The GAMA Program is Californias comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Heath Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

INTRODUCTION

Project Description

The proposed "Estia Dry Creek & Placer Creek Residential" (Project) includes a total of approximately 88 acres, comprised of a 52.3-acre parcel (Assessor's Parcel No. 023-221-046) located on the north side of Walerga Road and a 35.3 -acre parcel (APN 023-221-061) located south and east of Walerga Road, collectively, the "project", Estia Dry Creek and Placer Creek Residential. This Phase 1 project consists of 220 residential units on 19.9 acres. Construction will include streets, storm drainage improvements, underground utilities, garages, a fitness clubhouse, and pool. The site is currently unimproved agricultural land. It is bounded on the north by Baseline Road and bounded on the south by Estia Dry Creek Phase 2. The proposed underground storm drain system connects to the Baseline Road backbone storm drain system. A portion of Phase 1 is proposed to drain south through Phase 2 to the Walerga tributary.

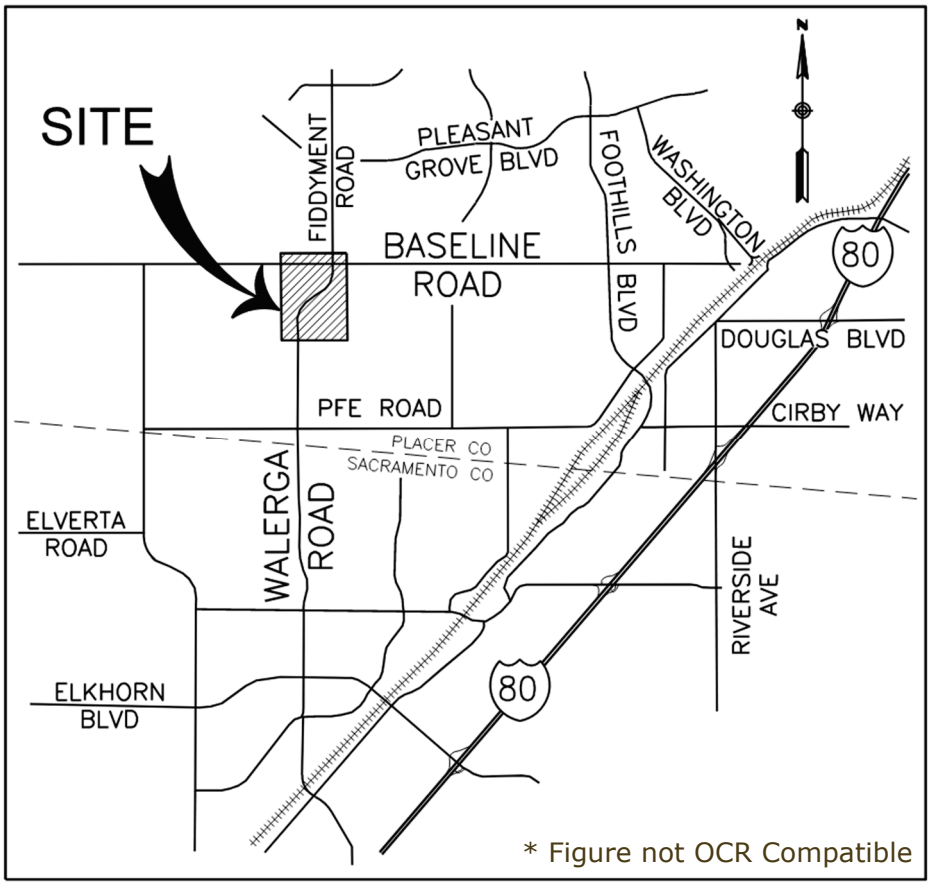

Figure 1: Project Vicinity Map

* Figure not OCR Compatible

Scope of the Report

This report provides analysis and documents for the existing pre-developed watershed characteristics and determines the required drainage facilities that are necessary for development of the project. The report will confirm that the post-development changes will be consistent with what is shown on the Drainage Maps.

Pursuant to Reference 2, this is a regulated project with more than one acre of new impervious area proposed and is within the Phase II MS4 Permit Area.

FEMA Information

The Federal Emergency Management Agency's (FEMA) Flood Insurance Study (FIS) Flood Insurance Rate Map (FIRM) contains the project area is Preliminary FIRM Panel ID# 06061C1026J, effective April 12, 2024.

The Dry Creek Walerga Road Tributary is classified as Zone AE which means base flood elevations have been determined and analyzed with a Flood Insurance Study that generated the floodplain limits and a floodway has been established. The limits of the detailed study terminate east of Crowder Lane with Zone A floodplain, which means base flood elevations have not been determined.

ULOP Applicability

The following table shows that this project does not meet the Urban Level of Flood Protection (ULOP) as determined by Placer County to construct improvements within a ULOP boundary. These criteria, enacted by State Senate Bill 5 (SB 5) in 2007, were developed to assist counties and cities within the Sacramento-San Joaquin Valley in making findings related to ULOP before approving land use decisions.

ULOP APPLICABILITY

Refer to the Tentative Map for limits of ULOP floodplain with greater than 3' flooding depth

Finding of Fact / ULOP Criteria	Yes/No	Remark
The project is located within the Sacramento Valley	Yes	Dry Creek is tributary to the Sacramento River
The project is located within an urban area as defined by Code of Federal Regulations Title 44, Section 59.1.	Yes	
A portion of the project is located within a flood hazard zone that is mapped as either a special hazard area or an area of moderate hazard on FEMA FIRM Panels.	Yes	Zone AE Floodplain
The project is located within a watershed that is more than 10 square miles in size.	No	Dry Creek Walerga Road Tributary Watershed area is approximately 1.3 square miles per FEMA FIS report
The project is located within an area with a potential flood depth above 3.0 feet during a 200-year event, from sources of flooding other than localized conditions.	No	Project is located along Dry Creek Walerga Road Tributary
Is any disturbance or development proposed within the ULOP 200-year boundary?	No	Dry Creek ULOP is downstream at the confluence

Future, Fully-Developed, Unmitigated Floodplain

The limits of the future, fully-developed, unmitigated 100-year floodplain are calculated and depicted on the Drainage Maps. The project does not propose residential lots in the future, fully-developed, unmitigated 100-year floodplain.

EXISTING CONDITIONS

Ground slopes range significantly across the project area. The Phase 1 area ground and a portion of the Phase 2 area ground slopes north toward Baseline Road and a portion of the Phase 2 area ground slopes downhill towards Walerga Tributary and Dry Creek. Existing ground cover is primarily grassland with rolling terrain. The USDA Soil Conservation Service classifies most of the soils within the project as Pleistocene alluvial deposits. The site soil is classified as hydrologic group D. ENGEO prepared a geotechnical study dated December 26, 2023 for the Estia Dry Creek project entitled "Estia at Dry Creek - Geotechnical Exploration". This report identifies the near surface soils generally as deeply weathered gravel, sand, and silt, which is consistent with the USDA data.

The Walerga Tributary is classified as Zone AE floodplain, which means base flood elevations have been determined and analyzed with a Flood Insurance Study that generated the floodplain limits and a floodway has been established. The river hydraulics and cross section profiles for the tributary are derived from the GeoHECRAS software provided by CivilGeo.

Figure 2: Pre-Development Land Photo, Baseline Rd, Looking South

Figure 3: Pre-Development Land Photo, Walerga Rd, Looking Southeast

DESIGN CRITERIA

The design criteria listed below are also found in the West Placer Stormwater Quality Design Manual and Placer County Flood Control and Water Conservation District Stormwater Management Manual (SWMM).

- **The streets remain passable during the 10- and 100-Year storm events and the finished floor elevations are 1', or greater, from the 100-year water surface elevations.**

* Figures not OCR Compatible

- **Inlet and Outlet pipes are to have matching Crown Elevations.**
- **The underground storm drain pipes do not flow full during the 10-Year storm.**
- **For Hydraulic Calculations, Pipes are sized as if all flow is captured at each inlet.**
- **Storm Drain pipes are designed to flow under gravity flow for up to the 10-year storm and allowed to flow surcharged, pressure flow for flows larger than the 10 year-storm.**
- **Culverts 30" in diameter and less are designed for 50% blockage at the inlet for the 10-year design storm. However, where there is a grated inlet with 8" maximum size opening, the inlet is designed for 50% blockage, but the culvert connected to such an inlet may be sized without blockage (figuring that large objects cannot get through the inlet openings to block the culvert).**
- **Gutters and inlets serving small drainage areas are sized according to Placer County drainage formulas as follows:**

$$\text{Sheet flow: } t_r = \frac{.355(nL)^{.6}}{S^{.3}}$$

$$\text{Channel flow: } t_r = \frac{.00735Ln^{.75}(1+z)^{.25}}{S^{.375}(A_c z)^{.25}}$$

$$\text{Peak Discharge: } Q = qA - A_p F_i$$

HYDROLOGY & HYDRAULICS

MacKay & Somps analyzed a portion of the existing shed to the Curry Creek watershed from this property in their drainage studies for The Storm Drainage Evaluation for Baseline Road – Segment 1, Upland Drive, Segment 5, and San Fernando Drive Improvement Plans Technical Memorandum dated September 19, 2023 and the Storm Drainage Evaluation for Baseline Road - Segment 3 & Portion of Segment 2 Improvement Plans Technical Memorandum, revision dated February 20, 2025 (for the C13X shed). The studies assumed a pre-development contributing area of 23.9 acres (i.e., Shed UP15X and C13X) draining to Baseline Rd within the Curry Creek Watershed. The Estia Dry Creek Pre-Development Shed Map (Drainage Map #1) assumes 35.6 acres (sheds 1-4) pre-development contributing area to Baseline Rd. within the Curry Creek Watershed, which is 11.7 acres greater than the contributing drainage area of 23.9 acres calculated by MacKay & Somps. In our professional opinion, any minor shed shift from Curry Creek to Dry Creek has no impact on Dry Creek and any downstream properties. This is supported by the HEC-RAS analysis presented in the preliminary drainage reports for Phases 3 & 4.

Maintaining the existing shed boundary on this project is not possible with any standard subdivision design. That is readily apparent from the pre-development shed boundaries in comparison to the site plan. The shape of the existing shed to Curry Creek is not conducive to any standard development for residential or commercial use if the shed boundary is strictly held and applied to development. The cross canal lawsuit determination created the City of Roseville's retention program in 1990 to mitigate volumetric impacts from Roseville to areas within Sutter County, which can experience flooding. The Curry Creek shed/Sutter County downstream is particularly sensitive to flood issues, while Dry Creek is not. Curry Creek is an intermittent watershed with unpredictable flows that is part of the Pleasant Grove Creek

watershed. Dry Creek is a major regional watershed where detention is discouraged because of the large flood wave.

Other project grading and layout configurations were considered to more closely maintain the existing watershed boundaries and capacities but were determined to be impractical. The project is required to sewer south as that is where the existing Placer County sewer facilities are located. Draining the existing shed to the north would raise some areas of the site by as much as 10-feet. This would require a significant import of material, approximately 240,000 cubic yards. Transporting such large import quantities could have significant air quality impacts. This would also result in steep road grades and potential noncompliance with ADA regulations.

Another option evaluated was a permanent storm drain pump facility. This pump facility would pump drainage from the existing shed boundary north toward the Baseline Rd storm drain system. Long-term maintenance requirements and electricity demands are higher with this type of system. Performance and reliability of these types of facilities over time can also be problematic, requiring special equipment and ongoing maintenance to function properly. Placer County Land Development Manual Section 5-11(J) states “The use of drainage pumps shall be avoided if at all possible, and is allowed only with approval of the Engineer.” The Placer County Flood Control and Water Conservation District Stormwater Management Manual (SWMM) also states in section VI-4 Drainage Systems, “Underground drainage systems shall be designed for ease of maintenance and repair.”

Please see Exhibits H, I and J for additional information on the shed shift and other design options considered.

In addition to the approximately 11.7 acres of shed shift to Dry Creek due to the difference in shed area assumptions with the MacKay and Somps Reports, the above design constraints result in an additional shed shift of approximately 14 acres. Therefore, the total shed shift from Curry Creek to Dry Creek is approximately 25.7 acres (11.7 acres + 14 acres) toward Walerga Tributary (Dry Creek), with 10.0 acres of Phase 1 continuing to drain to Curry Creek at the Sierra Vista master planned location in Baseline Rd previously described.

The County requires "compelling justification" to allow a shed shift, with supporting documentation and confirmation that the project does not negatively affect upstream or downstream drainage facilities. This project has coordinated with the County and Flood Control District for approval of this unique exception to SWMM policies (Section II(C)(3); Section IV(B)(3); Section VI(B)(1)(a)).

The project will discharge most of the stormwater runoff into Dry Creek Walerga Road Tributary. The watershed to Dry Creek is approximately 1.3 square miles. The peak flows for the various storm events were modeled in HEC-HMS (Version 4.9). The routing method used is Muskingum Method. The volumetric and discharge relationships were generated through existing surface information and HEC-RAS modeling to determine the necessary rating curve used in the Modified Puls method. The channel is approximated as a trapezoidal channel with a Muskingum Coefficient (X) between 0.10 and 0.20. The rainfall values were taken from Table 5-A-1 in the Stormwater Management Manual for the various storm events. The HEC-HMS model uses the Kinematic Wave transform method and initial/constant loss in determining flows. This method relates the shape of the channel, boundary roughness, and slope of the channel or overland flow surface. Though it simplifies the complex nature of drainage systems, the Kinematic Wave transform method provides a reasonably accurate approximation of flows.

The design flows for the 10-, 50, and 100-year storm events (10, 2 and 1 percent recurrence interval storms) for Dry Creek and the Antelope North Road Tributary were provided by FEMA and were

unchanged. There was no 500-year storm flow (0.2 percent chance of occurrence storm) provided for the tributary. Hydraulic models for the existing, revised, and unmitigated scenarios for the Dry Creek Walerga Road Tributary were generated from FEMA FIS data. The Existing model reflects the current physical improvements and latest topography in the area. The HEC-RAS models were generated with the design flows produced by the HEC-HMS model and provide the basis for comparing existing conditions BFEs to revised BFEs to analyze the impacts of the proposed project both upstream and downstream. The models were created using GeoHECRAS software using steady, uniform flow under Subcritical conditions. Refer to Tables 4-6 of the Phase 3 & 4 drainage reports for HEC-RAS modeling inputs and results.

DETENTION & RETENTION

The final predevelopment checklist identified the need for volumetric retention to mitigate impacts from the 8-day, 100-year storm event based on the potential downstream impacts on the Curry Creek Cross Canal watershed. Placer County is currently evaluating options for regional retention facilities; however, no County retention fee program has been established at this time. The project will need to demonstrate participation in a future Board-approved County retention program, if such program is established, or provide onsite retention facilities in accordance with County standards. Onsite underground retention is provided. Refer to Exhibit G for locations identified for potential retention facilities. The estimated retention required is 69,220 cubic feet. The Exhibit G alternative provides roughly 100,800 cubic feet of possible retention with room onsite for more. The final retention volumes will be provided and analyzed with the improvement plans for each phase.

Though drainage detention is not required or recommended for Dry Creek and its tributaries, hydromodification is still required under the MS4 rules, even though the distinction between detention and hydromodification is not made clear. If detention is required, despite the potential negative consequences of overlapping the flood wave and causing higher overall peak flows in Dry Creek, peak flows would be detained and approximately 2.9 ac-ft would be provided in Phase 1 either underground, in Phase 1 Basin B, or some combination thereof. 3.9 ac-ft would need to be provided in an above ground basin in Phase 2 and an additional 0.6 ac-ft can be provided in Phase 2 Basin C. This additional storage could provide for additional attenuation and reduce downstream peak flows, if needed.

WATER QUALITY

To evaluate storm water quality and best management policies (BMP) within the project limits, the West Placer Storm Water Quality Design Manual was referenced and used as a guideline for BMP locations. Drainage Management Areas (DMA) are delineated with infiltration basins shown in Drainage Map #5. The primary purpose of the infiltration basins is to retain minor storm events and capture any pollutants that would otherwise enter Dry Creek and Curry Creek. The infiltration basins are primarily for minor storm events but not intended to reduce the peak flows during extreme storm events. The BMPs shall be maintained in accordance with the project O&M Plan.

Phase 1 is divided into two DMAs, DMA A and DMA B. DMA A is the portion of the project which will discharge into infiltration Basin A at Discharge Point A on Drainage Map #2. From Basin A, treated runoff enters the storm drain system in Baseline Rd. analyzed with the Estia Dry Creek Backbone Infrastructure Preliminary Drainage Report. That storm drain system connects to the 42-inch elliptical pipe in Baseline Rd. constructed with the Baseline Marketplace improvement plans (CWJ#191108, EN22-1061). DMA B, which covers the remainder of the project, constructs the storm drain system which collects runoff and flows toward infiltration Basin B before outfalling to the storm drain system in Phase 2A Park 1.

The composite runoff coefficient (Rc) is determined using State Water Control Board Runoff Coefficient Fact Sheet 5.1.3. The fact sheet provides tables of various coefficients depending on land use. The land use within the Phase 1 project is Multi-Family. The Coefficient of 0.55 was used because it is the more conservative value for Water Quality calculations.

NOTES TO USERS

For information and questions about this Flood Insurance Rate Map (FIRM), available effective flood hazard information for your community, or the National Flood Insurance Program (NFIP) in general, please call the FEMA Mapping and Insurance eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA Flood Map Service Center website at https://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be downloaded from the website. Communities annexing land on adjacent FIRM panels must obtain a current copy of the adjacent panel as well as the current FIRM Index. These may be acquired directly from the Flood Map Service Center at the website listed above.

For community and countywide map dates refer to the Flood Insurance Study Report for this jurisdiction.

To determine if flood insurance is available in this community, contact your Insurance agent or call the National Flood Insurance Program at 1-800-638-6620.

Basemap information shown on this FIRM was provided in digital format by the United States Geological Survey (USGS). The basemap shown is the USGS National Map: Orthoimagery. Last refreshed October, 2020.

Note: Some Special Flood Hazard Areas with elevations may not appear with elevation labels if the Base Flood Elevation or Cross-section line which communicates the elevation for the location appears on the adjacent panel. Please see the Panel Locator Diagram on this map panel to determine the adjacent panel and find the elevation feature there, or alternatively use the Flood Insurance Study report for detailed elevations by flood source.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Placer County, California, Western Part
Survey Area Data: Version 15, Aug 31, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Apr 23, 2022—Apr 24, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

[1]25.7 acres are proposed to be shifted from the Curry Creek watershed to the Dry Creek watershed from Point A to Point B. The associated 100-year flows from this shed shift are 25.3 cfs from Phase 1 and 39.2 cfs from Phase 2. The associated 10-year flows from this shed shift are 13.4 cfs from Phase 1 and 17.3 cfs from Phase 2.

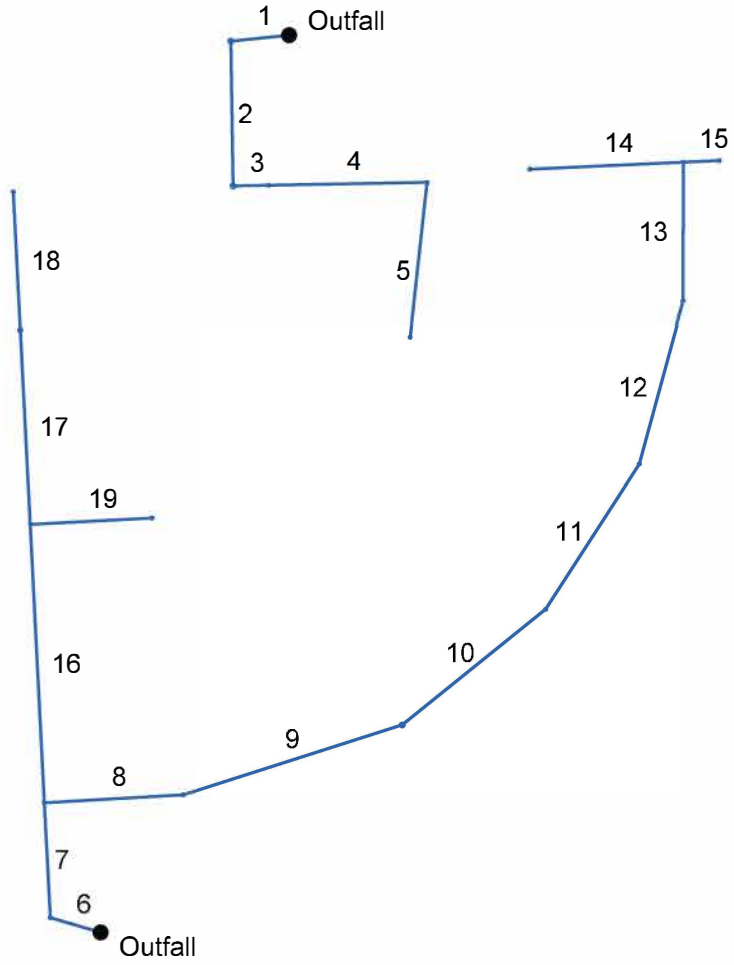
Notes

(1) Area is based on the difference between Pre-Development and Post-Development from the Pre-Development to Post-Development Table, Curry Creek watershed

(2) Equation 2-1, SCS Curve Number Method, TR-55

(3) Equation 2-2, SCS Curve Number Method, TR-55

(4) Equation 2-4, SCS Curve Number Method, TR-55



(5) Rainfall depth assumed to be 10.75-inches during the 100-year, 8-day design storm at elevation of 200-feet

(6) Assume pervious Type D Curve Number as 89 for urban landscaping

Hydraflow HGL Computation Procedure

General Procedure:

Hydraflow computes the HGL using the Bernoulli energy equation. Manning's equation is used to determine energy losses due to pipe friction. In a standard step, iterative procedure, Hydraflow assumes upstream HGLs until the energy equation balances. If the energy equation cannot balance, supercritical flow exists and critical depth is temporarily assumed at the upstream end. A supercritical flow Profile is then computed using the same procedure in a downstream direction using momentum principles.

Col. 1 The line number being computed. Calculations begin at Line 1 and proceed upstream.

Col. 2 The line size. In the case of non-circular pipes, the line rise is printed above the span.

Col. 3 Total flow rate in the line.

Col. 4 The elevation of the downstream invert.

Col. 5 Elevation of the hydraulic grade line at the downstream end. This is computed as the upstream HGL + Minor loss of this line's downstream line.

Col. 6 The downstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 7 Cross-sectional area of the flow at the downstream end.

Col. 8 The velocity of the flow at the downstream end, (Col. 3 / Col. 7).

Col. 9 Velocity head (Velocity squared / 2g).

Col. 10 The elevation of the energy grade line at the downstream end, HGL + Velocity head, (Col. 5 + Col. 9).

Col. 11 The friction slope at the downstream end (the S or Slope term in Manning's equation).

Col. 12 The line length.

Col. 13 The elevation of the upstream invert.

Col. 14 Elevation of the hydraulic grade line at the upstream end.

Col. 15 The upstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

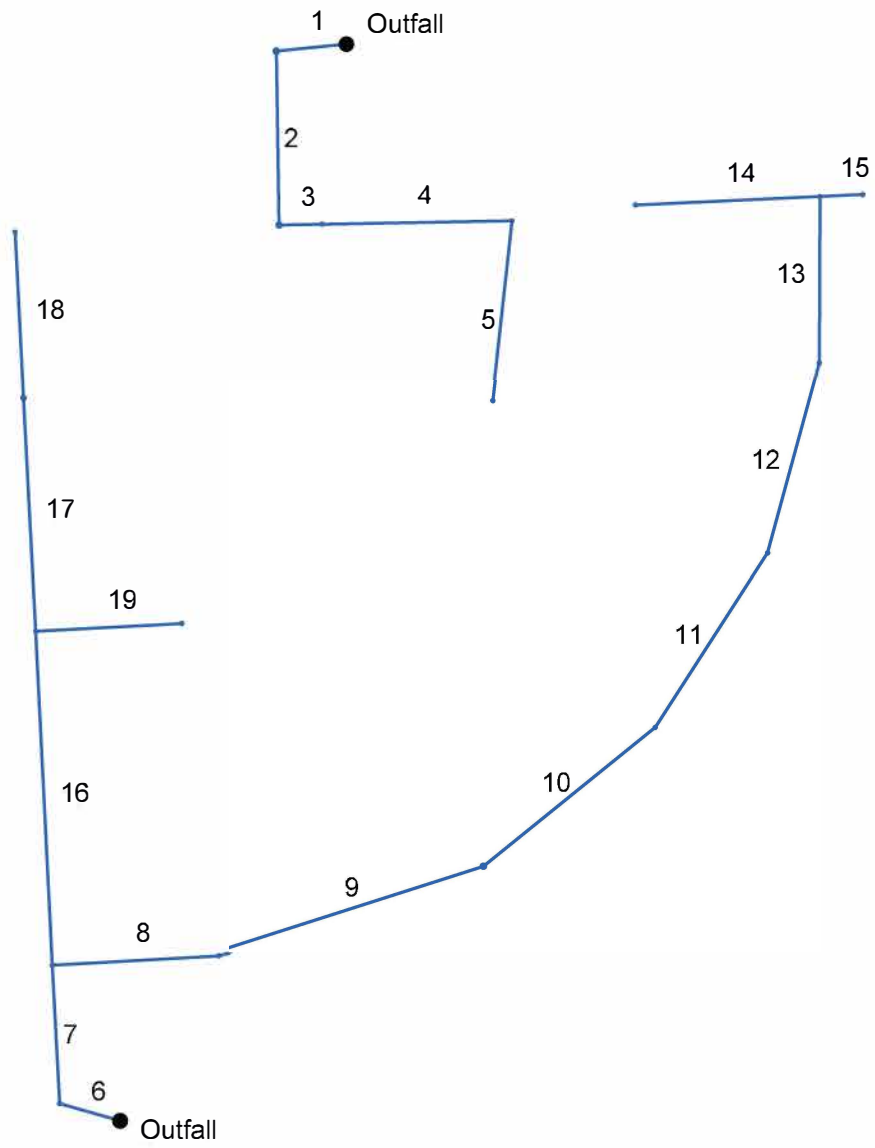
Col. 16 Cross-sectional area of the flow at the upstream end.

Col. 17 The velocity of the flow at the upstream end, (Col. 3 / Col. 16).

Col. 18 Velocity head (Velocity squared / 2g).

Col. 19 The elevation of the energy grade line at the upstream end, HGL + Velocity head, (Col. 14 + Col. 18) .

Col. 20 The friction slope at the upstream end (the S or Slope term in Manning's equation).



Col. 21 The average of the downstream and upstream friction slopes.

Col. 22 Energy loss. Average Sf/100 x Line Length (Col. 21/100 x Col. 12). Equals (EGL upstream - EGL downstream) +/- tolerance.

Col. 23 The junction loss coefficient (K).

Col. 24 Minor loss. (Col. 23 x Col. 18). Is added to upstream HGL and used as the starting HGL for the next upstream line(s).

Hydraflow HGL Computation Procedure

General Procedure:

Hydraflow computes the HGL using the Bernoulli energy equation. Manning's equation is used to determine energy losses due to pipe friction. In a standard step, iterative procedure, Hydraflow assumes upstream HGLs until the energy equation balances. If the energy equation cannot balance, supercritical flow exists and critical depth is temporarily assumed at the upstream end. A supercritical flow Profile is then computed using the same procedure in a downstream direction using momentum principles.

Col. 1 The line number being computed. Calculations begin at Line 1 and proceed upstream.

Col. 2 The line size. In the case of non-circular pipes, the line rise is printed above the span.

Col. 3 Total flow rate in the line.

Col. 4 The elevation of the downstream invert.

Col. 5 Elevation of the hydraulic grade line at the downstream end. This is computed as the upstream HGL + Minor loss of this line's downstream line.

Col. 6 The downstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 7 Cross-sectional area of the flow at the downstream end.

Col. 8 The velocity of the flow at the downstream end, (Col. 3 / Col. 7).

Col. 9 Velocity head (Velocity squared / 2g).

Col. 10 The elevation of the energy grade line at the downstream end, HGL + Velocity head, (Col. 5 + Col. 9).

Col. 11 The friction slope at the downstream end (the S or Slope term in Manning's equation).

Col. 12 The line length.

Col. 13 The elevation of the upstream invert.

Col. 14 Elevation of the hydraulic grade line at the upstream end.

Col. 15 The upstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 16 Cross-sectional area of the flow at the upstream end.

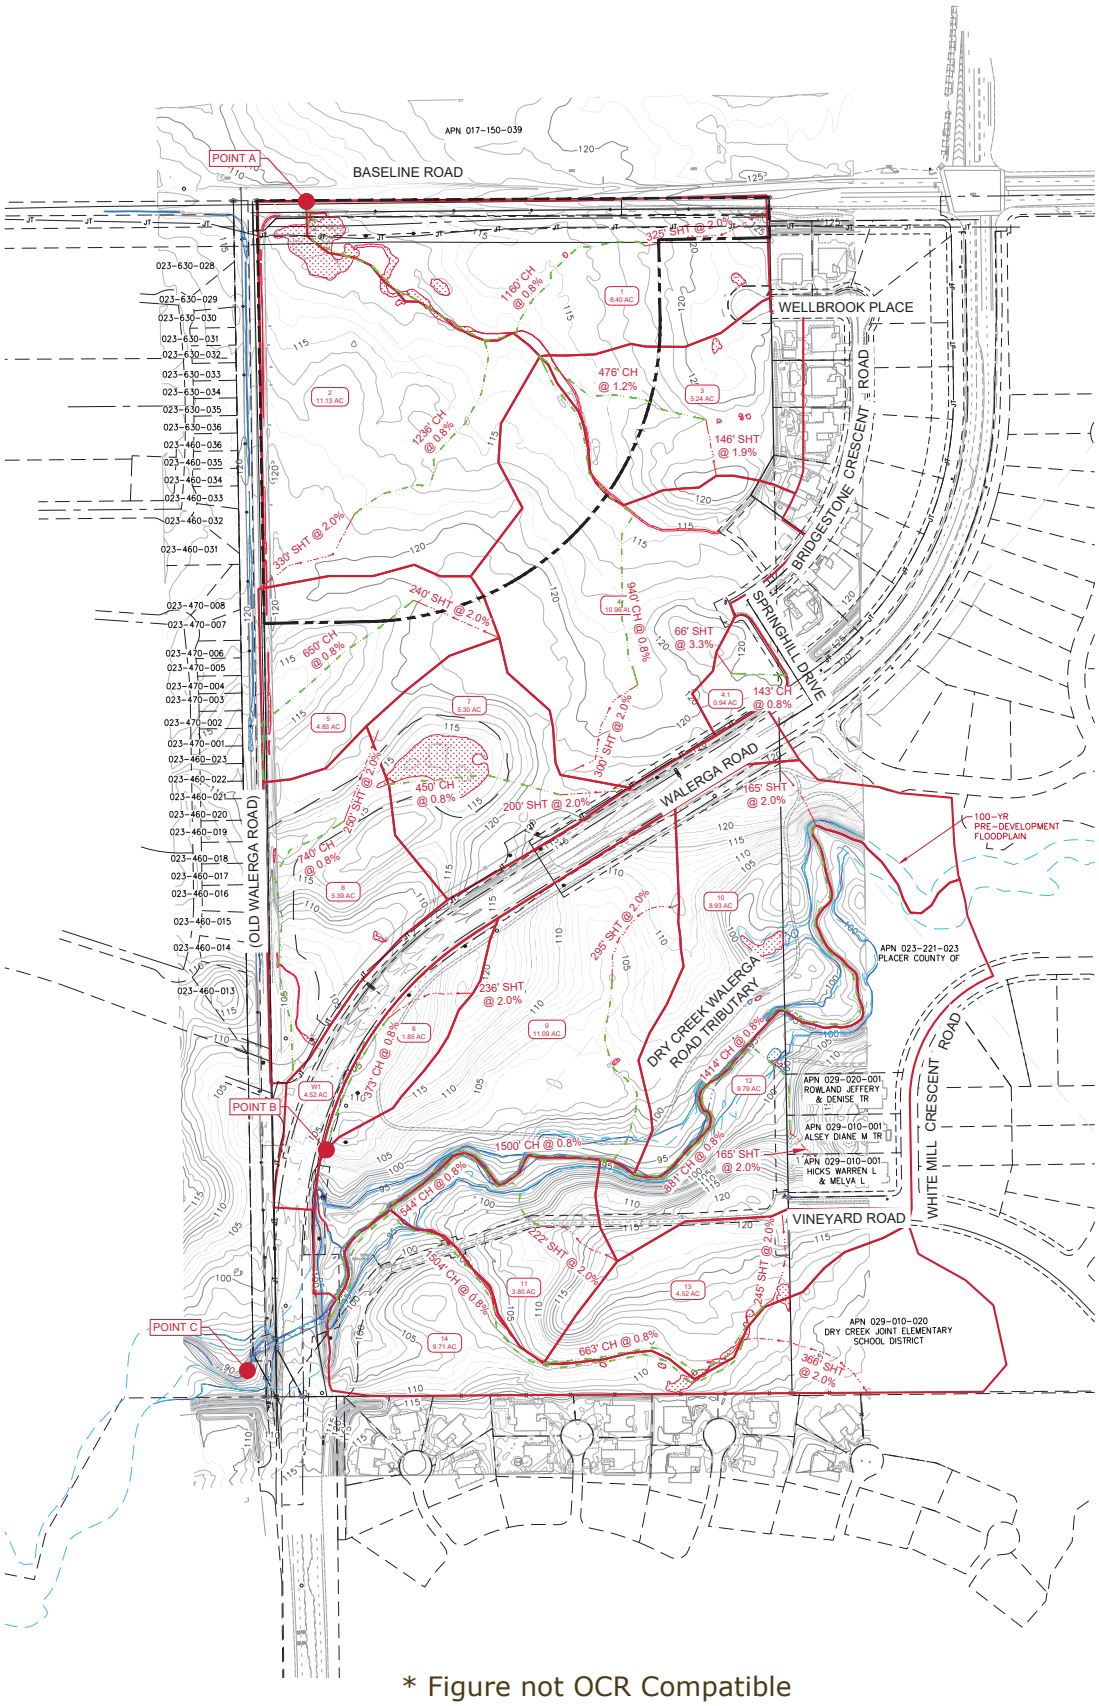
Col. 17 The velocity of the flow at the upstream end, (Col. 3 / Col. 16).

Col. 18 Velocity head (Velocity squared / 2g).

Col. 19 The elevation of the energy grade line at the upstream end, HGL + Velocity head, (Col. 14 + Col. 18) .

Col. 20 The friction slope at the upstream end (the S or Slope term in Manning's equation).

Col. 21 The average of the downstream and upstream friction slopes.



Col. 22 Energy loss. Average Sf/100 x Line Length (Col. 21/100 x Col. 12). Equals (EGL upstream - EGL downstream) +/- tolerance.

Col. 23 The junction loss coefficient (K).

Col. 24 Minor loss. (Col. 23 x Col. 18). Is added to upstream HGL and used as the starting HGL for the next upstream line(s).

Preparation Date:_____03/04/2026_____

Placer County Approval Date:_____

Revision Date December 11 2024

Section 1 General Project Information

The undersigned owner of the subject property, is responsible for the implementation of the provisions of this Storm Water Quality Plan (SWQP), including ongoing operations and maintenance (O&M), consistent with the requirements of the West Placer Storm Water Quality Design Manual and the State of California Phase II Small MS4 General Permit (Order No: 2013-0001-DWQ). If the undersigned transfers its interest in the property, its successors-in-interest shall bear the aforementioned responsibility to implement the SWQP.

For all Regulated Projects (As identified in Form 1-2 below), the undersigned owner hereby grants access to all representatives of the Jurisdictional Agency for the sole purpose of performing O&M inspections of the installed treatment system(s) and hydromodification control(s) if any.

A copy of the final signed and fully approved SWQP shall be available on the subject site for the duration of construction and then stored with the project approval documentation and improvement plans in perpetuity.

Form 1-1 Project Identification and Owner's Certification

Project Site Address:	BASELINE ROAD	
Owner Name:	CHRIS DICKINSON	
Title	LAND DEVELOPMENT AND ACQUISITIONS PROJECT MANAGER	
Company	HOMES BY TOWNE	
Address	11060 WHITE ROCK ROAD, SUITE 150	
City, State, Zip Code	RANCHO CORDOVA, CA 95670	
Email	cdickinson@hbtsac.com	
Telephone #	(916) 782-2424	
Signature	Date	
Engineer:*	Curtis King	PE Stamp* (Required for all Regulated Projects)
Title	Principal Engineer	
Company	King Engineering, Inc.	
Address	200 Auburn Folsom Road	
City, State, Zip Code	Auburn, CA 95603	
Email	Curtis.King@King-Engineering-Inc.com	
Telephone #	(530) 272-8328	
Signature		
Brief Description of Project: (Attach additional sheets as necessary)	Phases 1-4 and Backbone Roads	

* Not required for Small Projects as determined in Form 1-2 below. Project owners are responsible for ensuring that all storm water facilities are designed by an appropriately licensed and qualified professional.

Form 1-2 Project Category	
Development Category (Select all that apply)	
[1]**Small Project** – All projects, except LUPs, that create and/or replace between 2,500-5,000 ft^2 of impervious surface or detached single family homes that create and/or replace 2,500 ft^2 or more of impervious surface and are not part of a larger plan of development.	
[2]Enter total new and/or replaced impervious surface (ft^2)	
[3]**Regulated Project** – All projects that create and/or replace 5,000 ft^2 or more of impervious surface.	
[4]**Regulated Redevelopment Project** with equal to, or greater than 50 percent increase in impervious area	
[5]**Regulated Redevelopment Project** with less than 50 percent increase in impervious area	
[6]Enter total pre-project impervious surface (ft^2)	
[7]Enter total new and/or replaced impervious surface (ft^2)	
[8]**Regulated Road or linear underground/overhead project (LUP)** creating 5,000 ft^2 or more of newly constructed contiguous impervious surface.	
[9]Enter total new and/or replaced impervious surface (ft^2)	
[10]**Regulated Hydromodification Management Project** – Regulated projects that create and/or replace 1 acre or more of impervious surface. A project that does not increase impervious surface area over the pre-project condition is not a hydromodification management project.	YES
[11]Enter total new and/or replaced impervious surface (ft^2)	2255580.36

Section 3 Regulated Projects

Section 3 forms are to be completed for all Regulated Projects.

Form 3-1 Site Location and Hydrologic Features

Site coordinates: *Take GPS measurement at approximate center of site*	[1] Latitude	[2] Longitude	[3] Elevation (ft. above sea level)	[4] 85th Percentile, 24 Hour Design Storm Depth (in):
	38.75051	-121.36295	110	0.9

[5] Receiving waters *Name of stream, lake or other downstream waterbody to which the site runoff eventually drains*	Dry Creek and Curry Creek
[6] 303(d) listed pollutants of concern *Refer to State Water Resources Control Board website* www.waterboards.ca.gov/water_issues/programs/water_quality_assessment/#impaired	
[7] Is Project going to be phased? *If yes, ensure that the SWQP evaluates each phase with distinct DMAs, requiring LID BMPs to address runoff at time of completion.*	Yes

[8] *Use this form to show a conceptual schematic depicting DMAs and conveyance features connecting DMAs to the site outlet(s). An example is provided below that can be modified for the proposed project or a drawing clearly showing DMAs and flow routing may be attached.*

Example only
Modify for project specific SWQP
Use separate sheet if necessary

Please Refer to Site Assessment and Drainage Management Area Drainage Map

Form 3-2 Site Assessment and Layout Documentation

	Has this Item been considered in the Site Layout and depicted in the Site Plan?	
	Yes	**Not Applicable (Include brief explanation)**
Define the development envelope and protected areas, identifying areas that are most suitable for development and areas to be landscaped, or left undisturbed, and used for infiltration.	X	Reference Site Plan for infiltration basins and landscaped spaces to provide
Concentrate development on portions of the site with less permeable soils and preserve areas that can promote infiltration.		N/A
Limit overall impervious coverage of the site with paving and roofs.		N/A
Set back development from creeks, wetlands, and riparian habitats.	X	Reference Site Plan for setbacks and protected regions
To the extent practicable, avoid development and LID siting within floodplains.	X	Reference Site Plan for infiltration basins and landscaped spaces to provide
Preserve significant trees.	X	Reference Site Plan for protected trees
Conform site layout along natural landforms.	X	Site layout conforms to existing tributary flow paths and flood limits
Avoid excessive grading and disturbance of vegetation and soils.		N/A
Replicate the site's natural drainage patterns.	X	Site layout conforms to existing tributary flow paths and flood limits
Detain and retain runoff throughout the site.	X	Infiltration basins are incorporated to capture runoff throughout the site

Attach a Site Plan that incorporates the applicable considerations above. Ensure that the following items are included in the Site Plan:

Site Boundary
Soil types and areal extents, test pit and infiltration test locations
Topographic data with 1 ft. contours
Existing natural hydrologic features (depressions, watercourses, wetlands, riparian corridors)
Floodplain boundaries
Environmentally sensitive areas and areas to be preserved
Proposed locations and footprints of improvements creating new, or replaced, impervious surfaces
Potential pollutant sources and locations
Entire site divided into separate DMAs with unique identifiers
Existing and proposed site drainage network with flow directions and site run-on and discharge locations
Proposed design features and surface treatments used to minimize imperviousness and reduce runoff
Proposed locations and footprints of treatment and hydromodification management facilities
Design features for managing authorized non-stormwater discharges
Areas of soil and/or groundwater contamination
Existing utilities and easements
Maintenance areas

Form 3-3 Source Control Measures			
Potential Pollutant Generating Activity or Source	Check One		Describe the source control measures to be implemented for each potential pollutant generating activity or source present on the project as listed in Appendix C and in the CASQA Fact Sheets. Include any special features, materials, or methods of construction that will be used.
	Present	Not Applicable	
Accidental spills or leaks	☑	☐	measures per SC-11 fact sheet
Interior floor drains	☐	☑	
Parking/storage areas and maintenance	☐	☑	measure per SC-21, SC-22, SC-32 and SC-43 fact sheets
Indoor and structural pest control	☑	☐	measures done mainly by licensed pest control companies per SC-34, SC-61, SC-60 fact sheets
Pools, spas, ponds, decorative fountains, and other water features	☐	☑	measures per SC-72 fact sheet
Landscape/outdoor pesticide use	☑	☐	measures per SC-41, SC-60, SC-73 and SC-75 fact sheets
Restaurants, grocery stores, and other food service operations	☐	☑	
Refuse areas	☑	☐	homewoners to take measures per SC-34, SC-60
Industrial Processes	☐	☑	
Outdoor storage of equipment or materials	☐	☑	measures per SC-32, SC-41, SC-43 fact sheets
Vehicle and equipment cleaning	☑	☐	measures per SC-21 fact sheet
Vehicle and equipment repair and maintenance	☑	☐	measures per SC-22, SC-32 fact sheets
Fuel dispensing areas	☐	☑	
Loading docks	☐	☑	
Fire sprinkler test water	☐	☑	
Drain or wash water from boiler drain lines, condensate drain lines, rooftop equipment, drainage sumps, and other sources	☐	☑	
Unauthorized non-storm water discharges	☑	☐	measures per SC-10 fact sheet
Building and grounds maintenance	☑	☐	measures per SC-4, SC-43 fact sheets

The source control measures identified in this table shall be designed consistent with recommendations from the CASQA Stormwater BMP Handbook for New Development and Redevelopment[1], or from another equivalent manual.

INTRODUCTION

Project Description

The proposed "Estia Dry Creek & Placer Creek Residential" (Project) includes a total of approximately 88 acres, comprised of a 52.3-acre parcel (Assessor's Parcel No. 023-221-046) located on the north side of Walerga Road and a 35.3 -acre parcel (APN 023-221-061) located south and east of Walerga Road, collectively, the "project", Estia Dry Creek and Placer Creek Residential. This Phase 2 project consists of 110 residential units on 26.5 acres. Construction will include streets, storm drainage improvements, and underground utilities. The site is currently unimproved agricultural land. It is bounded on the north by Estia Dry Creek Phase 1 and bounded on the south by Walerga Road. The proposed underground storm drain system outfalls to Walerga Tributary south of Walerga Road.

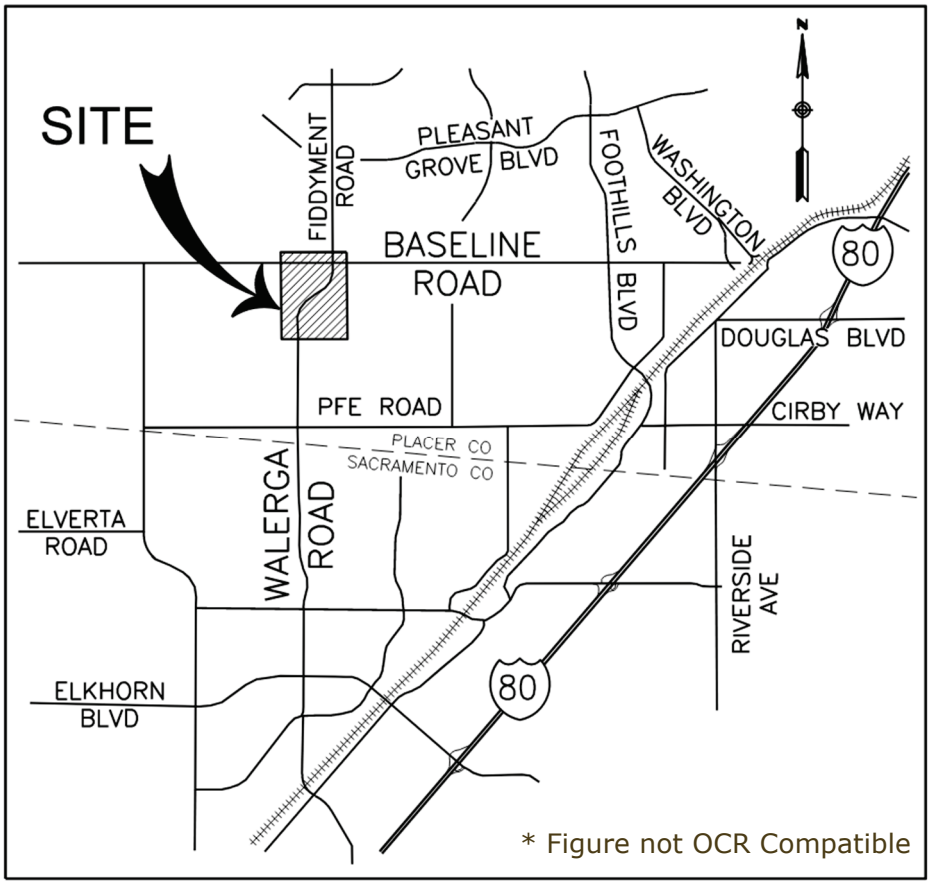

Figure 1: Project Vicinity Map

Scope of the Report

This report provides analysis and documents for the existing pre-developed watershed characteristics and determines the required drainage facilities that are necessary for development of the project. The report will confirm that the post-development changes will be consistent with what is shown on the Drainage Maps.

Pursuant to Reference 2, this is a regulated project with more than one acre of new impervious area proposed and is within the Phase II MS4 Permit Area.

FEMA Information

The Federal Emergency Management Agency's (FEMA) Flood Insurance Study (FIS) Flood Insurance Rate Map (FIRM) contains the project area is Preliminary FIRM Panel ID# 06061C1026J, effective April 12, 2024.

The Dry Creek Walerga Road Tributary is classified as Zone AE which means base flood elevations have been determined and analyzed with a Flood Insurance Study that generated the floodplain limits and a floodway has been established. The limits of the detailed study terminate east of Crowder Lane with Zone A floodplain, which means base flood elevations have not been determined.

ULOP Applicability

The following table shows that this project does not meet the Urban Level of Flood Protection (ULOP) as determined by Placer County to construct improvements within a ULOP boundary. These criteria, enacted by State Senate Bill 5 (SB 5) in 2007, were developed to assist counties and cities within the Sacramento-San Joaquin Valley in making findings related to ULOP before approving land use decisions.

ULOP APPLICABILITY

Refer to the Tentative Map for limits of ULOP floodplain with greater than 3' flooding depth

Finding of Fact / ULOP Criteria	Yes/No	Remark
The project is located within the Sacramento Valley	Yes	Dry Creek is tributary to the Sacramento River
The project is located within an urban area as defined by Code of Federal Regulations Title 44, Section 59.1.	Yes	
A portion of the project is located within a flood hazard zone that is mapped as either a special hazard area or an area of moderate hazard on FEMA FIRM Panels.	Yes	Zone AE Floodplain
The project is located within a watershed that is more than 10 square miles in size.	No	Dry Creek Walerga Road Tributary Watershed area is approximately 1.3 square miles per FEMA FIS report
The project is located within an area with a potential flood depth above 3.0 feet during a 200-year event, from sources of flooding other than localized conditions.	No	Project is located along Dry Creek Walerga Road Tributary
Is any disturbance or development proposed within the ULOP 200-year boundary?	No	Dry Creek ULOP is downstream at the confluence

Future, Fully-Developed, Unmitigated Floodplain

The limits of the future, fully-developed, unmitigated 100-year floodplain are calculated and depicted on the Drainage Maps. The project does not propose residential lots in the future, fully-developed, unmitigated 100-year floodplain.

EXISTING CONDITIONS

Ground slopes range significantly across the project area. The Phase 1 area ground and a portion of the Phase 2 area ground slopes north toward Baseline Road and a portion of the Phase 2 area ground slopes downhill towards Walerga Tributary and Dry Creek. Existing ground cover is primarily grassland with

rolling terrain. The USDA Soil Conservation Service classifies most of the soils within the project as Pleistocene alluvial deposits. The site soil is classified as hydrologic group D. ENGEO prepared a geotechnical study dated December 26, 2023 for the Estia Dry Creek project entitled "Estia at Dry Creek - Geotechnical Exploration". This report identifies the near surface soils generally as deeply weathered gravel, sand, and silt, which is consistent with the USDA data.

The Walerga Tributary is classified as Zone AE floodplain, which means base flood elevations have been determined and analyzed with a Flood Insurance Study that generated the floodplain limits and a floodway has been established. The river hydraulics and cross section profiles for the tributary are derived from the GeoHECRAS software provided by CivilGeo.

