21-3 Comparison of Environmental Impacts for Project Alternatives 21-30

1. Introduction

1. INTRODUCTION

1.1 TYPE AND PURPOSE OF THE EIR

The Estia Dry Creek and Placer Creek Residential Project EIR has been prepared in accordance with CEQA, Public Resources Code (PRC) Sections 21000-21189.91, as amended, and the Guidelines for Implementation of the California Environmental Quality Act, California Code of Regulations (CCR) Title 14, Sections 15000-15387 (CEQA Guidelines). Placer County is the lead agency for the environmental review of the Estia Dry Creek and Placer Creek Residential Project (proposed project) evaluated herein and has the principal responsibility for reviewing the impacts and considering approval of the proposed project. As required by Sections 15121 through 15126.6 of the CEQA Guidelines, this EIR will (a) inform public agency decision-makers, and the public generally, of the significant environmental effects of the project, (b) identify mitigation measures to minimize the significant adverse environmental effects, and (c) describe potentially feasible project alternatives that would attain most of the basic objectives of the project while avoiding or substantially lessening any of the significant environmental effects of the project. The public agency shall consider the information in the EIR along with other information that may be presented to the agency.

As provided in the CEQA Guidelines Section 15021, public agencies are charged with the duty to avoid or minimize environmental damage where feasible. The public agency has an obligation to balance a variety of public objectives, including economic, environmental, and social issues. CEQA requires the preparation of an EIR prior to approving any project that may have a significant effect on the environment. For the purposes of CEQA, the term *project* refers to the whole of an action that has the potential for resulting in a direct physical change or a reasonably foreseeable indirect physical change in the environment and that is either (i) undertaken by a public agency, (ii) supported or subsidized by a public agency, or (iii) permitted or otherwise authorized by a public agency (CEQA Guidelines Section 15378[a]). With respect to the proposed project, the County has determined that the proposed development is a *project* within the definition of CEQA, which has the potential for resulting in significant environmental effects.

The lead agency is required to consider the information in the EIR along with any other available information in deciding whether to approve the proposed project. The basic requirements for an EIR include discussions of the environmental setting, significant environmental impacts, mitigation measures, potentially feasible alternatives, growth-inducing impacts, and cumulative impacts.

The CEQA Guidelines identify several types of EIRs, each applicable to different project circumstances. This EIR has been prepared as a *project-level EIR* pursuant to CEQA Guidelines Section 15161, which is an analysis that examines the environmental impacts of a specific development project. A *project-level EIR* focuses primarily on the changes in the environment that would result from the development of the project, and examines all phases of the project, including planning, construction, and operation.

1.2 KNOWN RESPONSIBLE AND TRUSTEE AGENCIES

To the extent that such information is known, the lead agency must provide "a list of the agencies that are expected to use the EIR in their decision making" (CEQA Guidelines Section 15124(d)(1)(A). Most such agencies (not including federal agencies) qualify as a "responsible agency."

The term "Responsible agency" applies to a public agency that proposes to carry out or approve a project for which a lead agency is preparing or has prepared an EIR or Negative Declaration. For the purpose of CEQA, the term responsible agency includes all California public agencies other than the lead agency that have discretionary approval power over the project or an aspect of the project (CEQA Guidelines Section 15381).

Another category of agency recognized by CEQA is "trustee agency," which is defined as a "state agency having jurisdiction by law over natural resources affected by a project which are held in trust for the people of the State of California" (CEQA Guidelines Section 15386). Unlike responsible agencies, trustee agencies have no discretionary approval authority over a project.

The proposed project would require the following approvals/permits from other responsible agencies:

- Placer County Conservation Program Authorization (Placer Conservation Authority);
- Section 401 Water Quality Certification (Regional Water Quality Control Board [RWQCB] – Central Valley Region);
- Streambed Alteration Agreement (California Department of Fish and Wildlife [CDFW]) issued pursuant to Section 1602 of the Fish and Game Code; and
- City of Roseville Encroachment Permit.

The proposed project will be subject to the existing National Pollutant Discharge Elimination System (NPDES) Construction General Permit issued by the RWQCB – Central Valley Region. This General Permit is already in place and requires the preparation of a stormwater pollution prevention plan (SWPPP) that is submitted to, but need not be approved by, the RWQCB.

The only known possible trustee agency is the CDFW, which the CEQA Guidelines recognize as a trustee agency with regard to the fish and wildlife of the state, designated rare or endangered native plants, and game refuges, ecological reserves, and other areas administered by CDFW.

Although not subject to California law, and, thus, outside the definitions of responsible agency or trustee agency, the U.S. Army Corps of Engineers (USACE), U.S. Fish and Wildlife Service (USFWS), and Federal Emergency Management Agency (FEMA) will also be called upon to grant approvals — under federal law — necessary for the development of the project site. The above agencies do not have duties under CEQA, but, rather, are governed by a variety of federal statutes, such as the Clean Water Act, which governs the dredging and filling of waters of the U.S. (e.g., wetlands), and the Endangered Species Act, which requires USACE to consult with the USFWS as part of the review process for any wetland or fill permits that may be required.

1.3 PROJECT SUMMARY

The following sections include summaries of the project location, setting and project description.

Project Location and Setting

The project site consists of approximately 92.2 gross (87.6 net) acres located south of Baseline Road, immediately east of the abandoned old Walerga Road right-of-way, west of the Fiddyment Road/Baseline Road/Walerga Road intersection and the western portion of Sun Valley Oaks residential subdivision, and north of the Morgan Creek residential subdivision in the Dry Creek-West Placer Community Plan Area (DCWPCP) of unincorporated Placer County. Walerga Road, which curves from the northeast to the southwest, separates the northern 52.3-acre portion of the project site, identified by Assessor's Parcel Number (APN) 023-221-076, and the southern 35.3-acre portion of the project site, identified by APN 023-221-074.

The 52.3-acre northern portion of the site (APN 023-221-076) is bounded by Baseline Road to the north and Walerga Road to the south. The northern portion of the site is undeveloped, consists of non-native annual grassland with gently rolling topography, and is interspersed with seasonal wetlands and vernal pools. The 35.3-acre southern portion of the site (APN 023-221-074) is bounded by Walerga Road to the north and west. The southern portion of the site includes a paved sewer easement which extends from Vineyard Road to the east and Walerga Road to the west. In addition, the southern portion of the site includes undeveloped annual grassland with gently rolling topography, interspersed with seasonal wetlands, vernal pools, and is bisected by an un-named tributary of Dry Creek (named "Placer Creek" for this project) which flows east to west.

The FEMA 100-year floodplain, containing approximately 4.7 acres, is located within the Placer Creek tributary area, which bisects the southern portion of the project site. A band of oak woodlands is located along the Placer Creek riparian corridor.

Roadways in the immediate project vicinity include Baseline Road to the north, Walerga Road bisecting the project site from the southwest to the northeast, Town Center Avenue to the west, and Vineyard Road to the southeast. Additionally, the northern boundary of the project site is adjacent to the Roseville City Limits, and the southern boundary of the project site is located approximately 1.2 miles from the Placer County/Sacramento County line.

The Placer County General Plan/DCWPCP land use designations for the project site are Rural-Low Density Residential (1-2.3 acre minimum) (RLDR) and Greenbelt and Open Space (OS). The site is zoned Residential Single-Family, combining Agriculture, combining a minimum Building Site of 40,000 square feet, combining Planned Residential Development of one dwelling unit per acre (RS-AG-B-40 PD=1), and Open Space, combining Planned Residential Development of one dwelling unit per acre (O PD=1).

Project Description

The proposed project would include the development of two separate residential communities over the course of five phases. Phase 1 would consist of the 220-unit Estia Dry Creek development, and Phases 2A, 2B, 3, and 4 would consist of the 212-lot Placer Creek Residential development. Development of Phases 1, 2A, and 2B would occur on the northern portion of the site, north of Walerga Road, and development of Phases 3 and 4 would occur on the southern portion of the site, south of Walerga Road. The gross project density would be approximately 4.6 residential units per acre.

Various associated improvements would be included in the development of the proposed project, including, but not limited to, parks, trails, landscaping, and utility installation. Circulation system improvements would include vehicular access to each phase of the proposed project, including a new driveway from Baseline Road for access to Phase 1, new roadway connections from Walerga Road for access to Phases 2 and 3, and the western extension of Vineyard Road for access to Phase 4. From the proposed access points, the proposed project would be served by an internal roadway system with vehicle gates at the proposed Phase 3 and 4 access points. Phase 1 would also be gated on both sides of the parking lot at the entrance from Baseline Road.

As detailed in the Project Description chapter of this EIR, the applicant intends to satisfy the project's affordable housing requirements through an equivalency proposal including rezoning and transferring the fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the Riolo Vineyard Specific Plan (RVSP). This EIR also evaluates an alternative means by which the proposed project can meet the County's affordable housing regulations by providing a minimum of 22 Accessory Dwelling Units (ADUs) on lots with single-family residential units.

The proposed project would include development of a 2.1-acre public neighborhood park in Phase 2 of the Placer Creek Residential portion of the project. The proposed project would include approximately 9.9 acres of open space bisected by Placer Creek and situated between the Placer Creek Residential Phases 3 and 4 neighborhoods. In addition, the proposed project would include an approximately 1,300-foot-long Class I meandering trail along the Baseline Road frontage, and an approximately 2,300-foot-long Class I meandering trail along the southern/eastern Walerga Road frontage. Placer Creek Residential Phase 4 would also include an approximately 1,600-foot-long Class I trail on the southern side of Placer Creek, providing connection from Walerga Road at the western Emergency Vehicle Access (EVA) entry of Phase 4, traversing east, and connecting to the stubbed path north of the three existing Sun Valley Oaks homes fronting White Mill Crescent Road at Vineyard Road. From the proposed trail, a pedestrian bridge would go over Placer Creek and connect to a trail south of Phase 3, ultimately connecting to N Street within the Placer Creek Residential Phase 3 neighborhood. The project would also implement 2,130 feet of minor enhancements to the abandoned Old Walerga Road right-of-way corridor that separates the project site from Placer Vineyards to the west. The corridor is privately-owned and encumbered by existing public utility easements; accordingly, any proposed enhancements would be subject to landowner consent, utility coordination, and applicable approvals, and would not be implemented absent such consent.

The proposed project would require County approval of a General Plan/DCWPCP Amendment, Rezone, Vesting Large Lot Tentative Subdivision Map, Vesting Phased Small Lot Tentative Subdivision Map, Design Review, Variance, and three service area annexations.

The off-site affordable housing parcel, if chosen in order to satisfy the project's affordable housing requirements, would require County approval of a General Plan/RVSP Amendment, Rezone, and Development Agreement Amendment.

The details of the proposed project, including required approvals, are described in further detail in Chapter 3, Project Description, of this EIR.

1.4 EIR PROCESS

The EIR process begins with the decision by the lead agency to prepare an EIR, either during a preliminary review of a project or at the conclusion of an Initial Study. Once the decision is made to prepare an EIR, the lead agency sends a Notice of Preparation (NOP) to appropriate government agencies, including the Governor's Office of Land Use and Climate Innovation (LCI), to each responsible and trustee agency, and to the county clerk of each county in which the project will be located. Upon receipt of the NOP, the responsible and trustee agencies and LCI have 30 days in which to provide the lead agency with specific details about the scope and content of the environmental information related to the responsible agency's or trustee agency's area of statutory responsibility that must be included in the draft EIR. The responses shall identify, at a minimum, (i) the significant environmental issues and reasonable alternatives and mitigation measures that the responsible or trustee agency, or LCI will need to have explored in the draft EIR; and (ii) whether the agency will be a responsible agency or trustee agency for the project. The State Clearinghouse (SCH) within LCI will ensure that responsible and trustee State agencies reply within the required time. The SCH assigns an identification number to the project, which then becomes the identification number for all subsequent environmental documents on the project.

The NOP completed for the proposed project was circulated to the public; local, State and federal agencies; and other known interested parties for a 30-day review period from April 7, 2025, to May 7, 2025 (see Appendix A).

Upon completion of the Draft EIR and prior to circulation to State and local agencies and interested members of the public, a notice of completion is filed with the SCH and a public notice of availability is published to inform interested parties that a Draft EIR is available for agency and public review. In addition, the notice provides information regarding the location where copies of the Draft EIR are available for public review and any public meetings or hearings that are scheduled. The Draft EIR is circulated for a minimum period of 45 days, during which time reviewers may submit comments on the document to the lead agency. The lead agency must respond in writing to significant environmental issues raised in timely comments. If significant new information, as defined in CEQA Guidelines Section 15088.5, is added to an EIR after public notice of availability is given but before certification of the EIR, the revised EIR or affected chapters must be recirculated for an additional public review period with related comments and responses.

A Final EIR will be prepared, containing public comments on the Draft EIR and written responses to those comments, as well as a list of any changes to the Draft EIR text necessitated by public comments, as warranted. Before approving a project, the lead agency must certify that the EIR (consisting of the Draft EIR and Final EIR) has been completed in compliance with CEQA, and that the EIR has been presented to the decision-making body of the lead agency, which has reviewed and considered the EIR. The lead agency must also certify that the EIR reflects the lead agency's independent judgment and analysis.

Prior to project approval, the lead agency's decision-making body (here, the Placer County Board of Supervisors) must adopt what are commonly known as "CEQA Findings," which must (i) identify all significant environmental effects of a proposed project, (ii) identify all mitigation measures that will be adopted, (iii) explain why any proposed mitigation measures that have been rejected are infeasible, and (iv) address the feasibility of any EIR alternatives potentially available to reduce the severity of any significant unavoidable effects of the proposed project. These findings must

be based on substantial evidence in the administrative record and must include explanations that bridge the gap between evidence in the record and the conclusions required by CEQA. If the decision-making body elects to proceed with a project that would have unavoidable significant impacts, then that body must also adopt a Statement of Overriding Considerations explaining why, notwithstanding those unavoidable impacts, the body has determined that the specific economic, legal, social, technological, or other benefits of the project, including region-wide or statewide environmental benefits, outweigh those impacts and render them acceptable.

1.5 SCOPE OF THE EIR

An Initial Study has not been prepared for the proposed project, as the EIR addresses all CEQA-required environmental topics identified in the CEQA Guidelines. The following environmental issue areas are addressed in the EIR:

- Aesthetics;
- Agricultural Resources;
- Air Quality and Greenhouse Gas Emissions;
- Biological Resources;
- Cultural Resources;
- Energy;
- Geology and Soils;
- Hazards and Hazardous Materials;
- Hydrology and Water Quality;
- Land Use and Planning/Population and Housing;
- Noise;
- Public Services and Utilities;
- Transportation;
- Tribal Cultural Resources; and
- Wildfire.

In addition to the foregoing resource areas, Chapter 19, Effects Not Found to be Significant, has been prepared to present information regarding resource areas that do not have the potential to be affected by the proposed project.

The evaluation of effects is presented on a resource-by-resource basis in Chapters 4 through 18 of the EIR. Each chapter is divided into the following four sections: Introduction, Existing Environmental Setting, Regulatory Context, and Impacts and Mitigation Measures. Impacts that are determined to be significant in Chapters 4 through 18, and for which feasible mitigation measures are not available to reduce those impacts to a less-than-significant level, are identified as *significant and unavoidable*. Chapter 19 of the EIR presents a discussion of the environmental effects not found to be significant. Chapter 20 of the EIR presents a discussion of growth-inducing impacts, summary of cumulative impacts, and significant irreversible environmental changes associated with the project. Alternatives to the proposed project are discussed in Chapter 21 of the EIR.

1.6 DEFINITION OF BASELINE

According to CEQA Guidelines Section 15125, an EIR must include a description of the existing physical environmental conditions in the vicinity of the project to provide the “baseline physical conditions” against which project-related changes can be compared. In addition, CEQA

Guidelines Section 15126.2(a) states that an EIR shall identify and focus on the significant environmental effects of the proposed project. The CEQA Guidelines, Section 15126.2(a), states in pertinent part:

> An EIR shall identify and focus on the significant environmental effects of the proposed project. In assessing the impact of a proposed project on the environment, the lead agency should normally limit its examination to changes in the existing physical conditions in the affected area as they exist at the time the notice of preparation is published, or where no notice of preparation is published, at the time environmental analysis is commenced.

Normally, the baseline condition is the physical condition that exists when the NOP is published. The NOP for the proposed project was published on April 7, 2025. Therefore, conditions existing at that time are considered to be the baseline against which changes that would result from the proposed project are evaluated. Impacts could include both direct and reasonably foreseeable indirect physical changes to the baseline condition. The baseline condition for the proposed project site is described in Chapter 3, Project Description, of this EIR. The baseline conditions pertaining to each resource area are also described in the "Existing Environmental Setting" section of the respective chapters of this EIR.

In addition, with regard to the baseline conditions for the off-site affordable housing parcel, as described further in Chapter 3, Project Description, of this EIR, the off-site affordable housing parcel is within the RVSP and is currently approved for development. In cases where a project is undergoing subsequent review under CEQA, the "baseline" for the purposes of CEQA is adjusted such that the originally approved project is assumed to exist.[1] However, the analysis of the off-site affordable housing parcel included within this EIR is not considered a subsequent review pursuant to CEQA Guidelines Section 15162 through 15164 (e.g., a Subsequent EIR, Supplemental EIR, or Addendum). Thus, the baseline conditions for the off-site affordable housing parcel are conservatively assumed to be the existing conditions of the parcel. Notwithstanding, for informational purposes, certain sections of this EIR provide a comparison between the approved RVSP development and the proposed development conditions of the off-site affordable housing parcel.

1.7 SIGNIFICANCE CRITERIA

The CEQA Guidelines define a significant effect on the environment as "a substantial, or potentially substantial adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic and aesthetic significance." In addition, the Guidelines state, "An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant." (CEQA Guidelines Section 15382).

As presented in Section 1.12 below, the level of significance of an impact prior to mitigation is included at the end of each impact discussion throughout the technical chapters of this EIR. The following levels of significance prior to mitigation are used in this EIR:

[1] See Michael H. Remy et al. *Guide to CEQA, 11th Edition*. Point Arena: Solano Press Books (2007), pg. 207; Stephen L. Kostka and Michael H. Zischke. *Practice Under the Environmental Quality Act, Second Edition* (Vol. 1). Oakland: Continuing Education of the Bar (2018), pgs. 12-32; *Benton v. Board of Supervisors* (1st Dist. 1991) 226 Cal. App. 3d 1467.

1) Less than Significant: Impacts that are insubstantial, do not exceed the specified standards of significance, and do not require any mitigation to reduce impacts;
2) Significant: Impacts that exceed the defined standards of significance and require mitigation;
3) Less than Cumulatively Considerable: Where cumulative impacts have been identified, but the project's incremental contribution towards the cumulative impacts would not be considered significant in and of itself; and
4) Cumulatively Considerable: Where cumulative impacts have been identified and the project's incremental contribution towards the cumulative impacts would be considered significant in and of itself.

If an impact is determined to be significant or cumulatively considerable, mitigation is included, if available, in order to reduce the specific impact to the maximum extent feasible. A statement of the level of significance of an impact after mitigation is also included in each impact discussion throughout the technical chapters of this EIR. The following levels of significance after implementation of mitigation are used in the EIR:

1) Less than Significant: Impacts that exceed the defined standards of significance but can be eliminated or reduced to a less-than-significant level through the implementation of feasible mitigation measures;
2) Less than Cumulatively Considerable: Where the project's incremental contribution towards cumulative impacts would be eliminated or reduced to a less than cumulatively considerable level through the implementation of feasible mitigation measures; and
3) Significant and Unavoidable Impact: An impact (project-level or cumulative) that cannot be eliminated or reduced to a less-than-significant or less than cumulatively considerable level through the implementation of feasible mitigations measures.

Each environmental area of analysis uses a distinct set of significance criteria. Where measurable and explicit quantification of significance is identified, such as violation of an ambient noise level standard, this measurement is used to assess the level of significance of a particular impact in this EIR. If criteria for determining significance relative to a specific environmental resource impact are not identified in CEQA or the CEQA Guidelines, criteria were developed for this EIR.

The significance criteria are identified at the beginning of the Impacts and Mitigation Measures section in each of the technical chapters of this EIR. Although significance criteria are necessarily different for each resource considered, the provided significance levels ensure consistent evaluation of impacts for all resource areas evaluated.

1.8 NOTICE OF PREPARATION AND SCOPING

In accordance with CEQA Guidelines Section 15082, an NOP was circulated to the public; local, State and federal agencies; and other known interested parties for a 30-day public and agency review period from April 7, 2025 to May 7, 2025 (see Appendix A). The purpose of the NOP was to provide notification that an EIR for the proposed project was being prepared and to solicit public input on the scope and content of the document.

Pursuant to CEQA Guidelines Section 15082, Placer County held an NOP scoping meeting for the EIR during the 30-day review period, on April 24, 2025, for the purpose of receiving comments on the scope of the environmental analysis to be prepared for the proposed project. Agencies and members of the public were invited to attend and provide input on the scope of the EIR. All

comments were taken into consideration during the preparation of this EIR. A summary of the NOP comments received, including the verbal comments received at the NOP scoping meeting, is provided in Section 1.9 below.

1.9 COMMENTS RECEIVED ON THE NOTICE OF PREPARATION

During the NOP public review period from April 7, 2025 to May 7, 2025, Placer County received 15 comment letters. A copy of each letter is provided in Appendix B of this EIR. Two verbal comments were received during the NOP scoping meeting on April 24, 2025. The comment letters and verbal comments received were issued by the following representatives of public agencies and groups, as well as individual members of the general public:

Public Agencies

- California Department of Transportation (Caltrans) – Gary S. Arnold;
- Central Valley RWQCB – Peter G. Minkel;
- Native American Heritage Commission (NAHC) – Pricilla Torres-Fuentes;
- Pacific Gas and Electric Company (PG&E) – Plan Review Team, Land Management;
- Placer County Air Pollution Control District (PCAPCD) – Laura Navarro; and
- Placer County Local Agency Formation Commission (LAFCo) – Amanda Ross

Groups

- Redbud Chapter – California Native Plant Society (CNPS) – Sue Stack and Jeanne Wilson;
- Sierra Club Placer Group – Harry White; and
- Sierra Foothills Audubon Society – Donald L. Rivenes

Individuals

- Laura Bullard (3);
- Patty Greene;
- Lisa Mendenhall;
- Abe Nelson;
- John Schell; and
- Harry White.

The following list, categorized by issue, summarizes the concerns brought forth in the comment letters and verbal comments received on the scope of the EIR:

Aesthetics *(see Chapter 4)*	Concerns related to: • Change from natural landscape to development. • Changes to character of neighborhood. • Emphasizing the use of California native plants. • Landscaping designed to allow PG&E to access facilities and adhere to guidelines for safe landscaping.
Agricultural Resources *(see Chapter 5)*	Concerns related to: • Potential agricultural impacts. • Potential impacts to prime agricultural land under Government Code Section 56064. • Converting natural lands into urban uses.

Air Quality and Greenhouse Gas Emissions *(see Chapter 6)*	Concerns related to: • The use of natural gas and associated health impacts. • Compliance with all permitting requirements. • Fugitive dust generation. • Implementation of a dust control plan. • The use of wood burning appliances.
Biological Resources *(see Chapter 7)*	Concerns related to: • Impedance of the Placer County Conservation Plan's (PCCP's) ability to meet its biological goals and objectives. • Inclusion of adequate avoidance, minimization, and/or mitigation measures for all potential impacts. • Potential direct, indirect, and cumulative impacts to biological resources during construction and operation. • The reduction of open space. • Preservation of native plants. • Habitat connectivity. • Impacts to wildlife corridors. • Encroachment into stream corridors. • The spread of invasive weeds. • Compliance with requirements of the DCWPCP.
Hazards and Hazardous Materials *(see Chapter 11)*	Concerns related to: • Storage of fuel or combustibles within PG&E's easement.
Hydrology and Water Quality *(see Chapter 12)*	Concerns related to: • Compliance with all permitting requirements. • Potential water supply impacts. • Potential impacts to surface and groundwater quality during construction and operation. • Implementation of a Storm Water Prevention Plan.
Land Use and Planning/Population and Housing *(see Chapter 13)*	Concerns related to: • Variances, rezoning, and consistency with the existing neighborhood. • Consistency with City or County General and Specific Plans.
Noise *(see Chapter 14)*	Concerns related to: • Noise impacts from increased traffic.
Public Services and Utilities *(see Chapter 15)*	Concerns related to: • Increased demand on public services with population increase. • Impacts to existing PG&E gas transmission pipelines.
Transportation *(see Chapter 16)*	Concerns related to: • Increased traffic. • Increase in vehicle miles travelled (VMT). • Impact to operations and safety of the State Highway System. • Impacts to nearby County and City roads. • Consistency with the Sacramento Council of Governments Regional Transportation Plan/Sustainable Communities Strategy. • The extension of Vineyard Road through to Walerga Road. • Vehicle access to the proposed project.
Tribal Cultural Resources *(see Chapter 17)*	Concerns related to: • Potential presence of tribal cultural resources at project site. • Compliance with tribal consultation pursuant to Senate Bill (SB) 18 and Assembly Bill (AB) 52.

All of these issues are addressed in this EIR, in the relevant sections identified in the first column.

1.10 DRAFT EIR AND PUBLIC REVIEW

This Draft EIR is being circulated for public review and comment for a period of 45 days. During this period, the general public, organizations, and agencies can submit comments to the Lead Agency on the Draft EIR's accuracy and completeness. Release of the Draft EIR marks the beginning of a 45-day public review period pursuant to CEQA Guidelines Section 15105. The public can review the Draft EIR at the County's website at:

https://www.placer.ca.gov/10218/Estia-Dry-Creek-and-Placer-Creek-Residen

Comments may be submitted in written form and/or orally at the public hearing on the Draft EIR. Notice of the time and location of the hearing will be published in local newspapers, mailed to property owners and residents surrounding the project, emailed to residents that have requested to be placed on the project's email notification list, posted on the County's website, and posted at and adjacent to the site prior to the hearing.

All comments or questions regarding the Draft EIR should be addressed to:

Placer County, Community Development Resource Agency
Environmental Coordination Services
3091 County Center Drive, Suite 190
Auburn, CA 95603
(530) 745-3132
fax (530) 745-3080
cdraecs@placer.ca.gov

1.11 ORGANIZATION OF THE DRAFT EIR

The EIR is organized into the following sections:

Chapter 1 – Introduction

Provides an introduction and overview describing the intended use of the EIR and the review and certification process, as well as summaries of the issues and concerns received from the public and public agencies during the NOP review period.

Chapter 2 – Executive Summary

Summarizes the elements of the project and the environmental impacts that would result from implementation of the proposed project, describes proposed mitigation measures, and indicates the level of significance of impacts after mitigation. In addition, the Executive Summary includes a summary of the project alternatives and areas of known controversy.

Chapter 3 – Project Description

Provides a detailed description of the proposed project, including the project's location, background information, objectives, and technical characteristics.

Chapter 4 – Aesthetics

The Aesthetics chapter of the EIR describes existing aesthetic resources for the project area and the region, and evaluates potential aesthetic impacts of the project. In addition, the DCWPCP goals and policies pertaining to aesthetics are described. According to Appendix G to the CEQA

Guidelines, the concept of aesthetic resources refers to scenic vistas, scenic resources (such as trees, rock outcroppings, and historic buildings within a State Scenic Highway), conflicts with applicable zoning and other regulations governing scenic quality, and light and glare impacts.

Chapter 5 – Agricultural Resources

The Agricultural Resources chapter of the EIR summarizes the status of the existing agricultural resources within the boundaries of the project site, using the current State model and data, including identification of any Prime/Unique Farmland or Farmland of Statewide Importance within the project boundaries. If Prime/Unique Farmland or Farmland of Statewide Importance is determined to be on-site, the analysis will address the conversion of said lands to residential uses. In addition, any conflicts with existing zoning for agricultural use or right-to-farm ordinances applicable to the proposed project will be identified.

Chapter 6 – Air Quality and Greenhouse Gas Emissions

The Air Quality and Greenhouse Gas (GHG) Emissions chapter of the EIR describes the impacts of construction and operation of the proposed project related to air quality and global climate change. The chapter was prepared using methodologies and assumptions recommended within the CEQA Air Quality Handbook of the PCAPCD, as well as the GHG reduction measures included in the Placer County Sustainability Plan (PCSP).

Chapter 7 – Biological Resources

The Biological Resources chapter of the EIR evaluates the biological resources known to occur or potentially occur within the project area. The chapter uses information from the Placer County Conservation Plan (PCCP), describes potential impacts to protected biological resources and identifies measures to eliminate or substantially reduce those impacts.

Chapter 8 – Cultural Resources

The Cultural Resources chapter of the EIR evaluates archaeological and historical resources known to be located within the project area, as well as the potential for discovering unknown resources. The chapter summarizes the existing setting with respect to the aforementioned resources, identifies thresholds of significance and project impacts to such resources, and sets forth mitigation measures that would be necessary to reduce impacts.

Chapter 9 – Energy

The Energy chapter of the EIR discusses the potential impacts of the proposed project related to wasteful, inefficient, or unnecessary consumption of energy resources during project construction and operation. The chapter also evaluates the project consistency with applicable State or local plans for renewable energy, including the PCSP. The chapter includes a discussion of the existing energy setting and whether the proposed project would result in impacts associated with energy use.

Chapter 10 – Geology and Soils

The Geology and Soils chapter of the EIR describes the geologic and soil characteristics of the project site and evaluates the extent to which implementation of the proposed project could be affected by seismic hazards such as ground shaking, liquefaction, and expansive/unstable soils. In addition, the chapter identifies any known paleontological resources or unique geologic features within the project area and evaluates any potential adverse effects of the proposed project on such resources.

Chapter 11 – Hazards and Hazardous Materials

The Hazards and Hazardous Materials chapter of the EIR describes existing and potential hazards and hazardous materials within the project area. The chapter discusses potential impacts posed by these hazards to the surrounding environment.

Chapter 12 – Hydrology and Water Quality

The Hydrology and Water Quality chapter of the EIR describes existing drainage and stormwater conditions for the project site, as well as current stormwater flows and stormwater infrastructure, and potential for flooding. The chapter evaluates potential impacts of the proposed project with respect to increases in impervious surface area and associated stormwater flows, degradation of water quality, groundwater recharge, and on- and off-site flooding.

Chapter 13 – Land Use and Planning/Population and Housing

The Land Use and Planning/Population and Housing chapter of the EIR examines the proposed project's compatibility with existing land uses in the area, and current General Plan and DCWPCP policies adopted for the purpose of avoiding or mitigating an environmental effect. The chapter further evaluates the potential of the proposed project to induce substantial population growth within the area, either directly or indirectly.

Chapter 14 – Noise

The Noise chapter of the EIR describes the existing noise environment in the project vicinity and identifies potential impacts and mitigation measures related to the construction and operation of the proposed project, as well as potential impacts of construction vibration. The method by which the potential impacts are analyzed is discussed, followed by the identification of potential impacts and the recommended mitigation measures designed to reduce significant impacts.

Chapter 15 – Public Services and Utilities

The Public Services and Utilities chapter of the EIR addresses fire and law enforcement services, schools, parks, and recreation facilities, and other public facilities such as libraries. In addition, the chapter evaluates the proposed project's increase in water supply demand and wastewater generation in comparison to the capacity of the existing water and sewer infrastructure systems. The chapter also evaluates the proposed project's increase in solid waste disposal needs, as well as electricity and natural gas services.

Chapter 16 – Transportation

The Transportation chapter of the EIR discusses existing transportation and circulation conditions within the project area and the effects to the roadway network as a result of the proposed project and future, projected growth. VMT is used as the metric for assessing transportation impacts, consistent with the CEQA Guidelines. The analysis includes consideration of transit, bicycle, and pedestrian impacts, as well as emergency evacuation and roadway safety.

Chapter 17 – Tribal Cultural Resources

The Tribal Cultural Resources chapter of the EIR addresses known tribal cultural resources in the vicinity of the project area and the potential for tribal cultural resources to be present on the project site. The chapter summarizes the existing setting with respect to tribal cultural resources, identifies thresholds of significance, discusses the results of AB 52 and SB 18 consultation, evaluates project impacts to such resources, and sets forth mitigation measures designed to reduce impacts.

Chapter 18 – Wildfire
The Wildfire chapter of the EIR includes an evaluation of whether the proposed project would exacerbate the risk for wildfires, expose people and/or structures to significant wildfire risks, substantially impair an adopted emergency response plan or emergency evacuation plan, or expose people or structures to significant risks, including downslope flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes. The chapter offers mitigation measures to eliminate or substantially reduce impacts, as necessary.

Chapter 19 – Effects Not Found to be Significant
The Effects Not Found to be Significant chapter of the EIR addresses the project's effects that were determined not to be significant. CEQA Guidelines Section 15128 requires a brief discussion explaining why these effects were not found to be significant.

Chapter 20 – Statutorily Required Sections
The Statutorily Required Sections chapter of the EIR provides discussions required by CEQA regarding impacts that would result from the proposed project, including a summary of cumulative impacts, potential growth-inducing impacts, significant and unavoidable impacts, and significant irreversible changes to the environment.

Chapter 21 – Alternatives Analysis
The Alternatives Analysis chapter of the EIR describes and evaluates a reasonable range of potentially feasible alternatives to the proposed project. The alternatives are analyzed at a level of detail less than that of the proposed project; however, the analyses include sufficient detail to allow for a meaningful comparison of impacts.

Chapter 22 – EIR Authors and Persons Consulted
The EIR Authors and Persons Consulted chapter of the EIR lists EIR and technical report authors who provided technical assistance in the preparation and review of the EIR.

Chapter 23 – References
The References chapter of the EIR provides bibliographic information for all references and resources cited.

Appendices
The Appendices include the NOP, comments received during the NOP comment period, and technical reports prepared for the proposed project.

1.12 TECHNICAL CHAPTER FORMAT
Each technical chapter addressing a specific environmental issue begins with an **introduction** describing the purpose of the section. The introduction is followed by a description of the project's **existing environmental setting** as the setting pertains to that particular issue. The setting description is followed by the **regulatory context** and the **impacts and mitigation measures** discussion, which contains the **standards of significance**, followed by the **method of analysis**. The **impact and mitigation measures** discussion includes impact statements prefaced by a number in bold-faced type (for both project-level and cumulative analyses). An explanation of each impact and an analysis of the impact's significance follow each impact statement. All mitigation measures pertinent to each individual impact follow directly after the impact statement (see below). The extent of mitigation provided by identified mitigation measures is also evaluated. An example of the format is shown below:

Project-Specific Impacts and Mitigation Measures

The following discussion of impacts is based on the implementation of the proposed project in comparison with the standards of significance.

X-1 Statement of Impact

Discussion of impact for the proposed project in paragraph format.

Statement of ***level of significance*** of impact prior to mitigation is included at the end of each impact discussion. The following levels of significance are used in the EIR: less than significant, significant, or significant and unavoidable. If an impact is determined to be significant, mitigation will be included in order to reduce the specific impact to the maximum extent feasible. Impacts that cannot be reduced to a less-than-significant level with implementation of all feasible mitigation would be considered to remain significant and unavoidable.

Mitigation Measure(s)

Statement of *level of significance* after the mitigation is included immediately preceding mitigation measures.

X-1(a) *Required mitigation measure(s) presented in italics and numbered in consecutive order.*

X-1(b) *Required additional mitigation measure, if necessary.*

Cumulative Impacts and Mitigation Measures

The following discussion of cumulative impacts is based on implementation of the proposed project in combination with cumulative development within the applicable area or region.

X-2 Statement of Cumulative Impact

Discussion of cumulative impacts for the proposed project in paragraph format.

As discussed in detail in Chapter 20, Statutorily Required Sections, of the EIR, the cumulative setting for the proposed project is generally considered to be development anticipated to occur upon buildout of Estia Dry Creek and Placer Creek Residential Project, as well as buildout of a number of approved or reasonably foreseeable projects within the DCWPCP area (i.e., the Placer Vineyards Specific Plan [PVSP], RVSP, etc.).

Statement of ***level of significance*** of cumulative impact prior to mitigation is included at the end of each impact discussion. The following levels of significance are used in the EIR for cumulative impacts: less than significant, less than cumulatively considerable, cumulatively considerable, or significant and unavoidable. If an impact is determined to be cumulatively considerable, mitigation will be included in order to reduce the specific impact to the maximum extent feasible. Impacts that cannot be reduced to a less than cumulatively considerable level with the implementation of all feasible mitigation would be considered to remain significant and unavoidable.

Mitigation Measure(s)

Statement of *level of significance* after the mitigation is included immediately preceding mitigation measures.

X-2(a) *Required mitigation measure(s) presented in italics and listed in consecutive order.*

X-2(b) *Required additional mitigation measure, if necessary.*

1.13 FINAL EIR AND EIR CERTIFICATION

Upon completion of the Draft EIR public review period, a Final EIR will be prepared. It will include written and verbal comments on the Draft EIR received during the public review period and responses to significant environmental issues raised in those comments. The Final EIR will also include the Mitigation Monitoring and Reporting Plan (MMRP) prepared in accordance with PRC Section 21081.6. The Final EIR will include any revisions to the Draft EIR made in response to public comments. The Draft EIR and Final EIR together will comprise the EIR for the proposed project. Before the County Board of Supervisors can consider approval of the project, the Board must first certify that the EIR has been completed in compliance with CEQA, that the Board has reviewed and considered the information in the EIR, and that the EIR reflects the independent judgment of the County. The County will also be required to adopt Findings of Fact, and, for any impacts determined to be significant and unavoidable, adopt a Statement of Overriding Considerations.

2. Executive Summary

2. EXECUTIVE SUMMARY

2.1 INTRODUCTION

The Executive Summary chapter of the EIR provides an overview of the proposed project (see Chapter 3, Project Description, for further details) and provides a table summary of the conclusions of the environmental analysis provided in Chapters 4 through 18. This chapter also summarizes the alternatives to the proposed project that are described in Chapter 21, Alternatives Analysis, and identifies the Environmentally Superior Alternative. Table 2-1 contains the environmental impacts associated with the proposed project, the significance of the impacts, the proposed mitigation measures for the impacts, and the significance of the impacts after implementation of the mitigation measures.

2.2 SUMMARY DESCRIPTION OF THE PROPOSED PROJECT

The project site consists of approximately 92.2 gross (87.6 net) acres located south of Baseline Road, immediately east of the abandoned Old Walerga Road right-of-way, west of the Fiddyment Road/Baseline Road/Walerga Road intersection and the western portion of Sun Valley Oaks residential subdivision, and north of the Morgan Creek residential subdivision in the Dry Creek-West Placer Community Plan Area (DCWPCP) of unincorporated Placer County. Walerga Road, which curves from the northeast to the southwest, separates the northern 52.3-acre portion of the project site, identified by Assessor's Parcel Number (APN) 023-221-076, and the southern 35.3-acre portion of the project site, identified by APN 023-221-074.

The project site is bisected by Walerga Road, which generally curves from northeast to southwest. The 52.3-acre northern portion of the site (APN 023-221-076) is bounded by Baseline Road to the north and Walerga Road to the south. The northern portion of the site is undeveloped, consists of non-native annual grassland with gently rolling topography, and is interspersed with seasonal wetlands and vernal pools. The 35.3-acre southern portion of the site (APN 023-221-074) is bounded by Walerga Road to the north and west. The southern portion of the site includes a paved sewer easement which extends from Vineyard Road to the east and Walerga Road to the west. In addition, the southern portion of the site includes undeveloped annual grassland with gently rolling topography, interspersed with seasonal wetlands, vernal pools, and is bisected by an un-named tributary of Dry Creek (named "Placer Creek" for this project) which flows east to west. The Federal Emergency Management Agency (FEMA) 100-year floodplain, containing approximately 4.7 acres, is located within the Placer Creek tributary area, which bisects the southern portion of the project site. A band of oak woodlands is located along the Placer Creek riparian corridor.

Roadways in the immediate project vicinity include Baseline Road to the north, Walerga Road bisecting the project site from the southwest to the northeast, Town Center Avenue to the west, and Vineyard Road to the southeast. Additionally, the northern boundary of the project site is contiguous to the Roseville City Limits, and the southern boundary of the project site is located approximately 1.2 miles from the Placer County/Sacramento County line.

The Placer County General Plan/DCWPCP land use designations for the project site are Rural-Low Density Residential (1-2.3 acre minimum) (RLDR), and Greenbelt and Open Space (OS).

The site is zoned Residential Single-Family, combining Agriculture, combining a minimum Building Site of 40,000 square feet, combining Planned Residential Development of one dwelling unit per acre (RS-AG-B-40 PD=1) and Open Space, combining Planned Residential Development of one dwelling unit per acre (O PD=1).

The proposed project includes the development of two separate residential communities over the course of five phases. Phase 1 would consist of the 220-unit multi-family Estia Dry Creek development, and Phases 2A, 2B, 3, and 4 would consist of the 212-lot detached single-family Placer Creek Residential development. Development of Phases 1, 2A, and 2B would occur on the northern portion of the site (APN 023-221-076), north of Walerga Road, and development of Phases 3 and 4 would occur on the southern portion of the site (APN 023-221-074), south of Walerga Road. The gross project density would be approximately 4.6 residential units per acre.

Various associated improvements would be included in the development of the proposed project, including, but not limited to, parks, trails, landscaping, and utility installation. Circulation system improvements would include a new gated driveway located along Baseline Road, to the north of the site, providing access to the Phase 1 development; access to the Phase 2 neighborhood by a Springhill Drive extension and a new roadway off of Walerga Road between Springhill Drive and Town Center Avenue; access to Phase 3 from a new eastern/fourth leg of the existing signalized intersection at Walerga Road and Town Center Avenue; and access to Phase 4 from the western extension of Vineyard Road.

The proposed project would include development of a public, 2.1-acre neighborhood park in the Placer Creek Residential Phase 2 development and approximately 9.9 acres of open space bisected by “Placer Creek” and situated between the Placer Creek Residential Phase 3 and 4 neighborhoods. In addition, the proposed project would include an approximately 1,300-foot-long Class I meandering trail along the Baseline Road frontage, and an approximately 2,300-foot-long Class I meandering trail along the southern/eastern Walerga Road frontage. Placer Creek Residential Phase 4 would also include an approximately 1,600-foot-long Class I trail on the southern side of Placer Creek, providing connection from Walerga Road at the western Emergency Vehicle Access (EVA) entry of Phase 4, traversing east and connecting to the stubbed path north of the three existing Sun Valley Oaks homes fronting White Mill Crescent Road at Vineyard Road. From the proposed trail, a pedestrian bridge would go over Placer Creek and connect to a trail south of Phase 3, ultimately connecting to N Street within the Placer Creek Residential Phase 3 neighborhood. The project would also implement 2,130 feet of minor enhancements to the abandoned Old Walerga Road right-of-way corridor that separates the project site from Placer Vineyards to the west. The corridor is privately-owned and encumbered by existing public utility easements; accordingly, any proposed enhancements would be subject to landowner consent, utility coordination, and applicable approvals, and would not be implemented absent such consent.

As detailed in the Project Description chapter of this EIR, the applicant intends to satisfy the project’s affordable housing requirements through an equivalency proposal including rezoning and transferring the fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the Riolo Vineyard Specific Plan (RVSP). This EIR also evaluates an alternative means by which the proposed project can meet the County’s affordable housing regulations by providing a minimum of 22 Accessory Dwelling Units (ADUs) on lots with single-family residential units.

The proposed project would require County approval of a General Plan/DCWPCP Amendment, Rezone, Vesting Large Lot Tentative Subdivision Map, Vesting Phased Small Lot Tentative Subdivision Map, Design Review, Variance, and three service area annexations.

The off-site affordable housing parcel, if chosen in order to satisfy the project's affordable housing requirements, would require County approval of a General Plan/RVSP Amendment, Rezone, and Development Agreement Amendment.

The proposed project, including required approvals, is described in further detail in Chapter 3, Project Description, of this EIR.

2.3 ENVIRONMENTAL IMPACTS AND MITIGATION

Under CEQA, a significant effect on the environment is defined as a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, mineral, flora, fauna, ambient noise, and objects of historic or aesthetic significance. Any feasible mitigation measures must be implemented as part of the approval of the proposed project to reduce potential adverse impacts to a less-than-significant level. Such mitigation measures are noted in this EIR and are found in the following technical chapters: Aesthetics; Air Quality and Greenhouse Gas Emissions; Biological Resources; Cultural Resources; Geology and Soils; Hydrology and Water Quality; Noise; Public Services and Utilities; Transportation; and Tribal Cultural Resources. The mitigation measures presented in the EIR will form the basis of the Mitigation Monitoring and Reporting Program (MMRP). Any impact that remains significant after implementation of mitigation measures is considered a significant and unavoidable impact.

In Table 2-1, provided at the end of this chapter, a summary of the proposed project impacts are identified for each technical chapter (Chapters 4 through 18) of the EIR. In addition, Table 2-1 includes the level of significance of each impact, any mitigation measures required for each impact, and the resulting level of significance after implementation of mitigation measures for each impact.

2.4 SUMMARY OF PROJECT ALTERNATIVES

The following section presents a summary of the evaluation of the alternatives considered for the proposed project, which include the following:

- No Project (No Build) Alternative;
- Reduced Project Alternative; and
- Resource Avoidance Alternative.

For a more thorough discussion of project alternatives, please refer to Chapter 21, Alternatives Analysis. As discussed therein, reasonable alternatives to the project must be capable of feasibly attaining most of the basic objectives of the project. The following project objectives have been developed by the project applicant:

1. Create a high-quality neighborhood environment containing a mix of residential, open space, and recreational land uses.
2. Develop a well-designed, economically feasible residential community that consists of a variety of residential products and unit types.

3. Offer an amenity-rich residential community that offers modern amenities and open spaces for residents, such as trails, parks, recreational areas, and gathering spaces.
4. Provide a comprehensively planned project that protects sensitive environmental habitat and resources, including existing riparian and oak woodland habitat on the project site, within a permanent greenbelt area providing a significant public benefit.
5. Use land resources efficiently by providing a well-planned development on an underutilized vacant site.
6. Promote pedestrian-oriented development, providing medium and high-density housing on a major transportation corridor and within walking distance of places of business and employment.
7. Provide a well-designed residential community with neighborhood identity in close proximity to jobs and services in Placer and Sacramento counties.
8. Increase the supply and diversity of housing types in the DCWPCP area that can support a wider range of lifestyles, consistent with the goals and policies of the County's Housing Element.
9. Assist in providing affordable housing and complying with Regional Housing Needs Allocation (RHNA) requirements by conveying a four-acre affordable housing site within the Riolo Vineyards Specific Plan area to Placer County.
10. Create a development of a density, scale and character that complements and is supportive of surrounding development.
11. Design a residential neighborhood that complements surrounding/existing neighborhoods by incorporating compatible land uses, lot sizes, street layouts while providing smooth transitions to adjacent neighborhoods through the appropriate setbacks, landscaping, and open space features; and establishing logical roadway and pedestrian connections consistent with the County's design principles.

No Project (No Build) Alternative

The No Project (No Build) Alternative assumes that the current conditions of the project site and off-site affordable housing parcel would remain, and the sites would not be developed. As described in this EIR, the northern portion of the project site (i.e., north of Walerga Road) is undeveloped, consists of non-native annual grassland with gently rolling topography, and is interspersed with seasonal wetlands and vernal pools. The southern portion of the project site similarly includes undeveloped annual grassland with gently rolling topography, interspersed with seasonal wetlands, vernal pools, and is bisected by Placer Creek, which flows east to west. The FEMA 100-year floodplain, containing approximately 4.7 acres, is located within the Placer Creek tributary area, which bisects the southern portion of the project site. A band of oak woodlands is located along the Placer Creek riparian corridor. The off-site affordable housing parcel is undeveloped and consists of grassy fields with gently rolling topography. The No Project (No Build) Alternative would not meet any of the project objectives and would not meet the overall intent of the DCWPCP's land use designation for the project site. Because the project site is assumed to remain in its current condition under the No Project (No Build) Alternative, all of the impacts resulting from the proposed project would not occur under the Alternative.

Reduced Project Alternative

Under the Reduced Project Alternative, Phases 3 and 4 of the proposed project would not be developed, and on-site open space around Placer Creek would be increased. Similar to the proposed project, the Reduced Project Alternative would require a General Plan/DCWPCP Amendment and rezone to change the residential portions of the northern portion of the project site to High Density Residential (HDR) and Medium Density Residential (MDR). Unlike the

proposed project, the entire portion of the project site south of Walerga Road would be designated OS. Under the Reduced Project Alternative, the MDR portion of the project site would be developed at a density of 3.17 dwelling units per acre (du/ac) and the HDR portion of the project site would be developed at a density of 9.5 du/ac.

The Reduced Project Alternative would result in the development of 105 fewer residential units (327 vs 432 units) than the proposed project. The 220 multi-family HDR units would remain the same under the Alternative, and the single-family MDR units would be reduced from 212 units to 107 units. Should the project applicant choose the affordable housing option to develop on-site ADUs, a total of 11 ADUs (10 percent of the 107 single-family residential units) would be included under the Alternative to satisfy the County's affordable housing obligation, for a total of 338 residential units. The open space area would be increased under the Alternative by 24.6 acres (34.5 vs 9.9 acres). Because the Reduced Project Alternative would include fewer single-family residential units than the proposed project, and Phases 3 and 4 of the proposed project would not be developed, the Alternative would result in a smaller area of disturbance as compared to the proposed project. As such, the Alternative would result in an overall lesser disturbance area and a larger open space area than the proposed project.

Similar to the proposed project, the Reduced Project Alternative would include development of a residential community with both multi-family and single-family units, as well as an open space area. Because the Alternative would not include development in the southern portion of the project site, development near Placer Creek would be avoided, and the construction of new stormwater outfalls into Placer Creek and the pedestrian bridge over Placer Creek would not occur. Off-site improvements required under the proposed project, including upgrades to the existing Community Facilities District #1 Sewer Lift Station and improvements to nearby intersections and roadways, would still occur under the Reduced Project Alternative.

Due to the residential nature of the Reduced Project Alternative, and because the design would generally resemble the proposed project, including open space, most project objectives would be fully or partially met by the Alternative. However, due to the reduced number of single-family residential units, the Reduced Project Alternative would satisfy Objective 8 to a lesser extent. The Reduced Project Alternative would result in fewer impacts as compared to impacts associated with the proposed project related to all of the eight issue areas for which significant project impacts were identified.

The significant and unavoidable impact related to Noise that was identified for the proposed project would remain under the Alternative. However, under the Reduced Project Alternative, fewer sensitive receptors would be exposed to significant temporary noise increases. As such, the significant and unavoidable impact would be reduced in intensity under the Reduced Project Alternative as compared to the proposed project.

Resource Avoidance Alternative

The Resource Avoidance Alternative would require a General Plan/DCWPCP Amendment and rezone to change the residential portions of the project site to MDR. Under the Resource Avoidance Alternative, the residential portion of the project site would be developed at a density of 3.81 du/ac with no multi-family residential units constructed. Under the Resource Avoidance Alternative, the overall disturbance area of the project site would be reduced, as the Alternative would include the development of 165 fewer residential units (267 vs 432 units) than the proposed project and residential development under the Alternative would be reduced by 3.1 acres (77.1

acres vs 80.2 acres). Should the project applicant choose the affordable housing option to develop on-site ADUs, a total of 27 ADUs (10 percent of the 267 single-family residential units) would be included under the Alternative to satisfy the County's affordable housing obligation, for a total of 294 residential units. The amount of on-site park area would be increased by 1.2 acres (3.3 vs 2.1 acres) and open space area would be increased by 1.9 acres (11.8 vs 9.9 acres) as compared to the proposed project in order to avoid the largest on-site vernal pool in the park lot, as well as the smaller vernal pool along the eastern Phase 3 site boundary.

Similar to the proposed project, the Resource Avoidance Alternative would include development of single-family units. However, the Alternative would not include development of multi-family units in the northern portion of the project site, and instead would develop single-family units throughout the residential areas of the project site. Upgrades to the off-site existing Community Facilities District #1 Sewer Lift Station would still occur under the Resource Avoidance Alternative.

Due to the residential nature of the Resource Avoidance Alternative, and because the Alternative would include open space, most project objectives would be fully or partially met. However, because the Alternative would develop 165 fewer residential units (excluding potential ADUs) than the proposed project, and would only develop single-family units, and not provide a mix of single-family and multi-family units, Objectives 2, 6, and 8 would not be met. The Resource Avoidance Alternative would result in impacts similar to those of the proposed project related to Noise, and fewer impacts related to the remaining seven issue areas for which significant project impacts were identified. The significant and unavoidable impact related to Noise that was identified for the proposed project would remain under the Alternative.

Environmentally Superior Alternative

An EIR is required to identify the environmentally superior alternative from among the range of reasonable alternatives that are evaluated. Section 15126(e)(2) of the CEQA Guidelines requires that an environmentally superior alternative be designated and states, "If the environmentally superior alternative is the 'no project' alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives." The No Project (No Build) Alternative would be considered the environmentally superior alternative, because the project site is assumed to remain in its current condition under the alternative. Consequently, many of the impacts resulting from the proposed project would not occur under the Alternative.

The No Project (No Build) Alternative would not meet any of the project objectives and would not meet the overall intent of the DCWPCP's land use designation for the project site. Because the Reduced Project Alternative and the Resource Avoidance Alternative would include the development of a residential neighborhood incorporating open space, and because the designs of each Alternative would generally resemble the proposed project, including the upgrades to the existing Community Facilities District #1 Sewer Lift Station and improvements to nearby intersections and roadways, most project objectives would be fully or partially met by each Alternative. However, due to the reduced number of single-family residential units, the Reduced Project Alternative would satisfy Objective 8 to a lesser extent than the proposed project. In addition, because the Resource Avoidance Alternative would only develop single-family units and would eliminate the multi-family unit component of the proposed project, the Resource Avoidance Alternative would not satisfy Project Objectives 2, 6, or 8. Overall, none of the alternatives would be as effective as the proposed project in satisfying the portion of the underlying purpose of the proposed project focused on addressing statewide and regional housing shortages.

The Reduced Project Alternative would result in fewer impacts as compared to impacts associated with the proposed project related to all of the eight issue areas for which significant project impacts were identified. The Resource Avoidance Alternative would result in impacts similar to those of the proposed project related to one issue area, and fewer impacts related to the remaining seven issue areas for which significant project impacts were identified. While the significant and unavoidable impact related to Noise identified for the proposed project would still occur under all of the Alternatives, the significant and unavoidable impact related to Noise would be reduced under the Reduced Project Alternative, but would be similar under the Resource Avoidance Alternative, as compared to the proposed project.

Based on the above, the Reduced Project Alternative would satisfy Project Objective 8 to a lesser extent, but would result in fewer impacts than the proposed project related to each issue area for which significant project impacts were identified, whereas the Resource Avoidance Alternative would not satisfy Project Objectives 2, 6, or 8 and would result in a similar impact for the short-term significant and unavoidable impact related to Noise. Therefore, the Reduced Project Alternative would be considered the Environmentally Superior Alternative. However, as discussed above, the significant and unavoidable impact related to Noise that was identified for the proposed project would still occur under the Reduced Project Alternative. As such, the number of significant and unavoidable impacts overall would be the same under the Reduced Project Alternative and the proposed project.

2.5 AREAS OF KNOWN CONTROVERSY

Areas of controversy that were identified in Notice of Preparation (NOP) comment letters, and are otherwise known for the project area, include concerns related to the following:

- Change from natural landscape to development;
- Changes to character of neighborhood;
- Emphasizing the use of California native plants;
- Landscaping designed to allow Pacific Gas & Electric Company (PG&E) to access facilities and adhere to guidelines for safe landscaping;
- Potential agricultural impacts;
- Potential impacts to prime agricultural land under Government Code Section 56064;
- Converting natural lands into urban uses;
- The use of natural gas and associated health impacts;
- Compliance with all permitting requirements;
- Fugitive dust generation;
- Implementation of a dust control plan;
- The use of wood burning appliances;
- Impedance of the Placer County Conservation Plan's (PCCP's) ability to meet its biological goals and objectives;
- Inclusion of adequate avoidance, minimization, and/or mitigation measures for all potential impacts;
- Potential direct, indirect, and cumulative impacts to biological resources during construction and operation;
- The reduction of open space;
- Preservation of native plants;
- Habitat connectivity;
- Impacts to wildlife corridors;

- Encroachment into stream corridors;
- The spread of invasive weeds;
- Compliance with requirements of the DCWPCP;
- Storage of fuel or combustibles within PG&E's easement;
- Compliance with all permitting requirements;
- Potential water supply impacts;
- Potential impacts to surface and groundwater quality during construction and operation;
- Implementation of a Storm Water Prevention Plan;
- Variances, rezoning, and consistency with the existing neighborhood;
- Consistency with City or County General and Specific Plans;
- Noise impacts from increased traffic;
- Increased demand on public services with population increase;
- Impacts to existing PG&E gas transmission pipelines;
- Increased traffic;
- Increase in vehicle miles travelled (VMT);
- Impact to operations and safety of the State Highway System;
- Impacts to nearby County and City roads;
- Consistency with the Sacramento Council of Governments Regional Transportation Plan/Sustainable Communities Strategy;
- The extension of Vineyard Road through to Walerga Road;
- Vehicle access to the proposed project;
- Potential presence of tribal cultural resources at project site; and
- Compliance with tribal consultation pursuant to Senate Bill (SB) 18 and Assembly Bill (AB) 52.

Table 2-1
Summary of Impacts and Mitigation Measures

Impact		Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
4. Aesthetics				
4-1	**Have a substantial adverse effect on a scenic vista.**	LS	*None required.*	N/A
4-2	**In a non-urbanized area, substantially degrade the existing visual character or quality of public views of the site and its surroundings (public views are those that are experienced from publicly accessible vantage point) or, in an urbanized area, conflict with applicable zoning and other regulations governing scenic quality.**	S	*Off-Site Affordable Housing Parcel* *4-2 Implement RVSP EIR Mitigation Measure 8-3a:* *Oak trees and other large-scale vegetation compatible with the existing cemetery landscape shall be planted to form a visual buffer between the cemetery and proposed residences to the east and south, sufficient to completely screen views of residences from the cemetery in the long term. In order to provide adequate mitigation in the short term, large-scale, fast-growing shrubs shall also be planted in the buffer area to provide screening within a short period of time; this buffer would then be enhanced over the long term with maturation of oaks and other trees. Newly planted trees in the buffer area shall be monitored for 5 years. All new plantings will be irrigated for the first 2 years of growth to ensure successful establishment. Alternative visual buffer designs would be considered as part of the design review process for individual projects. Any alternative would need to achieve the above objectives, which include completely screening views of surrounding residences, and compatibility with the existing cemetery landscape. An alternative design may include a masonry wall with landscaping to soften the effect of the wall.*	LS

Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
during project construction.		*The Applicant shall submit to the PCAPCD and receive approval of a Construction Emission/Dust Control Plan prior to groundbreaking. This plan must address the minimum Administrative Requirements found in Sections 300 and 400 of District Rule 228, Fugitive Dust (www.placer.ca.gov/airpollution/airpolut.htm).* *The Applicant shall have a pre-construction meeting for grading activities for 20 or more acres to discuss the construction emission/dust control plan with employees and/or contractors and the District is to be invited.* *The Applicant shall suspend all grading operations when fugitive dust exceeds District Rule 228 fugitive dust limitations. An Applicant representative, CARB-certified to perform Visible Emissions Evaluations (VEE), shall routinely evaluate compliance with Rule 228. This requirement for a VEE is for projects grading 20 or more acres in size regardless in how many acres are to be disturbed daily.* *It is to be noted that fugitive dust is not to exceed 40 percent opacity and not to go beyond the property boundary at any time. If lime or other drying agents are used to dry out wet grading areas, they shall be controlled so as not to exceed District Rule 228 fugitive dust limitations.* *6-1(b) Implement RVSP EIR Mitigation Measure 10-1b:*	

N/A = *Not Applicable*; LS = *Less Than Significant*; LCC = *Less Than Cumulatively Considerable*; S = *Significant*; CC = *Cumulatively Considerable*; SU = *Significant and Unavoidable*

Table 2-1
Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		The PCAPCD shall be provided with a list of construction equipment and anticipated construction timeline for each project. The prime contractor for each construction project shall submit to the PCAPCD a comprehensive inventory (i.e., make, model, year, emission rating) of all the heavy-duty off-road equipment (50 horsepower of greater) that will be used an aggregate of 40 or more hours for the construction project. The PCAPCD shall be provided with the anticipated construction timeline for each project including start date, and name and phone number of the project manager and onsite foreman. A plan for each project shall be submitted for approval by the PCAPCD demonstrating that the heavy-duty (> 50 horsepower) off-road vehicles to be used in the construction project, including owned, leased and subcontractor vehicles, will achieve a project wide fleet-average 20 percent NOX reduction and 45 percent particulate reduction compared to the most recent CARB fleet average. The PCAPCD should be contacted for average fleet emission data. Acceptable options for reducing emissions may include use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, aftertreatment products, and/or other options as they become available. During smog season (May through October), the construction period shall be lengthened so as to minimize the number of vehicles and equipment operating at the same time. Contractors can access the Sacramento Metropolitan AQMD's web site to determine if their off-road fleet meets the requirements listed in this measure

		incorporation of this mitigation measure as part of the by-laws of a homeowners association (e.g., covenants, conditions, and restrictions) would ensure compliance with this future rule, which will be enforced by PCAPCD as a requirement for the County to comply with the ambient air quality standard for $PM_{2.5}$ pollutants. The Applicant proposes additional open-burning restrictions, which state that burning activities shall be limited to vegetation materials (green waste) and conducted within 200 feet of a public street, trail, or park facility. Additionally, open-burning activities shall require a burn permit from the Placer County Air Pollution Control District (APCD) and shall be in compliance with APCD Regulation 3. *6-2(c) Implement RVSP EIR Mitigation Measure 10-2d:* *Each project shall implement an offsite mitigation program, coordinated through the PCAPCD, to offset the project's long-term ozone precursor emissions. The project offsite mitigation program must be approved by the PCAPCD. The project's offsite mitigation program provides monetary incentives to sources of air pollution within the project's air basin that are not required by law to reduce their emissions. Therefore, the emission reductions are real, quantifiable and implement provisions of the 1994 State Implementation Plan. The offsite mitigation program reduces emissions within the air basin that would not otherwise be eliminated. In lieu of each project implementing its own offsite mitigation*

		7-7(b)	*PCCP Species Condition 1: Planning-level Swainson's hawk surveys shall be required a year in advance of construction using the survey guidelines developed for the PCCP. Planning-level surveys are intended to identify nest trees to guide avoidance during project tree removal and construction.* *Additionally, the year of construction (starting in February) and pre-construction (no more than 15 days prior to ground disturbance) surveys shall be conducted within a 1,320-foot radius of the project. Surveys shall be conducted consistent with PCCP guidelines (based on Swainson's Hawk Technical Advisory Committee 2000). In instances where an adjacent parcel is not accessible to a survey, the qualified biologist shall scan all potential nest trees from the adjacent property, roadsides, or other safe, publicly accessible viewpoints, without trespassing, using binoculars and/or a spotting scope. Surveys are typically required from February 1 to September 15 (or sooner if it is determined that birds are nesting earlier in the year). The applicant shall contact the PCA for assistance with survey timing. If a Swainson's hawk nest is located and presence confirmed, only one follow-up visit is required.* *During the nesting season (approximately February 1 to September 15 or sooner if it is determined that birds are nesting earlier in the year), ground-disturbing activities within 1,320 feet of occupied nests or nests under construction shall be prohibited to minimize the potential*	

N/A = *Not Applicable*; LS = *Less Than Significant*; LCC = *Less Than Cumulatively Considerable*; S = *Significant*; CC = *Cumulatively Considerable*; SU = *Significant and Unavoidable*

		for nest abandonment. While the nest is occupied, activities outside the buffer can take place provided they do not stress the breeding pair. *If the active nest site is shielded from view and noise from the project site by other development, topography, or other features, the project applicant can apply to the PCA for a reduction in the buffer distance or waiver. A qualified biologist shall be required to monitor the nest and determine that the reduced buffer does not cause nest abandonment. A monitoring, reporting, and/or buffer reduction plan shall be developed in coordination with PCA and CDFW. If PCA and CDFW, based on a qualified biologist's observations, determine nestlings have fledged, PCCP Covered Activities can proceed normally.* *Construction monitoring shall be conducted by a qualified biologist if work is to continue outside of the nest buffer, and shall focus on ensuring that activities do not occur within the buffer zone. The qualified biologist performing the construction monitoring shall ensure that effects on Swainson's hawks are minimized. If monitoring indicates that construction outside of the buffer is affecting nesting, the buffer shall be increased if space allows (e.g., move staging areas farther away). If space does not allow, all construction activities shall cease until the young have fledged from the nest (as confirmed by a qualified biologist).*

Table 2-1
Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		If construction is proposed during the burrowing owl breeding season (February 1 through August 31), focused surveys for active burrows shall be conducted within 30 days prior to the beginning of the construction activities. Surveys shall be conducted by a qualified biologist. If active nests are found, no construction activities shall take place within 250 feet of the nest until the young have fledged. Burrows that cannot be avoided shall be removed during the nonbreeding season (September 1 to January 31) in accordance with CDFG protocols (CDFG, 1995). If no active nests are found during focused surveys, no further mitigation will be required. *If occupied burrows would be removed as a result of construction and there is suitable habitat in the Plan Area, onsite passive relocation shall be implemented. Owls will be excluded from the occupied burrows using one-way doors and allowed to occupy alternate natural or artificial burrows that are beyond 250 feet from the impact zone and that are within or contiguous to a minimum of 6.5 acres of potential foraging habitat for each pair of relocated owls. Relocation of owls should only be implemented during the nonbreeding season. Onsite preservation of foraging habitat adjacent to any relocated owls shall be protected in a conservation easement and managed to promote burrowing owl use of the site. CDFG approval would be required for the habitat conservation easement.*

Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		buffer shall be applied to extend beyond the nest colony site as follows: 1) if the colony is nesting in a wetland, the buffer must be established from the outer edge of all hydric vegetation associated with the colony, or 2) if the colony is nesting in non-wetland vegetation (e.g., Himalayan blackberry), the buffer must be established from the edge of the colony substrate. This buffer may be modified to a minimum of 300 feet, with written approval from the USFWS and CDFW, in areas with dense forest, buildings, or other features between the Covered Activities and the occupied active nest colony; where there is sufficient topographic relief to protect the colony from excessive noise or visual disturbance; where sound curtains have been installed; or other methods developed in consultation with the USFWS and CDFW where conditions warrant reduction of the buffer distance. If tricolored blackbirds colonize habitat adjacent to Covered Activities after the activities have been initiated, the project applicant shall reduce disturbance through establishment of buffers or noise reduction techniques or visual screens, as determined in consultation with the USFWS, CDFW, and PCA. The buffer must be clearly marked to prevent project-related activities from occurring within the buffer zone. *Active nesting colonies that occur within the non-disturbance buffer shall be monitored by the qualified biologist(s) to verify the Covered Activity is not disrupting the nesting behavior of the colony. The frequency of monitoring shall be approved by the PCA and based on*	

N/A = *Not Applicable*; LS = *Less Than Significant*; LCC = *Less Than Cumulatively Considerable*; S = *Significant*; CC = *Cumulatively Considerable*; SU = *Significant and Unavoidable*

Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		days does not occur. If nests are not found, further mitigation is not required. *If an active raptor nest is found, construction activities shall not take place within 500 feet of the nest until the young have fledged. If active songbird nests are found, a 100-foot non-disturbance buffer shall be established. The non-disturbance buffers may be reduced if a smaller, sufficiently protective buffer is proposed by the project biologist and approved by the County after taking into consideration the natural history of the species of bird nesting, the proposed activity level adjacent to the nest, the nest occupants' habituation to existing or ongoing activity, and nest concealment (i.e., whether there are visual or acoustic barriers between the proposed activity and the nest). The project biologist can visit the nest as needed to determine when the young have fledged the nest and are independent of the site or the nest can be left undisturbed until the end of the nesting season.* *7-9(d) When it is determined that the size of the non-disturbance buffer requires the project biologist to monitor the nest, that monitoring shall include observations about the bird's behaviors relative to the construction activities. Should construction activities cause a nesting bird to do any of the following in a way that would be considered a result of construction activities, then the exclusionary buffer shall be increased such that activities are far enough from the nest to stop the following agitated behavior: vocalize, make defensive flights at intruders, get up from a*	

N/A = *Not Applicable*; LS = *Less Than Significant*; LCC = *Less Than Cumulatively Considerable*; S = *Significant*; CC = *Cumulatively Considerable*; SU = *Significant and Unavoidable*

		brooding position, or fly off the nest. The revised non-disturbance buffer shall remain in place until the chicks have fledged or as otherwise determined by a qualified biologist in consultation with the County. *Construction activities may only resume within the non-disturbance buffer after a follow-up survey by the project biologist has been conducted and a report has been prepared indicating that the nest (or nests) is no longer active, and that no new nests have been identified.* *Off-Site Affordable Housing Parcel* *7-9(e)* *Implement RVSP EIR Mitigation Measure 6-12a below. Alternatively, the future affordable housing developer may choose to participate in the PCCP for Swainson's hawk.* *If project or program activities occur are proposed during the breeding period of the Swainson's hawk or other nesting raptors (March 1 to September 15), a qualified biologist shall conduct pre-construction surveys within a 0.5-mile radius of the project, not more than two weeks prior to construction. Surveys shall be conducted using the guideline established in the Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley. If nesting Swainson's hawks or other raptors are found, project activities will be delayed within the following buffer distances until the young have fledged:*	

N/A = *Not Applicable*; LS = *Less Than Significant*; LCC = *Less Than Cumulatively Considerable*; S = *Significant*; CC = *Cumulatively Considerable*; SU = *Significant and Unavoidable*

Table 2-1
Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		• *Swainson's hawks – 1,300 feet (0.25-mile)* • *Other raptor species – 500 feet (0.10-mile)* *Swainson's hawk nest sites within 0.5-mile of active construction will be monitored by a qualified biologist to evaluate whether the construction activities are disturbing nesting hawks. If the nesting birds appear distressed, the monitor shall halt all construction activities within 0.5-mile of the nest site and CDFG will be contacted to identify appropriate contingency measures. These measures might include limitations on the activities that would be allowed within 0.5-mile of the nest site or termination of all work within 0.5-mile of the nest site. All CDFG recommendations shall be complied with. If construction activities occur over more than one year, surveys shall be conducted during each year of construction.* *If active nests are not identified during the preconstruction survey or if construction activities are proposed to occur during the nonbreeding season (September 16 through February 28), preconstruction surveys or other mitigation measures for Swainson's hawk or other nesting raptors shall not be required.*	
7-10 Impacts to roosting bats either directly (e.g., cause a wildlife population to drop below self-sustaining levels, threaten to eliminate an animal community) or through	S	*Proposed Project and Off-Site Sewer Lift Station Improvements Area* *7-10(a) Prior to the commencement of construction activities, a qualified biologist shall conduct a bat habitat assessment of all potential roosting habitat features, including trees within the proposed impact footprint within the project*	LS

N/A = *Not Applicable*; LS = *Less Than Significant*; LCC = *Less Than Cumulatively Considerable*; S = *Significant*; CC = *Cumulatively Considerable*; SU = *Significant and Unavoidable*

Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
substantial habitat modifications.		*vicinity. The habitat assessment shall identify all potentially suitable roosting habitat and may be conducted up to one year prior to the start of construction. The results of the assessment shall be submitted to the Placer County Community Development Resource Agency.* • *If potential roosting habitat is identified (cavities in trees or potential roosts within structures) within the areas proposed for impact, the biologist shall survey the potential roosting habitat during the active season (generally April through October or from January through March on days with temperatures in excess of 50 degrees Fahrenheit) to determine the presence of roosting bats. The surveys are recommended to be conducted utilizing methods that are considered acceptable by bat experts after consultation with CDFW. Methods may include evening emergence surveys, acoustic surveys, inspecting potential roosting habitat with fiberoptic cameras, or a combination thereof.* • *If roosting bats are identified within any of the trees planned for removal, or if presence is assumed, the trees shall be removed outside of pup season, only on days with temperatures in excess of 50 degrees Fahrenheit. Pup season is generally during the months of May through August. Two-step tree removal shall be utilized under the supervision of the qualified biologist.*	

N/A = *Not Applicable*; LS = *Less Than Significant*; LCC = *Less Than Cumulatively Considerable*; S = *Significant*; CC = *Cumulatively Considerable*; SU = *Significant and Unavoidable*

Table 2-1
Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		Two-step tree removal involves removal of all branches of the tree that do not provide roosting habitat on the first day, and then the next day cutting down the remaining portion of the tree. • *Additionally, it is recommended that all other tree removal shall be conducted from January through March on days with temperatures in excess of 50 degrees Fahrenheit to avoid potential impacts to foliage-roosting bat species.* • *If roosting bats are identified within any structures planned for removal, a bat exclusion plan shall be prepared by a qualified bat biologist describing the methods to be used to humanely exclude bats prior to disturbance. The plan shall be approved by the Placer County Community Development Resource Agency after consultation with CDFW and shall be implemented prior to the start of construction.* • *The requirements for the bat expert and County to consult with CDFW prior to approving survey methods and a bat exclusion plan shall be satisfied either where CDFW responds to requests for consultation within 30 days of the requests or where the bat expert and County have attempted to consult with CDFW but CDFW has failed to respond to the request within 30 days of the placement of the request.* *Off-Site Affordable Housing Parcel* *7-10(b) Implement RVSP EIR Mitigation Measure 6-8a:*	

N/A = *Not Applicable*; LS = *Less Than Significant*; LCC = *Less Than Cumulatively Considerable*; S = *Significant*; CC = *Cumulatively Considerable*; SU = *Significant and Unavoidable*

Table 2-1
Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		Prior to construction, a qualified biologist shall survey any affected structures and trees for evidences of bat roosts (e.g., bat guano). If roosts are found, they shall be removed in April, September, or October in order to avoid the hibernation and maternity seasons. Appropriate exclusion methods will be used, as needed, during habitat removal. If bats must be excluded, the Applicant shall work with a qualified biologist to determine appropriate exclusion methods. If bats are found onsite and cannot be avoided, each Applicant/developer for construction projects within the Plan Area shall work with a qualified biologist to determine if additional mitigation, such as the construction of bat boxes, is appropriate. Determination of these additional measures will depend on the species present and their specific ecological preferences/requirements. Other steps could include improving other avoided bat habitat or designing new project elements such as bat-friendly road crossings. If no active bat roosts are found during focused surveys, no further mitigation will be required.	
7-11 Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS.	S	*Proposed Project and Off-Site Sewer Lift Station Improvements Area* *7-11(a) Implement the following Mitigation Measures set forth in this EIR:* • *7-3(a) The Permittee shall apply for and be issued coverage under the PCCP to mitigate for all impacts to Covered Species, land cover, and sensitive natural communities. Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		7. *Native vegetation (shrubs and small trees) must be planted between other wetlands and the development such that the line of sight between other wetlands and the development is shielded. This measure is only required when the reviewing Permittee deems it necessary to shield other wetlands from adjacent development or to avoid direct or indirect effects from the adjacent development (e.g., trespass).* 8. *The reviewing Permittee will make a determination if fencing shall be required on a case-by-case basis. If needed, the type of fencing will match the activity and impact types. For example, projects that have the potential to cause erosion will require erosion-control barriers, and projects that may bring more household pets to a site must have permanent fencing to exclude pets. The temporal requirements for fencing also depend on the activity and impact type. For example, fencing to minimize permanent effects will be permanent, and fencing to minimize short-term effects will be removed after the activity is completed. Permanent fencing will be installed after grading or other construction activities in the area have been completed. If installed, a party responsible for maintenance will be identified prior to construction.*	

N/A = *Not Applicable*; LS = *Less Than Significant*; LCC = *Less Than Cumulatively Considerable*; S = *Significant*; CC = *Cumulatively Considerable*; SU = *Significant and Unavoidable*

Table 2-1
Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		7-12(d) *PCCP Community Condition 1.4: Prior to ground disturbance, the applicant shall schedule grading and construction in coordination with the PCA to provide the PCA the opportunity to salvage topsoil from the vernal pool wetland if they choose to do so. The applicant shall notify the PCA of their construction schedule within 30 days of the construction start date to allow the PCA the opportunity to salvage soils while the pools are completely dry (generally July through September) and the PCA must make salvage plans sufficiently far in advance so as to not unreasonably impair construction.* 7-12(e) *PCCP Community Condition 2.3: Covered Activities that affect riverine or riparian constituent habitat shall contribute to restoration as mitigation to compensate for loss of riverine or riparian constituent habitat.* *Projects that affect riverine and riparian shall contribute to replacement of these resources. Riverine restoration measures shall be located in the same watershed and salmonid habitat type (e.g., spawning or migrating if the effects occur in a salmonid stream) in which the effects occur.* *Generally, restoration and replacement actions shall be undertaken by the PCA and funded by additional fees imposed on projects. Riverine and riparian restoration to offset project effects may be implemented on-site to replace the functions of the riparian woodland degraded or lost to the Covered Activity. Riparian restoration*

		component of the PCCP, or the applicant shall utilize the Western Placer County HCP/NCCP Programmatic General Permit 18 in compliance with the CARP. *7-12(h) The applicant shall submit an application to the RWQCB for water quality certification of the PCCP LOP or utilize General Order R5-2020-0048, the Waste Discharge Requirements of the Clean Water Act Section 401 Water Quality Certification for the Western Placer County HCP/NCCP Programmatic General Permit, as applicable, and adhere to the certification conditions.* *7-12(i) <u>PCCP CARP Authorization Conditions</u>: The project applicant shall comply with the PCCP CARP Authorization Conditions, which are as follows:* • *<u>CARP Condition 1a</u>: All work within the PCCP plan area that impacts Aquatic Resources of Placer County shall be completed according to the plans and documents included in the CARP application, Water Quality Certification, and, if applicable, Waste Discharge Requirements (WDRs). All changes to those plans shall be reported to Placer County. Minor changes may require an amendment to the CARP Authorization, Water Quality Certification, and, if applicable, WDRs. Substantial changes may render the authorization, Water Quality Certification, and, if applicable, WDRs, void, and a new application may be required.*

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		• *CARP Condition 1b: All deviations from plans and documents provided with the application and approved by Placer County Community Development Resource Agency shall be reported to Placer County Community Development Resource Agency immediately.* • *CARP Condition 2: Any construction within the Stream System shall be implemented in a way to avoid and minimize impacts to vegetation outside the construction area. All preserved wetlands, other Aquatic Resources of Placer County, and the Stream Zone shall be protected with bright construction fencing. Temporary fencing shall be removed immediately upon completion of the project.* • *CARP Condition 3: Erosion control measures shall be specified as part of the CARP application, and the application shall not be complete without them. All erosion control specified in the permit application shall be in place and functional before the beginning of the rainy season and shall remain in place until the end of the season. Site supervisors shall be aware of weather forecasts year-round and shall be prepared to establish erosion control on short notice for unusual rain events. Erosion control features shall be inspected and maintained after each rainfall period. Maintenance includes, but is not limited to, removal of accumulated silt and the*

		replacement of damaged barriers and other features. • *CARP Condition 4: All required setbacks shall be implemented according to the Western Placer County HCP/NCCP Condition 4 (Western Placer County HCP/NCCP Section 6.1.2).* • *CARP Condition 5: All work in aquatic resources within the Stream System shall be restricted to periods of low flow and dry weather between April 15 and October 15, unless otherwise permitted by the Placer County Community Development Resource Agency and approved by the appropriate State and federal regulatory agency. Work within aquatic resources in the Stream System outside of the specified periods may be permitted under some circumstances. The project applicant shall provide Placer County Community Development Resource Agency with the following information: a) the extent of work already completed; b) specific details about the work yet to be completed; and c) an estimate of the time needed to complete the work in the Stream System.* • *CARP Condition 6: Weather forecasts should be monitored, and erosion control established before all storm events.* • *CARP Condition 7: Following work in a stream channel, the low flow channel shall be returned to its natural state to the extent possible. The shape and gradient of the streambed shall be*

		restored to the same gradient that existed before the work to the extent possible. • *CARP Condition 8: Except for site preparation for the installation and removal of dewatering structures, no excavation is allowed in flowing streams unless dredging WDRs are issued by the RWQCB. Detailed plans for dewatering must be part of the application.* • *CARP Condition 9: Temporary crossings as described in the application shall be installed no earlier than April 15 and shall be removed no later than October 15, unless otherwise permitted by the Placer County Community Development Resource Agency and approved by the appropriate State and federal regulatory agency. This work window could be modified at the discretion of Placer County and the CDFW.* • *CARP Condition 10: Vehicles other than necessary earthmoving and construction equipment shall not be allowed within the Stream System after the section of stream where work is performed is dewatered. The equipment and vehicles used in the Stream System shall be described in the application.* • *CARP Condition 11: Staging areas for equipment, materials, fuels, lubricants, and solvents shall be located outside the stream channel and banks and away from all preserved aquatic resources. All stationary equipment operated within the Stream System shall be*

		positioned over drip-pans. Equipment entering the Stream System shall be inspected daily for leaks that could introduce deleterious materials into aquatic resources. All discharges, unintentional or otherwise, shall be reported immediately to the Placer County Community Development Resource Agency. The Placer County Community Development Resource Agency shall then immediately notify the appropriate state and federal agencies. • *CARP Condition 12: Cement, concrete, washings, asphalt, paint, coating materials, oil, other petroleum products, and other materials that could be hazardous to aquatic life shall be prevented from reaching streams, lakes, or other water bodies. These materials shall be placed a minimum of 50 feet away from aquatic environments. All discharges, unintentional or otherwise, shall be reported immediately to the Placer County Community Development Resource Agency. The Placer County Community Development Resource Agency shall then immediately notify the appropriate State and federal agencies.* • *CARP Condition 13: During construction, litter or construction debris shall not be dumped into water bodies or other aquatic resources, nor shall it be placed in a location where it might be moved by wind or water into aquatic resources. All*

		construction debris shall be removed from the site upon completion of the project. • *CARP Condition 14: Only herbicides registered with the California Department of Pesticide Regulation shall be used in streams, ponds, and lakes, and shall be applied in accordance with label instructions. A list of all pesticides that may be used in the project area shall be submitted to the Placer County Community Development Resource Agency before use. The PCCP does not authorize the use of herbicides; herbicide application is not a Covered Activity.* • *CARP Condition 15: Before beginning construction, the project applicant shall have a valid CARP authorization or waiver notice. In order to obtain a permit, the project applicant shall pay all mitigation fees or purchase appropriate credits from an agency-approved mitigation bank.* • *CARP Condition 16: A copy of the CARP conditions and Water Quality Certification and WDRs shall be given to individuals responsible for activities on the site. Site personnel (employees, contractors, and subcontractors) shall be adequately informed and trained to implement all permit, Water Quality Certification, and WDR conditions and shall have a copy of all permits available on-site at all times for review by site personnel and agencies.*

		• *CARP Condition 17: Work shall not disturb active bird nests until young birds have fledged. To avoid impacts to nesting birds, any disturbance shall occur between September 1 and February 1 prior to the nesting season. Tree removal, earthmoving or other disturbance at other times is at the Placer County Community Development Resource Agency's discretion and shall require surveys by a qualified biologist to determine the absence of nesting birds prior to the activity.* • *CARP Condition 18: All trees marked for removal within the Stream System must be shown on maps included with the Application. Native trees over five inches diameter at breast height (DBH) shall not be removed without the consent of the Placer County Community Development Resource Agency.* • *CARP Condition 19: The Placer County Community Development Resource Agency shall be notified immediately if threatened or endangered species that are not Covered Species are discovered during construction activities. Placer County Community Development Resource Agency shall suspend work and notify the USFWS, National Marine Fisheries Service (NMFS), and the CDFW for guidance.* • *CARP Condition 20: Wildlife entering the construction site shall be allowed to leave the*

		area unharmed or shall be flushed or herded humanely in a safe direction away from the site. • *CARP Condition 21: All pipe sections shall be capped or inspected for wildlife before being placed in a trench. Pipes within a trench shall be capped at the end of each day to prevent entry by wildlife, except for those pipes that are being used to divert stream flow.* • *CARP Condition 22: At the end of each workday, all open trenches will be provided with a ramp of dirt or wood to allow trapped animals to escape.* • *CARP Condition 23: If human remains or cultural artifacts are discovered during construction, the applicant shall stop work in the area and notify the Placer County Community Development Resource Agency immediately. Work shall not continue in the area until the County Coroner and a qualified archaeologist have evaluated the remains, conducted a survey, prepared an assessment, and required consultations are completed.* *Off-Site Affordable Housing Parcel* *7-12(j) Implement the following Mitigation Measure set forth in this EIR:* • *7-5(c) Implement RVSP EIR Mitigation Measure 6-1c:*

Table 2-1
Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		The following BMPs to avoid impacts to wetlands in the Plan Area shall be implemented for all construction related to the proposed project: • *Four-foot-tall, brightly colored (yellow or orange), synthetic mesh material or chainlink fencing shall be installed at the edge of all avoided wetlands and a minimum of 50 feet from the edge of tributaries to Dry Creek prior to any construction equipment being moved on site or any construction activities taking place. Fencing shall be continuously maintained and shall be the responsibility of an onsite compliance officer designated by the developer. Fencing is to remain intact until construction is complete and may not be removed without the written consent of the County.* • *Ground disturbance associated with construction, including vehicle operation/parking and construction material storage, shall be prohibited within wetlands or within 50 feet of the edge of tributaries to Dry Creek.* • *Where working areas encroach on live or dry streams, lakes, or wetlands, RWQCB-approved physical barriers adequate to prevent the flow or*

		discharge of sediment into these systems shall be constructed and maintained between working areas and streams, lakes and wetlands. Discharge of sediment into streams shall be held to a minimum during construction of the barriers. Discharge will be contained through the use RWQCB-approved measures that will keep sediment from entering jurisdictional waters beyond the project limits. • *Oily or greasy substances originating from the Contractor's operations shall not be allowed to enter or be placed where they will later enter a live or dry stream, pond, or wetland.* • *Asphalt concrete shall not be allowed to enter a live or dry stream, pond, or wetland.* • *All off-road construction equipment shall be cleaned of potential noxious weed sources (mud, vegetation) before entry into the site and after entering a potentially infested area before moving on to another area, to help ensure noxious weeds from outside of the Plan Area are not introduced into the Plan Area. The contractor shall employ whatever cleaning methods (typically the use of a high-pressure water hose) are*

		necessary to ensure that equipment is free of noxious weeds. Equipment shall be considered free of soil, seeds, and other such debris when a visual inspection does not disclose such material. Disassembly of equipment components or specialized inspection tools is not required. Equipment washing stations shall be placed in areas that afford easy containment and monitoring and that do not drain into sensitive (riparian, wetland, etc.) areas. • *To further minimize the risk of introducing additional nonnative species into the area, only native plant species appropriate for the Plan Area will be used in any erosion control or revegetation seed mix or stock. No dry-farmed straw will be used, and certified weed-free straw shall be required where erosion control straw is to be used. In addition, any hydroseed mulch used for revegetation activities must also be certified weed-free.* • *The Applicant will restore and revegetate all temporary construction disturbance areas. Temporary disturbance areas will be restored to the original topography and hydrology, disked to relieve compaction, and planted with an erosion*

substantial adverse effect on the environment by converting oak woodlands or impacting individual trees.		• *7-3(a) The Permittee shall apply for and be issued coverage under the PCCP to mitigate for all impacts to Covered Species, land cover, and sensitive natural communities. Prior to application approval, additional species surveys may be necessary, and prior to construction, land cover and special habitat fees shall be paid. The Permittee shall comply with the terms of the PCCP Coverage Certificate, including compliance with all avoidance, mitigation, and minimization measures, which may include pre-construction surveys, construction monitoring, and BMPs.* *PCCP General Condition 3: The proposed project shall pay a land conversion fee for the permanent conversion of natural land cover including VPC Low, VPC Intermediate, and Valley Foothill Riparian Woodland. The fees to be paid shall be those in effect at the time of ground disturbance authorization for each project phase and shall be based on the effect to modeled species habitat at the parcel scale.* *In addition to land conversion, the project would result in permanent direct effects and temporary effects to PCCP Special Habitats as estimated in Table 6 of the Biological Resources Assessment (BRA) prepared for*

		the proposed project. The total special habitat fee obligation including temporary effect fees shall be paid prior to issuance of a land conversion authorization that allows ground disturbance. *7-14(b) <u>PCCP General Condition 5</u>: Prior to initiation of construction activities, all project construction personnel shall participate in a Worker Environmental Training Program that will educate workers regarding the Covered Species and their habitats, the need to avoid impacts, state and federal protection, and the legal implications of violating environmental laws and regulations. At a minimum this training may be accomplished through tailgate presentations at the project site and the distribution of informational brochures, with descriptions of sensitive biological resources and regulatory protections, to construction personnel prior to initiation of construction work. The signed documentation of training completion by all construction workers shall be submitted to the Placer County Resource Development Agency and the PCA.* *Off-Site Affordable Housing Parcel* *7-14(c) Implement RVSP EIR Mitigation Measure 6-13a:* *Mitigation for the loss of native trees in the Plan Area shall follow the policies and mitigation guidelines set forth in The Placer County Tree Preservation Ordinance found in Chapter 12, Article 12.16 of the Placer County Code. See*

		training and sign a form that acknowledges receipt of the training. *8-2(b) In the event that cultural resources are inadvertently discovered during project activities, work in the area must be halted within a 100-foot radius of the find and a qualified archaeologist (pursuant to the Standards at 36 CFR Part 61) and representative from the United Auburn Indian Community (if the resource is precontact) shall be notified immediately to evaluate the resource(s) encountered to determine whether they may be unique archaeological resources and/or historical resources. Notification of the resource for evaluation purposes shall also be provided immediately to the United Auburn Indian Community (UAIC) and Placer County. Construction activities may continue in other areas. If the qualified archaeologist determines that the discovery includes either unique archaeological resources or historical resources of an archaeological nature, the qualified archaeologist shall develop mitigation or treatment measures for consideration and approval by the Director of the Placer County Community Development Resource Agency or his or her designee in consultation with the project applicant. The Director may also consult with the State Historic Preservation Officer [SHPO] or any other regulatory agency that the Director believes may have informed and useful input to provide. Mitigation shall be developed and implemented in accordance with Public Resources Code Section 21083.2 and Section 15126.4 of the CEQA Guidelines, with a preference for*	

N/A = *Not Applicable*; LS = *Less Than Significant*; LCC = *Less Than Cumulatively Considerable*; S = *Significant*; CC = *Cumulatively Considerable*; SU = *Significant and Unavoidable*

Table 2-1
Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		preservation in place. Consistent with Section 15126.4(b)(3), preservation in place may be accomplished through one or more of the following: planning construction to avoid the resource; incorporating the resource within open space; capping and covering the resource; or deeding the site into a permanent conservation easement. If approved by the Director, such measures shall be implemented and completed prior to commencing further work for which grading or building permits were issued, unless otherwise directed by the Director. Avoidance or preservation of unique archaeological resources or historical resources of an archaeological nature shall not be required where such avoidance or preservation in place is deemed infeasible, as determined by the Director in consultation with the project applicant. Where avoidance or preservation are not appropriate, the qualified archaeologist, in consultation with the Director, shall prepare a detailed treatment plan for consideration and approval by the Director, which may include data recovery for resources that are not considered Tribal Cultural Resources by the UAIC. If employed, data recovery strategies for unique archaeological resources that do not also qualify as historical resources of an archaeological nature shall follow the applicable requirements and limitations set forth in Public Resources Code Section 21083.2. Data recovery will normally consist of (but would not be limited to) sample excavation, artifact collection, site documentation, and historical research, with the aim of recovering important scientific data contained within the

		unique archaeological resource or historical resource of an archaeological nature. The data recovery plan shall include provisions for analysis of data in a regional context, reporting of results within a timely manner, curation of artifacts and data at an approved facility, and dissemination of reports to local and State repositories, libraries, and interested professionals. If data recovery is determined by the Director to not be appropriate, then an equally effective treatment shall be proposed and implemented. Work may not resume within the no-work radius until the Director, in consultation with the qualified archaeologist and tribal representative, determines that the site either: 1) does not contain unique archaeological resources or historical resources of an archaeological nature; or 2) that the preservation and/or treatment measures have been completed to the Director's satisfaction. This determination shall be made in coordination with the project archaeologist and UAIC Representative if a Tribal Cultural Resource is involved. *Off-Site Affordable Housing Parcel* *8-2(c) Implement RVSP EIR Mitigation Measure 7-1a if culturally significant materials are discovered during construction:* *Potentially unique archaeological resources will be capped with soil prior to construction in the area except in locations in which such capping would be infeasible due to project design. An acceptable process of "capping"*

		be prepared and adopted prior to commencing any excavation activities. *8-3(d) Implement RVSP EIR Mitigation Measure 7-2a if archeological or historical resources are discovered during construction:* *In the event of the discovery of buried archaeological artifacts, exotic rock (non-native), or unusual amounts of shell or bone, it is recommended that project activities in the vicinity of the find be immediately stopped and a qualified professional archaeologist consulted to assess the resource and provide proper management recommendations. If the find is determined to be a historical or unique archaeological resource, contingency funding and a time allotment to allow for implementation of avoidance measures or appropriate mitigation shall be made available, as provided in Section 15064.5 of the CEQA Guidelines. In addition, the Placer County Planning Department and Department of Museums must also be contacted. Work in the area may only proceed after authorization is granted by the Placer County Planning Department. All construction and improvement plans for subsequent development within the Plan Area involving ground disturbance shall include these provisions. The archaeologist shall evaluate any potential effects on any historical resource or unique archaeological resource, and where such effects would be significant, shall recommend potential mitigation to the County for its consideration. The County will assess the*

Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		If paleontological resources are identified at a particular site, the project manager shall cease operation until a qualified professional can provide an evaluation. 1. *Identify and evaluate paleontological resource by intense field survey where impacts are considered high;* 2. *Assess effects on identified sites;* 3. *Consult with the institutional/academic paleontologists conducting research investigations within the geological formations that are slated to be impacted;* 4. *Obtain comments from the researchers; and* 5. *Comply with researchers' recommendations to address any significant adverse effects where determined by the County to be feasible.* *In considering any suggested mitigation proposed by the consulting paleontologist, Placer County Planning Department staff shall determine whether avoidance is necessary and feasible in light of factors such as the nature of the find, project design, costs, Specific Plan policies and land use assumptions, and other considerations. If avoidance is unnecessary or infeasible, other appropriate measures (e.g., data recovery) shall be instituted. Work may proceed on other parts of the project site while mitigation for paleontological resources is carried out.*

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		• *<u>10-2(e)</u> Implement RVSP EIR Mitigation Measure 12-3b:* *This project is subject to construction-related stormwater permit requirements of the federal Clean Water Act NPDES program. Each applicant/developer for future construction projects within the Plan Area shall implement Mitigation Measure 13-1c [the standards of which are included as Mitigation Measure 10-2(g) of this EIR], which requires an applicant to submit a Notice of Intent (NOI) to comply with the NPDES General Permit for Stormwater Discharges associated with Construction Activities to the State Regional Water Quality Control Board if the specific project would disturb 1 acre of land or more. The project applicant/developer shall provide to the ESD evidence of a state-issued Waste Discharge Identification (WDID) number or filing of a NOI and fees prior to start of construction, as required by the County's Sample Conditions and Improvement Plans, paragraph ip15 (Placer County Community Development Resource Agency, 2006).* *12-1(d) Implement the following Mitigation Measure set forth in this EIR:* • *<u>10-2(g)</u> Implement RVSP EIR Mitigation Measure 12-3d:*	

N/A = *Not Applicable*; LS = *Less Than Significant*; LCC = *Less Than Cumulatively Considerable*; S = *Significant*; CC = *Cumulatively Considerable*; SU = *Significant and Unavoidable*

Table 2-1
Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		For all construction activities that will disturb 1 or more acre of land, a stormwater pollution prevention plan (SWPPP) for the construction phase must be prepared and implemented. *The SWPPP will include development of site-specific structural and operational BMPs to prevent and control impacts to runoff quality, measures to be implemented before each storm event, inspection and maintenance of BMPs, and monitoring of runoff quality by visual and/or analytical means. The contents of the SWPPP are set forth in detail in the permit application package. BMPs shall be designed according to the California Stormwater Quality Association Stormwater Best Management Practice Handbooks for Construction (or other similar source as approved by the DPW). BMPs for the proposed project include, but are not limited to, silt fencing (Sediment Control SE -1), straw bale barriers (Sediment Control SE-9), fiber rolls (Sediment Control SE-5), storm drain inlet protection (Sediment Control SE-10), hydraulic mulch (Erosion Control EC-3), and stabilized construction entrance (Tracking Control TR-1). The SWPPP shall also include erosion control measures, to be implemented during construction, that conform to the NPDES, Storm Drain Standards, and local standards.*

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		and designate same as a building setback line unless greater setbacks are required by other conditions contained herein. The Improvement Plans shall also show the limits of the future, unmitigated, fully developed, 100-year floodplain for the existing project site conditions. *B) That finished house pad elevations for Tentative Map all Lot's for all lots along the floodplain shall be a minimum of two feet above the 100-year floodplain line (or finished floor -three feet above the 100-year floodplain line). The final pad elevation shall be certified by a California registered civil engineer or licensed land surveyor and submitted to the Engineering and Surveying Division. This certification shall be done prior to construction of the foundation or at the completion of final grading, whichever comes first. No building construction is allowed until the certification has been received by the Engineering.* *12-4(e) The final Drainage Report shall demonstrate that the proposed project will not increase the limits or water surface elevation of the off-site 100 year floodplain upstream and downstream of the project site, on both sides, to the satisfaction of the Engineering and Surveying Department and Placer County Flood Control District.*	

N/A = *Not Applicable*; LS = *Less Than Significant*; LCC = *Less Than Cumulatively Considerable*; S = *Significant*; CC = *Cumulatively Considerable*; SU = *Significant and Unavoidable*

Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		Off-Site Affordable Housing Parcel *12-4(f) Implement RVSP EIR Mitigation Measure 13-2a:* *Each applicant/developer for future construction projects within the Plan Area shall prepare and submit with their project Improvement Plans a project-specific drainage report in conformance with the requirements of Section 5 of the Land Development Manual and the Placer County Stormwater Management Manual (SWMM) that are in effect at the time of submittal, to the Placer County ESD for review and approval. The project-specific drainage reports shall be consistent with the Drainage Master Plan and Development Standards for Plan Area. The report shall be prepared by a Registered Civil Engineer and shall, at a minimum, include:* • *Written text describing existing conditions and proposed improvements,* • *The effects of the improvements,* • *All appropriate calculations,* • *A watershed map,* • *Increases in downstream flows, and* • *Proposed onsite and offsite improvements and drainage easements to accommodate flows from the project.* *The report shall identify water quality protection features and methods to be used both during construction and for long-term post-construction water quality protection.*	

N/A = *Not Applicable*; LS = *Less Than Significant*; LCC = *Less Than Cumulatively Considerable*; S = *Significant*; CC = *Cumulatively Considerable*; SU = *Significant and Unavoidable*

Table 2-1
Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		"Best Management Practice" (BMP) measures shall be provided to reduce erosion, water quality degradation, and prevent the discharge of pollutants to stormwater to the maximum extent practicable. *No construction shall be permitted within any identified wetlands area, floodplain, or right-of-way, except as authorized by project approvals. The project-specific drainage report shall demonstrate compliance with all relevant mitigation measures included in this Draft EIR.* *12-4(g) Implement RVSP EIR Mitigation Measure 13-2b:* *The project-specific drainage reports prepared for each future construction project within the Plan Area shall evaluate offsite drainage facilities for conditions and capacity and shall be upgraded, replaced, or mitigated as specified by the Placer County ESD. Each future construction project shall upgrade or replace drainage facilities, or mitigate drainage impacts in other ways as needed and as specified by Placer County ESD. This includes any existing drainage facilities located immediately downstream of the project that would receive drainage and would be changed by the proposed project. The analysis must include any existing roadside ditches and/or culverts along Walerga Road, PFE Road, and Watt Avenue. While the Plan Area is within the Dry Creek watershed and as such onsite detention is not required to reduce peak flow rates due to development, onsite detention may be required in order to comply with the*

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		County's requirements regarding road encroachments. In accordance with the SWMM, all travel lanes of Watt Avenue, PFE Road, and Walerga Road may be required to remain clear of stormwater flow for all storm events, including the 100-year event. In addition, the Applicant will be required to mitigate peak flow rates to pre-development levels for 10- and 100-year storm events (per the Placer County Stormwater Management Manual) for only the portion of the Riolo Vineyards Plan Area that drains south towards PFE Road. *12-4(h) Implement RVSP EIR Mitigation Measure 13-2c:* *New development in the Plan Area shall be subject to the one-time payment of drainage improvement and flood control fees pursuant to the Dry Creek Watershed Interim Drainage Improvements Ordinance (Ref. Article 15.32, formerly Chapter 4, Subchapter 20, Placer County Code). This fee is used to fund installation and maintenance of roadway drainage and stormwater drainage improvements within the watershed. The actual fees to be paid will be those in effect at the time the payment occurs and are assessed on the amount of development area. Each developer will be responsible for submitting the appropriate fee for the specific land development project to the Placer County ESD. The one-time fee shall be paid prior to issuance of the building permit or approval of improvement plans.* *12-4(i) Implement RVSP EIR Mitigation Measure 13-2d:*	

N/A = *Not Applicable*; LS = *Less Than Significant*; LCC = *Less Than Cumulatively Considerable*; S = *Significant*; CC = *Cumulatively Considerable*; SU = *Significant and Unavoidable*

		New development in the Plan Area shall be subject to payment of annual drainage improvement and flood control fees pursuant to the Dry Creek Watershed Interim Drainage Improvements Ordinance (Ref. Article 15.32, formerly Chapter 4, Subchapter 20, Placer County Code). These fees are used to fund installation and maintenance of roadway drainage and stormwater drainage improvements within the watershed. The Applicant will be required to form a County Service Area zone, if one currently does not cover the Plan Area, for collecting the annual special assessment. The actual fees to be paid will be those in effect at the time the payment occurs and are assessed on the basis of the new development acreage. The annual fee is a yearly charge and will be included on a parcel's property tax bill.	
12-5 Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows or expose people or structures to risk of loss, injury or death involving flooding through the placement of housing in a	S	*12-5(a) Prior to Improvement Plan approval, if required by the Federal Emergency Management Agency (FEMA), the Placer County Flood Control District, or the County Floodplain Administrator, the applicant shall obtain from FEMA, a Conditional Letter of Map Revision (CLOMR) or Conditional Letter of Map Revision based on Fill (CLOMR-F) for fill within a Special Flood Hazard Area. A copy of the letter shall be provided to the Engineering and Surveying Division. A Letter of Map Revision (LOMR), or a Letter of Map Revision based on Fill (LOMR-F) from FEMA shall be provided to the Engineering and Surveying Division (ESD) prior to acceptance of project improvements as complete.*	LS

Summary of Impacts and Mitigation Measures

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		1. *Select equipment capable of performing the necessary tasks with the lowest noise-emission level and the lowest possible height for the acoustic center of noise emissions.* 2. *Noise barriers may be required to block the line of sight from noise sources to noise-sensitive receivers of concern or to further reduce noise levels beyond that provided by line-of-sight breaks afforded by topographical features. The noise barriers could be constructed using either plywood sheets or other solid material that provides sufficient mass per unit surface area (perhaps approaching 4 pounds per square foot) and has minimal openings between the top of barrier and ground surface (perhaps as little as 1 percent). Noise barriers of a given height are generally most effective when placed as close as possible to either the source or receiver, and perhaps at two such separate locations. The least desirable location is generally at a middle distance between sources and receptors. The plan shall identify the proper height, location, and effectiveness of a noise barrier in terms of the expected hourly average noise level due to construction activity at noise-*

Impact	Level of Significance Prior to Mitigation	Mitigation Measures	Level of Significance After Mitigation
		contingency funding and a time allotment to allow for implementation of avoidance measures or appropriate mitigation shall be made available, as provided in Section 15064.5 of the CEQA Guidelines. In addition, the Placer County Planning Department and Department of Museums must also be contacted. Work in the area may only proceed after authorization is granted by the Placer County Planning Department. All construction and improvement plans for subsequent development within the Plan Area involving ground disturbance shall include these provisions. The archaeologist shall evaluate any potential effects on any historical resource or unique archaeological resource, and where such effects would be significant, shall recommend potential mitigation to the County for its consideration. The County will assess the feasibility of any proposed mitigation (e.g., avoidance of the historical resource) and impose the mitigation where feasible in light of factors such as the nature of the find, project design, costs, Specific Plan policies and land use assumptions, and other considerations. If avoidance is unnecessary or infeasible, other appropriate measures (e.g., data recovery) shall be instituted. Work may proceed on other parts of the project site while mitigation for paleontological resources is carried out.

3. Project Description

3. PROJECT DESCRIPTION

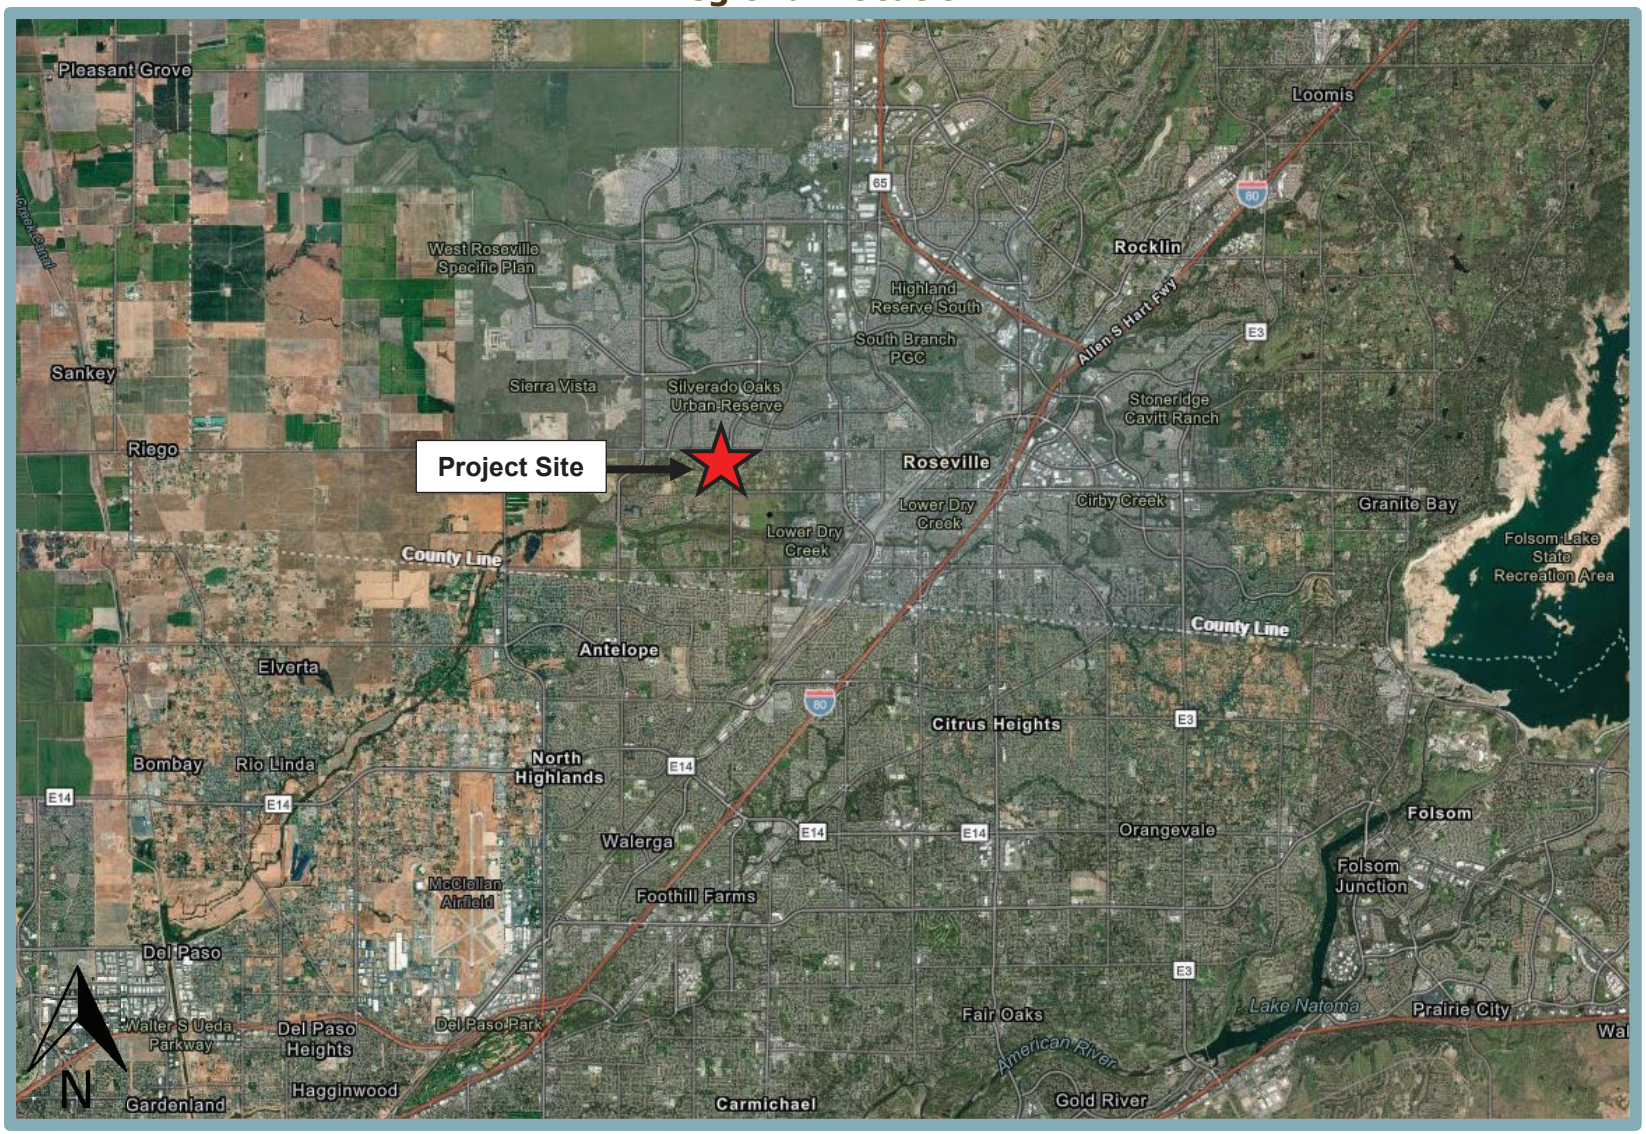
3.1 INTRODUCTION

The Project Description chapter of the EIR provides a comprehensive description of the Estia Dry Creek and Placer Creek Residential Project (proposed project) in accordance with CEQA Guidelines Section 15124. A detailed description of the project location, project setting and surrounding uses, project purpose and objectives, project components, and required project approvals is presented below.

3.2 PROJECT LOCATION

The project site consists of approximately 92.2 gross (87.6 net) acres located south of Baseline Road, immediately east of the abandoned Old Walerga Road right-of-way, west of the Fiddyment Road/Baseline Road/Walerga Road intersection and the western portion of Sun Valley Oaks residential subdivision, and north of the Morgan Creek residential subdivision in the Dry Creek-West Placer Community Plan Area (DCWPCP) of unincorporated Placer County (see Figure 3-1 and Figure 3-2). Walerga Road, which curves from the northeast to the southwest, separates the northern 52.3-acre portion of the project site, identified by Assessor's Parcel Number (APN) 023-221-076, and the southern 35.3-acre portion of the project site, identified by APN 023-221-074.

3.3 PROJECT SETTING AND SURROUNDING LAND USES



Section 15125 of the CEQA Guidelines requires an EIR to include a description of the physical environmental conditions in the vicinity of the project, from a local and regional perspective, as they exist at the time the Notice of Preparation (NOP) is published. Knowledge of the existing environmental setting is critical to the assessment of environmental impacts. Pursuant to CEQA Guidelines Section 15125, the description of the environmental setting shall not be longer than necessary to understand the potential significant effects of the project.

The following sections describe the existing setting of the project site and the surrounding land uses in the project vicinity. Please note that detailed discussions of the existing setting in compliance with CEQA Guidelines Section 15125, specific to each environmental resource area, are included in each corresponding technical chapter of this EIR.

Site Characteristics

The project site is bisected by Walerga Road, which generally curves from northeast to southwest. The 52.3-acre northern portion of the site (APN 023-221-076) is bounded by Baseline Road to the north and Walerga Road to the south. The northern portion of the site is undeveloped, consists of non-native annual grassland with gently rolling topography, and is interspersed with seasonal wetlands and vernal pools. The 35.3-acre southern portion of the site (APN 023-221-074) is bounded by Walerga Road to the north and west. The southern portion of the site includes a paved sewer easement which extends from Vineyard Road to the east and Walerga Road to the west. In addition, the southern portion of the site includes undeveloped annual grassland with gently rolling topography, interspersed with seasonal wetlands, vernal pools, and is bisected by an un-named tributary of Dry Creek (named "Placer Creek" for this project) which flows east to west.

Figure 3-1
Regional Location

* Figure not OCR Compatible

Figure 3-2
Project Location

* Figure not OCR Compatible

The Federal Emergency Management Agency (FEMA) 100-year floodplain, containing approximately 4.7 acres, is located within the Placer Creek tributary area, which bisects the southern portion of the project site. A band of oak woodlands is located along the Placer Creek riparian corridor.

Roadways in the immediate project vicinity include Baseline Road to the north, Walerga Road bisecting the project site from the southwest to the northeast, Town Center Avenue to the west, and Vineyard Road to the southeast. Additionally, the northern boundary of the project site is contiguous to the Roseville City Limits, and the southern boundary of the project site is located approximately 1.2 miles from the Placer County/Sacramento County line.

The Placer County General Plan/DCWPCP land use designations for the project site are Rural-Low Density Residential (1-2.3 acre minimum) (RLDR), and Greenbelt and Open Space (OS). The site is zoned Residential Single-Family, combining Agriculture, combining a minimum Building Site of 40,000 square feet, combining Planned Residential Development of one dwelling unit per acre (RS-AG-B-40 PD=1) and Open Space, combining Planned Residential Development of one dwelling unit per acre (O PD=1).

Surrounding Land Uses

Surrounding existing land uses for the project site include the under-construction Baseline Marketplace to the north, across Baseline Road; single-family residences associated with the Sun Valley Oaks residential neighborhood, a vacant property owned by Dry Creek Joint Elementary School District, and Dry Creek tributaries to the east; single-family residences associated with the Morgan Creek residential neighborhood to the south; and the under-construction Property 1A of the Placer Vineyards Specific Plan (PVSP), which will include 1,285 residential units, to the west. Table 3-1 describes the land use and zoning designations of the parcels surrounding the project site.

