring if/when construction activities have a low potential for impacting TCRs.*
- *In the event the Tribal Monitor does not report to the job site at the scheduled time after receiving 24 hour business day notice, construction activities may proceed without tribal monitoring. At no time, regardless of the presence or absence of a Tribal Monitor, shall suspected TCRs be mishandled or disrespected.*
- *The County shall assist with resolution of disagreements between the project proponent/contractor and the Tribe if such occurs on the project.*

17-1(c) *The following language shall be noted on Improvement Plans, subject to review and approval by the Placer County Community Development Resource Agency:*

- *The Applicant/Contractor shall provide a Tribal Cultural Awareness and Sensitivity Training (training) for all personnel involved in project construction, including field consultants and construction workers, at their own expense. The training shall be developed in coordination with interested Native American Tribes.*
- *The training shall be conducted before any project-related construction activities begin at the project site. The training will include relevant information regarding sensitive cultural resources and tribal cultural resources, including applicable regulations, protocols for avoidance, and consequences of violating State laws and regulations. The training will also describe appropriate avoidance and impact minimization measures for cultural resources and tribal cultural resources that could be located at the project site and will outline what to do and who to contact if any potential cultural resources or tribal cultural resources are encountered. The training will emphasize the requirement for confidentiality and culturally appropriate treatment of any discovery of significance to Native Americans and will discuss appropriate behaviors and responsive actions, consistent with Native American tribal values. The training may be done in coordination with the project archaeologist.*
- *All ground-disturbing equipment operators shall be required to receive the training and sign a form that acknowledges receipt of the training.*

Off-Site Affordable Housing Parcel

17-1(d) Implement the following Mitigation Measure set forth in this EIR:

- *<u>8-2(d)</u> Implement RVSP EIR Mitigation Measure 7-1b if culturally significant materials are discovered during construction:*

  A qualified professional archaeologist shall be retained to conduct subsurface testing at potentially important known archaeological sites. As it has not been determined if the known sites within the Specific Plan Area are eligible for inclusion to either the NRHP or CRHR, subsurface testing (i.e., resource evaluation) should be initiated for sites when construction is to occur within 100 feet of the resource and where Mitigation Measure 7-1a [incorporated as Mitigation Measure 8-2(c) of this EIR] proves infeasible. Subsurface testing should also be implemented if culturally significant materials (i.e., unique archaeological resources or historical resources) are inadvertently exposed during construction.

  Subsurface testing procedures could involve shovel testing, augering, or other such techniques designed to identify and/or characterize subsurface archaeological deposits. If a resource is determined to be important under CEQA (i.e., because it is a unique archaeological resource or an historical resource), then Mitigation Measure 7-1c [incorporated as Mitigation Measure 8-2(e) of this EIR] must also be implemented.

17-1(e) *Implement the following Mitigation Measure set forth in this EIR:*

- *<u>8-2(e)</u> Implement RVSP EIR Mitigation Measure 7-1c if culturally significant materials are discovered during construction:*

  A qualified professional archaeologist shall be retained to conduct data recovery excavation. This mitigation measure will be implemented as an alternative to Mitigation Measures 7-1a [incorporated as Mitigation Measure 8-2(c) of this EIR] at cultural resource sites determined to be eligible for inclusion in either the NRHP or CRHR.

  In compliance with CEQA, implementation of this mitigation measure would entail preparation and adoption of a data recovery plan that makes provisions for adequately recovering the scientifically consequential information from and about the resource. The data recovery plan must be prepared and adopted prior to commencing any excavation activities.

17-1(f) *Implement the following Mitigation Measure set forth in this EIR if significant archaeological materials are discovered during construction:*

- *<u>8-3(d)</u> Implement RVSP EIR Mitigation Measure 7-2a:*

  In the event of the discovery of buried archaeological artifacts, exotic rock (non-native), or unusual amounts of shell or bone, it is recommended that project activities in the vicinity of the find be immediately stopped and a qualified professional archaeologist consulted to assess the resource and provide proper management recommendations. If the find is determined to be a historical or unique archaeological resource, contingency funding and a time allotment to allow for implementation of avoidance measures or appropriate mitigation shall be made available, as provided in Section 15064.5 of the CEQA Guidelines. In addition, the Placer County Planning Department and Department of Museums must also be contacted. Work in the area may only proceed after authorization is granted by the Placer County Planning Department. All construction and improvement plans for subsequent development within the Plan Area involving ground disturbance shall include these provisions. The archaeologist shall evaluate any potential effects on any historical resource or unique archaeological resource, and where such effects would be significant, shall recommend potential mitigation to the County for its consideration. The County will assess the feasibility of any proposed mitigation (e.g., avoidance of the historical resource) and impose the mitigation where feasible in light of factors such as the nature of the find, project design, costs, Specific Plan policies and land use assumptions, and other considerations. If avoidance is unnecessary or infeasible, other appropriate measures (e.g., data recovery) shall be instituted. Work may proceed on other parts of

the project site while mitigation for paleontological resources is carried out.

Cumulative Impacts and Mitigation Measures

As defined in Section 15355 of the CEQA Guidelines, "cumulative impacts" refers to two or more individual effects which, when considered together, are considerable, compound, or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects.

17-2 Cause a cumulative loss of tribal cultural resources. Based on the analysis below, the cumulative impact is *less than significant*.

Generally, while some tribal cultural resources may have regional significance, the resources themselves are site-specific, and impacts to them are project-specific. For example, impacts to a subsurface tribal cultural resource at one project site would not generally be made worse by impacts to a tribal cultural resource at another site due to development of another project. Rather, the resources and the effects upon them are generally independent. A possible exception to the aforementioned general conditions would be where a tribal cultural resource represents the last known example of its kind or is part of a larger resource site. For such a resource, cumulative impacts, and the contribution of a project to them, may be considered cumulatively significant.

As described above, known tribal cultural resources do not exist within the project site or off-site sewer lift station improvements area. While the potential exists for tribal cultural resources to be present on the off-site affordable housing parcel, potential future development of the off-site affordable housing parcel would be subject to County review and compliance with the applicable requirements described in the PCGP, RVSP, and the DCWPCP aimed at reducing potential impacts to tribal cultural resources. Furthermore, implementation of the project-specific mitigation measures set forth in this EIR (Mitigation Measures 17-1[a] through 17-1[c]) would ensure that any impacts to previously unknown, subsurface resources that are discovered either on the project site or within the off-site sewer lift station improvements area or off-site affordable housing parcel during construction activities are reduced to less than significant.

Similar to the proposed project, future development projects within the DCWPCP would be required to consult with tribes culturally and traditionally affiliated with the project area to implement project-specific mitigation to ensure any potential impacts to identified tribal cultural resources are reduced to a less-than-significant level, where possible. Therefore, given that tribal cultural resource impacts are generally site-specific and each future project within the DCWPCP would be required to mitigate such impacts, any potential impacts associated with cumulative buildout of the DCWPCP area would not combine to result in a significant cumulative impact.

Based on the above, the potential for impacts related to a cumulative loss of tribal cultural resources, to which implementation of the proposed project might contribute, is ***less than significant.***

Mitigation Measure(s)

None required.

18. Wildfire

18. WILDFIRE

18.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County for an approximately four-acre parcel off-site within the Riolo Vineyards Specific Plan (RVSP) which could develop a maximum of 120 affordable income-restricted units.

The Wildfire chapter of the EIR summarizes the setting information and identifies wildfire potential within the project area based on State and local mapping. The chapter also includes a review of completed, active, and planned fuel treatment projects within the region and consideration of site-specific factors that could affect wildfire potential at the project site. The information contained in the analysis is primarily based on the Placer County General Plan (PCGP),[1] the PCGP EIR,[2] and the Dry Creek-West Placer Community Plan (DCWPCP).[3]

18.2 EXISTING ENVIRONMENTAL SETTING

The following section describes the existing wildfire setting in the project region, including the existing fire types, wildland fire hazards, fuel treatment efforts, public safety power shutoffs (PSPS), and fire protection agencies and resources in the project region.

Fire Types

The following sections describe the three fire types to which various areas of Placer County are at risk of experiencing.

Wildfires

Wildfires occur on mountains, hillsides, and grasslands. Vegetation, wind, temperature, humidity, and slope are all factors that affect how wildfires spread. In Placer County, native vegetation, such as chaparral, sage, and grassland, provide fuel that allows wildfires to spread easily across large tracts of land. Such plant species are capable of regeneration after a fire, making periodic wildfires a natural part of the local ecology. Placer County is considered a rural/suburban County with wildfire as the most prevalent fire type. The climate of the Placer County region keeps the grass dry, which makes the region's grass more readily combustible during fire season. As discussed in further detail in the Topography and Vegetation subsection, steep slopes bring grass and brush within reach of upward-moving flames, while impeding the access of firefighting equipment. Seasonal drought conditions exacerbate fire hazards.

2 Placer County. *Countywide General Plan EIR*. July 1994.
3 Placer County. *Dry Creek-West Placer Community Plan*. Amended May 12, 2009.

Wildland-Urban Interface Fires

The wildland-urban interface (WUI) zone is an area where buildings and infrastructure (e.g., cell towers, schools, water supply facilities) mix with areas of wildland vegetation susceptible to ignition due to several factors, including topographical features, vegetation fuel types, local weather conditions, and prevailing winds. The interface is sometimes divided into the defense zone (areas near communities, usually about 0.25-mile thick) and threat zones (an approximately 1.25-mile buffer around the defense zone). Wildfires and urban interface fires have occurred within Placer County, especially in the Sierra Nevada region where a majority of parcels are within a Very High Fire Hazard Severity Zone (FHSZ).

In the WUI zone, efforts to prevent ignitions and limit wildfire losses hinge on hardening structures and creating defensible space through a multi-faceted approach, including engineering, enforcement, education, emergency response, and economic incentive. Different strategies in the defense and threat zones of the WUI help to limit the spread of fire and reduce risks to people and property. As discussed in further detail in the Wildfire Classifications subsection, wildfire threat within the County ranges from Moderate to Very High. The highest threat occurs in the Sierra Nevada, which is considered a Very High FHSZ, whereas the County's valley and foothill regions are considered Moderate and High FHSZs.

Structural Fires

Urban fires occur in developed environments, destroying buildings and other humanmade structures. Structural fires are often caused by faulty wiring or mechanical equipment or combustible construction materials, and are able to proliferate due to the absence of fire alarms and sprinkler systems. The fires have been due largely to human accidents, although deliberate fires (arson) may be a cause of some events. Older buildings that lack modern fire safety features may face greater risk of damage from fires. To minimize fire damage and loss, the County's Fire Code, which is based on the California Fire Code (CFC), sets standards for building and construction. The code requires the provision of adequate water supply for firefighting, fire retardant construction, and minimum street widths, among other things. Fire prevention awareness programs and fire drills are conducted to train residents to respond quickly and correctly to reduce injury and losses during fires.

Wildland Fire Hazards

The following section includes a discussion of the potential for wildland fires to occur in the project area and the agencies and resources available for wildland fire suppression.

Wildfire Classifications

With respect to wildland fires, previous significant WUI fires within the State have precipitated the passage of statutes necessitating the classification of wildland fire hazard areas, according to a location's potential for causing ignitions to buildings. Such classifications are referred to as FHSZs and provide the basis for application of various mitigation strategies to reduce risks to buildings associated with wildland fires. The zones also relate to the requirements for building codes designed to reduce the ignition potential to buildings in the WUI zones.

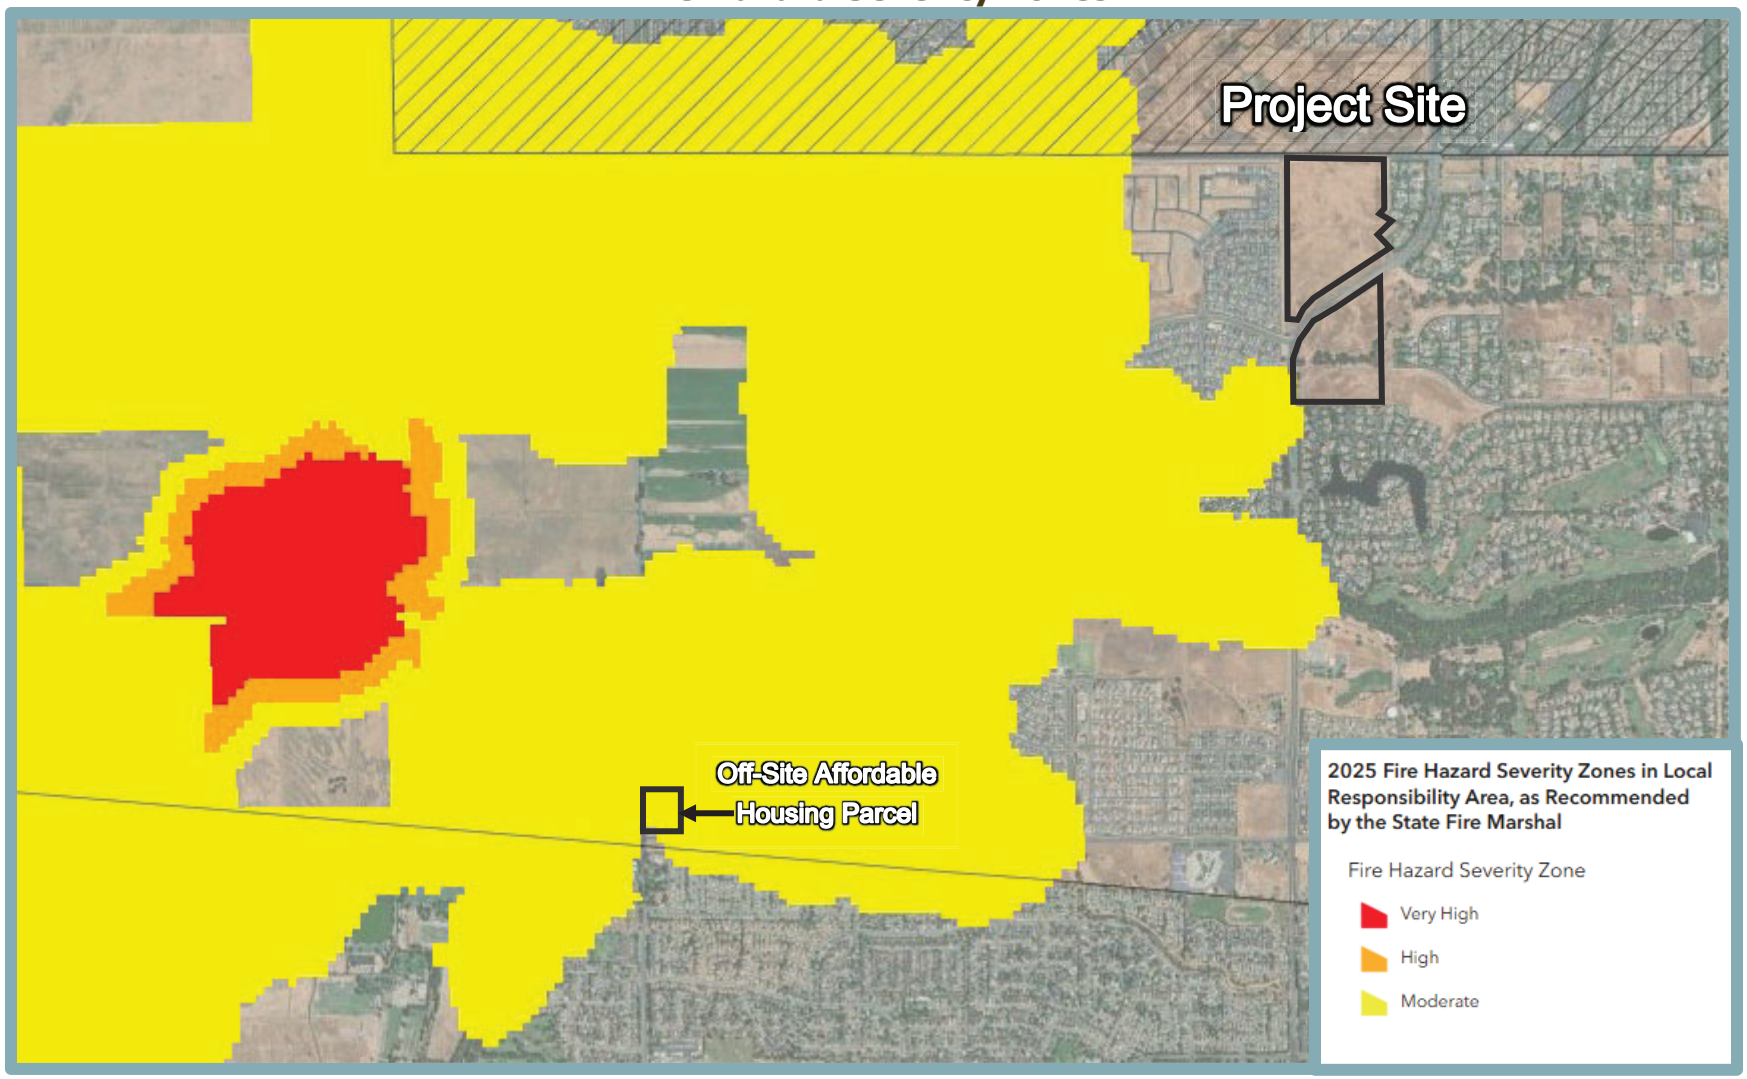
Pursuant to Government Code Section 51178, Very High FHSZs are determined by the Director of Forestry and Fire Protection, based on consistent statewide criteria and the severity of fire hazard that is expected to prevail in such areas. Very high FHSZs are based on fuel loading, slope, fire weather, and other relevant factors, including areas where Santa Ana, Mono, and Diablo winds have been identified by the California Department of Forestry and Fire Protection

(CAL FIRE) as a major cause of wildfire spread. Public Resources Code (PRC) Sections 4201 through 4204 direct CAL FIRE to map fire hazards within State Responsibility Areas (SRAs), based on relevant factors such as fuels, terrain and weather. SRAs are recognized by the Board of Forestry and Fire Protection as areas where CAL FIRE is the primary emergency response agency responsible for fire suppression and prevention.

The project site is not located within a SRA, but, rather, is located within a Local Responsibility Area (LRA). As shown in Figure 18-1, the project site is not identified by CAL FIRE as being within a FHSZ area, although the southern portion of the site is located adjacent to a Moderate FHSZ. The off-site affordable housing parcel is not located within the WUI zone, but is located within a moderate FHSZ. Additionally, the project site is not located within a WUI zone (see Figure 18-2).

Topography and Vegetation

Topography, which includes slope and aspect, can play a significant role in wildfire risk. Fires burn faster uphill than downhill, due to fuels above a fire being brought into closer contact with upward moving flames. In addition, the process of heat transfer is influenced by topography, because heat rises (convection) and heat transfer through convection tends to move upward. Furthermore, during wildfires, burning materials on the forest floor also create convection currents that preheat the leaves and branches of shrubs and trees above the fire. Heat transfer, therefore, occurs more rapidly through fuels up a slope, resulting in fire traveling more quickly upslope than downslope.



Vertical air currents can also lift burning materials, as floating embers, known as firebrands, can settle in unburned areas ahead of a fire, starting smaller fires. The phenomenon is called spotting and could result in rapid advancement of a fire.

With respect to the project region's topography and vegetation, the region's elevation and topography is varied, due to the presence of upland areas and floodplains, but overall, the DCWPCP area does not contain steep slopes or significant slopes, such as those in steep-walled canyons or mountainous valleys. The absence of steep and significant slopes limits wildfire risks related to topography in the project region.

While the project site and off-site affordable housing parcel are undeveloped, many portions of the DCWPCP area are currently developed with a variety of scattered single-family homes and residential subdivisions. The DCWPCP area is an urbanizing area, which encompasses approximately 9,200 acres in the southwest portion of Placer County and is comprised of multiple specific plan areas, including the RVSP and the Placer Vineyards Specific Plan (PVSP). As part of the PVSP, 1,285 residential units associated with Property 1A are currently under construction west of the project site, across Walerga Road. In addition, the Baseline Marketplace is under construction to the north. Completion of the foregoing development would remove available fuel sources from the area, primarily those consisting of grassland.

Other existing development is located in the project vicinity, which further reduces the available fuel sources near the project site. Single-family residences associated with the Sun Valley Oaks residential neighborhood are located to the east, and single-family residences associated with the Morgan Creek residential neighborhood are located to the south.

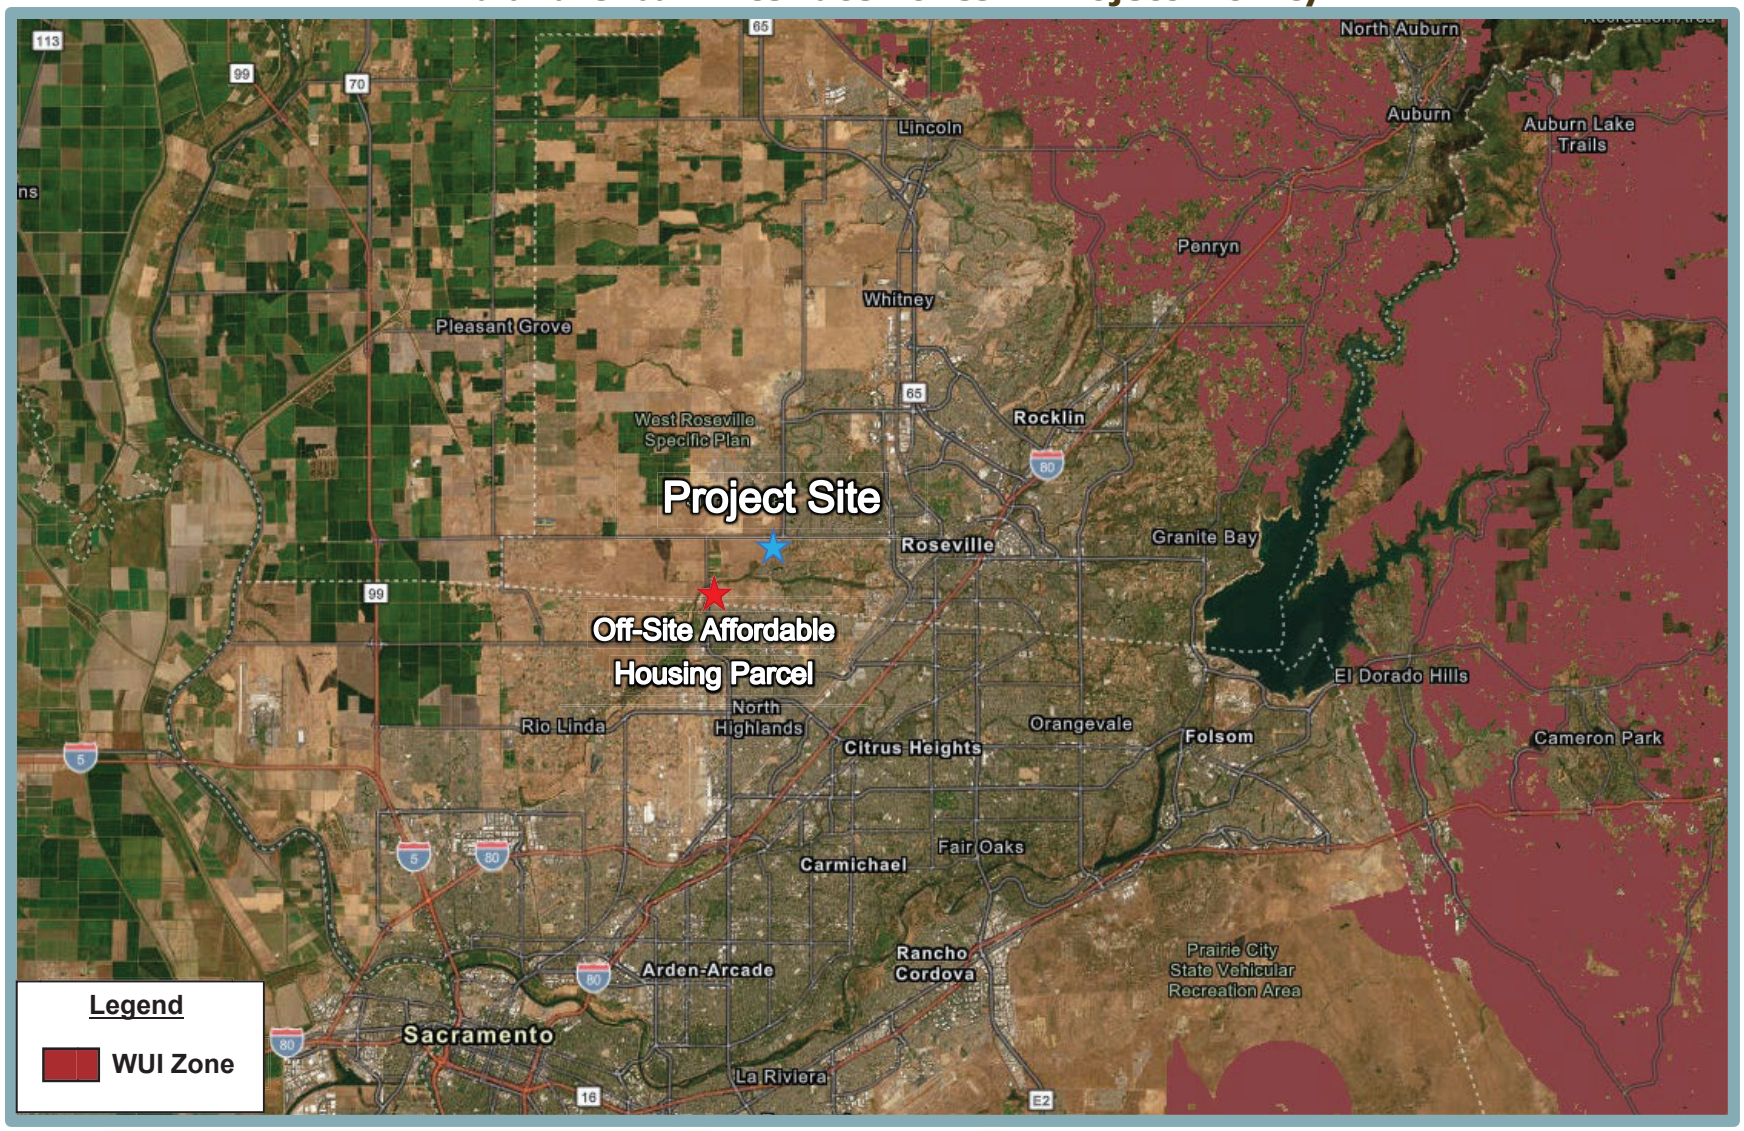


Figure 18-1
Fire Hazard Severity Zones

* Figure not OCR Compatible

Figure 18-2
Wildland-Urban Interface Zones in Project Vicinity

* Figure not OCR Compatible

With respect to the project site, the northern portion is undeveloped, consists of non-native annual grassland with gently rolling topography, and is interspersed with seasonal wetlands and vernal pools. The southern portion of the site also includes undeveloped annual grassland with gently rolling topography, interspersed with seasonal wetlands and vernal pools, and is bisected by a paved bicycle trail and Placer Creek, which flows east to west. The existing on-site vegetation provides potential fuel for wildfire. However, given the gently rolling terrain across the project site, slope would not affect on-site fire behavior, as compared to mountainous areas associated with the Sierra Nevada in the County's northeastern region. In addition, areas to the east of the project site contain tributaries to Dry Creek, which would provide potential fuel sources for wildfire.

The off-site affordable housing parcel is currently undeveloped and contains open grassy fields disturbed through regular maintenance. Similar to the project site, the existing on-site vegetation provides potential fuel for wildfire, but the gently rolling terrain would ensure that slope would not affect on-site fire behavior as compared to mountainous areas within the County.

Prevailing Winds

The predominant wind direction at the project site and off-site affordable housing parcel is from the south throughout the year.[4] Southerly winds are most dominant from May to September. The southerly direction of prevailing winds suggests that, during the majority of the year, winds would generally facilitate the spread of fire towards the north of the project site, towards Baseline Road, and towards the north of the off-site affordable housing parcel, towards the existing cemetery.

Large Fire History

According to CAL FIRE, relatively few larger wildfires, defined as 10 acres or greater, have occurred within the project region over the past four years.[5] Wildfire incidents were not recorded by CAL FIRE within Placer County in 2023.

- In September 2025, the Porter Fire burned 10 acres in Placer County, at the intersection of Porter Road and Karchner Road, approximately 18.15 miles north of the project site. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In September 2025, the Sierra Fire burned 44 acres in Placer County, at the intersection of Sierra College Boulevard and English Colony Way, approximately 10.86 miles northeast of the project site. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In August 2025, the Ranch Fire burned 140 acres in Placer County along State Route (SR) 65, just north of the community of Whitney and 6.88 miles northeast of the project site. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In July 2025, the Stardust Fire burned 12 acres in Placer County, along Stardust Lane within the City of Lincoln, approximately 10.91 miles northeast of the project site. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In July 2025, the Moore Fire burned 20 acres in Placer County, at the intersection of Moore Road and Nelson Lane in the City of Lincoln, approximately 8.67 miles north of the project site. Damages to structures or injuries to fire personnel and/or civilians were not reported.

[4] Weather Spark. *Climate and Average Weather Year Round in Roseville*. Available at: https://weatherspark.com/y/1156/Average-Weather-in-Roseville-California-United-States-Year-Round. Accessed September 2025.

[5] California Department of Forestry and Fire Protection. *Incidents Overview*. Available at: https://www.fire.ca.gov/incidents/. Accessed July 2025.

- In June 2025, the Riosa Fire burned 49 acres in Placer County, at Sheridan Lincoln Boulevard just south of the community of Sheridan. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In May 2025, the Sunset Fire burned 65 acres in Placer County, at the intersection of Sunset Boulevard and Fiddyment Road, approximately 5.09 miles north of the project site. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In May 2025, the Catlett Fire burned 175 acres in Placer County, along East Catlett Road approximately 6.93 miles northwest of the project site. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In August 2024, the Far Fire burned 12 acres in Placer County along Camp Far West Road and McCourtney Road, northwest of the community of Sheridan. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In July 2024, the Athens Fire burned 260 acres in Placer County surrounding the area of Athens Avenue and Fiddyment Road, approximately 6.06 miles north of the project site. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In July 2024, the Royal Fire burned 215 acres in Placer County near Soda Springs Road. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In July 2024, the Watt Fire burned 23 acres in Placer County near the intersection of Watt Avenue and Dyer Lane, approximately 1.60 miles to the west of the project site. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In June 2024, the Amoruso Fire burned 502 acres in Placer County at the intersection of Amoruso Way and Sunset Boulevard West, approximately 5.23 miles north of the project site and generally located east of the community of Pleasant Grove. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In June 2024, the PFE Fire burned 15 acres in Placer County at the intersection of PFE Road and Watt Avenue, located approximately 1.81 miles southwest of the project site and immediately adjacent to the off-site affordable housing parcel. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In May 2024, the Watt Fire burned 20 acres in Placer County at the intersection of PFE Road and Watt Avenue, located approximately 1.81 miles southwest of the project site and immediately adjacent to the off-site affordable housing parcel. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In May 2024, the Virginiatown Fire burned 95 acres immediately east of the community of Virginiatown in unincorporated Placer County. Updates and reports related to damages were not recorded.
- In September 2022, the Garden Fire burned 29 acres in Placer County, near the intersection of Garden Bar Road and Big Hill Road, northwest of the City of Auburn. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In September 2022, the Dutch Fire burned 48 acres in Placer County, north of Interstate 80 (I-80) and east of Ridge Road near the southern boundary of the community of Dutch Flat, which is located approximately 25 miles northeast of the City of Auburn. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In September 2022, the Hill Fire burned 11 acres in Placer County, on Iowa Hill Road approximately eight miles north of the community of Foresthill. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In September 2022, the Mosquito Fire burned 76,788 acres across El Dorado and Placer Counties at Mosquito Road and OxBow Reservoir east of the community of Foresthill, Placer County. According to the most recent incident update, a total of 78 structures were

destroyed and 13 were damaged. Injuries to fire personnel and/or civilians were not reported as part of the incident update.

- In August 2022, the Oak Fire burned 22 acres in Placer County west of I-80, along Live Oak Road near the unincorporated community of Weimar, which is located approximately 10 miles northeast of the City of Auburn. Damages to structures or injuries to fire personnel and/or civilians were not reported. This incident was separate from the 19,244-acre August 2022 wildfire in Mariposa County that shares the same name.
- In July 2022, a separate Riosa Fire burned 38 acres in Placer County, at the intersection of Riosa Road and Karchner Road, approximately three miles southeast of the City of Wheatland. Damages to structures or injuries to fire personnel and/or civilians were not reported.
- In July 2022, a separate Porter Fire burned 166 acres in Placer County, at the intersection of Porter Road and Camp Far West Road, approximately four miles east of the City of Wheatland. Damages to structures or injuries to fire personnel and/or civilians were not reported.

CAL FIRE strives to extinguish 95 percent of all wildland fires at 10 acres or less. Additional fires, beyond those listed above, have occurred within the project region over the past four years. The fires, for the most part, were extinguished within the above stated goal of under 10 acres.

Fuel Treatment Efforts

Fuel treatment efforts have been ongoing within the project region. Forest fuel treatments are used by managers for ecological restoration and reducing fire hazards. Due to past management decisions and long-term fire exclusion, forests are denser and are susceptible to severe wildfires. Fuel treatments aim to reduce the intensity and size of wildfires, increase species diversity, and restore forests to their historical condition. Two common types of treatments include:

- Mechanical thinning: cutting and clearing wood and brush; and
- Prescribed fire: burning existing fuel before more accumulates.

Based on proximity to homes and communities, one treatment may be used over the other. Several research studies show a combination of thinning, followed by burning of surface fuels, is most effective in promoting forest resilience to wildfire.[6]

Implementation of the Placer County Conservation Program (PCCP) would result in the permanent protection of approximately 50,000 acres in conservation reserves by the year 2060. Preservation of the protected lands requires that they are managed to reduce their susceptibility to wildfire. For example, each Reserve System unit would have a fire management component that would describe site-specific conditions and actions required to (1) reduce existing fuel loads, (2) re-introduce fire as a natural process of the ecosystem (if permissible), (3) minimize environmental effects and protect sensitive resources, and (4) enhance and/or restore natural community characteristics.

Current fuel reduction efforts (i.e., the Chipper Program) and new programs (i.e., the Biomass Box Program) would accomplish fuel reduction treatment efforts. The Placer County Resource Conservation District's (RCD) Chipper Program provides low-cost brush chipping for residents in

[6] For example, see U.S. Department of Agriculture/Forest Service, Rocky Mountain Research Station. *Review of Fuel Treatment Effectiveness in Forests and Rangelands and a Case Study from the 2007 Megafires in Central Idaho USA (General Technical Report RMRS-GTR-252)*. January 2011.

Placer County. The Chipper Program continues to be available for local residents seeking to reduce fire hazards and improve defensible space around buildings and structures. The Chipper Program is funded through grants secured through a partnership with the RCD, Placer County Office of Emergency Services (OES), the Placer County Sheriff's Office, the Placer County Air Pollution Control District, and CAL FIRE.[7]

The Placer County Wildfire Protection and Biomass Utilization Program (i.e., the Biomass Box Program) was established in 2006 to help protect residents, communities, forests, and important forest resources from the threat of wildfire and to efficiently manage and use biomass. Many wildfire protection activities and projects involve the cutting of trees and brush to reduce wildfire hazard. Trees large enough to have commercial value as lumber are transported to mills for processing, but brush, small trees, and the limbs and tops of larger trees are excess biomass that has most often been disposed of by open burning to complete the necessary reduction of fire hazard. Placer County has recognized that a better option is to use the excess biomass for generation of energy. As part of the thinning of forested areas, the excess brush, small trees, limbs, and tree tops are ground and then transported by way of haul trucks to a biomass power plant. Using excess biomass for generation of energy provides benefits through offsetting fossil fuel energy generation, reducing air pollution emissions, and increasing support for jobs associated with the biomass utilization. Use of biomass for energy also has potential to help support the economic sustainability of forest management and hazard reduction projects designed to reduce the negative effects of wildfires.[8]

Public Safety Power Shutoffs

In an effort to prevent fires, the electrical services provider for southern Placer County, Pacific Gas & Electric Co. (PG&E), initiated PSPS in 2019, which may continue in subsequent years until fire risks associated with power lines are decreased. PSPS events involve PG&E turning off electrical service during times when the weather is predicted to have a heightened fire risk from gusty winds and dry conditions. Dependent on the fire risks, the power outage events may occur in specific areas or for all PG&E customers across the County.

Similarly, the Sacramento Municipal Utility District (SMUD), a community-owned electric utility that serves Sacramento County and portions of Placer County, including the project site and off-site affordable housing parcel, maintains the option, if necessary, of shutting off power. SMUD has protocols for disabling automatic reclosers and for de-energizing lines to protect public safety and also has an Outage Communications Plan that addresses potential de-energization events. If power must be shutoff, SMUD will include targeted messaging for affected areas that will set expectations and identify support resources.

The California Public Utilities Commission (CPUC) adopted the High Fire-Threat District Map in 2018,[9] which serves to assist in the public's protection from potential fire hazards associated with overhead powerline facilities and nearby aerial communication facilities by delineating fire-threat areas in the State. Fire-threat areas are designated as Tier 1, 2, or 3, with Tier 1 defined as a High Hazard Zone, Tier 2 as an Elevated Hazard Zone, and Tier 3 as an Extreme Hazard Zone.

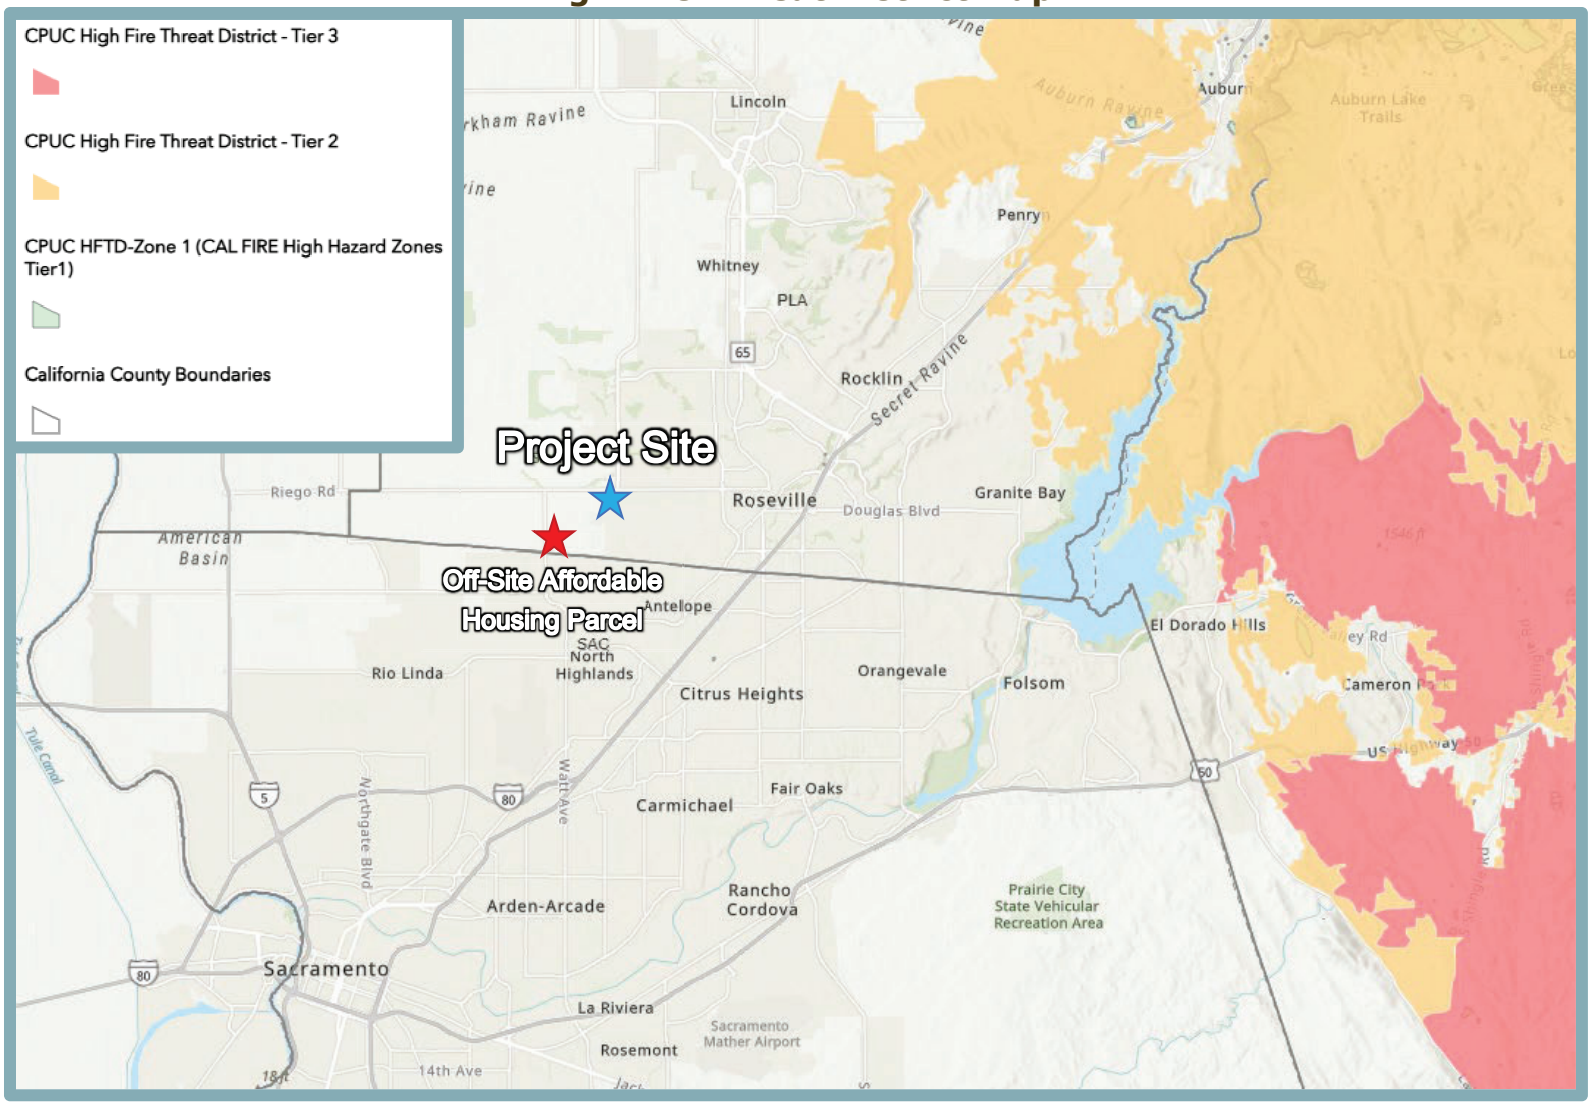
Neither the project site nor the off-site parcel is located within an area designated as Tier 1, 2, or 3 (see Figure 18-3). As such, the site would not be regularly subject to power-shutoff events by PG&E or SMUD. Throughout power-shutoff events, emergency services in Placer County remain functional with back-up power supplies, but many businesses and agencies are not operational, which could result in inadequate access to medical services and exposure to excessive heat or cold.

Fire Agencies and Resources

Several fire agencies provide fire protection services in the project region, including wildland fire and structural fire response. The Placer County Fire Department (PCFD), which has a Cooperative Fire Protection Agreement with CAL FIRE, provides wildland fire suppression at the project site. Both CAL FIRE and PCFD are discussed below.

California Department of Forestry and Fire Protection

Wildland fire protection is provided either by the State (through CAL FIRE) or the federal government (through the U.S. Forest Service). The State has direct protection responsibility for all State and private wildlands (or forest lands) in designated areas, and provides support and assistance to local jurisdictions in other areas of the State. CAL FIRE provides support and assistance to PCFD for wildland fire response at the project site and strives to meet the National Fire Protection Association (NFPA) 1710 guideline for fire department response time of five minutes 90 percent of the time.



The nearest CAL FIRE station to the project site and the off-site affordable housing parcel is Station No. 100, located at 8350 Cook Riolo Road, approximately 1.21 miles east of the project site and 3.10 miles northeast of the off-site affordable housing parcel. The CAL FIRE station is jointly operated with the PCFD and provides services to the unincorporated areas of Placer County. Station 100 is a full-time staffed station. The full-time firefighters are augmented by seasonal and volunteer firefighters that support the emergency response capabilities of CAL FIRE and PCFD. CAL FIRE has mutual and/or automatic aid agreements and, thus, may assist local fire agencies with structural fires and medical incidents under the closest resource concept. In addition, as is currently the case, incidents could occur where the City of Roseville Fire Department is called upon to provide mutual aid at or near the project area to send the closest available unit to an emergency incident, regardless of jurisdictional boundaries. In that spirit of cooperation to provide the fastest and highest level of service to the surrounding area, the Roseville Fire Department has signed onto a Closest Resource Agreement (CRA) with PCFD and other surrounding fire departments to provide mutual aid between all participating fire departments. As outlined in the CRA, Roseville can adjust the amount of reciprocal coverage by setting draw-down levels or withdraw from the CRA entirely.

Placer County Fire Department

The project site is located within the service territory of the PCFD, whose services are administered by the County OES. The territory served by the PCFD is consistent with the boundaries of County Service Area (CSA) 28, which is used as a means to fund PCFD services.

As previously discussed, because the project site and off-site affordable housing parcel are located within an LRA, the PCFD is responsible for providing wildland fire suppression services to the project site and off-site affordable housing parcel. In combination with CAL FIRE, the PCFD integrates State and local firefighting resources, which includes services rendered through eight full-time stations and seven volunteer fire stations.

Figure 18-3
High Fire-Threat District Map

Source: California Public Utilities Commission, CPUC High Fire Threat District (HFTD) Map, 2025.

* Figure not OCR Compatible

PCFD services include fire protection, rescue, and emergency response services for approximately 475 square miles of unincorporated area in Placer County. Fire prevention and protection in areas of Placer County not served by independent fire protection districts or municipal fire departments are provided through a partnership with CAL FIRE and seven volunteer companies, all operated by CAL FIRE under the name PCFD. Services provided include fire suppression, emergency medical, fire prevention, and rescue, among others. Additionally, PCFD, by way of its contract with CAL FIRE, conducts fire inspections and assists with land development functions within the PCFD service area. All fire agencies within Placer County operate under a mutual aid system, defined as a pre-arranged plan and contract between agencies for reciprocal assistance upon request by the first-response agency.

CAL FIRE is responsible for providing emergency services in Placer County and has stated their ability to serve future planned growth in the Dry Creek area and still maintain compliance with established safety response times. As is currently the case, incidents will occur where the City of Roseville (Roseville) Fire Department is called upon to provide mutual aid at or near the project area to send the closest available unit to an emergency incident, regardless of jurisdictional boundaries. In that spirit of cooperation to provide the fastest and highest level of service to the surrounding area, Roseville Fire Department has signed onto a Closest Resource Agreement (CRA) with PCFD and other surrounding fire departments to provide mutual aid between all participating fire departments. As outlined in the CRA, Roseville can adjust the amount of reciprocal coverage by setting draw-down levels, or withdraw from the CRA entirely. Timing and triggers for public service improvements occur when impacts associated with additional development exceeds established safety standards, which is not the case for the proposed project. As residential units are constructed and fire impact fees are collected, projects are required to pay their fair share towards existing and planned fire protection improvements, which will address the project's impacts to fire services for all safety providers and increase the County's ability to serve unincorporated areas, in addition to continuing to provide reciprocal aid to the City of Roseville and surrounding local governments.

Currently, CAL FIRE employs personnel that respond to PCFD calls for service, including permanent personnel assigned to serve PCFD stations full-time. As noted above, CAL FIRE Station No. 100, located approximately 1.21 miles east of the project site at 8350 Cook Riolo Road, is the closest fire station to the site and is jointly operated with the PCFD. Station 100 is approximately 3.10 miles northeast of the off-site affordable housing parcel; however, a Sacramento Metro Fire District station (Station 117) is located at 7961 Cherry Brook Drive, 1.80 miles southwest of the parcel.

Emergency Vehicle Access

Fire access can be described as the means by which firefighters can enter an area to quickly mitigate a wildfire incident prior to spread to adjacent properties and critical infrastructure at risk. For the purposes of fire apparatus access to the project site, emergency vehicles would have access to the site by way of Baseline Road and Walerga Road. Once on-site, fire engines could access the proposed residences by way of the newly constructed internal roadways. In addition, further access would be provided by the emergency vehicle access (EVA) routes included as part of the proposed project: one within Phase 1 between Estia Dry Creek and the Phase 2 roadways; one in Placer Creek Residential Phase 3, from Walerga Road to M Street; and one in Phase 4, located from Q Court to Walerga Road in the southwest corner of the project site. Phase 2 would provide two points of access to Walerga Road (J Street and the proposed Springhill Drive extension), and Sub-Phase 2A would include a temporary EVA through Phase 1 in the interim

until Sub-Phase 2B is constructed. Access to the off-site affordable housing parcel would be granted by way of Watt Avenue, which bounds the parcel to the west, and by PFE Road, which bounds the parcel to the south.

The existing roads that would serve as the primary evacuation routes during a wildfire event for both the project site and off-site affordable housing parcel would include Baseline Road and Walerga Road in the immediate project vicinity, as well as PFE Road, Foothills Boulevard, Watt Avenue, and I-80 in the surrounding area.

18.3 REGULATORY CONTEXT

Applicable federal laws or regulations pertaining to wildfire that would directly apply to the proposed project do not exist. The following sections provide a summary of the State and local regulations pertaining to wildfire that are applicable to the proposed project.

State Regulations

The following are the State environmental laws and policies relevant to wildfire.

State Responsibility Area

Pursuant to PRC Sections 4125-4128, the Board of Forestry and Fire Protection classifies all lands in the State for the purposes of determining areas in which the financial responsibility of preventing and suppressing wildfire is primarily the responsibility of the State. The classified lands are termed SRA.

Fire Hazard Severity Zones

FHSZs are geographical areas designated pursuant to California PRC Sections 4201 through 4204 and classified as Very High, High, or Moderate in SRAs or as Local Agency Very High FHSZs designated pursuant to California Government Code Sections 51175 through 51189.

The California Code of Regulations (CCR), Title 14, Section 1280 entitles the maps of the geographical areas as “Maps of the Fire Hazard Severity Zones in the State Responsibility Area of California.” The State Responsibility Area FHSZ maps, originally adopted in 2007, were updated by CAL FIRE in 2023 and incorporated into the CCR by the Office of the State Fire Marshal. The maps define the regulatory hazard designations that govern building standards and defensible space requirements within SRAs. The most recent adoption became effective April 1, 2024.

Local Regulations

The following local goals and policies related to wildfire are applicable to the proposed project.

Placer County General Plan

The following goals and policies from the PCGP related to wildfire are applicable to the proposed project.

Public Facilities and Services Element

Goal 4.I To protect residents of and visitors to Placer County from injury and loss of life and to protect property and watershed resources from fires.

Policy 4.I.1 The County shall encourage local fire protection agencies in Placer County to maintain the following minimum fire protection standards (expressed as Insurance Service Organization (ISO) ratings):

a. ISO 4 in urban areas
b. ISO 6 in suburban areas
c. ISO 8 in rural areas

Policy 4.I.2 The County shall encourage local fire protection agencies in the County to maintain the following standards (expressed as average response times to emergency calls):

a. 4 minutes in urban areas
b. 6 minutes in suburban areas
c. 10 minutes in rural areas

Policy 4.I.3 The County shall require new development to develop or fund fire protection facilities, personnel, and operations and maintenance that, at a minimum, maintains the above service level standards.

Policy 4.I.9 The County shall ensure that all proposed developments are reviewed for compliance with fire safety standards by responsible local fire agencies per the Uniform Fire Code and other County and local ordinances.

Health and Safety Element

Goal 8.C.1 To minimize the risk of loss of life, injury, and damage to property and watershed resources resulting from unwanted fires.

Policy 8.C.1.1 The County shall require that new development meet State, County, and local fire district standards for fire protection, including the California Building Standards Code, the International Wildland-Urban Interface Code, and the Placer County Municipal Code as applicable.

Policy 8.C.1.2 The County shall refer applicants of development projects in the unincorporated county to the appropriate local fire agencies for review for compliance with fire safety standards. If dual responsibility exists, then both agencies shall review and comment relative to their area of responsibility. If standards are different or conflicting, the more stringent standards shall be applied. All development in high fire hazard areas shall be designed and constructed to minimize the risk from fire hazards.

Policy 8.C.1.6	The County shall continue to implement State fire safety standards through enforcement of the applicable standards contained in the Placer County Land Development Manual.
Policy 8.C.1.9	For tentative parcel maps and tentative subdivision maps located in a High or Very High Fire Hazard Severity Zone (FHSZ), the County shall require the undergrounding of new electric utilities, except in cases where the undergrounding of such utilities is infeasible or where alternative mitigation is more appropriate or provides the same level of benefit or protection. For all projects located in a Moderate FHSZ, or nonresidential projects in High or Very High FHSZ, the County shall consider all feasible fire preventative measures during environmental review. All projects shall conform to the utility requirements, as specified in applicable Community and Specific Plans, as well as all applicable design standards and guidelines.

Dry Creek-West Placer Community Plan

The relevant goals and policies from the DCWPCP related to wildfire are presented below.

Community Development: Public Services

Goal 1	Protect the citizens and visitors of the plan area from loss of life while protecting property and watershed resources from unwanted fires through preplanning, education, fire defense improvements, and fire suppression.
Policy 1	Ensure that all proposed developments are reviewed for fire safety standards by local fire agencies responsible for its protection, including providing adequate water supplies and ingress and egress.
Policy 2	Maintain strict enforcement of the County Zoning Ordinance, Uniform Building Code and the Uniform Fire Code.
Policy 5	For those portions of the plan area that are served by the Dry Creek Fire Protection District and that are to be developed in rural-low density residential, low density residential, medium or high density residential, commercial, professional office or industrial, adopt a four minute maximum response time to as much of the new development as possible.

Placer County Code

The following applicable codes related to wildfire are from the Placer County Code.

Building Code

Buildings constructed within the project site would be subject to the current building standards found in both the CBC and Chapter 15 of the Placer County Code. Pursuant to Section 15.04.570

of the Placer County Code, the PCFD enforces standards associated with the CFC and all State fire marshal codes related to the installation of residential fire sprinkler systems and the installation of Class A roofing materials within all residential units. Both State and local requirements would significantly assist in reducing the threat of a wildfire spreading from undeveloped land to a nearby building.

Fire Code

Placer County has adopted the CFC (Title 24 CCR, Part 9) (Sections 15.04.510 [Fire Code Adopted] and 15.04.520 [Fire Code Amended]). The CFC addresses fire risk during project construction and operations, including emergency access, access gates, sprinkler systems, fire alarms within buildings, and construction of access roads to accommodate fire apparatus. With respect to construction, CFC Chapter 33 establishes fire safety provisions intended to reduce the risk of ignition and fire spread to the project site, adjacent structures, and surrounding land during construction. Additional requirements may apply, as well as at the discretion of the local fire authority having jurisdiction. The CFC also requires that an automatic fire sprinkler and/or fire extinguishing system be installed throughout new one- and two-family dwellings and commercial buildings 3,600 square feet (sf) and larger.

Fire Prevention Code

Chapter 9, Article 9.32, Part 3 of the Placer County Code requires the maintenance of “fire breaks" around structures and the clearing of roofs to prevent structural fires in the WUI. Chapter 9, Article 9.32, Part 4 of the Placer County Code requires that hazardous vegetation be abated on unimproved parcels in the County. Abatement of hazardous fuels is required if the unimproved parcel is adjacent to an improved parcel where implementation of required defensible space would extend onto the unimproved parcel. Abatement is also required along roads if, in the opinion of the County fire warden, the presence of hazardous fuels constitutes a potential obstacle to emergency access.

Subdivision Design Standards and Improvements

In order to better meet the ultimate goals of fire protection, including goals related to the protection of life, community, and valuable property, each subdivider of land in the unincorporated portions of Placer County is required to comply with the minimum requirements set forth in Placer County Code Section 16.08.080 (Fire Suppression). The requirements contained therein are related to water supply for the purposes of fire flow, including provisions related to hydrants, delivery rate, maintenance of the water system, and on-site water storage.

Placer County Office of Emergency Services

Placer County’s OES provides emergency management services in cooperation with local cities and special districts, including fire agencies. During an active incident, such as fire or flood, the OES helps initiate first responses. The functions of the OES include emergency planning, response, recovery, and mitigation, including preparation of a Local Hazard Mitigation Plan (LHMP). The currently adopted Placer County LHMP, which was updated in 2021,[10] is a joint effort between Placer County and 15 other jurisdictions and is intended to guide hazard mitigation planning to reduce the effects of hazard events, including wildfires.

[10] Placer County. *2021 Local Hazard Mitigation Plan Update*. June 2021.

Placer County Local Hazard Mitigation Plan

The LHMP was prepared pursuant to the requirements of the Disaster Mitigation Act of 2000 so that Placer County would be eligible for the Federal Emergency Management Agency's (FEMA) Pre-Disaster Mitigation and Hazard Mitigation Grant Programs, as well as lower flood insurance premiums. The LHMP is a multi-jurisdictional plan that geographically covers the entire area within Placer County's jurisdictional boundaries. The purpose of the plan is to guide hazard mitigation planning and to better protect the people and property of the County from the effects of hazard events. The LHMP demonstrates the community's commitment to reducing risks from hazards and serves as a tool to help decisionmakers direct mitigation activities and resources.

The Placer County Board of Supervisors adopted the 2021 LHMP on November 16, 2021. The goals of the 2021 LHMP are as follows:

- Goal 1: Minimize risk and vulnerability of Placer County to the impacts of natural hazards and protect lives and reduce damages and losses to property, economy, public health and safety, and the environment;
- Goal 2: Provide protection for critical facilities, infrastructure, utilities and services from hazard impacts;
- Goal 3: Improve public awareness, education, communication, and preparedness for all hazards;
- Goal 4: Increase communities' capabilities to mitigate losses and to be prepared for, respond to, and recover from a disaster event;
- Goal 5: Ensure a more resilient County that can adapt to the hazards created or exacerbated by Climate Change;
- Goal 6: Reduce fire severity and mitigate undesirable fire outcomes in Placer County; and
- Goal 7: Maintain FEMA Eligibility/Position the communities for grant funding.

Placer County and Placer Operational Area Emergency Operations Plan

The Placer County and Placer Operational Area Emergency Operations Plan (EOP) provides the guidelines needed for emergency response planning, preparation, training and execution throughout unincorporated Placer County.[11] The EOP is applicable to any natural disaster or manmade emergency occurring in or in the proximity of Placer County that affects, or may affect, the unincorporated area of the County (or the entire operational area, should response require coordination of the emergency response efforts of multiple agencies or jurisdictions). Emergency events range from minor oil spills, brush fires and minor flooding to severe winter storms, floods, wildland fires, and earthquakes to countywide public health emergencies, all of which have potentially catastrophic long-term public safety, economic, social and political implications.

Placer County Community Wildfire Protection Plan

The Placer County CWPP is the result of a communitywide planning effort that included extensive field data gathering, compilation of existing documents and geographic information system (GIS) data, and scientific analyses and recommendations designed to reduce the threat of wildfire-related damages to values at risk. The CWPP provides valuable information related to wildfire to citizens, policymakers, and public agencies throughout western Placer County. The primary goal of the CWPP is to protect human life, private property, essential infrastructure, and natural

[11] Placer County Office of Emergency Services. *Placer County and Placer Operational Area Emergency Operations Plan.* Adopted December 14, 2010.

resources through the implementation of fire prevention projects that work to increase public awareness, improve forest health, sustain local wildlife and preserve the natural beauty of the area through a shared responsibility concept. To that end, the CWPP identified recommendations to aid stakeholders in preventing and/or reducing the threat of wildfire in the County.

Placer County Sustainability Plan

The County adopted the Placer County Sustainability Plan (PCSP): A Greenhouse Gas Emission Reduction Plan and Adaptation Strategy on January 28, 2020. The primary goal for the adaptation component of the PCSP is to create a resilient Placer County that can adapt to the hazards created or exacerbated by climate change. To accomplish this goal, the PCSP provides several goals, strategies, and actions that promote coordination among agencies, protection of buildings, and implementation of mitigation measures to reduce wildfire activity in the County. The following PCSP strategies and actions are related to wildfire.

Strategy WF-5

Require all new large development projects in Moderate, High, or Very High Fire Hazard Severity Zones to have multiple points of ingress and egress to improve evacuations and emergency response access.

Strategy WF-7

Explore requiring fire-safe improvements before issuing a building permit or other formal approval for significant retrofits to buildings in identified Very High and High Fire Hazard Severity Zones, including installation of sprinklers and fire-safe exterior materials as feasible.

Action 1

Coordinate with the Placer County Fire Safe Alliance and local Fire Safe Councils to encourage new and existing planned developments in the WUI and other areas with elevated wildfire risk to join the Placer County Firewise Communities program.[12]

18.4 IMPACTS AND MITIGATION MEASURES

The following section describes the standards of significance and methodology used to analyze and determine the proposed project's potential impacts related to wildfire. In addition, a discussion of the project's impacts, as well as mitigation measures where necessary, is also presented.

Standards of Significance

Consistent with Appendix G of the CEQA Guidelines, Section XX, Wildfire, determination of significant impacts related to wildfire is based on whether the proposed project would result in the following, if located in or near SRAs or lands classified as Very High FHSZs:

- Substantially impair an adopted emergency response plan or emergency evacuation plan.

[12] The Placer County Fire Safe Alliance provides community assistance, information, and education programs in an effort to reduce the risks of wildfire danger to life and property in the County, and is comprised of various members, including, but not limited to, Placer County; CAL FIRE; U.S. Bureau of Land Management; U.S. Bureau of Reclamation; and the Greater Auburn Area, Foresthill/Iowa Hill, Lincoln, and Placer Sierra Fire Safe Councils. Through the County's Firewise Communities Program, Placer County is a member community of the NFPA's Firewise USA Program, which is aimed at homeowners and provides specific criteria for communities regarding wildfire preparedness. The program provides resources to help homeowners learn how to adapt to living with wildfire and encourages neighbors to work together to take action to prevent losses.

- Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.
- Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.
- Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

Pursuant to CEQA Guidelines Appendix G, the standards of significance listed above are only relevant when a project's location is within an SRA or Very High FHSZ. The project site is not located within land designated as either. Rather, the project site is located within a LRA and is identified by CAL FIRE as being within a Non-Very High FHSZ area. Nevertheless, because the project site is located adjacent to a Moderate FHSZ and the off-site parcel is located within a Moderate FHSZ, in order to provide a conservative analysis, this chapter evaluates the potential impacts of the proposed project based on the standards listed above.

In addition to the above standards, an additional, more generic significance standard can be derived from CEQA Guidelines Appendix G, Section X, Hazards and Hazardous Materials. Under the additional standard, which applies to projects located within LRAs and outside Very High FHSZs, the proposed project would result in a significant impact if the project would:

- Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

All of the above standards should be understood and applied in light of legal principles articulated by the California Supreme Court in *California Building Industry Assn. v. Bay Area Air Quality Management Dist.* (2015) 62 Cal.4th 369, 377-378, where the court explained that "agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents. But when a proposed project risks exacerbating those environmental hazards or conditions that already exist, an agency must analyze the potential impact of such hazards on future residents or users. In those specific instances, it is the *project's* impact on the environment—and not the *environment's* impact on the project—that compels an evaluation of how future residents or users could be affected by exacerbated conditions." (Original italics.)

Method of Analysis

The impact analysis contained in this chapter is based on a review of available CAL FIRE wildfire hazard mapping and recent wildfire history within Placer County. In addition, State and local fire hazard regulations were evaluated to identify applicable design requirements for the proposed project to minimize wildfire risk (e.g., defensible space).

Project-Specific Impacts and Mitigation Measures

The following discussion of impacts is based on the implementation of the proposed project and off-site sewer lift station improvements, as well as the two affordable housing options analyzed throughout this EIR, in comparison with the standards of significance identified above. In most cases, potential environmental impacts associated with the proposed project and the 22 on-site ADUs would not differ. Thus, unless otherwise noted, the below analysis applies to both the proposed project and the on-site ADUs.

18-1 Substantially impair an adopted emergency response plan or emergency evacuation plan. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as the off-site affordable housing parcel, which could substantially impair an adopted emergency response plan or emergency evacuation plan.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

The off-site sewer lift station improvements area is located within Dry Creek Community Park and the improvements would be limited to providing an underground tank for additional underground emergency sewer storage capacity. As such, the off-site sewer lift station improvements would not result in impacts to emergency response or evacuation. Thus, the following analysis is focused potential impacts associated with the proposed project.

Emergency events, like wildland fires, are unpredictable. The location of the fire, the time of day an event occurs, the direction of travel, and the rate of spread are unknown. Due to such uncertainty, the use of traditional capacity analysis, such as AM and PM peak hour operations at study intersections, is limited for the analysis of emergency events. Furthermore, while Placer County has an adopted LHMP and EOP, which are both intended to provide emergency resources and plans in response to local hazards, such as wildfires, the County does not have an adopted emergency evacuation plan. However, in the event of an emergency, emergency responders do have measures that can be deployed to aid in the movement of the public from danger. For instance, during evacuation events, State and/or local emergency responders provide active traffic control at intersections, close roads, provide detours for through traffic, and actively manage available travel lanes to facilitate evacuation away from the emergency. Such measures would be initiated in the event that an evacuation is deemed necessary.

For the purposes of this analysis, the existing roads adjacent to the project site, Baseline Road and Walerga Road, would serve as the primary evacuation route during a wildfire event. In addition, PFE Road and Foothills Boulevard, which are located within approximately two miles from the project site boundary, would also serve to assist in evacuating residents. As the closest major highway, I-80 would also facilitate evacuation from the area. In addition, the proposed EVA routes would be provided throughout the site, connecting to Walerga Road.

The Circulation Plan Diagram in the PCGP (Figure 1-8 of the PCGP) depicts the circulation system for the unincorporated portions of the County, with roadways shown by means of a set of roadway classifications. Roadways are classified based on the linkages they provide and their function, both of which reflect their importance to land use patterns, travelers, and the public's general welfare. The County's roadway system classifies roadways into the following hierarchy: local streets, collector roadways, arterial roadways, thoroughfares, and expressways. In general, roadways higher in the hierarchy are meant to collect traffic from roads lower in the order.

As discussed in Chapter 16, Transportation, of this EIR, the roadways that provide access to the project site include Baseline Road, Walerga Road, and Vineyard Road. Baseline Road is an east-west arterial, Walerga Road is a north-south four-lane major arterial, and Vineyard Road is an east-west two-lane major collector. The roadways surrounding the project site primarily serve to collect vehicles from local streets and route them to roads higher in the County's classification hierarchy. The roadways could experience substantial congestion if all residents of the 432 proposed residences evacuated the area at the same time.

However, the Placer County Board of Supervisors adopted the Countywide Traffic Impact Fee Program in April 1996, requiring new development within the County to address adverse effects to the roadway system through payment of traffic impact fees. The fees collected through the program, in addition to other funding sources, allow the County to construct roads and other transportation facilities and improvements needed to accommodate new development. The fee was updated by Placer County in August 2021. The County's fee program and Capital Improvement Program (CIP) is divided into 11 districts, and the project site is included in the Dry Creek-West Placer Benefit District.[13] Current roadway improvements planned in the project vicinity are shown in Table 18-1.

Table 18-1
Dry Creek CIP Improvements

Street	Existing Number of Lanes	Location	Description
Cook Riolo Road	Two Lanes	PFE Road to Baseline Road	Roundabouts/intersection improvements
Dyer Lane	Two Lanes	Baseline Road to 16th Street/ Placer Vineyards Road	Widen to four lanes
Locust Road	Two Lanes	Sacramento County line to 18th Street	Widen to four lanes
North Antelope Road	Two Lanes	Sacramento County line to PFE Road	Widen to five lanes
		at PFE Road	Signal/intersection improvements
PFE Road	Two Lanes	North Antelope Road to City of Roseville	Widen to five lanes
		Walerga Road to Cook Riolo Road	Traffic-calming/control measures
		Watt Avenue to Walerga Road	Widen to four lanes
Placer Vineyards Road	Two Lanes	Sacramento County line to Baseline Road	Widen to four lanes
Vineyard Road	Two Lanes	at Brady Lane	Intersection improvements
Walerga Road	Four Lanes	Baseline Road to Sacramento County line	Widen to six lanes

* Completed Project

Source: Placer County, Countywide Capital Improvement Programs, June 10, 2025.

Based on the planned CIP improvements shown in Table 18-1, project vicinity roadways, including Walerga Road, are scheduled for improvements that would allow for traffic volumes generated by buildout of the DCWPCP, including the proposed project, to be better accommodated. For example, as part of the proposed project, the section of Walerga Road that bisects the project site into the northern and southern portions would be widened from four lanes to six lanes.

The aforementioned improvements would aid in the event that evacuation of the project site during a wildfire is necessary. Additionally, during evacuation events, emergency responders would provide active traffic control at intersections, and may close roads, provide detours for through traffic, and/or actively manage available travel lanes to facilitate evacuation away from the emergency. Furthermore, as discussed previously, the proposed EVA routes would allow fire engines to access the project site, generally facilitating emergency vehicle responses and potential evacuation services throughout.

In the event of a wildfire, future residents of the proposed project would be provided sufficient warning through the Placer Alert system, a component of a partnership between public safety agencies in Placer, Sacramento, and Yolo counties to alert residents about emergency events and other important public safety information through a community notification system. The system enables the Placer County Sheriff's Office to provide the public with critical information quickly in a variety of situations, such as severe weather, unexpected road closures, and evacuations of buildings or neighborhoods. All members of the public can sign up for Placer Alert

through the Placer County Sheriff's Office website and elect to receive notifications of emergency situations through various means, including text messages and email.

During wildfire events, emergency responders would be able to access the project site to combat fires, which would serve to reduce the hazardous conditions that precipitate the need for evacuation of residents. As part of the proposed project, new internal roadways would be constructed within the project site, which would connect to Baseline Road and Walerga Road. From the proposed access points, the Placer Creek Residential neighborhoods would be served by an internal roadway system, which would include sidewalks and rolled curb and gutters on each side. Interior roadways would be public in Phase 2 and private in Phases 3 and 4. The proposed streets would provide access to individual residential lots and would feature travel lanes at least 10 feet wide. Therefore, all internal roadways proposed as part of the project would be wide enough to accommodate emergency vehicles. Accordingly, the proposed project would provide adequate emergency access to the project site and would not be expected to conflict with any potential evacuation routes.

The Placer Creek Residential Phase 3 entry from Walerga Road and Phase 4 entry on Vineyard Road would be gated. The gated entries would be constructed consistent with County Detail ST-27 and the proposed gated access points would be required to comply with the emergency vehicle access conditions established by Section 15.04.580 of the Placer County Code. Section 15.04.580 requires that emergency vehicles be provided access at gated entries through inclusion of an override switch and an approved emergency radio frequency gate opening device. Therefore, the proposed gated entries would not impair emergency vehicles from accessing the site in an emergency event.

EVA routes to the project site would be developed as part of Phase 1 between Estia Dry Creek and the Phase 2 roadways connecting to Walerga Road. An EVA route in Placer Creek Residential Phase 3 would be located from Walerga Road to M Street, opposite the new Phase 2 entrance/J Street. In Phase 4, an EVA route would be located from Q Court to Walerga Road in the southwest corner of the project site. The proposed EVA routes would be comprised of 20-foot-wide pavement for two-way travel. Emergency vehicles would be expected to primarily come from Station 100 at 8350 Cook Riolo Road. For example, emergency vehicles could proceed from the station southward along Cook Riolo Road, then proceed westward at the Cook Riolo Road/Vineyard Road intersection. From Vineyard Road, which would be extended westward to connect to the project site as part of the proposed project, emergency vehicles would access the Phase 4 portion of the project site through the proposed gated entry or gated EVA on Walerga Road. The Phase 1 area would be accessed by way of Baseline Road, and Phases 2 and 3 would be accessed by way of Walerga Road. Given that Station 100 is located approximately 1.21 miles east of the project site, emergency vehicles would be anticipated to arrive on-site within a timely manner.

During project construction, temporary lane closures on Baseline Road and Walerga Road could be required. However, as required by Mitigation Measure 16-1 in the Transportation chapter of this EIR, any temporary lane closures would be coordinated with County OES, the Placer County Engineering and Surveying Division, and local emergency services providers. In addition, any lane closures due to nighttime roadwork would not substantially impair emergency evacuations or emergency

responses, as less traffic occurs at night. Furthermore, complete closure of the roadways at any point is not anticipated.

Off-Site Affordable Housing Parcel

As discussed throughout this EIR, the proposed RVSP amendment and rezone would result in a maximum development potential of 120 affordable income-restricted units within the off-site affordable housing parcel. The existing roads adjacent to the off-site affordable housing parcel are Watt Avenue to the west and PFE Road to the south, which would serve as the primary evacuation route during a wildfire event. I-80, which is directly accessible from Watt Avenue, would also facilitate evacuation from the off-site affordable housing parcel.

Similar to the above, future development on the off-site affordable housing parcel would be subject to payment of all applicable Placer County traffic impact fees. The off-site parcel is also located within the Dry Creek-West Placer Benefit District.[14] Based on the planned CIP improvements shown in Table 18-1, project vicinity roadways, including PFE Road, are scheduled for improvements that would allow for traffic volumes generated by buildout of the project area, including the development of up to 120 new affordable units within the off-site affordable housing parcel, to be better accommodated. For example, the section of PFE Road that bounds the off-site affordable housing parcel to the south is anticipated to be widened from two lanes to four lanes. The CIP also includes planned signal and intersection improvements at the Watt Avenue/PFE Road intersection. As discussed in Chapter 3, Project Description, of this EIR, the installation of the traffic signal noted in the CIP is required for RVSP buildout; thus, the timing of the RVSP and the proposed project may dictate the party responsible for constructing the signal. Overall, the foregoing roadway improvements would aid in the event that evacuation of the project area during a wildfire is necessary. Additionally, during evacuation events, emergency responders would provide active traffic control to facilitate evacuation away from the emergency.

In the event of a wildfire, residents of the future off-site affordable units would be provided sufficient warning through the Placer Alert system, which would provide the public with critical information quickly. All members of the public can sign up for Placer Alert through the Placer County Sheriff's Office website and elect to receive notifications of emergency situations through various means.

Although specific site access plans are not currently available, Section 3.6.2 of the RVSP describes access to the off-site affordable housing parcel through a potential auxiliary lane and deceleration taper on the eastern side of Watt Avenue, as well as by a potential driveway near the southeastern corner of the parcel to facilitate right turns from westbound traffic on PFE Road. Even if future access to the off-site affordable housing parcel were to differ as compared to what was anticipated in the RVSP, roadway construction and driveways would be designed compliant with applicable Placer County standards, which would be confirmed during improvement plan review. Therefore, emergency responders would be able to access the parcel during wildfire events to combat fires, which would serve to reduce the hazardous conditions that precipitate the need for evacuation of residents. At the time project

[14] Placer County. *Countywide Capital Improvement Programs.* July 8, 2024. Available at: https://www.placer.ca.gov/DocumentCenter/View/63571/Countywide-Capital-Improvement-Programs-CIP.

information becomes available, the proposed access routes within the parcel would also be reviewed and approved by both PCFD and CAL FIRE.

Conclusion

Based on the above, the proposed project, off-site sewer lift station improvements, and potential future development of the off-site affordable housing parcel would not substantially impair an adopted emergency response plan or emergency evacuation plan, and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

18-2 Due to factors such as on-site fuel sources, slope, and prevailing winds, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. Based on the analysis below, the impact is *less than significant*.

As noted earlier, the significance standard applicable in or near SRAs or lands classified as Very High FHSZs assumes that a significant environmental effect occurs where a proposed project would exacerbate wildfire risks in a way that would expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire due to slope, prevailing winds, and other factors. Another, more generic significance standard, potentially applicable anywhere, assumes that a significant environmental effect occurs where a proposed project would expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires. The analysis below primarily considers the first significance standard, as well as the second significance standard insofar as a significant risk of loss, injury, or death could result from wildfire-generated pollutant concentrations exacerbated by the proposed project or the uncontrolled spread of a wildfire exacerbated by the proposed project and off-site sewer lift station improvements area, as well as the off-site affordable housing parcel.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

The off-site sewer lift station improvements area is located within Dry Creek Community Park and the improvements would be limited to providing an underground tank for additional underground emergency sewer storage capacity. As such, the off-site sewer lift station improvements would not exacerbate wildfire risks. Thus, the following analysis focuses on potential impacts associated with the proposed project.

The project site is located within the DCWPCP area and contains seasonal wetlands, vernal pools, Placer Creek tributary, and existing vegetation, including undeveloped annual grassland and limited riparian woodland vegetation. The following discussions evaluate the potential impacts associated with the proposed project related to the exacerbation of wildfire risks due to factors such as on-site fuel sources, slope, and prevailing winds.

Wildfire Risks Due to Existing On-Site Fuel Sources

CEQA Guidelines Appendix G indicates that the extent and nature of on-site vegetation, which would serve as fuel for a wildfire, should be evaluated to determine the potential for a project to exacerbate wildfire risk. The project site is undeveloped and currently consists of annual grassland interspersed with seasonal wetlands, vernal pools, and is bisected by Placer Creek. Some areas surrounding the site also currently contain grassland and trees. Development of the proposed project would include site clearing activities, which would remove on-site vegetation and would create a buffer between the 9.60 acres of the site that would be retained as open space and the proposed residential development. Development of the site with residential uses would reduce the existing risk of wildland fire to surrounding areas, because site improvements, such as roadways, driveways, and irrigated landscaping, would reduce readily combustible vegetation. Additionally, existing wildfire risks would not be anticipated to be exacerbated during project operation, as residential uses typically do not involve operation components that would increase the risk of wildfire.

The proposed project would reduce on-site fuel sources through the development of a total of 432 new residential units, which includes 212 single-family lots and 220 multi-family units, as well as the potential for an additional 22 ADUs, within the 92.2-acre project site, the sum of which would remove most of the on-site annual grassland. The proposed project would be required to comply with all applicable State and local standards and regulations associated with prevention of wildfire hazards, including Placer County Code Sections 15.04.510 and 15.04.520, which serve to adopt and amend, as applicable, the CFC. The CFC requires that an automatic fire sprinkler and/or fire extinguishing system be installed throughout new one- and two-family dwellings and commercial buildings 3,600 sf and larger. In addition, the project would be subject to the applicable provisions set forth in Placer County Code Section 16.08.080, which contains requirements for subdivisions related to water supply for the purposes of fire flow, including provisions related to hydrants, delivery rate, maintenance of the water system, and on-site water storage. Although the project site is not within a WUI or Very High or High FHSZ, Placer County Code Section 9.32.160 sets forth hazardous vegetation abatement standards for improved parcels with which the proposed project would be required to comply.[15] Furthermore, the PCFD enforces standards set forth in the CBC associated with the installation of residential fire sprinkler systems and the installation of Class A roofing materials within all residential units. Overall, both State and local requirements would significantly assist in reducing the threat of a wildfire spreading from undeveloped land to the proposed structures, as well as the potential of fire spreading from the site to surrounding areas.

The proposed project would include various landscaping buffers along the Baseline Road and Walerga Road frontages and throughout the site, which would introduce new sources of vegetation. However, as set forth in Placer County Code Section 15.75.040, the landscaping would include irrigation scheduling in accordance with the County's Water Efficient Landscape Ordinance, which would ensure the proposed vegetation is sufficiently watered to not result in excessively dry fuel sources. In addition, the landscape corridor along the south side of Baseline Road would include

[15] Woessner, Ryan, Fire Marshal, California Department of Forestry and Fire Protection, Placer County Fire Department. Personal Communication [email] with Nick Pappani, Vice President, Raney Planning & Management, Inc. March 14, 2022.

a six-foot-tall concrete masonry unit (CMU) wall, which would further reduce the risk of fire spreading to adjacent areas.

The proposed project would include development of a 2.2-acre neighborhood park in the Placer Creek Residential Phase 2 development (Lot PARK-1), additional park areas in pockets along Placer Creek, and approximately 9.6 acres of open space between the Placer Creek Residential Phase 3 and 4 neighborhoods (Lot OS-1). Preservation of such areas as open space would maintain portions of the on-site fuel sources. The acreage received by the County would be subject to a fire management component of an Open Space Management Plan that would be aimed at preventing or impairing the spread of a fire and reducing fire severity. The fire management component would ensure that fuel sources within Lot OS-1 are reduced. Therefore, because the on-site fuel sources would be subject to routine maintenance, the proposed project would not exacerbate the risk of wildfire spreading to adjacent areas.

Wildfire Risks Due to Slope

The DCWPCP area does not contain steep or significant slopes, which limits wildfire risks related to topography in the project region. Based on the existing topography of the project site, slope would not affect on-site fire behavior, as compared to the mountainous areas associated with the Sierra Nevada in the County's northeastern region. Therefore, the proposed project would not exacerbate wildfire risks due to slope, and a less-than-significant impact would occur.

Wildfire Risks Due to Prevailing Winds

With respect to prevailing winds at the project site, as previously discussed, winds from the south are most dominant from May to September. The predominant direction of prevailing winds suggests that, during the majority of the year, winds could be reasonably assumed to facilitate spread of fire towards the north of the site, towards Baseline Road. However, as discussed above, the majority of on-site fuel sources would be removed as part of development of the proposed project, which would ensure the proposed project does not exacerbate the wildfire risk due to prevailing winds during project operation.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is currently undeveloped and contains open grassy fields disturbed through regular maintenance. With respect to wildfire risks due to existing on-site fuel sources, future development of the affordable units would include site clearing activities, removing vegetation and thereby reducing the existing risk of wildland fire to surrounding areas. Additionally, existing wildfire risks would not be anticipated to be exacerbated during project operation, as residential uses typically do not involve operation components that would increase the risk of wildfire. The future affordable housing development within the parcel would be subject to the same State and local standards and regulations discussed above, including the CBC, Placer County Code Sections 15.04.510 and 15.04.520 related to adopting the CFC, and Placer County Code Section 16.08.080 related to water supply. Therefore, similar to the above, the proposed project would not exacerbate wildfire risk related to fuel sources.

With respect to wildfire risks due to slope, the area surrounding the off-site affordable housing parcel does not contain steep or significant slopes, which limits wildfire risks related to topography in the project region. Based on the existing topography of the site, slope would not affect fire behavior as compared to the mountainous areas in the County's northeastern region.

As discussed above, the predominant direction of prevailing winds in the area suggests that winds occurring throughout the year could be reasonably assumed to facilitate spread of fire north. The majority of fuel sources would be removed as part of development of the off-site parcel, which would ensure that potential future development does not exacerbate the wildfire risk due to prevailing winds during project operation. In addition, the off-site parcel is bounded to the south by PFE Road, which would act as a fuel break between any wildfires moving north and the parcel.

Conclusion

Based on the above, the proposed project, off-site sewer lift station improvements, and the potential future development of the off-site affordable housing parcel would not exacerbate wildfire risks due to prevailing winds, slope, and other factors, and the project would thereby not expose residents in the project vicinity to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. Because the project would result in the removal of the majority of fuel sources, the potential impact related to wildfire risks associated with winds, slope, and other factors would be reduced. Therefore, a ***less-than-significant*** impact could occur.

Mitigation Measure(s)

None required.

18-3 Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment. Based on the analysis below, the impact is *less than significant*.

The following discussion is an analysis of potential impacts related to the installation or maintenance of infrastructure associated with the proposed project and off-site sewer lift station improvements, as well as the potential future development of the off-site affordable housing parcel, that may exacerbate fire risk or result in temporary or ongoing impacts to the environment.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

The off-site sewer lift station improvements area is located within Dry Creek Community Park and the improvements would be limited to providing an underground tank for additional underground emergency sewer storage capacity. As such, the off-site sewer lift station improvements is not considered the type of infrastructure that could exacerbate fire risk or result in ongoing impacts to the environment. The potential environmental impacts of the off-site sewer lift station improvements have been evaluated throughout this EIR.

The proposed project would include installation of various infrastructure components, including roadways, EVA routes, connection to fire water sources, power lines, and other utilities. Additionally, the proposed project would include off-site improvements to the Walerga Road/Fiddyment Road/Baseline Road intersection. Potential physical environmental impacts that could result from implementation of the proposed project, including the off-site improvements, have been evaluated throughout the technical chapters of this EIR.