Figure 2: Pre-Development Land Photo, Baseline Rd, Looking South

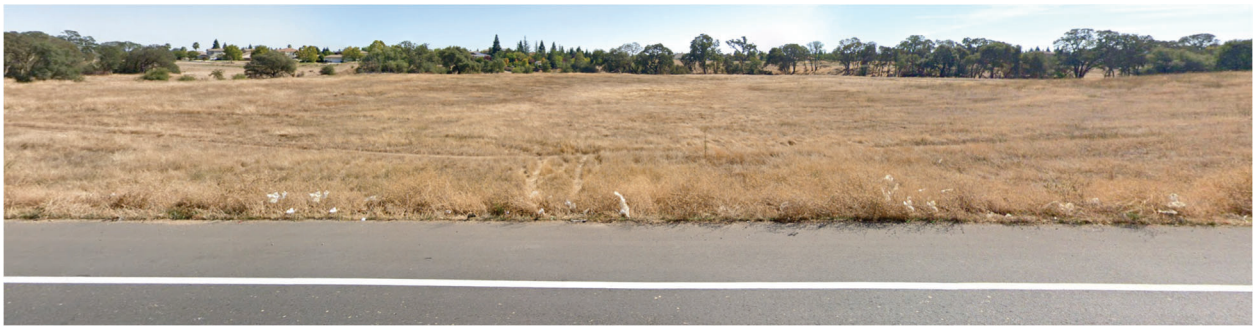

Figure 3: Pre-Development Land Photo, Walerga Rd, Looking Southeast

DESIGN CRITERIA

The design criteria listed below is also found in the West Placer Stormwater Quality Design Manual and Placer County Flood Control and Water Conservation District Stormwater Management Manual (SWMM).

- **The streets remain passable during the 10- and 100-Year storm events and the finished floor elevations are 1', or greater, from the 100-year water surface elevations.**
- **Inlet and Outlet pipes are to have matching Crown Elevations.**
- **The underground storm drain pipes do not flow full during the 10-Year storm.**

*Figures not OCR compatible

- **For Hydraulic Calculations, Pipes are sized as if all flow is captured at each inlet.**

- **Storm Drain pipes are designed to flow under gravity flow for up to the 10-year storm and allowed to flow surcharged, pressure flow for flows larger than the 10 year-storm.**

- **Culverts 30" in diameter and less are designed for 50% blockage at the inlet for the 10-year design storm. However, where there is a grated inlet with 8" maximum size opening, the inlet is designed for 50% blockage, but the culvert connected to such an inlet may be sized without blockage (figuring that large objects cannot get through the inlet openings to block the culvert).**

- **Gutters and inlets serving small drainage areas are sized according to Placer County drainage formulas as follows:**

$$\text{Sheet flow: } t_r = \frac{.355(nL)^{.6}}{S^{.3}}$$

$$\text{Channel flow: } t_r = \frac{.00735Ln^{.75}(1+z)^{.25}}{S^{.375}(A_c z)^{.25}}$$

$$\text{Peak Discharge: } Q = qA - A_p F_i$$

HYDROLOGY & HYDRAULICS

MacKay & Somps analyzed a portion of the existing shed to the Curry Creek watershed from this property in their drainage studies for The Storm Drainage Evaluation for Baseline Road – Segment 1, Upland Drive, Segment 5, and San Fernando Drive Improvement Plans Technical Memorandum dated September 19, 2023 and the Storm Drainage Evaluation for Baseline Road - Segment 3 & Portion of Segment 2 Improvement Plans Technical Memorandum, revision dated February 20, 2025 (for the C13X shed). The studies assumed a pre-development contributing area of 23.9 acres (i.e., Shed UP15X and C13X) draining to Baseline Rd within the Curry Creek Watershed. The Estia Dry Creek Pre-Development Shed Map (Drainage Map #1) assumes 35.6 acres (sheds 1-4) pre-development contributing area to Baseline Rd. within the Curry Creek Watershed, which is 11.7 acres greater than the contributing drainage area of 23.9 acres calculated by MacKay & Somps. In our professional opinion, any minor shed shift from Curry Creek to Dry Creek has no impact on Dry Creek and any downstream properties. This is supported by the HEC-RAS analysis presented in the preliminary drainage reports for Phases 3 & 4.

Maintaining the existing shed boundary on this project is not possible with any standard subdivision design. That is readily apparent from the pre-development shed boundaries in comparison to the site plan. The shape of the existing shed to Curry Creek is not conducive to any standard development for residential or commercial use if the shed boundary is strictly held and applied to development. The cross canal lawsuit determination created the City of Roseville's retention program in 1990 to mitigate volumetric impacts from Roseville to areas within Sutter County, which can experience flooding. The Curry Creek shed/Sutter County downstream is particularly sensitive to flood issues, while Dry Creek is not. Curry Creek is an intermittent watershed with unpredictable flows that is part of the Pleasant Grove Creek watershed. Dry Creek is a major regional watershed where detention is discouraged because of the large flood wave.

Other project grading and layout configurations were considered to more closely maintain the existing watershed boundaries and capacities but were determined to be impractical. The project is required to sewer south as that is where the existing Placer County sewer facilities are located. Draining the existing shed to the north would raise some areas of the site by as much as 10-feet. This would require a significant import of material, approximately 240,000 cubic yards. Transporting such large import quantities could

have significant air quality impacts. This would also result in steep road grades and potential noncompliance with ADA regulations.

Another option evaluated was a permanent storm drain pump facility. This pump facility would pump drainage from the existing shed boundary north toward the Baseline Rd storm drain system. Long-term maintenance requirements and electricity demands are higher with this type of system. Performance and reliability of these types of facilities over time can also be problematic, requiring special equipment and ongoing maintenance to function properly. Placer County Land Development Manual Section 5-11(J) states “The use of drainage pumps shall be avoided if at all possible, and is allowed only with approval of the Engineer.” The Placer County Flood Control and Water Conservation District Stormwater Management Manual (SWMM) also states in section VI-4 Drainage Systems, “Underground drainage systems shall be designed for ease of maintenance and repair.”

Please see Exhibits G, H and I for additional information on the shed shift and other design options considered.

In addition to the approximately 11.7 acres of shed shift to Dry Creek due to the difference in shed area assumptions with the MacKay and Somps Reports, the above design constraints result in an additional shed shift of approximately 14 acres. Therefore, the total shed shift from Curry Creek to Dry Creek is approximately 25.7 acres (11.7 acres + 14 acres) toward Walerga Tributary (Dry Creek), with 10.0 acres of Phase 1 continuing to drain to Curry Creek at the Sierra Vista master planned location in Baseline Rd previously described.

The County requires "compelling justification" to allow a shed shift, with supporting documentation and confirmation that the project does not negatively affect upstream or downstream drainage facilities. This project has coordinated with the County and Flood Control District for approval of this unique exception to SWMM policies (Section II(C)(3); Section IV(B)(3); Section VI(B)(1)(a)).

The project will discharge most of the stormwater runoff into Dry Creek Walerga Road Tributary. The watershed to Dry Creek is approximately 1.3 square miles. The peak flows for the various storm events were modeled in HEC-HMS (Version 4.9). The routing method used is Muskingum Method. The volumetric and discharge relationships were generated through existing surface information and HEC-RAS modeling to determine the necessary rating curve used in the Modified Puls method. The channel is approximated as a trapezoidal channel with a Muskingum Coefficient (X) between 0.10 and 0.20. The rainfall values were taken from Table 5-A-1 in the Stormwater Management Manual for the various storm events. The HEC-HMS model uses the Kinematic Wave transform method and initial/constant loss in determining flows. This method relates the shape of the channel, boundary roughness, and slope of the channel or overland flow surface. Though it simplifies the complex nature of drainage systems, the Kinematic Wave transform method provides a reasonably accurate approximation of flows.

The design flows for the 10-, 50, and 100-year storm events (10, 2 and 1 percent recurrence interval storms) for Dry Creek and the Antelope North Road Tributary were provided by FEMA and were unchanged. There was no 500-year storm flow (0.2 percent chance of occurrence storm) provided for the tributary. Hydraulic models for the existing, revised, and unmitigated scenarios for the Dry Creek Walerga Road Tributary were generated from FEMA FIS data. The Existing model reflects the current physical improvements and latest topography in the area. The HEC-RAS models were generated with the design flows produced by the HEC-HMS model and provide the basis for comparing existing conditions BFEs to revised BFEs to analyze the impacts of the proposed project both upstream and downstream. The models were created using GeoHECRAS software using steady, uniform flow under Subcritical conditions. Refer to Tables 4-6 of the Phase 3 & 4 drainage reports for HEC-RAS modeling inputs and results.

The total flows to Point B, as shown on Table 4, are Q10=57.5 cfs and Q100=108.7. This includes the shed shifted area from Phase 1, Phases 2A and 2B, as well as runoff from the backbone improvements. The infrastructure necessary for these flows is constructed with the Backbone improvements. Additionally, after treating these flows, Basin C is designed to outfall toward the existing 48-inch pipe system in Walerga Rd. The 48-inch outfall into the tributary will need to be extended outside of the roadway improvements constructed with the Backbone project. For simplicity and organization of information, this location is referred to as Point B, as it is the outfall of all flows from Phase 1 toward Dry Creek, Phases 2A and 2B, as well as Walerga Rd, after being treated at Basin C. Hydraulics demonstrating the adequacy of this system are presented in the Preliminary Backbone Drainage Report.

DETENTION & RETENTION

Though drainage detention is not required or recommended for Dry Creek and its tributaries, hydromodification is still required under the MS4 rules, even though the distinction between detention and hydromodification is not made clear. In the post-development condition, this phase discharges to Dry Creek; therefore, detention and retention are not required. Retention is only required for projects draining to the Curry Creek watershed.

WATER QUALITY

To evaluate storm water quality and best management policies (BMP) within the project limits, the West Placer Storm Water Quality Design Manual was referenced and used as a guideline for BMP locations. Drainage Management Areas (DMA) are delineated with infiltration basins shown in Drainage Map #5. The primary purpose of the infiltration basins is to retain minor storm events and capture any pollutants that would otherwise enter Dry Creek. The infiltration basins are primarily for minor storm events and are not intended to reduce the peak flows during extreme storm events. The BMPs shall be maintained in accordance with the project O&M Plan.

Treated Phase 1 flows at Basin B, which is located at the southern edge of the Phase 1 boundary, are collected via the project storm drain system at Park 1 in Phase 2A. The system collects flows from Phase 2B to the east and Phase 2A and directs them toward the Walerga Rd storm drain system analyzed in the Estia Dry Creek – Backbone Infrastructure Preliminary Drainage Report. Phase 2A constructs Basin C at the southwest corner of the project, which treats Phase 2A, Phase 2B, and the Backbone Infrastructure flows prior to outfalling into the Dry Creek Walerga Rd Tributary. Basin C is an underground infiltration basin. Additional flows from Walerga Rd will be directed toward underground infiltration Basin C.

The composite runoff coefficient (Rc) is determined using State Water Control Board Runoff Coefficient Fact Sheet 5.1.3. The fact sheet provides tables of various coefficients depending on land use. The land use within the Phase 2 project is medium density residential. An example calculation provided in Appendix A determined that the backbone portions do not accurately depict what is listed in the Fact Sheet. The Coefficient of 0.55 was used because it is the more conservative value for Water Quality calculations.

FEMA FIRM Panel

FLOOD HAZARD INFORMATION

SEE FIS REPORT FOR DETAILED LEGEND AND INDEX MAP FOR FIRM PANEL LAYOUT

THE INFORMATION DEPICTED ON THIS MAP AND SUPPORTING DOCUMENTATION ARE ALSO AVAILABLE IN DIGITAL FORMAT AT HTTPS://MSC.FEMA.GOV

SPECIAL FLOOD HAZARD AREAS
- Without Base Flood Elevation (BFE) *Zone A, V, A99*
- With BFE or Depth *Zone AE, AO, AH, VE, AR*
- Regulatory Floodway

OTHER AREAS OF FLOOD HAZARD
- 0.2% Annual Chance Flood Hazard, Areas of 1% annual chance flood with average depth less than one foot or with drainage areas of less than one square mile *Zone X*
- Future Conditions 1% Annual Chance Flood Hazard *Zone X*
- Area with Reduced Flood Risk due to Levee See Notes *Zone X*
- Area with Flood Risk due to Levee *Zone D*

OTHER AREAS
- NO SCREEN — Area of Minimal Flood Hazard *Zone X*
- Area of Undetermined Flood Hazard *Zone D*

GENERAL STRUCTURES
- Channel, Culvert, or Storm Sewer
- Levee, Dike, or Floodwall

OTHER FEATURES
- 20.2 — Cross Sections with 1% Annual Chance
- 17.5 — Water Surface Elevation
- Coastal Transect
- Coastal Transect Baseline
- Profile Baseline
- Hydrographic Feature
- 513 — Base Flood Elevation Line (BFE)
- Limit of Study
- Jurisdiction Boundary

NOTES TO USERS

For information and questions about this Flood Insurance Rate Map (FIRM), available effective flood hazard information for your community, or the National Flood Insurance Program (NFIP) in general, please call the FEMA Mapping and Insurance eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA Flood Map Service Center website at https://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be downloaded from the website. Communities annexing land on adjacent FIRM panels must obtain a current copy of the adjacent panel as well as the current FIRM Index. These may be acquired directly from the Flood Map Service Center at the website listed above.

For community and countywide map dates refer to the Flood Insurance Study Report for this jurisdiction.

To determine if flood insurance is available in this community, contact your Insurance agent or call the National Flood Insurance Program at 1-800-638-6620.

Basemap information shown on this FIRM was provided in digital format by the United States Geological Survey (USGS). The basemap shown is the USGS National Map: Orthoimagery. Last refreshed October, 2020.

Note: Some Special Flood Hazard Areas with elevations may not appear with elevation labels if the Base Flood Elevation or Cross-section line which communicates the elevation for the location appears on the adjacent panel. Please see the Panel Locator Diagram on this map panel to determine the adjacent panel and find the elevation feature there, or alternatively use the Flood Insurance Study report for detailed elevations by flood source.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Placer County, California, Western Part
Survey Area Data: Version 15, Aug 31, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Apr 23, 2022—Apr 24, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
140	Cometa sandy loam, 1 to 5 percent slopes	D	32.3	25.0%
141	Cometa-Fiddyment complex, 1 to 5 percent slopes	D	32.1	24.9%
142	Cometa-Ramona sandy loams, 1 to 5 percent slopes	D	1.4	1.1%
146	Fiddyment loam, 1 to 8 percent slopes	D	10.1	7.8%
147	Fiddyment-Kaseberg loams, 2 to 9 percent slopes	C	0.5	0.4%
175	Ramona sandy loam, 2 to 9 percent slopes	C	11.8	9.2%
182	San Joaquin-Cometa sandy loams, 1 to 5 percent slopes	D	29.5	22.9%
194	Xerofluvents, frequently flooded	B	11.4	8.8%

REF 1:		Hydraflow Express program																	
NOTES:		1. Design flow floods up to the but not including travel lanes - on site streets																	
		2. Design Capacity is based on Reference 4, Table 6-1 "Allowable Street Encroachments" & LDM Section 5-13																	
		3. Gutter spread is measured from face of curb.

[1]25.7 acres are proposed to be shifted from the Curry Creek watershed to the Dry Creek watershed from Point A to Point B. The associated 100-year flows from this shed shift are 25.3 cfs from Phase 1 and 39.2 cfs from Phase 2. The associated 10-year flows from this shed shift are 13.4 cfs from Phase 1 and 17.3 cfs from Phase 2.

Hydraflow HGL Computation Procedure

General Procedure:

Hydraflow computes the HGL using the Bernoulli energy equation. Manning's equation is used to determine energy losses due to pipe friction. In a standard step, iterative procedure, Hydraflow assumes upstream HGLs until the energy equation balances. If the energy equation cannot balance, supercritical flow exists and critical depth is temporarily assumed at the upstream end. A supercritical flow Profile is then computed using the same procedure in a downstream direction using momentum principles.

Col. 1 The line number being computed. Calculations begin at Line 1 and proceed upstream.

Col. 2 The line size. In the case of non-circular pipes, the line rise is printed above the span.

Col. 3 Total flow rate in the line.

Col. 4 The elevation of the downstream invert.

Col. 5 Elevation of the hydraulic grade line at the downstream end. This is computed as the upstream HGL + Minor loss of this line's downstream line.

Col. 6 The downstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 7 Cross-sectional area of the flow at the downstream end.

Col. 8 The velocity of the flow at the downstream end, (Col. 3 / Col. 7).

Col. 9 Velocity head (Velocity squared / 2g).

Col. 10 The elevation of the energy grade line at the downstream end, HGL + Velocity head, (Col. 5 + Col. 9).

Col. 11 The friction slope at the downstream end (the S or Slope term in Manning's equation).

Col. 12 The line length.

Col. 13 The elevation of the upstream invert.

Col. 14 Elevation of the hydraulic grade line at the upstream end.

Col. 15 The upstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

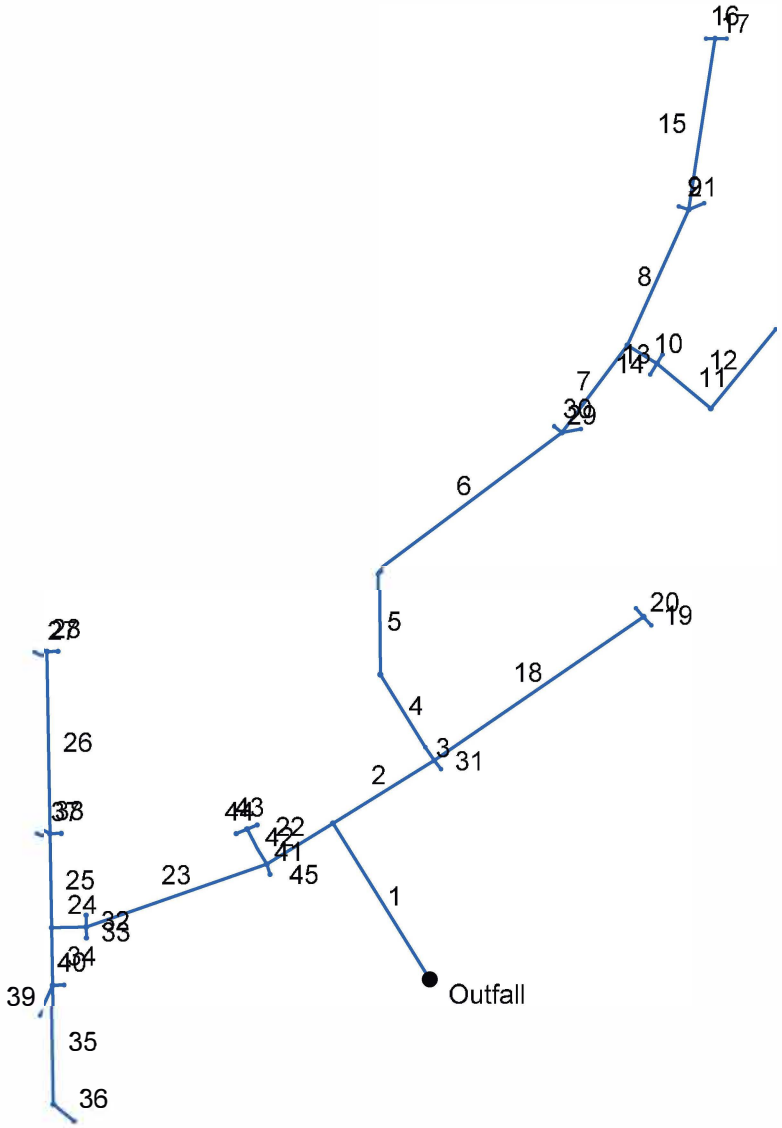
Col. 16 Cross-sectional area of the flow at the upstream end.

Col. 17 The velocity of the flow at the upstream end, (Col. 3 / Col. 16).

Col. 18 Velocity head (Velocity squared / 2g).

Col. 19 The elevation of the energy grade line at the upstream end, HGL + Velocity head, (Col. 14 + Col. 18) .

Col. 20 The friction slope at the upstream end (the S or Slope term in Manning's equation).



Col. 21 The average of the downstream and upstream friction slopes.

Col. 22 Energy loss. Average Sf/100 x Line Length (Col. 21/100 x Col. 12). Equals (EGL upstream - EGL downstream) +/- tolerance.

Col. 23 The junction loss coefficient (K).

Col. 24 Minor loss. (Col. 23 x Col. 18). Is added to upstream HGL and used as the starting HGL for the next upstream line(s).

Hydraflow HGL Computation Procedure

General Procedure:

Hydraflow computes the HGL using the Bernoulli energy equation. Manning's equation is used to determine energy losses due to pipe friction. In a standard step, iterative procedure, Hydraflow assumes upstream HGLs until the energy equation balances. If the energy equation cannot balance, supercritical flow exists and critical depth is temporarily assumed at the upstream end. A supercritical flow Profile is then computed using the same procedure in a downstream direction using momentum principles.

Col. 1 The line number being computed. Calculations begin at Line 1 and proceed upstream.

Col. 2 The line size. In the case of non-circular pipes, the line rise is printed above the span.

Col. 3 Total flow rate in the line.

Col. 4 The elevation of the downstream invert.

Col. 5 Elevation of the hydraulic grade line at the downstream end. This is computed as the upstream HGL + Minor loss of this line's downstream line.

Col. 6 The downstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 7 Cross-sectional area of the flow at the downstream end.

Col. 8 The velocity of the flow at the downstream end, (Col. 3 / Col. 7).

Col. 9 Velocity head (Velocity squared / 2g).

Col. 10 The elevation of the energy grade line at the downstream end, HGL + Velocity head, (Col. 5 + Col. 9).

Col. 11 The friction slope at the downstream end (the S or Slope term in Manning's equation).

Col. 12 The line length.

Col. 13 The elevation of the upstream invert.

Col. 14 Elevation of the hydraulic grade line at the upstream end.

Col. 15 The upstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 16 Cross-sectional area of the flow at the upstream end.

Col. 17 The velocity of the flow at the upstream end, (Col. 3 / Col. 16).

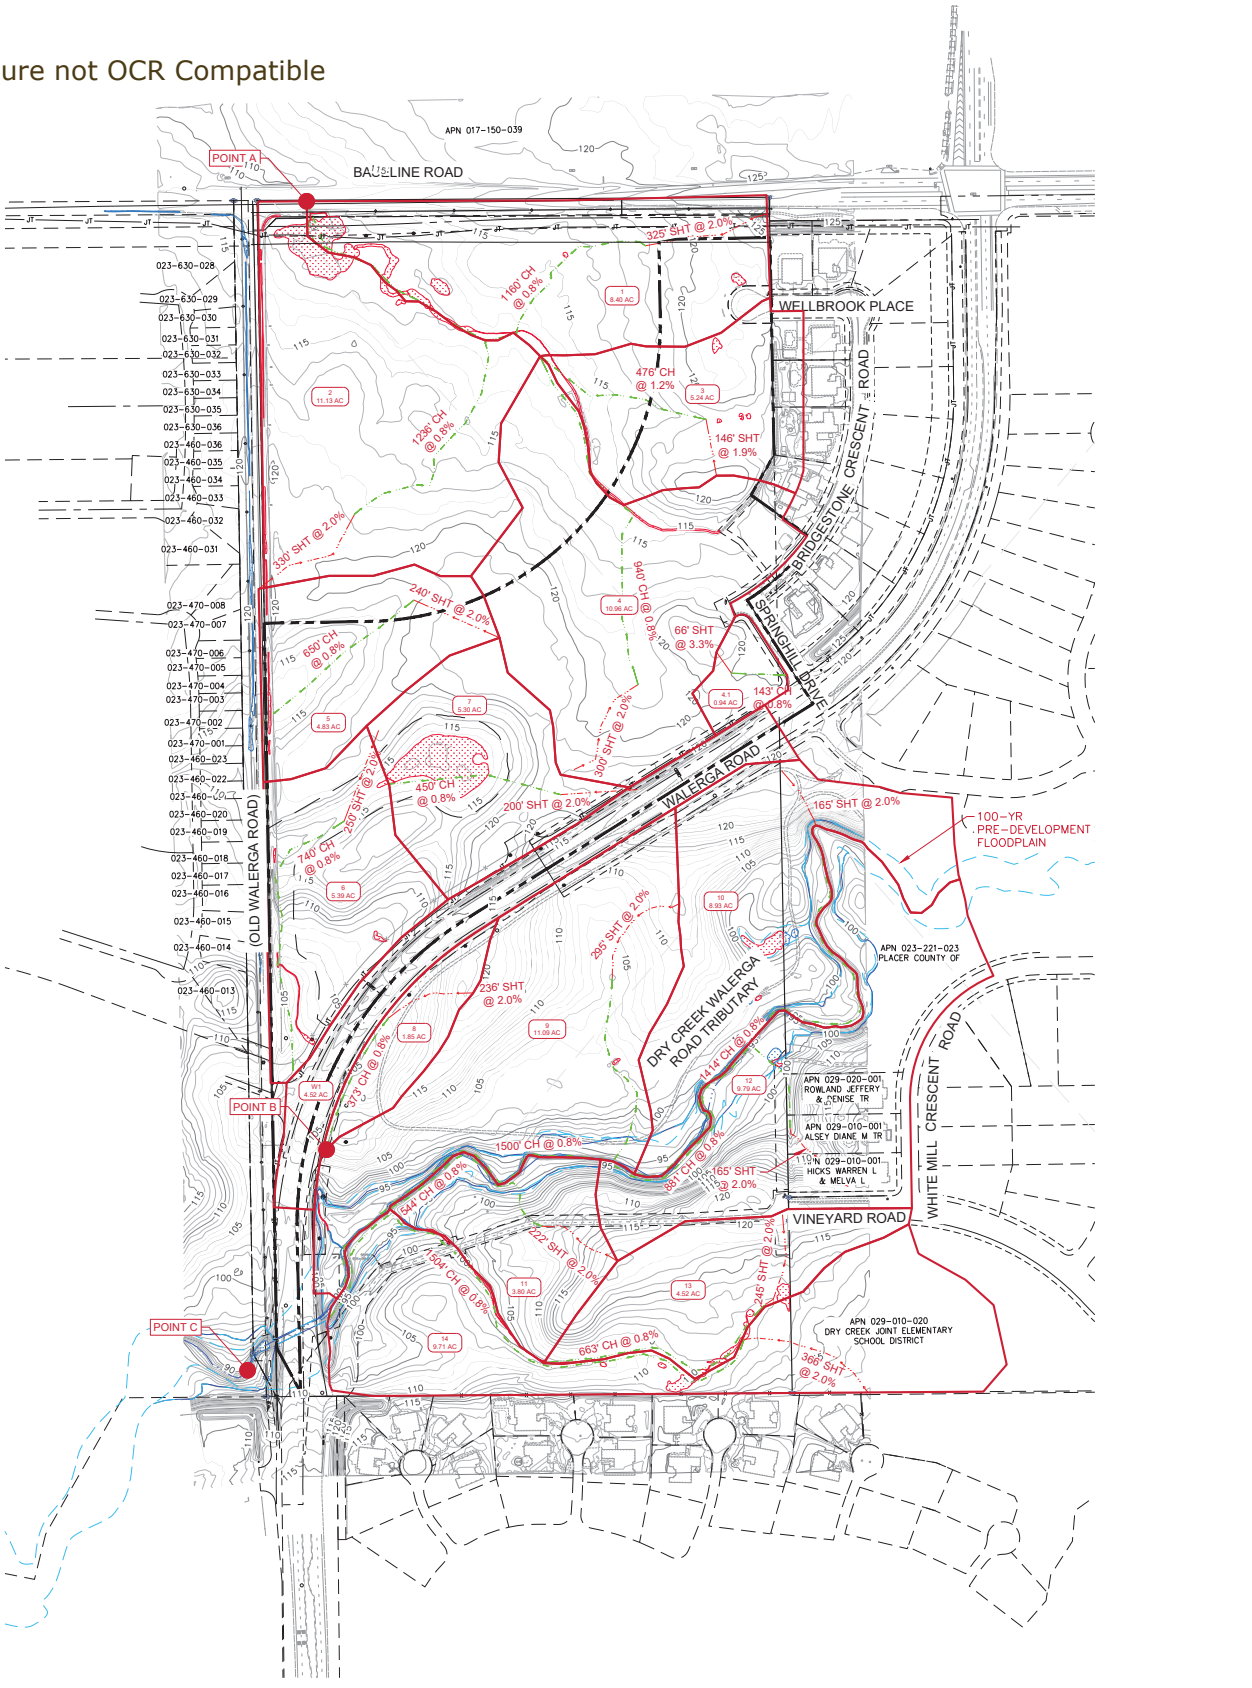
Col. 18 Velocity head (Velocity squared / 2g).

Col. 19 The elevation of the energy grade line at the upstream end, HGL + Velocity head, (Col. 14 + Col. 18) .

Col. 20 The friction slope at the upstream end (the S or Slope term in Manning's equation).

Col. 21 The average of the downstream and upstream friction slopes.

Col. 22 Energy loss. Average Sf/100 x Line Length (Col. 21/100 x Col. 12). Equals (EGL upstream - EGL downstream) +/- tolerance.



Col. 23 The junction loss coefficient (K).

Col. 24 Minor loss. (Col. 23 x Col. 18). Is added to upstream HGL and used as the starting HGL for the next upstream line(s).

Preparation Date:_____03/04/2026_____

Placer County Approval Date:_____

Revision Date December 11 2024

Section 1 General Project Information

The undersigned owner of the subject property, is responsible for the implementation of the provisions of this Storm Water Quality Plan (SWQP), including ongoing operations and maintenance (O&M), consistent with the requirements of the West Placer Storm Water Quality Design Manual and the State of California Phase II Small MS4 General Permit (Order No: 2013-0001-DWQ). If the undersigned transfers its interest in the property, its successors-in-interest shall bear the aforementioned responsibility to implement the SWQP.

For all Regulated Projects (As identified in Form 1-2 below), the undersigned owner hereby grants access to all representatives of the Jurisdictional Agency for the sole purpose of performing O&M inspections of the installed treatment system(s) and hydromodification control(s) if any.

A copy of the final signed and fully approved SWQP shall be available on the subject site for the duration of construction and then stored with the project approval documentation and improvement plans in perpetuity.

Form 1-1 Project Identification and Owner's Certification

Project Site Address:	BASELINE ROAD	
Owner Name:	CHRIS DICKINSON	
Title	LAND DEVELOPMENT AND ACQUISITIONS PROJECT MANAGER	
Company	HOMES BY TOWNE	
Address	11060 WHITE ROCK ROAD, SUITE 150	
City, State, Zip Code	RANCHO CORDOVA, CA 95670	
Email	cdickinson@hbtsac.com	
Telephone #	(916) 782-2424	
Signature	Date	
Engineer:*	Curtis King	PE Stamp* (Required for all Regulated Projects)
Title	Principal Engineer	
Company	King Engineering, Inc.	
Address	200 Auburn Folsom Road	
City, State, Zip Code	Auburn, CA 95603	
Email	Curtis.King@King-Engineering-Inc.com	
Telephone #	(530) 272-8328	
Signature		
Brief Description of Project: (Attach additional sheets as necessary)	Phases 1-4 and Backbone Roads	

* Not required for Small Projects as determined in Form 1-2 below. Project owners are responsible for ensuring that all storm water facilities are designed by an appropriately licensed and qualified professional.

Form 1-2 Project Category	
Development Category (Select all that apply)	
[1]**Small Project** – All projects, except LUPs, that create and/or replace between 2,500-5,000 ft^2 of impervious surface or detached single family homes that create and/or replace 2,500 ft^2 or more of impervious surface and are not part of a larger plan of development.	
[2]Enter total new and/or replaced impervious surface (ft^2)	
[3]**Regulated Project** – All projects that create and/or replace 5,000 ft^2 or more of impervious surface.	
[4]**Regulated Redevelopment Project** with equal to, or greater than 50 percent increase in impervious area	
[5]**Regulated Redevelopment Project** with less than 50 percent increase in impervious area	
[6]Enter total pre-project impervious surface (ft^2)	
[7]Enter total new and/or replaced impervious surface (ft^2)	
[8]**Regulated Road or linear underground/overhead project (LUP)** creating 5,000 ft^2 or more of newly constructed contiguous impervious surface.	
[9]Enter total new and/or replaced impervious surface (ft^2)	
[10]**Regulated Hydromodification Management Project** – Regulated projects that create and/or replace 1 acre or more of impervious surface. A project that does not increase impervious surface area over the pre-project condition is not a hydromodification management project.	YES
[11]Enter total new and/or replaced impervious surface (ft^2)	2255580.36

Section 3 Regulated Projects

Section 3 forms are to be completed for all Regulated Projects.

Form 3-1 Site Location and Hydrologic Features

Site coordinates: *Take GPS measurement at approximate center of site*	[1] Latitude	[2] Longitude	[3] Elevation (ft. above sea level)	[4] 85th Percentile, 24 Hour Design Storm Depth (in):
	38.75051	-121.36295	110	0.9

[5] Receiving waters *Name of stream, lake or other downstream waterbody to which the site runoff eventually drains*	Dry Creek and Curry Creek
[6] 303(d) listed pollutants of concern *Refer to State Water Resources Control Board website* www.waterboards.ca.gov/water_issues/programs/water_quality_assessment/#impaired	
[7] Is Project going to be phased? *If yes, ensure that the SWQP evaluates each phase with distinct DMAs, requiring LID BMPs to address runoff at time of completion.*	Yes

[8] *Use this form to show a conceptual schematic depicting DMAs and conveyance features connecting DMAs to the site outlet(s). An example is provided below that can be modified for the proposed project or a drawing clearly showing DMAs and flow routing may be attached.*

Example only
Modify for project specific SWQP
Use separate sheet if necessary

Please Refer to Site Assessment and Drainage Management Area Drainage Map

Form 3-2 Site Assessment and Layout Documentation

	Has this Item been considered in the Site Layout and depicted in the Site Plan?	
	Yes	**Not Applicable (Include brief explanation)**
Define the development envelope and protected areas, identifying areas that are most suitable for development and areas to be landscaped, or left undisturbed, and used for infiltration.	X	Reference Site Plan for infiltration basins and landscaped spaces to provide
Concentrate development on portions of the site with less permeable soils and preserve areas that can promote infiltration.		N/A
Limit overall impervious coverage of the site with paving and roofs.		N/A
Set back development from creeks, wetlands, and riparian habitats.	X	Reference Site Plan for setbacks and protected regions
To the extent practicable, avoid development and LID siting within floodplains.	X	Reference Site Plan for infiltration basins and landscaped spaces to provide
Preserve significant trees.	X	Reference Site Plan for protected trees
Conform site layout along natural landforms.	X	Site layout conforms to existing tributary flow paths and flood limits
Avoid excessive grading and disturbance of vegetation and soils.		N/A
Replicate the site's natural drainage patterns.	X	Site layout conforms to existing tributary flow paths and flood limits
Detain and retain runoff throughout the site.	X	Infiltration basins are incorporated to capture runoff throughout the site

Attach a Site Plan that incorporates the applicable considerations above. Ensure that the following items are included in the Site Plan:

Site Boundary
Soil types and areal extents, test pit and infiltration test locations
Topographic data with 1 ft. contours
Existing natural hydrologic features (depressions, watercourses, wetlands, riparian corridors)
Floodplain boundaries
Environmentally sensitive areas and areas to be preserved
Proposed locations and footprints of improvements creating new, or replaced, impervious surfaces
Potential pollutant sources and locations
Entire site divided into separate DMAs with unique identifiers
Existing and proposed site drainage network with flow directions and site run-on and discharge locations
Proposed design features and surface treatments used to minimize imperviousness and reduce runoff
Proposed locations and footprints of treatment and hydromodification management facilities
Design features for managing authorized non-stormwater discharges
Areas of soil and/or groundwater contamination
Existing utilities and easements
Maintenance areas

Form 3-3 Source Control Measures			
Potential Pollutant Generating Activity or Source	Check One		Describe the source control measures to be implemented for each potential pollutant generating activity or source present on the project as listed in Appendix C and in the CASQA Fact Sheets. Include any special features, materials, or methods of construction that will be used.
	Present	Not Applicable	
Accidental spills or leaks	☑	☐	measures per SC-11 fact sheet
Interior floor drains	☐	☑	
Parking/storage areas and maintenance	☐	☑	measure per SC-21, SC-22, SC-32 and SC-43 fact sheets
Indoor and structural pest control	☑	☐	measures done mainly by licensed pest control companies per SC-34, SC-61, SC-60 fact sheets
Pools, spas, ponds, decorative fountains, and other water features	☐	☑	measures per SC-72 fact sheet
Landscape/outdoor pesticide use	☑	☐	measures per SC-41, SC-60, SC-73 and SC-75 fact sheets
Restaurants, grocery stores, and other food service operations	☐	☑	
Refuse areas	☑	☐	homewoners to take measures per SC-34, SC-60
Industrial Processes	☐	☑	
Outdoor storage of equipment or materials	☐	☑	measures per SC-32, SC-41, SC-43 fact sheets
Vehicle and equipment cleaning	☑	☐	measures per SC-21 fact sheet
Vehicle and equipment repair and maintenance	☑	☐	measures per SC-22, SC-32 fact sheets
Fuel dispensing areas	☐	☑	
Loading docks	☐	☑	
Fire sprinkler test water	☐	☑	
Drain or wash water from boiler drain lines, condensate drain lines, rooftop equipment, drainage sumps, and other sources	☐	☑	
Unauthorized non-storm water discharges	☑	☐	measures per SC-10 fact sheet
Building and grounds maintenance	☑	☐	measures per SC-4, SC-43 fact sheets

The source control measures identified in this table shall be designed consistent with recommendations from the CASQA Stormwater BMP Handbook for New Development and Redevelopment[1], or from another equivalent manual.

[1] California Stormwater BMP Handbook New Development and Redevelopment. California Stormwater Quality Association (CASQA). January 2003.

Form 4-4 Trash Controls

Type of Trash Control Measure Implemented	Check One		Describe relevant information about each trash control measure. Include number present, size of drainage area to each measure, any special features, materials, or methods of construction that will be used.
	Present	Not Applicable	
Full Capture System	☐	☑	
Multi-Benefit Trash Treatment System: Bioretention	☑	☐	
Multi-Benefit Trash Treatment System: Capture and Use Systems	☐	☑	
Multi-Benefit Trash Treatment System: Detention Basin	☐	☑	
Multi-Benefit Trash Treatment System: Infiltration Trench or Basin	☐	☑	
Multi-Benefit Trash Treatment System: Media Filter	☐	☑	

Form 5-1 BMP Inspection and Maintenance		
BMP	**Inspection Point and Frequency**	**Maintenance Activity Required**
Infiltration Basins	Inlet/Outlet	Repair Erosion
	Entire Basin	Remove Debris and Trash as needed
	Overflow structure	Remove debris to unclog

Form 6-1 Post-Construction Stormwater BMPs

Following is a summary of all BMPs included in the Project design. This checklist must be included on the cover sheet of the Improvement Plans for all Regulated Projects.

BMP		Plan Sheet Number(s)
Structural Source Controls (list BMPs)		
Site Design Measures	Stream Setbacks and Buffers	
	Soil Quality Improvement and Maintenance	
	Tree Planting and Preservation	
	Rooftop and Impervious Area Disconnection	
	Porous Pavement	
	Vegetated Swales	
	Rain Barrels and Cisterns	
Stormwater Treatment and Baseline Hydromodification Measures	Bioretention with Infiltration	
	Flow-Through Planters, Tree Box Filters and Media Filters	
Hydromodification Management Measures	Supplemental Detention	
Trash Control Measures	Full Capture System	
	Multi-Benefit Treatment System: Bioretention	
	Multi-Benefit Treatment System: Capture and Use Systems	
	Multi-Benefit Treatment System: Detention Basin	
	Multi-Benefit Treatment System: Infiltration Trench or Basin	
	Multi-Benefit Treatment System: Media Filter

INTRODUCTION

Project Description

The proposed "Estia Dry Creek & Placer Creek Residential" (Project) includes a total of approximately 88 acres, comprised of a 52.3-acre parcel (Assessor's Parcel No. 023-221-046) located on the north side of Walerga Road and a 35.3 -acre parcel (APN 023-221-061) located south and east of Walerga Road, collectively, the "project", Estia Dry Creek and Placer Creek Residential. This Phase 3 project consists of 56 residential units on 21.3 acres. Construction will include streets, storm drainage improvements, and underground utilities. The site is currently unimproved agricultural land. It is bounded on the north by Walerga Road and bounded on the south by Dry Creek Walerga Rd Tributary. The proposed underground storm drain system outfalls to water quality basins before ultimately draining to the Dry Creek Walerga Road Tributary.

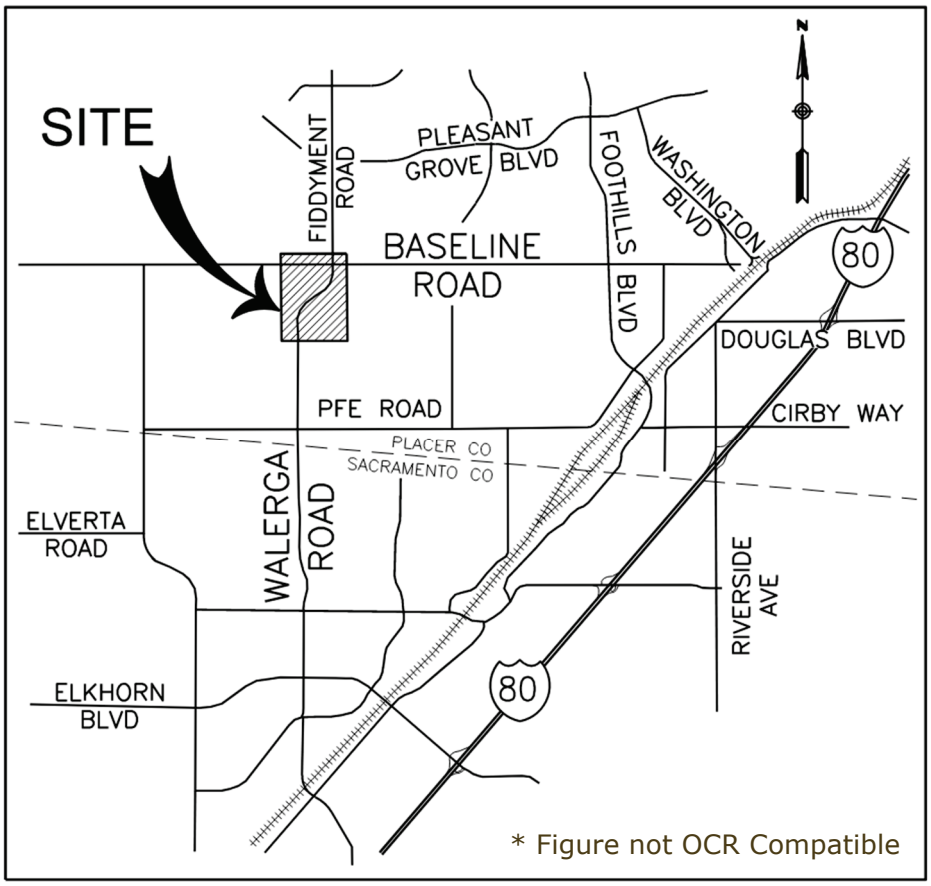

Figure 1: Project Vicinity Map

Scope of the Report

This report provides analysis and documents for the existing pre-developed watershed characteristics and determines the required drainage facilities that are necessary for development of the project. The report will confirm that the post-development changes will be consistent with what is shown on the Drainage Maps.

Pursuant to Reference 2, this is a regulated project with more than one acre of new impervious area proposed and is within the Phase II MS4 Permit Area.

FEMA Information

The Federal Emergency Management Agency's (FEMA) Flood Insurance Study (FIS) Flood Insurance Rate Map (FIRM) contains the project area is Preliminary FIRM Panel ID# 06061C1026J, effective April 12, 2024. Based off the panel, portions of the existing 100-year floodplain are impacted by the proposed development. Excavation is proposed along the tributary to construct water quality infiltration basins. A pedestrian bridge is proposed over the tributary, connecting trails between Phases 3 and 4. This bridge is proposed to be placed on existing grade with minimal grading activities to support placement. Minor storm events will pass under the bridge, while the 100-year storm is intended to inundate and pass over it. For the current Preliminary FIRM Panel, please see Exhibit A.

The Dry Creek Walerga Road Tributary is classified as Zone AE which means base flood elevations have been determined and analyzed with a Flood Insurance Study that generated the floodplain limits and a floodway has been established. The limits of the detailed study terminate east of Crowder Lane with Zone A floodplain, which means base flood elevations have not been determined.

ULOP Applicability

The following table shows that this project does not meet the Urban Level of Flood Protection (ULOP) as determined by Placer County to construct improvements within a ULOP boundary. These criteria, enacted by State Senate Bill 5 (SB 5) in 2007, were developed to assist counties and cities within the Sacramento-San Joaquin Valley in making findings related to ULOP before approving land use decisions.

ULOP APPLICABILITY

Refer to the Tentative Map for limits of ULOP floodplain with greater than 3' flooding depth

Finding of Fact / ULOP Criteria	Yes/No	Remark
The project is located within the Sacramento Valley	Yes	Dry Creek is tributary to the Sacramento River
The project is located within an urban area as defined by Code of Federal Regulations Title 44, Section 59.1.	Yes	
A portion of the project is located within a flood hazard zone that is mapped as either a special hazard area or an area of moderate hazard on FEMA FIRM Panels.	Yes	Zone AE Floodplain
The project is located within a watershed that is more than 10 square miles in size.	No	Dry Creek Walerga Road Tributary Watershed area is approximately 1.3 square miles per FEMA FIS report
The project is located within an area with a potential flood depth above 3.0 feet during a 200-year event, from sources of flooding other than localized conditions.	No	Project is located along Dry Creek Walerga Road Tributary
Is any disturbance or development proposed within the ULOP 200-year boundary?	No	Dry Creek ULOP is downstream at the confluence

Future, Fully-Developed, Unmitigated Floodplain

The limits of the future, fully-developed, unmitigated 100-year floodplain are calculated and depicted on the Drainage Maps. The project does not propose residential lots in the future, fully-developed, unmitigated 100-year floodplain.

EXISTING CONDITIONS

Ground slopes range significantly across the project area. The Phase 3 ground slopes downhill to the South towards Dry Creek Walerga Road Tributary. Existing ground cover is primarily grassland with rolling terrain. The USDA Soil Conservation Service classifies most of the soils within the project as Pleistocene alluvial deposits. The site soil is classified as hydrologic group D. ENGEO prepared a geotechnical study dated December 26, 2023 for the Estia Dry Creek project entitled "Estia at Dry Creek - Geotechnical Exploration". This report identifies the near surface soils generally as deeply weathered gravel, sand, and silt, which is consistent with the USDA data.

The Walerga Tributary is classified as Zone AE floodplain, which means base flood elevations have been determined and analyzed with a Flood Insurance Study that generated the floodplain limits and a floodway has been established. The river hydraulics and cross section profiles for the tributary are derived from the GeoHECRAS software provided by CivilGeo.

DESIGN CRITERIA

*Figures not OCR compatible

The design criteria listed below are also found in the West Placer Stormwater Quality Design Manual and Placer County Flood Control and Water Conservation District Stormwater Management Manual (SWMM).

- **The streets remain passable during the 10- and 100-Year storm events and the finished floor elevations are 1', or greater, from the 100-year water surface elevations.**
- **Inlet and Outlet pipes are to have matching Crown Elevations.**
- **The underground storm drain pipes do not flow full during the 10-Year storm.**
- **For Hydraulic Calculations, Pipes are sized as if all flow is captured at each inlet.**
- **Storm Drain pipes are designed to flow under gravity flow for up to the 10-year storm and allowed to flow surcharged, pressure flow for flows larger than the 10 year-storm.**
- **Culverts 30" in diameter and less are designed for 50% blockage at the inlet for the 10-year design storm. However, where there is a grated inlet with 8" maximum size opening, the inlet is designed for 50% blockage, but the culvert connected to such an inlet may be sized without blockage (figuring that large objects cannot get through the inlet openings to block the culvert).**
- **The future, fully developed unmitigated 100-Year floodplain limits for Dry Creek Walerga Road Tributary have been added to the maps using FIS flow data.**
- **Gutters and inlets serving small drainage areas are sized according to Placer County drainage formulas as follows:**

$$\text{Sheet flow: } t_r = \frac{.355(nL)^{.6}}{S^{.3}}$$

$$\text{Channel flow: } t_r = \frac{.00735Ln^{.75}(1+z)^{.25}}{S^{.375}(A_c z)^{.25}}$$

$$\text{Peak Discharge: } Q = qA - A_p F_i$$

HYDROLOGY & HYDRAULICS

The project will discharge stormwater runoff into Dry Creek Walerga Road Tributary. The watershed to Dry Creek is approximately 1.3 square miles. The peak flows for the various storm events were modeled in HEC-HMS (Version 4.9). The routing method used is Muskingum Method. The volumetric and discharge relationships were generated through existing surface information and HEC-RAS modeling to determine the necessary rating curve used in the Modified Puls method. The channel is approximated as a trapezoidal channel with a Muskingum Coefficient (X) between 0.10 and 0.20. The rainfall values were taken from Table 5-A-1 in the Stormwater Management Manual for the various storm events. The HEC-HMS model uses the Kinematic Wave transform method and initial/constant loss. This method relates the shape of the channel, boundary roughness, and slope of the channel or overland flow surface. Though it simplifies the complex nature of drainage systems, the Kinematic Wave transform method provides a reasonably accurate approximation of flows.

The design flows for the 10-, 50-and 100-year storm events (10, 2 and 1 percent chance of occurrence storms) for Dry Creek and the Antelope North Road Tributary were provided by FEMA and were unchanged. There was no 500-year storm flow (0.2 percent chance of occurrence storm) provided for the tributary. Hydraulic models for the existing, revised, and unmitigated scenarios for the Dry Creek Walerga Road Tributary were generated from FEMA FIS data. The Existing model reflects the current physical improvements and latest topography in the area. The HEC-RAS models were generated with the design flows produced by the HEC-HMS model and provide the basis for comparing existing conditions BFEs to revised BFEs to analyze the impacts of the proposed project both upstream and downstream. The models were created using Geo HEC-RAS software using steady, uniform flow under Subcritical conditions. Refer to Tables 4-6 for HEC-RAS modeling inputs and results.

DETENTION

Though drainage detention is not required or recommended for Dry Creek and its tributaries, hydromodification is still required under the MS4 rules, even though the distinction between detention and hydromodification is not made clear.