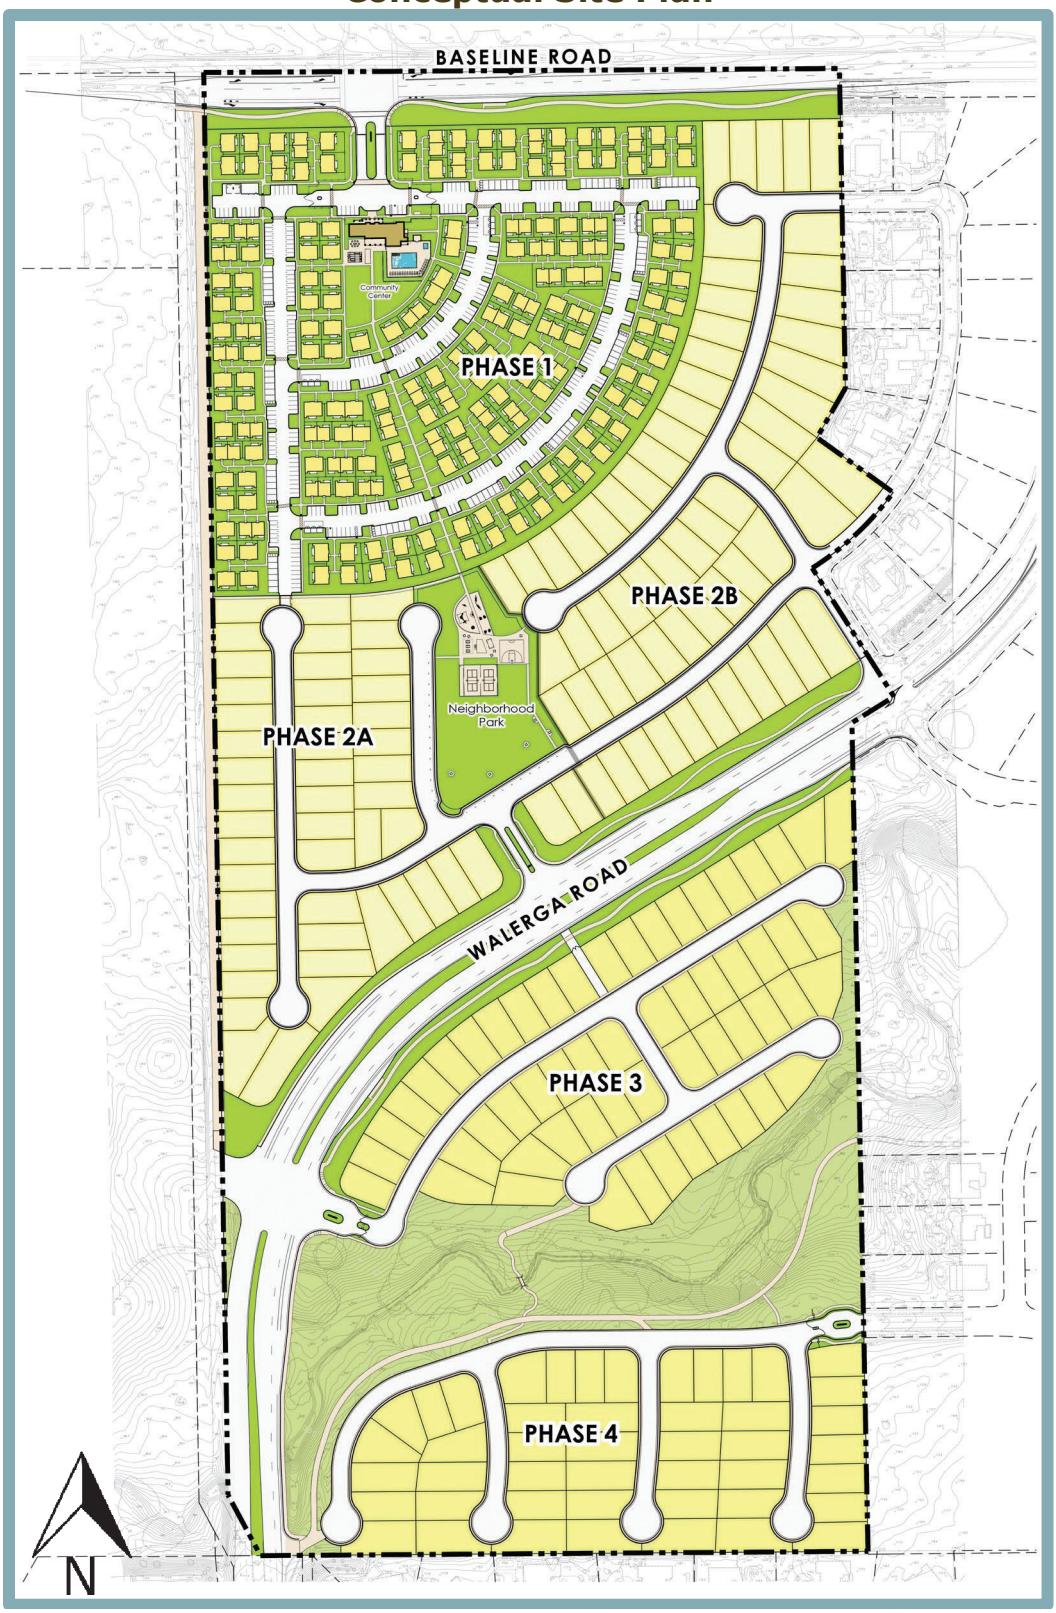
Table 3-1
Surrounding Land Use and Zoning Designations

Parcel Location	Land Use	Zoning
North of the Project Site	City of Roseville: Community Commercial (CC)	City of Roseville: General Commercial (GC)
South of the Project Site	Placer County: RLDR	Placer County: RS-AG-B-40 PD=1
East of the Project Site	Placer County: RLDR	Placer County: RS-AG-B-40 PD=1, O PD=1
West of the Project Site	Placer County: Placer Vineyards Specific Plan	Placer County: Specific Plan, Placer Vineyards Specific Plan (SPL-PVSP)

3.4 PROJECT OBJECTIVES

The following project objectives have been developed by the project applicant:

1. Create a high-quality neighborhood environment containing a mix of residential, open space, and recreational land uses.
2. Develop a well-designed, economically feasible residential community that consists of a variety of residential products and unit types.
3. Offer an amenity-rich residential community that offers modern amenities and open spaces for residents, such as trails, parks, recreational areas, and gathering spaces.



4. Provide a comprehensively planned project that protects sensitive environmental habitat and resources, including existing riparian and oak woodland habitat on the project site, within a permanent greenbelt area providing a significant public benefit.
5. Use land resources efficiently by providing a well-planned development on an underutilized vacant site.
6. Promote pedestrian-oriented development, providing medium and high-density housing on a major transportation corridor and within walking distance of places of business and employment.
7. Provide a well-designed residential community with neighborhood identity in close proximity to jobs and services in Placer and Sacramento counties.
8. Increase the supply and diversity of housing types in the DCWPCP area that can support a wider range of lifestyles, consistent with the goals and policies of the County's Housing Element.
9. Assist in providing affordable housing and complying with Regional Housing Needs Allocation (RHNA) requirements by conveying a four-acre affordable housing site within the Riolo Vineyards Specific Plan area to Placer County.
10. Create a development of a density, scale and character that complements and is supportive of surrounding development.
11. Design a residential neighborhood that complements surrounding/existing neighborhoods by incorporating compatible land uses, lot sizes, and street layouts while providing smooth transitions to adjacent neighborhoods through the appropriate setbacks, landscaping, and open space features; and establishing logical roadway and pedestrian connections consistent with the County's design principles.

3.5 PROJECT COMPONENTS

The proposed project includes the development of two separate residential communities over the course of five phases. Phase 1 would consist of the 220-unit multi-family Estia Dry Creek development, and Phases 2, 3, and 4 would consist of the 212-lot detached single-family Placer Creek Residential development. Development of Phases 1, 2A, and 2B would occur on the northern portion of the site (APN 023-221-076), north of Walerga Road, and development of Phases 3 and 4 would occur on the southern portion of the site (APN 023-221-074), south of Walerga Road (see Figure 3-3). The gross project density would be approximately 4.6 residential units per acre.

The proposed project would require County approval of a General Plan/DCWPCP Amendment, Rezone, Vesting Large Lot Tentative Subdivision Map, Vesting Phased Small Lot Tentative Subdivision Map, Design Review, Variance, and three service area annexations. These entitlement requests are discussed in further detail below, as are the two options by which the applicant could satisfy the project's affordable housing requirements, one of which includes transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the Riolo Vineyards Specific Plan (RVSP). Additional County approvals would be required for this off-site affordable housing proposal (see Affordable Housing section below).

Figure 3-3
Conceptual Site Plan

* Figure not OCR Compatible

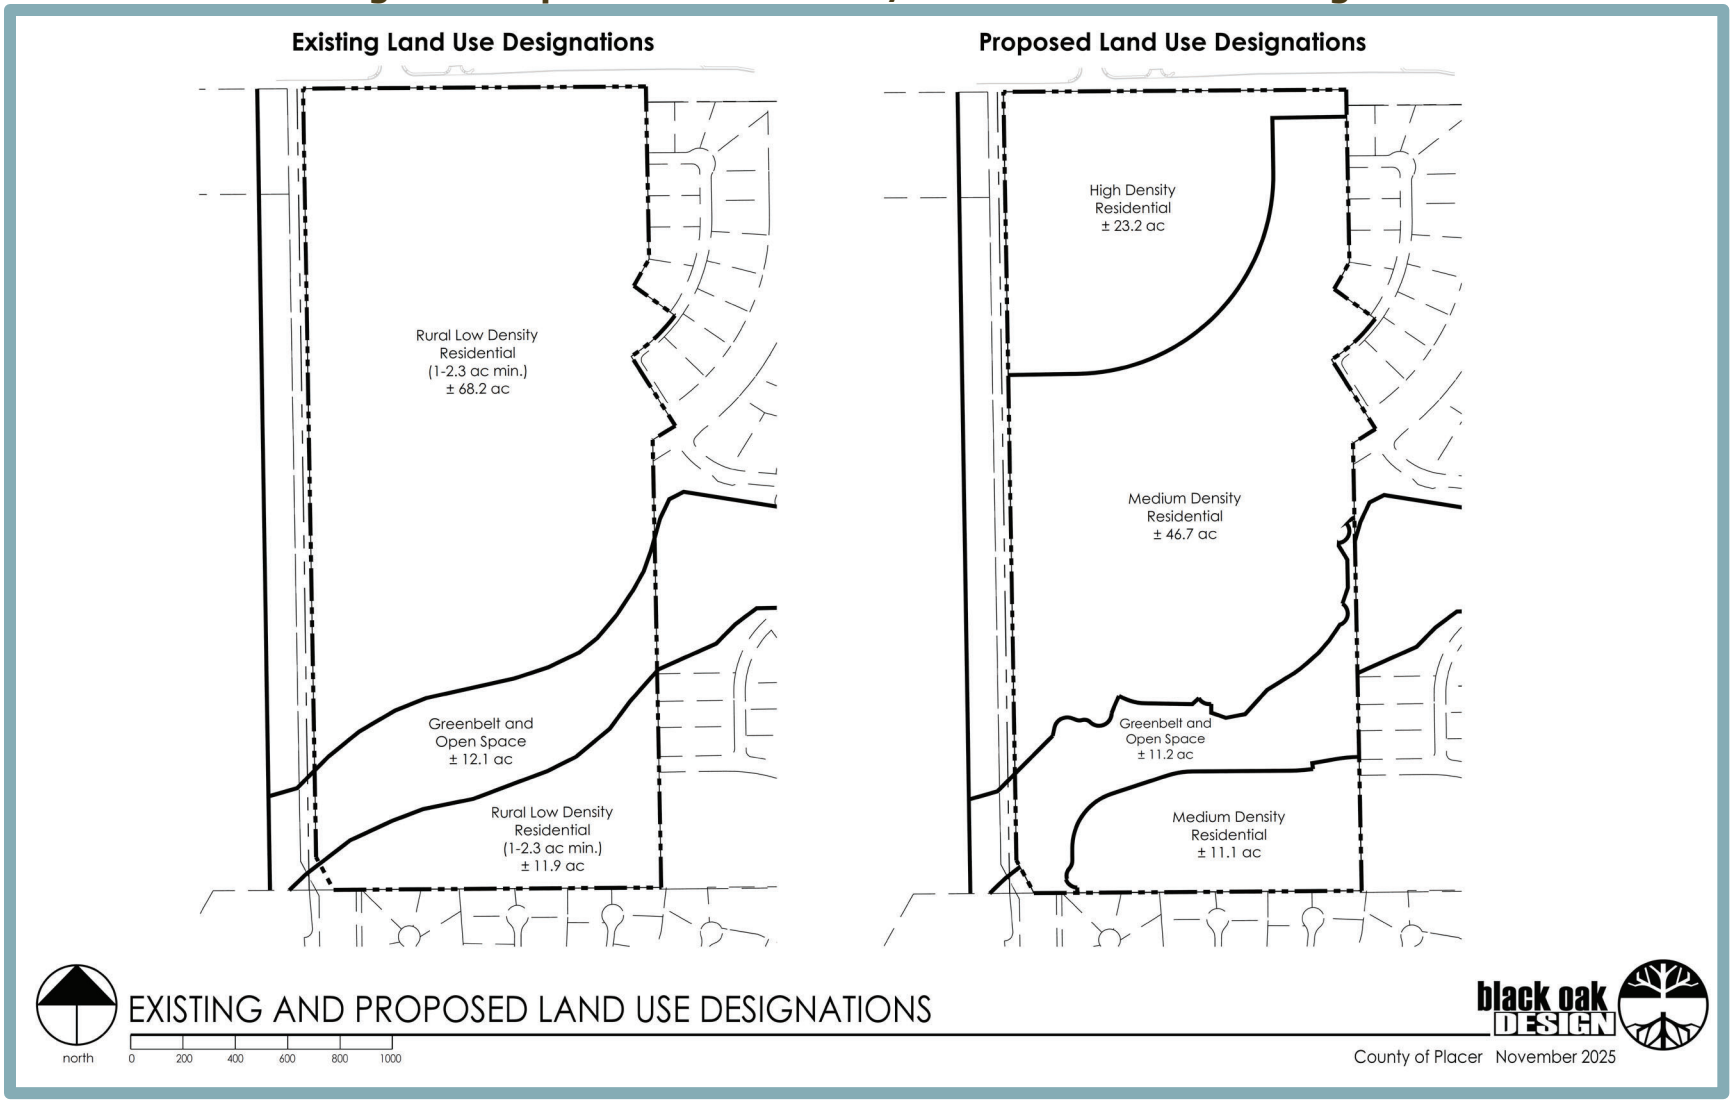
Other approvals necessary to implement the proposed project would include Placer County Conservation Program (PCCP) authorization, a Section 404 permit from U.S. Army Corps of Engineers (USACE), a Section 1602 permit from the California Department of Fish and Wildlife (CDFW), a Section 401 Water Quality Certification from the Regional Water Quality Control Board (RWQCB), a National Pollutant Discharge Elimination System (NPDES) Construction General Permit, and an Encroachment Permit from the City of Roseville for road improvements within their jurisdiction.

The proposed project components, including the required approvals, are described in further detail below.

Estia Dry Creek

The Estia Dry Creek development (Phase 1) would include 220 single-story multi-family units consisting of 80 one-bedroom units and 140 two-bedroom units, ranging from approximately 700 square feet (sf) to 1,100 sf. Units would be either detached or in duet configurations. Each unit would include a private fenced backyard. A 3,537-sf community center building would also be developed and would include a club room, two fitness rooms, and leasing offices with associated lounge, break room, and storage areas. An outdoor pool with patios and grill areas would be located adjacent to the community center. Additional amenities would include a centrally located dog park, pet washing stations, and car washing stations. Garages, covered, and surface parking would be located throughout the site. The density for the Estia Dry Creek portion of the proposed project would be approximately 9.5 residential units per acre.

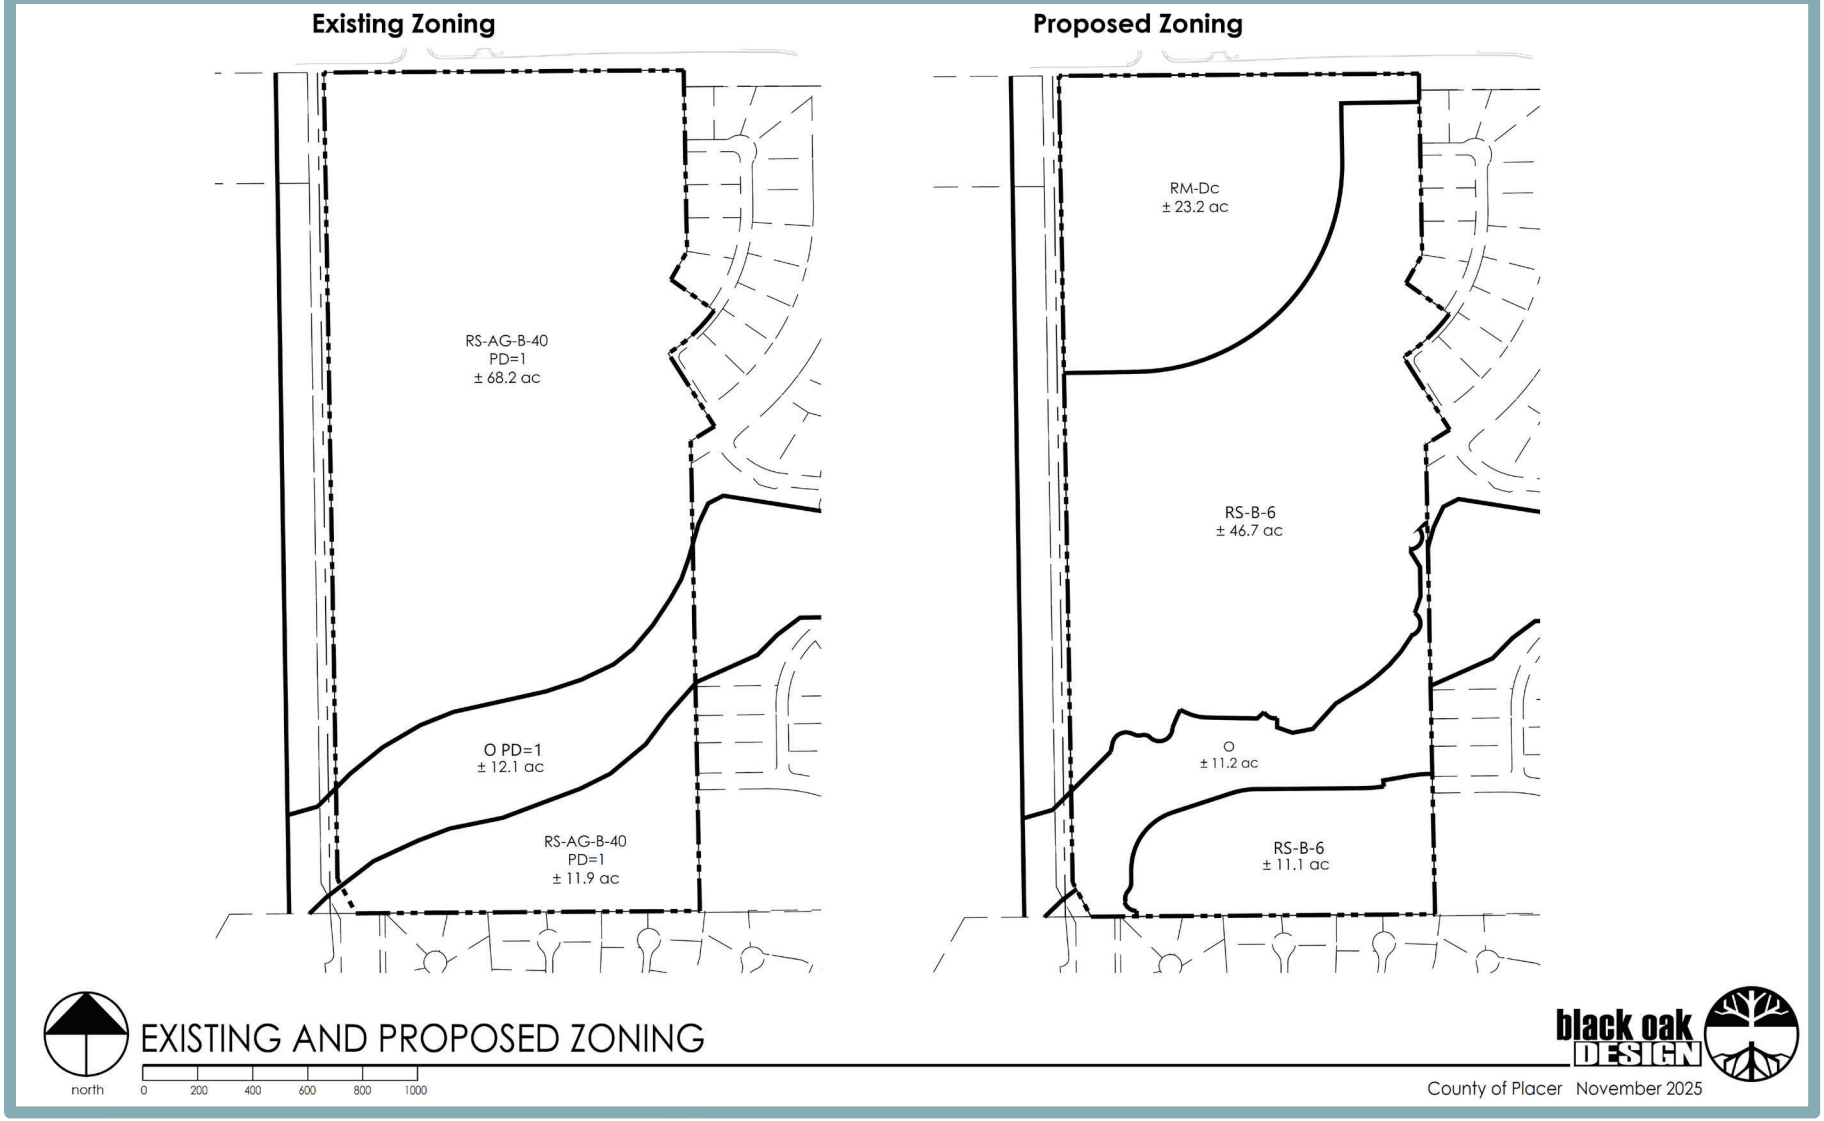
Placer Creek Residential



The Placer Creek Residential development (Phases 2, 3, and 4) would include 212 single-family residential lots with a minimum lot size of 6,036 sf. There are no lot coverage restrictions for lots less than 13,000 sf in the RS zone; for lots greater than 13,000 sf, maximum lot coverage is 40 percent for both single- and two-story homes. The Phase 2 neighborhood would have the potential to build as two phases: Phase 2A would include 49 lots and Phase 2B would include 61 lots. The overall Phase 2 would include a total of 110 single-family lots, and a centrally located 2.1-acre public neighborhood park with pickleball courts and associated amenities (described further below). Phase 3 would include the development of 56 single-family lots. Phase 4 would include the development of 46 single-family lots and the western extension of Vineyard Road, which would provide site access, along with trails and the 9.9-acre oak woodlands area along the “Placer Creek” riparian corridor, which would be preserved as open space.

The Placer Creek riparian corridor would separate the Phase 3 and 4 developments. The average residential density of the Placer Creek Residential site would be approximately 3.67 dwelling units per acre.

General Plan/DCWPCP and RVSP Amendments and Rezone



The 92.2-acre project site (including Walerga Road) is currently designated RLDR (80.1 acres) and OS (12.1 acres). The project would include a General Plan/DCWPCP Amendment to change the site’s land use designations to High Density Residential (HDR) (23.2 acres), Medium Density Residential (MDR) (57.8 acres), and OS (11.2 acres) (see Figure 3-4). In addition, the project would include a rezone to change the site’s zoning designations from RS-AG-B-40 PD=1 (80.1 acres) and O PD=1 (12.1 acres), to Residential Multifamily, combining Design Scenic Corridor (RM-Dc) (23.2 acres), Residential Single Family, combining minimum Building Site of 6,000 sf (RS-B-6) (57.8 acres), and Open Space (O) (11.2 acres) (see Figure 3-5).

Figure 3-4
Existing and Proposed General Plan/DCWPCP Land Use Designations

* Figure not OCR Compatible

Figure 3-5
Existing and Proposed Zoning Designations

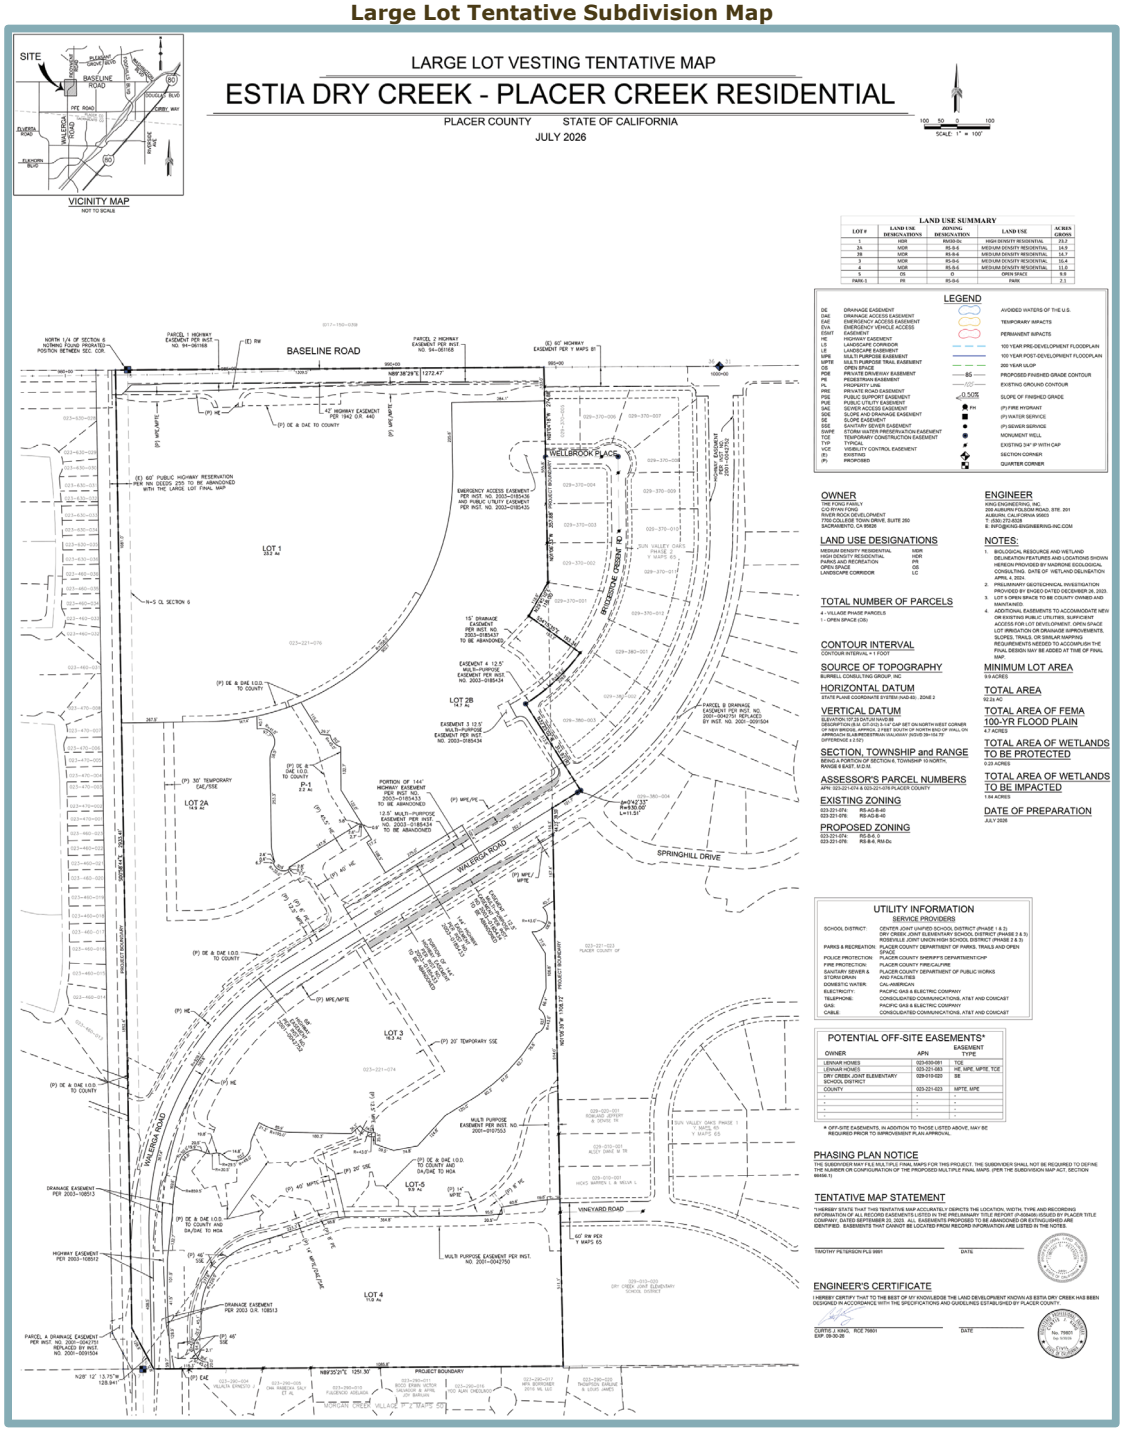
* Figure not OCR Compatible

As discussed further below in the Affordable Housing section, this EIR evaluates two options by which the applicant could satisfy the project's affordable housing requirements, one of which includes transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the RVSP. This option would involve rezoning the off-site affordable housing parcel to Residential Multifamily 30, combining Design Scenic Corridor (RM30-Dc) zone, which would result in a maximum development potential of 120 affordable income-restricted units.

Rezoning the off-site affordable housing parcel would also require a RVSP Amendment and Development Agreement Amendment. The off-site affordable housing parcel is not currently proposed for development as part of the proposed project, but rather the proposed project would transfer land in-lieu to accommodate future affordable housing. Approval of the currently proposed entitlements would allow for the future development of an affordable housing project either by the County or another developer. The second option for satisfying the project's affordable housing requirements includes developing 22 Accessory Dwelling Units (ADUs) on-site.

Tentative Subdivision Maps

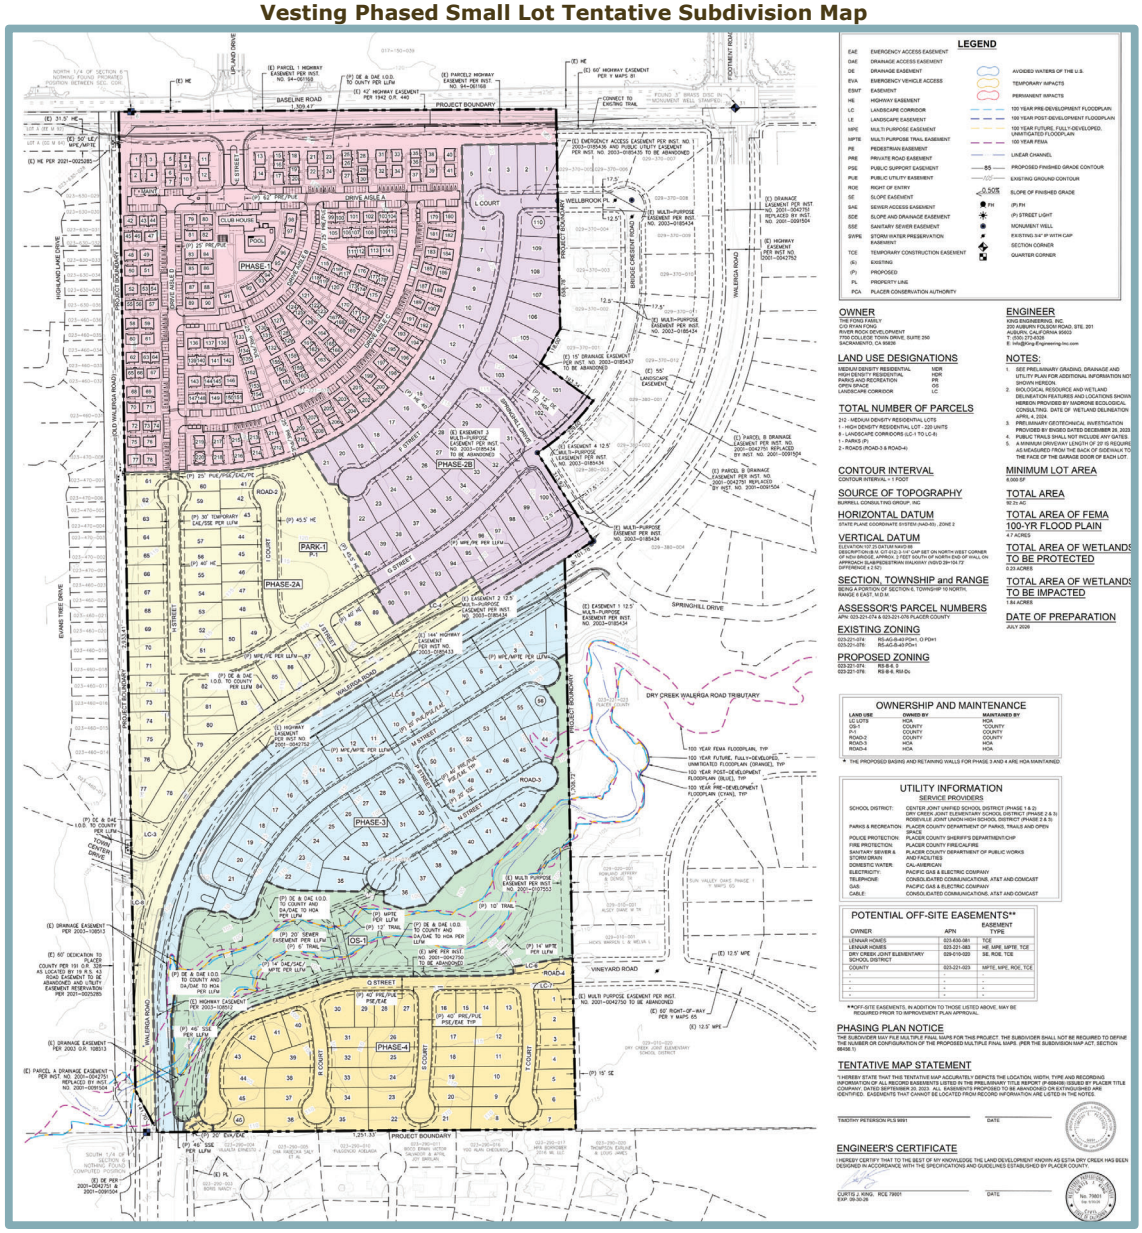
The proposed project would include a Vesting Large Lot Tentative Subdivision Map to subdivide the net 87.6-acre project site into large lot parcels corresponding to the residential areas of the site (Lots 1 through 4), the on-site open space (Lot 5), and the Park lot (Lot P-1) (see Figure 3-6). In addition, the proposed project would include a Vesting Phased Small Lot Tentative Subdivision Map (see Figure 3-7) to subdivide large Lots 2A, 2B, 3, and 4 into 212 single-family residential lots ranging from approximately 6,036 sf to 15,673 sf. The proposed project would be constructed over the course of five development phases. As shown below in Table 3-2, the total unit count would be 432, which includes 212 single-family lots and 220 multi-family units.



Affordable Housing

The Estia Dry Creek development is exempt from the Placer County Inclusionary Housing Ordinance (County Code 15.65.050.B.16) due to all unit sizes being less than 1,600 sf and being inherently affordable by design.

As discussed in the Rezone section above, this EIR evaluates two options by which the applicant could satisfy the project's affordable housing requirements, one of which includes an equivalency proposal composed of transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the RVSP. The proposed off-site affordable housing parcel is approximately four acres, located at the northeast corner of PFE Road and Watt Avenue, and is identified as APN 023-200-056-000 (see Figure 3-8). The RVSP EIR analyzed development of the off-site affordable housing parcel with 60 High-Density Residential (HDR) units. However, in 2015, the County approved an amendment to the RVSP, which redesignated the subject parcel from HDR to Commercial. The 2015 RVSP Amendment did not include additional traffic analysis; thus, the County limited the amount of commercial development on this parcel to a maximum of 3,750 sf, which roughly equates to the same number of vehicle trips that could be generated by the previously approved HDR use.



In addition to a commercial development potential of 3,750 sf, the applicant, Homes by Towne, has 39 density reserve units available towards the off-site affordable housing parcel. Thus, the baseline development potential for the proposed off-site affordable housing parcel consists of 3,750 sf of commercial, plus the 39 density reserve units.

Note: Lot acreages are approximate and will be refined through the EIR process.

*Lot developed with the Large Lot Final Map.

This option would involve an Amendment to the RVSP and a rezone of the proposed off-site affordable housing parcel to the RM30-Dc zone, which would result in a maximum development potential of 120 affordable income-restricted units. The amendment and rezone would allow the parcel to be developed at a future date with HDR units at a density of 30 units/acre. While development of the off-site affordable housing parcel is not currently proposed and this option would only involve the transfer of land, this EIR will evaluate the potential environmental impacts associated with the net increase in development potential at the off-site affordable housing parcel within the RVSP. In addition, future development of the off-site affordable housing parcel would require an Amendment to the Riolo Vineyards Development Agreement to add a High Density Residential (HDR) land use designation, Development Standards and Design Guidelines, rezoning of the property, and a change in assumptions for level of services.

This EIR also evaluates an alternative means by which the proposed project can meet the County's affordable housing regulations. According to Policy HE-C-3, included in the Housing Element of the County's General Plan, ADUs of less than 750 sf are considered to be affordable by design and eligible to satisfy low-income housing requirements in specific plans and new developments. The County's regulations require a minimum of 10 percent of the units within the

proposed project be affordable housing; thus, the proposed project could provide a minimum of 22 ADUs on lots with single-family residential units. ADUs are allowed by-right, pursuant to State and County regulations, within the project site's proposed land use and zoning designations.

Parks, Recreation, Open Space, and Trails

The proposed project would include development of a public, 2.1-acre neighborhood park in the Placer Creek Residential Phase 2 development (Lot PARK-1), which would include two pickleball courts, half basketball court, open turf areas, restrooms, pollinator garden, child play area, covered play structures, covered picnic area with barbecue, cornhole, lounge area, walking trails, and picnic tables throughout the park.. The proposed project would include approximately 9.9 acres of open space bisected by "Placer Creek" and situated between the Placer Creek Residential Phase 3 and 4 neighborhoods (Lot 5/Lot OS-1). The open space area would be preserved as natural open space by virtue of the underlying zoning and an open space easement to be recorded with the final map. Placer Creek Residential parks, trails and open space would be open to the public.

The Estia Dry Creek development would feature an extensive internal pedestrian circulation system that would provide connectivity to project amenities and the surrounding community. A 3,537-sf community center building would include a club room, two fitness rooms, a dog washing facility, and leasing offices with associated lounge, break room, and storage areas. An outdoor pool with patios and grill areas would be located adjacent to the community center. Additional amenities would include a centrally located dog park and car washing stations. The amenities and recreational facilities associated with the Estia Dry Creek development would be private.

The proposed project would include an approximately 1,300-foot-long Class I meandering trail along the Baseline Road frontage, and an approximately 2,300-foot-long Class I meandering trail along the southern/eastern Walerga Road frontage. Placer Creek Residential Phase 4 would also include an approximately 1,600-foot-long Class I trail on the southern side of Placer Creek, providing connection from Walerga Road at the western Emergency Vehicle Access (EVA) entry of Phase 4, traversing east and connecting to the stubbed path north of the three existing Sun Valley Oaks homes fronting White Mill Crescent Road at Vineyard Road. From the proposed trail, a pedestrian bridge would go over Placer Creek and connect to a trail south of Phase 3, ultimately connecting to N Street within the Placer Creek Residential Phase 3 neighborhood.

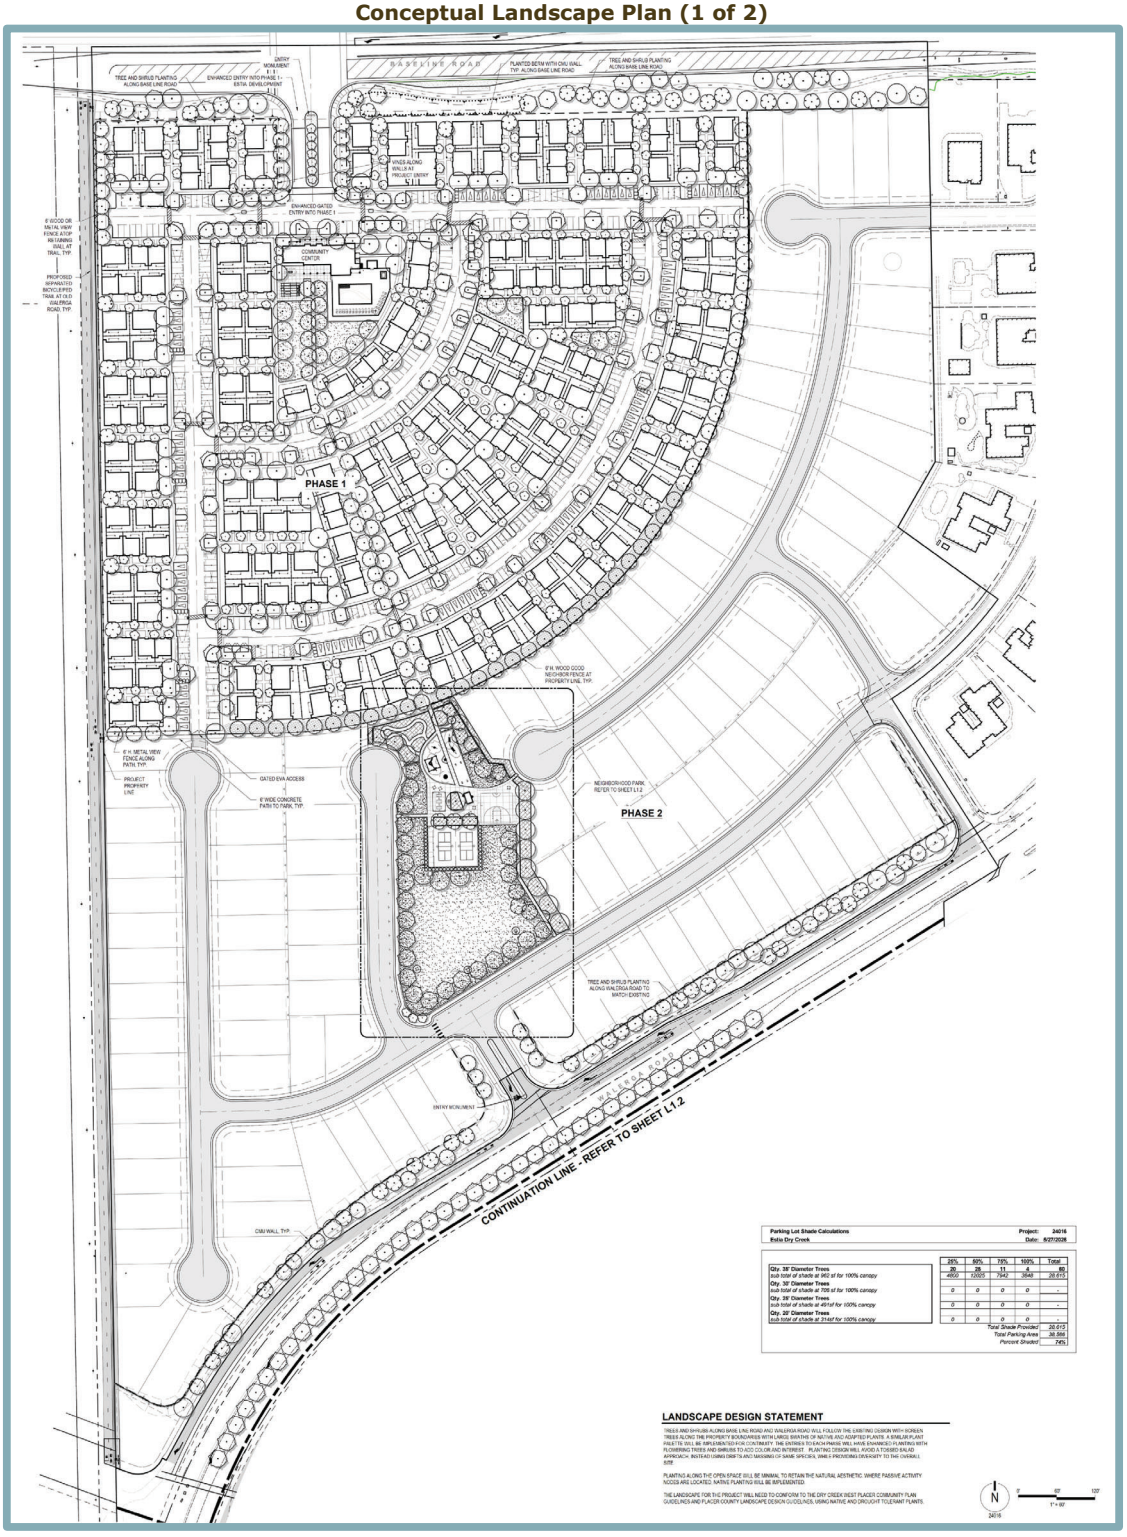
In addition, the proposed project aims to implement minor enhancements within the abandoned Old Walerga Road corridor, which bisects the project site and existing residential development to the west of the project site within the broader Placer Vineyards area. The corridor is privately owned and encumbered by existing public utility easements; accordingly, any proposed enhancements would be subject to landowner consent, utility coordination, and applicable approvals, and would not be implemented absent such consent. Proposed enhancements would be limited to areas previously disturbed by the former roadway and may include linkages on the north side to the planned Class I trail along Baseline Road and on the south side to Town Center Drive, limited pavement surface treatments (such as slurry seal or comparable non-structural applications), signage, and striping to accommodate pedestrians and bicyclists. If implemented, the improvements to the Old Walerga Road corridor would enhance connectivity of local residents to nearby retail and commercial centers, provide additional safety for pedestrians and cyclists, support multimodal access, and contribute to the overall functionality and integration of the local trail network.

The project site would be annexed into County Service Area 28, Zone of Benefit 169 (Dry Creek Parks) for ongoing maintenance of public parks, trails, and recreation amenities within the Dry Creek community.

Landscaping

The project frontage on the south side of Baseline Road would include a landscaped corridor with a six-foot tall concrete masonry unit (CMU) wall. The Phase 1/Estia Dry Creek and Placer Creek Residential Phase 2 entries on Walerga and Baseline Roads would be landscaped with native and adaptive vegetation and marked with enhanced hardscape features, using materials consistent with the DCWPCP and the Placer County Landscape Guidelines. Phase 1 would also be gated on both sides of the parking lot at the entrance from Baseline Road. The Placer Creek Residential Phase 3 entry from Walerga Road would include a landscaped median with a vehicle gate beyond the median, and the Placer Creek Residential Phase 4 entry on Vineyard Road would also be gated. Pedestrian gates would be located at the project entries and would remain unlocked during daylight hours. Project-identification monument features would be located at each of the entries.

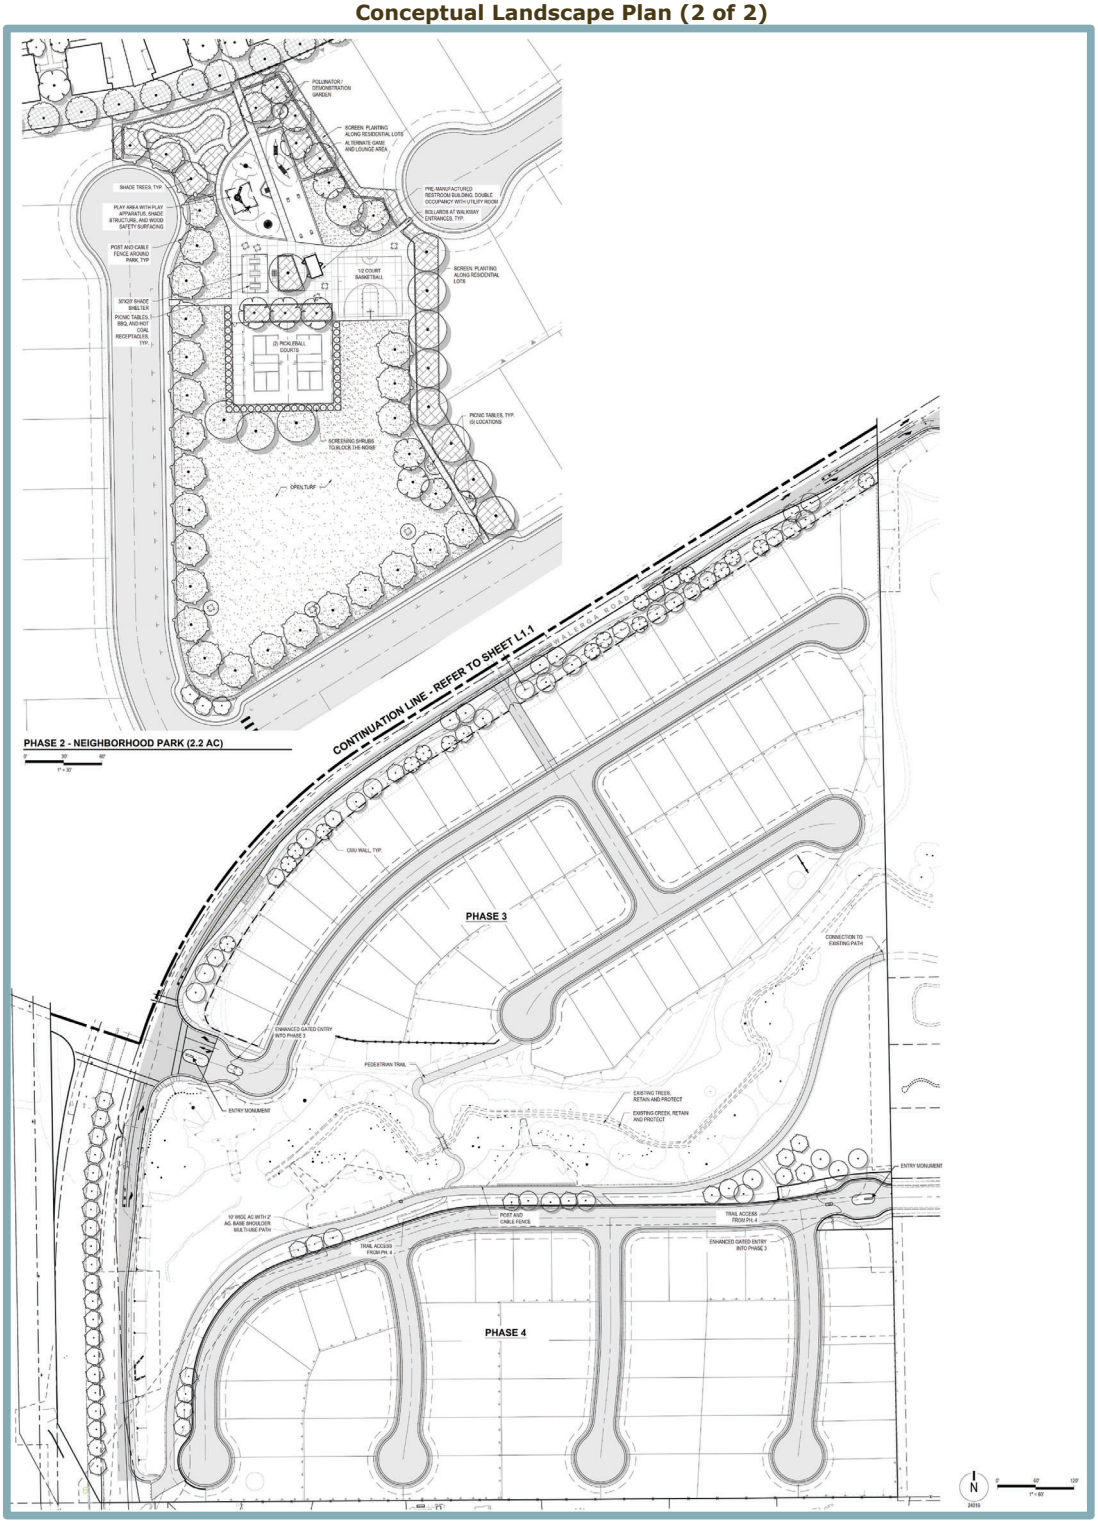
Trees and shrubs would be planted throughout the Estia Dry Creek development. A six-foot tall tubular open view fence and landscape strip would be located along the western boundary of the Estia Dry Creek development, and a six-foot tall privacy fence along the southern boundary. Trees and shrubs would also be planted along both sides of Walerga Road within the project site and along the boundary of the 2.1-acre neighborhood park. Within the Phase 4 development, native tree plantings and a post and cable fence would be provided along the Class I trail on the southern side of Placer Creek (see Figure 3-9 and Figure 3-10). All landscaping would conform to the DCWPCP and Placer County Landscape Design Guidelines.



Finally, a six-foot tall noise barrier, using a combination berm and wall, would be constructed between the Walerga Road frontages and adjacent residential units.

Access and Circulation

Primary access to the Estia Dry Creek development would be provided by way of a new driveway located along Baseline Road, to the north of the site. The proposed driveway would be aligned with the fully signalized Upland Drive, which serves the Baseline Marketplace Commercial development located north of the site, along the north side of Baseline Road. A temporary EVA to the Estia Dry Creek development would be through future Phase 2 by way of a non-signalized Walerga Road intersection (EVA only) located between Springhill Drive and the existing signalized access (i.e., Town Center Avenue) to the Placer Vineyards Property 1A development to the southwest of the site. The ultimate Estia Dry Creek EVA would use the Phase 2 subdivision roadways and connections to Walerga Road, including an additional Walerga Road connection by way of Springhill Road.



Access to the Placer Creek Residential Phase 2 neighborhood would be provided by a Springhill Drive extension and a new roadway off of Walerga Road between Springhill Drive and Town Center Avenue. Both access points would allow for right-in ingress and right-out egress controlled by a median in Walerga Road. While the new roadway off of Walerga Road would be restricted to right-in/right-out only, lefts-in would still be permitted at Springhill Drive.

Figure 3-9
Conceptual Landscape Plan (1 of 2)

* Figure not OCR Compatible

Figure 3-10
Conceptual Landscape Plan (2 of 2)

* Figure not OCR Compatible

Access to the Placer Creek Residential Phase 3 neighborhood would be from a new eastern/fourth leg of the existing signalized intersection at Walerga Road and Town Center Avenue, and an EVA is proposed from Walerga Road to M Street, opposite the new Phase 2 access on Walerga Road.

Access to the southern Phase 4 Placer Creek Residential neighborhood would be from the western extension of Vineyard Road, which currently terminates at the project site, just west of the southern entry to the Sun Valley Oaks subdivision at White Mill Crescent Road. An EVA for Phase 4 is proposed from Q Court to Walerga Road in the southwest corner of the project site, in the same location as the existing encroachment for Sewer and Emergency Access.

From the proposed access points, the Placer Creek Residential neighborhoods would be served by an internal roadway system, which would include sidewalks on each side. Interior roadways would be public in Phase 2 and private in Phases 1, 3 and 4. Low Impact Development (LID) features would be included along the roads, and on-street parking would be permitted on both sides of the residential subdivision streets (Phases 2-4).

Parking spaces provided in the Estia Dry Creek multi-family residential site would comply with the parking requirements pursuant to Placer County Municipal Code 17.54.040 and the Multifamily and Mixed-Use Design Manual. A total of 418 parking spaces would be included in the Estia Dry Creek site, including 346 surface spaces and 72 garage parking spaces in twelve, six car garage structures. All garage spaces would be electric vehicle (EV) capable. Additionally, three level 3 fast EV chargers would be provided on-site, one of which would be located at the Community Center, and two of which would be located within the community. Each single-family residence within the Placer Creek Residential development would include a private garage and driveway parking for a minimum of four cars as required by County code.

The proposed project would also include frontage improvements for the six-lane reconfiguration of Walerga Road and Baseline Road. Frontage improvements along Walerga Road would include the development of two, seven-foot-wide bike lanes, a Class I trail or sidewalk, and increasing from two existing travel lanes in each direction to three 12-foot-wide travel lanes in each direction. Baseline Road along the project frontage currently consists of two travel lanes in both the east and westbound directions and a center striped median of various widths and a signal at Upland Drive. The project would widen Baseline Road along its frontage to accommodate one half of the ultimate six-lane cross section with seven-foot-wide bike lanes on both sides of the street, along with curb and gutter improvements.

Additional Roadway and Intersection Improvements as Identified in the Local Transportation Analysis

The Local Transportation Analysis (LTA) prepared for the proposed project by Kimley-Horn identifies roadway improvements that would be triggered by the proposed project. As determined by the LTA, the following improvements would be required at the specified timing below:

- Baseline Road at Crowder Lane (Estia at Dry Creek/Phase 1): Project-induced Level of Service (LOS) deficiency would be improved by restricting northbound left turns. Westbound project trips from Crowder Lane would instead turn right from Crowder Lane on to Baseline Road and navigate a newly installed left-turn/U-turn at Baseline Road, near the existing entry to the St. Clare Catholic Church parking lot. The northbound left-turn restriction would be implemented by installing a mountable raised median and appropriate

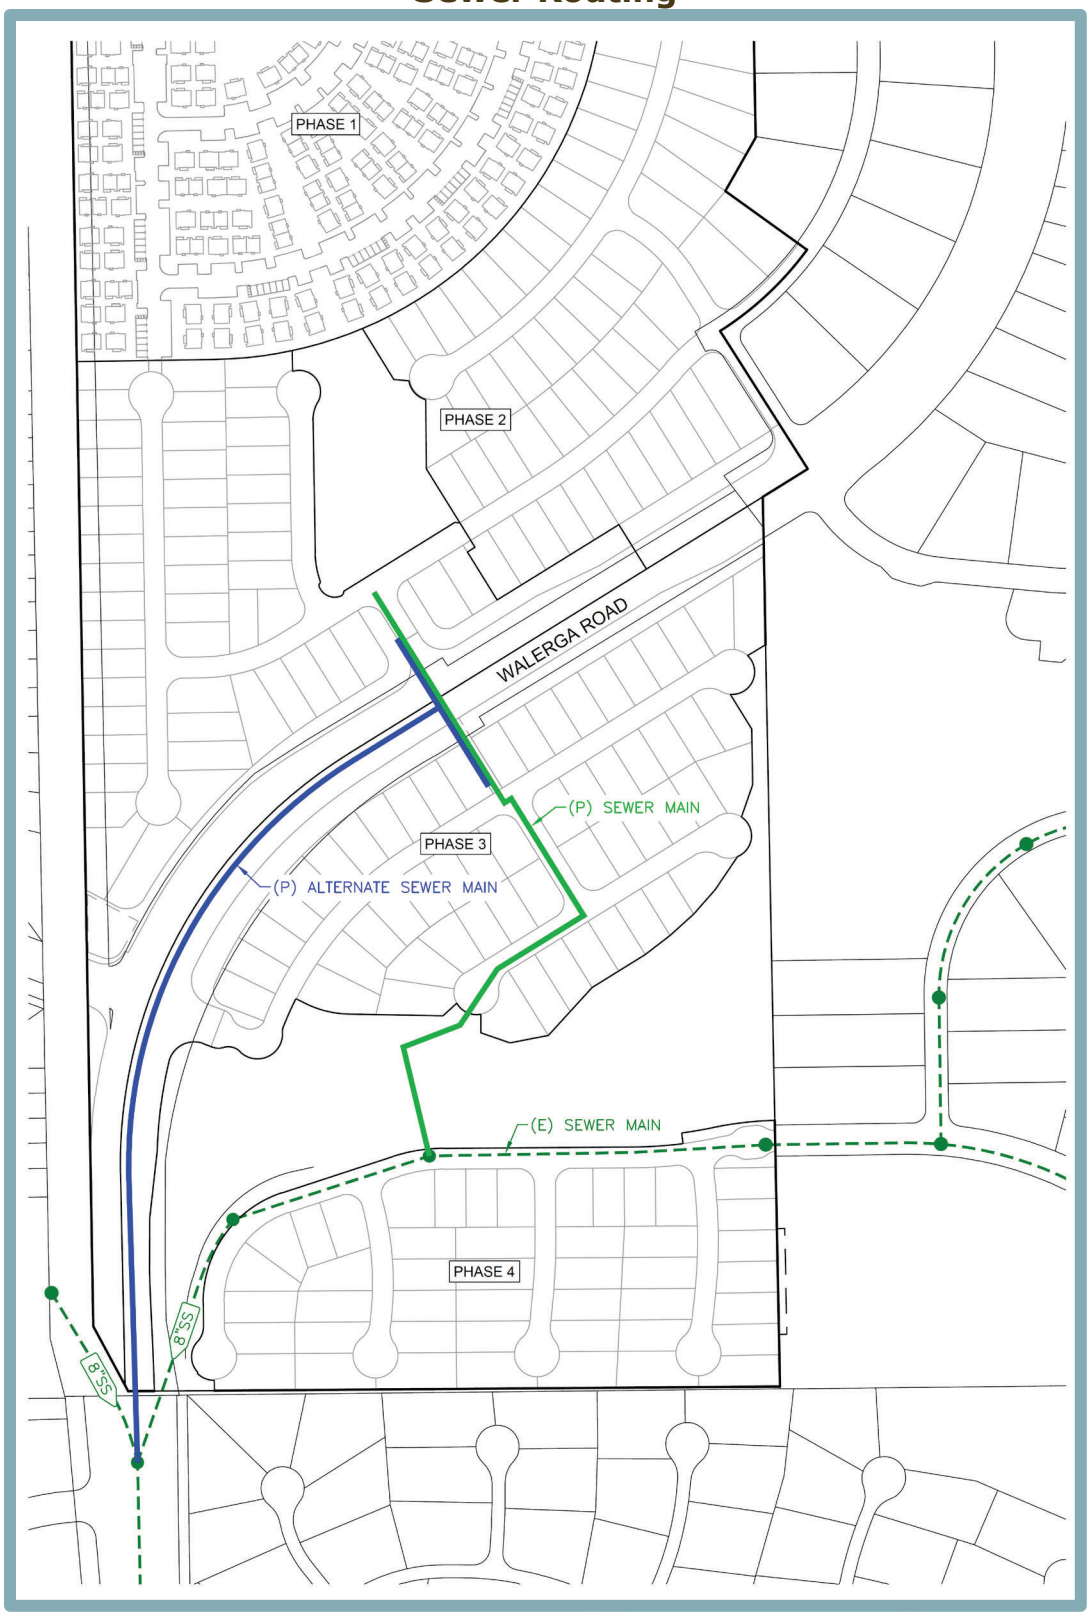
signage. Additionally, the Baseline Road median would be modified at the St. Clare Catholic Church entry to allow for U-turns.

- Walerga Road at Project Access/Springhill Drive (Full Project Buildout): Project-induced LOS deficiency would be improved by restricting the left turns out of the proposed Phase 2 and Phase 3 neighborhoods. Thus, northbound project trips from Springhill Drive would turn right from the proposed Phase 2 neighborhood onto Walerga Road and navigate a U-turn at the Walerga Road intersection with Town Center Avenue. Similarly, because left-turns out of the proposed neighborhoods would be restricted, southbound trips from Springhill Drive would turn right from the proposed Phase 3 neighborhood on to Walerga Road and navigate a U-turn at the Walerga Road intersection with Baseline Road. The left-turn out restrictions would be implemented by installing a median curb restriction.

Both of the above improvements would include coordination with the City of Roseville to implement the required modifications at the Baseline Road/Fiddyment Road/Walerga Road intersection to accommodate U-turns (signage, signal timing, etc.).

In addition, if dedication of the off-site affordable housing parcel is used to satisfy the project's affordable housing obligations, signalization of the Watt Avenue/PFE Road intersection would be a required improvement at the time of future development of the parcel. Installation of a traffic signal at this intersection is also required for RVSP buildout; thus, the timing of the respective developments may dictate the party responsible for constructing this signal, be it the RVSP developer or affordable housing parcel developer.

Utilities and Public Services



Treated water service for the project would be provided by California American Water (CAL-AM) through an agreement with Placer County Water Agency (PCWA). The Estia Dry Creek development would include construction of a 12-inch loop system. In addition, the proposed project would include four- to 12-inch internal water lines for domestic water service and fire/hydrant connections. Internal water lines would connect to an existing 16-inch line in Walerga Road and an existing 24-inch line in Baseline Road.

The proposed project would be served by the Dry Creek Wastewater Treatment Plant (Dry Creek WWTP). Flows would be conveyed through existing eight-inch "Sewer B" gravity lines within Walerga Road to the Dry Creek WWTP. The proposed project would include the development of an eight-inch sewer line either extending under Placer Creek or within Walerga Road in order to route sewer flows to the south (see Figure 3-11). Eight-inch sanitary sewer lines would be included throughout the project site and would connect to an existing eight-inch sewer line to the south of the project site.

In addition, the proposed project would include improvements to the existing Community Facility District #1 Sewer Lift Station, as discussed further in the Off-Site Sewer Lift Station Improvements header below.

All sewer improvements would be consistent with the South Placer Regional Wastewater and Recycled Water Systems Evaluation. The project site would be annexed into Placer County Service Area 28, Zone 173 for sanitary sewer service.

Figure 3-11
Sewer Routing

* Figure not OCR Compatible

The majority of the project site is located within the Dry Creek Watershed, with the northern portion (35.6 acres) of the project site located within the Curry Creek Watershed. The project site would be divided into seven drain management areas (DMAs) for stormwater quality treatment. The seven DMAs include the portions of the project site that would be developed as a result of the proposed project. The Estia Dry Creek portion of the project site (i.e., Phase 1) is divided into two DMAs: A and B. Both DMAs would provide stormwater quality treatment through bioretention basins at the north and south boundaries of the Estia Dry Creek portion of the project site.

This EIR considers two options for providing the required retention for the stormwater runoff from DMA A, which flows to the Curry Creek watershed (which has detention and volumetric retention obligations). The first option consists of routing runoff from DMA A to the proposed Basin A north of the site, along Baseline Road. Excess runoff that does not infiltrate within Basin A would be routed to the existing storm drain infrastructure within Baseline Road. If the proposed project does not participate in a regional retention basin, underground volumetric retention would be required for the runoff within DMA A. Stormwater runoff within DMA B (i.e., the remainder of the Estia Dry Creek portion of the project site) is proposed to be shifted to the Dry Creek watershed. The re-directed flows would be routed to Basin B in the southern portion of the Phase 1 area for treatment and infiltration.

Runoff within Phase 2 of Placer Creek Residential would be routed to a new storm drain pipe within Walerga Road, which would discharge into proposed Basin C in the southwest portion of the Phase 2 area. During large storm events, excess runoff that does not infiltrate within Basin C would discharge into a new 24-inch storm drain pipe that would connect to an existing 48-inch pipe in Walerga Road that currently outfalls into the on-site “Placer Creek” tributary between Phases 3 and 4. The existing 48-inch outfall would be extended to accommodate the Walerga Road improvements to be completed as part of the proposed project. In addition, the existing box culvert underneath Walerga Road would be extended.

The “Placer Creek” tributary to Dry Creek is located between the Placer Creek Residential Phases 3 and 4 residential neighborhoods and flows southwest to Dry Creek. Development of the project site would require installation of on-site drainage facilities and alteration of site topography to accommodate the proposed land uses. Phase 3 and Phase 4 would include water quality Basins D through F, which would each outfall to the Placer Creek tributary through 24-inch and 18-inch storm drains during large storm events.

The proposed project is within the service area of Pacific Gas & Electric Company (PG&E) for electric and natural gas service. A 30-inch PG&E gas transmission line is located along the north side of Baseline Road within an existing easement. In addition, Consolidated Communications and Comcast would provide fiber communication and internet services to the proposed project. The proposed project would connect to the existing dry utility lines within the project vicinity.

Solid waste would be collected by Recology Auburn Placer, a private collection firm, and transported to the Western Placer Waste Management Authority’s Western Regional Sanitary Landfill, located north of the City of Roseville.

Additionally, the proposed project would be served by the Placer County Sheriff’s Office, California Highway Patrol (CHP), Placer County Fire, Center Joint Unified School District (grades K-12), Dry Creek Joint Elementary School District (grades K-8), and Roseville Joint Union High School District (grades 9-12). The nearest Placer County Fire Station is the Dry Creek Fire Station (Station 100), located at 8350 Cook Riolo Road, approximately 1.5 miles east of the project site.

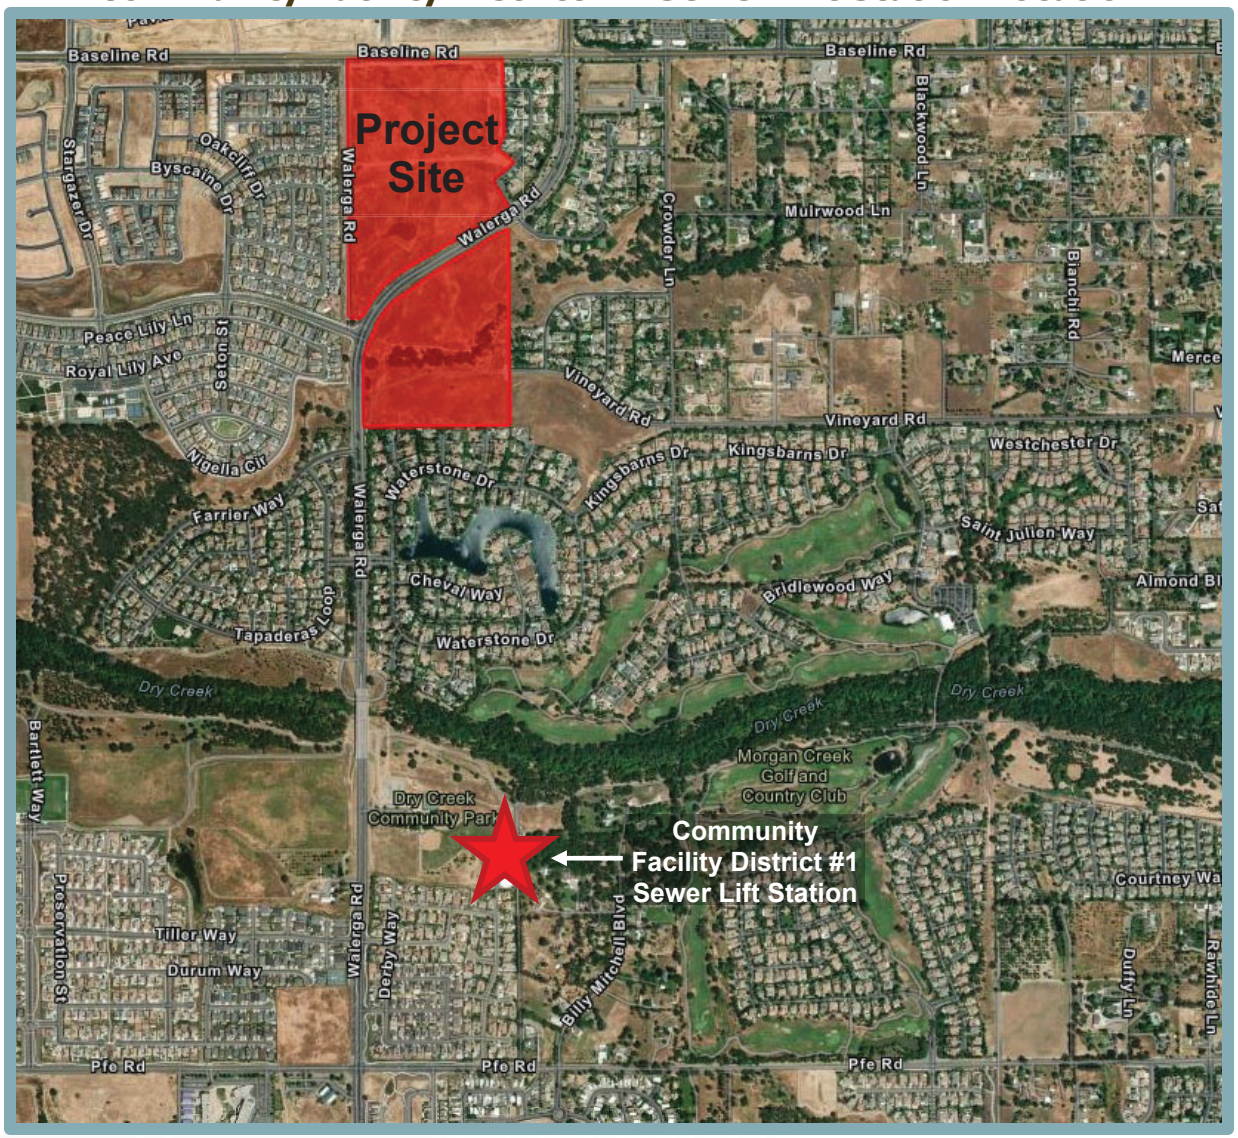
A new fire station is planned for the Placer Vineyards Project, which would provide supplemental fire services. The proposed project would require annexation into the Dry Creek Fire Zone of Benefit (County Service Area 28, Zone of Benefit 165) for provision of fire protection services.

Off-Site Sewer Lift Station Improvements

The existing Community Facility District #1 Sewer Lift Station is located east of Walerga Road and south of Dry Creek, approximately 0.53-mile to the south at the Dry Creek Community Park (see Figure 3-12). The Emergency Wastewater Storage Plan prepared for the proposed project would include a third 47,000-gallon underground tank adjacent to the existing lift station to be developed as part of the proposed project.

The tank areas would require embankment work to raise the access and maintenance areas out of the adjacent Dry Creek 100-year floodplain. Such embankment for flood protection would reduce Dry Creek floodwater storage in the area. To offset the reduced floodwater storage and maintain the same volume of floodwater storage, commensurate excavation would be required immediately north of the facility in an undeveloped area. The compensatory excavation areas are estimated to be two to four feet in depth and would be designed to re-establish natural drainage flow characteristics.

Design Review



Pursuant to Placer County Code Section 17.52.070, the Estia Dry Creek development would require County approval of Design Review for the rezone to the RM-Dc zoning designation to ensure compliance with the County's Multifamily and Mixed-Use Design Manual. The purpose of the design review (-Dc, -Dh, -Ds) combining districts is to provide special regulations to protect and enhance the aesthetic character of lands and buildings within public view; to protect historic buildings; to minimize any adverse impacts of conflicting land uses; to enhance tourism through the protection of lands and buildings having unique aesthetic characteristics; and to provide special project review procedures for lands and uses which by their nature require special attention to architectural design and massing, landscaping, circulation, and/or energy conservation. A Variance to allow for up to 12 consecutive parking spaces bounded by landscaped parking islands, where no more than a maximum of six is required by the Multi-Family and Mixed Use Design Manual, would be required to be approved with the Design Review.

Annexations

The proposed project would require annexation into the Placer County Service Area 28, Zone 173, for sanitary sewer service, subject to approval by the County Board of Supervisors. While maintenance and operation of the sewer collection system would be the responsibility of Placer County, the project's wastewater would be treated at the City of Roseville's Dry Creek WWTP, consistent with normal County practice for projects in this area.

The proposed project would also require annexation into the Placer County Service Area 28, Zone 169, for ongoing maintenance and the generation of funds for public parks, trails, and open space recreation amenities within the Dry Creek community, and annexation into the Dry Creek Fire Zone of Benefit (County Service Area 28, Zone of Benefit 165) for provision of fire protection services, subject to Placer County approval.

Figure 3-12
Community Facility District #1 Sewer Lift Station Location

* Figure not OCR Compatible

Project Phasing and Construction

As shown in Figure 3-3, the proposed project would be constructed over the course of five development phases, with the first phase (i.e., the Estia Dry Creek development) located adjacent to Baseline Road. The proposed Large Lot Tentative Subdivision Map parcels correspond to the conceptual phasing (see Figure 3-6). Development of Phases 1 and 2 would occur on the northern portion of the site (APN 023-221-076), north of Walerga Road, and development of Phases 3 and 4 would occur on the southern portion of the site (APN 023-221-074), south of Walerga Road. The Estia Dry Creek and Placer Creek Residential Phase 2 would be constructed in two separate sub-phases (2A and 2B), with all site work, including grading and necessary infrastructure, completed with the applicable phase. The Placer Creek Residential Phases 3 and 4 could be developed in a single phase, but the two neighborhoods would be physically separated. The Phase 3 and 4 sites would require mass grading.

3.6 PROJECT APPROVALS

The proposed project would require County approval of the following discretionary actions:

- General Plan/DCWPCP Amendment to change the land use designations to High Density Residential (HDR) (23.2 acres), Medium Density Residential (MDR) (57.8 acres), and Greenbelt & Open Space (O) (11.2 acres);
- General Plan/RVSP Map Amendment to change the land use designation of the four-acre parcel (APN 023-200-056-000), located on the northeast corner of PFE Road and Watt Avenue from Commercial to High Density Residential (HDR);
- Amendment to the RVSP to add High Density Residential (HDR) land use designation, Development Standards and Design Guidelines; rezone the property; and Amend the Development Agreement.
- Rezone to Residential Multifamily, combining Design Scenic Corridor (RM-Dc) (23.2 acres), Residential Single Family, combining a minimum Building Site of 6,000 sf (RS-B-6) (57.8 acres), and Open Space (O) (11.2 acres);
- Rezone of a four-acre parcel (APN 023-200-056-000), located at the northeast corner of PFE Road and Watt Avenue from Residential Single Family, combining Agriculture, combining a minimum Building Site of 20,000 square feet, combining Development Reserve, combining Planned Residential Development of 2 units per acre (RS-AG-B-20-DR PD = 2) and Specific Plan District – Riolo Vineyards Specific Plan (SPL-RVSP) to Residential Multifamily 30, combining Design Scenic Corridor (RM30-Dc);
- Vesting Large Lot Tentative Subdivision Map;
- Vesting Phased Small Lot Tentative Subdivision Map;
- Design Review for the Estia Dry Creek multifamily neighborhood to ensure compliance with the County's Multifamily and Mixed-Use Design Manual;
- A Variance to allow for up to 12 consecutive parking spaces bounded by landscaped parking islands, where no more than a maximum of six is required by the Multi-Family and Mixed Use Design Manual;
- Annexation into Placer County Service Area 28, Zone 173 for sanitary sewer service;
- Annexation into Placer County Service Area 28, Zone 169 for ongoing maintenance of public parks, trails and open space recreation amenities within the Dry Creek community; and
- Annexation into the Dry Creek Fire Zone of Benefit (County Service Area 28, Zone of Benefit 165) for provision of fire protection services.

In addition, the proposed project would require County approval of a PCCP Authorization.

The proposed project would also require the following approvals/permits from responsible agencies:

- Section 401 Water Quality Certification (RWQCB – Central Valley Region);
- Streambed Alteration Agreement (CDFW) issued pursuant to Section 1602 of the Fish and Game Code;
- NPDES Construction General Permit (RWQCB – Central Valley Region); and
- City of Roseville Encroachment Permit.

The project would also require the approval from federal agencies, including USACE, the Federal Emergency Management Agency (FEMA), and the U.S. Fish and Wildlife Service (USFWS), for a Section 404 Nationwide Permit (or Letter of Permission), Conditional Letter of Map Revision (CLOMR), and potentially Incidental Take Permits (ITPs).

4. Aesthetics

4. AESTHETICS

4.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County for an approximately four-acre parcel off-site within the Riolo Vineyards Specific Plan (RVSP), which could develop a maximum of 120 affordable income-restricted units.

The Aesthetics chapter of the EIR describes existing aesthetic resources in the area of the proposed project and the broader region, and evaluates the potential aesthetic impacts of the project, including the off-site sewer lift station improvements and off-site affordable housing parcel. Legislative intent language in CEQA states that "it is the policy of the state to … [t]ake all action necessary to provide the people of this state with clean air and water, enjoyment of *aesthetic*, natural, *scenic*, and historic environmental qualities, and freedom from excessive noise." (Public Resources Code [PRC] Section 21001[b], italics added.) Questions in the sample Initial Study checklist found in Appendix G to the CEQA Guidelines address potential impacts on aesthetic resources in terms of scenic vistas, scenic resources (such as trees, rock outcroppings, and historic buildings within a State scenic highway), and the existing visual quality or character of the project area. Light and glare are additional concerns that are addressed in this chapter. The following analysis is based on information drawn from the Placer County General Plan (PCGP),[1] the PCGP EIR,[2] the RVSP EIR,[3] and visual simulations prepared for the proposed project. Further information was sourced from the Dry Creek-West Placer Community Plan (DCWPCP),[4] the Placer County Design Guidelines,[5] and the Placer County Landscape Design Guidelines.[6]

Pursuant to the court ruling in *Preserve Poway v. City of Poway* (2016) 245 Cal.App.4th 560 576-582, community character is separate and apart from aesthetic impacts and, thus, is not a CEQA issue. Rather, the analysis of aesthetics should be limited to tangible, physical evidence that a project is visually inconsistent with the surrounding community (rather than a psychological "feel"). Therefore, where applicable, the analysis presented within this chapter focuses on potential physical changes to the visual character or quality of the project site and surrounding area, rather than overall community character.

4.2 EXISTING ENVIRONMENTAL SETTING

The following setting information provides an overview of the existing conditions of visual resources in the vicinity of the project site, which is located within the DCWPCP, immediately south of the City of Roseville city limits, in unincorporated Placer County.

Visual Character of the Region

The area covered by the DCWPCP encompasses approximately 9,200 acres in the southwest portion of Placer County, California. Currently, the project region is developed with a variety of scattered rural single-family residential units, a number of residential subdivisions, and two Specific Plan areas: Riolo Vineyards and Placer Vineyards. In addition, commercial uses, including a Costco Wholesale, are currently being developed to the north of the project site. The most dominant natural feature in the DCWPCP area is Dry Creek and associated woodlands and riparian habitats. Dry Creek and the associated tributaries generally trend east to west through the central portion of the region, punctuating the open grassland/large lot residential areas present in the eastern portion of the DCWPCP area and the residential subdivisions to the west. The topography is generally flat.

State Scenic Highways

According to the California Department of Transportation (Caltrans) map of designated and eligible scenic routes under the California Scenic Highway Program, officially designated State scenic highways do not exist within the vicinity of the project site or in Placer County.[7]

Visual Character of the Project Site, Off-Site Affordable Housing Parcel, and Surrounding Area

The following information provides an overview of the existing conditions of the project site, off-site affordable housing parcel, and surrounding area in relation to visual character.

Project Site

The project site consists of approximately 92.2 acres located south of Baseline Road, immediately east of the abandoned old Walerga Road right-of-way, west of the Fiddyment Road/Baseline Road/Walerga Road intersection and the western portion of Sun Valley Oaks residential subdivision, and north of the Morgan Creek residential subdivision in the DCWPCP area of unincorporated Placer County.

The project site is bisected by Walerga Road, which generally curves from northeast to southwest. The 52.3-acre northern portion of the site is bounded by Baseline Road to the north and Walerga Road to the south. The northern portion of the site is undeveloped, consists of non-native annual grassland with gently rolling topography, and is interspersed with seasonal wetlands and vernal pools (see Figure 4-1). The 35.3-acre southern portion of the site is bounded by Walerga Road to the north and west (see Figure 4-2). The southern portion of the site includes a paved bicycle trail, which extends from Vineyard Road to the east and Walerga Road to the west. In addition, the southern portion of the site includes undeveloped annual grassland with gently rolling topography (see Figure 4-3). Vineyard Road terminates at the eastern project site boundary of the southern portion of the site (see Figure 4-4).

---

[7] California Department of Transportation. *California State Scenic Highway System Map*. Available at: https://dot.ca.gov/programs/design/lap-landscape-architecture-and-community-livability/lap-liv-i-scenic-highways. Accessed June 2025.

* Figure not OCR Compatible

Figure 4-3
Existing View of the Project Site from Walerga Road, Looking East

* Figure not OCR Compatible

Figure 4-4
Existing View of the Project Site from Vineyard Road, Looking West

* Figure not OCR Compatible

The southern portion of the site is interspersed with seasonal wetlands, vernal pools, and is bisected by an unnamed tributary of Dry Creek (named "Placer Creek" for this project) which flows east to west. The Federal Emergency Management Agency (FEMA) 100-year floodplain, containing approximately 4.7 acres, is located within the Placer Creek tributary area. A band of oak woodlands is located along the Placer Creek riparian corridor.

Surrounding Areas

Surrounding existing land uses for the project site include the under-construction Baseline Marketplace to the north, across Baseline Road; single-family residences associated with the Sun Valley Oaks residential neighborhood to the east; single-family residences associated with the Morgan Creek residential neighborhood to the south; and the under-construction Property 1A of the Placer Vineyards Specific Plan (PVSP), which will include 1,285 residential units, to the west of the project site. Table 3-1 within Chapter 3, Project Description, of this EIR describes the land use and zoning designations of the parcels surrounding the project site.

Off-Site Sewer Lift Station Improvements Area

As discussed in further detail within Chapter 3, Project Description, of this EIR, the existing Community Facility District #1 Sewer Lift Station is located east of Walerga Road and south of Dry Creek, approximately 0.53-mile to the south at the Dry Creek Community Park. Generally, the off-site sewer lift station improvements area does not possess unique visual characteristics and has been largely subject to past development as part of the existing park.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is approximately four acres and is located at the northeast corner of PFE Road and Watt Avenue within the RVSP. The off-site affordable housing parcel is undeveloped and consists of grassy fields with gently rolling topography (see Figure 4-5).

Viewer Types

Viewer types in the vicinity that have views of the project site include the following:

- *Motorists* along Baseline Road and Walerga Road have existing views of the project site while driving past the site, and motorists along Watt Avenue and PFE Road have views of the off-site affordable housing parcel.
- *Pedestrians and bicyclists* in the area include nearby residents and visitors that use the public roadways to walk or bike to their destination. Such pedestrians have views of the project site from Baseline Road and Walerga Road. In general, views experienced by pedestrians and bicyclists are similar to views experienced by motorists. However, because sidewalks or dedicated street bike lanes are currently not provided along Baseline Road, pedestrian and bicyclist traffic along the roadway is relatively limited. Similarly, only a short portion of Walerga Road (near the Springhill Drive intersection) includes sidewalks. Walerga Road does not include dedicated street bike lanes. PFE Road and Watt Avenue along the off-site affordable housing parcel do not include sidewalks or bicycle lanes.
- *Residents* of the existing single-family residences to the east and west have visibility of the project site. Residents of the existing single-family residences to the west of the off-site affordable housing parcel, across Watt Avenue, also have views of the off-site affordable housing parcel.

Figure 4-5
Existing View of the Off-Site Affordable Housing Parcel from PFE Road, Looking North

* Figure not OCR Compatible

Public Versus Private Views

Travelers along nearby roadways, as well as the nearby residences east, west, and south of the project site, would be considered sensitive visual receptors. However, it is important to distinguish between public and private views. Private views are views seen from privately-owned land and are typically viewed by individual viewers, including views from private residences. Public views are views that are experienced by the collective public. In the case of the proposed project, public views would consist primarily of views from Baseline Road and Walerga Road.

CEQA (PRC Section 21000 et seq.) case law has established that only public views, not private views, are protected under CEQA. For example, in *Association for Protection etc. Values v. City of Ukiah* (1991) 2 Cal.App.4th 720 [3 Cal. Rptr.2d 488] the court determined that "we must differentiate between adverse impacts upon particular persons and adverse impacts upon the environment of persons in general." As recognized by the court in *Topanga Beach Renters Assn. v. Department of General Services* (1976) 58 Cal.App.3d 188 [129 Cal.Rptr. 739]: '[A]ll government activity has some direct or indirect adverse effect on some persons. The issue is not whether [the project] will adversely affect particular persons but whether [the project] will adversely affect the environment of persons in general.'" Such conclusions are consistent with the inquiries set forth in Appendix G of the CEQA Guidelines, which ask whether projects outside urbanized areas would "substantially degrade the existing visual character or quality of *public* views" of a project site and its surroundings (italics added). Therefore, it is appropriate to focus the aesthetic impact analysis on potential impacts to public views, rather than private views.

Light Pollution and Glare

Light pollution refers to all forms of unwanted light in the night sky, including glare, light trespass, sky glow, and over-lighting. Views of the night sky can be an important part of the natural environment, particularly in communities surrounded by extensive open space. Excessive light and glare can also be visually disruptive to humans and nocturnal animal species.

The project site and off-site affordable housing parcel are primarily characterized by an undeveloped, unlighted landscape. As such, significant sources of light and glare do not currently occur within the sites. However, both the project site and the off-site affordable housing parcel are located within the vicinity of existing residential development. Lighting associated with such development, as well as street lighting along nearby roadways and headlights from vehicles traveling on the roadways, contributes to the overall nighttime lighting environment in the area surrounding the sites.

4.3 REGULATORY CONTEXT

Applicable federal laws or regulations pertaining to the aesthetic quality of the project area do not exist. Existing State and local laws and regulations applicable to the proposed project are listed below.

State Regulations

The following is an applicable State regulation related to aesthetic resources.

California Scenic Highway Program

The State Scenic Highway System includes a list of highways that are either eligible for designation as scenic highways or have been so designated. Such highways are identified in Section 263 et seq. of the California Streets and Highways Code.

Local Regulations

The following local regulations are applicable to the proposed project.

Placer County General Plan

The following design goals and policies of the PCGP are applicable to the proposed project.

Land Use Element

Goal 1.K To protect the visual and scenic resources of Placer County as important quality-of-life amenities for County residents and a principal asset in the promotion of recreation and tourism.

Policy 1.K.1 The County shall require that new development in scenic areas (e.g., river canyons, lake watersheds, scenic highway corridors, ridgelines, and steep slopes) is planned and designed in a manner which employs design, construction, and maintenance techniques that:

a. Avoid locating structures along ridgelines and steep slopes;
b. Incorporate design and screening measures to minimize the visibility of structures and graded areas; and
c. Maintain the character and visual quality of the area.

Policy 1.K.2 The County shall require that new development in scenic areas be designed to utilize natural landforms and vegetation for screening structures, access roads, building foundations, and cut and fill slopes.

Policy 1.K.3 The County shall require that new development in rural areas incorporates landscaping that provides a transition between the vegetation in developed areas and adjacent open space or undeveloped areas.

Policy 1.K.4 The County shall require that new development incorporates sound soil conservation practices and minimizes land alterations. Land alterations should comply with the following guidelines:

a. Limit cuts and fills;
b. Limit grading to the smallest practical area of land;
c. Limit land exposure to the shortest practical amount of time;
d. Replant graded areas to ensure establishment of plant cover before the next rainy season;
e. Create grading contours that blend with the natural contours on site or with contours on property immediately adjacent to the area of development; and
f. Provide and maintain site-specific construction Best Management Practices (BMPs).

Policy 1.K.5 The County shall require that new roads, parking, and utilities be designed to minimize visual impacts. Unless limited by geological

or engineering constraints, utilities should be installed underground and roadways and parking areas should be designed to conform to the natural terrain.

Goal 1.O To promote and enhance the quality and aesthetics of development in Placer County.

Policy 1.O.1 Except as otherwise provided in the Design Guidelines of an approved Specific Plan, the County shall require all new development to be designed in compliance with applicable provisions of the Placer County Design Guidelines Manual.

Policy 1.O.3 The County shall require that all new development be designed to be compatible with the scale and character of the area. Structures, especially those outside of village, urban, and commercial centers, should be designed and located so that:

a. They do not silhouette against the sky above ridgelines or hilltops;
b. Rooflines and vertical architectural features blend with and do not detract from the natural background or ridge outline;
c. They fit the natural terrain; and
d. They utilize building materials, colors, and textures that blend with the natural landscape (e.g., avoid high contrasts).

Policy 1.O.5 The County shall require that new development at entrances to rural communities be designed to include elements such as signage, landscaping, and appropriate architectural detailing to help establish distinct identities for such communities.

Policy 1.O.9 The County shall discourage the use of outdoor lighting that shines unnecessarily onto adjacent properties or into the night sky.

Natural Resources Element

Goal 6.D To preserve and protect the valuable vegetation resources of Placer County.

Policy 6.D.1 The County shall encourage landowners and developers to preserve the integrity of existing terrain and natural vegetation in visually-sensitive areas such as hillsides, ridges, and along important transportation corridors.

Policy 6.D.12 The County shall support the retention of heavily vegetated corridors along circulation corridors to preserve their rural character.

Dry Creek-West Placer Community Plan

The relevant goals and policies from the DCWPCP related to aesthetics are presented below.

Community Development Element: The Land Use Plan

Goal 2 To preserve outstanding visual features, natural resources, and landmarks.

Goal 6 To encourage compatibility between neighboring land uses.

Policy 7 The design of future residential developments should emphasize character, quality, livability, and the provision of all necessary services and facilities, to ensure their permanent attractiveness.

Community Development Element: Community Design Element

Goal 1 This plan strives to preserve the natural land forms, natural vegetation, and natural resources of the area as much as possible, while also recognizing the deleterious effects of intense development in the surrounding areas.

Goal 2 It is a goal of the plan to encourage and support projects which exemplify good design characteristics when judged against the goals and policies of this plan as well as other applicable design and landscape guidelines.

Goal 5 It is a goal to maintain the heavily vegetated corridors that exist along circulation routes to preserve their rural nature and their value as natural noise buffers.

Goal 6 It is a goal to create residential development which allows the following elements: human interaction, bicycle and pedestrian circulation, an appropriate relationship to existing development in the area, and the creation of a neighborhood identity and/or focus (i.e. parks, schools, natural open space areas, creek site of historical or archaeological significance, etc.).

Goal 8 A major goal of the plan is to utilize and improve the Dry Creek environs as a focal point of existing and new neighborhoods to be created in the area through the placement of park facilities, roadways, trails, interpretive areas, visibility, etc.

Policy 1 Wherever possible, natural features should be retained as buffers between different, potentially incompatible uses. Where natural features are not available, landscaped buffer yards shall be provided to minimize the adverse effects of higher intensity uses upon lower intensity uses.

Policy 3 Preservation of natural features, noise exposure, road access, and relationship to the surrounding properties shall be considered in preparing subdivision designs. Subdivision density, or total number of lots, will ultimately be determined by these factors. The development of the maximum number of lots permitted by the zoning will not be possible in most cases due to these and other design considerations required by this Plan.

Policy 9 Night lighting, visible from the exterior of buildings shall be limited to that necessary for security, safety, and identification.

Policy 10	Projects within the Plan area will comply with the Placer County Landscape Guidelines, the Placer County Design Guidelines, and the specific design guidelines contained in the Plan.
Policy 11	Landscaping shall be used to reduce the visual impact of all structures, including solid fences. Natural vegetation should dominate where possible. Where existing vegetation is inadequate the use of native plant materials is encouraged. Landscaping materials provide an informal character and smooth transition between buildings, parking lots, adjoining roadways and open areas.
Policy 12	Large, bulky and unscreened structures shall be discouraged, particularly if they are visible from the road.
Policy 13	The use of natural materials (i.e., wood siding, brick, block, and field stone) is required. Primary exterior colors shall blend with the surrounding natural landscape. The use of "earthtones" or natural finishes which blend with the natural background is encouraged.
Policy 15	In place of sound wall construction, require, wherever possible, the use of greater setbacks to provide a scenic corridor for all parcels fronting on all the major circulation routes (2, 4, or 6 lanes of traffic). Long expanses of sound walls are not consistent with the desired character of the Plan area and the use of open space setbacks and landscaping instead, will be a major difference between this area and surrounding areas to the north and south.
Policy 18	Utility lines shall be installed underground to ensure minimum disruption to the environment and as little disturbance as possible to vegetation, particularly in scenic corridors.
Policy 20	Where residential development is proposed adjacent to Dry Creek, design it in such a way as to place streets and open space, not backyards, next to the riparian areas in order to enhance the creekside and neighborhood environments as well as providing a sense of ownership and to permit public access to this important resource.

Placer County Landscape Design Guidelines

The Placer County Landscape Design Guidelines were adopted by the Placer County Board of Supervisors on May 7, 2013. The overall purpose of the Placer County Landscape Design Guidelines is to provide County staff, prospective developers, and stakeholders with a basic framework for designing landscaped areas within unincorporated Placer County and to ensure continuity, consistency, and quality design. In addition, the Guidelines are used to assist the Planning Services Division with their review of submitted plans for landscape improvements by providing consistent and specific design criteria intended to help determine if a proposal is acceptable. The Guidelines focus on landscaping requirements for streetscape and parking lots.

Placer County Design Guidelines Manual

The Placer County Design Guidelines Manual includes guidelines and standards that aim to remove as much design discretion as possible at the staff level in order for prospective developers to assess their chances of approval based on consistency with the manual. The overall goal of the Placer County Design Guidelines Manual is to promote visual environments in the communities of western Placer County that are of high aesthetic quality, offer variety in developing community design images reflective of community heritage, and, in some cases, maintain an overall rural continuity while, in others, identify an appropriate urban design theme.

While the Placer County Design Guidelines Manual does not include a particular "style" for residential or institutional structures in western Placer County, the focus should be on constructing a high-quality residential environment which is sensitive to the surrounding neighborhood character. The Guidelines strive for "quality" architecture through the descriptions of appropriate and inappropriate materials and architectural expression.

Multifamily and Mixed-Use Design Manual

The Multifamily and Mixed-Use Design Manual consists of objective development standards and aesthetic design guidelines for multifamily and mixed-use development project types. The standards and guidelines are a regulatory tool, rather than a set of policies, meaning that development applications must be consistent with the standards and guidelines to be approved. The Design Manual provides measurable, objective standards for multifamily and mixed-use projects that will streamline the review process for duplexes, triplexes, fourplexes, townhouses, multifamily, and mixed-use projects.

Placer County Code

Section 17.54.070(A)(2)(i) of the Placer County Code ("Lighting") requires that "[l]ighting shall be provided as required by project conditions of approval, or as deemed appropriate by the development review committee (DRC), based upon the lighting standards contained within the Placer County design guidelines manual. The lighting patterns (i.e., the amount of light provided to the paved circulation areas) shall be coordinated with the design of the parking spaces and aisles so that maximum lighting benefit is derived from the placement of all approved light fixtures."

Riolo Vineyard Specific Plan

The off-site affordable housing parcel is located within the RVSP Plan Area. The RVSP is implemented by Placer County with the supporting Riolo Vineyards Design Guidelines and the Riolo Vineyard Development Standards. The aforementioned documents are used in conjunction with the RVSP to ensure full implementation of General Plan goals and policies. The Riolo Vineyard Design Guidelines recommend a series of design policies which implement traditional architecture fitting into the West Placer context. The Riolo Vineyard Development Standards implement the regulatory framework and planning concepts of the Specific Plan. The Riolo Vineyard Development Standards supersede portions of the Placer County Zoning Ordinance. Additionally, all project proposals within the RVSP area will be reviewed by the Placer County Design/Site Review Committee. The Placer County Design/Site Review Committee is required to make a finding of consistency among the development plan, the RVSP, and the accompanying Development Standards and Design Guidelines.

4.4 IMPACTS AND MITIGATION MEASURES

This section describes the standards of significance and methodology used to analyze and determine the proposed project's potential impacts related to aesthetics. A discussion of the project's impacts, as well as mitigation measures where necessary, is also presented.

Standards of Significance

Consistent with Appendix G of the CEQA Guidelines, an aesthetic impact is considered significant if the proposed project would:

- Have a substantial adverse effect on a scenic vista;
- Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway (see Chapter 19, Effects Not Found to be Significant);
- In a non-urbanized area, substantially degrade the existing visual character or quality of public views of the site and its surroundings (public views are those that are experienced from publicly accessible vantage point) or, in an urbanized area, conflict with applicable zoning and other regulations governing scenic quality; or
- Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

As noted above, issues related to whether the proposed project would result in the following impact are discussed in Chapter 19, Effects Not Found To Be Significant, of this EIR:

- Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway.

The sample Initial Study checklist found in Appendix G to the CEQA Guidelines suggests that different aesthetic standards apply in "non-urbanized" and "urbanized areas" respectively. For non-urbanized areas, there is an inquiry asking whether a proposed project "would substantially degrade the existing visual character or quality of public views of the site and its surroundings." For urbanized areas, the question is whether the project would "conflict with applicable zoning and other regulations governing scenic quality."

The likely reason that the California Natural Resources Agency (CNRA), in fashioning the inquiries in Appendix G, suggests different approaches to aesthetic analyses in non-urbanized areas and urbanized areas, is CNRA did not want purely aesthetic concerns – such as height and mass by themselves – to deter dense, land-efficient development in urbanized areas. In such highly developed areas, additional high-density development can reduce the long-term environmental effects of what is often called sprawl by making an efficient use of areas that are already highly urbanized. Thus, projects proposed in such areas only require an evaluation of consistency with city or county regulations that govern scenic quality, such as design guidelines. (See *Bowman v. City of Berkeley* (2004) 122 Cal.App.4th 572, 592, 594 ["[t]he aesthetic difference between a four-story and a three-story building on a commercial lot on a major thoroughfare in a developed urban area is not a significant environmental impact, even under the fair argument standard"; "[w]here a project must undergo design review under local law that process itself can be found to mitigate purely aesthetic impacts to insignificance"].)

In contrast, in less developed areas, concerns about mass and height, and how they affect existing visual conditions, are more appropriate.

With respect to the proposed project, the County considers the project site to be located in an urbanized area, as the area includes existing development and/or development that has been recently approved or is under construction. For example, the existing Sun Valley Oaks single-family residential neighborhood is located to the east, and the single-family residences associated with the Morgan Creek residential neighborhood are located to the south. In addition, existing and future single-family residences associated with the PVSP are located to the west of the site. The Baseline Marketplace is currently under construction to the north, across Baseline Road. Similarly, the off-site affordable housing parcel is located within the RVSP and is located near existing residential development. The County has therefore undertaken the inquiry appropriate for "urbanized areas" within this chapter.

Method of Analysis

The section below considers the development of the proposed project and acknowledges physical changes to the existing setting. Impacts to the existing environment of the project area are to be determined by the contrast between the visual setting before and after buildout of the proposed project. The standards of significance listed above are used to delineate the significance of any visual alterations of the site. As noted above, the project site and off-site affordable housing parcel are considered to be located within an "urbanized area," given the existing development and/or development under construction in the vicinity. Therefore, the appropriate inquiry to apply to the proposed project is for "urbanized areas" and whether the proposed project would conflict with the applicable zoning and other regulations governing scenic quality.

The following analysis assesses the potential for the proposed project to conflict with applicable zoning and other regulations governing scenic quality. In order to facilitate the analysis, computer-generated photo simulations of the proposed project viewed from Baseline Road and Walerga were prepared for the project.

Project-Specific Impacts and Mitigation Measures

The following discussion of impacts related to aesthetics is based on implementation of the proposed project, as well as the two affordable housing options analyzed throughout this EIR, in comparison to existing conditions and the standards of significance presented above. In most cases, potential environmental impacts associated with the proposed project and the 22 on-site ADUs would not differ. Thus, unless otherwise noted, the below analysis applies to both the proposed project and the on-site ADUs.

4-1 Have a substantial adverse effect on a scenic vista. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts associated with the proposed project and the off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, related to having a substantial adverse effect on a scenic vista.

Proposed Project, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

A scenic vista is an area that is designated, signed, and accessible to the public for the express purposes of viewing and sightseeing, or an undesignated area of particular aesthetic quality, such as sweeping mountain views, or verdant valleys. Federal and State agencies have not designated any scenic vistas within Placer County for viewing and

sightseeing. Similarly, Placer County, according to the PCGP, has determined that the planning area of the General Plan does not contain officially designated scenic highways, corridors, vistas, or viewing areas.

In addition, both the project site and the off-site affordable housing parcel, as well as the surrounding areas (including the off-site sewer lift station improvements area), lack defining features of particular aesthetic prominence that could contribute to the area being considered an undesignated scenic vista. Sweeping mountain views are not afforded from the project site, off-site sewer lift station improvements area, off-site affordable housing parcel, or immediate environs, nor are there uninterrupted valleys or open spaces.

Based on the above information, because scenic vistas are not located on or adjacent to the project site, the proposed project would not have a substantial adverse effect on a scenic vista. Therefore, the project would result in a ***less-than-significant*** impact.

Mitigation Measure(s)

None required.

4-2 In a non-urbanized area, substantially degrade the existing visual character or quality of public views of the site and its surroundings (public views are those that are experienced from publicly accessible vantage point) or, in an urbanized area, conflict with applicable zoning and other regulations governing scenic quality. Based on the analysis below, and with implementation of mitigation for the Off-Site Affordable Housing Parcel, the impact is *less than significant.*

Because the project site is located within an urbanized area, the relevant threshold is whether the proposed project would conflict with applicable zoning and other regulations governing scenic quality. The following discussion includes an analysis of such potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as the potential future development of the off-site affordable housing parcel.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

The DCWPCP and the County's Zoning Ordinance carry out the policies of the PCGP by classifying and regulating the uses of land and structures within the unincorporated County, consistent with the General Plan. The site's land uses are currently designated as 80.1 acres of Rural-Low Density Residential (1-2.3 acre minimum) (RLDR) and 12.1 acres of Greenbelt and Open Space (OS). The 80.1 acres of the project site designated RLDR are currently zoned Residential Single-Family, combining Agriculture, combining a minimum Building Site of 40,000 square feet, combining Planned Residential Development of one dwelling unit per acre (RS-AG-B-40 PD=1). The remaining 12.1 acres are zoned Open Space, combining Planning Residential Development of one dwelling unit per acre (O PD=1). The proposed project would include a General Plan/DCWPCP Amendment to change the site's land use designations to High Density Residential (HDR) (23.2 acres), Medium Density Residential (MDR) (57.8 acres), and OS (11.2 acres). In addition, the project would include a rezone to change the site's zoning designations to

Residential Multifamily, combining Design Scenic Corridor (RM-Dc) (23.2 acres), Residential Single Family, combining minimum Building Site of 6,000 sf (RS-B-6) (57.8 acres), and O (11.2 acres). While the proposed project would include a General Plan/DCWPCP Amendment and a Rezone to allow for development of the project, the County previously planned for buildout of the general areas of the site proposed for development, as indicated by the current land use and zoning designation. The proposed project would include subdivision of the project site and the development of 432 total residential units comprised of 212 single-family lots and 220 multi-family units, a 2.1-acre park, recreational amenities, 9.6 acres of open space, 3.3 acres of landscape corridors, and various associated on- and off-site improvements. The density for the Estia Dry Creek portion of the proposed project, which is located in the northwest area of the project site, would be approximately 9.5 residential units per acre. The average residential density of the Placer Creek Residential site, which comprises the remainder of the overall project site, would be approximately 3.8 dwelling units per acre. Lot coverage within the Placer Creek Residential site is proposed to be 40 percent for single-story and two-story homes on lots greater than 13,000 sf and less than maximum coverage on lots less than 13,000 sf.

As discussed above, computer-generated photo simulations of the proposed project viewed from Baseline Road and Walerga Road were prepared for the project. The photo simulations of the Phase 1 entry from Baseline Road and the Phase 2 entry from Walerga Road are included as Figure 4-6 and Figure 4-7, respectively. As shown in the photo simulations, the Phase 1 and 2 entries on Baseline Road and Walerga Road would be landscaped with native vegetation and marked with enhanced hardscape features, such as an entry monument and an enhanced gated entry. Phase 1 would also be gated on both sides of the parking lot at the entrance from Baseline Road. The foregoing components would use materials consistent with the DCWPCP and the Placer County Landscape Guidelines. The photo simulation of the Phase 3 entry from Walerga Road is included as Figure 4-8. As shown therein, the Phase 3 entry from Walerga Road would include a landscaped median with a vehicle gate beyond the median. The Phase 4 entry on Vineyard Road would also be gated in a similar manner (see Figure 4-9). Pedestrian gates would be located at the project entries for Phases 3 and 4 and would remain unlocked during daylight hours. Project-identification monument features would be located at each of the entries. The project frontage on the south side of Baseline Road would include a landscaped corridor with a six-foot tall concrete masonry unit (CMU) wall, which would help screen the proposed development from surrounding areas. Trees and shrubs would also be planted along both sides of Walerga Road within the project site, along the boundary of the 2.1-acre neighborhood park, and throughout the Estia Dry Creek development. A six-foot tall tubular open view fence would also be located along the western boundary of the Estia Dry Creek development, and a six-foot tall privacy fence along the southern boundary. Within the Phase 4 area in the southernmost portion of the project site, native tree plantings, and a post and cable fence would be provided along the Class I trail proposed along the southern side of Placer Creek. The proposed project has been designed to retain the Placer Creek tributary, consistent with General Plan Policies 6.D.1 and 6.D.2 related to preserving and protecting vegetation corridors, as well as DCWPCP goals and policies related to preserving natural features (e.g., Community Design Element Goal 1 and Land Use Plan Goal 2).

Construction activities associated with the proposed project and associated off-site improvements would include mass grading of the site, trenching for utilities, and other temporary activities that would be visible from Baseline Road and Walerga Road. The project would be constructed over the course of five development phases. The Estia Dry Creek and Placer Creek Residential Phase 2 (with subphases 2A and 2B) would be constructed separately, with all site work, including grading and necessary infrastructure, completed with the applicable phase. The Phase 1 development (Estia Dry Creek) would be located off Baseline Road and include 220 single-story multi-family units. The Estia Dry Creek multi-family neighborhood would be subject to Placer County's Multifamily and Mixed-Use Design Manual, which includes specific design guidelines related to building facades, outdoor living space, landscaping, exterior lighting, parking, and fences and walls. As such, the Phase 1 development would be subject to Placer County's Design Review process to ensure compliance with the County's Multifamily and Mixed-Use Design Manual, including the design guidelines therein.

In addition, Phases 3 and 4, located to the south of Walerga Road, could be developed in a single phase, although the two neighborhoods would be physically separated by the Placer Creek riparian corridor. All construction-related effects on the visual quality of the project site and/or surrounding area would be temporary.

As a condition of project approval, all of the proposed frontage improvements would be required to be consistent with the Placer County Design Guidelines and the Placer County Landscape Design Guidelines, and the specific design guidelines contained in the DCWPCP. For example, pursuant to DCWPCP Community Development: Community Design Policy 11, the proposed project would include landscaping and solid fences and walls to reduce the visual impact of new structures. In addition, DCWPCP Community Development: Community Design Policy 15 requires, wherever possible, the use of greater setbacks, rather than sound walls, to provide a scenic corridor on major circulation routes. While the proposed project would include sound walls along Walerga Road and Baseline Road, the sound walls would be located in landscaped areas between the proposed residential areas and the surrounding roadways, which allows for greater setback distances from Baseline Road and Walerga Road. The proposed project would also be subject to all applicable sections of Article 16.08, Design Standards and Improvements, and Article 17.54, General Development Regulations, of the Placer County Code. For example, in accordance with Section 16.08.130, the project would underground all utilities. Overall, the proposed project would be consistent with the Placer County Design Guidelines and the specific design guidelines contained in the DCWPCP.

Off-Site Affordable Housing Parcel

As discussed within Chapter 3, Project Description, of this EIR, the potential future development of the off-site affordable housing parcel would require an Amendment to the RVSP and a rezone of the parcel to the Residential Multifamily 30 (RM30) zone, which could result in a maximum development potential of 120 affordable income-restricted units. While this approach to meeting the County's affordable housing obligations would include a Rezone to allow for development of the aforementioned units, the County has previously planned for buildout of the site, as evidenced by the site's previous designations of HDR and Commercial.

The off-site affordable housing parcel does not currently include any site-specific development plans, designs, or proposals. However, future development of the off-site affordable housing parcel would be subject to County review and the applicable development standards for the RM30 zoning district included in Article 17.49 of the Placer County Code. As discussed therein, any residential multi-family development within the RM30 zone district is required to be developed at a minimum density of 20 units per acre and maximum density of 30 units per acre, and would be subject to the requirements established in the Multifamily and Mixed Use Design Manual (June 2021) for lot area, site width, setbacks, floor area ratio, height limit, and other applicable standards.

The Design Manual includes development standards for multi-family development, including duplexes, triplexes, fourplexes, and townhouses, as well as mixed use development. Specifically, the Design Manual would require that all multi-family and mixed-use development be designed such that rooflines, exterior materials, windows, railings, porches, and other design elements have the same exterior appearance as the design elements of the existing buildings in the area. In addition, the Design Manual includes design guidelines intended to complement and support the development standards by providing direction on architectural details and infrastructure, various building elements, and site planning considerations. The general design guidelines provide guidance on overall design, proportion, scale, and arrangement and architectural form and massing, which are intended to create attractive buildings, well-suited and compatible with surrounding buildings. More specific guidance is also included for building facades, including windows, materials and detailing, outdoor living space, landscaping and drainage, exterior lighting, fences and walls, and equipment and service areas. Future development of the off-site affordable housing parcel would be subject to all applicable design guidelines including, but not limited to, DG-37, which requires development projects to use landscaping and related site improvements to promote privacy, reduce off-site visual impacts, and manage stormwater, while maintaining significant scenic views enjoyed by existing neighbors.

The RVSP did not specifically analyze potential conflicts with applicable zoning and other regulations governing scenic quality. However, Impact 8-3 of the RVSP EIR evaluated the potential for new residences to result in visual intrusion and adverse changes to existing views from Union Cemetery, which is located immediately north of the off-site affordable housing parcel. As discussed therein, although a landscape corridor would be maintained to serve as a visual buffer, additional visual screening by large trees and other vegetation would be required because viewers at the cemetery were assumed by the EIR to have high sensitivity to visual changes. Therefore, the RVSP EIR included Mitigation Measure 8-3a, which requires the provision of a visual buffer between cemetery and adjacent homes. As determined in the RVSP EIR, implementation of Mitigation Measure 8-3a would reduce potential impacts to a less-than-significant level. At such time the off-site affordable housing parcel gets developed, the future developer would be required by the County to implement RVSP EIR Mitigation Measure 8-3a, which has been incorporated into this EIR as Mitigation Measure 4-2.

Furthermore, future development of the off-site affordable housing units would be required to comply with applicable guidelines and regulations related to visual quality, including the Placer County Design Guidelines, Placer County Landscape Design Guidelines, the Design Guidelines and Development Standards associated with the RVSP, and Article 17.54 of the Placer County Code. Compliance with such standards would reduce potential

impacts to the visual character of the project area due to future development of the rezone sites, and would ensure that the proposed project would not conflict with applicable zoning and other regulations governing scenic quality.

Conclusion

Based on the above, the proposed project would be consistent with the Placer County Design Guidelines, the specific design guidelines contained in the DCWPCP and/or RVSP, and Placer County Code design standards. Any future development of the off-site affordable housing parcel would require implementation of Mitigation Measure 8-3a of the RVSP EIR to ensure a ***significant*** impact does not occur. The referenced RVSP mitigation measure is incorporated into this EIR as Mitigation Measure 4-2 below.

Mitigation Measure(s)

Implementation of the following mitigation measure would reduce the above potential impact to a *less-than-significant* level.

Off-Site Affordable Housing Parcel

4-2 Implement RVSP EIR Mitigation Measure 8-3a:

Oak trees and other large-scale vegetation compatible with the existing cemetery landscape shall be planted to form a visual buffer between the cemetery and proposed residences to the east and south, sufficient to completely screen views of residences from the cemetery in the long term. In order to provide adequate mitigation in the short term, large-scale, fast-growing shrubs shall also be planted in the buffer area to provide screening within a short period of time; this buffer would then be enhanced over the long term with maturation of oaks and other trees. Newly planted trees in the buffer area shall be monitored for 5 years. All new plantings will be irrigated for the first 2 years of growth to ensure successful establishment. Alternative visual buffer designs would be considered as part of the design review process for individual projects. Any alternative would need to achieve the above objectives, which include completely screening views of surrounding residences, and compatibility with the existing cemetery landscape. An alternative design may include a masonry wall with landscaping to soften the effect of the wall.

4-3 Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project, as well as the potential future development of the off-site affordable housing parcel, which could create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

The proposed off-site sewer lift station improvements would provide additional underground emergency sewer storage capacity and would not result in new sources of

light or glare. Thus, impacts related to light and glare associated with the off-site sewer improvements area are not discussed further.

Proposed Project

As noted previously, the project site is primarily characterized by an undeveloped, unlighted landscape. Existing sources of light in the site vicinity include headlights from vehicles traveling on Baseline Road and Walerga Road, as well as the existing neighborhoods to the east, west, and south. As such, sources of light currently exist in the project vicinity. Nonetheless, development of the project site with single- and multi-family residences and associated improvements would introduce additional sources of light and/or glare to a site where few currently exist.

Individual homes within the project site would introduce new sources of night lighting in the form of exterior light sources such as porch and patio lights, architectural accent lighting, motion-activated security lighting, driveway lighting, landscape lighting, and interior lighting visible through windows. In addition, accent lighting could potentially be included along project frontages at the proposed entrances to the project site, and street lighting would be provided throughout the project site. Lighting could also be interspersed within the proposed on-site park and along the proposed trails for safety purposes. Pursuant to Section 17.54.070(A)(2)(i) of the Placer County Code, the project would be subject to compliance with the applicable sections of the Placer County Design Guidelines related to light pollution, including, but not limited to, shielding of fixtures such that direct rays do not pass property lines.

The proposed project would also be required to comply with Policy 9 of the DCWPCP Design Element, which requires that night lighting, visible from the exterior of buildings, must be limited to that which is necessary for security, safety, and identification. Compliance with Policy 9 of the DCWPCP Design Element would be ensured by requiring all on-site lighting to be “dark sky approved” by the International Dark-Sky Association (IDA). IDA’s Fixture Seal of Approval Program certifies outdoor lighting fixtures as being Dark Sky Friendly, meaning that they minimize glare while reducing light trespass and skyglow. All products approved in the program are required to be fully shielded and to minimize the amount of blue light in the nighttime environment.