The proposed internal roadways would not exacerbate fire risks, as the Placer County Code requires a 10-foot vegetation clearance next to roadsides to reduce fire hazards. Additionally, pursuant to County standards and DCWPCP Policy 18, power lines and other utilities constructed for the proposed project would be undergrounded, which would reduce fire risks during operations. As discussed above under Impact 18-2, structures constructed as part of the proposed project would comply with all applicable standards set forth by the CBC and CFC, including the use of Class A roofing materials within all residential units and fire-intrusion design of roofing and vents. Therefore, the proposed infrastructure improvements associated with the project would not substantially exacerbate wildfire risk.

The proposed project would also be subject to the applicable provisions set forth in Placer County Code Section 16.08.080, which contains requirements for subdivisions related to water supply for the purposes of fire flow, including provisions related to hydrants, delivery rate, maintenance of the water system, and on-site water storage. As mandated by Section 16.08.080(A)(1), the proposed project would be required to provide a pressurized hydrant system throughout the project site, subject to the approval by the Community Development Resource Agency Director. The fire hydrants within the site would meet all applicable PCFD and CAL FIRE requirements. Long-term maintenance and operation of the emergency water supply infrastructure would not involve any activities that would result in an increase in wildfire risk.

While the long-term maintenance of the proposed roadways, vegetation clearances, emergency water supply connections, power lines, and other utilities would not exacerbate fire risks, the activities associated with the initial construction and placement of the utilities and infrastructure could cause a temporary increase in fire risks due to the use of heavy equipment, which would contain combustible materials such as fuels and oils and ignition sources. However, the project contractor would be required to comply with all California Health and Safety Codes and local County ordinances regulating the handling, storage, and transportation of hazardous materials, which would help to minimize the potential for accidental conditions, including fire.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is reasonably anticipated to include installation of various infrastructure components, including roadways and connections to fire water sources, power lines, and other utilities. Potential physical environmental impacts that could result from the construction of a maximum of 120 affordable units on the off-site parcel have been evaluated throughout the technical chapters of this EIR.

The future units constructed within the off-site parcel would be subject to the same State and local standards and regulations discussed above, including the CBC, CFC, and Placer County standards related to the 10-foot vegetation clearance next to roadsides, undergrounding of utility lines, and water supply. In addition, the project contractor would also be required to comply with all California Health and Safety Codes and local County ordinances.

Conclusion

Based upon the above, the proposed project, off-site sewer lift station improvements, and the potential future development of the off-site affordable housing parcel would not require the installation or maintenance of associated infrastructure that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment. Therefore, the project would result in a ***less-than-significant*** impact.

Mitigation Measure(s)

None required.

18-4 Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes. Based on the analysis below, the impact is *less than significant*.

The following discussion is an analysis of potential impacts related to exposing people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes associated with the proposed project, off-site sewer lift station improvements, and the potential future development of the off-site affordable housing parcel.

Proposed Project, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

The off-site sewer lift station improvements area is located within Dry Creek Community Park and the improvements would be limited to providing an underground tank for additional underground emergency sewer storage capacity. As such, the off-site sewer lift station improvements is not considered the type of infrastructure that could exacerbate fire risk or result in ongoing impacts to the environment. The potential environmental impacts of the off-site sewer lift station improvements have been evaluated throughout this EIR. Therefore, the remainder of the below discussion is focused on the proposed project and the off-site affordable housing parcel.

As noted earlier, one significance standard applicable in or near SRAs or lands classified as Very High FHSZs assumes that a significant environmental effect occurs where a proposed project would expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes. Another, more generic significance standard, potentially applicable anywhere, assumes that a significant environmental effect occurs where a proposed project would expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

The analysis below primarily considers the first significance standard, as well as the second significance standard insofar as a significant risk of loss, injury, or death could result from downslope or downstream flooding or landslides exacerbated by the proposed project, as a result of runoff, post-fire slope instability, or drainage changes.

Wildfires alter landscapes and can result in post-event hazards triggered primarily by rainfall. Rainfall that is normally captured and stored by vegetation can run off almost instantly, causing creeks and drainage areas to flood much sooner during a storm and with more water than is expected under unburned conditions. Soils burned at moderate and high severity tend to have reduced infiltration capacity and are more easily eroded. The potential post-fire flooding, soil erosion, and debris flows could impact recreational areas, homes, structures, roads, and other infrastructure within, adjacent to, and downstream from burned areas.

Wildfire-related flooding and increased runoff may continue for several years in a burn area. However, post-fire debris flows do not typically occur beyond the second rainy season. Some of the largest debris-flow events happen during the first post-fire storm season. While multiple factors can affect debris-flow occurrence, post-fire debris flows generally are triggered by one of two processes: surface erosion caused by rainfall runoff; and landsliding caused by rainfall seeping into the ground. Surface erosion runoff processes are by far the most prevalent contributors to debris flows. Landsliding contributes less to fire-related debris flow, but prolonged heavy rains may increase soil moisture even after a wildfire.[16] The wetted soil can then fail, producing infiltration-triggered landslides. The landslides could be shallow or deep-seated (i.e., greater than 10 to 15 feet deep).

As previously discussed, the project site and off-site affordable housing parcel do not feature steep or significant slopes. As such, the proposed project would not be vulnerable to risks such as post-fire downslope or downstream flooding or landslides. Additionally, through development of the proposed project and potential future development of the off-site affordable housing parcel, the majority of on-site fuel sources would be removed as part of site improvements, thereby reducing the potential for substantial fire-burned areas to occur on-site. The reduction in on-site areas highly vulnerable to wildfires would similarly reduce the potential for post-fire runoff from the developed project site or off-site affordable housing parcel to transport substantial sediment to Placer Creek. Furthermore, given the developed nature of the area surrounding the project site and off-site affordable housing parcel, the potential for surface erosion caused by rainfall runoff to occur would be limited.

Conclusion

Based on the above, the proposed project, off-site sewer lift station improvements, and the potential future development of the off-site affordable housing parcel would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes and would not exacerbate any existing significant risk of exposing people or structures, either directly or indirectly, to loss, injury or death resulting from downslope or downstream flooding or landslides exacerbated by the proposed project

[16] U.S. Geological Survey. *Post-Fire Flooding and Debris Flow*. Available at: https://ca.water.usgs.gov/wildfires/wildfires-debris-flow.html. Accessed July 2025.

or potential future development of the off-site affordable housing parcel, as a result of runoff, post-fire slope instability, or drainage changes. Therefore, a ***less-than-significant*** impact would occur.

Mitigation Measure(s)
None required.

Cumulative Impacts and Mitigation Measures

As defined in Section 15355 of the CEQA Guidelines, "cumulative impacts" refers to two or more individual effects which, when considered together, are considerable, compound, or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects.

The cumulative setting for impacts related to wildfire encompasses buildout of the DCWPCP. For more details regarding the cumulative setting, refer to Chapter 20, Statutorily Required Sections, of this EIR.

18-5 Increase in wildfire risk attributable to the proposed project, in combination with cumulative development. Based on the analysis below, the cumulative impact is *less than significant*.

The cumulative setting for this EIR encompasses the DCWPCP area. Future development within the DCWPCP would result in changes to the existing land use environment through conversion of vacant land to developed uses that would result in a reduction of existing vegetation. Approved, planned, and under-construction development within the DCWPCP area includes the following: the Creekview Ranch Project, which is located approximately 1.59 miles southeast of the project site; the Brady Vineyard Subdivision Project, currently under construction, approximately 2.25 miles east of the project site down Vineyard Road; the under-construction Double S Ranch Subdivision Project, 1.28 miles east of the project site; the PVSP, portions of which are currently under construction west of the project site, across Walerga Road; the RVSP, currently under construction southeast of the PVSP; the approved Mill Creek Project, approximately 1.80 miles to the southeast of the site; and the under-construction The Ranch Project, approximately 1.50 miles east of the project site. All the foregoing future development areas are separated from the project site by intervening existing development, such as existing roadways, as well as residential and agricultural uses. Development of other approved projects, as well as the project site, would change the existing landscape of those specific locations from vacant or minimally developed land to more intensively developed residential areas with one- and two-story homes on various sized lots.

The DCWPCP area is not located within an SRA and or a Very High FHSZ. In fact, the entire DCWPCP area is located within a Non-Very High FHSZ. Additionally, all development facilitated by buildout of the DCWPCP would be subject to existing regulations and guidelines designed to prevent wildfire hazards. Similar to the proposed project, development of other areas within the DCWPCP would be required to comply with Placer County Code Sections 15.04.700 and 15.04.710, which serve to

adopt and amend, as applicable, the CFC. In addition, future subdivision projects would be subject to the applicable provisions set forth in Placer County Code Section 16.08.080, which contains requirements for subdivisions related to water supply for the purposes of fire flow, including provisions related to hydrants, delivery rate, maintenance of the water system, and on-site water storage. Furthermore, the PCFD enforces standards set forth in the CBC associated with the installation of residential fire sprinkler systems and the installation of Class A roofing materials within all residential units. As such, all buildings would meet all fire code requirements, as set forth by the CBC and CFC, which could include fire sprinklers and fire alarms, as determined by the County Fire Marshal at building permit stage, depending upon building and occupancy type. Finally, similar to the project site, parcels within the DCWPCP currently include fuel sources such as trees, riparian vegetation, and annual grassland. However, development of said parcels would remove some existing fuel sources, thereby reducing the cumulative risk of wildfire hazards. Compliance with State and local standards would minimize wildfire risks at each cumulative project location.

Based on the above, the cumulative impact associated with the proposed project, off-site sewer lift station improvements, and the potential future development of the off-site affordable housing parcel in conjunction with cumulative development in the region, would be ***less than significant*** related to exacerbating wildfire risk.

Mitigation Measure(s)

None required.

19. Effects Not Found to be Significant

19. EFFECTS NOT FOUND TO BE SIGNIFICANT

19.1 INTRODUCTION

Section 15128 of the CEQA Guidelines requires that an EIR briefly describe the reasons why various environmental effects were determined not to be significant and, therefore, were not discussed in detail in the EIR. The Effects Not Found to be Significant chapter of this EIR summarizes environmental issues that were determined not to be significant with implementation of the proposed project and potential future development of the off-site affordable housing parcel. The reasons for the conclusion of non-significance are provided for each issue area, as applicable, below.

19.2 AESTHETICS

Consistent with Appendix G of the CEQA Guidelines, the proposed project, including the off-site sewer lift station, and potential future development of the off-site affordable housing parcel were determined to have no impact with regard to the following issue area:

- Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State Scenic Highway.

Officially designated State Scenic Highways are not located in Placer County. Therefore, neither the proposed project nor the potential future development of the off-site affordable housing parcel would substantially damage any scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings, within a State Scenic Highway.

19.3 AGRICULTURAL RESOURCES

Consistent with Appendix G of the CEQA Guidelines, the proposed project and potential future development of the off-site affordable housing parcel were determined to have no impact with regard to the following issue areas:

- Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code [PRC] Section 12220[g]), timberland (as defined by PRC Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104[g]);
- Result in the loss of forest land or conversion of forest land to non-forest use; and
- Involve other changes in the existing environment which, due to their location or nature, could result in conversion of forest land to non-forest use.

The project site and off-site affordable housing parcel are not considered forest land (as defined in PRC Section 12220[g]) or timberland (as defined by PRC Section 4526), and are not zoned Timberland Production (as defined by Government Code Section 51104[g]). Therefore, neither the proposed project nor the potential future development of the off-site affordable housing parcel would conflict with existing zoning for, or cause rezoning of, forest land or timberland, or result in the loss of forest land or conversion of forest land to non-forest use, or involve other changes in

the existing environment which, due to their location or nature, could result in conversion of forest land to non-forest use.

19.4 GEOLOGY AND SOILS

Consistent with Appendix G of the CEQA Guidelines and in accordance with Placer County, the proposed project and potential future development of the off-site affordable housing parcel were determined to have no impact with regard to the following issue areas:

- Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water;
- Result in exposure of people or property to geologic and geomorphological (i.e., Avalanches) hazards, such as earthquakes, landslides, mudslides, seismic-related ground failure or similar hazards;
- Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State; and/or
- Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

The existing sewer pipeline system within unincorporated areas of Placer County in the vicinity of the proposed project and off-site affordable housing parcel are located within Placer County Service Area 28, Zone 173, and are owned and maintained by Placer County. The project and off-site affordable housing parcel would include annexation into Service Area 28, Zone 173 for sanitary sewer service; therefore, the sites would have access to the existing sewer infrastructure following Placer County Board of Supervisors approval of the annexation. The proposed project would also include sewer improvements in the off-site improvement area, including increasing emergency storage capacity at the existing sewer lift station located approximately 0.53-mile to the south of the project site. All sewer improvements would be consistent with the South Placer Regional Wastewater and Recycled Water Systems Evaluation. Thus, the construction or operation of septic tanks or other alternative wastewater disposal systems would not be included as part of the proposed project or the potential future development of the off-site affordable housing parcel. Therefore, no impact would occur regarding the capability of soil to adequately support the use of septic tanks or alternative wastewater disposal systems.

Seismically induced landslides are triggered by earthquake ground shaking. The risk of landslide hazard is greatest in areas with steep, unstable slopes. Because neither the project site nor the off-site affordable housing parcel contains any steep slopes and they are not located at or near any active or potentially active faults, the risk of landslide and/or ground failure on the site or off-site affordable housing parcel would not be substantial. Therefore, the proposed project and potential future development of the off-site affordable housing parcel would not expose people or property to geologic or geomorphological hazards, such as avalanches, earthquakes, landslides, mudslides, seismic-related ground failure, or similar hazards.

According to the Department of Conservation's Mineral Land Classification of Placer County,[1] documented mines or prospects do not exist in the vicinity of the project site or the off-site affordable housing parcel. The Placer County General Plan (PCGP), the Dry Creek-West Placer Community Plan (DCWPCP), and the Riolo Vineyard Specific Plan (RVSP), in which the off-site

[1] California Department of Conservation, Division of Mines and Geology. *Mineral Land Classification of Placer County, California*. 1995.

affordable housing parcel is located, do not identify any substantial mineral resources within the vicinity of the sites. Furthermore, neither the project site nor the off-site parcel is designated or zoned for any mineral resources. Therefore, development of the proposed project and potential future development of the off-site affordable housing parcel would not result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State, or of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

19.5 HAZARDS AND HAZARDOUS MATERIALS

Consistent with Appendix G of the CEQA Guidelines, the proposed project and potential future development of the off-site affordable housing parcel were determined to have no impact with regard to the following issue areas:

- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment; and
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area.

According to the Phase I Environmental Site Assessment prepared for the proposed project by Environmental Risk Assessors, the project site is not included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, and impacts related to such would not occur. In addition, the off-site affordable housing parcel is not included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5.[2] Therefore, neither the proposed project nor the potential future development of the off-site affordable housing parcel would create a significant hazard to the public or the environment associated with being located on such a site.

Neither the proposed project nor the off-site affordable housing parcel is located within an airport land use plan or within two miles of a public airport, public use airport, or private airstrip. The nearest airport relative to the project site and off-site affordable housing parcel is McClellan Airport, which is located approximately 5.41 miles and 4.74 miles, respectively, to the south of the sites. Both the project site and off-site affordable housing parcel are located outside of the McClellan Airport Influence Area.[3] Therefore, the proposed project and potential future development of the off-site affordable housing parcel would not result in a safety hazard for people residing or working in the project area associated with an airport or airstrip.

19.6 LAND USE AND PLANNING/POPULATION AND HOUSING

Consistent with Appendix G of the CEQA Guidelines and the Placer County Environmental Checklist, the proposed project and potential future development of the off-site affordable housing parcel were determined to have no impact with regard to the following issue areas:

[2] California Environmental Protection Agency. *Cortese List Data Resources.* Available at: https://calepa.ca.gov/sitecleanup/corteselist/. Accessed October 2025.

[3] Airport Land Use Commission. *McClellan Air Force Base Comprehensive Land Use Plan*. Amended December 1992.

- Cause economic or social changes that would result in significant adverse physical changes to the environment such as urban decay or deterioration; and/or
- Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.

CEQA does not require an analysis of social issues unless a direct link to the physical environment exists. One way that social issues are typically handled in CEQA documents is to consider the potential for a project to change the socioeconomics of a community, which could lead to physical blight. The proposed project and the potential future development of the off-site affordable housing parcel would construct a residential development within the DCWPCP area, which is primarily characterized by existing residential, agricultural, and vacant land. Neither the proposed project nor the potential future development of the off-site affordable housing parcel would develop retail uses that would result in increased vacancy rates or abandonment of commercial spaces in the project vicinity. Historically, only proposed retail projects or other commercial projects that would be open to the public have generated concerns about urban decay. The concern is that competition from new businesses would cause existing businesses to lose market share, which would then result in business closures and the physical decay of business structures or the geographic areas in which the businesses are located. (See, e.g., *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1204-1213 [two EIRs for proposed Walmart supercenters were inadequate for failing to address the possibility of urban decay resulting from the prospect that existing retailers with higher prices could go out of business]; *Chico Advocates for a Responsible Economy v. City of Chico* (2019) 40 Cal.App.5th 839, 849-852 [substantial evidence supported conclusion in EIR for a proposed grocery store that the project would not result in urban decay]; and *Placerville Historic Preservation League v. Judicial Council of California* (2017) 16 Cal.App.5th 187, 197-200 [substantial evidence supported conclusion in EIR for courthouse relocation project that the reduced number of court employees in Downtown Placerville would not lead to restaurant closures resulting in urban decay].) In contrast, residential projects bring new customers to a geographic area, with resulting benefits to local businesses. Here, the proposed project and potential future development of the off-site affordable housing parcel would be likely to bring economic benefits to existing and future retail and commercial businesses within reasonable driving distances of the sites.

For these reasons, neither the proposed project nor the potential future development of the off-site affordable housing parcel would cause economic or social changes that would result in significant adverse physical changes to the environment such as urban decay or deterioration.

The project site and the off-site affordable housing parcel are currently undeveloped. Thus, the proposed project and potential future development of the off-site affordable housing parcel would not result in the displacement of existing people or housing, necessitating the construction of replacement housing elsewhere, and no impact would occur.

19.7 NOISE

Consistent with Appendix G of the CEQA Guidelines, the proposed project and potential future development of the off-site affordable housing parcel were determined to have no impact with regard to the following issue area:

- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use

airport, exposure of people residing or working in the project area to excessive noise levels.

Neither the proposed project nor the off-site affordable housing parcel is located within the vicinity of a private airstrip, an airport land use plan, or two miles of a public airport or public use airport. The nearest airport relative to the project site and the off-site affordable housing parcel is McClellan Airport, which is located approximately 5.41 miles and 4.74 miles, respectively, to the south of the sites. Therefore, the proposed project and the potential future development of the off-site affordable housing parcel would not expose people residing or working in the project area to excessive noise levels associated with airports.

20. Statutorily Required Sections

20. STATUTORILY REQUIRED SECTIONS

20.1 INTRODUCTION

The Statutorily Required Sections chapter of the Draft EIR includes discussions regarding those topics that are required to be included in an EIR, pursuant to CEQA Guidelines Section 15126.2. The chapter includes a discussion of the proposed project's potential to result in growth-inducing impacts; the cumulative setting analyzed in this EIR; significant irreversible environmental changes; and significant and unavoidable impacts caused by the proposed project.

20.2 GROWTH-INDUCING IMPACTS

State CEQA Guidelines Section 15126.2(e) requires an EIR to evaluate the potential growth-inducing impacts of a proposed project. Specifically, an EIR must discuss the ways in which a proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Growth can be induced in a number of ways, including the elimination of obstacles to growth, or by encouraging and/or facilitating other activities that could induce growth. Examples of projects likely to have growth-inducing impacts include extensions or expansions of infrastructure systems beyond what is needed to serve project-specific demand, and development of new residential subdivisions or office complexes in areas that are currently only sparsely developed or are undeveloped.

The CEQA Guidelines are clear that while an analysis of growth-inducing effects is required, it should not be assumed that induced growth is necessarily significant or adverse. This analysis examines the following potential growth-inducing impacts related to implementation of the proposed project and assesses whether these effects are significant and adverse (see CEQA Guidelines, Section 15126.2[e]):

1. Foster population and economic growth and construction of housing.
2. Eliminate obstacles to population growth.
3. Affect service levels, facility capacity, or infrastructure demand.
4. Encourage or facilitate other activities that could significantly affect the environment.

Foster Population and Economic Growth and Construction of Housing

As discussed in Chapter 13, Land Use and Planning/Population and Housing, of this EIR, the proposed 432-unit single-family and multi-family development would increase the available housing within the Dry Creek-West Placer Community Plan (DCWPCP) area. Using the 2.94 persons/household average household size for the DCWPCP area,[1] the proposed project could house an estimated 1,270 residents. In addition, the proposed project could include 22 accessory dwelling units (ADUs) on-site in order to meet the County's affordable housing requirements. Because the 22 ADUs are anticipated to be smaller than the proposed 212 single-family units, a lower person per household rate of 1.91 persons per household is applied to the ADUs. Thus, the construction of 22 ADUs could result in approximately 42 additional residents within the project site, for a total of 1,312 residents. Under the existing General Plan/DCWPCP land use designations for the site, 80.1 acres of the site are currently designated as Rural-Low Density

[1] ESRI Business Analyst. *Housing Profile, DCWPCP Area*. January 2026.

Residential (RLDR) and zoned Residential Single-Family, combining Agriculture, combining a minimum Building Site of 40,000 square feet, combining Planned Residential Development of one dwelling unit per acre (RS-AG-B-40 PD=1, and 12.1 acres of the site are currently designated as Greenbelt and Open Space (OS) and zoned Open Space, combining Planned Residential Development of one dwelling unit per acre (O PD=1). As the maximum allowable residential density under the RLDR designation is one dwelling unit per acre, approximately 80 single-family residences could be built on the project site under the existing designation, resulting in a population of approximately 235 residents. Thus, the proposed project could result in an increase of approximately 1,035 residents beyond what was previously anticipated for the site by the County based on the existing land use designations.

As discussed within Chapter 3, Project Description, of this EIR, this EIR evaluates two options by which the applicant could satisfy the project's affordable housing requirements, one of which would involve an amendment to the Riolo Vineyard Specific Plan (RVSP) and a rezone of the four-acre off-site affordable housing parcel to Residential Multifamily 30 (RM30), which would result in a maximum development potential of 120 affordable income-restricted units. While this affordable housing option would include a rezone to allow for development of the aforementioned units, the County has previously planned for urban buildout of the off-site affordable housing parcel, as evidenced by the parcel's previous designation of High Density Residential (HDR). The RVSP EIR evaluated development of the off-site affordable housing parcel with 60 HDR units and determined that such development would result in 120 residents. Using the same estimated number of persons per household used within the RVSP EIR, a doubling in HDR units within the off-site affordable housing parcel would result in a total of 240 future residents. Nonetheless, similar to the proposed project, the increase in population that could be generated by potential future development of the off-site affordable housing parcel would still be within the range of growth projections assumed in the DCWPCP and by the Sacramento Area Council of Governments (SACOG) and would not be an introduction of substantial new population.

The new residential population would likely patronize local businesses and services in the area, fostering economic growth. Population growth resulting from the proposed project would be within the Placer County (i.e., DCWPCP) and SACOG growth estimates for the project area. Furthermore, the on-site infrastructure included in the proposed project would be sized to serve only the project site. The proposed project would include increasing emergency storage capacity at the existing Dry Creek/West Placer Community Facilities District (CFD) #1 lift station located approximately 0.53-mile to the south of the project site to meet project demands. All sewer improvements would be consistent with the South Placer Regional Wastewater and Recycled Water Systems Evaluation and would require increasing emergency storage capacity at the existing lift station. However, such improvements would be sized to meet the demands of only planned development and would not foster unplanned population growth.

While construction of the proposed project would result in increased construction employment opportunities, which could potentially result in increased permanent population and demand for housing in the vicinity of the project site, employment patterns of construction workers is such that construction workers would not likely, to any significant degree, relocate their households as a result of the construction-related employment opportunities associated with the proposed project. Although the proposed project would provide short-term employment opportunities, which would likely be filled from the local employee base, with the possible exception of a few household and landscape maintenance jobs, permanent jobs would not be directly created by the proposed project. Therefore, the project would not result in long-term employment growth in the area.

Appendix G of CEQA Guidelines has been recently amended to include inquiries asking whether unplanned population growth would result in potentially significant impacts. However, the occurrence of growth that is planned, and the environmental effects of which have been analyzed in connection with a land use plan or a regional plan, should not be considered in and of itself to be a significant impact. Rather, new development may result in specific impacts in particular categories, such as aesthetics, agricultural lands, air quality, etc. Such impacts may have already been anticipated in environmental documents prepared for earlier planning decisions such as general plans, community plans, and specific plans. Consequently, as discussed in further detail under Impacts 13-4 and 13-6 within Chapter 13, Land Use and Planning/Population and Housing, of this EIR, although the proposed project would result in population growth of the DCWPCP area, such growth would be within the buildout projections for the DCWPCP area, and within growth projections for unincorporated areas within Placer County. As discussed in Chapter 13, development of 432 single-family and multi-family residential units and potentially an additional 22 ADUs, and the associated addition of approximately 1,312 residents, would increase the total current population of the DCWPCP area from 8,352 to approximately 9,664, or a 15.7 percent increase, conservatively assuming that all project residents would be new to the DCWPCP area. However, as discussed in the Existing Environmental Setting section of Chapter 13, the DCWPCP projected that the area's population could grow to as much as 9,836 residents by buildout. In addition, the Sacramento Area Council of Governments (SACOG) 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) identifies the portion of the DCWPCP area, not including the Placer Vineyards Specific Plan (PVSP) and RVSP, as one of the Established Communities within the MTP/SCS study area. As of 2020, Established Communities within Placer County included 21,440 housing units, and such communities are anticipated to grow to 24,200 units by 2035, 24,600 units by 2040, and 30,650 housing units at buildout.[2] Thus, the increase in population that could be generated by the proposed project would still be within the range of growth projections assumed in the DCWPCP and MTP/SCS. In addition, as discussed in Chapter 13, Land Use and Planning/Population and Housing, of this EIR, the potential off-site affordable housing component could result in a doubling in HDR units with a total of 240 future residents. Similar to the proposed project, the increase in population that could be generated by the off-site affordable housing parcel would still be within the range of growth projections assumed in the DCWPCP and by SACOG. Therefore, while the project would foster population and economic growth, such growth would be similar to what has been previously anticipated for the project region, and a less-than-significant impact related to population and economic growth would occur.

Eliminate Obstacles to Population Growth

The elimination of either physical or regulatory obstacles to growth is considered to be a growth-inducing effect. A physical obstacle to growth typically involves the lack of public service infrastructure. The extension of public service infrastructure, including roadways, water mains, and sewer lines, into areas that are not currently provided with these services, would be expected to support new development. Similarly, the elimination or change to a regulatory obstacle, including existing growth and development policies, could result in new growth.

One of the options by which the applicant could satisfy the project's affordable housing requirements would include transferring in fee title to the County an off-site affordable housing parcel, as discussed throughout this EIR. This option would involve a rezone of the off-site affordable housing parcel to the Residential Multifamily 30, combining Design Scenic Corridor

[2] Sacramento Area Council of Governments. *2020 Metropolitan Transportation Plan/Sustainable Communities Strategy*. Adopted November 18, 2019.

(RM30-Dc) zone, which could enable the parcel to be developed by right, depending on the percentage of deed-restricted affordable units included in the future proposal, whereas development of the parcel would currently be considered a discretionary project. Thus, the rezone of the off-site affordable housing parcel could result in the elimination or change to a regulatory obstacle to growth. Nonetheless, this EIR analyzes all of the reasonably foreseeable consequences associated with the future maximum development potential of the off-site affordable housing parcel of 120 affordable income-restricted units.

As discussed in Chapter 15, Public Services and Utilities, of this EIR, the proposed project's water supply infrastructure would include the construction of a 12-inch loop system within the Estia Dry Creek development. In addition, the proposed project would include four- to 12-inch internal water lines for domestic water service and fire/hydrant connections. Internal water lines would connect to an existing 16-inch line in Walerga Road and an existing 24-inch line in Baseline Road. Additionally, the potential development of the off-site affordable housing parcel by the future developer would include the installation of new water pipelines that would connect to existing infrastructure in the vicinity. California American Water's (CAL-AM) existing water main infrastructure is anticipated to be sufficiently sized to accommodate the increased demand from the proposed project and the off-site affordable housing parcel, and the construction of new or expanded water conveyance infrastructure beyond the improvements noted above necessary to serve the proposed project and off-site affordable housing parcel would not be required. Water conveyance infrastructure needed for the proposed project would be financed by the project applicant, and required water line improvements for the off-site affordable housing parcel would be constructed by the future affordable housing developer. Consequently, the construction of on-site water infrastructure would not be anticipated to result in elimination of obstacles to population growth.

As discussed above, the proposed upgrades to the existing off-site CFD #1 lift station would be designed to serve the proposed project, as well as future planned development within the CFD #1 lift station sewer shed. All sewer improvements would be consistent with the South Placer Regional Wastewater and Recycled Water Systems Evaluation. Similar to the proposed project, future development projects throughout the project region would be required to evaluate project-specific impacts on wastewater conveyance infrastructure, such as the CFD #1 lift station. Thus, the proposed improvements to the CFD #1 lift station would not be anticipated to result in elimination of obstacles to unplanned population growth. The project site is located outside of existing Placer County Sewer Service Districts. Thus, the entitlements for the proposed project include a request for annexation into County Service Area (CSA) 28, Zone 173, for sanitary sewer service, subject to approval by the Placer County Board of Supervisors. In addition, existing infrastructure in the vicinity of the off-site affordable housing parcel would be used to provide wastewater service to the off-site affordable housing development, and the potential future development of the off-site affordable housing parcel would not require major relocation or expansion of any wastewater infrastructure. Therefore, the construction of wastewater infrastructure on the off-site affordable housing parcel would not be anticipated to result in elimination of obstacles to population growth.

In addition, as discussed in Chapter 3, Project Description, of this EIR, the proposed project would include roadway improvements in the project vicinity which would be designed to serve the proposed project, as well as future planned development within the project site vicinity. Thus, the proposed roadway improvements would not be anticipated to result in elimination of obstacles to unplanned population growth.

Although implementation of the aforementioned sewer and roadway improvements may be considered to eliminate obstacles to growth, such improvements are essential to support the proposed project, and the improvements would not eliminate obstacles to growth in a manner that would encourage previously unplanned growth.

Affect Service Levels, Facility Capacity, or Infrastructure Demand

Increases in population that would occur as a result of a proposed project may tax existing community service facilities, requiring construction of new facilities that could cause significant environmental impacts. As discussed in Chapter 15, Public Services and Utilities, of this EIR, increased demands for public services, including fire and police protection services, attributable to the proposed project and off-site affordable housing parcel would not necessitate the construction of new or expanded facilities that could cause significant environmental impacts. In addition, as discussed in Chapter 15, Public Services and Utilities, of this EIR, wastewater generated by the proposed project and the potential future development of the off-site affordable housing parcel can be accommodated by existing wastewater treatment facilities and infrastructure at the Dry Creek Wastewater Treatment Plant (WWTP), and, with the proposed upgrades to the off-site CFD #1 lift station, adequate conveyance capacity exists for the proposed project's sanitary sewer flows. In addition, existing water supply infrastructure would be sufficient to accommodate the domestic and fire flow demands associated with the proposed project and the potential future development of the off-site affordable housing parcel.

The landfill that would serve the proposed project and off-site affordable housing parcel has adequate capacity to manage the solid waste generated as a result of the project. Furthermore, mitigation measures set forth in Chapter 12, Hydrology and Water Quality, of this EIR would ensure that the proposed project and the potential future development of the off-site affordable housing parcel would not create or contribute runoff water that would exceed the capacity of the County's stormwater drainage systems. Therefore, the proposed project and the potential future development of the off-site affordable housing parcel would not increase population such that service levels, facility capacity, or infrastructure demand would require construction of new facilities that could cause significant environmental impacts.

Encourage or Facilitate other Activities That Could Significantly Affect the Environment

This EIR provides a comprehensive assessment of the potential for environmental impacts associated with implementation of the proposed project and the potential future development of the off-site affordable housing parcel. Please refer to Chapters 4 through 18 of this EIR, which comprehensively address the potential for impacts from urban development on the project site and the off-site affordable housing parcel.

20.3 CUMULATIVE IMPACTS

CEQA Guidelines, Section 15130 requires that an EIR discuss the cumulative and long-term effects of the proposed project that would adversely affect the environment. "Cumulative impacts" are defined as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts" (CEQA Guidelines, Section 15355). "[I]ndividual effects may be changes resulting from a single project or a number of separate projects" (CEQA Guidelines, Section 15355, subd. [a]). "The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future

projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time" (CEQA Guidelines, Section 15355, subd. [b]).

The need for cumulative impact assessment reflects the fact that, although a project may cause an "individually limited" or "individually minor" incremental impact that, by itself, is not significant, the increment may be "cumulatively considerable," and, thus, significant, when viewed together with environmental changes anticipated from past, present, and probable future projects (CEQA Guidelines, Section 15064, subd. [h(1)], Section 15065, subd. [c], and Section 15355, subd. [b]). Accordingly, particular impacts may be less than significant on a project-specific basis but significant on a cumulative basis if their small incremental contribution, viewed against the larger backdrop, is cumulatively considerable. However, CEQA Guidelines, Section 15064, subdivision (h)(5) states, "[…]the mere existence of significant cumulative impacts caused by other projects alone shall not constitute substantial evidence that the proposed project's incremental effects are cumulatively considerable." Therefore, even where cumulative impacts are significant, any level of incremental contribution is not necessarily deemed cumulatively considerable.

Section 15130(b) of CEQA Guidelines indicates that the level of detail of the cumulative analysis need not be as great as for the project impact analyses, but that analysis should reflect the severity of the impacts and their likelihood of occurrence, and that the analysis should be focused, practical, and reasonable. To be adequate, a discussion of cumulative effects must include the following elements:

> (1) Either (a) a list of past, present and probable future projects, including, if necessary, those outside the agency's control, or (b) a summary of projections contained in an adopted general plan or related planning document, or in a prior certified EIR, which described or evaluated regional or area-wide conditions contributing to the cumulative impact, provide that such documents are reference and made available for public inspection at a specified location;
>
> (2) A summary of the individual projects' environmental effects, with specific reference to additional information and stating where such information is available; and
>
> (3) A reasonable analysis of all of the relevant projects' cumulative impacts, with an examination of reasonable, feasible options for mitigating or avoiding the project's contribution to such effects (Section 15130[b]).

For some projects, the only feasible mitigation measures will involve the adoption of ordinances or regulations, rather than the imposition of conditions on a project-by-project basis (Section 15130[c]). Section 15130(a)(3) states that an EIR may determine that a project's contribution to a significant cumulative impact will be rendered less than cumulatively considerable, and thus not significant, if a project is required to implement or fund the project's fair share of a mitigation measure or measures designed to alleviate the cumulative impact.

A discussion of cumulative impacts is provided within each of the technical chapters of this EIR pursuant to CEQA Guidelines Section 15130.

Cumulative Setting

The lead agency should define the relevant geographic area of inquiry for each impact category (id., Section 15130, subd. [b][3]), and should then identify the universe of "past, present, and probable future projects producing related or cumulative impacts" relevant to the various categories, either through the preparation of a "list" of such projects or through the use of "a

summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or area wide conditions contributing to the cumulative impact" (id., subd. [b][1]).

The majority of the cumulative analysis in this section is based upon a summary of projections contained in the DCWPCP, as well as other reasonably foreseeable projects within the project region. Such projects include, but are not limited to, the Placer Vineyards Specific Plan, RVSP, Sierra Vista Specific Plan, Baseline Marketplace, the Double S Ranch Project, the Creekview Ranch Project, The Ranch Project, and Mill Creek Project. Limited situations exist where geographic setting differs between project chapter analysis within a particular region. Examples include hydrology, for which the cumulative geographic setting is generally limited to the 689.18-acre Dry Creek Walerga Road Tributary drainage shed. Another example is air quality, for which the cumulative geographic setting is the Sacramento Valley Air Basin (SVAB). Global climate change is, by nature, a cumulative impact, and greenhouse gas (GHG) emissions contribute, on a cumulative basis, to the significant adverse environmental impacts of global climate change (e.g., sea level rise, more extreme weather patterns, impacts to water supply and water quality, public health impacts, impacts to ecosystems, impacts to agriculture, and other environmental impacts). A single project could not generate enough GHG emissions to contribute noticeably to a change in the global average temperature. However, the combination of GHG emissions from a project in combination with other past, present, and future projects could contribute substantially to the world-wide phenomenon of global climate change and the associated environmental impacts. Although the geographical context for global climate change is the Earth, for analysis purposes under CEQA, and due to the regulatory context pertaining to GHG emissions and global climate change applicable to the proposed project, the geographical context for global climate change in this EIR is limited to the State of California.

20.4 SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES

CEQA Guidelines Section 15126.2(d) identifies an impact category that sometimes must be addressed in EIRs: significant irreversible environmental changes that would be caused by the proposed project, should the project be implemented. CEQA Guidelines Section 15127 states that this impact category need be included only in EIRs prepared in connection with certain categories of projects, one of which is "[t]he adoption, amendment, or enactment of a plan, policy, or ordinance of a public agency." Although the proposed project is not itself a plan, policy, or ordinance, the proposed project does propose amendments to the Placer County General Plan, DCWPCP, and the RVSP. For this reason, the County has conservatively chosen to address this impact category.

An impact would be determined to be a significant and irreversible change in the environment if:

- Buildout of the project area could involve a large commitment of nonrenewable resources;
- The primary and secondary impacts of development could generally commit future generations to similar uses (e.g., a highway provides access to a previously remote area);
- Development of the proposed project could involve uses in which irreversible damage could result from any potential environmental accidents associated with the project; or
- The phasing and eventual development of the project could result in an unjustified consumption of resources (e.g., the wasteful use of energy).

The proposed project would likely result in, or contribute to, the following significant irreversible environmental changes:

- Conversion of predominantly vacant land to a fully built-out residential community, thus precluding alternative land uses in the future;
- Irreversible consumption of goods and services, such as fire, police, and school services, associated with the future population; and
- Irreversible consumption of energy and natural resources, such as water, electricity, and natural gas, associated with the future residents.

If the Placer County Board of Supervisors chooses to approve the proposed project, the Board will be concluding that the irreversible environmental changes, and the natural resource consumption that accompanies them, are justified in light of the economic, social, or other benefits that the Board might invoke in approving the project. For example, the Board might conclude that the economic and social benefits created by 432 new homes and 22 new ADUs, or the potential future development of 120 affordable housing units within the off-site affordable housing parcel justify the irretrievable loss of environmental and natural resources.

20.5 SIGNIFICANT AND UNAVOIDABLE IMPACTS

According to CEQA Guidelines, an EIR must include a description of those impacts identified as significant and unavoidable should the proposed action be implemented (CEQA Guidelines Section 15126.2[c]). Such impacts would be considered unavoidable when the determination is made that either mitigation is not feasible or only partial mitigation is feasible such that the impact is not reduced to a level that is less-than-significant. This section identifies the significant impact that could not be eliminated or reduced to a less-than-significant level by mitigations imposed by the County. The final determination of the significance of impacts and the feasibility of mitigation measures would be made by the County as part of the County's certification action. The significant and unavoidable impact of the proposed project is summarized below.

Generation of a substantial temporary increase in ambient noise levels in noise-sensitive locations in the vicinity of the project or a substantial temporary increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. (Impact 14-1)

Development of the proposed project and potential future development of the off-site affordable housing parcel would be required to comply with Placer County Code and DCWPCP policies related to noise, which would ensure that the proposed project restricts noise sources associated with construction activities to specific hours and requires that all construction equipment be fitted with factory-installed muffling devices and maintained in good working order. However, according to the Noise Report prepared for the proposed project, the proposed project would likely require nighttime work on off-site utility lines and traffic signals at three different locations to minimize daytime traffic circulation impacts on Walerga Road and Baseline Road. The nighttime construction activities could result in exterior noise level increases greater than five decibels (dB) above ambient levels and interior noise levels above 45 dB. In addition, constructing temporary sound walls consistent with Mitigation Measure 14-1(a) along the existing single-family residences on Springhill Drive would not be feasible due to the existing topography. Based on the above and given that the project site and off-site affordable housing parcel are located near existing sensitive receptors, according to the Noise Report, construction activities could result in exterior noise level increases greater than five dB above ambient levels and interior noise levels above 45 dB. Therefore, a significant and unavoidable impact would occur.

21. Alternatives Analysis

21. ALTERNATIVES ANALYSIS

21.1 INTRODUCTION

The Alternatives Analysis chapter of the EIR includes consideration and discussion of a range of reasonable alternatives to the proposed project, as required per CEQA Guidelines Section 15126.6. Generally, the chapter includes discussions of the following: the purpose of an alternatives analysis; alternatives considered but dismissed; a reasonable range of project alternatives and their associated impacts in comparison to the proposed project's impacts; and the environmentally superior alternative.

21.2 PURPOSE OF ALTERNATIVES

The primary intent of the alternatives evaluation in an EIR, as stated in Section 15126.6(a) of the CEQA Guidelines, is to "[…] describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives." CEQA Guidelines Section 15364 defines "feasible" as:

> [...]capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social and technological factors.

Section 15126.6(f) of CEQA Guidelines states, "The range of alternatives required in an EIR is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice." Section 15126.6(f) of CEQA Guidelines further states:

> The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project. Of those alternatives, the EIR need examine in detail only the ones that the lead agency determined could feasibly attain most of the basic objectives of the project.

In addition, an EIR is not required to analyze alternatives when the effects of the alternative "cannot be reasonably ascertained and whose implementation is remote and speculative."

The CEQA Guidelines provide the following guidance for discussing alternatives to a proposed project:

- An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project, but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives (CEQA Guidelines Section 15126.6[a]).

- Because an EIR must identify ways to mitigate or avoid the significant effects that a project may have on the environment (Public Resources Code [PRC] Section 21002.1), the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if

these alternatives would impede to some degree the attainment of the project objectives, or would be more costly (CEQA Guidelines Section 15126.6[b]).

- The EIR should briefly describe the rationale for selecting the alternatives to be discussed. The EIR should also identify any alternatives that were considered by the lead agency but were rejected as infeasible during the scoping process and briefly explain the reasons underlying the lead agency's determination […] Among the factors that may be used to eliminate alternatives from detailed consideration in an EIR are: (i) failure to meet most of the basic project objectives, (ii) infeasibility, or (iii) inability to avoid significant environmental impacts (CEQA Guidelines Section 15126.6[c]).

- The EIR shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. A matrix displaying the major characteristics and significant environmental effects of each alternative may be used to summarize the comparison (CEQA Guidelines Section 15126.6[d]).

- If an alternative would cause one or more significant effects in addition to those that would be caused by the project as proposed, the significant effects of the alternative shall be discussed, but in less detail than the significant effects of the project as proposed (CEQA Guidelines Section 15126.6[d]).

- The specific alternative of "no project" shall also be evaluated along with its impact. The purpose of describing and analyzing a no project alternative is to allow decision-makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project. The no project alternative analysis is not the baseline for determining whether the proposed project's environmental impacts may be significant, unless it is identical to the existing environmental setting analysis which does establish that baseline (CEQA Guidelines Section 15126.6[e][1]).

- If the environmentally superior alternative is the "no project" alternative, the EIR shall also identify an environmentally superior alternative among the remaining alternatives (CEQA Guidelines Section 15126.6[e][2]).

Project Objectives

Based on the above, reasonable alternatives to the project must be capable of feasibly attaining most of the basic objectives of the project. As set forth in Chapter 3, Project Description, of this EIR, the project's underlying purpose is to address statewide and regional housing shortages through a project plan and design that increases the residential holding capacity of the Dry Creek-West Placer Community Plan (DCWPCP) while preserving key on-site open space and biological values and avoiding or minimizing land use conflicts with surrounding land uses. The following project objectives are consistent with this underlying purpose:

1. Create a high-quality neighborhood environment containing a mix of residential, open space, and recreational land uses.
2. Develop a well-designed, economically feasible residential community that consists of a variety of residential products and unit types.
3. Offer an amenity-rich residential community that offers modern amenities and open spaces for residents, such as trails, parks, recreational areas, and gathering spaces.

4. Provide a comprehensively planned project that protects sensitive environmental habitat and resources, including existing riparian and oak woodland habitat on the project site, within a permanent greenbelt area providing a significant public benefit.
5. Use land resources efficiently by providing a well-planned development on an underutilized vacant site.
6. Promote pedestrian-oriented development, providing medium and high-density housing on a major transportation corridor and within walking distance of places of business and employment.
7. Provide a well-designed residential community with neighborhood identity in close proximity to jobs and services in Placer and Sacramento counties.
8. Increase the supply and diversity of housing types in the DCWPCP area that can support a wider range of lifestyles, consistent with the goals and policies of the County's Housing Element.
9. Assist in providing affordable housing and complying with Regional Housing Needs Allocation (RHNA) requirements by conveying a four-acre affordable housing site within the Riolo Vineyards Specific Plan area to Placer County.
10. Create a development of a density, scale and character that complements and is supportive of surrounding development.
11. Design a residential neighborhood that complements surrounding/existing neighborhoods by incorporating compatible land uses, lot sizes, street layouts while providing smooth transitions to adjacent neighborhoods through the appropriate setbacks, landscaping, and open space features; and establishing logical roadway and pedestrian connections consistent with the County's design principles.

Impacts Identified in the EIR

In addition to attaining the majority of project objectives, reasonable alternatives to the project must be capable of substantially lessening, or avoiding, identified significant environmental impacts of the proposed project. The significance level of impacts identified in the EIR are presented below.

Less Than Significant or No Impact

As discussed in each respective section of this EIR, the proposed project would result in no impact or a less-than-significant impact related to the following topics associated with the resource area indicated, and mitigation would not be required:

- ***Aesthetics.*** The EIR determined that a less-than-significant impact would occur related to the proposed project having a substantial adverse effect on a scenic vista. The EIR also determined that a less-than-significant impact would occur related to the proposed project conflicting with applicable zoning and other regulations governing scenic quality associated with cumulative development of the proposed project in combination with future buildout of the DCWPCP area. In addition, the EIR determined that the proposed project would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway, and no impact would occur.

- ***Agricultural Resources.*** The EIR determined that the proposed project would result in no impact or less-than-significant impacts for all issues related to agricultural resources, including cumulative impacts.

- ***Air Quality and Greenhouse Gas Emissions.*** The EIR determined that the proposed project would result in a less-than-significant impact related to exposing sensitive receptors to substantial pollutant concentrations. In addition, the EIR determined that the proposed project would result in a less-than-significant impact related to resulting in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

- ***Biological Resources.*** The EIR determined that implementation of the proposed project would result in a less-than-significant impact related to interfering substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impeding the use of native wildlife nursery sites. In addition, the EIR determined that the proposed project would result in a less-than-significant impact related to conflicting with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan. Furthermore, the proposed project's incremental contribution to the cumulative loss of habitat for special-status species was determined to be less than cumulatively considerable.

- ***Cultural Resources.*** The EIR determined that the proposed project would result in a less-than-significant impact related to causing a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines, Section 15064.5. In addition, impacts related to causing a cumulative loss of cultural resources were determined to be less than significant.

- ***Energy.*** The EIR determined that the proposed project would result in less-than-significant impacts for all issues related to energy, including cumulative energy impacts.

- ***Geology and Soils.*** The EIR determined that impacts related to directly or indirectly causing potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure, including liquefaction and landslides, would be less than significant. In addition, the EIR determined that impacts related to having soils incapable of supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater would not occur. Similarly, the EIR determined that impacts related to resulting in exposure of people or property to geologic and geomorphological (i.e., Avalanches) hazards, such as earthquakes, landslides, mudslides, seismic-related ground failure, or similar hazards, would not occur. The EIR also determined that no impact would occur related to resulting in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State, or resulting in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan. Furthermore, impacts related to cumulative increases in the potential for geological related impacts and hazards were determined to be less than significant.

- ***Hazards and Hazardous Materials.*** The EIR determined that the proposed project would result in no impact or less-than-significant impacts for all issues related to hazards and hazardous materials, including cumulative impacts.

- ***Hydrology and Water Quality.*** The EIR determined that impacts related to substantially decreasing groundwater supplies or interfering substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin or conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan, as well as the proposed project's incremental contribution to the significant cumulative impact related to water quality and drainage, would be less than significant.

- ***Land Use and Planning/Population and Housing.*** The EIR determined that the proposed project would result in no impact or less-than-significant impacts for all issues related to land use and planning and population and housing, including cumulative impacts.

- ***Noise.*** The EIR determined that the proposed project would result in a less-than-significant impact related to the generation of a substantial permanent increase in ambient noise levels in noise-sensitive locations in the vicinity of the project or generation of a substantial permanent increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. In addition, the EIR determined that the proposed project would have a less-than-significant impact related to the exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels. The EIR also determined that the proposed project would have no impact related to being located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels. Furthermore, the EIR determined that impacts related to the generation of a substantial permanent increase in ambient noise levels associated with cumulative development of the proposed project in combination with future buildout of the DCWPCP would be less than significant.

- ***Public Services and Utilities.*** The EIR determined that the proposed project would result in less-than-significant impacts related to resulting in substantial adverse physical impacts associated with the provision of new or physically altered governmental services and/or facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection services, maintenance of public facilities, including roads, or other government services, and school services and/or facilities. Furthermore, the EIR determined that the proposed project would result in a less-than-significant impact related to resulting in an increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated, or include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment. The EIR also determined that the proposed project would result in a less-than-significant impact related to generating solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impairing the attainment of solid waste reduction goals, or conflict with federal, State, and local management and reduction statutes and regulations related to solid waste. A less-than-significant cumulative impact was identified related to public services as well as related to resulting in an increase in demand for utilities and service systems associated with the proposed project in combination with future buildout in the DCWPCP area.

- ***Transportation.*** The EIR determined that impacts related to conflicting with a program, plan, ordinance, or policy, except level of service (LOS), addressing the circulation system, including transit, roadway bicycle, and pedestrian facilities, during operations would be less-than-significant. In addition, the EIR determined that a less-than-significant impact would occur related to a substantial increase in hazards to vehicle safety due to a geometric design feature or incompatible uses, as well as related to resulting in inadequate emergency access or access to nearby uses. Furthermore, the EIR determined that the proposed project would not result in vehicle miles traveled (VMT) which exceeds an applicable threshold of significance, except as provided in CEQA Guidelines Section 15064.3, subdivision (b), and a less-than-significant impact would occur.

- ***Tribal Cultural Resources.*** The EIR determined that impacts related to causing a cumulative loss of tribal cultural resources would be less-than-significant.

- ***Wildfire.*** The EIR determined that the proposed project would result in less-than-significant impacts for all issues related to wildfire, including cumulative impacts.

As stated above, reasonable alternatives to the project must be capable of substantially lessening, or avoiding, identified significant environmental impacts of the proposed project. Because the proposed project would not result in significant impacts related to the resource areas listed above, a comparison of potential impacts associated with the aforementioned resource areas as a result of project alternatives versus the proposed project is not provided in this chapter. Rather, this chapter focuses on those resource areas and specific impacts listed below that have been identified for the proposed project as requiring mitigation to reduce significant impacts to less than significant, or have been found to remain significant and unavoidable.

Less Than Significant with Mitigation

Environmental impacts (including cumulative impacts) of the proposed project that have been identified as requiring mitigation measures to ensure that the level of significance is ultimately less than significant include the following:

- ***Aesthetics.*** Consistent with the findings of the Riolo Vineyards Specific Plan (RVSP) EIR, this EIR determined that potential future development of the off-site affordable housing parcel could conflict with applicable zoning and other regulations governing scenic quality. In addition, because the types of lighting and the specific locations have not yet been determined, implementation of the proposed project could create a new source of substantial light or glare which would adversely affect day or nighttime views in the area. Furthermore, the EIR determined that the proposed project's contribution to the significant cumulative impact related to light and glare associated with cumulative development of the DCWPCP area would be cumulatively considerable. However, the EIR requires mitigation in order to ensure that the aforementioned project-specific impacts are reduced to less-than-significant levels, and the project's incremental contribution to the significant cumulative impact is less than cumulatively considerable.

- ***Air Quality and Greenhouse Gas Emissions.*** Consistent with the findings of the RVSP EIR, this EIR determined that potential future development of the off-site affordable housing parcel could conflict with or obstruct implementation of the applicable air quality plan during project construction and operation. In addition, the EIR determined that the

off-site affordable housing parcel could result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors). Furthermore, potential future development of the off-site affordable housing parcel could result in the generation of greenhouse gas (GHG) emissions that may have a significant impact on the environment or conflict with an applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of GHGs. However, the EIR requires mitigation in order to ensure that the aforementioned impacts related to air quality and GHG emissions would be less than significant.

- ***Biological Resources.*** The EIR determined that implementation of the proposed project could result in potential adverse effects to special-status plants, Crotch's bumble bee, special-status branchiopods, valley elderberry longhorn beetle (VELB), western spadefoot, northwestern pond turtle, roosting bats, Swainson's hawk, burrowing owl, and nesting songbirds and raptors protected under the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (CFGC) either directly (e.g., threaten to eliminate a plant community or cause a wildlife population to drop below self-sustaining levels or threaten to eliminate an animal community), or through substantial habitat modifications or substantial reduction in the number or range of the species. In addition, the project could have a substantial adverse effect on riparian habitat or other sensitive natural communities identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife (CDFW) or the U.S. Fish and Wildlife Service (USFWS) and/or have a substantial adverse effect on federal or State protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means. The EIR also determined that the proposed project could conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, or have a substantial adverse effect on the environment by converting oak woodlands or impacting individual trees. The EIR requires mitigation in order to ensure that all of the aforementioned impacts related to biological resources would be reduced to less-than-significant levels.

- ***Cultural Resources.*** The EIR determined that implementation of the proposed project could cause a substantial adverse change in the significance of a unique archaeological resource pursuant to CEQA Guidelines, Section 15064.5, or disturb human remains, and would have the potential to cause a physical change which would affect unique ethnic cultural values, or restrict existing religious or sacred uses within the potential impact area. However, the EIR requires mitigation in order to ensure that the aforementioned impacts related to cultural resources would be less than significant.

- ***Geology and Soils.*** The EIR determined that implementation of the proposed project could result in short-term construction related impacts associated with soil erosion and the loss of topsoil. The EIR also determined that the proposed project could result in impacts related to being located on a geological unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site lateral spreading, subsidence, or collapse, or being located on expansive soil, as defined in Table 18-1B of the Uniform Building Code. In addition, the EIR determined that implementation of the proposed project could result in directly or indirectly destroying a unique paleontological resource or site or unique geologic feature. Furthermore, the EIR determined that the

proposed project could result in significant disruptions, displacements, compaction, or overcrowding of the soil, or substantial change in topography or ground surface relief features. However, the EIR requires mitigation in order to ensure that the aforementioned impacts are reduced to less-than-significant levels.

- ***Hydrology and Water Quality.*** The EIR determined that implementation of the proposed project could result in potential construction and operational impacts related to the violation of water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality. In addition, the EIR determined that the proposed project could substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site; or create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff either during construction or in the post-construction condition. Similarly, the EIR determined that the proposed project could substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows or expose people or structures to risk of loss, injury or death involving flooding through the placement of housing in a flood hazard area, or risk release of pollutants due to project inundation. However, the EIR requires mitigation in order to ensure that the aforementioned impacts related to hydrology and water quality are reduced to less-than-significant levels.

- ***Public Services and Utilities.*** Consistent with the findings of the RVSP EIR, this EIR determined that potential future development of the off-site affordable housing parcel could result in substantial adverse physical impacts associated with the provision of new or physically altered governmental services and/or facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for law enforcement services. In addition, the EIR determined that potential future development of the off-site affordable housing parcel could require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects, as well as a potential impact related to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years. Furthermore, the EIR determined that potential future development of the off-site affordable housing parcel could result in a determination by the wastewater treatment provider which serves or may serve the project that it does not have adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

- ***Transportation.*** The EIR determined that implementation of the proposed project could conflict with a program, plan, ordinance, or policy, except LOS, addressing the circulation system during construction activities. However, the EIR requires mitigation in order to ensure that the aforementioned impact is reduced to a less-than-significant level.

- ***Tribal Cultural Resources.*** The EIR determined that implementation of the proposed project could cause a substantial adverse change in the significance of a tribal cultural resource, as defined in PRC Section 21074. However, the EIR requires mitigation in order to ensure that the aforementioned impact is reduced to a less-than-significant level.

Significant and Unavoidable

The EIR has determined that the following project impact would remain significant and unavoidable, even after implementation of the feasible mitigation measures set forth in this EIR:

- ***Noise.*** The EIR determined that, even with the implementation of mitigation, impacts related to the generation of a substantial temporary increase in ambient noise levels during construction of the proposed project in noise-sensitive locations in the vicinity of the project or a substantial temporary increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, would be significant and unavoidable.

21.3 SELECTION OF ALTERNATIVES

The requirement that an EIR evaluate alternatives to the proposed project or alternatives to the location of the proposed project is a broad one; the primary intent of the alternatives analysis is to disclose other ways that most of the basic objectives of the project could be attained, while reducing the magnitude of, or avoiding, one or more of the significant environmental impacts of the proposed project. Alternatives that are included and evaluated in the EIR must be feasible alternatives. However, the CEQA Guidelines require the EIR to "set forth only those alternatives necessary to permit a reasoned choice." As stated in Section 15126.6(a), an EIR need not consider every conceivable alternative to a project. Rather, it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation. The CEQA Guidelines provide a definition for "a range of reasonable alternatives" and thus limit the number and type of alternatives that may need to be evaluated in a given EIR. According to the CEQA Guidelines Section 15126.6(f):

> The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project. Of those alternatives, the EIR need examine in detail only the ones that the lead agency determined could feasibly attain most of the basic objectives of the project.

First and foremost, alternatives in an EIR must be feasible. In the context of CEQA Guidelines Section 21061.1, "feasible" is defined as:

> ...capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social and technological factors.

Finally, an EIR is not required to analyze alternatives when the effects of the alternative "cannot be reasonably ascertained and whose implementation is remote and speculative."

In the context of Draft EIR preparation, "feasible" really means "*potentially* feasible." Importantly, the inclusion of an alternative in an EIR is not evidence that it is feasible as a matter of law, but rather reflects the judgment of lead agency staff that the alternative is potentially feasible. The final determination of *actual* feasibility will be made by the lead agency decision-making body through the adoption of CEQA Findings at the time of action on the project. (See CEQA

Guidelines, Section 15091[a][3] [findings requirement, where alternatives can be rejected as infeasible].)

As the courts have explained, "[t]he issue of feasibility arises at two different junctures: (1) in the assessment of alternatives in the EIR and (2) during the agency's later consideration of whether to approve the project." (*California Native Plant Society v. City of Santa Cruz* [2009] 177 Cal.App.4th 957, 981 [*CNPS*], citing *Mira Mar Mobile Community v. City of Oceanside* [2004] 119 Cal.App.4th 477, 489 [*Mira Mar*].) "But 'differing factors come into play at each stage.'" (*CNPS*, *supra*, 177 Cal.App.4th at p. 981.) "For the first phase—inclusion in the EIR—the standard is whether the alternative is potentially feasible." (*CNPS*, *supra*, 177 Cal.App.4th at p. 981, citing *Mira Mar*, supra, 119 Cal.App.4th at p. 489; CEQA Guidelines, § 15126.6, subd. [a].) "By contrast, at the second phase—the final decision on project approval—the decision-making body evaluates whether the alternatives are actually feasible." (*CNPS*, *supra*, 177 Cal.App.4th at p. 981, citing CEQA Guidelines, Section 15091, subd. [a][3].) "At that juncture, the decisionmakers may reject as infeasible alternatives that were identified in the EIR as potentially feasible." (*CNPS*, *supra*, 177 Cal.App.4th at p. 981, citing *Mira Mar*, *supra*, 119 Cal.App.4th at p. 489.)

One basis on which agency decisionmakers can reject a potentially feasible alternative as being actually infeasible is a determination that the alternative is *economically* infeasible. To demonstrate this kind of infeasibility, the decisionmakers must conclude, based on substantial evidence in the record, that "the marginal costs of the alternative as compared to the cost of the proposed project are so great that a reasonably prudent property owner would not proceed with the [alternative]." (*Uphold Our Heritage v. Town of Woodside* [2007] 147 Cal.App.4th 587, 600.) The reduction in profits or additional costs associated with an alternative, compared with those of the proposed project, must be enough to deter the reasonably prudent investor from proceeding with the alternative. (*San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* [2002] 102 Cal.App.4th 656, 693-694.)

Another basis by which decisionmakers may reject a potentially feasible alternative as actually infeasible is a determination that the alternative embodies an undesirable outcome from a policy standpoint. In this vein, decisionmakers may legitimately consider whether particular alternatives, compared with a proposed project, represent an undesirable balance of competing policy considerations or fail to attain project objectives to the same degree as a proposed project. (See *City of Del Mar v. City of San Diego* [1982] 133 Cal.App.3d 410, 417 ["'feasibility' under CEQA encompasses 'desirability' to the extent that desirability is based on a reasonable balancing of the relevant economic, environmental, social, and technological factors"]; *CNPS*, *supra*, 177 Cal.App.4th at p. 1001 [same]; *San Diego Citizenry Group v. County of San Diego* [2013] 219 Cal.App.4th 1, 17 [same]; *Sierra Club v. County of Napa* [2004] 121 Cal.App.4th 1490, 1506-1509 [upholding CEQA findings rejecting alternatives in reliance on applicant's project objectives]; *Citizens for Open Government v. City of Lodi* (2012) 296 Cal.App.4th 296, 314-315 [court upholds agency action where alternative selected "entirely fulfill" a particular project objective and "would be 'substantially less effective' in meeting" the lead agency's "goals"]; and *In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings* [2008] 43 Cal.4th 1143, 1165, 1166 ["feasibility is strongly linked to achievement of each of the primary program objectives"; "a lead agency may structure its EIR alternative analysis around a reasonable definition of underlying purpose and need not study alternatives that cannot achieve that basic goal"].)

Alternatives Considered But Dismissed From Further Analysis

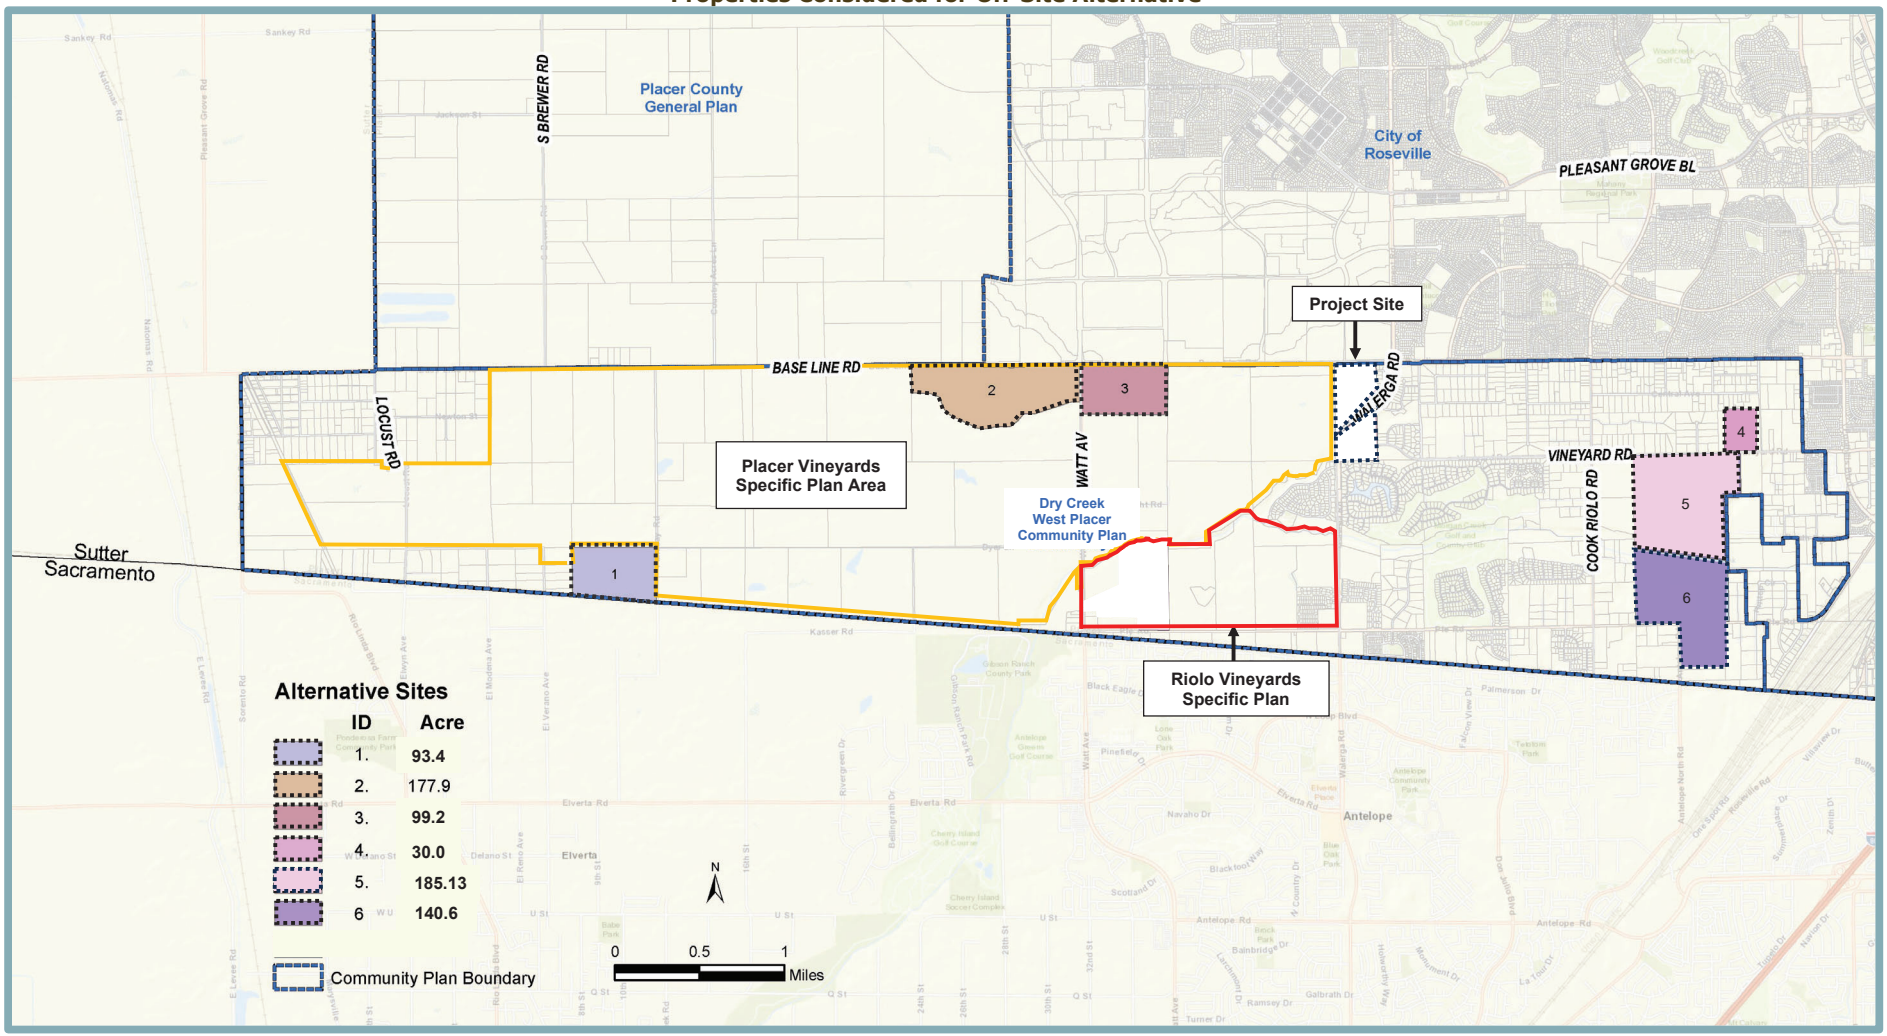
Consistent with CEQA, primary consideration was given to alternatives that could reduce significant project impacts, while still meeting most of the basic project objectives.

As stated in Guidelines Section 15126.6(c), among the factors that may be used to eliminate alternatives from detailed consideration in an EIR are:

(i) failure to meet most of the basic project objectives,
(ii) infeasibility, or
(iii) inability to avoid significant environmental impacts.

Regarding item (ii), infeasibility, among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries (projects with a regionally significant impact should consider the regional context), and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site (or the site is already owned by the proponent). No one of these factors establishes a fixed limit on the scope of reasonable alternatives.

The off-site alternative was considered but dismissed from detailed analysis in this EIR. The reason(s) for dismissal, within the context of the three above-outlined permissible reasons, are provided below.



Off-Site Alternative

The possibility of an off-site location was considered as an alternative to the proposed project. The County's Geographic Information System (GIS) database was consulted to provide information regarding vacant properties in the DCWPCP of sufficient size to accommodate the proposed project. The locations of such properties are illustrated in Figure 21-1 below.

In considering sites potentially available for future development, the objectives of the proposed project were used to assess the suitability of available sites. Site 2 was dismissed from further analysis, as a Small Lot Vesting Tentative Subdivision Map with 225 single-family lots was approved by the County for the parcel. In addition, Site 5, shown on the map, was dismissed from further analysis, as The Ranch Project was approved for that site. Site 6 has also been dismissed from further analysis, as the Creekview Ranch Project was approved by the County for the site and is under construction.

Site 1 (93.4 acres) is located outside of a Specific Plan area. Access to the property is limited, as compared to the proposed project. The primary access road, Palladay Road, is a very narrow roadway that transitions to an unmaintained dirt road along the parcel's eastern boundary. Furthermore, Parcel 1 is made up of agricultural land interspersed with sensitive drainage features. As such, biological and agricultural resource impacts would be expected to be similar or increased compared to the proposed project. In addition, the cost of providing infrastructure to the site is reasonably anticipated to render development of the proposed project at Site 1 infeasible.

Figure 21-1
Properties Considered for Off-Site Alternative

* Figure not OCR Compatible

Site 3 (99.2 acres) is located within the Placer Vineyards Specific Plan (PVSP) area. A small lot map has not yet been approved for Parcel 3; however, a conceptual lot plan including a mix of medium- and high-density residential units has been prepared for the site. According to the PVSP EIR, Parcel 3 contains extensive seasonal wetland features.[1] As such, impacts related to biological resources associated with construction of a residential subdivision on Parcel 3 would likely be greater compared to the proposed project.

Site 4 (30.0 acres) is currently vacant and undeveloped. However, Site 4 is significantly smaller than the project site and the other parcels considered for the Off-Site Alternative, and would not be able to accommodate a similar number of units as the proposed project.

It is also important to consider that the project site is located in an area served by existing regional infrastructure and arterial roadways, and is located adjacent to existing and planned urban development in the City of Roseville, as well as existing and planned urban areas within Placer County. Development of the proposed project at one of the aforementioned off-site locations within Placer County would be anticipated to require the extension of additional infrastructure and public services compared to the project site, and would not likely represent an efficient use of existing public investments. In addition, an off-site alternative would require an expansion of urban uses into areas within Placer County that are designated under the General Plan for agricultural use or to areas less suitable for development compared to the project site due to environmental or habitat constraints.

Overall, off-site alternatives that could accomplish the project objectives or accommodate a similar type and intensity of development as the proposed project are not considered feasible. As a result, the Off-Site Alternative is dismissed from detailed evaluation.

Alternatives Considered in this EIR

The following alternatives are considered and evaluated in this section:

- No Project (No Build) Alternative;
- Reduced Project Alternative; and
- Resource Avoidance Alternative.

See Table 21-3 for a comparison of the environmental impacts resulting from the considered alternatives and the proposed project.

As discussed in Chapter 3, Project Description, of this EIR, the project includes two options to meet the County's affordable housing regulations. One of the affordable housing options includes the construction of 22 on-site Accessory Dwelling Units (ADUs), resulting in a total of 454 units. Similarly, the Reduced Project Alternative and Resource Avoidance Alternative analyzed herein could require construction of on-site affordable housing in the form of ADUs. Similar to the proposed project, if the project applicant chooses this option to satisfy the affordable housing requirement, it is assumed that ADUs would be accommodated on the single-family lots, such that the total number of lots would remain unchanged, as would the overall disturbance area associated with the project. In order to provide an equivalent comparison, the same percentage of ADUs assumed for the proposed project has been applied to each Alternative. The County's

[1] Placer County. *Revised Draft Environmental Impact Report, Volume I, for Placer Vineyards Specific Plan, Placer County, California* [Figure 4.4-1]. March 2006.

regulations require a minimum of 10 percent of the units within the proposed project be affordable housing.

The other option under consideration to satisfy the project's affordable housing requirements includes transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the RVSP. The proposed affordable housing parcel is approximately four acres, located at the northeast corner of PFE Road and Watt Avenue, and is identified as Assessor's Parcel Number (APN) 023-200-056-000. The project applicant would seek an amendment to the RVSP and a rezone of the proposed affordable housing parcel to the newly established RM30 (Residential Multifamily 30) zone, which can result in a maximum development potential of 120 affordable income-restricted units. Although specific development plans are not currently available, the EIR evaluated the potential environmental impacts associated with the net increase in development potential at the affordable housing parcel within the RVSP. For the purposes of the Alternatives analysis contained herein, it is assumed that the amendment to the RVSP and rezone to RM30, which could result in a maximum development potential of 120 affordable income-restricted units on the off-site affordable housing parcel, could similarly apply to both the Reduced Project Alternative and the Resource Avoidance Alternative. Thus, any associated impacts related to the off-site affordable housing parcel, as discussed throughout this EIR, would also apply to the Alternatives, and the identified mitigation measures related to the potential future development of the off-site affordable housing parcel would be the same. As a result, there is no need for a comparison of impacts and mitigation measures related to the off-site affordable housing parcel for each Alternative.

No Project (No Build) Alternative

CEQA requires the evaluation of the comparative impacts of the "No Project" alternative (CEQA Guidelines Section 15126.6[e]). Analysis of the no project alternative shall:

> "… discuss […] existing conditions […] as well as what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services." (*Id.*, subd. [e][2]) "If the project is other than a land use or regulatory plan, for example a development project on identifiable property, the 'no project' alternative is the circumstance under which the project does not proceed. Here the discussion would compare the environmental effects of the property remaining in the property's existing state versus environmental effects that would occur if the project were approved. If disapproval of the project under consideration would result in predictable actions by others, such as the proposal of some other project, this 'no project' consequence should be discussed. In certain instances, the no project alternative means 'no build,' wherein the existing environmental setting is maintained. However, where failure to proceed with the project would not result in preservation of existing environmental conditions, the analysis should identify the practical result of the project's non-approval and not create and analyze a set of artificial assumptions that would be required to preserve the existing physical environment." (*Id.*, subd. [e][3][B]).

The County has decided to evaluate a No Project (No Build) Alternative, which assumes that the current conditions of the project site and off-site affordable housing parcel would remain, and the sites would not be developed. As described in this EIR, the northern portion of the project site (i.e., north of Walerga Road) is undeveloped, consists of non-native annual grassland with gently rolling topography, and is interspersed with seasonal wetlands and vernal pools. The southern portion of the project site similarly includes undeveloped annual grassland with gently rolling topography, interspersed with seasonal wetlands, vernal pools, and is bisected by Placer Creek, which flows east to west. The Federal Emergency Management Agency (FEMA) 100-year

floodplain, containing approximately 4.7 acres, is located within the Placer Creek tributary area, which bisects the southern portion of the project site. A band of oak woodlands is located along the Placer Creek riparian corridor. The off-site affordable housing parcel is undeveloped and consists of grassy fields with gently rolling topography. The No Project (No Build) Alternative would not meet any of the project objectives and would not meet the overall intent of the DCWPCP's land use designation for the project site.

Although the County has included this No Project (No Build) Alternative for informational purposes, the County notes that, given the Alternative's inconsistency with existing DCWPCP and RVSP designations and policies, it is very unlikely that the project site or the off-site affordable housing parcel would remain in the currently, relatively untouched physical conditions indefinitely. Even if the Board of Supervisors were to deny the proposed project, the sites would likely be developed at some point in a manner consistent with the DCWPCP and RVSP, which reflects the County's current planning policies regarding the amount of development appropriate for the sites.

Aesthetics

The EIR determined that without implementation of Mitigation Measure 4-3(a), development of the proposed project could increase the amount of light and glare generated on the site, which could be visible from the surrounding residential development and roadways in the project vicinity. In addition, the EIR determined that without implementation of Mitigation Measure 4-5(a), development of the proposed project could create new sources of light or glare associated with cumulative development of the sites in combination with future buildout of the DCWPCP. The No Project (No Build) Alternative would consist of the continuation of the existing conditions of the project site. Because the No Project (No Build) Alternative would not introduce any new structures or buildings on the site, the Alternative would not create new sources of light or glare associated with development of the site both individually and in combination with future buildout of the DCWPCP. Thus, significant impacts related to Aesthetics would not occur under the No Project (No Build) Alternative.

Biological Resources

Under the No Project (No Build) Alternative, construction activities, including ground disturbance, would not occur on the project site. As such, the Alternative would not have the potential to impact special-status plants, Crotch's bumble bee, special-status branchiopods, VELB, western spadefoot, northwestern pond turtle, roosting bats, Swainson's hawk, burrowing owl, and nesting songbirds and raptors protected under the MBTA and CFGC. The Alternative would not include removal of trees and, thus, would not conflict with the County's Tree Preservation Ordinance. In addition, the Alternative would not result in any substantial adverse effects on riparian habitat or other sensitive natural communities and/or have a substantial adverse effect on federal or State protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means. As such, the mitigation measures identified in Chapter 7 would not be required under the Alternative. Overall, significant impacts related to Biological Resources would not occur under the No Project (No Build) Alternative.

Cultural Resources

Because land disturbance on the project site would not occur under the No Project (No Build) Alternative, the Alternative would not have the potential to result in impacts to cultural resources. The mitigation measures identified in Chapter 8 would not be required under the Alternative. Overall, significant impacts related to Cultural Resources would not occur under the No Project (No Build) Alternative.

Geology and Soils

Because the No Project (No Build) Alternative would not include grading or other ground-disturbing activities, substantial soil erosion or loss of topsoil would not occur, and the Alternative would not result in significant disruptions, displacements, compaction, or overcrowding of the on-site soils, or a substantial change in topography or ground surface relief features. In addition, the Alternative would not have the potential to destroy a unique paleontological resource or unique geologic feature. Furthermore, because development would not occur, the Alternative would not have the potential to result in impacts related to unstable geologic units/soils, including expansive soils. Thus, the mitigation measures identified in Chapter 10 would not be required under the Alternative. Overall, significant impacts related to Geology and Soils would not occur under the No Project (No Build) Alternative.

Hydrology and Water Quality

The No Project (No Build) Alternative would not include any ground disturbance or otherwise alter existing site conditions and, thus, would not have the potential to result in construction or operational impacts related to water quality. Additionally, changes in the existing drainage patterns of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site; or create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff either during construction or in the post-construction condition, would not occur. In addition, the Alternative would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows or expose people or structures to risk of loss, injury or death involving flooding through the placement of housing in a flood hazard area, or risk release of pollutants due to project inundation. Thus, the mitigation measures identified in Chapter 12 would not be required under the Alternative. Overall, significant impacts related to Hydrology and Water Quality would not occur under the No Project (No Build) Alternative.

Noise

The EIR determined that the proposed project would result in a significant and unavoidable impact related to the generation of a substantial temporary increase (during construction) in ambient noise levels in noise-sensitive locations in the vicinity of the project or a substantial temporary increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. Because the No Project (No Build) Alternative would not involve construction activities, Mitigation Measures 14-1(a) and 14-1(b) to reduce construction noise to the extent feasible would not be required. Overall, the proposed project's significant and unavoidable temporary impact related to Noise would not occur under the No Project (No Build) Alternative.

Transportation

The No Project (No Build) Alternative would not include construction on the project site and, thus, would not generate construction traffic on local roadways. As such, the mitigation measure related to preparation and implementation of a construction signing and traffic control plan would not be required. Overall, significant impacts related to Transportation would not occur under the No Project (No Build) Alternative.

Tribal Cultural Resources

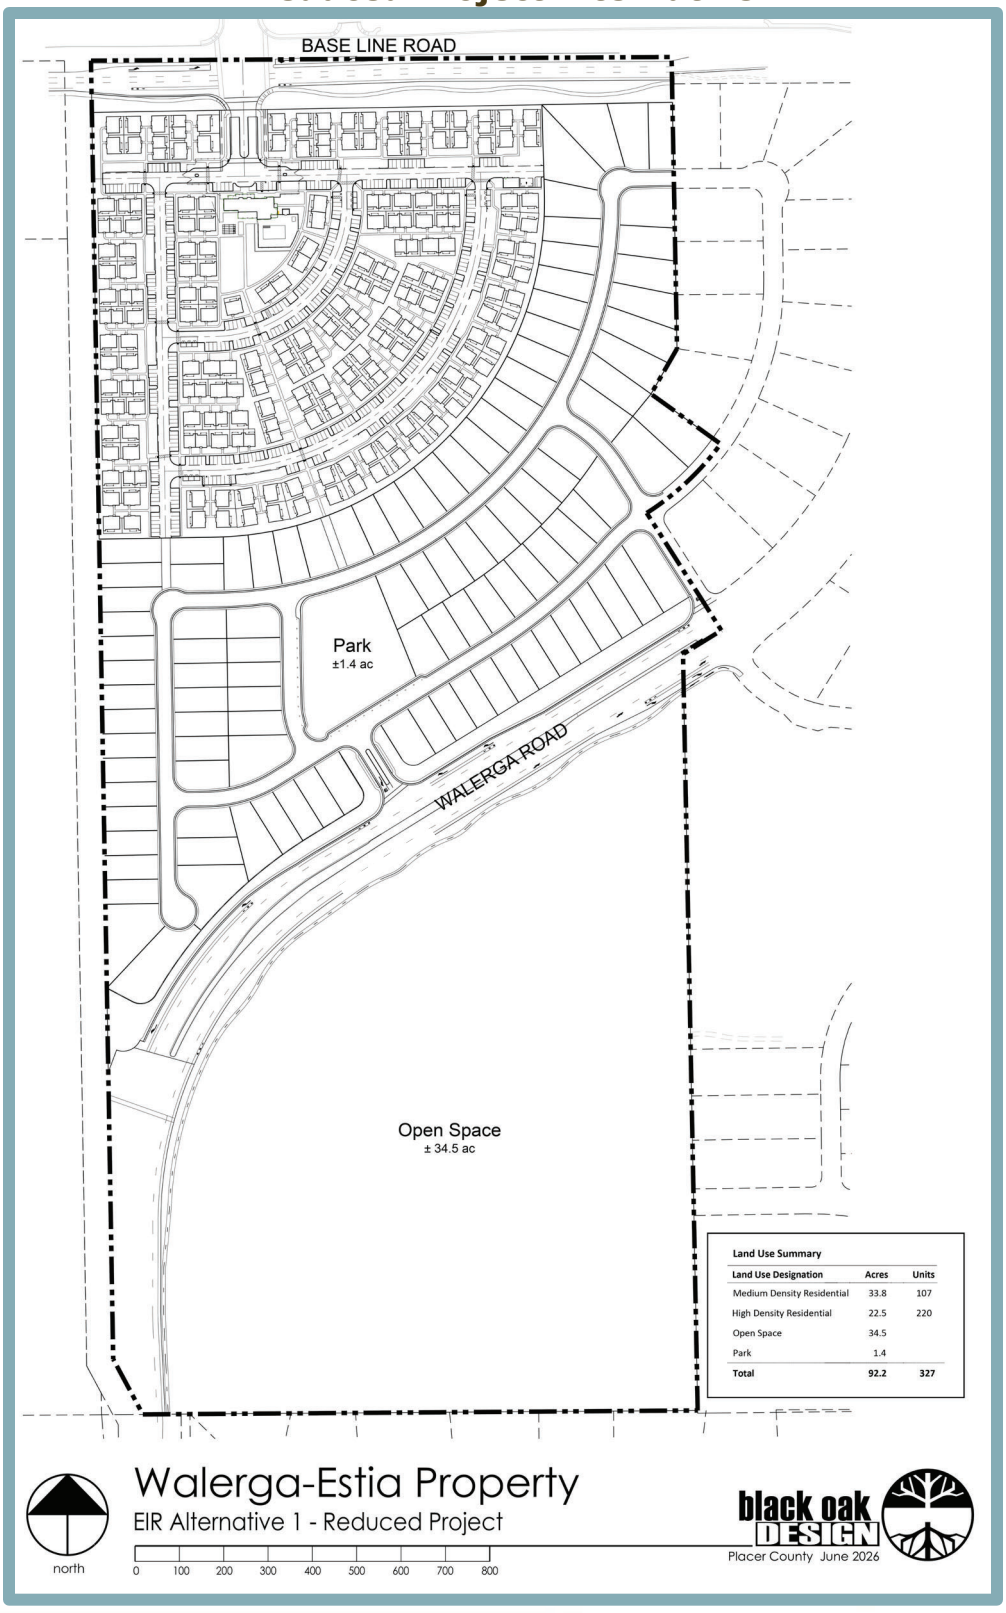
Because land disturbance on the project site would not occur under the No Project (No Build) Alternative, the Alternative would not have the potential to result in impacts to tribal cultural resources. The mitigation measures identified in Chapter 17 would not be required under the Alternative. Overall, significant impacts related to Tribal Cultural Resources would not occur under the No Project (No Build) Alternative.