The peak flood wave in the Dry Creek Walerga Road Tributary occurs at approximately 13 hours into 100-year, 24-hour storm, well ahead of the Dry Creek regional flood wave at approximately 17 hours (Dry Creek Watershed Plan, Placer County). This means that downstream properties will see no impact to the base flood elevation from this project. The shed shift from Curry Creek to Dry Creek of approximately 25.7 acres toward Walerga Tributary (Dry Creek) was accounted for in the HEC-HMS modeling, which determined the timing of this peak flood wave.

WATER QUALITY

To evaluate storm water quality and best management policies (BMP) within the project limits, the West Placer Storm Water Quality Design Manual was referenced and used as a guideline for BMP locations. Drainage Management Areas (DMA) are delineated with infiltration basins shown in Drainage Map #5. The primary purpose of the infiltration basins is to retain minor storm events and capture any pollutants that would otherwise enter Dry Creek. The infiltration basins are primarily for minor storm events but not intended to reduce the peak flows during extreme storm events.

Phase 3 is divided into two DMAs, DMA D and DMA E. DMA D is the portion of the project which will discharge into infiltration Basin D at Phase 3 Discharge Point 1 on Drainage Map #2. From Basin D, treated runoff enters the Dry Creek Walerga Road Tributary. DMA E is the portion of the project which will discharge into infiltration Basin E at Phase 3 Discharge Point 2 on Drainage Map #2. From Basin E, treated runoff enters the Dry Creek Walerga Road Tributary. The peak flows from these DMAs can be found in Tables 2 and 7. The combined runoff of Phases 3 and 4 is described as Point C in Table 7 and shown on Drainage Map #2.

The composite runoff coefficient (Rc) is determined using State Water Control Board Runoff Coefficient Fact Sheet 5.1.3. The fact sheet provides tables of various coefficients depending on land use. The land use within the Phase 3 project is medium density residential. The Coefficient of 0.55 was used because it is the more conservative value for Water Quality calculations.

NOTES TO USERS

For information and questions about this Flood Insurance Rate Map (FIRM), available effective flood hazard information for your community, or the National Flood Insurance Program (NFIP) in general, please call the FEMA Mapping and Insurance eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA Flood Map Service Center website at https://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be downloaded from the website. Communities annexing land on adjacent FIRM panels must obtain a current copy of the adjacent panel as well as the current FIRM Index. These may be acquired directly from the Flood Map Service Center at the website listed above.

For community and countywide map dates refer to the Flood Insurance Study Report for this jurisdiction.

To determine if flood insurance is available in this community, contact your Insurance agent or call the National Flood Insurance Program at 1-800-638-6620.

Basemap information shown on this FIRM was provided in digital format by the United States Geological Survey (USGS). The basemap shown is the USGS National Map: Orthoimagery. Last refreshed October, 2020.

Note: Some Special Flood Hazard Areas with elevations may not appear with elevation labels if the Base Flood Elevation or Cross-section line which communicates the elevation for the location appears on the adjacent panel. Please see the Panel Locator Diagram on this map panel to determine the adjacent panel and find the elevation feature there, or alternatively use the Flood Insurance Study report for detailed elevations by flood source.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Placer County, California, Western Part
Survey Area Data: Version 15, Aug 31, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Apr 23, 2022—Apr 24, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

[1]25.7 acres are proposed to be shifted from the Curry Creek watershed to the Dry Creek watershed from Point A to Point B. The associated 100-year flows from this shed shift are 25.3 cfs from Phase 1 and 39.2 cfs from Phase 2. The associated 10-year flows from this shed shift are 13.4 cfs from Phase 1 and 17.3 cfs from Phase 2.

Hydraflow HGL Computation Procedure

General Procedure:

Hydraflow computes the HGL using the Bernoulli energy equation. Manning's equation is used to determine energy losses due to pipe friction. In a standard step, iterative procedure, Hydraflow assumes upstream HGLs until the energy equation balances. If the energy equation cannot balance, supercritical flow exists and critical depth is temporarily assumed at the upstream end. A supercritical flow Profile is then computed using the same procedure in a downstream direction using momentum principles.

Col. 1 The line number being computed. Calculations begin at Line 1 and proceed upstream.

Col. 2 The line size. In the case of non-circular pipes, the line rise is printed above the span.

Col. 3 Total flow rate in the line.

Col. 4 The elevation of the downstream invert.

Col. 5 Elevation of the hydraulic grade line at the downstream end. This is computed as the upstream HGL + Minor loss of this line's downstream line.

Col. 6 The downstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 7 Cross-sectional area of the flow at the downstream end.

Col. 8 The velocity of the flow at the downstream end, (Col. 3 / Col. 7).

Col. 9 Velocity head (Velocity squared / 2g).

Col. 10 The elevation of the energy grade line at the downstream end, HGL + Velocity head, (Col. 5 + Col. 9).

Col. 11 The friction slope at the downstream end (the S or Slope term in Manning's equation).

Col. 12 The line length.

Col. 13 The elevation of the upstream invert.

Col. 14 Elevation of the hydraulic grade line at the upstream end.

Col. 15 The upstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

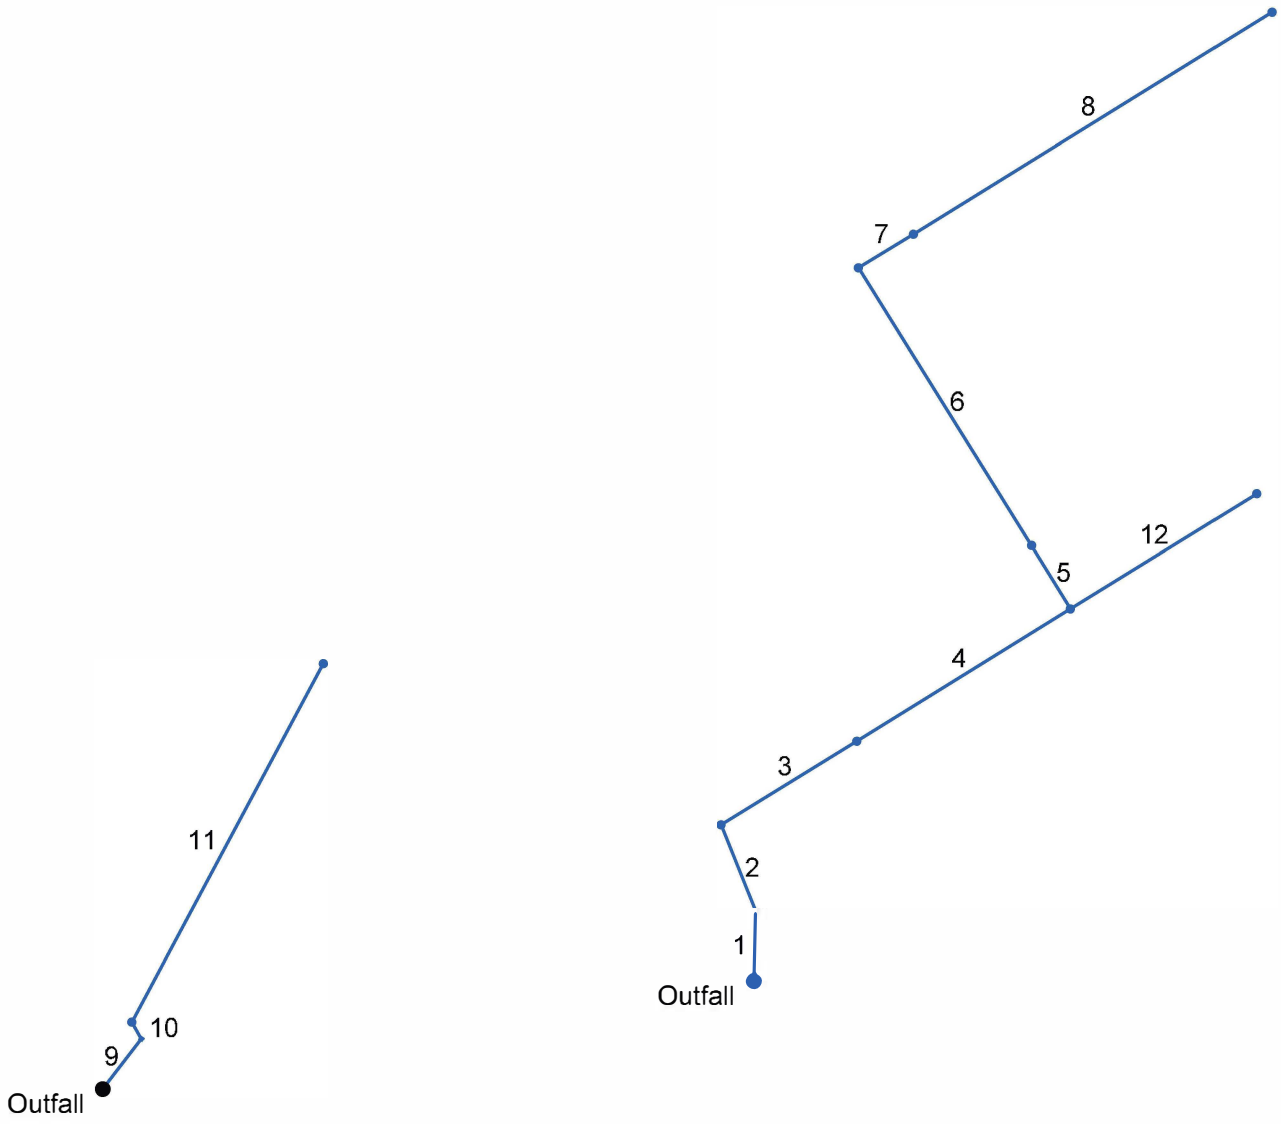
Col. 16 Cross-sectional area of the flow at the upstream end.

Col. 17 The velocity of the flow at the upstream end, (Col. 3 / Col. 16).

Col. 18 Velocity head (Velocity squared / 2g).

Col. 19 The elevation of the energy grade line at the upstream end, HGL + Velocity head, (Col. 14 + Col. 18) .

Col. 20 The friction slope at the upstream end (the S or Slope term in Manning's equation).



Col. 21 The average of the downstream and upstream friction slopes.

Col. 22 Energy loss. Average Sf/100 x Line Length (Col. 21/100 x Col. 12). Equals (EGL upstream - EGL downstream) +/- tolerance.

Col. 23 The junction loss coefficient (K).

Col. 24 Minor loss. (Col. 23 x Col. 18). Is added to upstream HGL and used as the starting HGL for the next upstream line(s).

Hydraflow HGL Computation Procedure

General Procedure:

Hydraflow computes the HGL using the Bernoulli energy equation. Manning's equation is used to determine energy losses due to pipe friction. In a standard step, iterative procedure, Hydraflow assumes upstream HGLs until the energy equation balances. If the energy equation cannot balance, supercritical flow exists and critical depth is temporarily assumed at the upstream end. A supercritical flow Profile is then computed using the same procedure in a downstream direction using momentum principles.

Col. 1 The line number being computed. Calculations begin at Line 1 and proceed upstream.

Col. 2 The line size. In the case of non-circular pipes, the line rise is printed above the span.

Col. 3 Total flow rate in the line.

Col. 4 The elevation of the downstream invert.

Col. 5 Elevation of the hydraulic grade line at the downstream end. This is computed as the upstream HGL + Minor loss of this line's downstream line.

Col. 6 The downstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 7 Cross-sectional area of the flow at the downstream end.

Col. 8 The velocity of the flow at the downstream end, (Col. 3 / Col. 7).

Col. 9 Velocity head (Velocity squared / 2g).

Col. 10 The elevation of the energy grade line at the downstream end, HGL + Velocity head, (Col. 5 + Col. 9).

Col. 11 The friction slope at the downstream end (the S or Slope term in Manning's equation).

Col. 12 The line length.

Col. 13 The elevation of the upstream invert.

Col. 14 Elevation of the hydraulic grade line at the upstream end.

Col. 15 The upstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 16 Cross-sectional area of the flow at the upstream end.

Col. 17 The velocity of the flow at the upstream end, (Col. 3 / Col. 16).

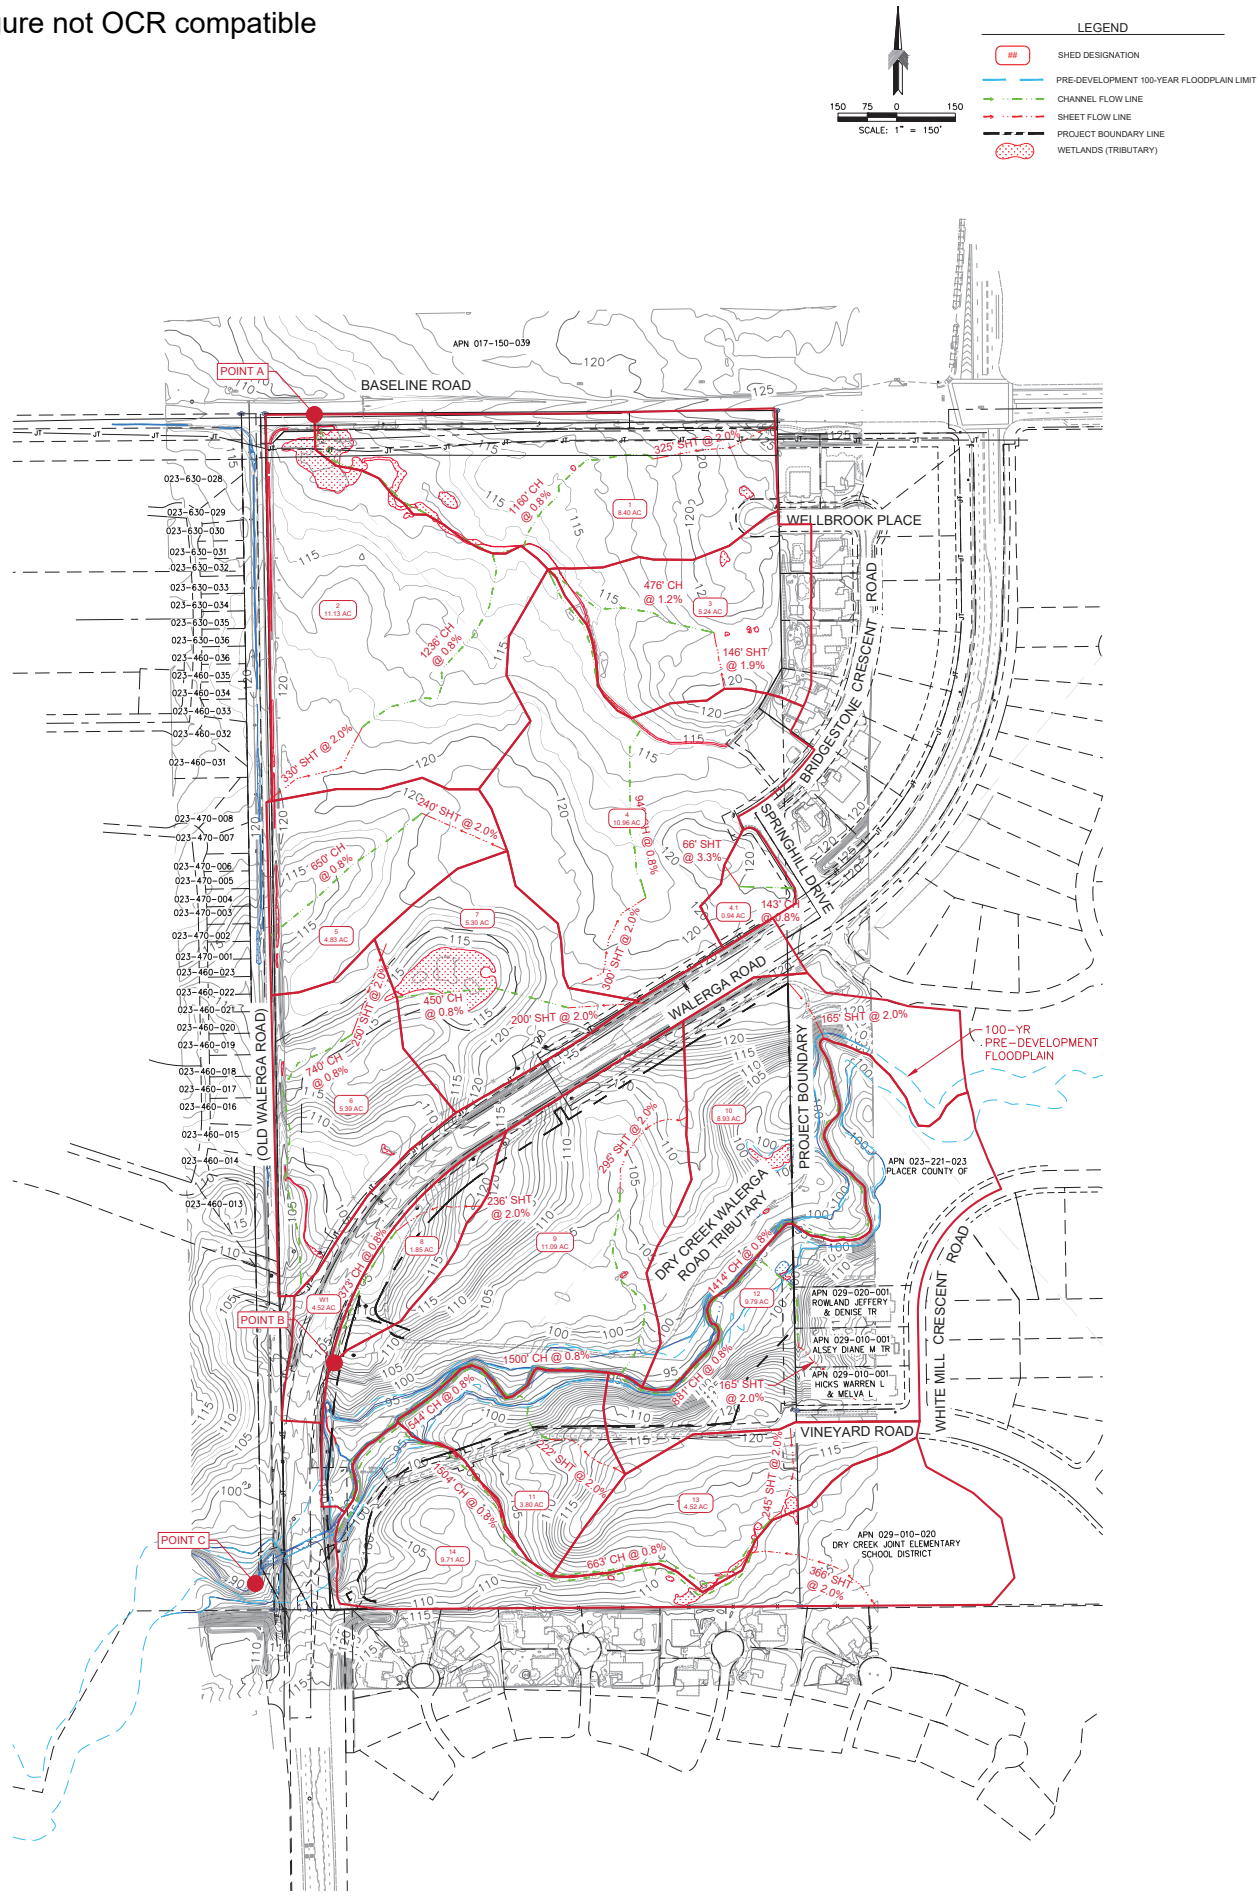
Col. 18 Velocity head (Velocity squared / 2g).

Col. 19 The elevation of the energy grade line at the upstream end, HGL + Velocity head, (Col. 14 + Col. 18) .

Col. 20 The friction slope at the upstream end (the S or Slope term in Manning's equation).

Col. 21 The average of the downstream and upstream friction slopes.

Col. 22 Energy loss. Average Sf/100 x Line Length (Col. 21/100 x Col. 12). Equals (EGL upstream - EGL downstream) +/- tolerance.



Col. 23 The junction loss coefficient (K).

Col. 24 Minor loss. (Col. 23 x Col. 18). Is added to upstream HGL and used as the starting HGL for the next upstream line(s).

Preparation Date:_____05/05/2026_____

Placer County Approval Date:_____

Revision Date December 11 2024

Section 1 General Project Information

The undersigned owner of the subject property, is responsible for the implementation of the provisions of this Storm Water Quality Plan (SWQP), including ongoing operations and maintenance (O&M), consistent with the requirements of the West Placer Storm Water Quality Design Manual and the State of California Phase II Small MS4 General Permit (Order No: 2013-0001-DWQ). If the undersigned transfers its interest in the property, its successors-in-interest shall bear the aforementioned responsibility to implement the SWQP.

For all Regulated Projects (As identified in Form 1-2 below), the undersigned owner hereby grants access to all representatives of the Jurisdictional Agency for the sole purpose of performing O&M inspections of the installed treatment system(s) and hydromodification control(s) if any.

A copy of the final signed and fully approved SWQP shall be available on the subject site for the duration of construction and then stored with the project approval documentation and improvement plans in perpetuity.

Form 1-1 Project Identification and Owner's Certification

Project Site Address:	BASELINE ROAD	
Owner Name:	CHRIS DICKINSON	
Title	LAND DEVELOPMENT AND ACQUISITIONS PROJECT MANAGER	
Company	HOMES BY TOWNE	
Address	11060 WHITE ROCK ROAD, SUITE 150	
City, State, Zip Code	RANCHO CORDOVA, CA 95670

Brief Description of Project: (Attach additional sheets as necessary)	Phases 1-4 and Backbone Roads	

* Not required for Small Projects as determined in Form 1-2 below. Project owners are responsible for ensuring that all storm water facilities are designed by an appropriately licensed and qualified professional.

Form 1-2 Project Category	
Development Category (Select all that apply)	
[1]**Small Project** – All projects, except LUPs, that create and/or replace between 2,500-5,000 ft^2 of impervious surface or detached single family homes that create and/or replace 2,500 ft^2 or more of impervious surface and are not part of a larger plan of development.	
[2]Enter total new and/or replaced impervious surface (ft^2)	
[3]**Regulated Project** – All projects that create and/or replace 5,000 ft^2 or more of impervious surface.	
[4]**Regulated Redevelopment Project** with equal to, or greater than 50 percent increase in impervious area	
[5]**Regulated Redevelopment Project** with less than 50 percent increase in impervious area	
[6]Enter total pre-project impervious surface (ft^2)	
[7]Enter total new and/or replaced impervious surface (ft^2)	
[8]**Regulated Road or linear underground/overhead project (LUP)** creating 5,000 ft^2 or more of newly constructed contiguous impervious surface.	
[9]Enter total new and/or replaced impervious surface (ft^2)	
[10]**Regulated Hydromodification Management Project** – Regulated projects that create and/or replace 1 acre or more of impervious surface. A project that does not increase impervious surface area over the pre-project condition is not a hydromodification management project.	YES
[11]Enter total new and/or replaced impervious surface (ft^2)	2255580.36

Section 3 Regulated Projects

Section 3 forms are to be completed for all Regulated Projects.

Form 3-1 Site Location and Hydrologic Features

Site coordinates: *Take GPS measurement at approximate center of site*	[1] Latitude	[2] Longitude	[3] Elevation (ft. above sea level)	[4] 85th Percentile, 24 Hour Design Storm Depth (in):
	38.75051	-121.36295	110	0.9

[5] Receiving waters *Name of stream, lake or other downstream waterbody to which the site runoff eventually drains*	Dry Creek and Curry Creek
[6] 303(d) listed pollutants of concern *Refer to State Water Resources Control Board website* www.waterboards.ca.gov/water_issues/programs/water_quality_assessment/#impaired	
[7] Is Project going to be phased? *If yes, ensure that the SWQP evaluates each phase with distinct DMAs, requiring LID BMPs to address runoff at time of completion.*	Yes

[8] *Use this form to show a conceptual schematic depicting DMAs and conveyance features connecting DMAs to the site outlet(s). An example is provided below that can be modified for the proposed project or a drawing clearly showing DMAs and flow routing may be attached.*

Example only
Modify for project specific SWQP
Use separate sheet if necessary

Please Refer to Site Assessment and Drainage Management Area Drainage Map

Form 3-2 Site Assessment and Layout Documentation

	Has this Item been considered in the Site Layout and depicted in the Site Plan?	
	Yes	**Not Applicable (Include brief explanation)**
Define the development envelope and protected areas, identifying areas that are most suitable for development and areas to be landscaped, or left undisturbed, and used for infiltration.	X	Reference Site Plan for infiltration basins and landscaped spaces to provide
Concentrate development on portions of the site with less permeable soils and preserve areas that can promote infiltration.		N/A
Limit overall impervious coverage of the site with paving and roofs.		N/A
Set back development from creeks, wetlands, and riparian habitats.	X	Reference Site Plan for setbacks and protected regions
To the extent practicable, avoid development and LID siting within floodplains.	X	Reference Site Plan for infiltration basins and landscaped spaces to provide
Preserve significant trees.	X	Reference Site Plan for protected trees
Conform site layout along natural landforms.	X	Site layout conforms to existing tributary flow paths and flood limits
Avoid excessive grading and disturbance of vegetation and soils.		N/A
Replicate the site's natural drainage patterns.	X	Site layout conforms to existing tributary flow paths and flood limits
Detain and retain runoff throughout the site.	X	Infiltration basins are incorporated to capture runoff throughout the site

Attach a Site Plan that incorporates the applicable considerations above. Ensure that the following items are included in the Site Plan:

Site Boundary
Soil types and areal extents, test pit and infiltration test locations
Topographic data with 1 ft. contours
Existing natural hydrologic features (depressions, watercourses, wetlands, riparian corridors)
Floodplain boundaries
Environmentally sensitive areas and areas to be preserved
Proposed locations and footprints of improvements creating new, or replaced, impervious surfaces
Potential pollutant sources and locations
Entire site divided into separate DMAs with unique identifiers
Existing and proposed site drainage network with flow directions and site run-on and discharge locations
Proposed design features and surface treatments used to minimize imperviousness and reduce runoff
Proposed locations and footprints of treatment and hydromodification management facilities
Design features for managing authorized non-stormwater discharges
Areas of soil and/or groundwater contamination
Existing utilities and easements
Maintenance areas

Form 3-3 Source Control Measures			
Potential Pollutant Generating Activity or Source	Check One		Describe the source control measures to be implemented for each potential pollutant generating activity or source present on the project as listed in Appendix C and in the CASQA Fact Sheets. Include any special features, materials, or methods of construction that will be used.
	Present	Not Applicable	
Accidental spills or leaks	☑	☐	measures per SC-11 fact sheet
Interior floor drains	☐	☑	
Parking/storage areas and maintenance	☐	☑	measure per SC-21, SC-22, SC-32 and SC-43 fact sheets
Indoor and structural pest control	☑	☐	measures done mainly by licensed pest control companies per SC-34, SC-61, SC-60 fact sheets
Pools, spas, ponds, decorative fountains, and other water features	☐	☑	measures per SC-72 fact sheet
Landscape/outdoor pesticide use	☑	☐	measures per SC-41, SC-60, SC-73 and SC-75 fact sheets
Restaurants, grocery stores, and other food service operations	☐	☑	
Refuse areas	☑	☐	homewoners to take measures per SC-34, SC-60
Industrial Processes	☐	☑	
Outdoor storage of equipment or materials	☐	☑	measures per SC-32, SC-41, SC-43 fact sheets
Vehicle and equipment cleaning	☑	☐	measures per SC-21 fact sheet
Vehicle and equipment repair and maintenance	☑	☐	measures per SC-22, SC-32 fact sheets
Fuel dispensing areas	☐	☑	
Loading docks	☐	☑	
Fire sprinkler test water	☐	☑	
Drain or wash water from boiler drain lines, condensate drain lines, rooftop equipment, drainage sumps, and other sources	☐	☑	
Unauthorized non-storm water discharges	☑	☐	measures per SC-10 fact sheet
Building and grounds maintenance	☑	☐	measures per SC-4, SC-43 fact sheets

The source control measures identified in this table shall be designed consistent with recommendations from the CASQA Stormwater BMP Handbook for New Development and Redevelopment[1], or from another equivalent manual.

[1] California Stormwater BMP Handbook New Development and Redevelopment. California Stormwater Quality Association (CASQA). January 2003.

INTRODUCTION

Project Description

The proposed "Estia Dry Creek & Placer Creek Residential" (Project) includes a total of approximately 88 acres, comprised of a 52.3-acre parcel (Assessor's Parcel No. 023-221-046) located on the north side of Walerga Road and a 35.3-acre parcel (APN 023-221-061) located south and east of Walerga Road, collectively, the "project", Estia Dry Creek and Placer Creek Residential. This Phase 4 project consists of 46 residential units on 11.5 acres. Construction will include streets, storm drainage improvements, and underground utilities. The site is currently unimproved agricultural land. It is bounded on the north by Dry Creek Walerga Road Tributary and bounded on the south by Morgan Creek Village P. The proposed underground storm drain system outfalls to water quality basins before ultimately draining to the Dry Creek Walerga Road Tributary.

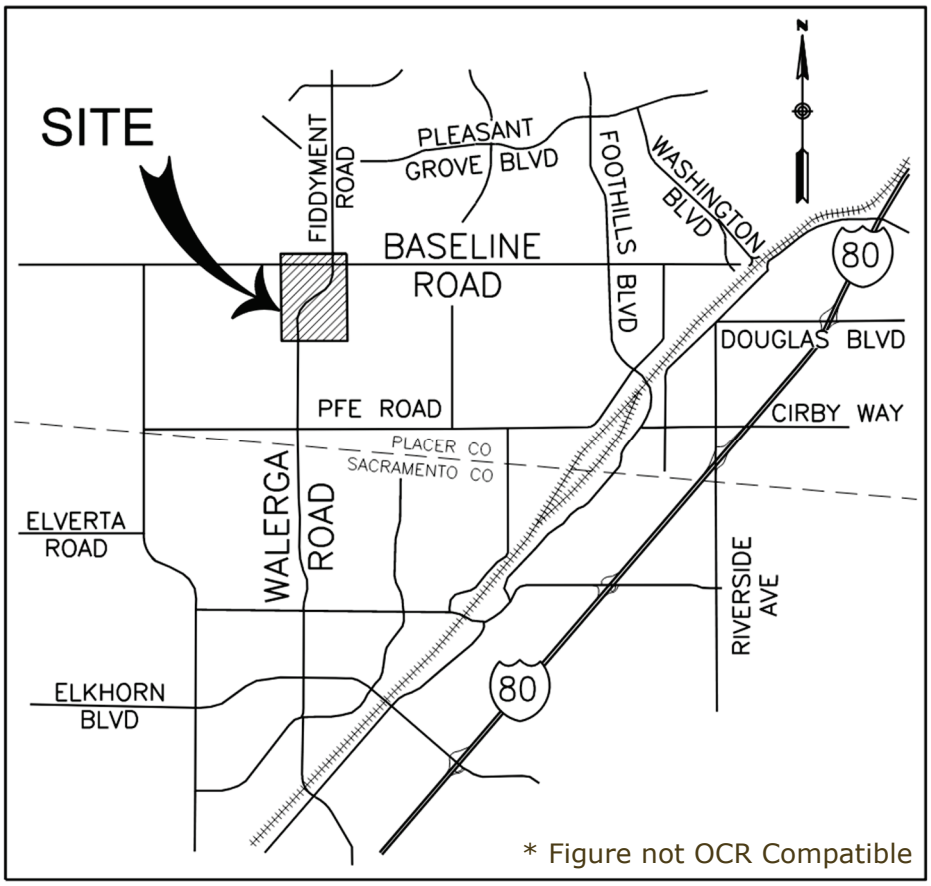

Figure 1: Project Vicinity Map

Scope of the Report

This report provides analysis and documents for the existing pre-developed watershed characteristics and determines the required drainage facilities that are necessary for development of the project. The report will confirm that the post-development changes will be consistent with what is shown on the Drainage Maps.

Pursuant to Reference 2, this is a regulated project with more than one acre of new impervious area proposed and is within the Phase II MS4 Permit Area.

FEMA Information

The Federal Emergency Management Agency's (FEMA) Flood Insurance Study (FIS) Flood Insurance Rate Map (FIRM) contains the project area is Preliminary FIRM Panel ID# 06061C1026J, effective April 12, 2024. Based off the panel, portions of the existing 100-year floodplain are impacted by the proposed development. Excavation is proposed along the tributary to construct water quality infiltration basins. For the current Preliminary FIRM Panel, please see Exhibit A. A pedestrian bridge is proposed over the tributary, connecting trails between Phases 3 and 4. This bridge is proposed to be placed on existing grade with minimal grading activities to support placement. Minor storm events will pass under the bridge, while the 100-year storm is intended to inundate and pass over it. For the current Preliminary FIRM Panel, please see Exhibit A.

The Dry Creek Walerga Road Tributary is classified as Zone AE which means base flood elevations have been determined and analyzed with a Flood Insurance Study that generated the floodplain limits and a floodway has been established. The limits of the detailed study terminate east of Crowder Lane with Zone A floodplain, which means base flood elevations have not been determined.

ULOP Applicability

The following table shows that this project does not meet the Urban Level of Flood Protection (ULOP) as determined by Placer County to construct improvements within a ULOP boundary. These criteria, enacted by State Senate Bill 5 (SB 5) in 2007, were developed to assist counties and cities within the Sacramento-San Joaquin Valley in making findings related to ULOP before approving land use decisions.

ULOP APPLICABILITY

Refer to the Tentative Map for limits of ULOP floodplain with greater than 3' flooding depth

Finding of Fact / ULOP Criteria	Yes/No	Remark
The project is located within the Sacramento Valley	Yes	Dry Creek is tributary to the Sacramento River
The project is located within an urban area as defined by Code of Federal Regulations Title 44, Section 59.1.	Yes	
A portion of the project is located within a flood hazard zone that is mapped as either a special hazard area or an area of moderate hazard on FEMA FIRM Panels.	Yes	Zone AE Floodplain
The project is located within a watershed that is more than 10 square miles in size.	No	Dry Creek Walerga Road Tributary Watershed area is approximately 1.3 square miles per FEMA FIS report
The project is located within an area with a potential flood depth above 3.0 feet during a 200-year event, from sources of flooding other than localized conditions.	No	Project is located along Dry Creek Walerga Road Tributary
Is any disturbance or development proposed within the ULOP 200-year boundary?	No	Dry Creek ULOP is downstream at the confluence

Future, Fully-Developed, Unmitigated Floodplain

The limits of the future, fully-developed, unmitigated 100-year floodplain are calculated and depicted on the Drainage Maps. The project does not propose residential lots in the future, fully-developed, unmitigated 100-year floodplain.

EXISTING CONDITIONS

Ground slopes range significantly across the project area. The Phase 4 ground slopes downhill to the North towards Dry Creek Walerga Road Tributary. Existing ground cover is primarily grassland with rolling terrain. The USDA Soil Conservation Service classifies most of the soils within the project as Pleistocene alluvial deposits. The site soil is classified as hydrologic group D. ENGEO prepared a geotechnical study dated December 26, 2023 for the Estia Dry Creek project entitled "Estia at Dry Creek - Geotechnical Exploration". This report identifies the near surface soils generally as deeply weathered gravel, sand, and silt, which is consistent with the USDA data.

The Walerga Tributary is classified as Zone AE floodplain, which means base flood elevations have been determined and analyzed with a Flood Insurance Study that generated the floodplain limits and a floodway has been established. The river hydraulics and cross section profiles for the tributary are derived from the GeoHECRAS software provided by CivilGeo.

Figure 2: Pre-Development Land Photo, Baseline Rd, Looking South

Figure 3: Pre-Development Land Photo, Walerga Rd, Looking Southeast

DESIGN CRITERIA

*Figures not OCR compatible

The design criteria listed below are also found in the West Placer Stormwater Quality Design Manual and Placer County Flood Control and Water Conservation District Stormwater Management Manual (SWMM).

- **The streets remain passable during the 10- and 100-Year storm events and the finished floor elevations are 1', or greater, from the 100-year water surface elevations.**
- **Inlet and Outlet pipes are to have matching Crown Elevations.**
- **The underground storm drain pipes do not flow full during the 10-Year storm.**
- **For Hydraulic Calculations, Pipes are sized as if all flow is captured at each inlet.**
- **Storm Drain pipes are designed to flow under gravity flow for up to the 10-year storm and allowed to flow surcharged, pressure flow for flows larger than the 10 year-storm.**
- **Culverts 30" in diameter and less are designed for 50% blockage at the inlet for the 10-year design storm. However, where there is a grated inlet with 8" maximum size opening, the inlet is designed for 50% blockage, but the culvert connected to such an inlet may be sized without blockage (figuring that large objects cannot get through the inlet openings to block the culvert).**
- **Gutters and inlets serving small drainage areas are sized according to Placer County drainage formulas as follows:**

$$\text{Sheet flow: } t_r = \frac{.355(nL)^{.6}}{S^{.3}}$$

$$\text{Channel flow: } t_r = \frac{.00735Ln^{.75}(1+z)^{.25}}{S^{.375}(A_c z)^{.25}}$$

$$\text{Peak Discharge: } Q = qA - A_p F_i$$

HYDROLOGY & HYDRAULICS FOR PHASES 3 & 4

The project will discharge stormwater runoff into Dry Creek Walerga Road Tributary. The watershed to Dry Creek is approximately 1.3 square miles. The peak flows for the various storm events were modeled in HEC-HMS (Version 4.9). The routing method used is Muskingum Method. The volumetric and discharge relationships were generated through existing surface information and HEC-RAS modeling to determine the necessary rating curve used in the Modified Puls method. The channel is approximated as a trapezoidal channel with a Muskingum Coefficient (X) between 0.10 and 0.20. The rainfall values were taken from Table 5-A-1 in the Stormwater Management Manual for the various storm events. The HEC-HMS model uses the Kinematic Wave transform method and initial/constant loss in determining flows. This method relates the shape of the channel, boundary roughness, and slope of the channel or overland flow surface. Though it simplifies the complex nature of drainage systems, the Kinematic Wave transform method provides a reasonably accurate approximation of flows.

The design flows for the 10-, 50-and 100-year storm events (10, 2 and 1 percent chance of occurrence storms) for Dry Creek and the Antelope North Road Tributary were provided by FEMA and were unchanged. There was no 500-year storm flow (0.2 percent chance of occurrence storm) provided for the tributary. Hydraulic models for the existing, revised, and unmitigated scenarios for the Dry Creek Walerga

Road Tributary were generated from FEMA FIS data. The Existing model reflects the current physical improvements and latest topography in the area. The HEC-RAS models were generated with the design flows produced by the HEC-HMS model and provide the basis for comparing existing conditions BFEs to revised BFEs to analyze the impacts of the proposed project both upstream and downstream. The models were created using Geo HEC-RAS software using steady, uniform flow under Subcritical conditions. Refer to Tables 4-6 for HEC-RAS modeling inputs and results.

DETENTION

Though drainage detention is not required or recommended for Dry Creek and its tributaries, hydromodification is still required under the MS4 rules, even though the distinction between detention and hydromodification is not made clear.

The peak flood wave in the Dry Creek Walerga Road Tributary occurs at approximately 13 hours into 100-year, 24-hour storm, well ahead of the Dry Creek regional flood wave at approximately 17 hours (Dry Creek Watershed Plan, Placer County). This means that downstream properties will see no impact to the base flood elevation from this project. The shed shift from Curry Creek to Dry Creek of approximately 25.7 acres toward Walerga Tributary (Dry Creek) was accounted for in the HEC-HMS modeling, which determined the timing of this peak flood wave.

WATER QUALITY

To evaluate storm water quality and best management policies (BMP) within the project limits, the West Placer Storm Water Quality Design Manual was referenced and used as a guideline for BMP locations. Drainage Management Areas (DMA) are delineated with infiltration basins shown in Drainage Map #5. The primary purpose of the infiltration basins is to retain minor storm events and capture any pollutants that would otherwise enter Dry Creek. The infiltration basins are primarily for minor storm events but not intended to reduce the peak flows during extreme storm events.

Phase 4 is divided into two DMAs, DMA F and DMA G. DMA F is the portion of the project which will discharge into infiltration Basin F at Phase 4 Discharge Point 1 on Drainage Map #2. From Basin F, treated runoff enters the Dry Creek Walerga Road Tributary. DMA G is the portion of the project which will discharge runoff into infiltration Basin G at Phase 4 Discharge Point 2 on Drainage Map #2. From Basin G, treated runoff enters the Dry Creek Walerga Road Tributary. The peak flows from these DMAs can be found in Tables 2 and 7. The combined runoff of Phases 3 and 4 is described as Point C in Table 7 and shown on Drainage Map #2.

The composite runoff coefficient (Rc) is determined using State Water Control Board Runoff Coefficient Fact Sheet 5.1.3. The fact sheet provides tables of various coefficients depending on land use. The land use within the Phase 3 project is medium density residential. The Coefficient of 0.55 was used because it is the more conservative value for Water Quality calculations.

NOTES TO USERS

For information and questions about this Flood Insurance Rate Map (FIRM), available effective flood hazard information for your community, or the National Flood Insurance Program (NFIP) in general, please call the FEMA Mapping and Insurance eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA Flood Map Service Center website at https://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be downloaded from the website. Communities annexing land on adjacent FIRM panels must obtain a current copy of the adjacent panel as well as the current FIRM Index. These may be acquired directly from the Flood Map Service Center at the website listed above.

For community and countywide map dates refer to the Flood Insurance Study Report for this jurisdiction.

To determine if flood insurance is available in this community, contact your Insurance agent or call the National Flood Insurance Program at 1-800-638-6620.

Basemap information shown on this FIRM was provided in digital format by the United States Geological Survey (USGS). The basemap shown is the USGS National Map: Orthoimagery. Last refreshed October, 2020.

Note: Some Special Flood Hazard Areas with elevations may not appear with elevation labels if the Base Flood Elevation or Cross-section line which communicates the elevation for the location appears on the adjacent panel. Please see the Panel Locator Diagram on this map panel to determine the adjacent panel and find the elevation feature there, or alternatively use the Flood Insurance Study report for detailed elevations by flood source.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Placer County, California, Western Part
Survey Area Data: Version 15, Aug 31, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Apr 23, 2022—Apr 24, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
140	Cometa sandy loam, 1 to 5 percent slopes	D	32.3	25.0%
141	Cometa-Fiddyment complex, 1 to 5 percent slopes	D	32.1	24.9%
142	Cometa-Ramona sandy loams, 1 to 5 percent slopes	D	1.4	1.1%
146	Fiddyment loam, 1 to 8 percent slopes	D	10.1	7.8%
147	Fiddyment-Kaseberg loams, 2 to 9 percent slopes	C	0.5	0.4%
175	Ramona sandy loam, 2 to 9 percent slopes	C	11.8	9.2%
182	San Joaquin-Cometa sandy loams, 1 to 5 percent slopes	D	29.5	22.9%
194	Xerofluvents, frequently flooded	B	11.4	8.8%
Totals for Area of Interest			**128.9**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

Aggregation Method: Dominant Condition

Component Percent Cutoff: None Specified

Tie-break Rule: Higher

REF 1: Hydraflow Express program

NOTES:
1. Design flow floods up to the but not including travel lanes - on site streets
2. Design Capacity is based on Reference 4, Table 6-1 "Allowable Street Encroachments" & LDM Section 5-13
3. Gutter spread is measured from face of curb.

Table 4

HEC-RAS Summary

HEC-RAS Existing Steady Flow Summary				
River	**Reach**	**Steady Flow Input (10-YR, cfs)**	**Steady Flow Input (100-YR, cfs)**	**Hydrologic Element in HEC-HMS**

[1]25.7 acres are proposed to be shifted from the Curry Creek watershed to the Dry Creek watershed from Point A to Point B. The associated 100-year flows from this shed shift are 25.3 cfs from Phase 1 and 39.2 cfs from Phase 2. The associated 10-year flows from this shed shift are 13.4 cfs from Phase 1 and 17.3 cfs from Phase 2.

Hydraflow HGL Computation Procedure

General Procedure:

Hydraflow computes the HGL using the Bernoulli energy equation. Manning's equation is used to determine energy losses due to pipe friction. In a standard step, iterative procedure, Hydraflow assumes upstream HGLs until the energy equation balances. If the energy equation cannot balance, supercritical flow exists and critical depth is temporarily assumed at the upstream end. A supercritical flow Profile is then computed using the same procedure in a downstream direction using momentum principles.

Col. 1 The line number being computed. Calculations begin at Line 1 and proceed upstream.

Col. 2 The line size. In the case of non-circular pipes, the line rise is printed above the span.

Col. 3 Total flow rate in the line.

Col. 4 The elevation of the downstream invert.

Col. 5 Elevation of the hydraulic grade line at the downstream end. This is computed as the upstream HGL + Minor loss of this line's downstream line.

Col. 6 The downstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 7 Cross-sectional area of the flow at the downstream end.

Col. 8 The velocity of the flow at the downstream end, (Col. 3 / Col. 7).

Col. 9 Velocity head (Velocity squared / 2g).

Col. 10 The elevation of the energy grade line at the downstream end, HGL + Velocity head, (Col. 5 + Col. 9).

Col. 11 The friction slope at the downstream end (the S or Slope term in Manning's equation).

Col. 12 The line length.

Col. 13 The elevation of the upstream invert.

Col. 14 Elevation of the hydraulic grade line at the upstream end.

Col. 15 The upstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

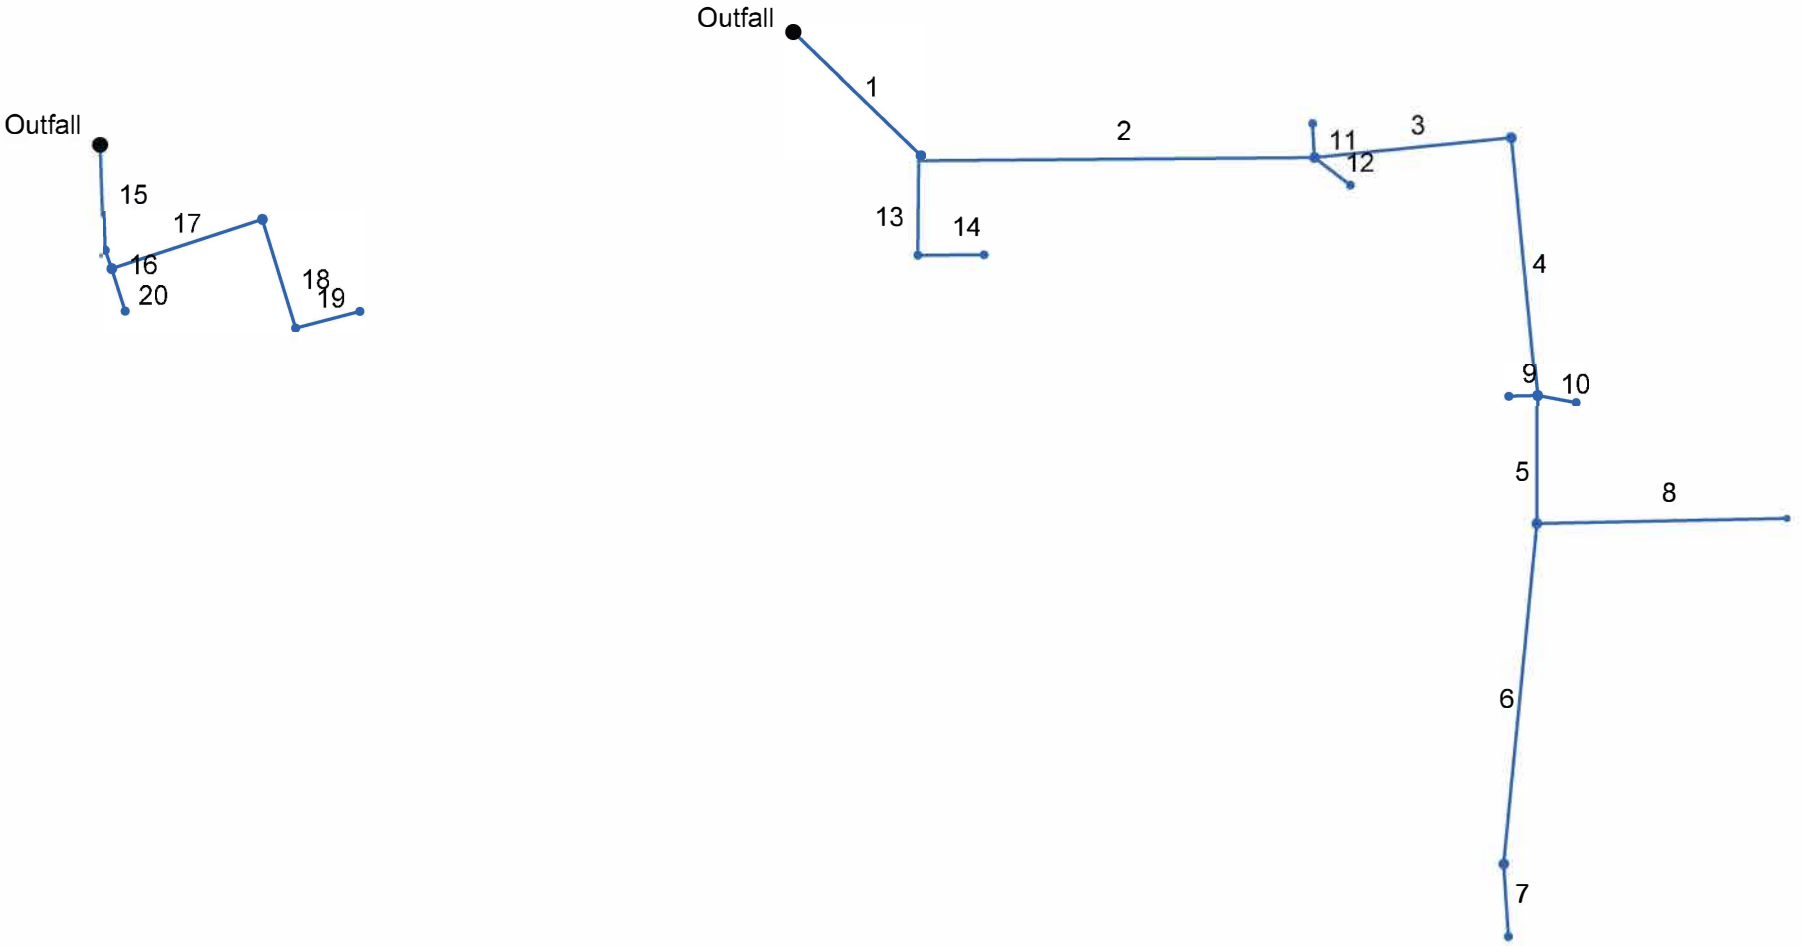
Col. 16 Cross-sectional area of the flow at the upstream end.