Off-Site Affordable Housing Parcel

Because the off-site affordable housing parcel is currently undeveloped, potential future development of the site with a maximum of 120 affordable income-restricted units and associated improvements would introduce additional sources of light and/or glare to a site where few currently exist. Such residences would introduce new sources of night lighting in the form of exterior light sources, interior lighting visible through windows, possible accent lighting along project frontages, and street lighting throughout the project site. As discussed above and pursuant to Section 17.54.070(A)(2)(i) of the Placer County Code, the potential future development of the off-site affordable housing parcel would be subject to compliance with the applicable sections of the Placer County Design Guidelines related to light pollution, including, but not limited to, shielding of fixtures such that direct rays do not pass property lines.

The RVSP EIR evaluated potential increases in night light and glare under Impact 8-4. As discussed therein, new night lighting associated with RVSP buildout could have site-

specific glare impacts. Therefore, the RVSP EIR included Mitigation Measures 8-4a and 8-4b, which establish various lighting guidelines to mitigate potential light and glare impacts. As determined in the RVSP EIR, implementation of Mitigation Measures 8-4a and 8-4b would reduce potential impacts to a less-than-significant level. At such time the off-site affordable housing parcel gets developed, the future developer would be required by the County to implement RVSP EIR Mitigation Measures 8-4a and 8-4b, which have been incorporated into this EIR as Mitigation Measures 4-3(b) and 4-3(c).

Any potential future development of the off-site affordable housing parcel would also be required to comply with the lighting policies of the RVSP Design Guidelines, which requires the following: that street lighting standards shall be spaced according to County requirements; lighting shall be provided to ensure a safe environment, but shall not result in excessive light or glare; that lighting shall be sensitive to adjacent land uses and viewsheds; and that fixtures that provide down-lighting shall be shielded from adjacent uses where feasible.

In addition, because the RVSP is located within the DCWPCP, future development of the off-site affordable housing units would also be required to comply with Policy 9 of the DCWPCP Design Element. Compliance with DCWPCP Policy 9 would be ensured by requiring all on-site lighting to comply with RVSP EIR Mitigation Measures 8-4a and 8-4b.

Conclusion

Because the types of lighting and the specific locations have not yet been determined, the proposed project could increase the amount of light and glare generated on-site, which could be visible from the surrounding residential development and roadways in the project vicinity, including contributions to nighttime sky glow that deteriorate the “dark sky” setting of the project site and surrounding environs. Therefore, the proposed project could be considered to create a new source of substantial light or glare which would adversely affect day or nighttime views in the area, and a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measure would reduce the above potential impact to a *less-than-significant* level.

Proposed Project

4-3(a) *Prior to Improvement Plan approval, the project applicant shall submit a lighting plan for the project to Placer County for review and approval, demonstrating that proposed lighting is Dark-Sky compliant as specified by the International Dark-Sky Association. The lighting plan shall include, but not necessarily be limited to, the following provisions:*

- *Shield or screen lighting fixtures to direct the light downward and prevent light spill on adjacent properties;*
- *Place shields or screens on any flood or area lighting needed for construction activities and/or security so as not to disturb adjacent residential areas and passing motorists;*
- *For public lighting, prohibit the use of light fixtures that are of unusually high intensity or brightness (e.g., harsh mercury vapor, low-pressure sodium, or fluorescent bulbs) or that blink or flash; and*

- *Use appropriate building materials (such as low-glare glass, low-glare building glaze or finish, neutral, earth-toned colored paint and roofing materials), shielded or screened lighting, and appropriate signage to prevent light and glare from adversely affecting motorists on nearby roadways.*

Off-Site Affordable Housing Parcel

4-3(b) *Implement RVSP EIR Mitigation Measure 8-4a, as slightly modified below (shown in strikethrough and double-underline):*

The Applicant proposes the following lighting guidelines as mitigation measures that would apply to lighting placed within public rights-of-ways and within open space areas.

i. *Lights on arterials will use American Electric Lighting, Roadway Series catalog number 325_S MR DT1 R2 FG Caltrans 4B or equivalent.*
ii. *Primary Residential and Secondary Residential Street lights will use Holophane outdoor lighting Hscape series, catalog number GE 100HP_2 B S 72 N H; CVC 27" 1 CA BK or equivalent.*

    These ornamental lighting styles shall be installed throughout the specific plan area with the exception of the following street corridors:

    - *PFE Road*
    - *Walerga Road*
    - *Watt Avenue*

    Standard "cobra head" street lighting may be provided along the street corridors listed above.

iii. *Bollards for trails will use Holophane outdoor lighting Hscapes series catalog number BOL/C 45/13/LW CA BK or equivalent. The source, wattage, and voltage will be determined by Placer County's Department of Public Works.*
iv. *Street lighting standards shall be spaced dependent upon County requirements.*
v. *Lighting shall be provided to ensure a safe environment but shall not cause areas of intense light or glare.*
vi. *Lighting shall be sensitive to adjacent land uses and viewsheds. Architectural features or lighting fixtures that provide down-lighting and lighting that is shielded from adjacent uses shall be implemented.*

4-3(c) *Implement RVSP EIR Mitigation Measure 8-4b:*

To minimize project contributions to cumulative, areawide night light pollution, no upward lighting shall be permitted, and all light standards shall

include shielding to direct illumination downward. All lighting shall be of minimum brightness consistent with safety.

No direct offsite light trespass shall be permitted; all lighting shall use shielded and directed light standards such that no direct offsite illumination will occur.

Cumulative Impacts and Mitigation Measures

As defined in Section 15355 of the CEQA Guidelines, "cumulative impacts" refers to two or more individual effects which, when considered together, are considerable, compound, or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects.

Some types of impacts to aesthetic resources are localized and not cumulative in nature. For example, the creation of glare or shadows at one location is not worsened by glare or shadows created at another location. Rather these effects are independent, and the determination as to whether they are adverse is specific to the project and location where they are created. Projects that block a view or affect the visual quality of a site also have localized aesthetic impacts. The impact occurs specific to a site or area and remains independent from another project elsewhere that may block a view or degrade the visual environment of a specific site.

Two types of aesthetic impacts may be additive in nature and thus cumulative, including night sky lighting and overall changes in the visual environment as the result of increasing urbanization of large areas. As development in one area increases and possibly expands over time and meets or connects with development in an adjoining exurban area, the effect of night sky lighting experienced outside the region may increase in the form of larger and/or more intense nighttime glow in the viewshed.

Similarly, as development in one area changes from rural to urban, and this pattern continues to occur throughout the undeveloped areas of a jurisdiction, the changes in visual character may become additive and cumulatively considerable. The proposed project's incremental contribution to night sky lighting and changes in visual character are addressed below.

The cumulative setting for impacts related to aesthetics encompasses buildout of the DCWPCP area, including the under-construction or planned Creekview Ranch project and PVSP, the latter of which is located west of the project site, as well as the RVSP and off-site affordable housing parcel, Brady Vineyard Subdivision project, Double S Ranch project, The Ranch project, Brookwood Estates project, and Mill Creek project. For more details regarding the cumulative setting, refer to Chapter 20, Statutorily Required Sections, of this EIR.

4-4 Conflict with applicable zoning and other regulations governing scenic quality associated with cumulative development of the proposed project in combination with future buildout of the DCWPCP area. Based on the analysis below, the cumulative impact is *less than significant*.

The geographic setting for analysis of long-term cumulative changes in visual character associated with the proposed project is the area covered by the DCWPCP, as development within the DCWPCP has the potential to affect many of the same views analyzed for the proposed project. Specific existing views of the project site from Baseline Road and Walerga Road are identified in Figure 4-1 through Figure 4-3 of this EIR. Currently, a number of projects within the cumulative geographic setting are under construction or are planned, including, but not limited to, the RVSP (under construction), the PVSP (portions under construction west of the project site), and the approved Creekview Ranch project, The Ranch project, and Mill Creek project.

Future development within the DCWPCP would result in changes to the existing land use environment through conversion of vacant land to developed uses that would result in a change in visual character. The goals and objectives of the DCWPCP are to identify those features of the DCWPCP area that characterize the unique nature and identifying traits of the community and then to specify standards of site development for proposed projects, which would implement the goals and policies of the DCWPCP.

Development within the DCWPCP area includes the under-construction Creekview Ranch Project, approximately 1.59 miles southeast of the project site; the under-construction Brady Vineyard Subdivision project, approximately 2.25 miles to the east of the project site down Vineyard Road; the under-construction Double S Ranch Subdivision Project, approximately 1.28 miles east of the project site; the PVSP, portions of which are currently under construction west of the project site, across Walerga Road; the RVSP, currently under construction southeast of the PVSP; the approved Mill Creek Project, approximately 1.80 miles to the southeast of the project site; and the under-construction The Ranch Project, approximately 1.50 miles east of the project site. Development of other approved projects, as well as the project site, would change the existing visual character of those specific locations from vacant or minimally developed land to more intensively developed residential areas with one- and two-story homes on various sized lots.

Such projects would be required to comply with the Placer County Landscape Guidelines, the Placer County Design Guidelines, the specific design guidelines contained in the DCWPCP, and all applicable sections of the Placer County Code. The Placer County Design Guidelines Manual provides instruction on the design direction to be implemented with the construction of new buildings, which includes setbacks, extensive use of wood, colors consistent with earth tones and significant amounts of landscaping. Such standards serve to reduce impacts on visual character and help to maintain general consistency with the project surroundings. The proposed project would use natural building materials (e.g., masonry, stucco, wood, and faux stone and complementary natural, earth tone colors) consistent with the Placer County Design Guidelines. Cumulative projects in the DCWPCP would result in substantial conversion of vacant land to developed land; however, the projects, including the proposed project, would develop new residential uses that would be well designed and consistent with other residential developments in the larger project

vicinity. Development patterns would include landscaping and setbacks that would both partially screen the projects from the adjacent neighbors and provide a transition space from existing surrounding rural residential lots.

While, cumulative buildout in the non-urbanized geographic areas of the County could result in a substantial change in visual character of the project region and, thus, a significant cumulative impact, the project site is located within an urbanized area and Impact 4-2 above appropriately evaluates the proposed project against the applicable threshold for urbanized areas. As discussed under Impact 4-2, overall, the proposed project would be consistent with the Placer County Design Guidelines and the specific design guidelines contained in the DCWPCP, which would ensure that the proposed project incorporates natural building materials, colors, and landscaping. Similar to the proposed project, the projects within the cumulative geographic setting and all future development within the DCWPCP would be required to comply with the applicable zoning and other regulations governing scenic quality. Therefore, the proposed project, in combination with other reasonably foreseeable development, would result in a ***less-than-significant*** cumulative impact under the non-urbanized threshold related to conflicting with zoning and other regulations governing scenic quality.

Mitigation Measure(s)

None required.

4-5 Creation of new sources of light or glare associated with cumulative development of the proposed project in combination with future buildout of the DCWPCP. Based on the analysis below and with implementation of mitigation, the project's incremental contribution to the significant cumulative impact is *less than cumulatively considerable*.

Cumulative effects of lighting are visible over a wide area, due to the potential for lighting from a number of projects to create sky glow. Cumulative development throughout the DCWPCP area, particularly conversion of rural or currently vacant sites to urban uses, would increase the sources of light and glare, which would have the potential to contribute to sky glow in the area and result in a significant cumulative impact. Such sources of light would be typical of existing residential development in the greater project vicinity, such as the residences to the east and west, as well as the residential subdivisions located further to the west, north of Baseline Road.

However, cumulative development within the DCWPCP area, including the proposed project and the potential future development of the off-site affordable housing parcel, would be subject to existing regulations and guidelines related to light and glare. For example, Section 17.54.070(i) of the Placer County Code requires that lighting in new development is consistent with the lighting standards contained within the Placer County Design Guidelines Manual. As described in Impact 4-3 above, the proposed project in particular would be required to submit a lighting plan for the project to the Placer County Planning Services Division for review and approval prior to Improvement Plan approval (see Mitigation Measure 4-3[a]). Mitigation Measure 4-3(a) requires the project's lighting to be Dark-Sky compliant as specified by the IDA.

Based upon the above analysis, cumulative development within the DCWPCP area would be subject to Section 17.54.070(i) of the Placer County Code requiring that new development within the County comply with lighting standards, and prior to project implementation, a lighting plan would be submitted showing that the proposed project would avoid contribution to sky glow through Dark-Sky design compliance. However, without compliance with Mitigation Measure 4-3(a), which requires submittal of a lighting plan, the proposed project, in combination with cumulative development of the DCWPCP area, could result in a significant cumulative impact related to light and glare and the impact could be ***cumulatively considerable***.

Mitigation Measure(s)

Implementation of the following mitigation measure would reduce the above potential impact to a *less than cumulatively considerable* level by ensuring that the project will not create any substantial sources of light or glare that would adversely affect day or nighttime views in the project area and surrounding properties.

Proposed Project

4-5(a) Implement the following Mitigation Measure set forth in this EIR:

- *4-3(a) Prior to Improvement Plan approval, the project applicant shall submit a lighting plan for the project to Placer County for review and approval, demonstrating that proposed lighting is Dark-Sky compliant as specified by the International Dark-Sky Association. The lighting plan shall include, but not necessarily be limited to, the following provisions:*
    - *Shield or screen lighting fixtures to direct the light downward and prevent light spill on adjacent properties;*
    - *Place and shield or screen flood and area lighting needed for construction activities and/or security so as not to disturb adjacent residential areas and passing motorists;*
    - *For public lighting, prohibit the use of light fixtures that are of unusually high intensity or brightness (e.g., harsh mercury vapor, low-pressure sodium, or fluorescent bulbs) or that blink or flash; and*
    - *Use appropriate building materials (such as low-glare glass, low-glare building glaze or finish, neutral, earth-toned colored paint and roofing materials), shielded or screened lighting, and appropriate signage to prevent light and glare from adversely affecting motorists on nearby roadways.*

Off-Site Affordable Housing Parcel

4-5(b) Implement the following Mitigation Measure set forth in this EIR, as slightly modified below (shown in strikethrough and double-underline):

- *4-3(b) Implement RVSP EIR Mitigation Measure 8-4a:*

The Applicant proposes the following lighting guidelines as mitigation measures that would apply to lighting placed within public rights-of-ways and within open space areas.

i. *Lights on arterials will use American Electric Lighting, Roadway Series catalog number 325_S MR DT1 R2 FG Caltrans 4B or equivalent.*
ii. *Primary Residential and Secondary Residential Street lights will use Holophane outdoor lighting Hscape series, catalog number GE 100HP_2 B S 72 N H; CVC 27" 1 CA BK or equivalent.*

    These ornamental lighting styles shall be installed throughout the specific plan area with the exception of the following street corridors:

    - *PFE Road*
    - *Walerga Road*
    - *Watt Avenue*

    Standard "cobra head" street lighting may be provided along the street corridors listed above.

iii. *Bollards for trails will use Holophane outdoor lighting Hscapes series catalog number BOL/C 45/13/LW CA BK or equivalent. The source, wattage, and voltage will be determined by Placer County's Department of Public Works.*
iv. *Street lighting standards shall be spaced dependent upon County requirements.*
v. *Lighting shall be provided to ensure a safe environment but shall not cause areas of intense light or glare.*
vi. *Lighting shall be sensitive to adjacent land uses and viewsheds. Architectural features or lighting fixtures that provide down-lighting and lighting that is shielded from adjacent uses shall be implemented.*

4-5(c) *Implement the following Mitigation Measure set forth in this EIR:*

- *4-3(c) Implement RVSP EIR Mitigation Measure 8-4b:*

  To minimize project contributions to cumulative, areawide night light pollution, no upward lighting shall be permitted, and all light standards shall include shielding to direct illumination downward. All lighting shall be of minimum brightness consistent with safety.

  No direct offsite light trespass shall be permitted; all lighting shall use shielded and directed light standards such that no direct offsite illumination will occur.

5. Agricultural Resources

5. AGRICULTURAL RESOURCES

5.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County for an approximately four-acre parcel off-site within the Riolo Vineyards Specific Plan (RVSP), which could develop a maximum of 120 affordable income-restricted units.

The Agricultural Resources chapter of the EIR describes the status of the existing agricultural resources within the boundaries of the project site and off-site sewer lift station improvements area, as well as the off-site affordable housing parcel, using the current State data, including identification of any Prime Farmland, Unique Farmland or Farmland of Statewide Importance. In addition, potential conflicts with existing zoning for agricultural use or right-to-farm ordinances applicable to the proposed project are identified, as well as Williamson Act Contracts. Documents referenced to prepare this chapter include the Placer County General Plan (PCGP),[1] the PCGP EIR,[2] the RVSP EIR,[3] the Dry Creek-West Placer Community Plan (DCWPCP),[4] the Placer Legacy Open Space and Agricultural Conservation Program Implementation Report,[5] the U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) Web Soil Survey,[6] and the California Important Farmland Finder.[7]

Information regarding forest resources is included in Chapter 19, Effects Not Found to be Significant, of this EIR.

5.2 EXISTING ENVIRONMENTAL SETTING

The Existing Environmental Setting section describes current farmland and soil productivity classification systems, as well as the extent and quality of any agricultural resources present on the project site.

Farmland Classifications

The Farmland Mapping and Monitoring Program (FMMP), part of the California Department of Conservation (DOC) Division of Land Resource Protection, uses soil agricultural productivity information from the NRCS to create maps illustrating the types of farmland in a particular area.

The FMMP was established in 1982 to continue the Important Farmland mapping efforts begun in 1975 by the USDA. The intent of the USDA was to produce agriculture maps based on soil quality and land use across the nation. As part of the nationwide agricultural land use mapping effort, the USDA developed a series of definitions known as Land Inventory and Monitoring (LIM) criteria. The LIM criteria classified the land's suitability for agricultural production; suitability included both the physical and chemical characteristics of soils and the actual land use. Important Farmland maps are derived from the USDA soil survey maps using the LIM criteria.

Since 1980, the State of California has assisted the USDA with completing the mapping in the State. The FMMP was created within the California DOC to carry on the mapping activity on a continuing basis, and with a greater level of detail. The California DOC applied a greater level of detail by modifying the LIM criteria for use in California. The LIM criteria in California use the Land Capability Classification and Storie Index Rating systems, but also consider physical conditions such as dependable water supply for agricultural production, soil temperature range, depth of the groundwater table, flooding potential, rock fragment content, and rooting depth.

The California DOC classifies lands into seven agriculture-related categories: Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, Grazing Land, Urban and Built-Up Land, and Other Land. The first three types listed above are collectively designated by the State as Agricultural Land for the purposes of CEQA (see Public Resources Code [PRC] Section 21060.1). Important Farmland maps for California are compiled using the modified LIM criteria and current land use information. The minimum mapping unit is 10 acres unless otherwise specified. Units of land smaller than 10 acres are incorporated into surrounding classifications.

Each of the seven farmland types are summarized below, based on California DOC's A Guide to the Farmland Mapping and Monitoring Program.[8]

Prime Farmland

Prime Farmland is land with the best combination of physical and chemical features able to sustain the long-term production of agricultural crops. The land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. The land must have been used for the production of irrigated crops at some time during the two update cycles (a cycle is equivalent to two years) prior to the mapping date.

Farmland of Statewide Importance

Farmland of Statewide Importance is land similar to Prime Farmland, but with minor shortcomings, such as greater slopes or with less ability to hold and store moisture. The land must have been used for the production of irrigated crops at some time during the two update cycles prior to the mapping date.

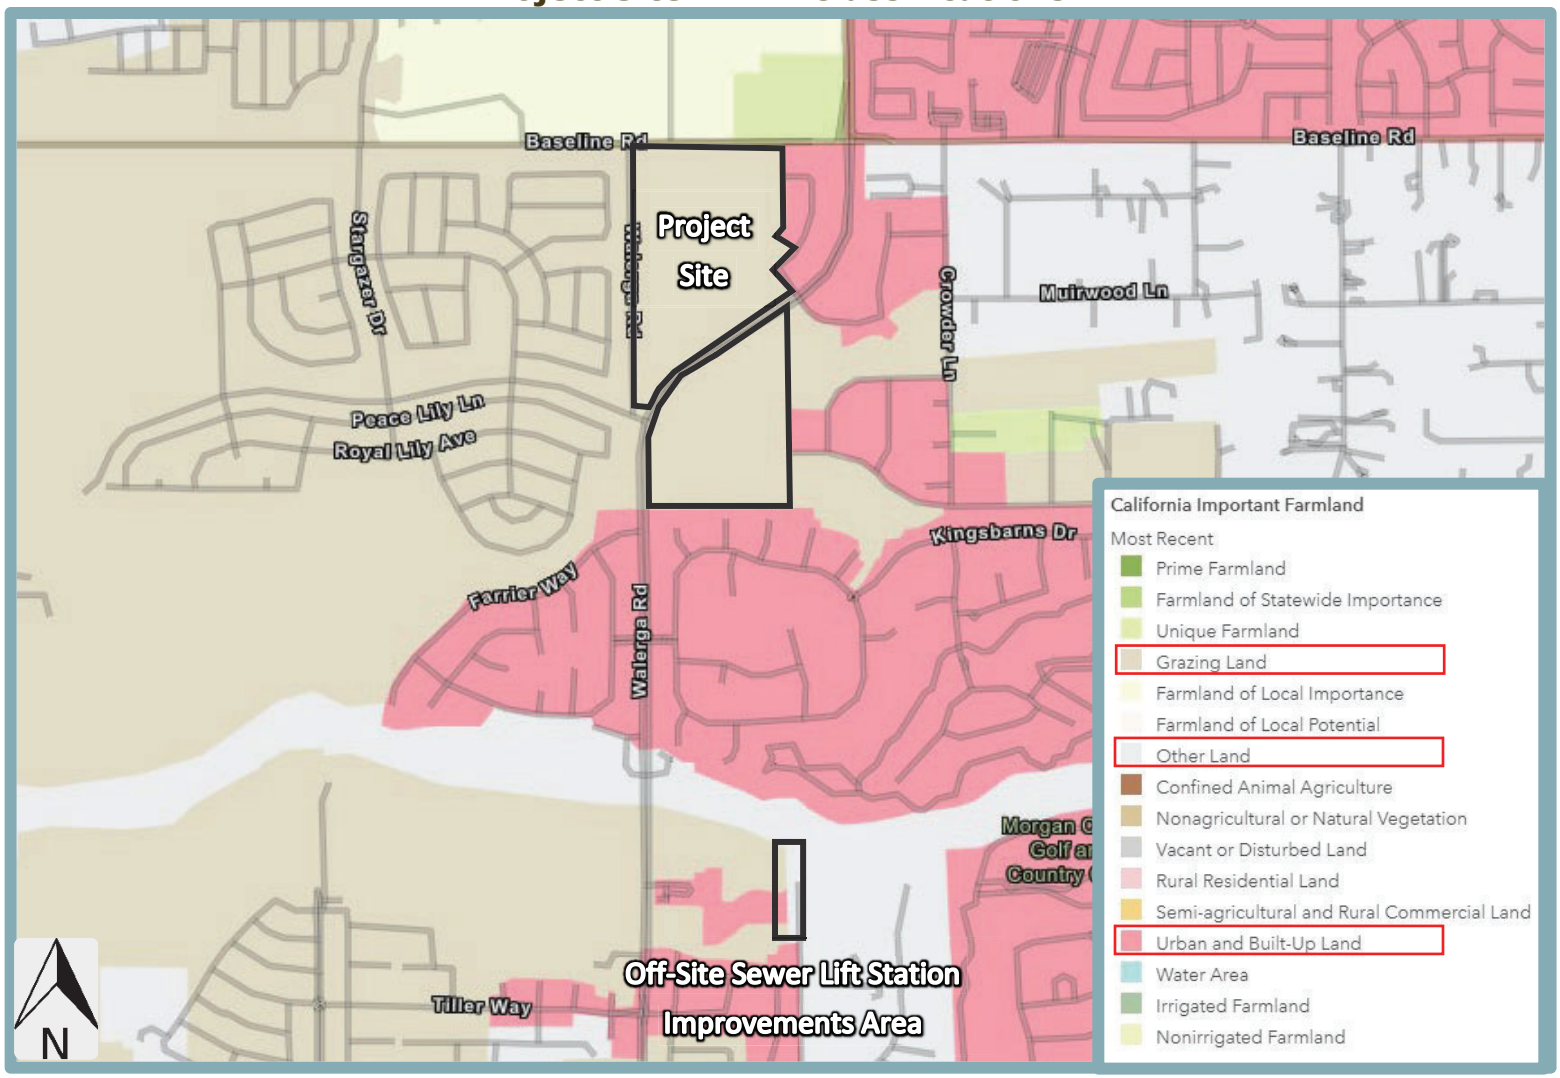
[8] California Department of Conservation, Division of Land Resource Protection. *A Guide to the Farmland Mapping and Monitoring Program*. 2004.

Unique Farmland
Unique Farmland is land of lesser quality soils used for the production of the State's leading agricultural crops. The land is usually irrigated, but may include non-irrigated orchards or vineyards, as found in some climatic zones in California. The land must have been cultivated at some time during the two update cycles prior to the mapping date.

Farmland of Local Importance
Farmland of Local Importance is land of importance to the local agricultural economy, as determined by each county's Board of Supervisors and a local advisory committee. Placer County farmland of local importance includes lands which do not qualify as Prime, Statewide, or Unique designation, but are currently irrigated crops or pasture or non-irrigated crops; lands that would meet the Prime or Statewide designation and have been improved for irrigation, but are now idle; and lands that currently support confined livestock, poultry operations, and aquaculture.

Grazing Land
Grazing Land is land on which the existing vegetation, whether grown naturally or through management, is suited to the grazing of livestock. The minimum mapping unit for the Grazing Land category is 40 acres.

Urban and Built-Up Land
Urban and Built-Up Land is occupied with structures with a building density of at least one unit to one-half acre. Uses may include but are not limited to, residential, industrial, commercial, construction, institutional, public administration purposes, railroad yards, cemeteries, airports, golf courses, sanitary landfills, sewage treatment plants, water control structures, and other development purposes. Highways, railroads, and other transportation facilities are mapped as part of this unit, if they are part of a surrounding urban area.



Other Land
Other Land is land that is not included in any other mapping categories. The following uses are generally included: rural development, brush timber, government land, strip mines, borrow pits, and a variety of other rural land uses.

Project Site Farmland Classifications
According to the FMMP, the project site and the off-site affordable housing parcel are mapped as Grazing Land, and the off-site sewer lift station improvements area is comprised of Grazing Land, Urban and Built-Up Land, and Other Land. (see Figure 5-1 and Figure 5-2).

Agricultural Productivity of Soils
The USDA NRCS uses two systems to determine a soil's agricultural productivity: the Land Capability Classification System and the Storie Index Rating System. The "prime" soil classification of both systems indicates the presence of few to no soil limitations, which, if present, would require the application of management techniques (e.g., drainage, leveling, special fertilizing practices) to enhance production.

The Land Capability Classification System takes into consideration soil limitations, the risk of damage when soils are used, and the way in which soils respond to treatment. Capability classes range from Class I soils, which have few limitations for agriculture, to Class VIII soils, which are unsuitable for agriculture.

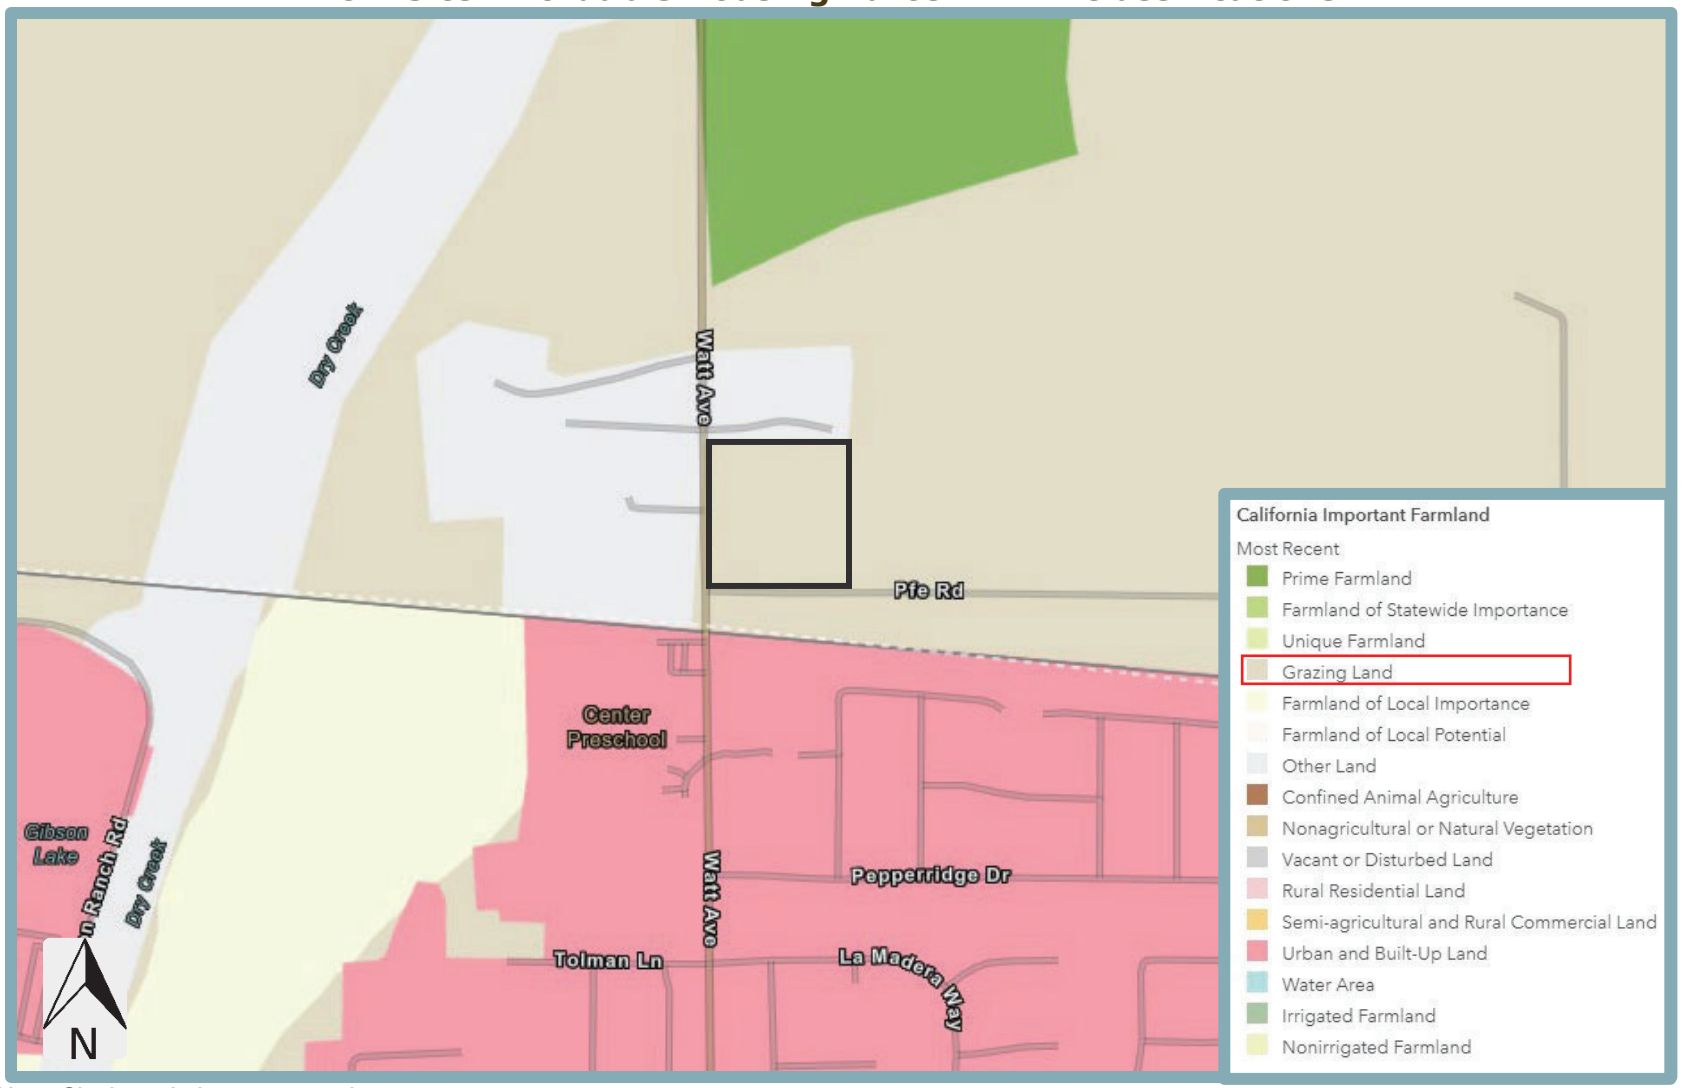


Figure 5-1
Project Site FMMP Classifications

* Figure not OCR Compatible

Generally, as the rating of the capability classification system increases, yields and profits are more difficult to obtain. A general description of soil classification, as defined by the NRCS, is provided in Table 5-1.

Table 5-1
Land Capability Classifications

Class	Definition
I	Soils have slight limitations that restrict their use.
II	Soils have moderate limitations that restrict the choice of plants or that require moderate conservation practices.
III	Soils have severe limitations that restrict the choice of plants or that require special conservation practices, or both.
IV	Soils have very severe limitations that restrict the choice of plants or that require very careful management, or both.
V	Soils are not likely to erode but have other limitations; impractical to remove that limit their use largely to pasture or range, woodland, or wildlife habitat.
VI	Soils have severe limitations that make them generally unsuited to cultivation and limit their use largely to pasture or range, woodland, or wildlife habitat.
VII	Soils have very severe limitations that make them unsuited to cultivation and that restrict their use largely to pasture or range, woodland, or wildlife habitat.
VIII	Soils and landforms have limitations that preclude their use for commercial plants and restrict their use to recreation, wildlife habitat, or water supply or to aesthetic purposes.

Source: USDA, Natural Resources Conservation Service. Available at: https://efotg.sc.egov.usda.gov/references/Delete/2004-3-27/landcap.htm. Accessed June 2025.

The Storie Index Rating system ranks soil characteristics according to suitability for agriculture from Grade 1 soils (80 to 100 rating), which have few or no limitations for agricultural production, to Grade 6 soils (less than 10 rating), which are not suitable for agriculture. Under the Storie Index Rating system, soils deemed less than prime can function as prime soils when limitations such as poor drainage, slopes, or soil nutrient deficiencies are partially or entirely removed. Unlike the Land Capability Classification outlined above, the Storie Index Rating System does not distinguish between irrigated and non-irrigated soils. The six grades, ranges in index rating, and definition of the grades, as defined by the NRCS, are provided below in Table 5-2.

Table 5-2
Storie Index Rating System

Grade	Index Rating	Definition
1 – Excellent	81 through 100	Few limitations that restrict their use for crops
2 – Good	61 through 80	Suitable for most crops, but have minor limitations that narrow the choice of crops and have a few special management needs
3 – Fair	41 through 60	Suited to a few crops, or special crops, and require special management
4 – Poor	21 through 40	If used for crops, severely limited and require special management
5 – Very Poor	11 through 20	Not suited for cultivated crops, but can be used for pasture/range
6 – Non-Agriculture	Less and 10	Soil and land types generally not suited to farming

Source: USDA, Web Soil Survey, 2025.

Table 5-3 below summarizes the on-site soil types, as well as the soils within the off-site improvement area and affordable housing parcel. Table 5-3 also summarizes the Land Capability Classification and Storie Index Rating for each soil type. The locations of the soil types within the

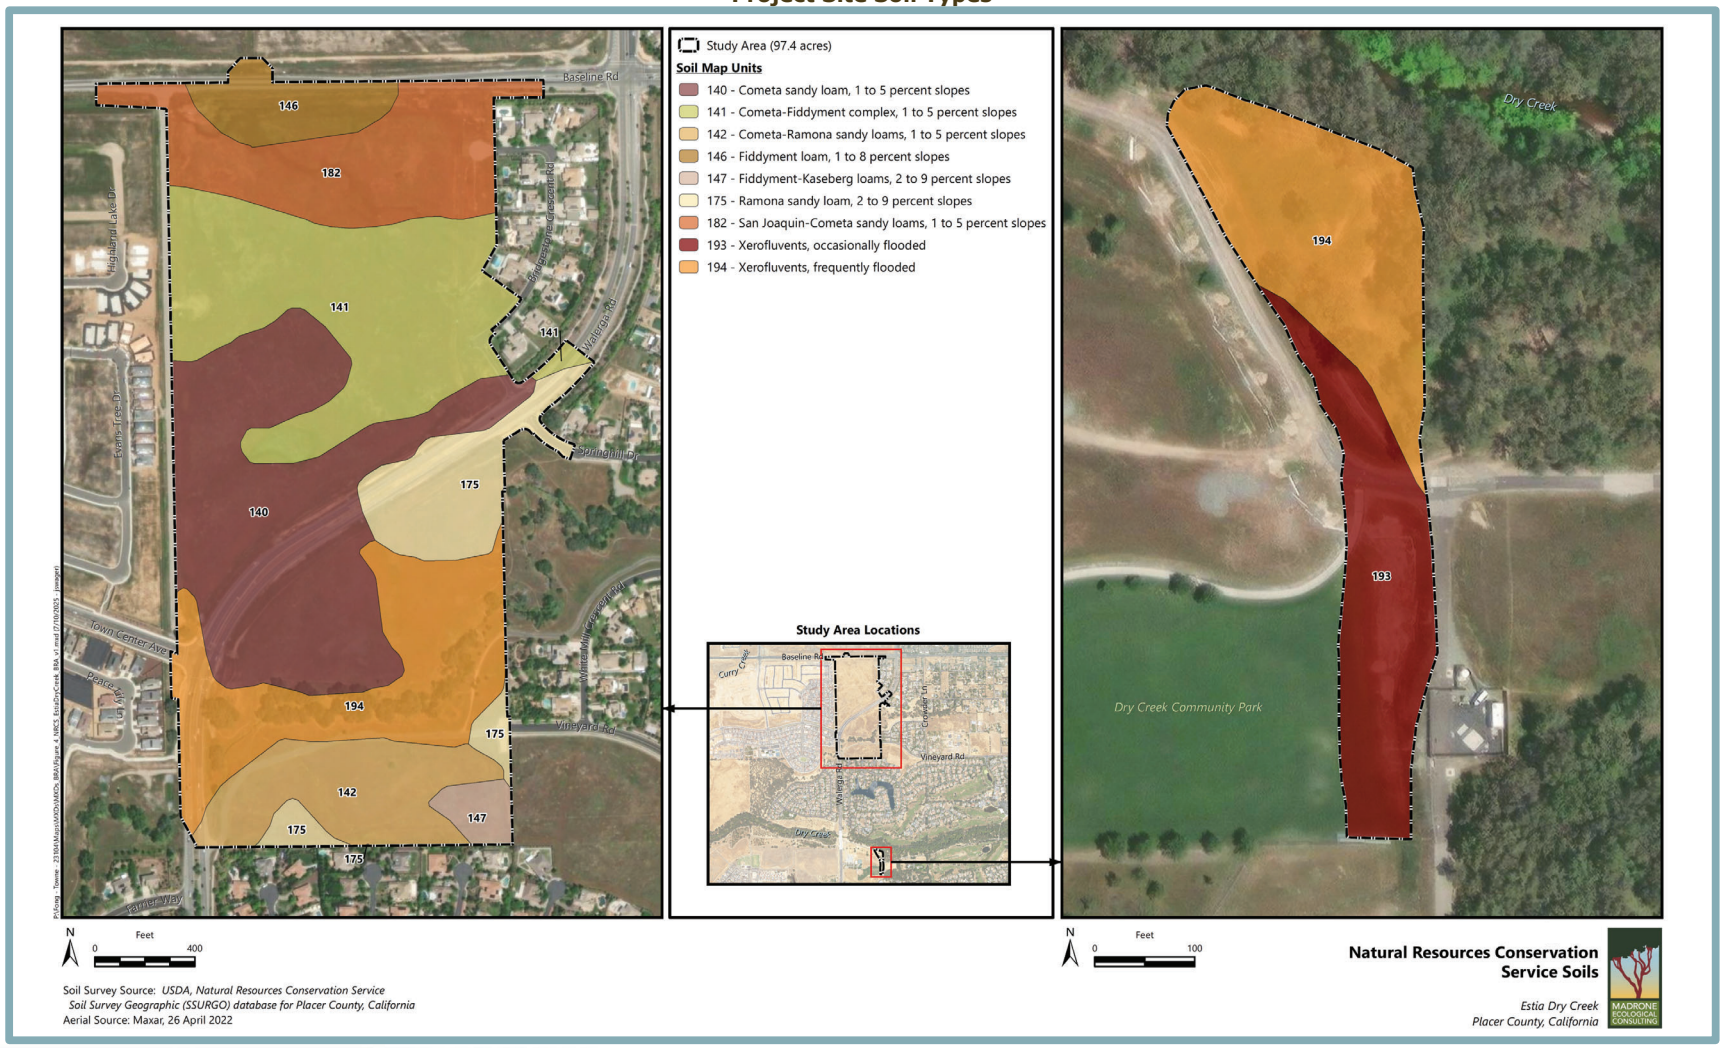
project site and off-site affordable housing parcel, are shown in Figure 5-3 and Figure 5-4. As shown in Table 5-3, according to the USDA NRCS Web Soil Survey, soils within the project site have Land Capability Classifications of Class III and Class IV.

Table 5-3
Agricultural Ratings of On-Site Soils

Soil Type	Land Capability Classification	Storie Index Grade	% Area (acres)[1]
Cometa sandy loam, 1 to 5 percent slopes	III	Grade 3 - Fair	27.8% (24.4)
Cometa-Fiddyment complex, 1 to 5 percent slopes	IV	Grade 3 - Fair	22.9% (20.0)
Cometa-Ramona sandy loams, 1 to 5 percent slopes	III	Grade 3 - Fair	9.4% (8.3)
Fiddyment loam, 1 to 8 percent slopes	IV	Grade 4 - Poor	3.8% (3.3)
Fiddyment-Kaseberg loams, 2 to 9 percent slopes	IV	Grade 4 - Poor	1.5% (1.4)
Ramona sandy loam, 2 to 9 percent slopes	III	Grade 1 - Excellent	7.5% (6.6)
San Joaquin-Cometa sandy loams, 1 to 5 percent slopes	IV	Grade 4 - Poor	13.0% (11.4)
Xerofluvents, frequently flooded	IV	Grade 3 - Fair	14.0% (12.2)
		Totals	**100% (87.6)**

[1] Soil type acreages were approximated using the USDA web soil survey, and are based on the total net acreage of the site.

Source: USDA, Web Soil Survey, 2025.



Class III soils are defined as having severe limitations that restrict the choice of plants or that require special conservation practices, or both. Class IV soils are defined as having very severe limitations that reduce the choice of plants or that require very careful management, or both.[9]

The Storie Index Ratings of the on-site soils include Grade 1 – Excellent, Grade 3 – Fair, and Grade 4 – Poor. Grade 1 soils have few limitations that restrict use and are suitable for most crops. Grade 3 soils are fairly well-suited to a few crops, or special crops, and require special management, while Grade 4 soils are severely limited for crop use and require special management.[10]

With respect to the off-site affordable housing parcel, the USDA NRCS Web Soil Survey shows the soils as having Land Capability Classifications of Class III and Class IV, and a Storie Index Rating of Grade 3 – Fair and Grade 4 – Poor.[11]

Williamson Act Contracts

The California Land Conservation Act of 1965, commonly referred to as the Williamson Act, enables local governments to enter into contracts with private landowners for the purpose of restricting specific parcels of land to agricultural or related open space use. Approximately 33,621 acres of agricultural land (31,853 acres under contract and 1,768 acres non-renewal), or approximately 3.5 percent of the County's total 960,788 acres, are currently enrolled under Williamson Act contracts. Pursuant to the Placer County Land Information Search viewer, neither the project site nor the off-site affordable housing parcel are subject to a Williamson Act contract.[12]

Existing Agricultural Operations

Existing agricultural operations do not occur within the project site. The northern portion of the site is undeveloped, consists of non-native annual grassland with gently rolling topography, and is interspersed with seasonal wetlands and vernal pools. The southern portion of the site includes undeveloped annual grassland with gently rolling topography, interspersed with seasonal wetlands, vernal pools, and is bisected by Placer Creek, which flows east to west. In addition, the southern portion of the site includes a paved bicycle trail which extends from Vineyard Road to the east and Walerga Road to the west.

Similarly, existing agricultural operations do not occur within the off-site affordable housing parcel, which is currently undeveloped and consists of grassy fields with gently rolling topography.

5.3 REGULATORY CONTEXT

Federal laws or regulations pertaining to agricultural resources are not applicable for this analysis. The existing State and local laws and regulations are listed below, as applicable.

State Regulations

The following are applicable State regulations related to agricultural resources.

Williamson Act

The California Land Conservation Act, better known as the Williamson Act, has been the State's premier agricultural land protection program since the act's enactment in 1965. The California Legislature passed the Williamson Act in 1965 to preserve agricultural and open space lands by discouraging premature and unnecessary conversion to urban uses. The Williamson Act creates an arrangement whereby private landowners contract with counties and cities to voluntarily restrict land to agricultural and open space uses. The vehicle for these agreements is a rolling term 10-year contract (i.e., unless either party files a "notice of non-renewal," the contract is automatically renewed annually for an additional year). In return, restricted parcels are assessed for property tax purposes at a rate consistent with their actual use, rather than potential market value.

Local Regulations

The following are the local regulations and standards relevant to the CEQA review process with respect to agricultural resources.

Placer County General Plan

The following goals and policies from the PCGP are applicable to the proposed project:

[12] Placer County. *CDRA – Land Information Search*. Available at: https://www.placer.ca.gov/1471/County-Map. Accessed September 2025.

Land Use Element

Goal 1.H To designate adequate agricultural land and promote development of agricultural uses to support the continued viability of Placer County's agricultural economy.

Policy 1.H.1 The County shall maintain agriculturally-designated areas for agricultural uses and direct urban uses to designated urban growth areas and/or cities.

Policy 1.H.2 The County shall seek to ensure that new development and public works projects do not encourage expansion of urban uses into designated agricultural areas.

Policy 1.H.4 The County shall allow the conversion of existing agricultural land to urban uses only within community plan areas and within city spheres of influence where designated for urban development on the General Plan Land Use Diagram.

Policy 1.H.5 The County shall require development within or adjacent to designated agricultural areas to incorporate design, construction, and maintenance techniques that protect agriculture and minimize conflicts with adjacent agricultural uses.

Policy 1.H.6 The County shall require new non-agricultural development immediately adjacent to agricultural lands to be designed to provide a buffer in the form of a setback of sufficient distance to avoid land use conflicts between the agricultural uses and the nonagricultural uses, except as it may be determined to be unnecessary or inappropriate within a Specific Plan as part of the Specific Plan approval. Such setback or buffer areas shall be established by recorded easement or other instrument, subject to the approval of County Counsel. A method and mechanism (e.g., a homeowners association or easement dedication to a non-profit organization or public entity) for guaranteeing the maintenance of this land in a safe and orderly manner shall be also established at the time of development approval.

Agricultural and Forestry Resources Element

Goal 7.B: To minimize existing and future conflicts between agricultural and non-agricultural uses in agriculturally-designated areas.

Policy 7.B.1 The County shall identify and maintain clear boundaries between urban/suburban and agricultural areas and require land use buffers between such uses where feasible. These buffers shall occur on the parcel for which the development

permit is sought and shall favor protection of the maximum amount of farmland.

Policy 7.B.3 The County shall consider fencing subdivided lands adjoining agricultural uses as a potential mitigation measure to reduce conflicts between residential and agricultural uses. Factors to be considered in implementing such a measure include: The type of agricultural operation (i.e., livestock, orchard, timber, row crops);

a. The size of the lots to be created;
b. The presence or lack of fences in the area;
c. Existing natural barriers that prevent trespass; and
d. Passage of wildlife.

Policy 7.B.4 The County shall continue to enforce the provisions of its Right-to-Farm Ordinance and of the existing state nuisance law.

Placer Legacy Open Space and Conservation Program

The Placer Legacy Open Space and Agricultural Conservation Program (Placer Legacy Program) was adopted in June 1998 to protect and conserve open space and agricultural lands in Placer County.[13] The Placer Legacy Program implements the goals, policies, and programs of the 1994 PCGP and supplements existing open space and conservation programs. The Placer Legacy Program also provides important resource information to guide and direct decisions on the preparation of environmental documents for compliance with CEQA and for discretionary land use entitlements being examined by County staff. The objectives of the Placer Legacy Program include the following:

- Maintain a viable agricultural segment of the economy;
- Conserve natural features necessary for access to a variety of outdoor recreation opportunities;
- Retain important scenic and historic areas;
- Preserve the diversity of plant and animal communities;
- Protect endangered and other special status plant and animal species;
- Separate urban areas into distinct communities; and
- Ensure public safety.

For implementation purposes, the County was divided into 10 study areas based on common geographic and political boundaries. The development of the implementation measures was based on an assessment of each area's existing open space resources, development trends, stressors and conflicts, and opportunities for Placer Legacy Program involvement. The project site is located within the South Placer Urban Study Area. Placer Legacy Program implementation measures for the South Placer Study Area that are pertinent to agricultural resources on and in the vicinity of the project site are listed below:

[13] Placer County. *Placer Legacy Open Space and Agricultural Conservation Program, Implementation Report.* June 2000.

SP-1. Work with farmers and ranchers to protect agricultural lands outside of designated development areas through the use of conservation easements.

SP-2. Provide certainty to farmers and ranchers concerning the future extent of urban encroachment by coordinating with cities to create permanent greenbelts around urban areas.

SP-3. Support the County's Right-To-Farm Ordinance provisions.

SP-12. Create regional trail connections and develop new regional trails, consistent with adjacent agricultural uses.

SP-20. Establish permanent transition areas and buffers between urban/suburban areas and agricultural areas through conservation easements and/or fee title acquisition of lands containing multiple resource values.

Placer County Right-to-Farm Ordinance

Placer County has adopted a Right-to-Farm Ordinance (Section 5.24.040 of the Placer County Code) to minimize loss of the County's commercial agricultural resources by limiting the circumstances under which agricultural operations may be deemed to constitute a nuisance. The provisions of the Right-to-Farm Ordinance are as follows:

A. It is the declared policy of the county of Placer to preserve, protect and encourage the development and improvement of its agricultural land for the production of food and other agricultural products. When nonagricultural land uses extend into the agricultural areas, agricultural operations often become the subject of nuisance suits. As a result, agricultural operations are sometimes forced to cease or are substantially curtailed. Others may be discouraged from making investments in agricultural improvements. It is the purpose of this section to reduce the loss to the county of its commercial agricultural resources by limiting the circumstances under which agricultural operations may be deemed to constitute a nuisance.
B. No agricultural activity, operation, or facility, or appurtenances thereof, conducted or maintained for commercial purposes, and in a manner consistent with proper and accepted customs and standards, as established and followed by similar agricultural operations, shall be or become a nuisance, private or public, due to any changed condition in or about the locality, after the same has been in operation for more than one year if it was not a nuisance at the time it began.
C. For purpose of this section, the term "agricultural activity, operation, or facility, or appurtenances thereof" shall include, but not be limited to, the cultivation and tillage of soil, dairying, the production, cultivation, growing, and harvesting of any agricultural commodity including timber, Christmas trees, viticulture, apiculture, nursery stock, or horticulture, the raising of livestock, fur bearing animals, fish, or poultry, and game birds, and any practices performed by a farmer or on a farm as incident to or in conjunction with such farming operations, including preparation for market, delivery to storage, or to market, or to carriers for transportation to market.
D. For the purpose of this section, commercial "agriculture" means those agricultural lands in designated areas, or those lands that are within the California Land Conservation Act, or within a timber preserve zone or those lands that produce a gross annual income of four thousand five hundred dollars ($4,500.00) from the sale of agricultural products.
E. Each prospective buyer of property in unincorporated Placer County shall be informed by the seller or his/her authorized agent of the right-to-farm ordinance.

The seller or his/her authorized agent will keep on file a disclosure statement signed by the buyer with the escrow process.

F. Whenever a building designated for residential occupancy is to be located on property in the unincorporated area of Placer County, the owners of the property, or their authorized agent, shall acknowledge receipt of the right-to-farm ordinance. (Ord. 4983-B, 1999: prior code § 5.715)

Dry Creek-West Placer Community Plan

The relevant goals and policies from the DCWPCP related to agricultural resources are presented below.

Community Development Element: The Land Use Plan

Policy 2 Maintain large agricultural areas and require development to provide adequate buffer zones between agricultural uses and other uses, as described in the Placer County General Plan.

Policy 15 Encourage logical expansion of the area by developing in-fill areas and those lands lying closest to existing developed areas before extending into outlying areas. On a Countywide basis, encourage in-fill of lands in cities and areas of the unincorporated portions of the County designated for urban uses before allowing the premature conversion of open space and agricultural lands.

Community Development Element: Community Design Element

Policy 5 Where a development permit/approval is sought adjacent to an agricultural operation/land use category, protection of agricultural operations shall be provided by the establishment of a man-made or retention of a natural buffer between the agricultural land use and the proposed use. This buffer shall occur on the parcel for which the development permit is sought and shall favor protection of the maximum amount of farmland.

Environmental Resources Management: Natural Resources

Goal 7 Recognize agricultural lands as a resource and seek to protect these areas from urban encroachment.

Policy 20 Preserve agricultural lands as an economically viable land use, and for the purposes of open space, groundwater recharge, wildlife habitat, buffering, flood control, and soil conservation.

Environmental Resources Management: Open Space

Goal 8 To permit existing agricultural uses to continue, and to conserve lands suitable for agricultural uses while allowing urban/suburban/rural residential uses.

Policy 2 Identify and, where possible, preserve all soils which are suitable for agricultural uses.

Policy 8 Preserve productive agricultural lands as regional open space.

Placer County Conservation Program

On September 1, 2020, Placer County adopted the Placer County Conservation Program (PCCP), which is a Habitat Conservation Plan under the Federal Endangered Species Act (FESA) and a Natural Community Conservation Plan under the California Natural Community Conservation Planning Act. The PCCP contains conservation measures to protect natural communities, including agricultural land such as rice, field crop, and orchard/vineyard habitat. Avoidance and minimization measures are set forth in Chapter 6 of the PCCP and are intended to ensure that adverse effects on natural communities are avoided and minimized.

Objective AO-1.1 of the PCCP (*Protect Agricultural Lands*), as set forth on page 5-33 of the Plan, is to "[p]rotect at least 8,240 acres of agricultural lands or natural communities in the Valley, including patches of natural vegetation, such as trees and shrubs that may be used by Covered Species, and provide large, contiguous blocks of open space between protected natural communities, agricultural land, and urban/suburban land uses in the Reserve System (Table 5-3)."

The rationale for this Objective, as set forth on pages 5-33 and 5-34 of the Plan, reads as follows: "Since agriculture is an important component of the economy and culture of Placer County, the Plan seeks to achieve a sustainable balance of agriculture and conservation within the landscape. The commitment for agriculture and other open space protection is large enough to assemble an interconnected Reserve System of natural communities and agricultural land in the Valley [Reserve Acquisition Area]. Objective GGS-1.1 ensures that at least 2,000 of the 8,240 acres will be rice land (or wetland equivalent; see Section 5.2.7.5, *Giant Garter Snake, Objective GGS-1.1 Rationale*) grown and managed (including securing the necessary water rights) annually to benefit giant garter snake. The remaining 6,240 acres will not be required to be maintained in any particular crop type, and therefore will not count toward meeting the U.S. Fish and Wildlife Service (USFWS) federal permit requirements or habitat commitments for mitigation for any Covered Species. The crops planted on the 6,240 acres will vary depending on market demand, future water availability, climate change, and a host of other factors. The 6,240 acres, while not required to meet Natural Community Conservation Plan (NCCP) requirements, will provide the following additional benefits under the NCCP Act to conserve representative natural and semi-natural landscapes: maintain the ecological integrity of large habitat blocks, ecosystem function, and biologically diversity (Fish and Game Code 2820 [a][4][A]) and sustain the effective movement and interchange of organisms between habitat areas in a manner that maintains the ecological integrity of the habitat areas within the Plan Area (Fish and Game Code 2820 [a][4][(E]) (Table 5-3)."

On page 5-35, the PCCP further explains that "[o]n all the protected agricultural lands, common practices can be implemented to increase the habitat value for wildlife, and landowners may voluntarily choose to adopt these practices in agreement with the PCA. These practices include use of hedgerows, herbaceous field borders, filter strips, grassed waterways, windbreaks, and riparian forest buffers (Clark and Reeder 2007). Landowners may also choose to restrict use of pesticides in their easements. These practices are described in Section 5.3.2.3.5, Agriculture and Other Open Space." The PCCP continues the explanation with "The Plan's Covered Activities will result in the loss of up to 2,900 acres of agricultural land throughout Plan Area A, including an estimated 2,000 acres of rice and 900 acres of other agricultural land-cover types. With the exception of rice for giant garter snake, the Plan will not mitigate effects on Covered Species that use agricultural lands through protection and management of agricultural lands; rather, the Plan

will mitigate loss of agricultural Covered Species' habitat through protection, restoration, management and enhancement of natural communities supporting habitat for these species."

To obtain coverage under the PCCP, project applicants are required to obtain a signed Certificate of PCCP Authorization form from Placer County for potential impacts to terrestrial and aquatic habitats (including loss of agricultural lands and open space). During the local impact authorization process, impact fees are calculated utilizing land cover data. Fees include Land Conversion fees and may also include Aquatic/Wetland Special Habitat fees. To address disturbances to vegetation communities/land covers within the PCCP, development fees are applied for a development project's vegetation community impacts, in accordance with PCCP guidelines.

5.4 IMPACTS AND MITIGATION MEASURES

The Impacts and Mitigation Measures section describes the standards of significance and methodology used to analyze and determine the proposed project's potential impacts related to agricultural resources. A discussion of the project's impacts, as well as mitigation measures where necessary, is also presented.

Standards of Significance

Consistent with Appendix G of the CEQA Guidelines, the PCGP, and the DCWPCP, a significant impact related to agricultural resources would occur if the proposed project would do any of the following:

- Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use;
- Conflict with existing zoning for agricultural use, a Williamson Act contract, or a Right-to-Farm Policy;
- Conflict with existing zoning for, or cause rezoning of, forest land (as defined in PRC Section 12220[g]), timberland (as defined by PRC Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104[g]) (see Chapter 19, Effects Not Found to be Significant);
- Result in the loss of forest land or conversion of forest land to non-forest use (see Chapter 19, Effects Not Found to be Significant);
- Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use;
- Involve other changes in the existing environment which, due to their location or nature, could result in conversion of forest land to non-forest use (see Chapter 19, Effects Not Found to be Significant); or
- Conflict with General Plan or other policies regarding land use buffers for agricultural operations.

Issues related to whether the proposed project would result in any of the following impacts are discussed in Chapter 19, Effects Not Found To Be Significant, of this EIR:

- Conflict with existing zoning for, or cause rezoning of, forest land (as defined in PRC Section 12220[g]), timberland (as defined by PRC Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104[g]);
- Result in the loss of forest land or conversion of forest land to non-forest use; and

- Involve other changes in the existing environment which, due to their location or nature, could result in conversion of forest land to non-forest use.

Method of Analysis

Evaluation of potential impacts of the proposed project on agricultural resources is based on the following: the PCGP, the associated EIR, the Placer Legacy Open Space and Agricultural Conservation Program, Implementation Report, the NRCS Web Soil Survey, and the FMMP online mapping system. Soil data from the FMMP was used to determine if the project site supports Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and Farmland of Local Importance. The standards of significance listed above are used to delineate the significance of any potential impacts.

Project-Specific Impacts and Mitigation Measures

The following discussion of impacts is based on implementation of the proposed project and off-site sewer lift station improvements, as well as the two affordable housing options analyzed throughout this EIR, in comparison to existing conditions and the standards of significance presented above. In most cases, potential environmental impacts associated with the proposed project and the potential 22 on-site ADUs would not differ. Thus, unless otherwise noted, the below analysis applies to both the proposed project and the on-site ADUs.

5-1 Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use, or involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts associated with the proposed project and the off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, related to converting Farmland to non-agricultural uses.

Proposed Project, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

According to the DOC Important Farmland Finder, the project site and the off-site affordable housing parcel are designated as Grazing Land (see Figure 5-1 and Figure 5-2). The off-site sewer lift station improvements area is comprised of Grazing Land, Urban and Built-Up Land, and Other Land. PRC Section 21060.1 defines “agricultural land” as Prime Farmland, Farmland of Statewide Importance, or Unique Farmland (Farmland). Therefore, the project site, off-site sewer lift station improvements area, and off-site affordable housing parcel do not constitute Farmland under CEQA, and development of the sites would not result in the conversion of Farmland to a non-agricultural use.

In addition, the current PCGP/DCWPCP land use designations for the project site are Rural-Low Density Residential (1-2.3 acre minimum) (RLDR) and Greenbelt and Open Space (OS). Pursuant to the County’s General Plan, typical land uses for RLDR include

detached single-family dwellings, secondary dwellings, and facilities and services that support residential neighborhoods, such as churches, schools, parks, golf courses, childcare facilities, and necessary public utility and safety facilities. The off-site affordable housing parcel was re-designated in 2015 from High-Density Residential (HDR) to Commercial. As such, the County has previously anticipated buildout of the sites with non-agricultural uses.

Based on the above, the proposed project would not convert Farmland, as shown on the maps prepared pursuant to the FMMP of the California Resources Agency, to non-agricultural use or involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use. Thus, a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

5-2 Conflict with existing zoning for agricultural use, a Williamson Act contract, or a Right-to-Farm policy. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as the off-site affordable housing parcel, which could conflict with existing zoning for agricultural use, a Williamson Act contract, or a Right-to-Farm policy.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

As noted above, the project site is not subject to an active Williamson Act contract. Thus, the proposed project would not conflict with a Williamson Act contract. The project site is zoned Residential Single-Family, combining Agriculture, combining a minimum Building Site of 40,000 square feet, combining Planned Residential Development of one dwelling unit per acre (RS-AG-B-40, PD=1); and Open Space, combining Planned Residential Development of one dwelling unit per acre (O PD=1). While the O zoning designation is not designated for agricultural purposes, the remainder of the project site includes an -AG combining district designation, which allows agricultural development as a use. While the -AG combining district allows for some limited agricultural uses, the district is generally intended primarily for residential uses. In addition, the project site is designated as RLDR and OS by the PCGP/DCWPCP. As such, the County has previously anticipated buildout of the site with non-agricultural uses. The proposed project would rezone the project site to O, Residential Multifamily, combining Design Scenic Corridor (RM-Dc), Residential Single Family, combining minimum Building Site of 6,000 sf (RS-B-6), thereby removing the -AG combining district designation. Upon approval of the proposed rezone, the project would be consistent with the new zoning designations.

Pursuant to the Placer County Code, commercial agricultural operations are protected by the County's Right-To-Farm Ordinance, provided that such operations occur on agricultural lands in designated areas, on lands that are protected by the California Land Conservation Act, within a timber preserve zone, or on lands that produce a gross annual income of $4,500 from the sale of agricultural products. The project site is not currently used for agricultural purposes or for livestock grazing, and surrounding existing land uses

do not include agricultural operations or activities. Therefore, because the proposed project is not currently used for agricultural purposes and is not located adjacent to commercial agricultural operations, the project would not conflict with existing zoning for agricultural use.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is not subject to an active Williamson Act contract. Thus, this component of the proposed project would not conflict with a Williamson Act contract. The off-site affordable housing parcel is currently zoned Specific Plan – Riolo Vineyards Specific Plan (SPL-RVSP). Pursuant to Section 17.51.010 of the Placer County Code, the purpose of the specific plan (SPL) district is to allow unique zone districts to be established consistent with an adopted specific plan (in the case of the off-site affordable housing parcel, the RVSP) and provide more flexibility. The specific plan specifies all permitted uses and land use permit requirements for the SPL district; as such, the RVSP's designation of the site as Commercial would establish the permitted uses. As such, the County has previously anticipated buildout of the site with non-agricultural uses. As discussed within Chapter 3, Project Description, of this EIR, this affordable housing option would involve a rezone of the subject parcel to Residential Multifamily 30, combining Design Scenic Corridor (RM30-Dc) zone. Upon approval of the proposed rezone, future development of affordable units within the parcel would be consistent with the new zoning designation.

Similar to the proposed project discussed above, the off-site affordable housing parcel is not currently used for agricultural purposes or for livestock grazing and surrounding existing land uses do not include agricultural operations or activities. Therefore, the project would not conflict with existing zoning for agricultural use.

Conclusion

Based on the above, the proposed project would not conflict with existing zoning for agricultural use, a Williamson Act contract, or a Right-to-Farm Policy, and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

5-3 Conflict with General Plan or other policies regarding land use buffers for agricultural operations. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts associated with the development of proposed project and the off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could conflict with General Plan or other policies regarding land use buffers for agricultural operations.

Proposed Project, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

The PCGP establishes Land Use Buffer Zone Standards for several types of development including agriculture/timberland, industrial/residential, and public facility buffer zone requirements.[14] The buffers are intended to separate incompatible land uses from surrounding areas, such as land uses where noise associated with vehicles and equipment could be substantial, the use of hazardous materials such as in manufacturing processes occurs, or where truck traffic and otherwise heavy traffic volumes occur. Regarding land use buffers for agricultural operations, the juxtaposition of agricultural lands and residential uses can result in land use compatibility issues. For example, agricultural activities may result in noise, dust, or odors that may be perceived as nuisances by non-agricultural neighbors. Additionally, residences may be a nuisance for agricultural uses due to the potential for trespassing. Agricultural practices, such as chemical applications, may also be a public health issue for residents should they affect air or water quality.

The surrounding existing uses to the project site and the off-site affordable housing parcel do not include agricultural operations. Surrounding existing land uses to the project site include the under-construction Baseline Marketplace to the north, across Baseline Road; single-family residences associated with the Sun Valley Oaks residential neighborhood and Dry Creek tributaries to the east; single-family residences associated with the Morgan Creek residential neighborhood to the south; and the under-construction Property 1A of the Placer Vineyards Specific Plan (PVSP), which will include 1,285 residential units, to the west, across Walerga Road. Surrounding land uses to the off-site affordable housing parcel include public uses associated with the existing cemetery to the north and single-family residential uses across Watt Avenue to the west and PFE Road to the south. In addition, the RVSP includes planned medium density residential (MDR) uses to the east of the parcel.

Based on the above information, the proposed project would not conflict with the General Plan or other policies regarding land use buffers for agricultural operations, and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

Cumulative Impacts and Mitigation Measures

As defined in Section 15355 of the CEQA Guidelines, “cumulative impacts” refers to two or more individual effects which, when considered together, are considerable, compound, or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Additional detail regarding the cumulative setting is included in Chapter 20, Statutorily Required Sections, of this EIR.

[14] Placer County. *Countywide General Plan Policy Document, Part 1, Land Use/Circulation Diagrams and Standards* [pg. 19]. August 1994 (updated May 2013).

5-4 Involve changes in the existing environment which, due to their location or nature, could cumulatively result in loss of Farmland to non-agricultural use. Based on the analysis below, the project's incremental contribution to the significant cumulative impact is *less than cumulatively considerable*.

The PCGP EIR concluded that the PCGP would bring about changes to the existing land uses in the unincorporated areas of the County. In addition, the buildout scenario presented in the DCWPCP presupposed that land uses would change as a result of growth and development occurring under buildout of the DCWPCP. Both the PCGP EIR and the DCWPCP anticipated that the conversion of existing farmland in the region to urban use would result in the loss of agricultural production. Furthermore, the PCCP anticipated the conversion of agricultural land to urban development. Specifically, approximately 30,000 acres of agricultural or natural and semi-natural land were anticipated to be converted to urban/suburban and rural-residential development within the PCCP area. While the PCGP EIR stated that the loss of Farmland and agricultural production was considered a significant adverse impact, the EIR did not provide mitigation measures sufficient to reduce the adverse impact to a less-than-significant level. The loss and conversion of agricultural lands, including lands within the project site, was identified as a significant and unavoidable impact of development in the Final EIR for the adopted DCWPCP. The aforementioned conclusion was included in the Placer County Board of Supervisors' Statement of Overriding Considerations adopted in 1990, in conjunction with the certification of the Final EIR and adoption of the DCWPCP.

With respect to the proposed project, as discussed under Impact 5-1 above, neither the project site nor the off-site affordable housing parcel contain Prime Farmland, Farmland of Statewide Importance, or Unique Farmland. The sites are designated as Grazing Land, which is not considered Farmland under CEQA. In addition, neither site is currently used for agricultural purposes. Thus, development of the proposed project would not result in the direct conversion of Farmland to non-agricultural uses, and the proposed project's incremental contribution to the significant cumulative impact would be ***less than cumulatively considerable***.

Mitigation Measure(s)

None required.

6. Air Quality and Greenhouse Gas Emissions

6. AIR QUALITY AND GREENHOUSE GAS EMISSIONS

6.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County for an approximately four-acre parcel off-site within the Riolo Vineyards Specific Plan (RVSP), which could develop a maximum of 120 affordable income-restricted units.

The Air Quality and Greenhouse Gas Emissions chapter of the EIR describes the potential impacts of the proposed project and off-site sewer lift station improvements area, as well as the potential future development of the off-site affordable housing parcel, on local and regional air quality emissions, and potential impacts related to greenhouse gas emissions (GHGs) and climate change. The chapter includes a discussion of the existing air quality and GHG setting, construction-related air quality impacts resulting from grading and equipment emissions, direct and indirect air quality and GHG emissions associated with operations of the project, the impacts of these emissions on both the local and regional scale, and mitigation measures warranted to reduce or eliminate any identified significant impacts. This chapter is based on the Placer County General Plan (PCGP)[1] and associated EIR,[2] the Dry Creek-West Placer Community Plan (DCWPCP),[3] the Placer County Air Pollution Control District's (PCAPCD) CEQA Air Quality Handbook,[4] Review of Land Use Projects Under CEQA,[5] the Placer County Sustainability Plan: A Greenhouse Gas Emission Reduction Plan and Adaptation Strategy (PCSP),[6] the RVSP EIR,[7] and the technical analysis performed by Raney Planning and Management, Inc.

6.2 EXISTING ENVIRONMENTAL SETTING

The following information provides an overview of the existing environmental setting in relation to air quality within the proposed project area. Air basin characteristics, ambient air quality standards (AAQS), attainment status and regional air quality plans, local air quality monitoring, odors, and sensitive receptors are discussed. In addition to the information pertaining to air quality, information related to climate change and GHGs is provided.

Air Basin Characteristics

The project site and the proposed off-site affordable housing parcel are located in western Placer County, which falls within the Sacramento Valley Air Basin (SVAB), within the jurisdictional boundaries of the PCAPCD. Air flows into the SVAB through the Carquinez Strait, moves across the Delta and carries pollutants from the heavily populated San Francisco Bay Area into the SVAB. The climate is characterized by hot, dry summers and cool, rainy winters. Characteristic of SVAB winter weather are periods of dense and persistent low-level fog, which are most prevalent between storms. From May to October, the region's intense heat and sunlight lead to high ozone concentrations. Prevailing winds are from the south and southwest, and as a result of prevailing winds coming generally from south to southwest, air quality in the area is heavily influenced by mobile and stationary sources of air pollution located upwind in the Sacramento Metropolitan Area.

Most precipitation in the SVAB results from air masses moving in from the Pacific Ocean during the winter months. Storms usually move through the area from the west or northwest. During the winter rainy season (November through February) over half the total annual precipitation falls while the average winter temperature is a moderate 49 degrees Fahrenheit. During the summer, daytime temperatures can exceed 100 degrees Fahrenheit. Dense fog occurs mostly in mid-winter and rarely in the summer. Daytime temperatures from April through October average between 60 and 80 degrees Fahrenheit with low humidity. The inland location and surrounding mountains shelter the valley from much of the ocean breeze that keeps the coastal regions moderate in temperature. The only breech in the mountain barrier is the Carquinez Strait, which exposes the midsection of the valley to the coastal air mass.

Air quality in Placer County is also affected by inversion layers, which occur when a layer of warm air traps a layer of cold air, preventing vertical dispersion of air contaminants. The presence of an inversion layer results in higher concentrations of pollutants near ground level. Summer inversions are strong and frequent, but are less troublesome than those that occur in the fall. Autumn inversions, formed by warm air subsiding in a region of high pressure, have accompanying light winds that do not provide adequate dispersion of air pollutants.

Air quality in the project vicinity is influenced by both local and distant emission sources. Air pollutant sources in the immediate project vicinity primarily include emissions from vehicle traffic on nearby roadways. Other sources of air pollutants in the area include activities associated with commercial, residential, and industrial land uses.

Ambient Air Quality Standards

Both the U.S. Environmental Protection Agency (USEPA) and the California Air Resources Board (CARB) have established AAQS for common pollutants. The federal standards are divided into primary standards, which are designed to protect the public health, and secondary standards, which are designed to protect the public welfare. The AAQS for each contaminant represent safe levels that avoid specific adverse health effects. Pollutants for which AAQS have been established are called “criteria” pollutants. Table 6-1 identifies the major pollutants, characteristics, health effects and typical sources. The national and California AAQS (NAAQS and CAAQS, respectively) are summarized in Table 6-2. The NAAQS and CAAQS were developed independently with differing purposes and methods. As a result, the federal and State standards differ in some cases. In general, the State of California standards are more stringent than the federal standards, particularly for ozone and particulate matter (PM).

A description of each criteria pollutant and its potential health effects is provided in the following section.

Table 6-1
Summary of Criteria Pollutants

Pollutant	Characteristics	Health Effects	Major Sources
Ozone	A highly reactive gas produced by the photochemical process involving a chemical reaction between the sun's energy and other pollutant emissions. Often called photochemical smog.	• Eye irritation • Wheezing, chest pain, dry throat, headache, or nausea • Aggravated respiratory disease such as emphysema, bronchitis, and asthma	Combustion sources such as factories, automobiles, and evaporation of solvents and fuels.
Carbon Monoxide	An odorless, colorless, highly toxic gas that is formed by the incomplete combustion of fuels.	• Impairment of oxygen transport in the bloodstream • Impaired vision, reduced alertness, chest pain, and headaches • Can be fatal in the case of very high concentrations	Automobile exhaust, combustion of fuels, and combustion of wood in woodstoves and fireplaces.
Nitrogen Dioxide	A reddish-brown gas that discolors the air and is formed during combustion of fossil fuels under high temperature and pressure.	• Lung irrigation and damage • Increased risk of acute and chronic respiratory disease	Automobile and diesel truck exhaust, industrial processes, and fossil-fueled power plants.
Sulfur Dioxide	A colorless, irritating gas with a rotten egg odor formed by combustion of sulfur-containing fossil fuels.	• Aggravation of chronic obstruction lung disease • Increased risk of acute and chronic respiratory disease	Diesel vehicle exhaust, oil-powered power plants, and industrial processes.
Particulate Matter (PM_{10} and $PM_{2.5}$)	A complex mixture of extremely small particles and liquid droplets that can easily pass through the throat and nose and enter the lungs.	• Aggravation of chronic respiratory disease • Heart and lung disease • Coughing • Bronchitis • Chronic respiratory disease in children • Irregular heartbeat • Nonfatal heart attacks	Combustion sources such as automobiles, power generation, industrial processes, and wood burning. Also from unpaved roads, farming activities, and fugitive windblown dust.
Lead	A metal found naturally in the environment as well as in manufactured products.	• Loss of appetite, weakness, apathy, and miscarriage • Lesions of the neuromuscular system, circulatory system, brain, and gastrointestinal tract	Industrial sources and combustion of leaded aviation gasoline.

Table 6-2
Ambient Air Quality Standards

Pollutant	Averaging Time	CAAQS	NAAQS	
			Primary	Secondary
Ozone	1 Hour	0.09 ppm	-	Same as primary
	8 Hour	0.070 ppm	0.070 ppm	
Carbon Monoxide	8 Hour	9 ppm	9 ppm	-
	1 Hour	20 ppm	35 ppm	
Nitrogen Dioxide	Annual Mean	0.030 ppm	53 ppb	Same as primary
	1 Hour	0.18 ppm	100 ppb	-
Sulfur Dioxide	24 Hour	0.04 ppm	-	-
	3 Hour	-	-	0.5 ppm
	1 Hour	0.25 ppm	75 ppb	-
Respirable Particulate Matter (PM_{10})	Annual Mean	20 ug/m^3	-	Same as primary
	24 Hour	50 ug/m^3	150 ug/m^3	
Fine Particulate Matter ($PM_{2.5}$)	Annual Mean	12 ug/m^3	9 ug/m^3	15 ug/m^3
	24 Hour	-	35 ug/m^3	Same as primary
Lead	30 Day Average	1.5 ug/m^3	-	-
	Calendar Quarter	-	1.5 ug/m^3	Same as primary
Sulfates	24 Hour	25 ug/m^3	-	-
Hydrogen Sulfide	1 Hour	0.03 ppm	-	-
Vinyl Chloride	24 Hour	0.010 ppm	-	-
Visibility Reducing Particles	8 Hour	see note below	-	-

ppm = parts per million
ppb = parts per billion
µg/m^3 = micrograms per cubic meter

Note: Statewide Visibility Reducing Particle Standard (except Lake Tahoe Air Basin): Particles in sufficient amount to produce an extinction coefficient of 0.23 per kilometer when the relative humidity is less than 70 percent. This standard is intended to limit the frequency and severity of visibility impairment due to regional haze and is equivalent to a 10-mile nominal visual range.

Ozone

Ozone is a reactive gas consisting of three oxygen atoms. In the troposphere, ozone is a product of the photochemical process involving the sun's energy, and is a secondary pollutant formed as a result of a complex chemical reaction between reactive organic gases (ROG) and oxides of nitrogen (NO_X) emissions in the presence of sunlight. As such, unlike other pollutants, ozone is not released directly into the atmosphere from any sources. In the stratosphere, ozone exists naturally and shields Earth from harmful incoming ultraviolet radiation. The primary source of ozone precursors is mobile sources, including cars, trucks, buses, construction equipment, and agricultural equipment.

Ground-level ozone reaches the highest level during the afternoon and early evening hours. High levels occur most often during the summer months. Ground-level ozone is a strong irritant that could cause constriction of the airways, forcing the respiratory system to work harder to provide oxygen. Ozone at the Earth's surface causes numerous adverse health effects and is a major

component of smog. High concentrations of ground level ozone can adversely affect the human respiratory system and aggravate cardiovascular disease and many respiratory ailments.

Reactive Organic Gas

ROG refers to several reactive chemical gases composed of hydrocarbon compounds typically found in paints and solvents that contribute to the formation of smog and ozone by involvement in atmospheric chemical reactions. A separate health standard does not exist for ROG. However, some compounds that make up ROG are toxic, such as the carcinogen benzene.

Oxides of Nitrogen

NO_X are a family of gaseous nitrogen compounds and are precursors to the formation of ozone and particulate matter. The major component of NO_X, nitrogen dioxide (NO_2), is a reddish-brown gas that discolors the air and is toxic at high concentrations. NO_X results primarily from the combustion of fossil fuels under high temperature and pressure. On-road and off-road motor vehicles and fuel combustion are the major sources of NO_X. NO_X reacts with ROG to form smog, which could result in adverse impacts to human health, damage the environment, and cause poor visibility. Additionally, NO_X emissions are a major component of acid rain. Health effects related to NO_X include lung irritation and lung damage and can cause increased risk of acute and chronic respiratory disease.

Carbon Monoxide

Carbon monoxide (CO) is a colorless, odorless, poisonous gas produced by incomplete burning of carbon-based fuels such as gasoline, oil, and wood. When CO enters the body, the CO combines with chemicals in the body, which prevents blood from carrying oxygen to cells, tissues, and organs. Symptoms of exposure to CO can include problems with vision, reduced alertness, and general reduction in mental and physical functions. Exposure to CO can result in chest pain, headaches, reduced mental alertness, and death at high concentrations.

Sulfur Dioxide

Sulfur dioxide (SO_2) is a colorless, irritating gas with a rotten egg odor formed primarily by the combustion of sulfur-containing fossil fuels from mobile sources, such as locomotives, ships, and off-road diesel equipment. SO_2 is also emitted from several industrial processes, such as petroleum refining and metal processing. Similar to airborne NO_X, suspended sulfur oxide particles contribute to poor visibility. The sulfur oxide particles are also a component of PM_{10}. Exposure to SO_2 can result in aggravation of chronic obstruction lung disease and increased risk of acute and chronic respiratory disease.

Particulate Matter

Particulate matter, also known as particle pollution or PM, is a complex mixture of extremely small particles and liquid droplets. Particle pollution is made up of a number of components, including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles. The size of particles is directly linked to their potential for causing health impacts. The USEPA is concerned about particles that are 10 micrometers in diameter or smaller (PM_{10}) because those are the particles that generally pass through the throat and nose and enter the lungs. Once inhaled, the particles could affect the heart and lungs and cause serious health effects. USEPA groups particle pollution into three categories based on their size and where they are deposited:

- "Inhalable coarse particles ($PM_{2.5-10}$)," which are found near roadways and dusty industries, are between 2.5 and 10 micrometers in diameter. $PM_{2.5-10}$ is deposited in the thoracic region of the lungs.
- "Fine particles ($PM_{2.5}$)," which are found in smoke and haze, are 2.5 micrometers in diameter and smaller. $PM_{2.5}$ particles could be directly emitted from sources such as forest fires, or could form when gases emitted from power plants, industries, and automobiles react in the air. They penetrate deeply into the thoracic and alveolar regions of the lungs.
- "Ultrafine particles (UFP)," are very, very small particles (less than 0.1 micrometers in diameter) largely resulting from the combustion of fossil fuels, meat, wood, and other hydrocarbons. While UFP mass is a small portion of $PM_{2.5}$, their high surface area, deep lung penetration, and transfer into the bloodstream could result in disproportionate health impacts relative to their mass. UFP is not currently regulated separately, but is analyzed as part of $PM_{2.5}$.

PM_{10}, $PM_{2.5}$, and UFP include primary pollutants, which are emitted directly to the atmosphere and secondary pollutants, which are formed in the atmosphere by chemical reactions among precursors. Generally speaking, $PM_{2.5}$ and UFP are emitted by combustion sources like vehicles, power generation, industrial processes, and wood burning, while PM_{10} sources include the same sources plus roads and farming activities. Fugitive windblown dust and other area sources also represent a source of airborne dust. Long-term PM pollution, especially fine particles, could result in significant health problems including, but not limited to, the following: increased respiratory symptoms, such as irritation of the airways, coughing or difficulty breathing; decreased lung function; aggravated asthma; development of chronic respiratory disease in children; development of chronic bronchitis or obstructive lung disease; irregular heartbeat; heart attacks; and increased blood pressure.

Lead

Lead is a relatively soft and chemically resistant metal that is a natural constituent of air, water, and the biosphere. Lead forms compounds with both organic and inorganic substances. As an air pollutant, lead is present in small particles. Sources of lead emissions in California include a variety of industrial activities. Gasoline-powered automobile engines were a major source of airborne lead through the use of leaded fuels. The use of leaded fuel has been mostly phased out, with the result that ambient concentrations of lead have dropped dramatically. However, because lead was emitted in large amounts from vehicles when leaded gasoline was used, lead is present in many soils (especially urban soils) as a result of airborne dispersion and could become re-suspended into the air.

Because lead is slowly excreted by the human body, exposures to small amounts of lead from a variety of sources could accumulate to harmful levels. Effects from inhalation of lead above the level of the AAQS may include impaired blood formation and nerve conduction. Lead can adversely affect the nervous, reproductive, digestive, immune, and blood-forming systems. Symptoms could include fatigue, anxiety, short-term memory loss, depression, weakness in the extremities, and learning disabilities in children. Lead also causes cancer.

Sulfates

Sulfates are the fully oxidized ionic form of sulfur and are colorless gases. Sulfates occur in combination with metal and/or hydrogen ions. In California, emissions of sulfur compounds occur primarily from the combustion of petroleum-derived fuels (e.g., gasoline and diesel fuel) that contain sulfur. The sulfur is oxidized to SO_2 during the combustion process and subsequently

converted to sulfate compounds in the atmosphere. The conversion of SO_2 to sulfates takes place comparatively rapidly and completely in urban areas of California due to regional meteorological features.

The sulfates standard established by CARB is designed to prevent aggravation of respiratory symptoms. Effects of sulfate exposure at levels above the standard include a decrease in ventilatory function, aggravation of asthmatic symptoms, and an increased risk of cardio-pulmonary disease. Sulfates are particularly effective in degrading visibility, and, because they are usually acidic, can harm ecosystems and damage materials and property.

Hydrogen Sulfide

Hydrogen sulfide (H_2S) is associated with geothermal activity, oil and gas production, refining, sewage treatment plants, and confined animal feeding operations. Hydrogen sulfide is extremely hazardous in high concentrations, especially in enclosed spaces (800 ppm can cause death).

Vinyl Chloride

Vinyl chloride (C_2H_3Cl, also known as VCM) is a colorless gas that does not occur naturally, but is formed when other substances such as trichloroethane, trichloroethylene, and tetrachloro-ethylene are broken down. Vinyl chloride is used to make polyvinyl chloride (PVC) which is used to make a variety of plastic products, including pipes, wire and cable coatings, and packaging materials. Exposure to vinyl chloride can result in skin or eye irritation, nausea, headache, dizziness, drowsiness, fatigue, central nervous system depression and cardiac arrhythmias, and liver damage or cancer.

Visibility Reducing Particles

Visibility reducing particles are a mixture of suspended particulate matter consisting of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. The standard is intended to limit the frequency and severity of visibility impairment due to regional haze and is equivalent to a 10-mile nominal visual range.

Toxic Air Contaminants

In addition to the criteria pollutants discussed above, toxic air contaminants (TACs) are also a category of environmental concern. TACs are present in many types of emissions with varying degrees of toxicity. Public exposure to TACs can result from emissions from normal operations, as well as accidental releases. Common stationary sources of TACs include gasoline stations, dry cleaners, and diesel backup generators, which are subject to PCAPCD stationary source permit requirements. The other, often more significant, common source type is on-road motor vehicles, such as cars and trucks, on freeways and roads, and off-road sources such as construction equipment, ships, and trains.

Fossil fueled combustion engines, including those used in cars, trucks, and some pieces of construction equipment, release at least 40 different TACs. In terms of health risks, the most volatile contaminants are diesel particulate matter (DPM), benzene, formaldehyde, 1,3-butadiene, toluene, xylenes, and acetaldehyde. Gasoline vapors contain several TACs, including benzene, toluene, and xylenes. Diesel engines emit a complex mixture of air pollutants, including both gaseous and solid material. The solid material in diesel exhaust, DPM, is composed of carbon particles and numerous organic compounds, including over 40 known cancer-causing organic substances. Examples of such chemicals include polycyclic aromatic hydrocarbons, benzene, formaldehyde, acetaldehyde, acrolein, and 1,3-butadiene. Diesel exhaust also contains gaseous

pollutants, including ROG and NO_X. Due to the published evidence of a relationship between diesel exhaust exposure and lung cancer and other adverse health effects, the CARB has identified DPM from diesel-fueled engines as a TAC. Although a variety of TACs are emitted by fossil fueled combustion engines, the cancer risk due to DPM exposure represents a more significant risk than the other TACs discussed above.[8]

More than 90 percent of DPM is less than one micrometer in diameter, and, thus, DPM is a subset of $PM_{2.5}$. As a California statewide average, DPM comprises about eight percent of $PM_{2.5}$ in outdoor air, although DPM levels vary regionally due to the non-uniform distribution of sources throughout the State. Most major sources of diesel emissions, such as ships, trains, and trucks, operate in and around ports, rail yards, and heavily-traveled roadways. Such areas are often located near highly populated areas. Thus, elevated DPM levels are mainly an urban problem, with large numbers of people exposed to higher DPM concentrations, resulting in greater health consequences compared to rural areas.

Due to the high levels of diesel activity, high volume freeways, stationary diesel engines, rail yards and facilities attracting heavy and constant diesel vehicle traffic are identified as having the highest associated health risks from DPM. Construction-related activities also have the potential to generate concentrations of DPM from on-road haul trucks and off-road equipment exhaust emissions.

The size of diesel particulates that are of the greatest health concern are fine particles (i.e., $PM_{2.5}$) and UFPs. The small diameter of UFPs imparts the particulates with unique attributes, such as high surface areas and the ability to penetrate deeply into lungs. Once UFPs have been deposited in lungs, the small diameter allows the UFPs to be transferred to the bloodstream. The high surface area of the UFPs also allows for a greater adsorption of other chemicals, which are transported along with the UFPs into the bloodstream of the inhaler, where the chemicals can eventually reach critical organs.[9] The penetration capability of UFPs may contribute to adverse health effects related to heart, lung, and other organ health.[10] UFPs are a subset of DPM and activities that create large amounts of DPM, such as the operations involving heavy diesel-powered engines, also release UFPs. Considering that UFPs are a subset of DPM, and DPM represents a subset of $PM_{2.5}$, estimations of either concentrations or emissions of $PM_{2.5}$ or DPM include UFPs.

Health risks from TACs are a function of both the concentration of emissions and the duration of exposure, which typically are associated with long-term exposure and the associated risk of contracting cancer. Health effects of exposure to TACs other than cancer can include birth defects, neurological damage, and death. Because chronic exposure can result in adverse health effects, TACs are regulated at the regional, State, and federal level. The identification, regulation, and monitoring of TACs is relatively new compared to criteria air pollutants that have established AAQS. TACs are regulated or evaluated on the basis of risk to human health rather than comparison to an AAQS or emission-based threshold.

Diesel Particulate Matter

Diesel powered engines, including locomotive engines, represent a major source of DPM in California. Because locomotive engines emit DPM during operations, areas where locomotive

8 California Air Resources Board. *Reducing Toxic Air Pollutants in California's Communities*. February 6, 2002.
9 Health Effects Institute. *Understanding the Health Effects of Ambient Ultrafine Particles*. January 2013.
10 South Coast Air Quality Management District. *Final 2012 Air Quality Management Plan*. December 2012.

engines are operated in place/idle frequently or for long periods of time can experience increased atmospheric concentrations of DPM. Consequently, the CARB considers rail yards to be substantial sources of TACs.

The Union Pacific J.R. Davis Yard (rail yard), located in Roseville, California, covers approximately 950 acres and is used for service and maintenance operations with approximately 30,000 locomotives visiting the rail yard annually. The rail yard is located approximately three miles northwest of the project site and four miles west of the off-site affordable housing parcel.

In 2004, the CARB and PCAPCD conducted a health risk assessment (HRA) to determine the potential public health risks from DPM emissions due to locomotive activity at the rail yard. The CARB concluded that operation of the rail yard resulted in the emission of approximately 25 tons of DPM in the year 2000. Moving locomotives accounted for 50 percent of the emissions, while idling locomotives accounted for 45 percent and testing accounted for five percent of the DPM emissions from the rail yard. The HRA showed that the potential impacts from DPM emissions originating at the rail yards to residents in the area varied with distance from the rail yard.[11]

Potential impacts related to DPM emissions were estimated based on a 70-year exposure period (i.e., a resident living a given distance from the rail yard for 70 years) and were presented as an increase in cancer risk per million residents. Representing increased cancer risk per million resident means that if a cancer risk of one per million is estimated, then in a population of one million people, one new case of cancer above the expected cancer risk may occur. At the time that the HRA was prepared for the rail yards, the risks estimated based on the DPM emissions from the rail yard ranged from as high as 500 cases per million for residents in proximity to the service area, to 10 cases per million for residents farther away from the project site. At the time of the 2004 study, at least 155,000 people lived within areas with increased cancer risk of 10 in one million or more.[12]

Subsequent to the preparation of the HRA, on December 9, 2004, the PCAPCD authorized an agreement with Union Pacific Railroad (UPRR) concerning mitigation measures and continued air monitoring at the rail yard. In addition, the CARB signed a Memorandum of Understanding (MOU) with the UPRR and BNSF Railway Company to mitigate emissions from major rail yards throughout the State. The PCAPCD agreement included a Mitigation Plan with four main areas of focus: 1) Reduction of unnecessary idling; 2) Introduction of low-sulfur diesel fuel for locomotives; 3) Switcher locomotive fleet replacements/upgrades; and 4) Investigate the use of emission control from the service, test, and maintenance and repair locations using stationary source type of equipment (often referred to as the “hood” or Advanced Locomotive Emission Control System [ALECS]).[13]

In 2009, the PCAPCD summarized findings from ongoing monitoring of the rail yard, and concluded that by the end of 2007, DPM emissions from operations of the rail yard had been reduced from 25 tons per year in 2000 to 19 tons per year in 2007, with emission of all pollutants from the overall facility operations being reduced by 23 percent. The reduction in pollutant emissions is a result of implementation of mitigation measures one through three. While a proof-

11 California Air Resources Board. *Roseville Rail Yard Study*. October 14, 2004.
12 *Ibid*.
13 Placer County Air Pollution Control District. *Memorandum: Final Update Pertaining to the Mitigation Measures and Monitoring Activities for the Union Pacific Roseville Railyard (Information)*. December 10, 2009.

of-concept test was completed for the ALECS technology, ALECS had not been deployed within the rail yard at the time of the 2009 report summarizing the monitoring of the rail yard.[14]

Although the PCAPCD has not released any subsequent health impact analyses based on the 2009 report and measured emissions reductions, the 23 percent reduction in overall emissions would directly reduce the exposure of nearby residences to pollutants; thus, reducing health risks to residents. Since the 2009 study, continued implementation of the PCAPCD-UPRR Agreement, as well as the CARB-UPRR-BNSF MOU, is anticipated to have resulted in maintained emissions reductions or further reductions.[15] In addition, as part of the PCAPCD Assembly Bill (AB) 617 Grant Agreement to implement the Community Air Protection Program, annual reports are prepared which include a summary of all activities associated with Community Air Protection Program tasks conducted by the PCAPCD. As noted in the Annual Report #2, dated March 31, 2020,[16] to investigate complaints regarding diesel exhaust from neighboring communities surrounding the Rail Yard, PCAPCD staff worked with the CARB Enforcement Division and the City of Roseville in order to install a video surveillance system at a City-owned property near the Rail Yard's maintenance shop to better confirm the complaints of excessive locomotive emissions. The surveillance system installed by CARB has a camera directly facing the maintenance yard, which provides video surveillance to assist in the investigation of potential excessive diesel emissions from the locomotives. As noted in Annual Report #3, dated April 1, 2021,[17] PCAPCD is working with additional vendors to update the surveillance systems further.

Furthermore, PCAPCD is working with CARB and the UPRR to discuss possible updates to the locomotive inventory, activity, and emissions data, and potentially develop an updated HRA for the Rail Yard. According to Annual Report #3, PCAPCD and CARB have begun discussions regarding data acquisition and analysis approaches for the HRA update. CARB has obtained the activity data from UPRR, and is evaluating the data quality for further modeling analysis.

The PCAPCD is also planning to purchase PM monitors for deployment around the Rail Yard to provide instant PM concentration measurements from the Rail Yard's activities. The data from the PM monitors could better provide an indication as to how locomotive activities affect local PM concentrations. However, reports summarizing emissions at the rail yards since 2009 have not yet been prepared.[18]

Considering the above, emissions and resulting health risks from the rail yard have decreased from the levels analyzed in the 2004 HRA. However, rail yard activity continues to involve emissions, which could pose health risks to residents in the area.

Naturally Occurring Asbestos

Another concern related to air quality is naturally occurring asbestos (NOA). Asbestos is a term used for several types of naturally-occurring fibrous minerals found in many parts of California. The most common type of asbestos is chrysotile, but other types are also found in California. When rock containing asbestos is broken or crushed, asbestos fibers may be released and become airborne. Exposure to asbestos fibers may result in health issues such as lung cancer,

mesothelioma (a rare cancer of the thin membranes lining the lungs, chest and abdominal cavity), and asbestosis (a non-cancerous lung disease which causes scarring of the lungs). Because asbestos is a known carcinogen, NOA is considered a TAC. Sources of asbestos emissions include: unpaved roads or driveways surfaced with ultramafic rock; construction activities in ultramafic rock deposits; or rock quarrying activities where ultramafic rock is present.

NOA is typically associated with fault zones, and areas containing serpentinite or contacts between serpentinite and other types of rocks. According to the Special Report 190: Relative Likelihood for the Presence of Naturally Occurring Asbestos in Placer County, California, prepared by the Department of Conservation, the project site and the off-site affordable housing parcel are located within an area categorized as least likely to contain NOA, because faults and serpentinite outcroppings are not known to exist in the project area.[19]

Attainment Status and Regional Air Quality Plans

The Federal Clean Air Act (FCAA) and the California Clean Air Act (CCAA) require all areas of California to be classified as attainment, nonattainment, or unclassified as to their status with regard to the NAAQS and/or CAAQS. The FCAA and CCAA require that the CARB, based on air quality monitoring data, designate portions of the State where the federal or State AAQS are not met as "nonattainment areas." Because of the differences between the national and State standards, the designation of nonattainment areas is different under the federal and State legislation. The CCAA requires local air pollution control districts to prepare air quality attainment plans. These plans must provide for district-wide emission reductions of five percent per year averaged over consecutive three-year periods or, provide for adoption of "all feasible measures on an expeditious schedule.

As presented in Table 6-3, under the CCAA, Placer County has been designated nonattainment for the State one-hour ozone, State and federal eight-hour ozone and State PM_{10} standards. The County is designated attainment or unclassified for all other AAQS.

Due to the nonattainment designations, the PCAPCD, along with the other air districts in the SVAB region, is required to develop plans to attain the federal and State standards for ozone and particulate matter. The air quality plans include emissions inventories to measure the sources of air pollutants, to evaluate how well different control measures have worked, and show how air pollution would be reduced. In addition, the plans include the estimated future levels of pollution to ensure that the area would meet air quality goals. Each of the attainment plans currently in effect are discussed in further detail in the Regulatory Context section of this chapter.

Local Air Quality Monitoring

Air quality is monitored by CARB at various locations to determine which air quality standards are being violated, and to direct emission reduction efforts, such as developing attainment plans and rules, incentive programs, etc. The nearest local air quality monitoring station to the project site and the off-site affordable housing parcel is the Roseville-N Sunrise Ave station, which is located approximately five miles east of the project site and approximately seven miles east of the off-site affordable housing parcel. Based on the data available from the applicable monitoring station, Table 6-4 presents the number of days that the State and federal AAQS were exceeded for the three-year period from 2022 to 2024.

Odors

While offensive odors rarely cause physical harm, they can be unpleasant, leading to considerable annoyance and distress among the public and can generate citizen complaints to local governments and air districts. Adverse effects of odors on residential areas and other sensitive receptors warrant the closest scrutiny; but consideration is also given to other land use types where people congregate, such as recreational facilities, worksites, and commercial areas.

The potential for an odor impact is dependent on a number of variables including the nature of the odor source, distance between a receptor and an odor source, and local meteorological conditions.

One of the most important factors influencing the potential for an odor impact to occur is the distance between the odor source and receptors, also referred to as a buffer zone or setback. The greater the distance between an odor source and receptor, the less concentrated the odor emission would be when reaching the receptor.

Meteorological conditions also affect the dispersion of odor emissions, which determines the exposure concentration of odiferous compounds at receptors. The predominant wind direction in an area influences which receptors are exposed to the odiferous compounds generated by a nearby source. Receptors located upwind from a large odor source may not be affected due to the produced odiferous compounds being dispersed away from the receptors. Wind speed also influences the degree to which odor emissions are dispersed away from any area.

Odiferous compounds could be generated from a variety of source types including both construction and operational activities. Examples of common land use types that typically generate significant odor impacts include, but are not limited to, wastewater treatment plants, sanitary landfills, composting/green waste facilities, recycling facilities, petroleum refineries, chemical manufacturing plants, painting/coating operations, rendering plants, and food packaging plants.

The Dry Creek Wastewater Treatment Plant (WWTP) is located approximately two miles from the project site and approximately four miles from the off-site affordable housing parcel and is considered a potential source of odors. Although the Dry Creek WWTP represents an existing potential source of odors in proximity to the project site and off-site affordable housing parcel, *California Building Industry Assn. v. Bay Area Air Quality Management Dist.* (2015) 62 Cal.4th 369, 377-378 case law dictates that analysis of existing environmental conditions must be limited to the effects of the proposed project on the environment. Nevertheless, the Project-Specific Impacts and Mitigation Measures section of this Chapter includes a brief discussion of potential odors associated with the Dry Creek WWTP for informational purposes only.

Sensitive Receptors

Some land uses are considered more sensitive to air pollution than others, due to the types of population groups or activities involved. Children, pregnant women, the elderly, and those with existing health problems are especially vulnerable to the effects of air pollution. Accordingly, land uses that are typically considered to be sensitive receptors include residences, schools, day care centers, playgrounds, and medical facilities. The nearest sensitive receptors to the project site are the single-family residences located adjacent to the site's eastern, western, and southern boundaries. Additionally, the nearest sensitive receptors to the off-site affordable housing parcel are the single-family residences located to the west of the parcel, across Watt Avenue, and to the south of the parcel, across PFE Road.

Greenhouse Gas Emissions

GHGs are gases that absorb and emit radiation within the thermal infrared range, trapping heat in the Earth's atmosphere. Some GHGs occur naturally and are emitted into the atmosphere through both natural processes and human activities. Other GHGs are created and emitted solely through human activities. The principal GHGs that enter the atmosphere due to human activities

are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), and fluorinated carbons. Other common GHGs include water vapor, ozone, and aerosols. The increase in atmospheric concentrations of GHG due to human activities has resulted in more heat being held within the atmosphere, which is the accepted explanation for global climate change.

The primary GHG emitted by human activities is CO_2, with the next largest components being CH_4 and N_2O. A wide variety of human activities result in the emission of CO_2. Some of the largest sources of CO_2 include the burning of fossil fuels for transportation and electricity, industrial processes including fertilizer production, agricultural processing, and cement production. The primary sources of CH_4 emissions include domestic livestock sources, decomposition of wastes in landfills, releases from natural gas systems, coal mine seepage, and manure management. The main human activities producing N_2O are agricultural soil management, fuel combustion in motor vehicles, nitric acid production, manure management, and stationary fuel combustion. Emissions of GHG by economic sector indicate that energy-related activities account for the majority of U.S. emissions. Electricity generation is the largest single-source of GHG emissions, and transportation is the second largest source, followed by industrial activities. The agricultural, commercial, and residential sectors account for the remainder of GHG emission sources.[20]

Emissions of GHG are partially offset by uptake of carbon and sequestration in trees, agricultural soils, landfilled yard trimmings and food scraps, and absorption of CO_2 by the Earth's oceans. Additional emission reduction measures for GHG could include, but are not limited to, compliance with local, State, or federal plans or strategies for GHG reductions, on-site and off-site mitigation, and project design features. Attainment concentration standards for GHGs have not been established by the federal or State government.

Global Warming Potential

Global warming potential (GWP) is one type of simplified index (based upon radiative properties) that can be used to estimate the potential future impacts of emissions of various gases. According to the USEPA, the GWP of a gas, or aerosol, to trap heat in the atmosphere is the "cumulative radiative forcing effects of a gas over a specified time horizon resulting from the emission of a unit mass of gas relative to a reference gas." The reference gas for comparison is CO_2. GWP is based on a number of factors, including the heat-absorbing ability of each gas relative to that of CO_2, as well as the decay rate of each gas relative to that of CO_2. Each gas's GWP is determined by comparing the radiative forcing associated with emissions of that gas versus the radiative forcing associated with emissions of the same mass of CO_2, for which the GWP is set at one. Methane gas, for example, is estimated by the USEPA to have a comparative global warming potential 25 times greater than that of CO_2, as shown in Table 6-5.

As shown in the table, at the extreme end of the scale, sulfur hexafluoride is estimated to have a comparative GWP 22,800 times that of CO_2. The atmospheric lifetimes of such GHGs are estimated by the USEPA to vary from 50 to 200 years for CO_2, to 50,000 years for CF_4. Longer atmospheric lifetimes allow GHG to buildup in the atmosphere; therefore, longer lifetimes correlate with the GWP of a gas. The common indicator for GHG is expressed in terms of metric tons of CO_2 equivalents ($MTCO_2e$), which is calculated based on the GWP for each pollutant.

Effects of Global Climate Change

Globally, climate change has the potential to affect numerous environmental resources through uncertain impacts related to future air temperatures and precipitation patterns. The Intergovernmental Panel on Climate Change's (IPCC) Climate Change 2021: The Physical Science Basis report indicated that warming of the climate system is unequivocal, and since the 1950s, many of the observed changes are unprecedented over decades to millennia.[21] Signs that global climate change has occurred include:

- Warming of the atmosphere and ocean;
- Diminished amounts of snow and ice;
- Rising sea levels; and
- Ocean acidification.

Table 6-5
GWPs and Atmospheric Lifetimes of Select GHGs

Gas	Atmospheric Lifetime (years)	GWP (100-year time horizon)
Carbon Dioxide (CO_2)	See footnote[1]	1
Methane (CH_4)	12.4	28
Nitrous Oxide (N_2O)	121	265
HFC-23	222	12,400
HFC-134a	13.4	1,300
HFC-152a	1.5	138
PFC: Tetrafluoromethane (CF_4)	50,000	6,630
PFC: Hexafluoroethane (C_2F_6)	10,000	11,100
Sulfur Hexafluoride (SF_6)	3,200	23,500

[1] For a given amount of CO_2 emitted, some fraction of the atmospheric increase in concentration is quickly absorbed by the oceans and terrestrial vegetation, some fraction of the atmospheric increase will only slowly decrease over a number of years, and a small portion of the increase will remain for many centuries or more.

Source: U.S. Environmental Protection Agency. Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2022 [Table 1-2]. April 11, 2024.

Although climate change is driven by global atmospheric conditions, climate change impacts are felt locally. A scientific consensus confirms that climate change is already affecting California. The Office of Environmental Health Hazard Assessment (OEHHA) identified various indicators of climate change in California, which are scientifically based measurements that track trends in various aspects of climate change. Many indicators reveal discernable evidence that climate change is occurring in California and is having significant, measurable impacts in the State. Changes in the State's climate have been observed, including:

- An increase in annual average air temperature with record warmth from 2012 to 2016;
- More frequent extreme heat events;
- More extreme drought;
- A decline in winter chill; and
- An increase in variability of statewide precipitation.

[21] Intergovernmental Panel on Climate Change. *Climate Change 2021: The Physical Science Basis Summary for Policymakers*. Available at: https://www.ipcc.ch/report/ar6/wg1/downloads/report/IPCC_AR6_WGI_SPM.pdf. Accessed July 2025.

Warming temperatures and changing precipitation patterns have altered California's physical systems—the ocean, lakes, rivers and snowpack—upon which the State depends. Winter snowpack and spring snowmelt runoff from the Sierra Nevada and southern Cascade Mountains provide approximately one-third of the State's annual water supply. Impacts of climate on physical systems have been observed, such as high variability of snow-water content (i.e., amount of water stored in snowpack), decrease in snowmelt runoff, glacier change (loss in area), rise in sea levels, increase in average lake water temperature and coastal ocean temperature, and a decrease in dissolved oxygen in coastal waters. Impacts of climate change on biological systems, including humans, wildlife, and vegetation, have also been observed, including climate change impacts on terrestrial, marine, and freshwater ecosystems. However, it should be noted that the effects of climate change are not fully understood. For example, due to a series of atmospheric rivers that occurred throughout the 2022-2023 winter season, California saw the most snow the State has seen since the record was set in the 1982-1983 winter season.

Nonetheless, in Placer County, specifically, effects of climate change will be more localized. Such hazards could include agriculture and forestry pests and diseases, avalanche, drought, extreme heat, flooding, fog, human health hazards, landslides, severe weather, severe winter weather, and wildfire. Some hazards, such as wildfire and drought, relate directly to the occurrence of other hazards, such as agriculture and forestry pests and diseases, landslides, and flooding. Placer County is currently experiencing some of the aforementioned changes, and others may not occur for several decades.[22]

6.3 REGULATORY CONTEXT

Air quality and GHG emissions are monitored and regulated through the efforts of various international, federal, State, and local government agencies. Agencies work jointly and individually to improve air quality through legislation, regulations, planning, policy-making, education, and a variety of programs. The agencies responsible for regulating and improving the air quality within the project area and monitoring or reducing GHG emissions are discussed below.

Federal Regulations Related to Air Quality

The following discussion provides a summary of the federal regulations relevant to air quality, organized by pollutant type.

Criteria Pollutants

The FCAA, passed in 1970 and last amended in 1990, forms the basis for the national air pollution control effort. The USEPA is responsible for implementing most aspects of the FCAA, including setting NAAQS for major air pollutants; setting hazardous air pollutant standards; approving state attainment plans; setting motor vehicle emission standards; issuing stationary source emission standards and permits; and establishing acid rain control measures, stratospheric ozone protection measures, and enforcement provisions. Under the FCAA, NAAQS are established for the following criteria pollutants: ozone, CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and lead.

The NAAQS describes acceptable air quality conditions designed to protect the health and welfare of the citizens of the nation. The NAAQS (other than for ozone, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and those based on annual averages or arithmetic mean) are not to be exceeded more than once per year. NAAQS for ozone, NO_2, SO_2, PM_{10}, $PM_{2.5}$ are based on statistical calculations over one- to three-

[22] Placer County. *Placer County Sustainability Plan: A Greenhouse Gas Emission Reduction Plan and Adaptation Strategy* [pg. 14]. January 28, 2020.

year periods, depending on the pollutant. The FCAA requires the USEPA to reassess the NAAQS at least every five years to determine whether adopted standards are adequate to protect public health based on current scientific evidence. States with areas that exceed the NAAQS must prepare a state implementation plan that demonstrates how those areas will attain the standards within mandated time frames.

Hazardous Air Pollutants/Toxic Air Contaminants

The 1977 FCAA amendments required the USEPA to identify national emission standards for hazardous air pollutants to protect public health and welfare. Hazardous air pollutants include certain volatile organic chemicals, pesticides, herbicides, and radionuclides that present a tangible hazard, based on scientific studies of exposure to humans and other mammals. Under the 1990 FCAA Amendments, which expanded the control program for hazardous air pollutants, 189 substances and chemical families were identified as hazardous air pollutants.

Federal Regulations Related to GHG Emissions

The following are the federal regulations relevant to GHG emissions.

Federal Vehicle Standards

In 2010, President Obama issued a memorandum directing the Department of Transportation, Department of Energy, USEPA, and National Highway Traffic Safety Administration (NHTSA) to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the USEPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017 through 2025 light-duty vehicles. The proposed standards were projected to achieve emission rates as low as 163 grams of CO_2 per mile by model year 2025 on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if the foregoing emissions level was achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017 through 2021 (77 FR 62624–63200), and NHTSA intended to set standards for model years 2022 through 2025 in future rulemaking.

In August 2016, the USEPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program would have applied to vehicles with model years 2018 through 2027 for certain trailers, and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all types of sizes of buses and work trucks. The final standards were expected to lower CO_2 emissions by approximately 1.1 billion metric tons (MT), and reduce oil consumption by up to two billion barrels over the lifetime of the vehicles sold under the program.

In August 2018, the USEPA and NHTSA proposed to amend certain fuel economy and GHG standards for passenger cars and light trucks and establish new, less-stringent standards for model years 2021 through 2026. Compared to maintaining the post-2020 standards that were previously in place, the 2018 proposal would increase U.S. fuel consumption by approximately 0.5 million barrels per day, and would impact the global climate by 3/1000th of one degree Celsius by 2100. California and other states stated their intent to challenge federal actions that would delay or eliminate GHG reduction measures, and committed to cooperating with other countries to implement global climate change initiatives.

On September 27, 2019, the USEPA and NHTSA published the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program (84 FR 51,310), which became effective

November 26, 2019. The Part One Rule revokes California's authority to set its own GHG emissions standards and set zero-emission-vehicle mandates in California. On March 31, 2020, the USEPA and NHTSA issued the Part Two Rule, which sets CO_2 emissions standards and corporate average fuel economy standards for passenger vehicles and light-duty trucks for model years 2021 through 2026. On January 20, 2021, an Executive Order (EO) was issued on Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis, which includes review of the Part One Rule by April 2021 and review of the Part Two Rule by July 2021. In response to the Part One Rule, in December 2021, the U.S. Department of Transportation withdrew its portions of the "SAFE I" rule. As a result, states are now allowed to issue their own GHG emissions standards and zero-emissions vehicle mandates.[23] In addition, the Part Two Rule was adopted to revise the existing national GHG emission standards for passenger cars and light trucks through model year 2026. These standards are the strongest vehicle emissions standards ever established for the light-duty vehicle sector and will result in avoiding more than three billion tons of GHG emissions through 2050.[24]

State Regulations Related to Air Quality

The following discussion summarizes applicable State regulations related to air quality, organized by pollutant type. Only the most prominent and applicable California air quality-related legislation is included below. An exhaustive list and extensive details of California air quality legislation can be found at the CARB website (http://www.arb.ca.gov/html/lawsregs.htm).

Criteria Air Pollutants

The FCAA delegates the regulation of air pollution control and the enforcement of the NAAQS to the states. In California, the task of air quality management and regulation has been legislatively granted to CARB, with subsidiary responsibilities assigned to air quality management districts and air pollution control districts at the regional and county levels. CARB, which became part of the California Environmental Protection Agency (CalEPA) in 1991, is responsible for ensuring implementation of the CCAA of 1988, responding to the FCAA, and regulating emissions from motor vehicles and consumer products.

CARB has established CAAQS, which are generally more restrictive than the NAAQS. The CAAQS describe adverse conditions; that is, pollution levels must be below these standards before a basin can attain the standard. Air quality is considered "in attainment" if pollutant levels are continuously below the CAAQS and do not violate the standards more than once each year. The CAAQS for ozone, CO, SO_2 (one-hour and 24-hour), NO_2, PM_{10}, $PM_{2.5}$, and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. The NAAQS and CAAQS are presented in Table 6-2.

Hazardous Air Pollutants/Toxic Air Contaminants

The State Air Toxics Program was established in 1983 under AB 1807 (Tanner), and involved definition of a list of TACs. The California TAC list identifies more than 700 pollutants, of which carcinogenic and noncarcinogenic toxicity criteria have been established for a subset of these pollutants pursuant to the California Health and Safety Code. The State list of TACs includes the

[23] National Highway Traffic Safety Administration. *In Removing Major Roadblock to State Action on Emissions Standards, U.S. Department of Transportation Advances Biden-Harris Administration's Climate and Jobs Goals.* Available at: https://www.nhtsa.gov/press-releases/cafe-preemption-final-rule. Accessed July 2025.

[24] U.S. Environmental Protection Agency. *Final Rule to Revise Existing National GHG Emissions Standards for Passenger Cars and Light Trucks Through Model Year 2026*. Available at: https://www.epa.gov/regulations-emissions-vehicles-and-engines/final-rule-revise-existing-national-ghg-emissions. Accessed July 2025.

federally-designated hazardous air pollutants. In 1987, the Legislature enacted the Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588) to address public concern over the release of TACs into the atmosphere. AB 2588 law requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hot spots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over five years. TAC emissions from individual facilities are quantified and prioritized. "High-priority" facilities are required to perform a health risk assessment, and, if specific thresholds are exceeded, the facility operator is required to communicate the results to the public in the form of notices and public meetings.

CARB Air Quality and Land Use Handbook

CARB's Air Quality and Land Use Handbook: A Community Health Perspective (CARB Handbook) addresses the importance of considering health risk issues when siting sensitive land uses, including residential development, in the vicinity of intensive air pollutant emission sources including freeways or high-traffic roads, distribution centers, ports, petroleum refineries, chrome plating operations, dry cleaners, and gasoline dispensing facilities (GDFs).[25] The CARB Handbook draws upon studies evaluating the health effects of traffic traveling on major interstate highways in metropolitan California centers within Los Angeles (Interstate-405 and Interstate-710), the San Francisco Bay, and San Diego areas. The recommendations identified by CARB, including siting residential uses a minimum distance of 500 feet from freeways or other high-traffic roadways, are consistent with those adopted by the State of California for location of new schools. Specifically, the CARB Handbook recommends, "Avoid siting new sensitive land uses within 500 feet of a freeway, urban roads with 100,000 vehicles/day, or rural roads with 50,000 vehicles/day."[26]

Importantly, the Introduction chapter of the CARB Handbook clarifies that the guidelines are strictly advisory, recognizing that: "[l]and use decisions are a local government responsibility. The Air Resources Board Handbook is advisory and these recommendations do not establish regulatory standards of any kind." CARB recognizes that there may be land use objectives as well as meteorological and other site-specific conditions that need to be considered by a governmental jurisdiction relative to the general recommended setbacks, specifically stating, "[t]hese recommendations are advisory. Land use agencies have to balance other considerations, including housing and transportation needs, economic development priorities, and other quality of life issues."[27]

Diesel Particulate Matter

In 2000, CARB approved a comprehensive diesel risk reduction plan to reduce diesel emissions, including DPM, from new and existing diesel-fueled vehicles and engines. The regulation was anticipated to result in an 80 percent decrease in statewide diesel health risk by 2020 compared with the diesel risk in 2000. Additional regulations apply to new trucks and diesel fuel, including the On-Road Heavy Duty Diesel Vehicle (In-Use) Regulation, the On-Road Heavy Duty (New) Vehicle Program, the In-Use Off-Road Diesel Vehicle Regulation, and the New Off-Road Compression-Ignition (Diesel) Engines and Equipment program. The aforementioned regulations and programs have timetables by which manufacturers must comply and existing operators must upgrade their diesel-powered equipment. Several Airborne Toxic Control Measures (ATCMs)

25 California Air Resources Board. *Air Quality and Land Use Handbook: A Community Health Perspective*. April 2005.
26 *Ibid.*
27 *Ibid.*

exist that reduce diesel emissions, including In-Use Off-Road Diesel-Fueled Fleets (13 California Code of Regulations [CCR] 2449 et seq.) and In-Use On-Road Diesel-Fueled Vehicles (13 CCR 2025).