Reduced Project Alternative

The Reduced Project Alternative would consist of buildout of the project site as shown in Figure 21-2. Under the Reduced Project Alternative, Phases 3 and 4 of the proposed project would not be developed, and on-site open space around Placer Creek would be increased. Similar to the proposed project, the Reduced Project Alternative would require a General Plan/DCWPCP Amendment and rezone to change the residential portions of the northern portion of the project site to High Density Residential (HDR) and Medium Density Residential (MDR). Unlike the proposed project, the entire portion of the project site south of Walerga Road would be designated Open Space (OS). Under the Reduced Project Alternative, the MDR portion of the project site would be developed at a density of 3.17 dwelling units per acre (du/ac) and the HDR portion of the project site would be developed at a density of 9.5 du/ac.

Table 21-1 provides a summary of the land uses that would be developed under the Reduced Project Alternative as compared to the proposed project.

Table 21-1
Land Use Comparison – Reduced Project Alternative



Land Use	Proposed Project (Acres)	Reduced Project Alternative (Acres)
Medium Density Residential	57.0	33.8
High Density Residential	23.2	22.5
Open Space	9.9	34.5
Park	2.1	1.4
Total Acreage	**92.2**	**92.2**
Total Dwelling Units	**432**	**327**

As shown in Table 21-1, the Reduced Project Alternative would result in the development of 105 fewer residential units (327 vs 432 units) than the proposed project. The 220 multi-family HDR units would remain the same under the Alternative, and the single-family MDR units would be reduced from 212 units to 107 units.

Should the project applicant choose the affordable housing option to develop on-site ADUs, a total of 11 ADUs (10 percent of the 107 single-family residential units) would be included under the Alternative to satisfy the County's affordable housing obligation, for a total of 338 residential units.

As discussed above, the off-site affordable housing parcel option would not change under the Alternative, and is therefore not discussed further.

Figure 21-2
Reduced Project Alternative

* Figure not OCR Compatible

The open space area would be increased under the Alternative by 24.6 acres (34.5 vs 9.9 acres). Because the Reduced Project Alternative would include fewer single-family residential units than the proposed project, and Phases 3 and 4 of the proposed project would not be developed, the Alternative would result in a smaller area of disturbance as compared to the proposed project. As such, the Alternative would result in an overall lesser disturbance area and a larger open space area than the proposed project.

Similar to the proposed project, the Reduced Project Alternative would include development of a residential community with both multi-family and single-family units, as well as an open space area. Because the Alternative would not include development in the southern portion of the project site, development near Placer Creek would be avoided, and the construction of stormwater outfalls into Placer Creek and the pedestrian bridge over Placer Creek would not occur. Off-site improvements required under the proposed project, including upgrades to the existing Community Facilities District #1 Sewer Lift Station and improvements to nearby intersections and roadways, would still occur under the Reduced Project Alternative.

Due to the residential nature of the Reduced Project Alternative, and because the design would generally resemble the proposed project, including open space, most project objectives would be fully or partially met by the Alternative. However, due to the reduced number of single-family residential units, the Reduced Project Alternative would satisfy Objective 8 to a lesser extent.

Aesthetics

Given that the project site is undeveloped and comprised primarily of undeveloped grassland interspersed with seasonal wetlands and vernal pools, the Alternative would introduce residential development to the project site that does not currently exist. Therefore, similar to the proposed project, the Alternative would introduce new substantial sources of light and glare to the undeveloped project site, including along the project site frontage at Baseline Road and Walerga Road. Such sources would include, but not be limited to, streetlights within internal street systems, vehicle headlights, exterior lighting fixtures, interior light spilling through windows, and light reflected off of windows. However, the Alternative would result in the development of approximately 105 fewer single-family residential units than the proposed project, and development would not occur south of Walerga Road. Therefore, the lighting and glare associated with the Alternative would be less intensive than the proposed project because sources of light and glare would not be developed in the southern portion of the project site. All lighting for on-site parking spaces and parking areas would be required to comply with Section 17.54.070(A)(2)(i) of the Placer County Code. Similar to the proposed project, the Reduced Project Alternative would be subject to compliance with the applicable sections of the Placer County Design Guidelines related to light pollution, including, but not limited to, shielding of fixtures such that direct rays do not pass onto residential property lines. However, because the types of lighting and the specific locations are not known for the Reduced Project Alternative, Mitigation Measure 4-3(a) would still be required.

As such, the mitigation measure identified for the proposed project related to Aesthetics would still be required under the Alternative, and the potential for the Alternative to create a new source of substantial light or glare which would adversely affect day or nighttime views in the area would remain. Overall, because the Alternative would include the development of substantially fewer residential units on a reduced development footprint, impacts related to Aesthetics could be reduced under the Alternative as compared to the proposed project.

Biological Resources

The Reduced Project Alternative would include residential development of the project site, similar to the proposed project. However, because the Reduced Project Alternative would not include the development of Phase 3 or Phase 4 of the proposed project in the southern portion of the site, the Alternative would result in the development of 105 fewer single-family residential units than the proposed project and the amount of open space area would be increased under the Alternative by 24.6 acres, thereby reducing the development footprint as compared to the proposed project. Because the Alternative would not include development in the southern portion of the project site, development near Placer Creek would be avoided, and the construction of stormwater outfalls into Placer Creek and the pedestrian bridge over Placer Creek would not occur. Due to the decreased disturbance area, impacts related to Biological Resources under the Alternative would be fewer than the proposed project. For example, as the Alternative would not include development in the southern portion of the project site, the 1.3 acres of valley foothill riparian woodland (VFRW) on both sides of Placer Creek that would be permanently impacted by the proposed project would be completely avoided under the Alternative. While the Alternative would still include ground-disturbing activities on the project site and would have the potential to impact special-status plants, Crotch's bumble bee, special-status branchiopods, VELB, western spadefoot, northwestern pond turtle, roosting bats, Swainson's hawk, burrowing owl, and nesting songbirds and raptors protected under the MBTA and CFGC, potential impacts to the foregoing species would be reduced as compared to the proposed project due to the reduced disturbance area. In particular, while impacts to northwestern pond turtle would remain potentially significant under the Alternative due to development within the off-site sewer lift station improvements area, by avoiding the 1.3 acres of VFRW adjacent to Placer Creek, the Alternative would eliminate potential impacts to northwestern pond turtle within the project site.

Due to the reduced disturbance area and the avoidance of the 1.3 acres of VFRW adjacent to Placer Creek, the Alternative could result in the removal of a reduced number of trees than the proposed project. Even so, the Alternative would still have the potential to conflict with the County's Tree Preservation Ordinance. In addition, the VFRW within the project site is considered to be a Sensitive Natural Community by the California Department of Fish and Wildlife (CDFW). Because the Alternative would completely avoid impacts to the 1.3 acres of VFRW that would be permanently impacted under the proposed project, the Alternative would have a reduced impact on riparian habitats or sensitive natural communities as compared to the proposed project. Furthermore, approximately 1.84 acres of aquatic resources would be permanently disturbed and approximately 0.01-acre of aquatic resources would be temporarily disturbed by development of the proposed project on the project site and the off-site sewer lift station improvements area. Because the amount of open space area would be increased under the Alternative and development would not occur on the southern portion of the project site, the Alternative would completely avoid impacts to 0.03-acre of irrigated wetland, 0.13-acre of seasonal wetland, 0.05-acre of seasonal wetland swale, 0.09-acre of vernal pool, 0.01-acre of ephemeral drainage, and 0.3-acre of intermittent drainage. Thus, impacts to aquatic resources on the project site would be reduced by 0.61-acre under the Alternative. However, the off-site sewer lift station improvements are still assumed to occur under the Alternative and, thus, impacts to aquatic resources located at the off-site sewer lift station improvements area would still occur under the Alternative. Therefore, the Alternative could also still result in substantial adverse effects on riparian habitat or other sensitive natural communities and/or have a substantial adverse effect on federal or State protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means. As such, all mitigation measures identified for the proposed project related to Biological Resources would still be required under

the Alternative. Overall, impacts related to Biological Resources could be fewer under the Alternative compared to the proposed project.

Cultural Resources

As mentioned above, the development footprint of the project site would be reduced under the Reduced Project Alternative. Due to the decreased disturbance area, the likelihood for development of the Alternative to unearth new, previously undiscovered resources would be reduced. As such, impacts related to Cultural Resources under the Alternative would be fewer than the proposed project. However, similar to the proposed project, the Reduced Project Alternative would still result in residential development on the project site. Consequently, the mitigation measures identified in Chapter 8 of this EIR would still be required, and the potential for the Alternative to result in disturbance or destruction of archaeological resources and human remains, and to cause a physical change which would affect unique ethnic cultural values or restrict existing religious or sacred uses would remain. Overall, impacts related to Cultural Resources could be fewer under the Reduced Project Alternative as compared to the proposed project.

Geology and Soils

Given that the Reduced Project Alternative would include a reduced overall area of disturbance as compared to the proposed project, the potential for grading and other ground-disturbing activities to result in substantial soil erosion or loss of topsoil, as well as significant disruptions, displacements, compaction, or overcrowding of the soil, or substantial change in topography or ground surface relief features, could be reduced. In addition, the Reduced Project Alternative would result in a reduction of 105 single-family residential units and 11 potential ADUs as compared to the proposed project and, therefore, a reduced number of residential units and associated occupants would be subject to potential impacts related to being located on unstable geologic units/soils, potentially resulting in lateral spreading, subsidence, collapse, or expansive soils. In particular, the loose surficial soils found in borings D7, D8, and D9 as a part of the Geotechnical Due Diligence Review prepared by ENGEO are all located in the southern portion of the project site; because the Reduced Project Alternative would not include development in the southern portion of the site, impacts related to unstable geologic units/soils due to loose surficial soils would be reduced as compared to the proposed project. Similar to the discussion related to cultural resources, the Alternative could have a decreased potential to encounter and destroy a unique paleontological resource or site or unique geologic feature. However, the Alternative would still include residential development and, as such, the mitigation measures identified in Chapter 10 of this EIR would still be required under the Alternative. Overall, impacts related to Geology and Soils could be fewer under the Reduced Project Alternative as compared to the proposed project.

Hydrology and Water Quality

Given that the Reduced Project Alternative would include a reduced overall area of disturbance as compared to the proposed project, the potential for the Alternative to result in construction and operational impacts related to water quality would be decreased. In particular, because the Alternative would not include development in the southern portion of the project site, development near Placer Creek would be avoided, and the construction of stormwater outfalls into Placer Creek and the pedestrian bridge over Placer Creek would not occur. Thus, as development near Placer Creek would be avoided under the Alternative, the potential for the Alternative to result in impacts to water quality during construction would be reduced as compared to the proposed project. In addition, as Phase 3 and Phase 4 of the proposed project would not be developed and the

stormwater outfalls into Placer Creek would not be constructed, stormwater runoff from Phase 3 and Phase 4 of the proposed project would not enter Placer Creek. As such, the potential for the Alternative to result in impacts to water quality during project operation would be reduced as compared to the proposed project. Additionally, because a smaller portion of the site would be developed with residential uses, and the amount of on-site open space would increase by 24.6 acres, a smaller amount of the site would be developed with impervious surfaces. Therefore, the potential for the Reduced Project Alternative to result in substantial changes in drainage patterns and increases in stormwater runoff rates could be decreased as compared to the proposed project. Furthermore, an area in the southern portion of the project site is within a Federal Emergency Management Agency (FEMA) mapped AE floodplain zone, which is a 100-year floodplain. As the Reduced Project Alternative would not include development in the southern portion of the project site, the portion of the 100-year floodplain within the project site would be completely avoided and impacts related to flooding would be reduced. However, the Alternative would still include grading in the floodplain located in the off-site sewer lift station improvements area and would include the shed shift for portions of Phase 1 and Phase 2 and, as such, the mitigation measures identified in Chapter 12 of this EIR would still be required under the Alternative. Overall, impacts related to Hydrology and Water Quality could be fewer under the Reduced Project Alternative as compared to the proposed project.

Noise

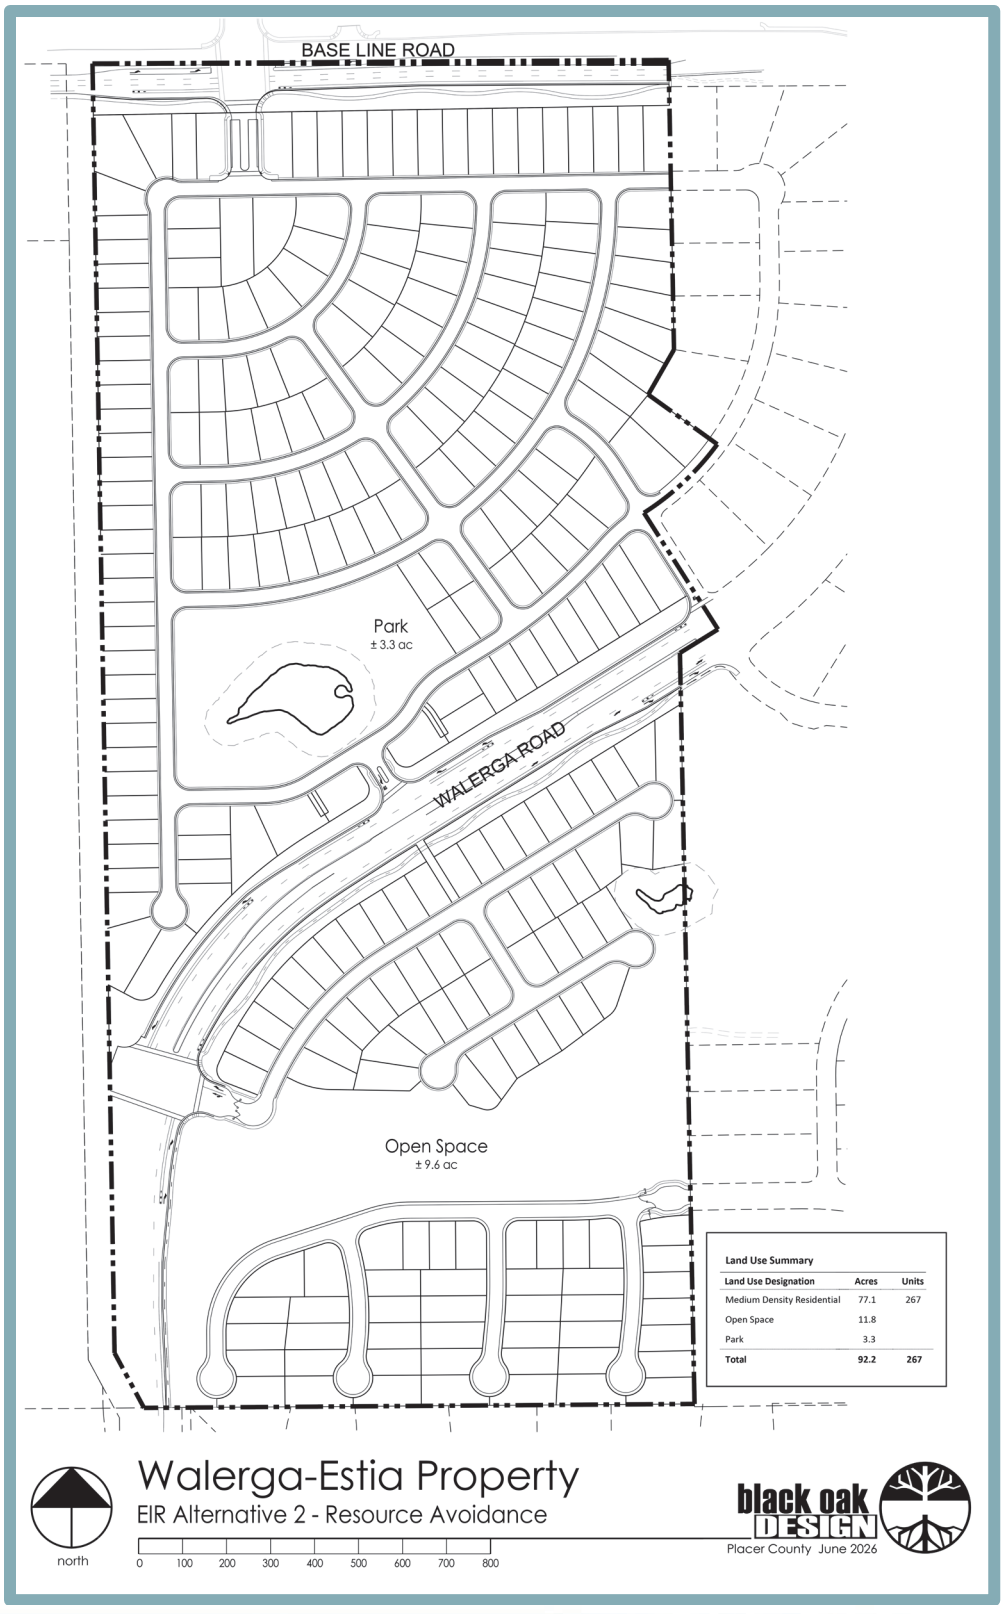
The Reduced Project Alternative would include development of the project site with residential uses, similar to the proposed project. However, the Alternative would only include development in the northern portion of the project site, leaving the southern portion of the site as undeveloped open space. As the southern portion of the project site would not be developed with residential uses, impacts related to temporary noise due to construction would be fewer than the proposed project as the noise levels at the sensitive receptors located to the south of the project site would be reduced. Nonetheless, the proposed project would likely require nighttime work and, according to the Noise Report, nighttime construction would result in noise levels exceeding the applicable threshold at sensitive receptors located to the west of the project site. As the Reduced Project Alternative would still include development in the northern portion of the project site, in the vicinity of the sensitive receptors located to the west of the project site, impacts related to temporary noise due to construction of the Alternative could still occur. Therefore, because the northern portion of the project site would still be developed with residential uses, Mitigation Measures 14-1(a) and 14-1(b) would still be required and a significant and unavoidable impact related to the generation of a substantial temporary increase in ambient noise levels in noise-sensitive locations in the vicinity of the project or a substantial temporary increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards or other agencies, would still occur. Overall, while the significant and unavoidable impact related to temporary noise due to construction would still occur under the Alternative, fewer sensitive receptors would be exposed to significant temporary noise increases, and noise impacts could be fewer under the Reduced Project Alternative as compared to the proposed project.

Transportation

As mentioned above, the Reduced Project Alternative would result in the development of 105 fewer single-family residential units and 11 fewer potential ADUs and a decreased development footprint as compared to the proposed project. Due to the decreased number of residential units and development footprint, the Reduced Project Alternative would result in a reduction in the overall intensity of construction traffic. However, because the proposed project would be constructed in phases, and Phase 1 and Phase 2 would remain the same under the proposed

project and the Alternative, the traffic volume at any time during construction of Phase 1 and Phase 2 of the Alternative would not decrease. Even so, because the Alternative would not include the construction of Phase 3 or Phase 4, vehicles associated with construction of the Alternative would be present on the roadways for a shorter amount of time. Nonetheless, the Alternative would still include residential development and off-site roadway improvements, and would add construction vehicle traffic to area roadways, thereby potentially conflicting with existing traffic patterns. As such, Mitigation Measure 16-1(a) related to preparation and implementation of a construction signing and traffic control plan would still be required under the Alternative. Overall, development of the Reduced Project Alternative would result in fewer impacts related to Transportation compared to the proposed project.

Tribal Cultural Resources



The development footprint would be reduced under the Reduced Project Alternative as compared to the proposed project. Due to the decreased disturbance area, the likelihood of development of the Alternative to unearth new, previously undiscovered resources would be reduced. As such, impacts related to Tribal Cultural Resources under the Alternative could be fewer than the proposed project. However, similar to the proposed project, the Reduced Project Alternative would still result in residential development on the project site, and construction of the Alternative could also unearth new, previously undisturbed resources. Consequently, the mitigation measures identified in Chapter 17 of this EIR would still be required, and the potential for the Alternative to result in a substantial adverse change in the significance of a tribal cultural resource would remain. Overall, impacts related to Tribal Cultural Resources could be fewer under the Reduced Project Alternative as compared to the proposed project.

Resource Avoidance Alternative

The Resource Avoidance Alternative would consist of buildout of the project site as shown in Figure 21-3. The Resource Avoidance Alternative would require a General Plan/DCWPCP Amendment and rezone to change the residential portions of the project site to MDR. Under the Resource Avoidance Alternative, the residential portion of the project site would be developed at a density of 3.81 du/ac with no multi-family residential units constructed. Table 21-2 provides a summary of the land uses that would be developed under the Resource Avoidance Alternative as compared to the proposed project.

As shown in Table 21-2, the overall disturbance area of the project site would be reduced, as the Resource Avoidance Alternative would include the development of 165 fewer residential units (267 vs 432 units) than the proposed project and residential development under the Alternative would be reduced by 3.1 acres (77.1 acres vs 80.2 acres). Should the project applicant choose the affordable housing option to develop on-site ADUs, a total of 27 ADUs (10 percent of the 267 single-family residential units) would be included under the Alternative to satisfy the County's affordable housing obligation, for a total of 294 residential units.

Figure 21-3
Resource Avoidance Alternative

* Figure not OCR Compatible

Table 21-2
Land Use Comparison – Resource Avoidance Alternative

Land Use	Proposed Project (Acres)	Resource Avoidance Alternative (Acres)
Medium Density Residential	57.0	77.1
High Density Residential	23.2	--
Open Space	9.9	11.8
Park	2.1	3.3
Total Acreage	**92.2**	**92.2**
Total Dwelling Units	**432**	**267**

As discussed above, the off-site affordable housing parcel option would not change under the Alternative, and is therefore not discussed further.

In addition, the amount of on-site park area would be increased by 1.2 acres (3.3 vs 2.1 acres) and open space area would be increased by 1.9 acres (11.8 vs 9.9 acres) as compared to the proposed project in order to avoid the largest on-site vernal pool in the park lot, as well as the smaller vernal pool along the eastern Phase 3 site boundary.

Similar to the proposed project, the Resource Avoidance Alternative would include development of single-family units. However, the Alternative would not include development of multi-family units in the northern portion of the project site, and instead would develop single-family units throughout the residential areas of the project site. Upgrades to the off-site existing Community Facilities District #1 Sewer Lift Station would still occur under the Resource Avoidance Alternative.

Due to the residential nature of the Resource Avoidance Alternative, and because the Alternative would include open space, most project objectives would be fully or partially met. However, because the Alternative would develop 165 fewer residential units (excluding potential ADUs) than the proposed project, and would only develop single-family units, and not provide a mix of single-family and multi-family units, Objectives 2, 6, and 8 would not be met.

Aesthetics

Similar to the proposed project, the Resource Avoidance Alternative would include development of the project site with residential uses. However, the Alternative would result in the development of approximately 165 fewer units than the proposed project (excluding potential ADUs), and residential development under the Alternative would be reduced by 3.1 acres. Nonetheless, the Alternative would introduce new substantial sources of light and glare to the undeveloped project site. Such sources would include, but not be limited to, streetlights within internal street systems, vehicle headlights, exterior lighting fixtures, interior light spilling through windows, and light reflected off of windows. However, the Alternative would result in the development of approximately 165 fewer residential units than the proposed project and would replace the development of the multi-family units in the northern portion of the project site with single-family units. Therefore, as the more densely populated multi-family units would not be developed under the Alternative, the lighting and glare associated with the Alternative would be less intensive than the proposed project. Similar to the proposed project, the Alternative would be subject to compliance with the applicable sections of the Placer County Design Guidelines related to light pollution, including, but not limited to, shielding of fixtures such that direct rays do not pass onto residential property lines. However, because the types of lighting and the specific locations are

not known for the Resource Avoidance Alternative, Mitigation Measure 4-3(a) would still be required.

As such, the mitigation measure identified for the proposed project related to Aesthetics would still be required under the Alternative, and the potential for the Alternative to create a new source of substantial light or glare which would adversely affect day or nighttime views in the area would remain. Overall, because the Alternative would include the development of substantially fewer residential units and exclude the development of multi-family units, impacts related to Aesthetics could be reduced under the Alternative as compared to the proposed project.

Biological Resources

The Resource Avoidance Alternative would include residential development of the project site, similar to the proposed project. However, the Alternative would result in the development of 165 fewer residential units than the proposed project (excluding potential ADUs), the amount of park area would be increased under the Alternative by 1.2 acres, and the amount of open space area would be increased by 1.9 acres, thereby reducing the development footprint as compared to the proposed project. The Alternative would be designed to avoid the majority of impacts to the on-site vernal pools by preserving the existing vernal pools in the central portion and on the southeastern boundary of the project site by expanding the acreage of the park and eliminating the development of several single-family homes in the southern portion of the site (e.g., in the Phase 3 portion of the proposed project). However, as the Alternative would include development of single-family homes in the northern portion of the project site, development of the Alternative would still impact the vernal pool located on the northern frontage of the project site. Due to the decreased disturbance area, impacts related to Biological Resources under the Alternative would be fewer than the proposed project. For example, due to the preservation of the vernal pools in the central portion and on the southeastern boundary of the project site, the Alternative would have a reduced potential to impact special-status branchiopods and western spadefoot as compared to the proposed project. However, as the Alternative would still include ground-disturbing activities on the project site, the Alternative would still have the potential to impact special-status plants, Crotch's bumble bee, VELB, northwestern pond turtle, roosting bats, Swainson's hawk, burrowing owl, and nesting songbirds and raptors protected under the MBTA and CFGC. In addition, while the Alternative could result in the removal of a reduced number of trees than the proposed project, the Alternative would still have the potential to conflict with the County's Tree Preservation Ordinance. The Alternative could also still result in substantial adverse effects on riparian habitat or other sensitive natural communities and/or have a substantial adverse effect on federal or State protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means as the Alternative would not avoid impacts to the vernal pool located on the northern frontage of the project site, nor the seasonal wetland within the northern portion of the site. In addition, similar to the proposed project, the Alternative would impact the VFRW and Placer Creek through installation of new stormwater outfalls and the pedestrian bridge over the creek. As such, all mitigation measures identified for the proposed project related to Biological Resources would still be required under the Alternative. Overall, impacts related to Biological Resources could be fewer under the Alternative as compared to the proposed project.

Cultural Resources

As mentioned above, the development footprint of the project site would be reduced under the Resource Avoidance Alternative, as the amount of park area would be increased by 1.2 acres under the Alternative, and the amount of open space area would be increased by 1.9 acres. Due

to the decreased disturbance area, the likelihood of development of the Alternative to unearth new, previously undiscovered resources would be reduced. As such, impacts related to Cultural Resources under the Alternative would be fewer than the proposed project. However, similar to the proposed project, the Resource Avoidance Alternative would still result in residential development on the project site. Consequently, the mitigation measures identified in Chapter 8 of this EIR would still be required, and the potential for the Alternative to result in disturbance or destruction of archaeological resources and human remains, and to cause a physical change which would affect unique ethnic cultural values or restrict existing religious or sacred uses would remain. Overall, impacts related to Cultural Resources could be fewer under the Resource Avoidance Alternative as compared to the proposed project.

Geology and Soils

Given that the Resource Avoidance Alternative would include a reduced overall area of disturbance as compared to the proposed project, the potential for grading and other ground-disturbing activities to result in substantial soil erosion or loss of topsoil, as well as significant disruptions, displacements, compaction, or overcrowding of the soil, or substantial change in topography or ground surface relief features, could be reduced. In addition, the Resource Avoidance Alternative would result in a reduction of 165 residential units as compared to the proposed project (excluding potential ADUs) and, therefore, a reduced number of residential units and associated occupants would be subject to potential impacts related to being located on unstable geologic units/soils, potentially resulting in lateral spreading, subsidence, collapse, or expansive soils. Similar to the discussion related to cultural resources, the Alternative could have a decreased potential to encounter and destroy a unique paleontological resource or site or unique geologic feature. However, the Alternative would still include residential development and, as such, the mitigation measures identified in Chapter 10 of this EIR would still be required under the Alternative. Overall, impacts related to Geology and Soils could be fewer under the Resource Avoidance Alternative as compared to the proposed project.

Hydrology and Water Quality

Given that the Resource Avoidance Alternative would include a reduced overall area of disturbance as compared to the proposed project, the potential for the Alternative to result in construction and operational impacts related to water quality would be decreased. In addition, because the amount of park area would be increased by 1.2 acres under the Alternative and the amount of open space area would be increased by 1.9 acres, a smaller amount of the site would be developed with impervious surfaces. Thus, the potential for the Resource Avoidance Alternative to result in substantial changes in drainage patterns and increases in stormwater runoff rates could be decreased as compared to the proposed project. Furthermore, an area in the southern portion of the project site is within a FEMA mapped AE floodplain zone, which is a 100-year floodplain. While the amount of on-site open space area would be increased by 1.9 acres in the Resource Avoidance Alternative, including in the floodplain area located in the southern portion of the project site, impacts related to flooding would still occur under the Alternative as construction of the pedestrian bridge and the associated placement of fill within the 100-year floodplain would still occur. Overall, the Alternative would still include residential development and the shed shift for portions of Phase 1 and Phase 2, as such, the mitigation measures identified in Chapter 12 of this EIR would still be required under the Alternative. Overall, impacts related to Hydrology and Water Quality could be fewer under the Resource Avoidance Alternative as compared to the proposed project.

Noise

With regard to construction noise, the overall intensity of development occurring under the Resource Avoidance Alternative would be relatively similar to the proposed project, considering the Alternative would still develop residential units throughout the project site. While the Alternative would not develop multi-family units and would develop 165 fewer residential units than the proposed project (excluding potential ADUs), the Alternative would still include development near all the sensitive receptors that Chapter 14 of this EIR identified as having significant and unavoidable impacts related to temporary construction noise, including the single-family residences located to the east, west, and south of the project site. As such, while construction duration would decrease due to the reduced number of residential units, the equipment used and noise intensity would be similar. Therefore, impacts related to construction noise would be similar, Mitigation Measures 14-1(a) and 14-1(b) would still be required, and a significant and unavoidable impact related to the generation of a substantial temporary increase in ambient noise levels in noise-sensitive locations in the vicinity of the project or a substantial temporary increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards or other agencies would still occur. Overall, noise impacts could be similar under the Resource Avoidance Alternative as compared to the proposed project.

Transportation

Similar to the proposed project, the Resource Avoidance Alternative would add construction vehicle traffic to area roadways, thereby potentially conflicting with existing traffic patterns. As such, Mitigation Measure 16-1(a) related to preparation and implementation of a construction signing and traffic control plan would still be required under the Alternative. However, because the Alternative would involve construction of 165 fewer residential units as the proposed project (excluding potential ADUs), the overall intensity of construction traffic would likely be reduced. Therefore, development of the Resource Avoidance Alternative could result in fewer impacts related to Transportation as compared to the proposed project.

Tribal Cultural Resources

Due to the decreased disturbance area associated with the Resource Avoidance Alternative as compared to the proposed project, the likelihood of development of the Alternative to unearth new, previously undiscovered resources could be reduced. As such, impacts related to Tribal Cultural Resources under the Alternative could be fewer than the proposed project. However, similar to the proposed project, the Resource Avoidance Alternative would still result in residential development on the project site, and construction of the Alternative could also unearth new, previously undisturbed resources. Consequently, the mitigation measures identified in Chapter 8 of this EIR would still be required, and the potential for the Alternative to result in a substantial adverse change in the significance of a tribal cultural resource would remain. Overall, impacts related to Tribal Cultural Resources could be fewer under the Resource Avoidance Alternative as compared to the proposed project.

21.4 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

An EIR is required to identify the environmentally superior alternative from among the range of reasonable alternatives that are evaluated. The environmentally superior alternative is generally the alternative that would be expected to generate the least amount of significant impacts. Identification of the environmentally superior alternative is an informational procedure and the alternative selected may not be the alternative that best meets the goals or needs of the County. Section 15126(e)(2) of the CEQA Guidelines requires that an environmentally superior alternative

be designated and states, “If the environmentally superior alternative is the ‘no project’ alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.” In this case, the No Project (No Build) Alternative would be considered the environmentally superior alternative, because the project site is assumed to remain in its current condition under the alternative. Consequently, all of the impacts resulting from the proposed project would not occur under the Alternative, as shown in Table 21-3 below. As will be demonstrated below, aside from the No Project (No Build) Alternative, the Reduced Project Alternative is the next best environmentally superior alternative.

The No Project (No Build) Alternative would not meet any of the project objectives. Because the Reduced Project Alternative and the Resource Avoidance Alternative would include the development of a residential neighborhood incorporating open space, and because the designs of each Alternative would generally resemble the proposed project, including the upgrades to the existing Community Facilities District #1 Sewer Lift Station and improvements to nearby intersections and roadways, most project objectives would be fully or partially met by each Alternative. However, due to the reduced number of single-family residential units, the Reduced Project Alternative would satisfy Objective 8 to a lesser extent than the proposed project. In addition, because the Resource Avoidance Alternative would only develop single-family units and would eliminate the multi-family unit component of the proposed project, the Resource Avoidance Alternative would not satisfy Project Objectives 2, 6, or 8. Overall, none of the alternatives would be as effective as the proposed project in satisfying the portion of the underlying purpose of the proposed project focused on addressing statewide and regional housing shortages.

As discussed throughout this chapter and shown in Table 21-3, the Reduced Project Alternative would result in fewer impacts as compared to impacts associated with the proposed project related to all of the eight issue areas for which significant project impacts were identified. The Resource Avoidance Alternative would result in impacts similar to those of the proposed project related to one issue area, and fewer impacts related to the remaining seven issue areas for which significant project impacts were identified. While the significant and unavoidable impact related to Noise identified for the proposed project would still occur under all of the Alternatives, the significant and unavoidable impact related to Noise would be reduced under the Reduced Project Alternative, but would be similar under the Resource Avoidance Alternative, as compared to the proposed project.

Based on the above, the Reduced Project Alternative would satisfy Project Objective 8 to a lesser extent, but would result in fewer impacts than the proposed project related to each issue area for which significant project impacts were identified, whereas the Resource Avoidance Alternative would not satisfy Project Objectives 2, 6, or 8 and would result in a similar impact for the short-term significant and unavoidable impact related to Noise. Therefore, the Reduced Project Alternative would be considered the Environmentally Superior Alternative. However, as discussed above, the significant and unavoidable impact related to Noise that was identified for the proposed project would still occur under the Reduced Project Alternative. As such, the number of significant and unavoidable impacts overall would be the same under the Reduced Project Alternative and the proposed project.

Table 21-3
Comparison of Environmental Impacts for Project Alternatives

Resource Area		Proposed Project	No Project (No Build) Alternative	Reduced Project Alternative	Resource Avoidance Alternative
4. Aesthetics					
4-3	Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.	Less-Than-Significant with Mitigation	None	Fewer	Fewer
4-5	Creation of new sources of light or glare associated with cumulative development of the proposed project in combination with future buildout of the DCWPCP.	Less-Than-Significant with Mitigation	None	Fewer	Fewer
7. Biological Resources					
7-1	Impacts to special-status plant species either directly (e.g., threaten to eliminate a plant community) or through substantial habitat modifications.	Less-Than-Significant with Mitigation	None	Fewer	Fewer
7-2	Impacts to Crotch's bumble bee either directly (e.g., cause a wildlife population to drop below self-sustaining levels or threaten to eliminate an animal community) or through substantial habitat modifications or substantial reduction in the number or range of the species.	Less-Than-Significant with Mitigation	None	Fewer	Fewer
7-3	Impacts to special-status branchiopods either directly (e.g., cause a wildlife population to drop below self-sustaining levels, threaten to eliminate an animal community) or through substantial habitat modifications or substantial	Less-Than-Significant with Mitigation	None	Fewer	Fewer

Table 21-3

COUNTY OF Placer
COMMUNITY DEVELOPMENT RESOURCE AGENCY

COMMUNITY DEVELOPMENT/RESOURCE AGENCY
Environmental Coordination Services
County of Placer

DATE: April 7, 2025

TO: California State Clearinghouse
Responsible and Trustee Agencies
Interested Parties and Organizations

SUBJECT: **Notice of Preparation of an Environmental Impact Report for the Proposed Estia Dry Creek and Placer Creek Residential Project**

REVIEW PERIOD: **April 7, 2025 to May 7, 2025**

As lead agency for the preparation of an Environmental Impact Report (EIR) for the Estia Dry Creek and Placer Creek Residential Project (proposed project) Placer County has prepared this Notice of Preparation (NOP) in accordance with Section 15082 of the Guidelines for the Implementation of the California Environmental Quality Act (CEQA) (CEQA Guidelines). According to that provision, the purpose of the NOP is to provide responsible agencies and trustee agencies the opportunity to provide the lead agency with specific details about the scope and content of the environmental information related to the responsible and trustee agencies' areas of statutory responsibility that the agencies would like the lead agency to include in the Draft EIR.

The County will need to know the views of your agency as to the scope and content of the environmental information germane to your agency's statutory responsibilities in connection with the proposed project. Responsible agencies will need to use the EIR prepared by the County when considering their permits or other approvals for the proposed project.

Your agencies' timely comments on this NOP should ensure that the Draft EIR will include sufficient environmental information to allow your agencies to complete their statutory responsibilities with respect to the proposed project.

This NOP is also being provided to other interested parties who are also invited to provide their recommendations regarding the scope and content of the Draft EIR.

Project Location: The project site consists of approximately 92.2 gross (87.6 net) acres located south of Baseline Road, immediately east of the abandoned old Walerga Road right-of-way, west of the Fiddyment Road/Baseline Road/Walerga Road intersection and the western portion of Sun Valley Oaks residential subdivision, and north of the Morgan Creek residential subdivision in the Dry Creek-West Placer Community Plan Area (DCWPCP) of unincorporated Placer County. Walerga Road, which curves from the northeast to the southwest, separates the northern 52.3-acre portion of the project site, identified by Assessor's Parcel Number (APN) 023-221-076, and the southern 35.3-acre portion of the project site, identified by APN 023-221-074.

Project Description: The proposed project would include the development of two separate residential communities over the course of four phases. Phase 1 would consist of the 220-unit Estia Dry Creek development, and Phases 2, 3, and 4 would consist of the 212-lot Placer Creek Residential development. Development of Phases 1 and 2 would occur on the northern portion of the site (APN 023-221-076), north of Walerga Road, and development of Phases 3 and 4 would occur on the southern portion of the site (APN 023-221-074), south of Walerga Road.

The Estia Dry Creek (Phase 1) development would include 220 single-story multi-family units consisting of 80 one-bedroom units and 140 two-bedroom units, ranging from approximately 700 square feet (sf) to 1,100 sf. A 3,537-sf community center building would also be developed in the center of the Estia Dry Creek site, and an outdoor pool with patios and grill areas would be located adjacent to the community center. Garages and surface parking would be located throughout the site. Site access would be provided by a new internal roadway system, which would connect to a new driveway off of Baseline Road. Pedestrian paths would be located throughout the site.

The Placer Creek Residential (Phases 2, 3, and 4) development would include 212 single-family residential lots with a minimum lot size of 6,000 sf. Phase 2 would include the development of 110 single-family lots, and a centrally located 2.2-acre public neighborhood park with associated amenities. Phase 3 would include the development of 55 single-family lots and potential recreational amenities. Phase 4 would include the development of 47 single-family lots and the western extension of Vineyard Road, which would provide site access, along with trails and the seven-acre oak woodlands area along the Dry Creek tributary, referred to as "Placer Creek," riparian corridor, which would be preserved as open space. The Placer Creek riparian corridor would separate the Phase 3 and 4 developments.

The proposed project would require County approval of a General Plan/DCWPCP Map Amendment, Rezone, Vesting Large Lot Tentative Subdivision Map, Vesting Phased Small Lot Tentative Subdivision Map, Design Review, and two service area annexations. The project will also request a General Plan/Riolo Vineyards Specific Plan (RVSP) Amendment and Rezone for the proposed affordable housing parcel located off-site. These entitlement requests are discussed in further detail below. Other approvals necessary to implement the proposed project would include Placer County Conservation Program (PCCP) authorization, a Section 404 permit from U.S. Army Corps of Engineers (USACE), a Section 1602 permit from the California Department of Fish and Wildlife (CDFW), a Section 401 Water Quality Certification from the Regional Water Quality Control Board (RWQCB), and a National Pollutant Discharge Elimination System (NPDES) Construction General Permit.

Towne Development of Sacramento, LLC is the applicant for the project.

Contact Information: For more information regarding the proposed project, please refer to the following detailed project description or contact Kara Conklin, Senior Planner, at (530) 745-3053 or kconklin@placer.ca.gov. A copy of the NOP is available for review on the Placer County website at:

https://www.placer.ca.gov/2526/Environmental-Impact-Reports

The NOP is also available during normal business hours, at the same link, via computer kiosks at the Placer County Libraries, the Placer County Community Development Resource Agency (3091 County Center Drive, Auburn) and Tahoe (775 North Lake Boulevard, Tahoe City), and the County Clerk's Office (2954 Richardson Drive, Auburn).

NOP Comment Period: Written comments should be submitted at the earliest possible date, but not later than 5:00 PM on May 7, 2025 to Meghan Schwartz, Environmental Coordination Services, Placer County Community Development Resource Agency, 3091 County Center Drive, Suite 190, Auburn, CA 95603, (530) 745-3132, or cdraecs@placer.ca.gov.

NOP Scoping Meeting: In addition to the opportunity to submit written comments, a NOP scoping meeting will be held in person to inform interested parties about the proposed project, and to provide agencies and the public with an opportunity to provide comments on the scope and content of the EIR. Further information on the date and time of the scoping meeting is provided below.

EIR Scoping Meeting on Estia Dry Creek and Placer Creek Residential Project
Thursday | April 24, 2025 | 4:00 PM to 6:00 PM
In-Person:
CDRA Planning Commission Room
3091 County Center Drive, Auburn, CA

1.0 PROJECT DESCRIPTION

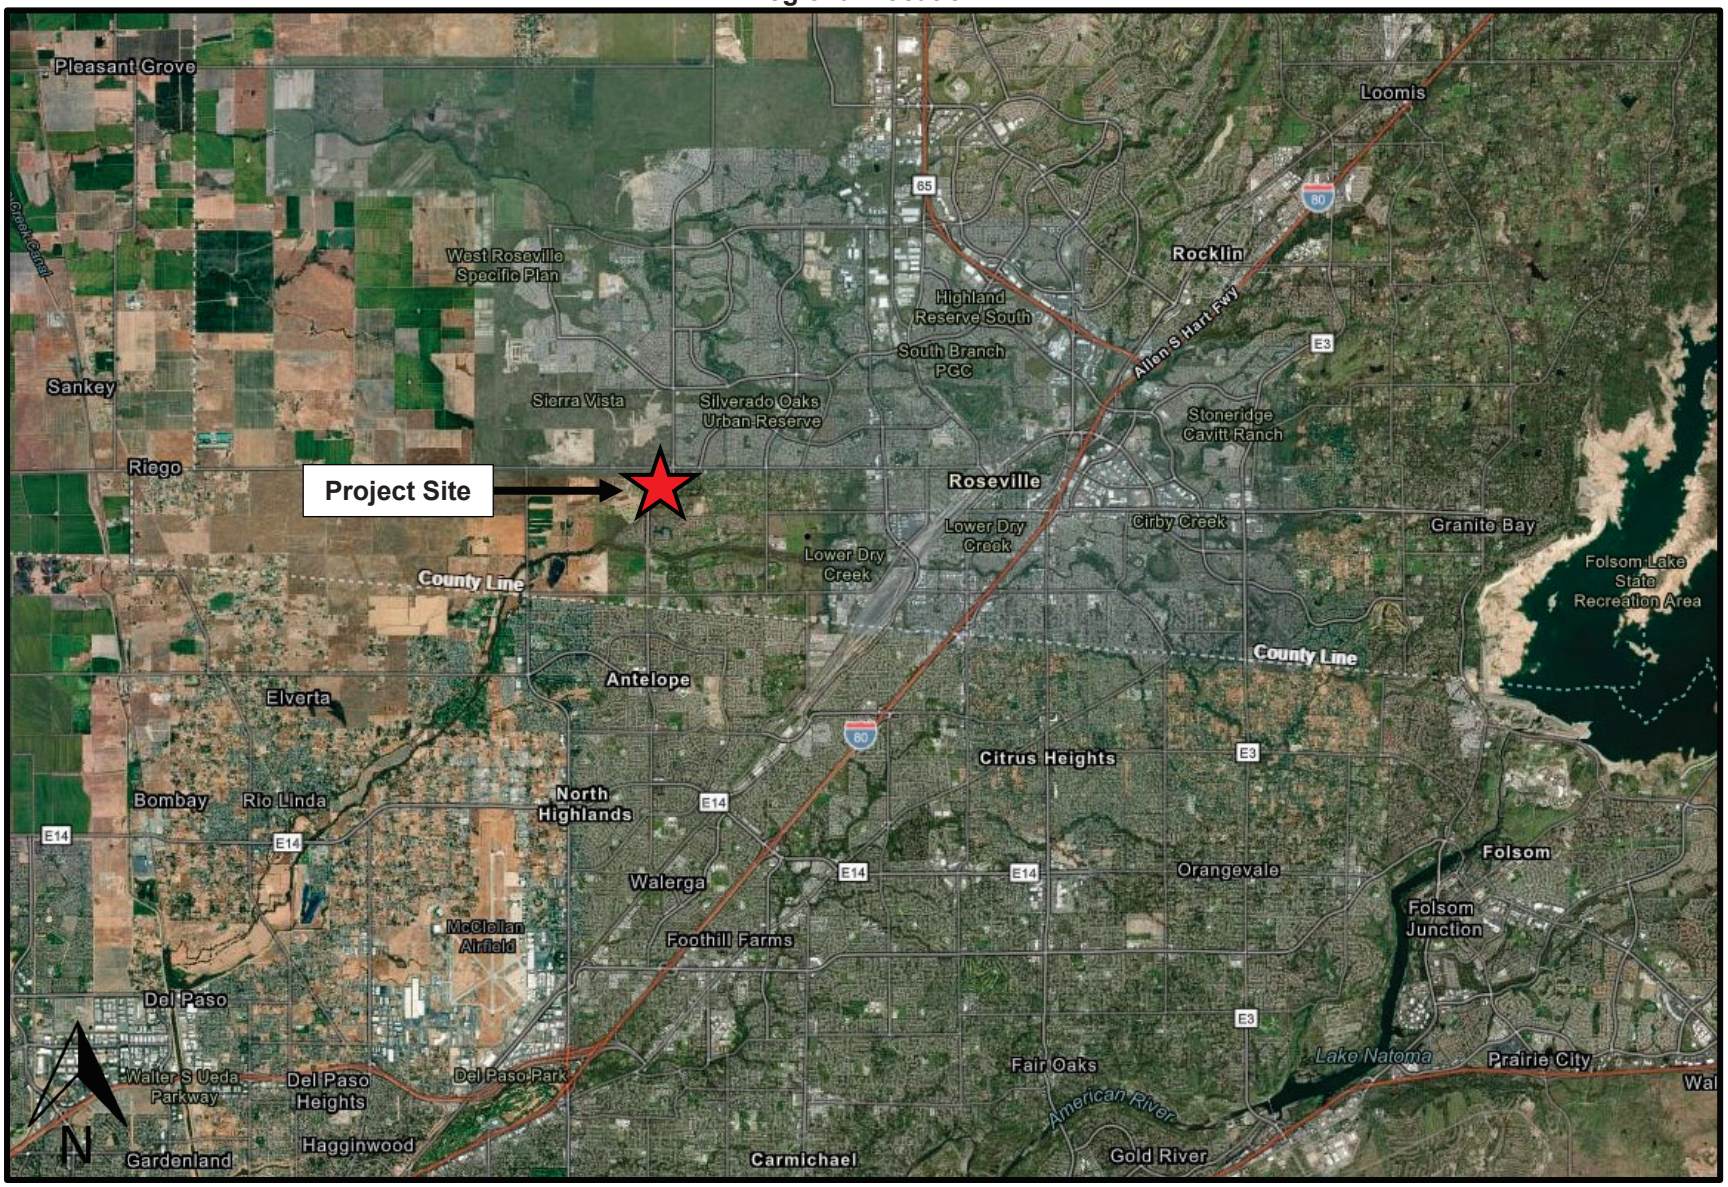
1.1 Location and Setting

The project site is located in the northern portion of the DCWPCP area in unincorporated Placer County (see Figure 1). The 92.2-acre project site (APNs 023-221-076 and -074) is bisected by Walerga Road, which generally curves from northeast to southwest. The 52.3-acre northern portion of the site (APN 023-221-076) is bounded by Baseline Road to the north and Walerga Road to the south. The northern portion of the site is undeveloped, consists of non-native annual grassland with rolling topography, and is

interspersed with seasonal wetlands and vernal pools. The 35.3-acre southern portion of the site (APN 023-221-074) is bounded by Walerga Road to the north and west. The southern portion of the site includes a paved bicycle trail which extends from Vineyard Road to the east and Walerga Road to the west. In addition, the southern portion of the site includes undeveloped annual grassland with rolling topography, interspersed with seasonal wetlands, vernal pools, and is bisected by an un-named tributary of Dry Creek (named "Placer Creek" for this project) which flows east to west. The Federal Emergency Management Agency (FEMA) 100-year floodplain, containing approximately 4.7 acres, is located within the Placer Creek tributary area, which bisects the southern portion of the project site. A band of oak woodlands is located along the Placer Creek riparian corridor.

Roadways in the immediate project vicinity include Baseline Road to the north, Walerga Road bisecting the project site from the southwest to the northeast, Town Center Avenue to the west, and Vineyard Road to the southeast. Additionally, the northern boundary of the project site is adjacent to the Roseville City Limits, and the southern boundary of the project site is located approximately 1.2 miles from the Placer County/Sacramento County line (see Figure 2).

The Placer County General Plan/DCWPCP land use designations for the project site are Rural-Low Density (1-2.3 acre minimum) (RLDR), and Greenbelt and Open Space (OS) (see Figure 3). The site is zoned Residential Single-Family, Combining Agricultural, Combining Building Site of 40,000 square feet (RS-AG-B-40), combining Planned Residential Development one dwelling unit per acre maximum density (PD=1); and Open Space (O) (see Figure 4).



1.2 Surrounding Land Uses

Surrounding existing land uses for the project site include the under-construction Baseline Commercial Center to the north, across Baseline Road; single-family residences associated with the Sun Valley Oaks residential neighborhood and Dry Creek tributaries to the east; single-family residences associated with the Morgan Creek residential neighborhood to the south; and the under-construction Property 1A of the Placer Vineyards Specific Plan (PVSP), which will include 1,285 residential units, to the west, across Walerga Road. Table 1 describes the land use and zoning designations of the parcels surrounding the project site.

Table 1
Surrounding Land Use and Zoning Designations

Parcel Location	Land Use	Zoning
North of the Project Site	City of Roseville: Community Commercial (CC)	City of Roseville: General Commercial (GC)
South of the Project Site	Placer County: Rural Residential (RR)	Placer County: RS-AG-B-40, PD=1
East of the Project Site	Placer County: RR; OS	Placer County: RS-AG-B-40, PD=1, O
West of the Project Site	Placer County: Placer Vineyards Specific Plan	Placer County: Specific Plan, Placer Vineyards Specific Plan (SPL-PVSP)

1.3 Project Components

The proposed project includes the development of two separate residential communities over the course of four phases. Phase 1 would consist of the 220-unit Estia Dry Creek development, and Phases 2, 3, and 4 would consist of the 212-lot Placer Creek Residential development. Development of Phases 1 and 2 would occur on the northern portion of the site (APN 023-221-076), north of Walerga Road, and development of Phases 3 and 4 would occur on the southern portion of the site (APN 023-221-074), south of Walerga Road (see Figure 5). The gross project density would be approximately 4.6 residential units per acre. The proposed project would require County approval of several discretionary entitlements. The proposed project components, along with all required entitlements and approvals, are described in the following sections.

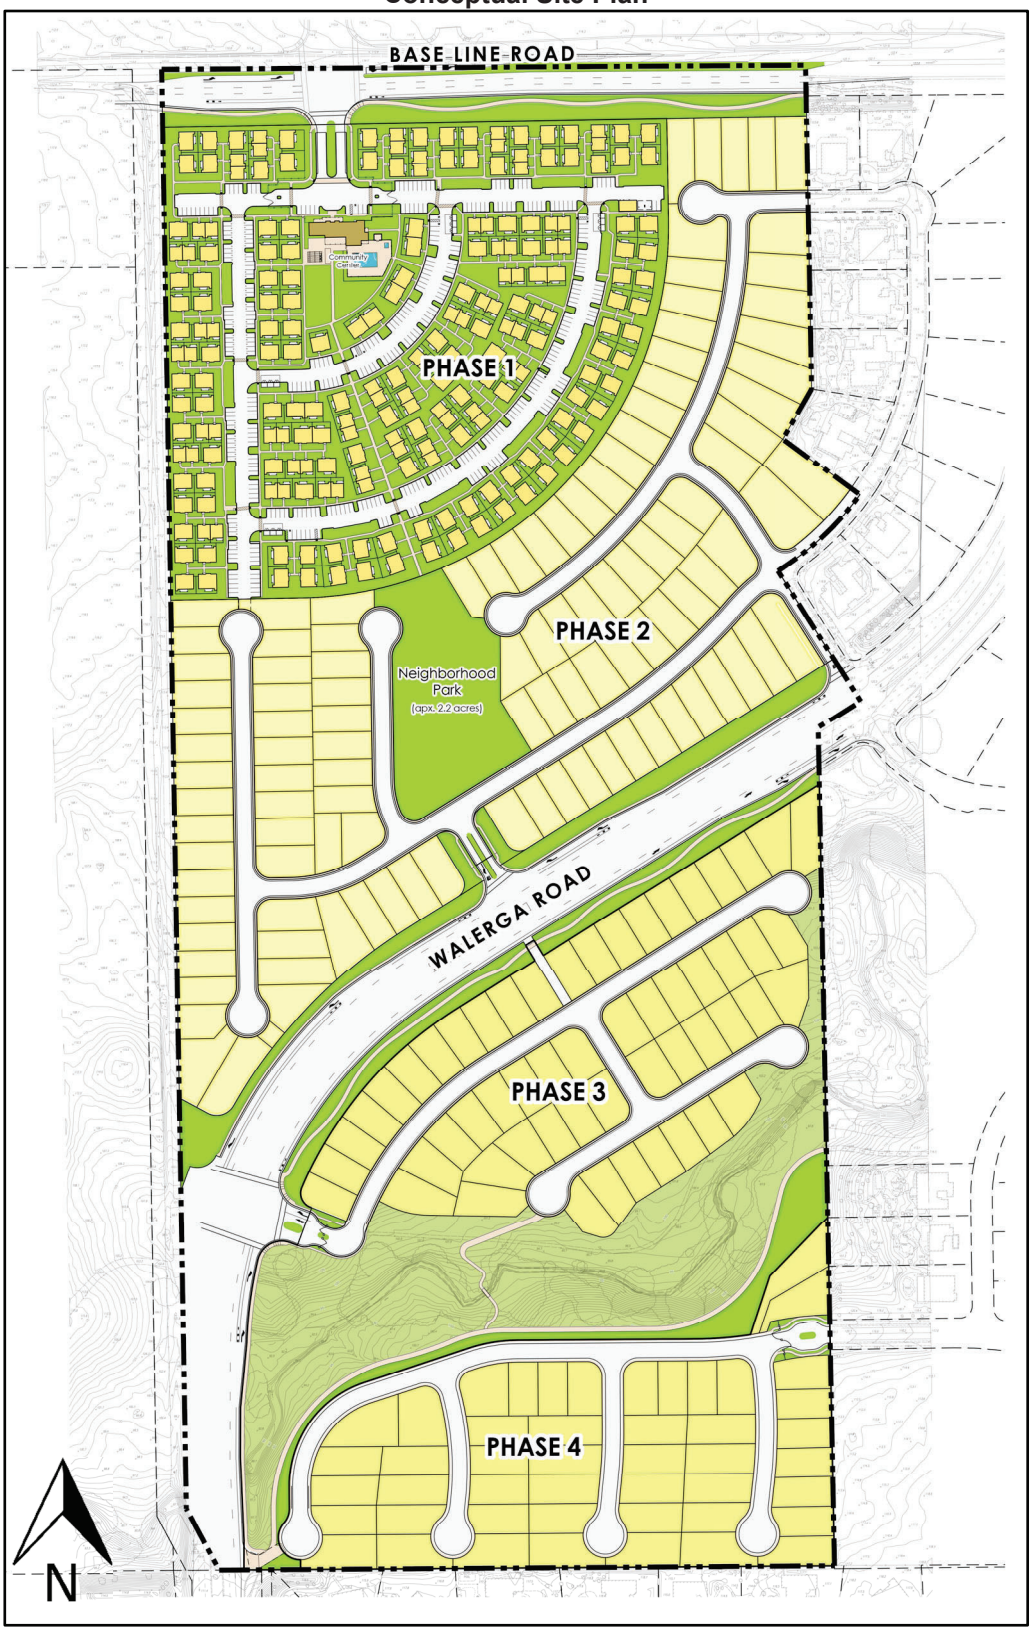
Estia Dry Creek

The Estia Dry Creek development (Phase 1) would include 220 single-story multi-family units consisting of 80 one-bedroom units and 140 two-bedroom units, ranging from approximately 700 sf to 1,100 sf. Each unit would include a private fenced backyard. A 3,537-sf community center building would also be developed and would include a club room, two fitness rooms, and leasing offices with associated lounge, break room, and storage areas. An outdoor pool with patios and grill areas would be located adjacent to the community center. Additional amenities would include a centrally-located dog park, pet washing stations, and car washing stations. Garages and surface parking would be located throughout the site. The density for the Estia Dry Creek portion of the proposed project would be approximately 9.5 residential units per acre.

Placer Creek Residential

The Placer Creek Residential development (Phases 2, 3, and 4) would include 212 single-family residential lots with a minimum lot size of 6,000 sf. Lot coverage is proposed to be 35 percent for two-story homes and 40 percent for single-story homes. Phase 2 would include the development of 110 single-family lots, and a centrally located 2.2-acre public neighborhood park with associated amenities. Phase 3 would include the development of 55 single-family lots and potential recreational amenities. Phase 4 would include the development of 47 single-family lots and the western extension of Vineyard Road, which would provide site access, along with trails and the seven-acre oak woodlands area along the “Placer Creek” riparian corridor, which would be preserved as open space. The Placer Creek riparian corridor would separate the Phase 3 and 4 developments. The average residential density of the Placer Creek Residential site would be approximately 3.8 dwelling units per acre.

General Plan and DCWPCP Amendments



The 92.2-acre project site (including Walerga Road) is currently designated RLDR (80.1 acres) and OS (12.1 acres). The project would include a General Plan/DCWPCP Map Amendment to change the site’s land use designations to High Density Residential (HDR) (22.5 acres), Medium Density Residential (MDR) (61.2 acres), and OS (9.6 acres).

Rezone

Project Site

The project would include a rezone to change the site’s zoning designations from RS-AG-B-40 PD=1 (80.1 acres) and O (12.1 acres), to Residential Multifamily, Combining Design Scenic Corridor (RM-Dc) (22.5 acres), Residential Single Family, Combining a Minimum Building Site of 6,000 sf (RS-B-X-6,000) (61.2 acres), and Open Space (O) (9.6 acres).

Figure 5
Conceptual Site Plan

* Figure not OCR Compatible

Off-Site Affordable Housing

As discussed further below in the Affordable Housing section, the applicant intends to satisfy the project's affordable housing requirements by transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the Riolo Vineyards Specific Plan (RVSP). The project applicant is seeking to rezone the affordable housing parcel to the newly established zone of Residential Multifamily 30 (RM30), which can result in a maximum development potential of 120 affordable income-restricted units.

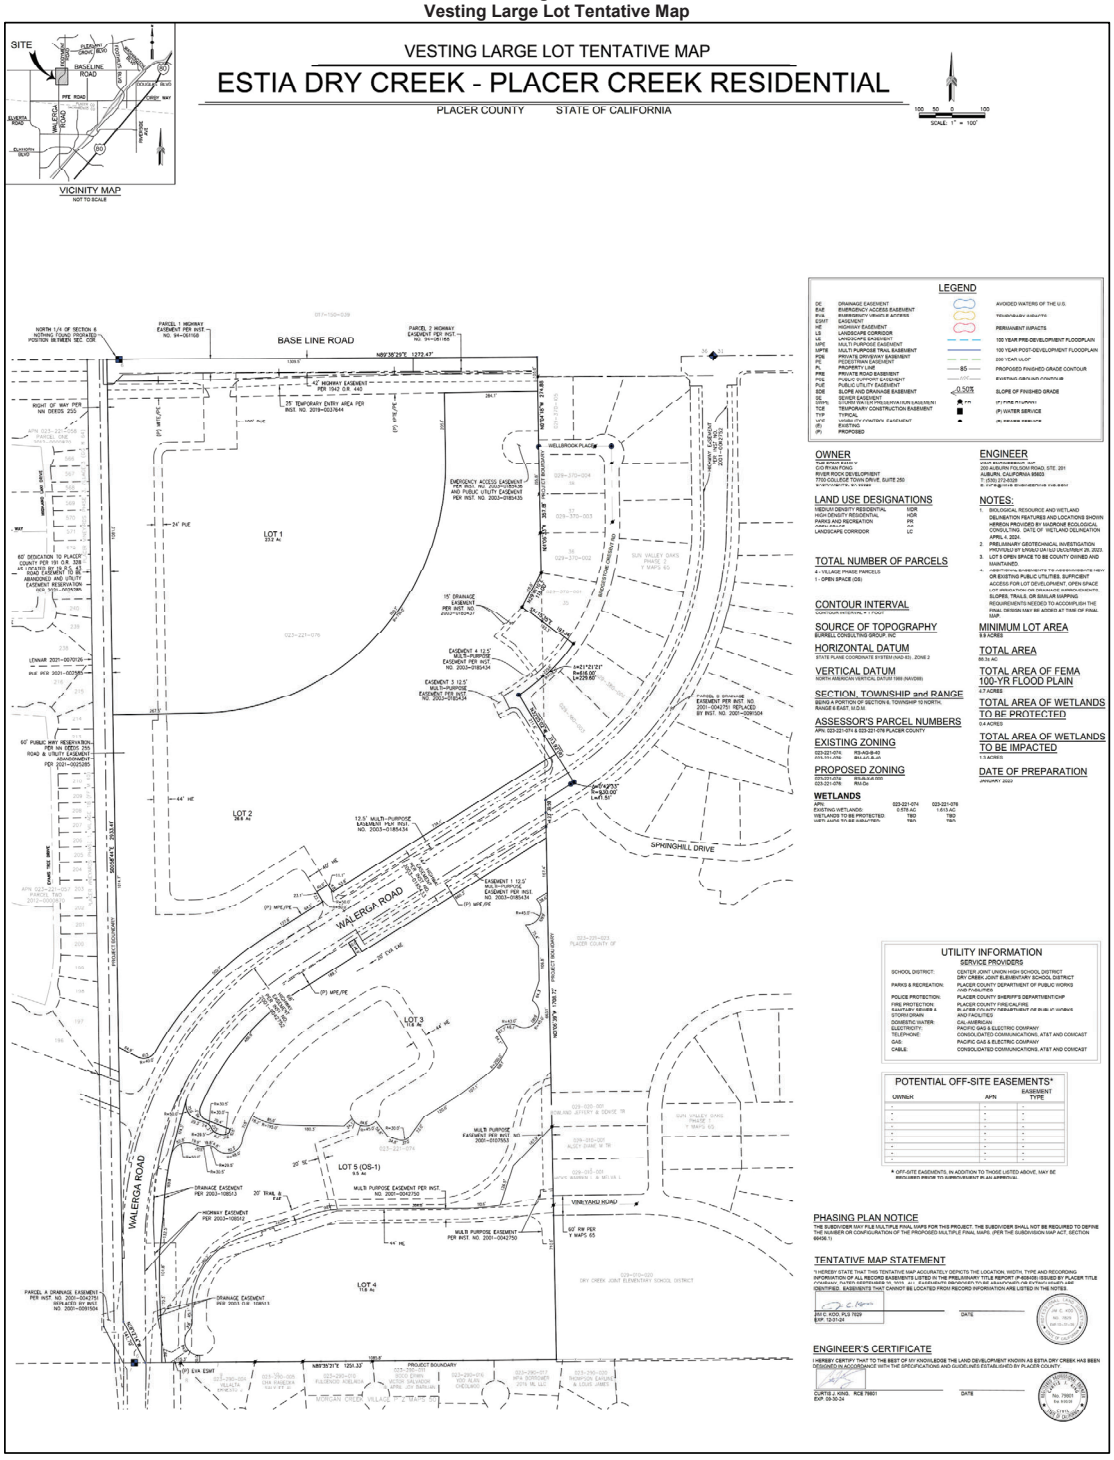
Tentative Subdivision Maps

The proposed project would include a Large Lot Tentative Subdivision Map (see Figure 6) to subdivide the net 87.6-acre project site into large lot parcels corresponding to the residential areas of the site (Lots 1 through 4) and the on-site open space (Lot 5) (see Figure 6). In addition, the proposed project would include a Vesting Phased Small Lot Tentative Subdivision Map (see Figure 7) to subdivide large Lots 2, 3, and 4 into 212 single-family residential lots ranging from approximately 6,000 sf to 15,673 sf. Table 2 below provides a summary of the proposed on-site land uses. As shown in the table, the total unit count is 432, which includes 212 single-family lots and 220 multi-family units.

Table 2
Land Use Summary

Lot	Phase	Land Use Designation	Zoning Designation	Land Use	Gross Acres
Lot 1 (220 Units)	1	HDR	RM-Dc	Multi-Family Residential	23.2
Lot 2 (110 Units)	2	MDR	RS-B-6	Single-Family Residential	19.2
Lot 3 (55 Units)	3	MDR	RS-B-6	Single-Family Residential	8.9
Lot 4 (47 Units)	4	MDR	RS-B-6	Single-Family Residential	8.7
LC-3	2	LC	RS-B-6	Landscape Corridor	0.8
LC-4	2	LC	RS-B-6	Landscape Corridor	0.8
LC-5	3	LC	RS-B-6	Landscape Corridor	1.5
LC-6	4	LC	RS-B-6	Landscape Corridor	0.1
LC-7	4	LC	RS-B-6	Landscape Corridor	0.1
OS-1*	3	OS	O	Open Space	9.6
PARK-1	2	PR	RS-B-6	Park	2.2
ROAD-2	2	HE	--	Public Road	4.9
ROAD-3	3	MDR	RS-B-6	Private Road	2.5
ROAD-4	4	MDR	RS-B-6	Private Road	2.7
Walerga Road	2, 3	HE	--	Public Road	5.7
Walerga Road	--	HE	--	Public Road	1.2
Total					**92.2**

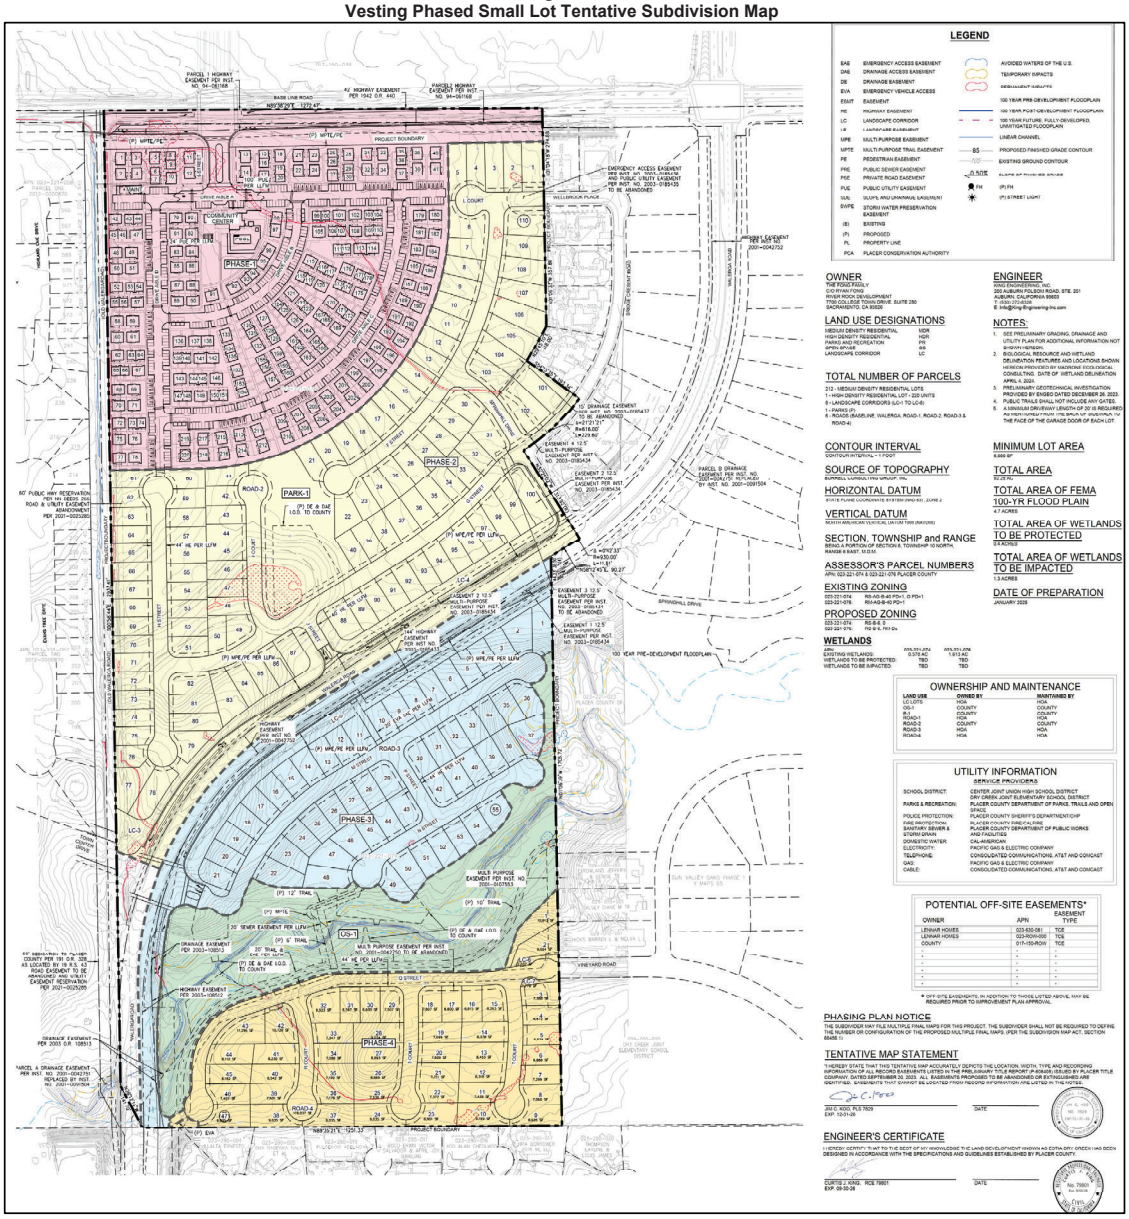
Note: Lot acreages are approximate and will be refined through the EIR process.



*Lot developed with the Large Lot Final Map.

Affordable Housing

The Estia Dry Creek development is exempt from the Placer County Inclusionary Housing Ordinance (County Code 15.65.050.B.16) due to the unit sizes averaging less than 1,600 sf.



As discussed in the Rezone section above, the applicant intends to satisfy the project's affordable housing requirements by transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the RVSP. The proposed affordable housing parcel is approximately four acres, located at the northeast corner of PFE Road and Watt Avenue, and is identified as APN 023-200-056-000.

Figure 6
Vesting Large Lot Tentative Map

* Figure not OCR Compatible

Figure 7
Vesting Phased Small Lot Tentative Subdivision Map

* Figure not OCR Compatible

In 2015, the County approved an amendment to the RVSP, which redesignated the subject parcel from HDR to Commercial. The 2015 RVSP Amendment did not include additional traffic analysis; thus, the County limited the amount of commercial development on this parcel to a maximum of 3,750 sf, which roughly equates to the same number of vehicle trips that could be generated by the previously approved HDR use.

In addition to a commercial development potential of 3,750 sf, the applicant, Homes by Towne, has 39 density reserve units available towards this parcel. Thus, the baseline development potential for the proposed affordable housing parcel consists of 3,750 sf of commercial, plus the 39 density reserve units. The project applicant is seeking an amendment to the RVSP and a rezone of the proposed affordable housing parcel to the newly established zone of RM30 (Residential Multifamily 30), which can result in a maximum development potential of 120 affordable income-restricted units. This EIR will evaluate the potential environmental impacts associated with the net increase in development potential at the affordable housing parcel within the RVSP.

Parks, Recreation, Open Space, and Trails

The proposed project would include development of a public, 2.2-acre neighborhood park in the Placer Creek Residential Phase 2 development (Lot PARK-1). Additional park areas would be provided in pockets along Placer Creek. The proposed project would include approximately 9.6 acres of open space bisected by “Placer Creek” and situated between the Placer Creek Residential Phase 3 and 4 neighborhoods (Lot 5/Lot OS-1). The open space area would be preserved as natural open space by virtue of the underlying zoning and an open space easement to be recorded with the final map. Placer Creek Residential parks, trails and open space would be open to the public.

The Estia Dry Creek development would feature an extensive internal pedestrian circulation system that would provide connectivity to project amenities and the surrounding community. A 3,537-sf community center building would include a club room, two fitness rooms, a dog washing facility, and leasing offices with associated lounge, break room, and storage areas. An outdoor pool with patios and grill areas would be located adjacent to the community center. Additional amenities would include a centrally located dog park, and car washing stations. The on-site amenities and recreational facilities associated with the Estia Dry Creek development would be private.

The proposed project would include an approximately 1,300-foot long Class I meandering trail along the Baseline Road frontage, and an approximately 2,300-foot long Class I meandering trail along the southern/eastern Walerga Road frontage. Placer Creek Residential Phase 4 would also include an approximately 1,600-foot long extension of the existing trail within the open space portion of the project site. An approximately 1,600 foot long Class I trail on the southern side of Placer Creek would be connected to the stubbed path north of the three existing Sun Valley Oaks homes fronting White Mill Crescent Road at Vineyard Road. From the proposed trail, a pedestrian bridge would go over to Placer Creek and connect to a trail south of Phase 3, ultimately connecting to N Street within the Placer Creek Residential Phase 2 neighborhood.

The project site would be annexed into County Service Area 28, Zone of Benefit 169 (Dry Creek Parks) for ongoing maintenance of public parks, trails, and recreation amenities within the Dry Creek community.

Access, Circulation, and Parking

Primary access to the Estia Dry Creek development would be provided by a new driveway located along Baseline Road, to the north of the site. The proposed driveway would be aligned with the future six-lane, fully signalized Upland Drive, which would serve the Baseline Marketplace Commercial development located north of the site, along the north side of Baseline Road. An Emergency Vehicle Access to the Estia Dry Creek development would be from Phase 2 via a non-signalized Walerga Road intersection located between Springhill Drive and the existing signalized access (i.e., Town Center Avenue) to the Placer Vineyards Property 1A development to the southwest of the site.

Access to the Placer Creek Residential Phase 2 neighborhood would be provided by the aforementioned new roadway off of Walerga Road between Springhill Drive and Town Center Avenue, and new street extensions from Wellbrook Place and Bridgestone Crescent Road to the east. Access to the Placer Creek Residential Phase 3 neighborhood would be from the eastern/fourth leg of the proposed signalized intersection/access to Walerga at Town Center Avenue, and an Emergency Vehicle Access is proposed from opposite the Phase 2 access on Walerga Road. Access to the southern Phase 4 Placer Creek Residential neighborhood would be from the western extension of Vineyard Road, which currently terminates at the southern entry to the Sun Valley Oaks subdivision at White Mill Crescent Road. An Emergency Vehicle Access for Phase 4 is proposed at the southwest corner of the site in the same location as the existing encroachment for Sewer and Emergency Access.

The Estia Dry Creek and Placer Creek Residential Phase 2 entries on Walerga and Baseline Roads would be landscaped with native vegetation and marked with enhanced hardscape features, using materials consistent with the DCWPCP and the Placer County Landscape Guidelines. The Placer Creek Residential Phase 3 entry from Walerga Road would include a landscaped median with a vehicle gate beyond the median, and the Placer Creek Residential Phase 4 entry on Vineyard Road would also be gated. Pedestrian gates would be located at the project entries and would remain unlocked during daylight hours. Project-identification monument features would be located at each of the entries.

From the proposed access points, the Placer Creek Residential neighborhoods would be served by an internal roadway system, which would include sidewalks and rolled curb and gutters on each side. Interior roadways would be public in Phase 2 and private in Phases 3 and 4. Low Impact Development (LID) features would be included along the roads, and on-street parking would be permitted on both sides of the streets.

An emergency vehicle access (EVA) connection would be developed as part of Phase 1 between Estia Dry Creek and the Phase 2 roadways connecting to Walerga Road. An EVA in Placer Creek Residential Phase 3 would be located from Walerga Road to M Street, opposite the new Phase 2 entrance/J Street. In Phase 4, an EVA would be located from Q Court to Walerga Road in the southwest corner of the project site.

Parking spaces provided in the Estia Dry Creek multi-family residential site would comply with the parking requirements pursuant to Placer County Municipal Code 17.54.040. A total of 457 parking spaces would be included in the Estia Dry Creek site, including 385 surface spaces and 72 garage parking spaces. All garage spaces would be electric vehicle (EV) ready. Additionally, three level 3 fast EV chargers would be provided on-site, one of which would be located at the Community Center, and two of which would be located within the community. Each single-family residence within the Placer Creek Residential development is anticipated to include a private garage and driveway.

Utilities and Public Services

Treated water service for the project would be provided by California American Water (Cal-Am) through an agreement with Placer County Water Agency (PCWA). The Estia Dry Creek development would include construction of a 12-inch loop system. In addition, the proposed project would include four- to 12-inch internal water lines for domestic water service and fire/hydrant connections. Internal water lines would connect to an existing 16-inch line in Walerga Road.

The proposed project would be served by the Dry Creek Wastewater Treatment Plant (Dry Creek WWTP). Flows would be conveyed through existing eight-inch “Sewer B” gravity lines within Walerga Road to the Dry Creek WWTP. The proposed project would include the development of an eight-inch sewer line extending across Placer Creek. Eight-inch sanitary sewer lines would be included throughout the project site and would connect to an existing eight-inch sewer line to the south of the project site. An existing sewer lift station is located east of Walerga Road and south of Dry Creek, approximately 0.75-mile to the south. All sewer improvements would be consistent with the South Placer Regional Wastewater and Recycled Water Systems Evaluation, and depending on the timing of other local projects, would require increasing emergency storage capacity at the existing lift station. The project site would be annexed into Placer County Service Area 28, Zone 173 for sanitary sewer service.

The project site is located within the Dry Creek Watershed. The Estia Dry Creek and Placer Creek Residential Phase 2 sites would have both Baseline Road and Walerga Road storm drain tie-ins, and the Placer Creek Residential Phase 2 component would also drain to the southwest. The "Placer Creek" tributary to Dry Creek is located between the Placer Creek Residential Phases 3 and 4 residential neighborhoods and flows southwest to Dry Creek. Development of the project site would require installation of on-site drainage facilities and alteration of site topography to accommodate the proposed land uses. 24-inch and 18-inch storm drains within the Phase 3 and Phase 4 site would outfall to the Placer Creek tributary. A box culvert extension would be included in the southwestern portion of the project site under Walerga Road. The proposed project would include on-site construction of stormwater quality treatment facilities, including LID features. The proposed project would participate in the Dry Creek Watershed Drainage Improvements in-lieu fee to fund improvements. The drainage system for the proposed project will be evaluated in detail in the EIR.

The proposed project is within the service area of Pacific Gas & Electric Company (PG&E) for electric and natural gas service. A 30-inch PG&E gas transmission line is located along the north side of Baseline Road within an existing easement. In addition, Consolidated Communications and Comcast would provide fiber communication and internet services to the proposed project. The proposed project would connect to the existing dry utility lines within the project vicinity.

Solid waste would be collected by Recology Auburn Placer, a private collection firm, and transported to the Western Placer Waste Management Authority's Western Regional Sanitary Landfill, located north of the City of Roseville.

Additionally, the proposed project would be served by the Placer County Sheriff's Office, California Highway Patrol (CHP), Placer County Fire, Center Joint Unified School District (grades K-12), Dry Creek Joint Elementary School District (grades K-8), and Roseville Joint Union High School District (grades 9-12). The nearest Placer County Fire Station is the Dry Creek Fire Station (Station 100), located at 8350 Cook Riolo Road, approximately 1.5 miles east of the project site. A new fire station is planned for the Placer Vineyards Project, which would provide supplemental fire services. The proposed project would require annexation into the Dry Creek Fire Zone of Benefit (County Service Area 28, Zone of Benefit 165) for provision of fire protection services.

Off-Site Improvements

The Estia Dry Creek development and the Placer Creek Residential development would each include respective off-site improvements. Depending upon the construction timing of each development, and any improvement triggers which would be determined by the traffic study prepared for the proposed project, either of the developments may be required to complete certain off-site improvements at the Walerga Road/Fiddyment Road/Baseline Road intersection.

The proposed project would include the reconfiguration of Walerga Road to include two, seven-foot wide bike lanes, three 12-foot wide travel lanes in each direction, a Class I trail or sidewalk, and a 13- to 24-foot wide center landscaped median.

A six-foot tall noise barrier, using a combination berm and wall, would be constructed between the Walerga Road frontages and adjacent residential units.

Design Review

Pursuant to Placer County Code Section 17.52.070, the Estia Dry Creek development would require County approval of Design Review for the rezone to the RM-Dc zoning designation to ensure compliance with the County's Multifamily and Mixed-Use Design Manual. The purpose of the design review (-Dc, -Dh, -Ds) combining districts is to provide special regulations to protect and enhance the aesthetic character of lands and buildings within public view; to protect historic buildings; to minimize any adverse impacts of conflicting land uses; to enhance tourism through the protection of lands and buildings having unique aesthetic characteristics; and to provide special project review procedures for lands and uses which by their nature

require special attention to architectural design and massing, landscaping, circulation, and/or energy conservation.

Annexations

The proposed project would require annexation into the Placer County Service Area 28, Zone 173, for sanitary sewer service, subject to approval by the County Board of Supervisors. While maintenance and operation of the sewer collection system would be the responsibility of Placer County, the project's wastewater would be treated at the City of Roseville's Dry Creek WWTP, consistent with normal County practice.

The proposed project would also require annexation into the Placer County Service Area 28, Zone 169, for ongoing maintenance and the generation of funds for public parks, trails, and open space recreation amenities within the Dry Creek community, and annexation into the Dry Creek Fire Zone of Benefit (County Service Area 28, Zone of Benefit 165) for provision of fire protection services, subject to Placer County approval.

Project Phasing and Construction

As shown in Figure 5, the proposed project would be constructed over the course of four development phases, with the first phase (i.e., the Estia Dry Creek development) located adjacent to Baseline Road. The proposed Large Lot Tentative Subdivision Map parcels correspond to the conceptual phasing (see Figure 6). Development of Phases 1 and 2 would occur on the northern portion of the site (APN 023-221-076), north of Walerga Road, and development of Phases 3 and 4 would occur on the southern portion of the site (APN 023-221-074), south of Walerga Road. The Estia Dry Creek and Placer Creek Residential Phase 2 would be constructed in two separate phases, with all site work, including grading and necessary infrastructure, completed with the first phase. The Placer Creek Residential Phases 3 and 4 would be developed in a single phase, but the two neighborhoods would be physically separated. The Phase 3 and 4 sites would require mass grading.