Col. 17 The velocity of the flow at the upstream end, (Col. 3 / Col. 16).

Col. 18 Velocity head (Velocity squared / 2g).

Col. 19 The elevation of the energy grade line at the upstream end, HGL + Velocity head, (Col. 14 + Col. 18) .

Col. 20 The friction slope at the upstream end (the S or Slope term in Manning's equation).



Col. 21 The average of the downstream and upstream friction slopes.

Col. 22 Energy loss. Average Sf/100 x Line Length (Col. 21/100 x Col. 12). Equals (EGL upstream - EGL downstream) +/- tolerance.

Col. 23 The junction loss coefficient (K).

Col. 24 Minor loss. (Col. 23 x Col. 18). Is added to upstream HGL and used as the starting HGL for the next upstream line(s).

Hydraflow HGL Computation Procedure

General Procedure:

Hydraflow computes the HGL using the Bernoulli energy equation. Manning's equation is used to determine energy losses due to pipe friction. In a standard step, iterative procedure, Hydraflow assumes upstream HGLs until the energy equation balances. If the energy equation cannot balance, supercritical flow exists and critical depth is temporarily assumed at the upstream end. A supercritical flow Profile is then computed using the same procedure in a downstream direction using momentum principles.

Col. 1 The line number being computed. Calculations begin at Line 1 and proceed upstream.

Col. 2 The line size. In the case of non-circular pipes, the line rise is printed above the span.

Col. 3 Total flow rate in the line.

Col. 4 The elevation of the downstream invert.

Col. 5 Elevation of the hydraulic grade line at the downstream end. This is computed as the upstream HGL + Minor loss of this line's downstream line.

Col. 6 The downstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 7 Cross-sectional area of the flow at the downstream end.

Col. 8 The velocity of the flow at the downstream end, (Col. 3 / Col. 7).

Col. 9 Velocity head (Velocity squared / 2g).

Col. 10 The elevation of the energy grade line at the downstream end, HGL + Velocity head, (Col. 5 + Col. 9).

Col. 11 The friction slope at the downstream end (the S or Slope term in Manning's equation).

Col. 12 The line length.

Col. 13 The elevation of the upstream invert.

Col. 14 Elevation of the hydraulic grade line at the upstream end.

Col. 15 The upstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 16 Cross-sectional area of the flow at the upstream end.

Col. 17 The velocity of the flow at the upstream end, (Col. 3 / Col. 16).

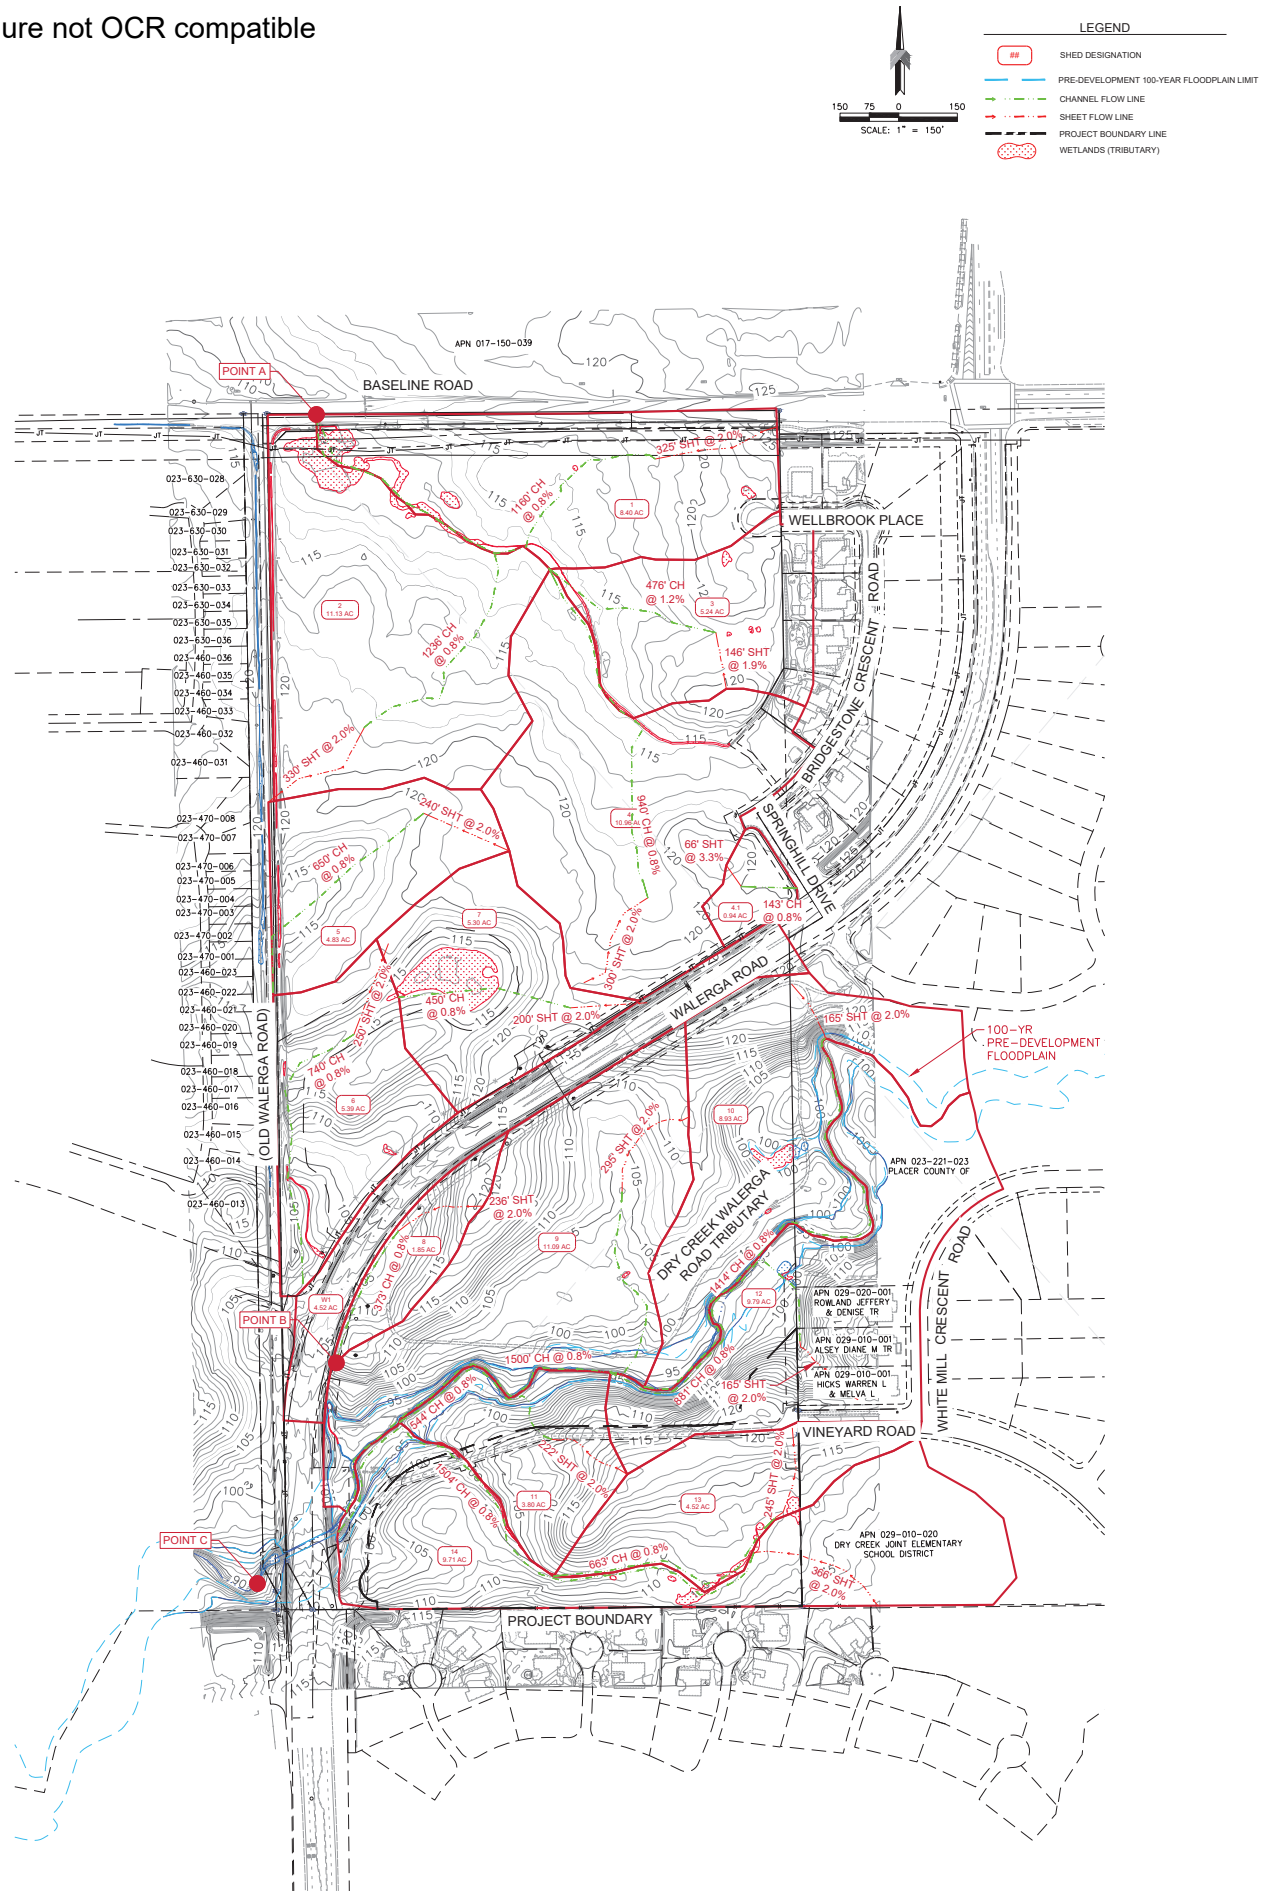
Col. 18 Velocity head (Velocity squared / 2g).

Col. 19 The elevation of the energy grade line at the upstream end, HGL + Velocity head, (Col. 14 + Col. 18) .

Col. 20 The friction slope at the upstream end (the S or Slope term in Manning's equation).

Col. 21 The average of the downstream and upstream friction slopes.

Col. 22 Energy loss. Average Sf/100 x Line Length (Col. 21/100 x Col. 12). Equals (EGL upstream - EGL downstream) +/- tolerance.



Col. 23 The junction loss coefficient (K).

Col. 24 Minor loss. (Col. 23 x Col. 18). Is added to upstream HGL and used as the starting HGL for the next upstream line(s).

Section 1 General Project Information

The undersigned owner of the subject property, is responsible for the implementation of the provisions of this Storm Water Quality Plan (SWQP), including ongoing operations and maintenance (O&M), consistent with the requirements of the West Placer Storm Water Quality Design Manual and the State of California Phase II Small MS4 General Permit (Order No: 2013-0001-DWQ). If the undersigned transfers its interest in the property, its successors-in-interest shall bear the aforementioned responsibility to implement the SWQP.

For all Regulated Projects (As identified in Form 1-2 below), the undersigned owner hereby grants access to all representatives of the Jurisdictional Agency for the sole purpose of performing O&M inspections of the installed treatment system(s) and hydromodification control(s) if any.

A copy of the final signed and fully approved SWQP shall be available on the subject site for the duration of construction and then stored with the project approval documentation and improvement plans in perpetuity.

Form 1-1 Project Identification and Owner's Certification

Project Site Address:	BASELINE ROAD		
Owner Name:	CHRIS DICKINSON		
Title	LAND DEVELOPMENT AND ACQUISITIONS PROJECT MANAGER		
Company	HOMES BY TOWNE		
Address	11060 WHITE ROCK ROAD, SUITE 150		
City, State, Zip Code	RANCHO CORDOVA, CA 95670		
Email	cdickinson@hbtsac.com		
Telephone #	(916) 782-2424		
Signature		Date	
Engineer:*	Curtis King		PE Stamp* (Required for all Regulated Projects)
Title	Principal Engineer		
Company	King Engineering, Inc.		
Address	200 Auburn Folsom Road		
City, State, Zip Code	Auburn, CA 95603		
Email	Curtis.King@King-Engineering-Inc.com		
Telephone #	(530) 272-8328		
Signature			
Brief Description of Project: (Attach additional sheets as necessary)	Phases 1-4 and Backbone Roads		

* Not required for Small Projects as determined in Form 1-2 below. Project owners are responsible for ensuring that all storm water facilities are designed by an appropriately licensed and qualified professional.

Form 1-2 Project Category	
Development Category (Select all that apply)	
[1]**Small Project** – All projects, except LUPs, that create and/or replace between 2,500-5,000 ft^2 of impervious surface or detached single family homes that create and/or replace 2,500 ft^2 or more of impervious surface and are not part of a larger plan of development.	
[2]Enter total new and/or replaced impervious surface (ft^2)	
[3]**Regulated Project** – All projects that create and/or replace 5,000 ft^2 or more of impervious surface.	
[4]**Regulated Redevelopment Project** with equal to, or greater than 50 percent increase in impervious area	
[5]**Regulated Redevelopment Project** with less than 50 percent increase in impervious area	
[6]Enter total pre-project impervious surface (ft^2)	
[7]Enter total new and/or replaced impervious surface (ft^2)	
[8]**Regulated Road or linear underground/overhead project (LUP)** creating 5,000 ft^2 or more of newly constructed contiguous impervious surface.	
[9]Enter total new and/or replaced impervious surface (ft^2)	
[10]**Regulated Hydromodification Management Project** – Regulated projects that create and/or replace 1 acre or more of impervious surface. A project that does not increase impervious surface area over the pre-project condition is not a hydromodification management project.	YES
[11]Enter total new and/or replaced impervious surface (ft^2)	2247652.44

Section 3 Regulated Projects

Section 3 forms are to be completed for all Regulated Projects.

Form 3-1 Site Location and Hydrologic Features

Site coordinates: *Take GPS measurement at approximate center of site*	[1] Latitude	[2] Longitude	[3] Elevation (ft. above sea level)	[4] 85th Percentile, 24 Hour Design Storm Depth (in):
	38.75051	-121.36295	110	0.9

[5] Receiving waters *Name of stream, lake or other downstream waterbody to which the site runoff eventually drains*	Dry Creek and Curry Creek
[6] 303(d) listed pollutants of concern *Refer to State Water Resources Control Board website* www.waterboards.ca.gov/water_issues/programs/water_quality_assessment/#impaired	
[7] Is Project going to be phased? *If yes, ensure that the SWQP evaluates each phase with distinct DMAs, requiring LID BMPs to address runoff at time of completion.*	Yes

[8] *Use this form to show a conceptual schematic depicting DMAs and conveyance features connecting DMAs to the site outlet(s). An example is provided below that can be modified for the proposed project or a drawing clearly showing DMAs and flow routing may be attached.*

Example only
Modify for project specific SWQP
Use separate sheet if necessary

Please Refer to Site Assessment and Drainage Management Area Drainage Map

Form 3-2 Site Assessment and Layout Documentation

	Has this Item been considered in the Site Layout and depicted in the Site Plan?	
	Yes	**Not Applicable (Include brief explanation)**
Define the development envelope and protected areas, identifying areas that are most suitable for development and areas to be landscaped, or left undisturbed, and used for infiltration.	X	Reference Site Plan for infiltration basins and landscaped spaces to provide
Concentrate development on portions of the site with less permeable soils and preserve areas that can promote infiltration.		N/A
Limit overall impervious coverage of the site with paving and roofs.		N/A
Set back development from creeks, wetlands, and riparian habitats.	X	Reference Site Plan for setbacks and protected regions
To the extent practicable, avoid development and LID siting within floodplains.	X	Reference Site Plan for infiltration basins and landscaped spaces to provide
Preserve significant trees.	X	Reference Site Plan for protected trees
Conform site layout along natural landforms.	X	Site layout conforms to existing tributary flow paths and flood limits
Avoid excessive grading and disturbance of vegetation and soils.		N/A
Replicate the site's natural drainage patterns.	X	Site layout conforms to existing tributary flow paths and flood limits
Detain and retain runoff throughout the site.	X	Infiltration basins are incorporated to capture runoff throughout the site

Attach a Site Plan that incorporates the applicable considerations above. Ensure that the following items are included in the Site Plan:

Site Boundary
Soil types and areal extents, test pit and infiltration test locations
Topographic data with 1 ft. contours
Existing natural hydrologic features (depressions, watercourses, wetlands, riparian corridors)
Floodplain boundaries
Environmentally sensitive areas and areas to be preserved
Proposed locations and footprints of improvements creating new, or replaced, impervious surfaces
Potential pollutant sources and locations
Entire site divided into separate DMAs with unique identifiers
Existing and proposed site drainage network with flow directions and site run-on and discharge locations
Proposed design features and surface treatments used to minimize imperviousness and reduce runoff
Proposed locations and footprints of treatment and hydromodification management facilities
Design features for managing authorized non-stormwater discharges
Areas of soil and/or groundwater contamination
Existing utilities and easements
Maintenance areas

Form 3-3 Source Control Measures			
Potential Pollutant Generating Activity or Source	Check One		Describe the source control measures to be implemented for each potential pollutant generating activity or source present on the project as listed in Appendix C and in the CASQA Fact Sheets. Include any special features, materials, or methods of construction that will be used.
	Present	Not Applicable	
Accidental spills or leaks	☑	☐	measures per SC-11 fact sheet
Interior floor drains	☐	☑	
Parking/storage areas and maintenance	☐	☑	measure per SC-21, SC-22, SC-32 and SC-43 fact sheets
Indoor and structural pest control	☑	☐	measures done mainly by licensed pest control companies per SC-34, SC-61, SC-60 fact sheets
Pools, spas, ponds, decorative fountains, and other water features	☐	☑	measures per SC-72 fact sheet
Landscape/outdoor pesticide use	☑	☐	measures per SC-41, SC-60, SC-73 and SC-75 fact sheets
Restaurants, grocery stores, and other food service operations	☐	☑	
Refuse areas	☑	☐	homewoners to take measures per SC-34, SC-60
Industrial Processes	☐	☑	
Outdoor storage of equipment or materials	☐	☑	measures per SC-32, SC-41, SC-43 fact sheets
Vehicle and equipment cleaning	☑	☐	measures per SC-21 fact sheet
Vehicle and equipment repair and maintenance	☑	☐	measures per SC-22, SC-32 fact sheets
Fuel dispensing areas	☐	☑	
Loading docks	☐	☑	
Fire sprinkler test water	☐	☑	
Drain or wash water from boiler drain lines, condensate drain lines, rooftop equipment, drainage sumps, and other sources	☐	☑	
Unauthorized non-storm water discharges	☑	☐	measures per SC-10 fact sheet
Building and grounds maintenance	☑	☐	measures per SC-4, SC-43 fact sheets

The source control measures identified in this table shall be designed consistent with recommendations from the CASQA Stormwater BMP Handbook for New Development and Redevelopment[1], or from another equivalent manual.

[1] California Stormwater BMP Handbook New Development and Redevelopment. California Stormwater Quality Association (CASQA). January 2003.

Form 3-4 Runoff Reduction Calculator for Site Design Measures on Regulated Projects

[1]DMA ID No.			1		2		3		4	
Site Design Measure	**Runoff Reduction Parameters**			**Runoff Reduction (ft^3)**		**Runoff Reduction (ft^3)**		**Runoff Reduction (ft^3)**		**Runoff Reduction (ft^3)**
[2] Adjacent/On-Site Stream Setbacks and Buffers	A_{imp} (ft^2)	*impervious drainage area*		0		0		0		0
	V_{85} (in)	*runoff volume from 85th percentile, 24-hour storm*	0.8		0.8		0.8		0.8	
[3] Soil Quality Improvement and Maintenance	A_{pond} (ft^2)	*ponding area*		0		0		0		0
	D_{pond} (ft)	*ponding depth*								
	A_{sa} (ft^2)	*soil amendment area*								
	D_{sa} (ft)	*depth of amended soil*								
	n	*porosity of amended soil*								
[4] Tree Planting and Preservation	n_e	*number of new evergreen trees*	26	966	24	874	51	1817	0	0
	n_d	*number of new deciduous trees*	79		71		145		0	
	A_{tc} (ft^2)	*canopy area of existing trees to remain on the property*	0		0		0		0	
	V_{85} (in)	*runoff volume from 85th percentile, 24-hour storm*	0.8		0.8		0.8		0.8	
[5] Rooftop and Impervious Area Disconnection	A_{imp} (ft^2)	*impervious drainage area*	125475	8470	113525	7663	92400	6237	0	0
	V_{85} (in)	*runoff volume from 85th percentile, 24-hour storm*	0.8		0.8		0.8		0.8	
[6] Porous Pavement	A_{res} (ft^2)	*area of gravel storage layer*		0		0		0		0
	D_{res} (ft)	*depth of gravel storage layer*								
	n_{agg}	*porosity of aggregate*								
	C	*efficiency factor*								
[7] Vegetated Swales	A_{imp} (ft^2)	*impervious drainage area*		0		0		0		0
	V_{85} (in)	*runoff volume from 85th percentile, 24-hour storm*	0.8		0.8		0.8		0.8	
[8] Rain Barrels and Cisterns	N	*number of rain barrels and/or cisterns*		0		0		0		0
	V_a (ft^3)	*volume of each rain barrel and/or cistern*								
[9] Do all Site Design Measures meet the design requirements outlined in the Fact Sheets?					**Yes**		**No**			
[10] Total Volume Reduction (ft^3)			**9435**		**8537**		**8054**		**0**	
[11] Effective Treated Impervious Area (ft^2)			**139781**		**126469**		**119323**		**0**	

Form 3-5 Computation of Water Quality Design Criteria for Stormwater Treatment and Baseline Hydromodification Measures

DMA ID No.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22
[1]Total impervious area requiring treatment	261360	261360	1027580.4		117089	239057	152155	189050														
[2] Impervious area untreated by Site Design Measures (ft^2) *Item 1 – Form 3-4 Item 11*	121579	134891	908257	0	103073	213861	138139	168435	0	0	0	0	0	0	0	0	0	0	0	0	0	0
[3]Additional pervious area draining to BMP (ft^2)	174240	174240	440391.6		50181	97095	65209	81022														
[4] Composite DMA Runoff Coefficient (C_w) *Enter area weighted composite runoff coefficient representing entire DMA*	0.55	0.55	0.56		0.55	0.55	0.55	0.55														
[5] Water Quality Volume (WQV) (ft^3) *WQV = 1/12 * [Item 2 + Item 3) *Item 4] * Unit WQV*	8813	9210	40909	0	4566	9264	6058	7432	0	0	0	0	0	0	0	0	0	0	0	0	0	0

INTRODUCTION

Project Description

The proposed "Estia Dry Creek & Placer Creek Residential" (Project) includes a total of approximately 88 acres, comprised of a 52.3-acre parcel (Assessor's Parcel No. 023-221-046) located on the north side of Walerga Road and a 35.3 -acre parcel (APN 023-221-061) located south and east of Walerga Road, collectively, the "project", Estia Dry Creek and Placer Creek Residential. The Backbone Infrastructure project proposes improvements to Baseline Road and Walerga Road. Construction will include street widening and storm drainage improvements. The site is currently unimproved agricultural land. It is bounded on the north by Estia Dry Creek Phase 2 and bounded on the south by Estia Dry Creek Phase 3. The proposed underground storm drain system outfalls to Walerga Tributary.

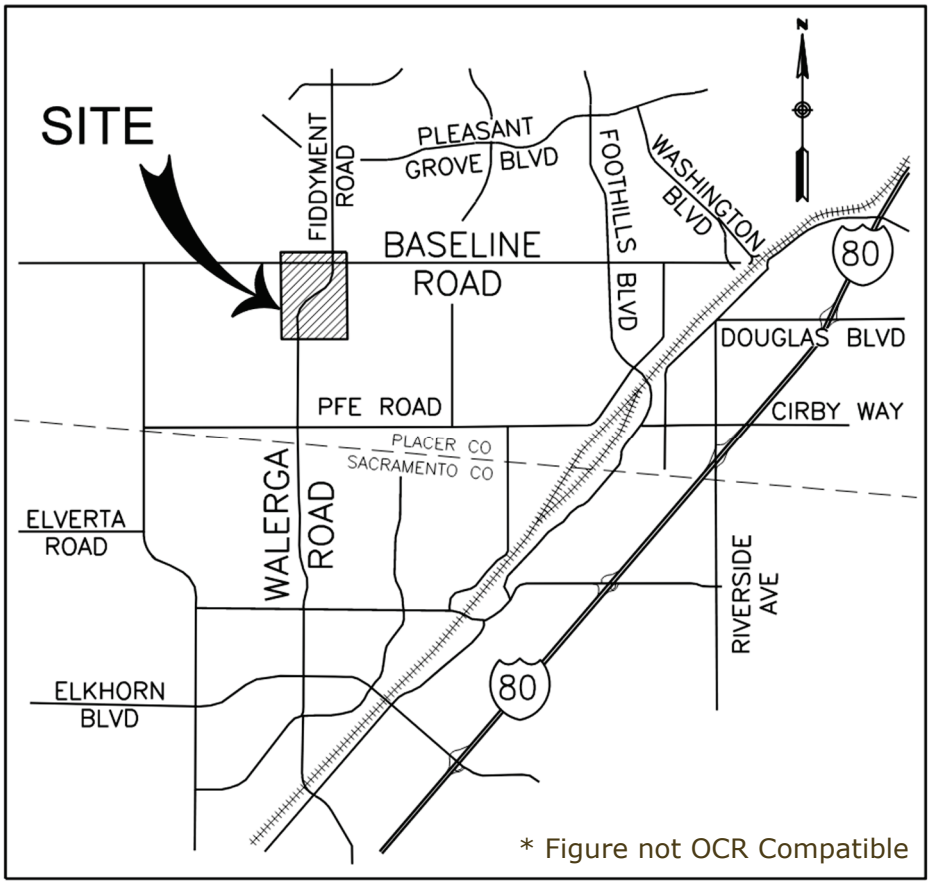

Figure 1: Project Vicinity Map

Scope of the Report

This report provides analysis and documents for the existing pre-developed watershed characteristics and determines the required drainage facilities that are necessary for development of the project. The report will confirm that the post-development changes will be consistent with what is shown on the Drainage Maps.

Pursuant to Reference 2, this is a regulated project with more than one acre of new impervious area proposed and is within the Phase II MS4 Permit Area.

EXISTING CONDITIONS

Ground slopes range significantly across the project area. The Phase 1 area ground and a portion of the Phase 2 area ground slopes north toward Baseline Road and a portion of the Phase 2 area ground slopes downhill towards Walerga Tributary and Dry Creek. Phases 3 and 4 slope to the south and north respectively towards Dry Creek Walerga Tributary. The USDA Soil Conservation Service classifies most of the soils within the project as Pleistocene alluvial deposits. The site soil is classified as hydrologic group D. ENGEO prepared a geotechnical study dated December 26, 2023 for the Estia Dry Creek project entitled "Estia at Dry Creek - Geotechnical Exploration". This report identifies the near surface soils generally as deeply weathered gravel, sand, and silt, which is consistent with the USDA data.

The Walerga Tributary is classified as Zone AE floodplain, which means base flood elevations have been determined and analyzed with a Flood Insurance Study that generated the floodplain limits and a floodway has been established. The river hydraulics and cross section profiles for the tributary are derived from the GeoHECRAS software provided by CivilGeo.

Figure 2: Pre-Development Land Photo, Baseline Rd, Looking South

Figure 3: Pre-Development Land Photo, Walerga Rd, Looking Northwest

DESIGN CRITERIA

The design criteria listed below are also found in the West Placer Stormwater Quality Design Manual and Placer County Flood and Control Water Conservation District Stormwater Management Manual (SWMM).

- **The streets remain passable during the 10- and 100-Year storm events and the finished floor elevations are 1', or greater, from the 100-year water surface elevations.**

*Figures not OCR compatible

- **Inlet and Outlet pipes are to have matching Crown Elevations.**
- **The underground storm drain pipes do not flow full during the 10-Year storm.**
- **For Hydraulic Calculations, Pipes are sized as if all flow is captured at each inlet.**
- **Storm Drain pipes are designed to flow under gravity flow for up to the 10-year storm and allowed to flow surcharged, pressure flow for flows larger than the 10 year-storm.**
- **Culverts 30" in diameter and less are designed for 50% blockage at the inlet for the 10-year design storm. However, where there is a grated inlet with 8" maximum size opening, the inlet is designed for 50% blockage, but the culvert connected to such an inlet may be sized without blockage (figuring that large objects cannot get through the inlet openings to block the culvert).**
- **Gutters and inlets serving small drainage areas are sized according to Placer County drainage formulas as follows:**

Sheet flow: $$t_r = \frac{.355(nL)^{.6}}{S^{.3}}$$

Channel flow: $$t_r = \frac{.00735\,Ln^{.75}(1+z)^{.25}}{S^{.375}(A_c z)^{.25}}$$

Peak Discharge: $$Q = qA - A_p F_i$$

HYDROLOGY & HYDRAULICS

The project will discharge most of the stormwater runoff into Dry Creek Walerga Road Tributary. The watershed to Dry Creek is approximately 1.3 square miles. The peak flows for the various storm events were modeled in HEC-HMS (Version 4.9). The routing method used is Muskingum Method. The volumetric and discharge relationships were generated through existing surface information and HEC-RAS modeling to determine the necessary rating curve used in the Modified Puls method. The channel is approximated as a trapezoidal channel with a Muskingum Coefficient (X) between 0.10 and 0.20. The rainfall values were taken from Table 5-A-1 in the Stormwater Management Manual for the various storm events. The HEC-HMS model uses the Kinematic Wave transform method and initial/constant loss in determining flows. This method relates the shape of the channel, boundary roughness, and slope of the channel or overland flow surface. Though it simplifies the complex nature of drainage systems, the Kinematic Wave transform method provides a reasonably accurate approximation of flows.

The design flows for the 10-, 50, and 100-year storm events (10, 2 and 1 percent recurrence interval storms) for Dry Creek and the Antelope North Road Tributary were provided by FEMA and were unchanged. There was no 500-year storm flow (0.2 percent chance of occurrence storm) provided for the tributary. Hydraulic models for the existing, revised, and unmitigated scenarios for the Dry Creek Walerga Road Tributary were generated from FEMA FIS data. The Existing model reflects the current physical improvements and latest topography in the area. The HEC-RAS models were generated with the design flows produced by the HEC-HMS model and provide the basis for comparing existing conditions BFEs to revised BFEs to analyze the impacts of the proposed project both upstream and downstream. The models were created using GeoHECRAS software using steady, uniform flow under Subcritical conditions. Refer to Tables 4-6 of the Phase 3 & 4 drainage reports for HEC-RAS modeling inputs and results.

The total flows to Point A from Phase 1, as shown on Table 4, are Q10=13.4 cfs and Q100=25.5 cfs. These flows are generally consistent with Table 2 flows of Q10=13.76 cfs and Q100=26.20 cfs, which differ slightly due to time of concentration. Point A is the connection to the Baseline Marketplace storm drain system. Sheds 97 and 98 in Table 2 also connect to the Baseline Marketplace system via DI-1. The remaining Baseline Rd drain inlets connect to the storm drain system in Baseline Rd constructed with the Upland Drive Segment 5 improvements, consistent with the drainage study, The Storm Drainage Evaluation for Baseline Road – Segment 1, Upland Drive, Segment 5, and San Fernando Drive Improvement Plans Technical Memorandum dated September 19, 2023 by MacKay and Somps and the Storm Drainage Evaluation for Baseline Road - Segment 3 & Portion of Segment 2 Improvement Plans Technical Memorandum, revision dated February 20, 2025 (for the C13X shed). The study assumed a pre-development contributing area of 3.9 acres (i.e., Sheds C12R, UP16R, UP17R, UP18R, and UP19R) draining to Baseline Rd within the Curry Creek Watershed. This report is generally consistent at 3.5 acres, with the difference being accounted for in the Preliminary Phase 1 Drainage Report analysis. The flows from that difference are part of the calculation for Point A.

The total flows to Point B, as shown on Table 4, are Q10=57.5 cfs and Q100=108.7 cfs. This includes the shed shifted area from Phase 1, Phases 2A and 2B, as well as runoff from the backbone improvements. The infrastructure necessary for these flows is constructed with the Backbone improvements. Additionally, after treating these flows, Basin C is designed to outfall toward the existing 48-inch pipe system in Walerga Rd. The 48-inch outfall into the tributary will need to be extended outside of the roadway improvements constructed with the Backbone project. For simplicity and organization of information, this location is referred to as Point B, as it is the outfall of all flows from Phase 1 toward Dry Creek, Phases 2A and 2B, as well as Walerga Rd, after being treated at Basin C. Hydraulics demonstrating the adequacy of this system are presented in Exhibit D Hydraulic Data and Profiles – 10-Year and 100-Year. Discharge Point B is approximately 900 linear feet downstream of Basin C. This point is used for tables and mapping because it is located at the Walerga Rd outfall to the tributary. Per Table 4, flows at Point B from Walerga Rd only are Q10=7.8 cfs and Q100=15.1cfs. Per Table 2, concentrated flows at Point B are Q10=50.61 cfs and Q100=96.68 cfs. As shown on Table 4, total combined discharge flows at Point B are Q10=57.5 cfs and Q100=108.7 cfs. The discrepancy is due to time of concentration. The total combined discharge flows are the most conservative values, which are shown this way to demonstrate the separate sources of runoff.

Refer to Exhibit G for a profile of the Walerga Rd Tributary water surface as calculated in HEC-RAS. Cross section outputs are provided for river stations 4100, 3975.67, and 3851 showing that there is adequate capacity for post-development project flows through the culvert under Walerga Rd.

DETENTION & RETENTION

The final predevelopment checklist identified the need for volumetric retention to mitigate impacts from the 8-day, 100-year storm event based on the potential downstream impacts on the Curry Creek Cross Canal watershed. Placer County is currently evaluating options for regional retention facilities; however, no County retention fee program has been established at this time. The project will need to demonstrate participation in a future Board-approved County retention program, if such program is established, or provide onsite retention facilities in accordance with County standards. Onsite underground retention is provided. Refer to Exhibit G in the Preliminary Phase 1 Drainage Report for locations identified for potential retention facilities. The estimated retention required is 69,220 cubic feet. The Exhibit G

alternative provides roughly 100,800 cubic feet of possible retention with room onsite for more. The final retention volumes will be provided and analyzed with the improvement plans for each phase.

Though drainage detention is not required or recommended for Dry Creek and its tributaries, hydromodification is still required under the MS4 rules, even though the distinction between detention and hydromodification is not made clear. If detention is required, despite the potential negative consequences of overlapping the flood wave and causing higher overall peak flows in Dry Creek, peak flows would be detained and approximately 2.9 ac-ft would be provided in Phase 1 either underground, in Phase 1 Basin B, or some combination thereof. 3.9 ac-ft would need to be provided in an above ground basin in Phase 2 and an additional 0.6 ac-ft can be provided in Phase 2 Basin C. This additional storage capacity could provide for additional attenuation and reduce downstream peak flows, if needed.

WATER QUALITY

To evaluate storm water quality and best management policies (BMP) within the project limits, the West Placer Storm Water Quality Design Manual was referenced and used as a guideline for BMP locations. Drainage Management Areas (DMA) are delineated with infiltration basins shown in Drainage Map #8. The primary purpose of the infiltration basins is to retain minor storm events and capture any pollutants that would otherwise enter Dry Creek and Curry Creek. The infiltration basins are primarily for minor storm events but not intended to reduce the peak flows during extreme storm events.

The Walerga Rd backbone storm drain system receives flows from Phases 1 & 2 and directs them to underground infiltration Basin C, which is constructed with Phase 2A. Additional runoff from Walerga Rd will be directed toward Basin C.

The composite runoff coefficient (Rc) is determined using State Water Control Board Runoff Coefficient Fact Sheet 5.1.3. The fact sheet provides tables of various coefficients depending on land use. The land use within the Phase 3 project is medium density residential. The Coefficient of 0.55 was used because it is the more conservative value for Water Quality calculations.

NO RISE CFD #1 LIFT STATION

The Estia Dry Creek project will require an emergency storage upgrade to the CFD#1 Lift Station south of Dry Creek near Walerga Road. Please refer to the Estia Dry Creek Preliminary Wastewater Report for additional information. As part of the emergency storage upgrade, additional grading is required in the floodplain as shown in the aforementioned report. This results in a need for compensatory cut in the floodplain, which is also shown in the aforementioned report. In order to demonstrate that this results in a No Rise condition at this facility, the following table has been prepared from HEC-RAS analysis.

Refer to Drainage Map #9 - CFD1 Emergency Storage HEC-RAS No Rise Exhibit for the HEC-RAS cross section locations given in Table 1 below.

Table 1 CFD #1 No Rise WSEL Summary

Walerga Tributary WSEL Summary			
Cross Section	Existing WSEL[(1)] (ft)	Revised WSEL[(1)] (ft)	Difference in Existing vs. Revised WSEL (ft)
	100-Year	100-Year	
14565 P	97.11	96.98	-0.13

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Placer County, California, Western Part
Survey Area Data: Version 15, Aug 31, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Apr 23, 2022—Apr 24, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
140	Cometa sandy loam, 1 to 5 percent slopes	D	32.3	25.0%
141	Cometa-Fiddyment complex, 1 to 5 percent slopes	D	32.1	24.9%
142	Cometa-Ramona sandy loams, 1 to 5 percent slopes	D	1.4	1.1%
146	Fiddyment loam, 1 to 8 percent slopes	D	10.1	7.8%
147	Fiddyment-Kaseberg loams, 2 to 9 percent slopes	C	0.5	0.4%
175	Ramona sandy loam, 2 to 9 percent slopes	C	11.8	9.2%
182	San Joaquin-Cometa sandy loams, 1 to 5 percent slopes	D	29.5	22.9%
194	Xerofluvents, frequently flooded	B	11.4	8.8%

[1]25.7 acres are proposed to be shifted from the Curry Creek watershed to the Dry Creek watershed from Point A to Point B. The associated 100-year flows from this shed shift are 25.3 cfs from Phase 1 and 39.2 cfs from Phase 2. The associated 10-year flows from this shed shift are 13.4 cfs from Phase 1 and 17.3 cfs from Phase 2.

Hydraflow HGL Computation Procedure

General Procedure:

Hydraflow computes the HGL using the Bernoulli energy equation. Manning's equation is used to determine energy losses due to pipe friction. In a standard step, iterative procedure, Hydraflow assumes upstream HGLs until the energy equation balances. If the energy equation cannot balance, supercritical flow exists and critical depth is temporarily assumed at the upstream end. A supercritical flow Profile is then computed using the same procedure in a downstream direction using momentum principles.

Col. 1 The line number being computed. Calculations begin at Line 1 and proceed upstream.

Col. 2 The line size. In the case of non-circular pipes, the line rise is printed above the span.

Col. 3 Total flow rate in the line.

Col. 4 The elevation of the downstream invert.

Col. 5 Elevation of the hydraulic grade line at the downstream end. This is computed as the upstream HGL + Minor loss of this line's downstream line.

Col. 6 The downstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 7 Cross-sectional area of the flow at the downstream end.

Col. 8 The velocity of the flow at the downstream end, (Col. 3 / Col. 7).

Col. 9 Velocity head (Velocity squared / 2g).

Col. 10 The elevation of the energy grade line at the downstream end, HGL + Velocity head, (Col. 5 + Col. 9).

Col. 11 The friction slope at the downstream end (the S or Slope term in Manning's equation).

Col. 12 The line length.

Col. 13 The elevation of the upstream invert.

Col. 14 Elevation of the hydraulic grade line at the upstream end.

Col. 15 The upstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

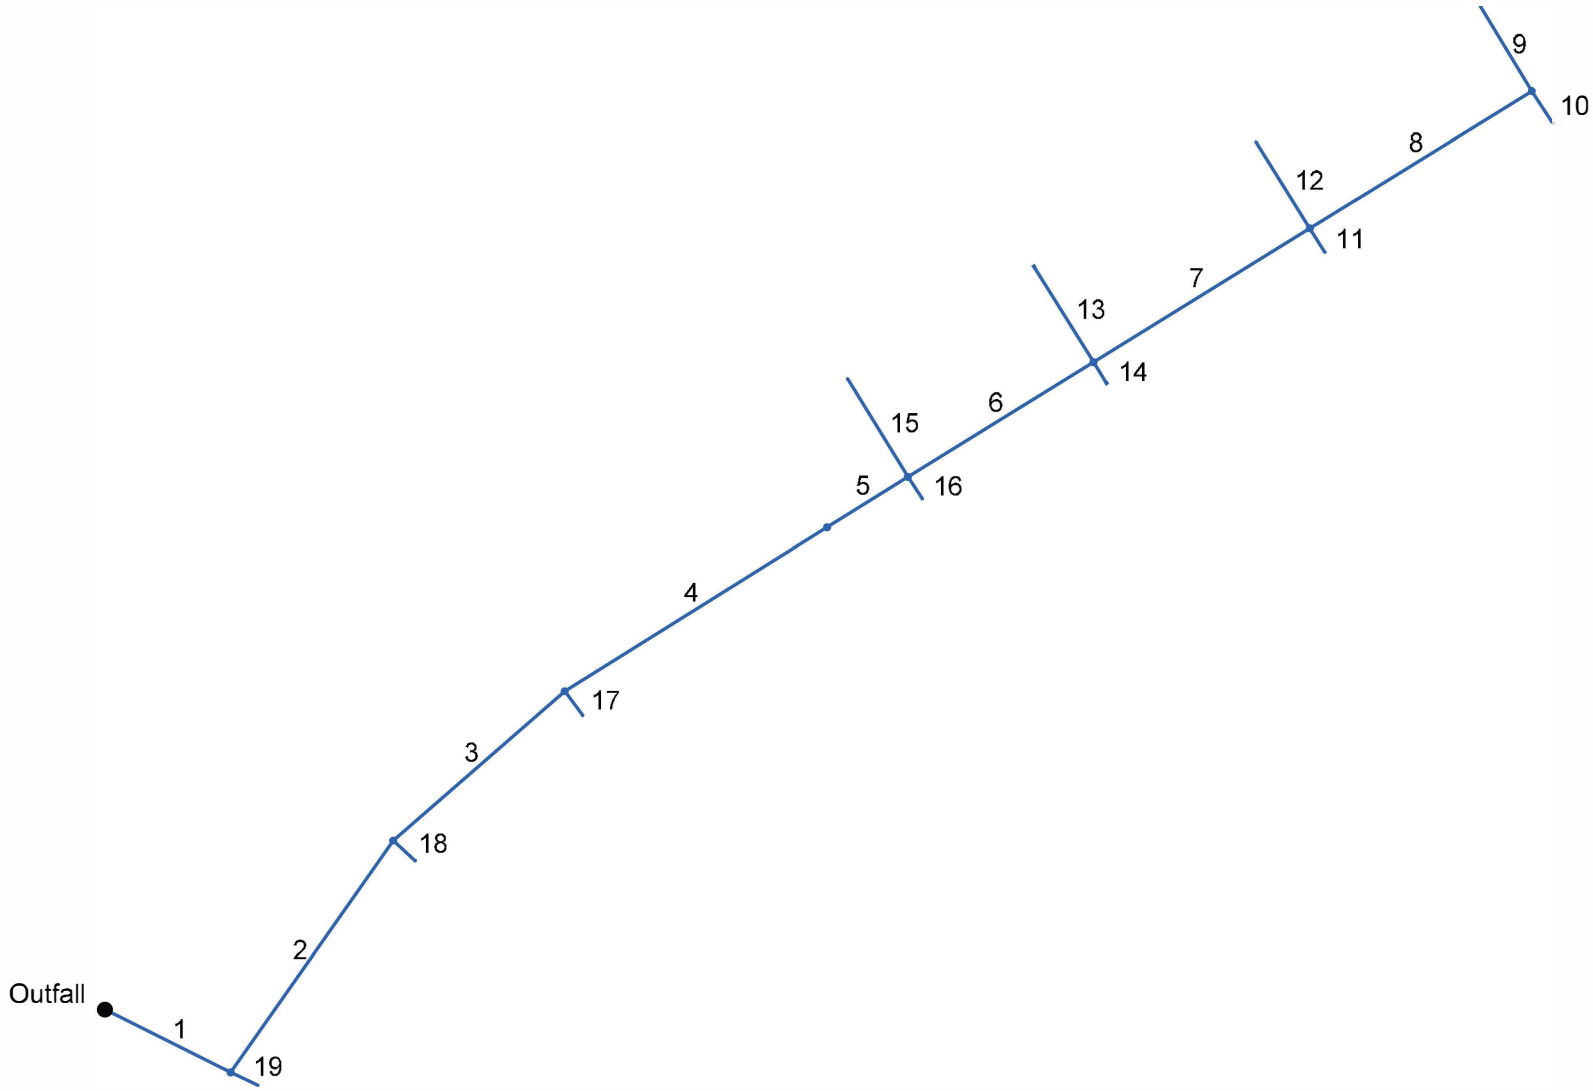
Col. 16 Cross-sectional area of the flow at the upstream end.

Col. 17 The velocity of the flow at the upstream end, (Col. 3 / Col. 16).

Col. 18 Velocity head (Velocity squared / 2g).

Col. 19 The elevation of the energy grade line at the upstream end, HGL + Velocity head, (Col. 14 + Col. 18) .

Col. 20 The friction slope at the upstream end (the S or Slope term in Manning's equation).



Col. 21 The average of the downstream and upstream friction slopes.

Col. 22 Energy loss. Average Sf/100 x Line Length (Col. 21/100 x Col. 12). Equals (EGL upstream - EGL downstream) +/- tolerance.

Col. 23 The junction loss coefficient (K).

Col. 24 Minor loss. (Col. 23 x Col. 18). Is added to upstream HGL and used as the starting HGL for the next upstream line(s).

Notes: ; ** Critical depth.; j-Line contains hyd. jump ; c = cir e = ellip b = box

Hydraflow HGL Computation Procedure

General Procedure:

Hydraflow computes the HGL using the Bernoulli energy equation. Manning's equation is used to determine energy losses due to pipe friction. In a standard step, iterative procedure, Hydraflow assumes upstream HGLs until the energy equation balances. If the energy equation cannot balance, supercritical flow exists and critical depth is temporarily assumed at the upstream end. A supercritical flow Profile is then computed using the same procedure in a downstream direction using momentum principles.

Col. 1 The line number being computed. Calculations begin at Line 1 and proceed upstream.

Col. 2 The line size. In the case of non-circular pipes, the line rise is printed above the span.

Col. 3 Total flow rate in the line.

Col. 4 The elevation of the downstream invert.

Col. 5 Elevation of the hydraulic grade line at the downstream end. This is computed as the upstream HGL + Minor loss of this line's downstream line.

Col. 6 The downstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 7 Cross-sectional area of the flow at the downstream end.

Col. 8 The velocity of the flow at the downstream end, (Col. 3 / Col. 7).

Col. 9 Velocity head (Velocity squared / 2g).

Col. 10 The elevation of the energy grade line at the downstream end, HGL + Velocity head, (Col. 5 + Col. 9).

Col. 11 The friction slope at the downstream end (the S or Slope term in Manning's equation).

Col. 12 The line length.

Col. 13 The elevation of the upstream invert.

Col. 14 Elevation of the hydraulic grade line at the upstream end.