Heavy-Duty Diesel Truck and Bus Regulation

CARB adopted the final Heavy-Duty Truck and Bus Regulation, Title 13, Division 3, Chapter 1, Section 2025, on December 31, 2014, to reduce DPM and NO_X emissions from heavy-duty diesel vehicles. The rule requires nearly all diesel trucks and buses to be compliant with the 2010 model year engine requirement by January 1, 2023. CARB also adopted an ATCM to limit idling of diesel-fueled commercial vehicles on December 12, 2013. The rule requires diesel-fueled vehicles with gross vehicle weights greater than 10,000 pounds to idle no more than five minutes at any location (13 CCR 2485).

California Health and Safety Code Section 41700

Section 41700 of the Health and Safety Code states that a person must not discharge from any source whatsoever quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public; or that endanger the comfort, repose, health, or safety of any of those persons or the public; or that cause, or have a natural tendency to cause, injury or damage to business or property. Section 41700 also applies to sources of objectionable odors.

Heavy-Duty Vehicle Idling Emission Reduction Program

On October 20, 2005, CARB approved a regulatory measure to reduce emissions of toxics and criteria pollutants by limiting idling of new and in-use sleeper berth equipped diesel trucks.[28] The regulation established new engine and in-use truck requirements and emission performance requirements for technologies used as alternatives to idling the truck's main engine. For example, the regulation requires 2008 and newer model year heavy-duty diesel engines to be equipped with a non-programmable engine shutdown system that automatically shuts down the engine after five minutes of idling, or optionally meet a stringent NO_X emission standard. The regulation also requires operators of both in-state and out-of-state registered sleeper berth equipped trucks to manually shut down their engine when idling more than five minutes at any location within California. Emission producing alternative technologies such as diesel-fueled auxiliary power systems and fuel-fired heaters are also required to meet emission performance requirements that ensure emissions are not exceeding the emissions of a truck engine operating at idle.

In-Use Off-Road Diesel Vehicle Regulation

On July 26, 2007, CARB adopted a regulation to reduce DPM and NO_X emissions from in-use (existing), off-road, heavy-duty diesel vehicles in California.[29] Such vehicles are used in construction, mining, and industrial operations. The regulation is designed to reduce harmful emissions from vehicles by subjecting fleet owners to retrofit or accelerated replacement/repower requirements, imposing idling limitations on owners, operators, renters, or lessees of off-road diesel vehicles. The idling limits require operators of applicable off-road vehicles (self-propelled diesel-fueled vehicles 25 horsepower and up that were not designed to be driven on-road) to limit idling to less than five minutes. The idling requirements are specified in Title 13 of the CCR.

State Regulations Related to GHG Emissions

The statewide GHG emissions regulatory framework is summarized below. The following text describes EOs, legislation, regulations, and other plans and policies that would directly or indirectly reduce GHG emissions and/or address climate change issues. The following discussion does not include an exhaustive list of applicable regulations; rather, only the most prominent and applicable California legislation related to GHG emissions and climate change is included below.

State Climate Change Targets

California has taken a number of actions to address climate change, including EOs, legislation, and CARB plans and requirements, which are summarized below.

Executive Order S-3-05

EO S-3-05 (June 2005) established California's GHG emissions reduction targets and laid out responsibilities among the State agencies for implementing the EO and for reporting on progress toward the targets. The EO established the following targets:

- By 2010, reduce GHG emissions to 2000 levels;
- By 2020, reduce GHG emissions to 1990 levels; and
- By 2050, reduce GHG emissions to 80 percent below 1990 levels.

EO S-3-05 also directed CalEPA to report biannually on progress made toward meeting the GHG targets and the impacts to California due to global warming, including impacts to water supply, public health, agriculture, the coastline, and forestry. The Climate Action Team was formed, which subsequently issues yearly GHG reduction report cards to track the progress of emission reduction strategies. Each report card documents the effectiveness of measures to reduce GHG in California, presents GHG emissions from State agencies' operations, and shows reductions that have occurred in the two years prior to publication.

Assembly Bill 32

In furtherance of the goals established in EO S-3-05, the Legislature enacted AB 32 (Núñez and Pavley). The bill is referred to as the California Global Warming Solutions Act of 2006 (September 27, 2006). AB 32 provided initial direction on creating a comprehensive, multi-year program to limit California's GHG emissions at 1990 levels by 2020 and initiate the transformations required to achieve the State's long-range climate objectives. AB 32 also required that the CARB prepare a "scoping plan" for achieving the maximum technologically feasible and cost-effective GHG emission reductions by 2020. The CARB's Scoping Plan is described in further detail below.

Executive Order B-30-15

EO B-30-15 (April 2015) identified an interim GHG reduction target in support of targets previously identified under EO S-3-05 and AB 32. EO B-30-15 set an interim target goal of reducing GHG emissions to 40 percent below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing GHG emissions to 80 percent below 1990 levels by 2050 as set forth in EO S-3-05. To facilitate achieving this goal, EO B-30-15 called for an update to the CARB's Climate Change Scoping Plan: A Framework for Change (Scoping Plan) to express the 2030 target in terms of million metric tons (MMT) of CO_2e. The CARB's Scoping Plan is discussed in further detail below. The EO also called for State agencies to continue to develop and implement GHG emission reduction programs in support of the reduction targets.

Senate Bill 32 and Assembly Bill 197

Senate Bill (SB) 32 and AB 197 (enacted in 2016) are companion bills. SB 32 codified the 2030 emissions reduction goal of EO B-30-15 by requiring CARB to ensure that statewide GHG emissions are reduced to 40 percent below 1990 levels by 2030. AB 197 established the Joint Legislative Committee on Climate Change Policies, consisting of at least three members of the Senate and three members of the Assembly, to provide ongoing oversight over implementation of the State's climate policies. AB 197 also added two members of the Legislature to the Board as non-voting members; requires CARB to make available and update (at least annually through the CARB's website) emissions data for GHGs, criteria air pollutants, and TACs from reporting facilities; and requires CARB to identify specific information for GHG emissions reduction measures when updating the Scoping Plan.

CARB's Climate Change Scoping Plan

One specific requirement of AB 32 is for CARB to prepare a scoping plan for achieving the maximum technologically feasible and cost-effective GHG emission reductions by 2020 (Health and Safety Code Section 38561[a]), and to update the Scoping Plan at least once every five years. In 2008, CARB approved the first Scoping Plan. The Scoping Plan included a mix of recommended strategies that combined direct regulations, market-based approaches, voluntary measures, policies, and other emission reduction programs calculated to meet the 2020 statewide GHG emission limit and initiate the transformations needed to achieve the State's long-range climate objectives. The key elements of the Scoping Plan include the following:

1. Expanding and strengthening existing energy efficiency programs as well as building and appliance standards;
2. Achieving a statewide renewable energy mix of 33 percent;
3. Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system and caps sources contributing 85 percent of California's GHG emissions;
4. Establishing targets for transportation-related GHG emissions for regions throughout California, and pursuing policies and incentives to achieve those targets;
5. Adopting and implementing measures pursuant to existing State laws and policies, including California's clean car standards, goods movement measures, and the Low Carbon Fuel Standard (LCFS) (17 CCR, Section 95480 et seq.); and
6. Creating targeted fees, including a public goods charge on water use, fees on high GWP gases, and a fee to fund the administrative costs of the State's long-term commitment to AB 32 implementation.

The Scoping Plan also identified local governments as essential partners in achieving California's goals to reduce GHG emissions because they have broad influence and, in some cases, exclusive authority over activities that contribute to significant direct and indirect GHG emissions through their planning and permitting processes, local ordinances, outreach and education efforts, and municipal operations. Specifically, the Scoping Plan encouraged local governments to adopt a reduction goal for municipal operations and for community emissions to reduce GHGs by approximately 15 percent from 2008 levels by 2020. Many local governments developed community-scale local GHG reduction plans based on this Scoping Plan recommendation.

In 2014, CARB approved the first update to the Scoping Plan. The First Update to the Climate Change Scoping Plan: Building on the Framework (First Update) defined the State's GHG emission reduction priorities for the next five years and laid the groundwork to start the transition

to the post-2020 goals set forth in EO S-3-05 and EO B-16-2012. The First Update concluded that California is on track to meet the 2020 target but recommended a 2030 mid-term GHG reduction target be established to ensure a continuation of action to reduce emissions. The First Update recommended a mix of technologies in key economic sectors to reduce emissions through 2050, including energy demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and the rapid market penetration of efficient and clean energy technologies. As part of the First Update, CARB recalculated the State's 1990 emissions level using more recent GWPs identified by the IPCC, from 427 MMT CO_2e to 431 MMT CO_2e.

In 2015, as directed by EO B-30-15, CARB began working on an update to the Scoping Plan to incorporate the 2030 target of 40 percent below 1990 levels by 2030 to keep California on a trajectory toward meeting or exceeding the long-term goal of reducing GHG emissions to 80 percent below 1990 levels by 2050, as set forth in EO S-3-05. In summer 2016, the Legislature affirmed the importance of addressing climate change through passage of SB 32 (Pavley, Chapter 249, Statutes of 2016).

In December 2017, the Scoping Plan was once again updated. The 2017 Scoping Plan built upon the successful framework established in the initial Scoping Plan and First Update, while identifying new, technologically feasible and cost-effective strategies that would serve as the framework to achieve the 2030 GHG target as established by SB 32 and define the State's climate change priorities to 2030 and beyond. For local governments, the 2017 Scoping Plan replaced the initial Scoping Plan's 15 percent reduction goal with a recommendation to aim for a communitywide goal of no more than six $MTCO_2e$ per capita by 2030, and no more than two $MTCO_2e$ per capita by 2050, which are consistent with the State's long-term goals. The 2017 Scoping Plan recognized the benefits of local government GHG planning (e.g., through Climate Action Plans [CAPs]) and provided more information regarding tools to support those efforts. The 2017 Scoping Plan also recognized the CEQA streamlining provisions for project-level review where a legally adequate CAP exists.

When discussing project-level GHG emissions reduction actions and thresholds in the context of CEQA, the 2017 Scoping Plan stated that "achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development" for project-level CEQA analysis, but also recognized that such a standard may not be appropriate or feasible for every development project. The 2017 Scoping Plan further provided that "the inability of a project to mitigate its GHG emissions to net zero does not imply the project results in a substantial contribution to the cumulatively significant environmental impact of climate change under CEQA."

The most recent update to the Scoping Plan, the 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan) was adopted by the CARB in December 2022.[30] The 2022 Scoping Plan builds upon previous efforts to reduce GHG emissions and is designed to continue to shift the California economy away from dependence on fossil fuels. The 2022 Scoping Plan, the most comprehensive and far-reaching Scoping Plan developed to date, identifies a technologically feasible and cost-effective path to achieve carbon neutrality by 2045 while also assessing the progress California is making toward reducing its GHG emissions by at least 40 percent below 1990 levels by 2030, as called for in SB 32 and laid out in the 2017 Scoping Plan. The 2022 Scoping Plan also lays out a more ambitious 48 percent reduction target by 2030. The 2030 target

[30] California Air Resources Board. *2022 Scoping Plan for Achieving Carbon Neutrality*. November 16, 2022.

is an interim but important stepping stone along the critical path to the broader goal of deep decarbonization by 2045. The relatively longer path assessed in the Scoping Plan incorporates, coordinates, and leverages many existing and ongoing efforts to reduce GHGs and air pollution, while identifying new clean technologies and energy. Given the focus on carbon neutrality, the Scoping Plan also includes discussion for the first time of the Natural and Working Lands (NWL) sectors as both sources of emissions and carbon sinks.

The 2022 Scoping Plan lays out a path to achieve targets for carbon neutrality and reduce GHG emissions by 85 percent below 1990 levels by 2045, as directed by AB 1279. The actions and outcomes in the plan will achieve significant reductions in fossil fuel combustion by deploying clean technologies and fuels, further reductions in short-lived climate pollutants, support for sustainable development, increased action on NWL to reduce emissions and sequester carbon, and the capture and storage of carbon.

CARB's Regulations for the Mandatory Reporting of GHG Emissions

CARB's Regulation for the Mandatory Reporting of GHG Emissions (17 CCR 95100–95157) incorporated by reference certain requirements that the USEPA promulgated in its Final Rule on Mandatory Reporting of GHGs (40 Code of Federal Regulations [CFR] Part 98). In general, entities subject to the Mandatory Reporting Regulation that emit more than 10,000 $MTCO_2e$ per year are required to report annual GHGs through the California Electronic GHG Reporting Tool. Certain sectors, such as refineries and cement plants, are required to report regardless of emission levels. Entities that emit more than the 25,000 $MTCO_2e$ per year threshold are required to have their GHG emission report verified by a CARB-accredited third party.

Senate Bill 1383

SB 1383 establishes specific targets for the reduction of short-lived climate pollutants (SLCPs) (40 percent below 2013 levels by 2030 for CH_4 and HFCs, and 50 percent below 2013 levels by 2030 for anthropogenic black carbon), and provides direction for reductions from dairy and livestock operations and landfills. Accordingly, CARB adopted its SLCP Reduction Strategy in March 2017. The SLCP Reduction Strategy establishes a framework for the statewide reduction of emissions of black carbon, CH_4, and fluorinated gases.

Executive Order B-55-18/Assembly Bill 1279

EO B-55-18 (September 2018) establishes a statewide policy for California to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net-negative emissions thereafter. The goal is an addition to the existing statewide targets of reducing the State's GHG emissions. CARB has prepared the 2022 Scoping Plan, as discussed above, which identifies and recommends measures to achieve the carbon neutrality goal. On September 16, 2022, AB 1279, also known as the California Climate Crisis Act, codified the carbon neutrality goal established by EO B-55-18.

Mobile Sources

The following regulations relate to the control of GHG emissions from mobile sources. Mobile sources include both on-road vehicles and off-road equipment.

Assembly Bill 1493

AB 1493 (Pavley) (July 2002) was enacted in response to the transportation sector accounting for more than half of California's CO_2 emissions. AB 1493 required CARB to set GHG emission standards for passenger vehicles, light-duty trucks, and other vehicles determined by the State

board to be vehicles that are primarily used for non-commercial personal transportation in the State. The bill required that CARB set GHG emission standards for motor vehicles manufactured in 2009 and all subsequent model years. CARB adopted the standards in September 2004. When fully phased in, the near-term (2009–2012) standards would result in a reduction of approximately 22 percent of GHG emissions compared to the emissions from the 2002 fleet, and the mid-term (2013–2016) standards would result in a reduction of approximately 30 percent.

Senate Bill 375

SB 375 (Steinberg) (September 2008) addresses GHG emissions associated with the transportation sector through regional transportation and sustainability plans. SB 375 requires CARB to adopt regional GHG reduction targets for the automobile and light-truck sector for 2020 and 2035, and to update those targets every eight years. SB 375 requires the State's 18 regional metropolitan planning organizations to prepare a sustainable communities strategy as part of their Regional Transportation Plans that will achieve the GHG reduction targets set by CARB. If a metropolitan planning organization is unable to devise a sustainable communities strategy to achieve the GHG reduction target, the metropolitan planning organization must prepare an alternative planning strategy demonstrating how the GHG reduction target would be achieved through alternative development patterns, infrastructure, or additional transportation measures or policies.

Pursuant to California Government Code Section 65080(b)(2)(K), a sustainable communities strategy does not (1) regulate the use of land, (2) supersede the land use authority of cities and counties, or (3) require that a city's or county's land use policies and regulations, including those in a general plan, be consistent with the sustainable community strategy. Nonetheless, SB 375 makes regional and local planning agencies responsible for developing those strategies as part of the federally required metropolitan transportation planning process and the State-mandated housing element process.

Executive Order N-79-20

EO N-79-20 (September 2020) directs the State to require that 100 percent of new passenger cars and light-duty trucks sold in California be zero-emission vehicles (ZEVs) by the year 2035. EO N-79-20 focuses on new vehicle sales for automakers, not existing cars and trucks already owned by California residents. The primary mechanism for achieving the ZEV target for passenger cars and light trucks is the Advanced Clean Cars II (ACC II) Program, as discussed in further detail below.

Advanced Clean Cars Program and Zero-Emissions Vehicle Program

The Advanced Clean Cars Program (January 2012) is an emissions-control program for model years 2015 through 2025. The program combines the control of smog- and soot-causing pollutants and GHG emissions into a single coordinated package. The package includes elements to reduce smog-forming pollution, reduce GHG emissions, promote clean cars, and provide the fuels for clean cars. To improve air quality, CARB has implemented new emission standards to reduce smog-forming emissions beginning with 2015 model year vehicles. By 2025, implementation of the rule is anticipated to reduce emissions of smog-forming pollution from cars by 75 percent compared to the average new car sold in 2015. To reduce GHG emissions, CARB, in conjunction with the USEPA and NHTSA, adopted GHG standards for model year 2017 to 2025 vehicles; the standards were estimated to reduce GHG emissions by 34 percent by 2025. The zero-emissions vehicle program acts as the focused technology of the Advanced Clean Cars

Program by requiring manufacturers to produce increasing numbers of zero-emissions vehicles and plug-in hybrid electric vehicles in the 2018 to 2025 model years.

In addition, the Advanced Clean Cars II Program was approved by CARB in August 2022 to establish the next phase of regulations beginning with the 2026 model year. The Advanced Clean Cars II Program (1) increased the stringency of the smog-causing criteria pollutant standards; (2) updated the ZEV regulation to require that 100 percent of new passenger vehicles meet zero-emission standards (including plug-in hybrids) by the 2035 model year, in compliance with EO N-79-20; and (3) established measures to ensure ZEV can provide enduring emission reductions. However, on May 22, 2025, the U.S. House of Representatives passed three Congressional Review Act (CRA) resolutions to rescind the U.S EPA's waiver for the Advanced Clean Cars II Program. The Senate passed all three resolutions on May 22, 2025, and President Donald Trump signed the CRA resolutions on June 12, 2025. Subsequently, a lawsuit has been filed by the State Attorney General on June 12, 2025 against the federal government's use of the CRA to upend California's clean vehicles program.[31] As such, the future enforceability of the Advanced Clean Cars II Program is currently unknown.

Executive Order B-16-12

EO B-16-12 (March 2012) required that State entities under the governor's direction and control support and facilitate the rapid commercialization of zero-emissions vehicles. The order directed CARB, California Energy Commission (CEC), California Public Utilities Commission (CPUC), and other relevant agencies to work with the Plug-In Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to help achieve goals by 2015, 2020, and 2025. On a statewide basis, EO B-16-12 established a target reduction of GHG emissions from the transportation sector equaling 80 percent less than 1990 levels by 2050. EO B-16-12 did not apply to vehicles that have special performance requirements necessary for the protection of the public safety and welfare.

Assembly Bill 1236

AB 1236 (October 2015) (Chiu) required a city, county, or city and county to approve an application for the installation of electric vehicle charging stations, as defined, through the issuance of specified permits unless the city or county makes specified written findings based on substantial evidence in the record that the proposed installation would have a specific, adverse impact upon the public health or safety, and a feasible method to satisfactorily mitigate or avoid the specific, adverse impact does not exist. The bill provided for appeal of that decision to the planning commission, as specified. AB 1236 required electric vehicle charging stations to meet specified standards. The bill required a city, county, or city and county with a population of 200,000 or more residents to adopt an ordinance, by September 30, 2016, that created an expedited and streamlined permitting process for electric vehicle charging stations. The bill also required a city, county, or city and county with a population of less than 200,000 residents to adopt the ordinance by September 30, 2017.

Water

The following regulations relate to the conservation of water, which reduces GHG emissions related to electricity demands from the treatment and transportation of water.

[31] State of California Department of Justice. *California Will Not Waver in Defending Itself from Federal Overreach: Attorney General Bonta Sues Trump Administration for Attack on California's Clean Vehicles Program.* Available at: https://oag.ca.gov/news/press-releases/california-will-not-waver-defending-itself-federal-overreach-attorney-general. Accessed June 12, 2025.

Executive Order B-29-15

In response to a drought in California, EO B-29-15 (April 2015) set a goal of achieving a statewide reduction in potable urban water usage of 25 percent relative to water use in 2013. The term of the EO extended through February 28, 2016, although many of the directives subsequently became permanent water-efficiency standards and requirements. The EO includes specific directives that set strict limits on water usage in the State. In response to EO B-29-15, the California DWR modified and adopted a revised version of the Model Water Efficient Landscape Ordinance (MWELO) that, among other changes, significantly increases the requirements for landscape water use efficiency, and broadens the applicability of the ordinance to include new development projects with smaller landscape areas.

Solid Waste

The following regulations relate to the generation of solid waste and means to reduce GHG emissions from solid waste produced within the State.

Assembly Bill 939 and Assembly Bill 341

In 1989, AB 939, known as the Integrated Waste Management Act (California Public Resources Code [PRC] Sections 40000 et seq.), was passed because of the observed increase in waste stream and the decrease in landfill capacity.

AB 341 (Chapter 476, Statutes of 2011 [Chesbro]) amended the California Integrated Waste Management Act of 1989 to include a provision declaring that the policy goal of the State is that not less than 75 percent of solid waste generated be source-reduced, recycled, or composted by 2020, and annually thereafter. In addition, AB 341 required the California Department of Resources Recycling and Recovery to develop strategies to achieve the State's policy goal.

Other State Actions

The following State regulations are broadly related to GHG emissions.

Senate Bill 97

SB 97 (Dutton) (August 2007) directed the Governor's Office of Planning and Research (OPR) (currently known as the Office of Land Use and Climate Innovation [LCI]) to develop guidelines under CEQA for the mitigation of GHG emissions. In 2008, the Governor's OPR issued a technical advisory as interim guidance regarding the analysis of GHG emissions in CEQA documents. The advisory indicated that the lead agency should identify and estimate a project's GHG emissions, including those associated with vehicular traffic, energy consumption, water usage, and construction activities. The advisory further recommended that the lead agency determine the significance of the impacts and impose all mitigation measures necessary to reduce GHG emissions to a level that is less than significant. The California Natural Resource Agency (CNRA) adopted the CEQA Guidelines amendments in December 2009, and the amended CEQA Guidelines became effective in March 2010.

Under the amended CEQA Guidelines, a lead agency has the discretion to determine whether to use a quantitative or qualitative analysis, or apply performance standards to determine the significance of GHG emissions resulting from a particular project (14 CCR 15064.4[a]). The CEQA Guidelines require a lead agency to consider the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4[b]). The CEQA Guidelines also allow a lead agency to consider feasible means of mitigating the significant effects of GHG emissions,

including reductions in emissions through the implementation of project features or off-site measures. The adopted amendments do not establish a GHG emission threshold, instead allowing a lead agency to develop, adopt, and apply the lead agency's own thresholds of significance or those developed by other agencies or experts. CNRA acknowledges that a lead agency may consider compliance with regulations or requirements implementing AB 32 in determining the significance of a project's GHG emissions.

With respect to GHG emissions, the CEQA Guidelines state that lead agencies should "make a good faith effort, to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions (14 CCR 15064.4[a]). The CEQA Guidelines note that an agency may identify emissions by either selecting a "model or methodology" to quantify the emissions or by relying on "qualitative analysis or other performance-based standards" (14 CCR 15064.4[a]). Section 15064.4(b) states that the lead agency should consider the following when assessing the significance of impacts from GHG emissions on the environment: (1) the extent to which a project may increase or reduce GHG emissions as compared to the existing environmental setting; (2) whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and (3) the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4[b]).

Executive Order S-13-08

EO S-13-08 (November 2008) is intended to hasten California's response to the impacts of global climate change, particularly sea-level rise. Therefore, the EO directs State agencies to take specified actions to assess and plan for such impacts. The final 2009 California Climate Adaptation Strategy report was issued in December 2009, and an update, Safeguarding California: Reducing Climate Risk, followed in July 2014. To assess the State's vulnerability, the report summarizes key climate change impacts to the State for the following areas: agriculture, biodiversity and habitat, emergency management, energy, forestry, ocean and coastal ecosystems and resources, public health, transportation, and water. Issuance of the Safeguarding California: Implementation Action Plans followed in March 2016. In January 2018, the CNRA released the Safeguarding California Plan: 2018 Update, which communicates current and needed actions that the State government should take to build climate change resiliency.

Local Regulations

The most prominent local regulations related to air quality and GHG emissions are established by the PCAPCD and the PCGP and are discussed in further detail below.

Placer County Air Pollution Control District

The PCAPCD regulates many sources of pollutants in the ambient air as well as GHG emissions, and is responsible for implementing certain programs and regulations for controlling air pollutant and GHG emissions to improve air quality to attain federal and State AAQS and reduce GHG emissions in compliance with State goals.

Air Quality Attainment Plan

As a part of the SVAB federal ozone nonattainment area, the PCAPCD works with the other local air districts within the Sacramento area to develop a regional air quality management plan under the FCAA requirement. The regional air quality management plan is called the State Implementation Plan (SIP) which describes and demonstrates how Placer County, as well as the Sacramento nonattainment area, would attain the required federal ozone standard by the

proposed attainment deadline. In accordance with the requirements of the FCAA, the PCAPCD, along with the other air districts in the region, prepared the *Sacramento Regional 8-Hour Ozone Attainment and Reasonable Further Progress Plan* (Ozone Attainment Plan), adopted by the PCAPCD on February 19, 2009. The CARB determined that the Ozone Attainment Plan met federal Clean Air Act requirements and approved the Plan on March 26, 2009 as a revision to the SIP. Revisions to the Placer County portion of the SIP or Ozone Attainment Plan were made and adopted on August 11, 2011. An update to the plan, *2013 Revisions to the Sacramento Regional 8-Hour Ozone Attainment and Reasonable Further Progress Plan* (2013 Ozone Attainment Plan), was adopted on September 26, 2013, and approved by CARB as a revision to the SIP on November 21, 2013. The 2013 Ozone Attainment Plan was approved by the USEPA on January 9, 2015. In addition, another update was prepared in 2017. The *2017 Sacramento Regional 2008 NAAQS 8-Hour Ozone Attainment and Reasonable Further Progress Plan* (2017 Ozone Attainment Plan) demonstrates how the region will attain the 2008 ozone NAAQS, and includes an updated emissions inventory, sets motor vehicle emissions budgets, and documents the modeling used to support the attainment demonstration.

In addition to strengthening the 8-hour ozone NAAQS, the USEPA also strengthened the secondary 8-hour ozone NAAQS, making the secondary standard identical to the primary standard. The SVAB remains classified as a severe nonattainment area for ozone with an attainment deadline of 2027. On October 26, 2015, the USEPA released a final implementation rule for the revised NAAQS for ozone to address the requirements for reasonable further progress, modeling and attainment demonstrations, and reasonably available control measures (RACM) and reasonably available control technology (RACT). On April 30, 2018, the USEPA published designations for areas in attainment/unclassifiable for the 2015 ozone standards. The USEPA identified the portions of Placer County within the SVAB as nonattainment for the 2015 ozone standards.[32]

PCAPCD Rules and Regulations

All projects under the jurisdiction of the PCAPCD are required to comply with all applicable PCAPCD rules and regulations. In addition, PCAPCD permit requirements apply to many commercial activities (e.g., print shops, drycleaners, gasoline stations), and other miscellaneous activities (e.g., demolition of buildings containing asbestos). The proposed project is required to comply with all applicable PCAPCD rules and regulations, which shall be noted on County-approved construction plans. The PCAPCD regulations and rules include, but are not limited to, the following:

Regulation 2 – Prohibitions

Regulation 2 is comprised of prohibitory rules that are written to achieve emission reductions from specific source categories. The rules are applicable to existing sources as well as new sources. Examples of prohibitory rules include Visible Emissions (Rule 202), Nuisance (Rule 205), Cutback and Emulsified Asphalt Paving Materials (Rule 217), Architectural Coatings (Rule 218), Wood Burning Appliances (Rule 225), and Fugitive Dust (Rule 228).

Regulation 5 – Permits

Regulation 5 is intended to provide an orderly procedure for the review of new sources, and modification and operation of existing sources, of air pollution through the issuance of permits.

[32] U.S. Environmental Protection Agency. *Nonattainment and Unclassifiable Area Designations for the 2015 Ozone Standards*. April 30, 2018.

Regulation 5 primarily deals with permitting major emission sources and includes, but is not limited to, rules such as General Permit Requirements (Rule 501), New Source Review (Rule 502), Emission Statement (Rule 503), Emission Reduction Credits (Rule 504), and Toxics New Source Review (Rule 513).

Placer County General Plan

The following goals and policies related to air quality are from the PCGP:

Natural Resources Element

Goal 6.F To protect and improve air quality in Placer County.

Policy 6.F.2 The County shall develop mitigation measures to minimize stationary source and area source emissions.

Policy 6.F.3 The County shall support the Placer County Air Pollution Control District (PCAPCD) in its development of improved ambient air quality monitoring capabilities and the establishment of standards, thresholds, and rules to more adequately address the air quality impacts of new development.

Policy 6.F.4 The County shall solicit and consider comments from local and regional agencies on proposed projects that may affect regional air quality.

Policy 6.F.5 The County shall encourage project proponents to consult early in the planning process with the County regarding the applicability of Countywide indirect and areawide source programs and transportation control measures (TCM) programs. Project review shall also address energy-efficient building and site designs and proper storage, use, and disposal of hazardous materials.

Policy 6.F.6 The County shall require project-level environmental review to include identification of potential air quality impacts and designation of design and other appropriate mitigation measures or offset fees to reduce impacts. The County shall dedicate staff to work with project proponents and other agencies in identifying, ensuring the implementation of, and monitoring the success of mitigation measures.

Policy 6.F.7 The County shall encourage development to be located and designed to minimize direct and indirect air pollutants.

Policy 6.F.8 The County shall submit development proposals to the PCAPCD for review and comment in compliance with CEQA prior to consideration by the appropriate decision-making body.

Policy 6.F.9 In reviewing project applications, the County shall consider alternatives or amendments that reduce emissions of air pollutants.

Policy 6.F.10 The County may require new development projects to submit an air quality analysis for review and approval. Based on this analysis, the County shall require appropriate mitigation measures consistent with the PCAPCD's 1991 Air Quality Attainment Plan (or updated edition).

Policy 6.F.11 The County shall apply the buffer standards described in Part I of this Policy Document and meteorological analyses to provide separation between possible emission/nuisance sources (such as industrial and commercial uses) and residential uses.

Goal 6.G To integrate air quality planning with the land use and transportation planning process.

Policy 6.G.1 The County shall require new development to be planned to result in smooth flowing traffic conditions for major roadways. This includes traffic signals and traffic signal coordination, parallel roadways, and intra- and inter-neighborhood connections where significant reductions in overall emissions can be achieved.

Policy 6.G.2 The County shall continue and, where appropriate, expand the use of synchronized traffic signals on roadways susceptible to emissions improvement through approach control.

Policy 6.G.3 The County shall encourage the use of alternative modes of transportation by incorporating public transit, bicycle, and pedestrian modes in County transportation planning and by requiring new development to provide adequate pedestrian and bikeway facilities.

Policy 6.G.5 The County shall endeavor to secure adequate funding for transit services so that transit is a viable transportation alternative. New development shall pay its fair share of the cost of transit equipment and facilities required to serve new projects.

Policy 6.G.6 The County shall require large new developments to dedicate land for and construct appropriate improvements for park-and-ride lots, if suitably located.

Transportation and Circulation Element

Goal 3.D To provide a safe, comprehensive, and integrated system of facilities for non-motorized transportation.

Policy 3.D.5 The County shall continue to require developers to finance and install pedestrian walkways, equestrian trails, and multi-purpose paths in new development, as appropriate.

Policy 3.D.7 The County shall, where appropriate, require new development to provide sheltered public transit stops, with turnouts.

Policy 3.D.9 Consider Complete Streets infrastructure and design features in street design and construction to create safe and inviting environments for all users consistent with the land uses to be served.

Dry Creek-West Placer Community Plan

The following goals and policies related to air quality are from the DCWPCP:

Community Development Element: The Land Use Plan

Policy 28 Continue to monitor and control existing land uses that could deteriorate air and water quality.

Policy 29 Review Proposed Developments for their potential adverse effect on air and water quality.

Policy 30 Encourage application of measures to mitigate erosion and water pollution from earth disturbing activities such as grading and road construction.

Environmental Resources Management Element: Natural Resources

Goal 8 Recognize that clean air and water are essential resources for maintaining a high quality of living, and ensure that these resources are maintained at acceptable levels.

Policy 11 Recognize clean air as a resource to be protected and improved through project mitigation.

Policy 22 Continue to monitor and control land uses which threaten to deteriorate air and water quality.

Placer County Sustainability Plan

The PCSP, adopted by the Placer County Board of Supervisors on January 28, 2020, includes goals and policies for energy efficiency and the reduction of GHGs.[33] Energy efficiency is specifically addressed in Chapter 9, Energy, of this EIR. The PCSP is a planning document that outlines the programs and policies that are recommended for implementation by the community and the County to achieve the most significant GHG emission reductions in unincorporated County. In addition to reducing GHG emissions, implementation of the PCSP is intended to help achieve multiple community-wide goals, such as lowering energy costs, reducing air and water pollution, supporting local economic development, and improving public health and quality of life within Placer County.

6.4 IMPACTS AND MITIGATION MEASURES

The standards of significance and methodology used to analyze and determine the proposed project's potential project-specific impacts related to air quality and GHG emissions are described below. In addition, a discussion of the project's impacts, as well as mitigation measures where necessary, is also presented.

[33] Placer County. *Placer County Sustainability Plan: A Greenhouse Gas Emission Reduction Plan and Adaptation Strategy*. January 28, 2020.

Standards of Significance

Based on the recommendations of PCAPCD and in coordination with the County, consistent with Appendix G of the CEQA Guidelines, the effects of a project are evaluated to determine if they would result in a significant adverse impact on the environment. For the purposes of this EIR, an impact related to air quality and GHG emissions is considered significant if the proposed project would:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors);
- Expose sensitive receptors to substantial pollutant concentrations (including localized CO concentrations and TAC emissions);
- Result in other emissions (such as those leading to odors) affecting a substantial number of people;
- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or
- Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

Pursuant to CEQA Guidelines Section 15064.4(b)(2), the lead agency is charged with determining a threshold of significance that is applicable to the project. For the analysis within this EIR, the County has elected to use the PCAPCD's thresholds of significance. The analysis in this EIR uses the thresholds for criteria pollutants, localized CO, TAC emissions, and GHG emissions, as discussed below.

Criteria Pollutant Emissions and Toxic Air Contaminant Emissions

In order to evaluate criteria air pollutant emissions from development projects, the PCAPCD has established significance thresholds for emissions of ROG, NO_X, and PM_{10}. The significance thresholds, expressed in pounds per day (lbs/day), serve as air quality standards in the evaluation of air quality impacts associated with proposed development projects. The PCAPCD's recommended thresholds of significance are listed in Table 6-6.

Therefore, if the proposed project's emissions exceed the PCAPCD's pollutant thresholds presented in Table 6-6, the project could have a significant effect on air quality, the attainment of federal and State AAQS, and could conflict with or obstruct implementation of the applicable air quality plan or result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment.

Table 6-6
PCAPCD Thresholds of Significance

Pollutant	Construction Threshold (lbs/day)	Operational/Cumulative Threshold (lbs/day)
ROG	82	55
NO_X	82	55
PM_{10}	82	82

***Source:** Placer County Air Pollution Control District. Placer County Air Pollution Control District Policy. Review of Land Use Projects Under CEQA. October 13, 2016.*

Additionally, the PCAPCD has developed screening criteria for determining whether a project would cause substantial localized CO emissions at a given intersection. If the project would result in CO emissions from vehicle operations in excess of 550 lbs/day and either of the following conditions are met, the project could potentially result in substantial concentrations of localized CO and further analysis would be required:

- Degrade the peak hour level of service (LOS) on one or more streets or at one or more intersections (both signalized and non-signalized) in the project vicinity from an acceptable LOS (i.e., LOS A, B, C, or D) to an unacceptable LOS (i.e., LOS E or F); or
- Substantially worsen (i.e., increase delay by 10 seconds or more when project-generated traffic is included) an already existing unacceptable peak hour LOS on one or more streets or at one or more intersections in the project vicinity.[34]

However, considering that the law has changed with respect to how transportation-related impacts may be addressed under CEQA such that unacceptable LOS is no longer considered a significant impact on the environment under CEQA, this analysis relies on the 550 lbs/day of CO emissions screening criterion only.

For evaluating TAC emissions, if a project would introduce a new source of TAC or a new sensitive receptor near an existing source of TAC that would not meet the CARB's minimum recommended setback, a detailed HRA may be required. The PCAPCD considers an increase in cancer risk levels of more than 10 in one million persons or a non-cancer hazard index greater than 1.0 to be a significant impact related to TACs. The foregoing cancer risk level and non-cancer hazard index are typically applied to individual stationary sources of TACs; however, the PCAPCD does note that the cancer risk and hazard index thresholds may also be applied to activities that are non-stationary, such as diesel delivery trucks and off-road construction equipment.

With regard to other cumulative emissions, such as the cumulative emissions of criteria air pollutants, the PCAPCD directs lead agencies to use the region's existing attainment plans as a basis for analysis of cumulative emissions. If a project would interfere with an adopted attainment plan, the project would inhibit the future attainment of AAQS, and thus result in a significant incremental contribution to cumulative emissions. As discussed throughout this Chapter, the PCAPCD's recommended thresholds of significance for ozone precursors and PM_{10} are based on attainment plans for the region. Thus, the PCAPCD concluded that if a project's ozone precursor and PM_{10} emissions would be less than PCAPCD project-level thresholds, the project would not be expected to conflict with any relevant attainment plans, and would not result in a cumulatively considerable contribution to a significant cumulative impact. As a result, the operational phase cumulative-level emissions thresholds established by PCAPCD are identical to the project-level operational emissions thresholds; the operational/cumulative thresholds are presented in Table 6-6.[35]

Ascertaining cancer risk, or similar measurements of health effects from air pollutants, is very difficult for regional pollutants such as the ozone precursors ROG and NO_X. The challenge was addressed in *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 510, 517-522. In that case, the California Supreme Court held generally that an EIR should "make a reasonable effort to substantively connect a project's air quality impacts to likely health consequences." A possible example of such a connection would be to calculate a project's "impact on the days of

[34] Placer County Air Pollution Control District. *CEQA Air Quality Handbook* [pg. 38]. November 21, 2017.
[35] Placer County Air Pollution Control District. *CEQA Air Quality Handbook* [pg. 40]. November 21, 2017.

nonattainment per year" (*Id*. at pp. 521). However, the court recognized that there might be scientific limitations on an agency's ability to make the connection between air pollutant emissions and public health consequences in a credible fashion, given limitations in technical methodologies (*Id*. at pp. 520-521). Thus, the court acknowledged that another option for an agency preparing an EIR might be "to explain why it was not feasible to provide an analysis that connected the air quality effects to human health consequences" (*Id*. at p. 522).

Here, the PCAPCD is the primary agency responsible for ensuring the health and welfare of sensitive individuals to elevated concentrations of emissions in Placer County. At present, PCAPCD has not provided any methodology to assist local governments in reasonably and accurately assessing the specific connection between mass emissions of ozone precursors (e.g., ROG and NO_X) and other pollutants of concern on a *regional* basis and any specific effects on public health or regional air quality concentrations that might result from such mass emissions.

Ozone concentrations, for instance, depend upon various complex factors, including the presence of sunlight and precursor pollutants, natural topography, nearby structures that cause building downwash, atmospheric stability, and wind patterns. Because of the complexities of predicting ground level ozone concentrations related to the NAAQS and CAAQS, it is not possible to link health risks to the magnitude of emissions exceeding the significance thresholds. To achieve the health-based standards established by the EPA, the air districts prepare air quality management plans that detail regional programs to attain the AAQS. However, if a project within PCACD exceeds the regional significance thresholds, the proposed project could contribute to an increase in health effects in the basin until the attainment standards are met in the SVAB.

Notably, during the litigation process that led to the California Supreme Court decision in *Sierra Club v. County of Fresno*, the San Joaquin Valley Air Pollution Control District (SJVAPCD) submitted an amicus curiae brief that provided scientific context and expert opinion regarding the feasibility of performing regional dispersion modeling for ozone. In the brief, SJVAPCD states that "CEQA does not require an EIR to correlate a project's air quality emissions to specific health impacts, because such an analysis is not reasonably feasible." As SJVAPCD explains (SJVAPCD 2015b [footnotes omitted]):

> Attainment of a particular NAAQS occurs when the concentration of the relevant pollutant remains below a set threshold on a consistent basis throughout a particular region. For example, the San Joaquin Valley attained the 1-hour ozone NAAQS when ozone concentrations remained at or below 0.124 parts per million Valley-wide on 3 or fewer days over a 3-year period. Because the NAAQS are focused on achieving a particular concentration of pollution region-wide, the Air District's tools and plans for attaining the NAAQS are regional in nature.
>
> For instance, the computer models used to simulate and predict an attainment date for the ozone or particulate matter NAAQS in the San Joaquin Valley are based on regional inputs, such as regional inventories of precursor pollutants (NOx, SOx and VOCs) and the atmospheric chemistry and meteorology of the Valley. At a very basic level, the models simulate future ozone or PM levels based on predicted changes in precursor emissions Valley wide. Because the NAAQS are set levels necessary to protect human health, the closer a region is to attaining a particular NAAQS, the lower the human health impact is from that pollutant.
>
> The goal of these modeling exercises is not to determine whether the emissions generated by a particular factory or development project will affect the date that the Valley attains the

> NAAQS. Rather, the Air District's modeling and planning strategy is regional in nature and based on the extent to which all of the emission-generating sources in the Valley (current and future) must be controlled in order to reach attainment.
>
> Accordingly, the Air District has based its thresholds of significance for CEQA purposes on the levels that scientific and factual data demonstrate that the [SJVAB] can accommodate without affecting the attainment date for the NAAQS. The Air District has tied its CEQA significance thresholds to the level at which stationary pollution sources must "offset" their emissions…Thus the CEQA air quality analysis for criteria air pollutants is not really a localized, project-level impact analysis but one of regional cumulative impacts.

The brief explains that the CEQA thresholds of significance are not intended to be applied such that any localized human health impact associated with a project's regional pollutant emissions could be identified. Rather, CEQA thresholds of significance are used to determine whether a project's emissions would obstruct a region's capability of attaining the NAAQS and CAAQS according to the emissions inventory prepared in a SIP, which is then submitted and reviewed by CARB and EPA. This sentiment is corroborated in an additional brief submitted by the South Coast Air Quality Management District in 2015. Based on the expert analyses submitted by such leading air districts, Placer County has concluded that it is not scientifically feasible to predict in a meaningful manner how mass emissions of pollutants of regional concern (e.g., ozone precursors) from a project of the size of the proposed project could lead to specific public health consequences, changes in pollutant concentrations, or changes in the number of days for which the SVAB will be in nonattainment for regional pollutants.

GHG Emissions

Nearly all development projects in the region have the potential to generate air pollutants that may increase global climate change. On October 13, 2016, the PCAPCD adopted GHG emissions thresholds. The thresholds were designed to analyze a project's compliance with applicable State laws including AB 32 and SB 32.[36] As discussed in the PCAPCD's Justification Report for the thresholds, the PCAPCD relied on a review of historical CEQA projects within the County during the 13-year period from 2003 to 2015. The PCAPCD modeled emissions from 688 approved projects for the model year 2020 and used the modeled emissions to determine a reasonable level to establish emissions thresholds. The PCAPCD found that with a threshold of 10,000 MT CO_2e/yr, 11 percent of projects would exceed the threshold, and those projects contribute approximately 82 percent of total GHG emissions of the 688 projects built-out. In addition to modeling past projects within Placer County, the PCAPCD modeled a range of potential future residential and commercial projects to provide additional County-specific evidence in developing the PCAPCD's thresholds.[37]

The GHG thresholds include a bright-line threshold for the construction and operational phases of land use projects and stationary source projects, a screening level threshold for the operational phase of land use projects, and efficiency thresholds for the operational phase of land use projects that result in GHG emissions that fall between the bright-line threshold and the screening level threshold.

The bright-line threshold of 10,000 MTCO_2e/yr represents the level at which a project's GHG emissions would be substantially large enough to contribute to cumulative impacts and mitigation

[36] Placer County Air Pollution Control District. *California Environmental Quality Act Thresholds of Significance: Justification Report*. October 2016.
[37] *Ibid.*

to lessen the emissions would be mandatory. The PCAPCD further recommends use of the 10,000 $MTCO_2e$/yr for analysis of construction-related GHG emissions for land use projects. Any project with GHG emissions below the screening level threshold of 1,100 $MTCO_2e$/yr is considered by the PCAPCD as having a less-than-significant impact related to GHG emissions, and would not conflict with any State or regional GHG emissions reduction goals. Projects that would result in GHG emissions above the 1,100 $MTCO_2e$/yr screening level threshold, but below the bright-line threshold of 10,000 $MTCO_2e$/yr, must result in GHG emissions below the efficiency thresholds in order to be considered to result in a less-than-significant impact related to GHG emissions and not conflict with any State or regional GHG emission reduction goals. The GHG efficiency thresholds, which are in units of $MTCO_2e$/yr per capita or per square foot (sf), are presented in Table 6-7.

Table 6-7
PCAPCD Operational GHG Efficiency Thresholds of Significance

Residential ($MTCO_2e$/capita)		Non-Residential ($MTCO_2e$/1,000 sf)	
Urban	**Rural**	**Urban**	**Rural**
4.5	5.5	26.5	27.3

Source: ***Placer County Air Pollution Control District. Placer County Air Pollution Control District Policy. Review of Land Use Projects Under CEQA. October 13, 2016.***

The PCAPCD directs lead agencies to determine whether a project is considered rural or urban. Because urban development generally exists within the project vicinity, the PCAPCD's urban efficiency threshold of 4.5 $MTCO_2e$/capita is used for further analysis of project-related operational emissions. The urban efficiency metric is more stringent, and, thus, use of the urban efficiency metric presents a conservative analysis.

In accordance with CARB and PCAPCD recommendations, the County, as lead agency, uses the currently adopted PCAPCD GHG thresholds of significance as presented above. Therefore, if the proposed project results in construction GHG emissions in excess of 10,000 $MTCO_2e$/yr, and/or operational GHG emissions in excess of 1,100 $MTCO_2e$/yr and is unable to show that emissions would achieve the efficiency thresholds presented in Table 6-7, the project would be considered to result in a cumulatively considerable contribution to global climate change.

Method of Analysis

The analysis protocol and guidance provided by the PCAPCD's CEQA Air Quality Handbook, including screening criteria and pollutant thresholds of significance, was used to analyze the proposed project's air quality impacts.

The analysis herein considers the development of the proposed 432 residential units and associated improvements, off-site sewer lift station improvement, and the two options by which the applicant could satisfy the project's affordable housing requirements. As discussed within Chapter 3, Project Description, of this EIR, one affordable housing option includes transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the RVSP. This option would involve rezoning the off-site affordable housing parcel to the Residential Multifamily 30 (RM30) zone and an RVSP amendment, which could result in a maximum development potential of 120 affordable income-restricted units. The second option by which the proposed project can meet the County's affordable housing regulations would be through the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots with single-family residential units. Thus, this analysis considers emissions from the off-site affordable housing parcel, as well as the 22 on-site ADUs, in addition to the proposed on-site residences.

With regard to the off-site affordable housing parcel, the project applicant is seeking to rezone the affordable housing parcel to the RM30 zone, which can result in a maximum development potential of 120 affordable income-restricted units. Therefore, this analysis considers the net increase in development that would occur as a result of the off-site affordable housing parcel through a comparative analysis of the approved conditions of the site, which includes development of 3,750 sf of commercial uses and 39 residential units, to the proposed 120-unit affordable housing parcel.

Construction Emissions

The proposed project's short-term construction emissions were estimated using the California Emissions Estimator Model (CalEEMod) version 2022.1.1.30 web-based software, which is a statewide model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify air quality emissions from land use projects. The model applies inherent default values for various land uses, including trip generation rates based on the Institute of Transportation Engineers (ITE) Manual, vehicle mix, trip length, average speed, etc. However, where project-specific data was available, such data was input into the model.

The proposed project is expected to be built in five separate phases as described in Chapter 3, Project Description, of this EIR. However, for conservative analysis purposes, the entire project, including the off-site sewer lift station improvements area, roadway frontage improvements, potential on-site ADUs, and the off-site affordable housing parcel, was assumed to be built out over one phase. While build-out of the off-site affordable housing parcel would not occur as part of the proposed project, even if selected as the option to satisfy the project's affordable housing obligation, construction of such potential future development was included herein for the purpose of providing a conservative analysis. Based on information provided by the project applicant, the following assumptions were made for the construction modeling for the proposed project:

The construction modeling for the proposed project assumed the following:

- Construction would commence in May of 2026;[38]
- Construction would occur over an approximately four-year period;
- The site preparation, grading, paving, and building construction phase timing was adjusted based on project-specific information provided by the applicant; and
- Based on typical construction practices, the architectural coating phase of construction was assumed to begin two weeks after the commencement of the building construction phase and occur over a similar number of days.

The construction modeling for the off-site affordable housing parcel under both approved conditions (3,750 sf of commercial uses and 39 density reserve units) and proposed conditions (120 multi-family residential units) assumed the following:

- Construction would commence in May of 2026;[39]
- Construction would occur over an approximately one-year period; and

[38] It is noted that when the CalEEMod modeling was conducted for this analysis, project construction was anticipated to commence in May 2026. While this is no longer the case, the analysis conducted for this EIR is conservative because construction fleets and electricity generation are becoming more efficient over time due to State regulations; thus, modeling construction at an earlier start date provides a more conservative analysis.

[39] *Ibid.*

- Based on typical construction practices, the architectural coating phase of construction was assumed to begin two weeks after the commencement of the building construction phase and occur over a similar number of days.

The results of the total construction emissions modeling were compared to the standards of significance discussed above in order to determine the associated level of impact. All CalEEMod modeling results are included in Appendix C to this EIR.

Operational Emissions

The proposed project's operational emissions were also estimated using CalEEMod Version 2022. Based on applicant provided information, the proposed project was assumed to be fully operational by the year 2030. The modeling performed for the proposed project included compliance with PCAPCD rules and regulations, as well as with the Building Energy Efficiency Standards Code. The proposed project's compliance with such would be verified as part of the County's building permit application review process. The project-specific trip generation and Vehicle Miles Traveled (VMT) data provided by Kimley-Horn for the proposed project was applied to the project modeling.[40] In addition, the modeling assumed that fireplaces would not be installed in the proposed residences.

The off-site affordable housing parcel, under both the approved (3,750 sf of commercial uses and 39 density reserve units) and proposed (120 multi-family residential units) conditions, was assumed to be fully operational by the year 2027. While build-out and associated operation of the off-site affordable housing parcel would not occur as part of the proposed project, even if selected as the option to satisfy the project's affordable housing obligation, the operation of such potential future development was included herein for the purpose of providing a conservative analysis. The modeling performed for the off-site affordable housing parcel included compliance with PCAPCD rules and regulations, as well as with the Building Energy Efficiency Standards Code. The off-site affordable housing parcel's compliance with such would be verified as part of the County's building permit application review process. The project-specific trip generation and VMT data provided by Kimley-Horn for the off-site affordable housing parcel was applied to the project modeling.[41] In addition, the modeling assumed that fireplaces would not be installed in the proposed residences.

The results of total operational emissions estimations were compared to the standards of significance discussed above in order to determine the associated level of impact. All CalEEMod modeling results are included in Appendix C to this EIR.

Project-Specific Impacts and Mitigation Measures

The following discussion of impacts is based on implementation of the proposed project and the off-site sewer lift station improvements area, as well as the two affordable housing options analyzed throughout this EIR, in comparison with the standards of significance identified above. It should be noted that GHG emissions are inherently cumulative; thus, the discussion of associated GHG impacts is included under the Cumulative Impacts and Mitigation Measures section below.

---

40 Kimley-Horn. *Estia Dry Creek and Placer Creek Residential, Vehicle Miles Traveled (VMT) Analysis Memorandum.* October 3, 2025.

41 *Ibid.*

In most cases, potential environmental impacts associated with the proposed project and the 22 on-site ADUs would not differ. Thus, unless otherwise noted, the below analysis applies to both the proposed project and the on-site ADUs.

6-1 Conflict with or obstruct implementation of the applicable air quality plan during project construction. Based on the analysis below, and with implementation of mitigation for the off-site affordable housing parcel, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and the off-site sewer lift station improvements area, as well as potential future development of the off-site affordable housing parcel which could conflict with or obstruct implementation of the applicable air quality plan during project construction.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

During construction of the proposed project and the off-site sewer lift station improvements area, various types of equipment and vehicles would temporarily operate on the project sites. Construction-related emissions would be generated from construction equipment, vegetation clearing and earth movement activities, construction workers' commute, and construction material hauling for the entire construction period. The aforementioned activities would involve the use of diesel- and gasoline-powered equipment that would generate emissions of criteria pollutants. Project construction activities also represent sources of fugitive dust, which include PM emissions. As construction of the proposed project and the off-site sewer lift station improvements area would generate emissions of criteria air pollutants, including ROG, NO_X, and PM_{10}, intermittently within the sites and in the vicinity of the sites, until all construction has been completed, construction is a potential concern, as the proposed project and off-site sewer lift station improvements area are located in a nonattainment area for ozone and PM.

The estimated unmitigated construction-related emissions associated with the proposed project are presented in Table 6-8. The emissions shown in Table 6-8 also account for construction of the off-site sewer lift station improvements area and the roadway frontage improvements described in Chapter 3, Project Description, of this EIR.

Table 6-8
Maximum Unmitigated Construction Emissions - Proposed Project (lbs/day)

	ROG	NO_X	PM_{10}
Proposed Project Emissions	8.30	29.00	21.00
PCAPCD Significance Threshold	**82.0**	**82.0**	**82.0**
Exceeds Threshold?	**NO**	**NO**	**NO**

Note: Although modeling was conducted for both the proposed project and the proposed project plus the 22 on-site ADUs, the addition of the 22 ADUs would result in a negligible increase in construction-related emissions.

Source: CalEEMod, December 2025. (see Appendix C).

As shown in the table above, the estimated unmitigated construction-related emissions associated with the proposed project and all off-site improvements would be below the applicable PCAPCD thresholds of significance for ROG, NO_X, and PM_{10}.

Construction activity related to implementation of the proposed project and all off-site improvements would be subject to PCAPCD Rule 228. Rule 228 requires projects involving earth-disturbing activities to implement various dust control measures, such as minimizing track-out onto paved public roadways, limiting vehicle travel on unpaved surfaces to 15 miles per hour, and stabilization of storage piles and disturbed areas. Furthermore, standard Placer County conditions of approval for projects within the County include various requirements that would result in additional reductions of emissions related to implementation of the proposed project and all off-site improvements from what has been estimated and presented above in Table 6-8. The County's standard conditions of approval are listed below:

- The applicant shall submit a Dust Control Plan to the Placer County Air Pollution Control District (APCD) when the project area to be disturbed is greater than one acre. The Dust Control Plan shall be submitted to the APCD a minimum of 21 days before construction activity is scheduled to commence. The Dust Control Plan can be submitted online via a fill-in form: http://www.placerair.org/dustcontrolrequirements/dustcontrolform.
- With submittal of the Dust Control Plan, the contractor shall submit to the APCD a comprehensive equipment inventory (e.g., make, model, year, emission rating) of all the heavy-duty off-road equipment (50 horsepower of greater) that will be used in aggregate of 40 or more hours. If any new equipment is added after submission of the inventory, the contractor shall notify the APCD prior to the new equipment being utilized. At least three business days prior to the use of subject heavy-duty off-road equipment, the project representative shall provide the APCD with the anticipated construction timeline including start date, name, and phone number of the property owner, project manager, and on-site foreman.
- With submittal of the equipment inventory, the contractor shall provide a written calculation to the APCD for approval demonstrating that the heavy-duty (> 50 horsepower) off-road vehicles to be used in the construction project, including owned, leased and subcontractor vehicles, will achieve a project-wide fleet-average of 20 percent NO_X reduction and 45 percent particulate reduction comparing with the statewide fleet averages. Acceptable options for reducing emissions may include the use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, and/or other options as they become available. The following link shall be used to calculate compliance with this condition and shall be submitted to the APCD as described above: http://www.airquality.org/businesses/ceqa-land-use-planning/mitigation (click on the current "Construction Mitigation Tool" spreadsheet under Step 1).

Moreover, the County's standard conditions of approval require Grading Plans for the proposed project and all off-site improvements to include the following notes:

- Prior to construction activity, a Dust Control Plan or Asbestos Dust Mitigation Plan shall be submitted to the Placer County Air Pollution Control District (APCD) when

the project area to be disturbed is greater than one acre. The Dust Control Plan shall be submitted to the APCD a minimum of 21 days before construction activity is scheduled to commence. The Dust Control Plan can be submitted online via the fill-in form:
http://www.placerair.org/dustcontrolrequirements/dustcontrolform.

- Construction equipment exhaust emissions shall not exceed the APCD Rule 202 Visible Emissions limitations. Operators of vehicles and equipment found to exceed opacity limits are to be immediately notified by the APCD to cease operations, and the equipment must be repaired within 72 hours.
- Dry mechanical sweeping is prohibited. Watering of a construction site shall be carried out to mitigate visible emissions. (Based on APCD Rule 228 / Section 301).
- The contractor shall not discharge into the atmosphere volatile organic compounds caused by the use or manufacture of Cutback or Emulsified asphalts for paving, road construction or road maintenance unless such manufacture or use complies with the provisions of Rule 217 Cutback and Emulsified Asphalt Paving Materials.
- The contractor shall utilize existing power sources (e.g., power poles) or clean fuel (e.g., gasoline, biodiesel, natural gas) generators rather than temporary diesel power generators.
- During construction, open burning of removed vegetation is only allowed under APCD Rule 304 Land Development Smoke Management. A Placer County Air Pollution Control District permit could be issued for land development burning, if the vegetation removed is for residential development purposes from the property of a single or two family dwelling or when the applicant has provided a demonstration as pursuant to Section 400 of the Rule that there is no practical alternative to burning and that the Air Pollution Control Officer (APCO) has determined that the demonstration has been made. The APCO may weigh the relative impacts of burning on air quality in requiring a more persuasive demonstration for more densely populated regions for a large proposed burn versus a smaller one. In some cases, all of the removed vegetative material shall be either chipped on site or taken to an appropriate recycling site, or if a site is not available, a licensed disposal site. (Based on APCD Rule 304).
- The contractor shall minimize idling time to a maximum of five minutes for all diesel-powered equipment. (Placer County Code Chapter 10, Article 10.14).
- Idling of construction-related equipment and construction-related vehicles shall be minimized within 1,000 feet of any sensitive receptor (i.e., house, hospital, or school).
- The contractor shall suspend all grading operations when fugitive dust exceeds the APCD Rule 228 (Fugitive Dust) limitations. Fugitive dust is not to exceed 40 percent opacity, nor go beyond the property boundary at any time. Lime or other drying agents utilized to dry out wet grading areas shall not exceed APCD Rule 228 limitations. (Based on APCD Rule 228 / section 302 and 401.4).
- The prime contractor shall be responsible for keeping adjacent public thoroughfares clean by keeping dust, silt, mud, dirt and debris from being released or tracked offsite. Wet broom or other methods can be deployed as control and as approved by the individual jurisdiction. (Based on APCD Rule 228 / section 401.5).
- During construction activity, traffic speeds on all unpaved surfaces shall be limited to 15 miles per hour or less unless the road surface and surrounding area is sufficiently stabilized to prevent vehicles and equipment traveling more than 15

miles per hour from emitting dust or visible emissions from crossing the project boundary line. (Based on APCD Rule 228 / section 401.2).

- The contractor shall apply methods such as surface stabilization, the establishment of a vegetative cover, paving, (or use another method to control dust as approved by the individual jurisdiction) to minimize wind-driven dust.
- The contractor shall apply water or use methods to control dust impacts offsite. Construction vehicles leaving the site shall be cleaned to prevent dust, silt, mud, and dirt from being released or tracked off-site. (Based on APCD Rule 228 / section 304).
- The contractor shall suspend all grading operations when wind speeds (including instantaneous gusts) are high enough to result in dust emissions crossing the boundary line, despite the application of dust mitigation measures. (Based on APCD Rule 228 / section 401.6).
- In order to minimize wind driven dust during construction, the prime contractor shall apply methods such as surface stabilization, establishment of a vegetative cover, paving (or use of another method to control dust as approved by Placer County). (Based on APCD Rule 228 / section 402).
- Any device or process that discharges 2 pounds per day or more of air contaminants into the atmosphere, as defined by Health and Safety Code Section 39013, may require an APCD permit. Developers/contractors should contact the APCD prior to construction and obtain any necessary permits prior to the issuance of a Building Permit. (APCD Rule 501).

Off-Site Affordable Housing Parcel

As discussed throughout this EIR, the proposed RVSP amendment and rezone would result in a maximum development potential of 120 affordable income-restricted units within the off-site affordable housing parcel. The existing zoning allows for the development of 3,750 sf of commercial, and 39 density reserve units.

As discussed under Impact 10-1 of the RVSP EIR, construction of the RVSP would result in a significant impact related to the short-term construction emissions of ROG, NO_X, and CO. The RVSP EIR included Mitigation Measures 10-1a and 10-1b, which would reduce fugitive dust emissions, and reduce the emissions of NO_X and PM_{10} from off-road construction equipment. However, the RVSP EIR determined that implementation of Mitigation Measures 10-1a and 10-1b would not reduce construction emissions to below the significance thresholds for ROG, NO_X, and CO. Additionally, Mitigation Measures 10-1c through 10-1e are recommended, which would require construction equipment and vehicles to be maintained, minimize idling time for diesel powered equipment, and restrict the burning of removed vegetation. However, these additional mitigation measures could not be quantified within the RVSP EIR. Therefore, the RVSP EIR concluded that RVSP would result in a significant impact related to short-term emissions of NO_X, CO, and ROG during construction, and a less-than-significant impact for PM_{10} and long-term construction-related emissions.

The estimated unmitigated net increase in construction-related emissions associated with the off-site affordable housing parcel is presented in Table 6-9.

Table 6-9
Maximum Unmitigated Construction Emissions – Off-Site Affordable Housing Parcel (lbs/day)

Scenario	ROG	NO_X	PM_{10}
Approved Conditions (3,750 sf of commercial uses and 39 density reserve units)	3.20	29.20	21.10
Proposed Future Conditions (120 multi-family residential units)	5.87	29.20	21.10
Net Increase	*+2.67*	--	--
Adopted PCAPCD Threshold	**82.0**	**82.0**	**82.0**
Exceed?	**NO**	**NO**	**NO**

Source: CalEEMod, August 2025 (see Appendix C).

In addition, the total maximum unmitigated construction-related emissions associated with the proposed project in combination with the net increase associated with the off-site affordable housing parcel are presented in Table 6-10.

Table 6-10
Total Maximum Unmitigated Construction Emissions - Proposed Project and Off-Site Affordable Housing Parcel (lbs/day)

Scenario	ROG	NO_X	PM_{10}
Proposed Project[1]	7.90	29.00	21.00
Off-Site Affordable Housing Parcel (Net Increase)	2.67	--	--
Combined Emissions	*10.57*	*29.00*	*21.00*
Adopted PCAPCD Threshold	**82.0**	**82.0**	**82.0**
Exceed?	**NO**	**NO**	**NO**

[1] Although modeling was conducted for both the proposed project and the proposed project plus the 22 on-site ADUs, the addition of the 22 ADUs would result in a negligible increase in construction-related emissions.

Source: CalEEMod, August/December 2025 (see Appendix C).

As shown in the tables above, the total maximum unmitigated construction-related emissions associated with the proposed project in combination with the net increase associated with potential future development of the off-site affordable housing parcel would be below the applicable PCAPCD thresholds of significance for ROG, NO_X, and PM_{10}. In addition, even if the total emissions from the off-site affordable housing parcel were added to the emissions from the proposed project's 432 units, the total combined

emissions would be under the applicable PCAPCD thresholds (13.77 lbs/day of ROG, 58.2 lbs/day of NO_X, and 42.1 lbs/day of PM_{10}).

Nonetheless, at such time the off-site affordable housing parcel gets developed, the future developer would be required to implement RVSP EIR Mitigation Measures 10-1a through 10-1e, which have been incorporated into this EIR as Mitigation Measures 6-2(a) through 6-2(e).

Conclusion

Because the proposed project's and the off-site affordable housing parcel's estimated unmitigated construction emissions would be below the applicable PCAPCD thresholds of significance, construction activities associated with the proposed project and all off-site improvements, as well as the potential future development of the off-site affordable housing parcel would not substantially contribute to the PCAPCD's nonattainment status for ozone or PM. Nevertheless, the off-site affordable housing parcel is located within the overall RVSP area for which the RVSP EIR included mitigation measures intended to be implemented by all future development to reduce total construction-related emissions within the RVSP area. Thus, the impact herein is determined to be ***significant*** as a means to incorporate the applicable RVSP mitigation measures into this EIR and ensure the applicable RVSP EIR mitigation measures are implemented for the potential future development of the off-site affordable housing parcel. Therefore, at such time the off-site affordable housing parcel gets developed, implementation of Mitigation Measures 10-1a through 10-1e would be required to ensure a significant impact does not occur. The referenced RVSP mitigation measures are incorporated into this EIR as Mitigation Measures 6-1(a) through 6-1(e) below.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level.

Off-Site Affordable Housing Parcel

6-1(a) *Implement RVSP EIR Mitigation Measure 10-1a:*

The Applicant shall submit to the PCAPCD and receive approval of a Construction Emission/Dust Control Plan prior to groundbreaking. This plan must address the minimum Administrative Requirements found in Sections 300 and 400 of District Rule 228, Fugitive Dust (www.placer.ca.gov/airpollution/airpolut.htm).

The Applicant shall have a pre-construction meeting for grading activities for 20 or more acres to discuss the construction emission/dust control plan with employees and/or contractors and the District is to be invited.

The Applicant shall suspend all grading operations when fugitive dust exceeds District Rule 228 fugitive dust limitations. An Applicant representative, CARB-certified to perform Visible Emissions Evaluations (VEE), shall routinely evaluate compliance with Rule 228. This requirement for a VEE is for projects grading 20 or more acres in size regardless in how many acres are to be disturbed daily.

It is to be noted that fugitive dust is not to exceed 40 percent opacity and not to go beyond the property boundary at any time. If lime or other drying agents are used to dry out wet grading areas, they shall be controlled so as not to exceed District Rule 228 fugitive dust limitations.

6-1(b) *Implement RVSP EIR Mitigation Measure 10-1b:*

The PCAPCD shall be provided with a list of construction equipment and anticipated construction timeline for each project. The prime contractor for each construction project shall submit to the PCAPCD a comprehensive inventory (i.e., make, model, year, emission rating) of all the heavy-duty off-road equipment (50 horsepower of greater) that will be used an aggregate of 40 or more hours for the construction project. The PCAPCD shall be provided with the anticipated construction timeline for each project including start date, and name and phone number of the project manager and onsite foreman. A plan for each project shall be submitted for approval by the PCAPCD demonstrating that the heavy-duty (> 50 horsepower) off-road vehicles to be used in the construction project, including owned, leased and subcontractor vehicles, will achieve a project wide fleet-average 20 percent NO_X reduction and 45 percent particulate reduction compared to the most recent CARB fleet average. The PCAPCD should be contacted for average fleet emission data. Acceptable options for reducing emissions may include use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, aftertreatment products, and/or other options as they become available. During smog season (May through October), the construction period shall be lengthened so as to minimize the number of vehicles and equipment operating at the same time. Contractors can access the Sacramento Metropolitan AQMD's web site to determine if their off-road fleet meets the requirements listed in this measure (http://www.airquality.org/ceqa/Construction_Mitigation_Calculator.xls).

6-1(c) *Implement RVSP EIR Mitigation Measure 10-1c:*

Construction equipment and vehicles shall be maintained for each project. Construction equipment exhaust emissions shall not exceed PCAPCD Rule 202 Visible Emission limitations. Operators of vehicles and equipment found to exceed opacity limits are to be immediately notified and the equipment must be repaired within 72 hours. An Applicant/developer representative (CARB-certified to perform visible emissions evaluations) shall routinely evaluate project related off-road and heavy-duty on-road equipment emissions for compliance with this requirement for projects grading more than 20 acres in size regardless of how many acres are to be disturbed daily.

6-1(d) *Implement RVSP EIR Mitigation Measure 10-1d:*

Idling time for all diesel-powered equipment shall be minimized to 5 minutes.

6-1(e) Implement RVSP EIR Mitigation Measure 10-1e:

For each project, the contract language shall stipulate that contractors shall not engage in open burning of removed vegetation. Vegetative material shall be chipped, delivered to waste to energy facilities, or disposed at an appropriate disposal site.

6-2 Conflict with or obstruct implementation of the applicable air quality plan during project operation. Based on the analysis below, and with implementation of mitigation for the off-site affordable housing parcel, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and the off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could conflict with or obstruct implementation of the applicable air quality plan during project operation.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

The proposed off-site sewer lift station improvements are related to providing additional floodwater storage capacity, and would not result in operational air quality emissions. Therefore, the below discussion focuses on operational emissions associated with the proposed project.

As discussed above, due to the nonattainment designations of the area, the PCAPCD has developed plans to attain the State and federal standards for ozone and particulate matter. The currently applicable air quality plan is the 2017 Ozone Attainment Plan. Adopted PCAPCD rules and regulations, as well as the thresholds of significance, have been developed with the intent to ensure continued attainment of AAQS, or to work towards attainment of AAQS for which the area is currently designated nonattainment, consistent with the applicable air quality plan. Thus, if a project's operational emissions exceed the PCAPCD's mass emission thresholds, a project would be considered to conflict with or obstruct implementation of the PCAPCD's air quality planning efforts.

Operational emissions of ROG, NO_X, and PM_{10} would be generated by the proposed project from both mobile and stationary sources. Day-to-day activities such as future resident vehicle trips to and from the project site would make up the majority of the mobile emissions. As discussed in the Method of Analysis section above, to capture the potential emissions related to mobile sources from the proposed project, the project-specific trip generation rates and VMT estimates prepared by Kimley-Horn were applied to the project modeling. Emissions would also occur from area sources such as architectural coatings, landscape maintenance equipment exhaust, and consumer products (e.g., deodorants, detergents, hair spray, cleaning products, spray paint, insecticides, floor finishes, polishes, etc.).

Estimated unmitigated operational emissions associated with the proposed project are presented in Table 6-11. As shown in the table, the unmitigated operational emissions associated with the proposed project would be below the PCAPCD's thresholds of significance for ROG, NO_X, and PM_{10}.

Table 6-11
Maximum Unmitigated Operational Emissions – Proposed Project (lbs/day)

	ROG	NO_X	PM_{10}
Proposed Project Emissions	33.00	13.00	18.00
PCAPCD Significance Threshold	**55.00**	**55.00**	**82.00**
Exceeds Threshold?	**NO**	**NO**	**NO**

Note: The project emissions shown above include emissions associated with the proposed project and the 22 on-site ADUs.

Sources: CalEEMod, December 2025. (see Appendix C).

Off-Site Affordable Housing Parcel

As discussed under Impact 10-2 of the RVSP EIR, operation of the RVSP would result in a significant impact related to the short-term operational emissions of ROG, NO_X, and PM_{10}, and long-term operational emissions of ROG and PM_{10}. The RVSP EIR included Mitigation Measures 10-2a through 10-2d, which are intended to reduce energy consumption, prohibit open burning, allow only gas-fired appliances, and implement an offsite mitigation program or pay an in-lieu amount into the PCAPCD's Air Quality Mitigation Program. However, the effectiveness of Mitigation Measures 10-2a through 10-2d could not be reliably quantified within the RVSP EIR. Therefore, the RVSP EIR concluded that RVSP would result in a significant impact related to long-term emissions of ROG, NO_X, and PM_{10} during operation.

The estimated unmitigated net increase in operational emissions associated with the potential future development of the off-site affordable housing parcel is presented in Table 6-12.

Table 6-12
Maximum Unmitigated Operational Emissions – Off-Site Affordable Housing Parcel (lbs/day)

Scenario	ROG lbs/day	NO_X lbs/day	PM_{10} lbs/day
Approved Conditions (3,750 sf of commercial uses and 39 density reserve units)	3.39	2.37	3.98
Proposed Conditions (120 multi-family residential units)	7.50	4.42	7.14
Net Increase	*+4.11*	*+2.05*	*+3.16*
Adopted PCAPCD Threshold	**55.00**	**55.00**	**82.00**
Exceed?	**NO**	**NO**	**NO**

Source: CalEEMod, August 2025 (see Appendix C).

In addition, the total maximum unmitigated operational emissions associated with the proposed project in combination with the net increase associated with the potential future development of the off-site affordable housing parcel are presented in Table 6-13.

Table 6-13
Total Maximum Unmitigated Operational Emissions – Proposed Project and Off-Site Affordable Housing Parcel (lbs/day)

Scenario	ROG lbs/day	NO_X lbs/day	PM_{10} lbs/day
Proposed Project	31.00	12.00	17.30
Off-Site Affordable Housing Parcel (Net Increase)	4.11	2.05	3.16
Combined Emissions	*35.21*	*14.15*	*20.19*
Adopted PCAPCD Threshold	**55.00**	**55.00**	**82.00**
Exceed?	**NO**	**NO**	**NO**

Note: The proposed project emissions shown above do not include emissions associated with the 22 on-site ADUs.

Source: CalEEMod, August/December 2025 (see Appendix C).

As shown in the tables above, the combined total unmitigated operational emissions associated with the proposed project and the off-site affordable housing parcel would be below the PCAPCD's thresholds of significance for ROG, NO_X, and PM_{10}. In addition, even if the total operational emissions from the off-site affordable housing parcel were added to the operational emissions from the proposed project's 432 units, the total combined emissions would be under the applicable PCAPCD thresholds (38.5 lbs/day of ROG, 16.42 lbs/day of NO_X, and 24.44 lbs/day of PM_{10}).

Furthermore, at such time the off-site affordable housing parcel gets developed, operations related to such would be required to comply with all applicable PCAPCD regulations listed above, as well as RVSP EIR Mitigation Measures 10-2a, 10-2b, and 10-2d, which have been incorporated into this EIR as Mitigation Measures 6-2(a) through 6-2(c). RVSP EIR Mitigation Measure 10-2c would not be applicable to the off-site affordable housing parcel, as fireplaces are not proposed.

Conclusion

Based on the above, operations of the proposed project and the potential future development of the off-site affordable housing parcel would not violate any AAQS or contribute substantially to an existing or projected air quality violation. Nevertheless, the off-site affordable housing parcel is located within the overall RVSP area for which the RVSP EIR included mitigation measures intended to be implemented by all future development to reduce total operational emissions within the RVSP area. Thus, the impact herein is determined to be ***significant*** as a means to incorporate the applicable RVSP mitigation measures into this EIR and ensure the applicable RVSP EIR mitigation measures are implemented for the off-site affordable housing parcel. Therefore, at such time the off-site affordable housing parcel gets developed, implementation of Mitigation

Measures 10-2a through 10-2d would be required to ensure a significant impact does not occur. The referenced RVSP mitigation measures are incorporated into this EIR as Mitigation Measures 6-2(a) through 6-2(c) below.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level.

Off-Site Affordable Housing Parcel

6-2(a) Implement RVSP EIR Mitigation Measure 10-2a:

The Riolo Vineyards Specific Plan shall incorporate and implement the following measures, or equally effective measures, to reduce energy consumption:

- *Install low-NO_X hot water heaters per PCAPCD Rule 246.*
- *Encourage landscape maintenance companies to use battery-powered or electric equipment for nonresidential maintenance activities, where feasible.*
- *Provide natural gas lines or electrical outlets to all backyards to encourage natural gas or electric barbecues, as well as electric lawn equipment.*
- *Install Class I bicycle lockers along with bike racks in commercial sites.*
- *Encourage landscaping with drought-resistant species, and the use of groundcovers rather than pavement to reduce heat reflection.*
- *Include Energy Star efficient appliances, such as dishwashers, refrigerators, and clothes washers.*
- *Include energy-efficient SunCoat Max window glazings, which have a solar heat gain of 0.27.*
- *Include high-efficiency heating and efficient ventilation methods on all new residential units. Furnaces to be low-NO_X with an AFUE of 80 percent.*
- *Incorporate solar heaters and panels in proposed project residences as feasible.*
- *Include high-efficiency water heaters. The external insulation used should have an R-value of 16 and an efficiency value of 0.62.*
- *Include high efficiency insulation with the following ratings – Ceilings: R-38, 2×6 Walls, 2×4 Walls: R-19, and Ducts: R-6.4.*

Implementation of Mitigation Measure 10-2a will also help reduce atmospheric and greenhouse gas emissions from the Riolo Vineyards project and/or reduce energy consumption, and thus may reduce the project's contribution to the impact of global climate change.

6-2(b) Implement RVSP EIR Mitigation Measure 10-2b:

Open burning of any kind shall be prohibited in the residential, commercial, and recreational parcels of the Riolo Vineyards Specific Plan Area. Open

burning will be allowed on the Agricultural, Agriculture-10, and Rural Residential parcels in accordance with PCAPCD Regulation 3, which requires a burn permit to be issued by the PCAPCD. Open burning creates substantial pollutant emissions of ozone precursors, CO, and PM. Any company employed to maintain landscapes within the Plan Area will be prohibited from open burning of vegetative refuse anywhere in the SVAB. The incorporation of this mitigation measure as part of the by-laws of a homeowners association (e.g., covenants, conditions, and restrictions) would ensure compliance with this future rule, which will be enforced by PCAPCD as a requirement for the County to comply with the ambient air quality standard for $PM_{2.5}$ pollutants. The Applicant proposes additional open-burning restrictions, which state that burning activities shall be limited to vegetation materials (green waste) and conducted within 200 feet of a public street, trail, or park facility. Additionally, open-burning activities shall require a burn permit from the Placer County Air Pollution Control District (APCD) and shall be in compliance with APCD Regulation 3.

6-2(c) *Implement RVSP EIR Mitigation Measure 10-2d:*

Each project shall implement an offsite mitigation program, coordinated through the PCAPCD, to offset the project's long-term ozone precursor emissions. The project offsite mitigation program must be approved by the PCAPCD. The project's offsite mitigation program provides monetary incentives to sources of air pollution within the project's air basin that are not required by law to reduce their emissions. Therefore, the emission reductions are real, quantifiable and implement provisions of the 1994 State Implementation Plan. The offsite mitigation program reduces emissions within the air basin that would not otherwise be eliminated. In lieu of each project implementing its own offsite mitigation program, the Applicant can choose to participate in the PCAPCD Offsite Mitigation Program by paying an equivalent amount of money into the District program. Based on the URBEMIS results in Appendix G2, the per house unit fee is $323 and the multi family per unit fee is $232. This is a one time fee that would be payable at the time of the final map recording.

6-3 Expose sensitive receptors to substantial pollutant concentrations. Based on the analysis below, the impact is *less than significant*.

The major pollutant concentrations of concern are localized CO emissions, TAC emissions, and criteria pollutant emissions. The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel which could result in impacts to sensitive receptors through the exposure to substantial pollutant concentrations of localized CO emissions, TAC emissions, and criteria pollutant emissions.

Localized CO Emissions

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel associated with localized CO emissions.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Localized concentrations of CO are related to the levels of traffic and congestion along streets and at intersections. The proposed off-site sewer lift station improvements are related to providing additional floodwater storage capacity, and would not result in any increased traffic. Therefore, the below discussion focuses on localized concentrations of CO associated with the proposed project.

Implementation of the proposed project would increase traffic volumes on streets near the project site; therefore, the project would be expected to increase local CO concentrations. Concentrations of CO approaching the AAQS are only expected where background levels are high, and traffic volumes and congestion levels are high.

The statewide CO Protocol document identifies signalized intersections operating at LOS E or F, or projects that would result in the worsening of signalized intersections to LOS E or F, as having the potential to result in localized CO concentrations in excess of AAQS, as a result of large numbers of cars idling at stop lights.[42]

As noted previously, the PCAPCD has established screening methodology for localized CO emissions. According to the PCAPCD's screening methodology, if the project would result in vehicle operations producing more than 550 lbs/day of CO emissions, then a potentially significant adverse health impact related to localized CO emissions could occur. According to the modeling performed for the proposed project, operation of the project would result in maximum unmitigated mobile source CO emissions of 89 lbs/day (see Appendix C). Consequently, CO emissions related to mobile sources associated with operation of the proposed project would be below the 550 lbs/day screening threshold used by PCAPCD. Therefore, according to the PCAPCD's screening methodology for localized CO emissions, the proposed project would not be expected to generate localized CO emissions that would contribute to an exceedance of AAQS, and the proposed project would not expose sensitive receptors to substantial concentrations of localized CO.

Off-Site Affordable Housing Parcel

As discussed within Impact 10-3 of the RVSP EIR, the buildout of the RVSP would result in a less-than-significant impact related to CO emissions. The RVSP EIR concluded that the increase in ambient concentrations of CO at nearby intersections were found not to exceed the 1-hour average standard of 20 ppm and/or the 8-hour average standard of 9.0 ppm, which if exceeded would result in a significant impact. Thus, the RVSP EIR concluded that buildout of the RVSP would not expose sensitive receptors to substantial concentrations of localized CO and would result in a less-than-significant impact.

As discussed above, the PCAPCD has established screening methodology for localized CO emissions. The off-site affordable housing parcel would result in a maximum net

[42] University of California, Davis. *Transportation Project-Level Carbon Monoxide Protocol*. December 1997.

increase in mobile source CO emissions of 15.7 lbs/day (see Appendix C). Additionally, the proposed project (without inclusion of the 22 on-site ADUs) would result in maximum unmitigated mobile source CO emissions of 84 lbs/day. Thus, the combined maximum unmitigated mobile source CO emissions associated with the proposed project and the off-site affordable housing parcel would be 99.7 lbs/day. Therefore, the combined CO emissions associated with the proposed project and the off-site affordable housing parcel would be far below the 550 lbs/day screening threshold. As a result, according to the PCAPCD's screening methodology for localized CO emissions, the off-site affordable housing parcel would not be expected to generate localized CO emissions that would contribute to an exceedance of AAQS, and the off-site affordable housing parcel would not expose sensitive receptors to substantial concentrations of localized CO.

TAC Emissions

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel associated with TAC emissions.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

As stated above, if a project would introduce a new source of TACs, a detailed health risk assessment may be required. The PCAPCD considers an increase in cancer risk levels of more than 10 in one million persons or a non-cancer hazard index greater than 1.0 to be a significant impact related to TACs.

The closest sensitive receptors to the project site are existing single-family residences located to the south, west, and east of the project site, the closest of which is approximately 20 feet from the site's eastern boundary. Additionally, the closest sensitive receptors to the off-site sewer lift station improvements area are the existing single-family residences located to the south of the lift station, the closest of which is approximately 30 feet from the site. Thus, activities related to the construction and operation of the proposed project and the off-site sewer lift station improvements area are qualitatively analyzed to determine whether the proposed project would expose nearby sensitive receptors to TAC emissions.

The CARB has identified DPM from diesel-fueled engines as a TAC; thus, high volume freeways, stationary diesel engines, and facilities attracting heavy and constant diesel vehicle traffic are identified as having the highest associated health risks from DPM. Health risks from TACs are a function of both the concentration of emissions and the duration of exposure. Health-related risks associated with DPM in particular are primarily associated with long-term exposure and associated risk of contracting cancer.

Construction-related activities have the potential to generate concentrations of TACs, specifically DPM, from on-road haul trucks and off-road equipment exhaust emissions. The construction period would be temporary and would occur over a relatively short duration in comparison to the operational lifetime of the proposed project. While methodologies for conducting health risk assessments are associated with long-term exposure periods (e.g., over a 30-year period or longer), construction activities associated with the proposed project were estimated to occur over an approximately four-year period. Only portions of the site would be disturbed at any given time throughout the construction

period, with operation of construction equipment occurring intermittently throughout the course of a day rather than continuously at any one location on each site. In addition, all construction equipment and operation thereof would be regulated per the In-Use Off-Road Diesel Vehicle Regulation. The In-Use Off-Road Diesel Vehicle Regulation includes emissions reducing requirements such as limitations on vehicle idling, disclosure, reporting, and labeling requirements for existing vehicles, as well as standards relating to fleet average emissions and the use of Best Available Control Technologies. As discussed above, through standard conditions of approval, Placer County requires off-road equipment used within the County to achieve lower than State-average emissions of NO_X and PM. Thus, on-site emissions of PM would be reduced, which would result in a proportional reduction in DPM emissions and exposure of nearby residences to DPM. Project construction would also be required to comply with all applicable PCAPCD rules and regulations, including Rule 501 related to General Permit Requirements.

Considering the intermittent nature of construction equipment operating within an influential distance to the nearest sensitive receptors, the duration of construction activities in comparison to the operational lifetime of the proposed project, the typical long-term exposure periods associated with conducting health risk assessments, and compliance with regulations, the likelihood that any one nearby sensitive receptor would be exposed to high concentrations of DPM for any extended period of time would be low.

Furthermore, as discussed above, the proposed project's and the off-site sewer lift station improvements area's construction-related emissions would be below the applicable mass emissions thresholds of significance for PM_{10}, which includes DPM and fugitive dust related to construction. The PCAPCD's Handbook advises that if construction-related emissions have been quantified and are below the thresholds of significance, the proposed project would result in a less-than-significant impact regarding PM emissions.[43] Considering that PM_{10} emissions, which include emissions of DPM, would be below the PCAPCD's thresholds of significance, construction of the proposed project and the off-site sewer lift station improvements area would not be expected to generate substantial DPM emissions such that an increase in cancer risk levels of more than 10 in one million persons or a non-cancer hazard index greater than 1.0 would occur. Therefore, the proposed project and the off-site sewer lift station improvements area would not expose sensitive receptors to substantial concentrations of DPM during construction.

Operational-related emissions of TACs are typically associated with stationary diesel engines or land uses that involve heavy truck traffic or idling. The proposed residences would not involve long-term or frequent operations of any stationary diesel engines.

J.R. Davis Rail Yard

As discussed above, the Union Pacific J.R. Davis rail yard, located in Roseville, California, is approximately three miles northwest of the project site. In 2004, the CARB and PCAPCD conducted an HRA to determine the potential public health risks from DPM emissions due to locomotive activity at the rail yard, and in 2009, the PCAPCD summarized findings from ongoing monitoring of the rail yard. Considering the proposed project's proximity to the rail yard, the conclusions of the 2004 rail yard study, and the 2009 summary of findings, the project site is anticipated to be within an area of increased cancer risk due to rail yard related DPM. Because the proposed project is a residential development, future residents

[43] Placer County Air Pollution Control District. *CEQA Air Quality Handbook* [pg. 31 and 32]. November 21, 2017.

of the project may be exposed to increased cancer risk related to DPM from rail yard activity.

In 2013, in response to a Court of Appeal opinion entitled, *California Building Industry Association v. Bay Area Air Quality Management District* (2013) 218 Cal.App.4th 1171, the California Supreme Court granted limited review to the question: Under what circumstances, if any, does CEQA require an analysis of how existing environmental conditions will impact future residents or users (receptors) of a proposed project? The question specifically concerned the applicability of thresholds promulgated by the Bay Area Air Quality Management District (BAAQMD), some of which related to exposure of sensitive receptors to existing TAC emissions. In its opinion published on December 17, 2015, entitled *California Building Industry Assn. v. Bay Area Air Quality Management Dist.* (2015) 62 Cal.4th 369, 377-378, the Supreme Court held that "agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents. But when a proposed project risks exacerbating those environmental hazards or conditions that already exist, an agency must analyze the potential impact of such hazards on future residents or users. In those specific instances, it is the *project's* impact on the environment—and not the *environment's* impact on the project—that compels an evaluation of how future residents or users could be affected by exacerbated conditions." (Original italics.) It is therefore appropriate to evaluate a project's potentially significant *exacerbating* effects on existing environmental hazards – effects that arise because the project brings "development and people into the area affected." (*Id*. at p. 388.) The Supreme Court stated that even in those specific instances where evaluation of a project's potentially significant exacerbating effects on existing environmental hazards is appropriate, the evaluation of how future residents or users could be affected by the exacerbated conditions is still compelled by the project's impact on the environment, for instance the project's emission of TACs, and not the environment's impact on the project, such as the exposure of proposed receptors to existing off-site TAC emissions.

Considering the court ruling, while the future residents of the proposed project would be considered sensitive receptors, consideration of potential impacts from existing sources of TACs, such as the existing rail yard, would only be justified if the proposed project would exacerbate existing hazardous conditions. The proposed project involves a residential development that would operate separately from the rail yard and would not have an effect on rail yard operations or rail yard related DPM emissions. In addition, while operation of the proposed project would include on-site deliveries, which could involve the use of diesel-powered delivery vehicles, depending on the vendor's fleet, the number of deliveries that would occur on-site would not be substantial such that DPM emissions would significantly increase in the project area. Most delivery companies operate a varied fleet including multiple size options and alternative fuel vehicles. Therefore, only a portion of delivery vehicles would be diesel-powered. Delivery vehicle fleets are also becoming increasingly more efficient, as companies are transitioning from traditional diesel-powered delivery vehicles to alternative-fueled or electric delivery vehicles.

Similarly, while residents have the potential to drive diesel-powered passenger vehicles and trucks, based on typical fleet mix data for the project area,[44] only a small percentage of passenger vehicles and trucks run on diesel fuel. Therefore, the assumption can be

[44] California Air Resources Board. *Emission Factor (EMFAC) 2025 – Emissions Inventory Software*. Available at: https://arb.ca.gov/emfac/emissions-inventory. Accessed December 2025.

made that the portion of on-site residents driving diesel-powered vehicles would not be a substantial amount such that DPM emissions would significantly increase in the project area.

While on-site construction-related activities have the potential to generate concentrations of TACs, specifically DPM, from on-road haul trucks and off-road equipment exhaust emissions, the construction period would be temporary and would occur over a relatively short duration in comparison to the operational lifetime of the proposed project and the off-site sewer lift station improvements area. Moreover, methodologies for conducting health risk assessments are associated with long-term exposure periods (e.g., over a 30-year period or longer) and construction activities associated with the proposed project and the off-site sewer lift station improvements area were estimated to occur over an approximately four-year period. Considering the duration of construction activities in comparison to the operational lifetime of the project and the typical long-term exposure periods associated with conducting health risk assessments, construction associated with the proposed project and the off-site sewer lift station improvements area is not anticipated to result in a substantial increase in DPM emissions in the project area.

Based on the above, the proposed project and the off-site sewer lift station improvements area would not be considered to exacerbate an existing hazardous condition, and further analysis of potential impacts related to DPM exposure of future residents is not warranted.

Also relevant in this context are considerations drawn in the CARB Handbook, which lists rail yards as a source category associated with emissions of TACs and, specifically, DPM. The CARB Handbook also provides advisory recommendations for siting sensitive receptors near such source categories in order to avoid health risks. The project site is located over 15,000 feet northwest of the J.R. Davis rail yard and, thus, would comply with the CARB's recommended 1,000-foot buffer distance between rail yards and sensitive land uses.[45]

Off-Site Affordable Housing Parcel

As discussed within Impact 10-5 of the RVSP EIR, the buildout of the RVSP would result in a less-than-significant impact related to the exposure of nearby sensitive receptors to TACs. The CARB off-road equipment regulations and mitigation measures identified for Impact 10-1 would reduce DPM from construction. During operation, CARB recommends sensitive receptors should not be sited within 500 feet of a freeway or urban roads with 100,000 vehicles per day. Watt Avenue, the most travelled road in the Plan vicinity, receives approximately 68,000 vehicles/day. Thus, the RVSP EIR concluded that buildout of the RVSP would result in a less-than-significant impact related to the exposure of nearby sensitive receptors to TACs.

The construction activities associated with potential future development of the off-site affordable housing parcel were estimated to occur over a one-year period. Only portions of the parcel would be disturbed at any given time throughout the construction period, with operation of construction equipment occurring intermittently throughout the course of a day rather than continuously at any one location on each site. Additionally, the potential future construction of the off-site affordable housing parcel would be subject to all rules, regulations, and Best Available Control Technologies listed above. Therefore, the

[45] California Air Resources Board. *Air Quality and Land Use Handbook: A Community Health Perspective*. April 2005.

likelihood that any one nearby sensitive receptor would be exposed to high concentrations of DPM for any extended period of time would be low.

As discussed above, the PCAPCD's Handbook advises that if construction-related emissions have been quantified and are below the thresholds of significance, the proposed project would result in a less-than-significant impact regarding PM emissions. The proposed off-site affordable housing parcel would result in PM_{10} emissions below the PCAPCD's threshold of significance. Therefore, the off-site affordable housing parcel would not be expected to generate substantial DPM emissions such that an increase in cancer risk levels of more than 10 in one million persons or a non-cancer hazard index greater than 1.0 would occur.

Additionally, the off-site affordable housing parcel would not involve long-term or frequent operations of any stationary diesel engines and would not involve heavy truck traffic or idling.

The Union Pacific J.R. Davis rail yard, located in Roseville, California, is approximately four miles west of the off-site affordable housing parcel. Similar to the proposed project, the off-site affordable housing parcel would not be considered to exacerbate an existing hazardous condition, and further analysis of potential impacts related to DPM exposure of future residents is not warranted. In addition, the off-site affordable housing parcel is located over 21,000 feet west of the J.R. Davis rail yard and, thus, would comply with the CARB's recommended 1,000-foot buffer distance between rail yards and sensitive land uses.[46]

Naturally Occurring Asbestos

According to the *Special Report 190: Relative Likelihood for the Presence of Naturally Occurring Asbestos in Placer County, California*, prepared by the Department of Conservation, neither the project site nor off-site affordable housing parcel is located near a fault zone, additionally, the general area containing both sites is categorized as least likely to contain NOA, because serpentinite outcroppings are not known to exist in the project area.[47] Consequently, NOA is not anticipated to be present on either site.

Criteria Pollutants

The following discussion includes an analysis of potential impacts related to development of the proposed project, off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel associated with criteria pollutant emissions.

Proposed Project, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

As noted in Table 6-1, exposure to criteria air pollutants can result in adverse health effects. The AAQS presented in Table 6-2 are health-based standards designed to ensure safe levels of criteria pollutants that avoid specific adverse health effects. Because the SVAB is designated as nonattainment for State and federal eight-hour ozone and State

[46] California Air Resources Board. *Air Quality and Land Use Handbook: A Community Health Perspective*. April 2005.
[47] California Department of Conservation, California Geological Survey. *Special Report 190: Relative Likelihood for the Presence of Naturally Occurring Asbestos in Placer County, California*. Published 2006.

PM_{10} standards, the PCAPCD, along with other air districts in the SVAB region, has adopted federal and state attainment plans to demonstrate progress towards attainment of the AAQS. Full implementation of the attainment plans would ensure that the AAQS are attained and sensitive receptors within the SVAB are not exposed to excess concentrations of criteria pollutants. The PCAPCD's thresholds of significance were established with consideration given to the health-based air quality standards established by the AAQS, and are designed to aid the district in implementing the applicable attainment plans to achieve attainment of the AAQS.[48] Thus, if a project's criteria pollutant emissions exceed the PCAPCD's mass emission thresholds of significance, a project would be considered to conflict with or obstruct implementation of the PCAPCD's air quality planning efforts, thereby delaying attainment of the AAQS. Because the AAQSs are representative of safe levels that avoid specific adverse health effects, a project's hinderance of attainment of the AAQS could be considered to contribute towards regional health effects associated with the existing nonattainment status of ozone and PM_{10} standards.

However, as discussed in Impacts 6-1 and 6-2, the proposed project and the off-site affordable housing parcel would not result in emissions that exceed the PCAPCD's thresholds of significance. Consequently, implementation of the proposed project and the off-site affordable housing parcel would not conflict with the PCAPCD's adopted attainment plans nor would the proposed project and the off-site affordable housing parcel inhibit attainment of regional AAQS. Therefore, implementation of the proposed project and the potential future development of the off-site affordable housing parcel would not contribute towards regional health effects associated with the existing nonattainment status of ozone and PM_{10} standards.

Conclusion

Based on the above analysis, the proposed land uses would not be anticipated to result in the production of substantial concentrations of pollutants such as TACs (including DPM), localized CO, or criteria pollutants. In addition, the likelihood of NOA being present on each site is low. Therefore, the proposed project and the potential future development of the off-site affordable housing parcel would not result in the exposure of sensitive receptors to substantial pollutant concentrations, and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

6-4 Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people. Based on the analysis below, the impact is *less than significant*.

Emissions of pollutants have the potential to adversely affect sensitive receptors within the project area. Pollutants of principal concern include emissions leading to odors, visible emissions (including dust), or emissions considered to constitute air pollutants. Air pollutants have been discussed in Impacts 6-1 through 6-3 above. Therefore, the following discussion focuses on emissions of odors and visible emissions.

[48] Placer County Air Pollution Control District. *CEQA Air Quality Handbook* [pg. 20]. November 21, 2017.

Odors

The following discussion includes an analysis of potential odor-related impacts associated with development of the proposed project and the off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Odors are generally regarded as an annoyance rather than a health hazard. Due to the subjective nature of odor impacts, the number of variables that can influence the potential for an odor impact, and the variety of odor sources, quantitative methodologies to determine the presence of a significant odor impact are difficult. Certain land uses such as wastewater treatment and conveyance facilities, landfills, confined animal facilities, composting operations, food manufacturing plants, refineries, and chemical plants have the potential to generate considerable odors. Operations of the proposed residential units would not introduce any such activities. The proposed off-site sewer lift station improvements would be limited to constructing additional underground emergency wastewater storage and would not generate additional odors.

The Dry Creek WWTP, which is a land use type associated with the potential to generate odors, is located to approximately two miles to the west of the proposed project. However, impacts of the existing environment on the proposed project is outside the purview of CEQA.[49] Nonetheless, a brief discussion is provided herein for informational purposes. The closest proposed residence would be sited over two miles away from the nearest water treatment pond. Additionally, the prevailing wind direction in the project area is from the south. Therefore, any odors associated with the Dry Creek WWTP would usually be directed in the north/northeast direction, and away from the project site.

Since the 1990s, the WWTP has undergone a number of plant improvements that have increased operating efficiencies, increased treatment levels, and reduced most latent odors. Such improvements included covering new primaries, odor-controlled headworks, new secondary clarifiers, a digester, and enclosed generators and blowers. Converting chlorine disinfection to ultraviolet (UV) disinfection and replacing the influent pumping structure further reduced odor and improved safety. Most treatment processes occur indoors or in other facilities that attenuate odor and noise. An in-ground biofilter and chemical scrubber abate odor by collecting and treating odor from the plant headworks and primary clarifier area. In addition, the City is designing and constructing a replacement odor system on the primary sedimentation basin to rehabilitate aging infrastructure and further reduce odors. Design of the improvements is underway, and construction is currently anticipated to commence in autumn or winter of 2026. Due to the proposed project's distance from the Dry Creek WWTP and the plant improvements to the WWTP, residents of the proposed project are unlikely to be exposed to substantial odors.

Diesel fumes from construction equipment are often found to be objectionable; however, construction is temporary, and operation of equipment is regulated by federal, State, and local standards, including PCAPCD rules and regulations. Buildout of the proposed project would involve construction activity in different areas of each site throughout the construction period. Therefore, construction equipment would operate at varying distances from existing sensitive receptors, and potential odors from such equipment

[49] See *Ballona Wetlands Land Trust v. City of Los Angeles,* [2011] 201 Cal.App.4th 455, 473.

would not expose any single receptor to odors for a substantial period of time. Furthermore, construction activity would be restricted to certain hours of the day per the Placer County Code, Section 9.36.030(A)(7), which would limit the times of day during which construction related odors would potentially be emitted. Development of the proposed project would be required to comply with all applicable PCAPCD rules and regulations, which would help to control construction-related odorous emissions. Due to the temporary duration of construction and the regulated nature of construction equipment, project-related construction activity would not be anticipated to result in the creation of substantial odors.

In addition, PCAPCD Rule 205, Nuisance, addresses the exposure of "nuisance or annoyance" air contaminant discharges, which would include odors, and provides enforcement of nuisance control. Rule 205 is complaint-based, where if public complaints are sufficient to cause the emission source to be considered a public nuisance, then the PCAPCD is required to investigate the identified source, as well as determine and ensure a solution for the source of the complaint, which could include operational modifications to correct the nuisance condition. Thus, although not anticipated, if odor complaints are made during project construction or operations, the PCAPCD would be required (per PCAPCD Rule 205) to ensure that such complaints are addressed and mitigated, as necessary.

Considering the above, construction equipment would be unlikely to result in the creation of substantial odors. Consequently, implementation of the proposed project would not be anticipated to result in a significant impact related to the emission of compounds, such as those leading to odors.

Off-Site Affordable Housing Parcel

As discussed under Impact 10-4 of the RVSP EIR, buildout of the RVSP would result in a less-than-significant impact related to the exposure of nearby sensitive receptors to odor. The buildout of the RVSP would not involve or construct sources, such as wastewater treatment plants, composting facilities, chemical plants, and other similar facilities and the Plan Area would not be located within a mile of sources which would emit objectionable odors. Therefore, the RVSP EIR concluded that RVSP would result in a less-than-significant impact related to the exposure of nearby sensitive receptors to odor.

Operations of the off-site affordable housing units would not introduce any odiferous land uses. Additionally, while the off-site affordable housing parcel would be located approximately four miles from Dry Creek WWTP, due to the parcel's distance from the Dry Creek WWTP, residents of the off-site affordable housing parcel are unlikely to be exposed to substantial odors.

Additionally, construction activities associated with the potential future development of the off-site affordable housing parcel would be regulated by federal, State, and local standards, including PCAPCD rules and regulations, such as PCAPCD Rule 205, and would be restricted to certain hours of the day per the Placer County Code, Section 9.36.030(A)(7). Thus, similar to the proposed project, construction activity associated with the potential future development of the off-site affordable housing parcel would not be anticipated to result in the creation of substantial odors. Consequently, implementation of the off-site affordable housing parcel would not be anticipated to result in a significant impact related to the emission of compounds, such as those leading to odors.

Visible Emissions

The following discussion includes an analysis of potential visible emissions-related impacts associated with development of the proposed project, the off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel.

Proposed Project, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

As defined in PCAPCD Rule 202, visible emissions may be smoke, dust, or any other substance that obscures an observer's view based on standardized scales of opacity. Visible emissions may result from the use of internal combustion engines, such as smoke from diesel fueled equipment, the burning of vegetation, or the upset and release of soil as dust.

PCAPCD Rule 202 specifically prohibits any person from discharging visible emissions of any air contaminant for a period or periods aggregating to more than three minutes in any one-hour time. Operation of the proposed land uses would not be anticipated to result in any visible emissions that would have the potential of violating Rule 202. Construction equipment on-site would be required to meet the visible emissions standards of Rule 202, and, considering the regulated nature of construction equipment, as well as the temporary use of such equipment on-site, would not be anticipated to result in substantial visible emissions. Additionally, PCAPCD Rule 228 requires implementation of dust control measures, such as minimizing track-out on to paved public roadways, limiting vehicle travel on unpaved surfaces to 15 miles per hour, and stabilization of storage piles and disturbed areas. Following project construction, vehicles operating within the project sites would be limited to paved areas of the site, which would not have the potential to create substantial dust emissions.

Considering the above, implementation of the proposed project and the off-site affordable housing parcel would not be anticipated to result in substantial visible emissions during project construction or operations.

Conclusion

For the aforementioned reasons, the proposed project and the off-site affordable housing parcel would not result in emissions of other pollutants (such as those leading to odors) that could adversely affect a substantial number of people. Accordingly, implementation of the proposed project and potential future development of the off-site affordable housing parcel would result in a ***less-than-significant*** impact.

Mitigation Measure(s)

None required.

Cumulative Impacts and Mitigation Measures

As defined in Section 15355 of the CEQA Guidelines, "cumulative impacts" refers to two or more individual effects which, when considered together, are considerable, compound, or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects.

A project's emissions may be individually limited, but cumulatively considerable when taken in combination with past, present, and future development projects. The geographic context for the cumulative air quality analysis includes Placer County and surrounding areas within the portion of the SVAB that is designated nonattainment for ozone and PM_{10}.

As mentioned above, global climate change is, by nature, a cumulative impact. Emissions of GHG contribute, on a cumulative basis, to the significant adverse environmental impacts of global climate change (e.g., sea level rise, impacts to water supply and water quality, public health impacts, impacts to ecosystems, impacts to agriculture, and other environmental impacts). A single project could not generate enough GHG emissions to contribute noticeably to a change in the global average temperature. However, the combination of GHG emissions from a project in combination with other past, present, and future projects could contribute substantially to the world-wide phenomenon of global climate change and the associated environmental impacts. Although the geographical context for global climate change is the Earth, for analysis purposes under CEQA, and due to the regulatory context pertaining to GHG emissions and global climate change applicable to the proposed project, the geographical context for global climate change in this EIR is limited to the State of California.

6-5 Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors). Based on the analysis below, and with implementation of mitigation for the off-site affordable housing parcel, the project's incremental contribution to the significant cumulative impact is *less than cumulatively considerable*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and the off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or State ambient air quality standard.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

The proposed project is within a nonattainment area for ozone and PM_{10}. By nature, air pollution is largely a cumulative impact. The population growth and vehicle usage within the nonattainment area from the proposed project, in combination with other past, present, and reasonably foreseeable projects within Placer County and surrounding areas, contributes to the region's adverse air quality impacts on a cumulative basis, and could either delay attainment of AAQS or require the adoption of additional controls on existing and future air pollution sources to offset emission increases. Thus, the project's emissions of criteria air pollutants would contribute to cumulative regional air quality effects.

As noted in the Standards of Significance section above, the PCAPCD directs lead agencies to use the region's existing attainment plans as a basis for analysis of cumulative emissions. A project's interference with such plans may be determined through the use of the PCAPCD's recommended thresholds of significance for ozone precursors and PM_{10}.

The PCAPCD's recommended cumulative thresholds are identical to the operational thresholds, both of which are presented in Table 6-6. Accordingly, if the project would result in an increase of ROG, NO_X or PM_{10} in excess of PCAPCD's operational phase cumulative-level emissions thresholds, which are identical to PCAPCD's project-level operational emissions thresholds, the project could potentially result in a significant incremental contribution towards cumulative air quality impacts.

As discussed under Impact 6-2 and demonstrated in Table 6-11, operational criteria pollutant emissions associated with the proposed project would be below the applicable PCAPCD thresholds of significance.

Off-Site Affordable Housing Parcel

As described within Impact 10-6 within the RVSP EIR, construction emissions for PM_{10}, NO_X, ROG, and CO would exceed the PCAPCD's thresholds of significance. Additionally, emissions of ROG during operation, resulting from new vehicle trips and area sources, were estimated to exceed PCAPCD's thresholds of significance. As such the RVSP included Mitigation Measure 10-6a, which would incorporate Mitigation Measures 10-1a through 10-1e and 10-2a through 10-2d, as described above. However, even with the implementation of Mitigation Measure 10-6a, the RVSP EIR concluded that buildout of the RVSP would exceed the PCAPCD's significance thresholds and a significant and unavoidable impact would occur. The Placer County Board of Supervisors adopted Findings of Fact and a Statement of Overriding Considerations for the significant and unavoidable impacts associated with the RVSP.

Although future potential development of 120 affordable income-restricted units on the off-site affordable housing parcel would result in a net increase in operational criteria pollutant emissions as compared to the approved conditions (see Table 6-12), the total emissions associated with potential future development of the off-site affordable housing parcel, as well as the net increase in emissions as compared to the approved conditions, would remain below the PCAPCD's thresholds of significance for operational criteria pollutant emissions. In addition, as noted above, even if the total emissions from the off-site affordable housing parcel were added to the proposed project's 432 units, the resulting emissions would be below the applicable PCAPCD thresholds. Therefore, future potential development of 120 affordable income-restricted units on the off-site affordable housing parcel would not result in a new significant environmental effect or a substantial increase in the severity of a previously identified significant effect beyond what was previously anticipated within the RVSP EIR.

Furthermore, at such time the off-site affordable housing parcel gets developed, RVSP EIR Mitigation Measure 10-6a, which has been incorporated into this EIR as Mitigation Measure 6-5, would be required.

Conclusion

Therefore, implementation of the proposed project and the off-site affordable housing parcel would not result in a significant incremental contribution to a cumulative violation of any air quality standards, contribute substantially to an existing or projected air quality violation, or conflict with and/or obstruct implementation of the PCAPCD's air quality planning efforts. Nevertheless, the off-site affordable housing parcel is located within the overall RVSP area for which the RVSP EIR included mitigation measures intended to be

implemented by all future development to reduce total operational emissions within the RVSP area. Thus, the impact herein is determined to be ***cumulatively considerable*** as a means to incorporate the applicable RVSP mitigation measures into this EIR and ensure the applicable RVSP EIR mitigation measures are implemented for the potential future development of the off-site affordable housing parcel. Therefore, at such time the off-site affordable housing parcel gets developed, implementation of Mitigation Measure 10-6a of the RVSP EIR would be required to ensure a cumulatively considerable incremental contribution to the significant cumulative impact does not occur. The referenced RVSP mitigation measure is incorporated into this EIR as Mitigation Measure 6-5 below.

Mitigation Measure(s)

Implementation of the following mitigation measure would reduce the above potential impact to a *less-than-cumulatively considerable* level.

Off-Site Affordable Housing Parcel

6-5 Implement RVSP EIR Mitigation Measure 10-6a:

Implement the following mitigation measures:

- *Mitigation Measure 10-1a [incorporated as Mitigation Measure 6-1(a) of this EIR] (Prepare and implement emission control/dust control measures);*
- *Mitigation Measure 10-1b [incorporated as Mitigation Measure 6-1(b) of this EIR] (Provide PCAPCD with a list of construction equipment and anticipated construction timeline);*
- *Mitigation Measure 10-1c [incorporated as Mitigation Measure 6-1(c) of this EIR] (Maintain construction equipment and vehicles);*
- *Mitigation Measure 10-1d [incorporated as Mitigation Measure 6-1(d) of this EIR] (Minimize idling time for diesel-power equipment);*
- *Mitigation Measure 10-1e [incorporated as Mitigation Measure 6-1(e) of this EIR] (No open burning of removed vegetation);*
- *Mitigation Measure 10-2a [incorporated as Mitigation Measure 6-2(a) of this EIR] (Implement measures to reduce energy consumption);*
- *Mitigation Measure 10-2b [incorporated as Mitigation Measure 6-2(b) of this EIR] (Prohibit open burning); and*
- *Mitigation Measure 10-2d [incorporated as Mitigation Measure 6-2(c) of this EIR] (Implement offsite mitigation programs or pay an in-lieu amount into the Placer County Air Pollution Control District's Air Quality Mitigation Program).*

The complete descriptions of these mitigation measures are provided above.

6-6 Generation of GHG emissions that may have a significant impact on the environment or conflict with an applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs. Based on the analysis below, and with implementation of mitigation for the off-site affordable housing parcel, the project's incremental contribution to the significant cumulative impact is *less than cumulatively considerable*.

Buildout of the proposed project, off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel would contribute to increases of GHG emissions that are associated with global climate change during construction and operation, as discussed in further detail below.

Construction GHG Emissions

The following discussion includes an analysis of potential impacts related to development of the proposed project and the off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could result in a generation of GHG emissions that may have a significant impact on the environment or conflict with an applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs during construction.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

The estimated unmitigated maximum construction-related GHG emissions from the proposed project and the off-site sewer lift station improvements area are presented in Table 6-14.

Table 6-14
Maximum Unmitigated Construction GHG Emissions – Proposed Project

Proposed Project ($MTCO_2e$/yr)	Threshold of Significance ($MTCO_2e$/yr)	Exceeds Threshold?
809	10,000	**NO**

Note: Although modeling was conducted for both the proposed project and the proposed project plus the 22 on-site ADUs, the addition of the 22 ADUs would result in a negligible increase in construction-related GHG emissions.

Source: CalEEMod, December 2025. (see Appendix C).

As shown in the table, the maximum construction-related GHG emissions associated with the proposed project and the off-site sewer lift station improvements area would be well below the PCAPCD's bright-line threshold of 10,000 $MTCO_2e$/yr.

Off-Site Affordable Housing Parcel

The RVSP EIR did not include a discussion regarding construction-related GHG emissions. The estimated unmitigated net increase in construction-related GHG emissions associated with the off-site affordable housing parcel are presented in Table 6-15.

Table 6-15
Maximum Unmitigated Construction GHG Emissions – Off-Site Affordable Housing Parcel

Scenario	Project GHG Emissions ($MTCO_2e$/yr)
Approved Conditions (3,750 sf commercial uses and 39 density reserve units)	232
Proposed Conditions (120 multi-family residential units)	292
Net Increase	*+60*
Adopted PCAPCD Threshold	**10,000**
Exceed?	**NO**

Source: CalEEMod, August 2025 (see Appendix C).

In addition, the total maximum unmitigated construction-related GHG emissions associated with the proposed project in combination with the net increase associated with the off-site affordable housing parcel are presented in Table 6-16.

Table 6-16
Total Maximum Unmitigated Construction GHG Emissions – Proposed Project and Off-Site Affordable Housing Parcel

Scenario	Project GHG Emissions ($MTCO_2e$/yr)
Proposed Project[1]	790
Off-Site Affordable Housing Parcel (Net Increase)	60
Combined Emissions	*850*
Adopted PCAPCD Threshold	**10,000**
Exceed?	**NO**

[1] Although modeling was conducted for both the proposed project and the proposed project plus the 22 on-site ADUs, the addition of the 22 ADUs would result in a negligible increase in construction-related GHG emissions.

Source: CalEEMod, August/December 2025 (see Appendix C).

As shown in the table, the total maximum construction-related GHG emissions associated with the proposed project in combination with the net increase associated with potential future development of the off-site affordable housing parcel would be well below the PCAPCD's bright-line threshold of 10,000 $MTCO_2e$/yr. In addition, even if the total GHG emissions from the off-site affordable housing parcel were added to the GHG emissions from the proposed project's 432 units, the total combined emissions would be under the applicable PCAPCD thresholds (1,082 $MTCO_2e$/yr).

Long-Term Operational GHG Emissions

The following discussion includes an analysis of potential impacts related to development of the proposed project and the off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could result in a generation of GHG emissions that may have a significant impact on the environment or conflict with an applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs during operations.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

The proposed off-site sewer lift station improvements are related to providing additional floodwater storage capacity, and would not result in operational GHG emissions. Therefore, the below discussion focuses on operational GHG emissions associated with the proposed project.

The modeling assumptions for the GHG emissions related to operations of the proposed project are discussed in the Method of Analysis section above. The estimated unmitigated operational GHG emissions for the proposed project at full buildout (2030) are presented in Table 6-17.

Table 6-17
Maximum Unmitigated Operational GHG Emissions – Proposed Project

Emission Source	GHG Emissions ($MTCO_2e$/yr)
Mobile	3,266.00
Area	5.70
Energy	950.00
Water	26.00
Waste	100
Refrigerants	0.84
Total Annual GHG Emissions	*4,347*
PCAPCD Screening Level Threshold	**1,100.00**
PCAPCD Bright Line Threshold	**10,000.00**

Notes:
- Rounding may result in small differences in summation.
- The project emissions shown above include emissions associated with the proposed project and the 22 on-site ADUs.