1.4 Requested Entitlements

The proposed project would require County approval of the following:

- General Plan/DCWPCP Map Amendment to change the land use designations to High Density Residential (22.5 acres), Medium Density Residential (61.2 acres), and Greenbelt & Open Space (8.5 acres);
- General Plan/RVSP Map Amendment to change the land use designation of the four-acre parcel (APN 023-200-056-000), located on the northeast corner of PFE Road and Watt Avenue from Commercial to High Density Residential (HDR);
- Rezone to Residential Multifamily, Combining Design Review (RM-Dc) (22.5 acres), Residential Single Family, Combining Building Site Minimum of 6,000 sf (RS-B-X-6,000) (61.2 acres), and O (8.5 acres);
- Rezone of a four-acre parcel (APN 023-200-056-000), located at the northeast corner of PFE Road and Watt Avenue from Residential Single Family, combining Agriculture, combining minimum Building Site of 20,000 square feet, combining Development Reserve, combining Planned Residential Development of 2 units per acre (RS-AG-B-20-DR PD = 2) and Specific Plan District – Riolo Vineyards Specific Plan (SPL-RVSP) to Residential Multifamily 30, combining Design Scenic Corridor (RM30-Dc);
- Vesting Large Lot Tentative Subdivision Map;
- Vesting Phased Small Lot Tentative Subdivision Map;
- Design Review for the Estia Dry Creek multifamily neighborhood to ensure compliance with the County's Multifamily and Mixed-Use Design Manual;
- Annexation into Placer County Service Area 28, Zone 173 for sanitary sewer service;

- Annexation into Placer County Service Area 28, Zone 169 for ongoing maintenance of public parks, trails and open space recreation amenities within the Dry Creek community; and
- Annexation into the Dry Creek Fire Zone of Benefit (County Service Area 28, Zone of Benefit 165) for provision of fire protection services.

The project would require the following approvals/permits from other responsible agencies:

- Placer County Conservation Program Authorization (Placer Conservation Authority);
- Section 404 Nationwide Permit (or Letter of Permission) (USACE);
- Section 401 Water Quality Certification (RWQCB – Central Valley Region);
- Section 1602 Permit (CDFW); and
- NPDES Construction General Permit (RWQCB – Central Valley Region).

2.0 PROBABLE ENVIRONMENTAL EFFECTS AND SCOPE OF THE EIR

Consistent with Appendix G of the CEQA Guidelines, the County anticipates that the EIR will contain the following chapters:

- Aesthetics
- Agricultural Resources
- Air Quality and Greenhouse Gas Emissions
- Biological Resources
- Cultural Resources
- Energy
- Geology and Soils
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning/Population and Housing
- Noise
- Public Services and Utilities
- Transportation
- Tribal Cultural Resources
- Wildfire
- Statutorily Required Sections
- Effects Not Found to be Significant
- Alternatives Analysis

Each chapter of the EIR will include identification of the thresholds of significance, identification of project-level and cumulative impacts, and the development of mitigation measures and monitoring strategies, as required. The proposed EIR will describe the relevant portions of the Placer County General Plan, the Placer County General Plan EIR, and the DCWPCP, where applicable. In addition to these County documents, project-specific technical studies are being prepared by technical experts to support the EIR's analyses.

The following paragraphs summarize the anticipated analyses that will be included in the EIR.

Aesthetics: The Aesthetics chapter of the EIR will summarize existing regional and project area aesthetics and visual setting. To the extent applicable, the chapter will describe project-specific aesthetics issues such as scenic vistas, trees, historic buildings, existing visual character or quality of the project area, as well as light and glare. Pursuant to Appendix G of the CEQA Guidelines, if the project site is determined to be in a non-urbanized area, the focus of the analysis concerning the project's effects on visual character or quality of the project site and its surroundings will be on whether the proposed project will substantially degrade the existing visual character or quality of public views of the site and its surroundings. If the project site is determined to be in an urbanized area, the focus of the analysis will be on whether the proposed project will conflict with applicable zoning and other regulations governing scenic quality.

Agricultural Resources: The Agricultural Resources chapter of the EIR will provide information regarding the existing setting relative to agricultural resources on the project site based on a review of maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency for Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, as well as the types of on-site soils, determined through a Web Soil Survey, which will be conducted using the USDA Natural Resources Conservation Service website. The chapter will include an analysis of the proposed project's potential to conflict with the existing zoning for agricultural-related use and any Williamson Act contract. The chapter

will identify thresholds of significance applicable to the proposed project. The impacts will be measured against the thresholds of significance and appropriate mitigation measures and monitoring strategies will be identified which are consistent with the policies of Placer County.

Air Quality and Greenhouse Gas Emissions. The air quality and greenhouse gas (GHG) emissions analysis for the proposed project will be performed using the California Emissions Estimator Model (CalEEMod) software program and following Placer County Air Pollution Control District (PCAPCD) CEQA Guidelines.

The air quality impact analysis will include a quantitative assessment of short-term (i.e., construction) and long-term (i.e., operational) increases of criteria air pollutant emissions of primary concern (i.e., ROG, NO_X, and PM_{10}). The project's cumulative contribution to regional air quality will be discussed, based in part on the modeling conducted at the project level. The analysis will also address any potential odor impacts that may occur, as well as toxic air contaminant (TAC) emissions.

The GHG emissions analysis will include a quantitative estimate of carbon dioxide equivalent emissions from the proposed project, including indirect emissions (e.g., electricity, natural gas) and construction emissions. The chapter will include an analysis of the project's consistency with the Placer County Sustainability Plan (PCSP).

The significance of air quality and GHG impacts will be determined in comparison to PCAPCD significance thresholds. PCAPCD-recommended mitigation measures and PCSP strategies will be incorporated, if needed, to reduce any significant air quality impacts, and anticipated reductions in emissions associated with proposed mitigation measures will be quantified.

Biological Resources. The Biological Resources chapter of the EIR will summarize the setting and describe the potential project effects to plant communities, oak woodlands, wildlife, and wetland and riparian communities, including adverse effects on rare, endangered, candidate, sensitive, and other special-status species for the project site. Effects associated with all on-site and off-site improvements will be included in the analysis. Analysis in the chapter will be based on a Biological Resources Assessment. The project site is within the PCCP boundary; thus, an evaluation of the potential for the proposed development of the project to conflict with the provisions of the adopted PCCP will be included in the chapter. Mitigation measures for all identified impacts will be developed consistent with applicable laws and regulations, including the PCCP.

Cultural Resources. The Cultural Resources chapter of the EIR will describe the potential effects to historical and archaeological resources from buildout of the proposed project. Analysis in the chapter will be based on a Cultural Resources Report prepared for the proposed project, which will include the results of a field survey and records search. Effects associated with all on-site and off-site improvements will be included in the analysis.

Energy. The Energy chapter of the EIR will evaluate whether the proposed project could result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation. The discussion will also evaluate whether the proposed project would conflict with or obstruct a State or local plan for renewable energy. The chapter will review the PCSP to identify energy-related measures that may be applicable to the proposed project.

Geology and Soils. The Geology and Soils chapter of the EIR will summarize the setting and describe the potential effects from the project relating to soil erosion, earthquakes, liquefaction, expansive/unstable soils, as well as identify any known paleontological resources or unique geological features within the project area. The chapter will also discuss the potential for significant disruptions to soil or changes in topography due to project development. The chapter will be based primarily on a site-specific Geotechnical Due Diligence Review prepared for the proposed project.

Hazards and Hazardous Materials. The Hazards and Hazardous Materials chapter of the EIR will summarize the setting and describe any potential for existing or possible hazardous materials within the project area, including but not limited to overhead/underground utility lines, or soil contamination associated

with pesticides. The chapter will also assess the potential for the proposed project to create a significant hazard to the public or environment through the routine transport, use, or disposal of hazardous materials.

Impacts of the environment on a project, as compared to impacts of a project on the environment, are beyond the scope of required CEQA review. The California Supreme Court has held that, "CEQA does not generally require an agency to consider the effects of existing environmental conditions on a proposed project's future users or residents. What CEQA does mandate is an analysis of how a project might exacerbate existing environmental hazards." As such, the mere presence of possible hazardous materials at the site or in the vicinity, should such exist, would be considered an existing environmental condition and, thus, would not be considered an impact under CEQA. Rather, the proposed project could have the potential to result in an impact associated with possible hazardous materials should the proposed project exacerbate the existing conditions (e.g., contaminated soils become airborne during ground-disturbing activities and expose construction workers or future residents of the proposed project). The chapter will primarily be based on a site-specific Phase I Environmental Site Assessment.

Hydrology and Water Quality. The Hydrology and Water Quality chapter of the EIR will summarize setting information and identify potential impacts on stormwater drainage, flooding, groundwater (i.e., depletion and recharge), and water quality, including stormwater runoff water quality. The Hydrology and Water Quality chapter will evaluate project-related increases in impervious surfaces and stormwater flows, increases in downstream flooding, and on-site facilities necessary to treat on-site runoff. In addition, the chapter will evaluate impacts associated with potential minor alteration of the 100-year floodplain limits and existing drainage patterns. The chapter will primarily be based on project-specific Preliminary Drainage Reports.

Land Use and Planning/Population and Housing. The Land Use and Planning/Population and Housing chapter of the EIR will evaluate the consistency of the proposed project with the policies and regulations included in the Placer County General Plan, DCWPCP, and County Code adopted for the purpose of avoiding or mitigating an environmental effect. In addition, the chapter will include an evaluation of the potential for the project to induce substantial unplanned population growth in the area, either directly or indirectly (i.e., through extension of roads or other infrastructure). Additionally, the chapter will include a discussion of Placer County's affordable housing requirements. The chapter will rely on information from the California Department of Finance, Placer County General Plan, and the Placer County General Plan Housing Element.

Noise. The Noise chapter of the EIR will be based on a project-specific Noise Study. The chapter will address potential noise impacts resulting from project construction and operation, including existing and future traffic noise levels on the local roadway network. Noise-sensitive land uses or activities in the project vicinity will be identified and ambient noise and vibration level measurements on, and in the vicinity of, the project site will be conducted to quantify existing background noise and vibration levels for comparison to the predicted project-generated levels. Noise exposure levels will then be compared to applicable significance criteria in the Placer County General Plan Noise Element, the DCWPCP, and CEQA. Feasible and appropriate mitigation measures to avoid or reduce adverse impacts will be identified, as needed.

Public Services and Utilities. The Public Services and Utilities chapter of the EIR will evaluate whether the proposed project could increase demands upon local service providers (e.g., fire, police, schools). In accordance with Appendix G, the focus of the analysis will be on whether the project's demand would require physical alteration of, or need for new governmental facilities, in order to maintain acceptable service ratios, response times, or other performance objectives, the construction of which could cause significant environmental impacts.

Additionally, the chapter will evaluate the proposed project's increase in water supply demand and wastewater generation to determine whether the existing water and sewer infrastructure systems have adequate capacity (wastewater) and supply (water), to accommodate demands from the proposed project, or if system upgrades would be required. The chapter will also evaluate the receiving landfill's capacity to accommodate the increase in solid waste associated with the proposed project. Electricity and natural gas service will also be addressed in the chapter. The chapter will be based on existing information from the

Placer County General Plan, DCWPCP, and information obtained from direct consultation with appropriate service providers.

Transportation. The Transportation chapter of the EIR will be based on a Transportation Impact Analysis (TIA) prepared specifically for the proposed project. Impact determination for CEQA purposes will be based on vehicle miles traveled (VMT), consistent with CEQA Guidelines Section 15064.3, which became effective statewide on July 1, 2020. The VMT analysis will be prepared consistent with Placer County's current guidance regarding analysis of VMT.

The proposed project's impacts to alternative modes such as pedestrian, bicycle and transit facilities will be assessed based on their significance criteria contained in the adopted Placer County guidelines. The EIR chapter will also include an analysis of the proposed project's potential impacts related to conflicting with applicable programs, policies, and ordinances addressing the circulation system, vehicle safety hazards, and emergency access. Feasible and appropriate mitigation measures to avoid or reduce adverse impacts will be identified, as needed.

Tribal Cultural Resources. The Tribal Cultural Resources chapter will describe the potential effects to tribal cultural resources from buildout of the proposed project. The County will conduct Native American tribal consultation pursuant to Assembly Bill (AB) 52 and Senate Bill (SB) 18, the latter of which is required for the proposed project due to the proposed General Plan Amendment. Input from tribes will be incorporated into the Tribal Cultural Resources chapter. Feasible and appropriate mitigation measures to avoid or reduce adverse impacts will be identified, as needed.

Wildfire. The Wildfire chapter of the EIR will address the questions in Section XX, Wildfire, of Appendix G of the CEQA Guidelines. Specifically, the proposed project will be evaluated to determine if the project would substantially impair an adopted emergency response plan or emergency evacuation plan. In addition, the chapter will consider whether the proposed project would exacerbate fire risk, as well as whether the project would expose people or structures to significant post-fire risks, including downslope or downstream flooding or landslides. Mapping prepared by the California Department of Forestry and Fire Protection (CAL FIRE) regarding fire hazard severity zones will be reviewed, and if necessary, the analysis will include consultation with CAL FIRE.

Statutorily Required Sections. Pursuant to CEQA Guidelines Section 21100(B)(5), the Statutorily Required Sections chapter of the EIR will address the potential for growth-inducing impacts of the proposed project, focusing on whether removal of any impediments to growth would occur with the proposed project. A summary of any significant and unavoidable impacts identified within the EIR will be included in this chapter, as well as a discussion of significant irreversible impacts. The chapter will generally describe the cumulative setting for the proposed project; however, a detailed description of the subject-specific cumulative setting, as well as analysis of the cumulative impacts, will be included in each technical chapter of the EIR.

Effects Not Found to be Significant. Section 15128 of the CEQA Guidelines states that an EIR shall contain a brief statement indicating the reasons that various possible significant effects of a project were determined not to be significant and were, therefore, not discussed in detail in the EIR. Accordingly, the Effects Not Found to be Significant chapter of the EIR will include abbreviated discussions of impacts determined not to be significant.

Alternatives Analysis. In accordance with Section 15126.6(a) of the CEQA Guidelines, the EIR will include an analysis of a range of alternatives, including a No Project Alternative. Consideration will be given to potential off-site locations consistent with CEQA Guidelines, Section 15126.6(f)(2), and such locations will be determined in consultation with County staff. If it is determined that an off-site alternative is not feasible or is unnecessary, the EIR will include a discussion describing why such a conclusion was reached. The project alternatives will be selected when more information related to project impacts is available in order to be designed to reduce significant project impacts. The chapter will also include a section of alternatives considered but dismissed, if necessary. The Alternatives Analysis chapter will describe the alternatives and identify the environmentally superior alternative. The alternatives will be analyzed at a level of detail less than that of the proposed project; however, the analyses will include sufficient detail to allow a meaningful

comparison of the impacts. Such detail may include conceptual site plans for each alternative, basic quantitative traffic information (e.g., trip generation), as well as a table that will compare the features and the impacts of each alternative in comparison to the proposed project.

APPENDIX B

Janeann Lyons, CDRA Technician
Placer County, Community Development Resource Agency
3091 County Center Dr.
Auburn, CA 95603

Estia Dry Creek & Placer Creek Residential (PLN24-00144)

Dear Ms. Lyons,

Thank you for including the California Department of Transportation (Caltrans) in the review process for the project referenced above. We reviewed this local development for impacts to the State Highway System (SHS) in keeping with our mission, vision, and goals, some of which includes addressing equity, climate change, and safety, as outlined in our statewide plans such as the California Transportation Plan, Caltrans Strategic Plan, and Climate Action Plan for Transportation Infrastructure.

The project consists of two parcels, APN # 023-221-076 and 023-221-074. The first parcel is in the southeast intersection of Baseline Blvd. and Walerga Road. The second parcel is south of the first parcel, located in the southeast intersection of the Walerga Road and Walerga Road. This site is approximately five miles north of Interstate (I-) 80 and approximately seven miles west of the State Route (SR) 65 and I-80 interchange. This project is proposing multiple development phases as one project, which will include a Highschool, three separate neighborhoods containing 217 single family residential homes, as well as a small community containing 220-unit single story apartment homes. Based on the Design Application, Environmental Impact Report files and other associated documents in the review request, Caltrans has the following requests and recommendations:

Freeway Operations / Forecasting and Modeling

Based on our review, the proposed development will generate a significant number of daily trips and will have a substantial impact on the VMT.

- Please provide a Transportation Impact Study that investigates the "No Project" and "Plus Project" scenarios under Existing and Cumulative conditions.
    - The traffic study should calculate the trip generation that will be generated by the project. Caltrans requests project trip generation tables, per SB 743 Guidelines, for weekday, weekday AM peak hour, and

weekday PM peak hour following methodologies outlined in the ITE Trip Generation Handbook, 3rd Edition, and use trip generation rates in the ITE Trip Generation Manual, 11th Edition, unless project-specific data or local land-use-specific data is available.

- If the analyses determines that the addition of the project would adversely affect operations and safety of the SHS' mainline and/or to the interchanges, the project will need to pay a fair share toward facility improvements. Please contact Caltrans if more information is required regarding the scope of work for the study.

- If you believe the project is exempt from VMT analysis, please provide your justification/explanations.

Transportation Impact Fees

Please identify project-generated travel demand and estimate the costs of transit and active transportation improvements necessitated by the proposed project; viable funding sources such as development and/or transportation impact fees should also be identified. We encourage a sufficient allocation of fair share contributions toward multi-modal and regional transit improvements to fully mitigate cumulative impacts to regional transportation. We also strongly support measures to increase sustainable mode shares, thereby reducing VMT.

If you have any question regarding these comments or require additional information, please contact Angelina Healy, Local Development Review Coordinator, by phone (530) 790-8138 or via email at D3.Local.Development@dot.ca.gov.

Sincerely,

Gary S. Arnold, Branch Chief
Local Development Review and Complete Streets
Division of Planning, Local Assistance, and Sustainability

COMMENTS TO REQUEST FOR REVIEW FOR THE NOTICE OF PREPARATION FOR THE DRAFT ENVIRONMENTAL IMPACT REPORT, ESTIA DRY CREEK AND PLACER CREEK RESIDENTIAL PROJECT (PLN24-00144), SCH#2025040378, PLACER COUNTY

Pursuant to the State Clearinghouse's 7 April 2025 request, the Central Valley Regional Water Quality Control Board (Central Valley Water Board) has reviewed the *Request for Review for the Notice of Preparation for the Draft Environmental Impact Report* for the Estia Dry Creek and Placer Creek Residential Project (PLN24-00144), located in Placer County.

Our agency is delegated with the responsibility of protecting the quality of surface and groundwaters of the state; therefore our comments will address concerns surrounding those issues.

I. Regulatory Setting

Basin Plan

The Central Valley Water Board is required to formulate and adopt Basin Plans for all areas within the Central Valley region under Section 13240 of the Porter-Cologne Water Quality Control Act. Each Basin Plan must contain water quality objectives to ensure the reasonable protection of beneficial uses, as well as a program of implementation for achieving water quality objectives with the Basin Plans. Federal regulations require each state to adopt water quality standards to protect the public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act. In California, the beneficial uses, water quality objectives, and the Antidegradation Policy are the State's water quality standards. Water quality standards are also contained in the National Toxics Rule, 40 CFR Section 131.36, and the California Toxics Rule, 40 CFR Section 131.38.

The Basin Plan is subject to modification as necessary, considering applicable laws, policies, technologies, water quality conditions and priorities. The original Basin Plans were adopted in 1975, and have been updated and revised periodically as

required, using Basin Plan amendments. Once the Central Valley Water Board has adopted a Basin Plan amendment in noticed public hearings, it must be approved by the State Water Resources Control Board (State Water Board), Office of Administrative Law (OAL) and in some cases, the United States Environmental Protection Agency (USEPA). Basin Plan amendments only become effective after they have been approved by the OAL and in some cases, the USEPA. Every three (3) years, a review of the Basin Plan is completed that assesses the appropriateness of existing standards and evaluates and prioritizes Basin Planning issues. For more information on the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, please visit our website:
http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/

Antidegradation Considerations

All wastewater discharges must comply with the Antidegradation Policy (State Water Board Resolution 68-16) and the Antidegradation Implementation Policy contained in the Basin Plan. The Antidegradation Implementation Policy is available on page 74 at:
https://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/sacsjr_201805.pdf

In part it states:

Any discharge of waste to high quality waters must apply best practicable treatment or control not only to prevent a condition of pollution or nuisance from occurring, but also to maintain the highest water quality possible consistent with the maximum benefit to the people of the State.

This information must be presented as an analysis of the impacts and potential impacts of the discharge on water quality, as measured by background concentrations and applicable water quality objectives.

The antidegradation analysis is a mandatory element in the National Pollutant Discharge Elimination System and land discharge Waste Discharge Requirements (WDRs) permitting processes. The environmental review document should evaluate potential impacts to both surface and groundwater quality.

II. Permitting Requirements

Construction Storm Water General Permit

Dischargers whose project disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit), Construction General Permit Order No. 2009-0009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention

Plan (SWPPP). For more information on the Construction General Permit, visit the State Water Resources Control Board website at: http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

Phase I and II Municipal Separate Storm Sewer System (MS4) Permits[1]

The Phase I and II MS4 permits require the Permittees reduce pollutants and runoff flows from new development and redevelopment using Best Management Practices (BMPs) to the maximum extent practicable (MEP). MS4 Permittees have their own development standards, also known as Low Impact Development (LID)/post-construction standards that include a hydromodification component. The MS4 permits also require specific design concepts for LID/post-construction BMPs in the early stages of a project during the entitlement and CEQA process and the development plan review process.

For more information on which Phase I MS4 Permit this project applies to, visit the Central Valley Water Board website at: http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/municipal_permits/

For more information on the Phase II MS4 permit and who it applies to, visit the State Water Resources Control Board at: http://www.waterboards.ca.gov/water_issues/programs/stormwater/phase_ii_municipal.shtml

Clean Water Act Section 404 Permit

If the project will involve the discharge of dredged or fill material in navigable waters or wetlands, a permit pursuant to Section 404 of the Clean Water Act may be needed from the United States Army Corps of Engineers (USACE). If a Section 404 permit is required by the USACE, the Central Valley Water Board will review the permit application to ensure that discharge will not violate water quality standards. If the project requires surface water drainage realignment, the applicant is advised to contact the Department of Fish and Game for information on Streambed Alteration Permit requirements. If you have any questions regarding the Clean Water Act Section 404 permits, please contact the Regulatory Division of the Sacramento District of USACE at (916) 557-5250.

Clean Water Act Section 401 Permit – Water Quality Certification

If an USACE permit (e.g., Non-Reporting Nationwide Permit, Nationwide Permit, Letter of Permission, Individual Permit, Regional General Permit, Programmatic General Permit), or any other federal permit (e.g., Section 10 of the Rivers and Harbors Act or Section 9 from the United States Coast Guard), is required for this

[1] Municipal Permits = The Phase I Municipal Separate Storm Water System (MS4) Permit covers medium sized Municipalities (serving between 100,000 and 250,000 people) and large sized municipalities (serving over 250,000 people). The Phase II MS4 provides coverage for small municipalities, including non-traditional Small MS4s, which include military bases, public campuses, prisons and hospitals.

project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification must be obtained from the Central Valley Water Board prior to initiation of project activities. There are no waivers for 401 Water Quality Certifications. For more information on the Water Quality Certification, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/water_issues/water_quality_certification/

Waste Discharge Requirements – Discharges to Waters of the State

If USACE determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the proposed project area, the proposed project may require a Waste Discharge Requirement (WDR) permit to be issued by Central Valley Water Board. Under the California Porter-Cologne Water Quality Control Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands, are subject to State regulation. For more information on the Waste Discharges to Surface Water NPDES Program and WDR processes, visit the Central Valley Water Board website at:https://www.waterboards.ca.gov/centralvalley/water_issues/waste_to_surface_water/

Projects involving excavation or fill activities impacting less than 0.2 acre or 400 linear feet of non-jurisdictional waters of the state and projects involving dredging activities impacting less than 50 cubic yards of non-jurisdictional waters of the state may be eligible for coverage under the State Water Resources Control Board Water Quality Order No. 2004-0004-DWQ (General Order 2004-0004). For more information on the General Order 2004-0004, visit the State Water Resources Control Board website at: https://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2004/wqo/wqo2004-0004.pdf

Dewatering Permit

If the proposed project includes construction or groundwater dewatering to be discharged to land, the proponent may apply for coverage under State Water Board General Water Quality Order (Low Threat General Order) 2003-0003 or the Central Valley Water Board's Waiver of Report of Waste Discharge and Waste Discharge Requirements (Low Threat Waiver) R5-2018-0085. Small temporary construction dewatering projects are projects that discharge groundwater to land from excavation activities or dewatering of underground utility vaults. Dischargers seeking coverage under the General Order or Waiver must file a Notice of Intent with the Central Valley Water Board prior to beginning discharge.

For more information regarding the Low Threat General Order and the application process, visit the Central Valley Water Board website at: http://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2003/wqo/wqo2003-0003.pdf

For more information regarding the Low Threat Waiver and the application process, visit the Central Valley Water Board website at:

https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/waivers/r5-2018-0085.pdf

Limited Threat General NPDES Permit

If the proposed project includes construction dewatering and it is necessary to discharge the groundwater to waters of the United States, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. Dewatering discharges are typically considered a low or limited threat to water quality and may be covered under the General Order for *Limited Threat Discharges to Surface Water* (Limited Threat General Order). A complete Notice of Intent must be submitted to the Central Valley Water Board to obtain coverage under the Limited Threat General Order. For more information regarding the Limited Threat General Order and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/r5-2016-0076-01.pdf

NPDES Permit

If the proposed project discharges waste that could affect the quality of surface waters of the State, other than into a community sewer system, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. A complete Report of Waste Discharge must be submitted with the Central Valley Water Board to obtain a NPDES Permit. For more information regarding the NPDES Permit and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/help/permit/

If you have questions regarding these comments, please contact me at (916) 464-4684 or Peter.Minkel2@waterboards.ca.gov.

Re: 2025040378 Estia Dry Creek and Placer Creek Residential Project, Placer County

Dear Ms. Schwartz:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

- **a.** A brief description of the project.
- **b.** The lead agency contact information.
- **c.** Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
- **d.** A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

- **a.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

- **a.** Alternatives to the project.
- **b.** Recommended mitigation measures.
- **c.** Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

- **a.** Type of environmental review necessary.
- **b.** Significance of the tribal cultural resources.
- **c.** Significance of the project's impacts on tribal cultural resources.
- **d.** If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

- **a.** Whether the proposed project has a significant impact on an identified tribal cultural resource.
- **b.** Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (https://ohp.parks.ca.gov/?page_id=30331) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
    b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
   a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
   b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
   a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
   b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
   c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Pricilla.Torres-Fuentes@NAHC.ca.gov.

Sincerely,

Pricilla Torres-Fuentes

Pacific Gas and Electric Company

Plan Review Team
Land Management

PGEPlanReview@pge.com

April 21, 2025

Ref: Gas and Electric Transmission and Distribution

Hello,

Thank you for submitting project plans for our review. PG&E will review the submitted plans in relationship to any existing Gas and Electric facilities within the project area. If the proposed project is adjacent/or within PG&E owned property and/or easements, we will be working with you to ensure compatible uses and activities near our facilities.

Attached you will find information and requirements as it relates to Gas facilities (Attachment 1) and Electric facilities (Attachment 2). Please review these in detail, as it is critical to ensure your safety and to protect PG&E's facilities and its existing rights.

Below is additional information for your review:

1. This plan review process does not replace the application process for PG&E gas or electric service your project may require. For these requests, please continue to work with PG&E Service Planning: https://www.pge.com/en/account/service-requests/building-and-renovation.html.

2. If the project being submitted is part of a larger project, please include the entire scope of your project, and not just a portion of it. PG&E's facilities are to be incorporated within any CEQA document. PG&E needs to verify that the CEQA document will identify any required future PG&E services.

3. An engineering deposit may be required to review plans for a project depending on the size, scope, and location of the project and as it relates to any rearrangement or new installation of PG&E facilities.

Any proposed uses within the PG&E fee strip and/or easement, may include a California Public Utility Commission (CPUC) Section 851 filing. This requires the CPUC to render approval for a conveyance of rights for specific uses on PG&E's fee strip or easement. PG&E will advise if the necessity to incorporate a CPUC Section 851filing is required.

This letter does not constitute PG&E's consent to use any portion of its easement for any purpose not previously conveyed. PG&E will provide a project specific response as required.

Sincerely,

Plan Review Team
Land Management

Attachment 1 – Gas Facilities

There could be gas transmission pipelines in this area which would be considered critical facilities for PG&E and a high priority subsurface installation under California law. Care must be taken to ensure safety and accessibility. So, please ensure that if PG&E approves work near gas transmission pipelines it is done in adherence with the below stipulations. Additionally, the following link provides additional information regarding legal requirements under California excavation laws: https://www.usanorth811.org/images/pdfs/CA-LAW-2018.pdf

1. Standby Inspection: A PG&E Gas Transmission Standby Inspector must be present during any demolition or construction activity that comes within 10 feet of the gas pipeline. This includes all grading, trenching, substructure depth verifications (potholes), asphalt or concrete demolition/removal, removal of trees, signs, light poles, etc. This inspection can be coordinated through the Underground Service Alert (USA) service at 811. A minimum notice of 48 hours is required. Ensure the USA markings and notifications are maintained throughout the duration of your work.

2. Access: At any time, PG&E may need to access, excavate, and perform work on the gas pipeline. Any construction equipment, materials, or spoils may need to be removed upon notice. Any temporary construction fencing installed within PG&E's easement would also need to be capable of being removed at any time upon notice. Any plans to cut temporary slopes exceeding a 1:4 grade within 10 feet of a gas transmission pipeline need to be approved by PG&E Pipeline Services in writing PRIOR to performing the work.

3. Wheel Loads: To prevent damage to the buried gas pipeline, there are weight limits that must be enforced whenever any equipment gets within 10 feet of traversing the pipe.

Ensure a list of the axle weights of all equipment being used is available for PG&E's Standby Inspector. To confirm the depth of cover, the pipeline may need to be potholed by hand in a few areas.

Due to the complex variability of tracked equipment, vibratory compaction equipment, and cranes, PG&E must evaluate those items on a case-by-case basis prior to use over the gas pipeline (provide a list of any proposed equipment of this type noting model numbers and specific attachments).

No equipment may be set up over the gas pipeline while operating. Ensure crane outriggers are at least 10 feet from the centerline of the gas pipeline. Transport trucks must not be parked over the gas pipeline while being loaded or unloaded.

4. Grading: PG&E requires a minimum of 36 inches of cover over gas pipelines (or existing grade if less) and a maximum of 7 feet of cover at all locations. The graded surface cannot exceed a cross slope of 1:4.

5. Excavating: Any digging within 2 feet of a gas pipeline must be dug by hand. Note that while the minimum clearance is only 24 inches, any excavation work within 24 inches of the edge of a pipeline must be done with hand tools. So to avoid having to dig a trench entirely with hand tools, the edge of the trench must be over 24 inches away. (Doing the math for a 24 inch

wide trench being dug along a 36 inch pipeline, the centerline of the trench would need to be at least 54 inches [24/2 + 24 + 36/2 = 54] away, or be entirely dug by hand.)

Water jetting to assist vacuum excavating must be limited to 1000 psig and directed at a 40° angle to the pipe. All pile driving must be kept a minimum of 3 feet away.

Any plans to expose and support a PG&E gas transmission pipeline across an open excavation need to be approved by PG&E Pipeline Services in writing PRIOR to performing the work.

6. Boring/Trenchless Installations: PG&E Pipeline Services must review and approve all plans to bore across or parallel to (within 10 feet) a gas transmission pipeline. There are stringent criteria to pothole the gas transmission facility at regular intervals for all parallel bore installations.

For bore paths that cross gas transmission pipelines perpendicularly, the pipeline must be potholed a minimum of 2 feet in the horizontal direction of the bore path and a minimum of 24 inches in the vertical direction from the bottom of the pipe with minimum clearances measured from the edge of the pipe in both directions. Standby personnel must watch the locator trace (and every ream pass) the path of the bore as it approaches the pipeline and visually monitor the pothole (with the exposed transmission pipe) as the bore traverses the pipeline to ensure adequate clearance with the pipeline. The pothole width must account for the inaccuracy of the locating equipment.

7. Substructures: All utility crossings of a gas pipeline should be made as close to perpendicular as feasible (90° +/- 15°). All utility lines crossing the gas pipeline must have a minimum of 24 inches of separation from the gas pipeline. Parallel utilities, pole bases, water line ‘kicker blocks’, storm drain inlets, water meters, valves, back pressure devices or other utility substructures are not allowed in the PG&E gas pipeline easement.

If previously retired PG&E facilities are in conflict with proposed substructures, PG&E must verify they are safe prior to removal. This includes verification testing of the contents of the facilities, as well as environmental testing of the coating and internal surfaces. Timelines for PG&E completion of this verification will vary depending on the type and location of facilities in conflict.

8. Structures: No structures are to be built within the PG&E gas pipeline easement. This includes buildings, retaining walls, fences, decks, patios, carports, septic tanks, storage sheds, tanks, loading ramps, or any structure that could limit PG&E’s ability to access its facilities.

9. Fencing: Permanent fencing is not allowed within PG&E easements except for perpendicular crossings which must include a 16 foot wide gate for vehicular access. Gates will be secured with PG&E corporation locks.

10. Landscaping: Landscaping must be designed to allow PG&E to access the pipeline for maintenance and not interfere with pipeline coatings or other cathodic protection systems. No trees, shrubs, brush, vines, and other vegetation may be planted within the easement area. Only those plants, ground covers, grasses, flowers, and low-growing plants that grow unsupported to a maximum of four feet (4’) in height at maturity may be planted within the easement area.

11. Cathodic Protection: PG&E pipelines are protected from corrosion with an “Impressed Current” cathodic protection system. Any proposed facilities, such as metal conduit, pipes, service lines, ground rods, anodes, wires, etc. that might affect the pipeline cathodic protection system must be reviewed and approved by PG&E Corrosion Engineering.

12. Pipeline Marker Signs: PG&E needs to maintain pipeline marker signs for gas transmission pipelines in order to ensure public awareness of the presence of the pipelines. With prior written approval from PG&E Pipeline Services, an existing PG&E pipeline marker sign that is in direct conflict with proposed developments may be temporarily relocated to accommodate construction work. The pipeline marker must be moved back once construction is complete.

13. PG&E is also the provider of distribution facilities throughout many of the areas within the state of California. Therefore, any plans that impact PG&E’s facilities must be reviewed and approved by PG&E to ensure that no impact occurs which may endanger the safe operation of its facilities.

Attachment 2 – Electric Facilities

It is PG&E's policy to permit certain uses on a case by case basis within its electric transmission fee strip(s) and/or easement(s) provided such uses and manner in which they are exercised, will not interfere with PG&E's rights or endanger its facilities. Some examples/restrictions are as follows:

1. Buildings and Other Structures: No buildings or other structures including the foot print and eave of any buildings, swimming pools, wells or similar structures will be permitted within fee strip(s) and/or easement(s) areas. PG&E's transmission easement shall be designated on subdivision/parcel maps as "**RESTRICTED USE AREA – NO BUILDING."**

2. Grading: Cuts, trenches or excavations may not be made within 25 feet of our towers. Developers must submit grading plans and site development plans (including geotechnical reports if applicable), signed and dated, for PG&E's review. PG&E engineers must review grade changes in the vicinity of our towers. No fills will be allowed which would impair ground-to-conductor clearances. Towers shall not be left on mounds without adequate road access to base of tower or structure.

3. Fences: Walls, fences, and other structures must be installed at locations that do not affect the safe operation of PG&'s facilities. Heavy equipment access to our facilities must be maintained at all times. Metal fences are to be grounded to PG&E specifications. No wall, fence or other like structure is to be installed within 10 feet of tower footings and unrestricted access must be maintained from a tower structure to the nearest street. Walls, fences and other structures proposed along or within the fee strip(s) and/or easement(s) will require PG&E review; submit plans to PG&E Centralized Review Team for review and comment.

4. Landscaping: Vegetation may be allowed; subject to review of plans. On overhead electric transmission fee strip(s) and/or easement(s), plant only low-growing shrubs under the wire zone and only grasses within the area directly below the tower. Along the border of the transmission line right-of-way, plant only small trees no taller than 10 feet in height at maturity. PG&E must have access to its facilities at all times, including access by heavy equipment. No planting is to occur within the footprint of the tower legs. Greenbelts are encouraged.

5. Reservoirs, Sumps, Drainage Basins, and Ponds: Prohibited within PG&E's fee strip(s) and/or easement(s) for electric transmission lines.

6. Automobile Parking: Short term parking of movable passenger vehicles and light trucks (pickups, vans, etc.) is allowed. The lighting within these parking areas will need to be reviewed by PG&E; approval will be on a case by case basis. Heavy equipment access to PG&E facilities is to be maintained at all times. Parking is to clear PG&E structures by at least 10 feet. Protection of PG&E facilities from vehicular traffic is to be provided at developer's expense AND to PG&E specifications. Blocked-up vehicles are not allowed. Carports, canopies, or awnings are not allowed.

7. Storage of Flammable, Explosive or Corrosive Materials: There shall be no storage of fuel or combustibles and no fueling of vehicles within PG&E's easement. No trash bins or incinerators are allowed.

8. Streets and Roads: Access to facilities must be maintained at all times. Street lights may be allowed in the fee strip(s) and/or easement(s) but in all cases must be reviewed by PG&E for proper clearance. Roads and utilities should cross the transmission easement as nearly at right angles as possible. Road intersections will not be allowed within the transmission easement.

9. Pipelines: Pipelines may be allowed provided crossings are held to a minimum and to be as nearly perpendicular as possible. Pipelines within 25 feet of PG&E structures require review by PG&E. Sprinklers systems may be allowed; subject to review. Leach fields and septic tanks are not allowed. Construction plans must be submitted to PG&E for review and approval prior to the commencement of any construction.

10. Signs: Signs are not allowed except in rare cases subject to individual review by PG&E.

11. Recreation Areas: Playgrounds, parks, tennis courts, basketball courts, barbecue and light trucks (pickups, vans, etc.) may be allowed; subject to review of plans. Heavy equipment access to PG&E facilities is to be maintained at all times. Parking is to clear PG&E structures by at least 10 feet. Protection of PG&E facilities from vehicular traffic is to be provided at developer's expense AND to PG&E specifications.

12. Construction Activity: Since construction activity will take place near PG&E's overhead electric lines, please be advised it is the contractor's responsibility to be aware of, and observe the minimum clearances for both workers and equipment operating near high voltage electric lines set out in the High-Voltage Electrical Safety Orders of the California Division of Industrial Safety (https://www.dir.ca.gov/Title8/sb5g2.html), as well as any other safety regulations. Contractors shall comply with California Public Utilities Commission General Order 95 (http://www.cpuc.ca.gov/gos/GO95/go_95_startup_page.html) and all other safety rules. No construction may occur within 25 feet of PG&E's towers. All excavation activities may only commence after 811 protocols has been followed.

Contractor shall ensure the protection of PG&E's towers and poles from vehicular damage by (installing protective barriers) Plans for protection barriers must be approved by PG&E prior to construction.

13. PG&E is also the owner of distribution facilities throughout many of the areas within the state of California. Therefore, any plans that impact PG&E's facilities must be reviewed and approved by PG&E to ensure that no impact occurs that may endanger the safe and reliable operation of its facilities.

SUBJECT: Estia Dry Creek and Placer Creek Residential Project (PLN24-00144)

Ms. Schwartz,

Thank you for submitting the Estia Dry Creek and Placer Creek Residential Project (PLN24-00144) Notice of Preparation Project (Project) to the Placer County Air Pollution Control District (District) for review and comment. The District provides the following comments for consideration.

1. Any project that includes the use of equipment capable of releasing emissions to the atmosphere may require permits(s) from the District. The applicant, developer, or operator of a project that includes a generator, boiler, or hot water heaters should contact the District early to determine if a permit is required, and to begin the permit application process. Portable construction equipment (e.g. generators, compressors, pile drivers, lighting equipment, etc.) with an internal combustion engine over 50 horsepower are required to have a PCAPCD permit or a California Air Resources Board portable equipment registration.

2. District Rule 228, Fugitive Dust (PDF), establishes standards to be met by activities generating fugitive dust. When an area to be disturbed is greater than one acre, a dust control plan must be submitted to and approved by the District. The District has developed an application for this purpose, which can be found on the District website: Form Center • Dust Control Form

3. The District suggests that no wood burning appliances, including fireplaces and woodstoves, shall be installed within any residential units associated with the Project.

Thank you for allowing the District this opportunity to review the project proposal. Please do not hesitate to contact me at 530.745.2327 or lnavarro@placer.ca.gov if you have any questions.

Sincerely,

Laura Navarro

Subject: **Comments on the Notice of Preparation of an Environmental Impact Report for the Proposed Estia Dry Creek and Placer Creek Residential Project**

Dear Ms. Schwartz,

Thank you for sending Placer LAFCO the Notice of Preparation for the *Estia Dry Creek and Placer Creek Residential Project.* Placer LAFCO appreciates the opportunity to provide meaningful comments regarding the scope and content of the EIR in accordance with CEQA Guidelines Section 15082. LAFCO staff has reviewed the supplied documents and offers the following comments.

Estia Dry Creek and Placer Creek Residential Project

As detailed in the Notice of Preparation, the project proposes the development of two separate residential communities over the course of four phases on two parcels (APN 023-221-076 and 023-221-074). The project site consists of approximately 92.2 gross (87.6 net) acres located south of Baseline Road, immediately east of the abandoned old Walerga Road right-of-way, west of the Fiddyment Road/Baseline Road/Walerga Road intersection and the western portion of Sun Valley Oaks residential subdivision, and north of the Morgan Creek residential subdivision in the Dry Creek-West Placer Community Plan Area (DCWPCP) of unincorporated Placer County. Walerga Road, which curves from the northeast to the southwest, separates the northern 52.3-acre portion of the project site, identified by Assessor's Parcel Number (APN) 023-221-076, and the southern 35.3-acre portion of the project site, identified by APN 023-221-074.

The Project proposes the development of Estia Dry Creek (Phase 1) of 220 single-story multi-family units consisting of 80 one-bedroom units and 140 two-bedroom units, ranging from approximately 700 square feet (sf) to 1,100sf. A 3,537-sf community center building would also be developed in the center of the Estia Dry Creek site, and an outdoor

pool with patios and grill areas would be located adjacent to the community center.

The Placer Creek Residential (Phases 2, 3, and 4) development would include 212 single-family residential lots with a minimum lot size of 6,000 sf. Phase 2 would include the development of 110 single-family lots, and a centrally located 2.2-acre public neighborhood park with associated amenities. Phase 3 would include the development of 55 single-family lots and potential recreational amenities. Phase 4 would include the development of 47 single-family lots and the western extension of Vineyard Road, which would provide site access, along with trails and the seven-acre oak woodlands area along the Dry Creek tributary, referred to as "Placer Creek" riparian corridor, which would be preserved as open space. The Placer Creek riparian corridor would separate the Phase 3 and 4 developments.

The proposed project is anticipated to require County approval of a General Plan/DCWPCP Map Amendment, Rezone, Vesting Large Lot Tentative Subdivision Map, Vesting Phased Small Lot Tentative Subdivision Map, Design Review, and two service area annexations. The project will also request a General Plan/Riolo Vineyards Specific Plan (RVSP) Amendment and Rezone for the proposed affordable housing parcel located off-site.

LAFCO Responsibility

LAFCO is an independent, regulatory agency with discretion to approve, wholly, partially or conditionally, or disapprove, changes of organization or reorganizations. In accordance with the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 ("CKH Act"), LAFCO is required to consider various factors when evaluating a proposal, including, but not limited to, impacts to agricultural and open space lands, the provision of municipal services and infrastructure to the project site, timely and available supply of water, fair share of regional housing, consistency with regional plans, and other factors. The statutory mission of LAFCO is to discourage urban sprawl and encourage the orderly formation and development of local agencies.

LAFCO Comments

The following sections detail Placer LAFCO's comments to the NOP for the above referenced project.

Proposed Annexation

There are references throughout the NOP that propose annexation of the project site to Placer County Service Area 28, Zone 173 for sanitary sewer services; Placer County Service Area 28, Zone 169 for ongoing maintenance of public parks, trails and open space recreation within the Dry Creek community; and annexation into the Dry Creek Fire Zone of Benefit (County Service Area 28, Zone of Benefit 165) for the provision of fire protection services.

As mentioned above, LAFCO's statutory mission is to encourage the orderly formation and development of local agencies. Because the project is located adjacent to the City of Roseville and within the existing City of Roseville Sphere of Influence, the CEQA analysis should consider the potential annexation by the City, as it may be the more logical service provider.

Additional Analysis to Satisfy Placer LAFCO Requirements

LAFCO's approvals for the annexation of the project into the adjacent special districts or the City of Roseville would be a fundamental part of the entitlements required for this project. In order to approve the annexation of the project into any special districts or the City, LAFCO must consider specific factors in reviewing such proposals as outlined in Government Code §56668. As such, LAFCO provides the following comments on the project proposal to be considered for inclusion in the project analysis. In addition, because LAFCO would rely on the project's Draft EIR in its own approvals to comply with CEQA, LAFCO requests that the following be addressed in the Draft EIR produced for this project. Deficiencies in the environmental document as required by LAFCO may result in the need for additional CEQA compliance work or disapproval of project proposals.

1. Project Description

   - Please ensure that Placer LAFCO is listed as an agency whose approval is required for any annexations of any special districts or to the City of Roseville.
   - Please identify maintenance entities for all utilities and public services, including landscaping, lighting, sound walls, roads, public water, storm water drainage, maintenance in and out of public right-of-way, and sewer infrastructure.
   - Please include a description of the timing of annexations in relation to the proposed development entitlements and construction schedule. Typically, LAFCO's organization and reorganization processes are required after project approvals and before map recordation. In the case of a tentative map, all approvals should happen prior to the recording of the map.
   - Please include a statement that acknowledges the project site is located adjacent to the City of Roseville's city boundaries to the north and within the City of Roseville's existing Sphere of Influence.

2. Agricultural Resources

   LAFCo Review Factor: *The effect of the proposal on maintaining the physical and economic integrity of agricultural lands*. (Government Code §56668.e)

   The project analysis should include an evaluation of this factor for LAFCO's consideration, as Placer LAFCO will consider this factor in any reorganization proposals. In addition to the definition of Prime Agricultural Land used by the Department of Conservation's Farmland Mapping and Monitoring Program, the Draft EIR should evaluate the project site to determine whether it meets the LAFCo definition of "prime agricultural land" under Government Code Section 56064, indicate whether implementation of the project would result in a loss of such land, and provide mitigation to reduce the impact if necessary. LAFCO will use this information and the findings of the EIR to inform its decisions about any annexation process.

3. Hazards and Hazardous Materials

   LAFCo Review Factor: *Information contained in a local hazard mitigation plan, information contained in a safety element of a general plan, and any maps that identify land as a very high fire hazard zone pursuant to Section 51178 or maps that identify land determined to be in a state responsibility area pursuant to Section 4102 of the Public Resources Code, if it is determined that such information is relevant to the area that is the subject of the proposal.* (Government Code §56668.q)

   The Draft EIR should include an analysis of potential safety impacts resulting from the project to ensure LAFCO can make appropriate determinations on the project.

4. Hydrology and Water Quality

   LAFCO Review Factor: *Timely availability of water supplies adequate for projected needs including, but not limited to, the projected needs as specified in Section 65352.5*. (Government Code §56668.l)

   The Draft EIR should include an analysis of potential water supply impacts resulting from the project to ensure LAFCO can make appropriate determinations on the project.

5. Land Use and Planning

   LAFCo Review Factors:

   The effect of the proposed action and of alternative actions, on adjacent areas, on mutual social and economic interests, and on the local governmental structure of the county. (Government Code §56668.c)

   The definiteness and certainty of the boundaries of the territory, the nonconformance of proposed boundaries with lines of assessment or ownership, the creation of island or corridors of unincorporated territory, and other similar matters affecting the proposed boundaries. (Government Code §56668.f)

   Please provide an exhibit in the Draft EIR that shows the proposed areas of annexation, City of Roseville boundaries, the City's sphere of influence, and public and private infrastructure and maintenance entities, with all layers on one map for ease of reference.

   The conformity of both the proposal and its anticipated effects with both the adopted commission policies on providing planned, orderly, efficient patterns of urban development, and the policies and priorities set forth in Section 56377. (Government Code §56668.d)

   Government Code §56377 states:

   (a) Development or use of land for other than open-space uses shall be guided away from existing prime agricultural lands in open-space use toward areas containing nonprime agricultural lands, unless that action would not promote the planned, orderly, efficient development of an area.

   (b) Development of existing vacant or nonprime agricultural lands for urban uses within the existing jurisdiction of a local agency or within the sphere of influence of a local agency

should be encouraged before any proposal is approved which would allow for or lead to the development of existing open-space lands for non-open-space uses which are outside of the existing jurisdiction of the local agency or outside of the existing sphere of influence of the local agency.

The Draft EIR should include an analysis of potential agricultural impacts, if any, resulting from the project to ensure LAFCO can make appropriate determinations on the project.

Consistency with city or county general and specific plans. (Government Code §56668.h)

Since the City of Roseville may be the more logical service provider, the EIR should also analyze its consistency with Roseville's General Plan.

6. Population and Housing

LAFCo Review Factors:

Population and population density; land area and land use; assessed valuation; topography, natural boundaries, drainage basins; proximity to other populated areas; and the likelihood of significant growth in the area, and in adjacent incorporated and unincorporated areas, during the next 10 years. (Government Code §56668.a)

Given that the project's proposal to convert two parcels to a higher intensity use will increase the population and require more intensive public services, this project will require the evaluation of the factors listed in this item, including but not limited to population and growth inducement in adjoining areas. Please include this information in the project analysis.

The extent to which the proposal will assist the receiving entity in achieving its fair share of the regional housing needs as determined by the appropriate council of governments. (Government Code §56668.m)

The project applicant proposes to satisfy the project's affordable housing requirements by transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the Riolo Vineyards Specific Plan (RSVP). The project applicant is seeking to rezone the affordable housing parcel to the newly established zone of Residential Multifamily 30 (RM30), which can result in a maximum development potential of 120 affordable income-restricted units. Because the City of Roseville may be the more logical service provider, please provide analysis relative to the City of Roseville's General Plan affordable housing policies and requirements. LAFCO will consider the project's assistance with regional fair share housing needs as determined by SACOG.

7. Public Services/Utilities and Service Systems (and Growth Inducing Impacts)

LAFCO Review Factors:

Need for organized community services; the present cost and adequacy of governmental services and controls in the area; probable future needs for those services and controls; probable effect of the proposed incorporation, formation, annexation, or exclusion and of

alternative courses of action on the cost and adequacy of services and controls in the area and in adjacent areas. (Government Code §56668.b.1)

The ability of newly formed or receiving entity to provide the services which are the subject of the application to the area, including the sufficiency of revenues for such services following the proposed boundary change. (Government Code §56668.k)

Pursuant to Government Code §56653, an annexation can only be approved if the applicable MSRs and Plans for Services demonstrate that adequate services can be provided to the annexed area. An annexation proposal must therefore include a Plan for Services consistent with the applicable MSR and must demonstrate that the service provider can provide the required services, including sufficiency of revenues for such services and any associated costs

8. Transportation and Circulation

LAFCo Review Factors:

The effect of the proposed action and of alternative actions, on adjacent areas, on mutual social and economic interests, and on the local governmental structure of the county. (Government Code §56668.c)

A regional transportation plan adopted pursuant to Section 65080. (Government Code §56668.g)

Please include trip distribution in the transportation analysis to determine the impact to nearby County and City roads, maintenance responsibility, and the need for annexation. Please also include an evaluation of the project's consistency with the Sacramento Council of Governments Regional Transportation Plan/Sustainable Communities Strategy.

Thank you for the opportunity to comment on Notice of Preparation for the *Estia Dry Creek and Placer Creek Residential Project*. Please contact the LAFCO office if you have any questions.

Sincerely,

Amanda Ross, Acting Assistant Executive Officer
Placer LAFCO

CALIFORNIA NATIVE PLANT SOCIETY, REDBUD CHAPTER
Representing Nevada & Placer Counties

https://chapters.cnps.org/redbud/

April 26, 2025

Meghan Schwartz, Environmental Coordination Services
Placer County Community Development Resource Agency
3091 County Center Drive, Suite 190, Auburn, CA 95603,
Dear Ms. Schwartz,

RE: Notice of Preparation of an Environmental Impact Report for the Proposed Estia Dry Creek and Placer Creek Residential Project

Dear Megan Schwarts and Placer County Community Development Resource Agency

The California Native Plant Society Redbud Chapter is responding to the NOP for the proposed Estia Dry Creek and Placer Creek Residential Project, which is proposed for the area south of the City of Roseville and north of Sacramento County.

First we request that legible maps and figures be included in the NOP. The published maps and figures are very hard to read because of their size and the pale gray and pink writing.

The biological resources discussion in the EIR must explain any impacts to vernal pools, oak woodlands and grassland habitat in addition to a detailed examination of the effects on the open space/riparian area. It is essential that there be a complete analysis of the cumulative impacts to grassland habitats, vernal pool habitats, and woodland habitats and the species of fauna that inhabit them. We also request that during preparation of the environmental document you review previous comments from Redbud Chapter CNPS and the Sierra Nevada Alliance (our partner organization) concerning the critical importance of connectivity (these issues are also addressed in comments submitted in connection with the General Plan update). Riparian areas and the plants growing there are essential to wildlife habitat and corridors. In fact, wildlife, especially birds and insects, provide seed dispersal and pollination to isolated native plant populations. Please report on evidence that the site is utilized as a wildlife dispersal or migration corridor and how the project will interfere with the movement of any native resident or migratory species or with established native resident or migratory wildlife and plants.

The document should include information on the placement of fences or walls around the project's borders. When gated development is proposed, placement of walls or fences is likely to result in alteration, disruption, or barriers to wildlife dispersal and migration patterns. The potential effects on the dispersal and migration patterns of wildlife are compounded by the multiple jurisdictions and projects along creeks.

The EIR should review impacts of the proposed reduction of open space from the current 12 acres to 8 acres. Alternatives should be identified that would increase open space, not by adding developed turf but by protecting existing flora and soil communities.

Please provide scientific analysis of the relationship of the project site/sites to the goals and footprint of Placer County's multiple-species conservation efforts and natural communities conservation planning. In addition, the EIR must assess the project's consistency with Senate Bill 1425 and Assembly Bill 1889 which require cities and counties to address habitat connectivity and cumulative impacts to wildlife populations. Our Chapter's previous comments on the Placer County Conservation Program/Plan (PCCP) are applicable to this proposed project.

Single family housing has traditionally included nonnative sod for lawns, which contribute to wasteful water use, greenhouse gas emissions, habitat loss and water pollution from herbicide/fertilizer runoff. This is incompatible with California laws designed to promote sustainable practices that conserve resources, protect the environment and promote landscaping with locally native plants. Note that there are locally native grasses that are indistinguishable in appearance but environmentally sustainable and preserve habitat. Outdoor play space for residents, including a community center and a dog park, do not substitute for the habitat value of undeveloped lands. In terms of community livability and quality of life, developments should not be allowed to substitute cheap acres of sod as recreation space" instead of providing amenities that actually improve the quality of life for residents, such as tennis courts, libraries, basketball hoops and the link should be made part of the concept plan - as once built, NIMBYism will preclude these enhancements in the future.

Since the project will be converting natural/semi-natural lands into urban/suburban uses, this is clearly a significant impact. Since the site is almost entirely surrounded by other developed properties, the habitat loss to listed species (swainson's hawk, tricolored blackbird, burrowing owl, Western Pond Turtle etc.) that are known to nest and forage in the area is especially concerning.

We note this project would reduce the open space corridor along the creek. These creek corridors provide the only avenue for terrestrial wildlife movement and as such are critical resources for wildlife survival. It is essential that there be an alternative that increases rather than decreases riparian open space and that at a minimum - CA Fish and WIldlife standards are applied.

Additionally, trails are proposed, partially encroaching on the natural area. While we see the value of trails, there should be a wide buffer and design features that keep people and pets out of the creek zone while allowing them to be near enough to hear birdsong.

The NOP does not indicate that any effort will be made to preserve grassland. Grassland bird species are declining faster than any other songbird populations, how will this be mitigated? How much and what type of habitat will be added to permanently protected lands elsewhere in the County? Please address the quantitative and qualitative impacts of the proposed project on biological resources during pre-construction site work, during construction, and upon completion and occupancy.

Land-use practices can indirectly affect flora. Specifically, single-family developments contribute more to ecosystem-service losses, habitat loss, high vehicle miles traveled (VMT) and social isolation than does multi-family housing. Multi-family housing also affords people who are not home buyers opportunities to enjoy safe, sanitary and affordable living. Additionally, the scarcity of affordable housing in the region and in Placer County specifically is not improved with this development. At a minimum, the unit price in this project should reflect the actual income demographic of the region - where 67% have incomes within the affordable housing threshold. The environmental document should address how a multifamily project for the subject property will better address county needs for affordable housing and state housing obligations while reducing the development footprint and associated ecosystem-service losses.

The California Native Plant Society Redbud Chapter recommends that the County of Placer:

- Comprehensively consider cumulative impacts. This is a relatively small project among many single family sprawl projects being entertained by the County, but it Regardless, the cumulative impacts of this project in context with the other developments must be considered as they are compounding. The NOP must comprehensively address cumulative\ threats to biodiversity and identify necessary actions and policies to mitigate these threats and protect the biodiversity that sustains us.

- Identify and protect wildlife corridors. must be identified and protected. Species inhabiting islands of habitat tend toward extinction. Wildlife corridors provide essential traveling avenues for wildlife species and plants, allow movement between isolated populations, promoting increased genetic diversity. They provide food and shelter for a variety of wildlife and help with juvenile dispersal and seasonal migrations.

- Setbacks from streams. The EIR must determine if the County's setbacks are adequate for long term protection of habitat and species survival. In addition, the EIR must determine whether the County has enforcement mechanisms consistent with California Fish and Wildlife regulations and those mechanisms will be engaged if violations occur. Encroachment into stream corridors with structures, excavation, waste-dumping, fencing, non-native animals, and non-native landscaping dilutes, destroys and constricts some of the last remaining safe corridors for fish and wildlife movement in the western part of the county. Enforcement of stream setbacks is often deferred to California Fish and Wildlife, which does not have capacity nor rapid response means.

- Protocols for mitigating/preventing spread of invasive weeds. Enact protocols at all public recreation venues to mitigate the spread of invasive weeds; they are the single greatest threat to native plants, the foundation of our ecosystem.

- Utilize Locally Native Plants. Require a minimum 70 percent locally native plants in the landscaping of new development. This 70% figure is scientifically proven to be necessary to support biodiversity. Native pollinators require specific native plants in order to reproduce. Without those native plants, our environments will not support the caterpillar larvae of butterflies and moths, which are necessary to feed native birds. A nest of baby birds requires 9,000 caterpillars in order to successfully fledge. No caterpillars? No birds. Research has shown that 70 percent locally native plants is the minimum necessary to maintain native songbird populations. Our native oak trees are keystone species, hosting caterpillars of over 550 butterfly and moth species.

- Provide a "pocket forest" or "pollinator garden" within a half mile of every home built in new subdivisions. These small plots of urban land densely planted with locally native plants provide health benefits to people and wildlife, build climate resilience, mitigate extreme heat, and advance equitable access to the benefits of nature, all while enhancing ecological biodiversity and supporting pollinator corridors. Pollinator gardens can be a desirable feature for homeowners and renters, as they provide a refreshing change to the same tired-old palette of non-native plants that are used in high volume in many developments.

- In all publicly funded projects and park spaces, choose plants that naturally occur in this part of Placer County. These provide both resident and migratory birds with the essential insect, fruit, seeds, and shelter they need year-round—while helping them adapt and survive in the face of climate change.

- Recognize and protect biodiversity in all native plant communities. A plant community is an assemblage of plant species that usually occur together in nature when environmental conditions are the same. Within these communities, plants and animals co-evolved with and depend upon one another for survival in complex food webs. Each plant community has an array of vertical layers-overstory, midstory and understory.

As a general comment, the massive developments in West Placer have irrevocably transformed the landscape, wiping out habitat for plants and animals, and replacing it with thousands of acres of heat generating asphalt, concrete, houses, and non-native plants of low ecological value. From here on out, it is incumbent on all of us to preserve what little open space is left, use native plants in and around developed areas, and get full mitigations of high ecological value to help offset the loss of natural areas.

We are available by email to explore these issues further with you or your staff. We can be reached at Redbudadvacacy@gmail.com.

Thank you for your time and consideration.

Sincerely,

Sue Stack

SIERRA CLUB
PLACER GROUP

May 7th, 2025

To:

Kara Conklin, Senior Planner, kconklin@placer.ca.gov

Meghan Schwartz, cdraecs@placer.ca.gov

Ladies and Gentlemen:

Thank you for the opportunity to comment on the Notice of Preparation of an Environmental Impact Report for the Proposed Estia Dry Creek and Placer Creek Residential Project.

We appreciate this statement from page 14 of the NOP:

> The Estia Dry Creek and Placer Creek Residential Phase 2 entries on Walerga and Baseline Roads would be landscaped with native vegetation and marked with enhanced hardscape features, using materials consistent with the DCWPCP and the Placer County Landscape Guidelines.

We request that extensive use of native plants also be done in other build phases, throughout the developments. This would be consistent with Placer County and Dry Creek requirements for use of native plants, and also help mitigate the huge loss of native flora and fauna which is occurring throughout West Placer County, which has so degraded the quality of life for residents.

First, let's take a high-level look. Populations of insects, birds and animals are crashing both worldwide and in our area, as habitats are converted from natural vegetation to human use (agriculture, residential and commercial development).[1] Agriculture can leave some room for native plants and animals, as has been well attested by Dry Creek residents who have described how their community used to have hawks, eagles, owls, and many bird species. But with the onslaught of development in West Placer, there are now many heartbreaking stories of how ripping out trees and paving over farmland and open space have meant the end of beneficial animal populations. The Estia Dry Creek and Placer Creek Residential Project could be just one more nail in the coffin in the death of West Placer ecology…

…But it doesn't have to be this way! The solution is to build some habitat into the project itself. Use of native plants throughout the developments (near open space, along roads, and adjacent to houses) will provide a desirable feature which benefits the developer and residents (pollinator gardens that people enjoy), and as mitigation for environmental degradation.

Locally native plants are the foundation of our ecosystem and the food chain. If "ecosystem" is a somewhat dry and abstract term, I encourage you to use the phrase "basis of all life" instead. When we destroy the native ecosystem, as this and other projects will do as currently designed (with standard commercial landscaping), we cut the legs out from underneath our basis of life.

Extensive use of native plants is in keeping with Goal 6.D of the Placer County Conservation Plan, "to preserve and protect the valuable vegetation resources of Placer County." In particular see policy 6.D.10, "The County shall encourage the planting of native trees, shrubs, and grasslands in order to preserve the visual integrity of the landscape, provide habitat conditions suitable for native wildlife, and ensure that a maximum number and variety of well-adapted plants are maintained."

See the requirements of Dry Creek West Placer Community Plan (DCWPCP), Policy 14, "Where possible, preserve native trees and support the use of native drought tolerant plant materials in all revegetation/landscaping projects." Also Policy 13, "For landscaping which is part of site development where original vegetation has been removed or where additional plantings are included, the emphasis should be on drought tolerant, native species where possible."

In addition to low water usage and benefits to nature, native plants can add visual interest and provide a welcome visual change from the same old boring commercial plantings.

This is not rocket science, folks. What we are talking about here is landscaping. Landscaping. An appropriate plant palette for use as an environmental mitigation is not hard to implement.

With any landscape planning, these 8 areas need to be addressed:

Ecological value

Appearance

Water use

Cost

Maintenance

Survivability

Availability

Flammability

All these are either favorable or manageable for use of native plants in Estia Dry Creek and Placer Creek and other developments. Resources for selecting an appropriate plant palette are available through CNPS, Audubon Society, Xerces Society and other sources.

The idea of building some habitat along with housing is not a "fringe science" or untested idea. Many mainsteam wildlife-protection groups now promote "backyard habitat" projects that can help stabilize populations of butterflies and birds. [2, 3, 4, 5] A recent local example of how native plants are practical and effective was the Gardens Gone Native Plant Tour in the Sacramento-Placer area on May 3rd.[6]

Our group has been involved in reviews of recent West Placer developments projects such as The Ranch, Mill Creek, and now Estia Dry Creek and Placer Creek Residential. The language in the EIRs follows a familiar pattern: Concerns about destruction of natural resources at the development sites are dismissed, saying that environmental impacts are reduced to insignificant status through the PCCP. The PCCP does provide lots of benefit to Placer County, but can't really compensate for what is being lost at the development sites. Bird and plant species won't migrate to another location. Instead, they will die in West Placer, leaving an ecological wasteland. Over time, plants and animals will spread in the natural areas in a different location, but this is not the same. Payment of a land conversion fee will not compensate for loss of habitat in the developed areas.

Thank you for the plan to use native plants in the Phase 2 entry areas. We request that this be expanded throughout the developments.

Regards,

Harry White

3091 County Center Drive, Suite 190
Auburn, CA 95603
cdraecs@placer.ca.gov

Dear Meghan,

RE Estia Dry Creek and Placer Creek Residential Project

I am submitting these comments on the Estia Dry Creek and Placer Creek Residential Project, on behalf of Sierra Foothills Audubon Society and its over 600 Placer County members. The Sierra Foothills Audubon Society's mission is to educate ourselves and others to the variety and beauty of our natural environment and protect our wildlife and natural places.

Biological resources

From the Estia NOP: *"The Biological Resources chapter of the EIR will summarize the setting and describe the potential project effects to plant communities, oak woodlands, wildlife, and wetland and riparian communities, including adverse effects on rare, endangered, candidate, sensitive, and other special-status species for the project site. Effects associated with all on-site and off-site improvements will be included in the analysis. Analysis in the chapter will be based on a Biological Resources Assessment. The project site is within the PCCP boundary; thus, an evaluation of the potential for the proposed development of the project to conflict with the provisions of the adopted PCCP will be included in the chapter. Mitigation measures for all identified impacts will be developed consistent with applicable laws and regulations, including the PCCP".*

SFAS Comments

We agree that the Project is subject to PCCP requirements and would be converting natural/semi-natural lands into urban/suburban uses. It is still potential habitat to listed species (swainson's hawk, tri colored blackbird, burrowing owl, etc.) that are known to nest and forage in the area.
Key findings from the 2025 U.S. State of the Birds Report show that more than one-third of U.S. bird species are of high or moderate conservation concern,

including 112 Tipping Point species that have lost more than 50 percent of their populations in the last 50 years. That includes 42 Red-Alert species facing perilously low populations, such as the Allen's Hummingbird, Tricolored Blackbird, and Saltmarsh Sparrow — birds that are at risk without immediate intervention.

We ask that the Draft EIR pay particular attention to the following species that rate as high likelihood of occurring at the site**.**

Swainson's hawk (*Buteo swainsoni*) is a raptor species that is not federally listed, but is listed as threatened by CDFW; Swainson's hawk is also a PCCP Covered Species. Breeding pairs typically nest in tall trees associated with riparian corridors, and forage in grassland, irrigated pasture, and cropland with a high density of rodents. The Central Valley populations breed and nest in the late spring through early summer before migrating to Central and South America for the winter. The annual brome grassland/VPC throughout the study area represents suitable foraging habitat for Swainson's hawk, and the trees within the study area provide suitable nesting habitat. Swainson's hawk has *high* potential for occurrence within the study area.

Proposed mitigation as recommended in the Mill Creek project.
A targeted Swainson's hawk nest survey shall be conducted throughout the non-PCCP portion of the overall project area and all accessible areas within a 0.25-mile radius of the proposed construction area, at most,15 days prior to construction activities. If active Swainson's hawk nests are found within 0.25-mile of a construction area, construction shall cease within 0.25-mile of the nest until the project biologist determines that the young have fledged or it is determined that the nesting attempt has failed. The 0.25-mile buffer may be reduced if a smaller, sufficiently protective buffer is proposed by the project biologist and approved by the County and CDFW after taking into consideration the natural history of the Swainson's hawk, the proposed activity level adjacent to the nest, the nest occupants' habituation to existing or ongoing activity, nest concealment (i.e., whether there are visual or acoustic barriers between the proposed activity and the nest), and what (if any) nest monitoring is proposed. Note that if CDFW fails to respond within three business days of the proposal for a revised nest buffer, that will be considered their approval of the revised buffer. The results of the Swainson's hawk nest survey shall be submitted to the Placer County Community Development Resource Agency.

If it has been determined that a portion of the overall project site is within 10 miles of an active Swainson's hawk nest (an active nest is defined as a nest with documented Swainson's hawk use within the past five years), the applicant shall mitigate for the loss of suitable Swainson's hawk foraging habitat by implementing the following measures:
 One acre of suitable foraging habitat shall be protected for each acre of suitable foraging habitat that is proposed to be developed that is within one mile

of an active nest. Protection shall be by way of purchase of mitigation bank credits or other land protection mechanism acceptable to the County.
 0.75-acre of suitable foraging habitat shall be protected for each acre of suitable foraging habitat that is proposed to be developed that is between one and five miles from an active nest. Protection shall be by way of purchase of mitigation bank credits or other land protection mechanism acceptable to the County.
 0.5-acre of suitable foraging habitat shall be protected for each acre of suitable foraging habitat that is proposed to be developed that is between five and 10 miles from an active nest. Protection shall be by way of purchase of mitigation bank credits or other land protection mechanism acceptable to the County.
PCCP General Condition 3: The proposed project shall pay a land conversion fee for the permanent conversion of natural land cover including VPC Low, VPC Intermediate, Cropland, Eucalyptus, Rural Residential, and Rural Residential Forested. The fees to be paid shall be those in effect at the time of ground disturbance authorization for each project phase and shall be based on the effect to modeled species habitat at the parcel scale. In addition to land conversion, the project would result in permanent direct effects and temporary effects to PCCP Special Habitats as estimated in the Biological Resources Assessment (BRA) prepared for the proposed project. The total special habitat fee obligation including temporary effect fees shall be paid prior to issuance of a land conversion authorization that allows ground disturbance.

SFAS Comment
Though mitigation bank credits as part of the PCCP sound like we will have reduced the project to non-significant status, the basic problem is that land set aside in the future in other areas far to the north of the County is not exactly equivalent. Bird species and plant species do not willingly migrate to another location. We also note that stopping construction during nesting season does not ensure that the area will continually be able to be used in the future. When they return the following year, they will find the trees gone, and nesting will not occur.

Northern harrier *Circus cyaneus* -- / CSC
Northern harrier (*Circus cyaneus*) is not listed pursuant to either the CESA or FESA; however, the species is considered to be a species of special concern by the CDFW. Northern harrier is known to nest within the Central Valley, along the Pacific Coast, and in northeastern California. Northern harrier is a ground nesting species, and typically nests in emergent wetland/marsh, open grasslands, or savannah habitats. Foraging occurs within a variety of open habitats such as marshes, agricultural fields, and grasslands. The annual brome grassland/VPC throughout the study area is suitable nesting and foraging habitat for northern harrier. Based on the above, northern harrier has *high* potential for occurrence within the study area.

White-tailed kite *Elanus leucurus* -- / CFP

White-tailed kite is not federally or State listed, but is a CDFW fully protected species. The species is a yearlong resident in the Central Valley and is primarily found in or near foraging areas such as open grasslands, meadows, farmlands, savannahs, and emergent wetlands. White-tailed kites typically nest from March through June in trees within riparian, oak woodland, and savannah habitats of the Central Valley and Coast Range. The annual brome grassland/VPC throughout the study area represent suitable foraging habitat for white-tailed kite, and the trees within the study area provide suitable nesting habitat. Two records of white-tailed kite have been documented in the CNDDB within five miles of the study area. Based on the above, white-tailed kite has *high* potential for occurrence within the study area.

Loggerhead shrike

Loggerhead shrike (*Lanius ludovicianus*) is not listed and protected pursuant to either the CESA or the FESA; however, the species is a CDFW species of special concern. Loggerhead shrikes nest in small trees and shrubs in woodland and savannah vegetation communities, and forage in open habitats throughout California. The nesting season ranges from March through June. The trees and annual brome grassland/VPC within the study area provide suitable habitat for loggerhead shrike. Loggerhead shrike has not been documented in the CNDDB within five miles of the study area. Based on the above, loggerhead shrike has *high* potential for occurrence within the study area.

Mitigation for these species

From the Mill Valley Draft EIR: If active raptor nests are found, construction activities shall not take place within 500 feet of the nest until the young have fledged. If active songbird nests are found, a 100-foot non-disturbance buffer shall be established. The non-disturbance buffers may be reduced if a smaller, sufficiently protective buffer is proposed by the project biologist and approved by the County (*and CDFW for any CESA listed or CDFW Fully-Protected species) after taking into consideration the natural history of the species of bird nesting, the proposed activity level adjacent to the nest, the nest occupants' habituation to existing or ongoing activity, and nest concealment (i.e., whether there are visual or acoustic barriers between the proposed activity and the nest)*

SFAS Comments

Though mitigations as part of the PCCP sound like we will have reduced the project to non-significant status, the basic problem is that land set aside in other areas far to the north of the County is not exactly equivalent. Bird species and plant species do not willingly migrate to another location. We also note that stopping construction during mating season does not ensure that the area will continually be able to be used in the future.

Wildlife Corridors

SFAS Comments

Wes the 2025 U.S. State of the Birds Report indicated, there is a Red Alert for habitat for Tri-Colored Blackbirds. We should be improving habitat for birds when we can, including creating corridors for wildlife to move through. We recommend that the project study how corridors can be created and maintained for the species that have high likelihood of occurrence, including Tricolored blackbirds that could also use this habitat. The project must identify and protect wildlife corridors. Species inhabiting islands of habitat are tending toward extinction. **Wildlife corridors** provide essential traveling avenues for wildlife species and plants, allow movement between isolated populations, promoting increased genetic diversity. They provide food and shelter for a variety of wildlife and help with juvenile dispersal and seasonal migrations.

Riparian areas

From the Estia NOP: *The northern portion of the site is undeveloped, consists of non-native annual grassland with rolling topography, and is interspersed with seasonal wetlands and vernal pools. , the southern portion of the site includes undeveloped annual grassland with rolling topography, interspersed with seasonal wetlands, vernal pools, and is bisected by an un-named tributary of Dry Creek (named "Placer Creek" for this project) which flows east to west. The Federal Emergency Management Agency (FEMA) 100-year floodplain, containing approximately 4.7 acres, is located within the Placer Creek tributary area, which bisects the southern portion of the project site. A band of oak woodlands is located along the Placer Creek riparian corridor.*

SFAS Comments
This project will include development in these areas. Riparian-associated bird species occupy a wide variety of ecological niches; accordingly, they require a complex vegetative structure for breeding, foraging, and shelter/cover (Riparian Habitat Joint Venture 2004). Riparian woodlands provide many niches for breeding birds because they typically support diverse plant communities, are varied in their vertical and horizontal structures, and provide a source of surface water (MacArthur 1964; James 1971; Rice et al. 1983, 1984; Brinson et al. 2002). Many riparian areas offer a range of successional habitats due to the dynamic nature of their hydrology.

Riparian woodlands are also critical to a diversity of migratory birds (e.g., raptors, flycatchers, vireos, warblers, tanagers, sparrows, and grosbeaks) that depend on trees and shrubs near streams for shelter/cover and for the rich food supplies (e.g., insects, seeds, and fruits) associated with these areas (Jones & Stokes 2004a). Moreover, riparian areas can also provide perching, nesting, and foraging habitat, as well as water, for bird species that primarily nest in upland areas (Heath and Ballard 2003).

We ask that the project EIR include a discussion that deals with protection of stream areas that will help in recovery efforts for sensitive species such as these.

Stream setbacks

SFAS Comments
We ask that adequate stream setbacks and enforcement mechanisms consistent with California Fish and Wildlife regulations. Encroachment into stream corridors with structures, excavation, waste-dumping, fencing, livestock, and non-native landscaping dilutes, destroys and constricts some of the last remaining safe corridors for fish and wildlife movement in the western part of the county. Enforcement of stream setbacks is often deferred to California Fish and Wildlife, which does not have capacity nor rapid response means.

Napa County Board of Supervisors Water Quality and Tree Protection Ordinance (WQTPO) Excerpt Page 1
"On April 9, 2019, the Napa County Board of Supervisors (BOS) amended the County's Conservation Regulations with the adoption of the Water Quality and Tree Protection Ordinance (WQTPO) to enhance requirements for stream, wetland, and municipal reservoir setbacks, and to increase tree canopy retention and preservation. These new requirements went into effect on May 10, 2019.

Since 1991, the County's Conservation Regulations (Chapter 18.108) prohibited the construction of main or accessory structures, earthmoving activity, grading or removal of vegetation, or agricultural uses of land within required stream setbacks. With the adoption of the WQTPO, existing requirements were expanded to apply setbacks to wetlands and ephemeral and intermittent streams."

We ask that the project comply with these guidelines until the County passes an ordinance for ensuring stream setbacks to protect the riparian habitat.

Trees

SFAS Comments
The basic question is: will the loss of special-status habitat in projects like this end up with the loss of special species that cause their disappearance from the general landscape? That would be a cumulatively considerable impact. SFAS does annual bird counts that show these declines.
We ask that replacement of plants and trees be replaced with native plants and species.

Open Space

SFAS Comments
In general, the Estia Dry Creek and Placer Creek Residential Project has insufficient requirements that would preserve open space. The project calls for one 2.2-acre public neighborhood park and a 6.6 acre (down from 12.2 acre)

riparian corridor. This is out of over 90 acres of current open space. This will have limited value as habitat for plants, insects, birds, and animals.

As a general comment, the massive developments in West Placer have irrevocably transformed the landscape, wiping out habitat for plants and animals, and replacing it with hundreds of acres of asphalt, concrete, houses, and non-native plants of low ecological value. From here on out, it is incumbent on all of us to preserve what little open space is left, use native plants in and around developed areas, and get full mitigations of high ecological value to help offset the loss of natural areas.

Energy

From the Estia Project; *The Energy chapter of the EIR will evaluate whether the proposed project could result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation. The discussion will also evaluate whether the proposed project would conflict with or obstruct a State or local plan for renewable energy. The chapter will review the PCSP to identify energy-related measures that may be applicable to the proposed project.*

From the Draft REIR for the Mill project:" *The 2022 Title 24 standards are the currently applicable building energy efficiency standards and became effective on January 1, 2023. Compliance with the 2022 Title 24 Building Energy Efficiency Standards will reduce energy use and associated GHG emissions compared to structures built in compliance with the previous 2019 Title 24 standards. The 2022 Title 24 standards focus on four key areas in newly constructed homes and businesses:*
 Encouraging electric heat pump technology for space and water heating, which consumes less energy and produces fewer emissions than gas-powered units.
 Establishing electric-ready requirements for single-family homes to position owners to use cleaner electric heating, cooking and EV charging options whenever they choose to adopt those technologies.
 Expanding solar photovoltaic (PV) system and battery storage standards to make clean energy available onsite and complement the state's progress toward a 100 percent clean electricity grid.
 Strengthening ventilation standards to improve indoor air quality.
It should also be noted that the CALGreen standards include what is commonly called California's 2020 Solar Mandate, which requires all newly built homes to install solar photovoltaic systems The mandate applies to "all low-rise residential occupancies including single-family homes, duplexes, garden apartments, and other housing types with three or fewer habitable stories" The mandate includes multi-family housing such as apartment buildings as long as the buildings are under three stories."

SFAS Comments

We are pleased that Placer County is complying with these State rules, and hope the Draft EIR calls for the same standards.

From the Draft Mill Project EIR: *"While the 2020 Solar Mandate requires solar power systems sufficient to generate enough electricity to meet the annual electricity usage of the building, exceptions and limitations exist such as for properties with a small roof area or that receive an abundance of shade."*

SFAS Comments
The project developers can design the project to minimize the exceptions to the Solar mandate by facing the buildings' roofs to the southwest for the maximum solar effect. Shading is not a problem since the project plans to take down most of the trees in the area. Choosing types of trees and their locations is also available.
We ask that lawns not be part of this project. American lawns occupy some 30-40 million acres of land. Lawnmowers to maintain them account for some 5 percent of the nation's air pollution – probably more in urban areas. Each year more than 17 million gallons of fuel are spilled during the refilling of lawn and garden equipment—more than the oil that the Exxon Valdez spilled. Homeowners spend billions of dollars and typically use 10 times the amount of pesticide and fertilizers per acre on their lawns as farmers do on crops; the majority of these chemicals are wasted due to inappropriate timing and application. These chemicals then runoff and become a major source of water pollution. Finally, 30 to 60 percent of urban fresh water is used on lawns. Most of this water is also wasted due to poor timing and application.

We also ask that the project comply with the latest recommendations on fire safety by hardening of the homes (siding, vegetation rules).

Air quality and GHG emissions

Greenhouse Gas Emissions

From the Estia Draft NOP: *The GHG emissions analysis will include a quantitative estimate of carbon dioxide equivalent emissions from the proposed project, including indirect emissions (e.g., electricity, natural gas) and construction emissions. The chapter will include an analysis of the project's consistency with the Placer County Sustainability Plan (PCSP). The significance of air quality and GHG impacts will be determined in comparison to PCAPCD significance thresholds. PCAPCD-recommended mitigation measures and PCSP strategies will be incorporated, if needed, to reduce any significant air quality impacts, and anticipated reductions in emissions associated with proposed mitigation measures will be quantified.*

From the Draft Mill Creek EIR: *Strategies from the PCSP related to energy use that would apply to the proposed project include the following:*
Strategy E-1. Facilitate a transition to electricity as the primary energy source for residential, mixed-use, commercial, and office buildings.
Strategy E-4. Encourage new residential, office, and commercial development, as mitigation for discretionary projects exceeding applicable CEQA GHG thresholds, to implement CALGreen Tier 1 standards and accelerate Zero Net Energy (ZNE) in new construction.
Strategy E-15. Incentivize new homes to install renewable energy generation and energy storage systems that can fully supply the home's energy needs, in cases where the required size of the renewable energy system is insufficient to fully meet on-site demand.
In addition, the 2022 CBSC has begun phasing in the provision of ZNE by requiring residential projects to include the provision of an on-site solar system. Therefore, a portion of the electricity demand associated with the proposed project would be met by on-site renewable energy."

SFAS Comments
We enthusiastically agree with these strategies and ask that they be included in the Draft Estia EIR. Unfortunately, these are all voluntary goals.
Are there project plans to offer solar plus storage to the homes? The California Public Utilities Commission (CPUC) approved a Net Energy Metering (NEM) solar tariff that applies new residential rates to incent battery storage and load shifting from evening hours to overnight or midday hours.
Are there project plans to install centralized solar plus battery storage on the site that could be used by residents to charge batteries if power goes down? This could be at a meeting place on the site or where community EV charging stations are situated.
Has there been a discussion of building all-electric homes? The California Air Resources Board recently passed a measure that beginning in 2030, homeowners in California looking to replace their furnace or hot-water heater will only be able to purchase zero-emission appliances. Regulators expect this to primarily mean a switch to heat pumps that can both heat and cool homes — as well as heat pump water heaters. It seems unwise to go with the expense of installing natural gas lines and connections and then having everyone convert to electric when their equipment ages and fails.
Energy star electric appliances could be recommended to the new homeowners, including information of the various rebate/credits.

We ask that the Planning department hold talks with the developer to strongly suggest that these strategies be implemented for this project.

From the Dry Creek-West Placer Community Plan
The following goal and policies related to energy are from the Community Development Element of the DCWPCP:
Goal Provide safe, innovative and energy efficient residential developments.

Policy 3 Encourage the use of passive and direct solar collection and incorporate home design innovations which limit energy consumption.
Policy 27 Promote energy and resource conservation in any future land development project especially through consideration of alternative energy sources (i.e. passive solar collection) or state of the art energy and water conservation measures.

SFAS Comments
We ask that the Planning department hold talks with the developer to strongly suggest that these policies be implemented for this project.

The main opposition to Berkeley implementing a no gas structure was the opposition from the restaurant industry for their gas cooking appliances. This project is for residential homes that have an option of induction burners rather than gas tops. SMUD's 100% renewable electricity goal is admirable. However, natural gas is possibly more impactful on climate change. Installing gas lines throughout the development is a waste since they will not be needed for HVAC space and air conditioning and other appliances. Though it is not a state law currently, meeting zero energy goals will require phasing out of natural gas by 2045, easily in the lifetime of the new houses being built.