Col. 15 The upstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

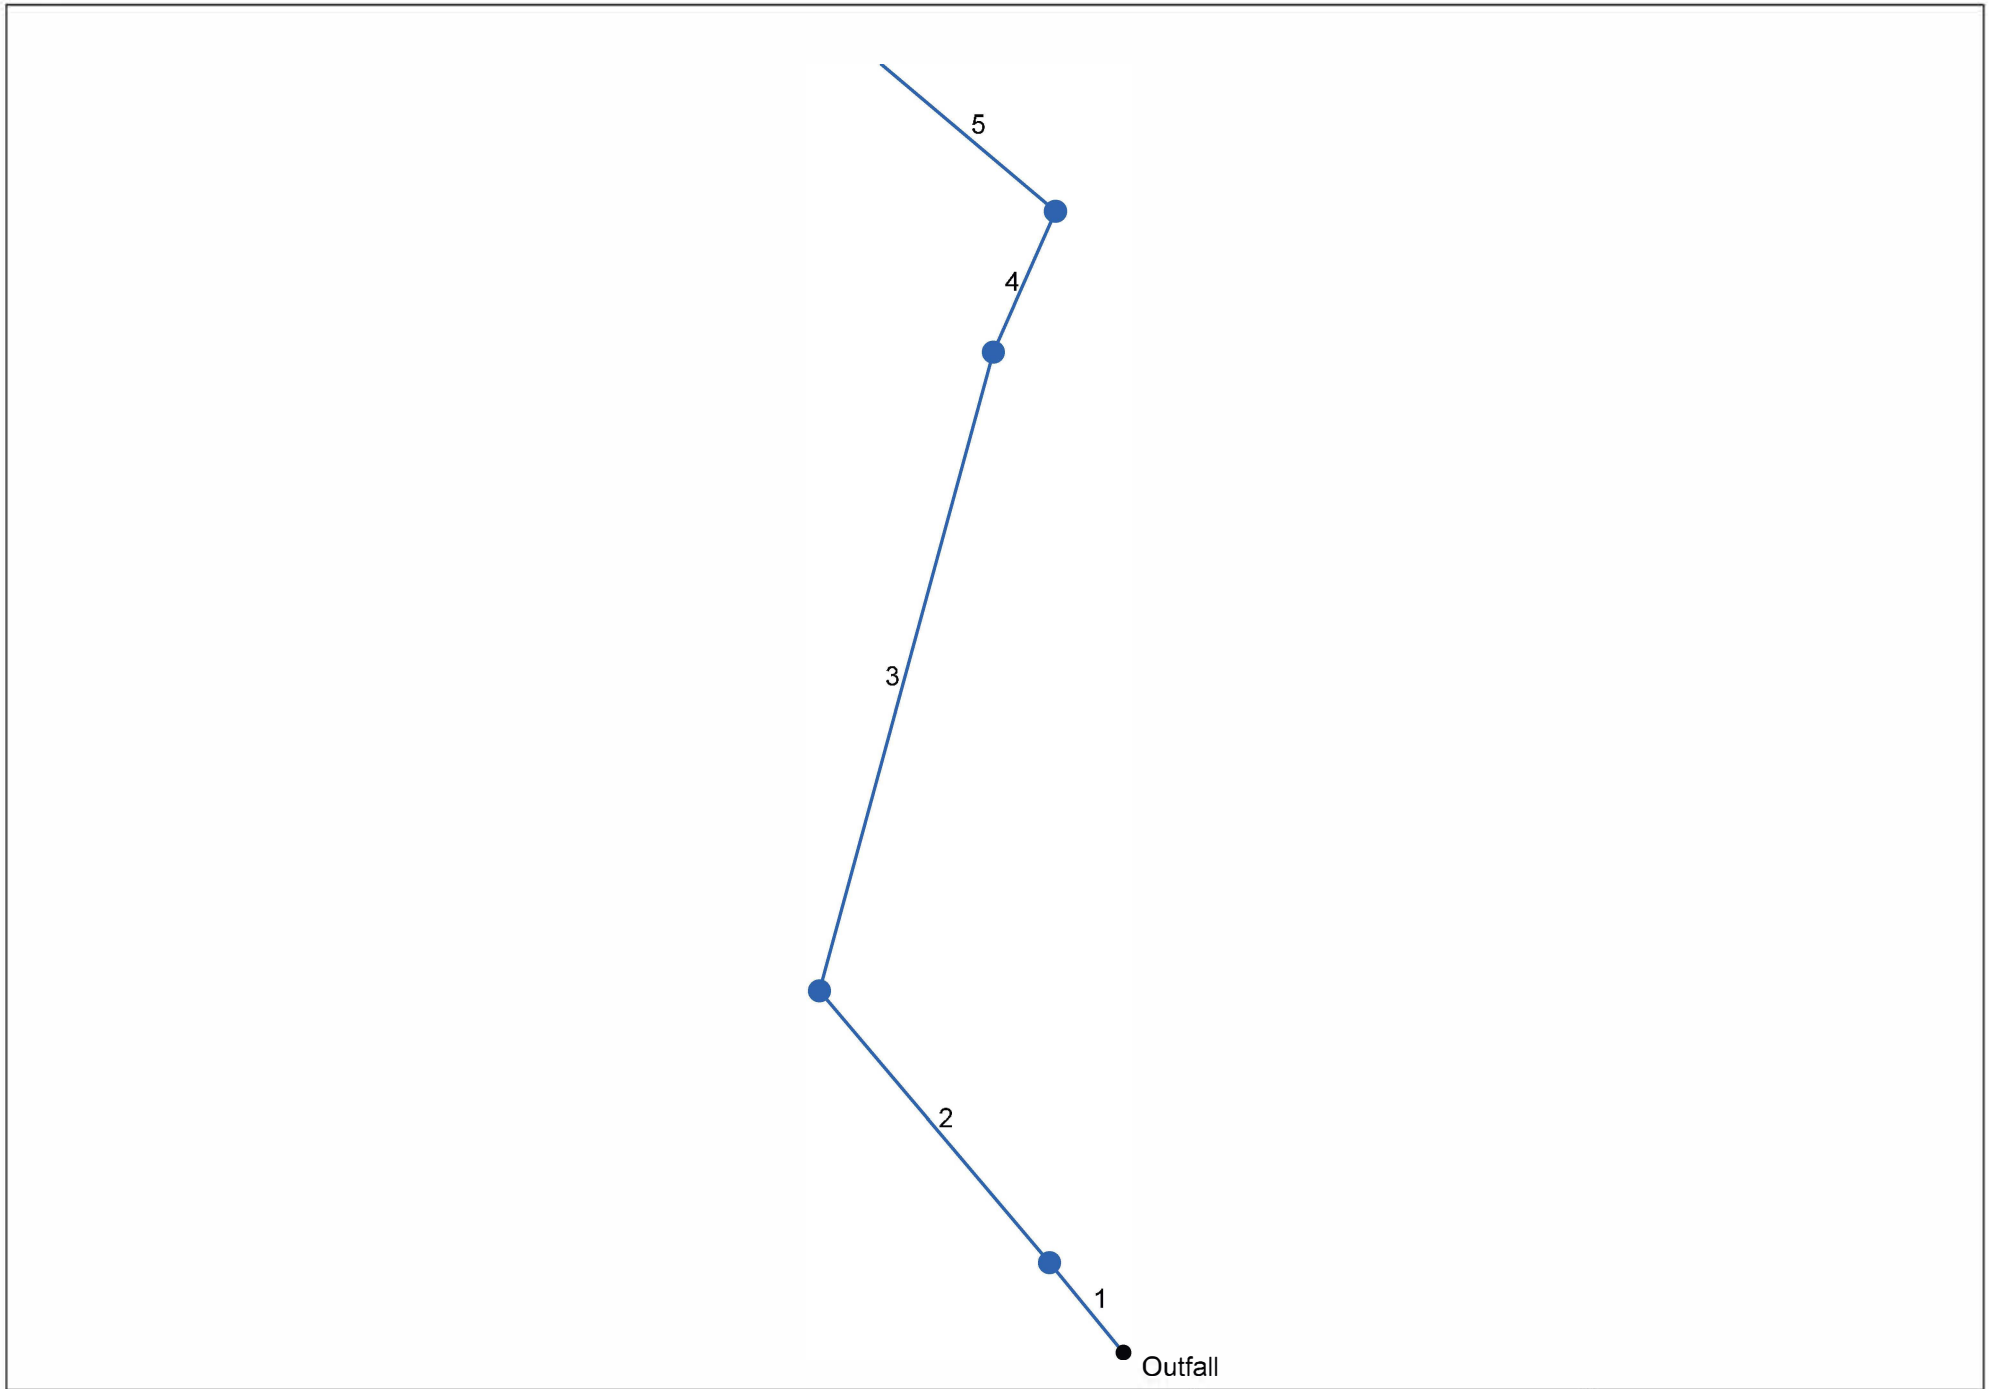
Col. 16 Cross-sectional area of the flow at the upstream end.

Col. 17 The velocity of the flow at the upstream end, (Col. 3 / Col. 16).

Col. 18 Velocity head (Velocity squared / 2g).

Col. 19 The elevation of the energy grade line at the upstream end, HGL + Velocity head, (Col. 14 + Col. 18) .

Col. 20 The friction slope at the upstream end (the S or Slope term in Manning's equation).



Col. 21 The average of the downstream and upstream friction slopes.

Col. 22 Energy loss. Average Sf/100 x Line Length (Col. 21/100 x Col. 12). Equals (EGL upstream - EGL downstream) +/- tolerance.

Col. 23 The junction loss coefficient (K).

Col. 24 Minor loss. (Col. 23 x Col. 18). Is added to upstream HGL and used as the starting HGL for the next upstream line(s).

Hydraflow HGL Computation Procedure

General Procedure:

Hydraflow computes the HGL using the Bernoulli energy equation. Manning's equation is used to determine energy losses due to pipe friction. In a standard step, iterative procedure, Hydraflow assumes upstream HGLs until the energy equation balances. If the energy equation cannot balance, supercritical flow exists and critical depth is temporarily assumed at the upstream end. A supercritical flow Profile is then computed using the same procedure in a downstream direction using momentum principles.

Col. 1 The line number being computed. Calculations begin at Line 1 and proceed upstream.

Col. 2 The line size. In the case of non-circular pipes, the line rise is printed above the span.

Col. 3 Total flow rate in the line.

Col. 4 The elevation of the downstream invert.

Col. 5 Elevation of the hydraulic grade line at the downstream end. This is computed as the upstream HGL + Minor loss of this line's downstream line.

Col. 6 The downstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 7 Cross-sectional area of the flow at the downstream end.

Col. 8 The velocity of the flow at the downstream end, (Col. 3 / Col. 7).

Post-Construction Storm Water Quality Plan Workbook

Post-Construction
Storm Water Quality Plan
West Placer County

For:

ESTIA DRY CREEK
within MS4 in Placer County, CA

Prepared for:

CHRIS DICKINSON
LAND DEVELOPMENT AND ACQUISITIONS PROJECT MANAGER
HOMES BY TOWNE
11060 WHITE ROCK ROAD, SUITE 150
RANCHO CORDOVA, CA 95670
(916) 782-2424

Prepared by:

King Engineering, Inc.
200 Auburn Folsom Road
Auburn, CA 95603
(530) 272-8328

Preparation Date:_____05/05/2026_____

Placer County Approval Date:_____

Revision Date December 11 2024

Section 1 General Project Information

The undersigned owner of the subject property, is responsible for the implementation of the provisions of this Storm Water Quality Plan (SWQP), including ongoing operations and maintenance (O&M), consistent with the requirements of the West Placer Storm Water Quality Design Manual and the State of California Phase II Small MS4 General Permit (Order No: 2013-0001-DWQ). If the undersigned transfers its interest in the property, its successors-in-interest shall bear the aforementioned responsibility to implement the SWQP.

For all Regulated Projects (As identified in Form 1-2 below), the undersigned owner hereby grants access to all representatives of the Jurisdictional Agency for the sole purpose of performing O&M inspections of the installed treatment system(s) and hydromodification control(s) if any.

A copy of the final signed and fully approved SWQP shall be available on the subject site for the duration of construction and then stored with the project approval documentation and improvement plans in perpetuity.

Form 1-1 Project Identification and Owner's Certification

Project Site Address:	BASELINE ROAD	
Owner Name:	CHRIS DICKINSON	
Title	LAND DEVELOPMENT AND ACQUISITIONS PROJECT MANAGER	
Company	HOMES BY TOWNE	
Address	11060 WHITE ROCK ROAD, SUITE 150	
City, State, Zip Code	RANCHO CORDOVA, CA 95670	
Email	cdickinson@hbtsac.com	
Telephone #	(916) 782-2424	
Signature	Date	
Engineer:*	Curtis King	PE Stamp* (Required for all Regulated Projects)
Title	Principal Engineer	
Company	King Engineering, Inc.	
Address	200 Auburn Folsom Road	
City, State, Zip Code	Auburn, CA 95603	
Email	Curtis.King@King-Engineering-Inc.com	
Telephone #	(530) 272-8328	
Signature		
Brief Description of Project: (Attach additional sheets as necessary)	Phases 1-4 and Backbone Roads	

* Not required for Small Projects as determined in Form 1-2 below. Project owners are responsible for ensuring that all storm water facilities are designed by an appropriately licensed and qualified professional.

Form 1-2 Project Category	
Development Category (Select all that apply)	
[1]**Small Project** – All projects, except LUPs, that create and/or replace between 2,500-5,000 ft^2 of impervious surface or detached single family homes that create and/or replace 2,500 ft^2 or more of impervious surface and are not part of a larger plan of development.	
[2]Enter total new and/or replaced impervious surface (ft^2)	
[3]**Regulated Project** – All projects that create and/or replace 5,000 ft^2 or more of impervious surface.	
[4]**Regulated Redevelopment Project** with equal to, or greater than 50 percent increase in impervious area	
[5]**Regulated Redevelopment Project** with less than 50 percent increase in impervious area	
[6]Enter total pre-project impervious surface (ft^2)	
[7]Enter total new and/or replaced impervious surface (ft^2)	
[8]**Regulated Road or linear underground/overhead project (LUP)** creating 5,000 ft^2 or more of newly constructed contiguous impervious surface.	
[9]Enter total new and/or replaced impervious surface (ft^2)	
[10]**Regulated Hydromodification Management Project** – Regulated projects that create and/or replace 1 acre or more of impervious surface. A project that does not increase impervious surface area over the pre-project condition is not a hydromodification management project.	YES
[11]Enter total new and/or replaced impervious surface (ft^2)	2255580.36

Section 3 Regulated Projects

Section 3 forms are to be completed for all Regulated Projects.

Form 3-1 Site Location and Hydrologic Features

Site coordinates: *Take GPS measurement at approximate center of site*	[1] Latitude	[2] Longitude	[3] Elevation (ft. above sea level)	[4] 85th Percentile, 24 Hour Design Storm Depth (in):
	38.75051	-121.36295	110	0.9

[5] Receiving waters *Name of stream, lake or other downstream waterbody to which the site runoff eventually drains*	Dry Creek and Curry Creek
[6] 303(d) listed pollutants of concern *Refer to State Water Resources Control Board website* www.waterboards.ca.gov/water_issues/programs/water_quality_assessment/#impaired	
[7] Is Project going to be phased? *If yes, ensure that the SWQP evaluates each phase with distinct DMAs, requiring LID BMPs to address runoff at time of completion.*	Yes

[8] *Use this form to show a conceptual schematic depicting DMAs and conveyance features connecting DMAs to the site outlet(s). An example is provided below that can be modified for the proposed project or a drawing clearly showing DMAs and flow routing may be attached.*

Example only
Modify for project specific SWQP
Use separate sheet if necessary

Please Refer to Site Assessment and Drainage Management Area Drainage Map

Form 3-2 Site Assessment and Layout Documentation

	Has this Item been considered in the Site Layout and depicted in the Site Plan?	
	Yes	**Not Applicable (Include brief explanation)**
Define the development envelope and protected areas, identifying areas that are most suitable for development and areas to be landscaped, or left undisturbed, and used for infiltration.	X	Reference Site Plan for infiltration basins and landscaped spaces to provide
Concentrate development on portions of the site with less permeable soils and preserve areas that can promote infiltration.		N/A
Limit overall impervious coverage of the site with paving and roofs.		N/A
Set back development from creeks, wetlands, and riparian habitats.	X	Reference Site Plan for setbacks and protected regions
To the extent practicable, avoid development and LID siting within floodplains.	X	Reference Site Plan for infiltration basins and landscaped spaces to provide
Preserve significant trees.	X	Reference Site Plan for protected trees
Conform site layout along natural landforms.	X	Site layout conforms to existing tributary flow paths and flood limits
Avoid excessive grading and disturbance of vegetation and soils.		N/A
Replicate the site's natural drainage patterns.	X	Site layout conforms to existing tributary flow paths and flood limits
Detain and retain runoff throughout the site.	X	Infiltration basins are incorporated to capture runoff throughout the site

Attach a Site Plan that incorporates the applicable considerations above. Ensure that the following items are included in the Site Plan:

Site Boundary
Soil types and areal extents, test pit and infiltration test locations
Topographic data with 1 ft. contours
Existing natural hydrologic features (depressions, watercourses, wetlands, riparian corridors)
Floodplain boundaries
Environmentally sensitive areas and areas to be preserved
Proposed locations and footprints of improvements creating new, or replaced, impervious surfaces
Potential pollutant sources and locations
Entire site divided into separate DMAs with unique identifiers
Existing and proposed site drainage network with flow directions and site run-on and discharge locations
Proposed design features and surface treatments used to minimize imperviousness and reduce runoff
Proposed locations and footprints of treatment and hydromodification management facilities
Design features for managing authorized non-stormwater discharges
Areas of soil and/or groundwater contamination
Existing utilities and easements
Maintenance areas

Form 3-3 Source Control Measures			
Potential Pollutant Generating Activity or Source	Check One		Describe the source control measures to be implemented for each potential pollutant generating activity or source present on the project as listed in Appendix C and in the CASQA Fact Sheets. Include any special features, materials, or methods of construction that will be used.
	Present	Not Applicable	
Accidental spills or leaks	☑	☐	measures per SC-11 fact sheet
Interior floor drains	☐	☑	
Parking/storage areas and maintenance	☐	☑	measure per SC-21, SC-22, SC-32 and SC-43 fact sheets
Indoor and structural pest control	☑	☐	measures done mainly by licensed pest control companies per SC-34, SC-61, SC-60 fact sheets
Pools, spas, ponds, decorative fountains, and other water features	☐	☑	measures per SC-72 fact sheet
Landscape/outdoor pesticide use	☑	☐	measures per SC-41, SC-60, SC-73 and SC-75 fact sheets
Restaurants, grocery stores, and other food service operations	☐	☑	
Refuse areas	☑	☐	homewoners to take measures per SC-34, SC-60
Industrial Processes	☐	☑	
Outdoor storage of equipment or materials	☐	☑	measures per SC-32, SC-41, SC-43 fact sheets
Vehicle and equipment cleaning	☑	☐	measures per SC-21 fact sheet
Vehicle and equipment repair and maintenance	☑	☐	measures per SC-22, SC-32 fact sheets
Fuel dispensing areas	☐	☑	
Loading docks	☐	☑	
Fire sprinkler test water	☐	☑	
Drain or wash water from boiler drain lines, condensate drain lines, rooftop equipment, drainage sumps, and other sources	☐	☑	
Unauthorized non-storm water discharges	☑	☐	measures per SC-10 fact sheet
Building and grounds maintenance	☑	☐	measures per SC-4, SC-43 fact sheets

The source control measures identified in this table shall be designed consistent with recommendations from the CASQA Stormwater BMP Handbook for New Development and Redevelopment[1], or from another equivalent manual.

[1] California Stormwater BMP Handbook New Development and Redevelopment. California Stormwater Quality Association (CASQA). January 2003.

Form 4-4 Trash Controls

Type of Trash Control Measure Implemented	Check One		Describe relevant information about each trash control measure. Include number present, size of drainage area to each measure, any special features, materials, or methods of construction that will be used.
	Present	Not Applicable	
Full Capture System	☐	☑	
Multi-Benefit Trash Treatment System: Bioretention	☑	☐	
Multi-Benefit Trash Treatment System: Capture and Use Systems	☐	☑	
Multi-Benefit Trash Treatment System: Detention Basin	☐	☑	
Multi-Benefit Trash Treatment System: Infiltration Trench or Basin	☐	☑	
Multi-Benefit Trash Treatment System: Media Filter	☐	☑	

Form 5-1 BMP Inspection and Maintenance		
BMP	**Inspection Point and Frequency**	**Maintenance Activity Required**
Infiltration Basins	Inlet/Outlet	Repair Erosion
	Entire Basin	Remove Debris and Trash as needed
	Overflow structure	Remove debris to unclog

Form 6-1 Post-Construction Stormwater BMPs

Following is a summary of all BMPs included in the Project design. This checklist must be included on the cover sheet of the Improvement Plans for all Regulated Projects.

BMP		Plan Sheet Number(s)
Structural Source Controls (list BMPs)		
Site Design Measures	Stream Setbacks and Buffers	
	Soil Quality Improvement and Maintenance	
	Tree Planting and Preservation	
	Rooftop and Impervious Area Disconnection	
	Porous Pavement	
	Vegetated Swales	
	Rain Barrels and Cisterns	
Stormwater Treatment and Baseline Hydromodification Measures	Bioretention with Infiltration	
	Flow-Through Planters, Tree Box Filters and Media Filters	
Hydromodification Management Measures	Supplemental Detention	
Trash Control Measures	Full Capture System	
	Multi-Benefit Treatment System: Bioretention	
	Multi-Benefit Treatment System: Capture and Use Systems	
	Multi-Benefit Treatment System: Detention Basin	
	Multi-Benefit Treatment System: Infiltration Trench or Basin	
	Multi-Benefit Treatment System: Media Filter

INTRODUCTION

This report analyzes the existing noise levels and potential noise impacts from the Placer County Estia Dry Creek and Placer Creek Residential Project (the "Project") in Placer County, California. The Project site is in the northern portion of the Dry Creek-West Placer Community Plan (DCWPCP) in Placer County. The Project is located on APNs 023-221-074 and -076 for a total area of approximately 88.3 acres. The Project includes the development of 212-medium density single-family residential lots, 220 multi-family apartment units, one park, and eight landscape corridors throughout four phases. The following analysis details the existing noise sources and levels in the Project vicinity and evaluates the potential noise impacts of the Project. This evaluation reviews applicable State and local noise regulations followed by analysis of noise impacts of construction and operation of the Project.

CHECKLIST

Would the project result in:	Significant or Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less than Significant	No Impact
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☒	☐	☐	☐
b) Generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☒	☐
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☒	☐

SETTING

Sound is mechanical energy transmitted by pressure waves through a medium such as air. Noise is defined as unwanted sound. Sound pressure level has become the most common descriptor used to characterize the "loudness" of an ambient sound level. Sound pressure level is measured in decibels (dB), with zero dB corresponding roughly to the threshold of human hearing, and 120 to 140 dB corresponding to the threshold of pain. Decibels are measured using different scales, and it has been found that A-weighting of sound levels best reflects the human ear's reduced sensitivity to low frequencies, and correlates well with human perceptions of the annoying aspects of noise. The A-weighted decibel scale (dBA) is cited in most noise criteria. All references to decibels (dB) in this report will be A-weighted unless noted otherwise.

Several time-averaged scales represent noise environments and consequences of human activities. The most commonly used noise descriptors are the equivalent A–weighted sound level over a given time period (Leq)[1]; average day–night 24-hour average sound level (Ldn)[2] with a nighttime increase of 10 dB to account for sensitivity to noise during the nighttime; and community noise equivalent level (CNEL)[3], also a 24-hour average that includes both an evening and a nighttime sensitivity weighting. **Table 1** identifies decibel levels for common sounds heard in the environment. With regard to increases in A-weighted noise level, the following relationships occur (Caltrans, 1998a):

- Under controlled conditions in an acoustics laboratory, the trained healthy human ear is able to discern changes in sound levels of 1 dB;
- Outside of such controlled conditions, the trained ear can detect changes of 2 dB in normal environmental noise;
- It is widely accepted that the average healthy ear, however, can barely perceive noise levels changes of 3 dB;
- A change in level of 5 dB is a readily perceptible increase in noise level; and
- A 10-dB change is recognized as twice as loud as the original source.

TABLE 1. TYPICAL NOISE LEVELS

Noise Level (dB)	Outdoor Activity	Indoor Activity
90+	Gas lawn mower at 3 feet, jet flyover at 1,000 feet	Rock Band
80-90	Diesel truck at 50 feet	Loud television at 3 feet
70-80	Gas lawn mower at 100 feet, noisy urban area	Garbage disposal at 3 feet, vacuum cleaner at 10 feet
60-70	Commercial area	
40-60	Quiet urban daytime, traffic at 300 feet	Large business office, dishwasher next room
20-40	Quiet rural, suburban nighttime	Concert hall (background), library, bedroom at night
10-20		Broadcast / recording studio
0	Lowest threshold of human hearing	Lowest threshold of human hearing

SOURCE: (modified from Caltrans Technical Noise Supplement, 1998)

NOISE ATTENUATION

Stationary point sources of noise, including construction equipment, attenuate (lessen) at a rate of 6 to 7.5 dB per doubling of distance from the source, depending on ground absorption. Physical barriers

[1] The Equivalent Sound Level (Leq) is a single value of a constant sound level for the same measurement period duration, which has sound energy equal to the time–varying sound energy in the measurement period.

[2] Ldn is the day–night average sound level that is equal to the 24-hour A-weighted equivalent sound level with a 10-decibel penalty applied to night between 10:00 p.m. and 7:00 a.m.

[3] CNEL is the average A-weighted noise level during a 24-hour day, obtained by addition of 5 decibels in the evening from 7:00 to 10:00 p.m., and an addition of a 10–decibel penalty in the night between 10:00 p.m. and 7:00 a.m.

located between a noise source and the noise receptor, such as berms or sound walls, would increase the attenuation that occurs by distance alone. Noise from large construction sites would have characteristics of both "point" and "line" sources, so attenuation would likely range between 4.5 and 7.5 dB per doubling of distance.

Vibration

Vibration is an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal and is typically expressed in units of inches per second (in/sec). The PPV is the most frequently used to describe vibration impacts on buildings. Some common sources of ground-borne vibration are trains, heavy trucks traveling on rough roads, and construction activities such as blasting, pile driving, and operation of heavy earthmoving equipment.

REGULATORY CONTEXT

Federal

There are no applicable federal noise requirements.

State

The State of California establishes noise insulation standards for new multi-family residential units, hotels, and motels that would be subject to relatively high levels of transportation-related noise. These requirements are collectively known as the California Noise Insulation Standards (Title 24, California Code of Regulations). The noise insulation standards set forth an interior standard of 45 dB, Ldn in any habitable room. They require an acoustical analysis demonstrating how dwelling units have been designed to meet this interior standard where such units are proposed in areas subject to noise levels greater than 60 dB, Ldn.

Local

Placer County General Plan

The Noise Section (Section 9) of the Placer County General Plan establishes goals and policies for both transportation and non-transportation sources (Placer County, 2013). The following goals and policies are relevant to the Project:

> Goal 9.A: To protect County residents from the harmful and annoying effects of exposure to excessive noise.
>
> Policy 9.A.3.: The County shall continue to enforce the State Noise Insulation Standards (California Code of Regulations, Title 24) of the California Building Code and Placer County Code, Article 9.36, Noise.

Policy 9.A.6.: The feasibility of proposed projects with respect to existing and future transportation noise levels shall be evaluated by comparison to Table 9-3 (shown as **Table 2** below).

Policy 9.A.8.: New development of noise-sensitive land uses shall not be permitted in areas exposed to existing or projected levels of noise from transportation noise sources, including airports, which exceed the levels specified in Table 9-3 (shown as **Table 2** below), unless the project design includes effective mitigation measures to reduce noise in outdoor activity areas and interior spaces to the levels specified in Table 9-3 (shown as **Table 2** below).

TABLE 2. MAXIMUM ALLOWABLE NOISE EXPOSURE FROM TRANSPORTATION NOISE SOURCES

Noise Sensitive Land Uses	Outdoor Activity Areas[1]	Interior Spaces	
	Ldn/CNEL, dB	Ldn/CNEL, dB	Leq, dB[2]
Residential	60[3]	45	-
Transient Lodging	60[3]	45	-
Hospitals, Nursing Homes	60[3]	45	-
Theaters, Auditoriums, Music Halls	-	-	35
Churches, Meeting Halls	60[3]	-	40
Office Buildings	-	-	45
Schools, Libraries, Museums	-	-	45
Playgrounds, Neighborhood Parks	70	-	-

Notes:

1. Where the location of the outdoor activity areas is unknown, the exterior noise level standard shall be applied to the property line of the receiving land use.
2. As determined for a typical worst-case hour during periods of use.
3. Where it is not possible to reduce noise in outdoor activity areas to 60 dB Ldn/CNEL or less using a practical application of the best-available noise reduction measures, an exterior noise level of up to 65 dB Ldn/CNEL may be allowed provided that available exterior noise level reduction measures have been implemented and interior noise levels are in compliance with this table.

SOURCE: Placer County General Plan, 2013, Section 9, Table 9-3.

Placer County Noise Ordinance

The Placer County Noise Ordinance (Article 9.36) prohibits unnecessary, excessive and offensive sounds. The following regulations are relevant to the Project:

Per § 9.36.060, it is unlawful for any person at any location to create any sound, or to allow the creation of any sound, on property leased, occupied or otherwise controlled by such person that:

1. Causes the exterior sound level when measured at the property line of any affected sensitive receptor to exceed the ambient sound level by five dB; or

2. Exceeds the sound level standards as set forth in Table 1 (shown as **Table 3** below), whichever is greater.

3. Policy 9.A.6.: The feasibility of proposed projects with respect to existing and future transportation noise levels shall be evaluated by comparison to Table 9-3 (shown as **Table 2** above).

Per § 9.36.060 (A)(7), Construction (e.g., construction, alteration or repair activities) is exempt if it occurs between the hours of 6:00 a.m. and 8:00 p.m. Monday through Friday, and between the hours of 8:00 a.m. and 8:00 p.m. on Saturday and Sunday, provided that all construction equipment shall be fitted with factory installed muffling devices and that all construction equipment shall be maintained in good working order.

TABLE 3. SOUND LEVELS STANDARDS (ON-SITE)

Sound Level Descriptor	Daytime (7 a.m. to 10 p.m.)	Nighttime (10 p.m. to 7 a.m.)
Hourly Leq, dB	55	45
Maximum level, (Lmax) dB	70	65

SOURCE: Placer County Municipal Code, §9.36.060, Table 1.

Dry Creek-West Placer Community Plan (DCWPCP)

The DCWPCP contains a noise section that is used to identify and appraise noise problems affecting the DCWPCP area (Placer County, 1990). The following are relevant to the Project:

Goal 2: Locate noise-sensitive land uses within areas of acceptable Community Noise Equivalent Levels (CNEL).

Policy 4: Require implementation of noise abatement techniques within new projects where warranted.

Policy 6: Require project specific noise studies for most commercial, office, public, institutional, and residential projects.

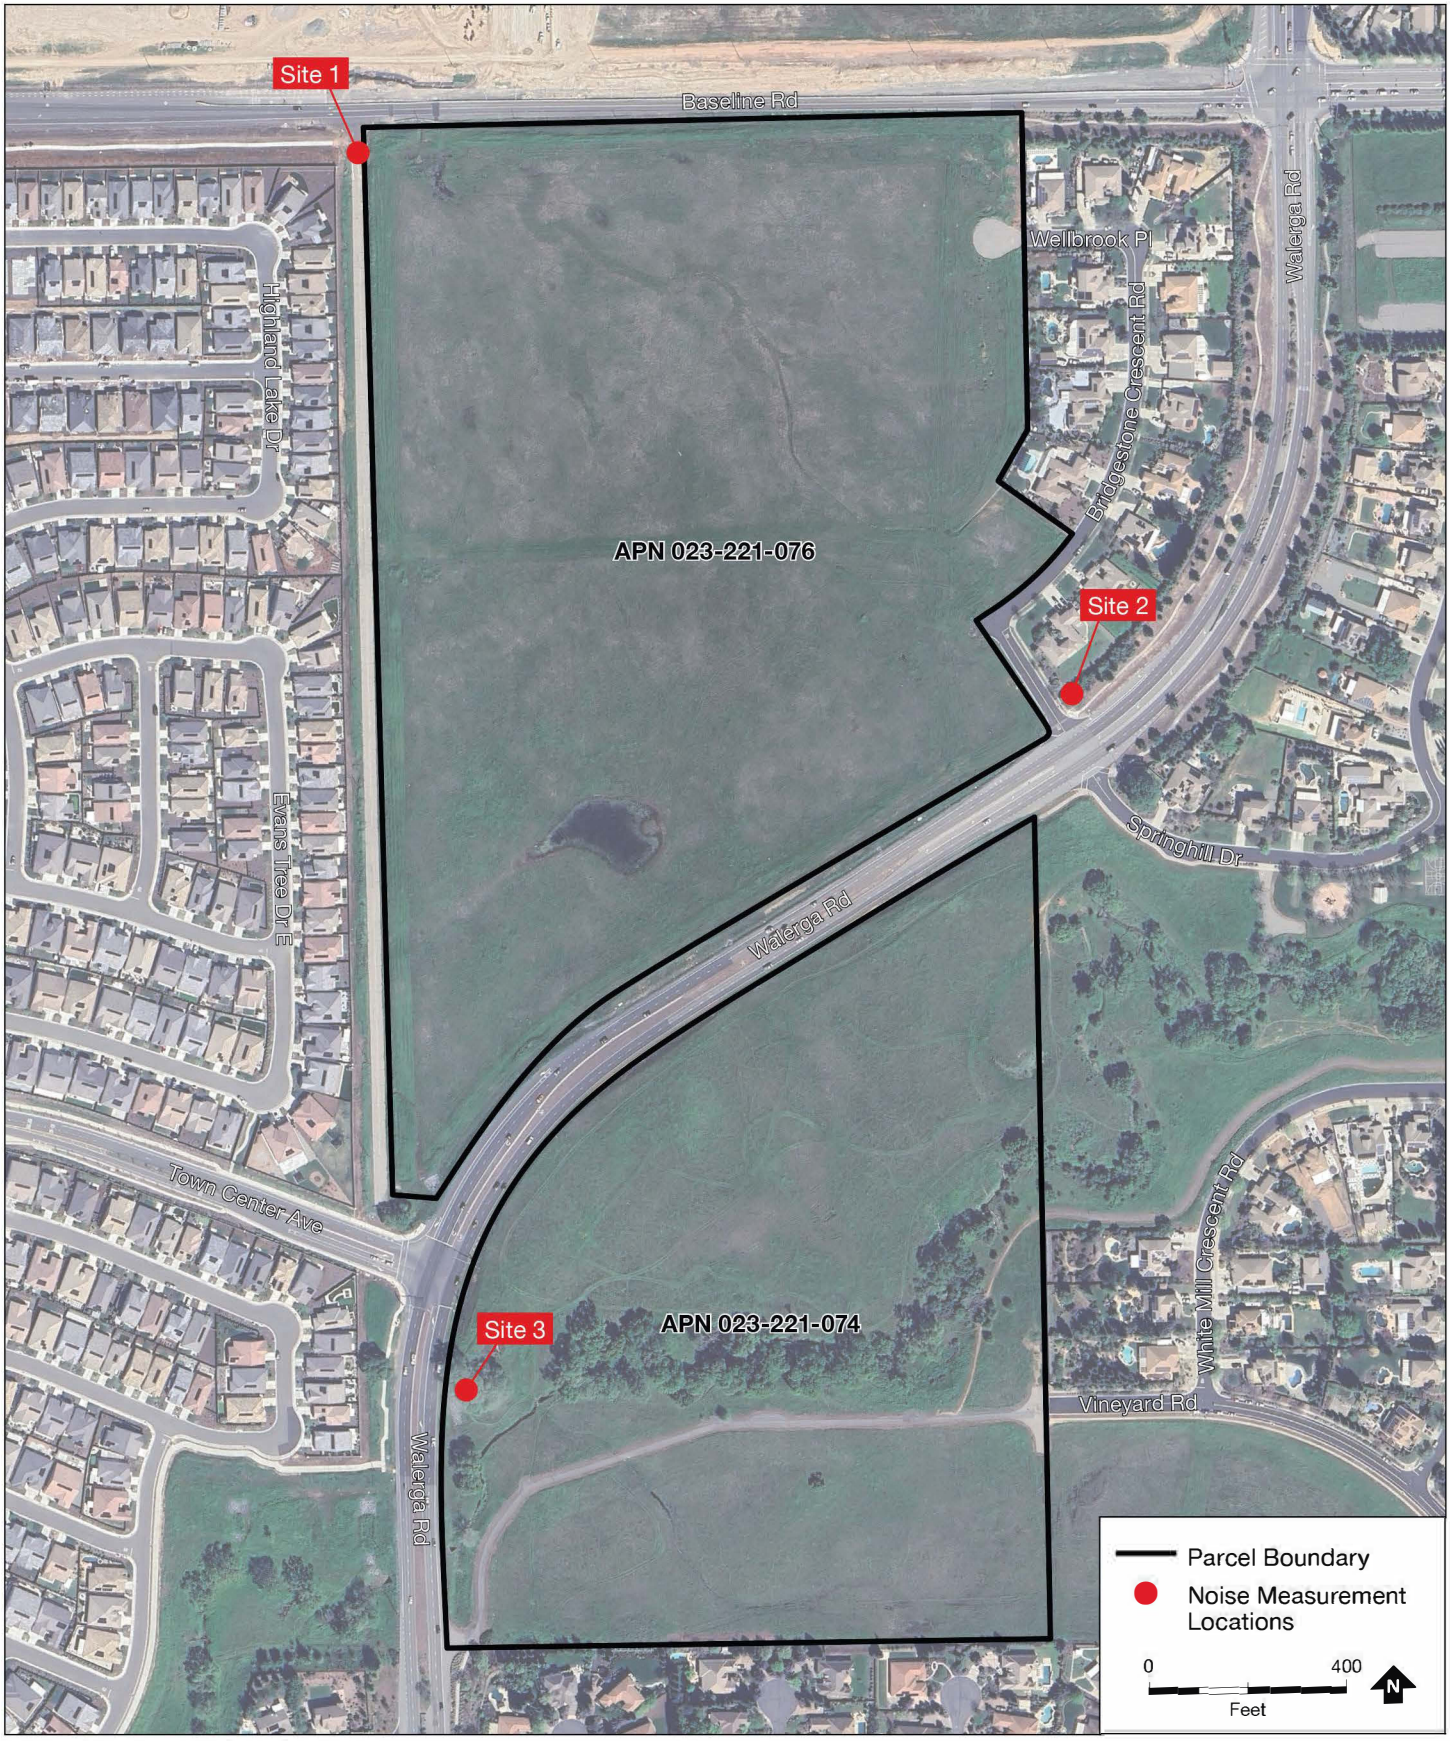
Policy 8: Where noise levels have a potential to be in excess of normally acceptable CNEL levels, landscaped setbacks should be considered versus sound walls for noise mitigation.

Sensitive Receptors

The Placer County Noise Ordinance (Article 9.36) defines noise-sensitive land uses as residential areas, schools, hospitals, churches, rest homes, cemeteries, and other public libraries. The nearest sensitive land uses to the Project site are residences to the east, west and south of the Project site. The nearest residences would be located directly east of the proposed Phase 2 lots (along Wellbrook Place and Bridgestone Crescent Road) and directly south of the proposed Phase 4 lots (along French Creek Court, Eagle Creek Court, Marsh Creek Court, and Rockporte Court).

METHODOLOGY AND EXISTING NOISE ENVIRONMENT

To quantify existing ambient noise levels, RCH group conducted three long-term (72-hour) and four short-term (10-minute) noise measurements at the Project site. Metrosonics db308 Sound Level Meters calibrated before and after the measurements were used for the long-term noise measurements. A Larson Davis SoundTrack LxT Sound Level Meter calibrated before and after the measurements was used for the short-term measurements. To measure existing 24-hour noise



levels at the Project site, a noise meter was attached to a telephone pole at the northwest corner of the site (Site 1) with clear view of Baseline Road (the primary source of noise at the Project site). A second noise meter was attached to a tree on the intersection of Walerga Road and Springhill Drive with a clear view of Walerga Road (the primary source of noise at the Project site) (Site 2). A third noise meter was attached to a tree on the western property boundary with a clear view of Walerga Road (Site 3). Existing 24-hour noise levels at the Project site ranged from 67-74 dB, CNEL. **Table 4** summarizes the locations and results of the noise measurements. **Figure 1** shows the noise measurement locations on a map.

The **Noise Appendix** includes 24-hour noise plots for Sites 1 through 3 and hourly measurements results. Based on observations from the short-term measurements, the main source of noise in the Project vicinity was traffic noise from Baseline Road and Walerga Road. No other minor sources of noise were observed during short-term measurements.

TABLE 4. EXISTING NOISE LEVELS

Location	Time Period	Noise Levels (dB)	Noise Sources
Site 1: Northwest corner of the Project site, approximately 100 feet south of centerline of Baseline Road.	June 25, 12:00 a.m. Through June 27, 11:59 p.m., 2024 Tuesday – Thursday 72-hour measurement.	Daytime Leq's ranged from: 61-65 Nighttime Leq's ranged from: 54-65 CNELs: 67, 68, 68	Unattended noise measurements do not specifically identify noise sources.
Site 1: Northwest corner of the Project site, approximately 100 feet south of centerline of Baseline Road.	Monday June 24, 2024 9:11 a.m. to 9:21 a.m.	5-minute Leq's: 58, 59	Traffic on Baseline Road was 58-71 dB.
Site 2: Intersection of Walerga Road and Springhill Drive, approximately 70 feet north of centerline of Walerga Road.	June 25, 12:00 a.m. Through June 27, 11:59 p.m., 2024 Tuesday – Thursday 72-hour measurement.	Daytime Leq's ranged from: 69-73 Nighttime Leq's ranged from: 59-71 CNELs: 73, 74, 74	Unattended noise measurements do not specifically identify noise sources.
Site 2: Intersection of Walerga Road and Springhill Drive, approximately 70 feet north of centerline of Walerga Road.	Monday June 24, 2024 9:33 a.m. to 9:43 a.m.	5-minute Leq's: 69, 70	Traffic on Walerga Road was 65-80 dB.
Site 3: Approximately 100 feet east of centerline of Walerga Road.	June 25, 12:00 a.m. Through June 27, 11:59 p.m., 2024 Tuesday – Thursday 72-hour measurement.	Daytime Leq's ranged from: 67-70 Nighttime Leq's ranged from: 58-71 CNELs: 72, 72, 73	Unattended noise measurements do not specifically identify noise sources.
Site 3: Approximately 100 feet east of centerline of Walerga Road.	Monday June 24, 2024 9:53 a.m. to 10:03 a.m.	5-minute Leq's: 66, 71	Traffic on Walerga Road was 65-86 dB.

SIGNIFICANCE THRESHOLDS

Appendix G of the *CEQA Guidelines* states that a Project would result in a significant impact to Noise if it would:

- Generate a substantial temporary or permanent increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
  - Daytime and nighttime construction activities would result in a potentially significant impact if construction activities would result in an increase of an hourly 5 dB, Leq (a readily perceptible increase) or more over existing exterior noise levels at the nearest noise-sensitive receptors.
  - Nighttime construction noise could be potentially significant if nighttime construction would expose nearby noise-sensitive receptors to noise levels exceeding an interior noise level of 45 dB, Ldn/CNEL as a result of nearby construction activities.
  - For the purposes of analyzing potential traffic noise impacts, this analysis uses a significance threshold of an increase of 5 dB, CNEL or greater where the resulting traffic noise levels are less than 60 dB, CNEL; an increase of 3 dB, CNEL or greater in traffic noise where resulting traffic noise levels are 60-65 dB, CNEL; or an increase of 1.5 dB, CNEL or greater in traffic noise where resulting traffic noise levels are above 65 dB, CNEL.
- Generate excessive groundborne vibration or groundborne noise levels; or
  - Vibration from construction would be potentially significant in vibration would exceed the 0.5 Peak Particle Velocity (PPV) Federal Transit Administration (FTA) threshold of 0.5 PPV at the nearest off-site structure.
- For a project located within the vicinity of a private airstrip or an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport or public use airport, expose persons residing or working in the project area to excessive noise levels.
  - The Project site is not within the vicinity of a private airstrip or an airport land use plan, or within 2 miles of a public use airport. The nearest airport is the Sacramento McClellan Airport and is located approximately 5 miles south of the Project site. At this distance, airport noise would not be a significant source of noise at the project site and would have no impact on people residing or working in the Project area. Therefore, airport noise impacts are not further discussed in this analysis.

DISCUSSION

a) Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction Related Noise Impacts

Construction would result in a temporary increase in ambient noise levels in the vicinity of the Project. Construction activities for the Project would include grading and excavation work, as well as building construction, paving, and coating. Construction activities would require the use of numerous pieces of noise-generating equipment, such as excavating machinery (e.g., loaders, excavators, etc.) and other construction equipment (e.g., dozers, dump trucks, etc.). The noise levels generated by construction equipment would vary greatly depending upon factors such as the type and specific model of the equipment, the condition of the equipment, the operation being performed, the location of the operations, and the prevailing wind direction.

The noise levels at 50 feet for various types of construction equipment that could be used during Project construction are provided in **Table 5** below. Average noise levels generated by construction equipment used for the proposed project would range from 73 to 83 dB, Leq at 50 feet. The majority of construction would occur at distances greater than 50 feet away from noise-sensitive receptors.

TABLE 5. TYPICAL NOISE LEVELS FROM CONSTRUCTION EQUIPMENT

Construction Equipment	Noise Level (dB, Leq at 50 feet)
Backhoe	74
Dozer	78
Forklift	77
Crane	73
Excavator	77
Dump Truck	73
Paver	74
Compressor (Air)	74
Generator	78
Roller	73
Concrete Mixer Truck	75
Front End Loader	75

Tractor	80
Concrete Saw	83

SOURCE: Federal Highway Administration (FHWA) Roadway Construction Noise Model (RCNM), Version 1.1

Roadway Construction Noise Model (RCNM)

Combined intermittent noise levels from the simultaneous operation of construction equipment was estimated based on equipment noise data published by the Federal Highway Administration (FHWA). The FHWA Roadway Construction Noise Model (RCNM), Version 1.1 was used for this analysis because it contains a robust inventory of off-road equipment and reference noise levels common to large-scale construction projects. Estimates of noise from the Project are based on a roster of the maximum amount of equipment used on a given day. Therefore, the noise level associated with the equipment is typical of the type of equipment and not based on any specific make or model.

Tables 6 and 7 present the results of RCNM for anticipated daytime and nighttime construction activities, respectively. For daytime construction, the grading phase was assumed to be the loudest construction phase. For nighttime construction, two phases (i.e., underground work and aboveground work) would occur. The aboveground work phase would be the loudest phase of nighttime work. For daytime construction, cumulative noise levels were modeled at 50, 200, 400, 600, and 800 feet. Distances for nighttime construction were modeled at 50, 150, and 300 feet. The predicted noise from each activity is presented as a worst-case scenario because it is assumed all equipment that would be used for that construction activity is present and operating simultaneously. Results of the RCNM noise calculations are included in the **Noise Appendix**.

Figures 2 through 4 show the predicted noise level contours from daytime construction noise from Phases 1-4 in terms of the average (Leq) noise descriptor. **Figure 5** shows the predicted noise level contours from nighttime construction (aboveground phase) noise at three locations in terms of the average (Leq) noise descriptor. These predicted noise level contours show the results of the RCNM noise calculations and are conservative, worst-case scenarios.

TABLE 6. PREDICTED NOISE LEVELS FROM CONSTRUCTION ACTIVITIES (DAYTIME)

Construction Activity	Proposed Equipment	Leq (h) Level (dB[3]) at 50 feet	Leq (h) Level (dB[3]) at 200 feet	Leq (h) Level (dB[3]) at 400 feet	Leq (h) Level (dB[3]) at 600 feet	Leq (h) Level (dB[3]) at 800 feet
Grading1	Combined Equipment Total[1]	84	72	66	62	60

NOTES:

Leq (h) = hourly Leq

1 Grading activities are assumed to be the loudest daytime construction phase.
2 See **Noise Appendix** for results of each individual piece of construction equipment. This modeling scenario assumes the following equipment for grading: (3x) excavators, (2x) loaders, and (2x) dump trucks.
3 Results from RCNM rounded to the nearest dB.

Note 1: The noise contours shown in this figure do not account for topographical features. There is an existing masonry sound wall atop of an earthen berm between the Project site and the homes to the west of the Project site that would significantly reduce construction noise levels reaching the nearest homes on Highland Lake Drive. This existing masonry sound wall is approximately 10-12 feet above the grade of Baseline Road and would block the line of sight between the construction footprint and the nearest homes on Highland Lake Drive. To be conservative, a 10 dB reduction in construction noise can be assumed to occur when construction noise reaches the eastern boundary of the homes on Highland Lake Drive.

Note 2: An attenuation rate of 6.0 dB per doubling distance was used to estimate the noise propagation in this figure.

Daytime Construction Noise Impacts

This analysis assumes that Phases 1-4 would occur separately and not simultaneously. The equipment and activities required for construction of the Project would be typical of large-scale residential construction projects and no noise-generating equipment (i.e., pile drivers) or other similar heavy equipment would be needed. The Placer County Noise Ordinance exempts temporary construction noise when construction occurs between the hours of 6:00 a.m. and 8:00 p.m. Monday through Friday, and between the hours of 8:00 a.m. and 8:00 p.m. on Saturday and Sunday, provided that all construction equipment shall be fitted with factory installed muffling devices and that all construction equipment shall be maintained in good working order.

For the purpose of this analysis, temporary daytime construction activities would result in a potentially significant impact if daytime construction activities would result in an increase of an hourly 5 dB, Leq (1-hour) (a readily perceptible increase) or more over existing exterior noise levels at the nearest noise-sensitive receptors. **Table 8** shows the predicted daytime construction noise impacts from grading activities, which is assumed to be the loudest construction phase.

TABLE 8. PREDICTED DAYTIME CONSTRUCTION NOISE LEVELS

Phase	Construction Reference Noise Level (dB, Leq at 50 feet)	Construction Noise Level (dB, Leq at the nearest receptor)	Existing Daytime Exterior Noise Levels (dB, Leq)	Change from Existing Noise Levels (dB, Leq)	Results in increase of 5 dB, Leq or more?	Requires Mitigation?	Significant Impact?
1	84	52[1]	61-65[2]	0	No	No	No[1]
2	84	64[3]	69-73[4]	0	No	No	No
3	84	65[5]	58-62[6]	3-7	Yes	Yes	Yes
4	84	70[7]	60-64[8]	6-10	Yes	Yes	Yes

NOTES:

1. Distance is assumed to be 600 feet between the center of the Phase 1 construction site and the nearest home to the west on Highland Lake Drive. The resulting noise level would be 62 dB, Leq. However, there is an existing masonry sound wall atop of an earthen berm that would significantly reduce nighttime construction noise levels reaching the nearest homes on Highland Lake Drive. This existing masonry sound wall is approximately 10-12 feet above the grade of Baseline Road and would block the line of sight between the construction footprint and the nearest homes on Highland Lake Drive; therefore, a conservative 10 dB reduction can be applied. Thus, the resulting noise levels would be approximately 52 dB, Leq.
2. See **Table 4,** Site 1 for daytime hourly Leq's which were taken nearby the nearest homes to the west of Phase 1 construction.
3. Distance is assumed to be 500 feet between the center of the Phase 2 construction site and the nearest home to the east on Bridgestone Crescent Road.
4. See **Table 4,** Site 2 for daytime hourly Leq's which were taken nearby the homes adjacent to Walerga Road and west of Phase 2 construction.
5. Distance is assumed to be 450 feet between the center of the Phase 3 construction site and the nearest home to the east on White Mill Crescent Road.
6. Daytime hourly Leq's were estimated based on the daytime hourly Leq's taken at Site 3. These noise levels were attenuated to the nearest home to the east on White Mill Crescent Road located closest to Phase 3 construction.
7. Distance is assumed to be 250 feet between the center of the Phase 4 construction site and the nearest home to the south on Marsh Creek Court.
8. Daytime hourly Leq's were estimated based on the daytime hourly Leq's taken at Site 3. These noise levels were attenuated to the nearest home to the east on Marsh Creek Court located closest to Phase 4 construction.

SOURCE: RCH GROUP, 2025.

As discussed above, **Table 8** shows the predicted daytime construction noise impacts from grading activities (assumed to be the loudest construction phase) when measured from the center of each construction phase to the nearest existing home. The center of the site was used because of the nature of grading activities (i.e., heavy equipment in constant motion that does not remain stationary for long periods of time). When grading activities are occurring nearby homes adjacent to Phase 3 and 4, the exterior noise level would increase by approximately 3-10 dB, Leq. As discussed above, these predicted increases in exterior noise levels are considered to be conservative, worst-case scenarios because it is assumed all grading equipment would be operating simultaneously.