Source: CalEEMod, December 2025 (see Appendix C).

As presented in Table 6-17, the proposed project would result in total maximum annual operational GHG emissions below the PCACPD's Bright Line Threshold of 10,000 $MTCO_2e$/yr. However, emissions would exceed the PCAPCD's Screening Level Threshold. Therefore, the proposed project has been further evaluated in comparison with the efficiency thresholds presented in Table 6-7. The efficiency thresholds are in units of $MTCO_2e$/yr per capita for residential projects in rural or urban settings. In general, urban projects are considered to involve shorter vehicle trips, which would inherently reduce GHG emissions from mobile sources, while rural projects are considered to involve relatively longer vehicle trips and proportionally higher GHG emissions from mobile sources.

In recognition of the inherent inequality between mobile source GHG emissions from rural and urban projects, PCAPCD established higher efficiency thresholds for rural projects as compared to urban projects. The PCAPCD directs lead agencies to determine whether a project is considered rural or urban. Because urban development generally exists within the project vicinity, the PCAPCD's urban efficiency threshold is used for further analysis of project-related operational emissions. The urban efficiency metric is more stringent, and, thus, use of the urban efficiency metric presents a conservative analysis. The

estimated GHG emissions per capita for the proposed project are presented below in Table 6-18 and compared to the applicable PCAPCD efficiency threshold.

Table 6-18
Maximum Unmitigated Annual Project Operational GHG Emissions Per Capita

Proposed Project Emissions ($MTCO_2e$/yr/capita)	PCAPCD Efficiency Threshold for Urban Residential Projects ($MTCO_2e$/yr/capita)
3.31	4.5

Notes: As detailed in Chapter 13, Land Use and Planning/Population and Housing, of this EIR, the estimated population for the project at buildout is based on a 2.94 persons per household average and 1.91 persons per ADU rate for the DCWPCP area. Thus, the estimated population of the proposed project is 1,312 residents. ([432 du * 2.94 persons per household] + [22 du * 1.91 persons per ADU= 1,312

As shown in the table, the proposed project would result in operational GHG emissions below the applicable PCAPCD efficiency threshold. Therefore, operation of the proposed project would not be considered to generate GHG emissions that may have a significant impact on the environment.

Off-Site Affordable Housing Parcel

As described within Impact 10-7 within the RVSP EIR, operational GHG emissions associated with the buildout of the RVSP, specifically from mobile sources and energy consumption during operation, could result in a significant impact. The RVSP EIR describes several components of the RVSP which are consistent with the principles developed by the Sacramento Area Council of Governments (SACOG), such as "Smart Growth" Factors, Traffic Factors, and Electricity Factors which would target the reduction of GHG emissions during operation. In addition, the RVSP EIR includes Mitigation Measure 10-7a, which would require implementation of several RVSP Mitigation Measures, including Mitigation Measures 10-1c, 10-1d, 10-2a, 10-2d, as described above. Additionally, RVSP Mitigation Measure 10-7a requires implementation of Mitigation Measures 9-1a, 9-2a, 9-2b, 9-3a, 9-8a, 9-9a, 9-11a, 9-16a, 9-17a, 9-18a, 9-19a, and 19-20a included in Chapter 9, Transportation and Circulation, of the RVSP EIR, which would require the implementation of a Construction Traffic Management Plan, the creation of a Community Service Area to cover Transit Service, and road widening and roadway improvements to select roads in vicinity of the RVSP. However, Mitigation Measures 9-2a, 9-2b, 9-3a, 9-8a, 9-9a, 9-11a, 9-16a, and 9-17a, would not be applicable to the analysis below as they apply to roadways outside the vicinity of the off-site affordable housing parcel. Further, as discussed in Chapter 16, Transportation, of this EIR, RVSP Mitigation Measure 9-1a would not be applicable to the off-site affordable housing parcel, and the requirements of Mitigation Measure 9-18a have been previously implemented. Finally, Mitigation Measures 9-19a and 9-20a of the RVSP are related to LOS, and, given that the law has changed with respect to how transportation-related impacts may be addressed under CEQA such that unacceptable LOS is no longer considered a significant impact on the environment under CEQA, would not be applicable to the off-site affordable housing parcel.

Due to the uncertainties of determining whether the RVSP would result in a cumulatively considerable incremental contribution to global climate change, the RVSP EIR concluded

that even with the implementation of Mitigation Measure 10-7a, the RVSP would result in a significant and unavoidable impact related to GHG emissions and climate change. The Placer County Board of Supervisors adopted Findings of Fact and a Statement of Overriding Considerations for the significant and unavoidable impacts associated with the RVSP.

The estimated unmitigated net increase in operational GHG emissions associated with the off-site affordable housing parcel are presented in Table 6-19.

Table 6-19
Maximum Unmitigated Operational GHG Emissions – Off-Site Affordable Housing Parcel

Emission Source	GHG Emissions ($MTCO_2e$)		
	Approved Conditions	**Proposed Conditions**	**Net Increase**
Mobile	745.00	1,336.00	*+591.00*
Area	0.54	1.49	+0.95
Energy	49.50	137.00	+87.50
Water	2.63	6.58	+3.95
Waste	10.30	27.70	+17.40
Refrigerants	0.05	0.15	+0.10
Total Annual GHG Emissions	*808.00*	*1,509.00*	*+701.00*
PCAPCD Screening Level Threshold	**1,100.00**	**1,100.00**	**1,100.00**
PCAPCD Bright Line Threshold	**10,000.00**	**10,000.00**	**10,000.00**

Note: Rounding may result in small differences in summation.

Source: CalEEMod, August 2025 (see Appendix C).

In addition, the total maximum unmitigated operational GHG emissions associated with the proposed project in combination with the net increase associated with the off-site affordable housing parcel are presented in Table 6-20.

As presented in Table 6-20, the total maximum unmitigated operational GHG emissions associated with the proposed project in combination with the net increase associated with the off-site affordable housing parcel would be below the PCACPD's Bright Line Threshold of 10,000 $MTCO_2e$/yr. However, emissions would exceed the PCAPCD's Screening Level Threshold. Therefore, the total maximum unmitigated operational GHG emissions associated with the proposed project in combination with the net increase associated with the off-site affordable housing parcel have been further evaluated in comparison with the efficiency thresholds presented in Table 6-7.

Table 6-20
Total Maximum Unmitigated Operational GHG Emissions – Proposed Project and Off-Site Affordable Parcel

Emission Source	GHG Emissions ($MTCO_2e$)		
	Off-Site Affordable Housing Parcel (Net Increase)	Proposed Project	Combined Emissions
Mobile	591.00	3,075.00	3,666.00
Area	0.95	5.40	6.35
Energy	87.50	898.00	985.5
Water	3.95	24.00	27.95
Waste	17.40	96.00	113.40
Refrigerants	0.10	0.79	0.89
Total Annual GHG Emissions	*701.00*	*4,099.00*	*4,800.00*
PCAPCD Screening Level Threshold	**1,100.00**	**1,100.00**	**1,100.00**
PCAPCD Bright Line Threshold	**10,000.00**	**10,000.00**	**10,000.00**

Notes:
- Rounding may result in small differences in summation.
- The proposed project emissions shown above do not include emissions associated 22 on-site ADUs.

Source: CalEEMod, August/December 2025 (see Appendix C).

The estimated combined GHG emissions per capita for the proposed project and the net increase in emissions associated with the off-site affordable housing parcel are presented below in Table 6-21 and compared to the applicable PCAPCD efficiency threshold.

Table 6-21
Total Maximum Unmitigated Annual Project Operational GHG Emissions Per Capita

Proposed Project and Off-Site Affordable Housing Parcel Emissions ($MTCO_2e$/yr/capita)	PCAPCD Efficiency Threshold for Urban Residential Projects ($MTCO_2e$/yr/capita)
3.45	4.5

Notes: As detailed in Chapter 13, Land Use and Planning/Population and Housing, of this EIR, the estimated population for the project at buildout is based on a 2.94 persons per household average for the DCWPCP area. Thus, the estimated population of the proposed project is 1,270 residents. ([432 du * 2.94 persons per household]. In addition, using the same estimated number of persons by household used within the RVSP EIR, the off-site affordable housing parcel would result in a total of 240 future residents associated with development of the off-site affordable housing parcel, an increase in 120 future residents as compared to what was previously analyzed in the RVSP EIR. Thus, total population associated with the proposed project and the net increase associated with the off-site affordable housing parcel is 1,390.

As shown in the table, the net increase in emissions associated with the off-site affordable housing parcel, in combination with the proposed project, would result in operational GHG emissions below the applicable PCAPCD efficiency threshold. In addition, even if the total GHG emissions from the off-site affordable housing parcel were added to the GHG

emissions from the proposed project's 432 units, and divided by the total population associated with the proposed project and the off-site affordable housing parcel, the total combined per capita GHG emissions would be under the applicable PCAPCD efficiency threshold.[50] Therefore, operation of the off-site affordable housing parcel would not be considered to generate GHG emissions that may have a significant impact on the environment or result in a new significant environmental effect or a substantial increase in the severity of a previously identified significant effect beyond what was previously anticipated within the RVSP EIR.

In addition, at such time the off-site affordable housing parcel gets developed, operations related to such would be required to comply with all applicable PCAPCD rules and regulations, as well as RVSP EIR Mitigation Measure 10-7a, which has been incorporated into this EIR as Mitigation Measure 6-6.

Consistency with Placer County Sustainability Plan

The CARB encourages local governments to adopt a reduction goal for municipal operations emissions and move toward establishing similar goals for community emissions that parallel the State's commitment to reducing GHG emissions. As noted previously, Placer County adopted the PCSP in January 2020.[51] The PCSP includes an inventory of baseline emissions from the year 2005 and forecasted emissions in 2020, 2030, and 2050. In addition, the PCSP establishes a target of reducing GHG emissions from Placer County to 15 percent below 2005 levels by 2020 and achieving the State-wide per capita efficiency target of six $MTCO_2e$ per person by 2030. The GHG reductions presented within the PCSP are designed to achieve the State's adopted AB 32 and SB 32 reduction targets. The PCSP would not be applicable to projects that have been previously analyzed under a certified EIR, which are consistent with such analysis, and addresses the most recent GHG regulatory requirements.

As noted above, because the proposed project's and the off-site affordable housing parcel's operational GHG emissions would be below the applicable thresholds, implementation of the GHG reduction measures included in the PCSP is not required. Therefore, the proposed project and the potential future development of the off-site affordable housing parcel would not conflict with implementation of the PCSP.

Conclusion

Based on the above, the proposed project and the potential future development of the off-site affordable housing parcel would not be considered to generate GHG emissions, either directly or indirectly, that would have a significant impact on the environment, or conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. Nevertheless, the off-site affordable housing parcel is located within the overall RVSP area for which the RVSP EIR included mitigation measures intended to be implemented by all future development to reduce total GHG emissions within the RVSP area. Thus, the impact herein is determined to be ***cumulatively considerable*** as a means to incorporate the applicable RVSP mitigation measures into this EIR and ensure the applicable RVSP EIR mitigation measures are implemented for the off-site affordable

[50] 1,509.00 $MTCO_2e$/yr + 4,099.00 $MTCO_2e$/yr = 5,608 $MTCO_2e$/yr; 1,270 residents + 240 future residents = 1,510 residents; 5,608 $MTCO_2e$/yr / 1,510 residents = 3.71 $MTCO_2e$/yr/capita

[51] Placer County. *Placer County Sustainability Plan: A Greenhouse Gas Emission Reduction Plan and Adaptation Strategy.* January 28, 2020.

housing parcel. Therefore, at such time the off-site affordable housing parcel gets developed, implementation of Mitigation Measure 10-7a of the RVSP EIR would be required to ensure a cumulatively considerable incremental contribution to the significant cumulative impact does not occur. The referenced RVSP mitigation measure is incorporated into this EIR as Mitigation Measure 6-6 below.

Mitigation Measure(s)

As discussed above, RVSP Mitigation Measure 10-7a would require implementation of several RVSP Mitigation Measures, including Mitigation Measures 10-1c, 10-1d, 10-2a, 10-2d, as described above. Additionally, RVSP Mitigation Measure 10-7a requires implementation of Mitigation Measures 9-1a, 9-2a, 9-2b, 9-3a, 9-8a, 9-9a, 9-11a, 9-16a, 9-17a, 9-18a, 9-19a, and 19-20a included in Chapter 9, Transportation and Circulation, of the RVSP EIR, which would require the implementation of a Construction Traffic Management Plan, the creation of a Community Service Area to cover Transit Service, and road widening and roadway improvements to select roads in vicinity of the RVSP. However, Mitigation Measures 9-2a, 9-2b, 9-3a, 9-8a, 9-9a, 9-11a, 9-16a, and 9-17a, would not be applicable as they apply to roadways outside the vicinity of the off-site affordable housing parcel and would not be adversely affected by potential future development of the off-site affordable housing parcel. Further, as discussed in Chapter 16, Transportation, of this EIR, RVSP Mitigation Measure 9-1a would not be applicable to the off-site affordable housing parcel, and the requirements of Mitigation Measure 9-18a have been previously implemented. Finally, Mitigation Measures 9-19a and 9-20a of the RVSP are related to LOS, and, given that the law has changed with respect to how transportation-related impacts may be addressed under CEQA such that unacceptable LOS is no longer considered a significant impact on the environment under CEQA, these measures would not be applicable to the off-site affordable housing parcel. Thus, Mitigation Measure 6-6 below appropriately includes only the mitigation measures listed in RVSP Mitigation Measure 10-7a that would be applicable to the potential future development of the off-site affordable housing parcel. Implementation of the following mitigation measure would reduce the above potential impact to a *less-than-cumulatively considerable* level.

Off-Site Affordable Housing Parcel

6-6 Implement RVSP EIR Mitigation Measure 10-7a:

Implement the following mitigation measures:

- *Mitigation Measure 10-1c [incorporated as Mitigation Measure 6-1(c) of this EIR] (Maintain construction equipment and vehicles);*
- *Mitigation Measure 10-1d [incorporated as Mitigation Measure 6-1(d) of this EIR] (Minimize idling time for diesel-powered equipment);*
- *Mitigation Measure 10-2a [incorporated as Mitigation Measure 6-2(a) of this EIR] (Implement measures to reduce energy consumption); and*
- *Mitigation Measure 10-2d [incorporated as Mitigation Measure 6-2(c) of this EIR] (Implement offsite mitigation programs or pay an in-lieu amount into the Placer County Air Pollution Control District's Air Quality Mitigation Program).*

7. Biological Resources

7. BIOLOGICAL RESOURCES

7.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County an approximately four-acre parcel off-site within the Riolo Vineyards Specific Plan (RVSP) which could develop a maximum of 120 affordable income-restricted units.

The Biological Resources chapter of the EIR evaluates the biological resources known to occur or potentially occur within the project site and surrounding environments. The chapter describes the potential impacts of the proposed project, off-site sewer lift station improvements area, and off-site affordable housing parcel related to biological resources and identifies measures to eliminate or substantially reduce impacts to a less-than-significant level. Existing plant communities, wetlands, wildlife habitats, and potential for special-status species and communities are discussed for the project region. The information contained in the analysis is primarily based on a Biological Resources Assessment (BRA) (see Appendix D of this EIR)[1] prepared by Madrone Ecological Consulting (Madrone). Further information was sourced from the Placer County General Plan (PCGP),[2] the PCGP EIR,[3] the Dry Creek-West Placer Community Plan (DCWPCP),[4] the RVSP EIR,[5] and the Placer County Conservation Program (PCCP).[6]

7.2 EXISTING ENVIRONMENTAL SETTING

The following sections describe the regional biological setting in which the project site is located, the biological setting of the project site, and the special-status species and sensitive natural communities known to occur within the project site and surrounding environs.

Regional Setting

The project site consists of 92.2 acres located south of Baseline Road, immediately east of the abandoned old Walerga Road right-of-way, west of the Fiddyment Road/Baseline Road/Walerga Road intersection and the western portion of Sun Valley Oaks residential subdivision, and north of the Morgan Creek residential subdivision in the DCWPCP of unincorporated Placer County. The off-site affordable housing parcel consists of approximately four acres located at the northeast corner of PFE Road and Watt Avenue in the RVSP. The DCWPCP area experiences a Mediterranean type climate with cool, wet winters, and hot, dry summers. Temperatures in the project region fluctuate from average highs in July of 96 degrees Fahrenheit, with average lows

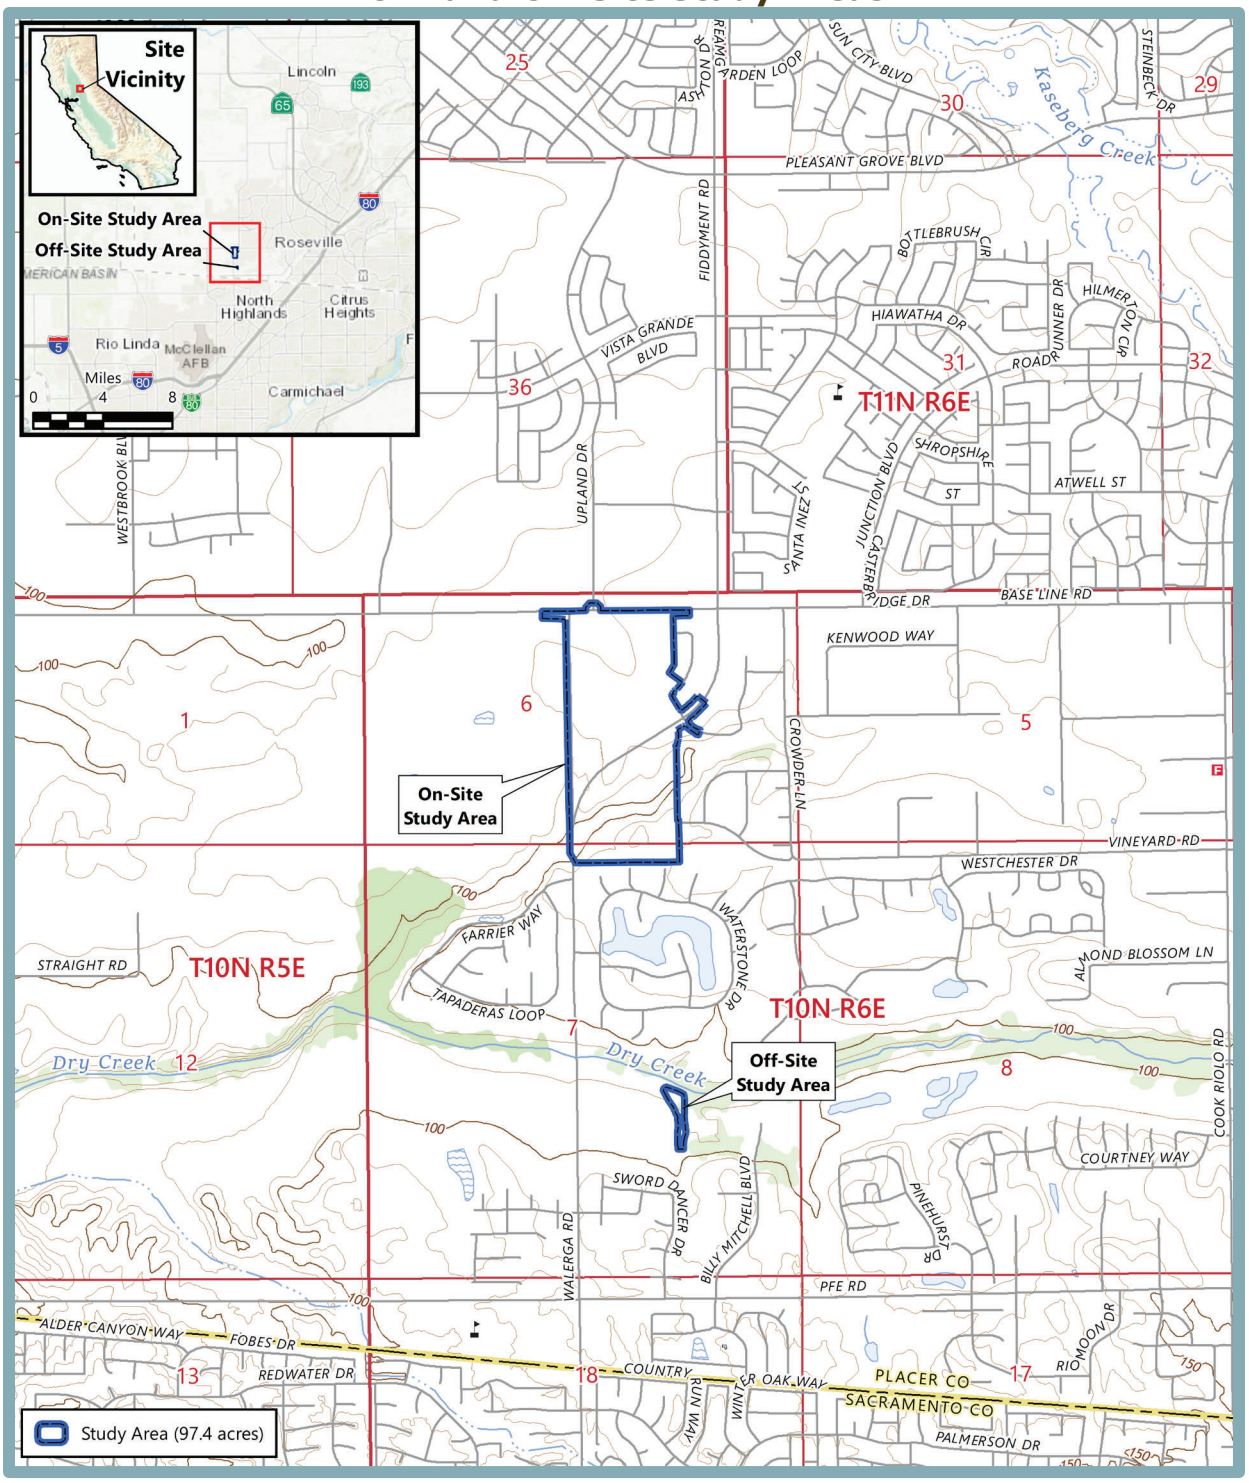
in December of 40 degrees Fahrenheit.[7] Nearly all precipitation occurs between October and April in the form of rainfall, with February typically the wettest month, averaging 4.6 inches.

The DCWPCP area is located within the Sacramento Valley portion of Placer County. The Sacramento Valley is a broad valley characterized by predominantly agricultural uses and open space, with interspersed urban centers and rural towns. To the east and northeast of the DCWPCP area, the terrain transitions from the relatively flat Sacramento Valley to the foothill region of Placer County, followed by the increasingly steep and rugged Sierra Nevada Mountains. Habitat types within the Sacramento Valley portion of Placer County generally include oak woodland, riparian woodland, annual brome grasslands, and agricultural land.

The DCWPCP, itself, is unique in that the plan area contains vast tracts of undeveloped land interspersed with rural single-family lots and residential subdivisions. A portion of the DCWPCP, the Dry Creek floodplain, remains in its natural state and generally flows in a west-to-east direction. A variety of ecotypes are located within the DCWPCP boundaries, including valley grasslands, riparian woodlands, valley woodlands, and cultivated or grazed agricultural lands. Within such biological communities, unique and sensitive habitats are also present, including vernal pools, riparian areas, salmon-spawning grounds, and groves of mature native oaks. Many of the foregoing habitats are associated with Dry Creek and its tributaries. Due to the expanse of its watershed, Dry Creek flows year-round.

Project Setting



The approximately 97.4-acre study area for the BRA consists of a 95.5-acre on-site study area, consisting of the site and various nearby roadway segments, and an approximately two-acre off-site study area located south of Dry Creek and just east of Dry Creek Community Park associated with the Community Facility District #1 Sewer Lift Station located adjacent to the park (off-site sewer lift station improvements area) (see Figure 7-1). The project site generally consists of gently rolling hills with an intermittent tributary drainage of Dry Creek. Study area elevations range from approximately 100 feet above mean sea level (amsl) to 130 feet amsl.

The on-site study area is mostly undeveloped, with the exception of the Walerga Road corridor, which runs southwest to northeast through the site, and a paved bike path that crosses through the southern portion of the site. On-site undeveloped areas are comprised of ungrazed annual brome grassland and vernal pool complex (VPC) on gently rolling terrain interspersed with an assemblage of seasonal wetlands and vernal pools. Several man-made wetlands are present along the eastern boundary of the project site. The on-site paved bike path parallels the south side of an intermittent tributary drainage of Dry Creek that bisects the southern portion of the on-site study area. The intermittent drainage is bordered by valley foothill riparian woodland (VFRW) that supports native valley oak (*Quercus lobata*), blue oak (*Q. douglasii*), and interior live oak (*Q. wislizenii*).

The off-site sewer lift station improvements area is bordered by Dry Creek Community Park to the west and an undeveloped area to the east, and includes a small section of an existing paved bike path. The northern portion of the off-site sewer lift station improvements area is comprised of VFRW and portions of intermittent tributary drainages of Dry Creek.

Figure 7-1
On- and Off-Site Study Areas

* Figure not OCR Compatible

Terrestrial Vegetation Communities/PCCP Land Covers

Madrone identified the following PCCP land covers within the study area: Annual Brome Grassland/VPC Low and Intermediate, VFRW, Road, Urban Parks, and Urban/Suburban, as summarized in Table 7-1 and shown in Figure 7-2. The study area's vegetation communities are discussed in further detail below.

Table 7-1
PCCP Land Cover Types within the Study Area

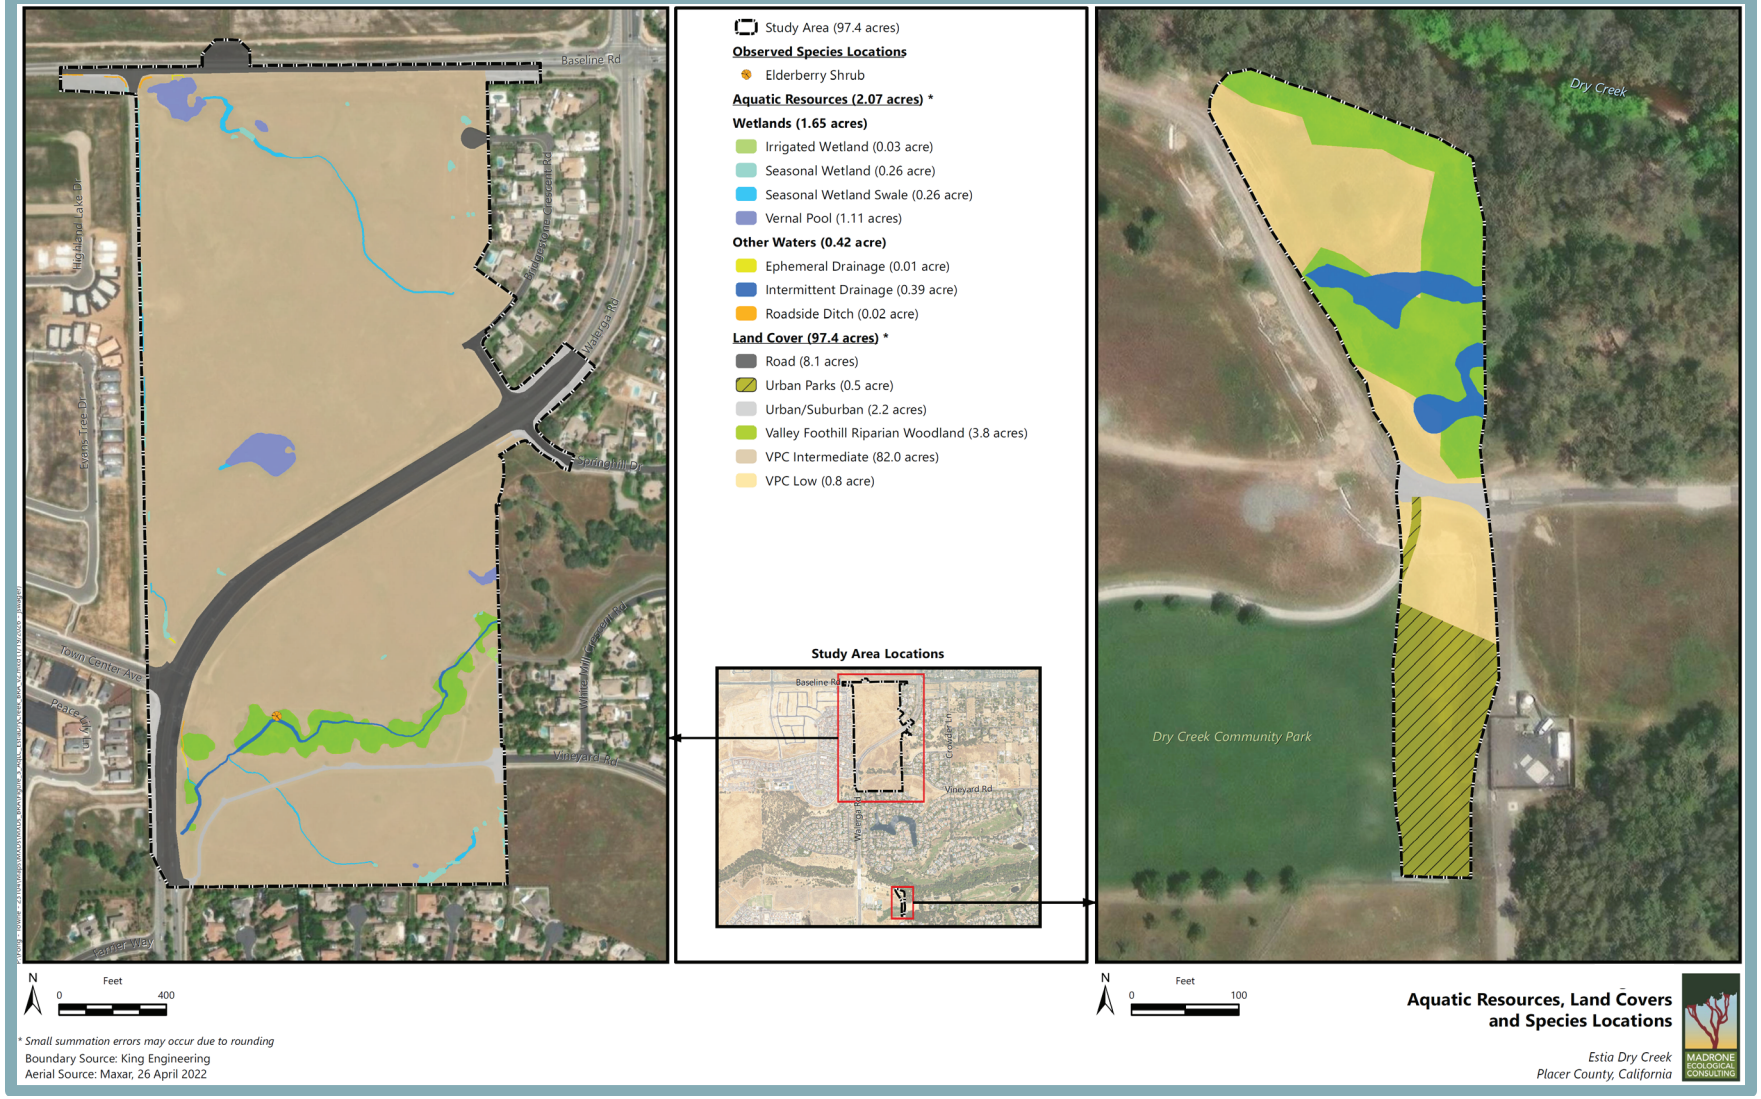
Land Covers/Vegetation Communities		Acres
Annual Brome Grassland/VPC	VPC Intermediate	82.0
	VPC Low	0.8
VFRW		3.8
Road		8.1
Urban Parks		0.5
Urban/Suburban		2.2
Total		**97.4**

Note: Small summation errors may occur due to rounding.

Source: Madrone Ecological Consulting, 2026.

Annual Brome Grassland/VPC Low and Intermediate

The areas mapped as VPC low and VPC intermediate land covers by the PCCP consist of annual brome grasslands with varying densities of wetlands (1.6 percent and 5.5 percent, respectively). The BRA uses the term annual brome grassland/VPC to describe the foregoing land cover types, as Madrone considers it to be more descriptive. The annual brome grassland/VPC land cover within the study area is dominated by non-native grasses and forbs such as wild oat (*Avena fatua*), soft brome (*Bromus hordeaceus*), medusa head (*Elymus caput-medusae*), ryegrass (*Festuca perennis*), winter vetch (*Vicia villosa*), and caley pea (*Lathyrus hirsutus*).



Valley Oak Riparian Woodland/Valley Foothill Riparian Woodland

Both sides of the intermittent drainage within the project site, as well as the northern portion of the off-site sewer lift station improvements area, support valley oak riparian woodland. The canopy of this community is comprised of valley oak (*Quercus lobata*), blue oak (*Quercus douglasii*), and interior live oak (*Quercus wislizeni*). The understory is primarily comprised of western poison oak (*Toxicodendron diversilobum*), California pipevine (*Aristolochia californica*), and species found in the surrounding annual brome grassland. The PCCP classifies valley oak woodlands in riparian areas as VFRW.

Urban (Non-Natural) Communities

A number of areas within the study area are designated as urban land covers that do not support species habitat. Such land covers are categorized as "Previously Converted" areas, and are not subject to Land Conversion Fees under the PCCP. Urban land cover within the study area includes 8.1 acres of road, consisting of the existing Walerga Road corridor, which runs southwest to northeast through the project site; a 0.5-acre portion of Dry Creek Community Park located within the off-site sewer lift station improvements area; and several areas within the study area mapped as urban and suburban.

Figure 7-2
Aquatic Resources, On-Site Land Covers, and Observed Species Locations

* Figure not OCR Compatible

Areas mapped as urban and suburban include paved roadways/pathways and adjacent street landscaping that are mostly paved or otherwise unvegetated. Some urban and suburban areas within the study area support maintained landscaping and ruderal vegetation. In addition, a paved bike bath is located parallel to the intermittent drainage in the southern portion of the project site as well as a paved path along the western boundary of the northern portion of the project site.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel consists of approximately four acres of undeveloped land with grassy fields and gently rolling topography located at the northeast corner of PFE Road and Watt Avenue. According to Figure 6-1a of the RVSP EIR, the off-site affordable housing parcel consists primarily of annual grasslands with seasonal wetland located on the southeast portion of the parcel. Several trees are present along the northern and western boundaries of the off-site affordable housing parcel. As part of the 2005 RVSP EIR, a BRA was prepared for the planning area.

Aquatic Resources

A total of approximately 2.07 acres of aquatic resources were delineated within the project site in accordance with the U.S. Army Corps of Engineers (USACE) Sacramento District's Minimum Standards for Acceptance of Preliminary Wetlands Delineations, and were verified by the USACE with Preliminary Jurisdictional Determinations (PJDs) (see Figure 7-2). Table 7-2 below provides the acreage of each aquatic resource located within the study area, as well as a detailed description of each.

Table 7-2
Aquatic Resources Delineated Within the Study Area

Resource Type	PCCP Classification	Acreage
Wetlands		
Irrigated Wetland	Aquatic/Wetland	0.03
Seasonal Wetland	Vernal Pool Constituent Habitat	0.26
Seasonal Wetland Swale	Vernal Pool Constituent Habitat	0.26
Vernal Pool	Vernal Pool Constituent Habitat	1.11
Other Waters		
Ephemeral Drainage	Riverine	0.01
Intermittent Drainage	Riverine	0.39
Roadside Ditch	Riverine	0.02
Total		**2.07**

Note: Small summation errors may occur due to rounding.

Source: Madrone Ecological Consulting, 2026.

Irrigated Wetland

One irrigated wetland was mapped along the eastern boundary of the project site. The irrigated wetland appears to be the result of irrigation runoff from adjacent residences. The fence around the adjacent residence has been designed to allow irrigation runoff to flow underneath, and into this wetland. Based on a review of historic aerial photography, it appears that this wetland formed between 2005 and 2006, shortly after the construction of adjacent houses. Because this wetland is supported by runoff during the dry season, a variety of plant species typical of prolonged saturation are present, including tall flatsedge (*Cyperus eragrostis*), common rush (*Juncus effusus*), Gooding's black willow (*Salix gooddingii*), Bermuda grass (*Cynodon dactylon*), English plantain (*Plantago lanceolata*), and yellow bristlegrass (*Setaria pumila*).

Seasonal Wetland

Several seasonal wetlands occur within the project site. In addition, based on Figure 6-1a of the RVSP EIR, seasonal wetlands occur within the southeastern portion of the off-site affordable housing parcel. Seasonal wetlands are depressional wetlands that pond water seasonally. Such features are often topographically and hydrologically similar to vernal pools, but have a short hydroperiod. As a result, seasonal wetlands support a slightly different plant community that is not characterized by the dominance of vernal pool endemics. The seasonal wetlands within the study area are largely dominated by Mediterranean barley (*Hordeum marinum*) and hyssop loosestrife *(Lythrum hyssopifolia*).

Seasonal Wetland Swale

The study area supports multiple seasonal wetland swales. Seasonal wetland swales are sloping, linear seasonal wetlands that convey surface runoff and may detain runoff for short periods of time. The seasonal wetland swales within the study area are dominated by ryegrass.

Vernal Pool

The project site supports five vernal pools. Vernal pools are topographic basins that are underlain with an impermeable or semi-permeable hardpan or duripan layer. They are inundated during the wet season, and typically dry by late spring, remaining dry through the summer months. Vernal pools are differentiated from depressional seasonal wetlands based upon the predominance of vernal pool endemic plant species. Vernal pools within the study area are dominated by Mediterranean barley, smooth goldfields (*Lasthenia glaberrima*), low manna grass (*Glyceria declinata*), and great valley popcorn flower (*Plagiobothrys stipitatus*).

Ephemeral Drainage

Three reaches of ephemeral drainage occur within the project site and are linear features that exhibit an ordinary high water mark (OHWM). Ephemeral drainages convey stormwater runoff for short periods of time directly after precipitation events, and do not convey any groundwater flow. The southern two drainages within the project site are the portions of a seasonal wetland swale. The third drainage is an incised drainage that drains a vernal pool into a culvert to the north.

Intermittent Drainage

Three reaches of intermittent drainage were mapped within the study area. Intermittent drainages flow seasonally, but for a longer duration than ephemeral drainages. Such drainages receive hydrological input from groundwater and, as a result, flow for weeks or months following rainfall events. The largest drainage, Placer Creek, flows from east to west across the project site and is a tributary to Dry Creek. Two smaller drainages occur within the off-site sewer lift station improvements area and are also tributary to Dry Creek. The intermittent drainages are largely unvegetated within their channels but contain patches of vegetation including ryegrass, creeping spikerush (*Eleocharis macrostachya*), and common monkeyflower (*Erythranthe guttata*).

Roadside Ditch

Several roadside ditches are present along the eastern edge of Walerga Road, and along the south side of Baseline Road. The ditches are unvegetated, maintained ditches that convey stormwater flows off of Baseline and Walerga Roads.

Placer County Conservation Program Special Habitats and County Aquatic Resources Program Setbacks

The following PCCP special habitats and Western Placer County Aquatic Resources Program (CARP) setbacks have been mapped within the study area, consistent with applicable guidelines (see Figure 7-3).

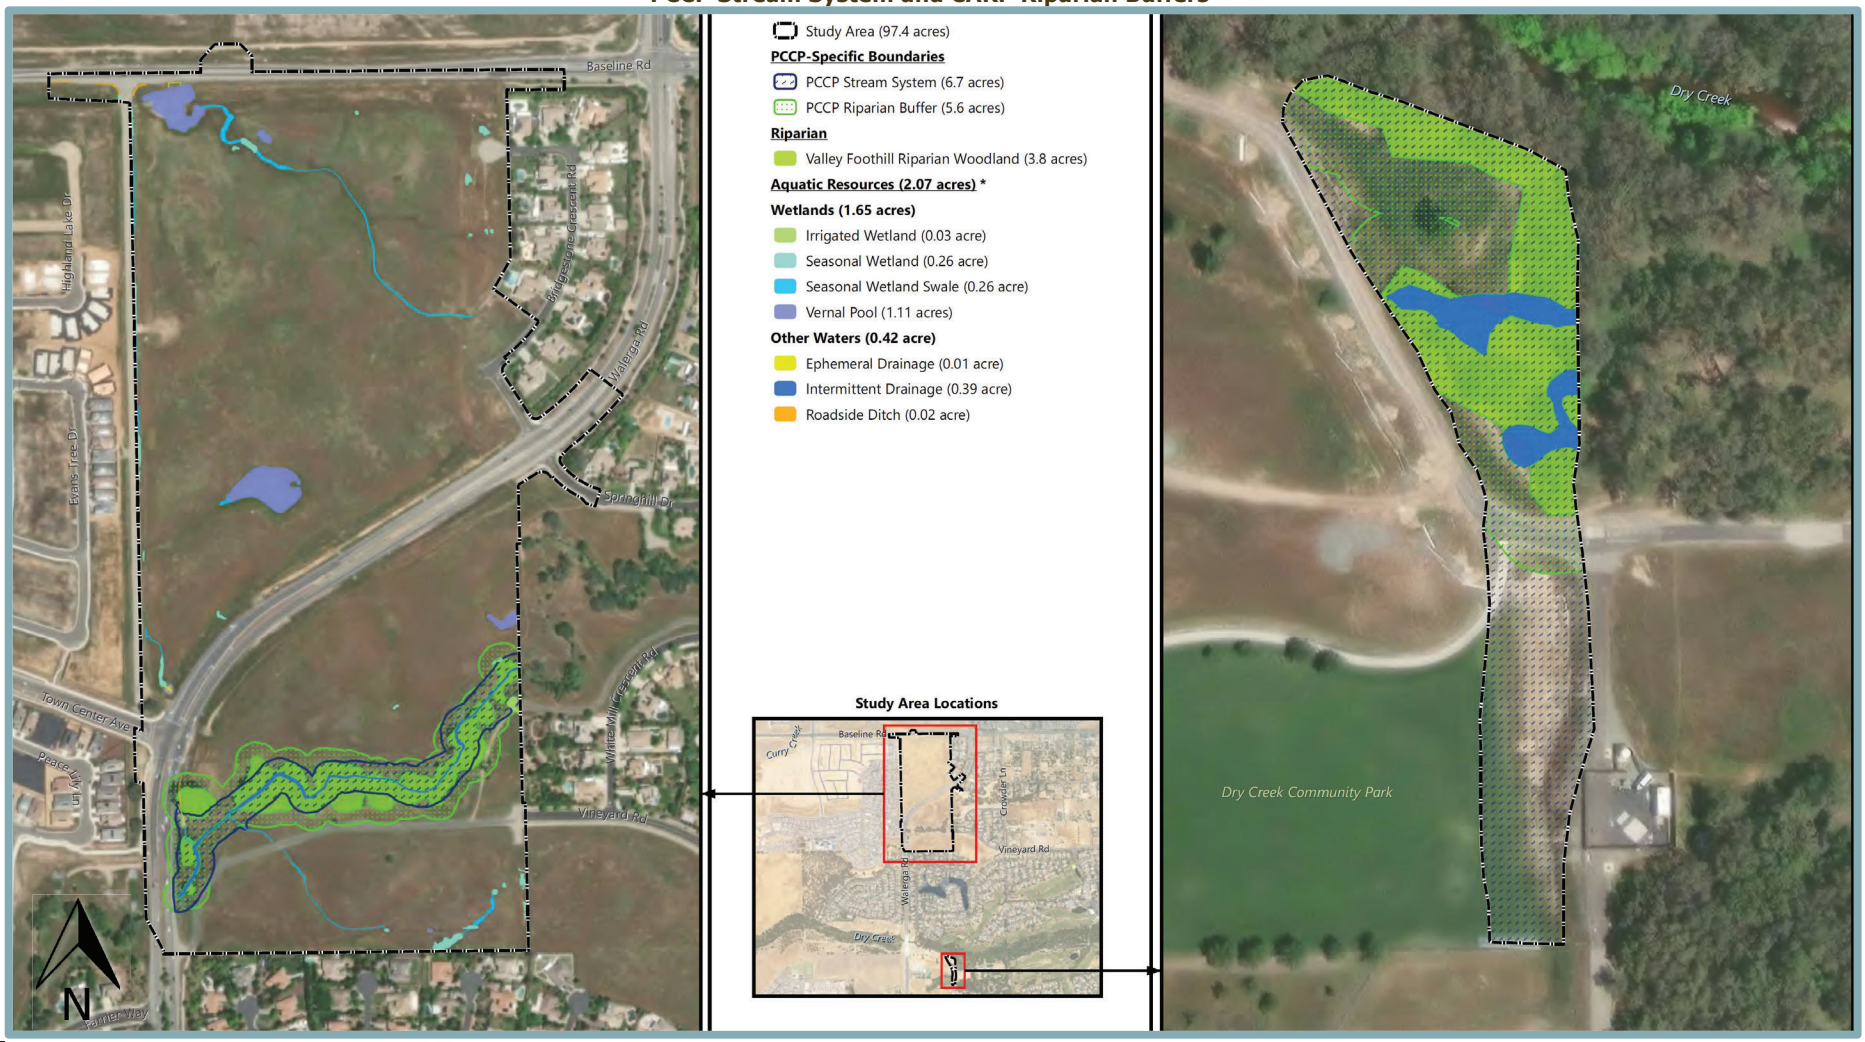
- PCCP Stream System along Dry Creek and its tributary drainages; and
- CARP Riparian Buffers, which are any areas within 50 feet of riparian land cover.

Stream System

A 6.7-acre area of PCCP-defined Stream System is present along the intermittent drainage that passes through the southern portion of the project site and encompasses the entire off-site sewer lift station improvements area that is just to the south of Dry Creek.

Special-Status Species

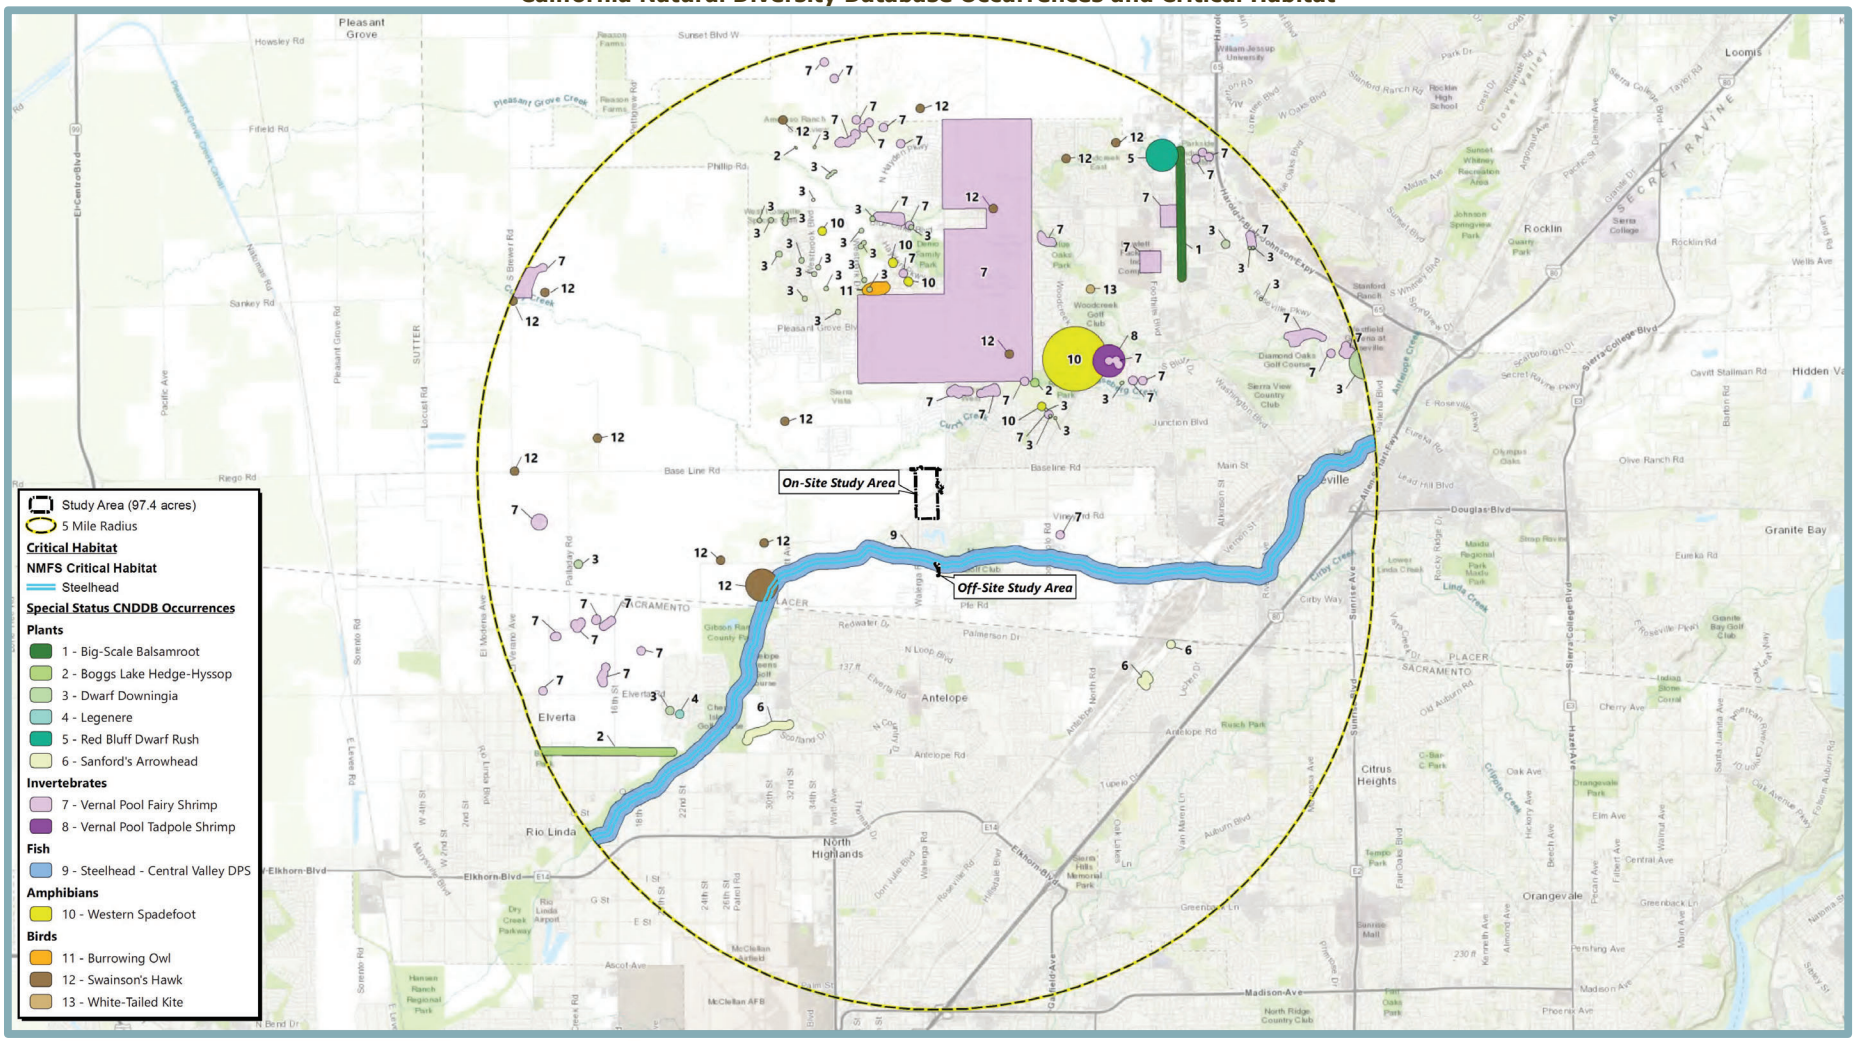
Special-status species are species that have been listed as threatened or endangered under the federal Endangered Species Act (FESA) or the California Endangered Species Act (CESA), that are "Fully Protected" under various California statutes (i.e., Fish and Game Code sections 3511, 4700, 5050, and 5515), that are protected under federal law (e.g., the federal Bald and Golden Eagle Protection Act), or that are of special concern to federal resource agencies, the State, or (in one instance) a private conservation organization, the California Native Plant Society (CNPS). A species may be considered to have special status due to declining populations, vulnerability to habitat change, or restricted distributions. A general description of the criteria and laws pertaining to special-status classifications is described below. Special-status plant and wildlife species may meet one or more of the following criteria:



1. Listed as threatened or endangered, or proposed or candidates for listing by the U.S. Fish and Wildlife Service (USFWS) or National Marine Fisheries Service (NMFS);
2. Listed as threatened or endangered or candidates for listing by the California Department of Fish and Wildlife (CDFW);
3. Identified as Fully Protected species or Species of Special Concern by CDFW;
4. Identified as Medium or High priority species by the Western Bat Working Group (WBWG); and
5. Plant species considered to be rare, threatened, or endangered in California by CNPS and CDFW (California Rare Plant Rank [CRPR] 1, 2, and 3):

a. CRPR 1A: Plants presumed extinct.
b. CRPR 1B: Plants rare, threatened, or endangered in California and elsewhere.
c. CRPR 2A: Plants extirpated in California, but common elsewhere.
d. CRPR 2B: Plants rare, threatened, or endangered in California, but more common elsewhere.
e. CRPR 3: Plants about which the CNPS needs more information – a review list.

Listed and Special-Status Plant Species



According to the records of the California Natural Diversity Database (CNDDB), maintained by the CDFW, 12 special-status plant species have the potential to occur on or within five miles of the study area, six of which have been documented within five miles of the study area (see Figure 7-4).

Figure 7-3
PCCP Stream System and CARP Riparian Buffers

* Figure not OCR Compatible

Figure 7-4
California Natural Diversity Database Occurrences and Critical Habitat

* Figure not OCR Compatible

The off-site affordable housing parcel is within five miles of the project site and, thus, was included in the CNDDB search conducted for the proposed project. Table 7-3 lists all 12 special-status plant species and all 31 special-status wildlife species with potential to occur in the vicinity of the study area. As part of determining the potential for special-status plant and wildlife species to occur within the study area, the following set of criteria was used:

- Present: Species occurs within the study area based on CNDDB records and/or was observed within the study area during the field surveys;
- High: The study area is within the known range of the species and suitable habitat exists within the study area;
- Moderate: The study area is within the known range of the species and very limited suitable habitat exists within the study area;
- Low: The study area is within the known range of the species and marginally suitable habitat exists within the study area or the species was not observed during protocol-level surveys conducted within the study area;
- Absent: The species was not observed during protocol-level surveys conducted within the study area; or
- No Habitat Present: The study area does not contain suitable habitat for the species, or the study area is outside the known range of the species.

As shown in the table, based on protocol-level special-status plant surveys and literature review (detailed further in this chapter under the Method of Analysis subsection), the study area was determined not to contain habitat for three species identified by the CNDDB: Spicate calycadenia, Hispid bird's-beak, and Red Bluff dwarf rush. The remaining nine special-status plant species: big-scale balsamroot, dwarf downingia, Bogg's Lake hedge-hyssop, Ahart's dwarf rush, Legenere, pincushion navarretia, slender Orcutt grass, Sacramento Orcutt grass, and Sanford's arrowhead, were determined to be *absent* from the project study area based on protocol-level surveys.

Listed and Special-Status Wildlife Species

According to the records search conducted as part of the BRA, 31 special-status wildlife species have the potential to occur on-site or within five miles of the study area, seven of which have been recorded within five miles of the study area (see Figure 7-4). The off-site affordable housing parcel is within five miles of the project site and, thus, was included in the CNDDB search conducted for the proposed project. Based on field observations and literature review (detailed further under the Method of Analysis subsection below), 19 of the 31 special-status wildlife species were determined to have the potential to occur within the study area. None of the aforementioned 19 are considered to be *present* within the study area. Species that are considered to have *high* potential to occur within the study area include Crotch's bumble bee, western spadefoot, northwestern pond turtle, Swainson's hawk, white-tailed kite, loggerhead shrike, pallid bat, and silver-haired bat. Species that are considered to have *low* potential to occur within the study area include vernal pool fairy shrimp, vernal pool tadpole shrimp, valley elderberry longhorn beetle (VELB), golden eagle, burrowing owl, northern harrier, olive-sided flycatcher, yellow warbler, western red bat, and hoary bat.

The following discussions provide further details of the 19 special-status wildlife species with the potential to occur within the study area. Table 7-3 lists all 31 special-status wildlife species identified in the literature and CNDDB searches.

Table 7-3
Special-Status Species with Potential to Occur Within the Study Area

Scientific Name (Common Name)	Federal Status	State Status	PCCP Covered Species	Habitat Requirements	Potential for Occurrence
Plants					
Balsamorhiza macrolepis Big-scale balsamroot	--	CRPR 1B.2	No	Occurs in chaparral, cismontane woodland and valley and foothill grasslands between 150 and 5,100 feet. Often associated with serpentine soils.	**Absent.** Marginally suitable habitat is present in the Annual Brome Grassland/VPC. Protocol-level surveys throughout the study area did not detect big-scale balsamroot.
Calycadenia spicata Spicate calycadenia		CRPR 1b.3	No	Occurs in disturbed areas and openings in annual grasslands and cismontane woodland between 130 and 4,600 feet. Found on a variety of open habitats including adobe clay, rock outcrops, gravelly areas, and mine tailings.	**No Habitat Present**. The clayey, rocky areas spicate calycadenia prefers are not present within the study area.
Chloropyron molle ssp. *hispidum* Hispid bird's-beak	--	CRPR 1B.1	No	Found in meadows and seeps, playas, and valley and foothill grasslands with alkaline soils between five and 510 feet in elevation.	**No Habitat Present**. Saline-alkali soils are not present within the study area.
Downingia pusilla Dwarf downingia	--	CRPR 2B.2	No	Strongly associated with vernal pools, depressional wetlands, and mesic valley and foothill grassland, and is found in elevations ranging from five to 1,460 feet. Dwarf downingia is typically associated with areas that experience a moderate degree of disturbance.	**Absent.** The vernal pools, seasonal wetlands, and seasonal wetland swales within the project site represent suitable habitat for dwarf downingia. Protocol-level surveys throughout the study area did not detect dwarf downingia.
Gratiola heterosepala Bogg's Lake hedge-hyssop	--	CE, CRPR 1B.2	No	Grows in vernal pools and around the perimeter of marshes and swamps between 35 and 7,790 feet. Known to favor clay soils.	**Absent**. The vernal pools and seasonal wetlands within the project site represent suitable habitat for Bogg's Lake hedge-hyssop. Protocol-level surveys throughout the study area did not detect Bogg's Lake hedge-hyssop.

Table 7-3
Special-Status Species with Potential to Occur Within the Study Area

Scientific Name (Common Name)	Federal Status	State Status	PCCP Covered Species	Habitat Requirements	Potential for Occurrence
Juncus leiospermus var. *ahartii* Ahart's dwarf rush	--	CRPR 1B.2	No	Grows along the edges of vernal pools and swales within mesic valley and foothill grassland habitat between elevations of approximately 100 and 750 feet.	**Absent**. The vernal pools and seasonal wetlands within the project site represent suitable habitat for Ahart's dwarf rush. Protocol-level surveys throughout the study area did not detect Ahart's dwarf rush.
Juncus leiospermus var. *leiospermus* Red Bluff dwarf rush	--	CRPR 1B.1	No	Grows in various habitats such as chaparral, cismontane woodland, valley and foothill grassland, meadows and seeps, as well as mesic vernal pools. Found between elevations of approximately 100 and 750 feet	**No Habitat Present.** The study area is outside of the range of the species. The nearby occurrence is widely considered to be erroneous.
Legenere limosa Legenere	--	CRPR 1B.1	No	Associated with vernal pools and found between five and 2,885 feet.	**Absent**. The vernal pools and seasonal wetlands within the project site represent marginal habitat for legenere. Protocol-level surveys throughout the study area did not detect legenere.
Navarretia myersii ssp. *myersii* Pincushion navarretia	--	CRPR 1B.1	No	Found in vernal pools, often in acidic micro habitats between approximately 65 and 1,085 feet.	**Absent**. The vernal pools and seasonal wetlands within the project site represent suitable habitat for pincushion navarretia. Protocol-level surveys throughout the study area did not detect pincushion navarretia.
Orcuttia tenuis Slender Orcutt grass	FT	CE, CRPR 1B.1	No	Found in vernal pools with gravelly substrates at elevations generally ranging between 115 and 5,775 feet.	**Absent**. The vernal pools within the project site represent marginal habitat for slender Orcutt grass. Protocol-level surveys throughout the study area did not detect slender Orcutt grass.
Orcuttia viscida Sacramento Orcutt grass	FE	CE, CRPR 1B.1	No	Favors vernal pool habitats and is found between elevations of 100 and 330 feet.	**Absent**. The vernal pools within the project site represent marginal habitat for Sacramento Orcutt grass.

(Continued on next page)

Table 7-3
Special-Status Species with Potential to Occur Within the Study Area

Scientific Name (Common Name)	Federal Status	State Status	PCCP Covered Species	Habitat Requirements	Potential for Occurrence
					Protocol-level surveys throughout the study area did not detect Sacramento Orcutt grass.
Sagittaria sanfordii Sanford's arrowhead	--	CRPR 1B.2	No	Occurs in shallow freshwater habitats associated with drainages, canals, and larger ditches that sustain inundation and/or slow-moving water into early summer. Found from approximately sea level to 2,135 feet.	**Absent**. The intermittent drainages represent suitable habitat for Sanford's arrowhead. Protocol level surveys of the study area did not detect Sanford's arrowhead.
Invertebrates					
Bombus crotchii Crotch's bumble bee	--	CC	No	Occurs in open grasslands and scrub habitats. The species occurs primarily in California, including the Mediterranean region, Pacific Coast, Western Desert, Great Valley, and adjacent foothills throughout most of southwestern California.	**High**. The Annual Brome Grassland/VPC land cover within the study area represents suitable habitat for Crotch's bumble bee.
Branchinecta conservatio Conservancy fairy shrimp	FE	--	Yes	Occurs in very large, turbid vernal pools.	**No Habitat Present**. Although vernal pools do occur on-site, none of the vernal pools within the study area are the large, deep, alkaline, clay bottomed vernal pool playas with turbid water required by the species. Additionally, the study area is not within the required survey area shown on Figure 5-7 of the PCCP nor does it encompass any of the 10 localities known to support conservancy fairy shrimp species.
Branchinecta lynchi Vernal pool fairy shrimp	FT	--	Yes	Occurs in vernal pools.	**Low**. Suitable habitat for vernal pool fairy shrimp is present in the vernal pools within the study area. Vernal pool fairy shrimp was not found

(Continued on next page)

Table 7-3
Special-Status Species with Potential to Occur Within the Study Area

Scientific Name (Common Name)	Federal Status	State Status	PCCP Covered Species	Habitat Requirements	Potential for Occurrence
					onsite during a full year of protocol-level wet season surveys of all suitable habitat.
Danaus plexippus Monarch butterfly	FC	--	No	A migratory species that is most prevalent in the Central Valley in summer and early fall. Dependent upon milkweed (*Asclepias* species) plants as their exclusive larval host.	**No Habitat Present.** No milkweed plants are present within the study area.
Desmocerus californicus dimorphus Valley elderberry longhorn beetle (VELB)	FT	--	Yes	Dependent upon elderberry *(Sambucus* species) shrubs as primary host species.	**Low**. One elderberry shrub occurs within the study area. No VELB exit holes were found during the protocol-level survey.
Lepidurus packardi Vernal pool tadpole shrimp	FE	--	Yes	Occurs in vernal pools.	**Low**. Suitable habitat for vernal pool tadpole shrimp is present in the vernal pools within the study area. Vernal pool tadpole shrimp was not found onsite during a full year of protocol-level wet season surveys of all suitable habitat.
Fish					
Oncorhynchus mykiss irideus Central Valley steelhead	FE	--	Yes	Anadromous species requiring freshwater water courses with gravelly substrates for breeding. The young remain in freshwater areas before migrating to estuarine and marine environments.	**No Habitat Present**. Dry Creek just north of the off-site sewer lift station improvements area is designated as Critical Habitat for Central Valley Steelhead. The intermittent drainages within the study area are tributary to Dry Creek, but are unsuitable for spawning or rearing because they do not provide steady flow of cool, clear water or suitable substrate for spawning. Although steelhead could swim through the drainages occasionally, the

(Continued on next page)

Table 7-3
Special-Status Species with Potential to Occur Within the Study Area

Scientific Name (Common Name)	Federal Status	State Status	PCCP Covered Species	Habitat Requirements	Potential for Occurrence
					intermittent drainages are not considered suitable habitat for the species.
Oncorhynchus tshawytscha Central Valley fall-run chinook salmon	--	CSC	Yes	Anadromous species requiring freshwater water courses with gravelly substrates for breeding. The young remain in freshwater areas before migrating to estuarine and marine environments.	**No Habitat Present**. Dry Creek just north of the off-site sewer lift station improvements area serves as a migration corridor to spawning habitat upstream of the project area. The intermittent drainages within the study area are tributary to Dry Creek, but are unsuitable for spawning or rearing because they do not provide steady flow of cool, clear water or suitable substrate for spawning. Although chinook salmon could swim through them occasionally, the intermittent drainages are not considered suitable habitat for the species.
Amphibians					
Ambystoma californiense California tiger salamander	FT	CT, CSC	No	Breeds in ponds or other deeply ponded wetlands, and uses gopher holes and ground squirrel burrows in adjacent grasslands for upland refugia/foraging.	**No Habitat Present.** The study area is outside of the known range of the species.
Spea hammondii Western spadefoot toad	FPT	CSC	No	Breeds in vernal pools, seasonal wetlands, and associated swales. Forages and hibernates in adjacent grasslands.	**Moderate**. The seasonal wetlands and vernal pools within the study area represent suitable habitat for the species. No western spadefoot were observed within the study area during field surveys, including wet season surveys, which would have documented larval spadefoot if present.

(Continued on next page)

Table 7-3
Special-Status Species with Potential to Occur Within the Study Area

Scientific Name (Common Name)	Federal Status	State Status	PCCP Covered Species	Habitat Requirements	Potential for Occurrence
Reptiles					
Actinemys marmorata Northwestern pond turtle	FPT	CSC	Yes	Occurs in ponds, rivers, streams, wetlands, and irrigation ditches with associated marsh habitat.	**High**. The intermittent drainages within the study area represent marginally suitable habitat for northwestern pond turtle. No northwestern pond turtles were observed within the intermittent drainages during field surveys.
Thamnophis gigas Giant garter snake	FT	CT	Yes	Occurs in rivers, canals, irrigation ditches, rice fields, and other aquatic habitats with slow-moving water and heavy emergent vegetation.	**No Habitat Present.** The study area is outside of the known range of the species.
Birds					
Agelaius tricolor Tricolored blackbird	--	CE, CSC	Yes	Colonial nester in cattails, bulrush, or blackberries associated with marsh habitats.	**Low.** Potential breeding habitat is not present within the study area, but the Annual Brome Grassland/ VPC provides marginal foraging habitat.
Ammodramus savannarum Grasshopper sparrow	--	CSC	No	Typically found in expansive short- to middle-height, moderately open grasslands with scattered shrubs, or other song perches.	**No Habitat Present**. The Annual Brome Grassland/VPC within the study area are not sufficiently expansive to support the species.
Aquila chrysaetos Golden eagle	--	CFP	No	Forages in open areas including grasslands, savannahs, deserts, and early successional stages of shrub and forest communities. Nests in large trees and cliffs.	**Low**. The Annual Brome Grassland/VPC within the study area is marginally suitable foraging habitat for golden eagle due to the small patch size and relative isolation from other annual grassland areas.
Asio otus Long-eared owl		CFP	No	Inhabits woodlands and conifer grove with dense trees for nesting and roosting and open country for hunting.	**No Habitat Present.** The VFRW within the study area is not sufficiently dense to provide habitat for long-eared owl, and the site is

(Continued on next page)

Table 7-3
Special-Status Species with Potential to Occur Within the Study Area

Scientific Name (Common Name)	Federal Status	State Status	PCCP Covered Species	Habitat Requirements	Potential for Occurrence
					outside the known range of long-eared owl.
Athene cunicularia *Burrowing owl*	--	CSC	Yes	Nests in abandoned ground squirrel burrows associated with open grassland habitats.	**Low**. Potential burrows and debris scattered throughout the study area could provide artificial burrows. The Annual Brome Grassland/VPC provides suitable foraging habitat.
Buteo swainsoni Swainson's hawk	--	CT	Yes	Nests in large trees, preferably in riparian areas. Forages in fields, cropland, irrigated pasture, and grassland near large riparian corridors.	**High**. The Annual Brome Grasslands/VPC land cover throughout the study area represents suitable foraging habitat for Swainson's hawk, and the trees within the study area provide suitable nesting habitat. Swainson's hawks were observed foraging on-site during field surveys.
Circus cyaneus Northern harrier	--	CSC	No	Nests in emergent wetland/marsh, open grasslands, or savannah habitats. Forages in open areas such as marshes, agricultural fields, and grasslands.	**Low**. The Annual Brome Grassland/VPC, throughout the study area is marginally suitable nesting and foraging habitat for northern harrier due to the small patch size and relative isolation from other annual grassland areas.
Contopus cooperi Olive-sided flycatcher	--	CSC	No	Summer resident in California. Nests in conifer forests. Spring and fall transient in the Central Valley.	**Low**. Suitable spring and fall foraging habitat is present in the VFRW within the study area.
Elanus leucurus *White-tailed kite*	--	CFP	No	Open grasslands, fields, and meadows are used for foraging. Isolated trees in close proximity to foraging habitat are used for perching and nesting.	**High**. The Annual Brome Grassland/VPC throughout the study area represents suitable foraging habitat for white-tailed kite, and the trees throughout the study area provide suitable nesting habitat. A white-tailed kite was

(Continued on next page)

Table 7-3
Special-Status Species with Potential to Occur Within the Study Area

Scientific Name (Common Name)	Federal Status	State Status	PCCP Covered Species	Habitat Requirements	Potential for Occurrence
					observed foraging on-site during a field survey.
Haliaeetus leucocephalus Bald eagle	FD	CE	No	Nests in large trees within one mile of lakes, rivers, or larger streams.	**No Habitat Present**. Suitable nesting and foraging habitat are not present within the study area.
Lanius ludovicianus Loggerhead shrike	--	CSC	No	Occurs in open areas with sparse trees, shrubs, and other perches.	**High**. The Annual Brome Grassland/VPC within the study area represents suitable foraging habitat for loggerhead shrike, and the trees and shrubs within the study area provide suitable nesting habitat.
Laterallus jamaicensis coturniculus California black rail	--	CT	Yes	Nests and forages in salt, brackish, and fresh marshes with abundant vegetative cover.	**No Habitat Present**. Marshes do not occur within the study area.
Progne subis Purple martin	--	CSC	No	Nests in tall bridges and overpasses near water and open areas.	**No Habitat Present**. Tall bridges or overpasses occur within the study area, which are outside of the known range of purple martin.
Seophaga petechia Yellow warbler	--	CSC	No	Occupies riparian vegetation in close proximity to water along streams and in wet meadows. The species does not breed in the Central Valley, but occurs as a common migrant in the fall and winter months.	**Low**. Although the study area is outside of the species' breeding range, yellow warbler has been documented along Dry Creek near the off-site sewer lift station improvements area, and suitable winter foraging habitat is present in the VFRW within the study area.
Mammals					
Antrozous pallidus Pallid bat	--	CSC, WBWG H	No	Roosts in crevices in rocky outcrops and cliffs, caves, mines, trees, bridges, barns, porches, bat boxes, and human-occupied as well as vacant buildings.	**High**. Suitable roosting habitat for the species is present in tree hollows and under exfoliating bark on trees scattered throughout the study area.

(Continued on next page)

Table 7-3
Special-Status Species with Potential to Occur Within the Study Area

Scientific Name (Common Name)	Federal Status	State Status	PCCP Covered Species	Habitat Requirements	Potential for Occurrence
Lasionycteris noctivagans Silver-haired bat	--	WBWG M	No	Roosts in caves and cave analogues, such as abandoned mines, buildings, bridges, rock crevices and large basal hollows of coast redwoods and giant sequoias. Extremely sensitive to human disturbance.	**High**. Suitable roosting habitat for the species is present in tree hollows and under exfoliating bark on trees scattered throughout the study area.
Lasiurus blossevillii Western red bat	--	CSC, WBWG H	No	Roosts primarily in the foliage of trees or shrubs. An association with intact riparian habitat (particularly willows, cottonwoods, and sycamores) may exist.	**Low**. Trees scattered throughout the study area are suitable roosting habitat for the species, but the lack of willows, cottonwoods and sycamores decreases the habitat suitability.
Lasiurus cinereus Hoary bat	--	WBWG M	No	Roosts primarily in foliage of both coniferous and deciduous trees at the edges of clearings.	**Low**. Trees within the VFRW within the study area are suitable roosting habitat for the species.
Taxidea taxus American badger	--	CSC	No	The species prefers dry open fields, grasslands, and pastures.	**No Habitat Present**. The Annual Brome Grassland/VPC within the study area is not sufficiently expansive to support American badger.

Source: Madrone Ecological Consulting, 2026.

Crotch's Bumble Bee

Crotch's bumble bee (*Bombus crotchii*) has a limited distribution in southwestern North America. The species occurs primarily in California, including the Mediterranean region, Pacific Coast, West Desert, Great Valley, and adjacent foothills through most of southwestern California. Crotch's bumble bee also occurs in Mexico (Baja California and Baja California Sur) and has been documented in southwest Nevada, near the California border. The species was historically common in the Central Valley of California, but now appears to be absent from most of the Valley, especially in the center of the species' historic range. In California, Crotch's bumble bee inhabits open grasslands and scrub habitats.

All bumblebees have three basic requirements: suitable nesting sites for the colonies, availability of nectar and pollen from floral resources throughout the duration of the entirety of the colony period (spring, summer, and fall), and suitable overwintering sites for the queens. Nests are often located underground in abandoned holes made by ground squirrels, mice, and rats, or occasionally abandoned bird nests. Some species nest on the surface of the ground in tufts of grass or in empty cavities. Bumble bees that nest aboveground may require undisturbed areas with nesting resources such as grass and hay to protect nests. As such, areas with woody cover, or other sheltered areas, such as downed wood, rock walls, or brush piles, provide bumble bees sites to build nests.

Bumble bees depend on the availability of habitats with a rich supply of floral resources that bloom continuously during the entirety of the colony's life. The queen collects nectar and pollen from flowers to support the production of her eggs, which are fertilized by sperm she has stored from mating the previous fall. As generalist foragers, bumble bees do not depend on any one flower type. Bumble bees generally prefer flowers that are purple, blue, or yellow; they are essentially blind to the color red. Very little is known about hibernacula, or overwintering sites used by most bumble bees. Generally, bumble bees overwinter in soft, disturbed soil, under leaf litter or other debris, in abandoned holes, or occasionally in abandoned burrows. Some species nest on the surface of the ground in grassy tussocks, or in empty cavities such as hollow logs, dead trees, or under rocks. Queens most likely overwinter in small cavities just below or on the ground surface.

The annual grassland/VPC within the study area represents suitable habitat for Crotch's bumble bee. The on-site habitat contains some flowering plants for much of the year and scattered small burrows in which the species could nest and overwinter. The species has not been documented within five miles of the study area in the CNDDB. Based on the above, Crotch's bumble bee has *high* potential for occurrence within the study area.

Vernal Pool Fairy Shrimp

The vernal pool fairy shrimp (*Branchinecta lynchi*) is listed as threatened, pursuant to the FESA. The species is also a PCCP Covered Species. Historically, the range of vernal pool fairy shrimp extended throughout the Central Valley. Vernal pool fairy shrimp populations have been found in several locations throughout California, with habitat extending from Stillwater Plain in Shasta County, through the Central Valley, to Pixley in Tulare County, and along the Central Coast range from northern Solano County to Pinnacles National Monument in San Benito County. Additional populations occur in San Luis Obispo, Santa Barbara, and Riverside counties. The historic and current ranges of vernal pool fairy shrimp are very similar in extent; however, the remaining populations are more fragmented and isolated than during historical times. The lifecycle of vernal pool fairy shrimp is adapted to seasonally inundated features such as vernal pools, seasonal wetlands, and seasonal wetland swales. Fairy shrimp embryos survive the dry season in cyst

form. Cysts "hatch" soon after pools become inundated during the wet season. Fairy shrimp complete their life cycle quickly and feed on small particles of detritus, algae, and bacteria.

The vernal pools within the project site represent suitable habitat for vernal pool fairy shrimp. Twenty CNDDB occurrences of vernal pool fairy shrimp have been recorded within five miles of the study area, the nearest of which is located 0.8-mile east of the project site in the Woodcreek Oaks Wetland Compensation Area (see Figure 7-4). Wet-season surveys of the vernal pools for the species were conducted during the 2024-2025 wet season, and the species was not detected. Based on the above, vernal pool fairy shrimp has *low* potential for occurrence within the study area.

Vernal Pool Tadpole Shrimp

The vernal pool tadpole shrimp (*Lepidurus packardi*) is listed as endangered, pursuant to the FESA, and is a PCCP Covered Species. The historic range of the vernal pool tadpole shrimp likely extended throughout the Central Valley and has been documented from east of Redding in Shasta County, south to Fresno County, and to the San Francisco Bay Wildlife Refuge in Alameda County. The historic and current ranges of vernal pool tadpole shrimp are very similar in extent; however, the remaining populations are more fragmented and isolated than during historical times. The species is associated with long-duration seasonal pools in grasslands throughout the northern and eastern portions of the Central Valley. Suitable vernal pools and seasonal swales are generally underlain by hardpan or sandstone. Similar to vernal pool fairy shrimp, vernal pool tadpole shrimp are adapted to seasonally inundated features, such as vernal pools, seasonal wetlands, and seasonal wetland swales.

Large vernal pools within the project site represent suitable habitat for the species. One documented CNDDB occurrence of vernal pool tadpole shrimp is within five miles of the study area (see Figure 7-4). The occurrence (CNDDB Occurrence #24) is located approximately 2.1 miles northeast of the project site in the Woodcreek Oaks Wetland Preserve and is considered potentially extirpated. Wet-season surveys of the vernal pools for the species were conducted during the 2024-2025 wet season, and the species was not detected. Based on the above, vernal pool tadpole shrimp has *low* potential for occurrence within the study area.

Valley Elderberry Longhorn Beetle

The VELB is listed as threatened pursuant to FESA and is a PCCP Covered Species. The historic range of VELB is limited to moist Valley oak woodlands along margins of rivers and streams in the lower Sacramento and lower San Joaquin Valley. At the time of its listing, the beetle was known from less than 10 localities in Merced, Sacramento, and Yolo Counties. Its current distribution is patchy throughout California's Central Valley and associated foothills.

The VELB is completely dependent on elderberry (*Sambucus species*), the species' host plant, which occurs in riparian and other woodland communities in California's Central Valley and the associated foothills. Female beetles lay their eggs in crevices on the stems or on the leaves of living elderberry plants. When the eggs hatch, larvae bore into the stems. The larval stages last for one to two years. The fifth instar larvae create emergence holes in the stems and then plug the holes and remain in the stems through pupation. Adults emerge through the emergence holes from late March through June. The short-lived adult beetles forage on leaves and flowers of elderberry shrubs.

One elderberry shrub is present to the north of the intermittent drainage within the project site. The shrub has two stems that are approximately three-inches in diameter, but exit holes typical of VELB were not observed on the shrub when surveyed by a qualified biologist on May 8, 2025. The species has not been documented within five miles of the study area in the CNDDB. Based on the above, VELB has *low* potential for occurrence within the study area.

Western Spadefoot

The western spadefoot (*Spea hammondii*) is proposed for federal listing and is a CDFW Species of Special Concern. The amphibian is a nocturnal animal that forages in grassland, open chaparral, and pine-oak woodlands for a variety of invertebrates, such as insects and worms. Western spadefoot breeds from January through May in a variety of temporary wetlands, including creeks, pools in intermittent drainages, vernal pools, and seasonal wetlands, and other fish-free water features. The tadpoles develop over three to 11 weeks and must complete their metamorphosis before the temporary pools dry. Post-metamorphic juveniles feed and then immediately seek underground refugia. Following metamorphosis, adults are largely terrestrial in nature and will burrow into sandy or gravelly soils utilizing the "spades" on their hind feet. The majority of an adult's life is spent in underground burrows. In Placer County, western spadefoots are known to breed in relatively deep manmade features, such as ponded areas adjacent to railroad tracks, and in intermittent drainage plunge pools or similar pools that hold water through late spring.

Western spadefoot was not observed during field surveys of the study area. However, several of the vernal pools and seasonal wetlands within the project site represent suitable breeding habitat for western spadefoot. The surrounding annual brome grasslands/VPC provides suitable dry-season habitat. Four documented CNDDB occurrences of western spadefoot are within five miles of the study area, the nearest of which (CNDDB Occurrence #171) is located approximately 1.2 miles to the northeast in the Woodcreek Oaks Open Space Preserve (see Figure 7-4). Based on the above, western spadefoot has *moderate* potential for occurrence within the study area.

Northwestern Pond Turtle

The northwestern pond turtle (*Actinemys marmorata*) is proposed for federal listing and is a CDFW Species of Special Concern and a PCCP Covered Species. Northwestern pond turtle's favored habitats include streams, large rivers, and canals with slow-moving water, aquatic vegetation, and open basking sites. Although the turtles must live near water, the species can tolerate drought by burrowing into the muddy beds of dried drainages. The species feeds mainly on invertebrates, such as insects and worms, but will also consume small fish, frogs, mammals, and some plants. Northwestern pond turtle predators include raccoons, coyotes, raptors, weasels, large fish, and bullfrogs. The species breeds from mid to late spring in adjacent open grasslands or sandy banks.

Northwestern pond turtle was not observed during reconnaissance level surveys of the study area. However, the intermittent drainages within the study area provide marginally suitable habitat for northwestern pond turtle due to their relatively short duration of inundation. The species has not been documented, pursuant to the CNDDB, within five miles of the study area; however, an unprocessed CNDDB record of the species has been documented approximately four miles to the east in Upper Linda Creek, a tributary of Dry Creek. Based on the above, northwestern pond turtle has *high* potential for occurrence within the study area.

Golden Eagle

Golden eagle (*Aquila chrysaetos*) is not listed pursuant to either the California or federal Endangered Species Acts; however, it is categorized as a Species of Special Concern and a Fully Protected species by the CDFW, and is protected under the federal Bald and Golden Eagle Protection Act. Golden eagle is a very large solitary raptor that feeds on mammals, carrion, and reptiles. It typically nests in large trees or cliffsides in rolling to mountainous terrain, and forages in large, expansive open grasslands and savannas. Although its natural densities are generally believed to be low, it was once relatively common to the open areas of California. Today, golden eagles are rarely observed in the Central Valley. Golden eagle typically nests between February and August.

The annual brome grassland/VPC within the study area provides marginally suitable foraging habitat due to the relatively small patch size and recent isolation of the habitat. Golden eagle has not been documented within five miles of the study area in the CNDDB. Based on the above, golden eagle has *low* potential to occur within the study area.

Burrowing Owl

Burrowing owl (*Athene cunicularia*) is a candidate for State listing, a CDFW Species of Special Concern, and a PCCP Covered Species. The species is designated as a CDFW Species of Special Concern and is a PCCP Covered Species. Burrowing owls typically inhabit dry open rolling hills, grasslands, desert floors, and open bare ground with gullies and arroyos. The species typically uses burrows created by fossorial mammals, most notably the California ground squirrel, but may also use manmade structures such as culverts; cement, asphalt, or wood debris piles; or openings beneath cement or asphalt pavement. The species' breeding season extends from February 1 through August 31.

Although few ground squirrel burrows were identified during surveys of the study area and evidence of burrowing owls was not observed, debris scattered throughout the study area could provide artificial burrows for burrowing owl. The annual brome grassland/VPC provides suitable foraging habitat for the species. One documented CNDDB occurrence of burrowing owl is within five miles of the study area (see Figure 7-4). The occurrence (CNDDB Occurrence #339) is located approximately two miles northeast of the study area, along Phillip Way. The occurrence was most recently observed in May 2019, when two owls were observed using the same burrow and exhibiting nesting behavior. Based on the above, burrowing owl has *low* potential for occurrence within the study area.

Swainson's Hawk

Swainson's hawk (*Buteo swainsoni*) is a raptor species that is not federally listed, but is listed as threatened by CDFW. The raptor is also a PCCP Covered Species. Breeding pairs typically nest in tall trees associated with riparian corridors, and forage in grassland, irrigated pasture, and cropland with a high density of rodents. The Central Valley populations breed and nest in the late spring through early summer before migrating to Central and South America for the winter.

The annual brome grassland/VPC throughout the study area represents suitable foraging habitat for Swainson's hawk, and the trees within the study area provide suitable nesting habitat. Thirteen occurrences of Swainson's hawk have been documented within five miles of the study area in the CNDDB (see Figure 7-4). The nearest occurrence (CNDDB Occurrence #791) is located approximately 1.5 miles northeast of the study area, in the Roseville Public Golf Course. Based on the above, Swainson's hawk has *high* potential for occurrence within the study area.

Northern Harrier

The northern harrier *(Circus cyaneus)* is not listed, pursuant to either the FESA or CESA. The species is a CDFW Species of Special Concern. Northern harrier, a ground-nesting species, is known to nest within the Central Valley, along the Pacific Coast, and in northeastern California, typically nesting in emergent wetland/marsh, open grasslands, or savannah habitats. Foraging occurs within a variety of open habitats such as marshes, agricultural fields, and grasslands.

The annual brome grassland/VPC throughout the study area provides suitable nesting and foraging habitat for the species. Northern harrier has not been documented in the CNDDB within five miles of the study area. Based on the above, northern harrier has *low* potential for occurrence within the study area.

Olive-Sided Flycatcher

The olive-sided flycatcher (*Contopus cooperi*) is not listed or protected pursuant to either the FESA or CESA. The species is a CDFW Species of Special Concern. The olive-sided flycatcher breeds in conifer forests in the coastal and mountainous regions of California and other areas to the east and north, winters in Central and South America, and occurs in California's Central Valley as an uncommon spring and fall migrant. Olive-sided flycatchers are almost always associated with forests and woodlands, especially openings and edges.

Suitable foraging habitat is present in the VFRW within the study area. Olive-sided flycatcher has not been documented in the CNDDB within five miles of the study area. Based on the above, olive-sided flycatcher has *low* potential for occurrence within the study area.

White-Tailed Kite

White-tailed kite (*Elanus leucurus*) is not federally or State listed. The raptor is a CDFW Fully Protected species. White-tailed kite is a yearlong resident of the Central Valley and is primarily found in or near foraging areas, such as open grasslands, meadows, farmlands, savannahs, and emergent wetlands. White-tailed kites typically nest from March through June in trees within riparian, oak woodland, and savannah habitats of the Central Valley and Coast Range.

The annual brome grassland/VPC throughout the study area provide suitable foraging habitat for white-tailed kite, and the trees within the study area provide suitable nesting habitat. The CNDDB includes one documented occurrence of white-tailed kite nests within five miles of the study area, the nearest of which is approximately 2.6 miles northeast of the study area, near the Woodcreek Golf Club (CNDDB Occurrence #56) (see Figure 7-4). Based on the above, white-tailed kite has *high* potential for occurrence within the study area.

Loggerhead Shrike

The loggerhead shrike *(Lanius ludovicianus)* is not listed, pursuant to either the FESA or CESA. The species is a CDFW Species of Special Concern. Loggerhead shrikes nest in small trees and shrubs in woodland and savannah vegetation communities, and forage in open habitats throughout California. The nesting season ranges from March through June.

The trees and annual brome grassland/VPC within the study area provide suitable foraging and nesting habitat for loggerhead shrike. The species has not been documented in the CNDDB within five miles of the study area. Based on the above, loggerhead shrike has *high* potential for occurrence within the study area.

Yellow Warbler

The yellow warbler *(Setophaga petechia)* is not listed, pursuant to the FESA or CESA. The species is a CDFW Species of Special Concern. The yellow warbler is largely extirpated as a breeder in the Sacramento Valley, but the bird is a common migrant during the fall and winter months. Yellow warblers generally occupy riparian vegetation in close proximity to streams. The species' preferred habitat in northern California is dominated by willows (*Salix* spp.), cottonwoods (*Populus* spp.), and Oregon ash (*Fraxinus latifolia*).

Although the study area is outside the species' breeding range, a yellow warbler has been documented along Dry Creek near the off-site sewer lift station improvements area, and suitable winter foraging habitat is present in the VFRW within the study area. Based on the above, yellow warbler has *low* potential for occurrence within the study area.

Pallid Bat

Pallid bat (*Antrozous pallidus*) is not federally or State listed. The species is a CDFW Species of Special Concern and classified by the WBWG as a High priority species. Pallid bat favors roosting sites in crevices in rock outcrops, caves, abandoned mines, hollow trees, and manmade structures, such as barns, attics, and sheds. Though pallid bats are gregarious, the species tends to group in smaller colonies of 10 to 100 individuals. The bat is a nocturnal hunter and captures prey in flight, but unlike most American bats, the species has been observed foraging for flightless insects, which the bat seizes after landing.

Tree hollows and exfoliating bark on trees throughout the study area represent suitable day and maternity roosting habitat for pallid bat. Pallid bat has not been documented in the CNDDB within five miles of the study area. Based on the above, pallid bat has *high* potential for occurrence within the study area.

Silver-Haired Bat

Silver-haired bat (*Lasionycteris noctivagans*) is not federally or State listed. The species is classified by the WBWG as a Medium priority species. Primarily considered a coastal and montane forest species, the silver-haired bat occurs in more xeric environments during winter and seasonal migrations. The bat roosts in abandoned woodpecker holes, under bark, and occasionally in rock crevices. The insectivore's favored foraging sites include open wooded areas near water features.

Tree hollows and exfoliating bark on trees throughout the study area provide suitable day and maternity roosting habitat for silver-haired bat. The species has not been documented in the CNDDB within five miles of the study area. Based on the above, silver-haired bat has *high* potential for occurrence within the study area.

Western Red Bat

Western red bat (*Lasiurus blossevillii*) is not federally or State listed. The species is a CDFW Species of Special Concern and is classified by the WBWG as a High priority species. Western red bat is typically solitary, roosting primarily in the foliage of trees or shrubs. Day roosts are commonly in edge habitats adjacent to streams or open fields, in orchards, and sometimes in urban areas. The species may associate with intact riparian habitat, particularly willows, cottonwoods, and sycamores.

Trees within the VFRW represent suitable day and maternity roosting habitat for western red bat. The species has not been documented in the CNDDB within five miles of the study area. Based on the above, western red bat has *low* potential for occurrence within the study area.

Hoary Bat

The hoary bat (*Lasiurus cinereus*) is not federally or State listed. The species is classified by the WBWG as a Medium priority species. Hoary bat is considered to be one of the most widespread of all American bats, with a range extending from Canada to central Chile and Argentina, as well as Hawaii. Hoary bats are solitary and roost primarily in foliage of both coniferous and deciduous trees, near the ends of branches at the edge of a clearing. The species may also occasionally roost in caves, beneath a rock ledge, in a woodpecker hole, in a grey squirrel nest, under a wood plank, or clinging to the side of a building.

Trees within the VFRW represent suitable day and maternity roosting habitat for hoary bat. The species has not been documented in the CNDDB within five miles of the study area. Based on the above, hoary bat has *low* potential for occurrence within the study area.

Trees

As discussed further in the Impacts and Mitigation Measures section of this chapter under Impact 7-14, potential project impacts to native trees and woodlands within the PCCP plan area, which encompasses the entirety of the study area, are mitigated through payment of land cover conversion fees. Because potential impacts would be mitigated through the PCCP by way of payment of land conversion fees based on acreage of woodland converted, the BRA did not quantify the number of native trees within the study area. As discussed above, the project site contains approximately 3.8 acres of VFRW land cover.

7.3 REGULATORY CONTEXT

A number of federal, State, and local policies provide the regulatory framework that guides the protection of biological resources. The following discussion summarizes those laws that are most relevant to biological resources in the vicinity of the project site. A discussion of water quality control statutes, regulations, and local requirements relevant to stormwater discharges from the project site is presented in Section 12.3, Regulatory Setting, in Chapter 12, Hydrology and Water Quality, of this EIR.

Federal Regulations

The following are the federal environmental laws and policies relevant to biological resources.

Federal Endangered Species Act

The U.S. Congress passed the FESA in 1973 to protect species that are endangered or threatened with extinction. FESA is intended to operate in conjunction with the National Environmental Policy Act (NEPA) to help protect the ecosystems upon which endangered and threatened species depend. FESA prohibits the "take" of endangered or threatened wildlife species. "Take" is defined to include harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species or any attempt to engage in such conduct (FESA Section 3 [3], [19]). Harm is further defined to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns (50 CFR Section 17.3). Harass is defined as actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns (50 CFR Section 17.3). Actions that result in take can result in civil or criminal penalties.

FESA provides greater protection to fish and wildlife than to plants. The "take" prohibition in Section 9 of FESA, which applies to private parties, does not protect federally-listed endangered or threatened plants located on private land, except insofar as such plants are already protected by State law. (16 U.S.C. Section 1538(a)(2)(B) ["it is unlawful for any person subject to the jurisdiction of the United States to … remove and reduce to possession any such species from *areas under Federal jurisdiction*; maliciously damage or destroy any such species on any such area; or remove, cut, dig up, or damage or destroy any such species on any other area in knowing violation of any law or regulation of any State or in the course of any violation of a State criminal trespass law"], italics added; *Northern California River Watch v. Wilcox* (9th Cir. 2011) 633 F.3d 766, 770 [the phrase, "areas under Federal jurisdiction," as used in ESA Section 9, does not apply to private land].)

When federal agencies are considering actions of their own and are consulting with either the USFWS or the NMFS pursuant to Section 7 of FESA, the consulting federal agencies shall insure that their proposed actions are not likely to jeopardize the continued existence of any endangered species or threatened species (including federally listed plants) or result in the destruction or adverse modification of the critical habitat of such species (including federally listed plants). (16 U.S.C. Section 1536(a)(2).)

For federally listed species covered under the PCCP, the Biological Opinions issued by the USFWS and NMFS for the PCCP provide incidental take coverage for covered projects under the PCCP that may impact federally listed species that are Covered Species under the PCCP. Further consultation is not required as long as the covered project complies with PCCP Avoidance, Minimization, and Mitigation Measures. For federally listed species that are not Covered Species under the PCCP, take coverage is required as outlined below.

In the context of the proposed project, FESA consultation with USFWS or the NMFS would be initiated if development resulted in take of a threatened or endangered species not covered under the PCCP or if issuance of a Section 404 permit or other federal agency action could result in take of an endangered species not covered under the PCCP or adversely modify critical habitat of such a species.

Migratory Bird Treaty Act

Raptors (birds of prey), migratory birds, and other avian species are protected by a number of State and federal laws. The federal Migratory Bird Treaty Act (MBTA) prohibits the killing, possessing, or trading of migratory birds except in accordance with regulations prescribed by the Secretary of Interior. Section 3503.5 of the California Fish and Game Code (CFGC) states, "It is unlawful to take, possess, or destroy any birds in the order *Falconiformes* or *Strigiformes* (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by the code or any regulation adopted pursuant thereto."

Clean Water Act

The USACE regulates discharge of dredged or fill material into waters of the U.S. under Section 404 of the Clean Water Act (CWA). "Discharge of fill material" is defined as the addition of fill material into waters of the U.S., including but not limited to the following: placement of fill that is necessary for the construction of any structure, or impoundment requiring rock, sand, dirt, or other material for the construction; site-development fills for recreational, industrial, commercial, residential, and other uses; causeways or road fills; and fill for intake and outfall pipes and sub-aqueous utility lines (33 CFR Section 328.2[f]). In addition, Section 401 of the CWA (Title 33 of

U.S. Code [USC], Section 1341) requires any applicant for a federal license or permit to conduct any activity that may result in a discharge of a pollutant into waters of the U.S. to obtain a certification that the discharge will comply with the applicable effluent limitations and water quality standards.

Waters of the United States (WOTUS) include a range of wet environments such as lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, and wet meadows. Wetlands are defined as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (33 CFR Section 328.3[b]).

Furthermore, jurisdictional waters of the U.S. can be defined by exhibiting a defined bed and bank and OHWM. The OHWM is defined by the USACE as "that line on shore established by the fluctuations of water and indicated by physical character of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas" (33 CFR Section 328.3[e]).

In May 2023, the United States Supreme Court interpreted the term "waters of the United States" as understood in wetland permitting in its decision in *Sackett v. Environmental Protection Agency*, 598 U.S. 651, 143 S.Ct. 1322 (2023). The Court's decision has been generally understood to contract the legal jurisdiction previously asserted by the USACE. In its opinion, the Court held that the "waters" protected under the CWA are limited to "geographic[al] features that are described in ordinary parlance as 'streams, oceans, rivers, and lakes'" and to adjacent wetlands that are "indistinguishable" from those bodies of water due to a continuous surface connection, though "temporary interruptions in surface connection may sometimes occur because of phenomena like low tides or dry spells."

On August 29, 2023, in response to the *Sackett* decision, USACE and the U.S. Environmental Protection Agency (EPA) issued a final rulemaking that revises the definition of WOTUS within USACE and EPA regulations. The adopted document is known as the WOTUS Rule. The WOTUS Rule defines "waters of the United States" to include the following:

- Traditional navigable waters, the territorial seas, and interstate waters (Jurisdictional Waters);
- Impoundments of Jurisdictional Waters (Jurisdictional Impoundments);
- Relatively permanent, standing or continuously flowing tributaries to either Jurisdictional Waters or Jurisdictional Impoundments (Jurisdictional Tributaries);
- Wetlands having a continuous surface connection to either Jurisdictional Waters, Jurisdictional Impoundments, or Jurisdictional Tributaries (Jurisdictional Wetlands); and
- Relatively permanent, standing or continuously flowing intrastate lakes and ponds with a continuous surface connection to (but are not themselves) a Jurisdictional Water, Jurisdictional Impoundment, Jurisdictional Tributary, or Jurisdictional Wetland.

For covered projects under the PCCP, impacts to Section 404 jurisdictional waters are addressed under the CARP, which allows a streamlined Section 404 permitting process for covered activities under the PCCP that will result in impacts to aquatic resources subject to Section 404 jurisdiction.

State Regulations

The following are the State environmental laws and policies relevant to biological resources.

California Department of Fish and Wildlife

CDFW administers a number of laws and programs designed to protect fish and wildlife resources under the CFGC, such as CESA (CFGC Section 2050, et seq.), Fully Protected Species (CFGC Section 3511) and the Lake or Streambed Alteration Agreement (LSAA) Program (CFGC Sections 1600 to 1616). Such regulations are summarized in the following sections.

California Endangered Species Act

The State of California enacted CESA in 1984. CESA is similar to the FESA but pertains to State-listed endangered and threatened species. Pursuant to CFGC Section 2080, no person or public agency shall "take" any species determined by the California Fish and Game Commission to be endangered or threatened, except as otherwise provided in the CESA, the Native Plant Protection Act (NPPA), or the California Desert Native Plants Act. Such incidental "take," however, can occur through a permit issued by CDFW under CFGC Section 2081. That statute empowers CDFW to issue a permit for lawful projects that otherwise be disallowed under the take prohibition found in Section 2080. Under the definition of "take" found in CFGC Section 86, which applies to Sections 2080 and 2081, "take" is defined as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." Under this definition, the concept of "take" extends to an activity that would directly or indirectly kill an individual of an endangered or threatened species, but does not include "harm" or "harass," as does the federal definition. As a result, the threshold for take is higher under CESA than under the FESA. Authorization for take of State-listed species can be obtained through a CFGC Section 2081 incidental take permit. As issued, such permits must ensure that the impacts of the authorized are minimized and fully mitigated. The measures required to meet this obligation shall be roughly proportional in extent to the impact of the authorized taking on the species. Where various measures are available to meet this obligation, the measures required shall maintain the applicant's objectives to the greatest extent possible. All required measures shall be capable of successful implementation.

As with FESA, for covered projects that may impact State-listed species under CESA that are also Covered Species under the PCCP, direct consultation with CDFW for State-listed take authorization is not required as long as the covered project complies with PCCP Avoidance, Minimization, and Mitigation Measures. For projects that may result in take of State-listed species that are not PCCP Covered Species, CESA directs agencies to consult with CDFW on projects or actions that could affect listed species, directs CDFW to determine whether jeopardy would occur and allows CDFW to identify "reasonable and prudent alternatives" to the project consistent with conserving the species. CESA allows CDFW to authorize exceptions to the State's prohibition against take of a listed species if the "take" of a listed species is incidental to carrying out an otherwise lawful project that has been approved under CEQA (CFGC Section 2081).

California Fish and Game Codes

A number of species have been designated "Fully Protected" species under Sections 5515, 5050, 3511, and 4700 of the CFGC, but are not listed as endangered (Section 2062) or threatened (Section 2067) species under CESA. Except for take related to scientific research or take undertaken pursuant to an adopted Natural Community Conservation Plan (NCCP), all take of Fully Protected species is prohibited. The CFGC defines take as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill."

Birds of prey are protected in California under provisions of the CFGC Section 3503.5 (1992), which states, "it is unlawful to take, possess, or destroy any birds in the order Falconiformes or Strigiformes (birds of prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this code or any regulation adopted pursuant thereto." Construction disturbance during the breeding season could result in the incidental loss of fertile eggs or nestlings, or otherwise lead to nest abandonment. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered "taking" by CDFW.

Lake or Streambed Alteration Program

The CDFW is responsible for conserving, protecting, and managing California's fish, wildlife, and native plant resources. To meet this responsibility, the CFGC Section 1602, requires notification to CDFW of any proposed activity that may substantially modify a river, stream, or lake. Notification is required by any person, business, State or local government agency, or public utility that proposes an activity that will:

- substantially divert or obstruct the natural flow of any river, stream or lake;
- substantially change or use any material from the bed, channel, or bank of any river, stream, or lake; or
- deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake.

For the purposes of Section 1602, rivers, streams and lakes must flow at least intermittently through a bed or channel. If notification is required and CDFW believes the proposed activity is likely to result in adverse harm to the natural environment, the CDFW will require that the parties enter into a LSAA.

CDFW Species of Special Concern

In addition to formal listings under FESA and CESA, plant and wildlife species receive additional consideration during the CEQA process. Species that may be considered for review are included on a list of "Species of Special Concern" developed by CDFW. Species whose numbers, reproductive success, or habitat may be threatened are tracked by CDFW in California.

Natural Communities Conservation Planning Act

The Natural Communities Conservation Planning Act is set forth in CFGC Sections 2800–2835. The intent of the legislation is to provide for conservation planning as an officially recognized policy that can be used as a tool to eliminate conflicts between the protection of natural resources and the need for growth and development. In addition, the legislation promotes conservation planning as a means of coordination and cooperation among private interests, agencies, and landowners, and as a mechanism for multispecies and multi-habitat management and conservation. The development of NCCPs is an alternative to obtaining take authorization under Section 2081 of the CFGC. The PCCP is an example of an NCCP.

Native Plant Protection Act

The NPPA was enacted in 1977 and allows the Fish and Game Commission to designate plants as rare or endangered. Currently, 64 species, subspecies, and varieties of plants are protected as rare under the NPPA. The NPPA prohibits take of endangered or rare native plants, but includes some exceptions for agricultural and nursery operations, emergencies, and after properly notifying CDFW for vegetation removal from canals, roads, and other sites, changes in land use, and in certain other situations.

Regional Water Quality Control Board

The PCCP and CARP serve as a program covering waters under the State's Section 401 authority. The Regional Water Quality Control Board (RWQCB) issued a Programmatic Section 401 to the County for Covered Activities. The PCCP and CARP also serve as a Watershed Plan for the purposes of meeting the RWQCB's requirements.

Any action requiring a CWA Section 404 permit, or a Rivers and Harbors Act Section 10 permit, must also obtain a CWA Section 401 Water Quality Certification. The State of California Water Quality Certification (WQC) Program was formally initiated by the State Water Resources Control Board (SWRCB) in 1990 under the requirements stipulated by Section 401 of the federal CWA. Although the CWA is a federal law, Section 401 of the CWA recognizes that states have the primary authority and responsibility for setting water quality standards. In California, under Section 401, the SWRCB and RWQCBs are the authorities that certify that issuance of a federal license or permit does not violate California's water quality standards (i.e., that they do not violate Porter-Cologne and the Water Code). The WQC Program currently issues the WQC for discharges requiring USACE's permits for fill and dredge discharges within waters of the U.S., and also implements the State's wetland protection and hydromodification regulation program under the Porter Cologne Water Quality Control Act.

On April 2, 2019, the SWRCB adopted a State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (Procedures), for inclusion in the forthcoming Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries of California Plan. The Procedures consist of four major elements: (1) a wetland definition; (2) a framework for determining if a feature that meets the wetland definition is a water of the State; (3) wetland delineation procedures; and (4) procedures for the submittal, review, and approval of applications for WQCs and Waste Discharge Requirements (WDR) for dredge or fill activities. The State Office of Administrative Law (OAL) approved the Procedures on August 28, 2019, and the Procedures became effective May 28, 2020.

Under the Procedures and the State Water Code (Water Code Section 13050[e]), "waters of the State" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state." Unless excluded by the Procedures, any activity that could result in discharge of dredged or fill material to waters of the State, which includes waters of the U.S. and non-federal waters of the State, requires filing of an application under the Procedures.

The Porter-Cologne Water Quality Control Act (Porter-Cologne Act, Water Code Section 13000 et seq.) is California's statutory authority for the protection of water quality in conjunction with the federal CWA. The Porter-Cologne Act requires the SWRCB and RWQCBs under the CWA to adopt and periodically update water quality control plans, or basin plans. Basin plans are plans in which beneficial uses, water quality objectives, and implementation programs are established for each of the nine regions in California. The Porter-Cologne Act also requires dischargers of pollutants or dredged or fill material to notify the RWQCBs of such activities by filing Reports of Waste Discharge and authorizes the SWRCB and RWQCBs to issue and enforce waste discharge requirements, National Pollutant Discharge Elimination System (NPDES) permits, Section 401 water quality certifications, or other approvals.

Oak Woodlands Conservation Act

Section 21083.4 of the California Public Resources Code requires counties to determine if a project within their jurisdiction may result in conversion of oak woodlands that would have a

significant adverse effect on the environment. If the lead agency determines that a project would result in a significant adverse effect on oak woodlands, mitigation measures to reduce the significant adverse effect of converting oak woodlands to other land uses are required.

Section 21083.4(b) provides the following four mitigation options where a county finds that a project may have a significant effect on oak woodlands: (1) conserve oak woodlands, through the use of conservation easements; (2) plant an appropriate number of trees, including maintaining plantings and replacing dead or diseased trees; (3) contribute funds to the Oak Woodlands Conservation Fund; and (4) "[o]ther mitigation measures developed by the county." The second option – tree planting – is subject to the following limitations and opportunities: (a) "[t]he requirement to maintain trees … terminates seven years after the trees are planted"; (b) this mitigation strategy "shall not fulfill more than one-half of the mitigation requirement for the project"; and (c) replanting "may be used to restore former oak woodlands."

Local Regulations

The following are the local environmental laws and policies relevant to biological resources.

Placer County Conservation Program

On September 1, 2020, Placer County adopted the PCCP, which is a Habitat Conservation Plan (HCP) under the FESA and a NCCP under the California Natural Community Conservation Planning Act. The PCCP applies to all Covered Activities within Placer County north of PFE Road, but outside of certain non-participating municipalities. The entire study area is within the PCCP plan area. The PCCP covers both terrestrial and aquatic species.

The PCCP includes the CARP to provide programmatic permit coverage related to Sections 401-404 of the CWA and Waters of the County. The CARP has a number of additional conditions for work within the vicinity of named streams and unnamed drainages. Conditions that are relevant to the proposed project include:

- Avoid and minimize activities within the Stream System including any area subject to flooding in a 100-year event as defined by the Federal Emergency Management Agency (FEMA) (FEMA 2005) or as determined by hydrologic analysis based on an engineering site survey (whichever is more accurate), or the outermost limit of a variable-width buffer measured outward from the edge of the OHWM on streams mapped in the National Hydrography Dataset (NHD) (so-called blueline streams). The OHWM corresponds to the waterline of the full channel when in non-flood condition and is defined as "that line on the shore established by the fluctuations of water and indicated by physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas" (33 Code of Federal Regulations [CFR] 328.8(e)). When the criteria specified by 33 CFR 328.8(3) are not present in the field or conditions do not provide a clear demarcation of the OHWM, the location of the OHWM will be based upon the two-year event. The area within 50 feet of streams, as measured from the OHWM as described above, not named, but which are shown as "blueline" streams on United States Geological Survey (USGS) Quad maps as specified in California Public Resources Code Section 4528 and as located on the NHD.
- Disturbance within 50 feet of the edge of riparian vegetation shall be limited to exempt activities such as bridge crossings, recreational trails, and outfalls. The 50-foot restricted area is referred to throughout this chapter as the "Riparian Buffer".

- Structures are not permitted within 50 feet of intermittent streams or within 100 feet of perennial streams unless authorized through an approved variance processed by Placer County. In addition, Placer County Code (Chapter 17.54.145) identifies a Watercourse Setback within which structures are not permitted except as approved by the Planning Director. The "Placer County Watercourse Setback" is defined as designated buffers for various named drainages, and 50-foot buffers for all other drainages in NHD. Within the overall project site, this is a 300-foot setback from Dry Creek, and a 50-foot setback from all other drainages.

As a permittee under the PCCP, Placer County can transfer take authorization to private entities conducting activities covered by the plan and under their jurisdiction. Covered Activities are generally any actions undertaken in the PCCP plan area by or under the authority of the Permittees that may affect Covered Species or Covered Natural Communities. The area for permit coverage under the HCP/NCCP has two main parts and associated subcomponents: (1) Plan Area A, comprised of Valley and Foothill areas; and (2) Plan Area B, which consists of subcomponent areas B1 through B5. The project site is within Plan Area A, which is the main focus of the HCP/NCCP and where all future growth and most of the Covered Activities will take place. Plan Area A is covered by a comprehensive permit and is comprised of the City of Lincoln plus all unincorporated lands within western Placer County: approximately 210,000 acres, or roughly five-sixths of western Placer County.

The Valley portion of Plan Area A, within which the project site is located, comprises the City of Lincoln and unincorporated western Placer County below roughly 200 feet in elevation. VPCs and annual grasslands are the primary natural communities in the Valley.

The PCCP addresses 14 Covered Species and several Covered Natural Communities, and includes conservation measures to protect all 14 Covered Species and their habitats. Avoidance and minimization measures (AMMs) are set forth in Chapter 6 of the PCCP, and are intended to ensure that adverse effects on Covered Species and Covered Natural Communities are avoided and minimized.

Applicants are required to obtain a signed Certificate of PCCP Authorization from Placer County for potential impacts to terrestrial and aquatic habitats. During the local impact authorization process, impact fees are calculated utilizing land cover data. Fees include Land Conversion fees and may also include Aquatic/Wetland Special Habitat fees. To address disturbances to vegetation communities/land covers within the PCCP, including disturbances to oak woodland acreages and impacts to individual trees, development fees are applied for a development project's vegetation community impacts, in accordance with PCCP guidelines.

According to Chapter 1, Introduction, Section 1.5.5, California Environmental Quality Act, of the PCCP (page 1-31), "[i]t is expected that the conservation provided in this Plan will be sufficient to meet all CEQA mitigation standards for impacts on the special-status species and natural communities that are covered in this Plan. However, because circumstances may change, full CEQA coverage through the EIS/EIR prepared for this HCP/NCCP cannot be guaranteed. Barring major changes, it is expected that future CEQA documents for activities that receive take coverage under this Plan will incorporate the conservation measures in this Plan by reference to comply with CEQA for the Covered Species and natural communities addressed in this Plan. The Plan implements a conservation strategy designed to achieve a comprehensive set of biological goals and objectives. Furthermore, as an NCCP, the Plan provides for broad-based planning to preserve natural communities at the ecosystem scale. [¶] Many of the conservation measures in

the Plan will also benefit other special-status species (i.e., species not covered by the Plan); such measures may be sufficient to meet CEQA standards for other special-status species as well."

Placer County General Plan

The PCGP biological resource policies that are applicable to the proposed project are presented below:

Natural Resources Element

Goal 6.A To protect and enhance the natural qualities of Placer County's rivers, streams, creeks and groundwater.

Policy 6.A.1 The County shall require the provision of sensitive habitat buffers which shall, at a minimum, be measured as follows: 100 feet from the centerline of perennial streams, 50 feet from centerline of intermittent streams, and 50 feet from the edge of sensitive habitats to be protected, including riparian zones, wetlands, old growth woodlands, and the habitat of special status, threatened or endangered species (see discussion of sensitive habitat buffers in Part I of this Policy Document). Based on more detailed information supplied as a part of the review for a specific project or input from state or federal regulatory agency, the County may determine that such setbacks are not applicable in a particular instance or should be modified based on the new information provided. The County may, however, allow exceptions, such as in the following cases:

1. Reasonable use of the property would otherwise be denied;
2. The location is necessary to avoid or mitigate hazards to the public;
3. The location is necessary for the repair of roads, bridges, trails, or similar infrastructure; or
4. The location is necessary for the construction of new roads, bridges, trails, or similar infrastructure where the County determines there is no feasible alternative and the project has minimized environmental impacts through project design and infrastructure placement.

Policy 6.A.3 The County shall require development projects proposing to encroach into a stream zone or stream setback to do one or more of the following, in descending order of desirability:

a. Avoid the disturbance of riparian vegetation;
b. Replace all functions of the existing riparian vegetation (on-site, in-kind);
c. Restore another section of stream (in-kind); and/or
d. Pay a mitigation fee for in-kind restoration elsewhere (e.g., mitigation banks).

Policy 6.A.4 Where stream protection is required or proposed, the County should require public and private development to:

a. Preserve stream zones and stream setback areas through easements or dedications. Parcel lines (in the case of a subdivision) or easements (in the case of a subdivision or other development) shall be located to optimize resource protection. If a stream is proposed to be included within an open space parcel or easement, allowed uses and maintenance responsibilities within that parcel or easement should be clearly defined and conditioned prior to map or project approval;
b. Designate such easement or dedication areas (as described in a. above) as open space;
c. Protect stream zones and their habitat value by actions such as: 1) providing an adequate stream setback, 2) maintaining creek corridors in an essentially natural state, 3) employing stream restoration techniques where restoration is needed to achieve a natural stream zone, 4) utilizing riparian vegetation within stream zones, and where possible, within stream setback areas, 5) prohibiting the planting of invasive, non-native plants (such as Vinca major and eucalyptus) within stream zones or stream setbacks, and 6) avoiding tree removal within stream zones;
d. Provide recreation and public access near streams consistent with other General Plan policies;
e. Use design, construction, and maintenance techniques that ensure development near a creek will not cause or worsen natural hazards (such as erosion, sedimentation, flooding, or water pollution) and will include erosion and sediment control practices such as: 1) turbidity screens and other management practices, which shall be used as necessary to minimize siltation, sedimentation, and erosion, and shall be left in place until disturbed areas; and/or are stabilized with permanent vegetation that will prevent the transport of sediment off site; and 2) temporary vegetation sufficient to stabilize disturbed areas.
f. Provide for long-term stream zone maintenance by providing a guaranteed financial commitment to the County which accounts for all anticipated maintenance activities.

Policy 6.A.5 The County shall continue to require the use of feasible and practical best management practices (BMPs) to protect streams from the adverse effects of construction activities and urban runoff and to encourage the use of BMPs for agricultural activities.

Goal 6.B To protect wetland communities and related riparian areas throughout Placer County as valuable resources.

Policy 6.B.1 The County shall support the “no net loss” policy for wetland areas regulated by the U.S. Army Corps of Engineers, the U.S. Fish and Wildlife Service, and the California Department of Fish and Wildlife. Coordination with these agencies at all levels of project review shall

continue to ensure that appropriate mitigation measures and the concerns of these agencies are adequately addressed.

Policy 6.B.2 The County shall require new development to mitigate wetland loss in both federal jurisdictional and non-jurisdictional wetlands to achieve "no net loss" through any combination of the following, in descending order of desirability: (1) avoidance; (2) where avoidance is not possible, minimization of impacts on the resource; or (3) compensation, including use of a mitigation and conservation banking program that provides the opportunity to mitigate impacts to special status, threatened, and endangered species and/or the habitat which supports these species in wetland and riparian areas. Non-jurisdictional wetlands may include riparian areas that are not federal "waters of the United States" as defined by the Clean Water Act.