We ask that the Planning department hold talks with the developer to strongly suggest that all-electric homes be constructed for this project.

From the Draft Mill Creek REIR: *The 2022 CBSC requires that all new residential unit garages be designed with wiring sufficient to single-family residences and would not include public parking areas. While the proposed project would not include any public EV charging stations, private EV charging stations would generally comply with the intent of this strategy.to provide future installation of electric vehicle charging infrastructure. Therefore, private EV charging stations could be accommodated, should the homeowners choose to install EV chargers. Additionally, the strategies set forth in the PCSP are not required to be implemented. In fact, the PCSP strategies are specifically recommended for discretionary projects when the applicable project-level GHG emission thresholds are exceeded. Under the PCSP, the County uses the PCAPCD's GHG thresholds to determine whether PCSP emission reduction measures are required. Because the proposed project's operational GHG emissions would be below the applicable GHG thresholds (refer to Tables 6-12 and 6-13 in Chapter 6, Air Quality and GHG Emissions), implementation of the efficiency strategies included in the PCSP is not required. Most importantly, implementation of the proposed project would not interfere with the goals established in the PCSP nor preclude future projects from complying with the suggested strategies.*

SFAS Comments
We ask that the goals of the PCSP be modified to require zero energy housing .

Based on the above, the proposed project would not be considered to generate GHG emissions, either directly or indirectly, that would have a significant impact on the environment, or conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. Consequently, the project would result in a ***less than cumulatively considerable*** incremental contribution to the significant cumulative impact related to GHG emissions and climate change.

In sum, though most of the projects being implemented in California individually would not have a considerable impact, the cumulative impact on the climate would be considerable. We ask that Placer County lower its standard to be zero energy for any new project. This includes modification of the Air Quality Standard of 10,000 megatons to zero energy.

SFAS Final comment
Expanding Placer County development to currently vacant areas is still not environmentally sound. Commute times with CO2 emissions are increased. Infill is still preferred. And to base housing assumptions on what growth will occur by 2050 is questionable given that these projections currently have not been met Even though the Regional projections seem to be met, houses are not built, especially low income housing.

From the draft Mill Creek Executive Summary
Areas of controversy that were identified in NOP comment letters, and are otherwise known for
the region, include the following:

- Maintaining the rural aesthetic of the area;
- Increased light pollution;
- Conversion of farmland to urban uses;
- Increases in air quality emissions and impacts to climate change;
- Biological impacts associated with wildlife habitats and naturally occurring wetlands;
- Impacts to archeological and tribal cultural resources;
- Concerns related to lead-based paint, asbestos, and contaminated soils;
- Concerns related to water supply, quality and distribution systems;
- Noise pollution;
- Cumulative impact on schools and other public services;
- Traffic increases along existing surrounding roadways; and
- Increased electrical delivery demand and energy efficiency.

All these areas of controversy are of legitimate concern and can only be satisfied by not doing this project. New housing must come from urban infill.

Thank you for your consideration of these comments.

Subject: Re: wrong phone number on Estia project?

Good Afternoon Kara,
Thanks for being so quick to get back to me. When I dial the number you have listed, it took me to a code compliance and cannabis enforcement line and asks me if I want to file a complaint. So, I am not sure what is happening, but you might want to check into that one. I spoke with a customer service person (one of the options) and she was not able to provide me with any information and forwarded me to Planning where I got a voice mail box. This is a lot of run around to get information.

I am trying to get information on this project as we have a lot of people with concerns on this project. I know at the MAC meeting on this project they were proposing some odd little lots which they were going to make "dog friendly" in order to get around the size limitations in our community plan. We all basically said that they needed to stick to the sizing of the community plan which is 1/4 acre (with no allowance for streets and undevelopable land).

I have not had the opportunity beyond the original MAC presentation to look at the DEIR, but one of the **concerns that I had texted to me yesterday was about them supposedly using the new RM 30 (**I may have the wrong letters). Is there something in this proposal where they are asking for this?

Another concern with this project is that it **NOT make it so that it becomes a through road from Vineyard over to Walerga**. I believe that in the proposal I heard at the MAC, there is no proposal to make that a through road, but please make sure that it does not become that.

There will **always be the concern that this area is being stretched way beyond what our community plan called for in regard to housing density**. The concern there is that **every time that occurs, the traffic situation in the area is becoming unbearable.** It is not as though these developments exist only within themselves. They feed into the larger traffic patterns in the area. This has made it so that what was once a short trip to my mother's house (which I am now living at taking care of her) has become a nightmare--taking up to 3-4 times as long as it once did a few

years ago.

Another concern is about the **"phasing" of the project and whether or not it contains the amount of both low and very low housing that is supposed to exist when a development goes in**. This is really a two-part concern.

First, does the overall project contain the **10% low income required by county mandate with a proportion for very low incom**e. If not, that should be an automatic NO! (That automatic NO should have come on THE RANCH project which got approved even though the county admitted it did not have the very low income portion dealt with. Your guys' response was, "We'll deal with that later." Are you?)

Second, **if it does require the 10%, is it being done in all phases so that it is not getting left until the end**--maybe after the next cycle of state enforcement for the standard.

The l**ast thing we need is to get to a point as just happened where developers were allowed to "buy out" their obligation or it was put into a later phase and so it did not meet the requirements for that state enforcement cycle.**

Help us out hear (I am referring to "us" as all of the current residents of Placer County). I am seeing my county destroyed, and it needs to stop. You all in Planning have the ability to limit these plans to what our community plans called for. Please don't allow our county to be destroyed any further.

Thanks for your time and consideration,
Laura Bullard
916-765-7903

And PS: The idea that people can only participate in person anymore is also bogus. As a former Government teacher who encouraged my students to get involved, I find the fact that the county is now making it more difficult for that to happen a true crime. For people who work or for people like me who take care of an aging parent (or one with kids), having to come all the way to Auburn to participate in these meetings is beyond an inconvenience. It also gives the appearance that the county is trying to hide things. Not a good thing. Any influence you can have on getting these meetings more easily accessible would be appreciated.

The notice was sent to property owners within 300 feet of the project boundary, and any interested parties and local agencies. It has also been posted on our website. The number listed below is my direct line and is correct. The purpose of the Environmental Impact Report (EIR) Scoping meeting is to obtain public and agency input regarding potentially significant environmental issues, reasonable alternatives and mitigation measures to be evaluated within the Environmental Impact Report. Comments received are considered in preparing the environmental analysis. The merits of the actual project are to be discussed at future hearings.

Do you have specific questions that I can help answer for you?

Thank you,

Kara Conklin

Subject: wrong phone number on Estia project?

We had something posted on our Facebook page about a **scoping meeting for the Estia project this afternoon. Is this true? And is it only in person?**

In trying to find out information, I went to the project posting and found the following for contact information. ***When I called it, it said that it was for code complaints and for Cannabis violations*****.** Could you clarify if the number was simply incorrect?

For more information regarding the proposed project, please refer to the following detailed project description or contact Kara Conklin, Assistant Planner, at (530) 745-3053 or kconklin@placer.ca.gov.

Comments and objections to Estia and Placer Creek residential project

May 4, 2025

From: Laura Bullard, Lifelong Placer County resident

This is another project which is asking for a rezoning and map amendment which **is NOT IN KEEPING WITH OUR COMMUNITY PLAN and adds undue traffic burdens on those of us in the county who must commute on the roads that this higher density will impact**.The Dry Creek/West Placer Community Plan PLANNED FOR A DENSITY WHICH WOULD BE IN KEEPING WITH OUR roadways and the rural living that at least part of this development will impact. While the majority of the traffic will impact Walerga and Baseline, the added traffic on those roads will still significantly impact the surrounding area simply by making the ability of the current residents of the area have to deal with the bumper to bumper traffic that is becoming a day to day reality on Baseline. The added traffic on Crowder and Vineyard (which are, by design, two lane roads) will have a significant impact on the surrounding community—which was designed to maintain the quiet, country feel that the residents of that community have always cherished. Our Community Plan specifically limits the lot sizes as well as states that the projected population would not probably be reached because of the restriction on lot size and density transfers. This needs to be upheld!

In addition, the idea that the very low-income aspect of this project is going to be transferred to the area off of Watt and PFE is commendable in that it at least accounts for the requirement that this issue be dealt with. But, unless that provision is clearly mandated in the approval, it is folly. Also, does this REQUIRE THEM TO BUILD THOSE UNITS? If not, that is also a magic hat trick. THE REQUIRED ACTUAL BUILDING OF LOW-INCOME UNITS MUST BE MANDATED in any approval. Otherwise, we are going to get into the same problem as we had last year when the county discovered that they did not have enough very low-income areas set aside to meet the state. And as we know, if those areas they set aside under the RM-30 suddenly get constructed with one of the 29 things that don't meet the state mandate, the county will now have to look for other areas to rezone. Not acceptable.

Another interesting component of this is that if you do not allow for the increased density, this development would not have to put in as many low-income units. If they truly got creative, could actually offer low and even very low income residents the ability to own a home (rather than rent) by adding some creative lower income units for sale.

These factors must be taken into consideration on any recommendation that the County does. You need to stick the Community Plan and not allow higher density and must also force the developer to deal with the low income and very low income housing and strictly

tie that to any approval (unlike the Ranch development which you approved recognizing that it did not deal with the very low income issue and you said, “We will deal with that later.” Not acceptable.

Date: Sunday, May 4, 2025 5:26:50 PM

With all due respect, I implore you all to put a pause on all this damned development. I get that it's going to happen come Hell or highwater, but have mercy on your existing constituents, would you? Please!

And quit kicking the developers requirements down the road. Why do they keep getting approved 'mitigations?' Isn't it enough that Newsom and Trump have both sold out on CEQA and the poor environment? I don't blame Republicans or Democrats. It's just elected officials, period.

Can you please consider staggering the build-outs? Right now everything, everywhere is under construction. No allowances for traffic congestion. No stores or restaurants...no medical providers...all the services that all these new people are going to demand, and bitch about when it's not available! Do YOU want to hear it? Or deal with the fall-out from overcrowded schools, not enough police or fire services...

Obviously, I am very concerned about what I see as a serious lack of oversight and planning. And that's being charitable since no mention has been made about how completely fugly all these homes are, and how depressing it is to see the animals struggling to find somewhere to go. Simply destruction of what was a beautiful place to live...

I object to the Estia development, not that it matters. Make the developers follow the rules, and for the love of God, slow down and freaking let the infrastructure catch up before pursuing more stinking "growth."

Sincerely,

Patty Greene

Subject: Estia Project
Date: Sunday, May 4, 2025 4:12:56 PM

Hello Meghan,

I'm writing to you over concerns about the Estia project. My husband and I live in Sun Valley Oaks, directly adjacent to the Estia development off Vineyard Rd, and are original owners. When we purchased our home we valued the open space, quiet nights and country living feel, as we raised our 3 kids. This proposed project must be carefully thought out and my requests are:

1. Please do not allow Vineyard Rd to extend through to Walerga Rd. This is a two lane road that cannot end up being a thoroughfare for people trying to get around traffic on Baseline Rd
2. Please do not allow residents of Estia to exit out of the development onto Vineyard. The ask is that they exit on Walerga which is built to handle the traffic, not Vineyard Rd.
3. Please abide by and honor the Dry Creek Community plan which was put in place to preserve the integrity of this precious gem of a community in Roseville. It truly is a special place which is being overtaken by aggressive growth. The infrastructure including roads, emergency personnel which supports this country feel within Placer County can only handle what is already in place.

Thank you for your consideration of the residents who have spent decades here and want to see it continue as the Dry Creek community we know and love.

Sincerely,

Lisa Mendenhall

Subject: Estia

Hey Kara, just wanted to touch base with you about the Estia project on Walerga. I have lived in the Sun Valley neighborhood for the last 10 years. Myself and the rest of my neighbors are completely against any high density housing in this area. We moved to this area because of how it is zoned. Rezoning this area so that developers can make a little more money on this land goes completely against why we all moved to this area to raise our families. Please let me know anything we can do to help block this and keep our community the same as why we moved here. Thank you for your time and effort to represent us. Abe Nelson-concerned home owner

To: Kara Conklin <KConklin@placer.ca.gov>
Subject: Estia Project

Good afternoon,
This note is intended to lodge our vote against the above project. I live in Morgan Creek and the traffic today is frightening when I leave my community. Heading north on Crowder I take my life in my hands turning left onto baseline. The traffic in this area is horrendous and getting worse. I don't even want to think about what it will be like when the corner of Baseline (Riego) and Fiddyment gets developed with Costco etc.

Please understand that my wife and I are opposed to the upcoming discussion and eventual development of this project.

Same goes with the Baseline project that includes multiple commercial businesses. More traffic, noise and congestion. West Roseville needs to get a break!

Thank you

John Schell

Estia NOP Scoping Meeting – 4/24/25

Laura Bullard –

- Aesthetics concerns – not pleasing.
- Traffic – Community Plan says Vineyard is not going to be extended. All traffic should go on Walerga. Development of Costco will also make traffic worse.
- The amount of time it takes commenter to get through traffic is absurd.
- School district boundaries? Where is boundary line between Center Unified, Roseville Joint Union, and Dry Creek?
- Will cars have access to Phase 4?

Harry White –

- Onslaught of development in Placer County has meant the end of beneficial animal populations.
- Solution – build native habitat. Attractive pollinator gardens.
- Extensive use of native plants is consistent with Policy 6D (6.D.10) of PCCP. See also DCWPCP Policies 13 and 14.
- Native plants are low water and aesthetic.

8. User Changes to Default Data

8.1. Justifications

Screen	Justification
Land Use	Building square footage and acreage adjusted to represent project-specific information. Health Club acreage representative of the Community Center. The 3.016 acres of other asphalt surfaces is representative of the off-site roadway improvements. The 0.273 acres of other non-asphalt surfaces is representative of off-site emergency wastewater storage improvements.
Construction: Construction Phases	Based on typical construction practices, architectural coating assumed to start two weeks after the start of building construction and last for the same number of days. Phase timing is based on the project-specific construction schedule provided by the applicant. Demolition not required for the proposed project.
Operations: Vehicle Data	Trip rates and VMT adjusted to be consistent with traffic data provided for the proposed project.
Operations: Hearths	Based on applicant provided information, all 432 units would not include fireplaces.

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

8. User Changes to Default Data

8.1. Justifications

Screen	Justification
Land Use	Building square footage and acreage adjusted to represent project-specific information. Health Club acreage representative of the Community Center. The 3.016 acres of other asphalt surfaces is representative of the off-site roadway improvements. The 0.273 acres of other non-asphalt surfaces is representative of off-site emergency wastewater storage improvements.
Construction: Construction Phases	Based on typical construction practices, architectural coating assumed to start two weeks after the start of building construction and last for the same number of days. Phase timing is based on the project-specific construction schedule provided by the applicant. Demolition not required for the proposed project.
Operations: Vehicle Data	Trip rates and VMT adjusted to be consistent with traffic data provided for the proposed project.
Operations: Hearths	Based on applicant provided information, all 432 units would not include fireplaces.

Strip Mall	Walk-in refrigerators and freezers	R-404A	3,922	< 0.005	7.50	7.50	20.0

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

Equipment Type	Fuel Type	Number per Day	Hours per Day	Hours per Year	Horsepower	Load Factor

5.16.2. Process Boilers

Equipment Type	Fuel Type	Number	Boiler Rating (MMBtu/hr)	Daily Heat Input (MMBtu/day)	Annual Heat Input (MMBtu/yr)

5.17. User Defined

Equipment Type	Fuel Type

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

8. User Changes to Default Data

Screen	Justification
Land Use	Lot acreage adjusted to represent overall acreage of the project site.
Construction: Construction Phases	Based on typical construction practices, architectural coating assumed to start two weeks after the start of building construction and last for the same number of days. Demolition not required for the proposed project.
Operations: Vehicle Data	Trip rates adjusted to be consistent with traffic data provided for the proposed project.
Operations: Hearths	All 39 units would not include fireplaces.

1.0 INTRODUCTION

This report presents the results of a Biological Resources Assessment (BRA) conducted for Estia Dry Creek and Placer Creek Residential Project (Project). The Project has previously been referred to as the Fong Property. The residential development portion of the Project is referred to as the On-Site Study Area throughout this document, while the area where off-site sewer improvements are proposed is referred to as the Off-Site Study Area. The On-Site Study Area and Off-Site Study Area are collectively referred to as the Study Areas. The 95.5-acre On-Site Study Area is located south of Baseline Road, west of Crowder Lane, and both north and south of Walerga Road, in an unincorporated area of Placer County, California. A small portion of the On-Site Study Area extends north of Baseline Road, and extends into the City of Roseville. The 2.0-acre Off-Site Study Area is located south of Dry Creek and just east of Dry Creek Community Park in an unincorporated area of Placer County, California. The 97.4-acre Study Areas are located in portions of Sections 6 and 7, Township 10 North, Range 6 East (MDB&M) of the "Citrus Heights, California" and "Roseville, California" 7.5-Minute Series USGS Topographic Quadrangles (USGS 2023 and USGS 2021) (**Figure 1)**.

1.1 Project Description

The proposed Project would generally include the development of two single-family residential communities: Estia Apartments and Placer Creek Residential. The area north of Walerga consists of the Estia Apartments (which is shown as Phase 1 on the Conceptual Lotting Study included as **Attachment A**) and Phase 2 Placer Creek Residential site. Phases 3 and 4 Placer Creek Residential are located south of Walerga.

Estia is a 220-unit single-story apartment home community. Estia represents the first "missing middle" multi-family housing community of its kind in the County, which offers a single-family experience in a standard apartment community setting. Also known as "Horizontal Apartments", each unit is uniquely designed with private entries, at most a single shared wall, and private fenced backyards. There will be a mix of one-bedroom and two-bedroom units ranging from approximately 700 square feet to 1,100 square feet.

The Placer Creek Residential (PCR) element of the Project is proposed as three separate neighborhoods containing 212 single-family residential home sites, with trails, recreation areas, and open space along the "Placer Creek" riparian area separating the Phase 3 and 4 neighborhoods. The Phase 2 PCR neighborhood would contain 110 lots and be accessed from Walerga Road. This phase would connect to the existing stub streets of Springhill Drive and Wellbrook Place. South of Walerga Road, the Phase 3 PCR neighborhood would contain 55 lots. Phase 3 has a single entry at the existing Placer Vineyards 1A signalized intersection at Town Center Avenue. The southern Phase 4 PCR neighborhood would contain 47 lots and would be accessed from the western extension of Vineyard Road, between Sun Valley Oaks and Morgan Creek. One pedestrian trail crossing over the intermittent drainage will be constructed between Phases 3 and 4 as part of the Project.

The intermittent drainage and its associated riparian corridor and Stream System will be largely avoided by the Project (**Attachment A**).

The Project may be required to construct offsite sewer improvements located at the Dry Creek Regional Park adjacent to the existing Community Facility District #1 Sewer Lift Station. This offsite improvement would include construction of large, underground storage tanks in the southern Portion of the Off-site Study Area as required by Placer County's redundancy standards. The tank areas would require embankment work to raise the access and maintenance areas out of the adjacent Dry Creek 100-year floodplain. This embankment for flood protection would reduce Dry Creek floodwater storage in the area. To offset this and maintain the same volume of floodwater storage, this would also require commensurate excavation immediately north of the facility in an undeveloped area to mitigate impact to the creek water surface elevations. These compensatory excavation areas in the northern portion of the Off-Site Study Area would be minor in nature, estimated at 2-4' in depth, and be designed to re-establish natural drainage flow characteristics.

2.0 REGULATORY SETTING

This section describes federal, state and local laws and policies that are relevant to this assessment of biological resources.

2.1 Federal Regulations

2.1.1 Federal Endangered Species Act

The Federal Endangered Species Act (FESA) of 1973 protects species that are federally listed as endangered or threatened with extinction. FESA prohibits the unauthorized "take" of listed wildlife species. Take includes harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species or any attempt to engage in such activities. Harm includes significant modifications or degradations of habitats that may cause death or injury to protected species by impairing their behavioral patterns. Harassment includes disruption of normal behavior patterns that may result in injury to or mortality of protected species. Civil or criminal penalties can be levied against persons convicted of unauthorized "take." In addition, FESA prohibits malicious damage or destruction of listed plant species on federal lands or in association with federal actions, and the removal, cutting, digging up, damage, or destruction of listed plant species in violation of state law. FESA does not afford any protections to federally listed plant species that are not also included on a state endangered species list on private lands with no associated federal action.

2.1.2 Clean Water Act, Section 404

Section 404 of the Federal Clean Water Act requires that a Department of the Army permit be issued prior to the discharge of dredged or fill material into waters of the United States, including some wetlands. The U.S. Army Corps of Engineers (USACE) administers this program, with oversight from the U. S. Environmental Protection Agency. As of the date of this document, waters of the United States (waters of the U.S.) are defined as follows (40 CFR 120.2):

(a) Waters of the United States means:

1. Waters which are:

i. Currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
ii. The territorial seas; or
iii. Interstate waters;

2. Impoundments of waters otherwise defined as waters of the United States under this definition, other than impoundments of waters identified under paragraph (a)(5) of this section;
3. Tributaries of waters identified in paragraph (a)(1) or (2) of this section that are relatively permanent, standing or continuously flowing bodies of water;
4. Wetlands adjacent to the following waters:
   i. Waters identified in paragraph (a)(1) of this section; or
   ii. Relatively permanent, standing or continuously flowing bodies of water identified in paragraph (a)(2) or (a)(3) of this section and with a continuous surface connection to those waters;
5. Intrastate lakes and ponds not identified in paragraphs (a)(1) through (4) of this section that are relatively permanent, standing or continuously flowing bodies of water with a continuous surface connection to the waters identified in paragraph (a)(1) or (a)(3) of this section

Under the current definition of waters of the U.S., "adjacent" means having a continuous surface connection.

2.1.3 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) prohibits the take, possession, import, export, transport, selling, purchase, barter, or offering for sale, purchase or barter, any native migratory bird, their eggs, parts, and nests, except as authorized under a valid permit (50 CFR 21.11.). Likewise, Section 3513 of the California Fish & Game Code prohibits the "take or possession" of any migratory non-game bird identified under the MBTA. Therefore, activities that may result in the injury or mortality of native migratory birds, including eggs and nestlings, would be prohibited under the MBTA.

2.2 State Regulations

2.2.1 California Environmental Quality Act

The California Environmental Quality Act (CEQA) requires evaluations of project effects on biological resources. Determining the significance of those effects is guided by Appendix G of the CEQA guidelines. These evaluations must consider direct effects on a biological resource within the project site itself, indirect effects on adjacent resources, and cumulative effects within a larger area or region. Effects can be locally important but not significant according to CEQA if they would not substantially affect the regional population of the biological resource. Significant adverse impacts on biological resources would include the following:

- Substantial adverse effects on any species identified as candidate, sensitive, or special-status in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife

(CDFW) or the U.S. Fish and Wildlife Service (USFWS) (these effects could be either direct or via habitat modification);

- Substantial adverse impacts to species designated by the California Department of Fish and Game (2009) as Species of Special Concern;
- Substantial adverse effects on riparian habitat or other sensitive habitat identified in local or regional plans, policies, or regulations or by CDFW and USFWS;
- Substantial adverse effects on federally protected wetlands defined under Section 404 of the Clean Water Act (these effects include direct removal, filling, or hydrologic interruption of marshes, vernal pools, coastal wetlands, or other wetland types);
- Substantial interference with movements of native resident or migratory fish or wildlife species population, or with use of native wildlife nursery sites;
- Conflicts with local policies or ordinances protecting biological resources (e.g., tree preservation policies); and
- Conflict with provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional, or state habitat conservation plan.

2.2.2 State Endangered Species Act

With limited exceptions, the California Endangered Species Act (CESA) of 1984 protects state-designated endangered and threatened species in a way similar to FESA. For projects on private property (i.e. that for which a state agency is not a lead agency), CESA enables CDFW to authorize take of a listed species that is incidental to carrying out an otherwise lawful project that has been approved under CEQA (Fish & Game Code Section 2081).

2.2.3 Native Plant Protection Act

The Native Plant Protection Act (NPPA) was enacted in 1977 and allows the Fish and Game Commission to designate plants as rare or endangered. There are 64 species, subspecies, and varieties of plants that are protected as rare under the NPPA. The NPPA prohibits take of endangered or rare native plants, but includes some exceptions for agricultural and nursery operations; emergencies; and after properly notifying CDFW for vegetation removal from canals, roads, and other sites, changes in land use, and in certain other situations.

2.2.4 Clean Water Act, Section 401

Section 401 of the Clean Water Act requires any applicant for a 404 permit in support of activities that may result in any discharge into waters of the United States to obtain a water quality certification with the Regional Water Quality Control Board (RWQCB). This program is meant to protect these waters and wetlands by ensuring that waste discharged into them meets state water quality standards. Because the water quality certification program is triggered by the need for a Section 404 permit (and both programs are a part of the Clean Water Act), the definition of waters of the United States under Section 401 is the same as that used by the USACE under Section 404.

2.2.5 California Water Code, Porter-Cologne Act

The Porter Cologne Act, from Division 7 of the California Water Code, requires any person discharging waste or proposing to discharge waste that could affect the quality of waters of the state to file a report of waste discharge (RWD) with the RWQCB. The RWQCB can waive the filing of a report, but once a report is filed, the RWQCB must either waive or adopt water discharge requirements (WDRs). "Waters of the state" are defined as any surface water or groundwater, including saline waters, within the boundaries of the state.

2.2.6 California Fish and Game Code, Section 1600 – Streambed and Lake Alteration

The CDFW is responsible for conserving, protecting, and managing California's fish, wildlife, and native plant resources. To meet this responsibility, the Fish and Game Code, Section 1602, requires notification to CDFW of any proposed activity that may substantially modify a river, stream, or lake. Notification is required by any person, business, state or local government agency, or public utility that proposes an activity that will:

- substantially divert or obstruct the natural flow of any river, stream or lake;
- substantially change or use any material from the bed, channel, or bank of any river, stream, or lake; or
- deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake.

For the purposes of Section 1602, rivers, streams and lakes must flow at least intermittently through a bed or channel. If notification is required and CDFW believes the proposed activity is likely to result in adverse harm to the natural environment, it will require that the parties enter into a Lake or Streambed Alteration Agreement (LSAA).

2.2.7 California Fish and Game Code, Section 3503.5 - Raptor Nests

Section 3503.5 of the Fish and Game Code makes it unlawful to take, possess, or destroy hawks or owls, unless permitted to do so, or to destroy the nest or eggs of any hawk or owl.

2.2.8 California Fully Protected Species

The State of California first began to designate species as "fully protected" prior to the creation of the federal and California ESAs. Lists of fully protected species were initially developed to provide protection to those animals that were rare or faced possible extinction and included fish, amphibians and reptiles, birds, and mammals. Most fully protected species have since been listed as threatened or endangered under the federal and/or California ESAs. The regulations that implement the Fully Protected Species Statute (California Fish and Game Code, § 4700 for mammals, § 3511 for birds, § 5050 for reptiles and amphibians, and § 5515 for fish) provide that fully protected species may not be taken or possessed at any time. Furthermore, CDFW prohibits any state agency from issuing incidental take permits for fully protected species. CDFW will issue licenses or permits for take of these species for necessary scientific research or live capture and relocation pursuant to the permit.

2.3 Local Regulations

2.3.1 Placer County Conservation Plan

The Western Placer County Conservation Plan (PCCP; also referred to as the Placer County Conservation Program) applies to all Covered Activities (as defined in the PCCP) within Placer County generally north of PFE Road, but outside of certain non-participating municipalities. The PCCP allows applicants to engage in a streamlined permitting process for mitigating project impacts to aquatic resources and sensitive wildlife species, where previously, applicants would need to obtain permits from the reviewing state and federal regulatory agencies (i.e., USACE, USFWS, CDFW). The PCCP is a multi-component program comprised of:

- Habitat Conservation Plan (HCP) under the Federal Endangered Species Act and a Natural Community Conservation Plan (NCCP) under the California Natural Community Conservation Planning Act,
- County Aquatic Resources Program (CARP) to fulfill the requirements of the federal Clean Water Act and state laws and regulations, and
- In-Lieu Fee Program to fulfill Clean Water Act Section 401/404 compensatory mitigation requirements for impacts to aquatic resources.

The PCCP addresses 14 Covered Species and several Covered Natural Communities and includes conservation measures to protect those Covered Species and their habitats. Projects that occur within the PCCP Plan Area are subject to applicable avoidance and minimization measures, which are intended to ensure that adverse effects on Covered Species and natural communities are avoided and minimized. Any conversion of natural or semi-natural lands, including oak woodland, grasslands, and wetlands will be subject to the applicable permits under the PCCP and associated impact fees. During the local impact authorization process, impact fees including Land Conversion fees and Aquatic/Wetland Special Habitat fees will be calculated utilizing land cover data.

Many of the conditions of the PCCP involve the Stream System. The Stream System boundary is the outermost of a variable-width buffer (50 feet or greater; detailed in Table 3-4 and Figure 3-8 of the PCCP) from the ordinary high-water mark of a drainage or the 100-year floodplain. The presence of the Stream System affects Covered Activities, informs land conversion and take of Covered Species, and guides the conservation strategy in the PCCP.

Within the Stream System, the CARP has a number of additional conditions for work within the vicinity of drainages and riparian vegetation. These conditions apply to certain defined areas (referred to as "CARP Drainage Setbacks" throughout this document); those that are relevant to this Project include:

- Disturbance within 50 feet of the edge of riparian vegetation shall be limited to exempt activities such as bridge crossings, recreational trails, and outfalls. This 50-foot restricted area is referred to throughout this document as the "Riparian Buffer".
- No structures are permitted within 50 feet of intermittent streams or within 100 feet of perennial streams unless authorized through an approved variance processed by Placer County.

3.0 METHODOLOGY

3.1 Literature Review

A list of special-status species with potential to occur within the Study Areas was developed by conducting a query of the following databases:

- California Natural Diversity Database (CNDDB) (CNDDB 2025) query of the Study Areas and all areas within 5 miles of the Study Areas (**Figure 2**);
- USFWS Information for Planning and Conservation (IPaC) (USFWS 2025) query for the Study Areas (**Attachment B**);
- California Native Plant Society (CNPS) Rare and Endangered Plant Inventory (CNPS 2025) query of the "Citrus Heights, California" and "Roseville, California" USGS topo quadrangles, and the ten surrounding quadrangles (**Attachment C**); and
- Western Bat Working Group (WBWG) Species Matrix (WBWG 2025).

In addition, any special-status species that are known to occur in the region, but that were not identified in any of the above database searches were also analyzed for their potential to occur within the Study Areas. For the purposes of this Biological Resources Assessment, special-status species are defined as those species that are:

- listed as threatened or endangered, or proposed or candidates for listing by the USFWS or National Marine Fisheries Service;
- listed as threatened or endangered and candidates for listing by CDFW;
- identified as Fully Protected species or species of special concern by CDFW;
- identified as Medium or High priority species by the WBWG (WBWG 2025); and
- plant species considered to be rare, threatened, or endangered in California by the CNPS and CDFW [California Rare Plant Rank (CRPR) 1, 2, and 3]:
    - CRPR 1A: Plants presumed extinct.
    - CRPR 1B: Plants rare, threatened, or endangered in California and elsewhere.
    - CRPR 2A: Plants extirpated in California, but common elsewhere.
    - CRPR 2B: Plants rare, threatened, or endangered in California, but more common elsewhere.
    - CRPR 3: Plants about which the CNPS needs more information – a review list.

3.2 Field Surveys

Madrone Ecological Consulting, LLC (Madrone) senior biologists Daria Snider, Tara Collins, and Jinnah Benn conducted field surveys of various portions of the Study Areas on 3 September 2015, 15 March and 9 May 2018, 30 April and 16 May 2024, 4 and 31 March, 8 April and 15 April, 8 May, 9 and 26 June and 1 July 2025 to map vegetation communities/land covers and assess the suitability of habitats on-site to support special-status species. Meandering pedestrian surveys were performed on foot throughout the Study Areas. Vegetation communities were classified in accordance with the PCCP Land Covers, and plant taxonomy was based on the nomenclature in the *Jepson eFlora* (Jepson Flora Project 2025). A list of all wildlife species

observed during field surveys is included as **Attachment D**. The following protocol-level surveys have been conducted within the Study Areas:

- Protocol-level special-status plant surveys were conducted within the On-Site Study Area on 15 March and 9 May 2018, 30 April and 16 May 2024.
- Protocol-level Valley elderberry longhorn beetle (VELB) habitat surveys were conducted throughout the On-Site Study Area concurrent with the 2018 special-status plant surveys and again on 8 May 2025.
- An aquatic resources delineation of the On-Site Study Area was conducted in accordance with USACE protocol on 3 September 2015, 15 March and 9 May 2018, and 1 and 9 July 2025.
- Protocol-level aquatic resources delineation, special-status plant survey and VELB habitat survey of the Off-Site Study Area on 9 June 2025.
- Protocol-level Swainson's hawk nest surveys and tricolored blackbird nesting surveys were conducted for the On-Site Study Area and a 0.25 mile buffer around that area on 31 March, 4, 8, 15 and 30 April, and 25 June 2025.
- Protocol-level wet-season surveys for large branchiopods were conducted within the On-Site Study Area throughout the winter of 2024-2025 (there are no vernal pool constituent habitats that could support vernal pool branchiopods within the Off-Site Study Area).

The results of the protocol-level surveys outlined above were incorporated into this report, and are detailed in the following attached reports:

- *Aquatic Resources Delineation Report for Placer Christian High School* (Madrone 2018a) (**Attachment E**),
- *Aquatic Resources Delineation Report for Placer Creek Residential* (Madrone 2018b) (**Attachment E**),
- *Special-Status Plant Survey Report for Fong Property* (Madrone 2024) (**Attachment F**), and
- *90-Day Survey Report for 2024-25 Wet-Season Surveys for Listed Large Branchiopods for Estia Dry Creek* (Madrone 2025) (**Attachment G**).

4.0 EXISTING CONDITIONS

The On-Site Study Area is bounded by a developing area to the north (north of Baseline Road), where a Costco and Upland Drive are being constructed in the northwest quadrant of the Baseline Road/Walerga Road intersection; residential subdivisions to the east and south; and in-progress residential construction to the west. The On-Site Study Area is mostly undeveloped, with the exception of the Walerga Road corridor, which runs southwest to northeast through the site, and a paved bike path that crosses through the southern portion of the site. Undeveloped areas are comprised of ungrazed Annual Brome Grassland/VPC on gently rolling terrain interspersed with an assemblage of seasonal wetlands and vernal pools. Several of the seasonal wetlands along the eastern boundary appear to be man-made or existing as a result of past human disturbance. The bike path parallels the south side of an intermittent tributary drainage of Dry Creek that bisects the southern portion of the On-Site Study Area. The intermittent drainage is bordered by Valley Foothill Riparian Woodland that supports native Valley oak (*Quercus lobata*), blue oak (*Q. douglasii*), and interior live oak *(Q. wislizenii*). The On-Site Study Area is situated at an elevation of approximately 100 to 130 feet above mean sea level.

The Off-Site Study Area borders Dry Creek Community Park to the west and an undeveloped area to the east. This site includes a small section of an existing paved bike path. The northern portion of the Off-Site Study Area is comprised of Valley Foothill Riparian Woodland and portions of intermittent tributary drainages of Dry Creek. A storage yard is located just east of the Off-Site Study Area. The Off-Site Study Area elevation is similar to that of the On-Site Study Area.

4.1 Terrestrial Vegetation Communities

Table 1 summarizes the PCCP Land Cover Types mapped within the Study Areas, and the following sections provide narrative descriptions of each of them. Of the approximately 97.4-acre Study Areas, 2.16 of those acres are comprised of aquatic resources **(Figure 3**).

Table 1. PCCP Land Cover Types within the Study Areas

Land Covers / Vegetation Communities		Acres
Annual Brome Grassland/VPC	VPC Intermediate	82.0
	VPC Low	0.8
Road		8.1
Urban Parks		0.5
Urban/Suburban		2.2
Valley Foothill Riparian Woodland		3.8
Total		**97.4**

4.1.1 Natural Communities

4.1.1.1 Annual Brome Grassland / VPC Low and VPC Intermediate

The areas mapped as Vernal Pool Complex (VPC) Low and VPC Intermediate Land Covers by the PCCP are annual brome grasslands with varying densities of wetlands. The term Annual Brome Grassland/VPC is used to collectively describe these two types because it is more descriptive and more understandable to the reader. On the figures, these areas are reported as VPC Intermediate and VPC Low to meet the requirements of the PCCP.

The Annual Brome Grassland/VPC is dominated by non-native grasses and forbs such as wild oat (*Avena fatua*), soft brome (*Bromus hordeaceus*), medusa head (*Elymus caput-medusae*), ryegrass (*Festuca perennis*), winter vetch (*Vicia villosa*), and caley pea (*Lathyrus hirsutus*).

4.1.1.2 Valley Oak Riparian Woodland/Valley Foothill Riparian Woodland

Both sides of the intermittent drainage support a Valley oak woodland. The canopy of this community is comprised of Valley oak (*Quercus lobata*), blue oak (*Quercus douglasii*), and interior live oak (*Quercus wislizeni*). The understory is primarily comprised of western poison oak (*Toxicodendron diversilobum*), California pipevine (*Aristolochia californica*), and species found in the surrounding annual brome grassland.

The PCCP classifies Valley oak woodlands in riparian areas as Valley Foothill Riparian Woodland. As a result, this is referred to as Valley Foothill Riparian Woodland throughout this document.

4.1.2 Urban (Non-Natural) Communities

The following urban land covers do not support species habitat, and as such, are not subject to Land Conversion fees under the PCCP. These are categorized as "Previously Converted" areas in the impact section, as they were converted from natural to non-natural communities prior to Project initiation.

4.1.2.1 Road

The existing Walerga Road corridor, which runs southwest to northeast through the On-Site Study Area makes up 8.1 acres of the Study Areas.

4.1.2.2 Urban Parks

A 0.5-acre portion of Dry Creek Community Park is located within the Off-Site Study Area of the Project. This area was under active construction during the June 2025 field survey.

4.1.2.3 Urban/Suburban

Several areas within the Study Areas are mapped as Urban and Suburban. These include paved roadways/pathways and adjacent street landscaping. Most of these areas are paved or otherwise unvegetated, but some areas support maintained landscaping or ruderal vegetation. A paved bike bath occurs parallel to the intermittent drainage in the southern portion of the On-Site Study Area as well as a paved path along the western boundary of the northern portion of the On-Site Study Area.

4.2 Aquatic Resources

Figure 3 shows the locations of aquatic resources in the Study Areas. These locations are based on aquatic resource delineation maps completed by Madrone and verified by the U.S. Army Corps of Engineers on 26 March 2019 (north of Walerga Road) and 21 February 2019 (south of Walerga Road) (**Attachment E**), as well as an aquatic resources delineation of off-site areas conducted by Madrone utilizing the same methodology on 1 and 9 July 2025. **Table 2** summarizes the aquatic resources by type in the Study Areas. A total of 2.07 acres of aquatic resources were mapped within the Study Areas. A description of each of the aquatic resource types and PCCP classifications is included below.

Table 2. Aquatic Resources Delineated within the Study Areas

Resource Type	PCCP Classification	Acreage
Wetlands		
Irrigated Wetland	Aquatic/Wetland	0.03
Seasonal Wetland	Vernal Pool Constituent Habitat	0.26
Seasonal Wetland Swale	Vernal Pool Constituent Habitat	0.26
Vernal Pool	Vernal Pool Constituent Habitat	1.11
Other Waters		
Ephemeral Drainage	Aquatic/Wetland	0.01
Intermittent Drainage	Riverine	0.39
Roadside Ditch	Aquatic/Wetland	0.02
Total		**2.07**

Summation errors may occur due to rounding.

4.2.1 Irrigated Wetland

One irrigated wetland was mapped along the eastern boundary of the On-Site Study Area. This feature appears to be the result of irrigation runoff from adjacent residences. The fence around the adjacent residence has been designed to allow irrigation runoff to flow underneath, and into this wetland. Based on a review of historic aerial photography, it appears that this wetland formed between 2005 and 2006, shortly after the construction of adjacent houses. Because this wetland is supported by runoff during the dry season, a variety of plant species typical of prolonged saturation have become established, including tall flatsedge (*Cyperus eragrostis*), common rush (*Juncus effusus*), Gooding's black willow (*Salix gooddingii*), Bermuda grass (*Cynodon dactylon*), English plantain (*Plantago lanceolata*), and yellow bristlegrass (*Setaria pumila*).

4.2.2 Seasonal Wetland

Several seasonal wetlands occur within the On-Site Study Area. Seasonal wetlands are depressional wetlands that pond water seasonally. These features are often topographically and hydrologically similar to vernal pools, but have a short hydroperiod, and as a result, support a slightly different plant community that is not characterized by a dominance of vernal pool endemics. The seasonal wetlands within the On-Site Study Area are largely dominated by Mediterranean barley (*Hordeum marinum*) and hyssop loosestrife (*Lythrum hyssopifolia*).

4.2.3 Seasonal Wetland Swale

The On-Site Study Area supports multiple seasonal wetland swales. Seasonal wetland swales are sloping, linear seasonal wetlands that convey surface runoff, and may detain it for short periods of time. The dominant plant occurring within the wetland swales was ryegrass.

4.2.4 Vernal Pool

The On-Site Study Area supports five vernal pools. Vernal pools are topographic basins that are underlain with an impermeable or semi-permeable hardpan or duripan layer. Vernal pools inundate during the wet season, and typically dry by late spring and remain dry through the summer months. The vernal pool was differentiated from depressional seasonal wetlands within the On-Site Study Area based upon the predominance of vernal pool endemic plant species. The vernal pools were dominated by Mediterranean barley, smooth goldfields (*Lasthenia glaberrima*), low manna grass (*Glyceria declinata*), and great valley popcorn flower (*Plagiobothrys stipitatus*).

4.2.5 Ephemeral Drainage

Three reaches of ephemeral drainage occur within the On-Site Study Area. These are linear features that exhibit an Ordinary High Water Mark. The southern two features within the On-Site Study Area are the portions of a seasonal wetland swale that runs through large expanses of riprap on either side of a culvert. The third is an incised drainage that drains a vernal pool into a culvert to the north. These features convey runoff for short periods of time, during and immediately following rain events, and are not influenced by groundwater sources at any time during the year.

4.2.6 Intermittent Drainage

Three reaches of intermittent drainage were mapped within the Study Areas. The largest feature flows from east to west across the On-Site Study Area and is a tributary to Dry Creek. Two smaller reaches occur within the Off-Site Study Area, and are also tributary to Dry Creek. The intermittent drainages are largely unvegetated within the channel yet contain patches of vegetation including ryegrass, creeping spikerush (*Eleocharis macrostachya*), and common monkeyflower (*Erythranthe guttata*).

4.2.7 Roadside Ditch

Several roadside ditches are present along the eastern edge of Walerga Road, and along the south side of Baseline Road. These features are unvegetated, maintained ditches that convey stormwater flows off of Baseline and Walerga Roads.

4.3 Soils

According to the Natural Resources Conservation Service (NRCS) Soil Survey Database (NRCS 2025), nine soil mapping units occur within the Study Areas (**Figure 4**): (140) Cometa sandy loam, 1-5% slopes; (141) Cometa-Fiddyment complex, 1-5% slopes; (142) Cometa-Ramona sandy loams, 1-5% slopes; (146) Fiddyment loam, 1-8% slopes; (147) Fiddyment-Kaseberg loams, 2-9% slopes; (175) Ramona sandy loam, 2-9% slopes; (182) San Joaquin-Cometa sandy loams, 1-5% slopes; (193) Xerofluvents, occasionally flooded; and (194) Xerofluvents, frequently flooded (NRCS 2024). None of the soil map units within the Study Areas

are derived from serpentine parent material, and no alkaline or saline soils are present within the Study Areas (NRCS 2025).

4.4 PCCP Special Habitats and CARP Setbacks

Within the PCCP Area, the following PCCP Special Habitats and CARP Setbacks have been mapped consistent with the PCCP and CARP guidelines:

- Stream System along Dry Creek and its tributary drainages
- Riparian Buffers, which are any areas within 50 feet of riparian land cover
- CARP Drainage Setback along Dry Creek and its intermittent tributary drainages

4.4.1 Stream System

A 6.7-acre area of PCCP-defined Stream System is present along the intermittent drainage that passes through the southern portion of the On-Site Study Area and encompasses the entire Off-Site Study Area that is just to the south of Dry Creek (**Figure 5**). The Stream System in this location is defined by the limits of the 100-year floodplain and by the Stream System limits noted in Table 6.1 of the CARP, which is 50 feet for an intermittent drainage, and 400 feet for Dry Creek to the north of the Off-Site Study Area.

5.0 RESULTS

Table 3 provides a list of special-status species that were evaluated, including their listing status, habitat associations, and their potential to occur in the Study Areas. The following set of criteria was used to determine each species' potential for occurrence on the site:

- Present: Species occurs in the Study Areas based on CNDDB records, and/or was observed on the site during field surveys.
- High: The Study Areas are within the known range of the species and suitable habitat exists.
- Moderate: The Study Areas are within the known range of the species but very limited suitable habitat exists.
- Low: The Study Areas are within the known range of the species and there is marginally suitable habitat.
- Absent: The species was not observed during protocol-level surveys conducted in the Study Areas.
- No Habitat Present: The Study Areas do not contain suitable habitat for the species or the Study Areas are outside the known range of the species.

Figure 2 is an exhibit displaying CNDDB occurrences within five miles of the Study Areas. Below is a discussion of all special-status plant and animal species with potential to occur on the site.

5.1 Plants

Madrone biologists conducted rare plant surveys of the On-Site Study Area targeting the species listed below on 30 April and 16 May 2024, and of the Off-Site Study Area on 9 June 2025 in accordance with the

Table 3. Special-Status Species with Potential to Occur within the Study Areas

Scientific Name **(Common Name)**	**Federal Status[1]**	**State Status[1]**	**Habitat Requirements**	**Potential for Occurrence**
Plants				
Balsamorhiza macrolepis Big-scale balsamroot	--	CRPR 1B.2	Occurs in chaparral, cismontane woodland and valley and foothill grasslands between 150 and 5100 feet (CNPS 2025). Often associated with serpentine soils.	**Absent.** Marginally suitable habitat is present in the Annual Brome Grassland/VPC. Protocol-level surveys throughout the On-Site Study Area did not detect this species, and no suitable habitat is present within the Off-Site Study Area.
Calycadenia spicata Spicate calycadenia	--	CRPR 1B.3	Occurs in disturbed areas and openings in annual grasslands and cismontane woodland between 130 and 4,600 feet (CNPS 2025). Found on a variety of open habitats including adobe clay, rock outcrops, gravelly areas, and mine tailings (CNPS 2025).	**No Habitat Present.** The clayey, rocky areas this species prefers are not present within the Study Areas.
Chloropyron molle ssp. *hispidum* Hispid bird's-beak	--	CRPR 1B.1	Found in meadows and seeps, playas, and valley and foothill grasslands with alkaline soils between five and 510 feet in elevation (CNPS 2025).	**No Habitat Present.** No saline-alkali soils are present within the Study Areas.
Downingia pusilla Dwarf downingia	--	CRPR 2B.2	Strongly associated with vernal pools, depressional wetlands, and mesic valley and foothill grassland, and is found in elevations ranging from five to 1460 feet (CNPS 2025). Dwarf downingia is typically associated with areas that experience a moderate degree of disturbance.	**Absent.** The vernal pools, seasonal wetlands, and seasonal wetland swales within the On-Site Study Area represent suitable habitat for this species. Protocol-level surveys throughout the On-Site Study Area did not detect this species, and no suitable habitat is present within the Off-Site Study Area.

Table 3. Special-Status Species with Potential to Occur within the Study Areas

Scientific Name **(Common Name)**	**Federal Status[1]**	**State Status[1]**	**Habitat Requirements**	**Potential for Occurrence**
Gratiola heterosepala Boggs Lake hedge-hyssop	--	CE, CRPR 1B.2	Grows in vernal pools and around the perimeter of marshes and swamps between 35 and 7,790 feet (CNPS 2025). Known to favor clay soils.	**Absent.** The vernal pools and seasonal wetlands within the On-Site Study Area represent suitable habitat for this species. Protocol-level surveys throughout the On-Site Study Area did not detect this species, and no suitable habitat is present within the Off-Site Study Area.
Juncus leiospermus var. *ahartii* Ahart's dwarf rush	--	CRPR 1B.2	Grows along the edges of vernal pools and swales within mesic valley and foothill grassland habitat between elevations of approximately 100 and 750 feet (CNPS 2025).	**Absent.** The vernal pools and seasonal wetlands within the On-Site Study Area represent suitable habitat for this species. Protocol-level surveys throughout the On-Site Study Area did not detect this species, and no suitable habitat is present within the Off-Site Study Area.
Juncus leiospermus var. *leiospermus* Red Bluff dwarf rush	--	CRPR 1B.1	Grows in various habitats such as chaparral, cismontane woodland, valley and foothill grassland, meadows and seeps, as well as mesic vernal pools. Found between elevations of approximately 100 and 750 feet (CNPS 2025).	**No Habitat Present.** The Study Areas are outside of the range of the species. The nearby occurrence is widely considered to be erroneous.
Legenere limosa Legenere	--	CRPR 1B.1	Associated with vernal pools and found between five and 2,885 feet (CNPS 2025).	**Absent.** The vernal pools and seasonal wetlands within the On-Site Study Area represent marginal habitat for this species. Protocol-level surveys throughout the On-Site Study Area did not detect this species, and no suitable habitat is present within the Off-Site Study Area.

Table 3. Special-Status Species with Potential to Occur within the Study Areas

Scientific Name **(Common Name)**	**Federal Status[1]**	**State Status[1]**	**Habitat Requirements**	**Potential for Occurrence**
Navarretia myersii ssp. *myersii* Pincushion navarretia	--	CRPR 1B.1	Found in vernal pools, often in acidic micro habitats between approximately 65 and 1,085 feet (CNPS 2025).	**Absent.** The vernal pools and seasonal wetlands within the On-Site Study Area represent suitable habitat for this species. Protocol-level surveys throughout the On-Site Study Area did not detect this species, and no suitable habitat is present within the Off-Site Study Area.
Orcuttia tenuis Slender Orcutt grass	FT	CE, CRPR 1B.1	Found in vernal pools with gravelly substrates at elevations generally ranging between 115 and 5,775 feet (CNPS 2025).	**Absent.** The vernal pools within the On-Site Study Area represent marginal habitat for this species. Protocol-level surveys throughout the On-Site Study Area did not detect this species, and no suitable habitat is present within the Off-Site Study Area.
Orcuttia viscida Sacramento Orcutt grass	FE	CE, CRPR 1B.1	Favors vernal pool habitats and is found between elevations of 100 and 330 feet (CNPS 2025).	**Absent.** The vernal pools within the On-Site Study Area represent marginal habitat for this species. Protocol-level surveys throughout the On-Site Study Area did not detect this species, and no suitable habitat is present within the Off-Site Study Area.
Sagittaria sanfordii Sanford's arrowhead	--	CRPR 1B.2	Occurs in shallow freshwater habitats associated with drainages, canals, and larger ditches that sustain inundation and/or slow-moving water into early summer. Found from approximately sea level to 2,135 feet (CNPS 2023).	**Absent.** The intermittent drainages represent suitable habitat for this species. Protocol-level surveys of the Study Areas did not detect this species.
Invertebrates				
Bombus crotchii Crotch's bumble bee	--	CC	Occurs in open grasslands and scrub habitats. This species occurs primarily in California including the Mediterranean region, Pacific Coast, Western Desert,	**High.** The Annual Brome Grassland/VPC within the Study Areas represents suitable habitat for this species.

Table 3. Special-Status Species with Potential to Occur within the Study Areas

Scientific Name **(Common Name)**	**Federal Status[1]**	**State Status[1]**	**Habitat Requirements**	**Potential for Occurrence**
			Great Valley, and adjacent foothills through most of southwestern California (Williams et al 2014).	
Branchinecta conservatio **Conservancy fairy shrimp**	FE	--	Occurs in very large, turbid vernal pools.	**No Habitat Present.** None of the vernal pools within the Study Areas provide appropriate habitat for this species, which consists of large, deep, alkaline, clay-bottomed vernal pool playas with turbid water. Additionally, the Study Areas are not within the required survey area showing on Figure 5-7 of the PCCP nor do they encompass any of the ten localities known to support this species.
Branchinecta lynchi **Vernal pool fairy shrimp**	FT	--	Vernal pools.	**Low.** Suitable habitat for this species is present in the vernal pools within the On-Site Study Area. This species was not found on-site during a full year of protocol-level wet season surveys of all suitable habitat (Madrone 2025).
Danaus plexippus Monarch butterfly	FC	--	Migratory species; most prevalent in the Central Valley in summer and early fall. Dependent upon milkweed (*Asclepias* species) plants as their exclusive larval host.	**No Habitat Present.** No milkweed plants are present within the Study Areas.
Desmocerus californicus dimorphus **Valley elderberry longhorn beetle**	FT	--	Dependent upon elderberry *(Sambucus* species) shrubs as primary host species.	**Low.** One elderberry shrub occurs within the On-Site Study Area. No VELB exit holes were found during the protocol-level survey.

Table 3. Special-Status Species with Potential to Occur within the Study Areas

Scientific Name (Common Name)	Federal Status[1]	State Status[1]	Habitat Requirements	Potential for Occurrence
Lepidurus packardi **Vernal pool tadpole shrimp**	FE	--	Vernal pools.	**Low.** Suitable habitat for this species is present in the vernal pools within the On-Site Study Area. This species was not found on-site during a full year of protocol-level wet season surveys of all suitable habitat (Madrone 2025).
Fish				
Oncorhynchus mykiss irideus **pop. 11 Central Valley steelhead DPS**	FE	--	Anadromous species requiring freshwater water courses with gravelly substrates for breeding. The young remain in freshwater areas before migrating to estuarine and marine environments.	**No Habitat Present.** Dry Creek just north of the Off-Site Study Area is designated as Critical Habitat for Central Valley Steelhead. The intermittent drainages within the Study Areas are tributary to Dry Creek, but are unsuitable for spawning or rearing because they do not provide steady flow of cool, clear water or suitable substrate for spawning. Although it is possible that steelhead could swim through them occasionally, the intermittent drainages are not considered suitable habitat for this species.
Oncorhynchus tshawytscha **Central Valley fall-run chinook salmon**	--	CSC	Anadromous species requiring freshwater water courses with gravelly substrates for breeding. The young remain in freshwater areas before migrating to estuarine and marine environments.	**No Habitat Present.** Dry Creek just north of the Off-site Study Area serves as a migration corridor to spawning habitat upstream of the Project Area. The intermittent drainages within the Study Areas are tributary to Dry Creek, but are unsuitable for spawning or rearing because they do not provide steady flow of cool, clear water or suitable substrate for spawning. Although it is possible that chinook salmon could swim through them occasionally, the intermittent drainages are

Table 3. Special-Status Species with Potential to Occur within the Study Areas

Scientific Name **(Common Name)**	**Federal Status[1]**	**State Status[1]**	**Habitat Requirements**	**Potential for Occurrence**
				not considered suitable habitat for this species.
Amphibians				
Ambystoma californiense California tiger salamander	FT	CT, CSC	Breeds in ponds or other deeply ponded wetlands, and uses gopher holes and ground squirrel burrows in adjacent grasslands for upland refugia/foraging.	**No Habitat Present.** The Study Areas are outside of the known range of the species.
Spea hammondii Western spadefoot	FPT	CSC	Breeds in vernal pools, seasonal wetlands and associated swales. Forages and hibernates in adjacent grasslands.	**Moderate.** The seasonal wetlands and vernal pools within the On-Site Study Area represent suitable habitat for this species. No western spadefoot were observed within the Study Area during field surveys, including wet season surveys, which would have documented larval spadefoot if present.
Reptiles				
Actinemys marmorata **Northwestern pond turtle**	FPT	FPT, CSC	Ponds, rivers, streams, wetlands, and irrigation ditches with associated marsh habitat.	**High.** The intermittent drainages within the Study Areas represent marginally suitable habitat for this species. No northwestern pond turtles were observed within the intermittent drainages during field surveys.

Table 3. Special-Status Species with Potential to Occur within the Study Areas

Scientific Name **(Common Name)**	**Federal Status[1]**	**State Status[1]**	**Habitat Requirements**	**Potential for Occurrence**
Thamnophis gigas **Giant garter snake**	FT	CT	Rivers, canals, irrigation ditches, rice fields, and other aquatic habitats with slow moving water and heavy emergent vegetation.	**No Habitat Present.** The Study Areas are outside of the known range of the species.
Birds				
Agelaius tricolor **Tricolored blackbird**	--	CE, CSC	Colonial nester in cattails, bulrush, or blackberries associated with marsh habitats.	**Low.** Potential breeding habitat is not present within the Study Areas, but the Annual Brome Grassland/VPC provides marginal foraging habitat.
Ammodramus savannarum Grasshopper sparrow	--	CSC	Typically found in expansive short to middle-height, moderately open grasslands with scattered shrubs or other song perches (Shuford and Gardali 2008).	**Low.** The Annual Brome Grassland/VPC within the Study Areas are not sufficiently expansive to support this species.
Aquila chrysaetos Golden eagle	--	CFP	Forages in open areas including grasslands, savannahs, deserts, and early successional stages of shrub and forest communities. Nests in large trees and cliffs.	**Low.** The Annual Brome Grassland/VPC within the Study Areas is marginally suitable foraging habitat for this species due to the small patch size and relative isolation from other annual grassland areas.
Asio otus Long-eared owl	--	CSC	Inhabits woodlands and conifer groves with dense trees for nesting and roosting and open country for hunting.	**No Habitat Present.** The valley foothill riparian woodland within the Study Areas is not sufficiently dense to provide habitat for this species, and the site is outside the known range of this species.

Table 3. Special-Status Species with Potential to Occur within the Study Areas

Scientific Name **(Common Name)**	**Federal Status[1]**	**State Status[1]**	**Habitat Requirements**	**Potential for Occurrence**
Athene cunicularia **Burrowing owl**	--	CC, CSC	Nests in abandoned ground squirrel burrows associated with open grassland habitats.	**Low.** Potential burrows and debris scattered throughout the Study Areas could provide artificial burrows. The Annual Brome Grassland/VPC provides suitable foraging habitat.
Buteo swainsoni **Swainson's hawk**	--	CT	Nests in large trees, preferably in riparian areas. Forages in fields, cropland, irrigated pasture, and grassland near large riparian corridors.	**High.** The Annual Brome Grassland/VPC throughout the Study Areas represents suitable foraging habitat for Swainson's hawk, and the trees within the Study Areas provide suitable nesting habitat. Swainson's hawks were observed foraging on-site during field surveys.
Circus hudsonius Northern harrier	--	CSC	Nests in emergent wetland/marsh, open grasslands, or savannah habitats. Forages in open areas such as marshes, agricultural fields, and grasslands.	**Low.** The Annual Brome Grassland/VPC, throughout the Study Areas is marginally suitable nesting and foraging habitat for this species due to the small patch size and relative isolation from other annual grassland areas.
Contopus cooperi Olive-sided flycatcher	--	CSC	Summer resident in California. Nests in conifer forests. Spring and fall transient in the Central Valley.	**Low.** Suitable spring and fall foraging habitat is present in the valley foothill riparian woodlands within the Study Areas.
Elanus leucurus White-tailed kite	--	CFP	Open grasslands, fields, and meadows are used for foraging. Isolated trees in close proximity to foraging habitat are used for perching and nesting.	**High.** The Annual Brome Grassland/VPC throughout the Study Areas represents suitable foraging habitat for white-tailed kite, and the trees throughout the Study Areas provide suitable nesting habitat. A white-tailed kite was observed foraging on-site during a field survey.

Table 3. Special-Status Species with Potential to Occur within the Study Areas

Scientific Name **(Common Name)**	**Federal Status[1]**	**State Status[1]**	**Habitat Requirements**	**Potential for Occurrence**
Haliaeetus leucocephalus Bald eagle	FD	CE	Nest in large trees within 1 mile of lakes, rivers, or larger streams.	**No Habitat Present.** Suitable nesting and foraging habitat are not present within the Study Areas.
Lanius ludovicianus Loggerhead shrike	--	CSC	Occurs in open areas with sparse trees, shrubs, and other perches.	**High.** The Annual Brome Grassland/VPC within the Study Areas represent suitable foraging habitat for loggerhead shrike, and the trees and shrubs within the Study Areas provide suitable nesting habitat.
Laterallus jamaicensis coturniculus **California black rail**	--	CT	Nests and forages in salt, brackish, and fresh marshes with abundant vegetative cover.	**No Habitat Present.** No marshes occur within the Study Areas.
Progne subis Purple martin	--	CSC	Nests in tall bridges and overpasses near water and open areas.	**No Habitat Present.** No tall bridges or overpasses occur within the Study Areas, which are outside of the known range of this species.
Setophaga petechia Yellow warbler	--	CSC	Occupy riparian vegetation in close proximity to water along streams and in wet meadows. This species no longer breeds in the Central Valley, but occurs as a common migrant in the fall and winter months (Shuford and Gardali 2008).	**Low.** Although the Study Areas are outside of this species' breeding range, it has been documented along Dry Creek near the Off-site Study Area (eBird 2025), and suitable winter foraging habitat is present in the valley foothill riparian woodlands within the Study Areas.
Mammals				
Antrozous pallidus Pallid bat	--	CSC, WBWG H	Roosts in crevices in rocky outcrops and cliffs, caves, mines, trees, bridges, barns, porches, bat boxes, and human-occupied as well as vacant buildings (WBWG 2025).	**High.** Suitable roosting habitat for this species is present in tree hollows and under exfoliating bark on trees scattered throughout the Study Areas.

Table 3. Special-Status Species with Potential to Occur within the Study Areas

Scientific Name **(Common Name)**	**Federal Status[1]**	**State Status[1]**	**Habitat Requirements**	**Potential for Occurrence**
Lasionycteris noctivagans Silver-haired bat	--	WBWG M	Roosts in abandoned woodpecker holes, under bark, and occasionally in rock crevices. It forages in open wooded areas near water features (WBWG 2025).	**High.** Suitable roosting habitat for this species is present in tree hollows and under exfoliating bark on trees scattered throughout the Study Areas.
Lasiurus frantzii Western red bat	--	CSC, WBWG H	Roosts primarily in the foliage of trees or shrubs (WBWG 2025). There may be an association with intact riparian habitat (particularly willows, cottonwoods, and sycamores) (WBWG 2025).	**Low.** Trees scattered throughout the Study Areas are suitable roosting habitat for this species, but the lack of willows, cottonwoods and sycamores decreases the habitat suitability.
Lasiurus cinereus Hoary bat	--	WBWG M	Roosts primarily in foliage of both coniferous and deciduous trees at the edges of clearings (WBWG 2025).	**Low.** Trees within the valley foothill riparian woodland within the Study Areas are suitable roosting habitat for this species.
Taxidea taxus American badger	--	CSC	This species prefers dry open fields, grasslands, and pastures.	**No Habitat Present.** The Annual Brome Grassland/VPC within the Study Areas is not sufficiently expansive to support this species.

Species in **bold text** are PCCP Covered Species.

[1] Status Codes:

CC - CDFW Candidate for Listing
CE - CDFW Endangered
CFP - CDFW Fully Protected
CRPR - California Rare Plant Rank
CSC - CDFW Species of Concern
CT - CDFW Threatened
FC - Federal Candidate for Listing
FPT - Federal Proposed Threatened
WBWG M - Western Bat Working Group Medium Threat Rank
WBWG H - Western Bat Working Group High Threat Rank
FD - Federally Delisted
FE - Federally Endangered
FT - Federally Threatened

Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed, and Candidate Plants (USFWS 2000), the *Botanical Survey Guidelines of the California Native Plant Society* (CNPS 2001), and *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (CDFW 2018). No special-status plants were documented during these surveys (Madrone 2024) (**Attachment F**).

5.1.1 Big-Scale Balsamroot

Big-scale balsamroot (*Balsamorhiza macrolepis* var. *macrolepis*) is not federally or state-listed, but it is classified as a CRPR List 1B.2 plant. It is a perennial herbaceous species that occurs in chaparral, cismontane woodland and valley and foothill grasslands between 295 and 4,600 feet. Big-scale balsamroot blooms from March through June and may be found on serpentine soils, though it is known to grow on other soil types as well (CNPS 2025).

The Annual Brome Grassland/VPC and Valley Foothill Riparian Woodlands throughout the On-Site Study Area provide marginally suitable habitat for this species. This species was not observed during the 2024 protocol-level special status plant survey of the On-Site Study Area (Madrone 2024). There is one record of big-scale balsamroot within five miles of the Study Area in the CNDDB (**Figure 2**). This record (CNDDB Occurrence #9) is located approximately 3.5 miles northeast of the site along Industrial Road (CNDDB 2025).

5.1.2 Dwarf Downingia

Dwarf downingia (*Downingia pusilla*) is not federally or state listed, but it is classified as a CRPR List 1B.2 plant. It is a diminutive annual herb that is strongly associated with vernal pools and other seasonally inundated features at elevations ranging from sea level to approximately 1,500 feet (CNPS 2025). Dwarf downingia is typically associated with areas that experience a moderate degree of disturbance, and it blooms from March to May.

The vernal pools, seasonal wetlands, and seasonal wetland swales within the On-Site Study Area represent suitable habitat for this species. This species was not observed during the 2024 protocol-level special status plant surveys of the On-Site Study Area (Madrone 2024). There are 15 records of dwarf downingia within five miles of the Study Areas in the CNDDB (**Figure 2**). The nearest of these (CNDDB Occurrence #142) is located approximately 1.4 miles northeast of the site in the Silverado Oaks Wetland Preserve (CNDDB 2025).

5.1.3 Boggs Lake Hedge-Hyssop

Boggs Lake hedge-hyssop (*Gratiola heterosepala*) is not federally listed, but it is a California endangered species and a CRPR List 1B.2 plant. Boggs Lake hedge-hyssop grows in vernal pools and around the perimeter of lakes and ponds between 30 and 7,800 feet (CNPS 2025). This small annual herb favors clay soils, and blooms from April to August (CNPS 2025).

The deeper portions of the vernal pools and seasonal wetlands within the On-Site Study Area represent suitable habitat for this species. This species was not observed during the 2024 protocol-level special status plant surveys of the On-Site Study Area (Madrone 2024). There are three records of Boggs Lake hedge-hyssop within five miles of the Study Areas in the CNDDB, two of which are presumed extant, and the last is possibly extirpated (**Figure 2**) (CNDDB 2025). The nearest of these (CNDDB Occurrence #113) is located approximately 1.4 miles northeast of the site in an open space preserve off Pleasant Grove and Foothills Boulevard (CNDDB 2025).

5.1.4 Ahart's Dwarf Rush

Ahart's dwarf rush (*Juncus leiospermus var. ahartii*) is not federally or state listed, but it is classified as a CRPR List 1B.2 plant. Ahart's dwarf rush grows along the edges of seasonal wet habitats such as vernal pools and swales within valley and foothill grasslands between elevations of approximately 100 feet and 750 feet (CNPS 2025). This annual herb blooms from March to May (CNPS 2025).

The vernal pools and seasonal wetlands within the On-Site Study Area represent suitable habitat for this species. This species was not observed during the 2024 protocol-level special status plant surveys of the On-Site Study Area (Madrone 2024). This species has not been documented within five miles of the Study Areas in the CNDDB (CNDDB 2025).

5.1.5 Legenere

Legenere (*Legenere limosa*) is not federally or state listed, but it is classified as a CRPR List 1B.1 species. This annual herb is primarily associated with seasonal wetlands with a long hydroperiod, such as vernal pools and marsh and pond edges (CNPS 2025). Legenere occurs at elevations between sea level and 2,600 feet, and blooms from April to June (CNPS 2025).

The deeper portions of vernal pools and seasonal wetlands within the On-Site Study Area represent suitable habitat for this species. This species was not observed during the 2024 protocol-level special status plant surveys of the On-Site Study Area (Madrone 2024). There is one record of Legenere within five miles of the Study Areas in the CNDDB (**Figure 2**) (CNDDB 2025). The nearest potentially extant occurrence (CNDDB Occurrence #32) is located approximately 3.3 miles southwest of the off-site area south of Elverta Road (CNDDB 2025).

5.1.6 Pincushion Navarretia

Pincushion navarretia (*Navarretia myersii ssp. myersii*) is not federally or state listed, but it is classified as a CRPR List 1B.1 plant. This species is found in vernal pools and other mesic areas in annual grasslands, often on acidic soils (CNPS 2025). Pincushion navarretia is found between approximately 65 and 1,100 feet and blooms in April and May (CNPS 2025).

The vernal pools, seasonal wetlands and seasonal wetland swales within the On-Site Study Area represent suitable habitat for this species. This species was not observed during the 2024 protocol-level special status plant surveys of the On-Site Study Area (Madrone 2024). This species has not been documented within five miles of the Study Areas in the CNDDB (CNDDB 2025).

5.1.7 Slender Orcutt Grass

Slender Orcutt grass (*Orcuttia tenuis*) is listed as threatened pursuant to the federal Endangered Species Act. A total of 82 occurrences are known, of which 76 are presumed to be extant (USFWS 2005). In addition to the counties listed in its historic range, slender Orcutt grass is also known from Lassen, Modoc, Butte, and Plumas Counties (USFWS 2005). The highest concentration of slender Orcutt grass occurs in Tehama County where 27 natural occurrences are found (USFWS 2005).

The vernal pools within the On-Site Study Area represent marginally suitable habitat for this species. This species was not observed during the 2024 protocol-level special status plant surveys of the On-Site Study Area (Madrone 2024). This species has not been documented within five miles of the Study Areas in the CNDDB (CNDDB 2025).

5.1.8 Sacramento Orcutt Grass

Sacramento Orcutt grass (*Orcuttia viscida*) is listed as endangered pursuant to the federal Endangered Species Act. The earliest collection of this species was in 1936 near Phoenix Field; however, by 1990, Sacramento Orcutt grass was known from seven natural occurrences and one introduction (USFWS 2005). The current distribution of the species is restricted to eight extant populations in Sacramento County. One additional population was discovered after 1990; but one known population and a portion of another have been extirpated (USFWS 2005). The highest concentration of occupied habitat occurs within a 2.3-square mile area near Rancho Cordova (USFWS 2005).

The vernal pools within the On-Site Study Area represent marginally suitable habitat for this species. This species was not observed during the 2024 protocol-level special status plant surveys of the On-Site Study Area (Madrone 2024). This species has not been documented within five miles of the Study Areas in the CNDDB (CNDDB 2025).

5.1.9 Sanford's Arrowhead

Sanford's arrowhead (*Sagittaria sanfordii*) is not federally or state listed, but it is classified as a CRPR List 1B.2 plant. It generally occurs in shallow freshwater habitats associated with drainages, canals, and larger ditches that sustain inundation and/or slow-moving water into early summer. This perennial rhizomatous species blooms from May to October and occurs from sea level to approximately 2,000 feet (CNPS 2025).

The intermittent drainages within the Study Areas represent suitable habitat for this species. This species was not observed during the 2024 or 2025 protocol-level special status plant surveys of the Study Areas

(Madrone 2024). There are three records of Sanford's arrowhead in the CNDDB within five miles of the Study Areas (**Figure 2**), the nearest of which (Occurrence #72) is located approximately 2.4 miles to the southwest of the Off-Site Study Area, in Goat Creek north of U Street (CNDDB 2025).

5.2 Invertebrates

5.2.1 Crotch's Bumble Bee

Crotch's bumble bee (*Bombus crotchii*) has a limited distribution in southwestern North America. This species occurs primarily in California, including the Mediterranean region, Pacific Coast, West Desert, Great Valley, and adjacent foothills through most of southwestern California. It also occurs in Mexico (Baja California and Baja California Sur) (Williams et al. 2014) and has been documented in southwest Nevada, near the California border. This species was historically common in the Central Valley of California, but now appears to be absent from most of it, especially in the center of its historic range (Williams et al. 2014; Richardson et al 2014). In California, *B. crotchii* inhabits open grasslands and scrub habitats.

All bumble bees have three basic requirements: suitable nesting sites for the colonies, availability of nectar and pollen from floral resources throughout the duration of the entirety of the colony period (spring, summer, and fall), and suitable overwintering sites for the queens. Nests are often located underground in abandoned holes made by ground squirrels, mice, and rats or occasionally abandoned bird nests (Osborne et al 2008). Some species nest on the surface of the ground (in tufts of grass) or in empty cavities. Bumble bees that nest aboveground may require undisturbed areas with nesting resources such as grass and hay to protect nests. Furthermore, areas with woody cover, or other sheltered areas provide bumble bees sites to build their nests (e.g., downed wood, rock walls, brush piles, etc.).

Bumble bees depend on the availability habitats with a rich supply of floral resources that bloom continuously during the entirety of the colony's life. The queen collects nectar and pollen from flowers to support the production of her eggs, which are fertilized by sperm she has stored from mating the previous fall. As generalist foragers, bumble bees do not depend on any one flower type. They generally prefer flowers that are purple, blue or yellow; they are essentially blind to the color red. The plant families most commonly associated with Crotch's bumblebee observations in California include Apocynaceae, Asteraceae, Boraginaceae, Fabaceae, and Lamiaceae (Xerces Society 2018). Very little is known about hibernacula, or overwintering sites utilized by most bumble bees. Generally, bumble bees overwinter in soft, disturbed soil (Goulson 2010), under leaf litter or other debris (Williams et al. 2014), in abandoned holes made by fossorial mammals or occasionally in abandoned bird nests (Osborne at all 2008). Some species nest on the surface of the ground (in grassy tussocks) or in empty cavities (hollow logs, dead trees, under rocks, etc.). Queens most likely overwinter in small cavities just below or on the ground surface.

The Annual Grassland/VPC within the Study Areas represents suitable habitat for Crotch's bumble bee. These areas contain some flowering plants for much of the year and scattered small burrows in which the species could nest and overwinter. There are no documented occurrences of this species in the CNDDB within 5 miles of the Study Areas (CNDDB 2025).

5.2.2 Vernal Pool Fairy Shrimp

The vernal pool fairy shrimp (*Branchinecta lynchi*) is listed as threatened pursuant to the federal Endangered Species Act and is a PCCP Covered Species. Historically, the range of vernal pool fairy shrimp extended throughout the Central Valley of California. Vernal pool fairy shrimp populations have been found in several locations throughout California, with habitat extending from Stillwater Plain in Shasta County through the Central Valley to Pixley in Tulare County, and along the Central Coast range from northern Solano County to Pinnacles National Monument in San Benito County (Eng et al. 1990, Fugate 1992). Additional populations occur in San Luis Obispo, Santa Barbara, and Riverside counties. The historic and current ranges of vernal pool fairy shrimp are very similar in extent; however, the remaining populations are more fragmented and isolated than during historical times (USFWS 2005). The life cycle of vernal pool fairy shrimp is adapted to seasonally inundated features such as vernal pools, seasonal wetlands, and seasonal wetland swales. Fairy shrimp embryos survive the dry season in cyst form. Cysts "hatch" soon after pools become inundated during the wet season. Fairy shrimp complete their life cycle quickly and feed on small particles of detritus, algae, and bacteria (Eriksen and Belk 1999).

The vernal pools within the On-Site Study Area represent suitable habitat for this species. There are twenty documented CNDDB occurrences of vernal pool fairy shrimp within 5 miles of the Study Areas, the nearest of which (Occurrence #309) is located 0.8 miles from the On-Site Study Area in the Woodcreek West Wetland Compensation Area (**Figure 2**) (CNDDB 2025). Wet-season surveys of the vernal pools for this species were conducted during the 2024-2025 wet season, and this species was not detected (Madrone 2025) (**Attachment G**).

5.2.3 Valley Elderberry Longhorn Beetle

The Valley elderberry longhorn beetle (VELB) is listed as threatened pursuant to the federal Endangered Species Act and is a PCCP Covered Species. The historic range of this beetle is limited to moist Valley oak woodlands along margins of rivers and streams in the lower Sacramento and lower San Joaquin Valleys (USFWS 1980). At the time of its listing, the beetle was known from less than 10 localities in Merced, Sacramento, and Yolo Counties (USFWS 1984). Its current distribution is patchy throughout California's Central Valley and associated foothills (USFWS 1999).

The Valley elderberry longhorn beetle is completely dependent on its host plant, elderberry (*Sambucus* species), which occurs in riparian and other woodland communities in California's Central Valley and the associated foothills (USFWS 1999). Female beetles lay their eggs in crevices on the stems or on the leaves of living elderberry plants. When the eggs hatch, larvae bore into the stems. The larval stages last for one to two years. The fifth instar larvae create emergence holes in the stems and then plug the holes and remain in the stems through pupation (Talley 2003). Adults emerge through the emergence holes from late March through June. The short-lived adult beetles forage on leaves and flowers of elderberry shrubs.

One elderberry shrub is present just north of the intermittent drainage in the On-Site Study Area (**Figure 3**). This shrub has two stems that are approximately 3" in diameter, but no exit holes typical of the Valley

elderberry longhorn beetle were observed on the shrub when surveyed by a qualified biologist on 8 May 2025. This survey was conducted to collect information for analysis of the shrubs consistent with *The Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle (*Desmocerus californicus dimorphus*)* (USFWS 2017). The shrub is in a riparian location. There are no documented occurrences of this species in the CNDDB within 5 miles of the Study Areas (CNDDB 2025).

5.2.4 Vernal Pool Tadpole Shrimp

The vernal pool tadpole shrimp (*Lepidurus packardi*) is listed as endangered pursuant to the federal Endangered Species Act and is a PCCP Covered Species. The historic range of the vernal pool tadpole shrimp likely extended throughout the Central Valley of California and has been documented from east of Redding in Shasta County south to Fresno County, and from the San Francisco Bay Wildlife Refuge in Alameda County. The historic and current ranges of vernal pool tadpole shrimp are very similar in extent; however, the remaining populations are more fragmented and isolated than during historical times (USFWS 2005).

This species is associated with long-duration seasonal pools in grasslands throughout the northern and eastern portions of the Central Valley (USFWS 2005). Suitable vernal pools and seasonal swales are generally underlain by hardpan or sandstone. Much like vernal pool fairy shrimp, vernal pool tadpole shrimp are adapted to seasonally inundated features such as vernal pools, seasonal wetlands, and seasonal wetland swales (USFWS 2005).

Large vernal pools within the On-Site Study Area represent suitable habitat for this species. There is one documented CNDDB occurrence of vernal pool tadpole shrimp within five miles of the Study Areas (**Figure 2**). This occurrence (CNDDB Occurrence #24) is located approximately 2.1 miles northeast of the On-Site Study Area in the Woodcreek Oaks Wetland Preserve and is considered potentially extirpated (CNDDB 2025). Wet-season surveys of the vernal pools for this species were conducted during the 2024-2025 wet season, and this species was not detected (Madrone 2025) (**Attachment G**).

5.3 Fish

5.3.1 Central Valley Steelhead

Steelhead (*Oncorhynchus mykiss irideus*) populations in the Central Valley ESU have been listed by the NMFS under the ESA as threatened and the population is a PCCP Covered Species. Steelhead, the anadromous form of rainbow trout, historically inhabited most tributaries to the Sacramento River. Juvenile steelhead may spend up to three years in freshwater prior to emigrating to the ocean as smolts. Typically, juvenile steelhead emigrate as age class 1+ fish (one year in fresh water) through the Sacramento River and the Sacramento-San Joaquin Estuary from November through May. Spawning steelhead require gravel or cobble substrates 0.2 to 5.1 inches in diameter for egg laying. Fine sediments (e.g., silt, fine sand, and clay) may suffocate eggs by preventing the transport of dissolved oxygen from the water to the eggs. The range of water temperatures for optimal survival and growth of rainbow trout is between 59 and 64°F (Moyle

2002). Both fry and older juveniles require instream object cover, cobble or boulders, large woody debris, undercut banks, or submerged and overhanging vegetation for protection against predators.

Dry Creek to the north of the Off-Site Study Area is Critical Habitat for Central Valley steelhead (CNDDB 2025). The intermittent drainages within the Study Areas are tributary to Dry Creek, but do not have appropriate substrate for spawning, and their intermittent nature renders them unsuitable for rearing habitat. Although it is possible that steelhead could swim through them occasionally, the intermittent drainages are not considered suitable habitat for this species.

5.3.2 Central Valley Fall-Run Chinook Salmon

Chinook salmon are an anadromous species which spawn in freshwater rivers but migrate to the ocean to rear (Moyle 2002). Chinook salmon typically return to their natal stream to spawn. Within the Central Valley there are four races of Chinook salmon: fall-run, late fall-run, winter-run, and spring-run. Adult fall-run Chinook salmon migrate through the Delta and into Central Valley rivers from July through December and spawn from October through December. Central Valley fall-run Chinook is not federally or state listed, but it is a PCCP Covered Species.

Chinook rely on suitable water temperature and substrate for successful spawning and incubation. Rearing habitat for juveniles includes riffles, runs, pools, and inundated floodplains. In streams, Chinook are opportunistic feeders. They eat aquatic insects, terrestrial insects and bottom invertebrates. Juvenile Chinook are significantly affected by predatory nonnative fish (Moyle 2002).

Dry Creek to the north of the Off-Site Study Area is Essential Fish Habitat for all Pacific Salmon, including the Central Valley fall-run Chinook (CNDDB 2025). The intermittent drainages within the Study Areas are tributary to Dry Creek, but do not have appropriate substrate for spawning, and their intermittent nature renders them unsuitable for rearing habitat. Although it is possible that Chinook could swim through them occasionally, the intermittent drainages are not considered suitable habitat for this species.

5.4 Amphibians

5.4.1 Western Spadefoot

The western spadefoot (*Spea hammondii*) is proposed for federal listing and is a CDFW species of special concern. This amphibian is a nocturnal animal that forages in grassland, open chaparral, and pine-oak woodlands for a variety of invertebrates such as insects and worms (USFWS 2005). Western Spadefoot breeds from January through May in variety of temporary wetlands including creeks, pools in intermittent drainages, vernal pools, and seasonal wetlands, and other fish-free water features. The tadpoles develop in 3 to 11 weeks and must complete their metamorphosis before the temporary pools dry. Post-metamorphic juveniles feed and then immediately seek underground refugia. Following metamorphosis, the adults are largely terrestrial in nature and will burrow into sandy or gravelly soils utilizing the "spades" on the hind feet. The majority of the adult's life is spent in underground burrows (USFWS 2005). In Placer County,

western spadefoot are known to breed in relatively deep man-made features, such as ponded areas adjacent to railroad tracks, and in intermittent drainage plunge pools or similar pools that hold water through late spring (CNDDB 2025).

Several of the seasonal wetlands and vernal pools within the On-Site Study Area represent suitable breeding habitat for western spadefoot and the surrounding Annual Brome Grasslands/VPC provide suitable dry-season habitat. There are four documented CNDDB occurrences of western spadefoot within five miles of the Study Areas, the nearest of which (CNDDB Occurrence #171) is located approximately 1.2 miles northeast of the site, in the Woodcreek Oaks Open Space Preserve (**Figure 2**) (CNDDB 2025). Western spadefoot was not observed on-site during numerous field surveys. These field surveys included a full wet-season of sampling all potential spadefoot breeding habitat with a dip-net every two weeks. Although the wet-season survey targeted federally listed vernal pool branchiopods, western spadefoot tadpoles would have been encountered and documented if present.

5.5 Reptiles

5.5.1 Northwestern Pond Turtle

The northwestern pond turtle (*Actinemys marmorata*) is proposed for federal listing, is a CDFW species of special concern, and is a PCCP Covered Species. Its favored habitats include streams, large rivers and canals with slow-moving water, aquatic vegetation, and open basking sites (Jennings and Hayes 1994). Although the turtles must live near water, they can tolerate drought by burrowing into the muddy beds of dried drainages. This species feeds mainly on invertebrates such as insects and worms, but will also consume small fish, frogs, mammals and some plants. Western pond turtle predators include raccoons, coyotes, raptors, weasels, large fish, and bullfrogs. This species breeds from mid to late spring in adjacent open grasslands or sandy banks (Jennings and Hayes 1994).

The intermittent drainages within the Study Areas provide marginally suitable habitat for northwestern pond turtle due to their relatively short duration of inundation. Northwestern pond turtle has not been documented in the processed records of the CNDDB within five miles of the Study Areas; however, an unprocessed CNDDB record of the species has been documented approximately 4 miles east of the site in Upper Linda Creek, a tributary of Dry Creek (**Figure 2**) (CNDDB 2025). Northwestern pond turtle was not observed on-site during reconnaissance level surveys.