When other construction activities are occurring closer to nearby noise-sensitive receptors (e.g., homes along Wellbrook Place and Bridgestone Crescent Road and along French Creek Court, Eagle Creek Court, Marsh Creek Court, and Rockporte Court), these receptors would be exposed to the highest noise levels during those activities. Phases 2 and 3 would require work that would occur directly adjacent to the above-mentioned receptors and even though construction noise would be less than the noise generated by grading activities (as shown in **Table 8**), other construction phases (e.g., foundations, framing, and post-construction finishing) could also exceed the exterior noise threshold of 5 dB, Leq (1-hour), depending on the activity being performed and the duration of the construction phase.

Mitigation Measure NOI-1 has been identified to reduce exterior noise impacts at nearby noise-sensitive locations. This Mitigation Measure would reduce daytime construction noise levels reaching the nearby noise-sensitive receptors. Implementation of this Mitigation Measure would reduce construction noise impacts at the nearest residences that are directly east of the proposed Phase 2 lots (along Wellbrook Place and Bridgestone Crescent Road) to a less-than-significant impact. However, even with the implementation of these measures, daytime construction noise levels reaching nearby noise-sensitive receptors directly south of Phase 4 lots (along French Creek Court, Eagle Creek Court, Marsh Creek Court, and Rockporte Court) would likely still exceed the exterior noise threshold of 5 dB, Leq (1-hour) threshold (a readily perceptible increase) and this increase in noise would likely result in annoyances to nearby noise-sensitive receptors. This would be a **Significant and Unavoidable** impact of the Project**.**

Mitigation Measures

Mitigation Measure NOI-1: The Applicant shall implement the following construction noise reduction measures:

- A six-foot-tall temporary sound wall shall be constructed on the eastern property boundary of the proposed Phase 2 lots along the fenceline of the homes on Wellbrook Place and Bridgestone Crescent Road that are directly east of the proposed Phase 2 construction. Another six-foot-tall temporary sound wall shall be constructed on the southern property boundary of the proposed Phase 4 lots along the fenceline of the homes on French Creek Court, Eagle Creek Court, Marsh Creek Court, and Rockporte Court that are directly south of the proposed Phase 4 construction. The sound wall fencing shall consist of 0.5-inch plywood or minimum STC 27 sound curtains placed to shield nearby noise-sensitive receptors from construction noise. The plywood barrier shall be free from gaps, openings, or penetrations to ensure maximum performance. The temporary construction sound wall

shall be constructed prior to any demolition or other ground disturbing activities associated with construction.

- Prior to construction activities, the Construction Contractor shall designate a "Construction Noise Coordinator" who would be responsible for responding to any local complaints about construction noise. The Construction Noise Coordinator shall determine the cause of the complaint and shall require implementation of reasonable measures to correct the problem. The telephone number for the Construction Noise Coordinator shall be conspicuously posted at the construction site.

- At least three weeks prior to the start of construction activities, the Construction Contractor shall provide written notification to residences within 500 feet of the construction site informing them of the estimated start date and duration of construction activities, the role of the Construction Noise Coordinator, and how to contact the Construction Noise Coordinator.

- All construction equipment shall be properly maintained and in good order.

- Locate staging areas at the greatest feasible distances away from nearby noise-sensitive receptors.

- Noise-reducing enclosures or acoustic barriers shall be used around stationary noise-generating equipment (e.g., generators, air compressors).

- Require that all construction equipment powered by gasoline or diesel engines have sound control devices (i.e., mufflers) that are at least as effective as those originally provided by the manufacturer and that all equipment be operated and maintained to minimize noise generation.

- Operate heavy-duty construction equipment at the lowest operating power possible.

Nighttime Construction Noise Impacts

The Project would likely require nighttime work at three different locations to minimize daytime traffic circulation impacts on Walerga Road and Baseline Road, since these roads have a high volume of traffic during the daytime. Nighttime work would include improvements to sewer, drain, and water lateral systems, as well as traffic signal work. Nighttime work would be short-term and is expected to last 1-2 weeks at each location and would occur at different times. For the purpose of this analysis, temporary nighttime construction activities would result in a potentially significant impact if nighttime construction activities would result in an increase of an hourly 5 dB, Leq (1-hour) (a readily perceptible increase) or more over existing exterior noise levels at the nearest noise-sensitive receptors and if nighttime construction would expose nearby noise-sensitive receptors to noise levels exceeding an interior noise level of 45 dB, Ldn/CNEL as a result of nearby construction activities. **Table 9** shows the predicted nighttime construction exterior noise levels from aboveground activities, which would be the loudest nighttime construction phase. **Table 10** shows the predicted nighttime construction interior noise levels at nearby noise-sensitive receptors. See **Figure 5** for the predicted noise level contours from nighttime construction (aboveground phase) noise at the three locations.

TABLE 9. PREDICTED NIGHTTIME CONSTRUCTION EXTERIOR NOISE LEVELS FOR ABOVEGROUND WORK

Location	Construction Reference Noise Level (dB, Leq at 50 feet)	Construction Noise Level (dB, Leq at the nearest receptor)	Existing Nighttime Exterior Noise Levels (dB, Leq)	Change from Existing Noise Levels (dB, Leq)	Results in increase of 5 dB, Leq or more?	Requires Mitigation?	Significant Impact?
1	85	76[1]	59-71[2]	5-17	Yes	Yes	Yes
2	85	61[3]	59-71[2]	0-2	No	No	No
3	85	56[4]	54-65[6]	0-2	No	No	No[4]

NOTES:

1. Distance is assumed to be 150 feet between the center of nighttime construction Location 1 and the nearest home to the north on Springhill Drive.
2. See **Table 4,** Site 2 for nighttime hourly Leq's which were taken nearby the nearest homes to the north of Walerga Road on Springhill Drive.
3. Distance is assumed to be 800 feet between the center of nighttime construction Location 2 and the nearest home to the northeast on Springhill Drive.
4. Distance is assumed to be 450 feet between the center of nighttime construction Location 3 and the nearest home to the southwest on Highland Lake Drive. The resulting noise level would be 66 dB, Leq. However, there is an existing masonry sound wall atop of an earthen berm that would significantly reduce nighttime construction noise levels reaching the nearest homes on Highland Lake Drive. This existing masonry sound wall is approximately 10-12 feet above the grade of Baseline Road and would block the line of sight between the construction footprint and the nearest homes on Highland Lake Drive; therefore, a conservative 10 dB reduction can be applied. Thus, the resulting noise levels would be approximately 56 dB, Leq.
5. See **Table 4,** Site 1 for nighttime hourly Leq's which were taken nearby the nearest homes on Highland Lake Drive.

SOURCE: RCH GROUP, 2025.

TABLE 10. PREDICTED NIGHTTIME CONSTRUCTION NOISE LEVEL IMPACTS ON INTERIOR NOISE LEVELS

Location	Construction Reference Noise Level (dB, Leq at 50 feet)	Construction Noise Level (dB, Leq at the nearest receptor)	Predicted Interior Noise Level at the nearest receptor	Results in increase of 45 dB, Ldn/CNEL or more	Requires Mitigation?	Significant Impact?
1	85	76[1]	46-51[2]	Yes	Yes	Yes
2	85	61[3]	31-36[2]	No	No	No
3	85	56[4]	26-31[2]	No	No	No

NOTES:

1. Distance is assumed to be 150 feet between the center of nighttime construction Location 1 and the nearest home to the north on Springhill Drive and Walerga Road.
2. Noise reductions afforded by building construction can vary depending on construction materials and techniques. Standard construction practices typically provide approximately 25-30 dB exterior-to-interior reduction (with windows and doors closed) (Caltrans, 2000). This analysis assumes the nearest noise-sensitive receptors to nighttime construction are construction with materials that would provide a 25-30 dB exterior-to-interior noise reduction (with windows and doors closed).
3. Distance is assumed to be 800 feet between the center of nighttime construction Location 2 and the nearest home to the northeast on Springhill Drive.
4. Distance is assumed to be 450 feet between the center of nighttime construction Location 3 and the nearest home to the southwest on Highland Lake Drive. The resulting noise level would be 66 dB, Leq. However, there is an existing masonry sound wall atop of an earthen berm that would significantly reduce nighttime construction noise levels reaching the nearest homes on Highland Lake

Drive. This existing masonry sound wall is approximately 10-12 feet above the grade of Baseline Road, therefore, a conservative 10 dB reduction is assumed. Thus, the resulting noise levels would be approximately 56 dB, Leq.

5. See **Table 4,** Site 1 for nighttime hourly Leq's which were taken nearby the nearest homes on Highland Lake Drive.

SOURCE: RCH GROUP, 2025.

As discussed above, **Tables 9 and 10** shows the predicted nighttime construction noise impacts from aboveground activities (the loudest nighttime construction phase) when measured from the center of each nighttime construction location to the nearest home. As shown in **Tables 9 and 10,** nighttime construction activities at Location 1 would exceed the exterior noise threshold of 5 dB, Leq (1-hour) and the interior noise level threshold of 45 dB, Ldn/CNEL at the nearest receptor that is located approximately 150 feet away from the center of Location 1 construction. Using a reference noise level of 85 dB, Leq at 50 feet for aboveground nighttime construction[4], any noise-sensitive receptor within 600 feet of the center of Location 1 during aboveground work would be expected to exceed the exterior noise threshold of 5 dB, Leq (1-hour) and any noise-sensitive receptor within 300 feet of the center of Location 1 during aboveground work would be expected to exceed the interior noise level threshold of 45 dB, Ldn/CNEL. **Figure 5** shows the homes within 300 feet and 600 feet of the center of nighttime construction Location 1, respectively.

Mitigation Measure NOI-1 has been identified to reduce exterior noise impacts at nearby noise-sensitive locations. In addition, **Mitigation Measure NOI-2** has been identified to reduce interior construction noise nighttime impacts at nearby-noise sensitive locations[5]. These Mitigation Measures would greatly reduce nighttime construction noise levels reaching the nearby noise-sensitive receptors. However, even with the implementation of these measures, nighttime construction noise levels reaching nearby noise-sensitive receptors would likely still exceed the exterior noise threshold of 5 dB, Leq (1-hour) threshold (a readily perceptible increase) and the interior noise level threshold of 45 dB, Ldn/CNEL. This increase in noise would likely result in annoyances and possible sleep disturbances to nearby noise-sensitive receptors. This would be a **Significant and Unavoidable** impact of the Project**.**

Mitigation Measures

Mitigation Measure NOISE-2: At least two weeks prior to nighttime construction occurring at the intersection of Walerga Road and Springhill Drive, the Construction Contractor shall provide written notification to residences within 600 feet of the nighttime construction footprint. The written notification shall provide the estimated start time and duration of the nighttime construction, as well as provide recommendations to these residences to keep windows and doors closed during nighttime construction events.

Project Exterior Noise Impacts

CEQA does not require an analysis of the environment's effects on the Project. However, potential effects to future residents of the Project due to traffic noise along local roadways are evaluated for the purposes of considering the Project's consistency with noise-related Placer County General

[4] See **Noise Appendix** for results of each individual piece of construction equipment. This modeling scenario assumes the following for nighttime aboveground construction: (2x) tractors, front end loader, paver, roller, concrete mixer truck (King Engineering, 2025).

[5] Note that it would not be feasible to construct temporary sound walls along the homes on Springhill Drive due to the existing topography on Springhill Drive. In addition, nighttime work would be very short-term (1-2 weeks in duration).

Plan Policies. As shown in **Table 4,** existing 24-hour noise levels are 67-68 dB, CNEL at Site 1, 73-74 dB, CNEL at Site 2 and 72-73 dB, CNEL at Site 3. Site 1 was chosen to represent the typical noise levels from traffic on Baseline Road that can be expected to reach the northernmost residences in Phase 1. Sites 2 and 3 were chosen to represent the typical noise levels from traffic on Walerga Road that can be expected to reach the exterior areas residences in Phases 2 and 3 that are adjacent to Walerga road.

The Placer County General Plan (Policy 9.A.8) states that new development of noise-sensitive land uses shall not be permitted in areas exposed to existing or projected levels of noise from transportation noise sources, including airports, which exceed the 60 dB, Ldn or CNEL threshold at outdoor activity areas, unless the project design includes effective mitigation measures to reduce noise in outdoor activity areas and interior spaces. Table 9-3 of the Placer County General Plan states that exterior noise levels of up to 65 dB, Ldn or CNEL at outdoor activity areas are considered acceptable provided that the best-available noise reduction measures are implemented.

RCH conducted traffic noise modeling using methodologies from the FHWA Traffic Noise Prediction Model (FHWA-RD-77-108) to model exterior traffic noise impacts from Baseline Road and Walerga Road. Existing and future traffic volumes were provided by Kimley-Horn and are from the Project-specific transportation analysis. The model is based upon noise emission factors for automobiles, medium trucks and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and the acoustical characteristics of the site. The future cumulative plus Project 2044 noise modeling analysis showed that the closest outdoor activity areas to Baseline Road would have a noise level of approximately 72 dB, CNEL and that the closest outdoor activity areas to Walerga Road would have a noise level of approximately 78 dB, CNEL. Therefore, future cumulative plus Project 2044 noise levels would be in excess of the County's 65 dB, Ldn conditionally acceptable standard for exterior noise.

A sound wall would be necessary to reduce the existing and future transportation noise exposure to the closest activity areas to Baseline Road and Walerga Road. The current Tentative Map has the locations of the proposed sound walls between the northern lots of Phase 1 and Baseline Road, between the southern lots of Phase 2 and Walerga Road, and between the northern lots of Phase 3 and Walerga Road. **Tables 11 through 13** summarize the results of noise attenuation analysis of various sound wall heights.

TABLE 11. NOISE MODELING FOR BASELINE ROAD TRAFFIC NOISE (PHASE 1 LOTS)

Sound Wall Height[1]	Noise Level (dB), CNEL Existing[3,4]	Noise Level (dB), CNEL Future 2044[3,4]	Meets the Placer County Exterior Noise Standard?
No Wall[2]	68	72	No
5 Feet	63	67	No
6 Feet	61	65	Yes

NOTES:

1. The modeled sound walls assume flat site conditions where elevations, base of wall elevations and building pad elevations are approximately equivalent.
2. Sound walls less than 5 feet tall were not estimated because they would not break the line of sight between vehicles and backyards.
3. Outdoor activity area noise levels were modeled in the center of the backyards of the proposed Phase 1 Lots closest to the sound wall. These are the closest backyards to Baseline Road
4.Noise levels rounded to the nearest dB.

TABLE 12. NOISE MODELING FOR WALERGA ROAD TRAFFIC NOISE (PHASE 2 LOTS)

Sound Wall Height[1]	Noise Level (dB), CNEL Existing[3,4]	Noise Level (dB), CNEL Future 2044[3,4]	Meets the Placer County Exterior Noise Standard?
No Wall[2]	74	78	No
5 Feet	69	73	No
6 Feet	67	71	No
7 Feet	66	70	No
8 Feet	65	69	No
9 Feet	64	68	No
10 Feet	64	68	No
11 Feet	63	67	No
12 Feet	61	65	Yes

NOTES:

1. The modeled sound walls assume flat site conditions where elevations, base of wall elevations and building pad elevations are approximately equivalent.
2. Sound walls less than 5 feet tall were not estimated because they would not break the line of sight between vehicles and backyards.
3. Outdoor activity area noise levels were modeled in the center of the backyards of the proposed Phase 2 lots closest to the sound wall. These are the closest backyards to Walerga Road.
4.Noise levels rounded to the nearest dB.

TABLE 13. NOISE MODELING FOR WALERGA ROAD TRAFFIC NOISE (PHASE 3 LOTS)

Sound Wall Height[1]	Noise Level (dB), CNEL Existing[3,4]	Noise Level (dB), CNEL Future 2044[3,4]	Meets the Placer County Exterior Noise Standard?
No Wall[2]	74	78	No
5 Feet	65	69	No
6 Feet	64	68	No
7 Feet	63	67	No
8 Feet	62	66	No
9 Feet	61	65	Yes

NOTES:

1. The modeled sound walls assume that the building pad elevations along the Phase 3 lots are an average of 4 feet below the grade of Walerga Road.
2. Sound walls less than 5 feet tall were not estimated because they would not break the line of sight between vehicles and backyards.
3. Outdoor activity area noise levels were modeled in the center of the backyards of the proposed Phase 3 lots closest to the sound wall. These are the closest backyards to Walerga Road.
4.Noise levels rounded to the nearest dB.

As discussed above, CEQA does not require an analysis of the environment's effects on the Project. While not an environmental issue required for analysis under CEQA, the existing and future traffic noise would be in excess of the County's 65 dB, CNEL conditionally acceptable standard for exterior noise. The following recommendations are provided to be consistent with the Placer County General Plan.

Sound Wall Recommendations

- Under projected noise from traffic volumes on Baseline Road, it is recommended that the Applicant constructs a 6-foot-tall sound wall between the northern lots of Phase 1 and Baseline Road. This sound wall can be a combination of earthen berm and masonry wall.

- Under projected noise from traffic volumes on Walerga Road, it is recommended that the Applicant constructs a 12-foot-tall sound wall between the southern lots of Phase 2 and Walerga Road. This sound wall can be a combination of earthen berm and masonry wall.

- Under projected noise from traffic volumes on Walerga Road, it is recommended that the Applicant constructs a 9-foot-tall sound wall between the northern lots of Phase 3 and Walerga Road. This sound wall can be a combination of earthen berm and masonry wall.

Residential building facades typically provide a minimum exterior-to-interior noise reduction of 25-30 dB with windows closed (Caltrans, 2002). Since the exterior noise levels are all estimated to be below 65 dB in the future (with implementation of the abovementioned Project recommendations), the additional 25 dB exterior-to-interior noise reduction would reduce interior noise levels below 40 dB, CNEL (65 dB – 25 dB = 40 dB). Therefore, interior noise levels at the Project residences would be less than the 45 dB, CNEL noise standard.

Traffic Noise Impacts

For the purposes of analyzing potential traffic noise impacts, this analysis considers impacts to be potentially significant if the Project's traffic noise results in an increase of 5 dB, CNEL or greater where the resulting traffic noise levels are less than 60 dB, CNEL; an increase of 3 dB, CNEL or greater in traffic noise where resulting traffic noise levels are 60-65 dB, CNEL; or an increase of 1.5 dB, CNEL or greater in traffic noise where resulting traffic noise levels are above 65 dB, CNEL.

To assess the impact of Project traffic on noise-sensitive receptors adjacent to nearby roadways, noise level projections were made using the methodologies from the FHWA Traffic Noise Prediction Model (FHWA-RD-77-108) to model the predicted future noise levels for road segments that would be used by passenger vehicles nearby the Project site (see **Noise Appendix** for traffic noise level estimates). Existing and future traffic volumes were provided by Kimley-Horn and are from the Project-specific transportation analysis.[6] Estimated traffic noise levels from AM and PM peak hour traffic turning volumes are shown in **Table 14.** Note that the Project also includes the option to develop up to 22 accessory dwelling units (ADUs) to satisfy affordable housing requirements. Since it is unknown how many ADUs would be developed, the additional traffic volume that could be generated by the ADUs was not included in the traffic noise modeling. However, the addition of 22 ADUs would increase project trip generation by less than 5 percent and the resulting traffic noise contribution distributed throughout the analyzed road segments would be negligible.

[6] Future cumulative traffic volumes include the 4-acre rezone site for up to 120 units of affordable housing.

NOTES:

1 Road center to model receptor distance is 30 meters (approximately 100 feet) for values shown in this table. Noise levels were calculated using the FHWA Traffic Noise Prediction Model (FHWA-RD-77-108). An attenuation rate of 3.0 dB was used as traffic noise is a line source and the ground absorption characteristics were soft sites for all the modeled locations.

2 The existing noise level from traffic noise is up to 74 dB, CNEL (see **Table 4**, Site 2).

Note: A total of 84 roadway segments were modeled as part of the traffic noise analysis. Other modeled roadway segments are shown in the **Noise Appendix.** The roadway segments that are not shown in this table did not result in any significant incremental noise increases.

SOURCE: RCH GROUP, 2025.

As shown in **Table 14,** traffic noise from the Project would cause a very minimal incremental increase compared to existing and future cumulative noise levels at the majority of the modeled roadway segments. The results for the Vineyard Road west of Crowder Lane segment indicate a 3.7 dB, CNEL increase for existing plus Project (AM Peak Hour) and a 3.6 dB, CNEL increase from Cumulative plus Project (PM Peak Hour). However, the resulting noise levels for both scenarios would be below 60 dB, CNEL. Thus, this incremental increase would not exceed any threshold.

As shown in **Table 14,** the results for the Springhill Drive west of Walerga Road indicate a 7.9 dB, CNEL increase for existing plus Project (AM Peak Hour), a 6.7 dB, CNEL increase for existing plus Project (PM Peak Hour), a 5.0 dB, CNEL increase for Cumulative plus Project (AM Peak Hour), and a 5.1 dB, CNEL increase for Cumulative plus Project (PM Peak Hour). The results of the modeling for this segment exceeds a 5 dB, CNEL increase for all modeled scenarios. However, this segment of roadway is only approximately 230 feet long (before it intersects with Bridgestone Crescent Road to the north) and is adjacent to only one home that is north of the corner of Walerga Road and Springhill Drive. The noise modeling indicates that highest resulting noise level on this segment would be 50.0 dB, CNEL (Cumulative plus Project, AM Peak Hour). This noise level is well below the existing traffic noise on Walerga Road (73-74 dB, CNEL) that already reaches the abovementioned home.[7] A resulting noise level of 50.0 dB, CNEL (at the highest) at this segment would be completely masked by the traffic noise that already exists on Walerga Road that reaches this home. Therefore, this increase in noise level would be negligible compared to the existing traffic noise nearby this segment and would not be perceptible at the nearest home. Therefore, incremental traffic noise increases from the Project would result in a **less-than-significant impact.**

Pickleball Noise Impacts from the Project

Once operational, the Project would include two pickleball courts as part of the Phase 2 outdoor recreation amenities. Noise generated by pickleball gameplay would be required to comply with the County's Noise Ordinance § 9.36.060 for daytime noise levels which is a maximum daytime (7 a.m. to 10 p.m.) outdoor noise level of 70 dB, Lmax when measured at the nearest property line.

To analyze potential outdoor noise impacts from pickleball courts, RCH conducted short-term measurements during a pickleball gameplay event[8]. Short-term noise measurements were taken at 50 feet from the center of the court. The gameplay consisted of two players on a single court. The primary noise level measured was the contact between the paddle and the ball which ranged from 52-61 dB, Lmax at 50 feet. The secondary source of noise was conversation between players which ranged from 50-54 dB, Lmax at 50 feet.

The nearest off-site residential property line is approximately 500 feet away. Based on the representative measurements taken during a pickleball gameplay event, pickleball gameplay noise

[7] The noise measurement taken at Site 2 was taken approximately 50 feet away from the home on the intersection of Springhill Drive and Walerga Road.

[8] Representative measurements were taken on September 30, 2025, at the Oasis Park Pickleball Courts in Elk Grove, California.

would be expected to range between 25-36 dB, Lmax[9] at the nearest residential property line. These noise levels would be well below the County's daytime outdoor noise level threshold of 70 dB, Lmax and would likely not be perceptible over other outdoor noise sources. Therefore, noise from pickleball gameplay would result in a **less-than-significant impact.**

Stationary Noise Impacts from the Project

Once operational, the Project would not produce substantial levels of on-site noise. The Project would include heating, ventilating and air conditioning equipment (HVAC) which is assumed to be rooftop mounted at the multi-family apartment units and ground-level at the single-family residential lots. Mechanical equipment would be required to comply with the most conservative threshold in the County's Noise Ordinance § 9.36.060 which is a maximum nighttime (10 p.m. to 7 a.m.) outdoor noise level of 45 dB, Hourly Leq when measured at the nearest property line.

Noise levels of up to 54 dB at a distance of 15 feet are typical for standard residential HVAC equipment[10]. Rooftop mounted HVAC equipment could be as close as 130 feet from the nearest residential property line. At this distance, noise levels from rooftop mounted HVAC equipment would attenuate to approximately 35 dB. Ground-level HVAC equipment could be as close as 50 feet from the nearest residential property line. At this distance, noise levels from ground-level HVAC equipment would attenuate to approximately 44 dB. These noise levels would not exceed the 45 dB, Hourly Leq threshold. Therefore, noise from mechanical equipment would result in a **less-than-significant impact.**

---

b) Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Construction activities have the potential to result in varying degrees of temporary ground vibration, depending on the specific construction equipment used and operations involved. In most cases, vibration induced by typical construction equipment does not result in adverse effects on people or structures (Caltrans, 2013). At the highest levels of vibration, damage to structures is primarily architectural (e.g., loosening and cracking of plaster or stucco coatings) and rarely results in structural damage. For vibration, a PPV threshold of 0.5 inch per second or greater can cause architectural damage and minor structural damage. The FTA recommends a threshold of 0.5 PPV for residential and commercial structures (FTA, 2006).

As discussed above, the nearest residences would be located directly east of the proposed Phase 2 lots (along Wellbrook Place and Bridgestone Crescent Road) and directly south of the proposed Phase 4 lots (along French Creek Court, Eagle Creek Court, Marsh Creek Court, and Rockporte Court). Based on the current site layout, several pieces of heavy equipment could be used for

[9] Assuming a 7.5 dB reduction per doubling of distance.

[10] RCH observed noise from a typical residential single-stage air conditioner unit operating at full capacity, which produced a constant noise level of 54 dB at 15 feet.

construction as near as 25 feet from nearby residential structures. The estimated PPV for heavy construction equipment that could be used at 25 feet is summarized in **Table 15** below.

TABLE 15. VIBRATION (PPV) LEVELS DURING CONSTRUCTION

Construction Equipment	PPV at 25 feet (in/sec)	Exceeds 0.5 in/sec FTA PPV Threshold?
Roller	0.21	No
Excavator[1]	0.175	No
Loaded Trucks	0.076	No
Backhoe[1]	0.028	No
Loader[1]	0.0263	No

NOTES:
[1] Construction Equipment PPV reference from NHDOT, *Ground Vibrations Emanating from Construction Equipment* (FHWA-NH-RD-12323W), 2012.

SOURCE: Federal Transit Administration, 2006.

As shown in **Table 15**, the predicted vibration levels would not exceed the FTA's 0.5 PPV threshold when they are in use at 25 feet away from the adjacent residential structures. The majority of construction would occur at distances far greater than 25 feet away from adjacent residential structures. Therefore, construction vibration would result in a **less-than-significant impact.**

EXHIBIT E Scenario 2 – Ultimate Results – Peak Hour Demand

INTRODUCTION

Project Description

Estia Dry Creek is a proposed single-family residential and multi-family development within Placer County. The project is within the Dry Creek West Placer Community Plan, and is bordered by Baseline Road to the North, with Walerga Road running through its center. The purpose of this memo is to provide a feasibility study of the proposed project and the ultimate improvements. This memo demonstrates the proposed improvements can be constructed to the minimum standards established by California American Water. It should be noted that no storage is required on-site for fire protection.

Project Phasing

The project proposes to be constructed over four phases. The preliminary phasing exhibit has been provided as **Exhibit B** with this memo, with **Exhibit A** serving to provide the Land Use of each phase. The initial phase at the northern end of the project is a 220-unit multi-family housing community. Phases 2, 3, and 4 contain approximately 217 single-family residential home sites, with trails, recreation areas, and open space along the "Placer Creek" riparian area separating the Phase 3 and 4 neighborhoods.

HYDRAULIC MODELING

A hydraulic model was developed for the purposes of this memo to demonstrate that the ultimate conditions proposed with the project are adequate to support the improvements. The on-site routing is primarily made up of 8-inch mains, with 24" main connections through Baseline Road. The buildout condition showing all four phases is included in **Exhibit B**.

For this project, PCWA is the wholesaler and CalAM is the retailer. CalAM defers to the PCWA standards for setting the unit water demand, and per the PCWA Improvement Standards, a maximum-day demand is applied to each typical residential dwelling unit. For developments with more than 60 lots a maximum-day demand of 0.8 gpm per dwelling unit is applied. For peak-hour demands, Calam specifies a peaking factor of 1.5 x maximum day demand. **Table 1** shows the resulting demand values for each service connection point. The service connection points have been simplified for the purposes of this memo into 18 connection points at various locations. The locations of the assumed service connections are included in **Exhibit C**.

A hydraulic model was generated using EPANET (Version 2.2) to analyze the hydraulics of the proposed improvements. Scenario 1 analyzes the maximum day demand of the ultimate buildout condition with the fire flow considered, results are included in **Exhibit D**. The second scenario was created to demonstrate the peak-hour demand of the ultimate buildout without the additional fire flow demand on the system, results are included in **Exhibit E**.

Based on SCADA pressures in the area, it is expected that points of connection will have pressures of approximately 65 to 70 psi. For the purposes of this report, and as a conservative estimate, all points of connection in the model were set at 60 psi. The CalAM standards require the water pressure to be greater than 50 psi and lower than 80 psi with no fire demand added. The minimum pressure is reduced to 20 psi when fire demand is included. The maximum velocity is 10 ft/s for all pipes less than 16" in diameter. **Table 2** provides all potable water distribution system criteria. The results for Scenario 1 and Scenario 2 demonstrate the proposed project will operate within these conditions.

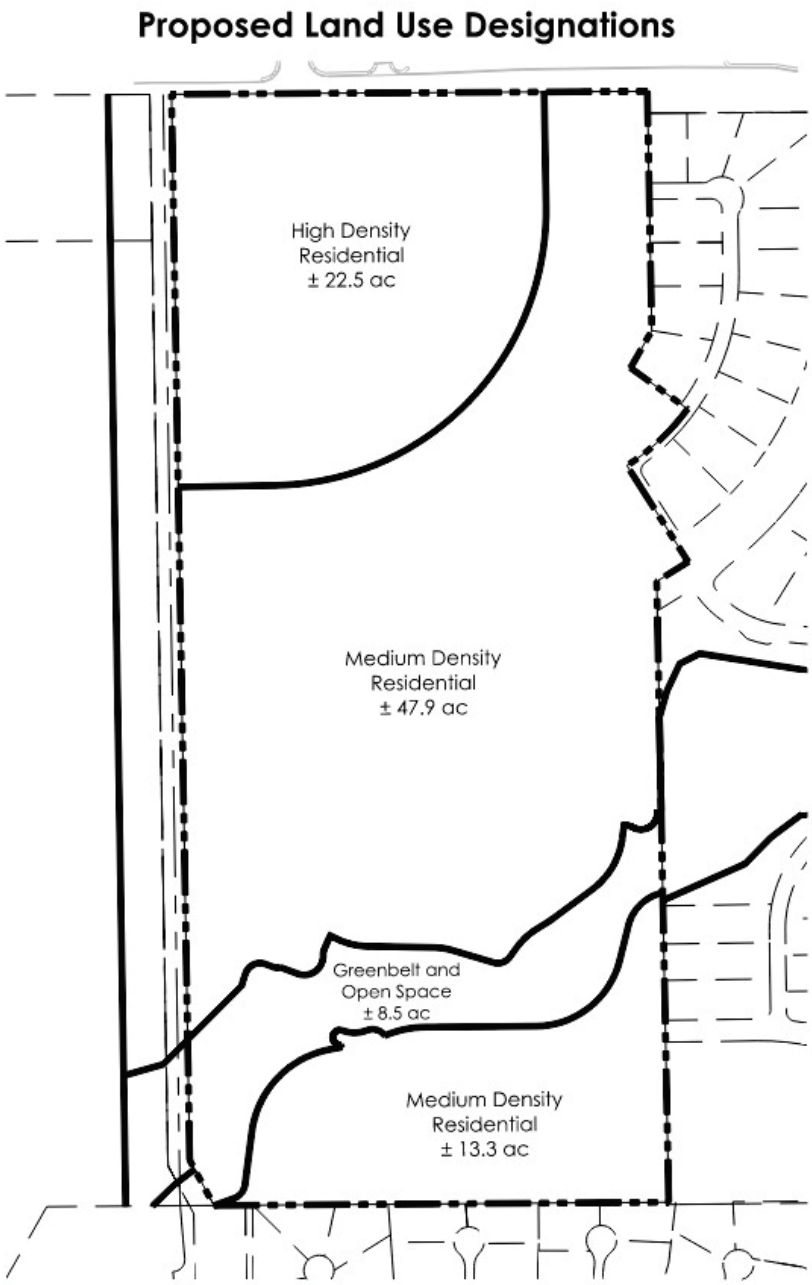
(a) See Table 2 for demand multipliers

Table 2 – Potable Water Distribution System Criteria



Criterion	Recommended
Distribution Pipeline Criteria	
Service Pressure Range	50 - 80 psi
Minimum Service Pressure, Fire Flow	20 psi
Residential and commercial fire flows	1,000 gpm for 2 hours
Pipe Material	For ≤ 12": PVC w/ C value of 140 For > 12": DIP w/ C value of 130
MDD peaking factor	2.25 x ADD
PHD peaking factor	1.5 x MDD
Maximum Distribution Pipe Velocity (diameter > = 16-inch)	5 ft/s
Maximum Distribution Pipe Velocity (diameter < 16-inch)	10 ft/s
Minimum Transmission Pipe Velocity	2 ft/s
Maximum Transmission Pipe Velocity	6 ft/s
Maximum Pipe Headloss (diameter > = 16-inch)	8 ft/1,000 ft pipe
Maximum Pipe Headloss (diameter < 16-inch)	10 ft/1,000 ft pipe

ADD = average day demand

MDD = maximum day demand

PHD = Peak hour demand

INTRODUCTION

Project Description

The proposed "Estia Dry Creek & Placer Creek Residential" (Project) includes a total of approximately 88 acres, comprised of a 52.3-acre parcel (Assessor's Parcel No. 023-221-076) located on the north side of Walerga Road and a 35.3 -acre parcel (APN 023-221-074) located south and east of Walerga Road, collectively, the "project", Estia Dry Creek.

This project is not presently within the Placer County Service Area 28, Zone 173 but proposes to annex into that Service Area. This report complies with the requirements, layout and modeling shown in the Walerga – Baseline Tentative Map and sewer studies prepared for Sewer Lift Station CFD #1 listed in the references.

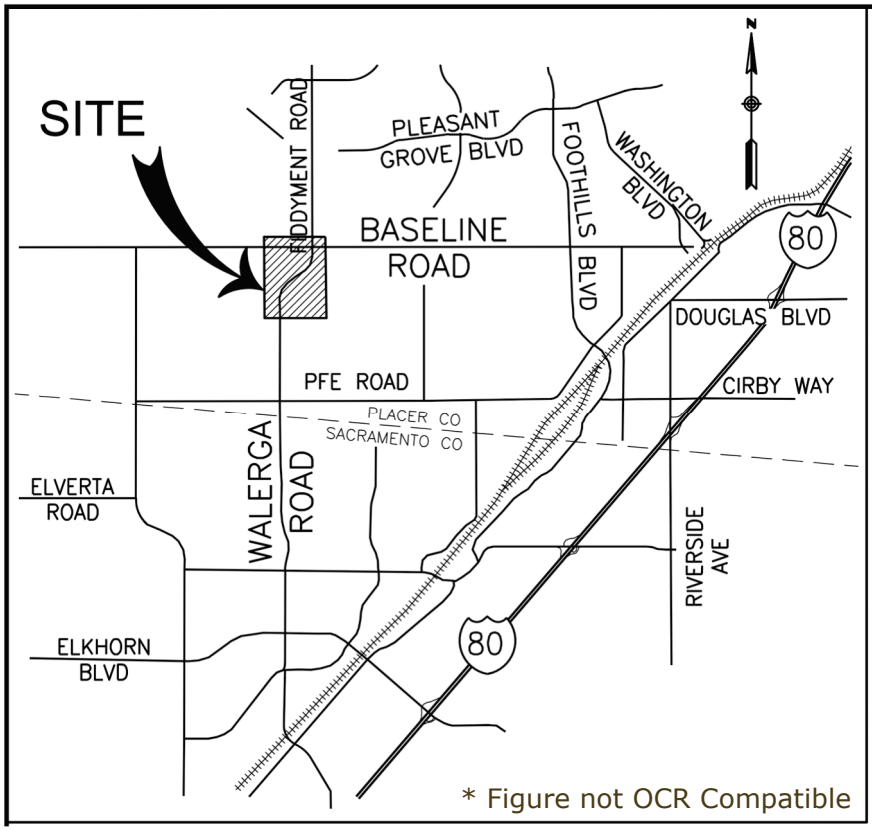

Figure 1: Project Vicinity Map

*Figure not OCR compatible

Scope of the Report

This report covers all four residential phases of the Estia Dry Creek tentative map. It also provides calculations to show downstream facilities are capable of handling proposed flows including the existing trunk mains and the emergency storage tanks at CFD1.

ENVIRONMENTAL DOCUMENTATION

Environmental documentation for this development is being prepared at the time of this report.

DESIGN CRITERIA

Hydraulic calculations have been prepared for the on-site gravity systems constructed with Estia Dry Creek in accordance with the "Placer County Land Development Manual", while average dry weather flows are sourced from the South Placer Wastewater Authority standards. Pipe sizes required to serve the service area were determined using Manning's Equation to calculate the capacity of typical pipe diameters flowing at 70% full and utilizing a Manning's Roughness Coefficient of 0.013. The Peaking Factor was assigned based on the Peaking Factor Curve of the Placer County LDM. The ratio of depth-to-diameter was found using the ASCE Hydraulic Elements Graph for Circular Pipes.

Average Dry Weather Flows (ADWF) including a Factor of Safety of 2.0

Residential Single Family Development	=380 gallons per day per EDU
Residential Multi Family Development	=260 gallons per day per EDU

Minimum Slopes

The minimum slopes for sewer pipes are set using the criterial defined in the Placer County Land Development Manual, Table 6.3 shown on page SS 11. For 8" pipe, a minimum of 0.005 slope is used whenever the design flow is low.

NOTES REGARDING THE WASTEWATER MASTER PLAN AND DESIGN

This wastewater report follows the referenced Riolo Vineyards Sanitary Sewer Master Plan Update with some differences or clarifications noted below. This report uses the EDU count presented in the Sewer Master Plan Addendum.

1. This project proposes to annex to the County Service Area (District).
2. Improvement Plans will be submitted to Placer County.
3. Watertight joints will be specified for all sanitary sewer pipe.
4. No pumped sewer lots are proposed in Estia Dry Creek. All lots will have gravity sewer

service.

5. Final EDU count to be approved by Placer County.
6. For calculating design flows in sewer pipes listed in Table 1, use sewer flow generation rates based on those cited in the RMC Technical Memo 3a.
7. Based on EDU counts to CFD#1 listed in reference 5, with 3,435 ultimate EDUs and 1,228 existing EDUs, this project is expected to contribute 432 of the total new EDUs proposed to connect to CFD #1LS.
8. Emergency storage required for this project at CFD #1 LS is calculated per the preliminary design by West Yost (Reference 5): 212 EDU x 380 gal x 1/3 + 220 HDR EDU x 260 x 1/3 = 45,930 gallons of emergency storage required with generator. Mariposa and Mason Trails at Riolo Vineyard have already built 35,250 gallons and 47,000 gallons of emergency storage at CFD#1. Other existing developments have paid into the reimbursement agreement. The combined emergency storage required for those projects and this project is calculated at (107 MP + 169 MT + 357 Others) EDU x 380 gal x 1/3 + 45,930 gallons = 126,120 gallons of emergency storage, which does not fit within the existing two tanks that are built. Therefore, the project is required to increase the emergency storage capacity at the existing lift station by constructing a 47,000 gallon underground tank.
9. Capacity calculations assume multi-family units as 260 gallons per unit.
10. Elevation drop in manholes is set at 0.10 foot.
11. Existing pipes internal to phase 4 from KC11-03 to KC11-05 may need to be upsized depending on final improvement plan wastewater report and the county's level of surcharge allowance.

PIPE CAPACITY CALCULATIONS

This report provides sewer service maps, Exhibit 1, and preliminary hydraulic calculations, Table 1, to support the layout and pipe sizes for the proposed sewer collection system design. Table 1 shows the designated EDU count and calculated peak design flow to each on site manhole listed. Design depth of flow in the pipes is listed for uniform, steady flow. Refer to the Sewer Service Maps for manhole locations and EDU counts.

Re: **Estia Dry Creek and Placer Creek Residential**
Vehicle Miles Traveled (VMT) Analysis

Date: October 3, 2025

In accordance with Task 3 of our Scope of Services, we are writing to summarize the Vehicle Miles Traveled (VMT) analysis completed for the proposed Estia Dry Creek development (the "Project" or "proposed Project") in Placer County, CA. This memorandum summarizes the VMT analysis and resultant findings for the proposed Project.

Project Description

The proposed Project includes the two separate sites. The first site would be developed into a residential community consisting of 220 duplex units called Estia Dry Creek, 212 single-family units and called Placer Creek Residential and 22 ADUs. The approximately 88-acre parcel site is located south of Baseline Road and is bisected by Walerga Road in the Dry Creek West Placer Community Plan Area (DCWPCP) of unincorporated Placer County. The second site is a four-acre parcel located on the corner of PFE Road and Watt Avenue (APN 023-200-056-000) and would be rezoned for residential land use and the land dedicated for the future development of up to 120 affordable housing units. The affordable community parcel is located on the northeast corner of the intersection of Watt Avenue and PFE Road. The Project locations are shown in **Exhibit 1.** The proposed site plan for the first parcel is shown in **Exhibit 2**. There is no site plan for the proposed affordable housing land dedication as that parcel is not under active development at the time of this analysis.

Purpose of Analysis

Senate Bill 743 (2013) changed the focus of transportation impact analyses in CEQA from measuring impacts to drivers, to measuring the impact of driving. The change was made by replacing Level of Service (LOS) with VMT. This shift in transportation impact focus was intended to better align transportation impact analyses and mitigation outcomes with the State's goals to reduce greenhouse gas (GHG) emissions, encourage infill development, and improve public health through more active transportation. Level of service or other delay metrics may still be used to evaluate the impact of projects on drivers as part of land use entitlement review, fee programs, and community plan conformance.

In January 2019, the Natural Resources Agency finalized updates to the CEQA Guidelines including the incorporation of SB 743 modifications. The Guidelines' changes were approved by the Office of Administrative Law and are now in effect. The provisions apply statewide as of July 1, 2020.

To aid lead agencies with SB 743 implementation, the Governor's Office of Planning and Research (OPR) produced the *Technical Advisory on Evaluating Transportation Impacts in CEQA* (December 2018) that provides guidance regarding the variety of implementation questions they face with respect to shifting to a VMT metric. Key guidance from this document includes:

- VMT is the most appropriate metric to evaluate a project's transportation impact.
- OPR recommends tour- and trip-based travel models to estimate VMT, but ultimately defers to local agencies to determine the appropriate tools.
- OPR recommends measuring VMT for residential and office Projects on a "per rate" basis (VMT per capita for residential and VMT per employee for office).
- OPR notes that residential and office projects that are located in areas with low VMT, and that incorporate similar features (i.e., density, mix of uses, transit accessibility), will tend to exhibit similarly low VMT.
- OPR recommends that maps created with VMT data, such as a travel demand model, can illustrate areas that are currently below threshold VMT. Because new development in such locations would likely result in a similar level of VMT, such maps can be used to screen out residential and office projects from needing to prepare a detailed VMT analysis.
- Lead agencies have the discretion to set or apply their own significance thresholds.

The thresholds to consider for projects located within the Unincorporated Placer County boundaries are defined by Table 2 of the County of Placer Transportation Study Guidelines[1] and are defined by project/land use type as follows:

- Residential – 15% below Unincorporated Placer County baseline household VMT per resident
- Employment-based land uses (e.g., office, industrial, hotel) – 15% below Unincorporated Placer County baseline work VMT per employee
- Customer-based non-residential land uses (e.g., retail) – Zero net increase in total VMT

Methodology and Assumptions

Based on the land use information provided, for the purposes of VMT analysis and the determination of transportation related significant impacts, the following land uses were analyzed:

- Residential

A project is considered to result in a significant impact if the VMT per capita for the proposed Project exceeds 85-percent of the Unincorporated Placer County average for the respective metric as noted in the previous section.

Analysis

The Placer County VMT Evaluation Tool[2] was used to determine whether the proposed Project will have a significant VMT impact without conducting a detailed study using the County's travel demand model. Note, the County's VMT tool is based on data contained within the latest version of the County's travel demand model and for projects that fall within the requirements for using the tool it is a method to perform a quick quantitative analysis. The Project is identified as generally consistent in size and land use type with the surrounding built environment, therefore the County VMT Evaluation was deemed appropriate for this analysis.

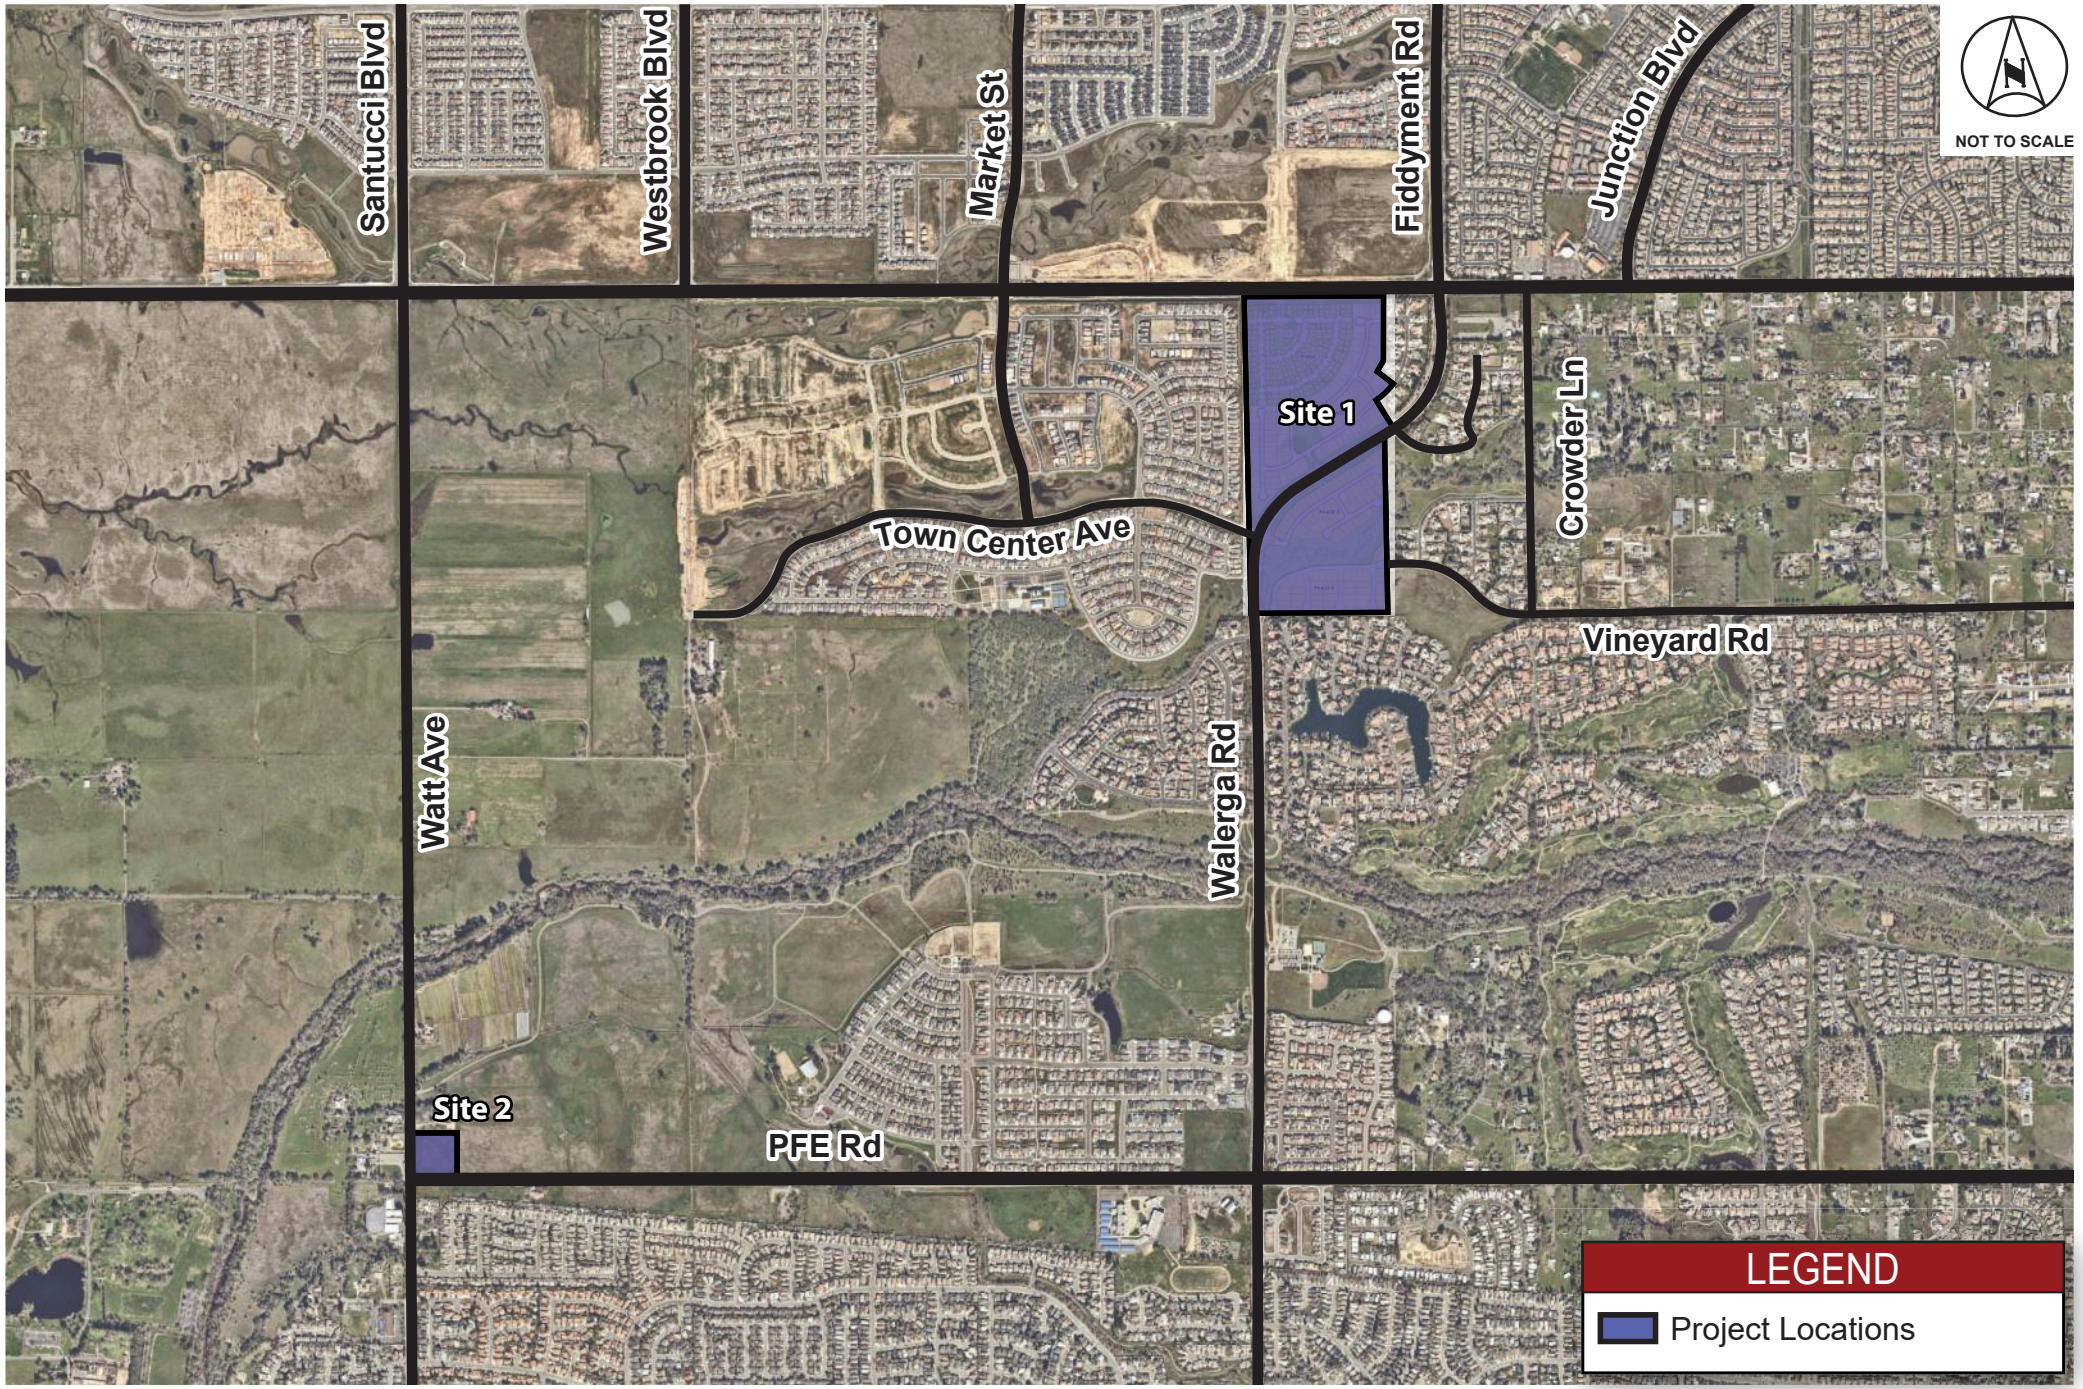
The Project's features were input into the tool, including the Project's location (APNs), development type (residential), and development intensity (220 duplex units, 212 single-family units, and 120 affordable housing units) to allow the tool to estimate the average household VMT per resident for the Project

[1] *County of Placer Transportation Study Guidelines*. County of Placer. Revised May 2021.
[2] *Placer County Vehicle Miles Traveled Evaluation Tool*. Placer County. https://apps.fehrandpeers.com/PlacerCountyVMT/#. Accessed April 1, 2025.

based on residential uses already within the travel demand model. Note that each Project site was analyzed separately rather than as one combined project to obtain the average VMT per resident for each individual Project site. The tool report is included as **Exhibit 3**.