Policy 6.B.3 The County shall discourage direct runoff of pollutants and siltation into wetland areas from outfalls serving nearby urban development. Development shall be designed in such a manner that pollutants and siltation will not significantly adversely affect the value or function of wetlands.

Policy 6.B.4 The County shall strive to identify and conserve remaining upland habitat areas adjacent to wetlands and riparian areas that are critical to the survival and nesting of wetland and riparian species.

Policy 6.B.5 The County shall require development that may affect a wetland to employ avoidance, minimization, and/or compensatory mitigation techniques. In evaluating the level of compensation to be required with respect to any given project, (a) on-site mitigation shall be preferred to off-site, and in-kind mitigation shall be preferred to out-of-kind; (b) functional replacement ratios may vary to the extent necessary to incorporate a margin of safety reflecting the expected degree of success associated with the mitigation plan; and (c) acreage replacement ratios may vary depending on the relative functions and values of those wetlands being lost and those being supplied, including compensation for temporal losses. Consideration shall be given to out-of-kind compensatory mitigation for wetland impacts when larger landscape-level goals and objectives may be met by doing so. The County shall continue to implement and refine criteria for determining when an alteration to a wetland is considered a less-than significant impact under CEQA.

Goal 6.C To protect, restore, and enhance habitats that support fish and wildlife species so as to maintain populations at viable levels.

Policy 6.C.1 The County shall identify and protect significant ecological resource areas and other unique wildlife habitats critical to protecting and sustaining wildlife populations. Significant ecological resource areas include the following:

a. Wetland areas including vernal pools.
b. Stream zones.
c. Any habitat for special status, threatened, or endangered animals or plants.
d. Critical deer winter ranges (winter and summer), migratory routes and fawning habitat.
e. Large areas of non-fragmented natural habitat, including blue oak woodlands, valley foothill and montane riparian, valley oak woodlands, annual grasslands, and vernal pool/grassland complexes.
f. Identifiable wildlife movement zones, including but not limited to, non-fragmented stream environment zones, avian mammalian migratory routes, and known concentration areas of waterfowl within the Pacific Flyway.
g. Important spawning and rearing areas for anadromous fish.
h. Habitat necessary to protect and recover populations of the Covered Species identified in the Placer County Conservation Program.

Policy 6.C.2 The County shall require development in areas known to have particular value for wildlife to be carefully planned and, where possible, located so that the reasonable value of the habitat for wildlife is maintained.

Policy 6.C.3 The County shall encourage the control of residual pesticides to prevent potential damage to water quality, vegetation, fish, and wildlife.

Policy 6.C.4 The County shall encourage private landowners to adopt sound fish and wildlife habitat management practices, as recommended by California Department of Fish and Wildlife officials, the U.S. Fish and Wildlife Service, the National Marine Fisheries Service, the U.S. Army Corps of Engineers, and the Placer County Resource Conservation District.

Policy 6.C.6 The County shall support programs that preserve the habitats of threatened, endangered, and/or other special status species including the implementation of the Placer County Conservation Program. Where County acquisition and maintenance is not practicable or feasible, federal and state agencies, as well as other resource conservation organizations, shall be encouraged to acquire and manage endangered species' habitats.

Policy 6.C.7 The County shall support the maintenance of suitable habitats for all indigenous species of wildlife, without preference to game or non-game species, through maintenance of habitat diversity.

Policy 6.C.9 The County shall require new private or public developments to preserve and enhance existing riparian habitat unless public safety concerns require removal of habitat for flood control or other essential public purposes (See Policy 6.A.1.). In cases where new

private or public development results in modification or destruction of riparian habitat the developers shall be responsible for acquiring, restoring, and enhancing at least an equivalent amount of like habitat within or near the project area.

Policy 6.C.11 Prior to approval of discretionary development permits involving parcels within a significant ecological resource area, the County shall require, as part of the environmental review process, a biotic resources evaluation of the sites by a wildlife biologist, the evaluation shall be based upon field reconnaissance performed at the appropriate time of year to determine the presence or absence of special status, threatened, or endangered species of plants or animals. Such evaluation will consider the potential for significant impact on these resources, and will identify feasible measures to mitigate such impacts or indicate why mitigation is not feasible. In approving any such discretionary development permit, the decision-making body shall determine the feasibility of the identified mitigation measures and whether the approval affects the viability of County, state or federal conservation programs that seek to protect the significant ecological resource areas.

Significant ecological resource areas shall, at a minimum, include the following:

a. Wetland areas including vernal pools.
b. Stream zones.
c. Any habitat for special status, threatened or endangered animals or plants.
d. Critical deer winter ranges (winter and summer), migratory routes and fawning habitat.
e. Large areas of non-fragmented natural habitat, including blue oak woodlands, valley foothill and montane riparian, valley oak woodlands, annual grasslands, vernal pool/grassland complexes habitat.
f. Identifiable wildlife movement zones, including but not limited to, non-fragmented stream environment zones, avian and mammalian migratory routes, and known concentration areas of waterfowl within the Pacific Flyway.
g. Important spawning and rearing areas for anadromous fish.
h. Habitat necessary to protect and recover populations of the Covered Species identified in the Placer County Conservation Program.

Policy 6.C.12 The County shall cooperate with, encourage, and support the plans of other public agencies to acquire fee title or conservation easements to privately-owned lands in order to preserve important wildlife corridors and to provide habitat protection of California Species of Concern and state or federally listed threatened, or endangered plant and animal species, or any species listed in an implementing agreement for a habitat conservation plan and natural

communities conservation plan such as the Placer County Conservation Program.

Policy 6.C.13 The County shall support and cooperate with efforts of other local, state, and federal agencies and private entities engaged in the preservation and protection of significant biological resources from incompatible land uses and development. Significant biological resources include endangered or threatened species and their habitats, wetland habitats, wildlife migration corridors, and locally important species/communities.

Goal 6.D To preserve and protect the valuable vegetation resources of Placer County.

Policy 6.D.1 The County shall encourage landowners and developers to preserve the integrity of existing terrain and natural vegetation in visually-sensitive areas such as hillsides, ridges, and along important transportation corridors.

Policy 6.D.2 The County shall require developers to use native and compatible non-native species, especially drought-resistant species, to the extent possible in fulfilling landscaping requirements imposed as conditions of discretionary permits or for project mitigation.

Policy 6.D.3 The County shall support the preservation of outstanding areas of natural vegetation, including, but not limited to, oak woodlands, riparian areas, vernal pools, and habitat necessary to protect and recover populations of the Covered Species identified in the Placer County Conservation Program.

Policy 6.D.4 The County shall ensure that landmark trees and major groves of native trees are preserved and protected. In order to maintain these areas in perpetuity, protected areas shall also include younger vegetation with suitable space for growth and reproduction.

Policy 6.D.5 The County shall require that new development preserve natural woodlands to the maximum extent possible.

Policy 6.D.6 The County shall ensure the conservation of sufficiently large, continuous expanses of vegetation that provides suitable habitat for maintaining abundant and diverse wildlife including habitat necessary to protect and recover populations of the Covered Species identified in the Placer County Conservation Program.

Policy 6.D.7 The County shall support the management of wetland and riparian plant communities for passive recreation, groundwater recharge, nutrient catchment, and wildlife habitats. Such communities shall be restored or expanded, where possible.

Policy 6.D.8 The County shall require that new development preserve natural woodlands to the maximum extent possible.

Policy 6.D.10 The County shall encourage the planting of native trees, shrubs, and grasslands in order to preserve the visual integrity of the landscape, provide habitat conditions suitable for native wildlife, and ensure that a maximum number and variety of well-adapted plants are maintained.

Policy 6.D.11 The County shall support the continued use of prescribed burning, mastication, chipping, and other methods to mimic the effects of natural fires to reduce fuel loads and associated fire hazard to human residents and to enhance the health of biotic communities.

Policy 6.D.14 The County shall require that new development avoid, as much as possible, ecologically-fragile areas (e.g., areas of rare or endangered species of plants, riparian areas). Where feasible, these areas should be protected through public acquisition of fee title or conservation easements to ensure protection.

Goal 6.E To preserve and enhance open space lands to maintain the natural resources of the County.

Policy 6.E.1 The County shall support the preservation and enhancement of natural land forms, natural vegetation, and natural resources as open space to the maximum extent feasible. The County shall permanently protect, as open space, areas of natural resource value, including wetlands, riparian corridors, unfragmented woodlands, and floodplains.

Policy 6.E.2 The County shall require that new development be designed and constructed to preserve the following types of areas and features as open space to the maximum extent feasible:

a. High erosion hazard areas;
b. Scenic and trail corridors;
c. Streams, riparian vegetation;
d. Wetlands;
e. Significant stands of vegetation;
f. Wildlife corridors; and
g. Any areas of special ecological significance.

Policy 6.E.3 The County shall support the maintenance of open space and natural areas that are interconnected and of sufficient size to protect biodiversity sustain viable populations, accommodate wildlife movement, and sustain ecosystems.

Dry Creek-West Placer Community Plan

The following goals and policies from the DCWPCP related to biological resources are applicable to the proposed project.

Community Development Element: The Land Use Plan

Goal 2 To preserve outstanding visual features, natural resources, and landmarks.

Policy 3 The retention of important open space features is critical to the future quality of life in the Plan area.

Policy 26 Encourage development activities in areas of least environmental sensitivity, and similarly, restrict from development activities those lands which are environmentally sensitive.

Community Development Element: Community Design Element

Policy 14 Where possible preserve native trees and support the use of native drought tolerant plant materials in all revegetation/landscaping projects.

Environmental Resources Management Element: Natural Resources

Goal 1 Provide for the protection of rare, threatened and endangered species and the habitat which supports those species.

Goal 2 Conserve the quality of all habitats which support the environment of fish and wildlife species so as to maintain populations at sustainable levels.

Goal 4 Safeguard and maintain natural waterways to ensure water quality, species diversity and unique habitat preservation.

Goal 6 Preserve outstanding areas of natural vegetation.

Policy 1 Any rare, significant, or endangered environmental features and conditions should be identified and programs designed to conserve or enhance their continued existence.

Policy 2 Preserve in their natural condition all stream environment zones, including flood plains, and riparian vegetation areas.

Policy 5 Identify all important fish and wildlife areas within the plan area and where feasible, protect these areas from urban/suburban encroachment.

Policy 6 Identify, preserve and protect areas of unique or significant natural vegetation, including but not limited to vernal pools, riparian areas and native oak groves.

Policy 8 Protect important spawning grounds, migratory routes, water-fowl resting areas, oak woodlands, and other unique wildlife habitats critical to protecting and sustaining wildlife populations.

Policy 12 Conservation of the natural landscape, including minimizing disturbance to natural terrain and vegetation, shall be an overriding consideration in the design of any subdivision or land development

project, paying particular attention to the protection and preservation of existing vegetation.

Policy 13 For landscaping which is part of site development where original vegetation has been removed or where additional plantings are included, the emphasis should be on drought tolerant, native species where possible.

Policy 14 No construction activities shall occur within the Dry Creek floodplain and only limited alteration of its tributaries shall be permitted except as part of the development of the floodplain as a recreational area, or for stream enhancement, or where work is done in accordance with the Placer County Flood Damage Prevention Ordinance, Department of Fish and Game Regulations, and Clean Water Act Provisions administered by the U.S. Corps of Engineers.

Policy 16 Require site specific studies, from qualified consultants, for projects which impact unique or significant fish, wildlife or vegetative resources.

Policy 17 Incorporate a mitigation monitoring program for all projects subject to environmental review where detrimental impacts to an area's natural resources have been identified.

Policy 18 Require field studies as part of project review where vernal pools are noted on the property. These studies shall document the possible occurrence of special status plant and wildlife species and provide a method of protecting, monitoring, replacing or otherwise mitigating development in and around these sensitive habitats.

Policy 19 Support the "no net loss" policy for wetland areas administered by the U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service and the State Department of Fish and Game. Continue to coordinate with these agencies at all levels of project review to ensure that their concerns are adequately addressed.

Policy 24 Tracts of undisturbed oak woodlands and valley grasslands that have significant value as wildlife habitat shall be preserved as open space.

Environmental Resources Management Element: Open Space

Goal 1 To preserve and enhance open space lands to maintain the natural resources and rural characteristics of the area.

Goal 2 To protect and preserve open spaces vital for wildlife habitat and other areas of major or unique ecological significance.

Goal 3 To protect the natural beauty and minimize disturbance of the natural terrain and vegetation.

Goal 4 To conserve and enhance the unique natural environment and open space of the area and to minimize disturbance of the natural terrain because these are unique and valuable assets for the Dry Creek-West Placer Community Plan Area, Placer County and the counties that border the area.

Goal 5 Preserve outstanding areas of natural vegetation including, but not limited to, oak woodlands, riparian areas and vernal pools.

Goal 6 To conserve the visual resources of the community, including the important vistas and wooded area, and in particular, the riparian habitat of Dry Creek and its intermittent streams and natural drainage channels which are important in providing low cost natural flood control.

Goal 7 Provide for the protection of rare, threatened and endangered species and/or the habitat which supports these species.

Goal 10 To provide open space to shape and guide development and to enhance community identity.

Policy 1 Preserve in their natural condition all stream environment zones, including floodplains, and riparian vegetation areas.

Policy 4 Encourage both private and public ownership and maintenance of open space.

Policy 5 Protect natural areas along creeks and canals through the use of non-development setback with setback distances varying according to the significance of the area to be protected.

Policy 12 Development on private lands should be planned and designed to provide for preservation of open space.

Policy 13 Because the dominant features of the Planning Area contributing to the open quality are the natural land forms and vegetation, structures should be subordinated thereto. Only in the confines of individual sites should structures be allowed to be dominant.

Policy 17 Stream corridors shall be left in an open, natural condition, except for structures or uses which are compatible with stream corridors.

Policy 18 In the design and development of new subdivisions the following types of areas and features shall be preserved as open spaces to the maximum extent feasible: high hazard areas, scenic and trail corridors, streams, streamside vegetation, other significant stands of beneficial native vegetation, and any areas of special ecological significance.

Policy 21 Where impacts to stream environment zones or wetland are unavoidable, project specific mitigation shall include the identification and quantification of vegetation impacted, the

preparation or revegetation plans to assure no net loss of riparian or wetland acreage or values, and the specific monitoring of pans to assure compliance and satisfactory results.

7.4 IMPACTS AND MITIGATION MEASURES

The following section describes the standards of significance and methodology used to analyze and determine the proposed project's potential impacts related to biological resources. In addition, a discussion of the project's impacts, as well as mitigation measures where necessary, is also presented.

Standards of Significance

Consistent with CEQA Guidelines Section 15065(a)(1) and Appendix G of the CEQA Guidelines, and Placer County's Environmental Checklist, a significant impact would occur if the proposed project would do any of the following:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS;
- Have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance;
- Conflict with the provisions of an adopted HCP, NCCP, or other approved local, regional, or State habitat conservation plan;
- Substantially reduce the habitat of a fish or wildlife species;
- Cause a fish or wildlife population to drop below self-sustaining levels;
- Threaten to eliminate a plant or animal community;
- Substantially reduce the number of or restrict the range of an endangered, rare, or threatened species; or
- Have a substantial adverse effect on the environment by converting oak woodlands.

Method of Analysis

The information contained in the analysis is primarily based on the BRA prepared by Madrone.

Biological Resources Assessment

The analyses within the BRA are based on a literature review and field surveys of the study area, which are detailed further below.

Literature Review

A list of special-status plant and wildlife species with potential to occur within the study area was developed as part of the BRA through queries of the following databases:

a) CNDDB query of the study area and all areas within five miles of the study area (see Figure 7-4);
b) USFWS Information for Planning and Conservation (IpaC) query of the study area (included as Attachment B of the BRA);
c) CNPS Rare and Endangered Plant Inventory query of the "Citrus Heights, California" U.S. Geological Survey topographic quadrangle and the eight surrounding quadrangles (included as Attachment C of the BRA); and
d) WBWG Species Matrix.

In addition, any special-status species that are known to occur in the project region, but that were not identified in any of the above database searches, were also analyzed for their potential to occur within the study area.

Field Surveys

Madrone conducted recent field surveys of various portions of the study area, as well as prior surveys conducted for previous proposals. Field surveys were conducted on September 3, 2015, March 15 and May 9, 2018, April 30 and May 16, 2024, March 4 and 31, April 8, May 8, June 9 and 26, and July 1, 2025, to map vegetation communities/land covers and assess the suitability of habitats on-site to support special-status species. Protocol-level special-status plant surveys were conducted within the project site on March 15 and May 9, 2018 and April 30 and May 16, 2025. Protocol-level VELB surveys were conducted throughout the study area concurrent with the 2018 special-status plant surveys and again on May 8, 2025. An aquatic resources delineation of the project site was conducted in accordance with USACE protocol on September 3, 2015, March 15 and May 9, 2018, and July 9, 2025. A protocol-level aquatic resources delineation, special-status plant survey, and VELB habitat survey of the off-site sewer lift station improvements area was conducted on June 9, 2025. Protocol-level Swainson's hawk nest surveys and tricolored blackbird nesting surveys were conducted for the project site and a 0.25-mile buffer area on March 31, April 4, 8, 15, and 30, and June 25, 2025. Protocol-level wet-season surveys for large branchiopods were conducted within the project site throughout the winter of 2024-2025. Meandering pedestrian surveys were performed on foot throughout the study area. Vegetation communities were classified in accordance with the PCCP land covers, and plant taxonomy was based on the nomenclature in the Jepson eFlora. A list of all wildlife species observed during the field surveys is included as Attachment D in the BRA (see Appendix D of this EIR).

The results of the protocol-level surveys described above were incorporated into and included as the following attachments to the BRA:

- Aquatic Resources Delineation Report for Placer Christian High School (Attachment E of the BRA);
- Aquatic Resources Delineation Report for Placer Creek Residential (Attachment E of the BRA);
- Special-Status Plant Survey Report for Fong Property (Attachment F of the BRA); and
- 90-Day Survey Report for 2024-25 Wet-Season Surveys for Listed Large Branchiopods for Estia Dry Creek (Attachment G of the BRA).

Project-Specific Impacts and Mitigation Measures

The following discussion of impacts related to biological resources is based on implementation of the proposed project, as well as the two affordable housing options analyzed throughout this EIR, in comparison to existing conditions and the standards of significance presented above. In most

cases, potential environmental impacts associated with the proposed project and the 22 on-site ADUs would not differ. Thus, unless otherwise noted, the below analysis applies to both the proposed project and the on-site ADUs.

7-1 Impacts to special-status plant species either directly (e.g., threaten to eliminate a plant community) or through substantial habitat modifications. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could result in impacts to special-status plant species either directly or through substantial habitat modifications.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the biological and habitat conditions of the project site and off-site sewer lift station improvements area are similar, the potential for either component to result in impacts to special-status plant species, either directly or through substantial habitat modifications, would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

As detailed in Table 7-3, the special-status plant species with potential to occur within the study area, due to the presence of suitable habitat, include big-scale balsamroot, dwarf downingia, Bogg's Lake hedge-hyssop, Ahart's dwarf rush, legenere, pincushion navarretia, slender Orcutt grass, Sacramento Orcutt grass, and Sanford's arrowhead. The protocol-level special-status plant surveys conducted throughout the study area in 2024 and 2025 did not identify any of the aforementioned species that could occur within study area; however, given enough time, plants may become established in areas where suitable habitat exists. Various on-site vegetation communities proposed for disturbance, such as the annual brome grassland/VPC and VFRW, provide suitable habitat for a variety of special-status plant species. Therefore, special-status plants could become established within the foregoing vegetation communities in the interim between surveys/analysis and eventual construction, which could result in potential impacts during construction of the proposed project.

The PCCP contains objectives focused on protecting and restoring grasslands on a regional scale. Actions to meet such objectives would protect or restore habitat for many of the special-status plant species discussed above. As explained in Section 5.2.6.1 of the PCCP (pages 5-18 and 5-19), Objective VPCG-1.3 ("Protect Grasslands") is to "[p]rotect 2,740 acres of grassland natural community (i.e., non-vernal pool complex grassland), including 350 acres in the Valley [Reserve Acquisition Area] RAA and 2,390 acres in the Foothills RAA (Tables 5-3)."

The rationale for this objective is as follows: "In the Valley, grasslands are interspersed with vernal pool complexes (vernal pool complexes comprise vernal pool constituent habitats and upland grasslands; see Chapter 3, *Physical and Biological Resources*, for descriptions of communities) and other natural communities. Most grasslands

within the Valley have vernal pool constituent habitats interspersed within them, and will therefore be protected as vernal pool complexes. The grassland protection commitment, in conjunction with Objectives VPCG 1.1 and VPCG 1.2, is intended to connect vernal pool complexes within a large, interconnected Reserve System of grassland and vernal pool complexes that will support grassland-dependent Covered Species and other native species. Large, interconnected grasslands are expected to benefit Swainson's hawk, western burrowing owl, and tri-colored blackbird by providing foraging and nesting habitat, and giant garter snake and western pond turtle by providing habitat for aestivation, resting and nesting."

The PCCP also contains Objective VPCG-1.4 ("Restore Grasslands"), which provides that "[i]n addition to the protection of 2,740 acres of existing grassland natural community, restore 1,000 acres of grassland in the Reserve System in the Valley, independent of effects (Table 5-4)."

The rationale for this objective is as follows: "An extensive amount of grassland has been converted to agriculture and for urban and suburban development in western Placer County and throughout California, fragmenting remaining grasslands. The Plan will restore grasslands from existing agricultural lands. The grassland restoration commitment is intended to expand and connect existing grasslands and vernal pool complexes to reduce fragmentation and increase permeability across the grassland/vernal pool complex landscape. [¶] Grasslands will be restored to sustain important habitat functions such as foraging, dispersal, and shelter for Covered Species and other native species. Grassland restoration will increase the extent, connectivity, and quality of grassland habitat available for use by Covered Species and other native species and thus contribute to their conservation. Covered Species expected to benefit from restored grasslands include Swainson's hawk, western burrowing owl, tri-colored blackbird, giant garter snake, and western pond turtle. [¶] The restored grasslands will be planted with a mixture of native and naturalized grasses and forbs, and managed to encourage native biodiversity, but will not require a predominance of natives for the restored lands to contribute to the 1,000-acre restoration commitment. Creation and maintenance of large areas of native grassland can be very costly and often unsuccessful, and the Covered Species do not require grasslands dominated by native grasses and forbs to benefit from grassland restoration. Once grassland restoration sites are selected, restoration designs will include success criteria for the proportion of native species (e.g., in terms of biomass, percent cover, or other appropriate metrics) based on the site conditions and comparable reference sites, if available. Such success criteria will be identified in site-level restoration plans (Section 5.3.3.2.1, *Site-level Restoration Plans*). This objective is intended to be met Plan-wide; some restoration sites may only be able to maintain the same proportion of natives pre-restoration, while others will increase it. Management goals for the control of non-native invasive species on restored and protected grasslands will be established in the reserve unit management plans."

Based on the above, if construction activities commence during or following the spring of 2026, without additional field surveys, the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a plant species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS.

Off-Site Affordable Housing Parcel

As discussed within Chapter 3, Project Description, of this EIR, the potential future development of the off-site affordable housing parcel would require an amendment to the RVSP and a rezone of the parcel to the newly established zone of Residential Multifamily 30 (RM30), which could result in a maximum development potential of 120 affordable income-restricted units. Because the off-site affordable housing parcel is currently undeveloped, development of the site could result in impacts to special-status plant species beyond those identified within the BRA prepared for the proposed project. While the proposed project would include a Rezone to allow for development of the aforementioned units, the County has previously planned for buildout of the site, as evidenced by the site's previous designations of HDR and Commercial. As such, impacts related to special-status plant species have been previously addressed in the RVSP EIR. As part of the RVSP EIR, focused special-status plant surveys were conducted on parcels within the planning area, including the off-site affordable housing parcel, and special-status plant species were not documented. However, as discussed above, given enough time plants may become established where suitable habitat exists. Therefore, because approximately 20 years have passed since the RVSP EIR plant surveys were conducted, the potential exists that special-status plants have been established and are present on the off-site affordable housing parcel.

Based on the above, without additional surveys for special-status plant species, the potential future development of the off-site affordable housing parcel could have a substantial adverse effect, either directly or through habitat modifications, on a plant species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS.

Conclusion

Based on the above, if construction activities commence during or following the spring of 2026, without additional field surveys, the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a plant species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. In addition, given the substantial amount of time that has passed since a plant survey has been conducted on the off-site affordable housing parcel, without additional surveys for special-status plant species, the potential future development on the off-site affordable housing parcel could result in a significant direct loss, indirect loss, or habitat modification of plant species identified as candidate, sensitive, or special-status species. Thus, a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measure, understood against the backdrop of the PCCP objectives described above, would reduce the above potential impacts to a *less-than-significant* level by ensuring the avoidance of any net loss of individual special-status plants that could be affected by the proposed project. In addition, at such time the off-site affordable housing parcel gets developed, the future developer would be required to comply with the following mitigation measure prior to development of the parcel.

Proposed Project, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

7-1 *If construction within the 97.4-acre study area analyzed in the BRA prepared for the proposed project has not commenced prior to March 15, 2027, a new round of special-status plant surveys shall be conducted in areas proposed for disturbance within three years prior to the commencement of construction.*

At such time the off-site affordable housing parcel gets developed, a new round of special-status plant surveys shall be conducted in areas proposed for disturbance, prior to the commencement of construction.

The surveys shall be conducted in accordance with the USFWS Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed, and Candidate Plants, the CNPS Botanical Survey Guidelines of the California Native Plant Society, and Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities. The survey results shall be submitted to the Placer County Community Development Resource Agency prior to the commencement of construction activities. If special-status plant species are not found, further mitigation shall not be required.

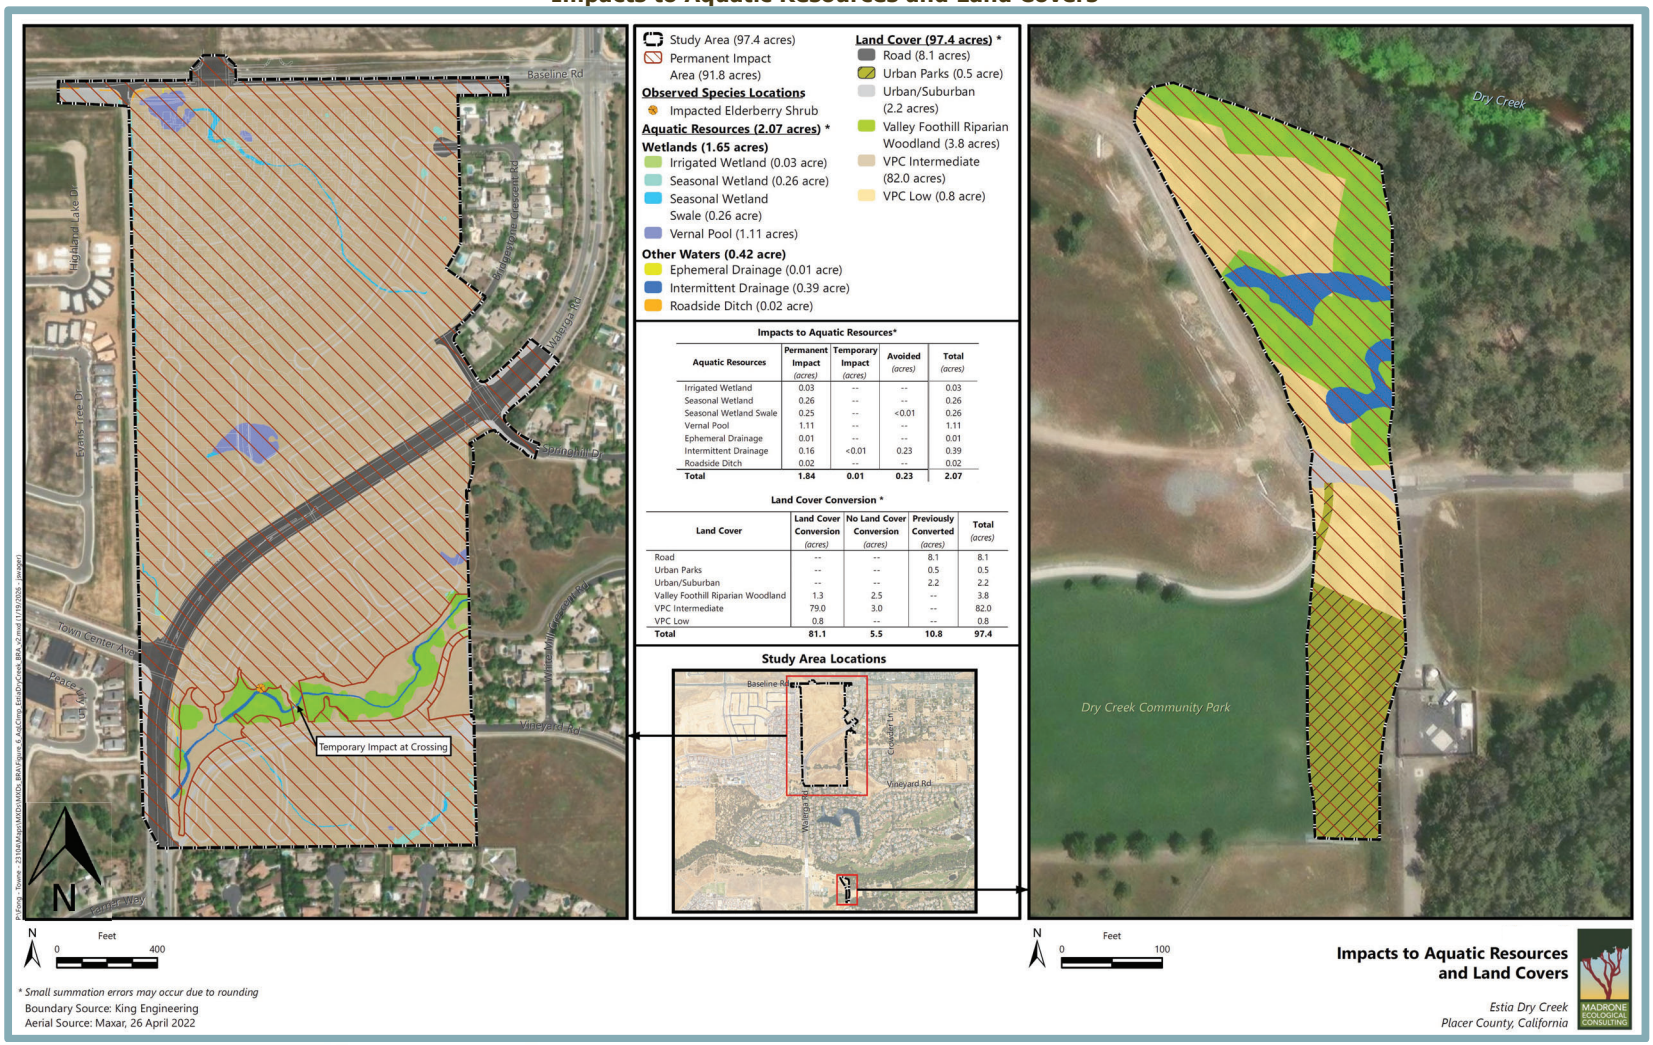
If special-status plants are found within the proposed impact area and they are perennials, such as Sanford's arrowhead or big-scale balsamroot, then mitigation shall consist of a qualified biologist or botanist digging up the plants and transplanting them into a suitable avoided area (e.g., planned open space) on-site prior to construction. If the plant found is an annual such as dwarf downingia, then mitigation shall consist of collecting seed-bearing soil and spreading it into a suitable constructed wetland at a mitigation site. If special-status plants are impacted, a mitigation plan shall be developed and approved by the Placer County Community Development Resource Agency. The Mitigation Plan shall describe the proposed mitigation for impacts to the plant species, and include (at minimum) details regarding success criteria, monitoring, reporting, and contingency in case of failure. Mitigation for the transplantation/establishment of rare plants shall not result in the net loss of individual plants after a five-year monitoring period.

7-2 Impacts to Crotch's bumble bee either directly (e.g., cause a wildlife population to drop below self-sustaining levels or threaten to eliminate an animal community) or through substantial habitat modifications or substantial reduction in the number or range of the species. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could result in impacts to Crotch's bumble bee either directly or through substantial habitat modifications or substantial reduction in the number or range of the species.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the biological and habitat conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to result in impacts to Crotch's bumble bee, either directly or through substantial habitat modifications or substantial reduction in the number or range of the species, would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.



As discussed above, the annual brome grasslands/VPC within the study area represents suitable habitat for Crotch's bumble bee. Crotch's bumble bee is a candidate for listing under CESA. Although a decision on the listing has not yet been published, a decision could be published by the time that construction begins on the proposed project. Development of the proposed project would result in the permanent removal of approximately 79.8 acres of annual brome grasslands/VPC (see Figure 7-5). As such, the BRA concluded that removal of such habitat could result in a substantial adverse effect to Crotch's bumble bee.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is currently undeveloped and, based on Figure 6-1a of the RVSP EIR, consists primarily of annual grasslands, which could represent suitable habitat for Crotch's bumble bee. Impacts to Crotch's bumble bee as a result of buildout of the RVSP were not addressed in the RVSP EIR, because the species was not yet being considered for listing at the time the RVSP EIR was drafted. Development of the site with a maximum of 120 affordable income-restricted units and associated improvements could result in impacts to Crotch's bumble bee either directly or through the removal of suitable habitat.

Based on the above, the potential future development of the off-site affordable housing parcel, could have a substantial adverse effect, either directly or through habitat modifications, on Crotch's bumble bee.

Conclusion

Based on the above, the proposed project, including potential future development of the off-site affordable housing parcel, could have a substantial adverse effect, either directly or through habitat modifications, on a wildlife species (Crotch's bumble bee) identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. Thus, a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measure would reduce the above potential impacts to a *less-than-significant* level, as the measure would ensure that Crotch's bumble bee populations would not be eliminated completely or drop below self-sustaining levels and would preclude any substantial adverse effect on the species' habitat or any substantial reduction in the number or range of the species.

Proposed Project, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

7-2 *Initial ground-disturbing activities associated with development of the 97.4-acre study area or at such time the off-site affordable housing parcel gets developed (e.g., grading, vegetation removal, staging) should take place between September 1 and March 31 (i.e., outside the colony active period) to avoid potential impacts on Crotch's bumble bee. If initial ground-disturbing activities do not occur between September 1 and March 31, then at a maximum of 14 days prior to the commencement of construction activities, a qualified biologist with 10 or more years of experience conducting biological resource surveys within California shall conduct a preconstruction survey for Crotch's bumble bee in the area(s) proposed for impact.*

The survey shall occur during the period from one hour after sunrise to two hours before sunset, with temperatures between 65 degrees Fahrenheit and 90 degrees Fahrenheit, with low wind and zero rain. If the timing of the start of construction makes the survey infeasible due to the temperature requirements, the surveying biologist shall select the most appropriate days based on the National Weather Service seven-day forecast and shall survey at a time of day that is closest to the temperature range stated above. The survey duration shall be commensurate with the physical extent of suitable floral resources (which represent foraging habitat) present within the area proposed for impact, and the level of effort shall be based on the metric of a minimum of one person-hour of searching per three acres of suitable floral resources/foraging habitat. A meandering pedestrian survey shall be conducted throughout the area proposed for impact in order to identify patches of suitable floral resources.

Suitable floral resources for Crotch's bumble bee include species in the following families: Apocynaceae, Asteraceae, Boraginaceae, Fabaceae, and Lamiaceae.

At a minimum, preconstruction survey methods shall include the following:

- *Search areas with floral resources for foraging bumble bees. Observed foraging activity may indicate a nest is nearby, and therefore, the survey duration shall be increased when foraging bumble bees are present;*
- *If Crotch's bumble bee are observed, watch any Crotch's bumble bees present and observe their flight patterns. Attempt to track their movements between foraging areas and the nest;*
- *Visually look for nest entrances. Observe burrows, any other underground cavities, logs, or other possible nesting habitat;*
- *If floral resources or other vegetation preclude observance of the nest, small areas of vegetation may be removed via hand removal, line trimming, or mowing to a height of a minimum of four inches to assist with locating the nest;*
- *Look for concentrated Crotch's bumble bee activity;*
- *Listen for the humming of a nest colony; and*
- *If bumble bees are observed, attempt to photograph the individual and identify it to species.*

The biologist conducting the survey shall record when the survey was conducted, a general description of any suitable foraging habitat/floral resources present, a description of observed bumble bee activity, a list of bumble bee species observed, a description of any vegetation removed to facilitate the survey, and their determination of if survey observations suggest a Crotch's bumble bee nest(s) may be present or if construction activities could result in take of special-status bumble bees. The report shall be submitted to the Placer County Community Development Resource Agency prior to the commencement of construction activities.

If bumble bees are not located during the preconstruction survey or the bumble bees located are definitively identified as a common species (i.e., not special-status species), then further mitigation or coordination with the California Department of Fish and Wildlife (CDFW) is not required.

If any sign(s) of a bumble bee nest is observed, and if the species present cannot be established as a common bumble bee, then construction shall not commence until either (1) the bumble bees present are positively identified as common (i.e., not a special-status species), or (2) the completion of coordination with CDFW to identify appropriate mitigation measures, which may include, but not be limited to, waiting until the colony active season ends, establishment of nest buffers, or obtaining an Incidental Take Permit (ITP) from CDFW.

If special-status bees are located, and after coordination with CDFW take of special-status bumble bees cannot be avoided, the project

applicant shall obtain an ITP from CDFW, and the applicant shall implement all conditions identified in the ITP.

Consistent with Fish and Game Code Section 2081, mitigation required by any ITP obtained from CDFW shall minimize and fully mitigate any impacts of the authorized take, be roughly proportional in extent to the impact of the take, be capable of successful implementation, and, where various alternative measures are available, maintain the applicant's objectives to the greatest extent possible. Specific required permit conditions may include, but not be limited to, the project applicant's qualified biologist translocating nesting substrate in accordance with the latest scientific research to another suitable location (i.e., a location that supports similar or better floral resources as the impact area), enhancing floral resources on areas of the project site that will remain appropriate habitat, worker awareness training, and/or other measures specified by CDFW.

7-3 Impacts to special-status branchiopods either directly (e.g., cause a wildlife population to drop below self-sustaining levels, threaten to eliminate an animal community) or through substantial habitat modifications or substantial reduction in the number or range of the species. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could result in impacts to special-status branchiopods either directly or through substantial habitat modifications or substantial reduction in the number or range of the species.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the biological and habitat conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to result in impacts to special-status branchiopods, either directly or through substantial habitat modifications or substantial reduction in the number or range of the species, would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

The identified special-status branchiopod species with the potential to occur within the study area include vernal pool fairy shrimp and vernal pool tadpole shrimp, which are both PCCP Covered Species. The vernal pool fairy shrimp is federally listed as threatened, while the vernal pool tadpole shrimp is federally listed as endangered. The project site contains approximately 1.11 acres of vernal pool that is considered potential habitat for vernal pool fairy shrimp and vernal pool tadpole shrimp. The on-site vernal pool habitat would be permanently impacted by development of the proposed project (see Figure 7-5). However, protocol-level surveys have not identified the presence of vernal pool fairy shrimp or vernal pool tadpole shrimp in all suitable

habitat on-site. Therefore, the BRA concluded that construction of the proposed project would not result in potential impacts to the foregoing species. Although the BRA determined that special-status branchiopod species are not currently present within the project site, the proposed project would result in the loss of suitable habitat for such species.

PCCP section 5.4.11.3 (Conservation Strategy) at pages 5-149 and 5-150 explains that "[t]he Plan's conservation strategy for the vernal pool branchiopods provides protection of 17,000 acres of VPC, including at least 790 wetted acres of vernal pool constituent habitats (Objective VPCG-1.1, *Protect Vernal Pools*). Additionally, it provides restoration or creation of at least 3,000 acres of vernal pool complex in the Reserve System, including at least 900 wetted acres of vernal pools and seasonal wetland habitat for covered vernal pool branchiopods, and additional acres, in-kind, to meet a 1.5:1 ratio of restored to affected habitat (Objective VPCG-1.2, *Restore/Create Vernal Pools*). The Placer Conservation Authority (PCA) will manage and enhance vernal pool branchiopod habitat in the Reserve System through actions described in Conservation Measure 2, *Manage and Enhance the Reserve System*, to reduce non-native species, increase native species diversity, and enhance and maintain the natural hydrology of vernal pool complexes in the Reserve System (Objectives L-3.2, *Reduce Non-native Species and Increase Native Species,* and VPCG-2.1, *Enhance Vernal Pool Vegetation and Hydrology*). The Reserve System will include sufficient occupied vernal pool fairy shrimp and vernal pool tadpole shrimp habitat to ensure an occupancy rate that is equal to or greater than the occupancy rate of vernal pools lost as a result of Covered Activities, for each species (Objectives VPB-1.1, *Maintain Vernal Pool Fairy Shrimp Occupancy in the Reserve System*, and VPB-1.2, *Maintain Vernal Pool Tadpole Shrimp Occupancy in the Reserve System*). This will be accomplished through vernal pool acquisition and restoration/creation, as described in Conservation Measures 1, *Establish Reserve System*, and 3, *Restore and Create Natural Communities and Covered Species' Habitat.* The PCA will also protect two occurrences of Conservancy fairy shrimp for the first occurrence lost and three occurrences for each additional occurrence lost."

"The Plan's conservation strategy provides for the recovery needs of the vernal pool fairy shrimp and vernal pool tadpole shrimp in the Plan Area, consistent with the Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon (U.S. Fish and Wildlife Service 2005). The recovery plan has no conservation goals for Conservancy fairy shrimp in Placer County. The core recovery area for vernal pool fairy shrimp and vernal pool tadpole shrimp in western Placer County totals 31,078 acres, of which 25,526 acres are mapped as vernal pool complex. The vernal pool recovery plan sets a goal of 85 percent protection of suitable vernal pool fairy shrimp and vernal pool tadpole shrimp habitat in the western Placer County core recovery area."

"Combined with existing protected vernal pool complexes in the core recovery area (5,421 acres or 21 percent), implementation of the Plan will result in the protection of approximately 51 percent of vernal pool complexes in the western Placer County core recovery area. This falls short of the 85 percent protection goal identified for this area in the recovery plan. However, this core area is identified as a Zone 2 area, indicating that the recovery goals have greater flexibility than for Zone 1 core areas and that these goals may be modified on a case-by-case basis based on additional information,

particularly for more widespread species such as vernal pool fairy shrimp (U.S. Fish and Wildlife Service 2005, page III-6)."

"By the end of the permit term, 27,068 acres of vernal pool complexes will be protected and restored in the Plan Area, which is greater than the total core area acreage recommended for protection by the recovery plan for western Placer County (i.e., 85 percent of the suitable habitat in the core area, or approximately 26,420 acres)."

Notwithstanding the above, the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a branchiopod species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is currently undeveloped and, based on Figure 6-1a of the RVSP EIR, consists primarily of annual grasslands with seasonal wetlands located on the southeast portion of the parcel. The on-site seasonal wetlands could represent suitable habitat for special-status branchiopod species. As discussed under Impact 6-4 of the RVSP EIR, buildout of the RVSP could result in the loss of habitat that could be occupied by special-status branchiopod species. Thus, development of the site with a maximum of 120 affordable income-restricted units and associated improvements could result in impacts to special-status branchiopod species either directly or through the removal of suitable habitat. However, the RVSP EIR included Mitigation Measure 6-4a, which is intended to avoid and compensate for potential impacts to special-status branchiopods.

At such time the off-site affordable housing parcel gets developed, the future developer would be required by the County to implement the RVSP EIR Mitigation Measure 6-4a, which is incorporated into this EIR as Mitigation Measure 7-3(c). Mitigation Measure 6-4a of the certified RVSP EIR requires avoidance and compensation for potential impacts to special-status branchiopod species. As determined in the RVSP EIR, implementation of Mitigation Measure 6-4a would reduce potential impacts to special-status branchiopod species to a less-than-significant level.

Conclusion

Based on the above, implementation of RVSP EIR Mitigation Measure 6-4a would be required to ensure the potential future development of the off-site affordable housing parcel would result in a less-than-significant impact to special-status branchiopod species. In addition, development of the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a branchiopod species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. Thus, a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measures, understood against the backdrop of the PCCP objectives described above, would reduce the above potential impacts to a *less-than-significant* level by ensuring the avoidance of any net loss of special-status branchiopod species that could be affected by the proposed project.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

7-3(a) *The Permittee shall apply for and be issued coverage under the PCCP to mitigate for all impacts to Covered Species, land cover, and sensitive natural communities. Prior to application approval, additional species surveys may be necessary, and prior to construction, land cover and special habitat fees shall be paid. The Permittee shall comply with the terms of the PCCP Coverage Certificate, including compliance with all avoidance, mitigation, and minimization measures, which may include pre-construction surveys, construction monitoring, and BMPs.*

> *PCCP General Condition 3: The proposed project shall pay a land conversion fee for the permanent conversion of natural land cover including VPC Low, VPC Intermediate, and Valley Foothill Riparian Woodland. The fees to be paid shall be those in effect at the time of ground disturbance authorization for each project phase and shall be based on the effect to modeled species habitat at the parcel scale.*
>
> *In addition to land conversion, the project would result in permanent direct effects and temporary effects to PCCP Special Habitats as estimated in Table 6 of the BRA prepared for the proposed project. The total special habitat fee obligation including temporary effect fees shall be paid prior to issuance of a land conversion authorization that allows ground disturbance.*

7-3(b) *PCCP Community Condition 1.1: Prior to land conversion authorization approval, the unavoidable effects to vernal pool type wetlands or their buffers shall be mitigated through payment of special habitat fees. The fees to be paid to the PCA shall be those in effect at the time of land conversion authorization issuance.*

Off-Site Affordable Housing Parcel

7-3(c) *Implement RVSP EIR Mitigation Measure 6-4a:*

> *The presence of listed vernal pool branchiopods shall be assumed on all parcels containing appropriate habitat where protocol-level surveys have not been conducted. Compensation described in this mitigation measure shall be implemented or USFWS-protocol surveys for special-status branchiopods shall be conducted to determine presence or absence. If vernal pool branchiopods are present, or if special-status vernal pool branchiopods are assumed to be present, the habitat shall be avoided to the extent feasible. If avoidance is not feasible, compensation shall be provided at a ratio of 3 acres for every 1 acre affected (3:1). This ratio will include creation of 1 acre of vernal pool habitat for every 1 acre impacted (1:1) and preservation of 2 acres of vernal pools for every 1 acre impacted (2:1), as described in the USFWS programmatic biological opinion issued to the Corps for small impacts to listed branchiopods (USFWS, 1996). Mitigation for impacts*

to listed branchiopods would be implemented according to one of the following three options, to be determined and completed prior to impact: (1) participation in a USFWS approved mitigation bank; (2) off-site mitigation at a non-bank location approved by the USFWS; or (3) contribution to the USFWS Species Fund. In the event that protocol level surveys demonstrate the absence of listed vernal pool branchiopods in these off-site features, mitigation would not be required.

7-4 Impacts to VELB either directly (e.g., cause a wildlife population to drop below self-sustaining levels, threaten to eliminate an animal community) or through substantial habitat modifications. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could result in impacts to VELB either directly or through substantial habitat modifications.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

The BRA did not identify elderberry shrubs within the off-site sewer lift station improvements area. Therefore, VELB is not anticipated to occur within the off-site sewer lift station improvements area. However, the BRA identified one elderberry shrub within the project site, which could indicate the presence of VELB. As discussed above, VELB is completely dependent on its host plant, the elderberry shrub, which occurs in riparian and other woodland communities in the Central Valley and associated foothills. Female beetles lay their eggs in crevices on the stems or on the leaves of living elderberry plants. When the eggs hatch, larvae bore into the stems. The larval stages last for one to two years. The fifth instar larvae create emergence holes in the stems and then plug the holes and remain in the stems through pupation.

The on-site elderberry shrub has two stems that are approximately three inches in diameter, but exit holes typical of VELB were not observed during field surveys conducted in early May 2025. In addition, VELB has not been documented within five miles of the study area. As such, the BRA concluded that VELB has a low potential to occur within the study area. Based on the lack of evidence of VELB occupation of the existing on-site elderberry shrub, as well as the lack of documented VELB occurrences in the vicinity of the project site, the BRA determined that impacts to VELB are not anticipated as a result of the proposed project. In addition, the existing on-site elderberry shrub is anticipated to be avoided during construction of the proposed project. Nonetheless, given the proximity of the existing on-site elderberry shrub to the proposed grading limits, the shrub would be required to be monitored for VELB and may be required to be transplanted to a PCCP VELB mitigation area to ensure impacts do not occur. However, because the project site contains VFRW, riparian, and stream system habitat and is located below 650 feet in elevation, the project would be required to comply with PCCP Community Condition 8, which is incorporated into this EIR as

Mitigation Measure 7-4. PCCP Community Condition 8 requires that if construction activities associated with the proposed project would encroach upon the existing on-site elderberry shrub and take is authorized, the project applicant shall coordinate with the PCA to provide transplants within suitable habitat within the PCCP Reserve System. Compliance with PCCP Community Condition 8 would ensure that impacts to VELB associated with the proposed project do not occur.

Based on the above, the BRA concluded that the proposed project would not result in a substantial adverse effect to VELB.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is currently undeveloped and, based on Figure 6-1a of the RVSP EIR, consists primarily of annual grasslands with seasonal wetlands located on the southeast portion of the parcel. As discussed under Impact 6-17 of the RVSP EIR, focused surveys for the host plant of VELB, elderberry shrubs, were conducted on parcels within the planning area, including the off-site affordable housing parcel. The surveys did not identify elderberry shrubs within the off-site affordable housing parcel. In addition, the RVSP EIR determined that elderberry shrubs are generally found in riparian areas. Within the RVSP planning area, riparian habitat is limited to the areas surrounding Dry Creek. The off-site affordable housing parcel is located approximately 0.3-mile south of Dry Creek and does not include riparian habitat. As such, suitable habitat for elderberry shrub is not anticipated to be present within the off-site affordable housing parcel.

Conclusion

Based on the above, because the off-site affordable housing parcel is not anticipated to support suitable habitat for VELB, the potential future development of the off-site affordable housing parcel would result in a less-than-significant impact to VELB. The proposed project is not anticipated to have a substantial adverse effect, either directly or through habitat modifications, on VELB. However, if construction activities occur in close proximity to the existing on-site elderberry shrub, development of the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on an invertebrate species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. Thus, a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measure would reduce the above potential impact to a *less-than-significant* level by ensuring that, if the existing elderberry shrub would be impacted by development of the proposed project, the shrub is either relocated to suitable habitat of equivalent or greater value or protected from construction activities.

Proposed Project

7-4 *The project applicant shall apply avoidance and minimization measures as specified in the USFWS's Conservation Guidelines for the Valley Elderberry Longhorn Beetle (U.S. Fish and Wildlife Service 1999b) or the current Wildlife Agency–approved avoidance and minimization protocol. When take is authorized the project applicant shall coordinate*

with the PCA to provide transplants and seedlings or cuttings for planting in suitable habitat on the Reserve System consistent with the USFWS Guidelines/Framework. Project-by-project mitigation requirements for VELB cannot be applied to the PCCP restoration requirements for a project's associated riparian native trees/shrubs impacts to be planted as replacement habitat (i.e., mitigation for impacts to valley elderberry longhorn beetle [transplants and plantings of seedlings/cuttings] does not count as mitigation for impacts to riverine and riparian [restoration of riverine and riparian]).

Proof of compliance with appliable VELB avoidance and mitigation measures shall be submitted to the Placer County Community Development Resource Agency prior to the commencement of construction activities.

7-5 Impacts to western spadefoot either directly (e.g., cause a wildlife population to drop below self-sustaining levels, threaten to eliminate an animal community) or through substantial habitat modifications. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could result in impacts to western spadefoot either directly or through substantial habitat modifications.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the biological and habitat conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to result in impacts to western spadefoot, either directly or through substantial habitat modifications, would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

Western spadefoot, which is proposed for federal listing and is a CDFW Species of Special Concern, is a nocturnal amphibian that forages in grassland, open chaparral, and pine-oak woodlands for a variety of invertebrates, such as insects and worms, and breeds in a variety of temporary wetlands, including creeks, pools in intermittent drainages, vernal pools, and seasonal wetlands, and other fish-free water features. The seasonal wetlands and vernal pools on-site represent suitable breeding habitat for the species and the surrounding annual brome grasslands/VCP within 300 feet of the seasonal wetlands and vernal pools represent suitable dry-season habitat. Construction of the proposed project would permanently disturb a total of approximately 1.37 acres of suitable breeding habitat and approximately 53.2 acres of suitable upland habitat (see Figure 7-5). As such, disturbance of the on-site seasonal wetlands, vernal pools, and annual brome grasslands/VPC associated with project buildout could result in a substantial adverse effect to western spadefoot.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is currently undeveloped and, based on Figure 6-1a of the RVSP EIR, consists primarily of annual grasslands and seasonal wetlands, which could represent suitable habitat for western spadefoot. As discussed under Impact 6-7 of the RVSP EIR, buildout of the RVSP could result in the loss of suitable upland and wetland habitat for western spadefoot. The RVSP EIR included Mitigation Measures 6-1a and 6-1c, which are intended to avoid construction related impacts to wetlands, and compensate for the loss of wetland habitat.

At such time the off-site affordable housing parcel gets developed, the future developer would be required by the County to implement RVSP EIR Mitigation Measure 6-1c which has been incorporated into this EIR as Mitigation Measure 7-5(c). Mitigation Measure 6-1a of the certified RVSP EIR requires compensation for the loss of jurisdictional wetlands in accordance with USACE Section 404 Permit and RWQCB requirements. Through consultation with the USACE, this mitigation measure has been fulfilled by the RVSP through purchase of mitigation bank credits; thus, Mitigation Measure 6-1(a) is not included in the below list of mitigation measures. Mitigation Measure 6-1c requires implementation of best management practices (BMPs) to avoid wetland impacts during construction activities. As determined in the RVSP EIR, implementation of Mitigation Measures 6-1a and 6-1c would reduce potential impacts to western spadefoot to a less-than-significant level.

Conclusion

Based on the above, implementation of RVSP Mitigation Measure 6-1c would be required to ensure the potential future development of the off-site affordable housing parcel would result in a less-than-significant impact to western spadefoot. In addition, development of the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a wildlife species (western spadefoot) identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. Thus, a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impacts to a *less-than-significant* level by ensuring that, if individual western spadefoots are determined to be present on the project site, they are either relocated to suitable habitat of equivalent or greater value or are protected from construction activities.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

7-5(a) *Within two years prior to the commencement of construction activities, one nocturnal acoustic survey of all areas within 300 feet of vernal pools and seasonal wetlands shall be conducted during the end of the wet season, specifically March or April. The acoustic survey shall consist of walking through the area and listening for the distinctive snore-like call of the species. Timing and methodology for the acoustic survey shall be based on those described in Distribution of the Western Spadefoot (Spea hammondii) in the Northern Sacramento Valley of California, with Comments on Status and Survey Methodology. The results of the*

survey shall be submitted to the Placer County Community Development Resource Agency.

If the nocturnal acoustic survey is negative, further mitigation shall not be necessary. If western spadefoots are observed within aquatic habitat proposed for impact, the tadpoles shall be captured and relocated by the applicant's qualified biologist to an off-site open space preserve with suitable habitat of equivalent or greater value in the vicinity of the overall project site. If western spadefoots are observed within aquatic habitat proposed for avoidance, then the project applicant may either relocate the tadpoles to an off-site open space preserve with habitat of equivalent or greater value (e.g., vernal pools and seasonal wetlands in a grassland/woodland matrix) in the vicinity of the overall project site, or install silt fence along the edge of the proposed area of disturbance within 300 feet of the occupied aquatic habitat to prevent metamorphosed individuals from dispersing into the construction area.

Off-Site Affordable Housing Parcel

7-5(b) *Implement Mitigation Measure 7-5(a).*

7-5(c) *Implement RVSP EIR Mitigation Measure 6-1c:*

The following BMPs to avoid impacts to wetlands in the Plan Area shall be implemented for all construction related to the proposed project:

- *Four-foot-tall, brightly colored (yellow or orange), synthetic mesh material or chainlink fencing shall be installed at the edge of all avoided wetlands and a minimum of 50 feet from the edge of tributaries to Dry Creek prior to any construction equipment being moved on site or any construction activities taking place. Fencing shall be continuously maintained and shall be the responsibility of an onsite compliance officer designated by the developer. Fencing is to remain intact until construction is complete and may not be removed without the written consent of the County.*
- *Ground disturbance associated with construction, including vehicle operation/parking and construction material storage, shall be prohibited within wetlands or within 50 feet of the edge of tributaries to Dry Creek.*
- *Where working areas encroach on live or dry streams, lakes, or wetlands, RWQCB-approved physical barriers adequate to prevent the flow or discharge of sediment into these systems shall be constructed and maintained between working areas and streams, lakes and wetlands. Discharge of sediment into streams shall be held to a minimum during construction of the barriers. Discharge will be contained through the use RWQCB-approved measures that will keep sediment from entering jurisdictional waters beyond the project limits.*

- *Oily or greasy substances originating from the Contractor's operations shall not be allowed to enter or be placed where they will later enter a live or dry stream, pond, or wetland.*
- *Asphalt concrete shall not be allowed to enter a live or dry stream, pond, or wetland.*
- *All off-road construction equipment shall be cleaned of potential noxious weed sources (mud, vegetation) before entry into the site and after entering a potentially infested area before moving on to another area, to help ensure noxious weeds from outside of the Plan Area are not introduced into the Plan Area. The contractor shall employ whatever cleaning methods (typically the use of a high-pressure water hose) are necessary to ensure that equipment is free of noxious weeds. Equipment shall be considered free of soil, seeds, and other such debris when a visual inspection does not disclose such material. Disassembly of equipment components or specialized inspection tools is not required. Equipment washing stations shall be placed in areas that afford easy containment and monitoring and that do not drain into sensitive (riparian, wetland, etc.) areas.*
- *To further minimize the risk of introducing additional nonnative species into the area, only native plant species appropriate for the Plan Area will be used in any erosion control or revegetation seed mix or stock. No dry-farmed straw will be used, and certified weed-free straw shall be required where erosion control straw is to be used. In addition, any hydroseed mulch used for revegetation activities must also be certified weed-free.*
- *The Applicant will restore and revegetate all temporary construction disturbance areas. Temporary disturbance areas will be restored to the original topography and hydrology, disked to relieve compaction, and planted with an erosion control mix composed only of native species. The proposed restoration and revegetation measures shall be summarized in the storm water pollution prevention plan for the project and submitted to Placer County for approval prior to initiation of construction activities.*

7-6 Impacts to northwestern pond turtle either directly (e.g., cause a wildlife population to drop below self-sustaining levels, threaten to eliminate an animal community) or through substantial habitat modifications. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could result in impacts to northwestern pond turtle either directly or through substantial habitat modifications.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the biological and habitat conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to result in impacts to northwestern pond turtle, either directly or through substantial habitat modifications, would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

The intermittent drainages within the study area provide marginally suitable aquatic habitat for northwestern pond turtle, which is proposed for listing as threatened under FESA and is a CDFW Species of Special Concern and a PCCP Covered Species. In addition, the VFRW adjacent to the intermittent drainages provides potential movement habitat. Approximately 1.3 acres of northwestern pond turtle movement habitat in adjacent woodlands, would be permanently disturbed by the proposed project. Additionally, approximately 0.16-acre of habitat within the intermittent drainages would be permanently impacted and less than 0.01-acre of habitat within the intermittent drainage would be temporarily disturbed (see Figure 7-5). Permanent impacts would be associated with construction of the off-site sewer lift station improvements, as well as the Walerga Road frontage and shoulder improvements. The temporary impacts would be associated with installation of the pedestrian bridge and sewer crossing. In the event that northwestern pond turtles or their nests are present in such areas during construction activities, individual turtles could be injured or killed, or nests could be destroyed.

Based on the above, the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a wildlife species (northwestern pond turtle) identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is currently undeveloped and, based on Figure 6-1a of the RVSP EIR, consists primarily of annual grasslands and seasonal wetlands, which do not represent suitable habitat for northwestern pond turtle. Therefore, suitable habitat for northwestern pond turtle is not present within the off-site affordable housing parcel.

Conclusion

Based on the above, the potential future development of the off-site affordable housing parcel would result in a less-than-significant impact to northwestern pond turtle. However, the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a wildlife species (northwestern pond turtle) identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. Thus, a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level by protecting water quality in aquatic habitat that might be occupied by northwestern pond turtle, by minimizing development within stream systems, by providing protective buffers adjacent to habitat during both

construction and operation, by requiring fee payments to offset impacts to habitat, and by providing for the relocation of affected individual members of the species pursuant to permit conditions imposed by USFWS or CDFW.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

7-6(a) Implement the following Mitigation Measure set forth in this EIR:

- *7-3(a) The Permittee shall apply for and be issued coverage under the PCCP to mitigate for all impacts to Covered Species, land cover, and sensitive natural communities. Prior to application approval, additional species surveys may be necessary, and prior to construction, land cover and special habitat fees shall be paid. The Permittee shall comply with the terms of the PCCP Coverage Certificate, including compliance with all avoidance, mitigation, and minimization measures, which may include pre-construction surveys, construction monitoring, and BMPs.*

  PCCP General Condition 3: The proposed project shall pay a land conversion fee for the permanent conversion of natural land cover including VPC Low, VPC Intermediate, and Valley Foothill Riparian Woodland. The fees to be paid shall be those in effect at the time of ground disturbance authorization for each project phase and shall be based on the effect to modeled species habitat at the parcel scale.

  In addition to land conversion, the project would result in permanent direct effects and temporary effects to PCCP Special Habitats as estimated in Table 6 of the Biological Resources Assessment (BRA) prepared for the proposed project. The total special habitat fee obligation including temporary effect fees shall be paid prior to issuance of a land conversion authorization that allows ground disturbance.

7-6(b) PCCP General Condition 1: Prior to improvement plan approval, the proposed project shall obtain coverage under the General Permit for Discharges of Storm Water Associated with Construction Activity (Construction General Permit Order 2009-0057-DWQ), including requirements to develop a project-based Storm Water Pollution Prevention Plan (SWPPP) and applicable NPDES program requirements as implemented by the County. Construction activity subject to this permit includes clearing, grading and disturbances to the ground such as stockpiling, or excavation.

The project shall comply with the West Placer Storm Water Quality Design Manual (Design Manual). The project shall implement the following BMPs. This list shall be included on the notes page of the improvement/grading plans and shall be shown on the plans:

1. *When possible, vehicles and equipment shall be parked on pavement, existing roads, and previously disturbed areas. When vehicle parking areas are to be established as a temporary facility, the site shall be recovered to pre-project or ecologically improved conditions within one year of start of groundbreaking to ensure effects are temporary (refer to Section 6.3.1.4, General Condition 4, Temporary Effects, for the process to demonstrate temporary effects).*
2. *Trash generated by Covered Activities shall be promptly and properly removed from the site.*
3. *Appropriate erosion control measures (e.g., fiber rolls, filter fences, vegetative buffer strips) shall be used on site to reduce siltation and runoff of contaminants into avoided wetlands, ponds, streams, or riparian vegetation.*

    (a) *Erosion control measures shall be of material that will not entrap wildlife (i.e., no plastic monofilament). Erosion control blankets shall be used as a last resort because of their tendency to biodegrade slowly and trap reptiles and amphibians.*
    (b) *Erosion control measures shall be placed between the area of disturbance and any avoided aquatic feature, within an area identified with highly visible markers (e.g., construction and erosion-control fencing, flagging, silt barriers) prior to commencement of construction activities. Such identification will be properly maintained until construction is completed and the soils have been stabilized.*
    (c) *Fiber rolls used for erosion control shall be certified by the California Department of Food and Agriculture or any agency that is a successor or receives delegated authority during the permit term as weed free.*
    (d) *Seed mixtures applied for erosion control shall not contain California Invasive Plant Council–designated invasive species (http://www.cal-ipc.org/paf/) but shall be composed of native species appropriate for the site or sterile non-native species. If sterile non-native species are used for temporary erosion control, native seed mixtures must be used in subsequent treatments to provide long-term erosion control and slow colonization by invasive non-natives.*

4. *If the runoff from the development will flow within 100 feet of a wetland or pond, vegetated storm water filtration features, such as rain gardens, grass swales, tree box filters, infiltration basins, or similar LID features to capture and treat flows, shall be installed consistent with local programs and ordinances.*

7-6(c) *PCCP Community Condition 2.2: Prior to land conversion authorization, the applicant shall coordinate with the PCA to determine which In-*

Stream and Stream System Best Management Practices (BMPs) from Table 7-1 of the User's Guide apply to the proposed project. The applicant shall identify the applicable BMPs on the project's improvement or grading plans. The selected BMPs shall be incorporated into the project's Land Conversion Authorization letter.

Prior to land conversion authorization approval, the unavoidable effects to riverine and riparian habitat or their buffers shall be mitigated through payment of special habitat fees. The fees to be paid shall be those in effect at the time of land conversion authorization.

7-6(d) *PCCP Stream System Condition 1: The project shall be designed to minimize development activities within the stream system to the maximum extent possible.*

7-6(e) *PCCP Stream System Condition 2: The project's development footprint is directly impacting the Stream System. The area of encroachment is subject to the Stream System Encroachment Special Habitats Fee as described in Chapter 5 of the PCCP User's Guide. Fees shall be paid to the PCA prior to the issuance of any permit or authorization that results in ground disturbance within the Stream System.*

7-6(f) *PCCP Community Condition 2.1: To the maximum extent possible, the proposed project shall not modify any area within a buffer that extends 50 feet outward from the outermost bounds of the riparian vegetation. The improvement or grading plans shall show the location of the riverine/riparian buffer.*

7-6(g) *A northwestern pond turtle survey shall be conducted by a qualified biologist within 48 hours prior to construction where construction activities overlap with Dry Creek, intermittent drainages, and woodlands within 150 feet of these aquatic resources. The results of the survey shall be submitted to the Placer County Community Development Resource Agency.*

If northwestern pond turtles or nests are not found, further mitigation is not necessary. If a northwestern pond turtle is observed within the proposed impact area, a qualified biologist shall relocate the individual to habitat of equivalent or greater value (e.g., riparian wetlands or riparian woodlands adjacent to a perennial creek or intermittent drainage) outside of the proposed impact area prior to construction. If a northwestern pond turtle nest is observed within the proposed impact area, the nest shall be fenced off and avoided until the eggs hatch. The exclusion fencing shall be placed at least 25 feet from the nest. A qualified biologist shall monitor the nest daily during construction to ensure that hatchlings do not disperse into the construction area. Relocation of hatchlings shall occur as stipulated above, if necessary.

7-7 Have a substantial adverse effect, either directly (e.g., cause a wildlife population to drop below self-sustaining levels, threaten to eliminate an animal community) or through substantial habitat modifications or substantial reduction in the number or range of the species, on Swainson's hawk. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could have a substantial adverse effect, either directly or through substantial habitat modifications or substantial reduction in the number or range of the species, on Swainson's hawk.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the biological and habitat conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to have a substantial adverse effect, either directly or through substantial habitat modifications or substantial reduction in the number or range of the species, on Swainson's hawk would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

The annual brome grassland/VPC throughout the study area provides suitable foraging habitat for Swainson's hawk, a State threatened species under CESA and a PCCP Covered Species. As such, removal of the foraging habitat could indirectly impact the species by reducing the availability of prey. Approximately 79.8 acres of annual brome grassland/VPC that currently provides Swainson's hawk foraging habitat would be permanently impacted by the proposed project (see Figure 7-5).

Additionally, the woodland habitats within the project site and proposed off-site improvements area provide suitable nesting habitat to accommodate Swainson's hawk. Should Swainson's hawk occur in areas proposed for disturbance, development of such locations could result in a significant impact to the aforementioned raptor species.

The land preservation and management objectives of the PCCP are intended to mitigate for the loss of Swainson's hawk nesting and foraging habitat within the Plan Area, including the project site. Section 5.4.1.3 of the PCCP (pages 5-135 and 5-136) explains that "[t]he biological goal for Swainson's hawk is habitat to provide for a sustained population of this species in the Plan Area. The Plan will result in protection and restoration of riverine/riparian and valley oak woodland natural communities, for a total of 1,268 acres of nesting habitat protected and 720 acres of riparian habitat restored (Table 5-6). Additionally, the Plan will result in the protection and restoration of grasslands and vernal pool complexes, for a total of 17,003 acres of foraging habitat protected and 3,920 acres of foraging habitat restored (Table 5-6). Swainson's hawk habitat will be provided in a large, interconnected Reserve System that accommodates the large home-range size for this species. The PCA will also protect at least four

active nest trees (Objective SWHA-1.1, Protect Swainson's Hawk Nest Trees), and will protect at least 741 acres of modeled foraging habitat surrounding each active nest tree protected (Objective SWHA-1.2, Protect Swainson's Hawk Foraging Habitat). The PCA will maintain or increase prey availability for Swainson's hawk by strategically planting shrubs or placing debris piles or other substrate that provides cover and refugia for prey, on at least four sites, each within a mile of one of the protected nest trees (Objective SWHA-1.3, Enhance Foraging Habitat). The PCA will also protect at least 20 isolated trees with the potential to be used as nesting sites for Swainson's hawk (Objective SWHA-1.4, Protect Isolated Trees). [¶] Although conservation strategies for nearby counties (e.g., San Joaquin, Yolo) rely on protection of cultivated lands such as alfalfa and row crops for Swainson's hawk foraging, the Plan focuses on grassland habitats in the Plan Area (e.g., vernal pool complex grassland, annual grassland) for Swainson's hawk. In the Plan Area, Swainson's hawk relies more on grassland habitats than agricultural land for foraging, because crops that provide valuable foraging habitat elsewhere in the Sacramento Valley are planted in small amounts in the Plan Area (e.g., approximately 176 acres are planted in alfalfa, less than 0.5 percent of the communities in the Valley)."

Notably, the number of breeding pairs of Swainson's hawk in California has grown rapidly in recent years. Bloom (1980) estimated that as many as 17,136 pairs of Swainson's hawks historically nested in California; in the same report, based on a 1979 survey, it was estimated that only 375 (±50) breeding pairs remained in California at that time. This demonstration of a 90 percent decline in the population prompted the listing of Swainson's hawk as a state threatened species in 1983. Estep (1989) estimated 430 breeding pairs in the Central Valley and 550 breeding pairs Statewide in 1988, and an estimate published by CDFW a decade later (CDFW 2007) showed a modest increase with an estimated number of breeding pairs Statewide at 1,893 in 2005 and in the Central Valley at 2,251 in 2006. In a recent study published by CDFW researchers in early 2022, Furnas et al (2022) concluded that California's Swainson's hawk summering population grew between 2005 and 2018 at the rapid rate of 13.9 percent per year and estimated the total Statewide population at 18,810 breeding pairs in 2018, which is within the range of the historical baseline that Dr. Bloom estimated in 1979. According to the Five-Year Status Review for Swainson's Hawk published by CDFW in 2016, habitat loss continues to be the primary threat to Swainson's hawk populations in California.

Notwithstanding the above, the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a raptor species (Swainson's hawk) identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS, and could result in a substantial reduction in the number or range of the species.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is currently undeveloped and, based on Figure 6-1a of the RVSP EIR, consists primarily of annual grasslands, which represent suitable foraging habitat for Swainson's hawk. In addition, the trees located along the northern and western boundaries of the off-site affordable housing parcel could represent suitable nesting habitat for Swainson's hawk. As discussed under Impact 6-10 of the RVSP EIR, buildout of the RVSP could result in the loss of potential foraging

habitat for Swainson's Hawk. The RVSP EIR included Mitigation Measure 6-10a, which is intended to compensate for the loss of any Swainson's hawk foraging habitat.

At such time the off-site affordable housing parcel gets developed, the future developer would be required by the County to implement the to implement RVSP EIR Mitigation Measure 6-10a, which is incorporated into this EIR as Mitigation Measure 7-7(c). Mitigation Measure 6-10a of the certified RVSP EIR requires consultation with CDFW regarding potential impacts to Swainson's hawk and compensation for the loss of Swainson's hawk foraging habitat. As determined in the RVSP EIR, implementation of Mitigation Measure 6-10a would reduce potential impacts to Swainson's hawk to a less-than-significant level.

Conclusion

Based on the above, implementation of RVSP Mitigation Measure 6-10a would be required to ensure the potential future development of the off-site affordable housing parcel would result in a less-than-significant impact to Swainson's hawk. In addition, the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a raptor species (Swainson's hawk) identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS, and could result in a substantial reduction in the number or range of the species. Thus, a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impacts to a *less-than-significant* level because the measures, combined with the features of the PCCP intended to mitigate for the loss of Swainson's hawk foraging habitat, ensure that the project would not result in a substantial reduction in the numbers or restriction in the range of the species or on-site habitat modifications that, viewed in a regional or Statewide context, are considered substantial.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

7-7(a) Implement the following Mitigation Measure set forth in this EIR:

- *7-3(a) The Permittee shall apply for and be issued coverage under the PCCP to mitigate for all impacts to Covered Species, land cover, and sensitive natural communities. Prior to application approval, additional species surveys may be necessary, and prior to construction, land cover and special habitat fees shall be paid. The Permittee shall comply with the terms of the PCCP Coverage Certificate, including compliance with all avoidance, mitigation, and minimization measures, which may include pre-construction surveys, construction monitoring, and BMPs.*

  PCCP General Condition 3: The proposed project shall pay a land conversion fee for the permanent conversion of natural land cover including VPC Low, VPC Intermediate, and Valley Foothill Riparian Woodland. The fees to be paid shall be those in effect at the time of ground disturbance

authorization for each project phase and shall be based on the effect to modeled species habitat at the parcel scale.

In addition to land conversion, the project would result in permanent direct effects and temporary effects to PCCP Special Habitats as estimated in Table 6 of the Biological Resources Assessment (BRA) prepared for the proposed project. The total special habitat fee obligation including temporary effect fees shall be paid prior to issuance of a land conversion authorization that allows ground disturbance.

7-7(b) *PCCP Species Condition 1: Planning-level Swainson's hawk surveys shall be required a year in advance of construction using the survey guidelines developed for the PCCP. Planning-level surveys are intended to identify nest trees to guide avoidance during project tree removal and construction.*

Additionally, the year of construction (starting in February) and pre-construction (no more than 15 days prior to ground disturbance) surveys shall be conducted within a 1,320-foot radius of the project. Surveys shall be conducted consistent with PCCP guidelines (based on Swainson's Hawk Technical Advisory Committee 2000). In instances where an adjacent parcel is not accessible to a survey, the qualified biologist shall scan all potential nest trees from the adjacent property, roadsides, or other safe, publicly accessible viewpoints, without trespassing, using binoculars and/or a spotting scope. Surveys are typically required from February 1 to September 15 (or sooner if it is determined that birds are nesting earlier in the year). The applicant shall contact the PCA for assistance with survey timing. If a Swainson's hawk nest is located and presence confirmed, only one follow-up visit is required.

During the nesting season (approximately February 1 to September 15 or sooner if it is determined that birds are nesting earlier in the year), ground-disturbing activities within 1,320 feet of occupied nests or nests under construction shall be prohibited to minimize the potential for nest abandonment. While the nest is occupied, activities outside the buffer can take place provided they do not stress the breeding pair.

If the active nest site is shielded from view and noise from the project site by other development, topography, or other features, the project applicant can apply to the PCA for a reduction in the buffer distance or waiver. A qualified biologist shall be required to monitor the nest and determine that the reduced buffer does not cause nest abandonment. A monitoring, reporting, and/or buffer reduction plan shall be developed in coordination with PCA and CDFW. If PCA and CDFW, based on a qualified biologist's observations, determine nestlings have fledged, PCCP Covered Activities can proceed normally.

Construction monitoring shall be conducted by a qualified biologist if work is to continue outside of the nest buffer, and shall focus on ensuring that activities do not occur within the buffer zone. The qualified biologist performing the construction monitoring shall ensure that effects on Swainson's hawks are minimized. If monitoring indicates that construction outside of the buffer is affecting nesting, the buffer shall be increased if space allows (e.g., move staging areas farther away). If space does not allow, all construction activities shall cease until the young have fledged from the nest (as confirmed by a qualified biologist).

The frequency of monitoring shall be approved by the PCA and based on the frequency and intensity of construction activities and the likelihood of disturbance of the active nest. In most cases, monitoring shall occur at least every other day, but in some cases, daily monitoring may be appropriate to ensure that direct effects on Swainson's hawks are minimized. The qualified biologist shall train construction personnel on the avoidance procedures and buffer zones.

Off-Site Affordable Housing Parcel

7-7(c) Implement RVSP EIR Mitigation Measure 6-10a:

The CDFG shall be consulted to determine appropriate mitigation for loss of Swainson's hawk foraging habitat. The Applicant shall submit to the County documentation of the mitigation plan for Swainson's hawks as approved by CDFG. Mitigation shall include any offsite impacts as determined by the Applicant and CDFG based upon the final design of the offsite project components. CDFG considers loss of foraging habitat within a 10-mile radius of any active nest as an impact to this species. Implementation of the following measures would reduce the impact on foraging habitat of this species to a less-than-significant level.

(i) Projects or related activities within 1 mile of an active nest tree shall provide mitigation as follows:

A. Preserve 1 acre of habitat management lands for each acre of development authorized (1:1 ratio). At least 10 percent of the habitat management land requirements shall be met by fee title acquisition or a conservation easement allowing for the active management of the habitat, with the remaining 90 percent of the habitat management lands protected by a conservation easement on agricultural lands or other suitable habitats, which provide foraging habitat.

or,

B. Preserve 0.5 acre of habitat management land for each acre of development authorized (0.5:1 ratio) with the

entire habitat management land requirement being met by fee title acquisition or with a conservation easement, which allows for the active management of the habitat for prey production.

or,

C. *Acquire Swainson's hawk foraging habitat credits from a CDFG-approved mitigation bank at the ratios.*

(ii) *Projects within 5 miles of an active nest tree but greater than 1 mile from the nest tree shall provide 0.75 acre of habitat management land for each acre of urban development authorized or purchase the equivalent area from a CDFG-approved habitat conservation bank.*

(iii) *Projects within 10 miles of an active nest tree but greater than 5 miles from an active nest tree shall provide 0.5 acre of habitat management land for each acre of urban development authorized (0.5:1 ratio) or purchase the equivalent area from a CDFG-approved habitat conservation bank.*

7-8 Impacts to burrowing owl either directly (e.g., cause a wildlife population to drop below self-sustaining levels, threaten to eliminate an animal community) or through substantial habitat modifications. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could result in impacts to burrowing owl either directly or through substantial habitat modifications.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the biological and habitat conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to result in impacts to burrowing owl, either directly or through substantial habitat modifications, would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

The annual brome grassland/VPC throughout the study area provides suitable foraging habitat for burrowing owl, which is a candidate for State listing, a California Species of Special Concern, and a PCCP Covered Species. In addition, occasional ground-squirrel burrows and debris located throughout the study area provide marginally suitable burrow habitat. Approximately 79.8 acres of annual brome grassland/VPC that currently provides marginal habitat for burrowing owl would be permanently impacted by the proposed project (see Figure 7-5). If ground disturbance

occurs while burrowing owls are in burrows in such areas, individuals could be directly impacted, and a significant impact would occur.

In Section 5.4.3.2 (Effects Summary) (page 5-138), the PCCP explains that "[t]he Plan's conservation goal for western burrowing owl provides sufficient habitat for maintaining or increasing the population size of overwintering western burrowing owls within the Reserve System and sufficient habitat for promoting the expansion of a breeding population of burrowing owls within the Reserve System. Achieving the natural community goals and objectives will result in the protection of 17,129 acres and restoration of 4,126 acres of western burrowing owl habitat (Table 5-6). The PCA will prioritize protection in areas that support western burrowing owls or supported this species within the last 5 years (Section 5.3.1.6.3, *Western Burrowing* Owl). It will also result in creating conditions to increase ground squirrel populations on these Reserve System lands, providing prey and burrows for western burrowing owl (CM2 VPCG-2, *Ground Squirrel Population Enhancement*). The species-specific biological objective for this species (Objective BUOW-1.1, *Protect and Manage Ground Squirrel Colonies*) will provide at least three protected ground squirrel colonies that will provide nesting opportunities for western burrowing owl, and will provide artificial burrows if ground squirrel colonies are not available to protect."

Section 5.4.3.3 (Conclusion) goes on to state, on the same page, that "[t]he Plan's conservation strategy will mitigate for the loss of 16,444 acres of habitat and indirect effects resulting from Covered Activities. Although the Plan Area is not critical to the long-term survival and recovery of the western burrowing owl, the strategy will further provide for the conservation of the species by providing nesting opportunities for western burrowing owls in the Plan Area, potentially facilitating expansion of the western burrowing owl's breeding range into the Plan Area."

Notwithstanding the above, the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a wildlife species (burrowing owl) identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is currently undeveloped and, based on Figure 6-1a of the RVSP EIR, consists primarily of annual grasslands, which represent suitable foraging and nesting habitat for burrowing owl. As discussed under Impact 6-11 of the RVSP EIR, buildout of the RVSP could result in the potential loss or disturbance of burrowing owl burrows. However, the RVSP EIR included Mitigation Measure 6-11a, which is intended to avoid potential impacts to burrowing owl nesting and foraging habitat, as well as breeding burrowing owls.

At such time the off-site affordable housing parcel gets developed, the future developer would be required by the County to implement RVSP EIR Mitigation Measure 6-11a, which has been incorporated into this EIR as Mitigation Measure 7-8(c). Mitigation Measure 6-11a of the certified RVSP EIR requires preconstruction surveys to be conducted if construction is proposed during the burrowing owl breeding season, as well as the removal of any active nests that cannot be avoided by construction

activities. As determined in the RVSP EIR, implementation of Mitigation Measure 6-11a would reduce potential impacts to burrowing owl to a less-than-significant level.

Conclusion

Based on the above, implementation of RVSP EIR Mitigation Measure 6-11a would be required to ensure the potential future development of the off-site affordable housing parcel would result in a less-than-significant impact to burrowing owl. In addition, the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a raptor species (burrowing owl) identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. Thus, a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measures, understood against the backdrop of the PCCP, would reduce the above potential impacts to a *less-than-significant* level by ensuring that the proposed project would not cause a burrowing owl population to drop below self-sustaining levels, threaten to eliminate a community of burrowing owls, or result in the substantial loss of burrowing owl habitat. In addition, at such time a future developer proceeds with development of the off-site affordable housing parcel, the future project applicant would be required to comply with Mitigation Measure 7-8(c) related to burrowing owl prior to development of the parcel.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

7-8(a) Implement the following Mitigation Measure set forth in this EIR:

- *7-3(a) The Permittee shall apply for and be issued coverage under the PCCP to mitigate for all impacts to Covered Species, land cover, and sensitive natural communities. Prior to application approval, additional species surveys may be necessary, and prior to construction, land cover and special habitat fees shall be paid. The Permittee shall comply with the terms of the PCCP Coverage Certificate, including compliance with all avoidance, mitigation, and minimization measures, which may include pre-construction surveys, construction monitoring, and BMPs.*

  PCCP General Condition 3: The proposed project shall pay a land conversion fee for the permanent conversion of natural land cover including VPC Low, VPC Intermediate, and Valley Foothill Riparian Woodland. The fees to be paid shall be those in effect at the time of ground disturbance authorization for each project phase and shall be based on the effect to modeled species habitat at the parcel scale.

  In addition to land conversion, the project would result in permanent direct effects and temporary effects to PCCP Special Habitats as estimated in Table 6 of the Biological Resources Assessment (BRA) prepared for the proposed project. The total special habitat fee obligation including

temporary effect fees shall be paid prior to issuance of a land conversion authorization that allows ground disturbance.

7-8(b) *PCCP Species Condition 3: Two surveys shall be conducted within 15 days prior to ground disturbance to establish the presence or absence of burrowing owls. The surveys shall be conducted at least seven days apart (if burrowing owls are detected on the first survey, a second survey is not needed) for both breeding and non-breeding season surveys. All burrowing owls observed shall be counted and mapped.*

During the breeding season (February 1 to August 31), surveys shall document whether burrowing owls are nesting in or within 250 feet of the project area.

During the non-breeding season (September 1 to January 31), surveys shall document whether burrowing owls are using habitat in or directly adjacent to any area to be disturbed. Survey results will be valid only for the season (breeding or non-breeding) during which the survey was conducted. The results of the burrowing owl surveys shall be submitted to the Placer County Community Development Resource Agency and PCA.

The qualified biologist shall survey the proposed footprint of disturbance and a 250-foot radius from the perimeter of the proposed footprint to determine the presence or absence of burrowing owls. The site shall be surveyed by walking line transects, spaced 20 to 60 feet apart, adjusting for vegetation height and density. At the start of each transect and, at least, every 300 feet, the surveyor, with use of binoculars, shall scan the entire visible project area for burrowing owls. During walking surveys, the surveyor shall record all potential burrows used by burrowing owls, as determined by the presence of one or more burrowing owls, pellets, prey remains, whitewash, or decoration. Some burrowing owls may be detected by their calls; therefore, observers shall also listen for burrowing owls while conducting the survey. Adjacent parcels under different land ownership shall be surveyed only if access is granted. If portions of the survey area are on adjacent sites for which access has not been granted, the qualified biologist shall get as close to the non-accessible area as possible, and use binoculars to look for burrowing owls.

The presence of burrowing owls or their sign anywhere on the site or within the 250-foot accessible radius around the site shall be recorded and mapped. Surveys shall map all burrows and occurrence of sign of burrowing owl on the project site. Surveys must begin one hour before sunrise and continue until two hours after sunrise (three hours total) or begin two hours before sunset and continue until one hour after sunset. Additional time may be required for large project sites.

If burrowing owls are found during the breeding season (approximately February 1 to August 31), the project applicant shall avoid all nest sites that could be disturbed by project construction during the remainder of the breeding season or while the nest is occupied by adults or young (occupation includes individuals or family groups foraging on or near the site following fledging). The applicant shall establish a 250-foot non-disturbance buffer zone around nests. The buffer zone shall be flagged or otherwise clearly marked. Should construction activities cause the nesting bird to vocalize, make defensive flights at intruders, or otherwise display agitated behavior, then the exclusionary buffer shall be increased such that activities are far enough from the nest so that the bird(s) no longer display this agitated behavior. The exclusionary buffer shall remain in place until the chicks have fledged or as otherwise determined by a qualified biologist in consultation with PCA. Construction may only occur within the 250-foot buffer zone during the breeding season if a qualified raptor biologist monitors the nest and determines that the activities do not disturb nesting behavior, or the birds have not begun egg-laying and incubation, or that the juveniles from the occupied burrows have fledged and moved off site, in consultation with PCA. Measures such as visual screens may be used to further reduce the buffer with CDFW approval and provided a biological monitor confirms that such measures do not cause agitated behavior.

If burrowing owls are found during the non-breeding season (approximately September 1 to January 31), the project applicant shall establish a 160-foot buffer zone around active burrows. The buffer zone shall be flagged or otherwise clearly marked. Measures such as visual screens may be used to further reduce the buffer with PCA and CDFW approval and provided a biological monitor confirms that such measures do not cause agitated behavior.

After all alternative avoidance and minimization measures are exhausted as confirmed by CDFW, a qualified biologist may passively exclude birds from those burrows during the non-breeding season. A burrowing owl exclusion plan shall be developed by a qualified biologist consistent with the most recent guidance from the USFWS and/or CDFW and submitted to and approved by the PCA and the USFWS and CDFW. Burrow exclusion shall be conducted for burrows located in the project footprint and within a 160-foot buffer zone as necessary.

A biological monitor shall be present on site daily to ensure that no Covered Activities occur within the buffer zone. The qualified biologist performing the construction monitoring shall ensure that effects on burrowing owls are minimized. If monitoring indicates that construction outside of the buffer is affecting nesting, the buffer shall be increased if space allows (e.g., move staging areas farther away). If space does not allow, construction shall cease until the young have fledged from all the nests in the colony (as confirmed by a qualified biologist) or until the end of the breeding season, whichever occurs first.

A biological monitor shall conduct training of construction personnel on the avoidance procedures, buffer zones, and protocols in the event a burrowing owl flies into an active construction zone.

Off-Site Affordable Housing Parcel

7-8(c) *Implement RVSP EIR Mitigation Measure 6-11a:*

If construction is proposed during the burrowing owl breeding season (February 1 through August 31), focused surveys for active burrows shall be conducted within 30 days prior to the beginning of the construction activities. Surveys shall be conducted by a qualified biologist. If active nests are found, no construction activities shall take place within 250 feet of the nest until the young have fledged. Burrows that cannot be avoided shall be removed during the nonbreeding season (September 1 to January 31) in accordance with CDFG protocols (CDFG, 1995). If no active nests are found during focused surveys, no further mitigation will be required.

If occupied burrows would be removed as a result of construction and there is suitable habitat in the Plan Area, onsite passive relocation shall be implemented. Owls will be excluded from the occupied burrows using one-way doors and allowed to occupy alternate natural or artificial burrows that are beyond 250 feet from the impact zone and that are within or contiguous to a minimum of 6.5 acres of potential foraging habitat for each pair of relocated owls. Relocation of owls should only be implemented during the nonbreeding season. Onsite preservation of foraging habitat adjacent to any relocated owls shall be protected in a conservation easement and managed to promote burrowing owl use of the site. CDFG approval would be required for the habitat conservation easement.

If there is not suitable habitat on site, burrowing owl habitat mitigation credits shall be purchased from a conservation bank approved by the CDFG. Offsite habitat must provide suitable burrowing owl habitat. Land shall be purchased and /or placed in a conservation easement in perpetuity and managed to main suitable habitat. Offsite mitigation shall use the following ratios:

- *(i) Replacement of occupied habitat with occupied habitat: 1.5 times 6.5 acres per pair or single bird (9.75 acres).*
- *(ii) Replacement of occupied habitat with habitat contiguous to currently occupied habitat: 2 times 6.5 acres per pair or single bird (13.0 acres).*
- *(iii) Replacement of occupied habitat with suitable unoccupied habitat: 3 times 6.5 acres per pair or single bird (19.5 acres).*

7-9 Impacts to other nesting birds and raptors protected under the MBTA and CFGC either directly (e.g., cause a wildlife population to drop below self-sustaining levels, threaten to eliminate an animal community) or through substantial habitat modifications or substantial reduction in the number or range of the species. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could result in impacts to nesting birds and raptors protected under the MBTA and CFGC either directly or through substantial habitat modifications or substantial reduction in the number or range of the species.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the biological and habitat conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to result in impacts to nesting birds and raptors protected under the MBTA and CFGC, either directly or through substantial habitat modifications, would be similar. Thus, the following discussion applies to both the proposed project, and the off-site sewer lift station improvements area.

Similar to the analysis under Impact 7-8 regarding Swainson's hawk, the vegetation communities within the study area provide suitable nesting and foraging habitat to accommodate nesting songbirds and raptors protected under the MBTA and CFGC. For example, the annual brome grassland/VPC throughout the study area could represent suitable foraging habitat for tricolored blackbird, golden eagle, and white-tailed kite, as well as both nesting and foraging habitat for northern harrier and loggerhead shrike. In addition, the VFRW within the study area provides suitable foraging habitat for olive-sided flycatcher and yellow warbler. Furthermore, the trees within the study area provide suitable nesting habitat for white-tailed kite. Should such species be nesting or foraging in areas proposed for disturbance as part of the proposed project, development of such locations could result in a significant impact to the species.

Based on the above, the project could have a substantial adverse effect, either directly or through habitat modifications, on other nesting songbirds and raptor species protected under the MBTA and CFGC.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is currently undeveloped and, based on Figure 6-1a of the RVSP EIR, consists primarily of annual grasslands, which could represent suitable nesting habitat for northern harrier and loggerhead shrike. In addition, the trees located along the northern and western boundaries of the off-site affordable housing parcel could represent suitable nesting habitat for white-tailed kite. As discussed under Impact 6-12 of the RVSP EIR, buildout of the RVSP could result in

the mortality of nesting bird species protected under the MBTA. To address such impacts, the RVSP EIR included Mitigation Measure 6-12a, which is intended to prevent disturbance to nesting raptors. However, Mitigation Measure 6-12a only pertains to nesting raptors and does not specifically address impacts to other nesting birds protected under the MBTA and CFGC. At such time the off-site affordable housing parcel gets developed, the future developer would be required by the County to implement RVSP Mitigation Measure 6-12a, which has been incorporated into this EIR as Mitigation Measure 7-9(e). Mitigation Measure 6-12a of the certified RVSP EIR requires the project applicant conduct preconstruction surveys of the project site for nesting raptors and establishes avoidance buffers to be enforced should nesting raptors be identified during preconstruction surveys. As determined in the RVSP EIR, implementation of Mitigation Measure 6-12a would reduce potential impacts to nesting raptors to a less-than-significant level.

Although the RVSP EIR includes mitigation to reduce impacts to nesting birds, because Mitigation Measure 6-12a only pertains to nesting raptors, the potential future development of the off-site affordable housing parcel could have a substantial adverse effect, either directly or through habitat modifications, on other nesting songbirds. As such, additional project-specific mitigation measures would be required to ensure that potential impacts to nesting songbirds do not occur.

Conclusion

Based on the above, the project, including the potential future development of the off-site affordable housing parcel, could have a substantial adverse effect, either directly or through habitat modifications, on other nesting songbirds and raptor species protected under the MBTA and CFGC. Thus, a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impacts to a *less-than-significant* level by ensuring that the proposed project would not cause a wildlife population to drop below self-sustaining levels, threaten to eliminate an animal community, result in the loss of substantial amounts of habitat, or result in substantial reduction in the number or range of the species. In addition, at such time a future developer proceeds with development of the off-site affordable housing parcel, the future project applicant would be required to comply with Mitigation Measures 7-9(b), 7-9(c), 7-9(d), and 7-9(e) related to nesting songbirds prior to development of the parcel.

Proposed Project, Off-Site Sewer Lift Station Improvements Area

7-9(a) Implement the following Mitigation Measure set forth in this EIR:

- *7-3(a) The Permittee shall apply for and be issued coverage under the PCCP to mitigate for all impacts to Covered Species, land cover, and sensitive natural communities. Prior to application approval, additional species surveys may be necessary, and prior to construction, land cover and special habitat fees shall be paid. The Permittee shall comply with the terms of the PCCP Coverage Certificate, including compliance with all avoidance, mitigation, minimization measures, which*

may include pre-construction surveys, construction monitoring, and BMPs.

> *PCCP General Condition 3: The proposed project shall pay a land conversion fee for the permanent conversion of natural land cover including VPC Low, VPC Intermediate, and Valley Foothill Riparian Woodland. The fees to be paid shall be those in effect at the time of ground disturbance authorization for each project phase and shall be based on the effect to modeled species habitat at the parcel scale.*
>
> *In addition to land conversion, the project would result in permanent direct effects and temporary effects to PCCP Special Habitats as estimated in Table 6 of the Biological Resources Assessment (BRA) prepared for the proposed project. The total special habitat fee obligation including temporary effect fees shall be paid prior to issuance of a land conversion authorization that allows ground disturbance.*

7-9(b) *PCCP Species Condition 4 (Tricolored Blackbird): Prior to initiation of PCCP Covered Activities associated with the proposed project, the qualified biologist(s) shall conduct preconstruction surveys to evaluate the presence of tricolored blackbird nesting colonies for each phase of the project. In instances where an adjacent parcel is not accessible to survey because the qualified biologist was not granted permission to enter, the qualified biologist shall scan all potential nest colony site(s) from the adjacent property, roadsides, or other safe, publicly accessible viewpoints, without trespassing, using binoculars and/or a spotting scope to look for tricolored blackbird nesting activity.*

Surveys shall be conducted at least twice, with at least one month between surveys, during the nesting season one year prior to initial ground disturbance for the Covered Activity (if feasible), and the year of ground disturbance for the Covered Activity (required). If Covered Activities will occur in the project work area during the nesting season, three surveys shall be conducted within 15 days prior to the Covered Activity, with one of the surveys occurring within five days prior to the start of the Covered Activity. The survey methods will be based on Kelsey (2008) or a similar protocol approved by the PCA and the USFWS and CDFW based on site-specific conditions.

If the first survey indicates that suitable nesting habitat is not present on the project site or within 1,300 feet of the project work area, additional surveys for nest colonies are not required.

If an active colony is known to occur within three miles of the project site, a qualified biologist shall conduct two surveys of foraging habitat within the project site and within a 1,300-foot radius around the project site to determine whether foraging habitat is being actively used by

foraging tricolored blackbirds. The qualified biologist shall map foraging habitat, as defined by the land cover types listed above, within a 1,300-foot radius around the project site to delineate foraging habitat that will be surveyed. The surveys shall be conducted approximately one week apart, with the second survey occurring no more than five calendar days prior to ground-disturbing activities.

Construction activity or other covered activities that may disturb an occupied nest colony site, as determined by a qualified biologist, shall be prohibited during the nesting season (March 15 through July 31) or until the chicks have fledged or the colony has been abandoned on its own) within a 1,300-foot buffer zone around the nest colony, to the extent practicable. The intent of this condition is to prevent disturbance to occupied nest colony sites on or near project sites so they can complete their nesting cycle. This condition is not intended to preserve suitable breeding habitat on project sites but to ensure impacts to active colony sites only take place once the site is no longer occupied by the nesting colony. The buffer shall be applied to extend beyond the nest colony site as follows: 1) if the colony is nesting in a wetland, the buffer must be established from the outer edge of all hydric vegetation associated with the colony, or 2) if the colony is nesting in non-wetland vegetation (e.g., Himalayan blackberry), the buffer must be established from the edge of the colony substrate. This buffer may be modified to a minimum of 300 feet, with written approval from the USFWS and CDFW, in areas with dense forest, buildings, or other features between the Covered Activities and the occupied active nest colony; where there is sufficient topographic relief to protect the colony from excessive noise or visual disturbance; where sound curtains have been installed; or other methods developed in consultation with the USFWS and CDFW where conditions warrant reduction of the buffer distance. If tricolored blackbirds colonize habitat adjacent to Covered Activities after the activities have been initiated, the project applicant shall reduce disturbance through establishment of buffers or noise reduction techniques or visual screens, as determined in consultation with the USFWS, CDFW, and PCA. The buffer must be clearly marked to prevent project-related activities from occurring within the buffer zone.

Active nesting colonies that occur within the non-disturbance buffer shall be monitored by the qualified biologist(s) to verify the Covered Activity is not disrupting the nesting behavior of the colony. The frequency of monitoring shall be approved by the PCA and based on the frequency and intensity of construction activities and the likelihood of disturbance of the active nest. In most cases, monitoring will occur at least every other day, but in some cases, daily monitoring may be appropriate to ensure that direct effects on tricolored blackbird are minimized. The biologist shall train construction personnel on the avoidance procedures and buffer zones.

If the qualified biologist(s) determines that the Covered Activity is disrupting nesting and/or foraging behavior, the qualified biologist(s)

shall notify the project applicant immediately, and the project applicant shall notify the PCA within 24 hours to determine additional protective measures that can be implemented. The qualified biologist(s) shall have the authority to stop Covered Activities until additional protective measures are implemented. Additional protective measures shall remain in place until the qualified biologist(s) determine(s) tricolored blackbird behavior has normalized. If additional protective measures are ineffective, the qualified biologist(s) shall have the authority to stop Covered Activities as needed until the additional protective measures are modified and nesting behavior of tricolored blackbird returns to normal.

Additional protective measures may include increasing the size of the buffer (within the constraints of the project site), delaying Covered Activities (or the portion of Covered Activities causing the disruption) until the colony is finished breeding and chicks have left the nest site, temporarily relocating staging areas, or temporarily rerouting access to the project work area. The project proponent shall notify the PCA and USFWS and CDFW within 24 hours if nests or nestlings are abandoned. If the nestlings are still alive, the qualified biologist(s) shall work with the USFWS and CDFW to determine appropriate actions for salvaging the eggs or nestlings. Notification to PCA and USFWS and CDFW shall be via telephone or email, followed by a written incident report. Notification shall include the date, time, location, and circumstances of the incident.

Foraging habitat within the buffer shall be monitored by the qualified biologist(s) to verify that the Covered Activity is not disrupting tricolored blackbird foraging behavior. The frequency of monitoring shall be approved by the PCA and based on the frequency and intensity of construction activities and the likelihood of disturbance of foraging tricolored blackbirds. In most cases, monitoring will occur at least every other day, but in some cases, daily monitoring may be appropriate to ensure that effects on tricolored blackbird are minimized. The biologist shall train construction personnel on the avoidance procedures and buffer zones.

If the qualified biologist(s) determines that the Covered Activity is disrupting foraging behavior, the qualified biologist(s) shall notify project applicant immediately, and the project applicant shall notify the PCA within 24 hours to determine additional protective measures that can be implemented. The qualified biologist(s) shall have the authority to stop Covered Activities until additional protective measures are implemented. Additional protective measures shall remain in place until the qualified biologist(s) determine(s) tricolored blackbird behavior has normalized. If additional protective measures are ineffective, the qualified biologist(s) shall have the authority to stop Covered Activities as needed until the additional protective measures are modified and foraging behavior of tricolored blackbird returns to normal. Additional protective measures may include increasing the size of the buffer

(within the constraints of the project site), temporarily relocating staging areas, or temporarily rerouting access to the project work area.

7-9(c) *A preconstruction nesting bird survey shall be conducted by the qualified biologist (project biologist) throughout the portions of the project site and off-site affordable housing parcel, if proposed for construction, as well as all accessible areas within a 500-foot radius of proposed construction areas for each phase, no more than three days prior to the initiation of construction. If there is a break in construction activity of more than three days, then subsequent surveys shall be conducted.*

A report summarizing the survey(s) shall be provided to the Placer County Community Development Resource Agency and the PCA within 30 days of the completed survey and is valid for one construction season, assuming that a break in construction activities of more than three days does not occur. If nests are not found, further mitigation is not required.

If an active raptor nest is found, construction activities shall not take place within 500 feet of the nest until the young have fledged. If active songbird nests are found, a 100-foot non-disturbance buffer shall be established. The non-disturbance buffers may be reduced if a smaller, sufficiently protective buffer is proposed by the project biologist and approved by the County after taking into consideration the natural history of the species of bird nesting, the proposed activity level adjacent to the nest, the nest occupants' habituation to existing or ongoing activity, and nest concealment (i.e., whether there are visual or acoustic barriers between the proposed activity and the nest). The project biologist can visit the nest as needed to determine when the young have fledged the nest and are independent of the site or the nest can be left undisturbed until the end of the nesting season.

7-9(d) *When it is determined that the size of the non-disturbance buffer requires the project biologist to monitor the nest, that monitoring shall include observations about the bird's behaviors relative to the construction activities. Should construction activities cause a nesting bird to do any of the following in a way that would be considered a result of construction activities, then the exclusionary buffer shall be increased such that activities are far enough from the nest to stop the following agitated behavior: vocalize, make defensive flights at intruders, get up from a brooding position, or fly off the nest. The revised non-disturbance buffer shall remain in place until the chicks have fledged or as otherwise determined by a qualified biologist in consultation with the County.*

Construction activities may only resume within the non-disturbance buffer after a follow-up survey by the project biologist has been conducted and a report has been prepared indicating that the nest (or nests) is no longer active, and that no new nests have been identified.

Off-Site Affordable Housing Parcel

7-9(e) *Implement RVSP EIR Mitigation Measure 6-12a below. Alternatively, the future affordable housing developer may choose to participate in the PCCP for Swainson's hawk.*

If project or program activities occur are proposed during the breeding period of the Swainson's hawk or other nesting raptors (March 1 to September 15), a qualified biologist shall conduct pre-construction surveys within a 0.5-mile radius of the project, not more than two weeks prior to construction. Surveys shall be conducted using the guideline established in the Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley. If nesting Swainson's hawks or other raptors are found, project activities will be delayed within the following buffer distances until the young have fledged:

- *Swainson's hawks – 1,300 feet (0.25-mile)*
- *Other raptor species – 500 feet (0.10-mile)*

Swainson's hawk nest sites within 0.5-mile of active construction will be monitored by a qualified biologist to evaluate whether the construction activities are disturbing nesting hawks. If the nesting birds appear distressed, the monitor shall halt all construction activities within 0.5-mile of the nest site and CDFG will be contacted to identify appropriate contingency measures. These measures might include limitations on the activities that would be allowed within 0.5-mile of the nest site or termination of all work within 0.5-mile of the nest site. All CDFG recommendations shall be complied with. If construction activities occur over more than one year, surveys shall be conducted during each year of construction.

If active nests are not identified during the preconstruction survey or if construction activities are proposed to occur during the nonbreeding season (September 16 through February 28), preconstruction surveys or other mitigation measures for Swainson's hawk or other nesting raptors shall not be required.

7-10 Impacts to roosting bats either directly (e.g., cause a wildlife population to drop below self-sustaining levels, threaten to eliminate an animal community) or through substantial habitat modifications. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could

result in impacts to roosting bats either directly or through substantial habitat modifications.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the biological and habitat conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to result in impacts to roosting bats either directly or through substantial habitat modifications would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

The pallid bat and western red bat are California Species of Special Concern but are not PCCP Covered Species. The silver-haired bat and hoary bat are not federally or State listed, nor are they PCCP Covered Species, but are classified as Medium priority species by the WBWG. Pursuant to the BRA, pallid bat and silver-haired bat have high potential to occur within the study area, and western red bat and hoary bat have low potential to occur. More specifically, the trees throughout the study area provide habitat for the foregoing special-status bats species. As such, if special-status bats were roosting in trees proposed for removal during project construction, the bats could be injured or killed.

Based on the above, the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a bat species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is currently undeveloped and, based on Figure 6-1a of the RVSP EIR, consists primarily of annual grasslands and seasonal wetlands, which do not represent suitable habitat for bat species. However, the existing trees located along the northern and western boundaries of the off-site affordable housing parcel could represent suitable roosting habitat for special-status bat species. As discussed under Impact 6-8 of the RVSP EIR, buildout of the RVSP could result in the removal of suitable roosting and nesting habitat for special-status bat species. Thus, development of the site with a maximum of 120 affordable income-restricted units and associated improvements could result in impacts to special-status bat species through the removal of suitable habitat. However, the RVSP EIR included Mitigation Measure 6-8a, which is intended to avoid and compensate for potential impacts to special-status bat species.

At such time the off-site affordable housing parcel gets developed, the future developer would be required by the County to implement RVSP EIR Mitigation Measure 6-8a, which has been incorporated into this EIR as Mitigation Measure 7-10(b). Mitigation Measure 6-8a of the certified RVSP EIR requires preconstruction surveys for special-status bat species, as well as avoidance and compensation for potential impacts to special-status bats. As determined in the RVSP EIR, implementation of Mitigation Measure 6-8a would reduce potential impacts to special-status bat species to a less-than-significant level.

Conclusion

Based on the above, implementation of RVSP EIR Mitigation Measure 6-8a would be required to ensure the reasonably foreseeable potential future development of the off-site affordable housing parcel would result in a less-than-significant impact to special-status bat species. In addition, development of the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a bat species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. Thus, a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impacts to a *less-than-significant* level by ensuring that construction activities do not result in bat mortality.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

7-10(a) *Prior to the commencement of construction activities, a qualified biologist shall conduct a bat habitat assessment of all potential roosting habitat features, including trees within the proposed impact footprint within the project vicinity. The habitat assessment shall identify all potentially suitable roosting habitat and may be conducted up to one year prior to the start of construction. The results of the assessment shall be submitted to the Placer County Community Development Resource Agency.*

- *If potential roosting habitat is identified (cavities in trees or potential roosts within structures) within the areas proposed for impact, the biologist shall survey the potential roosting habitat during the active season (generally April through October or from January through March on days with temperatures in excess of 50 degrees Fahrenheit) to determine the presence of roosting bats. The surveys are recommended to be conducted utilizing methods that are considered acceptable by bat experts after consultation with CDFW. Methods may include evening emergence surveys, acoustic surveys, inspecting potential roosting habitat with fiberoptic cameras, or a combination thereof.*
- *If roosting bats are identified within any of the trees planned for removal, or if presence is assumed, the trees shall be removed outside of pup season, only on days with temperatures in excess of 50 degrees Fahrenheit. Pup season is generally during the months of May through August. Two-step tree removal shall be utilized under the supervision of the qualified biologist. Two-step tree removal involves removal of all branches of the tree that do not provide roosting habitat on the first day, and then the next day cutting down the remaining portion of the tree.*
- *Additionally, it is recommended that all other tree removal shall be conducted from January through March on days with*

temperatures in excess of 50 degrees Fahrenheit to avoid potential impacts to foliage-roosting bat species.

- *If roosting bats are identified within any structures planned for removal, a bat exclusion plan shall be prepared by a qualified bat biologist describing the methods to be used to humanely exclude bats prior to disturbance. The plan shall be approved by the Placer County Community Development Resource Agency after consultation with CDFW and shall be implemented prior to the start of construction.*
- *The requirements for the bat expert and County to consult with CDFW prior to approving survey methods and a bat exclusion plan shall be satisfied either where CDFW responds to requests for consultation within 30 days of the requests or where the bat expert and County have attempted to consult with CDFW but CDFW has failed to respond to the request within 30 days of the placement of the request.*

Off-Site Affordable Housing Parcel

7-10(b) Implement RVSP EIR Mitigation Measure 6-8a:

Prior to construction, a qualified biologist shall survey any affected structures and trees for evidences of bat roosts (e.g., bat guano). If roosts are found, they shall be removed in April, September, or October in order to avoid the hibernation and maternity seasons. Appropriate exclusion methods will be used, as needed, during habitat removal. If bats must be excluded, the Applicant shall work with a qualified biologist to determine appropriate exclusion methods. If bats are found onsite and cannot be avoided, each Applicant/developer for construction projects within the Plan Area shall work with a qualified biologist to determine if additional mitigation, such as the construction of bat boxes, is appropriate. Determination of these additional measures will depend on the species present and their specific ecological preferences/requirements. Other steps could include improving other avoided bat habitat or designing new project elements such as bat-friendly road crossings. If no active bat roosts are found during focused surveys, no further mitigation will be required.

7-11 Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the biological and habitat conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

One terrestrial cover mapped within the study area is considered to be a Sensitive Natural Community by CDFW: VFRW. The study area contains approximately 3.8 acres of VFRW, 1.3 acres of which would be permanently impacted by the proposed project (see Figure 7-6).

Impacts to Riparian land cover within the PCCP require payment of special habitat fees to mitigate impacts. The PCCP's Special Habitat Fee Schedule (subject to annual adjustments) sets fees for impacts to Riparian areas and a 50-foot buffer off the riparian at a fee per directly impacted acre. In addition, because the proposed project would disturb riparian habitat within the PCCP, the project would be required to comply with the CARP. Permanent and temporary impacts to PCCP special habitats, Stream System, and the CARP riparian buffer are detailed in Table 7-4.

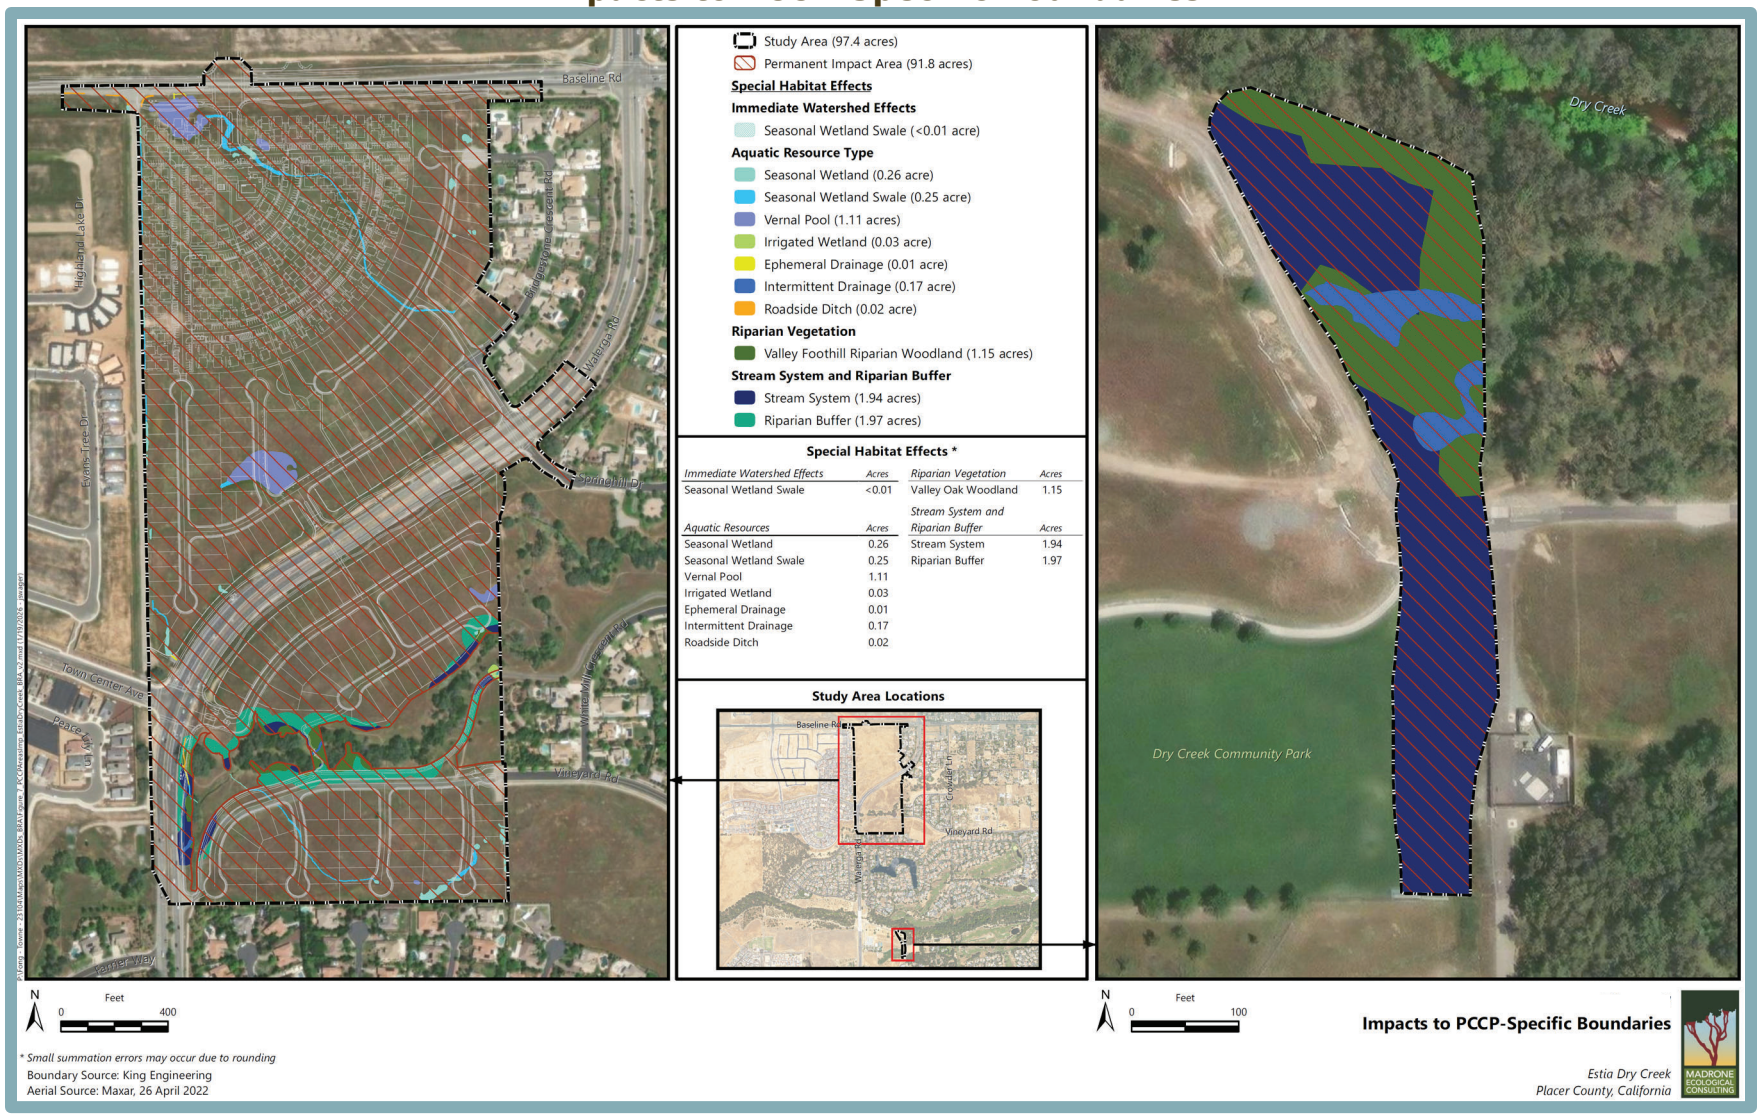

Table 7-4
Impacts to PCCP Special Habitats and CARP Setbacks within the Study Area

Special Habitat/Setback	Permanent Impacts	Temporary Impacts	Total
PCCP Special Habitats			
Vernal Pool Constituent Habitat Direct Effects[1]	1.62	--	**1.62**
Other Aquatic/Wetland	0.03	--	**0.03**
Riverine/Riparian	1.15	0.008[2]	**1.16**
Riverine/Riparian Buffer[3]	1.68	--	**1.68**
Stream System[3]	1.94	--	**1.94**
Salmonid Stream Channel	--	--	**--**
VP Immediate Watershed Effects	<0.01	--	**<0.01**
CARP Setbacks			
CARP Drainage Setback	1.94	--	**1.94**
Riparian Buffer	1.97	--	**1.97**

[1] Vernal pool constituent direct effects include impacts to seasonal wetlands, seasonal wetland swales, and vernal pools only and do not include impacts to irrigated wetlands. Irrigated wetland effects are included under Other Aquatic/Wetland in the following entry.
[2] This impact is a crossing of an intermittent drainage. Although the drainage may be temporarily impacted during construction of the crossing, the drainage itself will ultimately be avoided by the proposed project
[3] The stream system habitat excludes other special habitats that fall within the riverine/riparian and riparian buffer areas that would be subject to other special habitat fees.