5.6 Birds

5.6.1 Tricolored Blackbird

Tricolored blackbirds (*Agelaius tricolor*) are not federally listed but are state listed as threatened and it is a PCCP Covered Species. In addition, tricolored blackbird is listed by CDFW as a species of special concern. They are colonial nesters preferring to nest in dense stands of cattails, bulrush, or blackberry thickets associated with perennial water (Shuford and Gardali 2008).

Although nesting habitat for tricolored blackbird does not occur within the Study Areas, the Annual Brome Grassland/VPC within the Study Areas provide suitable foraging habitat. This species has not been documented within five miles of the Study Areas in the CNDDB (CNDDB 2025).

5.6.2 Golden Eagle

Golden eagle (*Aquila chrysaetos*) is not listed pursuant to either the California or federal Endangered Species Acts; however, it is categorized as a species of special concern and a fully protected species by the CDFW, and is protected under the federal Bald and Golden Eagle Protection Act. This species is a very large solitary raptor that feeds on mammals, carrion, and reptiles. It typically nests in large trees or cliffsides in rolling to mountainous terrain, and forages in large, expansive open grasslands and savannas (Shuford and Gardali 2008). Although its natural densities are generally believed to be low, it was once relatively common to the open areas of California. Today, golden eagles are rarely observed in the Central Valley. This species typically nests between February and August.

The Annual Brome Grassland/VPC within the Study Areas provides marginally suitable foraging habitat due the relatively small patch size and recent isolation of the habitat. This species has not been documented within five miles of the Study Areas in the CNDDB (CNDDB 2025).

5.6.3 Burrowing Owl

Burrowing owl (*Athene cunicularia*) is designated as a species of special concern by the CDFW, is a candidate for state listing, and is a PCCP covered species. This species typically inhabits dry open rolling hills, grasslands, desert floors, and open bare ground with gullies and arroyos. This species typically uses burrows created by fossorial mammals, most notably the California ground squirrel, but may also use man-made structures such as culverts; cement, asphalt, or wood debris piles; or openings beneath cement or asphalt pavement (CDFG 1995). The breeding season extends from February 1 through August 31 (CBOC 1993, CDFG 1995).

Although few ground squirrel burrows and no evidence of burrowing owls (such as whitewash or feathers) were observed, debris scattered throughout the Study Areas could provide artificial burrows for burrowing owl. The Annual Brome Grassland/VPC provides suitable foraging habitat for this species. There is one documented CNDDB occurrence of burrowing owl within five miles of the Study Areas (**Figure 2**). This occurrence (CNDDB Occurrence #339) is located approximately 2.0 miles northeast of the On-Site Study Area, along Phillip Way (CNDDB 2025). This occurrence was most recently observed in May 2019, when two owls were observed utilizing the same burrow and exhibiting nesting behavior (CNDDB 2025).

5.6.4 Swainson's Hawk

Swainson's hawk (*Buteo swainsoni*) is a raptor species that is not federally listed, but is listed as threatened by CDFW and is a PCCP covered species. Breeding pairs typically nest in tall trees associated with riparian corridors, and forage in grassland, irrigated pasture, and cropland with a high density of rodents (Shuford

and Gardali 2008). The Central Valley populations breed and nest in the late spring through early summer before migrating to Central and South America for the winter (Shuford and Gardali 2008).

The Annual Brome Grassland/VPC throughout the Study Areas represents suitable foraging habitat for Swainson's hawk, and the trees within the Study Areas provide suitable nesting habitat. There are 13 documented CNDDB occurrences of Swainson's hawk within five miles of the Study Areas (**Figure 2**) (CNDDB 2025). The nearest occurrence (CNDDB Occurrence #791) is located approximately 1.5 miles northeast of the site, in the Roseville Public Golf Course (**Figure 2**) (CNDDB 2025).

5.6.5 Northern Harrier

The northern harrier (*Circus hudsonius*) is not listed pursuant to either the California or federal Endangered Species Acts; however, it is considered to be a species of special concern by the CDFW. This species is known to nest within the Central Valley, along the Pacific Coast, and in northeastern California (Shuford and Gardali 2008). The northern harrier is a ground nesting species, and typically nests in emergent wetland/marsh, open grasslands, or savannah habitats. Foraging occurs within a variety of open habitats such as marshes, agricultural fields, and grasslands (Shuford and Gardali 2008).

The Annual Brome Grassland/VPC throughout the Study Areas are suitable nesting and foraging habitat for this species. Northern harrier has not been documented in the CNDDB within five miles of the Study Areas (CNDDB 2025).

5.6.6 Olive-Sided Flycatcher

The olive-sided flycatcher (*Contopus cooperi*) is not listed and protected pursuant to either the California or federal Endangered Species Acts, but it is a CDFW species of special concern. The olive-sided flycatcher breeds in conifer forests in the coastal and mountainous regions of California and other areas to the east and north, winters in Central and South America, and occurs in California's Central Valley as an uncommon spring and fall migrant (Shuford and Gardali 2008). Olive-sided flycatchers are almost always associated with forests and woodlands, especially openings and edges (Shuford and Gardali 2008).

Suitable foraging habitat for this species is present in the Valley Foothill Riparian Woodland within the Study Areas. Olive-sided flycatcher has not been documented in the CNDDB within five miles of the Study Areas (CNDDB 2025).

5.6.7 White-Tailed Kite

White-tailed kite (*Elanus leucurus*) is not federally or state listed but is a CDFW fully protected species. This species is a yearlong resident in the Central Valley and is primarily found in or near foraging areas such as open grasslands, meadows, farmlands, savannahs, and emergent wetlands (Shuford and Gardali 2008). White-tailed kites typically nest from March through June in trees within riparian, oak woodland, and savannah habitats of the Central Valley and Coast Range (Shuford and Gardali 2008).

The Annual Brome Grassland/VPC throughout the Study Areas represents suitable foraging habitat for white-tailed kite, and the trees within the Study Areas provide suitable nesting habitat. There is one documented occurrence of white-tailed kite nests within five miles of the site in the CNDDB (**Figure 2**) (CNDDB 2025). The occurrence (CNDDB Occurrence #56), is located approximately 2.6 miles northeast of the On-Site Study Area, near the Woodcreek Golf Club (CNDDB 2025).

5.6.8 Loggerhead Shrike

The loggerhead shrike (*Lanius ludovicianus*) is not listed and protected pursuant to either the California or federal Endangered Species Acts, but is a CDFW species of special concern. Loggerhead shrikes nest in small trees and shrubs in woodland and savannah vegetation communities, and forage in open habitats throughout California (Shuford and Gardali 2008). The nesting season ranges from March through June.

The trees and Annual Brome Grassland/VPC within the Study Areas provide suitable foraging and nesting habitat for loggerhead shrike. Loggerhead shrike has not been documented in the CNDDB within five miles of the Study Areas (CNDDB 2025).

5.6.9 Yellow Warbler

The yellow warbler (*Setophaga petechia*) is not listed and protected pursuant to either the California or federal Endangered Species Acts, but it is a CDFW species of special concern. The yellow warbler is largely extirpated as a breeder in the Sacramento Valley, but it is a common migrant during the fall and winter months (Shuford and Gardali 2008). Yellow warblers generally occupy riparian vegetation in close proximity to streams. Preferred habitat in northern California is dominated by willows (*Salix* spp.), cottonwoods (*Populus* spp.), and Oregon ash (*Fraxinus latifolia*) (Shuford and Gardali 2008).

Although the Study Areas are outside of this species' breeding range, it has been documented along Dry Creek near the Off-Site Study Area during the last few days of August and mid-September of several years (eBird 2025), during the beginning of fall migration. Suitable winter foraging habitat is present in the Valley Foothill Riparian Woodland within the Study Areas. Yellow warbler has not been documented in the CNDDB within five miles of the Study Areas (CNDDB 2025).

5.7 Mammals

5.7.1 Pallid Bat

Pallid bat (*Antrozous pallidus*) is not federally or state listed, but is considered a CDFW species of special concern, and is classified by the WBWG as a High priority species. It favors roosting sites in crevices in rock outcrops, caves, abandoned mines, hollow trees, and human-made structures such as barns, attics, and sheds (WBWG 2025). Though pallid bats are gregarious, they tend to group in smaller colonies of 10 to 100 individuals. It is a nocturnal hunter and captures prey in flight, but unlike most American bats, the species has been observed foraging for flightless insects, which it seizes after landing (WBWG 2025).

Tree hollows and exfoliating bark on trees throughout the Study Areas represent suitable day and maternity roosting habitat for pallid bat. Pallid bat has not been documented in the CNDDB within five miles of the Study Areas (CNDDB 2025).

5.7.2 Silver-Haired Bat

Silver-haired bat (*Lasionycteris noctivagans*) is not federally or state listed but is classified by the WBWG as a Medium priority species. Primarily considered a coastal and montane forest species, the silver-haired bat occurs in more xeric environments during winter and seasonal migrations (WBWG 2025). It roosts in abandoned woodpecker holes, under bark, and occasionally in rock crevices. This insectivore's favored foraging sites include open wooded areas near water features (WBWG 2025).

Tree hollows and exfoliating bark on trees throughout the Study Areas represent suitable day and maternity roosting habitat for silver-haired bat. Silver-haired bat has not been documented in the CNDDB within five miles of the Study Areas (CNDDB 2025).

5.7.3 Western Red Bat

Western red bat (*Lasiurus blossevillii*) is not federally or state listed but is considered a CDFW species of special concern, and is classified by the WBWG as a High priority species. Western red bat is typically solitary, roosting primarily in the foliage of trees or shrubs (WBWG 2025). Day roosts are commonly in edge habitats adjacent to streams or open fields, in orchards, and sometimes in urban areas. There may be an association with intact riparian habitat (particularly willows, cottonwoods, and sycamores) (WBWG 2025).

Trees within the Valley Foothill Riparian Woodland represent suitable day and maternity roosting habitat for western red bat. Western red bat has not been documented in the CNDDB within five miles of the Study Areas (CNDDB 2025).

5.7.4 Hoary Bat

The hoary bat (*Lasiurus cinereus*) is not federally or state listed, but is classified by the WBWG as a Medium priority species. It is considered to be one of the most widespread of all American bats with a range extending from Canada to central Chile and Argentina as well as Hawaii (WBWG 2025). Hoary bats are solitary and roost primarily in foliage of both coniferous and deciduous trees, near the ends of branches at the edge of a clearing (WBWG 2025). This species may also occasionally roost in caves, beneath a rock ledge, in a woodpecker hole, in a grey squirrel nest, under a wood plank, or clinging to the side of a building (WBWG 2025).

Trees within the Valley Foothill Riparian Woodland represent suitable day and maternity roosting habitat for hoary bat. Hoary bat has not been documented in the CNDDB within five miles of the Study Areas (CNDDB 2025).

6.0 IMPACTS TO SENSITIVE BIOLOGICAL RESOURCES

This section details potential impacts to the biological resources discussed above associated with construction of the Project, as discussed in **Section 1.1** and shown on **Attachment A**.

Impacts analyzed within this section include 91.5-acres of permanent impacts (**Figure 6**). Permanent impacts range from mass grading and lot construction to construction of pedestrian trails (including an intermittent drainage multipurpose trail crossing), a sewer line crossing, Walerga road shoulder/frontage improvements, off-site sewer improvements, and detention basins. Temporary impacts may occur within the intermittent drainage where the multipurpose trail and sewer line crosses it.

6.1 Aquatic Resources

Of the 2.07 acres of mapped aquatic resources within the Study Areas, 1.84-acre will be permanently impacted by the Project, <0.01 acre (0.008-acre) will be temporarily impacted by the Project, and 0.23-acre will be avoided (**Table 4** and **Figure 6).**

Table 4. Acres of Aquatic Resources Impacts within the Study Areas

Aquatic Resources	Permanent Impacts	Temporary Impacts	Avoided	Total
Irrigated Wetland	0.03	0.00	0.00	**0.03**
Seasonal Wetland	0.26	0.00	0.00	**0.26**
Seasonal Wetland Swale	0.25	0.00	<0.01	**0.26**
Vernal Pool	1.11	0.00	0.00	**1.11**
Ephemeral Drainage	0.01	0.00	0.00	**0.01**
Intermittent Drainage	0.16	<0.01	0.23	**0.39**
Roadside Ditch	0.02	0.00	0.00	**0.02**
Total	**1.84**	**<0.01**	**0.23**	**2.07**

The PCCP emphasizes minimization of aquatic resource impacts within the Stream System; this Project has done this to the maximum extent practicable. Permanent aquatic resource impacts within the PCCP-defined Stream System are limited to intermittent drainage in both the On-Site and Off-Site Study Areas, a portion of ephemeral drainage in the On-Site Study Area, and small areas of seasonal wetland and seasonal wetland swale in the On-Site Study Area. All vernal pool impacts occur outside of the Stream System.

The unavoidable permanent intermittent drainage impacts include Walerga Road shoulder improvements and detention basin outfalls in the On-Site Area and Dry Creek floodwater expansion in the Off-Site Area. Temporary intermittent drainage impacts are associated with a sewer and adjacent trail crossing of the intermittent drainage in the On-Site Area. The irrigated wetland would be impacted by trail construction, and all other wetland, roadside ditch, and ephemeral drainage impacts would be associated with mass grading for development.

6.2 Terrestrial Land Covers

Of the 97.4-acres of mapped terrestrial land covers within the Study Areas, 81.1 acres of natural land covers will be permanently impacted by the Project, 10.8 acres will involve work within previously converted urban land covers, (as defined in **Section 4.1.2**) and 5.5 acres will be avoided and no land cover conversion will occur in this area (**Table 5** and **Figure 6**).

Table 5. Acres of Terrestrial Land Cover Impacts within the Study Areas

Land Covers	Permanent Impacts	Previously Converted	No Land Cover Conversion	Total
Natural Communities/Land Covers				
Valley Foothill Riparian Woodland	1.3	0.0	2.5	**3.8**
VPC Intermediate	79.0	0.0	3.0	**82.0**
VPC Low	0.8	0.0	0.0	**0.8**
Total Natural Land Covers	*81.1*	*0.0*	*5.5*	***86.6***
Urban Communities/Land Covers				
Road	0.0	8.1	0.0	**8.1**
Urban Parks	0.0	0.5	0.0	**0.5**
Urban/Suburban	0.0	2.2	0.0	**2.2**
Total Urban Land Covers	*0.0*	*10.8*	*0.0*	***10.8***
Total	**81.1**	**10.8**	**5.5**	**97.4**

6.3 Special-Status Plant Species

The vegetation communities proposed for impact represent suitable habitat for a variety of special-status plant species. Protocol-level special-status plant surveys were conducted throughout the Study Areas in 2024 and 2025, and no special-status plants were found. Based on the results of these surveys, no special-status plants are expected to be impacted by the Project.

6.4 Crotch's Bumblebee

The Annual Brome Grassland/VPC within the Study Areas represents suitable habitat for Crotch's bumblebee. Approximately 79.8 acres of suitable habitat for this species (Annual Brome Grassland/VPC) will be permanently impacted by the Project (**Figure 6**). The removal of this habitat could adversely affect this species, if construction activity results in the removal of active Crotch's bumblebee nests.

6.5 Vernal Pool Branchiopods

Surveys were conducted for vernal pool branchiopods in the vernal pools throughout the On-Site Study Area, and the results were negative. The 1.11 acre of vernal pool within the On-Site Study Area is potential habitat for vernal pool fairy shrimp and vernal pool tadpole shrimp, and, as shown in **Table 5** above, all of

the vernal pools will be impacted by the Project (**Figure 6**). Therefore, 1.11 acres of vernal pool branchiopod habitat will be impacted by the Project.

6.6 Valley Elderberry Longhorn Beetle

A single elderberry shrub that represents potential habitat for Valley elderberry longhorn beetle is present on the northern edge of the intermittent drainage within the On-Site Study Area. This shrub was surveyed in accordance with USFWS protocol and no exit holes consistent with occupation of the shrub by VELB were observed. Project construction will encroach within five feet of the shrub. The intent is to avoid the shrub, but the potential need to transplant the shrub cannot be fully dismissed due to proximity of planned grading, and the final determination of preservation or removal will be made in the field. If the shrub must be removed, it will be transplanted to either the on-site open space, or a PCCP VELB mitigation area (as dictated by the County). Given the lack of evidence of VELB occupation and the lack of documented VELB occurrences in the vicinity of the Project, no impacts to Valley elderberry longhorn beetle are anticipated as part of this Project.

6.7 Western Spadefoot

The seasonal wetlands and vernal pools being impacted by the Project represent suitable breeding habitat for western spadefoot and the surrounding Annual Brome Grasslands/VPC within 300 feet provide suitable dry-season habitat. A total of 1.37 acres of suitable breeding habitat and 53.2 acres of suitable upland habitat will be permanently impacted by Project construction (**Figure 6**).

6.8 Western Pond Turtle

The intermittent drainages within the Study Areas provide marginally suitable aquatic habitat for western pond turtle, and the adjacent Valley Foothill Riparian Woodland provides potential movement habitat. Small portions of intermittent drainage and Valley Foothill Riparian Woodland will be temporarily and permanently impacted during Project construction (**Figure 6**). Permanent impacts will be associated with construction of the off-site sewer improvements, and Walerga Road frontage/shoulder improvements. The temporary impacts will be associated with installation of a pedestrian bridge and sewer crossing. If western pond turtles or their nests were present in those areas during construction, individual turtles could be injured or killed, or nests could be destroyed.

A total of 0.16 acre of western pond turtle aquatic habitat within the intermittent drainage will be permanently impacted by the Project, less than 0.01 acre of western pond turtle aquatic habitat within the intermittent drainage will be temporarily impacted by the Project, and 1.3 acre of movement habitat in Valley Foothill Riparian Woodlands will be permanently impacted by the Project (**Figure 6**).

6.9 Nesting Raptors and Songbirds

Swainson's hawk, white-tailed kite, northern harrier, and loggerhead shrike have the potential to nest within the Study Areas, as do other more common bird species protected by the MBTA (including colonial nesting water birds). If they were nesting on-site, removal of the nests would impact these species. Furthermore, birds nesting in avoided areas adjacent to construction could be disturbed by construction, which could result in nest abandonment.

6.10 Foraging Birds

The Annual Brome Grassland/VPC areas within the Study Areas provide suitable foraging habitat for tricolored blackbird, golden eagle, Swainson's hawk, white-tailed kite, northern harrier, loggerhead shrike, and other more common birds. The Valley Foothill Riparian Woodland provides suitable foraging habitat for olive-sided flycatcher and yellow warbler and other more common birds. Removal of this foraging habitat could indirectly impact these species by reducing food available to them.

A total of 79.8 acres of Annual Brome Grassland/VPC and 1.3 acres of Valley Foothill Riparian Woodland that currently provides bird foraging habitat will be permanently impacted by the Project (**Figure 6**).

6.11 Burrowing Owl

The Annual Brome Grassland/VPC within the Study Areas provides suitable foraging habitat for burrowing owl, and occasional ground-squirrel burrows and debris throughout the Study Areas provide marginally suitable burrow habitat. If ground disturbance occurred while burrowing owls were in burrows, individuals of this species could be killed.

A total of 79.8 acres of Annual Brome Grassland/VPC that currently provides marginal burrowing owl habitat will be permanently impacted by the Project (**Figure 6**).

6.12 Roosting Bats

Trees throughout the Study areas are habitat for various special-status bats species. If special-status bats were roosting in trees proposed to be removed by construction of the Project, they could be injured or killed during the removal.

6.13 Sensitive Natural Communities

One terrestrial land cover mapped on-site is considered to be a "Sensitive Natural Community" by CDFW: Valley Foothill Riparian Woodland. A total of 1.3 acres of Valley Foothill Riparian Woodland will be permanently impacted by the Project (**Table 5** and **Figure 6**). As detailed above in **Section 4.1.1.2**, these Valley Foothill Riparian Woodlands are Valley Oak Woodlands, and the PCCP has Community Conditions specifically targeted at protection of this community; these are detailed below in **Section 7.2**.

6.14 Wildlife Corridors

The Valley Foothill Riparian Woodland along either side of the intermittent drainage through the On-Site Study Area likely serves as a wildlife corridor for a wide variety of terrestrial wildlife. This wildlife corridor is being preserved within an avoidance area that maintains the On-Site Valley Foothill Riparian Woodland, and that is similar in width to the adjacent preserved corridor along this drainage to the west. The only potential barrier to wildlife movement along the intermittent drainage will be a single creek crossing for a pedestrian trail. This crossing will be designed to be large enough to accommodate terrestrial wildlife movement under the bridge.

Additionally, the Valley Foothill Riparian Woodland along Dry Creek in the northern portion of the Off-Site Study Area almost certainly functions as a wildlife corridor for terrestrial wildlife. The activity proposed in this area is excavation of the intermittent drainage in the area to expand Dry Creek floodwater storage (as described in **Section 1.1**). Although some trees may need to be removed for this excavation, relatively few trees will be removed, and following construction, the area will continue to provide habitat, and will not impede wildlife movement.

As such, negative impacts to wildlife corridors are not expected as a result of Project implementation.

6.15 PCCP Special Habitats, CARP Drainage Setbacks, and CARP Riparian Buffer

Impacts to PCCP Special Habitats, CARP Drainage Setbacks and CARP Riparian Buffer are summarized in **Table 6** and shown on **Figure 7**. As outlined in **Section 2.3.1**, impacts are allowed within the CARP Drainage Setbacks and CARP Riparian Buffer, but those impacts must be associated with certain allowable facilities. Although some permanent impacts within the CARP Drainage Setbacks and CARP Riparian Buffer have been proposed, all of the impacts in those areas are associated with a sewer line and trail creek crossing, floodwater detention, and roadway impacts that cannot be avoided. As some of the impacts are associated with a creek crossing and outfalls, some of the work occurs immediately adjacent to the drainage.

Table 6. Impacts to PCCP Special Habitats and CARP Setbacks within the Study Areas

Special Habitat/Setback	Permanent Impacts (acres)	Temporary Impacts (acres)	Total (acres)
PCCP Special Habitats			
Vernal Pool Constituent Habitat Direct Effects[1]	1.62	0.00	**1.62**
Other Aquatic/Wetland	0.03	0.00	**0.03**
Riverine/Riparian[3]	1.15	0.008[2]	**1.16**
Riverine/Riparian Buffer[3]	1.68	0.00	**1.68**
Stream System[3]	1.94	0.00	**1.94**
Salmonid Stream Channel (linear ft)	0.00	0.00	**0.00**
VP Immediate Watershed Effects	<0.01	0.00	**<0.01**

Table 7. Impacts to PCCP Special Habitats and CARP Setbacks within the Study Areas

Special Habitat/Setback	Permanent Impacts (acres)	Temporary Impacts (acres)	Total (acres)
CARP Setbacks			
CARP Drainage Setback	1.94	0.00	**1.94**
Riparian Buffer	1.97	0.00	**1.97**

[1] Vernal pool constituent direct effects include impacts to seasonal wetlands, seasonal wetland swales, and vernal pools only and do not include impacts to irrigated wetlands. Irrigated wetland effects are included under Other Aquatic/Wetland in the following entry.

[2] This impact is a crossing of an intermittent drainage. Although the drainage may be temporarily impacted during construction of the crossing, the drainage itself will ultimately be avoided by the Project.

[3] This excludes other special habitats that fall within the riverine/riparian and riparian buffer areas that would be subject to other special habitat fees.

Project impacts have been designed to avoid the vast majority of the Stream System. However, impacts would encroach into the Stream System in some areas. The majority of the Stream System impacts would be associated with Dry Creek floodwater expansion in the Off-Site Area, which lies entirely within Dry Creek's Stream System. Additional small impacts are primarily comprised of a sewer and adjacent trail crossing of the intermittent drainage, and smaller detention basins that outfall into the intermittent drainage. The Applicant has worked hard to design the Project to minimize impacts to the Stream System to the extent practicable. **Table 6** and **Figure 7** show Project-related Stream System impacts.

7.0 MITIGATION FOR IMPACTS TO SENSITIVE BIOLOGICAL RESOURCES

Mitigation for impacts to PCCP Covered Species and land covers, including riparian habitat and oak resources has been streamlined with participation in the PCCP, and impacts to Waters of the U.S. has been streamlined with participation in the CARP. This Project could result in impacts to special-status plant species, Crotch's bumble bee, western spadefoot, a number of special-status and more common birds, and roosting bats, none of which are PCCP Covered Species; therefore, mitigation for these species is detailed below.

The Project may be constructed in phases over several years. Planning level surveys under the PCCP as well as preconstruction surveys under both the PCCP and non-PCCP permitting frameworks (e.g., CEQA mitigation measures for resources not covered by the PCCP, CDFW streambed alteration agreement conditions) must be implemented according to the timing requirements outlined in each mitigation measure. Therefore, if such surveys are conducted for more than one phase but only a portion of that phase ends up going to construction in a given year, these surveys may have to be redone depending on the life of the survey.

7.1 Aquatic Resources

- The Project applicant shall apply for coverage under the PCCP Letter of Permission (LOP) procedures directly with the USACE using avoidance and minimization guidance from the CARP, a component of

the PCCP, and implement the conditions of the LOP. Note that the USACE may determine during the permitting process that some of the resources within the Study Areas are not subject to federal jurisdiction.

- The applicant shall submit an application to the RWQCB for water quality certification of the PCCP LOP, and adhere to the certification conditions.
- The applicant shall apply for a Section 1600 Lake or Streambed Alteration Agreement from CDFW for the entire Project or by phase as needed and implement the final Agreement measures. Mitigation shall result in no net loss of riparian habitat.

Note that the Lake and Streambed Alteration Agreement program is not fully integrated into the PCCP and must be applied for separate and apart from the PCCP. Impacts will be outlined in the notification and are expected to be in substantial conformance with the impacts to biological resources outlined in this document. Impacts for each activity will be broken down by temporary and permanent, and a description of the proposed mitigation for biological resource impacts will be outlined per activity and then by temporary and permanent. Information regarding Project-specific drainage and hydrology changes resulting from Project implementation will be provided as well as a description of storm water treatment methods. Minimization and avoidance measures are expected to follow the PCCP AMMs. CDFW may determine that evidence of payment of PCCP riparian land cover conversion fees is sufficient mitigation for impacts to riparian habitat. Alternatively, CDFW could request additional mitigation for impacts to riparian habitat, such as restoration or enhancement of resources on- or off-site, purchase of habitat credits from an agency-approved mitigation/conservation bank, working with a local land trust to preserve land, or any other method acceptable to CDFW.

7.2 PCCP Application

The Permittee shall apply for coverage under the PCCP to mitigate for all impacts to Covered Species, conversion of natural (habitat providing) land cover types, and sensitive natural communities. Prior to application approval, additional species surveys may be necessary, and land cover and special habitat fees shall be paid prior to construction. The Permittee shall comply with the terms of the PCCP Authorization Certificate, including compliance with all Avoidance and Minimization Measures/Conditions on Covered Activities, which may include pre-construction surveys, construction monitoring, and BMPs. Based on Project Impacts, the following PCCP measures will be required, subject to Placer Conservation Authority (PCA) confirmation:

7.2.1 General Condition 1, Watershed Hydrology and Water Quality

Prior to Improvement Plan approval, the Project shall obtain coverage under the *General Permit for Discharges of Storm Water Associated with Construction Activity* (Construction General Permit Order 2022-0057-DWQ); including requirements to develop a project-based Storm Water Pollution Prevention Plan (SWPPP); and applicable NPDES program requirements as implemented by the County. Construction activity subject to this permit includes clearing, grading and disturbances to the ground such as stockpiling, or excavation.

The Project shall comply with the West Placer Storm Water Quality Design Manual (Design Manual).

The Project shall implement the following BMPs. This list shall be included on the Notes page of the improvement/grading plans and shall be shown on the plans:

- When possible, vehicles and equipment will be parked on pavement, existing roads, and previously disturbed areas. When vehicle parking areas are to be established as a temporary facility, the site will be recovered to pre-project or ecologically improved conditions within 1 year of start of groundbreaking to ensure effects are temporary (refer to Section 6.3.1.4, *General Condition 4, Temporary Effects*, for the process to demonstrate temporary effects).
- Trash generated by Covered Activities will be promptly and properly removed from the site.
- Appropriate erosion control measures (e.g., fiber rolls, filter fences, vegetative buffer strips) will be used on site to reduce siltation and runoff of contaminants into avoided wetlands, ponds, streams, or riparian vegetation.
- Erosion control measures will be of material that will not entrap wildlife (i.e., no plastic monofilament). Erosion control blankets will be used as a last resort because of their tendency to biodegrade slowly and trap reptiles and amphibians.
- Erosion control measures will be placed between the area of disturbance and any avoided aquatic feature, within an area identified with highly visible markers (e.g., construction and erosion-control fencing, flagging, silt barriers) prior to commencement of construction activities. Such identification will be properly maintained until construction is completed and the soils have been stabilized.
- Fiber rolls used for erosion control will be certified by the California Department of Food and Agriculture or any agency that is a successor or receives delegated authority during the permit term as weed free.
- Seed mixtures applied for erosion control will not contain California Invasive Plant Council–designated invasive species (http://www.cal-ipc.org/paf/) but will be composed of native species appropriate for the site or sterile non-native species. If sterile non-native species are used for temporary erosion control, native seed mixtures must be used in subsequent treatments to provide long-term erosion control and slow colonization by invasive non-natives.
- If the runoff from the development will flow within 100 feet of a wetland or pond, vegetated storm water filtration features, such as rain gardens, grass swales, tree box filters, infiltration basins, or similar LID features to capture and treat flows, shall be installed consistent with local programs and ordinances.

7.2.3 General Condition 3, Land Conversion

The Project will result in a permanent land cover conversion from a natural condition to urban land covers. The Project shall pay a land conversion fee for the permanent conversion of approximately 81.1 acres of natural land cover including VPC Low, VPC Intermediate, and Valley Foothill Riparian Woodland. The fees to be paid shall be those in effect at the time of ground disturbance authorization for each Project phase and shall be the per acre fee based on the amount of land disturbance resulting from the activity.

In addition to land conversion, the Project would result in permanent direct effects and temporary effects to PCCP Special Habitats as detailed in **Table 6**. The total special habitat fee obligation including temporary effect fees shall be paid prior to issuance of a land conversion authorization that allows ground disturbance of a special habitat.

7.2.4 General Condition 4, Temporary Effects

The applicant shall restore all temporarily disturbed areas and, one year after Project groundbreaking, provide the County with a written assessment of how the performance standards were met. The Project will result in 0.008 acre of temporary effects to intermittent drainage (which is considered Riverine habitat). Prior to issuance of land conversion authorization, the Project shall pay a fee based on the acres of impact. The fee to be paid shall be that in effect at the time of land conversion authorization issuance. If it is determined by the County or the PCCP Program Biologist that the effects remain one year after groundbreaking activities have commenced, the effects shall be considered permanent and the County Project Lead shall reassess fees based on those effects.

7.2.5 General Condition 5, Conduct Worker Training

Prior to initiation of construction activities, all Project construction personnel shall participate in a worker environmental training program that will educate workers regarding the Covered Species and their habitats, the need to avoid impacts, state and federal protection, and the legal implications of violating environmental laws and regulations. At a minimum this training may be accomplished through tailgate presentations at the Project site and the distribution of informational brochures, with descriptions of sensitive biological resources and regulatory protections, to construction personnel prior to initiation of construction work.

7.2.6 Community Condition 1.1, Impacts to Vernal Pool Complex Constituent Habitat

Prior to land conversion authorization approval, the unavoidable effects to 1.62 acres of vernal pool constituent wetlands or their immediate watershed buffers shall be mitigated through payment of special habitat fees. The fees to be paid shall be that in effect at the time of land conversion authorization issuance.

7.2.7 Community Condition 1.2, Impacts to Aquatic/Wetland Complex Constituent Habitat

Prior to land conversion authorization approval, the unavoidable effects to 0.03 acres of non-vernal pool wetlands (irrigated wetland) shall be mitigated through payment of special habitat fees. The fees to be paid shall be that in effect at the time of land conversion authorization issuance.

7.2.8 Community Condition 1.4, Salvage of Vernal Pool Constituent Habitat

Prior to ground disturbance, the applicant shall schedule grading and construction in coordination with the PCA to provide the PCA the opportunity to salvage topsoil from the vernal pool wetlands to be impacted if

they choose to do so. The applicant shall notify the PCA of their construction schedule within 30 days of the construction start date to allow the PCA the opportunity to salvage soils while the pools are completely dry (generally July through September) and the PCA must make salvage plans sufficiently far in advance so as to not unreasonably impair construction.

7.2.9 Community Condition 2.1, Riverine and Riparian Avoidance and Minimization

To the maximum extent possible, the Project shall not modify any area within a buffer that extends 50 feet outward from the outermost bounds of the riparian vegetation. The improvement or grading plans shall show the location of the riverine/riparian buffer.

7.2.10 Community Condition 2.2, Minimize Riverine and Riparian Effects

Prior to land conversion authorization, the applicant shall coordinate with the PCA to determine which In-Stream and Stream System Best Management Practices (BMPs) from Table 7-1 of the PCCP User's Guide apply to the proposed Project. The applicant shall identify the applicable BMPs on the Project's (improvement or grading) plans. The selected BMPs will be incorporated into the Project's Land Conversion Authorization letter.

Prior to land conversion authorization approval, the unavoidable effects to 2.94 acres of riverine and riparian habitat and their buffers shall be mitigated through payment of special habitat fees. The fees to be paid shall be those in effect at the time of land conversion authorization.

7.2.11 Community Condition 2.3, Riverine and Riparian Restoration

Covered Activities that affect riverine or riparian constituent habitat shall contribute to restoration as mitigation to compensate for loss of riverine or riparian constituent habitat.

Projects that affect riverine and riparian shall contribute to replacement of these resources. Riverine restoration measures shall be located in the same watershed and salmonid habitat type (e.g., spawning or migrating if the effects occur in a salmonid stream) in which the effects occur.

Generally, restoration and replacement actions shall be undertaken by the PCA and funded by additional fees imposed on projects. Riverine and riparian restoration to offset project effects may be implemented on-site to replace the functions of the riparian woodland degraded or lost to the Covered Activity. Riparian restoration implemented on-site will be credited to Plan restoration targets if the restoration helps to meet the biological goals and objectives of the Plan. When it is deemed infeasible to implement restoration at the project site, in-kind restoration shall be required at an off-site location or through the payment of fees to the PCA. Stream enhancement shall be implemented in concert with Community Condition 2.2, Minimize Riverine and Riparian Effects.

7.2.12 Community Condition 3, Valley Oak Woodland Avoidance and Minimization, and Mitigation Measures

Although the project is avoiding most of the Valley oak woodland/Valley Foothill Riparian Woodland, significant impacts could occur to oak woodlands from modification of the onsite drainage from ground disturbance and landscaping irrigation. With implementation of the following mitigation measure, potential impacts would be less than significant.

Irrigation shall be prohibited in and around the avoided Valley oak woodland. Alteration of onsite hydrology (including from onsite sewage disposal system installation) shall be designed to ensure the Valley oak woodland receives no additional water than pre-project conditions. The Landscape Plans shall demonstrate that irrigation is not placed within the critical root zone of protected trees.

Unavoidable effects to individual Valley oak trees or Valley oak woodlands or their 50-foot buffers shall pay the Plan land conversion fee by quantifying impacts as described in Effects on Valley Oak Woodlands of the PCCP User's Guide.

7.2.13 Stream System Condition 1, Stream System Avoidance and Minimization

The Project shall be designed to minimize development activities within the stream system to the maximum extent possible.

7.2.14 Stream System Condition 2, Stream System Mitigation and Restoration

The Project's development footprint is directly impacting the Stream System. The area of encroachment (1.9 acres of permanent impact) is subject to the Stream System Encroachment Special Habitats Fee as described in Chapter 5 of the PCCP User's Guide. Fees must be paid prior to the issuance of any permit or authorization that results in ground disturbance within the Stream System.

7.2.15 Species Condition 1: Swainson's Hawk

If construction must occur during the nesting season (approximately February 1 to September 15), planning-level Swainson's hawk surveys are required a year in advance of construction using the survey guidelines developed for the PCCP. Planning-level surveys are intended to identify nest trees to guide avoidance during Project tree removal and construction.

Additionally, year of construction (starting in February) and pre-construction (no more than 15 days prior to ground disturbance) surveys shall be conducted within a 1,320-foot radius of the Project. Surveys shall be conducted consistent with PCCP guidelines (based on Swainson's Hawk Technical Advisory Committee 2000). In instances where an adjacent parcel is not accessible to survey, the qualified biologist shall scan all potential nest trees from the adjacent property, roadsides, or other safe, publicly accessible viewpoints, without trespassing, using binoculars and/or a spotting scope. Surveys are typically required from February

1 to September 15 (or sooner if it is determined that birds are nesting earlier in the year) so contact the PCA for assistance with survey timing. If a Swainson's hawk nest is located and presence confirmed, only one follow-up visit is required.

During the nesting season (approximately February 1 to September 15 or sooner if it is determined that birds are nesting earlier in the year), ground-disturbing activities within 1,320 feet of occupied nests or nests under construction shall be prohibited to minimize the potential for nest abandonment. While the nest is occupied, activities outside the buffer can take place provided they do not stress the breeding pair.

If the active nest site is shielded from view and noise from the Project site by other development, topography, or other features, the Project applicant can apply to the PCA for a reduction in the buffer distance or waiver. A qualified biologist shall be required to monitor the nest and determine that the reduced buffer does not cause nest abandonment. If a qualified biologist determines nestlings have fledged, PCCP Covered Activities can proceed normally.

Construction monitoring shall be conducted by a qualified biologist if work is to continue outside of the nest buffer, and shall focus on ensuring that activities do not occur within the buffer zone. The qualified biologist performing the construction monitoring shall ensure that effects on Swainson's hawks are minimized. If monitoring indicates that construction outside of the buffer is affecting nesting, the buffer shall be increased if space allows (e.g., move staging areas farther away). If space does not allow, all construction activities shall cease until the young have fledged from the nest (as confirmed by a qualified biologist).

The frequency of monitoring will be approved by the PCA and based on the frequency and intensity of construction activities and the likelihood of disturbance of the active nest. In most cases, monitoring will occur at least every other day, but in some cases, daily monitoring may be appropriate to ensure that direct effects on Swainson's hawks are minimized. The qualified biologist shall train construction personnel on the avoidance procedures and buffer zones.

7.2.16 Species Condition 3: Western Burrowing Owl

Two surveys shall be conducted within 15 days prior to ground disturbance to establish the presence or absence of burrowing owls. The surveys shall be conducted at least 7 days apart (if burrowing owls are detected on the first survey, a second survey is not needed) for both breeding and non-breeding season surveys. All burrowing owls observed shall be counted and mapped.

During the breeding season (February 1 to August 31), surveys shall document whether burrowing owls are nesting in or within 250 feet of the Project area.

During the non-breeding season (September 1 to January 31), surveys shall document whether burrowing owls are using habitat in or directly adjacent to any area to be disturbed. Survey results will be valid only for the season (breeding or non-breeding) during which the survey was conducted.

The qualified biologist shall survey the proposed footprint of disturbance and a 250-foot radius from the perimeter of the proposed footprint to determine the presence or absence of burrowing owls. The site will be surveyed by walking line transects, spaced 20 to 60 feet apart, adjusting for vegetation height and density. At the start of each transect and, at least, every 300 feet, the surveyor, with use of binoculars, shall scan the entire visible Project area for burrowing owls. During walking surveys, the surveyor shall record all potential burrows used by burrowing owls, as determined by the presence of one or more burrowing owls, pellets, prey remains, whitewash, or decoration. Some burrowing owls may be detected by their calls; therefore, observers will also listen for burrowing owls while conducting the survey. Adjacent parcels under different land ownership shall be surveyed only if access is granted. If portions of the survey area are on adjacent sites for which access has not been granted, the qualified biologist shall get as close to the non-accessible are as possible, and use binoculars to look for burrowing owls.

The presence of burrowing owl or their sign anywhere on the site or within the 250-foot accessible radius around the site shall be recorded and mapped. Surveys shall map all burrows and occurrence of sign of burrowing owl on the Project site. Surveys must begin 1 hour before sunrise and continue until 2 hours after sunrise (3 hours total) or begin 2 hours before sunset and continue until 1 hour after sunset. Additional time may be required for large project sites.

If burrowing owls are found during the breeding season (approximately February 1 to August 31, the Project applicant shall avoid all nest sites that could be disturbed by Project construction during the remainder of the breeding season or while the nest is occupied by adults or young (occupation includes individuals or family groups foraging on or near the site following fledging). The applicant shall establish a 250-foot non-disturbance buffer zone around nests. The buffer zone shall be flagged or otherwise clearly marked. Should construction activities cause the nesting bird to vocalize, make defensive flights at intruders, or otherwise display agitated behavior, then the exclusionary buffer will be increased such that activities are far enough from the nest so that the bird(s) no longer display this agitated behavior. The exclusionary buffer will remain in place until the chicks have fledged or as otherwise determined by a qualified biologist. Construction may only occur within the 250-foot buffer zone during the breeding season if a qualified raptor biologist monitors the nest and determines that the activities do not disturb nesting behavior, or the birds have not begun egg-laying and incubation, or that the juveniles from the occupied burrows have fledged and moved off site. Measures such as visual screens may be used to further reduce the buffer with Wildlife Agency approval and provided a biological monitor confirms that such measures do not cause agitated behavior.

If burrowing owls are found during the non-breeding season (approximately September 1 to January 31), the Project applicant shall establish a 160-foot buffer zone around active burrows. The buffer zone shall be flagged or otherwise clearly marked. Measures such as visual screens may be used to further reduce the buffer with Wildlife Agency approval and provided a biological monitor confirms that such measures do not cause agitated behavior.

After all alternative avoidance and minimization measures are exhausted as confirmed by the Wildlife Agencies, a qualified biologist may passively exclude birds from those burrows during the non-breeding season. A burrowing owl exclusion plan shall be developed by a qualified biologist consistent with the most

recent guidance from the Wildlife Agencies (e.g., California Department of Fish and Game 2012) and submitted to and approved by the PCA and the Wildlife Agencies. Burrow exclusion will be conducted for burrows located in the Project footprint and within a 160-foot buffer zone as necessary.

A biological monitor shall be present on site daily to ensure that no Covered Activities occur within the buffer zone. The qualified biologist performing the construction monitoring shall ensure that effects on burrowing owls are minimized. If monitoring indicates that construction outside of the buffer is affecting nesting, the buffer shall be increased if space allows (e.g., move staging areas farther away). If space does not allow, construction shall cease until the young have fledged from all the nests in the colony (as confirmed by a qualified biologist) or until the end of the breeding season, whichever occurs first.

A biological monitor shall conduct training of construction personnel on the avoidance procedures, buffer zones, and protocols in the event a burrowing owl flies into an active construction zone.

7.2.17 Species Condition 4: Tricolored Blackbird

Prior to initiation of PCCP Covered Activities, the qualified biologist(s) shall conduct preconstruction surveys to evaluate the presence of tricolored blackbird nesting colonies[1]. In instances where an adjacent parcel is not accessible to survey because the qualified biologist was not granted permission to enter, the qualified biologist shall scan all potential nest colony site(s) from the adjacent property, roadsides, or other safe, publicly accessible viewpoints, without trespassing, using binoculars and/or a spotting scope to look for tricolored blackbird nesting activity.

Surveys shall be conducted at least twice, with at least one month between surveys, during the nesting season one year prior to initial ground disturbance for the Covered Activity (if feasible), and the year of ground disturbance for the Covered Activity (required). If Covered Activities will occur in the Project work area during the nesting season, three surveys shall be conducted within 15 days prior to the Covered Activity, with one of the surveys occurring within five days prior to the start of the Covered Activity. The survey methods will be based on Kelsey (2008) or a similar protocol approved by the PCA and the Wildlife Agencies based on site-specific conditions.

If the first survey indicates that suitable nesting habitat is not present on the Project site or within 1,300 feet of the Project work area, additional surveys for nest colonies are not required.

If an active colony is known to occur within 3 miles of the Project site, a qualified biologist shall conduct two surveys of foraging habitat within the Project site and within a 1,300-foot radius around the Project site to determine whether foraging habitat is being actively used by foraging tricolored blackbirds. The qualified biologist shall map foraging habitat, as defined by the land cover types listed above, within a 1,300-foot radius around the Project site to delineate foraging habitat that will be surveyed. The surveys shall be

[1] Although there is no potential nesting habitat for tricolored blackbird within the Study Area, the PCCP requires this condition for all Projects with grassland habitat below 300 feet in elevation.

conducted approximately one week apart, with the second survey occurring no more than five calendar days prior to ground-disturbing activities.

Construction activity or other covered activities that may disturb an occupied nest colony site, as determined by a qualified biologist, will be prohibited during the nesting season (March 15 through July 31) or until the chicks have fledged or the colony has been abandoned on its own) within a 1,300-foot buffer zone around the nest colony, to the extent practicable. The intent of this condition is to prevent disturbance to occupied nest colony sites on or near project sites so they can complete their nesting cycle. This condition is not intended to preserve suitable breeding habitat on project sites but to ensure impacts to active colony sites only take place once the site is no longer occupied by the nesting colony. The buffer will be applied to extend beyond the nest colony site as follows: 1) if the colony is nesting in a wetland, the buffer must be established from the outer edge of all hydric vegetation associated with the colony, or 2) if the colony is nesting in non-wetland vegetation (e.g., Himalayan blackberry), the buffer must be established from the edge of the colony substrate. This buffer may be modified to a minimum of 300 feet, with written approval from the Wildlife Agencies, in areas with dense forest, buildings, or other features between the Covered Activities and the occupied active nest colony; where there is sufficient topographic relief to protect the colony from excessive noise or visual disturbance; where sound curtains have been installed; or other methods developed in consultation with the Wildlife Agencies where conditions warrant reduction of the buffer distance. If tricolored blackbirds colonize habitat adjacent to Covered Activities after the activities have been initiated, the Project applicant shall reduce disturbance through establishment of buffers or noise reduction techniques or visual screens, as determined in consultation with the Wildlife Agencies and PCA. The buffer must be clearly marked to prevent Project-related activities from occurring within the buffer zone.

Active nesting colonies that occur within the no-disturbance buffer shall be monitored by the qualified biologist(s) to verify the Covered Activity is not disrupting the nesting behavior of the colony. The frequency of monitoring will be approved by the PCA and based on the frequency and intensity of construction activities and the likelihood of disturbance of the active nest. In most cases, monitoring will occur at least every other day, but in some cases, daily monitoring may be appropriate to ensure that direct effects on tricolored blackbird are minimized. The biologist will train construction personnel on the avoidance procedures and buffer zones.

If the qualified biologist(s) determines that the Covered Activity is disrupting nesting and/or foraging behavior, the qualified biologist(s) shall notify the Project applicant immediately, and the Project applicant shall notify the PCA within 24 hours to determine additional protective measures that can be implemented. The qualified biologist(s) shall have the authority to stop Covered Activities until additional protective measures are implemented. Additional protective measures shall remain in place until the qualified biologist(s) determine(s) tricolored blackbird behavior has normalized. If additional protective measures are ineffective, the qualified biologist(s) shall have the authority to stop Covered Activities as needed until the additional protective measures are modified and nesting behavior of tricolored blackbird returns to normal.

Additional protective measures may include increasing the size of the buffer (within the constraints of the Project site), delaying Covered Activities (or the portion of Covered Activities causing the disruption) until the colony is finished breeding and chicks have left the nest site, temporarily relocating staging areas, or temporarily rerouting access to the Project work area. The Project proponent shall notify the PCA and Wildlife Agencies within 24 hours if nests or nestlings are abandoned. If the nestlings are still alive, the qualified biologist(s) shall work with the Wildlife Agencies to determine appropriate actions for salvaging the eggs or nestlings. Notification to PCA and Wildlife Agencies shall be via telephone or email, followed by a written incident report. Notification shall include the date, time, location, and circumstances of the incident.

Foraging habitat within the buffer shall be monitored by the qualified biologist(s) to verify that the Covered Activity is not disrupting tricolored blackbird foraging behavior. The frequency of monitoring will be approved by the PCA and based on the frequency and intensity of construction activities and the likelihood of disturbance of foraging tricolored blackbirds. In most cases, monitoring will occur at least every other day, but in some cases, daily monitoring may be appropriate to ensure that effects on tricolored blackbird are minimized. The biologist will train construction personnel on the avoidance procedures and buffer zones.

If the qualified biologist(s) determines that the Covered Activity is disrupting foraging behavior, the qualified biologist(s) shall notify Project applicant immediately, and the Project applicant shall notify the PCA within 24 hours to determine additional protective measures that can be implemented. The qualified biologist(s) shall have the authority to stop Covered Activities until additional protective measures are implemented. Additional protective measures shall remain in place until the qualified biologist(s) determine(s) tricolored blackbird behavior has normalized. If additional protective measures are ineffective, the qualified biologist(s) shall have the authority to stop Covered Activities as needed until the additional protective measures are modified and foraging behavior of tricolored blackbird returns to normal. Additional protective measures may include increasing the size of the buffer (within the constraints of the Project site), temporarily relocating staging areas, or temporarily rerouting access to the Project work area.

7.2.18 Species Condition 6: Western Pond Turtle

Impacts to this species are addressed through implementation of General Condition 1; Community Conditions 1.1, 1.2, 2 and 3; Stream System Condition 1; and Species Condition 4 (Species Condition 7, which addresses salmonid habitat and is identified in Species Condition 6, does not apply because the project would not affect salmonid habitat and/or fish passage). In addition, General Condition 3 (Land Conversion) provides the process for accounting for loss of natural and semi-natural land cover that is more encompassing than standard practice. This approach better addresses the piecemeal loss of high-quality contiguous habitat that would occur without a plan such as the HCP/NCCP. No additional avoidance and minimization measures specific to these species are required by the PCCP. If individual western pond turtles are identified on-site, the project proponent shall obtain an incidental take permit from CDFW and/or USFWS before relocating or otherwise impacting the species.

7.2.19 Species Condition 8: Valley Elderberry Longhorn Beetle

Planning surveys for valley elderberry longhorn beetle are required for Covered Activities within the following habitat features when below 650 feet elevation (above mean sea level)[2]:

1. Riparian constituent habitat
2. Valley oak woodland community
3. Stream System (excluding frequently disked or flooded agricultural lands such as rice that would not likely support elderberry shrubs)

The project applicant will apply avoidance and minimization measures as specified in the USFWS's *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (U.S. Fish and Wildlife Service 1999b) or the current Wildlife Agency–approved avoidance and minimization protocol. When take is authorized the project applicant must coordinate with the PCA to provide transplants and seedlings/cuttings for planting in suitable habitat on the Reserve System consistent with the USFWS Guidelines/Framework. Project-by-project mitigation requirements for valley elderberry longhorn beetle cannot be applied to the restoration requirements of 6.3.2.2.3 (Community Condition 2.3, Riverine and Riparian Restoration) for a project's associated riparian native trees/shrubs impacts to be planted as replacement habitat (i.e., mitigation for impacts to valley elderberry longhorn beetle [transplants and plantings of seedlings/cuttings] does not count as mitigation for impacts to riverine and riparian [restoration of riverine and riparian]). The distinction between valley elderberry longhorn beetle impacts and riverine/riparian impacts will be addressed through project-specific mitigation requirements that provide for restoration of natural communities, including riverine/riparian complex (i.e., restoration dependent on effects; see Table 5-4).

7.2.20 Species Condition 10: Vernal Pool Fairy Shrimp and Vernal Pool Tadpole Shrimp

Wet season surveys to determine occupancy of vernal pools by vernal pool fairy shrimp and vernal pool tadpole shrimp are required if the Project is implemented while the PCCP is still in the Initial Survey Phase. These wet season surveys have been completed; therefore, this species condition has already been accomplished and no further mitigation for this species is necessary.

7.2.21 CARP Authorization Conditions

CARP Condition 1a: All work within the Plan Area that impacts Aquatic Resources of Placer County shall be completed according to the plans and documents included in the CARP application, Water Quality Certification, and, if applicable, WDRs. All changes to those plans shall be reported to Placer County. Minor changes may require an amendment to the CARP Authorization, Water Quality Certification, and, if applicable, WDRs. Substantial changes may render the authorization, Water Quality Certification, and, if applicable, WDRs, void, and a new application may be required.

[2] Although planning level surveys have already been conducted, and the elderberry shrub may be avoided, the PCCP requires this condition for all Projects with the listed habitats below 650 feet in elevation.

CARP Condition 1b: All deviations from plans and documents provided with the Application and approved by Placer County Community Development Resource Agency (CDRA) must be reported to Placer County CDRA immediately.

CARP Condition 2: Any construction within the Stream System shall be implemented in a way to avoid and minimize impacts to vegetation outside the construction area. All preserved wetlands, other Aquatic Resources of Placer County, and the Stream Zone shall be protected with bright construction fencing. Temporary fencing shall be removed immediately upon completion of the Project.

CARP Condition 3: Erosion control measures shall be specified as part of the CARP application, and the application shall not be complete without them. All erosion control specified in the permit application shall be in place and functional before the beginning of the rainy season and shall remain in place until the end of the season. Site supervisors shall be aware of weather forecasts year-round and shall be prepared to establish erosion control on short notice for unusual rain events. Erosion control features shall be inspected and maintained after each rainfall period. Maintenance includes, but is not limited to, removal of accumulated silt and the replacement of damaged barriers and other features.

CARP Condition 4: All required setbacks shall be implemented according to the HCP/NCCP Condition 4 (HCP/NCCP Section 6.1.2).

CARP Condition 5: All work in aquatic resources within the Stream System shall be restricted to periods of low flow and dry weather between April 15 and October 15, unless otherwise permitted by Placer County CDRA and approved by the appropriate State and federal regulatory agency. Work within aquatic resources in the Stream System outside of the specified periods may be permitted under some circumstances. The Applicant must provide Placer County CDRA with the following information: a) the extent of work already completed; b) specific details about the work yet to be completed; and c) an estimate of the time needed to complete the work in the Stream System.

CARP Condition 6: Weather forecasts should be monitored, and erosion control established before all storm events.

CARP Condition 7: Following work in a stream channel, the low flow channel shall be returned to its natural state to the extent possible. The shape and gradient of the streambed shall be restored to the same gradient that existed before the work to the extent possible.

CARP Condition 8: Except for site preparation for the installation and removal of dewatering structures, no excavation is allowed in flowing streams unless dredging WDRs are issued by the RWQCB. Detailed plans for dewatering must be part of the Application.

CARP Condition 9: Temporary crossings as described in the Application shall be installed no earlier than April 15 and shall be removed no later than October 15, unless otherwise permitted by Placer County CDRA

and approved by the appropriate State and federal regulatory agency. This work window could be modified at the discretion of Placer County and the CDFW.

CARP Condition 10: No vehicles other than necessary earth-moving and construction equipment shall be allowed within the Stream System after the section of stream where work is performed is dewatered. The equipment and vehicles used in the Stream System shall be described in the Application.

CARP Condition 11: Staging areas for equipment, materials, fuels, lubricants, and solvents shall be located outside the stream channel and banks and away from all preserved aquatic resources. All stationary equipment operated within the Stream System must be positioned over drip-pans. Equipment entering the Stream System must be inspected daily for leaks that could introduce deleterious materials into aquatic resources. All discharges, unintentional or otherwise, shall be reported immediately to Placer County CDRA. Placer County CDRA shall then immediately notify the appropriate state and federal agencies.

CARP Condition 12: Cement, concrete, washings, asphalt, paint, coating materials, oil, other petroleum products, and other materials that could be hazardous to aquatic life shall be prevented from reaching streams, lakes, or other water bodies. These materials shall be placed a minimum of 50 feet away from aquatic environments. All discharges, unintentional or otherwise, shall be reported immediately to Placer County CDRA. Placer County CDRA shall then immediately notify the appropriate state and federal agencies.

CARP Condition 13: During construction, no litter or construction debris shall be dumped into water bodies or other aquatic resources; nor shall it be placed in a location where it might be moved by wind or water into aquatic resources. All construction debris shall be removed from the site upon completion of the Project.

CARP Condition 14: Only herbicides registered with the California Department of Pesticide Regulation shall be used in streams, ponds, and lakes, and shall be applied in accordance with label instructions. A list of all pesticides that may be used in the Project area shall be submitted to Placer County CDRA before use. The PCCP does not authorize the use of herbicides; herbicide application is not a Covered Activity.

CARP Condition 15: Before beginning construction, the Project Applicant must have a valid CARP authorization or waiver notice. In order to obtain a permit, the Applicant must pay all mitigation fees or purchase appropriate credits from an agency-approved mitigation bank.

CARP Condition 16: A copy of the CARP conditions and Water Quality Certification and WDRs shall be given to individuals responsible for activities on the site. Site personnel, (employees, contractors, and subcontractors) shall be adequately informed and trained to implement all permit, Water Quality Certification, and WDR conditions and shall have a copy of all permits available onsite at all times for review by site personnel and agencies.

CARP Condition 17: Work shall not disturb active bird nests until young birds have fledged. To avoid impacts to nesting birds, any disturbance shall occur between September 1 and February 1 prior to the nesting

season. Tree removal, earthmoving or other disturbance at other times is at Placer County CDRA's discretion and will require surveys by a qualified biologist to determine the absence of nesting birds prior to the activity.

CARP Condition 18: All trees marked for removal within the Stream System must be shown on maps included with the Application. Native trees over five inches diameter at breast height (DBH) shall not be removed without the consent of Placer County CDRA.

CARP Condition 19: Placer County CDRA shall be notified immediately if threatened or endangered species that are not Covered Species are discovered during construction activities. Placer County CDRA shall suspend work and notify the USFWS, NMFS, and the CDFW for guidance.

CARP Condition 20: Wildlife entering the construction site shall be allowed to leave the area unharmed or shall be flushed or herded humanely in a safe direction away from the site.

CARP Condition 21: All pipe sections shall be capped or inspected for wildlife before being placed in a trench. Pipes within a trench shall be capped at the end of each day to prevent entry by wildlife, except for those pipes that are being used to divert stream flow.

CARP Condition 22: At the end of each workday, all open trenches will be provided with a ramp of dirt or wood to allow trapped animals to escape.

CARP Condition 23: If human remains or cultural artifacts are discovered during construction, the Applicant shall stop work in the area and notify Placer County CDRA immediately. Work will not continue in the area until the County coroner and a qualified archaeologist have evaluated the remains, conducted a survey, prepared an assessment, and required consultations are completed.

7.3 Special-Status Plant Species

Special-status plant surveys conducted throughout the Study Areas in 2024 and 2025 were negative. However, given enough time, plants may become established in areas where suitable habitat exists. If construction does not commence prior to March 15, 2027, another round of special-status plant surveys shall be conducted within 3 years prior to commencement of construction in areas proposed for impact. Surveys shall be conducted in accordance with the *Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed, and Candidate Plants* (USFWS 2000), the *Botanical Survey Guidelines of the California Native Plant Society* (CNPS 2001), and *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (CDFW 2018). This protocol includes conducting surveys at the appropriate time of year, when plants are in bloom.

If no special-status plant species are found, no further mitigation would be required. If special status plants are found within proposed impact areas, and they are perennials, such as Sanford's arrowhead or big-scale balsamroot, then mitigation could consist of digging up the plants and transplanting them into a suitable

avoided area on-site prior to construction. If the plant found is an annual such as dwarf downingia, then mitigation could consist of collecting seed-bearing soil and spreading it into a suitable constructed wetland at a mitigation site. If special-status plants will be impacted, a qualified biologist shall prepare an avoidance and mitigation plan detailing protection and avoidance measures, transplantation procedures, success criteria, and long-term monitoring protocols. This plan shall be approved by the County, and shall ensure that mitigation for the impacts to rare plants will result in no net loss of individual plants after a five year monitoring period. Additionally, a pre-construction worker awareness training shall be conducted to alert workers to the presence of and protections for special-status plants.

7.4 Crotch's Bumble Bee

Crotch's bumble bee was designated as a candidate for listing under the CESA in 2019, but no decision on listing has been published. If, at the time of project implementation, the species is not a CESA candidate or CESA listed, and it does not fall into any of the other "special-status" categories defined in Section 3.0, then it would not qualify for protections under CEQA and no mitigation is necessary. Furthermore, as this is a candidate species, appropriate mitigation measures are still being developed and refined for these species. We have developed the following measure based on current literature and research. If at a later date, a different mitigation measure is determined to be more appropriate, that can be submitted to the County and CDFW at that time for review and approval.

- Initial ground-disturbing work (e.g., grading, vegetation removal, staging) shall take place between 1 September and 31 March (i.e., outside the colony active period), if feasible, to avoid impacts on Crotch's bumble bee.
- If completing all initial ground-disturbing work between 1 September and 31 March is not feasible, then a senior biologist with 10 or more years of experience conducting biological resource surveys within California shall conduct a pre-construction survey for Crotch's bumble bee in the area proposed for impact no more than 14 days prior to the commencement of construction activities. The survey shall occur during the period from one hour after sunrise to two hours before sunset, with temperatures between 65° F and 90° F, with low wind and no rain. If the timing of the start of construction makes the survey infeasible due to the temperature requirements, the surveying biologist shall select the most appropriate days based on the National Weather Service seven-day forecast and shall survey at a time of day that is closest to the temperature range stated above. The survey duration shall be commensurate with the extent of suitable floral resources (which represent foraging habitat) present within the area proposed for impact and the level of effort shall be based on the metric of a minimum of one person-hour of searching per three acres of suitable floral resources/foraging habitat. A meandering pedestrian survey shall be conducted throughout the area proposed for impact in order to identify patches of suitable floral resources. Suitable floral resources for Crotch's bumble bee include species in the following families: Apocynaceae, Asteraceae, Boraginaceae, Fabaceae, and Lamiaceae.
- At a minimum, pre-construction survey methods shall include the following:
    - Search areas with floral resources for foraging bumble bees. Observed foraging activity may indicate a nest is nearby, and therefore, the survey duration shall be increased when foraging bumble bees are present.

- If Crotch's bumble bee are observed, watch any Crotch's bumble bee present and observe their flight patterns. Attempt to track their movements between foraging areas and the nest.
- Visually look for nest entrances. Observe burrows, any other underground cavities, logs, or other possible nesting habitat.
- If floral resources or other vegetation preclude observance of the nest, small areas of vegetation may be removed via hand removal, line trimming, or mowing to a height of no less than 4 inches to assist with locating the nest.
- Look for concentrated special-status bumble bee activity.
- Listen for the humming of a nest colony.
- If bumble bees are observed, attempt to photograph the individual and identify it to species.

- The biologist conducting the survey shall record when the survey was conducted, a general description of any suitable foraging habitat/floral resources present, a description of observed bumble bee activity, a list of bumble bee species observed, a description of any vegetation removed to facilitate the survey, and their determination of if survey observations suggest a special-status bumble bee nest(s) may be present or if construction activities could result in take of Crotch's bumble bee. The report shall be submitted to the County prior to the commencement of construction activities.
- If no bumble bees are located during the pre-construction survey or the bumble bees located are definitively identified as common (i.e., not special-status) species, then no further mitigation or coordination with CDFW is required.
- If any sign(s) of a bumble bee nest is observed, and if it cannot be established the species present is not a special-status bumble bee, then construction shall not commence until either 1) the bumble bees present are positively identification as common (i.e., not special status) by an experienced bumble bee taxonomist, or 2) the completion of coordination with CDFW to identify appropriate mitigation measures, which may include but not be limited to: waiting until the colony active season ends, establishment of nest buffers, or obtaining an Incidental Take Permit (ITP) from CDFW.
- It is recommended, but not required that the Project Applicant also survey the proposed impact areas the year before construction begins in order to avoid potential last-minute delays associated with identifying Crotch's bumble bee on-site immediately prior to construction activities. To be most effective, this optional survey should follow the protocol outlined above.
- If special-status bees are located, and after coordination with CDFW take of Crotch's bumble bee cannot be avoided, the Applicant shall obtain an ITP from CDFW prior to County approval of permits authorizing construction, and the applicant shall implement all conditions identified in the ITP. Mitigation required by the ITP may include but will not be limited to, the Project Applicant translocating nesting substrate in accordance with the latest scientific research to another suitable location (i.e., a location that supports similar or better floral resources as the impact area), enhancing floral resources on areas of the Project site that will remain appropriate habitat, worker awareness training, and/or other measures specified by CDFW.

7.5 Western Spadefoot

The Applicant has surveyed all suitable aquatic habitat within the Project site (including features proposed for avoidance) by sampling the features thoroughly with dipnets during March or early April, when spadefoot tadpoles would be present.

Within the two years prior to construction, one nocturnal acoustic survey of all areas within 300 feet of vernal pools and seasonal wetlands shall be conducted during the end of the wet season, specifically March or April. Acoustic surveys consist of walking through the area and listening for the distinctive snore-like call of this species. Timing and methodology for the aquatic and acoustic surveys shall be based on those described in *Distribution of the Western Spadefoot* (Spea hammondii) *in the Northern Sacramento Valley of California, with Comments on Status and Survey Methodology* (Shedd 2017). If both the aquatic survey and the nocturnal acoustic survey are negative, no further mitigation is necessary (the aquatic survey was negative). If western spadefoot are observed within aquatic habitat proposed for impact, the tadpoles shall be captured and relocated to an off-site open space preserve with suitable habitat in the vicinity of the Project Area. If western spadefoot are observed within aquatic habitat proposed for avoidance, then the applicant may either: relocate the tadpoles to an off-site open space preserve with habitat of equivalent or greater value (e.g., vernal pools and seasonal wetlands in a grassland/woodland matrix) in the vicinity of the Project Area, or install silt fence along the edge of the proposed impact area within 300 feet of the occupied aquatic habitat to prevent metamorphosed individuals from dispersing into the construction area.

7.6 Nesting Raptors and Other Birds

The following nest survey requirements apply if construction activities take place during the typical bird breeding/nesting season (typically February 15 through August 31).

7.6.1 Nesting Bird Survey

A pre-construction nesting bird survey shall be conducted by the qualified biologist (Project Biologist) throughout the phase of the Project proposed for construction and all accessible areas within a 500-foot radius of proposed construction areas, no more than seven (7) days prior to the initiation of construction. If there is a break in construction activity of more than seven (7) days, then subsequent surveys shall be conducted. If no nests are observed, no further mitigation is required, unless there is a break in construction activity as noted above.

If an active raptor nest is found, no construction activities shall take place within 500 feet of the nest until the young have fledged. If active songbird nests are found, a 100-foot no disturbance buffer will be established. These no-disturbance buffers may be reduced if a smaller, sufficiently protective buffer is proposed by the Project Biologist and approved by the County after taking into consideration the natural history of the species of bird nesting, the proposed activity level adjacent to the nest, the nest occupants' habituation to existing or ongoing activity, and nest concealment (i.e., whether there are visual or acoustic barriers between the proposed activity and the nest). The Project Biologist can visit the nest as needed to

determine when the young have fledged the nest and are independent of the site or the nest can be left undisturbed until the end of the nesting season.

7.6.2 Survey Report

A report summarizing the survey(s) shall be provided to the County within 30 days of the completed survey and is valid for one construction season. If no nests are found, no further mitigation is required.

7.6.3 Increases to Buffers and Completion of Nesting

When a buffer has been set to protect an active nest and it is determined that the size of the no-disturbance buffer requires the Project Biologist to monitor the nest, that monitoring will include observations about the bird's behaviors relative to the construction activities. Should construction activities cause a nesting bird to do any of the following in a way that would be considered a result of construction activities: vocalize, make defensive flights at intruders, get up from a brooding position, or fly off the nest, then the exclusionary buffer shall be increased such that activities are far enough from the nest to stop this agitated behavior. The revised no-disturbance buffer will remain in place until the chicks have fledged or as otherwise determined by a qualified biologist in consultation with the County.

Construction activities may only resume within the no-disturbance buffer after a follow-up survey by the Project Biologist has been conducted and a report has been prepared indicating that the nest (or nests) is no longer active, and that no new nests have been identified.

7.7 Roosting Bats

A qualified biologist shall conduct a bat habitat assessment of all potential roosting habitat features, including trees, within the proposed impact footprint. This habitat assessment shall identify all potentially suitable roosting habitat and may be conducted up to one (1) year prior to the start of construction.

If potential roosting habitat is identified (cavities in trees or potential roosts within structures) within the areas proposed for impact, the biologist shall survey the potential roosting habitat during the active season (generally April through October or from January through March on days with temperatures in excess of 50 degrees F) to determine presence of roosting bats. These surveys are recommended to be conducted utilizing methods that are considered acceptable by CDFW and bat experts. Methods may include evening emergence surveys, acoustic surveys, inspecting potential roosting habitat with fiberoptic cameras or a combination thereof.

If roosting bats are identified within any of the trees planned for removal, or if presence is assumed, the trees shall be removed outside of pup season only on days with temperatures in excess of 50 degrees F. Pup season is generally during the months of May through August. Two-step tree removal shall be utilized under the supervision of the qualified biologist. Two-step tree removal involves removal of all branches of

the tree that do not provide roosting habitat on the first day, and then the next day cutting down the remaining portion of the tree.

Additionally, it is recommended that all other tree removal be conducted from January through March on days with temperatures in excess of 50 degrees F to avoid potential impacts to foliage-roosting bat species.

If roosting bats are identified within any structures planned for removal, a bat exclusion plan shall be prepared by a qualified bat biologist describing the methods to be used to humanely exclude bats prior to disturbance. Each exclusion is specific to the structure and no two are the same. All exclusions involve the installation of one-way doors or flaps during the non-breeding season that allow the bats to leave and not re-enter the structure. This plan shall be approved by the County and by CDFW and shall be implemented prior to the start of construction.

IPaC Trust Resource Report
for the Study Areas

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

Location

Placer County, California

* Figure not OCR Compatible

Local office

Sacramento Fish And Wildlife Office

(916) 414-6600
(916) 414-6713

Federal Building
2800 Cottage Way, Room W-2605
Sacramento, CA 95825-1846

NOT FOR CONSULTATION

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information. IPaC only shows species that are regulated by USFWS (see FAQ).
2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Reptiles

NAME	STATUS
Northwestern Pond Turtle Actinemys marmorata Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/1111	Proposed Threatened

Amphibians

NAME	STATUS
Western Spadefoot Spea hammondii No critical habitat has been designated for this species.	Proposed Threatened

Insects

NAME	STATUS

NOT FOR CONSULTATION

Monarch Butterfly Danaus plexippus Wherever found There is **proposed** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/9743	Proposed Threatened
Valley Elderberry Longhorn Beetle Desmocerus californicus dimorphus Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/7850	Threatened

Crustaceans

NAME	STATUS
Conservancy Fairy Shrimp Branchinecta conservatio Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/8246	Endangered
Vernal Pool Fairy Shrimp Branchinecta lynchi Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/498	Threatened
Vernal Pool Tadpole Shrimp Lepidurus packardi Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/2246	Endangered

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

There are no critical habitats at this location.

You are still required to determine if your project(s) may have effects on all above listed species.

Bald & Golden Eagles

Bald and Golden Eagles are protected under the Bald and Golden Eagle Protection Act [2] and the Migratory Bird Treaty Act (MBTA) [1]. Any person or organization who plans or conducts activities that may result in impacts to Bald or Golden Eagles, or their habitats, should follow appropriate regulations and consider implementing appropriate avoidance and minimization measures, as described in the various links on this page.

Additional information can be found using the following links:

- Eagle Management https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide avoidance and minimization measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf
- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

NOT FOR CONSULTATION

There are Bald Eagles and/or Golden Eagles in your project area.

Measures for Proactively Minimizing Eagle Impacts
For information on how to best avoid and minimize disturbance to nesting bald eagles, please review the National Bald Eagle Management Guidelines. You may employ the timing and activity-specific distance recommendations in this document when designing your project/activity to avoid and minimize eagle impacts. For bald eagle information specific to Alaska, please refer to Bald Eagle Nesting and Sensitivity to Human Activity.

The FWS does not currently have guidelines for avoiding and minimizing disturbance to nesting Golden Eagles. For site-specific recommendations regarding nesting Golden Eagles, please consult with the appropriate Regional Migratory Bird Office or Ecological Services Field Office.

If disturbance or take of eagles cannot be avoided, an incidental take permit may be available to authorize any take that results from, but is not the purpose of, an otherwise lawful activity. For assistance making this determination for Bald Eagles, visit the Do I Need A Permit Tool. For assistance making this determination for golden eagles, please consult with the appropriate Regional Migratory Bird Office or Ecological Services Field Office.

Ensure Your Eagle List is Accurate and Complete
If your project area is in a poorly surveyed area in IPaC, your list may not be complete and you may need to rely on other resources to determine what species may be present (e.g. your local FWS field office, state surveys, your own surveys). Please review the Supplemental Information on Migratory Birds and Eagles, to help you properly interpret the report for your specified location, including determining if there is sufficient data to ensure your list is accurate.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to bald or golden eagles on your list, see the "Probability of Presence Summary" below to see when these bald or golden eagles are most likely to be present and breeding in your project area.

Review the FAQs
The FAQs below provide important additional information and resources.

NAME	BREEDING SEASON
Bald Eagle Haliaeetus leucocephalus This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1626	Breeds Jan 1 to Aug 31
Golden Eagle Aquila chrysaetos This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1680	Breeds Jan 1 to Aug 31

NOT FOR CONSULTATION

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read "Supplemental Information on Migratory Birds and Eagles", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

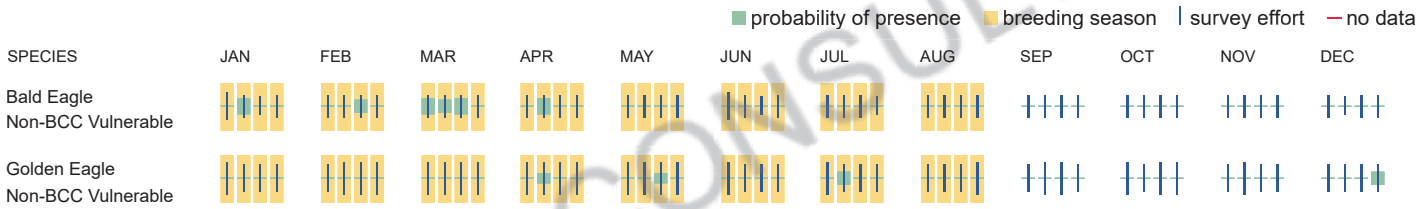
Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.

2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.



Breeding Season (■)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

Bald & Golden Eagles FAQs

What does IPaC use to generate the potential presence of bald and golden eagles in my specified location?

The potential for eagle presence is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are an eagle (Bald and Golden Eagle Protection Act requirements may apply).

Proper interpretation and use of your eagle report
On the graphs provided, please look carefully at the survey effort (indicated by the black vertical line) and for the existence of the "no data" indicator (a red horizontal line). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort line or no data line (red horizontal) means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list and associated information help you know what to look for to confirm presence and helps guide you in knowing when to implement avoidance and minimization measures to eliminate or reduce potential impacts from your project activities or get the appropriate permits should presence be confirmed.

How do I know if eagles are breeding, wintering, or migrating in my area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating, or resident), you may query your location using the RAIL Tool and view the range maps provided for birds in your area at the bottom of the profiles provided for each bird in your results. If an eagle on your IPaC migratory bird species list has a breeding season associated with it (indicated by yellow vertical bars on the phenology graph in your “IPaC PROBABILITY OF PRESENCE SUMMARY” at the top of your results list), there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

Interpreting the Probability of Presence Graphs

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. A taller bar indicates a higher probability of species presence. The survey effort can be used to establish a level of confidence in the presence score.

NOT FOR CONSULTATION

How is the probability of presence score calculated? The calculation is done in three steps:
The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.

To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.

The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

Breeding Season ()
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort ()
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

No Data ()
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

Migratory birds

The Migratory Bird Treaty Act (MBTA) [1] prohibits the take (including killing, capturing, selling, trading, and transport) of protected migratory bird species without prior authorization by the Department of Interior U.S. Fish and Wildlife Service (Service).

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Eagle Management https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide avoidance and minimization measures for birds
- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

Measures for Proactively Minimizing Migratory Bird Impacts

Your IPaC Migratory Bird list showcases birds of concern, including Birds of Conservation Concern (BCC), in your project location. This is not a comprehensive list of all birds found in your project area. However, you can help proactively minimize significant impacts to all birds at your project location by implementing the measures in the Nationwide avoidance and minimization measures for birds document, and any other project-specific avoidance and minimization measures suggested at the link Measures for avoiding and minimizing impacts to birds for the birds of concern on your list below.

Ensure Your Migratory Bird List is Accurate and Complete

If your project area is in a poorly surveyed area, your list may not be complete and you may need to rely on other resources to determine what species may be present (e.g. your local FWS field office, state surveys, your own surveys). Please review the Supplemental Information on Migratory Birds and Eagles document, to help you properly interpret the report for your specified location, including determining if there is sufficient data to ensure your list is accurate.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, see the "Probability of Presence Summary" below to see when these birds are most likely to be present and breeding in your project area.

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read "Supplemental Information on Migratory Birds and Eagles", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

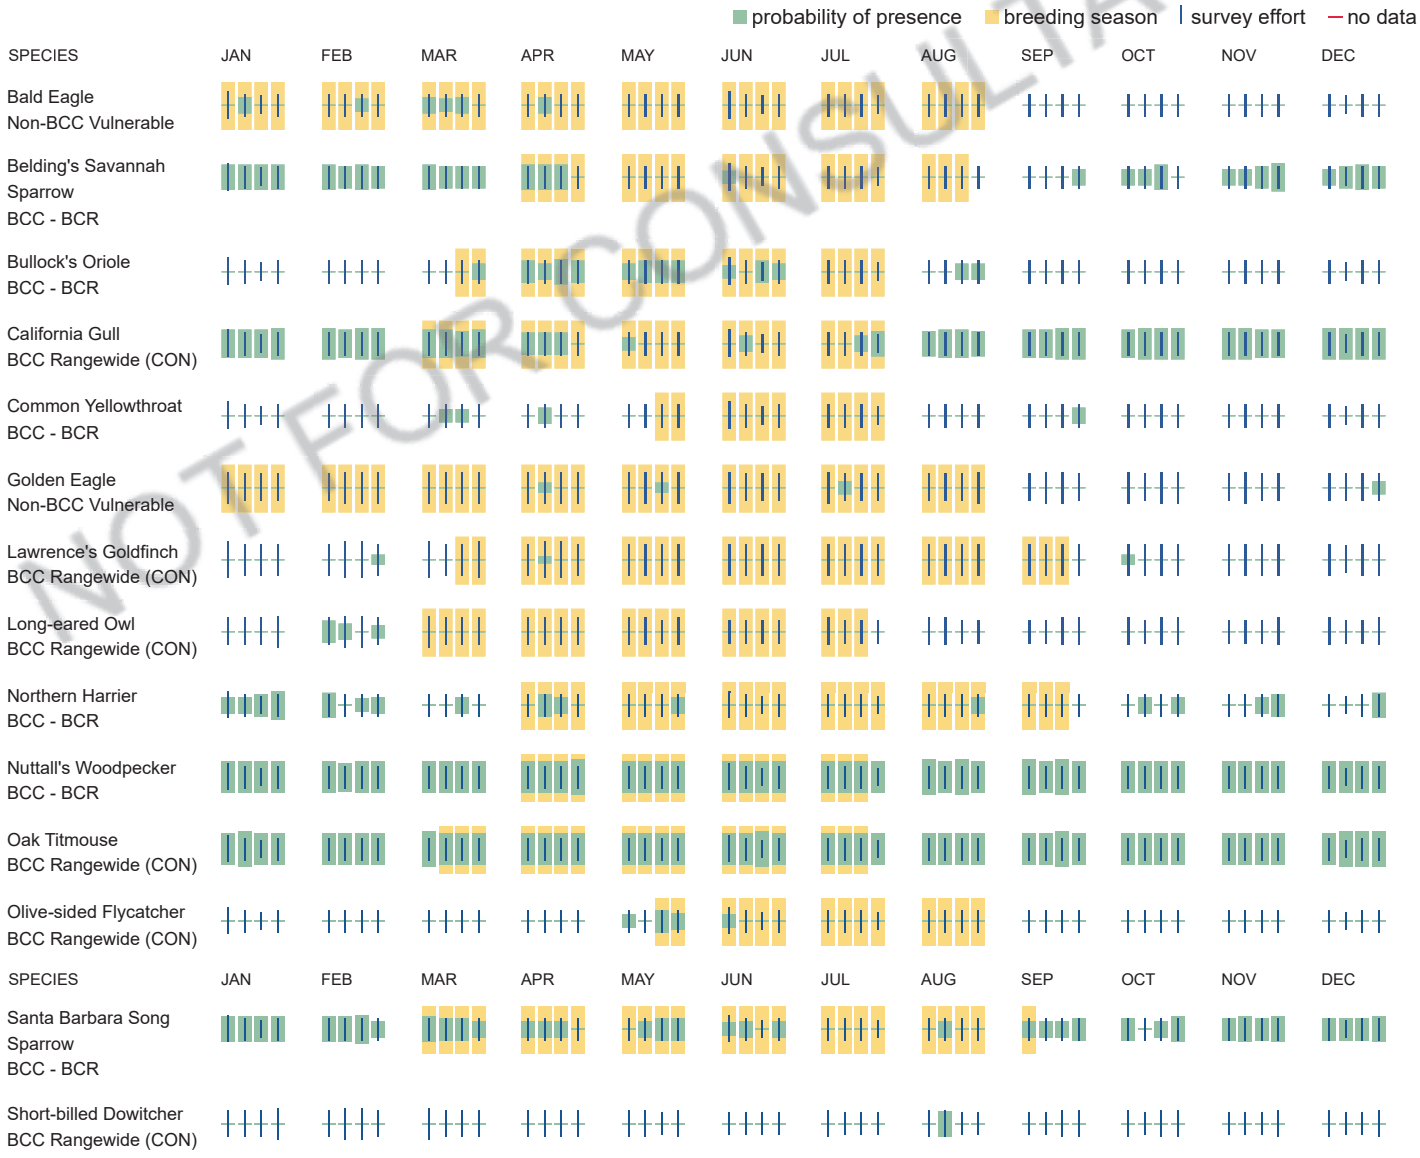
1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of

NOT FOR CONSULTATION

presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.

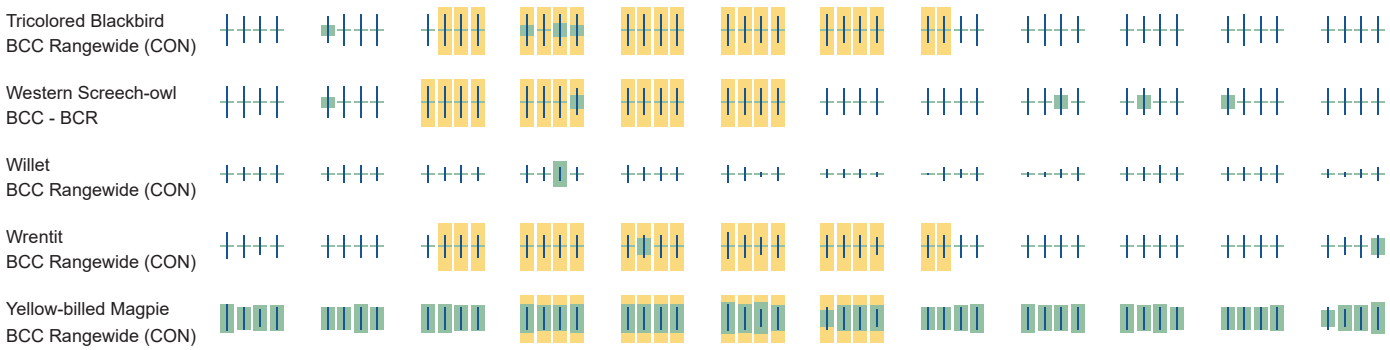
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.



Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.



To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

NOT FOR CONSULTATION

Migratory Bird FAQs

Tell me more about avoidance and minimization measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Avoidance & Minimization Measures for Birds describes measures that can help avoid and minimize impacts to all birds at any location year-round. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is one of the most effective ways to minimize impacts. To see when birds are most likely to occur and breed in your project area, view the Probability of Presence Summary. Additional measures or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the list of migratory birds that potentially occur in my specified location?

The Migratory Bird Resource List is comprised of Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location, such as those listed under the Endangered Species Act or the Bald and Golden Eagle Protection Act and those species marked as "Vulnerable". See the FAQ "What are the levels of concern for migratory birds?" for more information on the levels of concern covered in the IPaC migratory bird species list.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) with which your project intersects. These species have been identified as warranting special attention because they are BCC species in that area, an eagle (Bald and Golden Eagle Protection Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, and to verify survey effort when no results present, please visit the Rapid Avian Information Locator (RAIL) Tool.