For residential projects, the regional threshold is defined as the VMT per resident achieving a 15-percent reduction compared to the Unincorporated Placer County average. The Unincorporated Placer County average VMT per resident is 30.43. The Unincorporated Placer County threshold is calculated at 85-percent of the average, or 25.86 VMT per resident. The Project's estimated average VMT per resident is 18.98 for the residential units north/northwest of Walerga Road in Site 1 and 24.75 for the residential units south/southeast of Walerga Road in Site 1, which are both below the calculated threshold for Unincorporated Placer County. In addition, the Project's estimated average VMT per residents is 21.46 for Site 2, which is also below the calculated threshold for Unincorporated Placer County. Therefore, the proposed Project can be assumed to result in a less than significant impact and screens out from further VMT analysis based on the County's low VMT-generating area screening criteria.

Note that the 22 ADUs in Site 1 meet the County's definition and screening criteria for affordable housing. Therefore, the 22 ADUs can be presumed to have a less than significant VMT impact without the need for further quantitative analysis.



Conclusions

Based on the results of this analysis, the following conclusions are made:

- The proposed Project's estimated average VMT per resident is 18.98 for the residential units north/northwest of Walerga Road in Site 1 and 24.75 for the residential units south/southeast of Walerga Road in Site 1, which are both below the calculated threshold for Unincorporated Placer County. In addition, the Project's estimated average VMT per residents is 21.46 for Site 2, which is also below the calculated threshold for Unincorporated Placer County. **Therefore, the proposed Project is determined to have a less than significant transportation impact.**
- The proposed 22 ADUs in Site 1 meet the County's definition and screening criteria for affordable housing. Therefore, the 22 ADUs can be presumed to have a less than significant VMT impact without the need for further quantitative analysis.

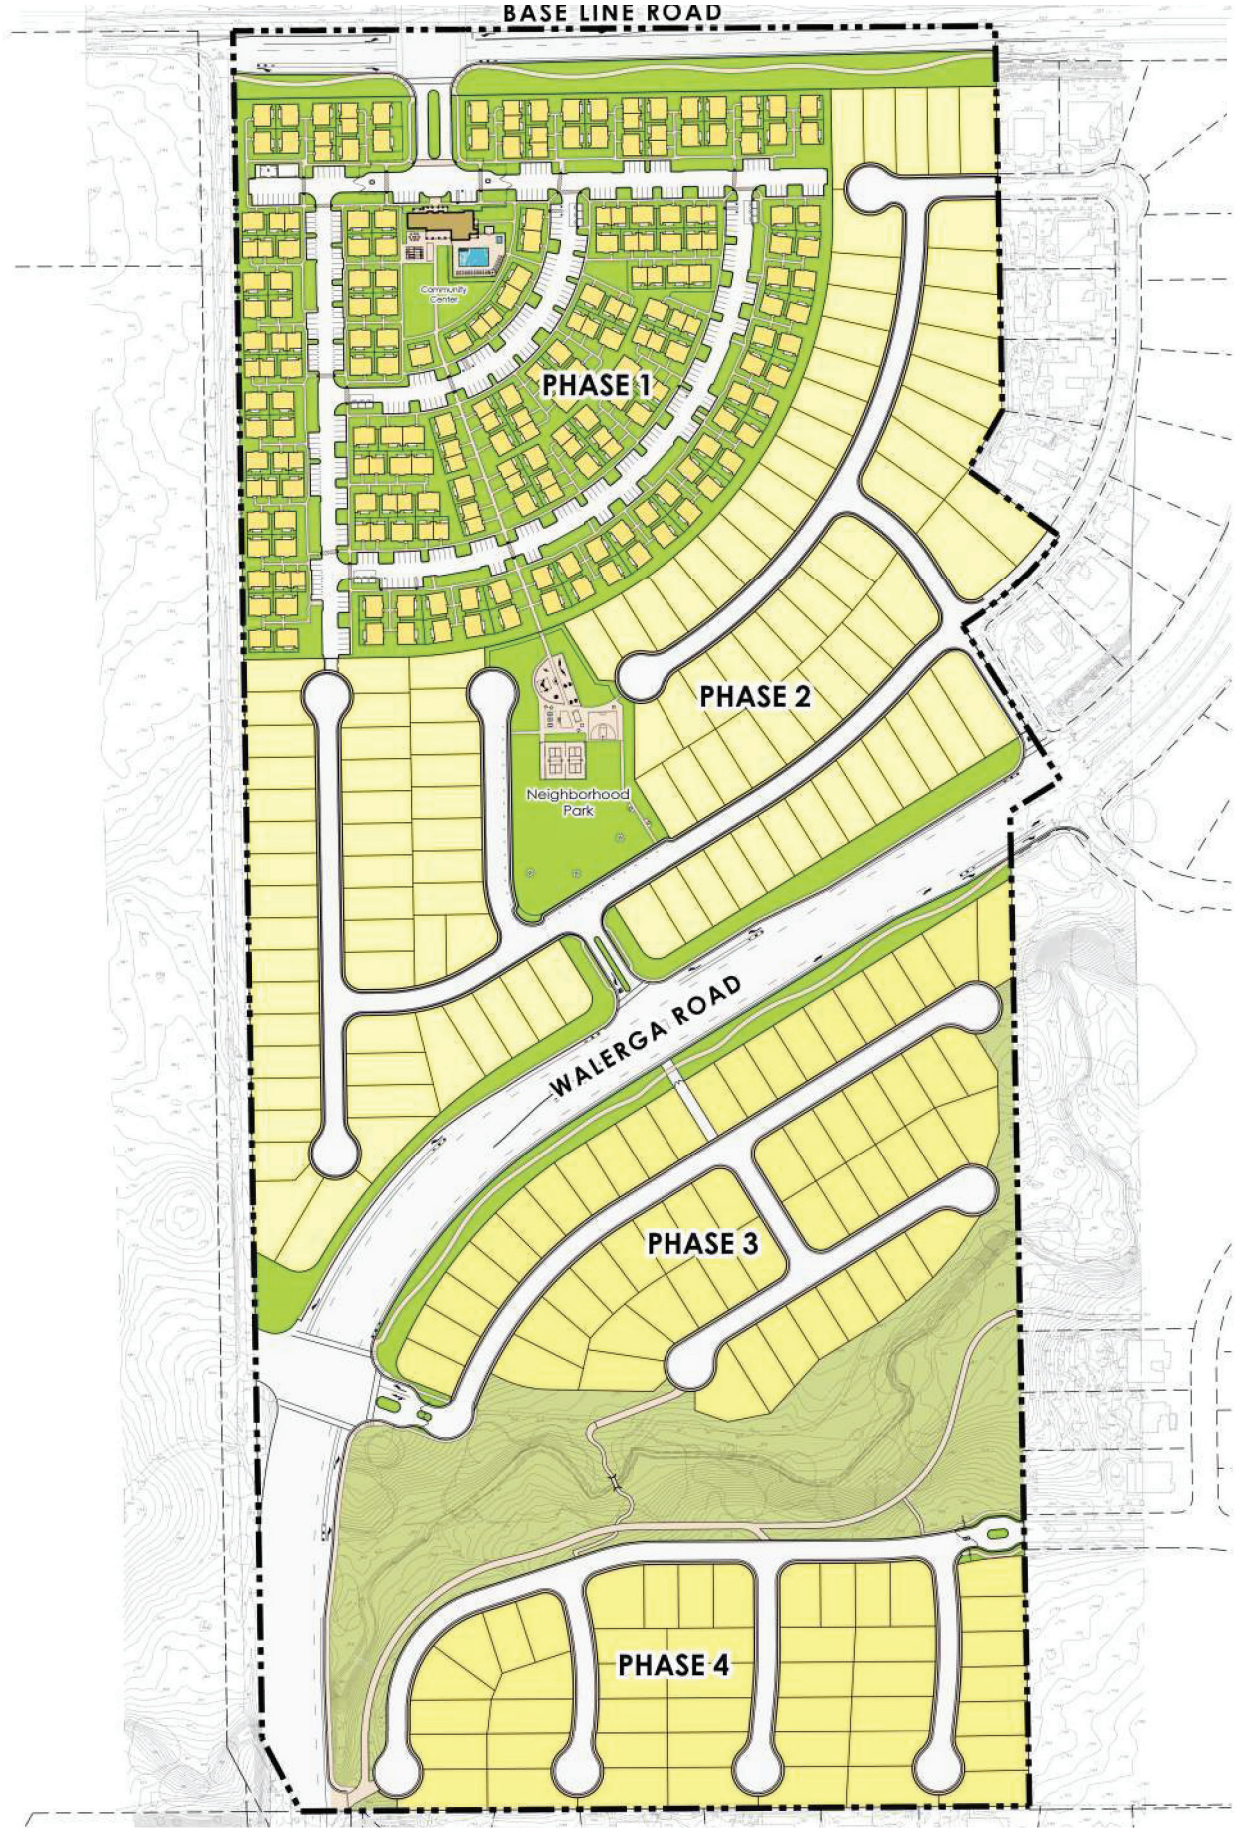
INTRODUCTION

Purpose

This report documents the transportation analysis completed for the proposed Estia Dry Creek and Placer Creek Residential development project located on the east and west sides of Walerga Road south of Baseline Road in the Dry Creek West Placer Community Plan Area (DCWPCP) of unincorporated Placer County (the "proposed Project" or "Project"). The purpose of this analysis was to evaluate the proposed Project's localized traffic operations and access points necessary to ensure efficient operations.

Project Description



Site 1: Estia Dry Creek and Placer Creek

The project includes two sites. The first site is on the south side of Baseline Road on the east and west sides of Walerga Road. This Project site is designated in the DCWPCP as Rural Low Density Residential. The project proposes to amend the DCWPCP designations to High Density Residential and Medium Density Residential. This project proposes 220 new multifamily-family residential units and 212 new single-family residential units. The Project is anticipated to be constructed in up to five (5) phases. The Project site plan and phasing are shown in Figure 1. The site will have five access points. The access to Phase 1 of the project will be from Baseline Road, aligned a fully signalized Upland Drive intersection serving the commercial development on the north side of Baseline Road. Phase 2A/B access will be from Springhill Drive and a new unsignalized Walerga Road intersection allowing only rights in/rights out (RIRO). Phase 3 access will be from the eastern leg of the signalized Walerga Road and Town Center Avenue intersection, featuring a landscaped median with a vehicle gate. Phase 4 access will be from the western extension of Vineyard Road, which currently terminates just west of Crowder Lane and will include a gate. One emergency vehicle access from Phase 1 through Phase 2 roadways, one emergency vehicle access for Phase 3, and one emergency vehicle access for Phase 4 are proposed.

Site 2: Affordable Housing

Per County Code Section 15.65.120, the project proposes to meet the minimum requirement for affordability on the detached residential portion of the project by transferring an offsite vacant parcel to the County. This second site is located at the northeast corner of PFE Road and Watt Avenue, which is intended for future affordable housing development. Based on an assumed future affordable housing development on the second site, the site could accommodate a minimum of 80 affordable units and potentially up to 120 units if built to the maximum density allowed in the zoning district. For this analysis 120 units were considered.

Additionally, if the affordable housing at Site 2 is not feasible, up to 22 Accessory Dwelling Units (ADUs) may be included to satisfy the County's affordable housing requirements. For this analysis, a scenario that includes both the Site 2, Affordable Housing, and ADUs was considered for a more conservative trip estimate.

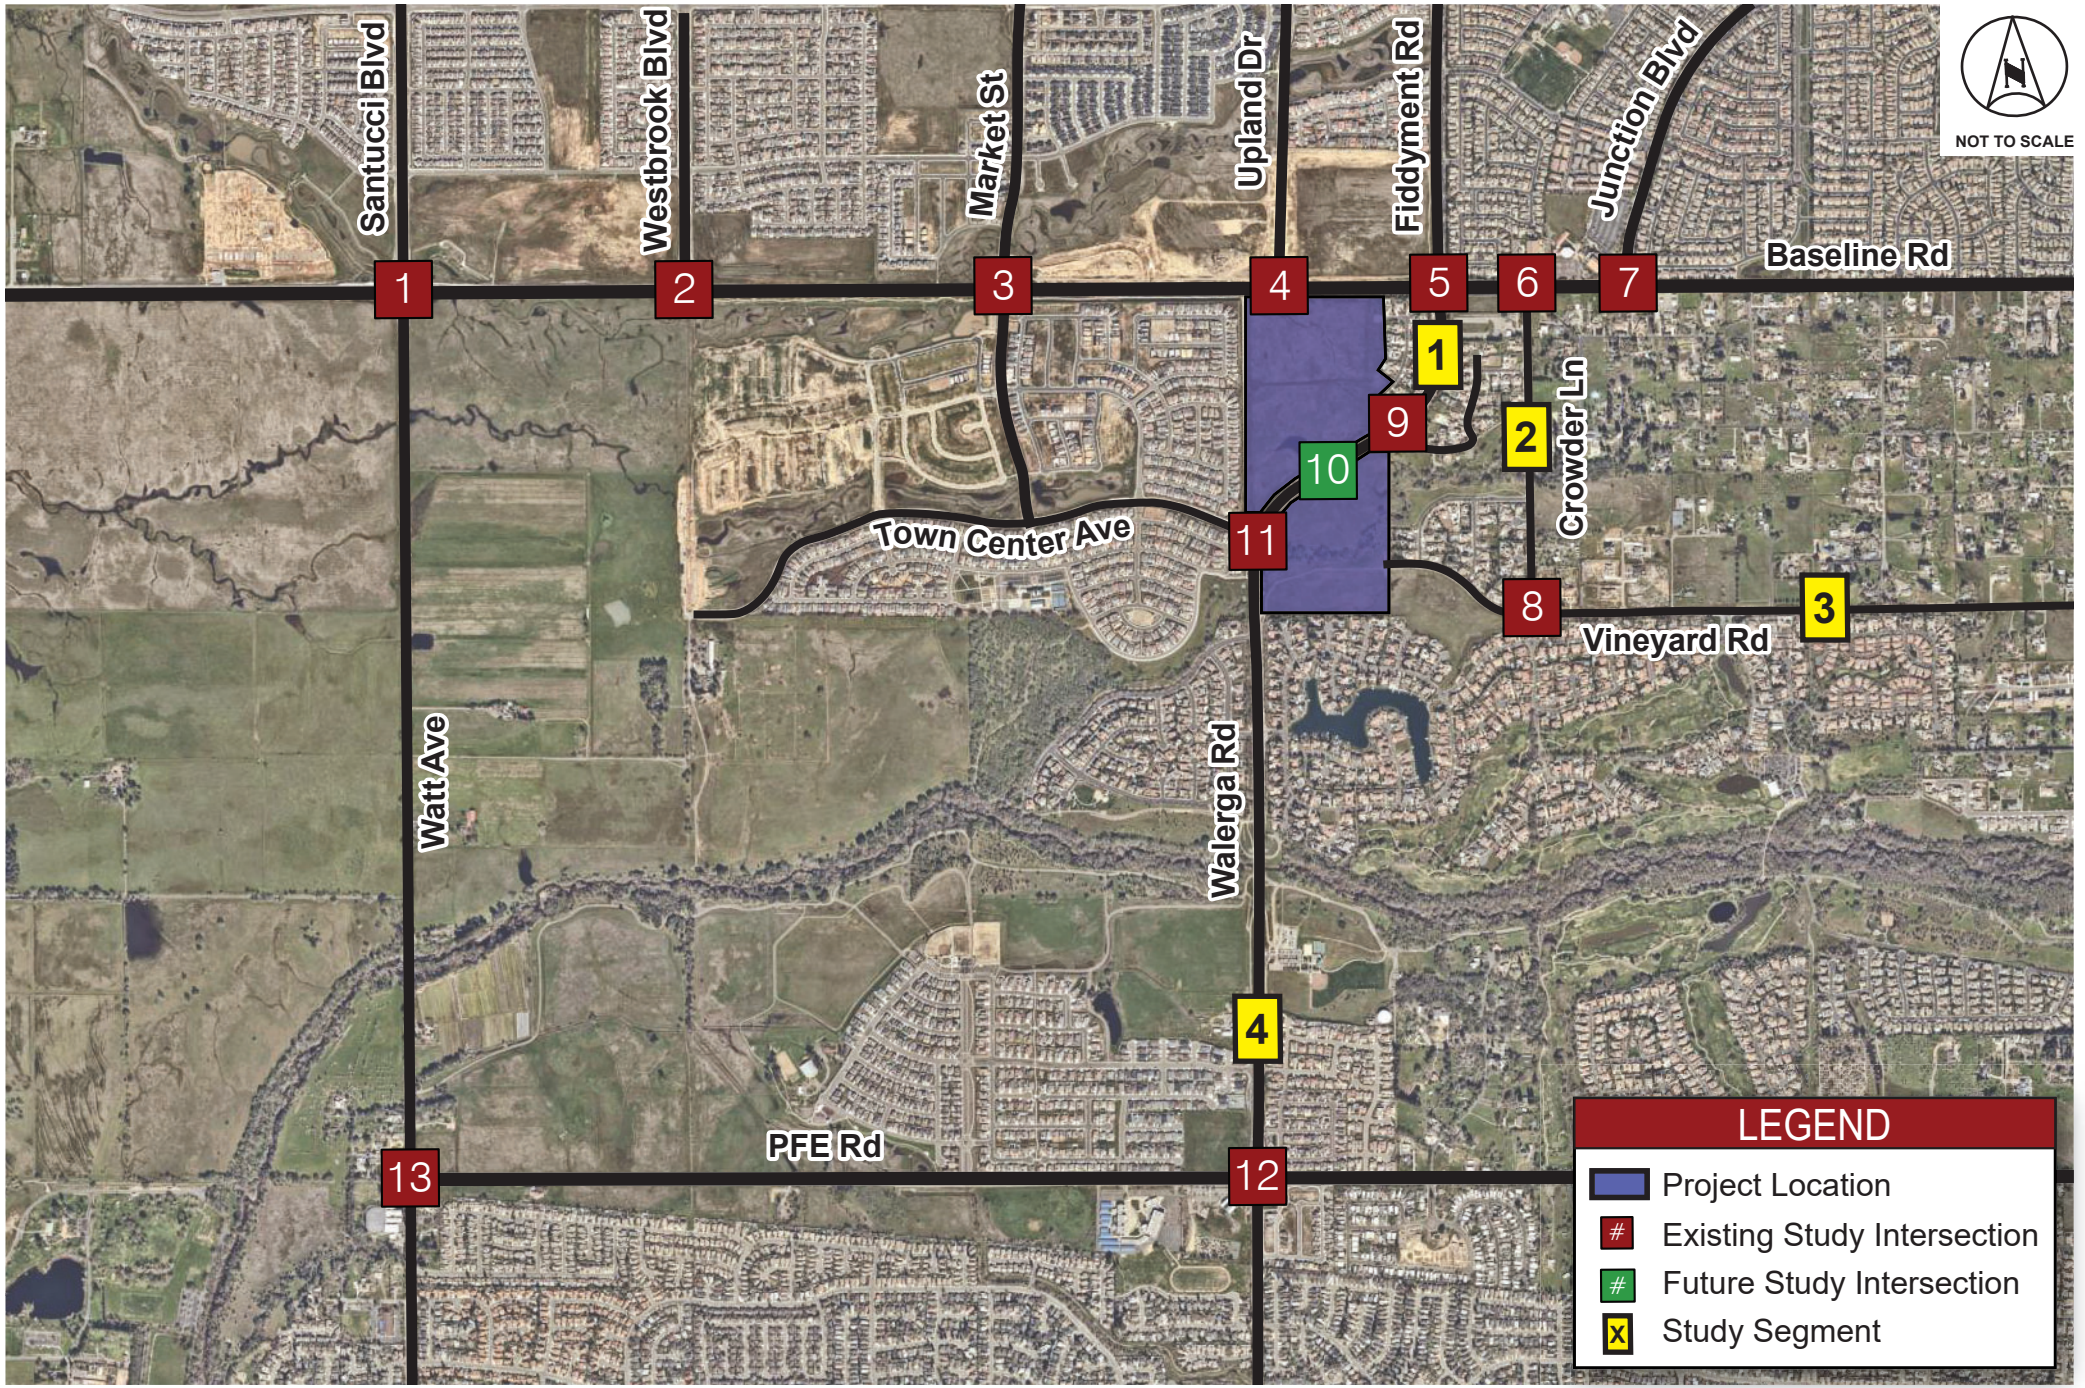
Site Plan Date: January 2025

* Figure not OCR Compatible

Figure 1
Project Site Plan and Phasing

Study Area

Figure 2 shows the project vicinity. A weekday AM and PM peak-hour level of service (LOS) analysis was completed for the following intersections:



1. Baseline Road at Santucci Boulevard/Watt Avenue (City of Roseville)
2. Baseline Road at Westbrook Boulevard (City of Roseville)
3. Baseline Road at Market Street (City of Roseville)
4. Baseline Road at Project Access/Upland Drive (City of Roseville)
5. Baseline Road at Fiddyment Road/Walerga Road (City of Roseville)
6. Baseline Road at Crowder Lane (City of Roseville)
7. Baseline Road at Junction Boulevard (City of Roseville)
8. Vineyard Road at Crowder Lane (Placer County)
9. Walerga Road at Springhill Drive (Placer County)
10. Walerga Road at Project Access (Placer County)
11. Walerga Road at Town Center Drive (Placer County)
12. Walerga Road at PFE Road (Placer County)
13. Watt Avenue at PFE Road (Placer County)

Additionally, a weekday Average Daily Traffic (ADT) LOS analysis was completed for the following roadway segments:

1. Walerga Road, from Baseline Road to Springhill Drive
2. Crowder Lane, from Baseline Road to Vineyard Road
3. Vineyard Road, from Crowder Lane to Cook Riolo Road
4. Walerga Road, from PFE Road to Dry Creek Community Park Driveway

This transportation analysis was conducted for the above-listed study facilities for the following scenarios:

A. Existing (2024) Conditions
B. Existing (2024) plus Project Phase 1 Conditions
   - Includes Project Phase 1 only and Project Phase 1 with Affordable Housing Traffic
C. Existing (2024) plus Project Buildout Conditions
   - Includes all Project Phases (1,2,3,4) with Affordable Housing Traffic and Additional ADU's
D. Cumulative (2044) Conditions
E. Cumulative (2044) plus Project Buildout Conditions
   - Includes all Project Phases (1,2,3,4) with Affordable Housing Traffic and Additional ADU's

STUDY METHODOLOGY

Level of Service (LOS) Definitions

The LOS of a facility is a qualitative measure used to describe operational conditions. LOS ranges from A, which represents minimal delay, to F, which represents heavy delay and a facility that is operating at or near its functional capacity. Levels of Service for this study were determined using methods defined in the *Highway Capacity Manual, 7th Edition (HCM).*

Intersection Analysis

The HCM includes procedures for analyzing side-street stop controlled (SSSC), all-way stop controlled (AWSC), and signalized intersections. The SSSC procedure defines LOS as a function of average control delay for the worst (most delay) minor street approach or movement. Conversely, the AWSC and signalized intersection procedures define LOS as a function of average control delay for the intersection overall. Table 1 presents intersection LOS definitions as defined in the HCM.

Table 1 – Intersection Level of Service Criteria

Level of Service (LOS)	Un-Signalized	Signalized
	Average Control Delay* (sec/veh)	Average Control Delay (sec/veh)
A	≤ 10	≤ 10
B	> 10 – 15	> 10 – 20
C	> 15 – 25	> 20 – 35
D	> 25 – 35	> 35 – 55
E	> 35 – 50	> 55 – 80
F	> 50	> 80

Source: Highway Capacity Manual, 7th Edition
* Applied to the worst lane/lane group(s) for SSSC and AWSC

LOS for the study intersections was determined using the Synchro® traffic analysis software. Synchro uses HCM 7th Edition methodology to analyze intersection delay and LOS.

Roadway Segment Analysis

The DCWPCP Final Transportation and Circulation Element provides LOS criteria for roadway segments based on traffic volume. Roadway segments are assessed using the appropriate roadway classifications defined in the Transportation and Circulation Element. Table 2 presents the roadway segment LOS definitions as defined in the DCWPCP.

Table 2 – Placer County Roadway Segment Level of Service Criteria

Roadway Capacity Class	Maximum Daily Traffic Volume Per Lane				
	LOS A	LOS B	LOS C	LOS D	LOS E
Arterial – High Access Control	6,000	7,000	8,000	9,000	10,000
Arterial – Moderate Access Control	5,400	6,300	7,200	8,100	9,000
Arterial/Collector – Low Access Control	4,500	5,250	6,000	6,870	7,500
Rural 2-lane Highway – Level Terrain	1,500	2,950	4,800	7,750	12,500
Rural 2-lane Highway – Rolling Terrain	800	2,100	3,800	5,700	10,500

Source: Dry Creek/West Placer Community Plan Final Transportation and Circulation Element (July 2011)

Level of Service (LOS) Assessment Methodology

Placer County

Per policy within the DCWPCP[1], the worst allowable level of service is LOS D on the Community Plan area road network. The policy notes exceptions to the level of service threshold for specific facilities when fully improved. The exceptions that apply to the project facilities are listed below with their respective LOS thresholds.

Intersections

- Baseline Road/Watt Avenue: LOS F
- Baseline Road/Fiddyment Road/Walerga Road: LOS F
- PFE Road/Walerga Road: LOS F

The LOS policy defines the criteria that roadway improvements would have to exceed to be considered as having an adverse impact on the network. This criterion is listed below:

Adverse Impact Criteria

- The LOS would worsen from acceptable A, B, C, D, or E (for the selected locations identified above) to unacceptable E or F
- Any worsening of LOS E or F conditions as measured by increased volume-to-capacity (v/c) ratio of 0.05 for roadways and signalized intersections or by increased delay of 5 seconds for unsignalized intersections.

City of Roseville

The City of Roseville's standards of significance were considered for study facilities within the City of Roseville limits. Deficiencies for intersections are created when traffic from the project forces the LOS to fall below a specific threshold. The City's *General Plan*[2] specifies the following:

> "*Level of Service (LOS) expresses the City's targeted level of mobility during the life of the General Plan. Its policies and implementation measures reflect the City's desire to maintain uncongested traffic operations (LOS "C" or better at 70% of the signalized intersections during the a.m. and p.m. peak periods) on its roadway system for all hours of the day. The level of service implementation measures provide criteria to be evaluated where the City may consider a modification to the level of service "C" policy."*

Based on the guidance provided by the City, and in a manner consistent with other traffic studies completed in the City, the Project would result in a deficiency if it would:

1. Cause a signalized intersection to be degraded as follows under Existing conditions during the weekday AM or PM peak-hours:
    - For intersections currently operating at LOS C or better: worsen operations to LOS D or worse.
    - For intersections currently operating at LOS D, E, or F: cause operations to further worsen by one or more service levels.
2. Cause the overall percentage of signalized intersections operating at LOS C or better during the AM and PM peak hours to fall below 70-percent.

ASSESSMENT OF PROPOSED PROJECT

Project Land Use, Access, and Circulation

The project proposes to amend the DCWPCP designations to High Density Residential and Medium Density Residential. The Project proposes 220 new multifamily-family residential units and 212 new single-family residential units, to be constructed in up to five (5) phases.

As per County Code Section 15.65.120, the project proposes to meet the minimum requirement for affordability on the detached residential portion of the project by transferring an offsite vacant parcel to the County. This parcel, located at the northeast corner of PFE Road and Watt Avenue, is intended for future affordable housing development. Based on an assumed future affordable housing development on the site, the site could accommodate a minimum of 80 affordable units and potentially up to 120 units if built to the maximum density allowed in the zoning district. For this analysis 120 units were considered.

Additionally, if the affordable housing at Site 2 is not feasible, up to 22 Accessory Dwelling Units (ADUs) may be included to meet the County's affordable housing requirements. For this analysis, a scenario that includes both the Site 2, Affordable Housing, and ADUs was considered for a more conservative trip estimate.

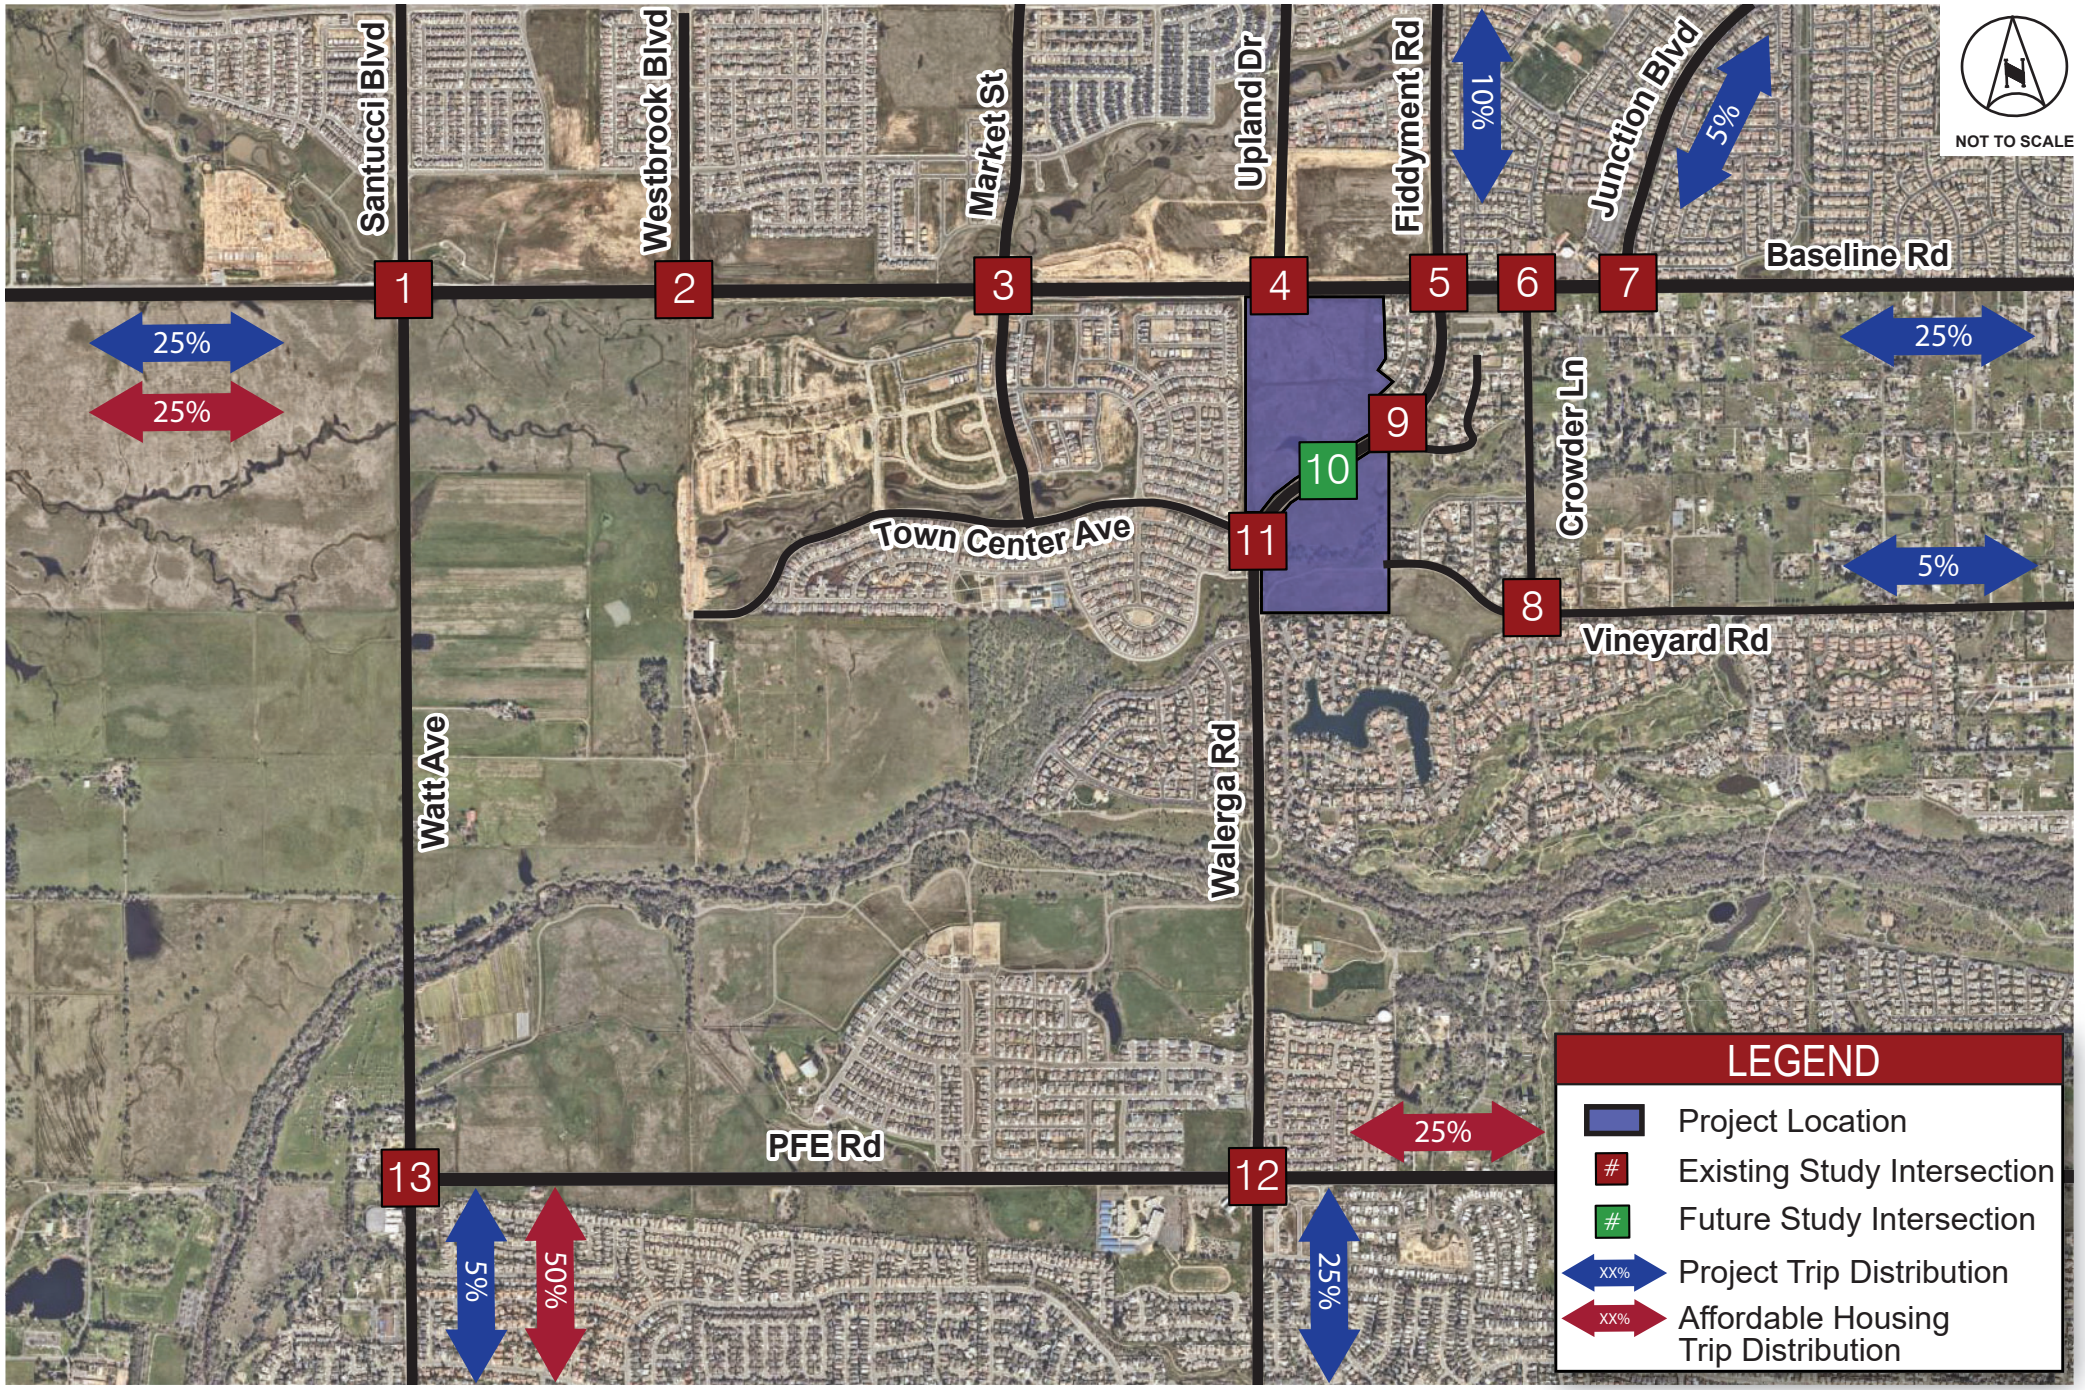
The project proposes five access points. The access to Phase 1 of the project will be from Baseline Road, aligned with a fully signalized Upland Drive intersection serving the commercial development on the north side of Baseline Road. Phase 2 access will be from Springhill Drive and a new unsignalized Walerga Road intersection allowing only rights in/rights out (RIRO). Phase 3 access will be from the eastern leg of the signalized Walerga Road and Town Center Avenue intersection, featuring a landscaped median with a vehicle gate. Phase 4 access will be from the western extension of Vineyard Road, which currently terminates just west of Crowder Lane and will include a gate.

Trip Generation

The projected number of trips generated by the proposed Project was approximated using data included in the *Trip Generation Manual, 11th Edition*, published by the Institute of Transportation Engineers (ITE). ITE Land Use Code 210 (Single-Family Detached Housing) was used to approximate single-family home trips. ITE Land Use Code 220 (Multi-Family Housing (Low-Rise)) was used to approximate the multi-family, affordable housing, and the potential ADU's home trips.

Table 3 presents the Project trip generation estimate. The Project is anticipated to generate 4,519 weekday trips, 312 trips during the AM peak-hour, and 402 during the PM peak-hour. If included, the ADU's would result in the addition of 216 weekday trips, 30 AM peak-hour trips, and 30 PM peak-hour trips.

Table 3 – Proposed Project Trip Generation



Land Use (ITE Code)[1]	Units	Daily Trips	Weekday AM Peak-Hour					Weekday PM Peak-Hour				
			Total Trips	In		Out		Total Trips	In		Out	
				%	Trips	%	Trips		%	Trips	%	Trips
Multifamily Housing (Low-Rise) (220) (Phase 1)	220 du	1,486	91	24%	22	76%	69	115	63%	73	37%	42
Single Family Detached Housing (210) (Phase 2)	110 du	1,102	81	25%	20	75%	61	109	63%	68	37%	41
Single Family Detached Housing (210) (Phase 3)	55 du	582	43	25%	11	75%	32	57	63%	36	37%	21
Single Family Detached Housing (210) (Phase 4)	47 du	504	37	25%	9	75%	28	49	63%	31	37%	18
Multifamily Housing (Low-Rise) (220) (Affordable Housing)	120 du	845	60	24%	14	76%	46	72	63%	45	37%	27
Project Trips:		**4,519**	**312**		**76**		**236**	**402**		**253**		**149**
Multifamily Housing (Low-Rise) (220) (ADU's)	22 du	216	30	24%	7	76%	23	30	63%	19	37%	11
Project Trips w ADUs:		**4,735**	**342**		**83**		**259**	**432**		**272**		**160**

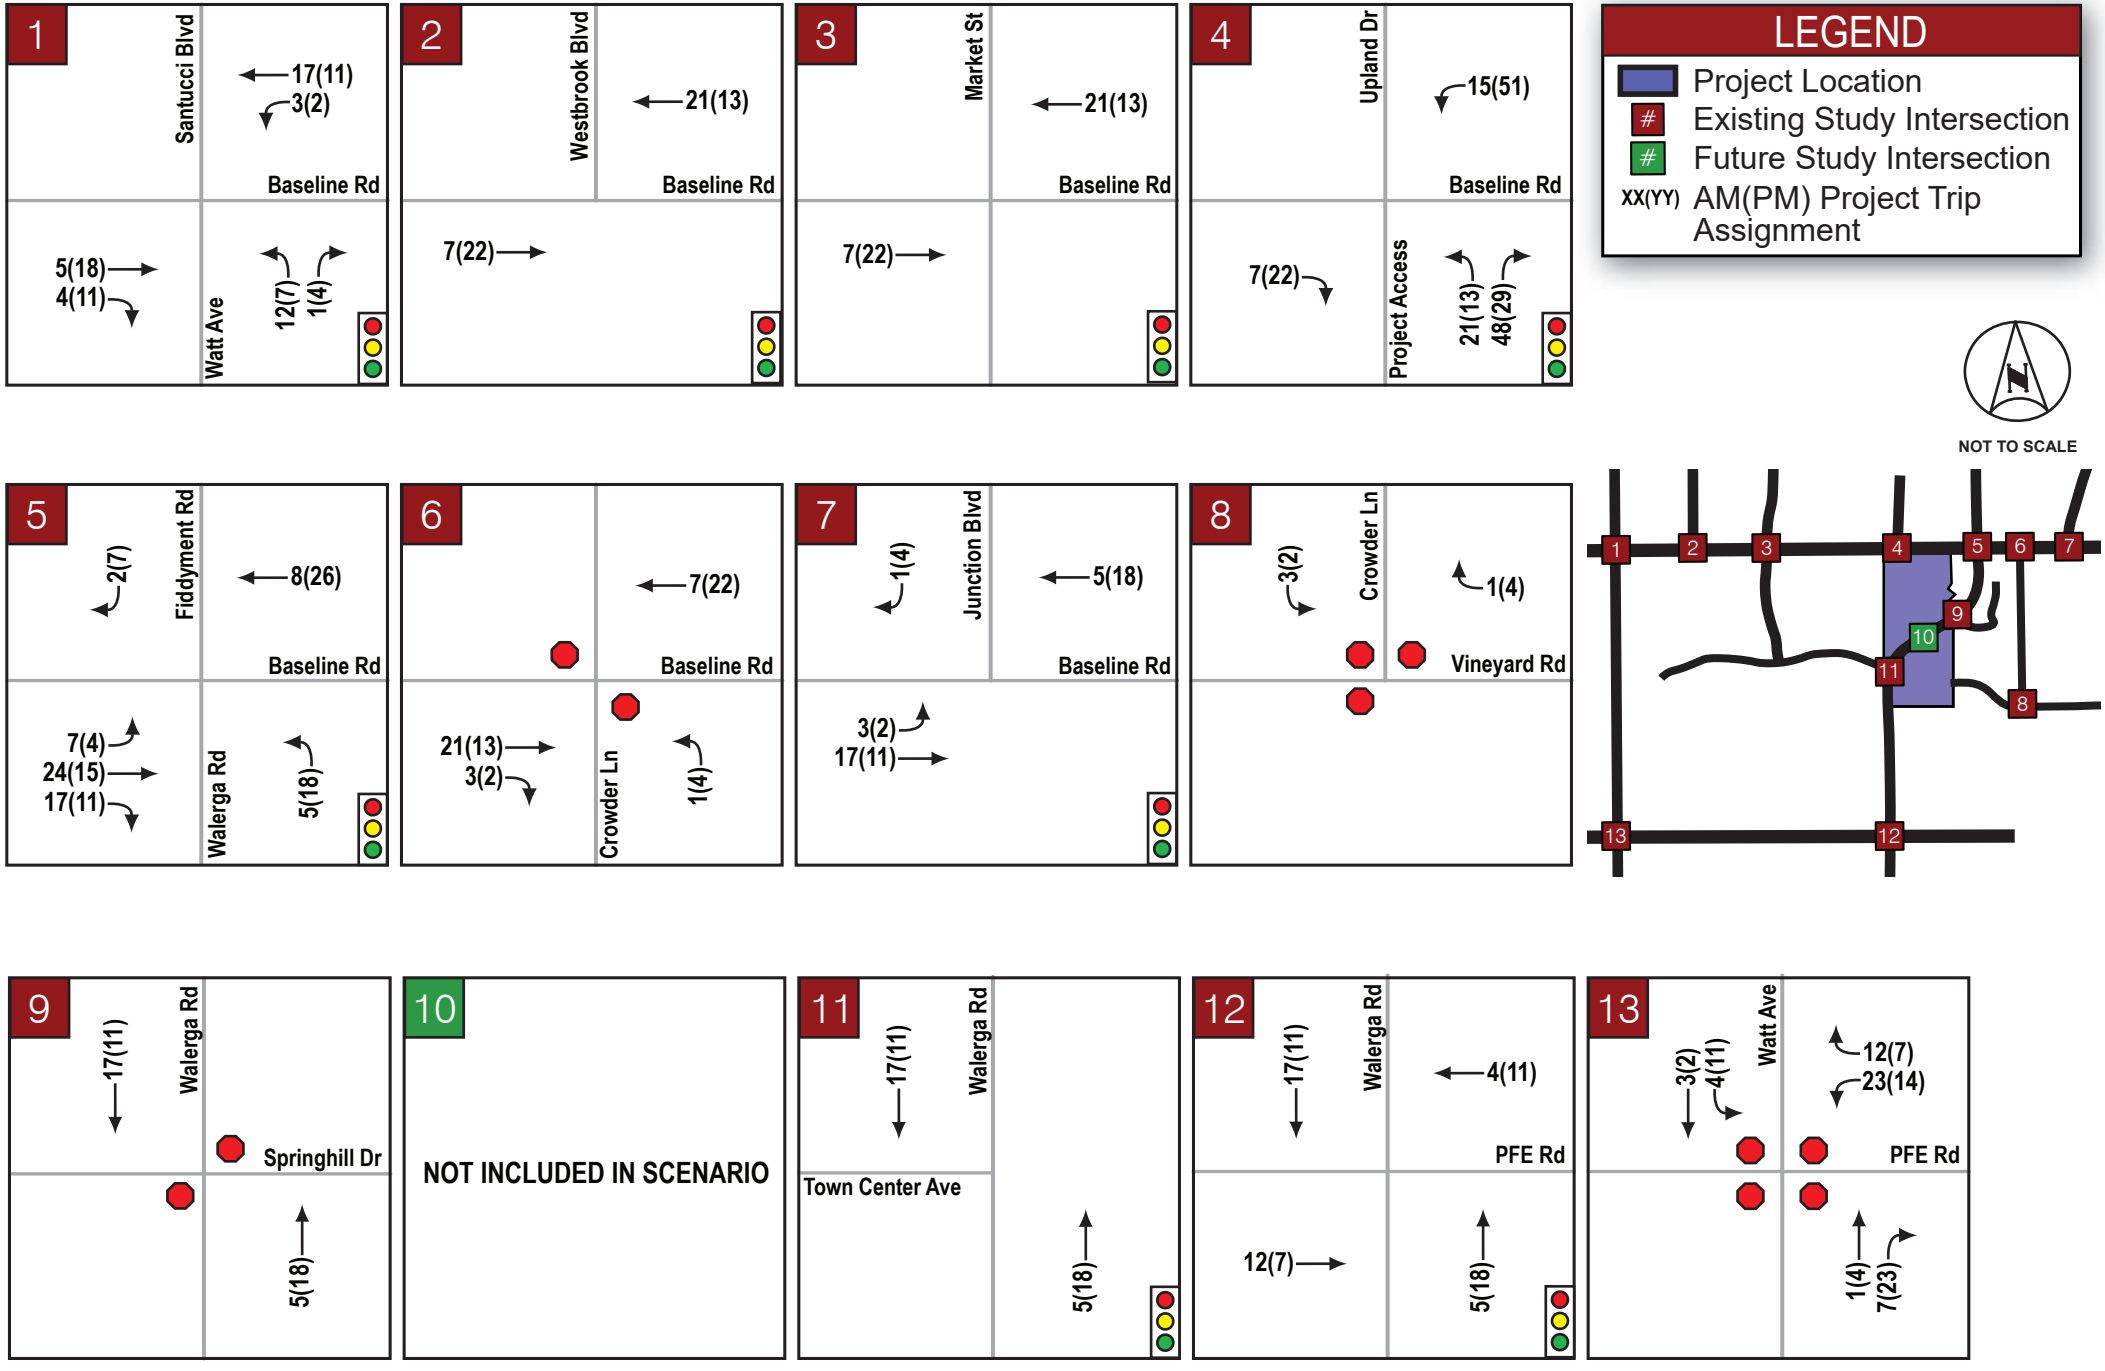
du=dwelling unit

Trip Distribution and Assignment



The general distribution of project traffic was developed based on traffic count data collected while nearby schools were in session, combined with an understanding of residential land uses, traffic patterns, proposed Phase accesses, and professional engineering judgment. This approach ensures the captured data accurately represents the residential trips traveling to the various schools in the surrounding area. Due to the multiple schools located in different directions, the distribution of traffic reflects the diverse travel patterns of residents. The Project is not anticipated to adversely affect traffic patterns throughout the roadway network. The general Project trip distribution is shown in Figure 3.