Source: Madrone Ecological Consulting, 2026.

Figure 7-6
Impacts to PCCP-Specific Boundaries

* Figure not OCR Compatible

On page 5-24 of the PCCP, the text sets forth Objectives RAR-1.1 and RAR-1.2. Objective RAR-1.1 (*Protect Riverine/Riparian Complex*) is to "[p]rotect 2,200 acres of riverine/riparian complex natural community, which will include at least 1,410 acres of riparian constituent habitat (960 acres in the Valley and 451 acres in the Foothills). This portion of the Reserve System will include 88.6 linear miles of streams (riverine)."

Objective RAR-1.2 (*Protect Riverine Constituent Habitat*) is to "[p]rotect at least 88.6 linear stream miles of riverine within the riverine/riparian complex natural community."

The Rationale for Objectives RAR-1.1 and RAR-1.2 reads as follows: "The assembly of the Reserve System will substantially increase the amount of protected riverine and riparian constituent habitats in the Plan Area. The riverine and riparian protection commitments are large enough (with contribution from Objective RAR 1.3 to expand and connect fragmented patches of riparian community) to protect corridors for movement from the Valley floor to the Foothills, which will contribute to achieving Landscape Objective 2.3, *Establish East–West Corridors*.

"The protection commitments for the riverine and riparian constituent habitats are intended to be large enough to protect, along with enhancement and restoration (Objectives RAR 1.3, 1.4, 1.5, 1.6, and 1.7), functioning hydrologic systems that provide habitat value for native biota while continuing to meet urban requirements for flood control, drinking water, agriculture, and recreation. For western Placer County streams, this generally means providing the channel width and depth to convey most flood flows while maintaining both aquatic and terrestrial habitat complexity necessary to ensure water quality and suitable streambed conditions for all life stages of aquatic Covered Species.

"The riverine and riparian commitment is intended to be large enough to ensure that extensive amounts of high quality spawning, rearing, and migrating habitat are protected for the covered salmonids within the Raccoon Creek, Doty Ravine, and Auburn Ravine, and Dry Creek watersheds, consistent with the Recovery Plan for the Evolutionarily Significant Units of Sacramento River Winter-run Chinook Salmon and Central Valley Spring-run Chinook Salmon and the Distinct Population Segment of California Central Valley Steelhead (National Marine Fisheries Service 2014).

"After restoration is successfully completed, at least 2,232 acres (and up to 3,625 acres if the proposed maximum allowable loss of riverine/riparian complex community occurs) of riverine/riparian communities will be protected and restored on the Reserve System. These protection and restoration commitments provide for the conservation and recovery of Covered Species in the Plan Area, in addition to mitigating indirect effects and the direct effects on 490 acres of the riverine/riparian complex natural community.

"The protection of 88.6 miles of streams in Plan Area A and B (see Section 5.3.1.3.4, *Conservation in Plan Area B*) and restoration of fish passage both upstream and downstream of existing barriers (Objective RAR 1.5) will provide for the conservation and recovery of riverine Covered Species in the Plan Area, in addition to mitigating direct and indirect effects on 551 miles of streams in the Plan Area. The protection of these streams will overlap the riverine/riparian complex community protected."

Objective RAR-1.3 (*Restore Riverine/Riparian Complex*), set forth on page 5-25 of the PCCP, states that "[a] minimum of 32 acres of riparian constituent habitat will be restored, independent of effects. In addition, impacts on riverine/riparian constituent habitat and the Stream System will be mitigated by restoration of riverine and riparian constituent habitat at ratio of 1.52:1. If the proposed maximum allowable effects on riverine/ riparian complex and the Stream System occur (490 acres and 426 acres, respectively, for a total estimated effect of 916 acres), up to an additional 1,425 acres of riverine/riparian complex will be restored. Of the 1,425 acres of riverine and riparian constituent habitat restoration, 1,250 acres must be restored as riparian constituent habitat. Also see Table 5-4. Effects on salmonid habitat (i.e., spawning or migrating) will be mitigated in kind. Other natural communities interspersed within riverine/riparian complex may be restored as part of riverine/riparian upland complex (e.g., valley oak woodland, fresh emergent wetlands)."

The Rationale for this objective, on pages 5-25 and 5-26, reads as follows: "Extensive amounts of riverine/riparian complex have been lost or degraded in the Plan Area, thereby fragmenting remaining habitat, particularly of riparian constituent habitat. Restoration of riverine/riparian complex will substantially increase the amount of this community in the Plan Area[.]

"This objective provides for the restoration of riverine/riparian complex as mitigation for the effects of Covered Activities on the Stream System (see Section 6.3.3.4, *Stream System Condition 3, Stream System Mitigation: Restoration,* for details), which includes direct effects on 490 acres of riverine/riparian complex and direct effects on another 426 acres of the Stream System. The effects on the Stream System (426 acres) will be determined when the Stream System boundary is assessed (see Section 6.3.3.1.1, *Stream System Boundary*). Where the affected Stream System includes constituent habitats, effects will be mitigated by restoration of those habitats. The Stream System also includes other communities, in addition to constituent habitats (e.g., grassland, valley oak woodland). Effects on other such communities within the Stream System will also be mitigated at a ratio of 1.52:1 by restoration of riverine/riparian constituent habitats to mitigate the irreversible loss of the valuable ecosystem services provided by land within the Stream System.

"The majority (over 74 percent) of riverine/riparian complex will be restored as constituent habitat. Riverine/riparian complex includes a diverse mosaic of riverine, riparian communities and other closely associated communities, including fresh emergent wetlands, seasonal wetlands, off-channel wetlands, and stands of valley oak woodland. This objective allows for up to 22 percent of riverine/riparian complex restoration to include these closely associated communities.

"The restoration of 32 acres of riparian vegetation independent of effect, and additional riparian vegetation dependent on effect, will be sited in spawning, rearing, and migrating habitat primarily along Raccoon Creek, Doty Ravine, and Auburn Ravine to optimize habitat values for covered fish species. Restoration of riverine/riparian complex dependent on effect will be implemented in-kind for effects on salmonid habitat. For example, if 20 acres of riverine/riparian complex are affected in spawning habitat on Raccoon Creek, 30.4 acres of riverine/riparian complex will be restored in spawning habitat on Raccoon Creek, with at least 74 percent restored as riparian vegetation.

"Riparian restoration will be focused on expanding and connecting existing fragments of riparian communities to restore corridors for movement in the Plan Area, which will contribute to achieving Landscape Objective 2.3, *Establish East–West Corridors.* "The riverine/riparian complex natural community provides important ecosystem functions. Achieving this objective will improve riparian-related ecosystem functions such as providing shade that moderates water temperatures in adjacent streams, slowing water velocities during flood events, reducing inputs of nutrients (e.g., nitrogen) and pollutants into streams, providing habitat for terrestrial and aquatic invertebrates, prey species for covered salmonids and native biota, and stabilizing banks against erosion.

"The riverine/riparian complex natural community provides important habitat for many Covered Species and other native species in the Plan Area. Riparian restoration, for example, will restore habitat for Swainson's hawk, valley elderberry longhorn beetle, western pond turtle, amphibians, and the covered salmonids. Swainson's hawk nests in riparian habitats in the Valley. Valley elderberry longhorn beetle occur almost entirely within riparian communities. For salmonids, the riparian vegetation provides shade that regulates water temperature and large woody material that provides cover and in-stream habitat complexity. Flooded riparian zones also provide rearing habitat for the covered salmonids."

PCCP Objective RAR-1.4 (*Enhance Riparian Vegetation*), set forth on page 5-26, is to "[e]nhance the cover, structural diversity, and native species diversity of the riparian constituent habitat in the Reserve System."

The Rationale for this objective, as stated on the same page, is as follows: **"**Riparian constituent habitat will be enhanced throughout the Reserve System. Achieving this objective will increase native biodiversity and relative cover of native plant species, increase structural diversity, and improve habitat function for Covered Species and native biota. High species diversity promotes natural community resilience, and native biodiversity in riparian systems generates structural diversity that constitutes habitat for many riparian wildlife species. Success criteria for individual enhancement sites will be developed within each reserve unit management plan."

Notwithstanding the above, without payment of applicable PCCP fees and compliance with the provisions of the CARP, the proposed project could have a substantial adverse effect on riparian habitat identified in local or regional plans, policies, regulations or by the CDFW or USFWS.

Off-Site Affordable Housing Parcel

Potential impacts to State- or federally protected wetlands are discussed further under Impact 7-12 of this EIR. The off-site affordable housing parcel is currently undeveloped and, based on Figure 6-1a of the RVSP EIR, consists primarily of annual grasslands with seasonal wetlands located on the southeast portion of the parcel, which are not identified as sensitive natural communities. As such, sensitive natural communities, including riparian habitat, are not present within the off-site affordable housing parcel. Therefore, at such time the off-site affordable housing parcel gets developed, impacts to riparian habitat identified in local or regional plans, policies, regulations or by the CDFW or USFWS would be less than significant.

Conclusion

Based on the above, the potential future development of the off-site affordable housing parcel would result in a less-than-significant impact to riparian habitat and other identified sensitive natural communities. However, without payment of applicable PCCP fees and compliance with the provisions of the CARP, the proposed project could have a substantial adverse effect on riparian habitat identified in local or regional plans, policies, regulations or by the CDFW or USFWS, and a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level by ensuring the avoidance of any substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

7-11(a) Implement the following Mitigation Measures set forth in this EIR:

- *7-3(a) The Permittee shall apply for and be issued coverage under the PCCP to mitigate for all impacts to Covered Species, land cover, and sensitive natural communities. Prior to application approval, additional species surveys may be necessary, and prior to construction, land cover and special habitat fees shall be paid. The Permittee shall comply with the terms of the PCCP Coverage Certificate, including compliance with all avoidance, mitigation, and minimization measures, which may include pre-construction surveys, construction monitoring, and BMPs.*

  PCCP General Condition 3: The proposed project shall pay a land conversion fee for the permanent conversion of natural land cover including VPC Low, VPC Intermediate, and Valley Foothill Riparian Woodland. The fees to be paid shall be those in effect at the time of ground disturbance authorization for each project phase and shall be based on the effect to modeled species habitat at the parcel scale.

  In addition to land conversion, the project would result in permanent direct effects and temporary effects to PCCP Special Habitats as estimated in Table 6 of the Biological Resources Assessment (BRA) prepared for the proposed project. The total special habitat fee obligation including temporary effect fees shall be paid prior to issuance of a land conversion authorization that allows ground disturbance of a special habitat.

- *7-4(c) PCCP Community Condition 2.2: Prior to land conversion authorization, the applicant shall coordinate with the PCA to determine which In-Stream and Stream System Best*

Management Practices (BMPs) from Table 7-1 of the Placer County Conservation Plan apply to the proposed project. The applicant shall identify the applicable BMPs on the project's improvement or grading plans. The selected BMPs shall be incorporated into the project's Land Conversion Authorization letter.

Prior to land conversion authorization approval, the unavoidable effects to riverine and riparian habitat or their buffers shall be mitigated through payment of special habitat fees. The fees to be paid shall be those in effect at the time of land conversion authorization.

- *7-6(b) PCCP Community Condition 2.1: To the maximum extent possible, the proposed project shall not modify any area within a buffer that extends 50 feet outward from the outermost bounds of the riparian vegetation. The improvement or grading plans shall show the location of the riverine/riparian buffer.*

7-11(b) *PCCP General Condition 4: The applicant shall restore all temporarily disturbed areas and, one year after project groundbreaking, provide the County with a written assessment of how the performance standards were met. The project would result in temporary effects to special habitats (riverine/riparian). Prior to issuance of land conversion authorization, the project shall pay a fee based on the acres of impact. The fee to be paid shall be that in effect at the time of land conversion authorization issuance. If it is determined by the County or the PCCP biologist that the effects remain one year after groundbreaking activities have commenced, the effects shall be considered permanent and the County project lead shall reassess fees based on those effects.*

7-11(c) *Prior to the commencement of ground-disturbing activities, the applicant shall apply for a Section 1600 Lake or Streambed Alteration Agreement from CDFW for the entire project or by phase as needed. The Lake and Streambed Alteration Agreement program is not fully integrated into the PCCP and must be applied for separate and apart from the PCCP. The information provided shall include a description of all activities associated with the project, not just those closely associated with the drainages and/or riparian vegetation. Impacts shall be outlined in the application and are expected to be in substantial conformance with the impacts to biological resources outlined in this document. Impacts for each activity shall be broken down by temporary and permanent, and a description of the proposed mitigation for biological resource impacts shall be outlined per activity and then by temporary and permanent. Information regarding project-specific drainage and hydrology changes resulting from project implementation shall be provided as well as a description of storm water treatment methods. Minimization and avoidance measures shall be proposed as appropriate and may include: preconstruction species surveys and reporting, protective fencing around avoided biological resources,*

worker environmental awareness training, seeding disturbed areas adjacent to open space areas with native seed, and installation of project-specific storm water BMPs. Mitigation shall be determined by CDFW and result in no net loss of riparian habitat.

7-12 Have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could have a substantial adverse effect on State- or federally protected wetlands through direct removal, filling, hydrological interruption, or other means.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the biological and habitat conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to have a substantial adverse effect on State- or federally protected wetlands through direct removal, filling, hydrological interruption, or other means would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

Wetlands are generally considered to be areas that are periodically or permanently inundated by surface or groundwater, and support vegetation adapted to life in saturated soil. Wetlands are recognized as important features on a regional and national level due to their high inherent value to fish and wildlife, use as storage areas for storm and flood waters, and water recharge, filtration, and purification functions.

The USACE, CDFW, and RWQCB have jurisdiction over modifications to stream channels, river banks, lakes, and other wetland features. The USACE's jurisdiction is established through the provisions of Section 404 of the CWA, which prohibits the discharge of dredged or fill material into waters of the U.S. without a permit, including certain wetlands and unvegetated "other waters of the U.S." The jurisdictional authority of the RWQCB is established pursuant to Section 401 of the CWA, which typically requires a water quality certification when an individual or nationwide permit is issued by the USACE. The RWQCB also has jurisdiction over waters of the State under the Porter-Cologne Water Quality Control Act. Within the PCCP plan area, the CARP is a component of the PCCP that identifies, classifies, and protects County aquatic resources. The CARP requires implementation of avoidance, minimization, and compensatory mitigation measures for work in waters of the County, including discharges of fill material and alterations to the bed, bank, shoreline, or channel of County streams, lakes, and ponds.

A total of approximately 2.07 acres of aquatic resources has been mapped within the study area in accordance with the USACE Sacramento District's Minimum Standards

for Acceptance of Preliminary Wetlands Delineations. The aquatic resources within the study area that could be potentially affected as a result of the proposed project are shown in Figure 7-5 and summarized in Table 7-5. As shown therein, of the approximately 2.07 acres of aquatic resources mapped within the study area, approximately 1.84 acres would be permanently disturbed and less than 0.01-acre would be temporarily disturbed by the proposed project.

Table 7-5
Acres of Aquatic Resources Impacts within the Study Area

Aquatic Resources	Permanent Impacts[1]	Temporary Impacts[1]	Avoided[1]	Total[1]
Irrigated Wetland	0.03	--	--	0.03
Seasonal Wetland	0.26	--	--	0.26
Seasonal Wetland Swale	0.25	--	<0.01	0.26
Vernal Pool	1.11	--	--	1.11
Ephemeral Drainage	0.01	--	--	0.01
Intermittent Drainage	0.16	<0.01	0.23	0.39
Roadside Ditch	0.02	--	--	0.02
Total	**1.84**	**<0.01**	**0.23**	**2.07**

[1] The estimates within this table are preliminary and subject to change during the PCCP application and permitting process.

Source: Madrone Ecological Consulting, 2026.

The PCCP emphasizes minimization of aquatic resource impacts within the Stream System, which the proposed project would do to the maximum extent practicable. Permanent impacts to aquatic resources within the PCCP-defined Stream System would be limited to intermittent drainage, a portion of ephemeral drainage, and small areas of seasonal wetland and seasonal wetland swale. All impacts to vernal pools would occur outside of the Stream System.

The permanent and unavoidable impacts to intermittent drainage would include impacts associated with the Walerga Road shoulder improvements and detention basin outfalls within the project site and the Dry Creek floodwater expansion in the off-site sewer lift station improvements area. Temporary intermittent drainage impacts would be associated with the proposed sewer line and pedestrian bridge crossing within the intermittent drainage on the project site. The irrigated wetland within the study area would be impacted by trail construction. All other impacts to wetlands, roadside ditch, and ephemeral drainages would be associated with mass grading for development.

The PCCP includes the CARP to issue permits related to the CWA and the CFGC. Applicants are required to obtain a signed Certificate of PCCP Authorization form from Placer County for potential impacts to terrestrial and aquatic habitats. During the local impact authorization process, impact fees are calculated utilizing land cover data. Fees can include Land Conversion fees and Aquatic/Wetland Special Habitat fees. Special habitat fees would apply to the proposed project to mitigate impacts to the aquatic resources in the study area, including wetlands and other applicable resources.

The proposed project would impact aquatic resources that are considered to be special habitats by the PCCP. Permanent and temporary impacts to PCCP special habitats, CARP drainage setbacks, and the CARP riparian buffer are detailed in Table 7-4. The proposed project would be required to pay fees proportional to the amount of special habitat impacted.

The PCCP would result in the protection, enhancement, and management of vernal pool complexes as a specific wetland habitat type and in the protection, enhancement, and management of emergent marshes, seasonal wetlands, and lacustrine habitats (e.g., ponds), as well as riverine/riparian habitat, including streams.

PCCP Objective VPCG-1.1 (*Protect Existing Vernal Pool Complexes*), as set forth in Section 5.2.6.1 (Vernal Pool Complex and Grassland Natural Communities) on page 5-17 of the Plan, is to "[p]rotect 17,000 acres of existing vernal pool complex, including 790 wetted acres of vernal pool constituent habitat (Table 5-3), to build a vernal pool Reserve System in large, contiguous blocks based on reserve units (minimum size of 200 acres unless agreed to by the Wildlife Agencies), primarily in the Valley RAA, and provide for the conservation of the covered vernal pool branchiopods in the Plan Area."

The Rationale for this objective is set forth as follows: "The assembly of the Reserve System in the western portion of the Plan Area will substantially increase the amount of protected vernal pool complexes and constituent vernal pools and seasonal wetlands in the Plan Area, thereby reducing fragmentation that can disrupt hydrologic processes and gene flow. The vernal pool protection commitment is large enough to assemble a Reserve System of interconnected vernal pool complexes that spans the north-south axis of the Valley RAA. Protecting large, interconnected vernal pool landscapes will provide sufficient upland habitat for the protection of vernal pool plant pollinators, provide for dispersal of vernal pool plants and animals, and sustain important predators, such as raptors that prey on rodents and rabbits (U.S. Fish and Wildlife Service 2005).

"The proportion of vernal pools to seasonal wetlands that will be protected will be equal to or greater than this proportion within vernal pool complexes lost as a result of Covered Activities. After restoration and creation is successfully completed (VPCG-1.2), a total of at least 820 wetted acres (790 acres protected and 30 acres restored), and up to 1,690 wetted acres if the proposed maximum allowable loss of wetland and aquatic community occurs (790 acres protected and 900 acres restored), of vernal pool constituent habitats will be protected and restored on the Reserve System (Tables 5-3 and 5-4). The vernal pool complex acre commitment and vernal pool complex reserve design criteria (see Section 5.3.1.5.2, *Vernal Pool Complexes and Grassland Natural Communities*) are intended to be large enough to ensure that extensive amounts of vernal pools, seasonal wetlands, and swales are protected within an upland matrix to facilitate the conservation and recovery of covered vernal pool branchiopods within the Plan Area, consistent with the Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon (U.S. Fish and Wildlife Service 2005) and Section 2820 (a)(4)(C) of the NCCP Act. Section 5.2.6.1, *Vernal Pool Complex and Grassland Natural Communities*, describes how the Plan's conservation strategy for the vernal pool complex and grassland natural community is consistent with the recovery plan for these species."

PCCP Objective VPCG 1.2 (*Restore/Create Vernal Pool Complexes*), as set forth on pages 5-17 and 5-18, is as follows: "In addition to the protection of 17,000 acres of existing vernal pool complex, restore/create 3,000 acres of vernal pool complex in the Reserve System by Year 35, independent of effects. Within the 20,000 acres of protected and restored/created vernal pool complex, restore/create vernal pool constituent habitats to provide habitat for covered vernal pool branchiopods (Table 5-5). At least 30 wetted acres of vernal pools will be restored/created independent of effects (Table 5-4). Assuming all effects occur, an additional 870 acres of vernal pool constituent habitat will be restored as mitigation (Table 5-4). If the proposed maximum allowable effect occurs, restoration totals will be 900 acres of vernal pool constituent habitat, of which a minimum of 326 acres would be delineated as vernal pool wetlands (Table 5-4). At least 34 percent of all effects on vernal pool constituent habitat will be mitigated as vernal pool wetlands (up to 290 acres). The proportion of vernal pool wetlands to seasonal wetlands that will be restored/created will be equal to or greater than the proportion lost as a result of Covered Activities."

The Rationale for this objective, laid out on page 5-18, is as follows: "Vernal pool complexes have been degraded in western Placer County and throughout their range in southern Oregon and California by direct disturbance, invasion of non-native species, and by alteration of hydrological patterns. For many complexes, habitat restoration may be necessary to regain proper functioning of a vernal pool ecosystem (U.S. Fish and Wildlife Service 2005).

"The Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon (U.S. Fish and Wildlife Service 2005) recognizes that vernal pool restoration and creation may be valuable recovery tools for some vernal pool species. Although vernal pool fairy shrimp and vernal pool tadpole shrimp are known to occupy restored and created pools, data on long-term persistence of these species in restored and created pools are lacking. For this reason, the recovery plan states that the order of preference for recovery of vernal pool species is, first, protection of existing habitat, followed by restoration of former or degraded habitat, and lastly, creation of vernal pools if necessary to maintain the range of vernal pool habitat. The Plan therefore relies primarily on protection of existing vernal pool complexes, but includes a restoration and creation component to supplement the vernal pool complex protection and to expand and connect existing vernal pool complexes in the Plan Area.

"The acre commitment for restoration of vernal pool complex will support vernal pools at densities comparable to naturally occurring vernal pool complexes in the Plan Area. The result will be a substantial increase in the amount of interconnected vernal pool complexes in the Reserve System, thereby reducing landscape-level fragmentation and increasing permeability for Covered Species."

PCCP Objective VPCG-2.1 (*Enhance Vernal Pool Vegetation and Hydrology*), as stated on page 5-20 of the PCCP, is to "[e]nhance the vegetation and hydrology of degraded vernal pools and seasonal wetlands in the Reserve System to a self-sustaining natural hydroperiod (timing, frequency, and duration of inundation), and to sustain the vernal pool complex natural community, including associated covered vernal pool species."

The Rationale for this objective, laid out on the same page, is as follows: "Altered hydrology of vernal pool complexes can change the timing, frequency, and duration of vernal pool inundation, which can create conditions that render vernal pools unsuitable or less suitable for vernal pool species (U.S. Fish and Wildlife Service 2005, 2007). Vernal pool hydrology has been altered by hydrologic barriers such as roads or canals, and the diversion of urban runoff and agriculture. Diversion of urban runoff and agriculture can increase pond timing and duration, converting vernal pools to perennial ponds that are incapable of supporting vernal pool species. Many vernal pools in the Plan Area have become degraded as a result of past agricultural practices. This objective will provide for the enhancement of existing, degraded vernal pools and seasonal wetlands by rehabilitating them to the appropriate hydrological conditions for sustaining covered vernal pool species within the Reserve System. This objective will also provide for the enhancement of native vegetation within the vernal pools through control of invasive species and thatch build-up.

"Objective VPCG-1.1 requires the protection of at least 790 acres of vernal pool constituent habitats consisting of covered vernal pool branchiopod habitat, but this acreage may include vernal pools and seasonal wetlands that have been degraded and have low habitat value for covered vernal pool branchiopods (Tables 5-3). Objective VPCG-2.1 requires that degraded vernal pools and seasonal wetlands in the Reserve System be enhanced to increase their habitat value for the covered vernal pool branchiopods."

PCCP Objective AW-1.1 (*Protect Aquatic/Wetlands Complex Natural Community*), found in Section 5.2.6.2 (Aquatic/Wetlands Complex Natural Communities) on page 5-21, is to "[p]rotect 600 acres of aquatic/wetlands complex natural community (400 acres in the Valley and 200 acres in the Foothills). The 600 acres of aquatic/wetlands complex will include at least 586 acres of wetlands (e.g., fresh emergent marsh, lacustrine, non-vernal pool seasonal wetland), of which at least 256 acres will be fresh emergent marsh (Table 5-3)."

The Rationale for this Objective, on pages 5-21 and 5-22, is as follows: "The assembly of the Reserve System will substantially increase the amount of protected aquatic/wetlands complex natural community in the Plan Area. After restoration and creation is successfully completed (Table 5-4), a total of at least 606 wetted acres (and up to 989 wetted acres if the proposed maximum allowable effects on wetland and aquatic community occurs) of wetland and aquatic complex community will be protected and restored on the Reserve System. The protection and restoration commitments (Objectives AW-1.1 and AW-1.2) provide for the conservation and recovery of some of the Covered Species in the Plan Area, in addition to mitigating indirect effects and the direct effects on up to 260 acres of aquatic/wetland constituent habitats.

"The protection commitments for the wetland and aquatic natural community are intended to be large enough with commitments for each constituent habitat to protect the range of wetland and aquatic types in the Plan Area. The net effect will be an increase in acreage and ecological function of wetland and aquatic communities, which provides habitat for giant garter snake, western pond turtle, California red-legged frog, tricolored blackbird, California black rail, and a diversity of native species.

"Wetland and aquatic communities will be protected, restored, and created within a matrix of upland natural communities (e.g., grasslands and oak woodlands) to protect watershed integrity and to provide adjacent habitat for Covered Species necessary for nesting, migrating, dispersing, and aestivating."

PCCP Objective AW-1.2 (*Restore/Create Aquatic/Wetland Complex Natural Community*), found on page 5-22, reads as follows: "In addition to the protection of 600 acres of existing aquatic/wetland complex, restore and create aquatic/wetland natural community by restoring fresh emergent marsh, lacustrine, and non-vernal pool seasonal wetland constituent wetlands. At least 20 acres of fresh emergent marsh will be restored independent of effects. Additional restoration/creation will occur dependent on effect at a 1.5:1 ratio of restored/created to affected aquatic/wetland types. In the Valley, at least 40 percent of the restoration dependent on effects will be fresh emergent marsh. In the Foothills, at least 50 percent of the restoration dependent on effects will be fresh emergent marsh. The remaining 10 percent may occur in the Valley or the Foothills. Restoration dependent on effect may result in an additional 390 acres of aquatic/wetland type wetlands restored/created as mitigation. If the proposed maximum allowable effect on aquatic/wetland complex occurs, independent and dependent restoration will total 410 wetted acres of aquatic/wetland complex community of which a minimum of 196 acres would be delineated as fresh emergent marsh (Table 5-4)."

The Rational for this Objective, found on page 5-22, reads as follows: "The restoration and creation of at least 20 acres of fresh emergent wetland, and up to 410 additional acres of aquatic/wetland complex constituent habitats (fresh emergent marsh, lacustrine, and/or non-vernal pool seasonal wetland) if the proposed maximum allowable effects occur, will result in a net increase in the aquatic/wetland complex natural community in the Plan Area. Aquatic/wetland type wetlands will be restored and created to mitigate in-kind for affected habitat. Aquatic/wetland creation will occur when suitable land is not available for restoration.

"Aquatic/wetland complex natural communities will be restored and created to provide habitat (e.g., fresh emergent marshes and basking sites around the perimeter of ponds) for Covered Species, including giant garter snake, western pond turtle, California red-legged frog, tricolored blackbird, and California black rail. Aquatic/wetland complex communities will be restored and created within a matrix of upland natural communities (e.g., grasslands and oak woodlands) to protect watershed integrity and to provide adjacent habitat for Covered Species necessary for nesting, migrating, dispersing, and aestivating."

PCCP Objective AW-1.3 (*Maintain and Enhance Wetlands and Ponds*), found on pages 5-22 and 5-23, is to "[m]aintain and enhance hydrological functions, native biodiversity, and habitats for populations of Covered Species in all protected aquatic/wetland complexes within the Reserve System."

The Rationale for Objective AW-1.3, found on PCCP page 5-23, is as follows: "Wetlands and ponds will be maintained and enhanced throughout the Reserve System. Achieving this objective will ensure that appropriate hydrologic conditions and ecosystem functions are maintained and enhanced to support aquatic/wetland complex communities in the Reserve System, consistent with performance standards

as described in Conservation Measure 2, *Manage and Enhance the Reserve System*, and in Chapter 7, *Monitoring and Adaptive Management Program*. These hydrologic conditions include inundation regimes suitable to provide habitat for Covered Species. Ecosystem functions will be maintained and enhanced, for example, to provide suitable vegetation structure and composition in aquatic/wetland complex communities. Vegetation provides cover and basking sites for Covered Species and native species. However, excessive and invasive vegetation reduces the quality and extent of aquatic and open water habitats for Covered Species and other native species. Fencing of wetlands and ponds and rotational grazing are two methods that will be used to manage sustainable grazing in these habitats.

"Where predators such as bullfrog and bass are present, ponds may be drained to remove those aquatic predators. Plan Area ponds provide habitat for western pond turtle and California red-legged frog. These ponds are frequently dominated by non-native predators (e.g., bullfrog). Bullfrogs and several species of bass are known to prey upon the eggs and tadpoles of California red-legged frog, as well as western pond turtle hatchlings and juveniles (Moyle 1973; Holland 1991). Hatchlings of wood ducks, mallards, and even Canada geese often fall prey to largemouth bass."

Notwithstanding the above, without compliance with the CARP and CFGC, the proposed project could have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is currently undeveloped and, based on Figure 6-1a of the RVSP EIR, consists primarily of annual grasslands with seasonal wetlands located on the southeast portion of the parcel. As discussed under Impact 6-1 of the RVSP EIR, buildout of the entire RVSP could result in the permanent loss of approximately 1.871 acres of wetlands or other waters of the Unites States, as well as 0.077-acre of non-jurisdictional wetland features. The RVSP EIR included Mitigation Measures 6-1a, 6-1c, and 6-1d, which are intended to prevent the loss of jurisdictional and potentially non-jurisdictional wetlands.

At such time the off-site affordable housing parcel gets developed, the future developer would be required by the County to implement RVSP EIR Mitigation Measures 6-1a, 6-1c, and 6-1d, which have been incorporated into this EIR as Mitigation Measures 7-5(b), 7-5(c), and 7-12(l). Mitigation Measure 6-1a of the certified RVSP EIR requires the project applicant mitigate and compensate for loss of jurisdictional and non-jurisdictional wetlands in accordance with USACE Section 404 Permit and RWQCB requirements. In addition, RVSP Mitigation Measure 6-1c establishes BMPs that would be required by the project applicant to avoid potential impacts to wetlands, and Mitigation Measure 6-1d requires the project applicant design final drainage master plan facilities to ensure that drainage features would avoid impacts to wetlands and other jurisdictional waters. As determined in the RVSP EIR, implementation of Mitigation Measures 6-1a, 6-1c, and 6-1d would reduce potential impacts to jurisdictional and potentially non-jurisdictional wetlands to a less-than-significant level.

Conclusion

Based on the above, implementation of RVSP EIR Mitigation Measures 6-1a, 6-1c, and 6-1d, would be required to ensure the potential future development of the off-site affordable housing parcel would result in a less-than-significant impact to wetland habitats. In addition, without compliance with the CARP and CFGC, the proposed project could have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means. Therefore, a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impacts to a *less-than-significant* level by ensuring that the proposed project would not have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means. In addition, at such time the off-site affordable housing parcel gets developed, the future developer would be required to comply with Mitigation Measures 7-12(j) and 7-12(k) related to wetlands prior to development of the parcel.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

7-12(a) Implement the following Mitigation Measures set forth in this EIR:

- *7-3(a) The Permittee shall apply for and be issued coverage under the PCCP to mitigate for all impacts to Covered Species, land cover, and sensitive natural communities. Prior to application approval, additional species surveys may be necessary, and prior to construction, land cover and special habitat fees shall be paid. The Permittee shall comply with the terms of the PCCP Coverage Certificate, including compliance with all avoidance, mitigation, and minimization measures, which may include pre-construction surveys, construction monitoring, and BMPs.*

  PCCP General Condition 3: The proposed project shall pay a land conversion fee for the permanent conversion of natural land cover including VPC Low, VPC Intermediate, and Valley Foothill Riparian Woodland. The fees to be paid shall be those in effect at the time of ground disturbance authorization for each project phase and shall be based on the effect to modeled species habitat at the parcel scale.

  In addition to land conversion, the project would result in permanent direct effects and temporary effects to PCCP Special Habitats as estimated in Table 6 of the Biological Resources Assessment (BRA) prepared for the proposed project. The total special habitat fee obligation including temporary effect fees shall be paid prior to issuance of a

land conversion authorization that allows ground disturbance of a special habitat.

- *7-3(b) PCCP Community Condition 1.1: Prior to land conversion authorization approval, the unavoidable effects to vernal pool type wetlands or their buffers shall be mitigated through payment of special habitat fees. The fees to be paid to the PCA shall be those in effect at the time of land conversion authorization issuance.*

- *7-6(c) PCCP Community Condition 2.2: Prior to land conversion authorization, the applicant shall coordinate with the PCA to determine which In-Stream and Stream System Best Management Practices (BMPs) from Table 7-1 of the Placer County Conservation Plan apply to the proposed project. The applicant shall identify the applicable BMPs on the project's improvement or grading plans. The selected BMPs shall be incorporated into the project's Land Conversion Authorization letter.*

  Prior to land conversion authorization approval, the unavoidable effects to riverine and riparian habitat or their buffers shall be mitigated through payment of special habitat fees. The fees to be paid shall be those in effect at the time of land conversion authorization.

- *7-6(d) PCCP Stream System Condition 1: The project shall be designed to minimize development activities within the stream system to the maximum extent possible.*

- *7-6(e) PCCP Stream System Condition 2: The project's development footprint is directly impacting the Stream System. The area of encroachment is subject to the Stream System Encroachment Special Habitats Fee as described in Chapter 5 of the PCCP User's Guide. Fees shall be paid to the PCA prior to the issuance of any permit or authorization that results in ground disturbance within the Stream System.*

- *7-6(f) PCCP Community Condition 2.1: To the maximum extent possible, the proposed project shall not modify any area within a buffer that extends 50 feet outward from the outermost bounds of the riparian vegetation. The improvement or grading plans shall show the location of the riverine/riparian buffer.*

- *7-11(b) PCCP General Condition 4: The applicant shall restore all temporarily disturbed areas and, one year after project groundbreaking, provide the County with a written assessment of how the performance standards were met. The project would result in temporary effects to special habitats, including*

riverine/riparian, riverine/riparian buffer, and stream system (which includes blue oak woodland). Prior to issuance of land conversion authorization, the project shall pay a fee based on the acres of impact. The fee to be paid shall be that in effect at the time of land conversion authorization issuance. If it is determined by the County or the PCCP biologist that the effects remain one year after groundbreaking activities have commenced, the effects shall be considered permanent and the County project lead shall reassess fees based on those effects.

7-12(b) *PCCP Community Condition 1.2: Prior to land conversion authorization approval, the unavoidable effects to non-vernal pool wetlands or their buffers shall be mitigated through payment of special habitat fees. The fees to be paid to the PCA shall be those in effect at the time of land conversion authorization issuance.*

7-12(c) *PCCP Community Condition 1.3: Prior to land conversion authorization, the project shall demonstrate compliance with the following measures. These measures shall be included on the (improvement or grading) plans.*

1. *Personnel conducting ground-disturbing activities in or around other wetlands must be trained by a qualified biologist in these minimization measures and the permit obligations of project applicants working under the Plan.*
2. *Construction and maintenance vehicles or equipment cannot be refueled within the wetland or its buffer unless a bermed and lined refueling area is constructed and hazardous material absorbent pads are available in the event of a spill.*
3. *No equipment will be present in the wetted portion of the aquatic feature. Equipment may only enter the area when the aquatic feature is dry and there is no forecasted rain within 72 hours. Vehicles will be checked for leaks prior to entering or traveling around the aquatic feature.*
4. *All organic matter must be removed from nets, traps, boots, vehicle tires, and all other surfaces that have come into contact with aquatic features, or potentially contaminated sediments. Items shall be rinsed with clean water before leaving each study site (U.S. Fish and Wildlife Service 2005).*
5. *Measures to minimize the spread of disease and non-native species shall be implemented based on current Wildlife Agency protocols (e.g., Revised Guidance on Site Assessments and Field Surveys for the California Red-legged Frog, Appendix B, Recommended Equipment Decontamination Procedures [U.S. Fish and Wildlife Service 2005]) and other best available science.*
6. *Used cleaning materials (e.g., liquids) must be disposed of safely and, if necessary, taken off site for proper disposal. Used disposable gloves shall be retained for safe disposal in sealed bags (U.S. Fish and Wildlife Service 2005).*

7. *Native vegetation (shrubs and small trees) must be planted between other wetlands and the development such that the line of sight between other wetlands and the development is shielded. This measure is only required when the reviewing Permittee deems it necessary to shield other wetlands from adjacent development or to avoid direct or indirect effects from the adjacent development (e.g., trespass).*
8. *The reviewing Permittee will make a determination if fencing shall be required on a case-by-case basis. If needed, the type of fencing will match the activity and impact types. For example, projects that have the potential to cause erosion will require erosion-control barriers, and projects that may bring more household pets to a site must have permanent fencing to exclude pets. The temporal requirements for fencing also depend on the activity and impact type. For example, fencing to minimize permanent effects will be permanent, and fencing to minimize short-term effects will be removed after the activity is completed. Permanent fencing will be installed after grading or other construction activities in the area have been completed. If installed, a party responsible for maintenance will be identified prior to construction.*

7-12(d) *PCCP Community Condition 1.4: Prior to ground disturbance, the applicant shall schedule grading and construction in coordination with the PCA to provide the PCA the opportunity to salvage topsoil from the vernal pool wetland if they choose to do so. The applicant shall notify the PCA of their construction schedule within 30 days of the construction start date to allow the PCA the opportunity to salvage soils while the pools are completely dry (generally July through September) and the PCA must make salvage plans sufficiently far in advance so as to not unreasonably impair construction.*

7-12(e) *PCCP Community Condition 2.3: Covered Activities that affect riverine or riparian constituent habitat shall contribute to restoration as mitigation to compensate for loss of riverine or riparian constituent habitat.*

Projects that affect riverine and riparian shall contribute to replacement of these resources. Riverine restoration measures shall be located in the same watershed and salmonid habitat type (e.g., spawning or migrating if the effects occur in a salmonid stream) in which the effects occur.

Generally, restoration and replacement actions shall be undertaken by the PCA and funded by additional fees imposed on projects. Riverine and riparian restoration to offset project effects may be implemented on-site to replace the functions of the riparian woodland degraded or lost to the Covered Activity. Riparian restoration implemented on-site will be credited to Plan restoration targets if the restoration helps to meet the biological goals and objectives of the Plan. When it is deemed

infeasible to implement restoration at the project site, in-kind restoration shall be required at an off-site location or through the payment of fees to the PCA. Stream enhancement shall be implemented in concert with Community Condition 2.2, Minimize Riverine and Riparian Effects.

7-12(f) *PCCP Community Condition 3: Irrigation shall be prohibited in and around the avoided Valley oak woodland. Alteration of onsite hydrology (including from onsite sewage disposal system installation) shall be designed to ensure the Valley oak woodland receives no additional water than pre-project conditions. The Landscape Plans shall demonstrate that irrigation is not placed within the critical root zone of protected trees. Unavoidable effects to individual Valley oak trees or Valley oak woodlands or their 50-foot buffers shall pay the Plan land conversion fee by quantifying impacts as described in Effects on Valley Oak Woodlands of the PCCP User's Guide.*

7-12(g) *Depending on the acreage of aquatic resources within the project area the USACE considers jurisdiction when project permitting occurs, the project applicant shall either apply for coverage under the streamlined PCCP Letter of Permission (LOP) process directly with the USACE using avoidance and minimization guidance from the CARP, a component of the PCCP, or the applicant shall utilize the Western Placer County HCP/NCCP Programmatic General Permit 18 in compliance with the CARP.*

7-12(h) *The applicant shall submit an application to the RWQCB for water quality certification of the PCCP LOP or utilize General Order R5-2020-0048, the Waste Discharge Requirements of the Clean Water Act Section 401 Water Quality Certification for the Western Placer County HCP/NCCP Programmatic General Permit, as applicable, and adhere to the certification conditions.*

7-12(i) *PCCP CARP Authorization Conditions: The project applicant shall comply with the PCCP CARP Authorization Conditions, which are as follows:*

- *CARP Condition 1a: All work within the PCCP plan area that impacts Aquatic Resources of Placer County shall be completed according to the plans and documents included in the CARP application, Water Quality Certification, and, if applicable, Waste Discharge Requirements (WDRs). All changes to those plans shall be reported to Placer County. Minor changes may require an amendment to the CARP Authorization, Water Quality Certification, and, if applicable, WDRs. Substantial changes may render the authorization, Water Quality Certification, and, if applicable, WDRs, void, and a new application may be required.*
- *CARP Condition 1b: All deviations from plans and documents provided with the application and approved by Placer County Community Development Resource Agency shall be reported*

to Placer County Community Development Resource Agency immediately.

- *CARP Condition 2: Any construction within the Stream System shall be implemented in a way to avoid and minimize impacts to vegetation outside the construction area. All preserved wetlands, other Aquatic Resources of Placer County, and the Stream Zone shall be protected with bright construction fencing. Temporary fencing shall be removed immediately upon completion of the project.*
- *CARP Condition 3: Erosion control measures shall be specified as part of the CARP application, and the application shall not be complete without them. All erosion control specified in the permit application shall be in place and functional before the beginning of the rainy season and shall remain in place until the end of the season. Site supervisors shall be aware of weather forecasts year-round and shall be prepared to establish erosion control on short notice for unusual rain events. Erosion control features shall be inspected and maintained after each rainfall period. Maintenance includes, but is not limited to, removal of accumulated silt and the replacement of damaged barriers and other features.*
- *CARP Condition 4: All required setbacks shall be implemented according to the Western Placer County HCP/NCCP Condition 4 (Western Placer County HCP/NCCP Section 6.1.2).*
- *CARP Condition 5: All work in aquatic resources within the Stream System shall be restricted to periods of low flow and dry weather between April 15 and October 15, unless otherwise permitted by the Placer County Community Development Resource Agency and approved by the appropriate State and federal regulatory agency. Work within aquatic resources in the Stream System outside of the specified periods may be permitted under some circumstances. The project applicant shall provide Placer County Community Development Resource Agency with the following information: a) the extent of work already completed; b) specific details about the work yet to be completed; and c) an estimate of the time needed to complete the work in the Stream System.*
- *CARP Condition 6: Weather forecasts should be monitored, and erosion control established before all storm events.*
- *CARP Condition 7: Following work in a stream channel, the low flow channel shall be returned to its natural state to the extent possible. The shape and gradient of the streambed shall be restored to the same gradient that existed before the work to the extent possible.*
- *CARP Condition 8: Except for site preparation for the installation and removal of dewatering structures, no excavation is allowed in flowing streams unless dredging WDRs are issued by the RWQCB. Detailed plans for dewatering must be part of the application.*

- *CARP Condition 9: Temporary crossings as described in the application shall be installed no earlier than April 15 and shall be removed no later than October 15, unless otherwise permitted by the Placer County Community Development Resource Agency and approved by the appropriate State and federal regulatory agency. This work window could be modified at the discretion of Placer County and the CDFW.*
- *CARP Condition 10: Vehicles other than necessary earthmoving and construction equipment shall not be allowed within the Stream System after the section of stream where work is performed is dewatered. The equipment and vehicles used in the Stream System shall be described in the application.*
- *CARP Condition 11: Staging areas for equipment, materials, fuels, lubricants, and solvents shall be located outside the stream channel and banks and away from all preserved aquatic resources. All stationary equipment operated within the Stream System shall be positioned over drip-pans. Equipment entering the Stream System shall be inspected daily for leaks that could introduce deleterious materials into aquatic resources. All discharges, unintentional or otherwise, shall be reported immediately to the Placer County Community Development Resource Agency. The Placer County Community Development Resource Agency shall then immediately notify the appropriate state and federal agencies.*
- *CARP Condition 12: Cement, concrete, washings, asphalt, paint, coating materials, oil, other petroleum products, and other materials that could be hazardous to aquatic life shall be prevented from reaching streams, lakes, or other water bodies. These materials shall be placed a minimum of 50 feet away from aquatic environments. All discharges, unintentional or otherwise, shall be reported immediately to the Placer County Community Development Resource Agency. The Placer County Community Development Resource Agency shall then immediately notify the appropriate State and federal agencies.*
- *CARP Condition 13: During construction, litter or construction debris shall not be dumped into water bodies or other aquatic resources, nor shall it be placed in a location where it might be moved by wind or water into aquatic resources. All construction debris shall be removed from the site upon completion of the project.*
- *CARP Condition 14: Only herbicides registered with the California Department of Pesticide Regulation shall be used in streams, ponds, and lakes, and shall be applied in accordance with label instructions. A list of all pesticides that may be used in the project area shall be submitted to the Placer County Community Development Resource Agency before use. The PCCP does not authorize the use of herbicides; herbicide application is not a Covered Activity.*

- *CARP Condition 15: Before beginning construction, the project applicant shall have a valid CARP authorization or waiver notice. In order to obtain a permit, the project applicant shall pay all mitigation fees or purchase appropriate credits from an agency-approved mitigation bank.*
- *CARP Condition 16: A copy of the CARP conditions and Water Quality Certification and WDRs shall be given to individuals responsible for activities on the site. Site personnel (employees, contractors, and subcontractors) shall be adequately informed and trained to implement all permit, Water Quality Certification, and WDR conditions and shall have a copy of all permits available on-site at all times for review by site personnel and agencies.*
- *CARP Condition 17: Work shall not disturb active bird nests until young birds have fledged. To avoid impacts to nesting birds, any disturbance shall occur between September 1 and February 1 prior to the nesting season. Tree removal, earthmoving or other disturbance at other times is at the Placer County Community Development Resource Agency's discretion and shall require surveys by a qualified biologist to determine the absence of nesting birds prior to the activity.*
- *CARP Condition 18: All trees marked for removal within the Stream System must be shown on maps included with the Application. Native trees over five inches diameter at breast height (DBH) shall not be removed without the consent of the Placer County Community Development Resource Agency.*
- *CARP Condition 19: The Placer County Community Development Resource Agency shall be notified immediately if threatened or endangered species that are not Covered Species are discovered during construction activities. Placer County Community Development Resource Agency shall suspend work and notify the USFWS, National Marine Fisheries Service (NMFS), and the CDFW for guidance.*
- *CARP Condition 20: Wildlife entering the construction site shall be allowed to leave the area unharmed or shall be flushed or herded humanely in a safe direction away from the site.*
- *CARP Condition 21: All pipe sections shall be capped or inspected for wildlife before being placed in a trench. Pipes within a trench shall be capped at the end of each day to prevent entry by wildlife, except for those pipes that are being used to divert stream flow.*
- *CARP Condition 22: At the end of each workday, all open trenches will be provided with a ramp of dirt or wood to allow trapped animals to escape.*
- *CARP Condition 23: If human remains or cultural artifacts are discovered during construction, the applicant shall stop work in the area and notify the Placer County Community Development Resource Agency immediately. Work shall not continue in the area until the County Coroner and a qualified archaeologist*

have evaluated the remains, conducted a survey, prepared an assessment, and required consultations are completed.

Off-Site Affordable Housing Parcel

7-12(j) Implement the following Mitigation Measure set forth in this EIR:

- *7-5(c) Implement RVSP EIR Mitigation Measure 6-1c:*

  The following BMPs to avoid impacts to wetlands in the Plan Area shall be implemented for all construction related to the proposed project:

  - *Four-foot-tall, brightly colored (yellow or orange), synthetic mesh material or chainlink fencing shall be installed at the edge of all avoided wetlands and a minimum of 50 feet from the edge of tributaries to Dry Creek prior to any construction equipment being moved on site or any construction activities taking place. Fencing shall be continuously maintained and shall be the responsibility of an onsite compliance officer designated by the developer. Fencing is to remain intact until construction is complete and may not be removed without the written consent of the County.*
  - *Ground disturbance associated with construction, including vehicle operation/parking and construction material storage, shall be prohibited within wetlands or within 50 feet of the edge of tributaries to Dry Creek.*
  - *Where working areas encroach on live or dry streams, lakes, or wetlands, RWQCB-approved physical barriers adequate to prevent the flow or discharge of sediment into these systems shall be constructed and maintained between working areas and streams, lakes and wetlands. Discharge of sediment into streams shall be held to a minimum during construction of the barriers. Discharge will be contained through the use RWQCB-approved measures that will keep sediment from entering jurisdictional waters beyond the project limits.*
  - *Oily or greasy substances originating from the Contractor's operations shall not be allowed to enter or be placed where they will later enter a live or dry stream, pond, or wetland.*
  - *Asphalt concrete shall not be allowed to enter a live or dry stream, pond, or wetland.*
  - *All off-road construction equipment shall be cleaned of potential noxious weed sources (mud, vegetation) before entry into the site and after entering a potentially infested area before moving on to another area, to help ensure noxious weeds from outside of the Plan Area are not introduced into the Plan Area. The contractor shall*

employ whatever cleaning methods (typically the use of a high-pressure water hose) are necessary to ensure that equipment is free of noxious weeds. Equipment shall be considered free of soil, seeds, and other such debris when a visual inspection does not disclose such material. Disassembly of equipment components or specialized inspection tools is not required. Equipment washing stations shall be placed in areas that afford easy containment and monitoring and that do not drain into sensitive (riparian, wetland, etc.) areas.

- *To further minimize the risk of introducing additional nonnative species into the area, only native plant species appropriate for the Plan Area will be used in any erosion control or revegetation seed mix or stock. No dry-farmed straw will be used, and certified weed-free straw shall be required where erosion control straw is to be used. In addition, any hydroseed mulch used for revegetation activities must also be certified weed-free.*
- *The Applicant will restore and revegetate all temporary construction disturbance areas. Temporary disturbance areas will be restored to the original topography and hydrology, disked to relieve compaction, and planted with an erosion control mix composed only of native species. The proposed restoration and revegetation measures shall be summarized in the storm water pollution prevention plan for the project and submitted to Placer County for approval prior to initiation of construction activities.*

7-12(k) *Implement RVSP EIR Mitigation Measure 6-1d:*

The final drainage master plan will be developed to ensure that the stormwater drainage facilities will avoid the excavation or placement of fill within jurisdictional Waters of the U.S.

7-13 Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the biological and habitat conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

Wildlife corridors link areas of suitable wildlife habitat that are otherwise separated by rugged terrain, changes in vegetation, or human disturbance. The fragmentation of open space areas by urbanization creates isolated "islands" of wildlife habitat. Fragmentation also occurs when a portion of one or more habitats is converted into another habitat, such as when woodland or scrub habitat is altered or converted into grasslands after a disturbance, such as fire, mudslide, or grading activities. Wildlife corridors mitigate the effects of fragmentation by (1) allowing animals to move between remaining habitats, thereby permitting depleted populations to be replenished and promoting genetic exchange; (2) providing escape routes from fire, predators, and human disturbances, thereby reducing the risk of catastrophic events (such as fire or disease) on population or local species extinction; and (3) serving as travel routes for individual animals as they move within their home ranges in search of food, water, mates, and other needs.

The VFRW along either side of the intermittent drainage within the project site serves as a wildlife corridor for a wide variety of terrestrial wildlife. However, the wildlife corridor is planned to be preserved within an avoidance area that maintains the on-site VFRW, and that is similar in width to the adjacent preserved corridor along this drainage to the west. The only potential barrier to wildlife movement proposed along the intermittent drainage would be a creek crossing for a pedestrian trail. The creek crossing would be designed to be large enough to accommodate terrestrial wildlife movement under the pedestrian bridge. Additionally, the VFRW along Dry Creek in the northern portion of the off-site sewer lift station improvements area likely serves as a wildlife corridor for terrestrial wildlife. The proposed project would include excavation of the intermittent drainage in the area to expand Dry Creek floodwater storage (see Figure 7-6). Although some trees may need to be removed prior to excavation, relatively few trees would be removed, and following construction, the area would continue to provide habitat, and would not impede wildlife movement.

As such, the proposed project would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is currently undeveloped and, based on Figure 6-1a of the RVSP EIR, consists primarily of annual grasslands with seasonal wetlands located on the southeast portion of the parcel. As discussed under Impact 6-15 of the RVSP EIR, the planning area is partly surrounded by arterial roads and residential development. The RVSP EIR determined that the only portion of the planning area

that provides a significant movement corridor for wildlife occurs along Dry Creek, which is planned to be developed with a multi-use trail and buried water and sewer pipelines, and does not include the off-site affordable housing parcel. As such, buildout of the planning area, including the off-site affordable housing parcel, is not expected to substantially impede or alter wildlife movement.

Conclusion

Based on the above, the proposed project would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. In addition, because the off-site affordable housing parcel is not included within the wildlife movement corridor identified along Dry Creek in the RVSP EIR, the potential future development of the off-site affordable housing parcel would not interfere substantially with the movement of any native wildlife species or with established migratory wildlife corridors. Therefore, a ***less-than-significant*** impact would occur. Compliance with Community Condition 2 would also require that a 50-foot buffer be established between construction activities and the outermost bounds of riparian vegetation, thus further ensuring that wildlife corridors would be preserved.

Mitigation Measure(s)

None required.

7-14 Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, or have a substantial adverse effect on the environment by converting oak woodlands or impacting individual trees. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, or have a substantial adverse effect on the environment by converting oak woodlands or impacting individual trees.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the biological and habitat conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, or have a substantial adverse effect on the environment by converting oak woodlands or impacting individual trees, would be similar. Thus, the following discussion applies to both the proposed project, and the off-site sewer lift station improvements area.

As detailed in the Existing Environmental Setting section of this chapter, the study area is comprised of a variety of vegetation communities/PCCP land covers, including

annual brome grassland/VPC land cover, VFRW, and urban areas. Table 7-6 provides the acreages of land covers/vegetation communities that would be permanently disturbed, temporarily disturbed, or avoided, as a result of the proposed project.

Table 7-6
Acres of Terrestrial Land Cover Impacts within the Study Area

Land Covers	Permanent Impacts[1]	Temporary Impacts[1]	No Land Cover Conversion[1]	Total[1]
VFRW	1.3	--	2.5	3.8
VPC Intermediate	79.0	--	3.0	82.0
VPC Low	0.8	--	--	0.8
Road	--	8.1	--	8.1
Urban Parks	--	0.5	--	0.5
Urban/Suburban	--	2.2	--	2.2
Total	**81.1**	**10.8**	**5.5**	**97.4**

[1] The estimates within this table are preliminary and subject to change during the PCCP application and permitting process.

Source: Madrone Ecological Consulting, 2026.

As detailed in Table 7-6, development of the proposed project would result in the permanent disturbance of approximately 81.1 acres of vegetation communities/land covers, including approximately 1.3 acres of VFRW, and temporary disturbances to approximately 10.8 acres. To address disturbances to the aforementioned vegetation communities/land covers, development fees would be applied for the proposed project's conversion of vegetation communities, in accordance with PCCP guidelines. According to the PCCP's Land Conversion Fee Schedule, the Plan Area A – Valley, Fee 1c for "All other development" applies to this project, as well as any applicable special habitat fees.

With respect to potential impacts to native trees and woodlands, as discussed above, the BRA did not quantify the number of native trees and woodlands within the study area. However, as previously discussed, the proposed project would result in permanent impacts to approximately 1.3 acres of VFRW. Project impacts to such resources would require payment of land cover conversion fees to the PCA, which would be used to set aside similar or better lands elsewhere.

CEQA mitigation for the loss of woodland habitat in counties is governed by Public Resources Code Section 21083.4, enacted in 2004 as part of the Oak Woodlands Conservation Act (Stats. 2004, c. 732, Section 1). The statute provides a framework by which counties shall mitigate under CEQA for any "conversion of oak woodlands that will have a significant effect on the environment." (Public Resources Code, Section 21083.4, subd. [b].) The statute authorizes conservation as a desired form of mitigation, which may be effectuated through two means: (i) "the use of conservation easements" on existing oaks woodlands or (ii) contributions into the State's "Oak Woodland Conservation Fund." (*Id*., subds. (b)(1), (b)(3).) Tree-planting and restoration of former oak woodlands are other available options, though tree-planting cannot be used to fulfil more than one-half of the mitigation requirements for an

individual project. (*Id.*, subds. (b)(2).) Because the PCCP includes mitigation requirements for oak woodland conversion that is a form of "conservation," such reliance is consistent with the approaches allowed under Section 21083.4. Reliance on an HCP/NCCP such as the PCCP is allowed under the statutory statement that mitigation for the loss of oak woodlands can be satisfied through "[o]ther mitigation measures developed by the county." (Section 21083.4, subd. (b)(4).) In addition, Section 21083.4(d)(1) provides that "Projects undertaken pursuant to an approved Natural Community Conservation Plan…that includes oaks as a covered species or that conserves oaks through natural community conservation preserve designation and implementation and mitigation measures that are consistent with this section…" are exempt from the requirements of Section 21083.4.

Based on the above, without compliance with requirements set forth by the PCCP to address tree impacts, the proposed project could conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

Off-Site Affordable Housing Parcel

Several trees are present along the northern and western boundaries of the off-site affordable housing parcel. In addition, as discussed under Impact 6-13 of the RVSP EIR, the planning area contains approximately 700 native trees, the majority of which have protected status. As such, buildout of the RVSP could result in the significant loss of native tree species regulated under the Placer County Code. However, the RVSP EIR included Mitigation Measures 6-13a and 6-13b, which are intended to prevent the loss of protected native trees.

At such time the off-site affordable housing parcel gets developed, the future developer would be required by the County to implement RVSP EIR Mitigation Measures 6-13a and 6-13b, which have been incorporated into this EIR as Mitigation Measures 7-14(c) and 7-14(d). Mitigation Measure 6-13a of the certified RVSP EIR requires the project applicant to comply with Placer County Tree Preservation Ordinance. In addition, RVSP Mitigation Measure 6-13b would preserve and protect existing native trees not proposed for removal. As determined in the RVSP EIR, implementation of Mitigation Measures 6-13a and 6-13b would reduce potential impacts to native trees protected under the Placer County Tree Preservation Ordinance to a less-than-significant level.

Conclusion

Based on the above, implementation of RVSP Mitigation Measures 6-13a and 6-13b would be required to ensure the potential future development of the off-site affordable housing parcel would result in a less-than-significant impact to native trees protected under the Placer County Tree Preservation Ordinance. In addition, without compliance with requirements set forth by the PCCP to address tree impacts, the proposed project could conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. Therefore, a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above impacts to a *less-than-significant* level by ensuring compliance with local policies or ordinances

protecting biological resources, such as a tree preservation policy or ordinance, by avoiding a substantial loss of oak woodland habitat, and by limiting, and requiring mitigation for, impacts on individual trees.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

7-14(a) *Implement the following Mitigation Measure set forth in this EIR:*

- *7-3(a) The Permittee shall apply for and be issued coverage under the PCCP to mitigate for all impacts to Covered Species, land cover, and sensitive natural communities. Prior to application approval, additional species surveys may be necessary, and prior to construction, land cover and special habitat fees shall be paid. The Permittee shall comply with the terms of the PCCP Coverage Certificate, including compliance with all avoidance, mitigation, and minimization measures, which may include pre-construction surveys, construction monitoring, and BMPs.*

  PCCP General Condition 3: The proposed project shall pay a land conversion fee for the permanent conversion of natural land cover including VPC Low, VPC Intermediate, and Valley Foothill Riparian Woodland. The fees to be paid shall be those in effect at the time of ground disturbance authorization for each project phase and shall be based on the effect to modeled species habitat at the parcel scale.

  In addition to land conversion, the project would result in permanent direct effects and temporary effects to PCCP Special Habitats as estimated in Table 6 of the Biological Resources Assessment (BRA) prepared for the proposed project. The total special habitat fee obligation including temporary effect fees shall be paid prior to issuance of a land conversion authorization that allows ground disturbance.

7-14(b) *PCCP General Condition 5: Prior to initiation of construction activities, all project construction personnel shall participate in a Worker Environmental Training Program that will educate workers regarding the Covered Species and their habitats, the need to avoid impacts, state and federal protection, and the legal implications of violating environmental laws and regulations. At a minimum this training may be accomplished through tailgate presentations at the project site and the distribution of informational brochures, with descriptions of sensitive biological resources and regulatory protections, to construction personnel prior to initiation of construction work. The signed documentation of training completion by all construction workers shall be submitted to the Placer County Resource Development Agency and the PCA.*

Off-Site Affordable Housing Parcel

7-14(c) Implement RVSP EIR Mitigation Measure 6-13a:

Mitigation for the loss of native trees in the Plan Area shall follow the policies and mitigation guidelines set forth in The Placer County Tree Preservation Ordinance found in Chapter 12, Article 12.16 of the Placer County Code. See Article 12.16 for details on protection, replanting and mitigation for removed trees.

The replacement or replanting of trees for mitigation may occur within the open space areas of the Specific Plan area, with approval of the County. If a suitable area for replacement planting is not available, Placer County's Tree Preservation Ordinance allows mitigation in the form of a contribution to the Tree Preservation Fund. This contribution shall be in an amount sufficient to offset the costs of purchase, planting, and maintenance of all trees planted for mitigation as result of the project.

7-14(d) Implement RVSP EIR Mitigation Measure 6-13b:

Native trees that are not planned for removal shall be preserved and protected per the Placer County Tree Preservation Ordinance, particularly Section 12.16.070, Item "D".

7-15 Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the biological and habitat conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan, would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

As discussed above under the various analyses within this chapter, as the PCCP has been adopted, development fees would be applied for the proposed project's vegetation community impacts and aquatic resources impacts, in accordance with PCCP guidelines. The study area is within Plan Area A (A.1 Valley Potential Future

Growth), which is covered by a comprehensive permit. AMMs, set forth in Chapter 6 of the PCCP, are intended to ensure that adverse effects on Covered Species and natural communities are avoided and minimized. Applicants are required to obtain a signed Certificate of PCCP Authorization form from Placer County for potential impacts to terrestrial and aquatic habitats. During the local impact authorization process, impact fees are calculated utilizing land cover data. Fees include Land Conversion fees and Aquatic/Wetland Special Habitat fees, both of which are applicable to the project. The proposed project would participate in the PCCP for incidental take coverage and mitigation for effects to waters of the U.S. and State. Payment of all applicable development fees, as well as implementation of BMPs and AMMs pursuant to the PCCP, as required by the applicable mitigation measures in this chapter, would ensure the proposed project is in compliance with the provisions of the PCCP.

Off-Site Affordable Housing Parcel

Similar to the proposed project, the off-site affordable housing parcel is within PCCP Plan Area A, which is covered by a comprehensive permit. However, it should be noted that although the off-site affordable housing parcel is located within the boundaries of the PCCP, the potential future development of the off-site affordable housing parcel would not be required to participate in the PCCP for incidental take coverage of species and natural communities covered under the PCCP, given that the RVSP EIR was certified prior to adoption of the PCCP. The PCCP, which is an HCP under FESA and a NCCP under the California Natural Community Conservation Planning Act, was adopted by Placer County on September 1, 2020. In addition, the mitigation measures set forth by the RVSP EIR, to which future development of the off-site affordable housing parcel would be subject, provide equally effective mitigation to reduce potential project impacts to similar levels as those set forth by the PCCP. Thus, the potential future development of the off-site affordable housing parcel would not conflict with the provisions of an adopted HCP, NCCP, or other approved local, regional, or state habitat conservation plan.

Conclusion

Based on the above, through compliance with all applicable requirements set forth by the PCCP, as well as the mitigation measures included in the RVSP EIR, the proposed project and potential future development of the off-site affordable housing parcel would not conflict with the provisions of an adopted HCP, NCCP, or other approved local, regional, or State habitat conservation plan, and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required. The proposed project is required to participate in the PCCP through the avoidance, minimization, and mitigation measures set forth in this chapter, and for the off-site affordable housing parcel, should it be developed in the future, Mitigation Measure 7-9(e) provides the option for Swainson's hawk coverage through the PCCP.

Cumulative Impacts and Mitigation Measures

As defined in Section 15355 of the CEQA Guidelines, "cumulative impacts" refers to two or more individual effects which, when considered together, are considerable, compound, or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the

change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects.

The geographic scope for the cumulative biological resources analysis generally includes buildout of the proposed project in conjunction with the DCWPCP. For more details regarding the cumulative setting, refer to Chapter 20, Statutorily Required Sections, of this EIR.

7-16 Cumulative loss of habitat for special-status species. Based on the analysis below, the project's incremental contribution to the significant cumulative impact is *less than cumulatively considerable*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could result in the cumulative loss of habitat for special-status species.

Proposed Project, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

Because the biological and habitat conditions of the proposed project area, off-site sewer lift station improvements area, and off-site affordable housing parcel are similar, the potential for such components to result in the cumulative loss of habitat for special-status species would be similar. Thus, the following discussion applies to the proposed project, the off-site sewer lift station improvements area, and the off-site affordable housing parcel.

The DCWPCP includes several approved developments, including, but not limited to, the following: the under-construction Creekview Ranch Project, approximately 1.59 miles southeast of the project site; the under-construction Brady Vineyard Subdivision project, approximately 2.25 miles to the east of the project site down Vineyard Road; the under-construction Double S Ranch Subdivision Project, approximately 1.28 miles east of the project site; the Placer Vineyards Specific Plan (PVSP), portions of which are currently under construction west of the project site, across Walerga Road; the RVSP, currently under construction southeast of the PVSP; the approved Mill Creek Project, approximately 1.80 miles to the southeast of the project site; and the under-construction The Ranch Project, approximately 1.50 miles east of the project site. Implementation of the proposed project and potential future development of the off-site affordable housing parcel, in combination with other development within the DCWPCP area, would result in a significant cumulative impact related to the loss of special-status species habitat.

As discussed above, the study area contains a variety of vegetation communities/land covers, including annual brome grassland/VPC land cover, VFRW, and urban areas. In addition, the study area is comprised of aquatic resources, including irrigated wetland, seasonal wetland, seasonal wetland swale, vernal pools, ephemeral drainages, intermittent drainages, and roadside ditches. Development of the proposed on-site and off-site project components would result in potential impacts to portions of the foregoing areas. Such potential impacts are detailed in Table 7-6 above. Additionally, according to the RVSP EIR, the off-site affordable housing parcel is

comprised of annual grasslands and seasonal wetland. As discussed throughout this chapter, the above areas represent potential habitat for various special-status species listed in Table 7-3.

This chapter provides a wide range of mitigation to minimize potential adverse effects to habitat for special-status species. Mitigation measures have been set forth in this chapter to ensure that the proposed project complies with all applicable PCCP AMMs, including, but not limited to, AMMs to address potential impacts to PCCP Covered Species, such as northwestern pond turtle, Swainson's hawk, and burrowing owl, as well as AMMs for potential impacts to riparian woodlands and on-site wetlands. In addition, relevant mitigation measures from the RVSP EIR have been incorporated throughout this chapter to ensure that potential adverse effects to habitat for special-status species within the off-site affordable housing parcel, should the applicant proceed with development.

While the proposed project would result in the loss of a portion of the existing on-site habitat, the proposed parks, open space, and trails components would include a total of 12 acres of green space preserved on-site, consistent with DCWPCP Policy 5, which requires the identification of all important fish and wildlife areas within the DCWPCP plan area and protection of such areas from urban/suburban encroachment, where feasible. Such preservation would ensure that portions of the existing habitat within the project site remain undisturbed, following implementation of the proposed project.

The proposed project and the potential future development of the off-site affordable housing parcel would not include the conversion of any lands not previously identified for development and would include protection of portions of the project site within designated open space, as discussed above. Also notable is the PCCP's identification of the project site and off-site affordable housing parcel as areas of Valley Potential Future Growth Area (A1) (PCCP Volume 1, pg. 2-34), as well as the majority of the DCWPCP. The PCCP EIR/EIS concluded that impacts to biological resources related to future growth identified in the PCCP would be less-than-significant with implementation of the Plan's conservation strategy.[8] To ensure the preservation of special-status plant and wildlife species, sensitive habitats, and State and federally protected wetlands, the PCCP includes the establishment of a RAA, an area designated in the PCCP within which a connected Reserve System will be assembled. The conservation strategy would establish most of the Reserve System in the RAA.

The PCA, created to implement the HCP/NCCP and the CARP, will acquire approximately 47,300 acres for natural and semi-natural community protection and restoration over the 50-year permit term for the HCP/NCCP. On July 23, 2025, the PCA approved 4,245 acres of Prime farmland, open space, and streams, known as Racoon Creek Ranch, located north of the City of Lincoln within Placer County to be established as conservation easements under the PCCP Reserve System. Funding for the acquisition of conservation easements and the restoration of Racoon Creek Ranch comes from mitigation fees collected from development and public infrastructure projects in western Placer County that are covered by the PCCP, and is

[8] Placer County. *Placer County Conservation Program Final Environmental Impact Statement/Environmental Impact Report* [pg. 4.3-47]. May 2020.

being paid for over time as fees are collected. With the addition of Racoon Creek Ranch, approximately 9,100 total acres of habitat have been added to the PCCP Reserve System to be protected and restored since the program began implementation in 2021.

Overall, with incorporation of the mitigation measures set forth herein, the proposed project would be required to comply with all applicable AMMs and pay all applicable fees to address potential impacts to biological resources within the study area. Furthermore, at such time the off-site affordable housing parcel gets developed, the future developer would be required to comply with the RVSP mitigation measures included herein to address potential impacts to biological resources within the off-site affordable housing parcel. As such, the proposed project and potential future development of the off-site affordable housing parcel would not result in substantial adverse effects to biological resources protected by CEQA.

As further discussed in Chapter 20 of this EIR, CEQA Guidelines Section 15064, Subdivision (h)(5) states, "[…]the mere existence of significant cumulative impacts caused by other projects alone shall not constitute substantial evidence that the proposed project's incremental effects are cumulatively considerable." Therefore, even where cumulative impacts are significant, any level of incremental contribution is not necessarily deemed cumulatively considerable.

In addition, the courts have explicitly rejected the notion that a finding of significance is required simply because a proposed project would result in a net loss of habitat. "[M]itigation need not account for every square foot of impacted habitat to be adequate. What matters is that the unmitigated impact is no longer significant" (*Save Panoche Valley v. San Benito County* [2013] 217 Cal.App.4th 503, 528 (*Save Panoche*), quoting *Banning Ranch Conservancy v. City of Newport Beach* [2012] 211 Cal.App.4th 1209, 1233 [*Banning*)). Stated another way, "[t]he goal of mitigation measures is not to net out the impact of a proposed project, but to reduce the impact to insignificant levels" (*Save Panoche*, *supra*, 217 Cal.App.4th at p. 529, citing *Banning*, *supra*, 211 Cal.App.4th at p. 1233).

The above discussion provides substantial evidence that, while the combined effects on biological resources resulting from approved/planned development throughout the DCWPCP would be considered significant, the incremental contribution to the significant cumulative effect associated with the proposed project and off-site affordable housing parcel would be reduced with implementation of the mitigation measures required in this EIR.

Based on the above, although cumulative buildout of the DCWPCP plan area would result in a significant cumulative impact related to the loss of special-status species habitat, incorporation of the mitigation measures set forth herein would ensure that the incremental contribution of the proposed project and potential future development of the off-site affordable housing parcel to the significant impact would be ***less than cumulatively considerable***.

Mitigation Measure(s)

None required.

8. Cultural Resources

8. CULTURAL RESOURCES

8.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County for an approximately four-acre parcel off-site within the Riolo Vineyards Specific Plan (RVSP) which could develop a maximum of 120 affordable income-restricted units.

The Cultural Resources chapter of the EIR addresses known and unknown historic and precontact cultural resources in the vicinity of the project site and off-site sewer lift station improvements area, as well as the off-site affordable housing parcel. Cultural resources can be categorized into precontact or historic resources. Precontact resources are those sites and artifacts of or related to a time period generally prior to contact with people of European descent. Historic resources include structures, features, artifacts, and sites that date from Euro-American settlement of the region. The chapter summarizes the existing setting with respect to cultural resources, identifies thresholds of significance, evaluates project impacts to such resources, and sets forth mitigation measures. The impact discussions and mitigation measures presented in each technical section apply to both the project site and the off-site sewer lift station improvements area, unless otherwise noted; and applicable RVSP EIR mitigation measures are incorporated for the off-site affordable housing parcel.

Information presented in the chapter is primarily drawn from the Cultural and Paleontological Resources Assessment prepared by Natural Investigations Company,[1] as well as the Placer County General Plan (PCGP),[2] the PCGP EIR,[3] the RVSP EIR,[4] and the Dry Creek-West Placer Community Plan (DCWPCP).[5]

Potential impacts to tribal cultural resources are discussed and evaluated in Chapter 17, Tribal Cultural Resources, of this EIR.

8.2 EXISTING ENVIRONMENTAL SETTING

Placer County contains a rich cultural resource heritage that includes archeological and historical sites and resources. Given the rich heritage of the area, many archeological and historical sites and resources remain undiscovered. The following sections provide further details regarding the precontact overview, ethnographic overview, and historic overview of the project area, as well as

1 Natural Investigations Company. *Cultural and Paleontological Resources Assessment for the Estia Dry Creek & Placer Creek Residential Property Development Project, Placer County, California.* June 2025.
2 Placer County. *Countywide General Plan Policy Document*. August 1994 (updated May 2013).
3 Placer County. *Countywide General Plan EIR*. July 1994.
4 Placer County. *Riolo Vineyard Specific Plan Environmental Impact Report*. January 2008.
5 Placer County. *Dry Creek-West Placer Community Plan.* Amended May 12, 2009.

a description of any identified cultural resources associated with the project site, off-site sewer lift station improvements area, and off-site affordable housing parcel.

Precontact Overview

A three-part classification scheme for cultural change in California's Sacramento Valley, Sacramento–San Joaquin Delta, and San Joaquin Valley was developed as the result of efforts of many researchers since the 1930s and has been further refined over the succeeding decades. With the timeframes adjusted for modern calibration curves for radiocarbon dates, the chronological sequence for the Central Valley is: Paleo-Indian (11,500 – 8550 B.C.E.), Lower Archaic (8550 – 5550 B.C.E.), Middle Archaic (5550–550 B.C.E.), Upper Archaic (550 B.C.E. – 1100 C.E.), and Emergent or Late Prehistoric Period (1100 C.E. – Historic Contact).

Subsequent to the Paleo-Indian and Lower Archaic periods, the cultural framework within the greater study region is further divided into three regionally based "patterns." Specific to the Central Valley precontact era and the current study region, the regionally based patterns are the Windmiller, Berkeley, and Augustine. The patterns mark changes in distinct artifact types, subsistence orientation, and settlement patterns, which began circa 5550 B.C.E. and lasted until historic contact in the early 1800s. The patterns were initially identified at three archaeological sites: the Windmiller site near the Cosumnes River in Sacramento County; the West Berkeley site on the east side of the Bay in Alameda County; and the Augustine site in the Sacramento–San Joaquin Delta. In general, the patterns conform to three temporal divisions: Middle Archaic Period/Windmiller Pattern, Upper Archaic Period/Berkeley Pattern, and Late Prehistoric Period/Augustine Pattern.

Paleo-Indian and Lower Archaic Periods (11,500 – 5550 B.C.E.)

Little evidence exists of the Paleo-Indian and Lower Archaic periods in the Central Valley. As shown by geoarchaeological studies, large segments of the Late Pleistocene landscape throughout the central California lowlands have been buried or removed by periodic episodes of deposition or erosion. Periods of climate change and associated alluvial deposition occurred at the end of the Pleistocene (approximately 9050 B.C.E.) and at the beginning of the early Middle Holocene (approximately 5550 B.C.E.). Earlier studies had also estimated that Paleo-Indian and Lower Archaic sites along the lower stretch of the Sacramento River and San Joaquin River drainage systems had been buried by Holocene alluvium up to 33 feet thick that was deposited during the last 5,000 to 6,000 years. The formation of the Sacramento–San Joaquin Delta began during the early Middle Holocene. After approximately 1,000 B.C.E. during the Late Holocene, there were renewed episodes of alluvial fan and floodplain deposition.

The archaeological evidence that is available for the Paleo-Indian Period is comprised primarily of basally thinned, fluted projectile points. The points are morphologically similar to well-dated Clovis points found elsewhere in North America. In the Central Valley, fluted points have been recovered from remnant features of the Pleistocene landscape at only three archaeological localities, including Woolfsen Mound in Merced County, Tracey Lake in San Joaquin County, and Tulare Lake basin in Kings County.

In the Central Valley, the Lower Archaic Period is mainly represented by isolated finds, as the early landscape was buried by natural alluvial fan and floodplain deposition. The earliest confirmed archaeological evidence for habitation of the immediate Sacramento vicinity was recovered from below 10 feet of overburden and extending to a depth of 10 to 22 feet below current street level with dates for occupation on a stable paleo-sandbar at CA-SAC-38 from 8,500

to 3,000 years ago. At Lower Archaic foothill sites in eastern Contra Costa County and Calaveras County, abundant milling slabs and handstones have been recovered. On the ancient shoreline of Buena Vista Lake in Kern County, stratified cultural deposits have yielded a stemmed projectile point, chipped stone crescents, and the remains of fish, birds, and shellfish; however, milling tools or plant remains have not been discovered.

Middle Archaic Period/Windmiller Pattern (5550 - 550 B.C.E.)

For the first 3,000 years of the Middle Archaic, archaeological sites on the valley floor were relatively scarce, in part due to natural geomorphic processes, unlike the foothills where many of buried sites have been found. On the valley floor, sites are more common after 2550 cal. B.C.E. The archaeological record in the valley and foothills indicates the subsistence system during this period included a wide range of natural resources, including plants, small and large mammals, fish, and waterfowl, that indicate people followed a seasonal foraging strategy. Some researchers suggest populations may have occupied lower elevations during the winter and shifted to higher elevations in the summer. Others also suggest there was increasing residential stability along the Central Valley river corridors during the Middle Archaic.

Excavations at Windmiller Pattern sites have yielded abundant remains of terrestrial fauna (deer, tule elk, pronghorn, and rabbits) and fish (sturgeon, salmon, and smaller fishes). Projectile points with a triangular blade and contracting stems are common at Windmiller Pattern sites. A variety of fishing implements such as angling hooks, composite bone hooks, spears, and baked clay artifacts, which may have been used as net or line sinkers, are also relatively common. The points are classified within the Sierra Contracting Stem and Houx Contracting Stem series. The presence of milling implements, including grinding slabs, handstones, and mortar fragments, indicate acorns or seeds were an important part of the Middle Archaic diet. In the foothills, pine nut and acorn remains have been recovered from sites in Fresno and Calaveras counties.

The variety of artifacts recovered from Windmiller Pattern sites includes shell beads, ground and polished charmstones, and bone tools, as well as impressions of twined basketry. Baked clay items include pipes, discoids, and cooking “stones” as well as the net sinkers. Burials in cemetery areas, which were separate from habitation areas, were accompanied by a variety of grave goods. The presence of an established trade network is indicated by the recovery of Olivella shell beads, obsidian tools, and quartz crystals. Obsidian sources during the Middle Archaic included quarries in the North Coast Ranges, eastern Sierra, and Cascades.

Upper Archaic Period/Berkeley Pattern (550 B.C.E. - 1100 C.E.)

Better understood than any of the preceding periods, the Upper Archaic is characterized by a shift over 1,000 years to the more specialized, adaptive Berkeley Pattern. Excavated archaeological sites signal an increase in mortars and pestles, as well as archaeobotanical remains, accompanied by a decrease in slab milling stones and handstones. Archaeologists generally agree mortars and pestles are better suited to crushing and grinding acorns, while milling slabs and handstones may have been used primarily for grinding wild grass grains and seeds. The proportional change indicates a shift during the Berkeley Pattern to a greater reliance on acorns as a dietary staple. Innovations such as new types of shell beads, charmstones, bone tools, and ceremonial blades are additional evidence of the more specialized technology present during the Upper Archaic period.

The artifact assemblage in Berkeley Pattern sites demonstrates that populations continued to exploit a variety of natural resources. In addition to seeds and acorns, hunting persisted as an

important aspect of food procurement. Large, mounded villages that developed around 2,700 years ago in the Delta region included accumulations of habitation debris and features, such as hearths, house floors, rock-lined ovens, and burials. The remains of a variety of aquatic resources in the large shell midden/mounds that developed near salt or fresh water indicate exploitation of shellfish was relatively intensive.

Berkeley Pattern artifact assemblages are also characterized by Olivella shell beads, Haliotis ornaments, and a variety of bone tool types. Mortuary practices continue to be dominated by interment, although a few cremations have been discovered at sites dating to this period. Trade networks brought obsidian toolstone to the Central Valley from the North Coast Ranges and the east side of the Sierra Nevada Range.

Emergent Period/Augustine Pattern (1100 C.E. - Historic Contact)

The comprehensive archaeological record for the Emergent or Late Prehistoric Period in the Central Valley shows an increase in the number of archaeological sites associated with the Augustine Pattern in the lower Sacramento Valley/Delta region, as well as an increase in the number and diversity of artifacts. The Emergent Period was shaped by a number of cultural innovations, such as the bow and arrow and more elaborate and diverse fishing technology, as well as an elaborate social and ceremonial organization. Dart and atlatl technology was effectively replaced by the introduction of the bow and arrow. Additionally, the cultural patterns typical of the Augustine Pattern as viewed from the archaeological record are reflected in the cultural traditions known from historic period Native American groups.

The faunal and botanical remains recovered at Emergent Period archaeological sites indicate the occupants relied on a diverse assortment of mammals, fish, and plant parts, including acorns and pine nuts. Hopper mortars, shaped mortars and pestles, and bone awls used to produce coiled baskets are among the variety of artifacts recovered from Augustine Pattern sites. The toolkit during this period also included bone fishhooks, harpoons, and gorge hooks for fishing, as well as the bow and arrow for hunting. Small, Gunther barbed series projectile points have been found at sites dating to the early part of the period, while Desertside notched points appear later in the period. The Stockton serrated arrow point also appears in archaeological assemblages dating to this period and in some parts of the lower Sacramento Valley, Cosumnes Brownware is present. The appearance of ceramics during this period is likely a direct improvement on the prior baked clay industry.

During the Emergent Period, numerous villages, ranging in size from small to large, were established along the valley floor sloughs and river channels and along the foothills sidestreams. House floors or other structural remains have been preserved at some sites dating to this period. The increase in sedentism and population growth led to the development of social stratification, with an elaborate social and ceremonial organization. Examples of items associated with rituals and ceremonials include flanged tubular pipes and baked clay effigies representing animals and humans. Mortuary practices changed to include flexed burials, cremation of high-status individuals, and pre-interment burning of offerings in a burial pit. Currency, in the form of clamshell disk beads, also developed during this period together with extensive exchange networks.

Ethnographic Overview

The project area is located in lands historically occupied by the Nisenan (also known as the Southern Maidu). Prior to Euro-American contact, Nisenan territory included the southern extent of the Sacramento Valley, east of the Sacramento River between the North Fork Yuba River and

Cosumnes River on the north and south, respectively, and extended east into the foothills of the Sierra Nevada. For a more detailed ethnographic overview of the project area, see Chapter 17, Tribal Cultural Resources, of this EIR.

Historic Overview

The following sections provide an overview of California history, including the Spanish, Mexican, and American Periods, as well as local history associated with the project area.

California History

Post-contact history for the State of California is divided into the following three periods: the Spanish Period from 1769 to1822; the Mexican Period from 1822 to 1848; and the American Period from 1848 to present. Although brief visits by Spanish, Russian, and British explorers occurred from 1529 to 1769, the first significant settlement in California was established by the Spanish at San Diego in 1769. Between 1769 and 1823, 21 missions were built by the Spanish and the Franciscan Order along the coast between San Diego and San Francisco. The Spanish expeditions into the Central Valley in 1806 and 1808 led by Lieutenant Gabriel Moraga explored the main rivers, including the American, Calaveras, Cosumnes, Feather, Merced, Mokelumne, Sacramento, San Joaquin, and Stanislaus. Moraga is said to have named the lower Sacramento River and the valley region “Sacramento.”

In 1813, Moraga led another expedition in the lower portion of the Central Valley and gave the San Joaquin River its name. The abundance of wildlife, such as waterfowl, fish, and fur-bearing animals, within or along the banks of the rivers attracted immigrants to the region. The last Spanish expedition into California’s interior was led by Luis Arguello in 1817. He and his men traveled up the Sacramento River, past the future site of the City of Sacramento to the mouth of the Feather River, before returning to the coast.

The first American trapper to enter California during the Mexican Period was Jedediah Smith, who explored the Sierra Nevada in 1826 and 1827, entering the Sacramento Valley and traveling along the American and Cosumnes Rivers. In 1827, Smith also traveled through the San Joaquin Valley. Other trappers soon followed, including employees of the Hudson’s Bay Company in 1832. Between 1830 and 1833, and again in 1837, diseases were introduced by non-indigenous explorers, trappers, and settlers. The diseases, along with relocation to the missions, military raids, and settlement by non-native groups, decimated native Californian populations, communities, and tribes in the Sacramento and San Joaquin valleys.

The American Period was initiated in 1848 with the signing of the Treaty of Guadalupe Hidalgo, which ended the Mexican–American War (1846–1848) and incorporated California as a territory of the United States. Gold was discovered at John Sutter’s Mill on the American River in Coloma the same year, and by 1849, nearly 90,000 people had journeyed to the gold fields to share in the riches. In 1850, largely as a result of the Gold Rush, California became the thirty-first state. Four years later, the bustling boomtown of Sacramento became the state capital. In contrast to the economic boom and population growth that enabled statehood, the loss of land and territory (including traditional hunting and gathering locales), malnutrition, starvation, and violence contributed to the further decline of indigenous Californians from the Northern California coast to the Sierra Nevada foothills.

Placer County History

Placer County was formed in 1851 from portions of neighboring Sutter and Yuba counties. The principal economic activity in much of the County at that time was placer mining, from which the County later drew its name. The City of Auburn, one of the earliest mining towns in California, was designated the seat of justice when the County was created. Auburn continues to be the County seat today.

The earliest settlers in Placer County arrived in the late 1840s, as miners poured into the region in search of placer deposits. By the mid-1850s the area was sparsely settled and dotted with small-scale ranches. By the mid-1860s, the construction and development of the railroad industry played a significant role in the region's development. The Central Pacific Railroad (CPRR) was incorporated in 1861 to build the western portion of the First Transcontinental Railroad. The tracks of the CPRR (later Southern Pacific Railroad [SPRR]; now Union Pacific Railroad [UPRR]) reached Roseville, Rocklin, and Newcastle in 1864. A designated California Historical Landmark (No. 780), the First Transcontinental Railroad has a marker in Old Town Roseville. Roseville prospered as a principal rail head that provided the frontier towns with goods and services. When the SPRR moved its major locomotive terminal from Rocklin to Roseville in 1908, Roseville expanded to one of the largest railroad centers in the country.

The presence of the railroad also contributed to the growth of Placer County's agricultural industry, mainly fruits and nuts, because the rail line provided access to a large market east of the Sierra Nevada. Incorporated in 1906, the Pacific Fruit Express Company (PFE) was a joint SPRR and UPRR enterprise. The company operated a number of ice plants and docks, as well as car and repair shops throughout the west, and shipped produce in ice-refrigerated railcars. The first units of the Pacific Fruit Express Ice Plant were erected in 1909, and by 1920, the ice plant was known as the world's largest artificial ice plant. The name of present-day PFE Road, whose unnamed precedent is shown on the 1911 U.S. Geologic Survey (USGS) Antelope quadrangle, is derived from the company, which is now a UPRR subsidiary.

Project Site History and Current Uses

The project vicinity is a densely developed area, with residential housing to the east, west, and south of the project area and commercial uses to the north. However, the 92.2 gross-acre project site (Assessor's Parcel Numbers [APNs] 023-221-076 and 023-221-074) remains undeveloped and is not currently in use. The project site has historically been undeveloped and used for agricultural (such as grazing) purposes since at least 1947. Predominant vegetation on the property is primarily non-native grassland, with scattered seasonal wetlands on gently rolling terrain. Oak woodlands are found on both sides of a riparian corridor along an unnamed tributary to Dry Creek (named "Placer Creek" for this project), which flows east to west.

The two-acre off-site sewer lift station improvements area (APNs 023-221-045 and 023-221-052) is located approximately 0.53-mile south of the southern portion of the project site. Aerial imagery shows that the off-site sewer lift station improvements area was historically surrounded by agricultural land until more recent development of the area. The utility area in the off-site sewer lift station improvements area was developed between 1998 and 2002, and the area has remained largely unchanged since. Surrounding residential development can be seen beginning in 2005, and the Dry Creek Community Park was developed in 2013 to the west of the off-site sewer lift station improvements area.

Off-Site Affordable Housing Parcel

As discussed throughout this EIR, one of the options being evaluated in this EIR to satisfy the project's affordable housing requirements consists of transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the RVSP. The off-site affordable housing parcel is approximately four acres in size and is located at the northeast corner of PFE Road and Watt Avenue (APN 023-200-056-000). Aerial imagery shows that the off-site affordable housing parcel has remained undeveloped since at least 1985. Center Preschool, located to the southwest of the off-site affordable housing parcel, has also been present since at least 1985. The surrounding residential development, notably south of the off-site affordable housing parcel, was developed between 1993 and 1998. The off-site affordable housing parcel is currently undeveloped and consists of grassy fields with rolling topography.

Known Cultural Resources

Background research was carried out as part of the Cultural and Paleontological Resources Assessment prepared by Natural Investigations Company for the proposed project and off-site sewer lift station improvements area, including a cultural and paleontological records search and an intensive field survey. The results of a records search and field survey for the project site and off-site sewer lift station improvements area are described below, with further details provided in the Method and Analysis subsection of this Chapter. In addition, relevant information from the RVSP EIR regarding the off-site affordable housing parcel is also presented below.

Project Site

The California Historical Resources Information System (CHRIS) identifies that two previous cultural resource studies have been conducted within the project site, and 16 previous cultural resource studies have been conducted within a 0.25-mile radius. The CHRIS records indicate that six previously recorded cultural resources, including four precontact resources and two historic resources, have been recorded within the 0.25-mile search radius. No cultural resources have been previously recorded within the project site. The intensive field survey conducted by Natural Investigations Company did not identify any new precontact sites, historic sites, features, or ethnographic resources within the project site.

Off-Site Sewer Lift Station Improvements Area

The CHRIS records indicate that eight previous cultural resource studies have been conducted within the off-site improvement area and 12 previous cultural resource studies have been conducted within a 0.25-mile radius. Four previously recorded cultural resources, two precontact and two historic, have been recorded within the 0.25-mile search radius. While cultural resources have not been previously recorded within the off-site improvement area, one previously recorded site (P-31-000203) is mapped as being directly adjacent to the off-site improvement area.

P-31-000203 is identified as a small precontact occupation site comprised of one white petrified wood projectile point, ochre, and manos. The site was first recorded in 1965 and was updated in 1991, during which one unifacial Greenstone flake with possible utilized chippage was identified; the update did not include mention of the previously found artifacts. A subsequent update of the site occurred in 1999, during which a fragment of a small andesitic cobble mano and a uniface metavolcanic cobble chopper were located. Further differences from the 1991 update were not noted. During the intensive pedestrian survey completed by Natural Investigations Company, the presence of P-31-000203 was not indicated and the location of the resource therefore could not be confirmed. In addition, the off-site improvement area is heavily utilized by recreational activities, with a Community Park adjacent to the west, and a previously landscaped grass area

adjacent to the south that was being regraded during the survey. The 1999 update of P-31-000203 mentioned that the site was disced regularly.

Natural Investigations Company determined that new cultural resources were not identified in the off-site sewer lift station improvements area.

Off-Site Affordable Housing Parcel

As part of the RVSP EIR, a record search for archaeological resources within the planning area was completed at the North Central Information Center (NCIC) and a request for information regarding potential cultural resources located in or near the planning area was submitted to the Native American Heritage Commission (NAHC). In their response, the NAHC stated that the Sacred Land Files did not indicate the presence of cultural resources in the RVSP planning area. The NCIC record search indicated that the majority of the study area has been previously inventoried for archaeological resources and identified archaeological resources CA-PLA-76 and -81 within the planning area and resources CA-PLA-69 and -77 outside of the RVSP. An archaeological reconnaissance for the RVSP was conducted in 1990. The archaeological reconnaissance was unsuccessful in locating archaeological resource CA-PLA-76 and identified a single artifact in the purported location of resource CA-PLA-81, as well as a historic era archaeological site referred to as I.F.1. Subsequent surveys of the area conducted in 2005 and 2006 successfully identified archaeological resource CA-PLA-69. Evidence of resource CA-PLA-77 was not observed. No new archaeological resources were observed during the 1990, 2005, or 2006 surveys of the planning area. The off-site affordable housing parcel was included in the records searches and pedestrian surveys conducted for the RVSP EIR. According to the RVSP EIR, known archaeological resources do not occur within the off-site affordable housing parcel.

8.3 REGULATORY CONTEXT

Federal, State, and local governments have developed laws and regulations designed to protect significant cultural resources that may be affected by actions that they undertake or regulate. The following section contains a summary of basic federal and State laws governing preservation of historic and archaeological resources of national, regional, State, and local significance.

Federal Regulations

The following are the federal environmental laws and policies relevant to cultural resources.

Section 106 for the National Historical Preservation Act of 1966

Federal regulations for cultural resources are governed primarily by Section 106 of the National Historical Preservation Act (NHPA) of 1966. Section 106 of NHPA requires federal agencies to take into account the effects of their undertakings on historic properties and affords the Advisory Council on Historic Preservation a reasonable opportunity to comment on such undertakings. The Council's implementing regulations, "Protection of Historic Properties," are found in 36 Code of Federal Regulations (CFR) Part 800. The goal of the Section 106 review process is to offer a measure of protection to sites, which are determined eligible for listing on the National Register of Historic Places (NRHP). The criteria for determining NRHP eligibility are found in 36 CFR Part 60. Amendments to the Act (1986 and 1992) and subsequent revisions to the implementing regulations have, among other things, strengthened the provisions for Native American consultation and participation in the Section 106 review process. While federal agencies must follow federal regulations, most projects by private developers and landowners do not require this level of compliance. Federal regulations only come into play in the private sector if a project requires a federal permit or uses federal funding.

National Register of Historic Places

The NRHP is the nation's master inventory of known historic resources. The NRHP includes listings of resources, including: buildings, structures, sites, objects, and districts that possess historic, architectural, engineering, archaeological, or cultural significance at the national, State, or local level. Resources over 50 years of age could be listed on the NRHP. However, properties under 50 years of age that are of exceptional significance or are contributors to a district could also be included on the NRHP. Four criteria are used to determine if a potential resource may be considered significant and eligible for listing on the NRHP. The criteria include resources that:

A. Are associated with events that have made a significant contribution to the broad patterns of history; or
B. Are associated with the lives of persons significant in our past; or
C. Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
D. Have yielded or may likely yield information important in prehistory or history.

A resource can be individually eligible for listing on the NRHP under any of the above four criteria, or can be listed as contributing to a group of resources that are listed on the NRHP.

A resource can be considered significant in American history, architecture, archaeology, engineering, or culture. Once a resource has been identified as significant and potentially eligible for the NRHP, the resource's historic integrity must be evaluated. Integrity is a function of seven factors: location, design, setting, materials, workmanship, feeling, and association. The factors closely relate to the resource's significance and must be intact for NRHP eligibility.

Historical buildings, structures, and objects are usually eligible under Criteria A, B, and C based on historical research and architectural or engineering characteristics. Archaeological sites are usually eligible under Criterion D, the potential to yield information important in precontact history or history. An archaeological test program may be necessary to determine whether the site has the potential to yield important data. The lead federal agency makes the determination of eligibility based on the results of the test program and seeks concurrence from the State Historic Preservation Officer (SHPO).

Effects to NRHP-eligible resources (historic properties) are adverse if the project may alter, directly or indirectly, any of the characteristics of an historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association.

State Regulations

The following are the State environmental laws and policies relevant to cultural resources.

California Environmental Quality Act and California Register of Historic Places

State historic preservation regulations affecting this project include the statutes and guidelines contained in CEQA (Public Resources Code [PRC] Sections 21083.2 and 21084.1 and Sections 15064.5 and 15126.4 (b) of the CEQA Guidelines). CEQA requires lead agencies to consider the potential effects of a project on historical resources and unique archaeological resources. A "historical resource" includes, but is not limited to, any object, building, structure, site, area, place,

record or manuscript that is historically or archaeologically significant (PRC Section 5020.1). Under Section 15064.5 of the CEQA Guidelines, a resource is considered to be an "historical resource," and thus presumptively worthy of protection where feasible, if one or more of the following California Register of Historic Resources (CRHR) criteria have been met:

1. The resource is associated with events that have made a significant contribution to the broad patterns of California history;
2. The resource is associated with the lives of important persons from our past;
3. The resource embodies the distinctive characteristics of a type, period, region or method of construction, or represents the work of an important creative individual or possesses high artistic values; or
4. The resource has yielded, or may be likely to yield, important information in prehistory or history.

In addition, the resource must retain integrity. Cultural resources determined eligible for the NRHP by a federal agency are automatically eligible for the CRHR.

CEQA requires preparation of an EIR if a proposed project would cause a "substantial adverse change" in the significance of an historical resource. A "substantial adverse change" would occur if a proposed project would result in physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired (CEQA Guidelines Section 15064.5[b][1]).

In addition to historical resources, which can include archeological resources that meet the criteria listed above, CEQA also requires consideration of "unique archaeological resources." If a site meets the definition of a unique archaeological resource, the site must be treated in accordance with the provisions of PRC Section 21083.2.

Under PRC Section 20183.2(g), an archaeological resource is considered "unique" if it:

1) Is associated with an event or person of recognized significance in California or American history or recognized scientific importance in prehistory;
2) Can provide information that is of demonstrable public interest and is useful in addressing scientifically consequential and reasonable research questions;
3) Has a special kind or particular quality such as oldest, best example, largest, or last surviving example of its kind;
4) Is at least 100 years old and possesses substantial stratigraphic integrity; or
5) Involves important research questions that can be answered only with archaeological methods.

CEQA also includes specific guidance regarding the accidental discovery of human remains. Specifically, CEQA Guidelines Section 15064.5(e) requires that if human remains are uncovered, excavation activities must be stopped and that the county coroner be contacted. If the county coroner determines that the remains are Native American, the coroner must contact the NAHC within 24 hours. The NAHC identifies the most likely descendant, and that individual or individuals can make recommendations for treatment of the human remains under the procedures set forth in Section 15064.5 of the CEQA Guidelines.

The SHPO maintains the CRHR. Properties that are listed on the NRHP are automatically listed on the CRHR, along with State Landmarks and Points of Interest. The CRHR can also include

properties designated under local ordinances or identified through local historical resource surveys.

Local Regulations

The following are the local government's environmental policies that are intended to protect cultural resources by mitigating the potential impacts of new development in areas containing important archaeological or historic resources.

Placer County General Plan

The PCGP goals and policies relating to the protection of cultural and historical resources that are applicable to the proposed project are presented below.

Recreation and Cultural Resources Element

Goal 5.D.1. To identify, protect, and enhance Placer County's important historical, archaeological, paleontological, and cultural sites and their contributing environment.

Policy 5.D.2 The County shall solicit the cooperation of the owners of cultural and paleontological resources, encourage those owners to treat these resources as assets rather than liabilities, and encourage the support of the general public for the preservation and enhancement of these resources.

Policy 5.D.3 The County shall solicit the views of the Native American Heritage Commission, State Office of Historic Preservation, North Central Information Center, and/or the local Native American community in cases where development may result in disturbance to sites containing evidence of Native American activity and/or to sites of cultural importance.

Policy 5.D.4 The County shall coordinate with the cities and municipal advisory councils in the County to promote the preservation and maintenance of Placer County's paleontological and archaeological resources.

Policy 5.D.6 The County shall require that discretionary development projects identify and protect from damage, destruction, and abuse, important historical, archaeological, paleontological, and cultural sites and their contributing environment. Such assessments shall be incorporated into a County-wide cultural resource database, to be maintained by the Division of Museums.

Policy 5.D.7 The County shall require that discretionary development projects are designed to avoid potential impacts to significant paleontological or cultural resources whenever possible. Unavoidable impacts, whenever possible, shall be reduced to a less than significant level and/or shall be mitigated by extracting maximum recoverable data. Determinations of impacts,

significance, and mitigation shall be made by qualified archaeological (in consultation with recognized local Native American groups), historical, or paleontological consultants, depending on the type of resource in question.

Policy 5.D.8 The County shall, within its power, maintain confidentiality regarding the locations of archaeological sites in order to preserve and protect these resources from vandalism and the unauthorized removal of artifacts.

Policy 5.D.10 The County will use existing legislation and propose local legislation for the identification and protection of cultural resources and their contributing environment.

Policy 5.D.11 The County shall support the registration of cultural resources in appropriate landmark designations (i.e., National Register of Historic Places, California Historical Landmarks, Points of Historical Interest, or Local Landmark). The County shall assist private citizens seeking these designations for their property.

Policy 5.D.12 The County shall consider acquisition programs (i.e. Placer Legacy Open Space and Agricultural Conservation Program) as a means of preserving significant cultural resources that are not suitable for private development. Organizations that could provide assistance in this area include, but are not limited to, the Archaeological Conservancy, the Native American community, and local land trusts.

Dry Creek-West Placer Community Plan

The following goals and policies from the Environmental Resources Management Element of the DCWPCP related to cultural resources are applicable to the proposed project.

Environmental Resources Management Element: Cultural Resources

Goal 1 Recognize that the Dry Creek West Placer Community Plan Area is a unique community, which should incorporate development standards that enhance the area's separate cultural, sociological and physical identity.

Goal 2 Preserve areas of outstanding historical, cultural, or archaeological significance.

Policy 1 Identify and protect from destruction and abuse all representative and unique historical, cultural and archaeological sites.

Policy 2 Require site specific studies for archaeological or historical sites in all instances where land development has the potential to have a detrimental impact on these sites.

Policy 8 Preserve outstanding visual features and landmarks.

8.4 IMPACTS AND MITIGATION MEASURES

The following section describes the standards of significance and methodology used to analyze and determine the proposed project's potential impacts related to cultural resources. In addition, a discussion of the project's impacts, as well as mitigation measures where necessary, is also presented.

Standards of Significance

Consistent with PRC Sections 21083.2, 21084.1, and 21084.2, Section 15064.5 and Appendix G of the CEQA Guidelines, and Placer County's Environmental Checklist, an impact related to cultural resources is considered significant if the proposed project would:

- Cause a substantial adverse change in the significance of an historical resource pursuant to CEQA Guidelines Section 15064.5;
- Cause a substantial adverse change in the significance of a unique archaeological resource pursuant to CEQA Guidelines Section 15064.5;
- Disturb any human remains, including those interred outside of dedicated cemeteries;
- Have the potential to cause a physical change which would affect unique ethnic cultural values; or
- Restrict existing religious or sacred uses within the potential impact area.

Method of Analysis

The impact analysis contained in this chapter is primarily based on the Cultural and Paleontological Resources Assessment prepared by Natural Investigations Company. Preparation of the Cultural and Paleontological Resources Assessment included a cultural resources records search, paleontological resource analysis, and intensive pedestrian survey of the project area. The Cultural and Paleontological Resources Assessment addresses the entire project area, which includes the project site and the off-site sewer lift station improvements area. Potential impacts related to cultural resources associated with development of the off-site affordable housing parcel were previously evaluated in the 2008 RVSP EIR. The methods of analysis are described in further detail below.

Records Search Methods

Cultural resource literature searches for the project area were completed at the NCIC of the CHRIS at California State University, Sacramento, on February 8, 2025 for the project site and on June 16, 2025 for the off-site sewer lift station improvements area. The record searches were conducted to determine the extent of previous surveys within a 0.25-mile radius of the project site and off-site sewer lift station improvements area, and whether previously documented pre-contact or historic archaeological sites, architectural resources, or traditional cultural properties exist within the project area.

In addition to the official records and maps for archaeological sites and surveys in Placer County, the following historic references were also reviewed:

- NRHR: listed properties;
- CRHR: listed resources;
- Historic Property Data File for Placer County;
- Archaeological Determinations of Eligibility;
- Built Environment Resources Directory;

- California Inventory of Historical Resources;
- California Historical Landmarks;
- California Points of Historical Interest; and
- Historical General Land Office (GLO) land plat maps.

Natural Investigations Company received a negative response from the NAHC on January 14, 2025, regarding the request to search the SLF for tribal cultural resources within or near the project site.

Field Survey Methods

Natural Investigations Company conducted an intensive pedestrian survey of the project site on January 1, 2025 and conducted an intensive pedestrian survey of the off-site sewer lift station improvements area on June 16, 2025. All portions of the project areas were surveyed intensively using transects spaced at 15 meters apart or less. During the pedestrian surveys, all visible ground surface within the project area was carefully examined for cultural material (e.g., flaked stone tools, toolmaking debris, stone milling tools, or fire-affected rock), soil discoloration that might indicate the presence of a cultural midden, soil depressions and features indicative of the former presence of structures or buildings (e.g., postholes, foundations), or historic-era debris (e.g., metal, glass, ceramics). Ground disturbances (e.g., animal burrows, drainages, dirt roads, etc.) were visually inspected. A digital camera was used to take photographs of the project area, a Munsell® Soil Color Chart was used to record soil color, and a handheld BE-3300-GPS global positioning system (GPS) unit with sub-meter accuracy was used to record locational data.

Project-Specific Impacts and Mitigation Measures

The following discussion of impacts is based on implementation of the proposed project and off-site sewer lift station improvements, as well as the two affordable housing options analyzed throughout this EIR, in comparison with the standards of significance identified above. In most cases, however, potential environmental impacts associated with the proposed project and the 22 on-site ADUs being considered for development to satisfy the County's affordable housing requirement would not differ. Thus, unless otherwise noted, the below analysis applies to both the proposed project and the potential on-site ADUs.

8-1 Cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines, Section 15064.5. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to the potential for development of the proposed project and off-site sewer lift station improvements area, as well as potential future development of the off-site affordable housing parcel, to cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines, Section 15064.5.

Historical resources are features that are associated with the lives of historically important persons and/or historically significant events, that embody the distinctive characteristics of a type, period, region or method of construction, or that have yielded, or may be likely to yield, information important to the precontact history or history of the local area, California, or the nation. Examples of possible historical resources include, but are not

limited to, buildings, farmsteads, rail lines, bridges, and trash scatters containing objects such as colored glass and ceramics. The CEQA Guidelines sometimes refer to "historical resource[s] of an archaeological nature" as a subset of historical resources (see CEQA Guidelines Section 15126.4[b][3]). As previously noted above, cultural resources determined eligible for the NRHP by a federal agency are automatically eligible for the CRHR. The proposed project, off-site sewer lift station improvements area, and off-site affordable housing parcel are discussed below.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines, Section 15064.5 would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

The project site consists of approximately 92.2 gross acres and is bisected by Walerga Road, separating the site into northern and southern portions. The 52.3-acre northern portion of the project site is currently undeveloped, consists of non-native annual grassland with rolling topography, and is interspersed with seasonal wetlands and vernal pools. The 35.3-acre southern portion of the site consists of undeveloped annual grassland with rolling topography, interspersed with seasonal wetlands, vernal pools, and is bisected by Placer Creek. The project site does not contain any existing buildings or other structures. The Cultural and Paleontological Resources Assessment determined that known cultural resources are not present within the project site.

According to the Cultural and Paleontological Resources Assessment, the off-site sewer lift station improvements area is heavily utilized for recreational activities. The off-site sewer lift station improvements area does not contain any existing buildings or other structures that could be considered historic. While one previously recorded site (P-31-000203) was mapped as being directly adjacent to the off-site sewer lift station improvements area, Natural Investigations Company did not observe evidence of P-31-000203 within the off-site sewer lift station improvements area during the pedestrian survey. Thus, the Cultural and Paleontological Resources Assessment prepared for the proposed project concluded that evidence of historic or precontact cultural resources does not exist in the project site or the off-site sewer lift station improvements area.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is approximately four acres in size and is located at the northeast corner of PFE Road and Watt Avenue. The off-site affordable housing parcel is undeveloped and consists of grassy fields with rolling topography. Similar to the project site and off-site sewer lift station improvements area, the off-site affordable housing parcel does not contain any existing buildings or other structures that could be considered historic. Furthermore, the off-site affordable housing parcel is located within the RVSP. As discussed on page eight of Chapter 7, Cultural Resources, of the RVSP EIR, historic architectural resources do not exist within the RVSP area. Therefore, the off-site affordable housing parcel does not contain any known historic resources.

Conclusion

Based on the above, the proposed project, including the off-site sewer lift station improvements area, as well as potential future development of the off-site affordable housing parcel, would not result in a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines, Section 15064.5, and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

8-2 Cause a substantial adverse change in the significance of a unique archeological resource pursuant to CEQA Guidelines, Section 15064.5. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as potential future development of the off-site affordable housing parcel, which could cause a substantial adverse change in the significance of a unique archeological resource pursuant to CEQA Guidelines, Section 15064.5.

According to CEQA Guidelines Section 21083.2(g), unique archaeological resources are archaeological artifacts, objects, or sites about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that the resource meets any of the criteria determined by CEQA to constitute a unique archaeological resource. The criteria outlined in CEQA Guidelines Section 21083.2(g) include that the resource contains information needed to answer important scientific research questions and that there is a demonstrable public interest in the information, has a special and particular quality such as being the oldest or the best available example of its type, or is directly associated with a scientifically recognized important precontact or historic event or person. The proposed project, off-site sewer lift station improvements area, and off-site affordable housing parcel are discussed below.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to cause a substantial adverse change in the significance of a unique archeological resource pursuant to CEQA Guidelines, Section 15064.5 would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

As previously discussed, one precontact site (P-31-000203) has been previously recorded directly adjacent to the off-site sewer lift station improvements area. However, the intensive pedestrian survey completed during the field survey by Natural Investigations Company determined that the presence of P-31-000203 was not indicated within the off-site sewer lift station improvements area. As such, development of the project site and off-site sewer lift station improvements area would not cause a substantial adverse change in the significance of a known archaeological resource.

However, while known archaeological resources have not been recorded within the project site, and the previously recorded site (P-31-000203) adjacent to the off-site sewer lift station improvements area was not located during the field survey conducted for the Cultural and Paleontological Resources Assessment, unknown archaeological resources could exist beneath the ground surface and have the potential to be uncovered during ground-disturbing activities associated with the proposed project, such as excavation associated with construction of the new residential buildings, associated internal roadways, and trenching for new utility lines. In addition, according to the Cultural and Paleontological Resources Assessment, the project area is comprised of soil formations that date back to periods of known human occupation. As such, the potential exists for the project area to contain buried archaeological deposits.

Off-Site Affordable Housing Parcel

One of the options being evaluated in this EIR to satisfy the project's affordable housing requirements consists of transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the RVSP. While the proposed project would include a rezone to allow for development of the off-site affordable housing parcel, the County has previously planned for buildout of the site, as evidenced by the parcel's existing designations of High Density Residential (HDR) and Commercial. As such, impacts related to unique archeological resources have been previously addressed in the RVSP EIR. As discussed under Impact 7-1 of the RVSP EIR, previously recorded archaeological resources CA-PLA-69, -76, -77, and -81 may lie buried beneath flood-related deposits within the planning area. As such, the RVSP EIR determined that ground-disturbing activities associated with buildout of the RVSP within or adjacent to archaeological resources CA-PLA-69, -76, -77, and -81 could potentially damage unique archeological resources. Archaeological resources CA-PLA-69, -76, -77, and -81 are not located within or adjacent to the off-site affordable housing parcel. Thus, the potential future development of the off-site affordable housing parcel would not cause a substantial adverse change in the significance of a recorded unique archeological resource. Nonetheless, the RVSP EIR included Mitigation Measures 7-1a through 7-1c, which intend to avoid impacts to unique archeological resources, if found, by requiring soil capping, subsurface testing, and data recovery excavation.

At such time the off-site affordable housing parcel gets developed, the future developer would be required to comply with the RVSP Mitigation Measures 7-1a through 7-1c, which would reduce potential impacts to unique archeological resources to a less-than-significant level.

Conclusion

Based on the above, the Cultural and Paleontological Resources Assessment prepared for the proposed project and the RVSP EIR determined that known archaeological resources do not exist within the project site, the off-site sewer lift station improvements area, or the off-site affordable housing parcel. However, in the event that project ground-disturbing activities encounter previously unrecorded archaeological resources, the proposed project could cause a substantial adverse change in the significance of a unique archaeological resource pursuant to CEQA Guidelines Section 15064.5. Therefore, the proposed project could result in a ***significant*** impact. The referenced RVSP mitigation measures are incorporated into this EIR as Mitigation Measures 8-2(c) through 8-2(e) below.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level by ensuring the avoidance of substantial adverse changes in the significance of any unique archaeological resources or historical resources of an archaeological nature that might be encountered during construction or by ensuring the treatment of such resources in a manner that recovers any important scientific data contained within them.