Why are subspecies showing up on my list?

Subspecies profiles are included on the list of species present in your project area because observations in the AKN for **the species** are being detected. If the species are present, that means that the subspecies may also be present. If a subspecies shows up on your list, you may need to rely on other resources to determine if that subspecies may be present (e.g. your local FWS field office, state surveys, your own surveys).

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets.

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go to the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering, or migrating in my area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating, or resident), you may query your location using the RAIL Tool and view the range maps provided for birds in your area at the bottom of the profiles provided for each bird in your results. If a bird on your IPaC migratory bird species list has a breeding season associated with it (indicated by yellow vertical bars on the phenology graph in your "IPaC PROBABILITY OF PRESENCE SUMMARY" at the top of your results list), there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

NOT FOR CONSULTATION

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Bald and Golden Eagle Protection Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially BCC species. For more information on avoidance and minimization measures you can implement to help avoid and minimize migratory bird impacts, please see the FAQ “Tell me more about avoidance and minimization measures I can implement to avoid or minimize impacts to migratory birds”.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Proper interpretation and use of your migratory bird report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please look carefully at the survey effort (indicated by the black vertical line) and for the existence of the "no data" indicator (a red horizontal line). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list does not represent all birds present in your project area. It is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list and associated information help you know what to look for to confirm presence and helps guide implementation of avoidance and minimization measures to eliminate or reduce potential impacts from your project activities, should presence be confirmed. To learn more about avoidance and minimization measures, visit the FAQ "Tell me about avoidance and minimization measures I can implement to avoid or minimize impacts to migratory birds".

Interpreting the Probability of Presence Graphs
Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. A taller bar indicates a higher probability of species presence. The survey effort can be used to establish a level of confidence in the presence score.

How is the probability of presence score calculated? The calculation is done in three steps:
The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.

To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.

The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

Breeding Season ()
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort ()
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

No Data ()
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

NOT FOR CONSULTATION

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

There are no refuge lands at this location.

Fish hatcheries

There are no fish hatcheries at this location.

Wetlands in the National Wetlands Inventory (NWI)

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

Wetland information is not available at this time

This can happen when the National Wetlands Inventory (NWI) map service is unavailable, or for very large projects that intersect many wetland areas. Try again, or visit the NWI map to view wetlands at this location.

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate Federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

1.0 INTRODUCTION

This report presents the results of a delineation of aquatic resources within the Placer Christian High School property (Study Area) conducted by Madrone Ecological Consulting, LLC (Madrone).

The approximately 67.9-acre Study Area is located north and west of Walerga Road, and south of Baseline Road in southwestern Placer County, California. The Study Area is located in portions of Sections 6 and 7, Township 10 North, Range 6 East and Section 36, Township 11N, Ranch 5E (MDB&M) of the "Citrus Heights, California" and "Roseville, California" 7.5-Minute Series USGS Topographic Quadrangles (USGS 1992a and USGS 1992b, respectively) (**Figure 1**).

Portions of the Study Area overlap adjacent proposed development projects, such as Placer Vineyards (SPK-1999-00737), Sierra Vista (SPK-2006-01050) and the concurrently submitted Placer Residential property. The overlap areas comprise 17.0 acres of the 67.9-acre Study Area, which includes the 52.3-acre Project area.

1.1 Contact Information

Applicant (controls the property)	***Agent***
Placer Christian School Association c/o David L. Aton 1223 Pleasant Grove Blvd., #100 Roseville, CA 95678	Sarah VonderOhe Madrone Ecological Consulting, LLC 8421 Auburn Blvd., Suite #248 Citrus Heights, CA 95610

2.0 METHODOLOGY

Madrone senior biologist Daria Snider conducted a delineation of aquatic resources within the Study Area on 3 September 2015, and follow-up surveys on 15 March and 9 May 2018. Water features and data points were mapped in the field with a GPS unit capable of sub-meter accuracy (Trimble GeoXT and Arrow 100). Three-parameter data (vegetation, soils, and hydrology) were collected at each data point, documenting wetland/waters or upland status, as appropriate. The delineation map was prepared in accordance with the *Updated Map and Drawing Standards for the South Pacific Division Regulatory Program* (USACE 2016a). The GPS data was overlayed on an ortho-rectified aerial photograph (NAIP 2014).

The delineation was performed in accordance with the *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory 1987), the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (USACE 2008a), *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE 2008b), and the Sacramento District's *Minimum Standards for Acceptance of Preliminary Wetlands Delineations* (USACE 2016b). U.S. Army Corps of Engineers (USACE) regulations (33 CFR 328) were used to determine the presence of Waters of the United States other than wetlands. The most recent *National Wetland Plant List*

(Lichvar et al. 2016) was used to determine the wetland indicator status of plants observed in the Study Area. The *Jepson eFlora* (Jepson Flora Project 2018) was used for plant nomenclature, except where it conflicted with the nomenclature in the *National Wetland Plant List*, which was given priority on the data sheets.

As noted above, the delineation for this Study Area was conducted in 2015, and at the time, this Study Area was part of a larger Project Area that included an adjacent area to the south of Walerga Road that is now called the *Placer Creek Residential* property. One set of paired data points was collected for each aquatic resource feature type at that time. Following the split, there were not data points for each feature type within each Study Area, but as the features are largely similar between the two Study Areas, the off-site data points are representative of the aquatic resources within the Study Area. Therefore, we have included all of the data sheets for both Study Areas in **Attachment A**. The map in **Attachment B** shows which of these data points occur within this Study Area.

3.0 EXISTING CONDITIONS

The Study Area is primarily comprised of ungrazed annual grassland on gently rolling terrain. Two major transportation corridors run along the edges of the Study Area – Walerga Road along the south, and Baseline Road along the north. Roadside ditches adjacent to an abandoned roadway along the western edge of the Study Area have degraded somewhat, and portions now function as seasonal wetlands. The eastern portion of the Study Area has a number of constructed pits that are presumed to have been hand-dug by children from the adjacent residences. Several of these pond water and have been mapped as wetlands. An intermittent tributary to Dry Creek cuts across the southern portion of the Study Area. The Study Area is situated at an elevation of approximately 100 to 130 feet above mean sea level.

3.1 Terrestrial Plant Communities

The majority of the site is occupied by non-native annual grassland. This vegetation community is dominated by medusahead grass (*Elymus caput-medusae*) and soft brome (*Bromus hordeaceus*). Other plant species commonly occurring within this community within the Study Area include perennial ryegrass (*Lolium perenne*), winter vetch (*Vicia villosa*), hairy hawkbit (*Leontodon saxatilis*), rattail fescue (*Vulpia myuros*), hairgrass (*Aira caryophyllea*), slender tarweed (*Holocarpha virgata*), Fitch's spikeweed (*Centromadia fitchii*), yellow star-thistle (*Centaurea solstitialis*), rose clover (*Trifolium hirtum*), American deerweed (*Acmispon americanus*), and smooth cat's ear (*Hypochaeris glabra*).

3.2 Hydrology

Surface water runoff within the portion of the Study Area including and south of VP 5 drains south into the intermittent tributary of Dry Creek, which is a tributary of the Sacramento River. The southern portion of the Study Area is located in the *Dry Creek Watershed* (HUC 1802011101) (USGS 1978).

Surface water runoff in the northern portion of the Study Area drains to the northwest via a seasonal wetland swale and a series of disjunct roadside ditches that exit the Study Area through a culvert under Baseline Road. This culvert used to connect with a swale north of Baseline Road, which eventually drained to Pleasant Grove Creek, a tributary of the Sacramento River. Current development plans indicate that the development currently in process north of Baseline Road will maintain this connection. This portion of the Study Area is located in the *Curry Creek-Sacramento River Watershed* (HUC 1802016104) (USGS 1978).

3.3 Soils

According to the Natural Resources Conservation Service (NRCS) Soil Survey Database (NRCS 2018), six soil mapping units occur within the Study Area (**Figure 2**): (140) Cometa sandy loam, 1-5% slopes; (141) Cometa-Fiddyment complex, 1-5% slopes; (146) Fiddyment loam, 1-8% slopes; (175) Ramona sandy loam, 2-9% slopes; (182) San Joaquin-Cometa sandy loams, 1-5% slopes; and (194) Xerofluvents, frequently flooded. Xerofluvents, frequently flooded consists of hydric components, and all of the mapping units within the Study Area may contain hydric inclusions (NRCS 2018).

3.4 Driving Directions

To access the Study Area from Sacramento, drive east on Interstate 80 to Exit 98. Take Exit 98, and head west on Elkhorn Boulevard. Turn right on Walerga. The site is primarily on the north and west side of Walerga Road, north of Waterstone Drive.

4.0 RESULTS

A total of 1.613 acres of aquatic resources were delineated within the Study Area (**Table 1**). Data sheets are included in **Attachment A**, maps of the aquatic resources are included as **Figure 3** and **Attachment B**, and a list of the plant species observed in the Study Area with their wetland indicator status is included in **Attachment C**. GIS Shapefiles and the *Aquatic Resources Excel Spreadsheet* for the aquatic resources shown on **Figure 3** are included on a CD in **Attachment D**. Each of the feature types is described below. As shown on **Figure 3**, a number of the aquatic resources fall within the portions of the Study Area that overlap other adjacent projects. The acreage of these resources that fall within the overlap areas (0.400 acre) is broken out in **Table 1** and in **Attachment B**. Each aquatic resource was cut at the overlap line when calculating the acreages in **Table 1** and **Attachment B**.

Table 1. Aquatic Resources Mapped within the Study Area

Resource Type	Total Study Area Acreage	Overlap Area Acreage
Wetlands		
Seasonal Wetland	0.259	0.107
Seasonal Wetland Swale	0.198	0.003
Vernal Pool	1.027	0.214
Total of Wetlands	*1.484*	*0.325*
Other Waters		
Ephemeral Drainage	0.006	0.006
Intermittent Drainage	0.043	0.043
Roadside Ditch	0.080	0.026
Total of Other Waters	*0.129*	*0.075*
Total	**1.613**	**0.400**

4.1 Wetlands

4.1.1 Vernal Pool

Three vernal pools were mapped within the Study Area. Vernal pools are topographic basins within the grassland community that are typically underlain with an impermeable or semi-permeable hardpan or duripan layer. Vernal pools inundate during the wet season, and typically dry by late spring and remain dry through the summer months. Vernal pools were differentiated from depressional seasonal wetlands within the Study Area based upon the predominance of vernal pool endemic plant species. Plant species found in the vernal pools within the Study Area include double-horned calico flower (*Downingia bicornuta*), slender popcorn flower (*Plagiobothrys stipitatus* var. *micranthus*), bractless hedge hyssop (*Gratiola ebracteata*), smooth goldfields (*Lasthenia glaberrima*), Vasey's coyote-thistle (*Eryngium vaseyi*), Carter's buttercup (*Ranunculus bonariensis*), hyssop loosestrife (*Lythrum hyssopifolium*), pillwort (*Pilularia americana*), Mediterranean beard grass (*Polypogon maritimus*), and creeping spikerush (*Eleocharis macrostachya*).
Indicators of wetland hydrology observed in the vernal pools during the field survey included the presence of oxidized rhizospheres along live roots and deep soil cracks. The soil matrix color at Data Points 1 and 2 was 7.5YR3/2 with 20% 5YR4/6 redox concentrations along pore linings and as soft masses in the matrix. The soils at these data points were considered to be hydric based on the presence of field indicator F6 (redox dark surface).

4.1.2 Seasonal Wetlands

A number of seasonal wetlands were delineated within the Study Area. Seasonal wetlands are depressional wetlands that pond water seasonally. These features are often topographically and hydrologically similar to vernal pools, but have a short hydroperiod, and as a result, support a slightly different plant community that is not characterized by a dominance of vernal pool endemics. Plant species commonly occurring in the seasonal wetlands within the Study Area include Mediterranean barley (*Hordeum marinum*), perennial ryegrass, annual hairgrass (*Deschampsia danthonioides*), toad rush (*Juncus bufonius*), hyssop loosestrife, slender popcorn flower, hairy hawkbit, Fitch's spikeweed, and vinegarweed.

The only indicator of wetland hydrology observed in the seasonal wetlands during the field survey was the presence of oxidized rhizospheres along live roots. The soil matrix color at Data Point 8 was 7.5YR4/2 with 30% 7.5YR3/4 redox concentrations along pore linings and as soft masses in the matrix. The soil at this data point was considered to be hydric based on the presence of field indicator F3 (depleted matrix).

4.1.3 Seasonal Wetland Swales

Six seasonal wetland swales were mapped within the Study Area. Seasonal wetland swales are sloping, linear seasonal wetlands that convey surface runoff, and may detain it for short periods of time. Plant species occurring in the seasonal wetland swales.

The only indicator of wetland hydrology observed in the seasonal wetland swales during the field survey was the presence of oxidized rhizospheres along live roots. The soil matrix color at Data Point 9 was 7.5YR3/2 with 15% 7.5YR4/6 redox concentrations along pore linings and as soft masses in the matrix. The soil at this data point was considered to be hydric based on the presence of field indicator F6 (redox dark surface).

4.2 Other Waters

4.2.1 Ephemeral Drainage

Three ephemeral drainages were mapped within the Study Area. These features are primarily unvegetated, and adjacent vegetation is primarily comprised of upland, annual grassland species. Ephemeral drainages convey flow during and immediately following rain events, but are not supported by groundwater flows, and as such, are not inundated for a sufficient duration to support hydrophytic vegetation. The lateral limits of the ephemeral channels within the Study Area were mapped at the Ordinary High Water Mark (OHWM), which was identified based on the extent of scour and adjacent vegetation.

4.2.2 Intermittent Drainage

Two sections of one intermittent drainage were mapped within the Study Area. This feature flows under Walerga Road in the southern portion of the Study Area, and appears to be a tributary of Dry Creek. Although the intermittent drainage is almost completely unvegetated within the channel, some vegetation has encroached into the channel. Species found scattered within and along the edges of the channel include perennial ryegrass, pennyroyal (*Mentha pulegium*), seep spring monkeyflower (*Mimulus guttatus*), tall flatsedge, swamp pricklegrass (*Crypsis schoenoides*), creeping spikerush, Indian chickweed (*Mollugo verticillata*), and prostrate knotweed (*Polygonum aviculare* ssp. *depressum*). The edges of the intermittent channel within the Study Area were mapped at the OHWM, which was identified based primarily on the extent of scour.

4.2.3 Roadside Ditch

A number of roadside ditch (or drainage ditch) segments were mapped along the western edge of the Study Area adjacent to the abandoned roadway in that area. The roadside ditch appears to have been constructed in uplands concurrent with construction of that roadway, but after the roadway was abandoned, portions of the ditch have silted in or collapsed, resulting in a series of disjunct segments. These features are primarily unvegetated or occupied by upland ruderal vegetation, such as wild radish (*Raphanus sativus*) and Bermuda grass (*Cynodon dactylon*). The OHWM of the roadside ditch was identified in the field based on the extent of scour, sediment sorting, and changes in vegetation.

5.0 CONCLUSION

The applicant is requesting a Preliminary Jurisdictional Determination for the Aquatic Resources Delineation map included as **Attachment B**. A signed statement providing USACE staff accompanied access to the Study Area is included as **Attachment E**.

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Walerga Baseline Property City/County: Placer County Sampling Date: 09/03/15
Applicant/Owner: Mourier Investments, LLC State: CA Sampling Point: 1
Investigator(s): Daria Snider Section, Township, Range: Section 6, Township 10 North, Range 6 East
Landform (hillslope, terrace, etc.): Terrace Local relief (concave, convex, none): Concave Slope (%): 0-1
Subregion (LRR): Mediterranean California (LRR C) Lat: 38.75136753 Long: -121.3644962 Datum: NAD 83
Soil Map Unit Name: San Joaquin-Cometa sandy loams, 1-5% slopes NWI Classification: None
Are climatic / hydrologic conditions on the site typical for this time of year? Yes ____ No X (If no, explain in Remarks.)
Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes X No ____
Are Vegetation ____, Soil ____, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes X No ____	**Is the Sampled Area within a Wetland?**	**Yes X No ____**
Hydric Soil Present?	Yes X No ____		
Wetland Hydrology Present?	Yes X No ____		

Remarks:

Data point is in a vernal pool.

The region is currently experiencing a multi-year drought, and the climatic conditions are drier than normal.

VEGETATION – Use scientific names of plants.

- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes _____ No X Depth (inches): _____

Water Table Present? Yes _____ No X Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No X Depth (inches): _____

Wetland Hydrology Present? **Yes** _____ **No** X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

No wetland hydrology indicators observed

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Walerga Baseline Property City/County: Placer County Sampling Date: 09/03/15
Applicant/Owner: Mourier Investments, LLC State: CA Sampling Point: 10
Investigator(s): Daria Snider Section, Township, Range: Section 6, Township 10 North, Range 6 East
Landform (hillslope, terrace, etc.): Swale Local relief (concave, convex, none): None Slope (%): 2
Subregion (LRR): Mediterranean California (LRR C) Lat: 38.74374438 Long: -121.3627577 Datum: NAD 83
Soil Map Unit Name: Cometa-Ramona sandy loams, 1-5% slopes NWI Classification: None
Are climatic / hydrologic conditions on the site typical for this time of year? Yes ____ No X (If no, explain in Remarks.)
Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes X No ____
Are Vegetation ____, Soil ____, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes X No ____	**Is the Sampled Area within a Wetland?**	**Yes X No ____**
Hydric Soil Present?	Yes X No ____		
Wetland Hydrology Present?	Yes X No ____		

Remarks:

Data point is in a seasonal wetland swale.

The region is currently experiencing a multi-year drought, and the climatic conditions are drier than normal.

VEGETATION – Use scientific names of plants.

	Absolute % Cover	Dominant Species?	Indicator Status
Tree Stratum (Plot size: ____)

Plant Species Observed within the Study Area

Plant Species Observed within the Placer Christian High School Study Area 3 September 2015, 15 March 2018, and 9 May 2018

Species Name	Common Name	Wetland Indicator Status
Achyrachaena mollis	Blow wives	FAC
Acmispon americanus	American deerweed	UPL
Aira caryophyllea	Hairgrass	FACU
Aira elegans	Elegant hair grass	UPL
Alopecurus saccatus	Pacific foxtail	OBL
Amsinckia menziesii	Common fiddleneck	UPL
Avena fatua	Wild oat	UPL
Briza maxima	Rattlesnake grass	UPL
Briza minor	Little quaking grass	FAC
Brodiaea elegans subsp. elegans	Harvest brodiaea	FACU
Bromus diandrus	Ripgut brome	UPL
Bromus hordeaceus	Soft brome	FACU
Calandrinia menziesii	Red maids	FACU
Callitriche marginata	Winged water starwort	OBL
Carduus pycnocephalus	Italian thistle	UPL
Castilleja attenuata	Valley tassels	UPL
Centaurea solstitialis	Yellow star-thistle	UPL
Centromadia fitchii	Fitch's spikeweed	FACU
Cerastium glomeratum	Sticky mouse-ear chickweed	UPL
Chondrilla juncea	Skeleton weed	UPL
Clarkia purpurea	Winecup clarkia	UPL
Clarkia unguiculata	Elegant clarkia	UPL
Claytonia perfoliata	Miner's lettuce	FAC
Convolvulus arvensis	Bindweed	UPL
Crassula aquatica	Water pygmy weed	OBL
Croton setiger	Turkey mullein	UPL
Crypsis schoenoides	Swamp pricklegrass	OBL
Cynodon dactylon	Bermuda grass	FACU
Cyperus eragrostis	Tall flatsedge	FACW
Deschampsia danthonioides	Annual hair grass	FACW
Dichelostemma capitatum	Blue dicks	FACU
Dittrichia graveolens	Stinkwort	UPL
Downingia bicornuta	Double-horned downingia	OBL
Downingia ornatissima var. ornatissima	Horned downingia	OBL
Eleocharis macrostachya	Creeping spikerush	OBL
Elymus caput-medusae	Medusahead grass	UPL
Elymus triticoides	Beardless wild rye	FAC
Epilobium brachycarpum	Panicled willow-herb	UPL

Species Name	Common Name	Wetland Indicator Status
Epilobium campestre	Smooth willow-herb	OBL
Erodium botrys	Filaree	FACU
Eryngium castrense	Great Valley coyote thistle	FACW
Eschscholzia californica	California poppy	UPL
Festuca bromoides	Brome fescue	FACU
Festuca myuros	Rattail sixweeks grass	FACU
Galium aparine	Sticky willy	FACU
Glyceria declinata	Low manna grass	FACW
Gratiola ebracteata	Bractless hedge-hyssop	OBL
Heterotheca grandiflora	Telegraph weed	UPL
Hirschfeldia incana	Short-podded mustard	UPL
Holocarpha virgata	Slender tarweed	UPL
Hordeum marinum	Mediterranean barley	FAC
Hordeum murinum	Wall barley	FACU
Hypochaeris glabra	Smooth cat's ear	UPL
Isoetes howellii	Howell's quillwort	OBL
Juncus bufonius	Toad rush	FACW
Juncus capitatus	Capped rush	FACU
Juncus effusus	Common rush	FACW
Lactuca serriola	Prickly wild lettuce	FACU
Lasthenia glaberrima	Smooth goldfields	OBL
Lathyrus angulatus	Angled pea	UPL
Leontodon saxatilis	Hairy hawkbit	FACU
Lolium perenne	Perennial ryegrass	FAC
Logfia gallica	Daggerleaf cottonrose	UPL
Lupinus bicolor	Miniature lupine	UPL
Lupinus microcarpus	Chick lupine	UPL
Lysimachia arvensis	Scarlet pimpernel	FAC
Lythrum hyssopifolium	Hyssop loosestrife	OBL
Marrubium vulgare	Horehound	FACU
Medicago polymorpha	California burclover	FACU
Mentha pulegium	Pennyroyal	OBL
Mimulus guttatus	Seep spring monkeyflower	OBL
Mollugo verticillata	Indian chickweed	FACU
Parentucellia viscosa	Yellow gland weed	FAC
Phalaris lemmonii	Lemmon's canary grass	FACW
Phalaris minor	Little canarygrass	UPL
Phalaris paradoxa	Hood canary grass	FAC
Pilularia americana	American pillwort	OBL
Plagiobothrys canescens	Valley popcornflower	UPL
Plagiobothrys greenei	Greene's popcornflower	FACW
Plagiobothrys stipitatus var. micranthus	Great Valley popcornflower	FACW
Plagiobothrys undulatus	Wavy-stemmed popcornflower	OBL

Species Name	Common Name	Wetland Indicator Status
Plantago coronopus	Cut-leaved plantain	FAC
Plantago lanceolata	English plantain	FAC
Poa annua	Annual blue grass	FAC
Polygonum aviculare ssp. *depressum*	Knotweed	FACW
Polypogon maritimus	Mediterranean beard grass	FACW
Polypogon monspeliensis	Annual rabbitfoot grass	FACW
Pseudognaphalium luteoalbum	Pearly everlasting	FAC
Psilocarphus oregonus	Oregon woollyheads	OBL
Quercus douglasii	Blue oak	UPL
Quercus lobata	Valley oak	FACU
Quercus wislizenii	Interior live oak	UPL
Ranunculus bonariensis	Carter's buttercup	OBL
Ranunculus muricatus	Spiny fruit buttercup	FACW
Raphanus sativus	Radish	UPL
Rumex conglomeratus	Green dock	FACW
Rumex crispus	Curly dock	FAC
Rumex pulcher	Fiddle dock	FAC
Rumex salicifolius	Willow dock	FACW
Setaria pumila	Yellow bristlegrass	FAC
Senecio vulgaris	Common groundsel	FACU
Sherardia arvensis	Field madder	UPL
Silene gallica	Small-flower catchfly	UPL
Silybum marianum	Milk thistle	UPL
Spergula arvensis	Starwort	UPL
Spergularia rubra	Red sand-spurrey	FAC
Torilis arvensis	Tall sock-destroyer	UPL
Torilis nodosa	Short sock-destroyer	UPL
Trichostema lanceolatum	Vinegarweed	FACU
Trifolium campestre	Hop clover	UPL
Trifolium dubium	Little hop clover	UPL
Trifolium fragiferum	Strawberry clover	FAC
Trifolium glomeratum	Clustered clover	UPL
Trifolium hirtum	Rose clover	UPL
Trifolium subterraneum	Subterranean clover	UPL
Trifolium tomentosum	Woolly clover	UPL
Triteleia hyacinthina	White brodiaea	FAC
Triteleia laxa	Ithuriel's spear	UPL
Veronica peregrina subsp. xalapensis	Purslane speedwell	FAC
Vicia sativa	Spring vetch	FACU
Vicia villosa	Winter vetch	UPL
Xanthium strumarium	Rough cocklebur	FAC

Re: Placer Christian High School Access

This letter serves as written permission to enter the Placer Christian High School property shown on the attached Figure 1 when accompanied by Madrone Ecological Consulting, LLC (Madrone) staff. When accompanied by Madrone staff, you may dig soil pits by hand and collect plant materials related to the verification of potential Waters of the U.S. on the Placer Christian High School property. If you have any questions, please contact Sarah VonderOhe at Madrone (916) 822-3230 or svonderohe@madroneeco.com.

Sincerely,

David L Aton

1.0 INTRODUCTION

This report presents the results of a delineation of aquatic resources within the Placer Creek Residential property (Study Area) conducted by Madrone Ecological Consulting, LLC (Madrone).

The approximately 44.3-acre Study Area is located along and south and east of Walerga Road, west of White Mill Crescent and north of Waterstone Drive in southwestern Placer County, California. The Study Area is located in a portion of Sections 6 and 7, Township 10 North, Range 6 East (MDB&M) of the "Citrus Heights, California" 7.5-Minute Series USGS Topographic Quadrangle (USGS 1992) (**Figure 1**).

Portions of the Study Area overlap adjacent proposed development projects, such as Placer Vineyards (SPK-1999-00737) and the concurrently submitted Placer Christian High School. The overlap area comprises 7.2 acres of the 44.3-acre Study Area, which includes a 35.5 acre parcel for residential development.

2.0 METHODOLOGY

Madrone senior biologist Daria Snider conducted a delineation of aquatic resources within the Study Area on 3 September 2015, and follow-up surveys on 15 March and 9 May 2018. Water features and data points were mapped in the field with a GPS unit capable of sub-meter accuracy (Trimble GeoXT and Arrow 100). Three-parameter data (vegetation, soils, and hydrology) were collected at each data point, documenting wetland/waters or upland status, as appropriate. The delineation map was prepared in accordance with the *Updated Map and Drawing Standards for the South Pacific Division Regulatory Program* (USACE 2016a). The GPS data was overlayed on an ortho-rectified aerial photograph (City of Roseville 2015).

The delineation was performed in accordance with the *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory 1987), the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (USACE 2008a), *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE 2008b), and the Sacramento District's *Minimum Standards for Acceptance of Preliminary Wetlands Delineations* (USACE 2016b). U.S. Army Corps of Engineers (USACE) regulations (33 CFR 328) were used to determine the presence of Waters of the United States other than wetlands. The most recent *National Wetland Plant List* (Lichvar et al. 2016) was used to determine the wetland indicator status of plants observed in the Study Area. The *Jepson eFlora* (Jepson Flora Project 2018) was used for plant nomenclature, except where it

conflicted with the nomenclature in the *National Wetland Plant List*, which was given priority on the data sheets.

As noted above, the delineation for this Study Area was conducted in 2015, and at the time, this Study Area was part of a larger Project Area that included an adjacent area to the north of Walerga Road that is now called the *Placer Christian High School* property. One set of paired data points was collected for each aquatic resource feature type at that time. Following the split, there were not data points for each feature type within each Study Area, but as the features are largely similar between the two Study Areas, the off-site data points are representative of the aquatic resources within the Study Area. Therefore, we have included all of the data sheets for both Study Areas in **Attachment A**. The map in **Attachment B** shows which of these data points occur within this Study Area.

3.0 EXISTING CONDITIONS

The Study Area is primarily comprised of ungrazed annual grassland with scattered seasonal wetlands on gently rolling terrain. An intermittent tributary to Dry Creek that bisects the southern portion of the Study Area, and flows from east to west, is bordered by a mixed oak woodland. Walerga Road runs along the northern and western edge of the Study Area. The Study Area is situated at an elevation of approximately 100 to 120 feet above mean sea level.

3.1 Terrestrial Plant Communities

3.1.1 Annual Grassland

The majority of the site is occupied by non-native annual grassland. This vegetation community is dominated by medusahead grass (*Elymus caput-medusae*) and soft brome (*Bromus hordeaceus*). Other plant species commonly occurring within this community within the Study Area include perennial ryegrass (*Lolium perenne*), winter vetch (*Vicia villosa*), hairy hawkbit (*Leontodon saxatilis*), rattail fescue (*Vulpia myuros*), hairgrass (*Aira caryophyllea*), slender tarweed (*Holocarpha virgata*), Fitch's spikeweed (*Centromadia fitchii*), yellow star-thistle (*Centaurea solstitialis*), rose clover (*Trifolium hirtum*), American deerweed (*Acmispon americanus*), and smooth cat's ear (*Hypochaeris glabra*).

3.1.2 Oak Woodland

A mixed oak woodland borders both sides of the intermittent drainage. The overstory of this community is comprised of Valley oak (*Quercus lobata*), blue oak (*Q. douglasii*), and interior live oak (*Q. wislizenii*). The understory is primarily comprised of species found in the surrounding annual grasslands, with the addition of occasionally dense stands of poison-oak (*Toxicodendron diversilobum*), pipevine (*Aristolochia californica*), and several prominent stands of milk thistle (*Silybum marianum*).

3.2 Hydrology

Surface water runoff within the Study Area all drains into the intermittent drainage. The intermittent drainage is a tributary of Dry Creek, which is a tributary of the Sacramento River. The Study Area is located in the *Dry Creek Watershed* (HUC 1802011101) (USGS 1978).

3.3 Soils

According to the Natural Resources Conservation Service (NRCS) Soil Survey Database (NRCS 2018), six soil mapping units occur within the Study Area (**Figure 2**): (140) Cometa sandy loam, 1-5% slopes; (141) Cometa-Fiddyment complex, 1-5% slopes; (142) Cometa-Ramona sandy loams, 1-5% slopes; (147) Fiddyment-Kaseberg loams, 2-9% slopes; (175) Ramona sandy loam, 2-9% slopes; and (194) Xerofluvents, frequently flooded. Xerofluvents, frequently flooded consists of hydric components, and all of the mapping units within the Study Area may contain hydric inclusions (NRCS 2018).

3.4 Driving Directions

To access the Study Area from Sacramento, drive east on Interstate 80 to Exit 98. Take Exit 98, and head west on Elkhorn Boulevard. Turn right on Walerga. The site is on the east side of Walerga Road, just north of Waterstone Drive.

4.0 RESULTS

A total of 0.578 acre of aquatic resources were delineated within the Study Area (**Table 1**). Data sheets are included in **Attachment A**, maps of the aquatic resources are included as **Figure 3** and **Attachment B**, and a list of the plant species observed in the Study Area with their wetland indicator status is included in **Attachment C**. GIS Shapefiles and the *Aquatic Resources Excel Spreadsheet* for the aquatic resources shown on **Figure 3** are included on a CD in **Attachment D**. Each of the feature types is described below. As shown on **Figure 3**, a number of the aquatic resources fall within the portion of the Study Area that overlaps other adjacent projects. The acreage of these resources that fall within the overlap area (0.047 acre) is broken out in **Table 1** and in **Attachment B**. Each aquatic resource was cut at the overlap line when calculating the acreages in **Table 1** and **Attachment B**.

Table 1. Aquatic Resources Mapped within the Study Area

Resource Type	Total Study Area Acreage	Overlap Area Acreage
Wetlands		
Irrigated Wetland	0.028	0.000
Seasonal Wetland	0.129	0.000
Seasonal Wetland Swale	0.047	0.000
Vernal Pool	0.091	0.000
Total of Wetlands	*0.294*	0.000
Other Waters		
Ephemeral Drainage	0.013	0.004
Intermittent Drainage	0.271	0.043
Total of Other Waters	*0.284*	*0.047*
Total	**0.578**	**0.047**

4.1 Wetlands

4.1.1 Vernal Pool

Two vernal pools were mapped within the Study Area. Vernal pools are topographic basins within the grassland community that are typically underlain with an impermeable or semi-permeable hardpan or duripan layer. Vernal pools inundate during the wet season, and typically dry by late spring and remain dry through the summer months. Vernal pools were differentiated from depressional seasonal wetlands within the Study Area based upon the predominance of vernal pool endemic plant species. Plant species found in the vernal pools within the Study Area include double-horned calico flower (*Downingia bicornuta*), slender popcorn flower (*Plagiobothrys stipitatus* var. *micranthus*), bractless hedge hyssop (*Gratiola ebracteata*), smooth goldfields (*Lasthenia glaberrima*), Vasey's coyote-thistle (*Eryngium vaseyi*), Carter's buttercup (*Ranunculus bonariensis*), hyssop loosestrife (*Lythrum hyssopifolium*), pillwort (*Pilularia americana*), Mediterranean beard grass (*Polypogon maritimus*), and creeping spikerush (*Eleocharis macrostachya*).

Indicators of wetland hydrology observed in the vernal pools during the field survey included the presence of oxidized rhizospheres along live roots and deep soil cracks. The soil matrix color at Data Points 1 and 2 was 7.5YR3/2 with 20% 5YR4/6 redox concentrations along pore linings and as soft masses in the matrix. The soils at these data points were considered to be hydric based on the presence of field indicator F6 (redox dark surface).

4.1.2 Seasonal Wetlands

Ten seasonal wetlands were delineated within the Study Area. Seasonal wetlands are depressional wetlands that pond water seasonally. These features are often topographically and hydrologically similar to vernal pools, but have a short hydroperiod, and as a result, support a slightly different plant community that is not characterized by a dominance of vernal pool endemics. Plant species commonly occurring in the seasonal wetlands within the Study Area include Mediterranean barley (*Hordeum marinum*), perennial ryegrass,

annual hairgrass (*Deschampsia danthonioides*), toad rush (*Juncus bufonius*), hyssop loosestrife, slender popcorn flower, hairy hawkbit, Fitch's spikeweed, and vinegarweed.

The only indicator of wetland hydrology observed in the seasonal wetlands during the field survey was the presence of oxidized rhizospheres along live roots. The soil matrix color at Data Point 8 was 7.5YR4/2 with 30% 7.5YR3/4 redox concentrations along pore linings and as soft masses in the matrix. The soil at this data point was considered to be hydric based on the presence of field indicator F3 (depleted matrix).

4.1.3 Seasonal Wetland Swales

Three seasonal wetland swales were mapped within the Study Area. Seasonal wetland swales are sloping, linear seasonal wetlands that convey surface runoff, and may detain it for short periods of time. Plant species occurring in the seasonal wetland swales are largely similar to those found in the seasonal wetlands.

The only indicator of wetland hydrology observed in the seasonal wetland swales during the field survey was the presence of oxidized rhizospheres along live roots. The soil matrix color at Data Point 9 was 7.5YR3/2 with 15% 7.5YR4/6 redox concentrations along pore linings and as soft masses in the matrix. The soil at this data point was considered to be hydric based on the presence of field indicator F6 (redox dark surface).

4.1.4 Irrigated Wetland

One irrigated wetland was mapped in the southeastern portion of the Study Area. This feature appears to be the result of irrigation runoff from adjacent residences. The fence around the adjacent residence has been designed to allow irrigation runoff to flow underneath, and into this wetland. Based on a review of historic aerial photography, it appears that this wetland formed between 2005 and 2006, shortly after the construction of the adjacent houses. Because this wetland is supported by runoff during the dry season, a variety of plant species typical of prolonged saturation have become established, including tall flatsedge (*Cyperus eragrostis*), common rush (*Juncus effusus*), Gooding's black willow (*Salix gooddingii*), Bermuda grass (*Cynodon dactylon*), English plantain (*Plantago lanceolata*), and yellow bristlegrass (*Setaria pumila*).

Indicators of wetland hydrology observed during the field survey included the presence of oxidized rhizospheres along live roots and soil cracks. The soil matrix color at Data Points 1 and 2 was 7.5YR3/2 with 5YR4/6 redox concentrations along pore linings and as soft masses in the matrix. The soil at these data points was considered to be hydric based on the presence of field indicator F6 (redox dark surface).

4.2 Other Waters

4.2.1 Ephemeral Drainage

Two ephemeral drainages were mapped within the Study Area. These features are almost entirely unvegetated, and adjacent vegetation is primarily comprised of upland, annual grassland species.

Ephemeral drainages convey flow during and immediately following rain events, but are not supported by groundwater flows, and as such, are not inundated for a sufficient duration to support hydrophytic vegetation. The lateral limits of the ephemeral channels within the Study Area were mapped at the Ordinary High Water Mark (OHWM), which was identified based on the extent of scour and adjacent vegetation.

4.2.2 Intermittent Drainage

Two sections of one intermittent drainage were mapped within the Study Area. This feature flows from east to west across the Study Area, and appears to be a tributary of Dry Creek. The intermittent drainage is almost completely unvegetated within the channel, due to the scouring effects of water. Adjacent vegetation is comprised of the oak woodland described in detail in Section 3.1.2. Near the western edge of the Study Area, the intermittent channel broadens, and some vegetation has encroached into the channel. Species found in the channel in this reach include perennial ryegrass, pennyroyal (*Mentha pulegium*), seep spring monkeyflower (*Mimulus guttatus*), tall flatsedge, swamp pricklegrass (*Crypsis schoenoides*), creeping spikerush, Indian chickweed (*Mollugo verticillata*), and prostrate knotweed (*Polygonum aviculare* ssp. *depressum*). Further to the east, adjacent vegetation is primarily annual grassland species, although common sedge (*Carex praegracilis*) also occurs intermittently along the banks. The edges of the intermittent channel within the Study Area were mapped at the OHWM, which was identified based primarily on the extent of scour.

5.0 CONCLUSION

The applicant is requesting a Preliminary Jurisdictional Determination for the Aquatic Resources Delineation map included as **Attachment B**. A signed statement providing USACE staff accompanied access to the Study Area is included as **Attachment E**.

Hydrophytic Vegetation Present?	Yes X No ____	**Is the Sampled Area within a Wetland?**	**Yes X No ____**
Hydric Soil Present?	Yes X No ____		
Wetland Hydrology Present?	Yes X No ____		

Remarks:

Data point is located in an irrigated wetland. This feature appears to be the result of excess irrigation water runoff from the adjacent residences. Based on the size of the few willows that have established in this feature, and a review of aerial photography, this has been occuring since the houses were built. The region is currently experiencing a multi-year drought, and the climatic conditions are drier than normal.

VEGETATION – Use scientific names of plants.

- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ___ No X Depth (inches): ___

Water Table Present? Yes ___ No X Depth (inches): ___

Saturation Present? (includes capillary fringe) Yes ___ No X Depth (inches): ___

Wetland Hydrology Present? **Yes** ___ **No** X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

No wetland hydrology indicators observed

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Walerga Baseline Property City/County: Placer County Sampling Date: 09/03/15
Applicant/Owner: Mourier Investments, LLC State: CA Sampling Point: 10
Investigator(s): Daria Snider Section, Township, Range: Section 6, Township 10 North, Range 6 East
Landform (hillslope, terrace, etc.): Swale Local relief (concave, convex, none): None Slope (%): 2
Subregion (LRR): Mediterranean California (LRR C) Lat: 38.74374438 Long: -121.3627577 Datum: NAD 83
Soil Map Unit Name: Cometa-Ramona sandy loams, 1-5% slopes NWI Classification: None
Are climatic / hydrologic conditions on the site typical for this time of year? Yes ____ No X (If no, explain in Remarks.)
Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes X No ____
Are Vegetation ____, Soil ____, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes X No ____	**Is the Sampled Area within a Wetland?**	**Yes X No ____**
Hydric Soil Present?	Yes X No ____		
Wetland Hydrology Present?	Yes X No ____		

Remarks:

Data point is in a seasonal wetland swale.

The region is currently experiencing a multi-year drought, and the climatic conditions are drier than normal.

VEGETATION – Use scientific names of plants.

	Absolute % Cover	Dominant Species?	Indicator Status

Plant Species Observed within the Study Area

Plant Species Observed within the Placer Creek Residential Study Area 3 September 2015, 15 March 2018, and 9 May 2018

Species Name	Common Name	Wetland Indicator Status
Achyrachaena mollis	Blow wives	FAC
Acmispon americanus	American deerweed	UPL
Aira caryophyllea	Hairgrass	FACU
Aira elegans	Elegant hair grass	UPL
Alisma triviale	Northern water plantain	OBL
Alopecurus saccatus	Pacific foxtail	OBL
Amsinckia menziesii	Common fiddleneck	UPL
Aristolochia californica	Pipevine	UPL
Artemisia douglasiana	Mugwort	FAC
Avena fatua	Wild oat	UPL
Baccharis pilularis	Coyote brush	UPL
Briza maxima	Rattlesnake grass	UPL
Briza minor	Little quaking grass	FAC
Brodiaea elegans subsp. elegans	Harvest brodiaea	FACU
Bromus diandrus	Ripgut brome	UPL
Bromus hordeaceus	Soft brome	FACU
Calandrinia menziesii	Red maids	FACU
Callitriche marginata	Winged water starwort	OBL
Carduus pycnocephalus	Italian thistle	UPL
Carex praegracilis	Common sedge	FACW
Castilleja attenuata	Valley tassels	UPL
Centaurea solstitialis	Yellow star-thistle	UPL
Centromadia fitchii	Fitch's spikeweed	FACU
Cerastium glomeratum	Sticky mouse-ear chickweed	UPL
Chondrilla juncea	Skeleton weed	UPL
Clarkia purpurea	Winecup clarkia	UPL
Clarkia unguiculata	Elegant clarkia	UPL
Claytonia perfoliata	Miner's lettuce	FAC
Convolvulus arvensis	Bindweed	UPL
Crassula aquatica	Water pygmy weed	OBL
Croton setiger	Turkey mullein	UPL
Crypsis schoenoides	Swamp pricklegrass	OBL
Cynodon dactylon	Bermuda grass	FACU
Cyperus eragrostis	Tall flatsedge	FACW
Deschampsia danthonioides	Annual hair grass	FACW
Dichelostemma capitatum	Blue dicks	FACU
Dittrichia graveolens	Stinkwort	UPL
Downingia bicornuta	Double-horned downingia	OBL

Species Name	Common Name	Wetland Indicator Status
Downingia ornatissima var. ornatissima	Horned downingia	OBL
Eleocharis macrostachya	Creeping spikerush	OBL
Elymus caput-medusae	Medusahead grass	UPL
Elymus triticoides	Beardless wild rye	FAC
Epilobium brachycarpum	Panicled willow-herb	UPL
Epilobium campestre	Smooth willow-herb	OBL
Erodium botrys	Filaree	FACU
Eryngium castrense	Great Valley coyote thistle	FACW
Eschscholzia californica	California poppy	UPL
Festuca bromoides	Brome fescue	FACU
Festuca myuros	Rattail sixweeks grass	FACU
Galium aparine	Sticky willy	FACU
Glyceria declinata	Low manna grass	FACW
Gratiola ebracteata	Bractless hedge-hyssop	OBL
Heterotheca grandiflora	Telegraph weed	UPL
Hirschfeldia incana	Short-podded mustard	UPL
Holocarpha virgata	Slender tarweed	UPL
Hordeum marinum	Mediterranean barley	FAC
Hordeum murinum	Wall barley	FACU
Hypochaeris glabra	Smooth cat's ear	UPL
Isoetes howellii	Howell's quillwort	OBL
Juncus bufonius	Toad rush	FACW
Juncus capitatus	Capped rush	FACU
Juncus effusus	Common rush	FACW
Lactuca serriola	Prickly wild lettuce	FACU
Lasthenia glaberrima	Smooth goldfields	OBL
Lathyrus angulatus	Angled pea	UPL
Leontodon saxatilis	Hairy hawkbit	FACU
Lolium perenne	Perennial ryegrass	FAC
Logfia gallica	Daggerleaf cottonrose	UPL
Lupinus bicolor	Miniature lupine	UPL
Lupinus microcarpus	Chick lupine	UPL
Lysimachia arvensis	Scarlet pimpernel	FAC
Lythrum hyssopifolium	Hyssop loosestrife	OBL
Marrubium vulgare	Horehound	FACU
Medicago polymorpha	California burclover	FACU
Mentha pulegium	Pennyroyal	OBL
Mimulus guttatus	Seep spring monkeyflower	OBL
Mollugo verticillata	Indian chickweed	FACU
Parentucellia viscosa	Yellow gland weed	FAC
Pentagramma triangularis	Goldback fern	UPL
Phalaris lemmonii	Lemmon's canary grass	FACW
Phalaris minor	Little canarygrass	UPL

Species Name	Common Name	Wetland Indicator Status
Phalaris paradoxa	Hood canary grass	FAC
Pilularia americana	American pillwort	OBL
Plagiobothrys canescens	Valley popcornflower	UPL
Plagiobothrys greenei	Greene's popcornflower	FACW
Plagiobothrys stipitatus var. micranthus	Great Valley popcornflower	FACW
Plagiobothrys undulatus	Wavy-stemmed popcornflower	OBL
Plantago coronopus	Cut-leaved plantain	FAC
Plantago lanceolata	English plantain	FAC
Poa annua	Annual blue grass	FAC
Polygonum aviculare ssp. *depressum*	Knotweed	FACW
Polypogon maritimus	Mediterranean beard grass	FACW
Polypogon monspeliensis	Annual rabbitfoot grass	FACW
Populus fremontii	Fremont cottonwood	FAC
Prunus dulcis	Almond	UPL
Pseudognaphalium luteoalbum	Pearly everlasting	FAC
Psilocarphus oregonus	Oregon woollyheads	OBL
Quercus douglasii	Blue oak	UPL
Quercus lobata	Valley oak	FACU
Quercus wislizenii	Interior live oak	UPL
Ranunculus bonariensis	Carter's buttercup	OBL
Ranunculus muricatus	Spiny fruit buttercup	FACW
Raphanus sativus	Radish	UPL
Rumex conglomeratus	Green dock	FACW
Rumex crispus	Curly dock	FAC
Rumex pulcher	Fiddle dock	FAC
Rumex salicifolius	Willow dock	FACW
Salix gooddingii	Black willow	FACW
Sambucus nigra	Black elderberry	FACU
Setaria pumila	Yellow bristlegrass	FAC
Senecio vulgaris	Common groundsel	FACU
Sherardia arvensis	Field madder	UPL
Silene gallica	Small-flower catchfly	UPL
Silybum marianum	Milk thistle	UPL
Spergula arvensis	Starwort	UPL
Spergularia rubra	Red sand-spurrey	FAC
Torilis arvensis	Tall sock-destroyer	UPL
Torilis nodosa	Short sock-destroyer	UPL
Toxicodendron diversilobum	Poison-oak	FACU
Trichostema lanceolatum	Vinegarweed	FACU
Trifolium campestre	Hop clover	UPL
Trifolium dubium	Little hop clover	UPL
Trifolium fragiferum	Strawberry clover	FAC
Trifolium glomeratum	Clustered clover	UPL

Species Name	Common Name	Wetland Indicator Status
Trifolium hirtum	Rose clover	UPL
Trifolium subterraneum	Subterranean clover	UPL
Trifolium tomentosum	Woolly clover	UPL
Triteleia hyacinthina	White brodiaea	FAC
Triteleia laxa	Ithuriel's spear	UPL
Veronica peregrina subsp. xalapensis	Purslane speedwell	FAC
Vicia sativa	Spring vetch	FACU
Vicia villosa	Winter vetch	UPL
Xanthium strumarium	Rough cocklebur	FAC

Re: Placer Christian High School Access

This letter serves as written permission to enter the Placer Christian High School property shown on the attached Figure 1 when accompanied by Madrone Ecological Consulting, LLC (Madrone) staff. When accompanied by Madrone staff, you may dig soil pits by hand and collect plant materials related to the verification of potential Waters of the U.S. on the Placer Christian High School property. If you have any questions, please contact Sarah VonderOhe at Madrone (916) 822-3230 or svonderohe@madroneeco.com.

Sincerely,

David L Aton

1.0 INTRODUCTION

This report presents the results of special-status plant surveys conducted for the approximately 80-acre Fong Property Project (Study Area). The Study Area is located generally north and south of Walerga Road, and south of Baseline Road in southwestern Placer County, California. The Study Area is located in portion of Section 6-7, Township 10 North, Range 6 East (MDB&M) of the "Citrus Heights, California" and "Roseville, California" 7.5-Minute Series USGS Topographic Quadrangles (USGS 2023 and USGS 2021) (**Figure 1**).

2.0 METHODOLOGY

Madrone Ecological Consulting, LLC (Madrone) botanist Tara Collins conducted special-status plant surveys of the Study Area on 30 April and 16 May 2024. The special-status plant surveys were conducted in accordance with the U.S. Fish and Wildlife Service's *Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plants* (USFWS 2000), the California Department of Fish and Wildlife's *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (CDFW 2018), and the *CNPS Botanical Survey Guidelines* (CNPS 2001).

A list of special-status plant species with potential to occur within the Study Area was developed by reviewing the following literature, and then refining the list based on habitats present within the Study Area:

- California Native Plant Society (CNPS) Rare and Endangered Plant Inventory (CNPS 2024a) query of CRPR Lists 1A, 1B, 2A, 2B, and 3 within the "Citrus Heights and Roseville, California" (USGS 2023 and 2021) and eight surrounding quadrangles; and
- The California Natural Diversity Database occurrences of special-status plant species within five miles of the Study Area (CNDDB 2024).

The target species for this survey were:

- Big-scale balsamroot (*Balsamorhiza macrolepis*);
- Dwarf downingia (*Downingia pusilla*);
- Boggs Lake hedge-hyssop (*Gratiola heterosepala*);
- Ahart's dwarf rush (*Juncus leiospermus var. ahartii*);
- Legenere (*Legenere limosa*);
- Slender Orcutt grass (*Orcuttia tenuis*);
- Sacramento Orcutt grass (*Orcuttia viscida*); and
- Sanford's arrowhead (*Sagittaria sanfordii*).

Meandering pedestrian surveys were conducted throughout the Study Area. The surveys were floristic in nature, which means that all plant species observed on-site were identified to the taxonomic level necessary to determine rarity. Thus, if a special-status plant was present but not on the target list, it would have been detected and documented. Plant taxonomy was based on the nomenclature in the *Jepson eFlora* (Jepson Flora Project 2024). Vegetation communities were classified according to the *Manual of California Vegetation, Second Edition* as updated online (CNPS 2024b). Qualifications for the botanist that conducted the surveys are included in **Attachment A,** a list of reference populations of target plants visited is included

in **Attachment B**, and a comprehensive list of all plant species observed during surveys of the Study Area is included in **Attachment C**.

3.0 EXISTING SITE CONDITIONS

The Study Area is characterized by gently rolling topography supporting ungrazed annual grassland interspersed with seasonal wetlands. Several of the seasonal wetlands along the eastern boundary appear to be man-made or existing as a result of past human disturbance. An intermittent tributary to Dry Creek bisects the southern portion of the Study Area from west to east and is bordered by a valley oak woodland. A major transportation corridor runs along the center of the Study Area, Walerga Road. The Study Area is situated at an elevation of approximately 100 to 130 feet above mean sea level.

3.1 Terrestrial Plant Communities

3.1.1 Annual Brome Grassland

The majority of the site supports the Wild Oats (*Avena* spp.) and Annual Brome (*Bromus* spp.) Herbaceous Semi-Natural Alliance as described in *A California Manual of Vegetation* (CNPS 2024b) (hereafter "annual brome grassland"). This vegetation community is dominated by medusa head (*Elymus caput-medusae*), soft brome (*Bromus hordeaceus*), ryegrass (*Festuca perennis*), winter vetch (*Vicia villosa*), and caley pea (*Lathyrus hirsutus*).

3.1.2 Valley Oak Woodland

Both sides of the intermittent drainage support the Valley Oak (*Quercus lobata*) woodland Alliance as described in *A California Manual of Vegetation* (CNPS 2024b) (hereafter "valley oak woodland") . The overstory of this community is comprised of valley oak (*Quercus lobata*), blue oak (*Quercus douglasii*), and interior live oak (*Quercus wislizeni*). The understory is primarily comprised of western poison oak (*Toxicodendron diversilobum*), California pipevine (*Aristolochia californica*), and species found in the surrounding annual brome grassland.

3.2 Soils

According to the Natural Resources Conservation Service (NRCS) Soil Survey Database (NRCS 2024), eight soil mapping units occur within the Study Area: (140) Cometa sandy loam, 1-5% slopes; (141) Cometa-Fiddyment complex, 1-5% slopes; (142) Cometa-Ramona sandy loams, 1-5% slopes; (146) Fiddyment loam, 1-8% slopes; (147) Fiddyment-Kaseberg loams, 2-9% slopes; (175) Ramona sandy loam, 2-9% slopes; (182) San Joaquin-Cometa sandy loams, 1-5% slopes; and (194) Xerofluvents, frequently flooded (NRCS 2024). None of the soil map units within the Study Area are derived from serpentine parent material, and no alkaline or saline soils are present within the Study Area (NRCS 2024).

3.3 Aquatic Resources

A protocol-level aquatic resources delineation was conducted for the Study Area (Madrone 2018a, 2018b). Aquatic resources mapped within the Study Area during this survey are depicted in **Figure 2**. **Table 1** summarizes these mapped aquatic resource types and a description by type is included below.

Table 1. Aquatic Resources Mapped within the Study Area

Waters Type	Acreage
Wetlands	
Irrigated Wetland	0.03
Seasonal Wetland	0.20
Seasonal Wetland Swale	0.25
Vernal Pool	1.01
Other Waters	
Intermittent Drainage	0.24
Total	**1.73**

3.2.1 Irrigated Wetland

One irrigated wetland was mapped in the southeastern portion of the Study Area. This feature appears to be the result of irrigation runoff from adjacent residences. Because this wetland is supported by runoff during the dry season, a variety of plant species typical of prolonged saturation have become established, including soft brome, toad rush (*Juncus bufonius*), yellow star-thistle (*Centaurea solstitialis*), and starwort (*Spergula arvensis*).

3.2.2 Seasonal Wetland

A number of seasonal wetlands occur within the Study Area. Seasonal wetlands are depressional wetlands that pond water seasonally. These features are often topographically and hydrologically similar to vernal pools, but have a short hydroperiod, and as a result, support a slightly different plant community that is not characterized by a dominance of vernal pool endemics. The seasonal wetlands within the Study Area are largely dominated by Mediterranean barley (*Hordeum marinum*) and hyssop loosestrife (*Lythrum hyssopifolia*).

3.2.3 Seasonal Wetland Swale

The Study Area supports multiple seasonal wetland swales. Seasonal wetland swales are sloping, linear seasonal wetlands that convey surface runoff, and may detain it for short periods of time. The dominant plant occurring within the wetland swales was ryegrass.

3.2.4 Vernal Pool

The Study Area supports five vernal pools. Vernal pools are topographic basins that are underlain with an impermeable or semi-permeable hardpan or duripan layer. Vernal pools inundate during the wet season, and typically dry by late spring and remain dry through the summer months. The vernal pool was differentiated from depressional seasonal wetlands within the Study Area based upon the predominance of vernal pool endemic plant species. The vernal pools were dominated by Mediterranean barley, smooth goldfields (*Lasthenia glaberrima*), low manna grass (*Glyceria declinata*), and great valley popcorn flower (*Plagiobothrys stipitatus*).

3.2.5 Intermittent Drainage

Two sections of one intermittent drainage were mapped within the Study Area. This feature flows from east to west across the Study Area and is a tributary to Dry Creek. The intermittent drainage is largely unvegetated within the channel yet contains patches of vegetation including ryegrass, creeping spikerush (*Eleocharis macrostachya*), and common monkeyflower (*Erythranthe guttata*).

4.0 SURVEY RESULTS

4.1 Big-Scale Balsamroot

Big-scale balsamroot (*Balsamorhiza macrolepis*) is not federally or state listed, but it is classified as a CRPR List 1B.2 plant. It is a perennial herbaceous species that occurs in chaparral, cismontane woodland and valley and foothill grasslands between 150 and 5,100 feet (CNPS 2024a). Big-scale balsamroot blooms from March through June and may be found on serpentine soils, though it is known to grow on other soil types as well (CNPS 2024a).

The annual brome grassland throughout the Study Area represents marginally suitable habitat for this species. This species was not observed during the 2024 protocol-level special status plant surveys of the Study Area.

4.2 Dwarf Downingia

Dwarf downingia (*Downingia pusilla*) is not federally or state listed, but it is classified as a CRPR List 2B.2 plant. It is a diminutive annual herb that is strongly associated with vernal pools mesic valley and foothill grassland habitats at elevations ranging from five to 1,460 feet (CNPS 2024a). Dwarf downingia is typically associated with areas that experience a moderate degree of disturbance, and it blooms from March to May.

The vernal pools, seasonal wetlands, seasonal wetland swales, and portions of the intermittent drainages within the Study Area represent suitable habitat for this species. This species was not observed during the 2024 protocol-level special status plant surveys of the Study Area.

4.3 Boggs Lake Hedge-Hyssop

Boggs Lake hedge-hyssop (*Gratiola heterosepala*) is not federally listed, but it is a California endangered species and a CRPR List 1B.2 plant. Boggs Lake hedge-hyssop grows in vernal pools and around the perimeter of marshes and swamps between 35 and 7,790 feet (CNPS 2024a). This small annual herb favors clay soils, and blooms from April to August (CNPS 2024a).

The deeper portions of the vernal pools and seasonal wetlands within the Study Area represent suitable habitat for this species. This species was not observed during the 2024 protocol-level special status plant surveys of the Study Area.

4.4 Ahart's Dwarf Rush

Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*) is not federally or state listed, but it is classified as a CRPR List 1B.2 plant. Ahart's dwarf rush grows in mesic valley and foothill grassland habitats between elevations of approximately 100 feet and 750 feet (CNPS 2024a). This annual herb blooms from March to May (CNPS 2024a).

The vernal pools, seasonal wetlands, and seasonal wetland swales within the Study Area represent suitable habitat for this species. This species was not observed during the 2024 protocol-level special status plant surveys of the Study Area.

4.5 Legenere

Legenere (*Legenere limosa*) is not federally or state listed, but it is classified as a CRPR List 1B.1 species. This annual herb is primarily associated with vernal pools (CNPS 2024a). Legenere occurs at elevations between 5 and 2,885 feet, and blooms from April to June (CNPS 2024a).

The deeper portions of the vernal pools and seasonal wetlands within the Study Area represent suitable habitat for this species. This species was not observed during the 2024 protocol-level special status plant surveys of the Study Area.

4.6 Slender Orcutt Grass

Slender Orcutt grass (*Orcuttia tenuis*) is listed as threatened under CESA and endangered under FESA. This annual herb is found in vernal pools, often with gravelly substrates, at elevations generally ranging between 85 and 5,775 feet. Categorized as a CRPR 1B.1 plant, the slender Orcutt grass bloom period usually extends from May to September, but it is identifiable until the winter rains or cattle cause the seed heads to shatter.

The deeper portions of the vernal pools and seasonal wetlands within the Study Area represent suitable habitat for this species. This species was not observed during the 2024 special-status plant surveys of the Study Area.

4.7 Sacramento Orcutt Grass

Sacramento Orcutt grass (*Orcuttia viscida*) is a CRPR 1B.1 plant that is listed as endangered under the Federal Endangered Species Act (FESA) and CESA. This herbaceous annual favors vernal pool habitats and is found between elevations of 95 and 330 feet. Sacramento Orcutt grass typically blooms from April to July, but it is identifiable until the winter rains or cattle cause the seed heads to shatter. This plant species has previously been documented within the Cordova Hills Project site outside of the current Study Area.

The deeper portions of the vernal pools and seasonal wetlands within the Study Area represent suitable habitat for this species. This species was not observed during the 2024 special-status plant surveys of the Study Area.

4.8 Sanford's Arrowhead

Sanford's arrowhead (*Sagittaria sanfordii*) is not federally or state listed, but it is classified as a CRPR List 1B.2 plant. It generally occurs in shallow freshwater habitats associated with marshes and swamps, including drainages, canals, and larger ditches that sustain inundation and/or slow moving water into early summer. This emergent perennial rhizomatous species blooms from May to October (November), and occurs from sea level to 2,135 feet (CNPS 2024a)

The intermittent drainage within the Study Area represents suitable habitat for this species. This species was not observed during the 2024 protocol-level special status plant surveys of the Study Area.

5.0 CONCLUSION

No special-status plant species were observed during the 2024 protocol-level special-status plant surveys of the Fong Property Study Area.

Botanist Qualifications

Special-Status Plant Survey Botanist Qualifications

Tara Collins

Ms. Collins has a B.S. in Botany from Humboldt State University and more than 24 years of experience conducting botanical inventories. As a senior biologist, she specializes in rare plant surveys, constructed/restored wetland floristic monitoring, and open space preserve management. In addition to rare plant surveys, her botanical experience includes general vegetation surveys, aerial and field vegetation mapping, CRAM assessments, measuring and monitoring special-status species plant populations, and invasive species identification and mapping. Ms. Collins' experience includes a wide variety of upland and wetland vegetation communities including annual grassland, vernal pool complex, ephemeral and emergent wetlands, preserved and created/restored vernal pools, seasonal marshes, floodplain wetlands, managed marshes, oak woodlands, riparian woodland/scrub, chaparral, coastal sage scrub, Mojave Desert scrub, desert riparian, iodine bush scrub, alkali sink habitat, and coniferous forests. Her geographic expertise covers much of California, from Shasta County in the north to the Mojave Desert and San Gabriel Mountains in the south, and from Contra Costa County in the west to the Sierra Nevada foothills in the east. Her primary focus is on the Sacramento Valley and San Joaquin Valley.

Attachment B

Target Plant Species
Reference Population Information

Target Plant Species Reference Population Information for the Fong Property Special-Status Plant Survey

Plant Species	Location of Reference Population	Date of Visit	Phenology of Reference Population/ Distinctive Characteristics
Balsamorhiza macrolepis Big-scale balsamroot	Herbarium specimen at UC Davis Center for Plant Diversity Online Jepson Manual and Calflora	23 April 2019 March through May 2024	Pressed specimen. Similar to *Wyethia*, but with grey, dissected leaves. Leaves are mostly basal (as opposed to *Wyethia*, which has basal and cauline leaves).
Downingia pusilla Dwarf downingia	Woodcreek Oaks Open Space Preserve (CNDDB #142)	10 April 2024	Plants are just coming into bloom below *Plagiobothrys stipitatus* and *Ranunculus bonariensis*. Should be in full bloom in about a week.
Gratiola heterosepala Boggs Lake hedge-hyssop	Churchill Downs Wetland Preserve (CNDDB Occurrence #35)	29 April 2024	Hundreds to thousands of *Gratiola heterosepala* plants were observed in this location this year. About half were in bud and half in full bloom. Pool was not inundated, but soil was still saturated. Individuals of this species were also observed in an adjacent pool. That feature was drier, and the plants were half in bloom and half in fruit.
Juncus leiospermus var. *ahartii* Ahart's dwarf rush	Mather Regional Park (CNDDB Occurrence #8)	12 April 2024	A few plants scattered within the area; seems like a decent year for this species, but all of the plants are quite small. The plants were all in fruit, but the long style was still readily apparent on the top of the fruits.
Legenere limosa Legenere	Sacramento County (CNDDB Occurrence #27)	17 April 2024 20 May 2024	Pool is still inundated, but millions of plants are present, above the water level. Plants were still green and identifiable, with most in fruit but some still in flower.
Orcuttia tenuis Slender Orcutt grass	Herbarium specimen at UC Davis Center for Plant Diversity	23 April 2019	Pressed specimen. Leaves and leaf sheaths are continuous with no ligule, and lemmas are toothed.

Plant Species	Location of Reference Population	Date of Visit	Phenology of Reference Population/ Distinctive Characteristics
	Online Jepson Manual and Calflora	March through May 2024	Inflorescences are tall and slender in comparison to *Orcuttia viscida*, the only other *Orcuttia* species known to occur in the area.
Orcuttia viscida Sacramento Orcutt grass	Population at Phoenix Park in Sacramento County (CNDDB Occurrence #15)	5 June 2024	Only four plants were observed in this pool, where thousands have been observed in past years. An exhaustive search was not conducted, but there are clearly fewer plants, and those that are present are small. They were still green and identifiable to species. Other botanists state that populations at other locations did not decline as substantially this year.
Sagittaria sanfordii Sanford's arrowhead	Population in Laguna Creek north of Elk Grove Blvd in Elk Grove (CNDDB Occurrence #43)	20 May 2024	Plants were in early bloom, with some plants still entirely aquatic. Those that had terrestrial leaves exhibited the typical triangular cross-section, and the blooms and fruit made blooming plants readily identifiable to species.

Plant Species Observed within the Fong Property Study Area

Plant Species Observed within the Fong Property Study Area
30 April and 16 May 2024

Family / Species Name	Common Name	Native / Non-Native
ANACARDIACEAE		
Toxicodendron diversilobum	Western poison oak	Native
APIACEAE		
Anthriscus caucalis	Bur-chervil	Non-Native
Eryngium castrense	Great valley coyote-thistle	Native
ARISTOLOCHIACEAE		
Aristolochia californica	California pipevine	Native
ASTERACEAE		
Artemisia douglasiana	Mugwort	Native
Baccharis pilularis	Coyote brush	Native
Bidens frondosa	Sticktight	Native
Carduus pycnocephalus	Italian thistle	Non-Native
Centaurea solstitialis	Yellow star-thistle	Non-Native
Centromadia fitchii	Fitch's spikeweed	Native
Chondrilla juncea	Skeleton weed	Non-Native
Erigeron canadensis	Horseweed	Native
Holocarpha virgata	Slender tarweed	Native
Hypochaeris glabra	Smooth cat's-ear	Non-Native
Lactuca serriola	Prickly lettuce	Non-Native
Lasthenia glaberrima	Smooth goldfields	Native
Leontodon saxatilis	Hairy hawkbit	Non-Native
Logfia gallica	Daggerleaf cottonrose	Non-Native
Pseudognaphalium luteoalbum	Jersey cudweed	Non-Native
Psilocarphus chilensis	Round woolly-marbles	Native
Senecio vulgaris	Common groundsel	Non-Native
Sonchus asper	Prickly sow thistle	Non-Native
Sonchus oleraceus	Common sow thistle	Non-Native
BORAGINACEAE		
Amsinckia menziesii	Small-flowered fiddleneck	Native
Plagiobothrys stipitatus	Great valley popcorn flower	Native
BRASSICACEAE		
Brassica nigra	Black mustard	Non-Native

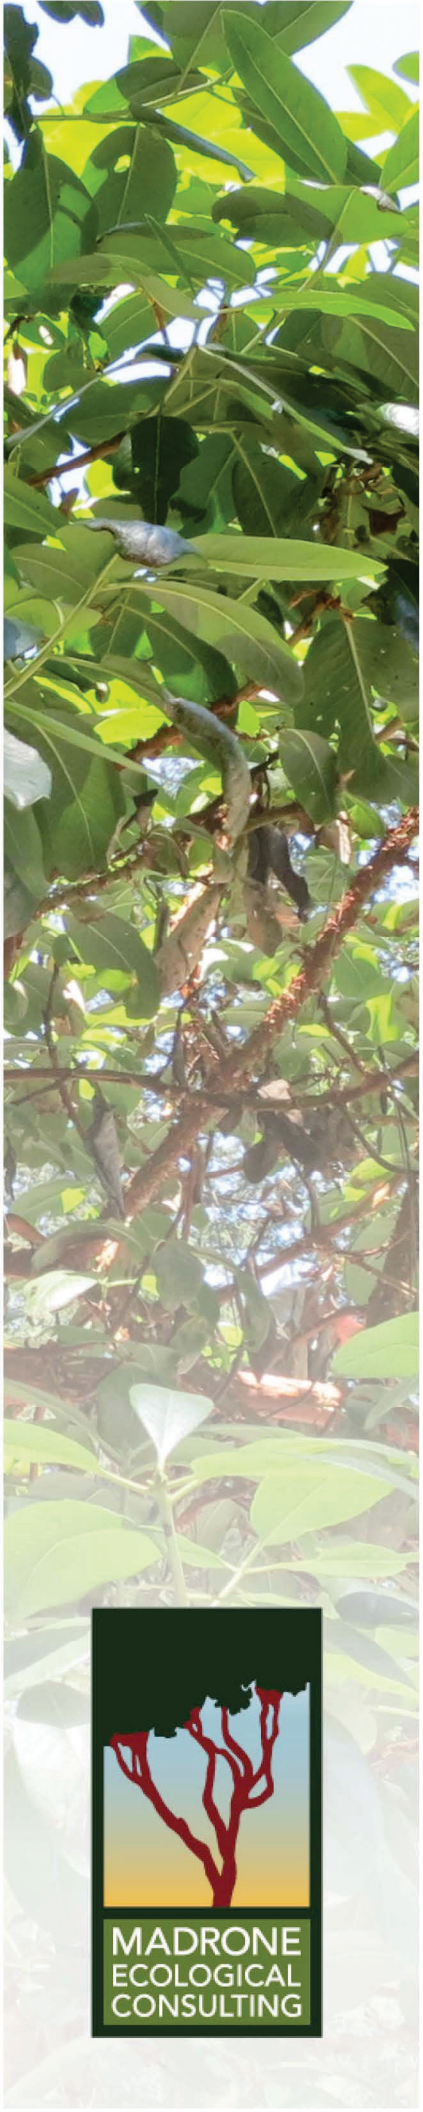
Veronica peregrina	Purslane speedwell	Native
POACEAE		
Aira caryophyllea	Silver hair grass	Non-Native
Alopecurus saccatus	Pacific foxtail	Native
Avena barbata	Slender wild oat	Non-Native
Briza maxima	Large quaking grass	Non-Native
Briza minor	Small quaking grass	Non-Native
Bromus diandrus	Ripgut grass	Non-Native
Bromus hordeaceus	Soft brome	Non-Native
Cynodon dactylon	Bermuda grass	Non-Native
Deschampsia danthonioides	Annual hair grass	Native
Elymus caput-medusae	Medusa head	Non-Native

Plant Species Observed within the Fong Property Study Area
30 April and 16 May 2024



Family / Species Name	Common Name	Native / Non-Native
POACEAE, cont.		
Elymus triticoides	Beardless wild-rye	Native
Festuca myuros	Rattail fescue	Non-Native
Festuca perennis	Ryegrass	Non-Native
Glyceria declinata	Low manna grass	Non-Native
Hordeum marinum	Mediterranean barley	Non-Native
Hordeum murinum	Wall barley	Non-Native
Phalaris lemmonii	Lemmon's canary grass	Native
Polypogon monspeliensis	Annual beard grass	Non-Native
Stipa pulchra	Purple needle grass	Native
POLYGONACEAE		
Polygonum aviculare	Prostrate knotweed	Non-Native
Rumex californicus	California dock	Native
Rumex crispus	Curly dock	Non-Native
PTERIDACEAE		
Pentagramma triangularis	Goldback fern	Native
RANUNCULACEAE		
Ranunculus bonariensis	Vernal pool buttercup	Native
ROSACEAE		
Prunus dulcis	Almond	Non-Native
RUBIACEAE		
Galium aparine	Goose grass	Native
Sherardia arvensis	Field madder	Non-Native
SALICACEAE		
Populus fremontii	Fremont’s cottonwood	Native
THEMIDACEAE		
Brodiaea elegans	Harvest brodiaea	Native
Dipterostemon capitatus	Blue dicks	Native
Triteleia hyacinthina	White brodiaea	Native
Triteleia laxa	Ithuriel's spear	Native

Plant Species Observed within the Fong Property Study Area
30 April and 16 May 2024

Family / Species Name	Common Name	Native / Non-Native
VIBURNACEAE		
Sambucus mexicana	Elderberry	Native

1.0 INTRODUCTION

The purpose of this report is to provide the results of wet season surveys for federally-listed large vernal pool branchiopods (listed large branchiopods) conducted by Madrone Ecological Consulting, LLC (Madrone) within the Estia Dry Creek Project (Study Area) during the 2024-2025 wet season. This report is intended to fulfill the mandatory reporting requirements of the U.S. Fish and Wildlife Service (USFWS) Recovery Permit issued to the permittee as listed on the cover page of this report and as described further below. Conditions within the Study Area during the 2024-2025 wet season were suitable for conducting surveys for listed large branchiopods. Target species included the federally endangered Conservancy fairy shrimp (*Branchinecta conservatio*) and vernal pool tadpole shrimp (*Lepidurus packardi*), as well as the federally-threatened vernal pool fairy shrimp (*Branchinecta lynchi*).

2.0 LOCATION

The combined area of the two parcels (Study Area) is approximately 80 acres. The Study Area is located south of Baseline Road, west of Crowder Lane, and both north and south of Walerga Road, in an unincorporated area of Placer County, California. Baseline Road marks the southern limit of the City of Roseville in the area. The Study Area is within Sections 6-7, Township 10 North, Range 6 East (MDB&M) of the "Citrus Heights, California" and "Roseville, California" 7.5-Minute Series USGS Topographic Quadrangles (USGS 2023 and 2021) (**Figure 1**). The approximate center of the Study Area is latitude 38.747561° and longitude -121.36253°. The property owner contact information is provided on the cover sheets of this report.

3.0 SURVEY AUTHORIZATION

Wet season surveys for listed large branchiopods were conducted under the authority of USFWS Recovery Permit for Madrone senior biologist Daria Snider (89994 B) issued under Section 10(a)(1)(A) of the Endangered Species Act, 16 U.S. Code 1531 et seq. and in accordance with the 13 November 2017 *Survey Guidelines for the Listed Large Branchiopods* (Guidelines) (USFWS 2017). Authorization to conduct wet season surveys was issued by the USFWS in an email from the Sacramento Fish and Wildlife Office on 4 December 2024 (**Attachment A).**

4.0 SURVEY METHODS

All "vernal pools" (as defined by Placer County below) within the Study Area were sampled. **Figure 2** is an exhibit of the sampled habitat features within the Study Area. Five vernal pools were sampled.

The HCP/PCCP requires that during implementation of the initial survey phase, all existing vernal pools be sampled to establish branchiopod occupancy rates for a future reserve system. This requirement modifies the survey methods of the Guidelines as outlined below:

- All vernal pools at a site be surveyed, rather than allowing for the survey to be terminated when presence on a project site is confirmed. If presence is confirmed for vernal pool fairy shrimp and

vernal pool tadpole shrimp in an individual vernal pool, surveys may be stopped for that vernal pool.

- All vernal pools on the project site must be surveyed. Surveys cannot be suspended prior to completion, as allowed by the Guidelines, if one or more of the six listed large branchiopods, identified in the Guidelines is determined to be present.
- The Guidelines define a complete survey as consisting of one wet-season and one dry-season survey conducted and completed in accordance with the Guidelines within a 3-year period. For the purposes of the HCP/PCCP, only one wet-season survey is required; dry-season surveys are not required.
- Data that will be collected at each vernal pool surveyed during the wet season survey will include the presence or absence of vernal pool fairy shrimp and vernal pool tadpole shrimp, species identity and the estimated abundance (10s, 100s, 1,000s) of immature and mature vernal pool fairy shrimp and vernal pool tadpole shrimp present and estimated maximum surface area of the vernal pool. Other information on the USFWS data sheet is not required to be collected (i.e., air and water temperature, average and estimated maximum depth of the vernal pool, presence of non-target crustaceans, insects, and platyhelminths, and habitat condition).
- Information will be recorded on the PCA-provided data sheet, which will be the USFWS data sheet (included as Appendix A to the Guidelines), modified to include the above information.
- Voucher specimens will not be collected during wet season surveys unless the identity of the mature shrimp is uncertain and cannot be identified in the field. The Guidelines allow for a limited number of voucher specimens to be collected for each vernal pool. For the purpose of the HCP/PCCP, the modified survey protocol further limits the collection of voucher specimens to instances where identity is uncertain.

A total of ten field surveys were conducted during the 2024-2025 wet season by Ms. Snider with the assistance of Lily Kalachik on the following dates: 5 December, 18 December 2024, 1 January, 15 January, 29 January, 12 February, 26 February, 10 March, 24 March, and 7 April 2025. As the Study Area lies within Survey Zone A (Southern Oregon, Sacramento Valley, San Francisco Bay Area, North Coast Ranges, Northern Sierra Valley Foothills, Cascade Range foothills, and South Coast Ranges) as defined in the Guidelines, surveys were timed to occur at 14-day intervals after initial inundation of habitat and continued until each potential habitat dried or a minimum of 90 consecutive days of inundation had occurred. Sampling was reinstated within 14 days of an individual habitat drying and inundating during the same wet season.

Sampling methods for features inundated during the survey dates were as follows: each sampled feature was first visually inspected for the presence of listed large branchiopods. Next, the habitat was sampled using a 5-foot-long dip net equipped with a 12-inch D-ring and 650-micron mesh. Net sampling involved making a series of pulls through the ponded habitat by extending the net out and pulling it back in a sweeping or zig-zag motion, occasionally gently bouncing the net at the bottom of the feature. The net was visually examined for captured organisms and then cleaned of debris between pulls. The number of pulls made in each feature was commensurate to feature size and ponding depth. All captured organisms were visually identified to the extent possible and were returned to the habitat they were captured from; no voucher specimens were collected. Data collected during each survey included date, air temperature, water temperature, weather conditions (e.g., sunny, overcast), present maximum depth of each sampled

feature, and hydrology/ponding. If listed large branchiopods were captured, the number of individuals in each feature was estimated in an order of magnitude (e.g., 10s, 100s, 1000s) and recorded.

5.0 GENERAL SITE CONDITIONS AND HABITATS

The Study Area is bounded by an undeveloped area to the north (north of Baseline Road), residential subdivisions to the east and south, and to the west by in-progress residential construction. The Study Area is mostly undeveloped, with the exception of the Walerga Road corridor, which runs southwest to northeast through the site, and a paved bike path that crosses through the southern portion of the site. Undeveloped areas are comprised of non-native annual grassland on gently rolling terrain. The bike path parallels the south side of an intermittent tributary drainage of Dry Creek that bisects the southern portion of the Study Area. The intermittent drainage is bordered by mixed oak woodland that supports native valley oak (*Quercus lobata*), blue oak (*Q. douglasii*), and interior live oak *(Q. wislizenii*).

The Study Area is dominated by annual grassland that is interspersed with an assemblage of vernal pools and seasonal wetlands. Vegetation within the annual grassland is dominated by non-native grasses and forbs such as wild oat (*Avena fatua*), soft brome (*Bromus hordeaceus*), medusa head (*Elymus caput-medusae*), ryegrass (*Festuca perennis*), winter vetch (*Vicia villosa*), and caley pea (*Lathyrus hirsutus*). The understory is primarily comprised of western poison oak (*Toxicodendron diversilobum*), California pipevine (*Aristolochia californica*), and species found in the surrounding annual brome grassland.

6.0 RESULTS

Wet season surveys for large vernal pool branchiopods were conducted within the Estia Dry Creek Study Area by a permitted Madrone biologist during the 2024-2025 wet season. Wet season conditions were suitable for conducting surveys for listed large branchiopods and surveys were conducted following the Survey Zone A protocol outlined in the Guidelines. All captured organisms were visually identified to the extent possible and were returned to the habitat they were captured from; no voucher specimens were collected.

Attachment B contains the wet season data sheets from each sampling event and provides detailed sampling data. **Attachment C** includes the representative photographs taken of the Study Area during the 2024-2025 wet season surveys.

No listed large branchiopods were observed within the Study Area during the 2024-2025 wet season surveys. Other large branchiopods observed during the surveys included the common California fairy shrimp (*Linderiella occidentalis*) which was documented in two features. Aquatic invertebrates observed included micro-turbellaria, ostracods, cladocera, and copepods.

USFWS Survey Authorization

From:	SFWO Permits, FW8
To:	Daria Snider
Cc:	Sarah Vonderohe; Cook, Megan T;
Subject:	Re: [EXTERNAL] Request to Conduct Wet-Season and Dry-Season Vernal Pool Branchiopod Surveys - Estia Dry Creek
Sent:	12/4/2024 1:33:48 PM

Hello,

Thank you for the email. We have reviewed your request and approve the wet season survey with vernal pool branchiopods. By conducting activities with listed species under the recovery permit, you agree to follow the Special Terms and Conditions of the permit. Failure to do so will result in suspension or revocation of the recovery permit. Please remember to carry a copy of the permit while performing authorized activities. This authorization does not include access to the property, which must be arranged with the landowner or manager.

Within 90 days following completion of the final presence/absence survey for the vernal pool branchiopods, a report shall be submitted to fw8_sfwo_permits@fws.gov and the Sacramento Valley Division Supervisor, Megan Cook (megan_cook@fws.gov). The report will include all reporting criteria specified in the Survey Guidelines for the Listed Large Branchiopods. For surveys with negative results and for incomplete surveys (e.g., projects put on hold or withdrawn) a survey report is still required. Survey reports shall include:

1. i) Title, ii) permit number, iv) permittee name and their respective contact details, v) the location/GPS coordinates, vi) number and dates of surveys, vii) the activities completed, and viii) date of preparation on the report;
2. GIS data or GPS coordinates. The location of the listed vernal pool branchiopods (i.e., pools, swales, ponds) shall be plotted in as precise a manner as possible on 1:24,000 or closer scale map(s) of the survey area. Maps shall be either topographic or aerial photography with roads and place names identified (where available). Surface features on the map shall be readable and not masked out by other information. Maps shall identify the scale and include a North Arrow;
3. All vernal pool data sheets should be included as attachments to this final report. Vernal pool datasheets will not solely be submitted as a final report for any one project site;
4. The following certification statement signed by each surveyor performing activities in independent status pursuant to this permit: “I certify that the information in this survey report and attached exhibits fully and accurately represents my work.” The date of signature and the surveyor’s permit number shall be included; and
5. All other information required in the Survey Guidelines for the Listed Large Branchiopods and 90-Day Survey Report section of the permit.

Please email fw8_sfwo_permits@fws.gov if you have additional questions.

Thank you,

Sacramento Fish and Wildlife Office

Subject: [EXTERNAL] Request to Conduct Wet-Season and Dry-Season Vernal Pool Branchiopod Surveys - Estia Dry Creek

This email has been received from outside of DOI - Use caution before clicking on links, opening attachments, or responding.

Hi,

I would like to request permission to conduct wet season sampling for federally listed vernal pool branchiopods within the Estia Dry Creek Survey Area in Placer County, California (**Figure 1**). The Survey Area is located within the Placer County Conservation Plan (PCCP) Area and the results of the surveys will be reported to the PCCP (County) per the Plan guidance. We will only be surveying the depressional vernal pools and any seasonal wetlands that function as vernal pools within the PCCP Area, as swales are not

required to be surveyed according to the PCCP guidance. Please see the request to sample below and let me know if you have any questions. The authorized work would be conducted under the following permits: Dustin Brown (TE85084C-0; pending), Bonnie Peterson (TE205600-1), Daria Snider (TE89994B-0), Tara Collins (ESPER0121456) and Matthew Shaffer (ESPER4207925).

Purpose

The purpose of the survey is to determine the abundance of federally-listed vernal pool branchiopods within the Survey Area. Knowing which species are present within the Survey Area will assist the PCCP in mitigation planning.

Methods

The surveys will be conducted according to the *Survey Guidelines for the Listed Large Branchiopods* (Guidelines), updated in November 2017; with the modification that only vernal pools and any seasonal wetlands that function as vernal pools will be sampled.

Proposed Survey Schedule

Wet-season sampling of 4 vernal pools totaling 1.01 acres and up to 20 seasonal wetlands totaling 0.20 acre will commence following approval from the Service and when sufficient rain has fallen to inundate the features and will occur every 14-days until the feature has dried or has been inundated for 90-consecutive days. The final number of wetlands (and associated acreage) sampled will depend on how many of the seasonal wetlands appear to be functioning as vernal pools.

Location/UTM Coordinates

The approximately 80-acre Survey Area is located south of Baseline Road and north and south of Walerga Road in western Placer County, California and corresponds to portions of Sections 6 and 7, Township 10 North, and Range 6 East of the "Citrus Heights, California" and "Roseville, California" 7.5-minute quadrangles (U.S. Geological Survey 2023 and 2021). The approximate center of the Study Area is located at Longitude -121.36253, Latitude 38.747561 (**Figure 1**).