Project trips were assigned to the study intersections and the surrounding roadway network according to these patterns and based on the completed phases and their respective access. The Project trip assignment for Phase 1 and Affordable Housing, Buildout, and potential ADUs is reflected in Figure 4, Figure 5, and Figure 6, respectively.

EXISTING (2024) CONDITIONS

Project Area Roadways

The following are descriptions of the primary roadways near the Project site.

- Baseline Road is an east-west arterial roadway, located north of the project site, features two lanes in each direction separated by a two-way left turn lane. It has a speed limit of 45 mph and a design speed of 65 mph. It provides vehicular access to minor arterials and major collectors leading to residential and commercial areas east of Santucci Boulevard/Watt Avenue.
- Watt Avenue is a north-south major arterial that spans two lanes and connects Baseline Road with Sacramento County, where it transitions to a four-lane roadway. Watt Avenue links Western Placer County with Interstate-80 and has a speed limit of 45 mph and design speed of 65 mph.
- Walerga Road is a north-south four-lane minor arterial that connects Baseline Road to Sacramento County and provides vehicle access to the project site. The posted speed limit along Walerga Road is 50 mph and a design speed of 65 mph.
- Crowder Lane is a north-south two-lane minor collector that connects Baseline Road to Vineyard Road. The posted speed limit along Crowder Lane is 35 mph and the design speed is 50 mph.
- PFE Road is located south of the project site, this east-west rural collector intersects with Walerga Road and Watt Avenue. PFE Road offers vehicle access to arterials, local roadways, and residential driveways and has a posted speed limit of 45 mph and a design speed of 55 mph.
- Vineyard Road is an east-west two-lane major collector that provides vehicle access to the Project site, local roadways, and residential driveways. Vineyard Road intersects with Cook Riolo Road to the west and Foothills Boulevard to the east. The posted speed limit along Vineyard Road is 45 mph and the design speed is 55 mph.

Intersection Geometry and Volumes

Traffic counts were collected for the existing study intersections and study roadway segments. Weekday AM and PM peak-hour intersection turning movement counts were collected on Wednesday May 15, 2024. The study roadway segment 24-hour counts were collected concurrently. Counts for Intersection #13 (Watt Avenue at PFE Road) were collected later on Wednesday April 2, 2025. This collected data is included in Appendix A. Signal timing sheets provided by the County and the City were used to establish the baseline Existing (2024) scenario.

In coordination with the City of Roseville and Placer County, the Existing (2024) scenario reflects the completion of the West Roseville Retail Center, located north of Baseline Road. Therefore, Intersection #4 (Baseline Road at Project Access/Upland Drive) was analyzed with the stated improvements in the Retail Center traffic study[3]. The Retail Center project trips were then manually added to the study intersections to establish the baseline Existing (2024) Conditions. Based on the Retail Center traffic study[3], the project generates 1,882 gross trips during the AM peak period and 3,795 gross trips during the PM peak period. Since the AM peak-hour was not analyzed in the prior study, the calculated ratio of 50% of PM peak-hour trips was applied to estimate AM peak-hour Retail Center trips. This ensures the AM analysis does not understate background project volumes while remaining reasonable for baseline conditions. Existing (2024) peak-hour traffic volumes, traffic control, and lane geometry are illustrated in Figure 7.

Figure 7

Existing (2024) Peak-Hour Traffic Volumes, Traffic Control, and Lane Geometry

Intersection Level of Service

Table 4 presents the peak-hour intersection LOS analysis results for the Existing (2024) Conditions. As indicated in Table 4, the study intersections operate between LOS A and F in the Existing (2024) Conditions scenario. Intersection analysis worksheets for Existing (2024) Conditions are provided in Appendix B.

Table 4 – Existing (2024) Intersection Level of Service Summary

ID	Intersection	Peak Hour	Control	Existing (2024)	
				Delay (sec)	LOS
1	Baseline Rd at Santucci Blvd/Watt Ave	AM	Signal	26.7	C
		PM		**41.7**	**D**

10	Walerga Rd at Project Access	AM	SSSC	-	-
		PM		-	-
11	Walerga Rd at Town Center Ave	AM	Signal	6.5	A
		PM		5.9	A
12	Walerga Rd at PFE Rd	AM	Signal	23.1	C
		PM		23.7	C
13	Watt Ave at PFE Rd	AM	AWSC	**84.5**	**F**
		PM		**49.8**	**E**

Notes: **Bold** represents deficient operations. Shaded represents a project induced deficiency
Side Street Stop Controlled (SSSC) reported as intersection delay followed by worst approach's delay.

As noted previously, Placer County defines a deficient intersection as one that operates at LOS E or worse within the DCWPCP area[1]. The City of Roseville defines a deficient intersection as one that operates at LOS D or worse[2]. Intersection #1 (Baseline Road at Santucci Boulevard/Watt Avenue), Intersection #5 (Baseline Road at Fiddyment Road/Walerga Road), Intersection #6 (Baseline Road at Crowder Lane), Intersection #9 (Walerga Road at Springhill Drive), and Intersection #13 (Watt Avenue at PFE Road) operate at a deficient LOS.

Roadway Segment Level of Service

Table 5 presents the roadway segment operating conditions for Existing (2024) Conditions. As indicated in Table 5, the roadway segments operate from LOS A to LOS B.

Table 5 – Existing (2024) Roadway Segment Level of Service Summary

ID	Location	Classification	Lanes	Existing (2024)	
				Volume (ADT)	LOS
1	Walerga Road, between Baseline Road and Springhill Drive	Arterial - High Access Control	4	26,830	B
2	Crowder Lane, between Baseline Road and Vineyard Road	Rural 2-lane Highway - Rolling Terrain	2	1,372	A
3	Vineyard Road, between Crowder Lane and Cook Riolo Road	Rural 2-lane Highway - Rolling Terrain	2	1,364	A
4	Walerga Road, between PFE Road and Dry Creek Community Park Driveway	Arterial - High Access Control	4	27,803	B

As noted previously, Placer County defines a deficient roadway segment as one that operates at LOS E or worse within the DCWPCP area[1]. All study roadway segments operate within Placer County standards.

EXISTING (2024) PLUS PROJECT PHASE 1 CONDITIONS

Proposed Project Phase 1 and the affordable housing project traffic was added to the Existing (2024) peak-hour traffic volumes to establish the Existing (2024) plus Project Phase 1 peak-hour traffic volumes. **Figure 8** illustrates the Existing (2024) plus Project Phase 1 peak-hour traffic volumes, traffic control, and lane geometry. The signal timing parameters established in the baseline Existing (2024) scenario were maintained.

Intersection Level of Service

Table 6 presents the peak-hour intersection LOS analysis results for the Existing (2024) plus Project Phase 1 with Affordable Housing Conditions. As indicated in **Table 6**, the study intersections operate between LOS A and F in the Existing (2024) plus Project Phase 1 with Affordable Housing Conditions scenario. Intersection analysis worksheets for Existing (2024) plus Project Phase 1 Conditions are provided in **Appendix C.**

Table 6 – Existing (2024) plus Project Phase 1 with Affordable Housing Intersection Level of Service Summary

ID	Intersection	Peak Hour	Control	Existing (2024)		Existing (2024) plus Project Ph 1 w Affordable Housing	
				Delay (sec)	LOS	Delay (sec)	LOS
1	Baseline Rd at Santucci Blvd/Watt Ave	AM	Signal	26.7	C	27.0	C

		PM		23.7	C	24.1	C
13	Watt Ave at PFE Rd	AM	AWSC	**84.5**	**F**	**98.8**	**F**
		PM		**49.8**	**E**	**63.5**	**F**

Notes: **Bold** represents deficient operations. Shaded represents a project induced deficiency
Side Street Stop Controlled (SSSC) reported as intersection delay followed by worst approach's delay.

Intersection #1 (Baseline Road at Santucci Boulevard/Wat Avenue), Intersection #5 (Baseline Road at Fiddyment Road/Walerga Road), Intersection #6 (Baseline Road at Crowder Lane), Intersection #9 (Walerga Road at Springhill Drive), and Intersection #13 (Watt Avenue at PFE Road) operate at a deficient LOS and Intersection #13 (Watt Avenue at PFE Road) has a project induced deficiency as defined by the DCWPCP policy and City of Roseville standards.

In accordance with the County, a focused analysis was conducted on Intersection #13 (Watt Avenue at PFE Road) to determine if the affordable housing component is responsible for the project-induced deficiency. Phase 1 project trip assignments, excluding Affordable Housing, were added to the Existing (2024) traffic volumes. Intersection analysis worksheets for this focused analysis are provided in **Appendix C.** As shown in **Table 7**, Intersection #13 does not exhibit a project-induced deficiency with Phase 1 traffic only. Therefore, it is concluded that the affordable housing component triggers the project-induced deficiency.

Table 7 – Existing (2024) plus Project Phase 1 Only Intersection Level of Service Summary

ID	Intersection	Peak Hour	Control	Existing (2024)		Existing (2024) plus Project Ph 1 Only	
				Delay (sec)	LOS	Delay (sec)	LOS
13	Watt Ave at PFE Rd	AM	AWSC	**84.5**	**F**	**85.8**	**F**
		PM		**49.8**	**E**	**51.1**	**F**

Notes: **Bold** represents deficient operations. Shaded represents a project induced deficiency
Side Street Stop Controlled (SSSC) reported as intersection delay followed by worst approach's delay.

Existing (2024) plus Project Phase 1 Peak-Hour Traffic Volumes, Traffic Control, and Lane Geometry

Roadway Segment Level of Service

Table 8 presents the roadway segment operating conditions for Existing (2024) plus Project Phase 1 with Affordable Housing Conditions. As indicated in Table 8, the roadway segments operate from LOS A to LOS C.

Table 8 – Existing (2024) plus Project Phase 1 with Affordable Housing Roadway Segment Level of Service Summary

ID	Location	Classification	Lanes	Existing (2024)		Existing (2024) plus Project Ph1 with Affordable Housing	
				Volume (ADT)	LOS	Volume (ADT)	LOS
1	Walerga Road, between Baseline Road and Springhill Drive	Arterial - High Access Control	4	26,830	B	27,202	B
2	Crowder Lane, between Baseline Road and Vineyard Road	Rural 2-lane Highway - Rolling Terrain	2	1,372	A	1,446	A
3	Vineyard Road, between Crowder Lane and Cook Riolo Road	Rural 2-lane Highway - Rolling Terrain	2	1,364	A	1,438	A
4	Walerga Road, between PFE Road and Dry Creek Community Park Driveway	Arterial - High Access Control	4	27,803	B	28,175	C

All study roadway segments operate within County standards.

EXISTING (2024) PLUS PROJECT BUILDOUT CONDITIONS

Proposed Project Buildout (all Project phases) traffic was added to the Existing (2024) peak-hour traffic volumes to establish the Existing (2024) plus Project Buildout peak-hour traffic volumes. Figure 9 illustrates the Existing (2024) plus Project Buildout peak-hour traffic volumes, traffic control, and lane geometry. The 22 additional ADUs traffic was added to the Project Buildout traffic and included as a separate scenario. Figure 10 illustrates the Existing (2024) plus Project Buildout with ADUs peak-hour traffic volumes, traffic control, and lane geometry. The signal timing parameters established in the baseline Existing (2024) scenario were maintained.

Intersection Level of Service

Table 9 presents the peak-hour intersection LOS analysis results for the Existing (2024) plus Project Buildout with and without ADUs Conditions. As indicated in Table 9, the study intersections operate between LOS A and F in both Existing (2024) plus Project Buildout Conditions scenario. There is nominal difference with the addition of the ADUs. Intersection analysis worksheets for Existing (2024) plus Project Buildout Conditions with and without ADUs are provided in Appendix D.

Side Street Stop Controlled (SSSC) reported as intersection delay followed by worst approach's delay.

Intersection #1 (Baseline Road at Santucci Boulevard/Watt Avenue), Intersection #5 (Baseline Road at Fiddyment Road/Walerga Road), Intersection #6 (Baseline Road at Crowder Lane), Intersection #9 (Walerga Road at Springhill Drive), and Intersection #13 (Watt Avenue at PFE Road) operate at a deficient LOS and Intersection #9 (Walerga Road at Springhill Drive), and Intersection #13 (Watt Avenue at PFE Road) have project induced deficiencies as defined by the DCWPCP policy and City of Roseville standards.

A focused analysis was conducted on Intersection #13 (Watt Avenue at PFE Road) to determine if the affordable housing component is responsible for the project-induced deficiency. This focused analysis considered the Existing (2024) plus Project Buildout with ADUs, excluding Affordable Housing. Intersection analysis worksheets for this focused analysis are provided in **Appendix D.** As shown in **Table 10**, by excluding the Affordable Housing, Intersection #13 does not exhibit a project-induced deficiency. Therefore, it is concluded that the affordable housing component triggers the project-induced deficiency.

Table 10 – Existing (2024) plus Project Buildout with ADUs Only Intersection Level of Service Summary

Roadway Segment Level of Service

Table 11 presents the roadway segment operating conditions for Existing (2024) plus Project Buildout Conditions with and without the 22 additional ADUs. As indicated in Table 11, the roadway segments operate from LOS A to LOS C.

Table 11 – Existing (2024) plus Project Buildout Roadway Segment Level of Service Summary

ID	Location	Classification	Lanes	Existing (2024)		Existing (2024) plus Project Buildout		Existing (2024) plus Project Buildout with ADUs	
				Volume (ADT)	LOS	Volume (ADT)	LOS	Volume (ADT)	LOS
1	Walerga Road, between Baseline Road and Springhill Drive	Arterial - High Access Control	4	26,830	B	28,532	C	28,596	C
2	Crowder Lane, between Baseline Road and Vineyard Road	Rural 2-lane Highway - Rolling Terrain	2	1,372	A	2,009	B	2,215	B
3	Vineyard Road, between Crowder Lane and Cook Riolo Road	Rural 2-lane Highway - Rolling Terrain	2	1,364	A	1,548	A	1,559	A
4	Walerga Road, between PFE Road and Dry Creek Community Park Driveway	Arterial - High Access Control	4	27,803	B	28,831	C	28,885	C

All study roadway segments operate within County standards.

CUMULATIVE (2044) CONDITIONS

Intersection Geometry and Volumes

To establish Cumulative conditions, future study volumes were estimated using the South Placer Regional Transportation Authority's (SPRTA) travel demand model. To capture the relative growth predicted by the model, the "difference method" was used to develop the Cumulative volumes by first calculating the growth between the base year model scenario (representing 2019 conditions) and future year model scenario (representing 2040 conditions). The growth was then annualized and multiplied by the growth in the number of years between Existing (2024) and Cumulative (2044) (20 years). The total model volume growth was then added to the traffic counts collected for the study intersections and roadway segments resulting in traffic volumes for Cumulative Conditions.

It should be noted that the cumulative SPRTA travel demand model was confirmed to contain known future developments and roadway improvements in the project area. The model also accounts for the widening of Baseline Road between Santucci Boulevard and Fiddyment Road/Walerga Rd to 6-lanes, PFE Road from 2-lanes to 4-lanes, Walerga Road from 4-lanes to 6-lanes, and Watt Avenue from 2-lanes to 6-lanes.

The future intersection and roadway segment geometry were informed by the SPRTA model, DCWCP[1], the City of Roseville General Plan[2], and Retail Center traffic study[3] and are reflected in the intersection and segment analyses. Figure 11 illustrates the Cumulative (2044) peak-hour traffic volumes, traffic control, and lane geometry. Signal timing cycle lengths were optimized to establish the Cumulative (2044) scenario.

Intersection Level of Service

Table 12 presents the peak-hour intersection LOS analysis results for the Cumulative (2044) Conditions. As indicated in Table 12, the study intersections operate between LOS A and F in the Cumulative (2044) Conditions scenario. Intersection analysis worksheets for Cumulative (2044) Conditions are provided in Appendix E.

Intersection #1 (Baseline Road at Santucci Boulevard/Watt Avenue), Intersection #2 (Baseline Road at Westbrook Boulevard), Intersection #3 (Baseline Road at Market Street), Intersection #5 (Baseline Road at Fiddyment Road/Walerga), Intersection #6 (Baseline Road at Crowder Lane), Intersection #9 (Walerga Road at Springhill Drive), per DCWPCP policy and City of Roseville standards.

Roadway Segment Level of Service

Table 13 presents the roadway segment operating conditions for Cumulative (2044) Conditions. As indicated in Table 13, the roadway segments operate from LOS A to LOS D.

Table 13 – Cumulative (2044) Roadway Segment Level of Service Summary

ID	Location	Classification	Lanes	Cumulative (2044)		
				Volume (ADT)	Volume (ADT) Per Lane	LOS
1	Walerga Road, between Baseline Road and Springhill Drive	Arterial - High Access Control	6	51,755	8,626	D
2	Crowder Lane, between Baseline Road and Vineyard Road	Collector - Low Access Control	2	2,430	1,215	A
3	Vineyard Road, between Crowder Lane and Cook Riolo Road	Arterial - Low Access Control	2	2,060	1,030	A
4	Walerga Road, between PFE Road and Dry Creek Community Park Driveway	Arterial - High Access Control	6	52,950	8,825	D

All study roadway segments within Placer County operate within County standards.

CUMULATIVE (2044) PLUS PROJECT CONDITIONS

The Proposed Project Buildout traffic was added to the Cumulative (2044) peak-hour traffic volumes to establish the Cumulative (2044) plus Project peak-hour traffic volumes. **Figure 12** illustrates the Cumulative (2044) plus Project study intersections, traffic control, and lane configurations. The 22 additional ADUs traffic was added to the Project Buildout traffic and included as a separate scenario. **Figure 13** illustrates the Cumulative (2044) plus Project with ADUs peak-hour traffic volumes, traffic control, and lane geometry. The signal timing parameters established in the Cumulative (2044) scenario were maintained.

Intersection Level of Service

Table 14 presents the peak-hour intersection LOS analysis results for the Cumulative (2044) plus Project with and without ADUs Conditions. As indicated in **Table 14**, the study intersections operate between LOS A and F in both Cumulative (2044) plus Project Conditions scenario. There is nominal difference with the addition of the ADUs. Intersection analysis worksheets for Cumulative (2044) plus Project Conditions with and without ADUs are provided in **Appendix F.**

All study roadway segments operate within County standards.

DEFICIENCIES AND IMPROVEMENTS

Summary of Project Induced Deficiencies and Improvements

Project Induced Deficiencies

D1. *Intersection #6, Baseline Road at Crowder Lane, Existing (2024) plus Project Phase 1 with Affordable Housing, Existing plus Project Buildout, Cumulative plus Project Buildout*
As shown in Table 6, Table 9, and Table 14, this intersection operates at LOS F in all scenario conditions during both peak-hours with and without the project.

D2. Intersection #9, Walerga Road at Springhill Drive, Existing (2024) plus Project Buildout, Cumulative (2044) plus Project Buildout
As shown in Table 9 and Table 14, this intersection operates at LOS E in the Existing (2024) conditions during the AM peak-hour without the project and at LOS F during the AM peak-hour with Phase 1 and Project Buildout. The intersection operates at LOS F in the Cumulative (2044) conditions with and without the project. The deficiency is considered project induced as the project adds more than 5 seconds of delay, per DCWPCP policy.

D3. Intersection #13, Watt Avenue at PFE Road, Existing (2024) plus Project Phase 1 with Affordable Housing and Existing (2024) plus Project Buildout
As shown in Table 6 and Table 9, this intersection operates deficiently during the AM and PM peak-hours with and without the project. The deficiency is considered project induced as the project adds more than 5 seconds of delay, per DCWPCP policy. In accordance with the County, a focused analysis was conducted to determine if the affordable housing component is responsible for the project-induced deficiency. As shown in Table 7, Intersection #13 does not exhibit a project-induced deficiency with Phase 1 traffic only. Therefore, it is concluded that the affordable housing component triggers the project-induced deficiency.

Improvements

I1. Intersection #6, Baseline Road at Crowder Lane
This deficiency can be improved by restricting northbound left turns and southbound left turns out of the intersection. Westbound project trips from Crowder Lane will instead turn right from Crowder Lane on to Baseline Road and navigate a U-turn just west of the eastbound left turn lane at the Baseline Road intersection with Junction Boulevard. Eastbound trips from the north leg will instead turn right on to Baseline Road and navigate a U-turn at the Baseline Road intersection with Fiddyment Road/Walerga Road. The northbound and southbound left-turn restrictions can be implemented by installing a mountable raised median and appropriate signage, and by constructing left turn/U-turn Lane at the driveway just west of the Baseline Road intersection with Junction Boulevard. The project will be required to coordinate with the City of Roseville to modify signage and signal timing, as necessary, with implementation of the median restriction. These changes will be required at the time the median restrictions are constructed. As shown in Table 16 and Table 17, this improvement reduces the intersection delay. Worksheets for the improved conditions are presented in Appendix G.

I2. Intersection #9, Walerga Road at Springhill Drive
This deficiency can be improved by restricting the eastbound left turn and westbound left turn. Northbound project trips from Springhill Drive will turn right on to Walerga Road and navigate a U-turn at the Walerga Road intersection with Town Center Avenue. Southbound trips from Springhill Drive will turn right on to Walerga Road and navigate a U-turn at the Walerga Road intersection with Baseline Road. The restriction can be implemented by installing a median curb restriction. Additionally, a signal can be considered in the future in order to bring the intersection to a LOS

within the DCWPCP threshold. The project will be required to coordinate with the City of Roseville to modify signage and signal timing, as necessary, with implementation of the median restriction. These changes will be required at the time the median restrictions are constructed. As shown in Table 16 and Table 17, the left turn restrictions reduce the intersection delay to below no-project levels and the signal improvement brings it to a LOS within the threshold. Worksheets for the improved conditions are presented in Appendix G.

I3. Intersection #13, Watt Avenue at PFE Road

Peak-hour traffic signal warrants finds that this intersection's traffic warrants a traffic signal as shown in Table 20. This deficiency can be improved by signalizing the intersection. As shown in Table 16, signalization of this intersection results in improvement in LOS from LOS F and E to LOS B for the AM and PM peak-hours, respectively. Worksheets for the improved conditions are presented in Appendix G.

Table 16 – Existing (2024) plus Project (Improved) Intersection Level of Service Summary

PROJECT ON-SITE OPERATIONS, ACCESS, AND SAFETY EVALUATION

Emergency Vehicle Access

Placer County Building and Construction Code[4] states that on-site roadways shall provide an "inside turning radius for a fire access road [and it] shall be thirty (30) feet or greater. The outside turning radius for an access road shall be fifty (50) feet or greater." As shown by the turning radii in the Project site plan (Figure 1), the Project site will allow fire access.

Neighborhood Gate Evaluation

Per the site plan (Figure 1) neighborhood gates are proposed for on-site access at Phase 3 and Phase 4. The gates are located beyond the landscape median. A queueing analysis was performed to ensure safe operations. The PM peak-hour ingress volumes were analyzed as these are expected to be the highest arrival rates for the Project. As was shown in Table 3, 36 vehicles are projected to access the Project Phase 3 access, and 31 vehicles are projected to access the Project Phase 4 access during the PM peak-hour. The Project trips accessing the site were assigned to one of the following user groups:

- Resident – those who live in the Project. Residents are assumed to have familiarity with the gate operations, and may even have a keycard, gate FOB, or other automatic gate operation technology to assist them in entering the Project. These entering vehicles are expected to queue at the gate for a short period (4.5-8.3 seconds per vehicle).

- Non-resident – any other vehicles entering the site who do not live at the Project, those who may not be familiar with gate operations, or those who need authorization to enter the Project. This group of users would include visitors of residents, as well as any delivery vans or maintenance workers. Non-resident vehicles are expected to have a longer queueing time at the gate than a resident (8.0- 18.0 seconds per vehicle).

As shown in Figure 2, all entering vehicles would queue together waiting to enter the gate. It was assumed that 95-percent of entering vehicles during the PM peak-hour are residents, and the remaining 5-percent are non-residents.

A detailed queueing simulation was conducted to determine the PM peak-hour 95th percentile queue, which is the queue length that is expected to be exceeded during a PM peak-hour less than 5-percent of the time. To calculate this 95th percentile queue, an arrival time and a service time was randomly assigned to each entering vehicle during the peak-hour. Service times for this analysis were based on a range of rates reported in *Parking Structures 3rd Edition (2001)*. This manual lists the range of service rates for residents (those familiar with gate operations) as ranging from 4.5-8.3 seconds per vehicle (sec/veh) while non-residents (those unfamiliar with gate operations) as ranging from 8.0-18.0 sec/veh. The assumed "queueing length" of each vehicle was assumed to be 25 feet. The analysis contained 1,000 iterations of the gated entry queuing and results are summarized in Table 18.

[4] *Part II. Codes Adopted and Amended, Article 15.04 Building And Construction Code, Chapter 15 Building And Development, Part 2 California Building Code,* Placer County, 2022.

Table 18 – Gated Entry 95th Percentile Queues

Vehicles Entering Gate		Available Storage (ft)	Max Queue (ft)	95th% Queue (ft)	Distribution of Maximum Queue Length (%)				
					25ft	50ft	75ft	100ft	125ft
Phase 3 Entrance	36	85	100	75	10.2%	80.8%	8.5%	0.5%	0.0%
Phase 4 Entrance	31	80	100	50	20.7%	74.4%	4.8%	0.1%	0.0%

The maximum queue for the Phase 3 and Phase 4 entrances was 100 feet or 4 vehicles. However, as shown in Table 18, this is expected to occur 0.5-percent and 0.1-percent or less of the time, respectively. The 95th percentile queue for Phase 3 entrance was 75 feet or 3 vehicles. The 95th percentile queue for Phase 4 entrance was 50 feet or 2 vehicles. It is standard to provide enough storage to accommodate the 95th percentile queue length. As shown in Table 18, the site has adequate storage available.

Public Transit System

Roseville Transit service operates on fixed routes in Roseville with connections to Placer County Transit and Sacramento Regional Transit. Roseville Transit services Route R with a stop at Foothills Boulevard at Main Street/Baseline Road approximately 3.0 miles from the Project site. Roseville Transit also services Route D with a stop approximately 0.7 miles from the Project site at Baseline Road and Woodcreek Oaks Boulevard. Route D traverses the western neighborhoods of Roseville and connects to the Civic Center Junction that provides connections to commuter buses.

The site is 5.9 miles away from the Louis Orlando Transit Center which houses regional transit Route 10: Auburn/Light Rail (bus) and Route 60: Placer Commuter Express (vanpool). The transit center is located at the Orlando Avenue intersection with Louis Lane. The addition of the Project is not anticipated to conflict with the goals, policies, and objectives found in the PCTPA Short Range Transit Plan, Long Range Transit Plan, and 2040 Regional Transportation Plan.

Pedestrian and Bicycle Access and Circulation

Consistent with DCWPCP, the project includes an 8-foot separated sidewalk along the project frontages south of Baseline Road and on Walerga Road. Additionally, the project includes a 4-foot Class II bike lane on the south side of Baseline Road and the east and west side of Walerga Road along the project frontages. Lastly, the project extends the existing trail north of Vineyard Road, just north of Phase 4.

Vehicle Queuing at Intersections

Queueing analyses were conducted for select movements where Project-added trips occur at intersections with limited turning-movement storage. Table 19 summarizes the expected 95th percentile queues for exclusive turn pockets at signalized intersections along Baseline Road and Walerga Road for all analysis scenarios. The calculated vehicle queues were compared to existing vehicle storage lengths. Analysis sheets that include the anticipated vehicle queues are presented in Appendices B-F.

As presented in Table 19, the addition of the project does not contribute more than one vehicle length (25-feet) where the available storage is already exceeded, with the exception of Baseline Road at Fiddyment Road/Walerga Road (Intersection #5). At Intersection #5, the project adds more than one vehicle length to the queue for the westbound left, northbound right, and northbound left turn movements in the Cumulative (2044) plus Project Buildout Conditions. Future improvement to the intersection's turn lane storage is not under any planned or adopted fee program, and as such, is not assumed to included in our Cumulative (2044) analysis. However, there appears to be adequate right-of-way for the turn lanes to be extended under future lane conditions to accommodate the additional queuing.

Shaded cell indicates queue exceeds storage by > 25' (one vehicle length).

Peak-Hour Signal Warrants

A planning level assessment of the need for traffic signalization was performed for the un-signalized study intersections. This evaluation was performed consistently with the peak-hour warrant methodologies noted in Section 4C of the *California Manual on Uniform Traffic Control Devices (CAMUTCD)*[5]. A summary of the peak-hour warrant results is presented in Table 20. Detailed results of this analysis are presented in Appendix H.

As shown in Table 20 the intersection of Baseline Road with Crowder Lane (Intersection #6) and Watt Avenue with PFE Road (Intersection#13) warrant a traffic signal in all analysis scenarios.

[5] *Section 4C, California Manual on Uniform Traffic Control Devices (CAMUTCD) 2014 Edition Revision 8*, Caltrans, January 11, 2024.

Table 20 – Traffic Signal Warrant Analysis Results

ID	Intersection	Analysis Scenario				
		Existing (2024)	Existing (2024) plus Project Ph 1	Existing (2024) plus Project Buildout	Cumulative (2044)	Cumulative (2044) plus Project Buildout
6	Baseline Rd at Crowder Ln	No/Yes	No/Yes	Yes/Yes	Yes/Yes	Yes/Yes
8	Vineyard Rd at Crowder Ln	No/No	No/No	No/No	No/No	No/No
9	Walerga Rd at Springhill Dr	No/No	No/No	No/No	No/No	No/No
13	Watt Ave at PFE Rd	Yes/Yes	Yes/Yes	Yes/Yes	-	-

Results are presented in **AM / PM format**, locations where a signal is warranted during a peak hour are shaded.
Note: Peak-hour warrant is satisfied if Condition A or B is satisfied

Safety Evaluation

Collision data[6] was evaluated for the study intersections and compared against Caltrans data[7] for similar intersections. The provided crash data was combined with the calculated intersection entering average daily traffic (ADT) to develop an existing intersection crash rate. Collision data is summarized below in Figure 14.

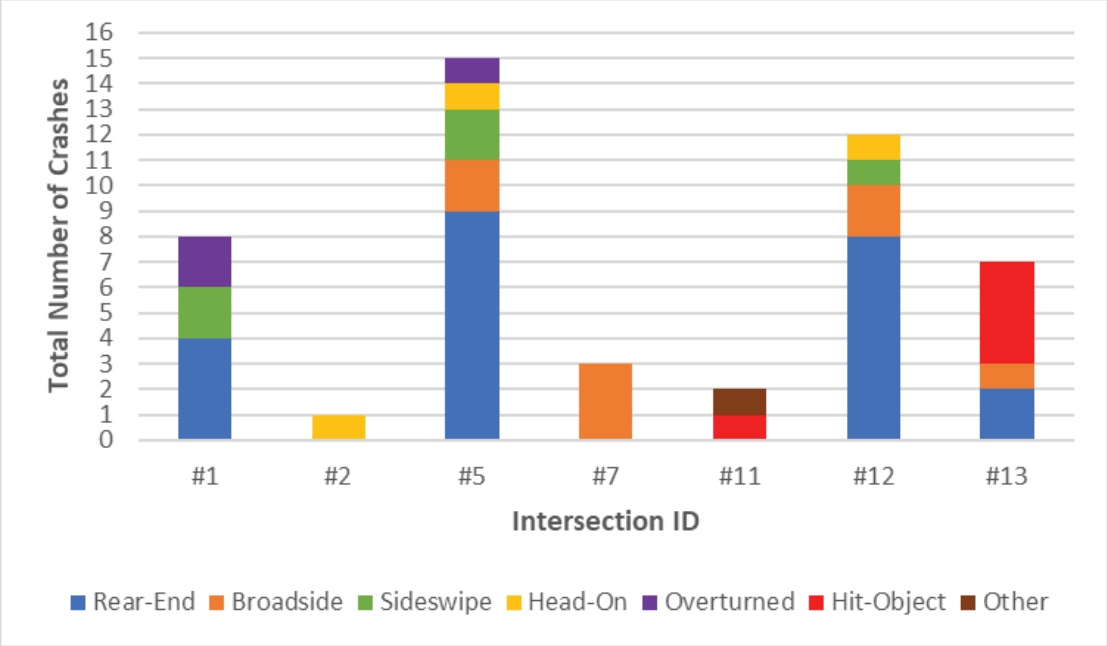

Figure 14 – 5-Year Intersection Collision Summary

*Figure not OCR compatible

[6] *2021-2025 Crash Data – Transportation Injury Mapping System (TIMS)*, Safe Transportation Research and Education Center, University of California, Berkeley, 2025.
[7] *2021 Crash Data on California State Highways*, Caltrans, August 2023.

Based on the collision data, there were eight (8) collisions at Intersection #1 (Baseline Road at Santucci Boulevard/Watt Avenue) within the five-year period between 2020 and 2024. As shown in Figure 14, the crash types were Rear-End, Sideswipe, and Overturned. The total calculated existing intersection crash rate was 0.22 crashes per million entering vehicles. The total average crash rate for similar intersections is 0.33 crashes per million entering vehicles.

The collision data revealed one (1) collision at Intersection #2 (Baseline Road at Westbrook Boulevard) within the five-year period. The crash type was Head-On. The total calculated existing intersection crash rate was 0.03 crashes per million entering vehicles. The total average crash rate for similar intersections is 0.28 crashes per million entering vehicles.

The collision data revealed 15 collisions at Intersection #5 (Baseline Road at Fiddyment Road/Walerga Rd) within the five-year period. The crash types were Rear-End, Broadside, Sideswipe, Head-On, and Overturned. The total calculated existing intersection crash rate was 0.20 crashes per million entering vehicles. The total average crash rate for similar intersections is 0.33 crashes per million entering vehicles.

The collision data revealed three (3) collisions at Intersection #7 (Baseline Road at Junction Boulevard) within the five-year period. The crash types were Broadside. The total calculated existing intersection crash rate was 0.09 crashes per million entering vehicles. The total average crash rate for similar intersections is 0.28 crashes per million entering vehicles.

The collision data revealed two (2) collisions at Intersection #11 (Walerga Road at Town Center Avenue) within the five-year period. The crash types were Hit-Object and Other. The total calculated existing intersection crash rate was 0.05 crashes per million entering vehicles. The total average crash rate for similar intersections is 0.28 crashes per million entering vehicles.

The collision data revealed 12 collisions at Intersection #12 (Walerga Road at PFE Road) within the five-year period. The crash types were Rear-End, Broadside, Sideswipe, and Head-On. The total calculated existing intersection crash rate was 0.24 crashes per million entering vehicles. The total average crash rate for similar intersections is 0.33 crashes per million entering vehicles.

The collision data revealed seven (7) collisions at Intersection #13 (Watt Avenue at PFE Road) within the five-year period. The crash types were Rear-End, Broadside, and Hit-Object. The total calculated existing intersection crash rate was 0.28 crashes per million entering vehicles. The total average crash rate for similar intersections is 0.11 crashes per million entering vehicles.

The crash rates for the study intersections are summarized in Table 21.

Table 21 – Intersection Crash Rate Summary

ID	Intersection	Statewide Average Crash Rate	Intersection Actual Crash Rate
1	Baseline Rd at Santucci Blvd/Watt Ave	0.33	0.22
2	Baseline Rd at Westbrook Blvd	0.28	0.03
5	Baseline Rd at Fiddyment Rd/Walerga Rd	0.33	0.20
7	Baseline Rd at Junction Blvd	0.28	0.09
11	Walerga Rd at Town Center Ave	0.28	0.05
12	Walerga Rd at PFE Rd	0.33	0.24
13	Watt Ave at PFE Rd	0.11	0.28

Shaded cell represents intersection crash rate higher than the statewide average

CONCLUSIONS

Significant findings of this study include:

- Intersection #6 (Baseline Road at Crowder Lane) operates at a deficient LOS in all scenarios with and without the project. This deficiency can be improved by restricting northbound left turns and southbound left turns out of the intersection. Westbound project trips from Crowder Lane will instead turn right from Crowder Lane on to Baseline Road and navigate a U-turn just west of the eastbound left turn lane at the Baseline Road intersection with Junction Boulevard. Eastbound trips from the north leg will instead turn right on to Baseline Road and navigate a U-turn at the Baseline Road intersection with Fiddyment Road/Walerga Road. The northbound and southbound left-turn restrictions can be implemented by installing a mountable raised median and appropriate signage, and by constructing left turn/U-turn Lane at the driveway just west of the Baseline Road intersection with Junction Boulevard. This improvement reduces the intersection delay.
- Intersection #9 (Walerga Road at Springhill) operates at a deficient LOS in all scenarios with and without the project. This deficiency can be improved by restricting the eastbound left turns and westbound left turns from Springhill Drive to Walerga Road. The restriction can be implemented by installing a median curb restriction. This improvement reduces the intersection delay to below no-project levels. Additionally, a signal can be considered in the future in order to bring the intersection to a LOS within the DCWPCP threshold This improvement reduces the intersection delay to within the LOS threshold.
- Intersection #13 (Watt Avenue at PFE Road) operates at a deficient LOS in all Existing (2024) scenarios with and without the project. Intersection #13 does not exhibit a project-induced deficiency with Phase 1 traffic only. Therefore, it is concluded that the affordable housing component triggers the project-induced deficiency. This deficiency can be improved by signalizing the intersection. This improvement results in acceptable LOS B for the AM and PM peak-hours.
- Intersection #13 (Watt Avenue at PFE Road) exhibits a crash rate higher than the statewide average for similar facilities. The traffic signal improvements at this intersection are expected to improve safety for all roadway users.
- The addition of the Project does not conflict with the goals, policies, and objectives of the PCTPA Short Range Transit Plan, Long Range Transit Plan, and 2040 Regional Transportation Plan.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

HCM 7th LOS	B

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 7th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

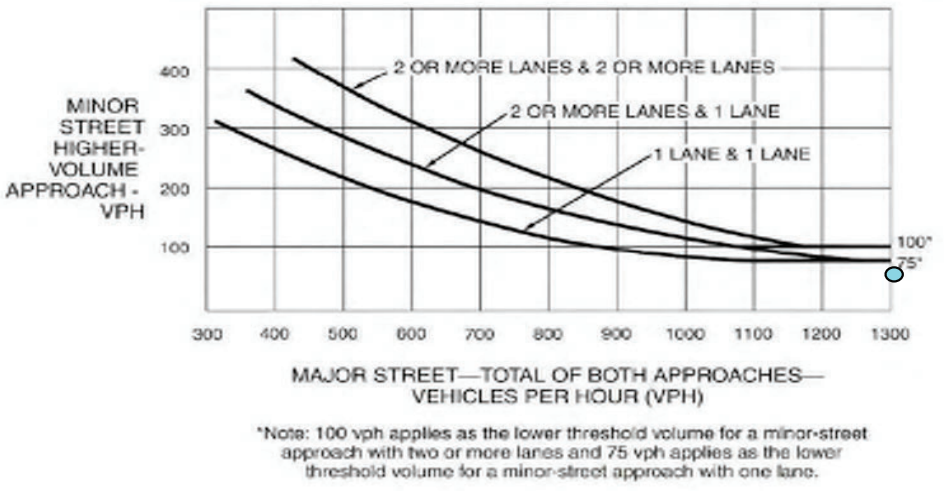
Traffic Signal Warrants Worksheet
Warrant 3: Peak Hour
Source: MUTCD 2014 California Supplement

Scenario: Existing (2024) AM
Intersection: Baseline Rd AND Crowder Ln
Comments:

	PART A or PART B	SATISFIED	**NO**

PART A
(All parts 1, 2, and 3 below must be satisfied) SATISFIED **NO**



1.	The total delay experienced for traffic on one minor street approach controlled by a STOP sign equals or exceeds four vehicle-hours for a one-lane approach and five vehicle hours for a two-lane approach; AND	No
2.	The volume on the same minor street approach equals or exceeds 100 vph for one moving lane of traffic or 150 vph for two moving lanes; AND	No
3.	The total entering volume serviced during the hour equals or exceeds 800 vph for intersection with four or more approaches or 650 vph for intersection with less than four approaches.	Yes

PART B SATISFIED **No**

APPROACH LANES	One	2 or More
Both Approaches - Major Street		2354
Highest Approach - Minor Street	70	

The plotted points for vehicles per hour on major streets (both approaches) and the corresponding per hour higher volume minor street approach (one direction only) for one hour (any consecutive 15 minute period) fall above applicable curves in MUTCD Figure 4C-3.

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)
(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 40 MPH ON MAJOR STREET)

*Note: 100 vph applies as the lower threshold volume for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold volume for a minor-street approach with one lane.

* Figure not OCR Compatible

Warrant 3: Peak Hour
Source: MUTCD 2014 California Supplement

Scenario: Existing (2024) AM
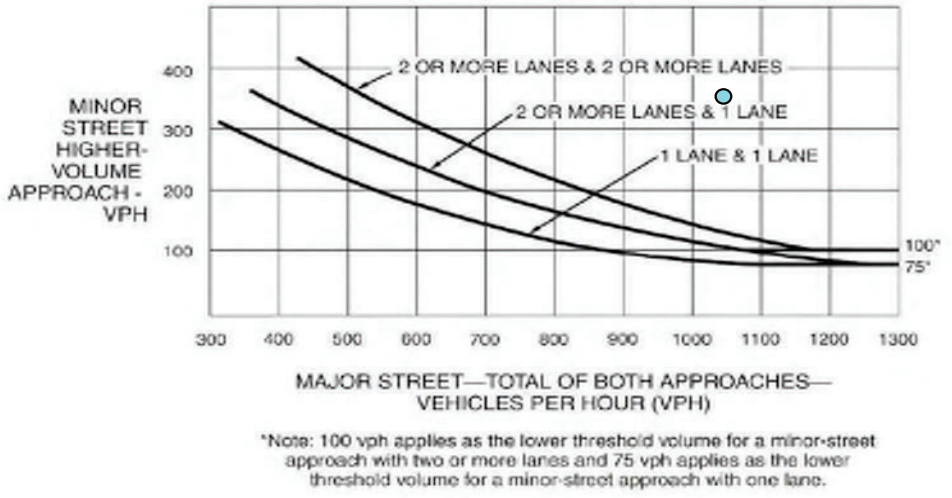
Intersection: Watt Ave AND PFE Rd
Comments:

	PART A or PART B	SATISFIED	**YES**

PART A
(All parts 1, 2, and 3 below must be satisfied) SATISFIED **YES**



1. The total delay experienced for traffic on one minor street approach controlled by a STOP sign equals or exceeds four vehicle-hours for a one-lane approach and five vehicle hours for a two-lane approach; AND — Yes
2. The volume on the same minor street approach equals or exceeds 100 vph for one moving lane of traffic or 150 vph for two moving lanes; AND — Yes
3. The total entering volume serviced during the hour equals or exceeds 800 vph for intersection with four or more approaches or 650 vph for intersection with less than four approaches. — Yes

PART B SATISFIED **Yes**

APPROACH LANES	One	2 or More
Both Approaches - Major Street	1056	
Highest Approach - Minor Street	317	

The plotted points for vehicles per hour on major streets (both approaches) and the corresponding per hour higher volume minor street approach (one direction only) for one hour (any consecutive 15 minute period) fall above applicable curves in MUTCD Figure 4C-3.

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)
(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 40 MPH ON MAJOR STREET)

Warrant 3: Peak Hour
Source: MUTCD 2014 California Supplement

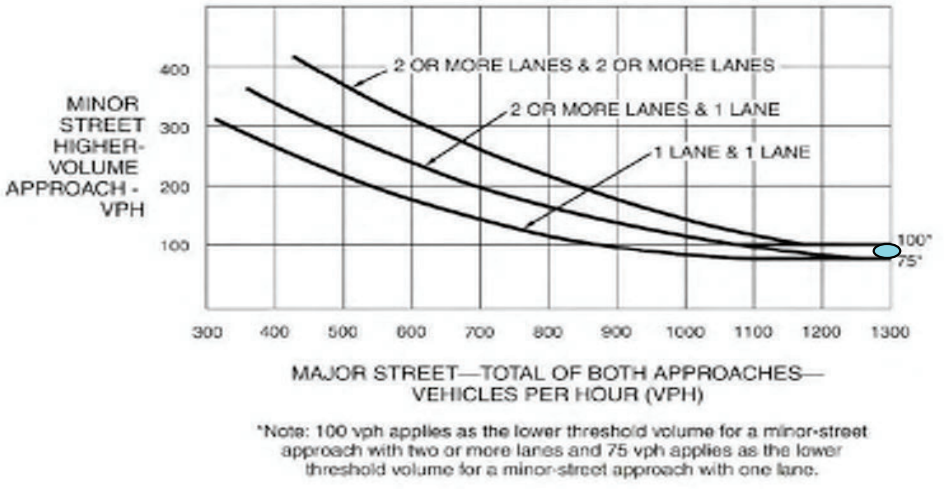
Scenario: Existing (2024) plus Project Buildout AM
Intersection: Baseline Rd AND Crowder Ln
Comments:

PART A or PART B	SATISFIED	**YES**

PART A
(All parts 1, 2, and 3 below must be satisfied) — SATISFIED: **NO**



1.	The total delay experienced for traffic on one minor street approach controlled by a STOP sign equals or exceeds four vehicle-hours for a one-lane approach and five vehicle hours for a two-lane approach; AND	No
2.	The volume on the same minor street approach equals or exceeds 100 vph for one moving lane of traffic or 150 vph for two moving lanes; AND	No
3.	The total entering volume serviced during the hour equals or exceeds 800 vph for intersection with four or more approaches or 650 vph for intersection with less than four approaches.	Yes

PART B — SATISFIED: **Yes**

APPROACH LANES	One	2 or More
Both Approaches - Major Street		2436
Highest Approach - Minor Street	89	

The plotted points for vehicles per hour on major streets (both approaches) and the corresponding per hour higher volume minor street approach (one direction only) for one hour (any consecutive 15 minute period) fall above applicable curves in MUTCD Figure 4C-3.

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)
(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 40 MPH ON MAJOR STREET)

* Figure not OCR Compatible

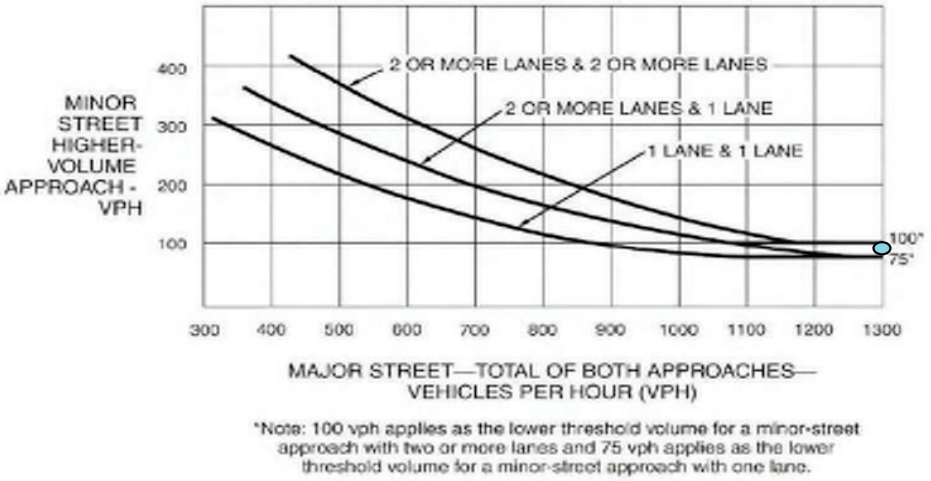
PART A
(All parts 1, 2, and 3 below must be satisfied) SATISFIED **NO**



1.	The total delay experienced for traffic on one minor street approach controlled by a STOP sign equals or exceeds four vehicle-hours for a one-lane approach and five vehicle hours for a two-lane approach; AND	Yes
2.	The volume on the same minor street approach equals or exceeds 100 vph for one moving lane of traffic or 150 vph for two moving lanes; AND	No
3.	The total entering volume serviced during the hour equals or exceeds 800 vph for intersection with four or more approaches or 650 vph for intersection with less than four approaches.	Yes

PART B SATISFIED **No**

APPROACH LANES	One	2 or More
Both Approaches - Major Street		4630
Highest Approach - Minor Street	53	

The plotted points for vehicles per hour on major streets (both approaches) and the corresponding per hour higher volume minor street approach (one direction only) for one hour (any consecutive 15 minute period) fall above applicable curves in MUTCD Figure 4C-3.

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)
(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 40 MPH ON MAJOR STREET)

*Note: 100 vph applies as the lower threshold volume for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold volume for a minor-street approach with one lane.

* Figure not OCR Compatible