Site Description and Proposed Survey Features/Wetland Acreages

The Survey Area is located in the Sacramento Valley at an elevation of approximately 100 feet above mean sea level. It is comprised of ungrazed annual brome grasslands. There are 4 vernal pools totaling 1.01 acres and 20 seasonal wetlands totaling 0.20 acre within the Survey Area that may represent potential habitat for federally-listed vernal pool branchiopods (**Figure 2**).

Land Owner

The contact information for the Survey Area land owner is:

Fong Family Trust
7919 Folsom Blvd #340
Sacramento, CA 95826

Recovery of the Species

By conducting branchiopod surveys within the Survey Area, we will potentially provide additional species distribution data. An accumulation of such information may enhance the understanding of the biology and ecology of vernal pool crustaceans, and allow us to better manage, protect, and promote the recovery of these species.

If you have any questions or need additional information, please do not hesitate to contact me at (916) 822-3230 or dsnider@madroneeco.com.

December 26, 2023

Mr. Chris Dickinson
Towne Development of Sacramento, Inc.
1640 Lead Hill Blvd., Suite 220
Roseville, CA 95661

Subject: Estia Walerga
Walerga Road and Baseline Road
Placer County, California

GEOTECHNICAL DUE DILIGENCE REVIEW

Dear Mr. Dickinson:

At your request, we prepared this due diligence letter to summarize our geotechnical findings and provide preliminary considerations for your site acquisition. As outlined in our agreement dated November 30, 2023, you authorized ENGEO to conduct the following scope of services.

- Review relevant data from the provided geotechnical report
- Review geologic maps, historic aerial photographs, topographic maps, and other nearby geotechnical data in our files
- Visit the site to observe the current surface conditions and collect several near-surface soil samples for visual classification and laboratory testing
- Perform plasticity index and sieve analysis in our laboratory on representative soil samples
- Prepare a geotechnical due diligence review letter with an overview of the geologic and geotechnical issues that may impact site development

For our use, we were provided a Geotechnical Engineering Report for the Vineyard Christian School Project, prepared by Wallace Kuhl and Associates, and dated August 2, 2018. This document is referenced in the Selected References List at the end of this letter.

PROJECT LOCATION

The approximately 88-acre Estia Walerga site is identified as Assessor's Parcel Numbers (APNs) 023-221-076 and 023-221-076. The site is bisected by Walerga Road and is located south of Baseline Road in unincorporated Placer County, California. A tributary to Dry Creek is located in the southern portion of the site, oriented approximately northeast–southwest. As shown in Exhibit 1, the site is bound by Baseline Road to the north and bordered by residential subdivisions.

EXHIBIT 1: Site Vicinity Map

Aerial image by Google Earth. * Figure not OCR Compatible

PROJECT DESCRIPTION

While a conceptual plan is still being developed, we understand the project will likely consist of a combination of single-family residential houses and single-story duets on either side of Walerga Road.

We anticipate the buildings will be one- to three-story wood-framed residential structures and one- to two-story duets. We expect associated improvements could include roadways, sidewalks, parking lots, underground utilities, stormwater basins, and landscaping. Structural loads and grading are yet to be determined; however, we assume that structural loads will be representative of this type of construction and that cut and fill of less than roughly 5 feet may be required for construction.

SITE BACKGROUND

We reviewed topographic maps, aerial photographs, and satellite imagery of the site for the years summarized in Table 1 below.

TABLE 1: Historical Review Summary

HISTORICAL MAP/PHOTOGRAPH	YEARS
Topographic Maps	1891-1893, 1902, 1911, 1947, 1951, 1954, 1956, 1957, 1967, 1975, 1980, 1992, 1994
Aerial Photographs and Satellite Imagery	1947, 1957, 1958, 1964, 1966, 1984, 1993, 1998, 2002–2023

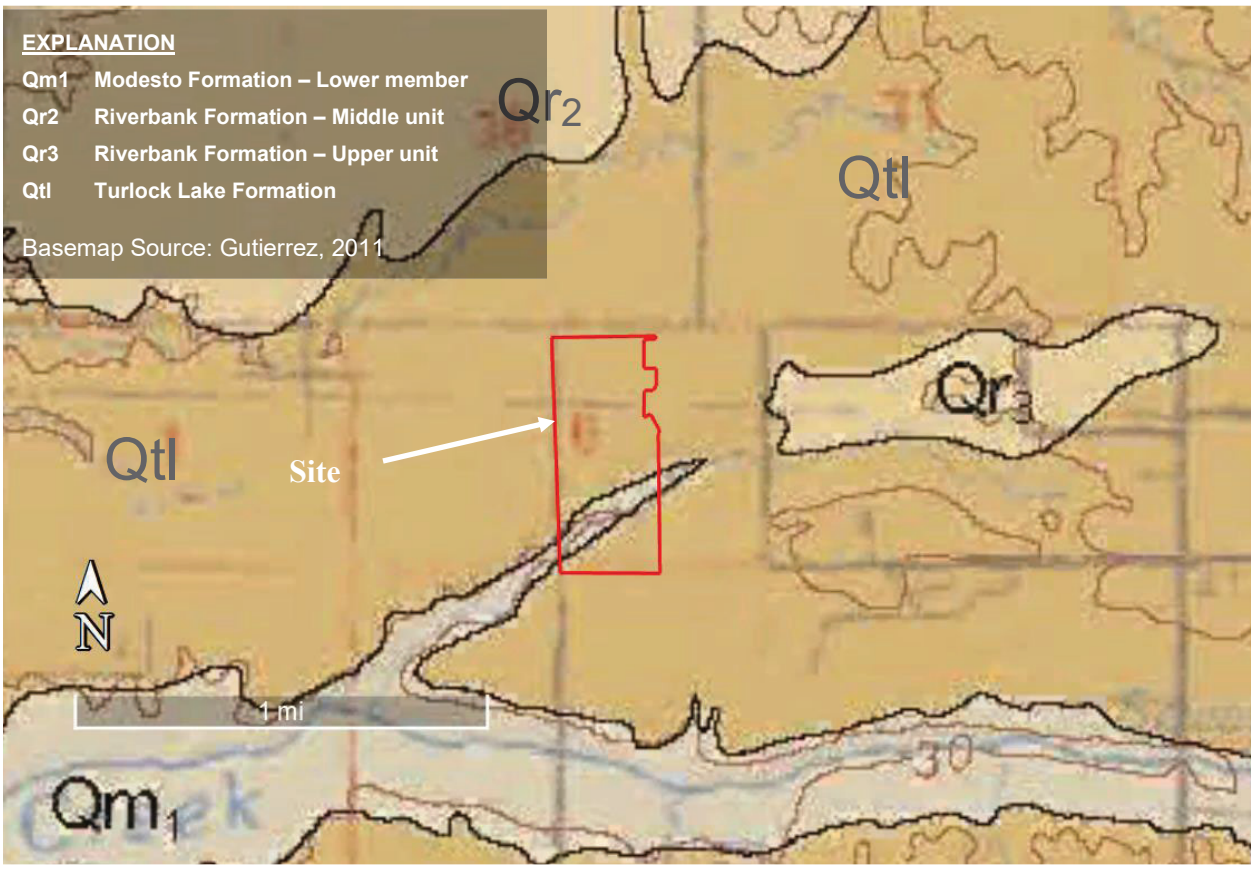
The majority of the site has remained undeveloped since at least 1947, with a tributary to Dry Creek located in the southern portion of the site, oriented approximately northeast–southwest. Grading for Walerga Road, which bisects the site, was first shown on the May 2002 aerial photograph as shown in Exhibit 2; the road was shown to be in use in the November 2002 photograph. Additional grading was shown south of the Dry Creek tributary on the May through December 2002 aerial photographs in what appears to be a future extension to Vineyard Road. This area is currently a bike trail with underground utilities. The remainder of the site appears to have remained vacant and unused.

EXHIBIT 2: May 2002 Satellite Image Showing Grading and Earthwork.

EXHIBIT 3: December 2002 Satellite Image Showing Walerga Road and Other Improvements

* Figures not OCR Compatible

GEOLOGY AND SEISMIC HAZARDS



The site is located in the Great Valley Geomorphic Province. The Great Valley is an elongate, northwest-trending structural trough bound by the Coast Ranges on the west and the Sierra Nevada on the east. The Great Valley has been and is presently being filled with sediment primarily derived from surrounding mountain ranges.

As shown in Exhibit 4, Regional Geologic Map, the site is mapped as Pleistocene alluvial deposits. Gutierrez (2011) mapped the underlying geologic formation as the Turlock Lake Formation (Qtl). The Turlock Lake Formation consists of deeply weathered gravel, sand, and silt derived from the

western slopes of the Sierra Nevada, and is older than 700,000 years (Helley and Harwood, 1985). Overlying the Turlock Lake Formation along the unnamed Dry Creek tributary, Gutierrez mapped the lower member of the Pleistocene Modesto Formation. The Modesto Formation consists of unconsolidated, slightly weathered, tan to light gray alluvium composed of gravel, sand, silt, and clay derived from surrounding mountains.

EXHIBIT 4: Regional Geologic Map

* Figure not OCR Compatible

No State of California Landslide and/or Liquefaction Zones of Required Investigations maps for the site have been published.

The site is not located within a currently designated Alquist-Priolo Earthquake Fault Zone and no known surface expression of active faults is believed to exist within the site. The site does lie within a seismically active region, as California has numerous faults that are known to be active.

SITE RECONNAISSANCE AND FIELD SAMPLING

We visited the site on December 8, 2023, to perform a site reconnaissance and observe the current site conditions. We also collected shallow soil samples for laboratory testing. The sample locations are shown on the Site Plan, Figure 1.

The site generally consisted of relatively level grass land with some areas of low hilly terrain, with a moderate growth of seasonal grasses. A tributary to Dry Creek was observed in the southern portion of the site and was dry at the time of our site visit. Walerga Road bisects the site and a

paved bike path was observed in the southern portion of the site. We observed the following additional site features during our reconnaissance.

- Numerous large trees in the southern portion of the site along the Dry Creek tributary riparian corridor
- A paved extension to Vineyard Road that entered the site from the east and extended a short distance
- Culverts and other drainage diversions near Walerga Road

PHOTO 1: Southern Portion of Site, Showing Bike Path and Dry Creek Tributary

PHOTO 2: Southwestern Portion of Site, Showing Walerga Road and Bike Path, Looking North

PHOTO 3: Typical Conditions in Northern Portion of the Site, Looking South

PHOTO 4: Typical Conditions at Dry Creek Tributary

While no topographic information was provided, Google Earth (WGS 84) indicates that site grades range from approximately Elevation 125 feet in the east to approximately Elevation 95 feet in the southwestern corner at the Dry Creek tributary invert. The topography generally slopes toward the Dry Creek tributary in the southern portion of the site, and to the north in the northern portion of the site (north of Walerga Road).

* Photos not OCR Compatible

SUBSURFACE CONDITIONS

We collected seven near-surface soil samples at the locations indicated on Figure 1, Site Plan, for visual classification in general accordance with the Unified Soil Classification System (USCS) and laboratory testing, as summarized in Table 2 below. The near-surface soil generally consisted of silty or clayey sand or sandy lean clay. Plasticity index (PI) tests on representative soil samples of the clayey material resulted in PIs of 14 and 15, indicating low to moderate swell potential with variations in moisture content. This is generally consistent with tests performed by others at other locations on the site.

TABLE 2: Near-Surface Soil Samples

SAMPLE NO.	USCS SOIL DESCRIPTION	LABORATORY TEST RESULTS
SS-1	SILTY SAND (SM), dark reddish brown, slightly moist, fine-grained sand, approx. 40% fines	
SS-2	SANDY LEAN CLAY (CL), dark brown, slightly moist, medium plasticity, fine- to medium-grained sand	64.5% FINES; LL 31, PL 16, PI 15
SS-3	SILTY SAND (SM), dark yellowish brown, slightly moist, fine- to medium-grained sand, approx. 15% fines, traces of fine to coarse subangular to subrounded gravel	
SS-4	SILTY SAND (SM), dark brown, slightly moist, fine- to coarse-grained sand, approx. 20% fines	
SS-5	CLAYEY SAND (SC), dark yellowish brown, fine- to coarse-grained sand, medium plasticity fines	32% FINES; LL 29, PL 15, PI 14
SS-6	SILTY SAND (SM), dark reddish brown, slightly moist, fine- to coarse-grained sand, approx. 30% fines	
SS-7	SILTY SAND (SM), dark reddish brown, slightly moist, fine- to medium-grained sand, approx. 20% fines, traces of fine to coarse subangular to subrounded gravel	

USCS=United Soil Classification System per ASTM D 2487-06
LL=Liquid Limit; PL=Plastic Limit; PI=Plasticity Index per ASTM D4318-17e1

Previous subsurface explorations by others generally encountered medium dense to very dense, fine to coarse silty and clayey sand interbedded with sandy silt from the ground surface to the maximum depth explored of approximately 21½ feet below the ground surface. The three borings located between Walerga Road and the Dry Creek tributary (Borings D7, D8, and D9) encountered a surficial layer of loose to medium dense silty or clayey sand. The surficial layer was between approximately 4 and 8 feet in thickness and was underlain by medium dense to very dense sand and silty sand. Boring logs and laboratory test reports prepared by others are included in Appendix B.

LABORATORY TESTING

We performed laboratory tests on selected soil samples to evaluate their engineering properties. For this project, we performed plasticity index and sieve analysis. Laboratory data sheets are included in Appendix A. Data from laboratory tests performed by others are included in Appendix B.

GROUNDWATER CONDITIONS

Groundwater was not encountered in the previous subsurface exploration performed by others. We reviewed the Sustainable Groundwater Management Act (SGMA) Data Viewer

(https://sgma.water.ca.gov/webgis/?appid=SGMADataViewer#gwlevels), a website maintained by the State of California Department of Water Resources, for local groundwater levels. The data viewer plotted groundwater contours that indicated groundwater in the vicinity occurred at depths of 110 to 120 feet in fall 2021 and 100 to 110 feet in spring 2022.

Fluctuations in the level of groundwater may occur due to variations in rainfall, irrigation practice, and other factors not evident at the time measurements were made.

GEOTECHNICAL CONSIDERATIONS

Based on our review of the existing information and site conditions, the primary geotechnical concerns that may impact site development are expansive soil and loose surficial soil. We describe these and other considerations below.

Expansive Soil - We observed potentially expansive lean clay and clayey sand at shallow depths during our site reconnaissance. Our laboratory testing and previous laboratory testing by others indicate that this soil exhibits low to moderate shrink/swell potential with variations in moisture content. Based on our observations and experience with the underlying geologic formation, we anticipate that expansive clay layers may be discontinuous on the site.

Expansive soil changes in volume with changes in moisture. It can shrink or swell and cause heaving and cracking of slabs-on-grade, pavements, and structures founded on shallow foundations. Damage due to volume changes associated with expansive soil can be reduced by capping the expansive soil with a blanket of low-expansive soil or by using a rigid mat foundation that is designed to resist the settlement and heave of expansive soil.

To mitigate potential damage from expansive soil, selective grading or blending would be necessary to create relatively low expansion potential surface conditions. Selective grading typically involves careful planning of cut and fill, along with blending and disking to mix soil types and create low expansion soil conditions. Creating low expansion conditions can necessitate more complicated cut/fill operations and multiple blending operations that can increase earthwork costs. As an alternative to selective grading, properly designed post-tensioned mat foundations bearing on competent native soil or compacted fill could be used for building foundations to mitigate the effects of expansive soil.

Loose Surficial Soil – Portions of the site appear to have been disced and the upper approximately ½ to 1 foot of soil appears to consist of loose/disturbed clay, silt, and sand. General site clearing, stripping, and compaction of subgrade will likely mitigate loose soil conditions of 1 foot or less.

Loose Soil Near the Creek - Previous explorations indicate that portions of the site are underlain by between approximately 4 and 8 feet of loose soil. Borings D7, D8, and D9 encountered this soil horizon that was markedly less dense than at the other portions of the site. Fill or loose soil horizons greater than 1 foot thick may need to be partially overexcavated and recompacted in areas to be developed. We recommend that a design-level geotechnical exploration be performed to further evaluate the depth and extent of the loose soil to determine if mitigation is necessary for development.

FUTURE DESIGN-LEVEL STUDIES

A design-level geotechnical exploration will need to be performed when development plans are finalized. The design-level geotechnical report would likely include:

- Additional subsurface exploration based upon the development plans to evaluate the extent of loose soil south of Walerga Road.
- Design-level foundation and earthwork recommendations.
- Pavement recommendations.
- Slab-on-grade and exterior flatwork recommendations.
- California Building Code seismic design parameters.

LIMITATIONS

The recommendations provided in this letter are professional opinions developed for site acquisition purposes. We strive to perform our professional services in accordance with generally accepted principles and practices currently employed in the area; there is no warranty, express or implied. We developed this letter with limited subsurface data by others and assumed that the subsurface exploration data prepared by others are representative of the actual subsurface conditions at the site. If changes occur in the nature or design of the project, we should be allowed to review this report and provide additional recommendations, if any.

If you have any questions or comments regarding this letter, please call and we will be glad to discuss them with you.

Sincerely,

ENGEO Incorporated

Stephen Blakely, CEG

Mark Gilbert, GE

FIGURE 14

UNIFIED SOIL CLASSIFICATION SYSTEM (ASTM D2487)

MAJOR DIVISIONS		USCS[4]	CODE	CHARACTERISTICS
COARSE GRAINED SOILS (More than 50% of soil > no. 200 sieve size)	GRAVELS[1] (More than 50% of coarse fraction > no. 4 sieve size)	GW		Well-graded gravels or gravel - sand mixtures, trace or no fines
		GP		Poorly graded gravels or gravel - sand mixtures, trace or no fines
		GM		Silty gravels, gravel - sand - silt mixtures, containing little to some fines[2]
		GC		Clayey gravels, gravel - sand - clay mixtures, containing little to some fines[2]
	SANDS[1] (50% or more of coarse fraction < no. 4 sieve size)	SW		Well-graded sands or sand - gravel mixtures, trace or no fines
		SP		Poorly graded sands or sand - gravel mixtures, trace or no fines
		SM		Silty sands, sand - gravel - silt mixtures, containing little to some fines[2]
		SC		Clayey sands, sand - gravel - clay mixtures, containing little to some fines[2]
FINE GRAINED SOILS (50% or more of soil < no. 200 sieve size)	SILTS & CLAYS LL < 50	ML		Inorganic silts, gravely silts, and sandy silts that are non-plastic or with low plasticity
		CL		Inorganic lean clays, gravelly lean clays, sandy lean clays of low to medium plasticity[3]
		OL		Organic silts, organic lean clays, and organic silty clays
	SILTS & CLAYS LL ≥ 50	MH		Inorganic elastic silts, gravelly elastic silts, and sandy elastic silts
		CH		Inorganic fat clays, gravelly fat clays, sandy fat clays of medium to high plasticity
		OH		Organic fat clays, gravelly fat clays, sandy fat clays of medium to high plasticity
HIGHLY ORGANIC SOILS		PT		Peat
ROCK		RX		Rocks, weathered to fresh
FILL		FILL		Artificially placed fill material

OTHER SYMBOLS

= Drive Sample: 2-1/2" O.D. Modified California sampler

= Drive Sampler: no recovery

= SPT Sampler

= Initial Water Level

= Final Water Level

— — — = Estimated or gradational material change line

——— = Observed material change line

Laboratory Tests

CR = Corrosion
PI = Plasticity Index
EI = Expansion Index
UCC = Unconfined Compression Test (TSF)
TR = Triaxial Compression Test
GR = Gradational Analysis (Sieve/Hydro)
FC = Wash (Fines Content)
PP = Pocket Penetrometer Test (TSF)
PID = Photo Ionization Detector Test (PPM)
RV = Resistance ("R") Value

REF = Refusal (>50 blows in 6 inches)

GRAIN SIZE CLASSIFICATION

CLASSIFICATION	RANGE OF GRAIN SIZES	
	U.S. Standard Sieve Size	Grain Size in Millimeters
BOULDERS (b)	Above 12"	Above 300
COBBLES (c)	12" to 3"	300 to 75
GRAVEL (g) coarse fine	3" to No. 4 3" to 3/4" 3/4" to No. 4	75 to 4.75 75 to 19 19 to 4.75
SAND coarse medium fine	No. 4 to No. 200 No. 4 to No. 10 No. 10 to No. 40 No. 40 to No. 200	4.75 to 0.075 4.75 to 2.00 2.00 to 0.425 0.425 to 0.075
SILT & CLAY	Below No. 200	Below 0.075

Trace - Less than 5 percent
Few - 5 to 10 percent
Little - 15 to 25 percent
Some - 35 to 45 percent
Mostly - 50 to 100 percent

* Percents as given in ASTM D2488

NOTES:

1. Coarse grained soils containing 5% to 12% fines, use dual classification symbol (ex. SP-SM).
2. If fines classify as CL-ML (4<PI<7), use dual symbol (ex. SC-SM).
3. Silty Clays, use dual symbol (CL-ML).
4. Borderline soils with uncertain classification list both classifications (ex. CL/ML).

Attn: Mr. Chris Dickinson

SUBJECT: Phase I Environmental Site Assessment
Fong Property
Old Walerga Road and Baseline Road
Roseville, California 95747
ERA Project No. 01-2023-400-003

Dear Mr. Dickinson,

Environmental Risk Assessors (ERA) is pleased to present this Phase I Environmental Site Assessment (Phase I ESA) Report for the above-referenced property (the Site).

The Phase I ESA was conducted in general accordance with the processes prescribed in the American Society for Testing Materials International (ASTM) E 1527-21 guidelines and the Code of Federal Regulations (CFR) 40 CFR Part 312 *Standards and Practices for All Appropriate Inquiries: Final Rule*. The primary purpose of the Phase I ESA was to identify recognized environmental conditions (RECs) in connection with the Site. Our scope of work and findings are presented in the attached report.

It has been a pleasure working with you on this project. Please do not hesitate to contact me via email at litafreeman@gmail.com or telephone at (916) 677-9897 if you have any questions or comments regarding this assessment.

Sincerely,

Environmental Risk Assessors

Lita D. Freeman, PG

1. EXECUTIVE SUMMARY

Environmental Risk Assessors (ERA) is pleased to present this Phase I Environmental Site Assessment (ESA) Report (the "Report") to Towne Development of Sacramento, Inc. (Towne) for the approximately 86-acre property located to the southwest of the intersection of Walerga Road and Baseline Road in Roseville, Placer County, California (the "Site"; Figure 1). The Site consists of two parcels of land that are identified by Placer County Assessor Parcel Numbers (APNs) 023-221-076-000 (the *northern parcel*; approximately 51 acres) and 023-221-074-000 (the sou*thern parcel*; approximately 35 acres). The Site is currently vacant land (Site Plan; Figure 2).

The objective of the Phase I ESA was to identify recognized environmental conditions (RECs) in connection with the Site, to the extent feasible pursuant to the processes prescribed in the American Society for Testing Materials International (ASTM) E 1527-21 guidelines entitled *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*, and U.S. Environmental Protections Agency's *All Appropriate Inquires (AAI) Final Rule* (Code of Federal Regulations [CFR] 40 CFR Part 312).

1.1 On-Site Findings

The following information was obtained by ERA from our review of regulatory agency files and databases, our site observations, and interviews:

- No structures were apparent on site in the historical sources reviewed during this assessment. Historical resources reveal that most of the Site was used for agricultural purposes (dry-land farming) with the remainder as undeveloped land between at least 1910 and the early 1990s. According to the *Interim Guidance for Sampling Agricultural Properties (Third Revision)* dated August 7, 2008, by the California Environmental Protection Agency Department of Toxic Substances Control (DTSC), crops grown using dry-land methods are generally not treated with agricultural chemicals including environmentally persistent pesticides. The northern portion was used for cattle grazing in 2018 and 2019. Historical resources reveal that the Site's southern portion has been undeveloped land since at least 1910. Walerga Road (aka Old Walerga Road) has been present along the Site's western side since at least 1910; Walerga Road was realigned to cross the Site by 2006.
- No evidence of former structures was observed on the Site and no paved area or possible covers for underground utilities (as noted in the 1984 aerial photo; see Section 5) was observed at the Site's northwestern corner during the site visit. Small debris piles (household trash, furniture, children's toys, etc.) and several small piles of asphalt rubble were observed along Old Walerga Road. A small soil and gravel stockpile was observed on the Site's western portion just off Old Walerga Road. Also, a soil stockpile was observed near the Site's northeastern corner and appeared to be related to grading activities along the Site's northern border. Two large construction equipment size vehicle tires, reportedly used as cattle water troughs, were located on the Site's central portion. No evidence of chemical or fuel releases was noted in these areas. Markers for a buried fiber optic cable were observed along the east side of Old Walerga Road and several Placer Waterworks utility boxes were located across the Site. A tree-lined creek, a paved walking path with several underground utility covers (marked as *Sanitary Sewer*) located along the walking path, and several unpaved paths cross the Site's southern portion.
- Wetlands have not been mapped on site by the U.S. Fish and Wildlife Service; however, the California Department of Fish and Wildlife has mapped state wetlands on the Site's northern portion. During the site visit, this area had a generally level topography.

- The Site is not located within a Federal Emergency Management Agency 1% Special Flood Hazard Area (100-year) zone and is not located within a 0.2% Annual Chance Flood Hazard (500-year) zone except a small area on the Site's southwestern corner along the creek.
- According to Environmental Data Resources, Inc. (EDR) and ERA's review of online databases, the site location has not been included in the regulatory agency databases reviewed for this assessment. EDR's search did not reveal environmental liens or activity and use limitations for the Site.

1.2 Off-Site Findings

- Based on review of available historical resources, the surrounding areas were predominantly undeveloped land or used for agricultural purposes (dry-land farming) between at least 1910 and the late 1990s with Baseline Road along the Site's northern border and Walerga Road along the Site's western border. By the mid-2000s, the existing single-family residences had been constructed on the east adjoining properties with Walerga Road realigned to its' current configuration. No significant changes were noted in the site vicinity since the mid-2000s except a residential development is currently being constructed on the west adjoining property and Baseline Road is being widened.
- According to EDR, several regulated facilities were identified within the ASTM search distances during the regulatory agency databases review with none located within a 1,000-foot radius of the Site except the Rutan Environmental Safety Services Corporation property located approximately 675 feet east of the Site. This business has been included in the Resources Conservation and Recovery Act (RCRA) NonGen/ No Longer Regulated (RCRA NonGen/NLR) database. Based on the lack of reported releases at this property, this facility does not appear to present a significant environmental concern to the Site.
- Regulated properties that could not be located because of insufficient address information are referred to by EDR as "orphan" facilities. Several orphan facilities/properties were reported by EDR but, based on observations during the site visit and ERA's knowledge of the site vicinity, these facilities/properties are not located within close proximity to the Site.

1.3 Opinion

A *recognized environmental condition (REC)* refers to the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: due to release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment. The following was identified during the course of this assessment:

- ERA did not identify *RECs* during the course of this assessment.

A *controlled recognized environmental condition (CREC)* refers to a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

The following was identified during the course of this assessment:

- ERA did not identify *CRECs* during the course of this assessment.

A *historical recognized environmental condition (HREC)* refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use

criteria established by a regulatory authority, without subjecting the property to any required controls. The following was identified during the course of this assessment:

- ERA did not identify *HRECs* during the course of this assessment.

A *de minimis* condition is a condition that generally does not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. The following was identified during the course of this assessment:

- ERA did not identify a *de minimis* condition during the course of this assessment.

1.4 Limiting Factors/Data Gaps

The following limiting factors were documented during this assessment: a 50-year chain-of-title report was not provided to ERA for review, intervals between aerial photographs/topographic maps were more than 5 years, surface soil could not be observed in some on-site areas because of thick vegetation, and site observations were limited due to the size of the Site.

These limiting factors represent data gaps but do not represent significant data gaps and are unlikely to impact ERA's ability to identify RECs. Based on information obtained by ERA during our review of historical sources and observation of site conditions during our visit, these limiting factors would not appear to be significant and we do not anticipate that the information that could be obtained from these sources would change the conclusions of this report.

1.5 Conclusions

ERA has performed this assessment in conformance with the scope and limitations of ASTM Practice E 1527-21 for Phase I ESAs.

Based on the available information, this assessment has revealed no RECs, CRECs, HRECs, de minimis conditions, or significant data gaps in connection with the Site.

1.6 Recommendations

Based on the findings of this Phase I ESA, no further assessment appears warranted at the Site.

2. INTRODUCTION

ERA is pleased to present this Phase I ESA Report to Towne for the approximately 86-acre rectangular shaped property located southwest of the intersection of Walerga Road and Baseline Road in Roseville, Placer County, California (the "Site"; Figure 1). The Site is currently vacant land (Site Plan; Figure 2) and consists of two parcels of land that are identified by the Placer County APNs 023-221-076-000 (the *northern parcel*) and 023-221-074-000 (the *southern parcel*).

This assessment included review of information gathered from federal, State of California ("the State"), and local regulatory agencies, and a site visit conducted by ERA staff. The findings and conclusions presented in this Report are based on the results of a reconnaissance-level site visit, review of regulatory records, and our review of available and pertinent background information.

2.1 Purpose

Towne requested that ERA conduct a Phase I ESA of the Site to facilitate their evaluation of the Site for potential environmental concerns.

The purpose of this assessment has been to identify RECs in connection with the Site to the extent feasible pursuant to the processes prescribed in ASTM's *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM Designation E 1527-21), and CFR 40 CFR Part 312 *Standards and Practices for All Appropriate Inquiries: Final Rule* of November 1, 2005, as amended December 30, 2013. RECs, as defined by ASTM Standard Practice E1527-21, are the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or the material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property.

The term includes the presence or release of hazardous substances or petroleum products that occur under conditions that are in compliance with environmental laws. The term is not intended to include *de minimis* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. *De minimis* conditions are not RECs.

ASTM Standard Practice E1527-21 includes an evaluation of vapor encroachment potential as noted in ASTM's Vapor Encroachment Standard (ASTM E 2600-10).

2.2 Detailed Scope of Services

The Phase I ESA conducted by ERA included, but was not limited to, the following services:

- Conducting a reconnaissance-level site visit to look for visual evidence of the release(s) of hazardous materials and/or petroleum products, and to assess the potential for on-site releases of hazardous materials and/or petroleum products;
- Conducting a drive-by reconnaissance of adjacent properties and the site vicinity;
- Reviewing regulatory agency files;
- Reviewing historical documents; and
- Preparing this report presenting our findings, including conclusions and recommendations, as warranted.

2.3 Significant Assumptions

The purpose of the assessment is to provide appropriate inquiry into the ownership and use of the Site, consistent with good commercial and customary practice, in an effort to minimize liability. ERA assumes that the information provided by Towne, the regulatory database provider, and the regulatory agencies is correct, true and reliable.

2.4 Limitations and Exceptions

The opinions and recommendations presented in the Report are based upon the scope of services, information obtained through the performance of the services, and the schedule as agreed upon by ERA and the party for whom this report was originally prepared. This Report is an instrument of professional service and was prepared in accordance with the generally accepted standards and level of skill and care under similar conditions and circumstances established by the environmental consulting industry. No representation, warranty, or guarantee, express or implied, is intended or given. To the extent that ERA relied upon information prepared by other parties not under contract to ERA, ERA makes no representation as to the accuracy or completeness of such information.

This Report is expressly for the sole and exclusive use of the parties for which this Report was originally prepared for a particular purpose. Only the parties for which this Report was originally prepared and/or other specifically named parties, may make use of and rely upon the information in this Report, in its entirety, for a period not to exceed 180 days in accordance with ASTM's *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* ASTM Designation E 1527-00 dated May 10, 2000, ASTM's *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* ASTM Designation E 1527-21, and/or 40 CFR Part 312 *Standards and Practices for All Appropriate Inquiries: Final Rule* of November 1, 2005 as amended December 30, 2013. After 180 days, and prior to using the information contained herein, the report should be updated in accordance with ASTM standards and federal regulations. Reuse of this Report or any portion thereof for other than its intended purpose, or if modified, or if used by third parties without proper authorization, shall be at the user's sole risk.

The findings presented in this Report apply solely to site conditions existing at the time when ERA's assessment was performed. It must be recognized, however, that a Phase I ESA is conducted for the purpose of evaluating the potential for contamination through limited research and investigative activities and in no way represents a conclusive or complete site characterization. Conditions in other parts of the project Site may vary from those at the locations where data were collected. ERA's ability to interpret investigation results is related to the availability of the data and the extent of the investigation activities. Therefore, 100 percent confidence in Phase I ESA conclusions cannot reasonably be achieved.

ERA, therefore, does not provide any guarantees, certifications, or warranties that a property is free from environmental contamination. Furthermore, nothing contained in this document shall relieve any other party of its responsibility to abide by contract documents and applicable laws, codes, regulations, or standards.

The following limiting factors were documented during this assessment: 1) a 50-year chain-of-title report was not provided to ERA for review; 2) intervals between aerial photographs/topographic maps were more than 5 years; 3) surface soil could not be observed in some on-site areas because of thick vegetation, and 4) visual observations were limited due to the size of the Site. These limiting factors represent data gaps but do not represent significant data gaps and are unlikely to impact ERA's ability to identify RECs. Based on information obtained by ERA during our review of historical sources and observation of site conditions during our visit, these limiting factors would not appear to be significant and we do not anticipate that the information that could be obtained from these sources would change the conclusions of this report.

Pertinent data, if any, obtained by the Client following the issuance of this report should be reviewed by an environmental professional and an addendum prepared presenting an evaluation of the data and any changes to the conclusions of this report, as warranted by the data.

2.5 Special Terms and Conditions

The Phase I ESA scope of work was presented in the contract executed on October 25, 2023.

The scope of work for this assessment did not include testing of electrical equipment for the potential presence of polychlorinated biphenyls (PCBs) or the assessment of natural hazards such as naturally occurring asbestos, radon gas, or methane gas, assessment of the potential presence of radionuclides, or assessment of non-chemical hazards such as the potential for damage from earthquakes or floods. This Phase I ESA also did not include an extensive assessment of the

environmental compliance status of the Site or of the businesses operating at the Site or a health-based risk assessment.

2.6 User Reliance

This Report is for the exclusive use of the parties for which it was prepared, their agents, and assignees, and for such other parties as ERA agrees may rely on the Report. Use of this Report by any other party shall be at such party's sole risk.

2.7 Qualifications

A summary of the ERA personnel who worked on this project follows:

- Ms. Lita Freeman, California Professional Geologist and California Asbestos Consultant, has over 25 years of experience providing site assessment services. This has included evaluating potential impacts from historical on- and off-site operations, conducting subsurface investigations, and implementing remediation plans. Ms. Freeman works with property owners, attorneys, and regulators to mitigate and resolve environmental issues.

3. SITE SETTING

3.1 Site Location and Description

General site information is presented in Table 3.1-1.

Table 3.1-1. General Site Information

Project Name: Fong Property		**Owner(s):** As noted below
Address(es): Not assigned		**Past/Associated Address(es):** None identified
APN(s) – Current: 023-221-076-000, 023-221-074-000		**County:** Placer
APN(s) - Former: 023-221-046 (now 023-221-076-000)		**Location:** Southwest of Baseline Road and Walerga Road in Roseville, CA
Property Size: Approximately 86 acres	**Current Use:** Undeveloped land	**Occupant:** None
Heating/Cooling Equipment: None	**Domestic Water Provider:** None	**Sanitary Sewer:** None
Property Manager/Contact Information: Mr. Chris Dickinson, Towne Development		

The Site is reportedly owned by the following individuals/entities: Edward G.H. Fong; Roger G.F. Fong, Trustee of The Fong Family Trust Dated June 18, 2009; Ryan C. Fong; Rachelle K. Fong; Alisa R. Fong; EDPR Family Limited Partnership, a California limited partnership; and Bellory Fong, Trustee of the William Fong Family Trust dated May 26, 2010.

Photographs of the Site are included in Appendix A.

3.2 Adjacent Property Use

ERA staff performed a drive-by and walk-by reconnaissance of adjacent properties from public areas (e.g. sidewalks) to observe current businesses or land uses that may use, store, generate, or dispose of hazardous materials. Current activities at the adjacent properties do not appear to be of potential environmental concern to the Site based on the observations during the reconnaissance.

Walerga Road crosses the Site in a generally east to southwest direction (see Figures 1 and 2). Specific observations of adjacent property use are presented in Table 3.2-1, considering the Site as a whole.

Table 3.2-1. Site Vicinity Reconnaissance	
Direction	**Land Use**
North	Baseline Road, beyond which is vacant land
East	Single-family residences and open space/undeveloped land; a meandering creek is present within the open space to the east and crosses the southern portion of the Site in an east to west direction; Vineyard Road currently terminates to the east of the Site.
South	Single-family residences
West	Residential development under construction

3.3 Topography, Geology, Hydrogeology

Information on topography was obtained from the United States Geological Survey (USGS) 7.5-Minute Series Topographic Map of the Citrus Heights, California Quadrangle dated 2015, and the regional and local surface hydrology, geology, and hydrogeology information was obtained from various sources.

Information on topography, regional and local surface hydrology, geology, and hydrogeology is presented in Table 3.3-1.

Table 3.3-1. Site Setting	
Topography	The topography on the Site's northern portion slopes gently downward towards the northwest from a high of approximately 90 feet above mean sea level (amsl) near the southeastern corner to about 80 feet at the northwestern corner. The Site's southern portion slopes moderately downward towards the creek from a high of approximately 130 feet amsl along Walerga Road to 100 feet amsl near the creek bank with a gradual slope upward to an elevation of approximately 110 feet amsl along the Site's southern border.
Surface Features	The Site is vacant land with no evidence of former or current structures. Two large construction equipment size vehicle tires are located in the Site's central portion with a polyvinyl chloride (PVC) pipe between the tires; the tires appeared to have formerly been used as water troughs for cattle. No evidence of a water-supply well was observed in this area and no information was available on the water source to fill the troughs. An asphalt-paved cul-de-sac is present on the Site's northeastern portion and markers for a buried fiber optic cable were observed along the east side of Old Walerga Road. An asphalt-paved walking path is present across the Site's southern portion with several underground utility manhole covers (marked with *Sanitary Sewer*) observed along the walking path. Several Placer Waterworks utility boxes were located across the Site. Storm water at the Site infiltrates into the ground or flows across the ground surface. According to available information from EDR, the Site is not located within a Federal Emergency Management Agency (FEMA) 1% Special Flood Hazard Area (100-year) zone or within a 0.2% Annual Chance Flood Hazard (500-year) zone except a small area on the Site's southwestern corner along the creek (see EDR's report in Appendix D). Wetlands have not been mapped on site by the U.S. Fish and Wildlife Service, as shown on the copy of the National Wetland Inventory Map presented in Appendix B. However, wetlands have been mapped on the Site's northern portion by the State of California, according to EDR's research of the State Wetlands Data: Wetland Inventory maintained by the California Department of Fish and Wildlife (see EDR's report in Appendix D). Surface water on the Site is limited to the creek that crosses the Site's southern portion. The nearest off-site surface water is Curry Creek is located approximately 2,000 feet northwest of the Site. Dry Creek is located approximately 2,200 feet south of the Site.

Table 3.3-1. Site Setting	
Regional Geology	The Site is located within the Great Valley Geomorphic Province. The Great Valley is an elongated sedimentary trough that is characterized by thick Jurassic through Holocene-aged sedimentary deposits, overlain by younger Quaternary-aged sedimentary deposits composed of alluvial gravel, sand and silt. The Great Valley is bounded by the Klamath and Cascade Mountain Ranges to the north, the Sierra Nevada Mountains to the east, and the California Coast Mountain Range to the west. Overlying the bedrock in many places is a mantle of alluvial, lake, playa, and terrace deposits that are unconsolidated to semi-consolidated. The sediments in this portion of the Great Valley are mostly of non-marine origin (California Geologic Survey 2010).
Local Geology	Near-surface sediments in the site vicinity consist primarily of alluvial interbedded sequences of silts and clays with poorly sorted sands to gravels derived from highlands to the east. These sediments represent Quaternary alluvial deposits that originated in the Sierra Nevada mountains (California Geological Survey 2010). A *Custom Soil Resource Report* (Appendix B) was obtained for the property from the U. S. Department of Agriculture (USDA), Natural Resources Conservation Service (NRCS; HTTP://WEBSOILSURVEY.NRCS.USDA.GOV). According to the NRCS, surface soil on site is classified as: 1) *Fiddyment loam* (146) on the north-central portion that is described as well drained soil consisting of loam, clay loam, indurated, and weathered bedrock (alluvium derived from siltstone) on 1% to 8 % slopes; 2) *San Joaquin-Cometa sandy loams* (182) on the northern portion that is described as well drained soil consisting of sandy loam, clay loam, indurated, and stratified sandy loam to loam (alluvium derived from granite) on 1% to 5% slopes; 3) *Cometa-Fiddyment complex* (141) on the central portion that is described as well drained soil consisting of sandy loam and clay (alluvium derived from granite) on 1% to 5% slopes; 4) *Cometa sandy loam* (140) on the central, southern, and western portions that is described as well drained soil consisting of sandy loam and clay (alluvium derived from granite) on 1% to 5% slopes; 5) *Ramona sandy loam* (175) on the eastern and southern portions that is described as well drained soil consisting of sandy loam, sandy clay loam, and gravelly sandy loam (alluvium derived from granite) on 2% to 9% slopes; 6) *Xerofluvents* (194) on the southern portion that is described as frequently flooded somewhat poorly drained soil consisting of stratified loamy sand to fine sandy loam, stratified loamy sand to fine sandy loam to silt loam, and stratified loam to silty clay loam to clay with parent material that is alluvium; 7) *Cometa-Ramona sandy loams* (142) on the southern portion that is described as well drained soil consisting of sandy loam and clay (alluvium derived from granite) on 1% to 5% slopes; and 8) *Fiddyment-Kaseberg loams* (147) on the southeastern corner that is described as well drained soil consisting of loam, clay loam, and weathered bedrock (alluvium derived from siltstone) on 2% to 9% slopes.
Hydrogeology	The Site is located in the Sacramento County Basin of the Sacramento Basin Hydrologic Study Area (California Department of Water Resources, Bulletin 118-80 1980 and Bulletin 118-6 1978). This basin generally is drained by the Sacramento River and its tributaries. The principal water-bearing units of the basin includes younger and older alluvium, and older volcanic formations. Data collected in 2010 by the Sacramento Groundwater Authority (SGA 2011) indicated that depth to water in the site vicinity was approximately 130 to 160 feet bgs. Based on surface topography, groundwater flow direction beneath the Site is assumed to be with regional groundwater flow direction (westward). Actual local groundwater flow direction can be influenced by factors such as local surface topography, underground structures, seasonal fluctuations, soil and bedrock geology, and production wells, none of which were considered during this study.

Table 3.3-1. Site Setting	
Wells	No water-supply wells were observed on site during the site visit. No oil and gas wells were observed on site during the site visit and no oil and gas wells have been mapped on site. A map for oil and gas wells in the area obtained from the California Department of Conservation Geologic Energy Management Division (https://www.conservation.ca.gov/calgem) is presented in Appendix B.

4. User-Provided Information

4.1 Title Record

ERA was not provided with a 50-year chain-of-title report by Towne.

4.2 Environmental Liens or Activity and Use Limitations

There were no environmental liens or activity or use limitations documentation provided for this report based on review of the SWRCB Geotracker database and DTSC ENVIROSTOR database. These databases did not indicate that environmental liens or activity or use limitations had been filed against the Site.

4.3 Specialized Knowledge

Towne representatives had no specialized knowledge of the Site.

5. SITE HISTORY

Historical information obtained during this Phase I ESA is summarized in Table 5-1. Copies of supporting documents are presented in Appendix C.

Table 5-1. Historical Information Reviewed/Agency Records Summary		
Source	**Date**	**Information Obtained**
Sanborn® Fire Insurance Maps	November 2023	EDR searched their collection of Sanborn® Fire Insurance Maps for maps of the site vicinity. Sanborn maps are not available for the site vicinity indicating that the area was not considered a “high” fire risk for insurance purposes.
Topographic Maps	1910/1911, 1962/1967, 1980/1981, 2015	**Site.** The Site is depicted as undeveloped land on the 1910/1911 through 1980/1981 maps with Walerga Road (aka Old Walerga Road) on the Site’s western side. The Site is depicted as undeveloped land on the 2015 map but Walerga Road (aka Old Walerga Road) is not depicted on the Site’s western side. **Off Site.** The area is depicted as undeveloped land on the 1910/1911 through 1980/1981 maps with Baseline Road along the Site’s northern border and Walerga Road (aka Old Walerga Road) along the Site’s western border. Only landmark buildings are depicted on the 2015 map and no structures are depicted in the site vicinity. On the 2015 map, Baseline Road is depicted along the Site’s northern border and streets within the residential development adjoining to the east are depicted with Walerga Road in its’ current alignment.

Table 5-1. Historical Information Reviewed/Agency Records Summary		
Aerial Photographs	EDR 1937, 1947, 1952, 1957, 1962, 1966, 1972, 1975, 1984, 1993, 1998, 2006, 2009, 2012, 2016, 2020 Google Earth 2020, 2021, 2022	**Site.** In the 1937 photo, the Site is undeveloped with a dry pond on the central portion. Walerga Road is visible along the western side of the Site and terminates at Baseline Road located immediately north of the Site. A line of trees is visible along the path of the creek that traverses the Site's southern portion in an east to west direction in 1937. The Site is used for agricultural purposes (dryland farming) in the 1947 and 1952 photos. The Site appears as fallow land in the 1957 photo. Only the Site's northern portion is shown in the 1962 photo with this area used for dryland farming. The Site continues to be used for dryland farming in the 1966 through 1993 photos except in the area of the creek that crosses the Site's southern portion. In the 1984 photo, the Site appears as fallow land with a dirt track crossing the Site's northern portion and accessing Old Walerga Road at the Site's northwestern corner. The Site appears as fallow land in the 1998 and later photos. In the 1998 and 2006 photos, an unpaved walking pathway is present on the Site's southern portion. By 2006, the walking pathway appears to be paved with several underground utility covers visible along the walking pathway and Walerga Road is under construction across the center of the Site in an east to southwest direction. The Site is undeveloped land in the 2009 through 2016 photos with what appears to be cattle trailers on the Site's central western portion in the 2009 photo. The area along the Site's northern border was graded in the 2020 photo; this work appeared to be associated with the widening of Baseline Road. What appeara to be a small soil stockpile is visible near the Site's northeastern corner in the 2020 photo but is not visible in the 2021 photo. By 2022, vegetation had grown over this area and what appeared to be a small, paved area and possibly covers for underground utilities were visible at the Site's northwestern corner. **Off Site.** In the 1937 through 1998 photos, the site vicinity is predominantly undeveloped land or used for dryland farming with Baseline Road along the Site's northern border. In the 2006 photo, the surrounding properties to the north (across Baseline Road) and west are undeveloped land, the existing residential developments are visible to the east and south, and Walerga Road is in its' current configuration and divides the Site into two parcels. No significant changes are noted in the 2009 through 2020 photos. In the 2020 and 2021 photos, the are appears as it currently with the residential development under construction to the west.

6. REGULATORY AGENCY RESEARCH

As part of this assessment, ERA reviewed regulatory databases and available agency files and records for the Site. Information from these sources is discussed in the following sections.

6.1 Regulatory Database Research

An environmental database report prepared by EDR was reviewed for local, state, and federal listings for properties within the site area. Included in EDR's report are regulatory databases reviewed by EDR for cases pertaining to leaking underground storage tanks (USTs) and ASTs, hazardous waste sites, and abandoned sites within ASTM-specified radii (Table 6.1-1).

EDR also reviewed selected databases generated by the United States Environmental Protection Agency (U.S. EPA). Explanations of the regulatory agency databases reviewed and acronyms used by EDR are presented in EDR's report in Appendix D.

Table 6.1-1. Regulatory Agency Databases/Lists Reviewed			
Search Radius	**Agency**	**Database**	**Type of Records in Database**
1 mile	U.S. EPA	NPL	Sites designated for Superfund cleanup by the U.S. EPA
	DTSC	RESPONSE	State equivalent NPL: Site with confirmed releases where DTSC is involved in remediation, either in a lead or oversight capacity; these confirmed release sites are generally high-priority and high potential risk
	DTSC	ENVIROSTOR	State equivalent CERCLIS: Sites that have known contamination or sites for which there may be a reason to investigate
	U.S. EPA	CORRACTS	RCRA facilities undergoing "corrective actions"
	DHS	BEP	Specific expenditure plan as the basis for an appropriation of Hazardous Substance Cleanup Bond Act funds
0.5 mile	U.S. EPA	CERCLIS	Sites under review by the U.S. EPA
	U.S. EPA	TSD	Facilities that treat, store and/or dispose of hazardous waste
	RWQCB	LUST	Sites with LUSTs
0.5 mile	IWMB	SWLF/SWAT	Sites permitted as solid waste landfills, incinerators or transfer stations
	SWRCB	WMUDS/ SWAT	Tracking and inventory of waste management units
	U.S. EPA	CERCLIS – NFRAP	CERCLIS sites with no further remedial actions planned.
Site and Adjacent Properties	U.S. EPA	RCRA Generator	Sites that generate large or small quantities of hazardous waste
	U.S. EPA and OES	ERNS	Sites with reported accidental releases of oil and hazardous substances
	SWRCB	UST	Sites with registered USTs

Notes:

AST=aboveground storage tank
BEP=Bond Expenditure Plan
CERCLIS=Comprehensive Environmental Response, Compensation and Liability Information System
CORRACTS=Corrective Action Report
DPH=Department of Public Health
DTSC=Department of Toxic Substances Control
ERNS= Emergency Response Notification System
IWMB=Integrated Waste Management Board
LUST=Leaking Underground Storage Tank
NFRAP=No Further Remedial Action Planned
NPL=National Priorities List
OES=Office of Emergency Services
RCRA=Resource Conservation and Recovery Act
RWQCB=Regional Water Quality Control Board
SCL=CORTESE List
SWAT=Solid Waste Assessment Test
SWIS=Solid Waste Information System
SWLF=Solid Waste Landfills
SWRCB=State Water Resources Control Board
U.S. EPA=U.S. Environmental Protection Agency
UST=underground storage tank
WMUDS=Waste Management Unit Database

6.1.1 Site

The Site has not been assigned a street address but review of EDR's Radius Map Report indicates that the site location has not been included in the regulatory agency databases reviewed for this assessment.

6.1.2 Off-Site Properties

According to EDR, several regulated facilities were identified within the ASTM search distances during the regulatory agency databases review with none located within a 1,000-foot radius of the Site except as noted below. Additional regulated facilities were located within the ASTM search radius; however, based on their downgradient locations with respect to assumed groundwater flow direction (regionally to the west) and the Site, distance from the Site, and lack of reported releases, these facilities do not appear to present environmental concerns to the Site.

Rutan Environmental Safety Services Corporation. This business, located approximately 640 feet east of the Site at 8575 Parkwood Court, has been included in the RCRA NonGen/No Longer Regulated (RCRA NonGen/NLR) database. The business was established to be a non-generator of hazardous waste in 2018. Several administrative-type violations were reported in 2019. No chemical or fuel releases have been reported at this property. Based on the lack of reported releases at this property, this facility does not appear to present a significant environmental concern to the Site.

6.1.3 Orphan Properties

Regulated properties that could not be located because of insufficient address information are referred to by EDR as "orphan" facilities. Several orphan facilities/properties were reported by EDR. Based observations during the site visit, distances of these facilities/properties from the Site (based on ERA's knowledge of the site vicinity), these facilities/properties are not located within close proximity to the Site and do not appear to present significant environmental concerns to the Site.

6.1.4 Vapor Encroachment Condition

Vapor encroachment occurs when vapors from volatile chemicals in soil or groundwater intrude upon another property where they may migrate upwards into the indoor air of overlying buildings. The chemicals responsible for vapor encroachment include VOC, semi-volatile organic compounds (SVOCs), and volatile inorganic compounds such as mercury. Once contaminant vapors enter a structure, they may accumulate and potentially pose health hazards for building occupants.

The ASTM released its Vapor Encroachment Standard (ASTM E 2600-10) in 2010 to provide guidance on evaluating vapor encroachment when performing a Phase I ESA. In accordance with the new ASTM standard, two conditions are evaluated: Vapor Encroachment Condition (VEC) and potential Vapor Encroachment Condition (pVEC). A VEC results from "the presence or likely presence of any chemicals of concern in the indoor air environment of existing or planned structures on a property caused by the release of vapor from contaminated soil or groundwater on the property or within close proximity to the property, at a concentration that presents or may present an unacceptable health risk to occupants." A pVEC is "a condition that exists when screening indicates the possibility of a VEC, but where there is insufficient data to ascertain the presence or likely presence of compounds of concern (COCs) in the indoor air environment." "Chemicals of Concern" are defined by the ASTM to be "chemicals in the subsurface environment that are known or reasonably expected to be present, that can potentially migrate as a vapor into

an existing or planned structure on a property, and that are generally recognized as having the potential for an adverse impact on human health."

ERA has found no evidence of a potential release of vapor encroachment contaminants of concern (as identified in ASTM E 2600-10) into the subsurface due to the current or past on-site operations discussed elsewhere in this Phase I ESA report. Considering there was no evidence of a release, a vapor encroachment condition due to on-site sources is unlikely to exist.

6.2 Agency Research

Files and records available at the agencies listed in Table 6.2-1 were reviewed for site information. Copies of pertinent documents are included in Appendix B.

Table 6.2-1. Agency Files/Records Summary

Source	Date	Information Obtained
Cal-EPA State Water Resources Control Board (SWRCB)	November 2023	Available information maintained on the RWQCB website (http://geotracker.swrcb.ca.gov) was reviewed for records concerning hazardous substance/waste spills, USTs, and LUSTs at the Site. Records for the Site were not identified.
SWRCB Storm Water Multiple Applications & Report Tracking System (SMARTS)	November 2023	ERA searched the SMARTS website. Records for the Site were not identified for the Site.
Cal-EPA Department of Toxic Substances Control (DTSC)	November 2023	Review of DTSC's website (http://www.envirostor.dtsc.ca.gov/public/) for spills, releases, and cleanup actions. Records for the Site were not identified.
Department of Water Resources	November 2023	The Department of Water Resources (DWR) was contact for records for on-site water-supply well. DWR had no records for on-site water-supply wells.
Geologic Energy Management Division	November 2023	ERA searched the CalGEM Well Finder website. No oil and gas wells are located on the Site or adjoining properties. A copy of the map is presented in Appendix B.
Placer County Assessor Office	November 2023	The Site is identified by Placer County Assessor as 023-221-076-000 (formerly 023-221-046) and 023-221-074-000. A copy of the parcel map is presented in Appendix B.
Placer County Fire Department	November 2023	According to the PCFD public information clerk, records on hazardous materials and tanks are maintained by PCEHD or the City of Roseville.
Roseville Fire Department	November 2023	According to the Roseville Fire Department public information clerk, no records on hazardous materials or tanks are available for the Site.
Placer County Environmental Health Department (PCEHD)	November 2023	PCEHD maintains records on chemical storage/usage, USTs, ASTs, and releases for some cities and outlying areas in Placer County. No records were available for the Site's APNs.

Table 6.2-1. Agency Files/Records Summary		
Source	**Date**	**Information Obtained**
Placer County Community Development Department, Building Division	November 2023	ERA's representative requested records on file for the current and past site APNs. According to the Building Division administrative clerk and our review of the online database, building permits were not available as records are maintained by street address and street addresses have not been assigned to the Site.

No environmental concerns were noted with regards to the records available for review.

6.3 Radon

Radon is a colorless, tasteless radioactive gas with a half-life of 3.8 days. The health risk potential of radon is associated with its rate of accumulation within confined areas, particularly those near or in the ground, such as basements, where vapors can readily transfer to indoor air from the ground through foundation cracks or other pathways. The U.S. EPA-specified action level is 4.0 picocuries per liter of air (pCi/L) with radon levels above 4.0 pCi/L of air considered to be unhealthy.

According to the U.S. EPA, the Site is located in U.S. EPA-designated Zone 2. Average radon concentrations within this zone are predicted to have an average indoor screening level of equal to or greater than 2 pCi/L and less than or equal to 4 pCi/L. The U.S. EPA conducted 68 radon tests within Placer County and 100% of the tests showed radon levels at less than 4 pCi/L for the 1st floor and 2nd floor living areas; 71% of the tests showed radon levels at less than 4 pCi/L for the basement and 29% of the tests showed radon levels at between 4 pCi/L and 20 pCi/L for the basement with the average activity in the basement reported as slightly over 3 pCi/L.

Based on ERA's review of available information; it is unlikely that elevated radon levels represent a potential environmental risk for the Site.

7. PREVIOUS ENVIRONMENTAL REPORTS

Previous environmental reports for the Site were not provided to ERA.

8. SITE RECONNAISSANCE

On November 9, 2023, Ms. Lita Freeman, performed a reconnaissance-level assessment of the Site to observe general site conditions and indications of the possible release(s) of chemicals to the subsurface. A walkover site reconnaissance was conducted to identify visible evidence of RECs. At the time of the site reconnaissance (2:00 p.m. to 3:45 p.m.), the climate at the Site was sunny and dry with temperatures in the mid- to high-60^{o}s Fahrenheit and dry surfaces. Photographs taken during the site reconnaissance are included in Appendix A.

Ms. Freeman was not accompanied during the site reconnaissance.

8.1 Methodology and Limiting Conditions

ERA notes that the Site is a large approximately 86-acre, undeveloped tract of land comprised of dense vegetation. Therefore, the entire Site was not reasonably accessible at the time of the site reconnaissance. Prior to the site reconnaissance, aerial photographs were reviewed to identify areas of potential environmental concern historically and/or currently present at the subject property. Those identified (if any) were observed at the time of the site reconnaissance to the best of our ability.

The methodology for the site visit included walking the Site and observing current site conditions.

8.2 Site Description

At the time of ERA' site visit, the Site was vacant land and divided by Walerga Road which crosses the Site in an east to southwest direction. An area approximately 20 feet wide between Old Walerga Road and the middle of the Site's northern border was graded for the widening of Baseline Road and erosion control material (hydroseed spray over weed barrier blanket) was observed across the surface; the remainder of this area along Baseline Road appeared to have been recently disced but erosion control materials were not present across this area. A paved cul-de-sac extending onto the Site from the residential development to the east was observed on the Site's northeastern portion.

A tree-lined creek, a paved walking path with several underground utility covers (marked as *Sanitary Sewer*), and several unpaved paths cross the Site's southern portion.

No evidence of former structures was observed on the Site and no paved area or possible covers for underground utilities (as noted in the 1984 aerial photo; see discussion in Section 5) was observed at the Site's northwestern corner during the site visit.

Small debris piles were observed along Old Walerga Road. The debris piles were limited to household trash, furniture, children's toys, etc. Several small piles of broken asphalt (asphalt rubble) were also observed along Old Walerga Road. A small stockpile of soil and gravel was observed on the Site's western portion at an access point from Old Walerga Road. Also, a soil stockpile was observed near the northeastern corner of the Site and appeared to be related to grading activities along the Site's northern border. No evidence of chemical or fuel releases was noted in these areas.

Two large construction equipment size vehicle tires were located on the Site's central portion with a PVC pipe between the tires. ERA understands that the tires were formerly used as water troughs for cattle. No information was available on the water source to fill the troughs and no evidence of a water-supply well was observed on the Site.

Markers for a buried fiber optic cable were observed on the Site's western portion (just east of Old Walerga Road) and several Placer Waterworks utility boxes were located across the Site.

No evidence of former on-site farm dumps was noted during the site visit.

Site observations are documented in Table 8-1.

Table 8-1. Site Observations

Item	Observations/Comments
Evidence of Past Site Use(s)	None revealed by our reconnaissance
Evidence of Past Use(s) of Adjoining Properties	None revealed by our reconnaissance
Storm Water	Storm water infiltrates the ground
Stressed Vegetation	None revealed by our reconnaissance
Stained Soil or Pavement	None revealed by our reconnaissance

Table 8-1. Site Observations	
Solid Waste Disposal/Fill Placement	None revealed by our reconnaissance except soil, gravel, and asphalt rubble observed on site as noted above
Pits, Ponds, Lagoons	None revealed by our reconnaissance
Pools of Liquid/Standing Water	None revealed by our reconnaissance except within the creek
Strong, Pungent, or Noxious Odors	None revealed by our reconnaissance
Existing/Former USTs, Vent/Fill Pipes	None revealed by our reconnaissance
Existing/Former ASTs	None revealed by our reconnaissance
Drums/Containers with Hazardous Liquids/Solids, Hazardous Waste, Petroleum Products	None revealed by our reconnaissance
Unidentified Substance Containers	None revealed by our reconnaissance
Sumps/Trenches/Floor Drains	None revealed by our reconnaissance
Stained Floors	None revealed by our reconnaissance
Petroleum Pipelines	None revealed by our reconnaissance
Hydraulic Fluid-Containing Equipment	None revealed by our reconnaissance
Equipment Containing Polychlorinated Biphenyls (PCBs)	None revealed by our reconnaissance
Wastewater/Treatment	None revealed by our reconnaissance
Heating/Cooling Method	No on-site structures
Water-Supply/Oil and Gas Wells	No oil or gas wells, water-supply wells, or groundwater monitoring wells were observed on the Site.
Potable Water Supply	None revealed by our reconnaissance
Septic Systems/Sanitary District	None revealed by our reconnaissance
Electricity	No on-site structures
Natural Gas	No on-site structures
Other	Not Applicable

No environmental concerns were noted during the site reconnaissance.

9. INTERVIEWS

The individuals noted in Table 9-1 were contacted in person, by phone, or by written communication to obtain information relevant to the environmental status and condition of the Site.

Specific information provided by the individuals contacted is presented below Table 9-1.

Table 9-1. Interviews	
Relationship to Property	**Name/Affiliation**
Key Site Manager/Owner Representative	Mr. Ryan Fong
User Representative	Mr. Chris Dickinson, Towne
Tenants/Former Owner	Mr. Kirk Doyle
Local Government Agency	As noted in Section 6.2

Mr. Ryan Fong was interviewed by ERA and noted that the Site has been vacant and fallow land, that construction of roadways for utility improvements have occurred on the site boundary and through the middle of the Site, and that the Site was used for cattle grazing in 2018 and 2019. Mr. Fong noted that the two large construction equipment size vehicle tires that are located on the Site's central portion were likely formerly used as water troughs for cattle. ERA understands that low-lying areas on the Site's northern portion were graded to level the ground surface across the Site and that no "imported fill material" was brought to the Site.

Mr. Kirk Doyle, a previous owner of the Site, informed ERA that his family owned the Site as part of an approximately 540-acre property between at least 1940 and 2007. Mr. Doyle noted that his family used the Site for dry land farming with crops generally limited to wheat and oats. Farming of the Site by Mr. Doyle's family ceased in the late 1980s. A small residence was located on the property until about 1999, according to Mr. Doyle. ERA's research indicated that no structures such as residences, barns, outbuildings, etc. were located on site in the past and that the residence referred to by Mr. Doyle was likely located on another portion of the 540-acre property.

Information obtained from others noted in Table 8-1 is presented throughout this report.

10. FINDINGS

This section discusses information was obtained by ERA from our review of regulatory agency files and databases, our site observations, and interviews during the Phase I ESA.

10.1 On-Site Findings

- No structures were apparent on site in the historical sources reviewed during this assessment. Historical resources reveal that most of the Site was used for agricultural purposes (dry-land farming) with the remainder as undeveloped land between at least 1910 and the early 1990s. According to the *Interim Guidance for Sampling Agricultural Properties (Third Revision)* dated August 7, 2008, by the DTSC, crops grown using dry-land methods are generally not treated with agricultural chemicals including environmentally persistent pesticides. The northern portion was used for cattle grazing in 2018 and 2019. Historical resources reveal that the Site's southern portion has been undeveloped land since at least 1910. Walerga Road (aka Old Walerga Road) has been present along the Site's western side since at least 1910; Walerga Road was realigned to cross the Site by 2006.
- No evidence of former structures was observed on the Site and no paved area or possible covers for underground utilities (as noted in the 1984 aerial photo; see Section 5) was observed at the Site's northwestern corner during the site visit. Small debris piles (household trash, furniture, children's toys, etc.) and several small piles of asphalt rubble were observed along Old Walerga Road. A small soil and gravel stockpile was observed on the Site's

western portion just off Old Walerga Road. Also, a soil stockpile was observed near the Site's northeastern corner and appeared to be related to grading activities along the Site's northern border. Two large construction equipment size vehicle tires, reportedly used as cattle water troughs, were located on the Site's central portion. No evidence of chemical or fuel releases was noted in these areas. Markers for a buried fiber optic cable were observed along the east side of Old Walerga Road and several Placer Waterworks utility boxes were located across the Site. A tree-lined creek, a paved walking path with several underground utility covers (marked as *Sanitary Sewer*) located along the walking path, and several unpaved paths cross the Site's southern portion.

- Wetlands have not been mapped on site by the U.S. Fish and Wildlife Service; however, the California Department of Fish and Wildlife has mapped state wetlands on the Site's northern portion. During the site visit, this area had a generally level topography.
- The Site is not located within a Federal Emergency Management Agency 1% Special Flood Hazard Area (100-year) zone and is not located within a 0.2% Annual Chance Flood Hazard (500-year) zone except a small area on the Site's southwestern corner along the creek.
- According to EDR and ERA's review of online databases, the site location has not been included in the regulatory agency databases reviewed for this assessment. EDR's search did not reveal environmental liens or activity and use limitations for the Site.

10.2 Off-Site Findings

- Based on review of available historical resources, the surrounding areas were predominantly undeveloped land or used for agricultural purposes (dry-land farming) between at least 1910 and the late 1990s with Baseline Road along the Site's northern border and Walerga Road along the Site's western border. By the mid-2000s, the existing single-family residences had been constructed on the east adjoining properties with Walerga Road realigned to its' current configuration. No significant changes were noted in the site vicinity since the mid-2000s except a residential development is currently being constructed on the west adjoining property and Baseline Road is being widened.
- According to EDR, several regulated facilities were identified within the ASTM search distances during the regulatory agency databases review with none located within a 1,000-foot radius of the Site except the Rutan Environmental Safety Services Corporation property located approximately 675 feet east of the Site. This business has been included in the RCRA NonGen/ No Longer Regulated (RCRA NonGen/NLR) database. Based on the lack of reported releases at this property, this facility does not appear to present a significant environmental concern to the Site.
- Regulated properties that could not be located because of insufficient address information are referred to by EDR as "orphan" facilities. Several orphan facilities/properties were reported by EDR but, based on observations during the site visit and ERA's knowledge of the site vicinity, these facilities/properties are not located within close proximity to the Site.

11. OPINION

This section discusses known or suspect environmental concerns, historical environmental concerns, and *de minimis* conditions identified during the ESA.

11.1 Known or Suspect Recognized Environmental Conditions

A *REC* refers to the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: due to release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment.

The following was identified during the course of this assessment:

- ERA did not identify *RECs* during the course of this assessment.

11.2 Known or Suspect Controlled Recognized Environmental Conditions

A *CREC* refers to a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls. The following was identified during the course of this assessment:

- ERA did not identify *CRECs* during the course of this assessment.

11.3 Known or Suspect Historical Recognized Environmental Conditions

A *HREC* refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. The following was identified during the course of this assessment:

- ERA did not identify *HRECs* during the course of this assessment.

11.4 De Minimis Conditions

A *de minimis* condition is a condition that generally does not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. The following was identified during the course of this assessment:

- ERA did not identify a *de minimis* condition during the course of this assessment.

12. CONCLUSIONS

ERA has performed a Phase I ESA of the Site in conformance with the scope and limitations of ASTM Practice E 1527-21.

Based on the available information, this assessment has revealed no RECs, CRECs, HRECs, de minimis conditions, or significant data gaps in connection with the Site.

13. RECOMMENDATIONS

Based on the findings of this Phase I ESA, no further assessment appears warranted at the Site.

14. DEVIATIONS/DATA GAPS

ERA has performed this Phase I ESA in conformance with the scope and limitations of ASTM Practice E 1527-21 and 40 CFR Part 312. Any additions to or deletions from this practice are described in Section 2.4.

The following limiting factors were documented during this assessment:

- A 50-year chain-of-title report was not provided to ERA for review;
- Intervals between aerial photographs/topographic maps were more than 5 years;
- Surface soil could not be observed in some on-site areas because of thick vegetation; and
- Site observations were limited due to the size of the Site.

These limiting factors represent data gaps but do not represent significant data gaps and are unlikely to impact ERA' ability to identify RECs. Based on information obtained by ERA during our review of historical sources and observation of site conditions during our visit, these limiting factors would not appear to be significant and we do not anticipate that the information that could be obtained from these sources would change the conclusions of this report.

No significant data gaps were identified during this assessment.

15. ADDITIONAL SERVICES

No additional services were provided as part of this assessment.

SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

The environmental assessment described herein was conducted by the undersigned employee of ERA. ERA's assessment was conducted in accordance with the American Society for Testing Materials International (ASTM) E 1527 - 21 guidelines, and the Code of Federal Regulations (CFR) 40 CFR Part 312 *Standards and Practices for All Appropriate Inquiries: Final Rule* which became effective on November 1, 2006. This assessment consisted solely of the activities described in the Introduction of this report, and the contract signed by ERA and the client prior to initiation of the assessment.

I declare that, to the best of my professional knowledge and belief, I meet the definition of environmental professional as defined in §312.10 of 40 C.F.R. 312. I, have the specific qualifications based on education, training, and experience to assess a property of the nature, and setting of the subject property. I have developed and performed all the appropriate inquiries in conformance with the standards and practices set forth in 40 C.F.R. Part 312.*

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Placer County, California, Western Part
Survey Area Data: Version 15, Aug 31, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Apr 23, 2022—Apr 24, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a

given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Placer County, California, Western Part

140—Cometa sandy loam, 1 to 5 percent slopes

Map Unit Setting

National map unit symbol: hfzj
Elevation: 20 to 400 feet
Mean annual precipitation: 10 to 23 inches
Mean annual air temperature: 63 degrees F
Frost-free period: 260 to 300 days
Farmland classification: Farmland of statewide importance

Map Unit Composition

Cometa and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Cometa

Setting

Landform: Terraces
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 18 inches: sandy loam
H2 - 18 to 29 inches: clay
H3 - 29 to 60 inches: sandy loam

Properties and qualities

Slope: 1 to 5 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Very low (about 2.2 inches)

Interpretive groups

Land capability classification (irrigated): 3e
Land capability classification (nonirrigated): 3e
Hydrologic Soil Group: D
Ecological site: R017XY905CA - Dry Alluvial Fans and Terraces
Hydric soil rating: No

Minor Components

Parent material: Alluvium derived from granite

Typical profile
H1 - 0 to 18 inches: sandy loam
H2 - 18 to 29 inches: clay
H3 - 29 to 60 inches: sandy loam

Properties and qualities
Slope: 1 to 5 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)

Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Very low (about 2.2 inches)

Interpretive groups

Land capability classification (irrigated): 4e
Land capability classification (nonirrigated): 4e
Hydrologic Soil Group: D
Ecological site: R017XD093CA - CLAYPAN
Hydric soil rating: No

Description of Fiddyment

Setting

Landform: Ridges
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium derived from siltstone

Typical profile

H1 - 0 to 12 inches: loam
H2 - 12 to 28 inches: clay loam
H3 - 28 to 35 inches: indurated
H4 - 35 to 39 inches: weathered bedrock

Properties and qualities

Slope: 1 to 5 percent
Depth to restrictive feature: 20 to 35 inches to duripan; 35 to 39 inches to lithic bedrock
Drainage class: Well drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low (0.00 to 0.00 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Very low (about 2.7 inches)

Interpretive groups

Land capability classification (irrigated): 4e
Land capability classification (nonirrigated): 4e
Hydrologic Soil Group: D
Ecological site: R017XD093CA - CLAYPAN
Hydric soil rating: No

Minor Components

San joaquin, sandy loam

Percent of map unit: 10 percent
Hydric soil rating: No

Kaseberg, loam

Percent of map unit: 10 percent
Hydric soil rating: No

Ramona, sandy loam
Percent of map unit: 5 percent
Hydric soil rating: No

Alamo, clay
Percent of map unit: 5 percent
Landform: Depressions
Hydric soil rating: Yes

142—Cometa-Ramona sandy loams, 1 to 5 percent slopes

Map Unit Setting
National map unit symbol: hfzl
Elevation: 20 to 3,500 feet
Mean annual precipitation: 10 to 23 inches
Mean annual air temperature: 63 degrees F
Frost-free period: 230 to 320 days
Farmland classification: Farmland of statewide importance

Map Unit Composition
Cometa and similar soils: 50 percent
Ramona and similar soils: 30 percent
Minor components: 20 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Cometa

Setting
Landform: Terraces
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium derived from granite

Typical profile
H1 - 0 to 18 inches: sandy loam
H2 - 18 to 29 inches: clay
H3 - 29 to 60 inches: sandy loam

Properties and qualities
Slope: 1 to 5 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None

Frequency of ponding: None
Available water supply, 0 to 60 inches: Very low (about 2.2 inches)

Interpretive groups

Land capability classification (irrigated): 3e
Land capability classification (nonirrigated): 3e
Hydrologic Soil Group: D
Ecological site: R017XY905CA - Dry Alluvial Fans and Terraces
Hydric soil rating: No

Description of Ramona

Setting

Landform: Terraces
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 6 inches: sandy loam
H2 - 6 to 14 inches: loam
H3 - 14 to 55 inches: sandy clay loam
H4 - 55 to 73 inches: gravelly sandy loam

Properties and qualities

Slope: 1 to 5 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Medium
Capacity of the most limiting layer to transmit water (Ksat): Moderately high (0.20 to 0.57 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Moderate (about 8.2 inches)

Interpretive groups

194—Xerofluvents, frequently flooded

Map Unit Setting

National map unit symbol: hg18
Elevation: 0 to 1,500 feet
Mean annual precipitation: 14 to 20 inches
Mean annual air temperature: 61 to 64 degrees F
Frost-free period: 250 to 270 days
Farmland classification: Not prime farmland

Map Unit Composition

Xerofluvents, frequently flooded, and similar soils: 90 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Xerofluvents, Frequently Flooded

Setting

Landform: Drainageways
Landform position (two-dimensional): Toeslope

Landform position (three-dimensional): Talf
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

H1 - 0 to 15 inches: stratified loamy sand to fine sandy loam
H2 - 15 to 37 inches: stratified loamy sand to fine sandy loam to silt loam
H3 - 37 to 55 inches: stratified loam to silty clay loam to clay

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Somewhat poorly drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.20 to 1.98 in/hr)
Depth to water table: About 30 to 57 inches
Frequency of flooding: Frequent
Frequency of ponding: None
Calcium carbonate, maximum content: 5 percent
Available water supply, 0 to 60 inches: Moderate (about 8.1 inches)

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Environmental Risk Assessors were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Certification # 4AEA-4974-AF81

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E2247 - 16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E1528 - 22) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk

characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 07/24/2023 has revealed that there are 4 ENVIROSTOR sites within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page

Lists of state and tribal leaking storage tanks

CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CPS-SLIC list, as provided by EDR, has revealed that there is 1 CPS-SLIC site within approximately 0.5 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
DEL WEBB SUN CITY RO Database: CPS-SLIC, Date of Government Version: 06/05/2023 Facility Status: Completed - Case Closed Global Id: SLT5S1183158	FIDDYMENT ROAD	NE 1/4 - 1/2 (0.380 mi.)	7	29

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 07/24/2023 has revealed that

there are 2 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page

Evaluation:
Eval General Type: Compliance Evaluation Inspection
Eval Date: 04-07-2021
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: On site with Mike Miller for the facility's initial routine hazardous materials business plan (HMBP) inspection. Verified materials and quantities on site. The facility's submitted the initial HMBP in CERS on 02/27/2021. The facility's HMBP is complete and accurate at this time. The facility's annual HMBP certification is due on or before 02/27/2022. Reviewed employee training records. Employee training records were available and complete at time of inspection. Facility is located on leased property. AT&T notifies the property owner of HMBP requirements in the property lease contract. No violations observed on this date. Due to COVID, the operator's signature was not captured at

VERIZON WIRELESS - ROSEVILLE W (Continued) **S110504181**

time of inspection. The inspection report was emailed to the operator.

Eval Division: Placer County Environmental Health
Eval Program: HMRRP
Eval Source: CERS,

Eval General Type: Compliance Evaluation Inspection
Eval Date: 06-19-2023
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: On site for a routine hazardous materials business plan (HMBP) inspection. Consent for inspection given by Mike Miller. Facility is up to date with HMBP reporting to CERS- last submittal was 9/27/2022. Owner/ operator information was confirmed as accurate. Verified materials and quantities on site. Batteries located on site are under HMBP reporting thresholds. Site map and emergency response/ contingency plan were confirmed as complete and accurate. Three years of employee training records were available and were reviewed. Spill kits are available in technicians trucks. No violations observed on this date.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 09/19/2023
Date Data Arrived at EDR: 10/03/2023
Date Made Active in Reports: 10/19/2023
Number of Days to Update: 16

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

PFAS RCRA MANIFEST: PFAS Transfers Identified In the RCRA Database Listing

To work around the lack of PFAS waste codes in the RCRA database, EPA developed the PFAS Transfers dataset by mining e-Manifest records containing at least one of these common PFAS keywords: PFAS, PFOA, PFOS, PERFL, AFFF, GENX, GEN-X (plus the VT waste codes). These keywords were searched for in the following text fields: Manifest handling instructions (MANIFEST_HANDLING_INSTR), Non-hazardous waste description (NON_HAZ_WASTE_DESCRIPTION), DOT printed information (DOT_PRINTED_INFORMATION), Waste line handling instructions (WASTE_LINE_HANDLING_INSTR), Waste residue comments (WASTE_RESIDUE_COMMENTS).

PFAS NPDES: Clean Water Act Discharge Monitoring Information

Any discharger of pollutants to waters of the United States from a point source must have a National Pollutant Discharge Elimination System (NPDES) permit. The process for obtaining limits involves the regulated entity (permittee) disclosing releases in a NPDES permit application and the permitting authority (typically the state but sometimes EPA) deciding whether to require monitoring or monitoring with limits. Caveats and Limitations: Less than half of states have required PFAS monitoring for at least one of their permittees and fewer states have established PFAS effluent limits for permittees. New rulemakings have been initiated that may increase the number of facilities monitoring for PFAS in the future.

PFAS ECHO FIRE TRAINING: Facilities in Industries that May Be Handling PFAS Listing

A list of fire training sites was added to the Industry Sectors dataset using a keyword search on the permitted facilitys name to identify sites where fire-fighting foam may have been used in training exercises. Additionally, you may view an example spreadsheet of the subset of fire training facility data, as well as the keywords used in selecting or deselecting a facility for the subset. as well as the keywords used in selecting or deselecting a facility for the subset. These keywords were tested to maximize accuracy in selecting facilities that may use fire-fighting foam in training exercises, however, due to the lack of a required reporting field in the data systems for designating fire training sites, this methodology may not identify all fire training sites or may potentially misidentify them.

PFAS PART 139 AIRPORT: All Certified Part 139 Airports PFAS Information Listing

Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration?s document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

CHROME PLATING: Chrome Plating Facilities Listing

This listing represents chrome plating facilities the California State Water Resources Control Board staff identified as possibly being a source of Per- and polyfluoroalkyl substance (PFAS) contamination. Sites and locations were identified by staff with the Division of Water Quality in the California State Water Board. Data was collected from the CA Air Resources Board 2013 and 2018 - Cr VI emission survey, CA Emission Inventory, CA HAZ Waste discharge database and by reviewing storm water permits. Former chrome plating sites are also included that are open site investigation or remediation cases with the Regional Water Quality Control Boards and the Department of Toxic Substances Control.

Last EDR Contact: 09/27/2023
Next Scheduled EDR Contact: 01/15/2024
Data Release Frequency: Varies

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing
In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

LOS ANGELES CO LF METHANE: Methane Producing Landfills
This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Northwest Map:	12021637 PLEASANT GROVE, CA
Version Date:	2018

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

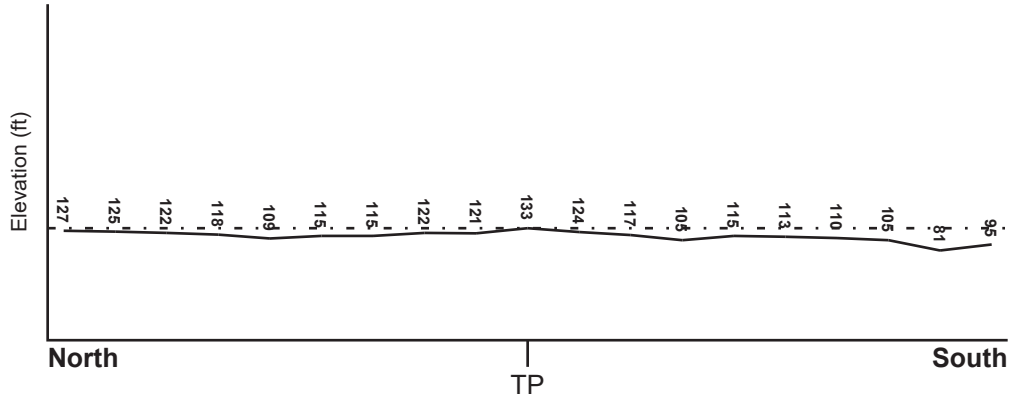
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

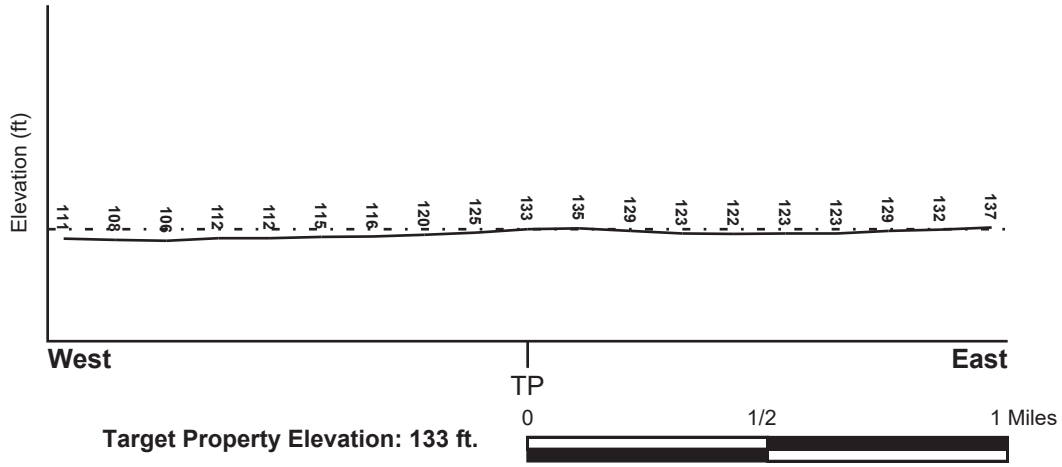
GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.



TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

* Figure not OCR Compatible

Target Property Elevation: 133 ft.

* Figure not OCR Compatible

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06067C0076H	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
0602390475E	FEMA Q3 Flood data
0602430003D	FEMA Q3 Flood data
0602430011D	FEMA Q3 Flood data
06067C0060H	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CITRUS HEIGHTS	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: COMETA

Soil Surface Texture: sandy loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	18 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 1.4 Min: 0.42	Max: 7.3 Min: 6.6
2	18 inches	29 inches	clay	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 1.4 Min: 0.42	Max: 7.3 Min: 6.6
3	29 inches	59 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 1.4 Min: 0.42	Max: 7.3 Min: 6.6

Soil Map ID: 2

Soil Map ID: 5

Soil Component Name: RAMONA

Soil Surface Texture: sandy loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 7.3 Min: 6.6
2	5 inches	14 inches	fine sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 7.3 Min: 6.6
3	14 inches	55 inches	sandy clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 7.3 Min: 6.6
4	55 inches	72 inches	gravelly sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 7.3 Min: 6.6

Soil Map ID: 6

Soil Component Name: Xerofluvents

Soil Surface Texture: stratified loamy sand to fine sandy loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Somewhat poorly drained

Hydric Status: All hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 111 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	14 inches	stratified loamy sand to fine sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 14 Min: 1.4	Max: 8.4 Min: 7.9
2	14 inches	37 inches	stratified loamy sand to fine sandy loam to silt loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 14 Min: 1.4	Max: 8.4 Min: 7.9
3	37 inches	55 inches	stratified loam to silty clay loam to clay	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 14 Min: 1.4	Max: 8.4 Min: 7.9

Soil Map ID: 7

Soil Component Name: FIDDYMENT

Soil Surface Texture: loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Well drained

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005, 2010 and 2015 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish and Wildlife
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.