Project Site and Off-Site Sewer Lift Station Improvements Area

8-2(a) *Prior to initiation of ground-disturbing activities, a qualified archaeologist shall conduct a short awareness training session for all construction workers and supervisory personnel. The course shall explain the importance of, and legal basis for, the protection of significant archaeological resources (i.e., unique archaeological resources and historical resources of an archaeological nature). Each worker shall also learn the proper procedures to follow in the event cultural resources or human remains/burials are uncovered during construction activities, including work curtailment or redirection and to immediately contact their supervisor and the archaeological monitor. The worker education session shall include visuals of artifacts (prehistoric and historic) that might be found in the project vicinity, and take place on the construction site immediately prior to the start of any construction activities including equipment staging, installation of fencing, and any project-related ground disturbance. All ground-disturbing equipment operators shall be required to receive the training and sign a form that acknowledges receipt of the training.*

8-2(b) *In the event that cultural resources are inadvertently discovered during project activities, work in the area must be halted within a 100-foot radius of the find and a qualified archaeologist (pursuant to the Standards at 36 CFR Part 61) and representative from the United Auburn Indian Community (if the resource is precontact) shall be notified immediately to evaluate the resource(s) encountered to determine whether they may be unique archaeological resources and/or historical resources. Notification of the resource for evaluation purposes shall also be provided immediately to the United Auburn Indian Community (UAIC) and Placer County. Construction activities may continue in other areas. If the qualified archaeologist determines that the discovery includes either unique archaeological resources or historical resources of an archaeological nature, the qualified archaeologist shall develop mitigation or treatment measures for consideration and approval by the Director of the Placer County Community Development Resource Agency or his or her designee in consultation with the project applicant. The Director may also consult with the State Historic Preservation Officer [SHPO] or any other regulatory agency that the Director believes may have informed and useful input to provide. Mitigation shall be developed and implemented in accordance with Public Resources Code Section 21083.2 and Section 15126.4 of the CEQA Guidelines, with a preference for preservation in place. Consistent with Section 15126.4(b)(3), preservation in place may be accomplished through*

one or more of the following: planning construction to avoid the resource; incorporating the resource within open space; capping and covering the resource; or deeding the site into a permanent conservation easement. If approved by the Director, such measures shall be implemented and completed prior to commencing further work for which grading or building permits were issued, unless otherwise directed by the Director. Avoidance or preservation of unique archaeological resources or historical resources of an archaeological nature shall not be required where such avoidance or preservation in place is deemed infeasible, as determined by the Director in consultation with the project applicant. Where avoidance or preservation are not appropriate, the qualified archaeologist, in consultation with the Director, shall prepare a detailed treatment plan for consideration and approval by the Director, which may include data recovery for resources that are not considered Tribal Cultural Resources by the UAIC. If employed, data recovery strategies for unique archaeological resources that do not also qualify as historical resources of an archaeological nature shall follow the applicable requirements and limitations set forth in Public Resources Code Section 21083.2. Data recovery will normally consist of (but would not be limited to) sample excavation, artifact collection, site documentation, and historical research, with the aim of recovering important scientific data contained within the unique archaeological resource or historical resource of an archaeological nature. The data recovery plan shall include provisions for analysis of data in a regional context, reporting of results within a timely manner, curation of artifacts and data at an approved facility, and dissemination of reports to local and State repositories, libraries, and interested professionals. If data recovery is determined by the Director to not be appropriate, then an equally effective treatment shall be proposed and implemented. Work may not resume within the no-work radius until the Director, in consultation with the qualified archaeologist and tribal representative, determines that the site either: 1) does not contain unique archaeological resources or historical resources of an archaeological nature; or 2) that the preservation and/or treatment measures have been completed to the Director's satisfaction. This determination shall be made in coordination with the project archaeologist and UAIC Representative if a Tribal Cultural Resource is involved.

Off-Site Affordable Housing Parcel

8-2(c) *Implement RVSP EIR Mitigation Measure 7-1a if culturally significant materials are discovered during construction:*

Potentially unique archaeological resources will be capped with soil prior to construction in the area except in locations in which such capping would be infeasible due to project design. An acceptable process of "capping" archaeological resources with soil must include the following elements:

- *The soils to be covered must not suffer serious compaction;*
- *The covering materials must not be chemically active;*
- *The site must be one in which the natural process of deterioration have been arrested; and*

- *The site must have been recorded, including the areal extent of subsurface deposits.*

8-2(d) *Implement RVSP EIR Mitigation Measure 7-1b if culturally significant materials are discovered during construction:*

A qualified professional archaeologist shall be retained to conduct subsurface testing at potentially important known archaeological sites. As it has not been determined if the known sites within the Specific Plan Area are eligible for inclusion to either the NRHP or CRHR, subsurface testing (i.e., resource evaluation) should be initiated for sites when construction is to occur within 100 feet of the resource and where Mitigation Measure 7-1a [incorporated as Mitigation Measure 8-2(c) of this EIR] proves infeasible. Subsurface testing should also be implemented if culturally significant materials (i.e., unique archaeological resources or historical resources) are inadvertently exposed during construction.

Subsurface testing procedures could involve shovel testing, augering, or other such techniques designed to identify and/or characterize subsurface archaeological deposits. If a resource is determined to be important under CEQA (i.e., because it is a unique archaeological resource or an historical resource), then Mitigation Measure 7-1c [incorporated as Mitigation Measure 8-2(e) of this EIR] must also be implemented.

8-2(e) *Implement RVSP EIR Mitigation Measure 7-1c if culturally significant materials are discovered during construction:*

A qualified professional archaeologist shall be retained to conduct data recovery excavation. This mitigation measure will be implemented as an alternative to Mitigation Measures 7-1a [incorporated as Mitigation Measure 8-2(c) of this EIR] at cultural resource sites determined to be eligible for inclusion in either the NRHP or CRHR.

In compliance with CEQA, implementation of this mitigation measure would entail preparation and adoption of a data recovery plan that makes provisions for adequately recovering the scientifically consequential information from and about the resource. The data recovery plan must be prepared and adopted prior to commencing any excavation activities.

8-3 Disturb any human remains, including those interred outside of dedicated cemeteries. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could disturb any human remains, including those interred outside of dedicated cemeteries.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to disturb any human remains, including those interred outside of dedicated cemeteries, would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

As discussed previously, the project site does not contain any known archaeological resources, as determined by the Cultural and Paleontological Resources Assessment prepared for the proposed project. While the off-site sewer lift station improvements area is heavily utilized by recreational activities, the project site is undeveloped and has been relatively undisturbed.

The project site and off-site sewer lift station improvements area are located in an area associated with the Nisenan culture, whose territory encompassed the project site and off-site sewer lift station improvements area. The field survey conducted as part of the Cultural and Paleontological Resources Assessment did not detect human remains. Nevertheless, the potential for human remains to be discovered during construction cannot be eliminated, given the known precontact occupation of the project vicinity by Native American tribes.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is undeveloped and consists of grassy fields with rolling topography. As discussed under Impact 7-2 of the RVSP EIR, previously undiscovered cultural resources, including human remains, could be inadvertently exposed during grading or excavation activities associated with buildout of the RVSP. Thus, the potential future development of the off-site affordable housing parcel could disturb human remains, including those interred outside of dedicated cemeteries. However, the RVSP EIR included Mitigation Measures 7-1b, 7-1c, and 7-2a, which intend to avoid impacts to previously unknown cultural resources by requiring compliance with the recommendations of a qualified archaeologist, subsurface testing, and data recovery excavation.

At such time the off-site affordable housing parcel gets developed, the future developer would be required to comply with RVSP Mitigation Measures 7-1b, 7-1c, and 7-2a, which would reduce potential impacts related to disturbing human remains, including those interred outside of dedicated cemeteries, to a less-than-significant level.

Conclusion

Based on the above, ground-disturbing activities on the project site, off-site sewer lift station improvement areas, and off-site affordable housing parcel could disturb human remains, including those interred outside of dedicated cemeteries, and a ***significant*** impact could occur. The referenced RVSP mitigation measures are incorporated into this EIR as Mitigation Measures 8-2(d), 8-2(e), and 8-3(d).

Mitigation Measure(s)

Implementation of the following mitigation measure would reduce the above potential impact to a *less-than-significant* level by protecting unknown individual Native American remains that might be encountered during construction or by ensuring that such remains

are reinterred with appropriate dignity, with input from the Most Likely Descendant if such person can be found and consulted within the time frame contemplated by state law.

Project Site, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

8-3(a) *The following language shall be noted on project Improvement Plans, subject to review and approval by the Placer County Community Development Resource Agency:*

If articulated or disarticulated human remains are encountered on the proposed project site, off-site improvement area, or off-site affordable housing parcel during construction activities, all work within 100 feet of the find must cease, and any necessary steps to ensure the integrity of the immediate area must be taken. The Placer County Coroner shall be immediately notified. If the Coroner determines the remains are of Native American origin, the Coroner shall notify the Native American Heritage Commission (NAHC) within 24 hours. The NAHC shall determine and notify a Most Likely Descendant (MLD). Further actions shall be determined, in part, by the desires of the MLD. The MLD shall be afforded 48 hours to make recommendations regarding the disposition of the remains following notification from the NAHC of the discovery. If the MLD does not make recommendations within 48 hours, the owner shall, with appropriate dignity, reinter the remains in an area of the property secure from further disturbance. Alternatively, if the owner does not accept the MLD's recommendations, the owner or the descendant may request mediation by the NAHC.

Off-Site Affordable Housing Parcel

8-3(b) *Implement the following Mitigation Measure set forth in this EIR if archeological or historical resources are discovered during construction:*

- *<u>8-2(d)</u> Implement RVSP EIR Mitigation Measure 7-1b:*

  A qualified professional archaeologist shall be retained to conduct subsurface testing at potentially important known archaeological sites. As it has not been determined if the known sites within the Specific Plan Area are eligible for inclusion to either the NRHP or CRHR, subsurface testing (i.e., resource evaluation) should be initiated for sites when construction is to occur within 100 feet of the resource and where Mitigation Measure 7-1a [incorporated as Mitigation Measure 8-2(c) of this EIR] proves infeasible. Subsurface testing should also be implemented if culturally significant materials (i.e., unique archaeological resources or historical resources) are inadvertently exposed during construction.

  Subsurface testing procedures could involve shovel testing, augering, or other such techniques designed to identify and/or characterize subsurface archaeological deposits. If a resource is determined to be important under CEQA (i.e., because it is a unique

archaeological resource or an historical resource), then Mitigation Measure 7-1c [incorporated as Mitigation Measure 8-2(e) of this EIR] must also be implemented.

8-3(c) *Implement the following Mitigation Measure set forth in this EIR if archeological or historical resources are discovered during construction:*

- *<u>8-2(e)</u> Implement RVSP EIR Mitigation Measure 7-1c:*

  A qualified professional archaeologist shall be retained to conduct data recovery excavation. This mitigation measure will be implemented as an alternative to Mitigation Measures 7-1a [incorporated as Mitigation Measure 8-2(c) of this EIR] at cultural resource sites determined to be eligible for inclusion in either the NRHP or CRHR.

  In compliance with CEQA, implementation of this mitigation measure would entail preparation and adoption of a data recovery plan that makes provisions for adequately recovering the scientifically consequential information from and about the resource. The data recovery plan must be prepared and adopted prior to commencing any excavation activities.

8-3(d) *Implement RVSP EIR Mitigation Measure 7-2a if archeological or historical resources are discovered during construction:*

In the event of the discovery of buried archaeological artifacts, exotic rock (non-native), or unusual amounts of shell or bone, it is recommended that project activities in the vicinity of the find be immediately stopped and a qualified professional archaeologist consulted to assess the resource and provide proper management recommendations. If the find is determined to be a historical or unique archaeological resource, contingency funding and a time allotment to allow for implementation of avoidance measures or appropriate mitigation shall be made available, as provided in Section 15064.5 of the CEQA Guidelines. In addition, the Placer County Planning Department and Department of Museums must also be contacted. Work in the area may only proceed after authorization is granted by the Placer County Planning Department. All construction and improvement plans for subsequent development within the Plan Area involving ground disturbance shall include these provisions. The archaeologist shall evaluate any potential effects on any historical resource or unique archaeological resource, and where such effects would be significant, shall recommend potential mitigation to the County for its consideration. The County will assess the feasibility of any proposed mitigation (e.g., avoidance of the historical resource) and impose the mitigation where feasible in light of factors such as the nature of the find, project design, costs, Specific Plan policies and land use assumptions, and other considerations. If avoidance is unnecessary or infeasible, other appropriate measures (e.g., data recovery) shall be instituted. Work may proceed on

other parts of the project site while mitigation for paleontological resources is carried out.

8-4 Have the potential to cause a physical change which would affect unique ethnic cultural values, or restrict existing religious or sacred uses within the potential impact area. Based on the analysis below and with the implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as potential future development of the off-site affordable housing parcel, which have the potential to cause a physical change which would affect unique ethnic cultural values, or restrict existing religious or sacred uses within the potential impact area.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to have the potential to cause a physical change which would affect unique ethnic cultural values, or restrict existing religious or sacred uses within the potential impact area, would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

Cultural resource site P-31-000203 was originally recorded as a small precontact occupation site, located adjacent to the off-site sewer lift station improvements area, containing one white petrified wood projectile point, ochre, and manos. The site was first recorded in 1965 and was updated in 1991, during which one unifacial Greenstone flake with possible utilized chippage was identified. The updated 1991 report did not include mention of the previously found artifacts. A subsequent update of the site occurred in 1999 during which a fragment of a small andesitic cobble mano and a uniface metavolcanic cobble chopper were located; further differences from the 1991 update were not noted. Natural Investigations Company completed a field survey that included the portion of P-31-000203 located in the off-site sewer lift station improvements area. The intensive pedestrian survey completed for the Cultural and Paleontological Resources Assessment determined that P-31-000203 was not located within the off-site sewer lift station improvements area. In addition, the off-site sewer lift station improvements area is heavily utilized by recreational activities; a Community Park is adjacent to the west, and a previously landscaped grass area adjacent to the south was being regraded during the survey. The 1999 update of P-31-000203 mentioned the site being disced regularly. Given the disturbance of the site and inability to locate any of the recorded artifacts, the site does not retain any integrity or further useful cultural information.

Nonetheless, given the project site's location within an area sensitive for precontact archaeological resources, including resources associated with the ancestral Nisenan culture, unknown sites that provide significant cultural value to Native American tribes culturally affiliated with the project area could be located on-site beneath the ground surface. In the event that project ground-disturbing activities encounter such sites, a significant impact could occur. Potential impacts to tribal cultural resources are evaluated in Chapter 17, Tribal Cultural Resources, of this EIR.

Off-Site Affordable Housing Parcel

As previously discussed, impacts related to cultural resources within the RVSP planning area have been previously addressed in the RVSP EIR. The RVSP EIR did not specifically analyze impacts related to physical changes which would affect unique ethnic cultural values, or restrict existing religious or sacred uses. As discussed under Impact 7-1 of the RVSP EIR, previously recorded archaeological resources CA-PLA-69, -76, -77, and -81 may lie buried beneath flood-related deposits within the planning area. As such, the RVSP EIR determined that ground-disturbing activities associated with buildout of the RVSP within or adjacent to archaeological resources CA-PLA-69, -76, -77, and -81 could potentially damage unique archeological resources. In addition, as discussed under Impact 7-2 of the RVSP EIR, previously undiscovered cultural resources could be inadvertently exposed during grading or excavation activities associated with buildout of the RVSP. Therefore, although the off-site affordable housing parcel is undeveloped and relatively undisturbed, development of the parcel could cause a physical change which would affect unique ethnic cultural values, or restrict existing religious or sacred uses within the potential impact area. However, the RVSP EIR included Mitigation Measures 7-1b, 7-1c, and 7-2a, which intend to avoid impacts to previously unknown cultural resources by requiring compliance with the recommendations of a qualified archaeologist, subsurface testing, and data recovery excavation.

At such time the off-site affordable housing parcel gets developed, the future developer would be required to comply with RVSP Mitigation Measures 7-1b, 7-1c, and 7-2a, which would reduce the potential to cause a physical change which would affect unique ethnic cultural values, or restrict existing religious or sacred uses within the potential impact area to a less-than-significant level.

Conclusion

Based on the above, ground-disturbing activities on the project site, off-site sewer lift station improvements area, and off-site affordable housing parcel could have the potential to cause a physical change which would affect unique ethnic cultural values, or restrict existing religious or sacred uses within the potential impact area, and a ***significant*** impact could occur. The referenced RVSP mitigation measures are incorporated into this EIR as Mitigation Measures 8-2(d), 8-2(e), and 8-3(d).

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level by ensuring the avoidance and preservation of any tribal cultural resources encountered during construction or by ensuring the reburial of any such resources that cannot be avoided and preserved in place (or, with written permission from a culturally affiliated Tribe, the curation of such resources).

Project Site and Off-Site Sewer Lift Station Improvements Area

8-4(a) Implement the following Mitigation Measures set forth in this EIR:

- *<u>17-1(a)</u> The following language shall be noted on project Improvement Plans, subject to review and approval by the Placer County Community Development Resource Agency:*

If any suspected Tribal Cultural Resources (TCRs) or resources of cultural significance to the UAIC, including, but not limited to, features, anthropogenic/cultural soils, cultural belongings or objects (artifacts), shell, bone, shaped stones or bone, or ash/charcoal deposits are discovered by any person during construction activities, including ground disturbing activities, all work shall pause immediately within 100 feet of the find, or an agreed upon distance based on the project area and nature of the find. Work shall cease in and within the immediate vicinity of the find regardless of whether the construction is being actively monitored by a Tribal Monitor, cultural resources specialist, or professional archaeologist.

A Tribal Representative and the Placer County Community Development Resource Agency shall be immediately notified, and the Tribal Representative, in coordination with the Placer County Community Development Resource Agency, shall determine if the find is a TCR (PRC Section 21074) and the Tribal Representative shall make recommendations for further evaluation and treatment as necessary.

Treatment and Documentation:

The culturally affiliated Tribe shall consult with the Placer County Community Development Resource Agency to (1) identify the boundaries of the new TCR and (2) if feasible, identify appropriate preservation in place and avoidance measures, including redesign or adjustments to the existing construction process, and long-term management, or 3) if avoidance is infeasible, identify a reburial location in proximity of the find where no future disturbance is anticipated. Permanent curation of TCRs shall not take place unless approved in writing by the culturally affiliated Tribe.

The construction contractor(s) shall provide secure, on-site storage for culturally sensitive soils or objects that are components of TCRs that are found or recovered during construction. Only Tribal Representatives shall have access to the storage. Storage size shall be determined by the nature of the TCR and can range from a small lock box to a conex box (shipping container). A secure (locked), fenced area can also provide adequate on-site storage if larger amounts of material must be stored.

The construction contractor(s) and Placer County shall facilitate the respectful reburial of the culturally sensitive soils or objects. This includes providing a reburial location that is consistent with the Tribe's preferences, excavation of the reburial location, and assisting with the reburial, upon request.

Any discoveries shall be documented on a Department of Parks and Recreation (DPR) 523 form within two weeks of the discovery and submitted to the appropriate CHRIS center in a timely manner. The

DPR 523 forms shall be completed and submitted to the CHRIS center by the project archaeologist. If the project does not require an archaeologist, the DPR forms shall be completed and submitted to the CHRIS by the UAIC. If completed by the project archaeologist, the UAIC shall have an opportunity to review the completed forms.

Work at the TCR discovery location shall not resume until authorization is granted by the Placer County in coordination with the culturally affiliated Tribe.

If articulated or disarticulated human remains, or human remains in any state of decomposition or skeletal completeness, are discovered during construction activities, the Placer County Coroner and the culturally affiliated Tribe shall be contacted immediately. Upon determination by the Placer County Coroner that the find is Native American in origin, the Native American Heritage Commission will assign the Most Likely Descendent who will work with the project proponent to define appropriate treatment and disposition of the burials.

- *17-1(b) The following language shall be noted on project Improvement Plans, subject to review and approval by the Placer County Community Development Resource Agency:*

  The project proponent or their construction contractor shall comply with the following measure to assist with identification of TCRs at the earliest possible time during project-related earthmoving activities:

  - *The project proponent shall contact the UAIC Tribal Historic Preservation Officer (THPO) (thpo@auburnrancheria.com) at least two months prior to project ground-disturbing activities to retain the services of a UAIC Certified Tribal Monitor(s). The duration of the construction schedule and Tribal Monitoring shall be determined at this time.*
  - *A contracted Tribal Monitor(s) shall monitor all ground disturbing activities (e.g., vegetation removal, grading, and/or other ground disturbing activities; note: fill activities are excluded from this requirement) in the mapped area and 50' buffer provided by the UAIC to the County on June 26, 2025 (confidential map provided to the County and subsequently to the applicant). All ground-disturbing activities in the mapped area provided by the UAIC to the County on June 26, 2025, shall be subject to Tribal Monitoring unless otherwise determined unnecessary by the UAIC.*

- *Specific to the off-site sewer lift station location, a contracted Tribal Monitor(s) shall monitor initial clearing and grubbing for the entire footprint of disturbance.*
- *Tribal Monitors or Tribal Representatives shall have the authority to direct that work be temporarily paused, diverted, or slowed within 100 feet of the immediate impact area if sites, cultural soils, or objects of potential significance are identified. The temporary pause/diversion shall be of an adequate duration for the Tribal Representative to examine the resource.*
- *Appropriate treatment of TCRs may include, but is not limited to:*

    A. *Recordation of the resource(s);*
    B. *Avoidance and preservation of the resource(s); and/or*
    C. *Recovery and reburial of the resource(s) onsite or in a feasible off-site location in a designated area subject to no future disturbance. The location of the reburial shall be acceptable to the UAIC.*

- *To track the implementation of this measure, the Tribal Monitor(s) shall document field-monitoring activities on a Tribal Monitor log.*
- *The Tribal Monitor(s) shall wear the appropriate safety equipment while on the construction site.*
- *The Tribal Monitor, in consultation with the UAIC THPO and the project proponent, shall determine a mutual end or reduction to the on-site monitoring if/when construction activities have a low potential for impacting TCRs.*
- *In the event the Tribal Monitor does not report to the job site at the scheduled time after receiving 24 hour business day notice, construction activities may proceed without tribal monitoring. At no time, regardless of the presence or absence of a Tribal Monitor, shall suspected TCRs be mishandled or disrespected.*
- *The County shall assist with resolution of disagreements between the project proponent/contractor and the Tribe if such occurs on the project.*

- *<u>17-1(c)</u> The following language shall be noted on Improvement Plans, subject to review and approval by the Placer County Community Development Resource Agency:*

    - *The Applicant/Contractor shall provide a Tribal Cultural Awareness and Sensitivity Training (training) for all personnel involved in project construction, including field consultants and construction workers, at their own expense. The training shall be developed in coordination with interested Native American Tribes.*

- *The training shall be conducted before any project-related construction activities begin at the project site. The training will include relevant information regarding sensitive cultural resources and tribal cultural resources, including applicable regulations, protocols for avoidance, and consequences of violating State laws and regulations. The training will also describe appropriate avoidance and impact minimization measures for cultural resources and tribal cultural resources that could be located at the project site and will outline what to do and who to contact if any potential cultural resources or tribal cultural resources are encountered. The training will emphasize the requirement for confidentiality and culturally appropriate treatment of any discovery of significance to Native Americans and will discuss appropriate behaviors and responsive actions, consistent with Native American tribal values. The training may be done in coordination with the project archaeologist.*
- *All ground-disturbing equipment operators shall be required to receive the training and sign a form that acknowledges receipt of the training.*

Off-Site Affordable Housing Parcel

8-4(b) Implement the following Mitigation Measure set forth in this EIR:

- *<u>8-2(d)</u> Implement RVSP EIR Mitigation Measure 7-1b if culturally significant materials are discovered during construction:*

  A qualified professional archaeologist shall be retained to conduct subsurface testing at potentially important known archaeological sites. As it has not been determined if the known sites within the Specific Plan Area are eligible for inclusion to either the NRHP or CRHR, subsurface testing (i.e., resource evaluation) should be initiated for sites when construction is to occur within 100 feet of the resource and where Mitigation Measure 7-1a [incorporated as Mitigation Measure 8-2(c) of this EIR] proves infeasible. Subsurface testing should also be implemented if culturally significant materials (i.e., unique archaeological resources or historical resources) are inadvertently exposed during construction.

  Subsurface testing procedures could involve shovel testing, augering, or other such techniques designed to identify and/or characterize subsurface archaeological deposits. If a resource is determined to be important under CEQA (i.e., because it is a unique archaeological resource or an historical resource), then Mitigation Measure 7-1c [incorporated as Mitigation Measure 8-2(e) of this EIR] must also be implemented.

8-4(c) Implement the following Mitigation Measure set forth in this EIR:

- *<u>8-2(e)</u> Implement RVSP EIR Mitigation Measure 7-1c if culturally significant materials are discovered during construction:*

  A qualified professional archaeologist shall be retained to conduct data recovery excavation. This mitigation measure will be implemented as an alternative to Mitigation Measures 7-1a [incorporated as Mitigation Measure 8-2(c) of this EIR] at cultural resource sites determined to be eligible for inclusion in either the NRHP or CRHR.

  In compliance with CEQA, implementation of this mitigation measure would entail preparation and adoption of a data recovery plan that makes provisions for adequately recovering the scientifically consequential information from and about the resource. The data recovery plan must be prepared and adopted prior to commencing any excavation activities.

8-4(d) *Implement the following Mitigation Measure set forth in this EIR:*

- *<u>8-3(d)</u> Implement RVSP EIR Mitigation Measure 7-2a if archeological or historical resources are discovered during construction:*

  In the event of the discovery of buried archaeological artifacts, exotic rock (non-native), or unusual amounts of shell or bone, it is recommended that project activities in the vicinity of the find be immediately stopped and a qualified professional archaeologist consulted to assess the resource and provide proper management recommendations. If the find is determined to be a historical or unique archaeological resource, contingency funding and a time allotment to allow for implementation of avoidance measures or appropriate mitigation shall be made available, as provided in Section 15064.5 of the CEQA Guidelines. In addition, the Placer County Planning Department and Department of Museums must also be contacted. Work in the area may only proceed after authorization is granted by the Placer County Planning Department. All construction and improvement plans for subsequent development within the Plan Area involving ground disturbance shall include these provisions. The archaeologist shall evaluate any potential effects on any historical resource or unique archaeological resource, and where such effects would be significant, shall recommend potential mitigation to the County for its consideration. The County will assess the feasibility of any proposed mitigation (e.g., avoidance of the historical resource) and impose the mitigation where feasible in light of factors such as the nature of the find, project design, costs, Specific Plan policies and land use assumptions, and other considerations. If avoidance is unnecessary or infeasible, other appropriate measures (e.g., data recovery) shall be instituted. Work may proceed on other parts of

the project site while mitigation for paleontological resources is carried out.

Cumulative Impacts and Mitigation Measures

As defined in Section 15355 of the CEQA Guidelines, "cumulative impacts" refers to two or more individual effects which, when considered together, are considerable, compound, or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects.

8-5 Cause a cumulative loss of cultural resources. Based on the analysis below, the cumulative impact is *less than significant*.

Generally, while some cultural resources may have regional significance, the resources themselves are site-specific, and impacts to them are project-specific. For example, impacts to a subsurface archeological find at one project site would not generally be made worse by impacts to a cultural resource at another site due to development of another project. Rather, the resources and the effects upon them are generally independent. A possible exception to the aforementioned general conditions would be where a cultural resource represents the last known example of its kind or is part of larger cultural resources such as a single building along an intact historic Main Street. For such a resource, cumulative impacts, and the contribution of a project to them, may be considered cumulatively significant.

As described throughout this chapter, one previously recorded site (P-31-000203) was mapped directly adjacent to the off-site sewer lift station improvements area. However, the intensive pedestrian survey completed for the Cultural and Paleontological Resources Assessment determined that P-31-000203 was not located within the off-site sewer lift station improvements area.

Furthermore, the project site does not contain known surface or subsurface cultural resources. Nevertheless, the possibility exists that previously unknown resources could be discovered within the project site, off-site sewer lift station improvements area, or the off-site affordable housing parcel during construction activities. Such subsurface cultural resources could prove after inspection and analysis to be either unique archaeological resources or historical resources of an archaeological nature, or both. However, implementation of the project-specific mitigation measures set forth in this EIR (Mitigation Measures 8-2[a] through 8-2[e], 8-3[a] and 8-3[b], and 8-4[a]) would ensure that any impacts to known and previously unknown subsurface resources that are discovered on the project site, off-site sewer lift station improvements area, and off-site affordable housing parcel during construction activities are reduced to less than significant.

Similar to the proposed project, future development projects within the DCWPCP would be required to implement project-specific mitigation to ensure any potential impacts to identified cultural resources are reduced to a less-than-significant level, where feasible. Therefore, given that cultural resource impacts are generally site-specific and each future project within the DCWPCP would be required to mitigate any significant impacts as

feasible, any potential impacts associated with cumulative buildout of the DCWPCP area would not combine to result in a significant cumulative impact.

Conclusion

Based on the above, the potential for impacts related to a cumulative loss of cultural resources, to which implementation of the proposed project might contribute, is ***less than significant.***

Mitigation Measure(s)

None required.

9. ENERGY

9. ENERGY

9.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County for an approximately four-acre parcel off-site within the Riolo Vineyards Specific Plan (RVSP), which could develop a maximum of 120 affordable income-restricted units.

The Energy chapter of the EIR describes the potential impacts of the proposed project and off-site sewer lift station improvements area, as well as the off-site affordable housing parcel, related to energy. The chapter includes a discussion of the existing energy setting and potential impacts associated with energy use. This chapter is based primarily on the Placer County General Plan[1] (PCGP) and associated EIR,[2] the Dry Creek-West Placer Community Plan (DCWPCP),[3] the Placer County Sustainability Plan (PCSP),[4] the RVSP,[5] and the RVSP EIR.[6]

9.2 EXISTING ENVIRONMENTAL SETTING

The following section provides background information regarding the evaluation of energy impacts under CEQA, as well as an overview of the existing environmental setting in relation to energy consumption within the project area.

Overview of Energy Analyses Under CEQA

Energy use refers to the consumption of electricity, natural gas, propane, coal, or other fuel types in order to perform work. Public Resources Code Section 21100(b)(3) requires that EIRs prepared by state lead agencies shall include "[m]itigation measures proposed to minimize significant effects on the environment, including, but not limited to, measures to reduce the wasteful, inefficient, and unnecessary consumption of energy." Based on this language, CEQA Guidelines Section 15126.4(a)(1)(D), which applies to all lead agencies, provides that "[e]nergy conservation measures, as well as other appropriate mitigation measures, shall be discussed when relevant. Examples of energy conservation measures are provided in Appendix F." Subdivision (c)(2) of the same section, which focuses on mitigation for greenhouse gas (GHG) emissions, states that such measures may include "[r]eductions in emissions resulting from a project through implementation of project features, project design, or other measures, such as those described in Appendix F[.]" Appendix F (Energy Conservation), in turn, states that:

> The goal of conserving energy implies the wise and efficient use of energy. The means of achieving this goal include:
>
> 1) decreasing overall per capita energy consumption,
> 2) decreasing reliance on fossil fuels such as coal, natural gas and oil, and
> 3) increasing reliance on renewable energy sources.
>
> To assure that energy implications are considered in project decisions, the California Environmental Quality Act requires that EIRs include a discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful and unnecessary consumption of energy (see Public Resources Code Section 21100(b)(3)).

Accordingly, the fact that a proposed project uses energy resources would not necessarily result in a significant environmental impact. Rather, the question is whether the project would result in inefficient, wasteful, or unnecessary consumption of non-renewable energy resources.

The generation of electricity through non-renewable sources and the direct combustion of fuel is known to result in the emission of GHGs. As a result, energy use is closely related to GHGs and to automobile use. Refer to Chapter 6, Air Quality and Greenhouse Gas Emissions, and Chapter 16, Transportation, of this EIR for additional details related to GHG emissions and vehicle miles travelled (VMT). This chapter specifically focuses on the use of energy during construction (i.e., the use of diesel-fueled off-road equipment, emergency generators, heavy truck use for hauling materials, worker commutes, etc.) and operation of the proposed project (i.e., the combustion of natural gas for cooking appliances, fireplaces, and heating mechanisms, household electricity use, and energy use associated with resident vehicle trips). Natural gas use is typically considered in units of kilo-British thermal units (kBTU), and electricity use is typically referred to in units of kilowatt-hours (KWh).

Energy Use in California

California is one of the highest energy demanding states within the nation. According to the U.S. Department of Energy, the State consumes approximately 303,300 gigawatt-hours (GWh) of electricity per year.[7] Activities such as heating and cooling structures, lighting, the movement of goods, agricultural production, and other facets of daily life consume a variety of energy sources. However, despite California's overall high level of energy use, the State has one of the lowest per capita energy consumption levels in the U.S.

In 2024, California was the fourth-largest electricity producer in the nation.[8] Energy within the State is provided primarily to consumers through a mix of sources including natural gas, hydroelectric, non-hydroelectric renewable sources, nuclear, coal, and petroleum. California is the nation's top producer of electricity from solar, geothermal, and biomass energy. Renewable resources, including hydroelectric power and small-scale (less than one megawatt [MW]), customer-sited solar photovoltaic (PV) systems, accounted for 57 percent of California's in-state electricity generation; natural gas-fired power plants fueled another 35 percent of the State's energy generation, and nuclear power supplied almost all the rest.

8 U.S. Energy Information Administration. *California: State Profile and Energy Estimates*. Available at: https://www.eia.gov/state/index.php?sid=CA. Accessed December 2025.

Figure 9-1 presents the sources that are used to produce electricity in the State. As presented therein, energy is mostly generated from non-hydroelectric renewables (such as wind and solar), followed by natural gas combustion and hydroelectric. Figure 9-2 presents energy consumption within California for the most recent year for which data is available (2024).

As shown in the figure, transportation-related activity consumes the largest single share of energy within the State. The second largest consumer is the industrial sector, followed closely by the residential and commercial sectors.

Energy Use in Placer County

In the year 2024, Placer County consumed approximately 3,171 GWh, which constitutes approximately one percent of the total energy consumed within the State that year.[9] In 2020, the Placer County Board of Supervisors adopted the PCSP, which establishes goals and policies for energy efficiency.[10] As a result, the PCSP is considered the local plan for renewable energy and efficiency. However, the County first began programs to improve municipal building energy efficiency and resource conservation in 2005. For example, the Placer County Government Center Master Plan represents an effort to update the County's Dewitt Center. The Master Plan includes strategies for significant reductions in energy and water use, and efforts to reduce GHG emissions associated with commuting.

The Master Plan also calls for on-site housing and commercial uses, in addition to water efficiency improvements and efforts to reduce employee commute trips, and support for alternative fuel vehicles.

The County has also encouraged increases in electric vehicle (EV) infrastructure at four County buildings, supported greater use of battery electric and plug-in hybrid vehicles in the County fleet, and installed solar panels on County buildings in Auburn and Roseville. Placer County is also involved in the Middle Fork Project hydroelectric generations, which is discussed in further detail below.

Middle Fork Project

The Middle Fork Project is a multi-purpose water supply and hydro-generation project designed to conserve and control waters of the Middle Fork American River, the Rubicon River, and several associated tributary streams. The Middle Fork Project stores water from rain and snow during the fall and winter months and releases water all year to meet the water demands within western Placer County and to generate hydroelectric power for the California electrical grid.[11] The Placer County Water Agency, with Placer County as a partner, has operated the Middle Fork Project for over 50 years. Hydroelectric power from the Middle Fork Project has a combined generating capacity of approximately 224 MW, with an average of 1,030,000 MW-hours per year (MWh/yr).

* Figures not OCR Compatible

Energy Use at the Project Site

Electricity in the project area is currently provided by the Sacramento Municipal Utility District (SMUD), and natural gas is provided by Pacific Gas and Electric (PG&E).

The project site is generally undeveloped, consisting mainly of annual grasslands, with trees scattered throughout. Walerga Road runs through the center of the project site and the southern portion of the site contains an existing paved bicycle trail. Additionally, the off-site affordable housing parcel is generally undeveloped and consists of annual grasslands. The only energy utilized within any of the project improvements areas is the limited energy use at the existing Dry Creek/West Placer Community Facilities District (CFD) #1 lift station. Thus, the existing energy demand associated with the project site, off-site affordable housing parcel, and off-site sewer lift station improvements area is generally little to null.

9.3 REGULATORY CONTEXT

Energy consumption and generation is monitored and regulated through the efforts of various international, federal, State, and local government agencies. The agencies responsible for monitoring or reducing energy consumption are discussed below.

Federal Regulations

The following are the federal regulations relevant to energy.

Energy Policy and Conservation Act

The Energy Policy and Conservation Act (EPCA) was originally enacted in 1975 with the intention of ensuring that all vehicles sold in the U.S. meet established fuel economy standards. Part A of Title III of the EPCA established the Corporate Average Fuel Economy (CAFÉ) standards for automobiles. Following congressional establishment of the original set of fuel economy standards the U.S. Department of Transportation was tasked with establishing additional on-road vehicle standards and making revisions to standards as necessary. Compliance with established standards is based on manufacturer fleet average fuel economy, which originally applied to both passenger cars and light trucks but did not apply to heavy-duty vehicles exceeding 8,500 pounds in gross vehicle weight. The fuel economy program implemented under the Energy Policy and Conservation Act is known as CAFE Standards. Updates to the CAFE standards since original implementation have increased fuel economy requirements and began regulation of medium- and heavy-duty vehicles.

Part B of Title III of the EPCA established the Energy Conservation Program gives the Department of Energy the "authority to develop, revise, and implement minimum energy conservation standards for appliances and equipment." In early 2024, the Ninth Circuit Court of Appeals, in *California Restaurant Association v. City of Berkeley*, 89 F.4th 1094, held that EPCA preempted an ordinance enacted by the City of Berkeley prohibiting natural gas connections in new construction. The court reasoned that the ban effectively regulates the energy usage of natural gas fired products, some of which are regulated under the EPCA, because those products' "energy usage" would be reduced to zero in buildings subject to Berkeley's gas ban. EPCA, the court concluded, disallowed such an outcome.

Energy Policy Act of 2005

The Energy Policy Act of 2005 addressed energy production in the U.S. from various sources. In particular, the Energy Policy Act of 2005 included tax credits, loans, and grants for the

implementation of energy systems that would reduce GHG emissions related to energy production.

State Regulations

The primary State regulatory agencies governing energy consumption are the California Energy Commission (CEC) and the California Public Utilities Commission (CPUC).

The CEC, created by the Legislature in 1974, has seven major responsibilities: forecasting future energy needs; promoting energy efficiency and conservation by setting the State's appliance and building energy efficiency standards; supporting energy research that advances energy science and technology through research, development, and demonstration projects; developing renewable energy resources; advancing alternative and renewable transportation fuels and technologies; certifying thermal power plants 50 MW and larger; and planning for and directing State response to energy emergencies.[12]

The CPUC regulates privately owned electric, natural gas, telecommunications, water, railroad, rail transit, and passenger transportation companies. The CPUC is responsible for ensuring that customers have safe, reliable utility service and infrastructure at reasonable rates, regulating utility services, stimulating innovation, and promoting competitive markets.[13]

The State has adopted various regulations aimed at reducing energy consumption, increasing energy efficiency, and mandating sourcing requirements for electricity production. The following regulations are applicable to the proposed project and the off-site affordable housing parcel.

Building Energy

The following regulations relate to energy efficiency and energy use reductions in the built environment.

Title 24, Part 6

Title 24 of the California Code of Regulations (CCR), which is known as the California Building Standards Code (CBSC), was established in 1978 and serves to enhance and regulate California's building standards. While not initially promulgated to reduce GHG emissions, Part 6 of Title 24 specifically established Building Energy Efficiency Standards that are designed to ensure new and existing buildings in California achieve energy efficiency and preserve outdoor and indoor environmental quality. These energy efficiency standards are reviewed periodically, and revised if necessary, by the Building Standards Commission and CEC (Public Resources Code [PRC] Section 25402[b][1]). The regulations receive input from members of industry, as well as the public, with the goal of "reducing of wasteful, uneconomic, inefficient, or unnecessary consumption of energy" (PRC Section 25402). The regulations are scrutinized and analyzed for technological and economic feasibility (PRC Section 25402[d]) and cost effectiveness (PRC Sections 25402[b][2] and [b][3]). As a result, the standards save energy, increase electricity supply reliability, increase indoor comfort, avoid the need to construct new power plants, and help preserve the environment.

[12] California Energy Commission. *About the California Energy Commission*. Available at: http://www.energy.ca.gov/about. Accessed July 2025.
[13] California Public Utilities Commission. *California Public Utilities Commission*. Available at: https://www.cpuc.ca.gov/about-cpuc. Accessed July 2025.

The 2022 Title 24 standards are the applicable building energy efficiency standards and became effective on January 1, 2023. Compliance with the 2022 Title 24 Building Energy Efficiency Standards will reduce energy use and associated GHG emissions compared to structures built in compliance with the previous 2019 Title 24 standards.

Title 24, Part 11

In addition to the CEC's efforts, in 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (Part 11 of Title 24) is commonly referred to as CALGreen, and establishes minimum mandatory standards and voluntary standards pertaining to the planning and design of sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and interior air quality. The CALGreen standards took effect in January 2011 and instituted mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low-rise residential and State-owned buildings and schools and hospitals. The original CALGreen standards have been updated several times. The CALGreen 2022 standards, which are the current standards, improved upon the 2019 CALGreen standards, and went into effect on January 1, 2023. The 2022 CALGreen Code focuses on four key areas in newly constructed homes and businesses:[14]

- Encouraging electric heat pump technology for space and water heating, which consumes less energy and produces fewer emissions than gas-powered units.
- Establishing electric-ready requirements for single-family homes to position owners to use cleaner electric heating, cooking and electric vehicle (EV) charging options whenever they choose to adopt those technologies.
- Expanding solar PV system and battery storage standards to make clean energy available onsite and complement the state's progress toward a 100 percent clean electricity grid.
- Strengthening ventilation standards to improve indoor air quality.

The CALGreen standards also include voluntary efficiency measures that are provided at two tiers and implemented at the discretion of local agencies and applicants. According to Section A4.602 of Appendix A4 of the CALGreen Code, CALGreen's Tier 1 standards call for a 15 percent improvement in energy requirements, stricter water conservation, 65 percent diversion of construction and demolition waste, 10 percent recycled content in building materials, 20 percent permeable paving, 20 percent cement reduction, and cool/solar-reflective roofs. CALGreen's more rigorous Tier 2 standards call for a 30 percent improvement in energy requirements, stricter water conservation, 80 percent diversion of construction and demolition waste, 15 percent recycled content in building materials, 30 percent permeable paving, 25 percent cement reduction, and cool/solar-reflective roofs.

It should also be noted that the CALGreen standards include what is commonly called California's 2020 Solar Mandate, which requires all newly built homes to install solar photovoltaic systems. The mandate applies to "all low-rise residential occupancies including single-family homes, duplexes, garden apartments, and other housing types with three or fewer habitable stories." The mandate includes multi-family housing such as apartment buildings as long as the buildings are under three stories. Sizing requirements are based on the floor area of the home and the climate

[14] California Energy Commission. *2022 Building Energy Efficiency Standards for Residential and Nonresidential Buildings: For the 2022 Building Energy Efficiency Standards Title 24, Part 6, and Associated Administrative Regulations in Part 1.* Available at: https://www.energy.ca.gov/publications/2022/2022-building-energy-efficiency-standards-residential-and-nonresidential. Accessed June 2025.

zone. The solar panel systems must be sized to provide for the full annual energy usage of the home. Effective in January 2023, California's Solar Mandate also requires that all single-family homes be electric-ready. The CALGreen standards also include guidance for installing battery storage systems. The battery portion of the mandate currently only applies to select businesses.

Title 20

Title 20 of the CCR requires manufacturers of appliances to meet State and federal standards for energy and water efficiency. The CEC certifies an appliance based on a manufacturer's demonstration that the appliance meets the standards. New appliances regulated under Title 20 include refrigerators, refrigerator-freezers, and freezers; room air conditioners and room air-conditioning heat pumps; central air conditioners; spot air conditioners; vented gas space heaters; gas pool heaters; plumbing fittings and plumbing fixtures; fluorescent lamp ballasts; lamps; emergency lighting; traffic signal modules; dishwaters; clothes washers and dryers; cooking products; electric motors; low-voltage dry-type distribution transformers; power supplies; televisions and consumer audio and video equipment; and battery charger systems. Title 20 presents protocols for testing each type of appliance covered under the regulations, and appliances must meet the standards for energy performance, energy design, water performance, and water design. Title 20 contains three types of standards for appliances: federal and State standards for federally regulated appliances, State standards for federally regulated appliances, and State standards for non-federally regulated appliances.

Assembly Bill 1109

Enacted in 2007, Assembly Bill (AB) 1109 required the CEC to adopt minimum energy efficiency standards for general-purpose lighting to reduce electricity consumption by 50 percent for indoor residential lighting and by 25 percent for indoor commercial lighting.

Climate Change Scoping Plan

In 2008, the California Air Resources Board (CARB) approved the first Scoping Plan related to the reduction of GHG emissions, which includes several measures related to energy efficiency. The Scoping Plan included a mix of recommended strategies that combined direct regulations, market-based approaches, voluntary measures, policies, and other emission reduction programs calculated to meet the 2020 statewide GHG emission limit and initiate the transformations needed to achieve the State's long-range climate objectives. The key elements of the Scoping Plan related to building energy include the following:

1. Expanding and strengthening existing energy efficiency programs as well as building and appliance standards;
2. Achieving a statewide renewable energy mix of 33 percent;
3. Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system and caps sources contributing 85 percent of California's GHG emissions; and
4. Creating targeted fees, including a public goods charge on water use, fees on gases with a high global warming potential, and a fee to fund the administrative costs of the State's long-term commitment to AB 32 implementation.

In 2014, CARB approved the first update to the Scoping Plan. The *First Update to the Climate Change Scoping Plan: Building on the Framework* (First Update) defined the State's GHG emission reduction priorities for the next five years. The First Update recommended a mix of technologies in key economic sectors to reduce emissions through 2050, including energy

demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and the rapid market penetration of efficient and clean energy technologies.

In December 2017, CARB adopted California's *2017 Climate Change Scoping Plan* (2017 Scoping Plan). The 2017 Scoping Plan builds on the successful framework established in the initial Scoping Plan and First Update. Strategies within the 2017 Scoping Plan include implementing renewable energy and energy efficiency measures, increased stringency of the Low Carbon Fuel Standard (LCFS), measures identified in the Mobile Source and Freight Strategies, measures identified in the proposed Short-Lived Climate Pollutant Plan, and increased stringency of SB 375 targets (discussed in further detail below).

The most recent update to the Scoping Plan, the 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan Update) was adopted by the CARB in December 2022.[15] The 2022 Scoping Plan Update builds upon previous efforts to reduce GHG emissions and is designed to continue to shift the California economy away from dependence on fossil fuels. The 2022 Scoping Plan Update, the most comprehensive and far-reaching Scoping Plan developed to date, identifies a technologically feasible and cost-effective path to achieve carbon neutrality by 2045 while also assessing the progress California is making toward reducing its GHG emissions by at least 40 percent below 1990 levels by 2030, as called for in SB 32 and laid out in the 2017 Scoping Plan. The 2030 target is an interim but important step to the broader goal of deep decarbonization by 2045. The relatively longer path assessed in the Scoping Plan incorporates, coordinates, and leverages many existing and ongoing efforts to reduce GHGs and air pollution, while identifying new clean technologies and energy. Given the focus on carbon neutrality, the Scoping Plan also includes discussion for the first time of the Natural and Working Lands (NWL) sectors as both sources of emissions and carbon sinks.

The 2022 Scoping Plan Update lays out a path to achieve targets for carbon neutrality and reduce GHG emissions by 85 percent below 1990 levels by 2045, as directed by AB 1279. The actions and outcomes in the plan will achieve significant reductions in fossil fuel combustion by deploying clean technologies and fuels, further reductions in short-lived climate pollutants, support for sustainable development, increased action on NWL to reduce emissions and sequester carbon, and the capture and storage of carbon.

Transportation/Fuel Energy

The following regulations relate to fuel efficiency and energy use reductions in the transportation and motorized vehicle sector.

Assembly Bill 1493

In 2002 California adopted AB 1493, also known as the Pavley I standards, which required new passenger vehicles with model years 2009 to 2016 to meet more stringent fuel efficiency standards. Additional laws have extended these rules to cover vehicles from future model years.

Executive Order S-1-07

Executive Order (EO) S-1-07, otherwise known as the LCFS, was adopted in 2009 and requires transportation fuels such as gasoline and diesel sold within the state to be less carbon intensive.

[15] California Air Resources Board. *2022 Scoping Plan for Achieving Carbon Neutrality*. November 16, 2022.

These policies reduce emissions from on-road transportation and off-road equipment use in Placer County.

Executive Order B-16-12

EO B-16-12 (March 2012) required that State entities under the governor's direction and control support and facilitate the rapid commercialization of zero-emissions vehicles. The order directed CARB, CEC, CPUC, and other relevant agencies to work with the Plug-In Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to help achieve goals by 2015, 2020, and 2025. On a statewide basis, EO B-16-12 established a target reduction of GHG emissions from the transportation sector equaling 80 percent less than 1990 levels by 2050. EO B-16-12 did not apply to vehicles that have special performance requirements necessary for the protection of public safety and welfare.

Assembly Bill 1346

AB 1346 (October 2021) prohibits non-electric small off-road engines. Small off-road engines, which are used primarily in lawn and garden equipment, emit high levels of air pollutants and, in 2020, California daily criteria pollutant emissions from small off-road engines were higher than emissions from light-duty passenger cars. Thus, by January 1, 2024, regulations shall prohibit engine exhaust and evaporative emissions from new small off-road engines.

Executive Order N-79-20 and the Advanced Clean Cars II Program

EO N-79-20 (September 2020) directs the State to require that 100 percent of new passenger cars and light-duty trucks sold in California be zero-emission vehicles (ZEVs) by the year 2035. EO N-79-20 focuses on new vehicle sales for automakers, not existing cars and trucks already owned by California residents. The primary mechanism for achieving the ZEV target for passenger cars and light trucks is the Advanced Clean Cars II Program, which was approved by CARB in August 2022. The Advanced Clean Cars II Program (1) increased the stringency of the smog-causing criteria pollutant standards; (2) updated the ZEV regulation to require that 100 percent of new passenger vehicles meet zero-emission standards (including plug-in hybrids) by the 2035 model year, in compliance with EO N-79-20; and (3) established measures to ensure ZEV can provide enduring emission reductions. However, on May 22, 2025, the U.S. House of Representatives passed three Congressional Review Act (CRA) resolutions to rescind the U.S EPA's waiver for the Advanced Clean Cars II Program. The Senate passed all three resolutions on May 22, 2025, and President Donald Trump signed the CRA resolutions on June 12, 2025. Subsequently, a lawsuit has been filed by the State Attorney General on June 12, 2025 against the federal government's use of the CRA to upend California's clean vehicles program.[16] As such, the future enforceability of the Advanced Clean Cars II Program is currently unknown.

Senate Bill 500

SB 500 (September 2021) requires that, beginning January 1, 2030, to the extent allowed by federal law, any autonomous vehicle that is model year 2031 or later, has a gross vehicle weight rating of less than 8,501 pounds, and is equipped with Level 3, 4, or 5 automation (as defined by the International Society of Automotive Engineers) to be a zero-emission vehicle to be operated on California public roads.

[16] State of California Department of Justice. *California Will Not Waver in Defending Itself from Federal Overreach: Attorney General Bonta Sues Trump Administration for Attack on California's Clean Vehicles Program*. Available at: https://oag.ca.gov/news/press-releases/california-will-not-waver-defending-itself-federal-overreach-attorney-general. Accessed June 12, 2025.

Climate Change Scoping Plan

The key elements of CARB's 2022 Scoping Plan, as introduced above, related to transportation energy include the following:

1. Establishing targets for transportation-related GHG emissions for regions throughout California, and pursuing policies and incentives to achieve those targets; and
2. Adopting and implementing measures pursuant to existing State laws and policies, including California's clean car standards, goods movement measures, and the LCFS (17 CCR, Section 95480 et seq.).

Renewable Energy and Energy Procurement

The following regulation relates to the source of electricity provided to consumers within the State, as well as standards related to the generation of electricity within the State.

Renewable Portfolio Standard (RPS), Senate Bill 350, and Senate Bill 100

Established in 2002 under SB 1078, accelerated in 2006 under SB 107, and expanded in 2011 under SB 2, California's RPS is one of the most ambitious renewable energy standards in the country. The RPS program requires investor-owned utilities, electric service providers, and community choice aggregators to increase procurement from eligible renewable energy resources to 33 percent of total procurement by 2020.

Since the inception of the RPS program, the program has been extended and enhanced multiple times. In 2015, SB 350 extended the State's RPS program by requiring that publicly owned utilities procure 50 percent of their electricity from renewable energy sources by 2030. The requirements of SB 350 were expanded and intensified in 2018 through the adoption of SB 100, which mandated that all electricity generated within the State by publicly owned utilities be generated through carbon-free sources by 2045. In addition, SB 100 increased the previous renewable energy requirement for the year 2030 by 10 percent; thus, requiring that 60 percent of electricity generated by publicly owned utilities originate from renewable sources by the year 2030.

Local Regulations

The most prominent local regulations related to energy are established by the PCGP and the Placer County Sustainability Plan which are discussed in further detail below.

Placer County General Plan

The PCGP includes several goals that directly relate to energy efficiency. Some goals, however, have the indirect benefit of improving energy efficiency. For example, goals and policies related to the efficacy of the multi-modal transportation system would also affect fuel consumption and, thus, County-wide transportation energy resources. The following goals and policies related to energy, either directly or indirectly, are from the PCGP:

Natural Resources Element

Goal 6.F To protect and improve air quality in Placer County.

Policy 6.F.5 The County shall encourage project proponents to consult early in the planning process with the County regarding the applicability of Countywide indirect and areawide source programs and transportation control measures (TCM) programs. Project review

shall also address energy-efficient building and site designs and proper storage, use, and disposal of hazardous materials.

Goal 6.G To integrate air quality planning with the land use and transportation planning process.

Policy 6.G.3 The County shall encourage the use of alternative modes of transportation by incorporating public transit, bicycle, and pedestrian modes in County transportation planning and by requiring new development to provide adequate pedestrian and bikeway facilities.

Policy 6.G.5 The County shall endeavor to secure adequate funding for transit services so that transit is a viable transportation alternative. New development shall pay its fair share of the cost of transit equipment and facilities required to serve new projects.

Policy 6.G.6 The County shall require large new developments to dedicate land for and construct appropriate improvements for park-and-ride lots, if suitably located.

Transportation and Circulation Element

Goal 3.C To maximize the efficient use of transportation facilities so as to: 1) reduce travel demand on the County's roadway system; 2) reduce the amount of investment required in new or expanded facilities; 3) reduce the quantity of emissions of pollutants from automobiles; and 4) increase the energy-efficiency of the transportation system.

Policy 3.C.1 The County shall promote the use of transportation systems management (TSM) programs that divert automobile commute trips to transit, walking, and bicycling.

Policy 3.C.2 The County shall promote the use, by both the public and private sectors, of TSM programs that increase the average occupancy of vehicles.

Policy 3.C.3 The County shall work with other responsible agencies to develop other measures to reduce vehicular travel demand and meet air quality goals.

Policy 3.C.4 During the development review process, the County shall require that proposed projects meet adopted Trip Reduction Ordinance (TRO) requirements.

Goal 3.D To provide a safe, comprehensive, and integrated system of facilities for non-motorized transportation.

Policy 3.D.5 The County shall continue to require developers to finance and install pedestrian walkways, equestrian trails, and multi-purpose paths in new development, as appropriate.

Policy 3.D.9 Consider Complete Streets infrastructure and design features in street design and construction to create safe and inviting environments for all users consistent with the land uses to be served.

Dry Creek-West Placer Community Plan

The following goal and policies related to energy are from the Community Development Element of the DCWPCP:

Community Development Element: Population and Housing

Goal Provide safe, innovative and energy efficient residential developments.

Policy 3 Encourage the use of passive and direct solar collection and incorporate home design innovations which limit energy consumption.

Community Development Element: The Land Use Plan

Policy 27 Promote energy and resource conservation in any future land development project especially through consideration of alternative energy sources (i.e. passive solar collection) or state of the art energy and water conservation measures.

Placer County Sustainability Plan

The PCSP is a planning document that outlines the programs and policies that are recommended for implementation by the community and the County to achieve the most significant GHG emission reductions in unincorporated County. Implementation of the PCSP is intended to help achieve multiple community-wide goals, such as lowering energy costs, reducing air and water pollution, supporting local economic development, and improving public health and quality of life within Placer County. Strategies from the PCSP related to energy use that would apply to the proposed project and the off-site affordable housing parcel include the following:

Strategy E-1. Facilitate a transition to electricity as the primary energy source for residential, mixed-use, commercial, and office buildings.

Strategy E-4. Encourage new residential, office, and commercial development, as mitigation for discretionary projects exceeding applicable CEQA GHG thresholds, to implement CALGreen Tier 1 standards and accelerate Zero Net Energy (ZNE) in new construction.

Strategy E-15. Incentivize new homes to install renewable energy generation and energy storage systems that can fully supply the home's energy needs, in cases where the required size of the renewable energy system is insufficient to fully meet on-site demand.

Strategy E-18. Encourage electrical customers to participate in demand-reduction programs.

Strategy OR-1. Promote use of hybrid and alternative fuel construction equipment for new developments and significant retrofits.

Strategy OR-2. Encourage property owners and landscaping companies to adopt the use of hybrid and alternative-fuel landscaping equipment and promote the availability of incentive programs for new efficient landscaping equipment.

Strategy T-1. Facilitate the installation of public electric vehicle (EV) charging stations at existing and new residential and non-residential uses.

Strategy T-3. Encourage new development to provide a mix of land uses and to be located contiguous to existing developed areas and infrastructure to support connectivity and to reduce trip lengths.

Strategy T-10. Promote infill development that combines multiple land use types.

9.4 IMPACTS AND MITIGATION MEASURES

The standards of significance and methodology used to analyze and determine the proposed project's potential project-specific impacts related to energy are described below. In addition, a discussion of the project's impacts, as well as mitigation measures where necessary, is also presented.

Standards of Significance

Based on Appendix G of the CEQA Guidelines, an impact related to energy is considered significant if the proposed project would:

- Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation; or
- Conflict with or obstruct a State or local plan for renewable energy or energy efficiency.

Method of Analysis

Quantitative thresholds for the analysis of potential impacts related to energy consumption have not been adopted by any local, regional, or statewide entities. Consequently, potential impacts of the project related to energy are determined based on whether the project would result in wasteful, inefficient, or unnecessary use of energy. In addition, the potential for the project to conflict with or obstruct a State or local plan for renewable energy generation or energy efficiency, such as the PCSP, is considered. The analysis of energy consumption includes consideration of energy demand during project construction and operations.

Project-Specific Impacts and Mitigation Measures

The following discussion of impacts is based on implementation of the proposed project and off-site sewer lift station improvements, as well as the two affordable housing options analyzed throughout this EIR, in comparison with the standards of significance identified above. In most cases, potential environmental impacts associated with the proposed project and the 22 on-site

accessory dwelling units (ADUs) would not differ. Thus, unless otherwise noted, the below analysis applies to both the proposed project and the on-site ADUs.

9-1 Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of the potential impacts related to the development of the proposed project, off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could potentially result in the wasteful, inefficient, or unnecessary consumption of energy resources during project construction.

Proposed Project, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

Construction of the proposed project and the off-site sewer lift station improvements area, as well as the potential future development of the off-site affordable housing parcel would involve on-site energy demand and consumption related to use of oil in the form of gasoline and diesel fuel for construction worker vehicle trips, hauling and materials delivery truck trips, and operation of off-road construction equipment. In addition, diesel-fueled portable generators may be necessary to provide additional electricity demands for temporary on-site lighting, welding, and for supplying energy to areas of the site where energy supply cannot be met via a hookup to the existing electricity grid. As such, construction of the proposed project and the off-site affordable housing parcel would result in a temporary increase in energy consumption in the area. As the project site and the off-site affordable housing parcel develop, operational electricity demand would become the dominant demand source. Operational electricity demand would be much greater than construction, and is discussed further under Impact 9-2, below.

One of the primary energy-consuming activities associated with construction of the proposed project, off-site sewer lift station improvements, and potential future development of the off-site affordable housing parcel would be the soil hauling associated with properly grading and leveling the project site, off-site sewer lift station improvements area, and the off-site affordable housing parcel. However, site grading and leveling are required components of safe building practices and, thus, the energy consumption associated with such would not be considered wasteful or unnecessary. Even during the most intense period of construction, due to the different types of construction activities (e.g., site preparation, grading, building construction), only portions of the 92.2-acre project site, two-acre off-site sewer lift station improvements area, and four-acre off-site affordable housing parcel would be disturbed at a time, with operation of construction equipment occurring at different locations on each site, rather than a single location. In addition, the entire construction phase of the proposed project, including the off-site sewer lift station improvements, is anticipated to occur over approximately 10 years, and potential future construction of the off-site affordable housing parcel is anticipated to occur separately from the proposed project over approximately one year. As a result, the increased energy demand associated with construction would take place for a limited amount of time compared to the operational lifetime of the proposed project and the off-site affordable housing parcel. Additionally, construction equipment would be used

intermittently over the duration of the construction period, and equipment use would be restricted to the allowable hours set forth in Placer County Code Section 9.36.030(A)(7).

Specific considerations related to electricity and oil demand during construction of the proposed project, off-site sewer lift station improvements, and the off-site affordable housing parcel are discussed below.

Electricity Demand During Construction

Typically, at construction sites, electricity from the existing grid is used to power portable and temporary lights or office trailers. Because grid electricity would be used primarily for steady sources such as lighting, not sudden, intermittent sources such as welding or other hand-held tools, the increase in electricity usage at the project site, off-site sewer lift station improvements area, and off-site affordable housing parcel during construction would not be expected to cause any substantial peaks in demand. Construction of the proposed project, off-site sewer lift station improvements, and potential future development of the off-site affordable housing parcel would result in temporary increases in electricity demand and would not cause a permanent or substantial increase in demand that would exceed the SMUD's demand projections or exceed the ability of SMUD's existing infrastructure to handle such an increase. Therefore, construction of the proposed project, off-site sewer lift station improvements, and potential future development of the off-site affordable housing parcel would not result in any significant impacts on local or regional electricity supplies, the need for additional capacity, or on peak or base period electricity demands. In addition, standards or regulations specific to construction-related electricity usage do not currently exist.

Oil Demand During Construction

Based on the estimated number of off-road equipment used during construction activities, as well as the estimated number of hauling trips, worker trips, and vendor trips that would occur during project construction, the proposed project, including the off-site sewer lift station improvements, is anticipated to result in the use of approximately 191,682 gallons of diesel and 158,374 gallons of gasoline during construction activities.

In addition, construction associated with future potential development of the off-site affordable housing parcel is anticipated to result in a net increase of 2,460 gallons of diesel and 9,017 gallons of gasoline during construction activities. Therefore, the proposed project and the off-site affordable housing parcel would result in a combined total of 191,582 gallons of diesel and 162,015 gallons of gasoline during construction activities.

Nonetheless, all construction equipment and operation thereof would be regulated pursuant to the CARB In-Use Off-Road Diesel Vehicle Regulation. The In-Use Off-Road Diesel Vehicle Regulation is intended to reduce emissions from in-use, off-road, heavy-duty diesel vehicles in California by imposing a five-minute limit on idling, requiring all vehicles to be reported to CARB, restricting the addition of older vehicles into fleets, and requiring fleets to reduce emissions by retiring, replacing, or repowering older engines, or installing exhaust retrofits. Furthermore, as a means of reducing emissions, construction vehicles are required to become cleaner by using renewable energy resources. Engine tiers are used to describe the emissions intensity and efficiency of an engine. Construction equipment with Tier 0 or Tier 1 engines are the least efficient, and Tier 4 is the most efficient. In November 2021, the CARB began developing standards for Tier 5 engines.

All fleets are currently prohibited from adding Tier 0, Tier 1, or Tier 2 vehicles to the fleet. In addition, starting January 1, 2024, fleets with a total horsepower over 2,501, excluding non-profit training centers, may not add any Tier 3 or Tier 4 Interim vehicles.[17] The In-Use Off-Road Diesel Vehicle Regulation would, therefore, help to improve fuel efficiency for equipment used in construction of the proposed project, off-site sewer lift station improvements, and potential future development of the off-site affordable housing parcel.

The CARB enforces off-road equipment regulations through their reporting system, Diesel Off-road Online Reporting System (DOORS). Each construction fleet is required to update their DOORS account within 30 days of buying or selling a vehicle, and DOORS automatically calculates the fleet average index for each fleet. The fleet average index is an indicator of a fleet's overall emission rate, and is based on each vehicle's engine horsepower and model year, and whether it is equipped with a Verified Diesel Emission Control Strategy (VDECS). If a fleet cannot, or the entity or person who controls it does not want to, meet the fleet average target in a given year, the fleet operator may instead choose to comply with the Best Available Control Technology (BACT) requirements. A fleet may meet the BACT requirements each year by turning over or installing VDECS on a certain percentage of its total fleet horsepower. 'Turnover' means retiring a vehicle, designating a vehicle as permanent low-use (a vehicle used less than 200 hours per year), repowering a vehicle with a higher tier engine, or rebuilding the engine to a more stringent emission standard. By each compliance date (annually on January 1st), the fleet must either show that its fleet average index was less than or equal to the calculated fleet average target rate, or that the fleet has met the BACT requirements.[18] The proposed project, off-site sewer lift station improvements, and potential future development of the off-site affordable housing parcel would be required to comply with such regulations, which would ensure that construction equipment meets all State efficiency requirements.

Technological innovations and more stringent standards are being researched, such as multi-function equipment, hybrid equipment, or other design changes, which could help to further reduce demand on oil and limit emissions associated with construction. Over time, as technology progresses and more stringent emissions standards are put in place, construction equipment engines become increasingly efficient. Project construction would also be required to comply with all applicable Placer County Air Pollution Control District (PCAPCD) rules and regulations, which are indirectly related to energy efficiency, and would help to further reduce energy use associated with the proposed project, off-site sewer lift station improvements, and potential future development of the off-site affordable housing parcel. Refer to Chapter 6, Air Quality and Greenhouse Gas Emissions, for a complete list of the applicable PCAPCD rules and regulations.

Conclusion

Based on the above, the temporary increase in energy use occurring during construction of the proposed project, off-site sewer lift station improvements, and the potential future construction of the off-site affordable housing parcel would not result in a significant increase in peak or base demands or require additional capacity from local or regional energy supplies. In addition, the proposed project, off-site sewer lift station improvements,

[17] California Air Resources Board. *Amendments to the In-Use Off-Road Diesel-Fueled Fleets Regulation*. August 29, 2023.

[18] California Air Resources Board. *Frequently Asked Questions, Regulation for In-Use Off-Road Diesel-Fueled Fleets (Off-Road Regulation)*. August 2014.

and the off-site affordable housing parcel would be required to comply with all applicable regulations related to energy conservation and fuel efficiency, as discussed above, which would help to reduce the temporary increase in demand. Therefore, construction of the proposed project, off-site sewer lift station improvements, and the potential future construction of the off-site affordable housing parcel would not result in wasteful, inefficient, or unnecessary consumption of energy resources, and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

9-2 Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project operations. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of the potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as potential future development of the off-site affordable housing parcel, which could result in the wasteful, inefficient, or unnecessary consumption of energy resources during project operations.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

The proposed off-site sewer lift station improvements are related to providing additional floodwater storage capacity, and would not result in a substantial increase in operational energy usage. Therefore, the below discussion focuses on operational energy usage associated with the proposed project.

Energy use associated with operation of the proposed project would be typical of residential uses, requiring electricity for interior and exterior building lighting, heating, ventilation, and air conditioning (HVAC) systems, electronic equipment, machinery, refrigeration, appliances, security systems, and more. Maintenance activities during operations, such as landscape maintenance, would involve the use of electric or gas-powered equipment. In addition to on-site energy use, the proposed project would result in transportation energy use associated with vehicle trips generated by the proposed single-family residences. Building energy use and transportation energy use for the proposed project are discussed separately below.

Building Energy Demand

The proposed project is required to comply with all applicable standards and regulations regarding energy conservation and fuel efficiency, including the CBSC and CARB standards, which would ensure that the future uses would be designed to be energy efficient to the maximum extent practicable. Adherence to the most recent CALGreen Code and the Building Energy Efficiency Standards would ensure that the proposed development would consume energy efficiently through the incorporation of such features as efficient water heating systems, high performance attics and walls, and high efficacy lighting. In addition, the 2022 CBSC requires that newly constructed residential buildings be developed to include a solar PV system. Therefore, a portion of the electricity demand associated with the proposed project would be met by on-site renewable energy.

State regulations promote the generation of renewable energy and encourage energy efficiency through requirements placed on utility providers and strict development standards. For instance, the RPS require utilities, including SMUD, to procure an increasing proportion of electricity from renewable sources. Ultimately the RPS requirements mandate that all electricity produced within the State be renewably sourced by the year 2045. Based on the air quality modeling prepared for the proposed project (refer to Chapter 6, Air Quality and Greenhouse Gas Emissions for additional detail), the proposed project is anticipated to result in increased electricity consumption of approximately 3.30 GWh annually during operations. Compared to the electricity consumption for all of Placer County, the proposed project's contribution would represent a 0.11 percent increase in electricity demand. Although the proposed project would increase electricity demand in the project area, the increased demand is not anticipated to conflict with SMUD's ability to meet the RPS requirements. In fact, SMUD intends to generate 100 percent of their electricity through renewable sources by 2030, which exceeds the requirements established by the RPS.

Natural gas would be provided to the proposed project by PG&E. The proposed project could include natural gas stovetops, heating mechanisms, and other appliances. Based on the air quality modeling prepared for the proposed project, the proposed project is anticipated to result in an annual natural gas consumption of approximately 12,062 million British Thermal Units (mBTU). However, increased energy and natural gas demand does not necessarily mean that a project would have an impact related to energy resources. Based on Appendix F of the CEQA Guidelines, a project would result in an impact related to energy resources if a project would result in the inefficient use or waste of energy. As stated above, any natural gas appliances would be required to comply with the efficiency standards set forth in the CBSC, and the provision of natural gas appliances would not conflict or obstruct with any State or local plans related to renewable energy. Notably, moreover, federal law does not permit the County, as ad hoc mitigation imposed on an individual development project, to prohibit the use of natural gas, as explained in the earlier discussion of the Energy Policy and Conservation Act (EPCA) and the Ninth Circuit Court of Appeal's decision *California Restaurant Association v. City of Berkeley,* 89 F.4th 1094. That court in that case explained that "EPCA preempts regulations that relate to 'the quantity of [natural gas] directly consumed by' certain consumer appliances at the place where those products are used. Right off the bat, we know that EPCA is concerned with the end-user's ability to use installed covered products at their intended final destinations. After all, a regulation that prohibits consumers from using appliances necessarily impacts the 'quantity of energy directly consumed by [the appliances] at point of use.' So, by its plain language, EPCA preempts Berkeley's regulation here because it prohibits the installation of necessary natural gas infrastructure on premises where covered natural gas appliances are used." (89 F.4th at pp. 1101-1102.)

With regard to landscaping and maintenance equipment, AB 1346 requires that all small off-road engines sold after January 1, 2024, be all-electric. By the time the proposed project is operational, a reasonable assumption can be made that at least a portion of the landscaping and maintenance equipment that would be used on-site would be electric. Given that electricity from SMUD is partially generated from renewable sources, the use of electric landscaping and maintenance equipment would be considered more energy efficient than diesel- or gas-powered landscaping and maintenance equipment.

Overall, the aforementioned requirements, especially including the requirement that new residential structures include on-site solar systems, would help to reduce building energy demand associated with the proposed project such that the proposed project would not result in wasteful, inefficient, or unnecessary consumption of energy resources during project operations associated with building energy demand.

Transportation Energy Demand

The average fuel economy for the U.S. passenger vehicle fleet was 24.7 miles per gallon (mpg) in 2023, the most recent year such data is available.[19] In addition, petroleum refineries in the U.S. typically produce approximately 20 gallons of gasoline from one 42-gallon barrel of crude oil. Using an average of 24.7 mpg and an annual VMT of approximately 8,701,491[20] for the proposed project, the proposed project is estimated to result in the consumption of approximately 17,403 barrels of petroleum a year related to gasoline. California is estimated to consume approximately 648 million barrels of petroleum per year.[21] Based on the annual consumption within the State, vehicle trips generated by the proposed project would result in an approximately 0.003 percent increase in the State's current consumption of gasoline.

The calculation above is likely an overestimate, as the estimate does not account for future project residents who already own vehicles and are currently driving, or the increasing ownership of electric vehicles. California leads the nation in registered alternatively-fueled and hybrid vehicles. In fact, under EO N-79-20 and the Advanced Clean Car II Program, the State has required that, to the extent allowed by federal law, all cars sold shall be zero-emission/electric vehicles starting in the year 2035. However, as discussed in the Regulatory Context section of this chapter, the future enforceability of the Advanced Clean Cars II Program is currently unknown as of the date of this EIR.

In addition, State-specific regulations encourage fuel efficiency and reduction of dependence on oil. Improvements in vehicle efficiency and fuel economy standards help to reduce consumption of gasoline and reduce the State's dependence on petroleum products. The 2022 CBSC also requires new developments to include the necessary electrical infrastructure for EV charging stations. Based on the above, the actual consumption of gasoline associated with the proposed project is anticipated to be even lower than the estimated 0.003 percent statewide contribution noted above.

Furthermore, a portion of the trips associated with the proposed project would not necessarily be new trips. Rather, some trips would be redistributed as residents from other areas relocate to the project site. As such, energy consumption associated with project VMT would not be unique to the proposed project.

The vehicles associated with the proposed project would be required to comply with all applicable regulations associated with vehicle efficiency and fuel economy. In addition, the proposed project would include off-site roadway improvements, such as the

[19] U.S. Energy Information Administration. *Total Energy, Table 1.8 Motor Vehicle Mileage, Fuel Consumption, and Fuel Economy*. Available at: https://www.eia.gov/totalenergy/data/browser/?tbl=T01.08#/?f=A&start=200001. Accessed July 2025.

[20] The annual VMT estimate presented herein is based on VMT data provided by Kimley-Horn who prepared the Estia Dry Creek and Placer Creek Residential Vehicle Miles Traveled (VMT) Analysis.

[21] U.S. Energy Information Administration. *California: State Profile and Energy Estimates*. Available at: https://www.eia.gov/state/index.php?sid=CA. Accessed December 2025.

reconfiguration of Walerga Road to include two, seven-foot-wide bike lanes and a Class I trail or sidewalk. The aforementioned improvements would provide pedestrian and bicycle connectivity within the project site and to existing off-site facilities, thereby helping to encourage walking and driving, and reduce vehicle trips and associated transportation energy demand.

Off-Site Affordable Housing Parcel

Similar to the proposed project, energy use associated with operation of the future potential multi-family units on the off-site affordable housing parcel would be typical of residential uses, requiring electricity for interior and exterior building lighting, HVAC systems, electronic equipment, machinery, refrigeration, appliances, security systems, and more. Maintenance activities during operations, such as landscape maintenance, would involve the use of electric or gas-powered equipment. In addition to on-site energy use, the future potential development of the off-site affordable housing parcel would result in transportation energy use associated with vehicle trips generated by the proposed multi-family residences. Building energy use and transportation energy use for the off-site affordable housing parcel are discussed separately below.

Building Energy Demand

The projected electric energy use for the entire RVSP at buildout was estimated to be approximately 7,077 MWH/yr, which SMUD anticipates would not result in supply issues during operation of the RVSP. Therefore, the RVSP EIR concluded that buildout of the RVSP would result in a less-than-significant impact to the demand for electrical supply.

Additionally, the estimated demand for natural gas at buildout of the RVSP was estimated to be approximately 56,754 cubic feet per hour. PG&E would provide the natural gas supply and did not anticipate any supply issues. Therefore, the RVSP EIR concluded that buildout of the RVSP would result in a less-than-significant impact on the demand for natural gas supply.

The off-site affordable housing parcel is anticipated to result in a net increase in electricity consumption of approximately 0.37 GWh annually during operations. The off-site affordable housing parcel would represent 5.23 percent of the overall electricity demand associated with the buildout of the RVSP. The proposed project and the potential future development of the off-site affordable housing parcel would result in a combined total increase in electricity consumption of approximately 3.48 GWh during operation. Compared to the electricity consumption for all of Placer County, the proposed project's contribution would represent a 0.13 percent increase in electricity demand. The off-site affordable housing parcel development would be required to comply with the CBSC standards and requirements.

The off-site affordable housing parcel is anticipated to result in a net annual natural gas consumption of approximately 999 mBTU. Therefore, the proposed project and the potential future development of the off-site affordable housing parcel could result in a combined total annual natural gas consumption of approximately 12,421 mBTU. As discussed above, a project would result in an impact related to energy resources if a project would result in the inefficient use or waste of energy.

At such time the off-site affordable housing parcel gets developed, development of the parcel would be required to comply with the CBSC standards and the AB 1346 requirements, which would reduce building energy demand. Therefore, the incorporation of the aforementioned standards and regulations would ensure that operation of the off-site affordable housing parcel would not result in a wasteful, inefficient, or unnecessary consumption of energy resources associated with building energy demand.

Transportation Energy Demand

According to the CalEEMod modeling conducted for the off-site affordable housing parcel, the off-site affordable housing parcel could result in a net increase of annual VMT of an estimated 1,598,136. Operation of the off-site affordable housing parcel is estimated to result in the consumption of approximately 3,196 barrels of petroleum a year related to gasoline. Thus, the proposed project and the off-site affordable housing parcel could result in a combined total consumption of approximately 20,599 barrels of petroleum a year related to gasoline. As discussed above, the calculations would likely be an overestimate, as the estimate does not account for future project residents who already own vehicles and are currently driving, or the increasing ownership of electric vehicles. Additionally, future development of the off-site affordable housing parcel would be required to comply with all applicable regulations associated with vehicle efficiency and fuel economy described above, which would reduce vehicle trips and associated transportation energy demand.

Conclusion

Based on the above, the proposed project and the off-site affordable housing parcel would not be considered to result in a wasteful, inefficient, or unnecessary use of energy, and impacts related to operational energy would be considered ***less than significant***.

Mitigation Measure(s)

None required.

9-3 Conflict with or obstruct a State or local plan for renewable energy or energy efficiency. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project, off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel which could conflict with or obstruct a State or local plan for renewable energy or energy efficiency.

Proposed Project, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

As stated previously, the proposed project and the off-site sewer lift station improvements area, as well as the potential future development of the off-site affordable housing parcel, would be required to comply with all applicable State regulations related to renewable energy and energy efficiency, including, but not limited to, Title 24 and Title 20 of the CBSC, SB 1 related to solar energy systems and AB 1109 related to lighting efficiency.

The PCSP is considered the local plan for renewable energy and efficiency. The PCSP contains community-wide and municipal energy efficiency and GHG mitigation strategies that can be applied to discretionary projects, as feasible. Energy reduction strategies, which are prefaced by an "E", cover the topics of energy efficiency, energy conservation, and renewable energy for both residential and nonresidential buildings. Most strategies focus on reducing electricity and natural gas use, but a few strategies reduce emissions from other fuel use. Table 9-1, below, evaluates the proposed project's and the off-site affordable housing parcel's consistency with the strategies from the PCSP, as applicable.

As shown in Table 9-1, the proposed project and the off-site affordable housing parcel would comply with the majority of the suggested measures. For others, compliance is uncertain or infeasible due to the residential nature of the proposed project and the off-site affordable housing parcel, and the location of the project site and the off-site affordable housing parcel. Some strategies included in the PSCP, such as OR-2 and T-10, are considered supportive strategies to improve energy efficiency and reduce GHG emissions, and do not result in quantifiable reductions in GHG emissions or energy consumption. Additionally, the strategies set forth in the PCSP are not required to be implemented. In fact, the PCSP strategies are specifically recommended for discretionary projects when the applicable project-level GHG emission thresholds are exceeded.

Table 9-1
Project Consistency with the PCSP

Strategy	Consistency Discussion
Strategy E-1: Facilitate a transition to electricity as the primary energy source for residential, mixed-use, commercial, and office buildings.	The proposed project would be required to comply with the applicable State and local standards and regulations related to energy, such as the 2022 CBSC and CALGreen Code. Electricity is anticipated to be the primary source of energy. However, as previously discussed, natural gas appliances (i.e., stovetops, water heaters, etc.) are also allowed in Placer County and are protected by the federal EPCA, as explained earlier (see *California Restaurant Association v. City of Berkeley*, 89 F.4th 1094). Thus, the proposed project and the off-site affordable housing parcel may consume both electricity and natural gas and would comply with this strategy to the extent permitted by federal law.
Strategy E-4: Encourage new residential, office, and commercial development, as mitigation for discretionary projects exceeding applicable CEQA GHG thresholds, to implement CALGreen Tier 1 standards and accelerate ZNE in new construction.	Placer County does not require CALGreen Tier 1 standards. New single-family residential structures that are constructed with all electric appliances are expected to achieve ZNE. However, as discussed previously, natural gas appliances (i.e., stovetops, water heaters, etc.) are also allowed in Placer County and are protected by the federal EPCA (see *California Restaurant Association v. City of Berkeley*, 89 F.4th 1094). The proposed project and the off-site affordable housing parcel would not exceed applicable CEQA GHG thresholds and, thus, this strategy is not directly applicable to the proposed project or the off-site affordable housing parcel.

(Continues on next page)

Table 9-1
Project Consistency with the PCSP

Strategy	Consistency Discussion
Strategy E-15: Incentivize new homes to install renewable energy generation and energy storage systems that can fully supply the home's energy needs, in cases where the required size of the renewable energy system is insufficient to fully meet on-site demand.	The 2022 Building Energy Efficiency Standards require that all new residential structures, including single-family residential structures and multi-family residential structures of any height, include on-site solar systems. Therefore, the proposed project and the off-site affordable housing parcel would comply with this strategy.
Strategy E-18: Encourage electrical customers to participate in demand-reduction programs.	This strategy focuses on implementation at a County-wide level and is not directly applicable to the proposed project or the off-site affordable housing parcel.
Strategy OR-1: Promote use of hybrid and alternative fuel construction equipment for new developments and significant retrofits.	The project applicant has not committed to the use of hybrid or alternative construction equipment. Therefore, compliance with this strategy is uncertain at this time.
Strategy OR-2: Encourage property owners and landscaping companies to adopt the use of hybrid and alternative-fuel landscaping equipment and promote the availability of incentive programs for new efficient landscaping equipment.	Consistent with AB 1346, landscaping equipment used by property owners and landscaping companies would be required to be electric by the time the proposed project and the off-site affordable housing parcel are operational. Thus, the proposed project and off-site affordable housing parcel would comply with this strategy.
Strategy T-1: Facilitate the installation of public electric vehicle (EV) charging stations at existing and new residential and non-residential uses.	The CBSC requires that all new residential unit garages be designed with wiring sufficient to provide future installation of electric vehicle charging infrastructure. All proposed garages within the Estia Dry Creek multi-family residential site, as well as each single-family residence within the Placer Creek Residential site, would be EV ready. Therefore, private EV charging stations could be accommodated within the proposed project, should the homeowners choose to install EV chargers. Additionally, three public level 3 fast EV chargers would be provided on-site, one of which would be located at the Community Center, and two of which would be located within the community. Thus, the proposed project would comply with this strategy.
Strategy T-3: Encourage new development to provide a mix of land uses and to be located contiguous to existing developed areas and infrastructure to support connectivity and to reduce trip lengths.	The project site was planned for residential development as part of the DCWPCP. Additionally, the off-site affordable housing parcel was planned as commercial development as part of the RVSP; however, the applicant intends to rezone the parcel from commercial to residential multi-family. Thus, the proposed project and the off-site affordable housing parcel would site new residences in an area that is generally contiguous with existing residential development to the east, west, and south. Commercial uses are located in the project vicinity as well, north of the site.

(Continues on next page)

Table 9-1
Project Consistency with the PCSP

Strategy	Consistency Discussion
	With regard to trip lengths, and as discussed in further detail in Chapter 16, Transportation, the proposed project and the potential future development of the off-site affordable housing parcel would generate VMT per resident that is below the Countywide average. Thus, impacts related to VMT were determined to be less-than-significant for the proposed project and the development of the off-site affordable housing parcel. Based on the above, the proposed project and the off-site affordable housing parcel would generally comply with the intent of this strategy. However, given the nature of the proposed project and the off-site affordable housing parcel, the proposed project and the potential future development of the off-site affordable housing parcel would not include any mixed land uses.
Strategy T-10: Promote infill development that combines multiple land use types.	Although the project site and the off-site affordable housing parcel are not considered infill locations, each site is generally adjacent to existing development. Additionally, the project site and the off-site affordable housing parcel have been planned for development in the DCWPCP and the RVSP. As noted above, the proposed project and the off-site affordable housing parcel would not include multiple land use types. Different land use types exist in the project area, such as commercial and school uses.

Source: Placer County. Placer County Sustainability Plan: A Greenhouse Gas Emission Reduction Plan and Adaptation Strategy. January 28, 2020.

Under the PCSP, the County uses the PCAPCD's GHG thresholds to determine whether PCSP emission reduction measures are required. Because the proposed project's and the off-site affordable housing parcel's total operational GHG emissions would be below the applicable GHG thresholds (refer to Chapter 6, Air Quality and Greenhouse Gas Emissions), implementation of the efficiency strategies included in the PCSP is not required. Most importantly, implementation of the proposed project and the potential future construction of the off-site affordable housing parcel would not interfere with the goals established in the PCSP nor preclude future projects from complying with the suggested strategies.

Conclusion

Based on the above, the proposed project and the off-site affordable housing parcel would not conflict with or obstruct a State or local plan for renewable energy or energy efficiency, and the impact would be ***less than significant***.

Mitigation Measure(s)
None required.

Cumulative Impacts and Mitigation Measures

As defined in Section 15355 of the CEQA Guidelines, "cumulative impacts" refers to two or more individual effects which, when considered together, are considerable, compound, or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects.

A project's impacts related to energy use may be individually limited, but cumulatively considerable when taken in combination with past, present, and future development projects. The geographic context for the cumulative energy analysis includes the DCWPCP area. Additional details regarding the cumulative project setting can be found in Chapter 20, Statutorily Required Sections, of this EIR.

9-4 Result in cumulative energy impacts. Based on the analysis below, the cumulative impact is *less than significant*.

Impacts 9-1, 9-2, and 9-3 discuss the consumption of energy on a project-level associated with the proposed project, off-site sewer lift station improvements area, and off-site affordable housing parcel within the context of existing State plans and regulations, as well as local plans. As discussed previously, the proposed project and off-site sewer lift station improvements, as well as the potential future development of the off-site affordable housing parcel would involve consumption of diesel, gasoline, natural gas, and electricity throughout construction and operations. However, all proposed structures would be built in compliance with existing statewide mandatory energy efficiency standards, such as those contained in the California Building Energy Efficiency Standards and the CALGreen Code. Compliance with the energy efficiency standards would reduce the amount of electricity consumed by the proposed development. The standards include requirements that new residential structures include on-site photovoltaic solar power. State regulations would also help to reduce the amount of energy consumed by on-road vehicles over time. For instance, State and federal emissions standards and fuel economy standards result in increased fuel efficiency for on-road vehicles. In addition, although not required, the proposed project, including the off-site sewer lift station improvements and future potential development of the off-site affordable housing parcel would generally comply with the efficiency strategies set forth in the PCSP. Overall, as concluded above, the project would result in a less-than-significant impact related to the inefficient or wasteful use of energy or conflicting with a State or local plan for renewable energy or energy efficiency.

Similar to the proposed project, off-site sewer lift station improvements area, and off-site affordable housing parcel, all future development within the DCWPCP and the RVSP would be required to comply with applicable State and local regulations related to energy efficiency. Increased efficiency would be ensured in the future as cumulative development occurs due to compliance with the State's robust energy efficiency requirements. For example, the 2022 CBSC and the 2022 Building Energy Efficiency Standards require that newly constructed residential and non-residential buildings,

including grocery stores, offices, financial institutions, unleased tenant space, retail space, schools, warehouses, auditoriums, convention centers, hotel/motels, libraries, medical office building/clinics, and theaters install a solar PV system. Additionally, all future projects that exceed the PCAPCD's GHG thresholds of significance would be required to comply with the efficiency strategies included in the PCSP. Furthermore, energy efficiency regulations have been progressively more stringent over time. Thus, as cumulative development occurs under the increasingly stringent regulations, the energy use associated with such cumulative development is anticipated to be increasingly energy efficient over time as well.

Conclusion

Based on the above, implementation of the proposed project, off-site sewer lift station improvements, and the off-site affordable housing parcel, in combination with other cumulative development, would not result in the wasteful or inefficient use of energy on a cumulative basis and a ***less-than-significant*** cumulative impact would occur.

Mitigation Measure(s)

None required.

10. Geology and Soils

10. GEOLOGY AND SOILS

10.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County for an approximately four-acre parcel off-site within the Riolo Vineyards Specific Plan (RVSP), which could develop a maximum of 120 affordable income-restricted units.

The Geology and Soils chapter of the EIR describes the geologic and soil characteristics of the project site and off-site sewer lift station improvements area, as well as the off-site affordable housing parcel. In addition, the Geology and Soils chapter evaluates the extent to which implementation of the proposed project and either affordable housing option could be affected by unstable earth conditions and various geologic and geomorphic hazards. The chapter also evaluates any potentially adverse impacts on paleontological resources. The impact discussions and mitigation measures presented in each technical section apply to both the project site and the off-site sewer lift station improvements area, unless otherwise stated.

Information in this chapter is primarily drawn from the Geotechnical Due Diligence Review prepared by ENGEO (see Appendix E)[1] and the Cultural and Paleontological Resources Assessment prepared by Natural Investigations Company (NIC).[2] In addition, information was sourced from the Placer County General Plan (PCGP),[3] the PCGP EIR,[4] the Dry Creek-West Placer Community Plan (DCWPCP),[5] the RVSP,[6] and the RVSP EIR.[7]

10.2 EXISTING ENVIRONMENTAL SETTING

Background setting information regarding the geology, soils, seismicity, and paleontological resources associated with the project site, the off-site sewer lift station improvements area, the off-site affordable housing parcel, and the surrounding region is provided below.

Regional Setting

The project site and the off-site affordable housing parcel are located within the boundaries of the DCWPCP in Placer County, California. In addition, the off-site affordable housing parcel is located within the within the RVSP area within the DCWPCP. The DCWPCP and RVSP areas lie within

the eastern portion of the Sacramento Valley, which extends from Redding in the north to the Sacramento-San Joaquin Delta region in the south. The Sacramento Valley is bordered by the Coast Ranges to the west and the Sierra Nevada foothills to the east. The DCWPCP and RVSP areas also lie within the Central Valley, a large north-westward trending, asymmetric structural trough with a long, gently sloping eastern shelf underlain by the subsurface extension of the Sierran granitic rocks and a shorter more steeply sloping western margin where the basin sediments have been upturned and dip eastward back toward the valley axis. The Central Valley has been filled with more than 30,000 feet of sediment in the San Joaquin Valley and more than 50,000 feet of sediment in the Sacramento Valley derived primarily from erosion of the adjacent Sierra Nevada and Coast Range Mountains. The sediment ranges in age from the Jurassic to recent (approximately 210 to 1.6 million years old), while bedrock underlying the sediment are predominantly marine deposits of siltstone, claystone, and sandstone. The following section describes the geology and seismicity of the project region.

Regional Geology

The geology of the DCWPCP area is generally categorized by sedimentary or metasedimentary rocks.[8] Such underlying rock formations are primarily composed of alluvium, an unconsolidated sediment of relatively recent geologic age deposited by flowing water. The three general types of rocks found within the DCWPCP area fall into the following categories:

- Riverbank Formation – Pleistocene deposits of alluvium;
- Turlock Lake Formation – Pleistocene deposits of partially consolidated sand, silt, and gravel derived primarily from Sierran granitic and metamorphic rocks, generally found outside the Dry Creek floodplain; and
- Modesto-Riverbank Formation – Pleistocene deposits of alluvium generally found within the Dry Creek floodplain.

Regional Seismicity

A fault is defined as a fracture or zone of closely associated fractures along which rocks on one side have been displaced with respect to those on the other side. A fault zone is a zone of related faults that is commonly braided and subparallel, but may be branching or divergent. Movement within a fault causes an earthquake. When movement occurs along a fault, the energy generated is released as waves that cause ground shaking. Ground shaking intensity varies with the magnitude of the earthquake, the distance from the epicenter, and the type of rock or sediment the seismic waves move through.

The potential risk of fault rupture is based on the concept of recency and recurrence. The more recently a particular fault has ruptured, the more likely the fault would rupture again. The California Geological Survey defines an “active fault” as one that has had surface displacement within the past 11,000 years (Holocene). Potentially active faults are defined as those that have ruptured between 11,000 and 1.6 million years before the present (Quaternary). Faults are generally considered inactive if evidence of displacement is not present during the Quaternary. According to the California Department of Conservation, potentially active faults with Holocene-epoch surface displacement are not known to exist within the project region.[9]

[8] Placer County. *Dry Creek-West Placer Community Plan* [pgs. 101-102]. Amended May 12, 2009.
[9] California Department of Conservation. *Fault Activity Map of California.* Available at: https://maps.conservation.ca.gov/cgs/fam/. Accessed November 2025.

According to the PCGP, Placer County lies within a seismically active area of the western U.S., but beyond the influence of the highly active faults found along California's coast. The South Placer area is classified by the California Department of Conservation as a low-severity earthquake zone.[10] The western portion and central portions of the County are generally characterized by low seismicity, while the eastern area of the County in the vicinity of Lake Tahoe has relatively higher seismicity.[11] The areas of Placer County with the largest ground shaking risk are in the vicinity of Stampede Valley and Tahoe faults in the Truckee-Tahoe area.

Project Site Characteristics

The project site, including the areas which could potentially be developed with the 22 ADUs, consists of approximately 92.2 acres of undeveloped annual grassland located south of Baseline Road, immediately east of the abandoned old Walerga Road right-of-way (ROW), west of the Fiddyment Road/Baseline Road/Walerga Road intersection and the western portion of Sun Valley Oaks residential subdivision, and north of the Morgan Creek residential subdivision, within the DCWPCP of unincorporated Placer County. The project site is bisected by Walerga Road which generally curves from northeast to southwest. The 52.3-acre northern portion of the project site generally consists of undeveloped annual grassland with gently rolling topography, interspersed with seasonal wetlands and vernal pools. The 35.3-acre southern portion of the site includes a paved bicycle trail, but generally consists of undeveloped annual grassland with gently rolling topography, interspersed with seasonal wetlands, vernal pools, and is bisected by an un-named tributary of Dry Creek (named "Placer Creek" for this project). The Federal Emergency Management Agency (FEMA) 100-year floodplain, containing approximately 4.7 acres, is located within the Placer Creek tributary area and a band of oak woodlands is located along the Placer Creek riparian corridor. The project site is bound by Baseline Road to the north and Walerga Road to the west. Single-family developments are located to the east and south.

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include frontage improvements for the six-lane reconfiguration of Walerga Road and Baseline Road, and limited off-site improvements at the intersection of Baseline Road at Crowder Lane. In addition, potential off-site emergency wastewater storage improvements could be constructed at the existing Community Facility District #1 Sewer Lift Station in Dry Creek Community Park. Generally, the off-site sewer lift station improvements area and frontage improvement areas have been largely subject to past development. However, as discussed in Chapter 7, Biological Resources, of this EIR, the portion of the off-site sewer lift station improvements area north of Dry Creek Community Park is comprised of undeveloped land containing valley foothill riparian woodland (VFRW) and portions of intermittent tributary drainages of Dry Creek.

If dedication of the off-site affordable housing parcel is used to satisfy the project's affordable housing obligations, the parcel would be rezoned to Residential Multifamily 30, combining Design Scenic Corridor (RM30-Dc) zone, which could result in a maximum development potential of 120 affordable income-restricted units located within the RVSP. Specifically, the off-site affordable housing parcel consists of approximately four acres of undeveloped land with grassy fields and gently rolling topography located at the northeast corner of PFE Road and Watt Avenue (Assessor's Parcel Number [APN] 023-200-056-000).

[11] Placer County. *Countywide General Plan EIR* [pg. 9-1]. July 1994.

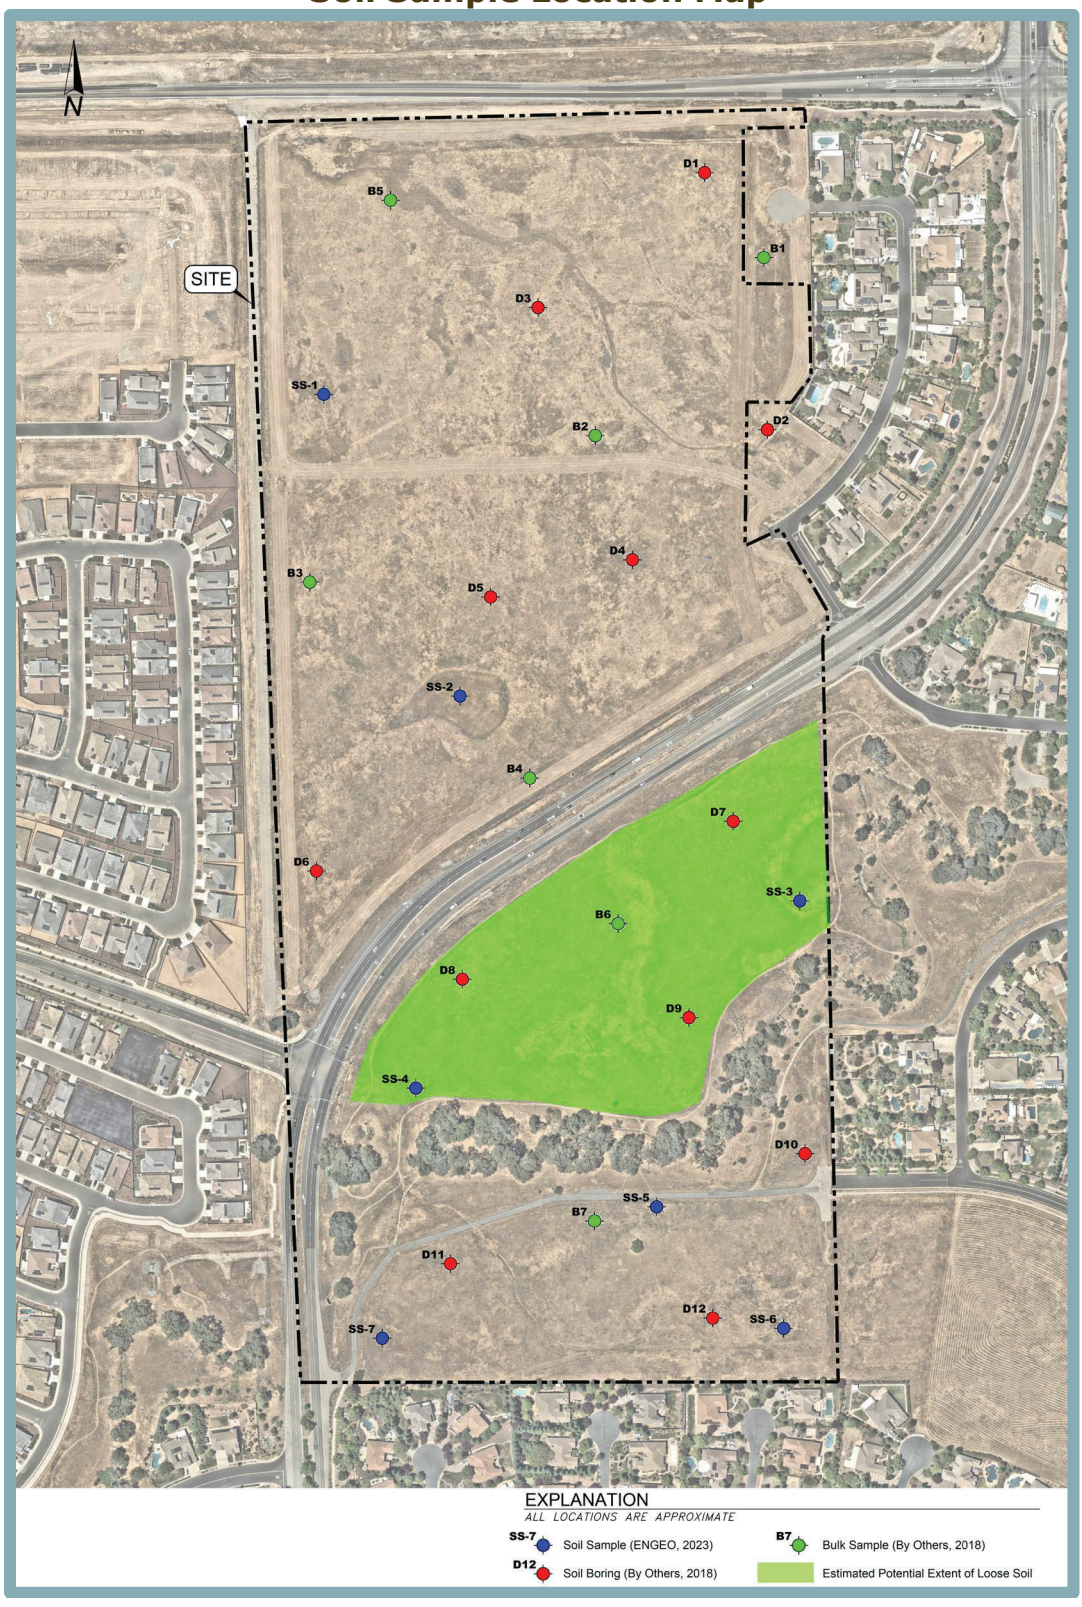
The geologic conditions on the project site, off-site sewer lift station improvements area, and the off-site affordable housing parcel are discussed below in further detail, including descriptions of existing site geology, subsurface soil conditions, seismicity and ground shaking, potential for earthquake-induced liquefaction, expansive soils, and groundwater conditions. In addition, a description of known paleontological resources within the project area is included below.

Site Geology

The project site, off-site sewer lift station improvements area, and off-site affordable housing parcel are located within the Great Valley geomorphic province, which is an alluvial plain that drains by way of the Sacramento and San Joaquin rivers into the San Francisco Bay area. According to the Geotechnical Due Diligence Review, the majority of the project site, and the project site vicinity where the off-site improvements would be located, are underlain by the Turlock Lake Formation and the Modesto Formation. Similarly, according to the RVSP EIR, the overall RVSP area, where the off-site affordable housing parcel is located, is underlain by the Turlock Lake Formation and the Modesto Formation. The Turlock Lake Formation consists of deeply weathered gravel, sand, and silt derived from the western slopes of the Sierra Nevada. The lower member of the Modesto Formation consists of unconsolidated, slightly weathered, tan to light gray alluvium composed of gravel, sand, silt, and clay derived from surrounding mountains.

Subsurface Soil Conditions

As part of the Geotechnical Due Diligence Review, ENGEO conducted a site reconnaissance and field sampling of the site on December 8, 2023. ENGEO observed the excavation and sampling of seven shallow soil samples (SS-1 through SS-7) (see Figure 10-1). In addition, Figure 10-1 provides the location of 12 soil borings and seven bulk soil samples conducted previously in 2018.



The shallow soil samples collected by ENGEO at the project site consisted of silty or clayey sand or sandy lean clay, which is generally consistent with the soil tests conducted during previous surveys. Subsurface soil conditions predominantly consist of silts, sands, and clays between four and eight feet in thickness underlain by medium dense to very dense sand and silty sand. Loose/disturbed clay, silt, and sand are present in the central portion of the site and the vicinity of Dry Creek, as discussed in further detail below.

According to the RVSP EIR, the RVSP area, including the off-site affordable housing parcel, is underlain by Fiddyment-Kaseberg loams. The Fiddyment soil is a well-drained soil that is moderately deep overlying a hardpan. The surface layer is composed of a light yellowish-brown loam and silt loam, which is about 12 inches thick. The subsoil is yellowish-brown and brown, dense clay loam. The Kaseberg soil is well-drained, shallow, and overlying a hardpan. The surface layer is light brownish-gray loam with yellowish-brown mottles and is about eight inches thick. The subsoil consists of light gray silt loam.[12]

According to the United States Department of Agriculture (USDA) Web Soil Survey, locations proposed for potential off-site improvements are similarly comprised of Fiddyment and Fiddyment-Kaseberg loams, as well as San Joaquin Cometa sandy loams, Cometa Ramona sandy loams, and Ramona sandy loam.[13] Furthermore, according to the DCWPCP EIR, the DCWPCP area consist of clay subsoils at shallow depths.

Figure 10-1
Soil Sample Location Map

* Figure not OCR Compatible

Seismicity and Ground Shaking

Fault rupture hazards are important near active faults and tend to recur along the surface traces of previous fault movements. Known faults do not extend across the project site, off-site sewer lift station improvements area, or the off-site affordable housing parcel. Similarly, the site, off-site sewer lift station improvements area, and the off-site affordable housing parcel are not located within an Alquist-Priolo Special Studies Zone.[14] Therefore, the potential for fault rupture, damage from fault displacement, or fault movement directly below the site is considered low. However, the site and off-site affordable housing parcel are located within an area where shaking from earthquake generated ground motion waves are considered likely.

Liquefaction

Liquefaction occurs when saturated fine-grained sands and/or silts lose physical strength temporarily during earthquake-induced shaking and behave as a liquid due to the loss of point-to-point grain contact and transfer of normal stress to the pore water. Liquefaction potential varies with water level, soil type, material gradation, relative density, and probable intensity and duration of ground shaking. The California Geologic Survey (CGS) has designated certain areas within California as potential liquefaction hazard zones, which are areas considered at risk of liquefaction-related ground failure during a seismic event based upon mapped surficial deposits and the depth to the areal groundwater table. The project site, off-site sewer lift station improvements area, and off-site affordable housing parcel are not currently mapped for potential liquefaction hazard by the CGS.[15] According to the Geotechnical Due Diligence Review, groundwater levels at the project site occur at depths of approximately 100 to 120 feet below ground surface (bgs) dependent on fluctuations in rainfall, irrigation practice, and other factors. Due to the absence of permanently elevated groundwater table, and the relatively low seismicity of the area, ENGEO concluded that the potential for seismically-induced damage due to liquefaction at the project site is considered low.

Expansive Soils

Expansive soils are characterized by their ability to undergo significant volume change due to variation in moisture content. Compressible materials consisting of surficial organic material, loose soils, undocumented fills, debris, rubble, rubbish, etc., are considered unsuitable materials for support of proposed structures as such materials have the potential to differentially settle. Changes in soil moisture content have the potential to result from rainfall, landscape irrigation, utility leakage, roof drainage, perched groundwater, drought, or other factors and may cause unacceptable settlement of structures. ENGEO encountered potentially expansive lean clay and clayey sand at shallow depths within the project site during the site reconnaissance. Laboratory testing conducted by ENGEO and previous on-site soil studies identified low to moderate shrink-swell potential with variations in moisture content within soil samples. Thus, ENGEO concluded that expansive clay layers may occur discontinuously on the project site. Similarly, according to the RVSP EIR, the potential for expansive soils in the off-site affordable housing parcel area is moderate.[16] According to the USDA web soil survey, the Plasticity Index (PI) for areas proposed for potential off-site improvements range from 2.5 to five percent and, thus, the potential for expansive soil in such areas is low.[17]

---

[14] California Department of Conservation. *California Earthquake Hazards Zone Application*. Available at: https://maps.conservation.ca.gov/cgs/EQZApp/app/. Accessed October 2025.

[15] *Ibid*.

[16] Placer County. *Riolo Vineyard Specific Plan EIR* [pg. 12-19]. January 2008.

[17] United States Department of Agriculture, Natural Resources Conservation Service. *Web Soil Survey*. Available at: https://websoilsurvey.nrcs.usda.gov/app/WebSoilSurvey.aspx. Accessed November 2025.

Loose Surficial Soils

According to ENGEO, portions of the site appear to have been disced and the upper approximately 0.5 to one foot of soil appears to consist of loose/disturbed clay, silt, and sand. In addition, previous soil explorations indicate that portions of the site are underlain by between approximately four and eight feet of loose soil. As shown in Figure 10-1 (green area), borings D7, D8, and D9 encountered such loose surficial soil horizons that were markedly less dense than at the other portions of the site.

Groundwater

According to ENGEO, groundwater has not been encountered during previous site studies. As part of the Geotechnical Due Diligence Review, ENGEO reviewed the Sustainable Groundwater Management Act (SGMA) Data Viewer Database to assess local groundwater levels. Groundwater levels at the project site occur at depths of approximately 100 to 120 feet bgs. Specifically, the SGMA Data Viewer plotted groundwater contours that indicated groundwater in the vicinity occurred at depths of 110 to 120 feet in fall 2021 and 100 to 110 feet in spring 2022. Fluctuations in the level of groundwater may occur due to variations in rainfall, irrigation practice, and other factors not evident at the time measurements were made. Similarly, according to the RVSP EIR, the depth to groundwater in the off-site affordable housing parcel area is approximately 100 feet bgs.[18] According to the DCWPCP EIR, the depth to groundwater throughout the DCWPCP area, including areas where off-site improvements would occur, is 70 to 90 feet bgs.

Paleontological Resources

Paleontological resources are limited, non-renewable resources of scientific, cultural, and educational value that are explicitly afforded protection by CEQA. A search of the paleontological records in the University of California Museum of Paleontology (UCMP) database was conducted by NIC on March 25, 2025, to locate potential fossils documented within the project site and the surrounding area.[19] The UCMP database indicates that four fossil localities recorded within Placer County have produced vertebrate fossils. A locality near Rocklin, approximately eight miles northeast of the proposed project, yielded a Pleistocene-age mastodon from the Mehrten Formation, while a locality near Lincoln, a City located approximately 6.68 miles northeast of the project site, produced three Tertiary-age vertebrates, a bony fish, a mammal, and a reptile. A cartilaginous fish from the Cretaceous was recovered from the third locality of the Chico Formation. The remaining localities in Placer County recorded in the UCMP database have produced plant and invertebrate specimens. According to NIC, the aforementioned geologic rock units do not occur in the project area and UCMP records did not identify paleontological resources from the Turlock Lake Formation in Placer County. Overall, NIC concluded that, based on Society of Vertebrate Paleontology (SVP) criteria, the sensitivity for paleontological resources on the project site is low. Because the off-site sewer lift station improvements area and off-site affordable housing parcel are located within two miles of the project site, and are underlain by similar soil formations, the sensitivity for paleontological resources on the off-site sewer lift station improvements area and off-site affordable housing parcel are also considered low. Furthermore, because the proposed off-site improvements would occur within existing ROWs and other previously developed areas, surface-level paleontological resources located in the off-site sewer lift station improvements area would likely have been previously encountered.

10.3 REGULATORY CONTEXT

The following section is a brief summary of the regulatory context under which soils, geology, seismic hazards, and paleontological resources are managed at the federal, State, and local levels.

Federal Regulations

The following are the federal environmental laws and policies relevant to soils, geology, seismic hazards, and paleontological resources.

Federal Earthquake Hazards Reduction Act

Passed by Congress in 1977, the Federal Earthquake Hazards Reduction Act is intended to reduce the risks to life and property from future earthquakes. The Federal Earthquake Hazards Reduction Act established the National Earthquake Hazards Reduction Program (NEHRP). The goals of NEHRP are to educate and improve the knowledge base for predicting seismic hazards, improve land use practices and building codes, and to reduce earthquake hazards through improved design and construction techniques.

International Building Code

The Uniform Building Code (UBC) was first published in 1927 by the International Council of Building Officials and is intended to promote public safety and provide standardized requirements for safe construction. The UBC was replaced in 2000 by the new International Building Code (IBC), published by the International Code Council (ICC), which is a merger of the International Council of Building Officials' UBC, Building Officials and Code Administrators International's National Building Code, and the Southern Building Code Congress International's Standard Building Code. The intention of the IBC is to provide consistent standards for safe construction and eliminate any differences between the three preceding codes. All State building standard codes are based on the federal building codes.

State Regulations

The following are the State environmental laws and policies relevant to soils, geology, seismic hazards, and paleontological resources. Please see Section 12.3 Regulatory Setting in Chapter 12, Hydrology and Water Quality, of this EIR for a discussion of water quality control statutes, regulations, and local requirements relevant to erosion control.

Alquist-Priolo Earthquake Fault Zoning Act

The 1972 Alquist-Priolo Earthquake Fault Zone Act was passed to prevent the new development of buildings and structures for human occupancy on the surface of active faults. The Alquist-Priolo Earthquake Fault Zone Act is directed at the hazards of surface fault rupture and does not address other forms of earthquake hazards. The locations of active faults are established into fault zones by the Alquist-Priolo Zone Act. Local agencies regulate any new developments within the appropriate zones in their jurisdiction. The Alquist-Priolo Zone Act regulates development near active faults so as to mitigate the hazard of surface fault rupture. The Alquist-Priolo Zone Act requires that the State Geologist (Chief of the California Department of Mines and Geology [CDMG]) delineate "special study zones" along known active faults in California. Cities and counties affected by the special study zones must regulate certain development projects within the special study zones. The Alquist-Priolo Zone Act prohibits the development of structures for human occupancy across the traces of active faults. According to the Alquist-Priolo Earthquake Fault Zone Act, active faults have experienced surface displacement during the last 11,000 years. Potentially active faults are those that show evidence of surface displacement during the last 1.6

million years. A fault may be presumed to be inactive based on satisfactory geologic evidence; however, the evidence necessary to prove inactivity sometimes is difficult to obtain and may not exist.

Seismic Hazards Mapping Act

The California Seismic Hazards Mapping Act of 1990 (California Public Resources Code [PRC] Section 1690-2699.6) addresses non-surface rupture earthquake hazards, including liquefaction, induced landslides, and subsidence. A mapping program is also established by this Act, which identifies areas within California that have the potential to be affected by such non-surface rupture hazards. The Seismic Hazards Mapping Act specifies that the lead agency for a project may withhold development permits until geologic or soils investigations are conducted for specific sites and mitigation measures are incorporated into plans to reduce hazards associated with seismicity and unstable soils.

California Building Standards Code

The State of California regulates development within the State through a variety of tools that reduce or mitigate potential hazards from earthquakes or other geologic hazards. The 2022 California Building Standards Code (CBSC) (California Code of Regulations [CCR], Title 24) governs the design and construction of all building occupancies and associated facilities and equipment throughout California. In addition, the CBSC governs development in potentially seismically active areas and contains provisions to safeguard against major structural failures or loss of life caused by earthquakes or other geologic hazards. The California building standards include building standards in the national building code, building standards adapted from national codes to meet California conditions, and building standards adopted to address particular California concerns. The CBSC is updated on a triennial cycle.

Local Regulations

Relevant goals and policies from the PCGP and various other local guidelines and regulations related to soils, geology, seismic hazards, and paleontological resources.

Placer County General Plan

The following goals and policies from the PCGP are applicable to the proposed project.

Land Use Element

Goal 1.K To protect the visual and scenic resources of Placer County as important quality-of-life amenities for County residents and a principal asset in the promotion of recreation and tourism.

Policy 1.K.4 The County shall require that new development incorporates sound soil conservation practices and minimizes land alterations. Land alterations should comply with the following guidelines:

a. Limit cuts and fills;
b. Limit grading to the smallest practical area of land;
c. Limit land exposure to the shortest practical amount of time;
d. Replant graded areas to ensure establishment of plant cover before the next rainy season; and

e. Create grading contours that blend with the natural contours on site or with contours on property immediately adjacent to the area of development.

Recreation and Cultural Resources Element

Goal 5.D To identify, protect, and enhance Placer County's important historical, archaeological, paleontological, and cultural sites and their contributing environment.

Policy 5.D.2 The County shall solicit the cooperation of the owners of cultural and paleontological resources, encourage those owners to treat these resources as assets rather than liabilities, and encourage the support of the general public for the preservation and enhancement of these resources.

Policy 5.D.4 The County shall coordinate with the cities and municipal advisory councils in the County to promote the preservation and maintenance of Placer County's paleontological and archaeological resources.

Policy 5.D.6 The County shall require that discretionary development projects identify and protect from damage, destruction, and abuse, important historical, archaeological, paleontological, and cultural sites and their contributing environment. Such assessments shall be incorporated into a County-wide cultural resource database, to be maintained by the Division of Museums.

Policy 5.D.7 The County shall require that discretionary development projects are designed to avoid potential impacts to significant paleontological or cultural resources whenever possible. Unavoidable impacts, whenever possible, shall be reduced to a less than significant level and/or shall be mitigated by extracting maximum recoverable data. Determinations of impacts, significance, and mitigation shall be made by qualified archaeological (in consultation with recognized local Native American groups), historical, or paleontological consultants, depending on the type of resource in question.

Health and Safety Element

Goal 8.A To minimize the loss of life, injury, and property damage due to seismic and geological hazards.

Policy 8.A.1.1 The County shall require the preparation of a soils engineering and geologic-seismic analysis prior to permitting development in areas prone to geological or seismic hazards (e.g., ground shaking, landslides, liquefaction, critically expansive soils, avalanche), prepared

by a California registered civil engineer and based upon adequate test borings as needed.

Policy 8.A.1.2 The County shall require submission of a preliminary soils report, prepared by a California registered civil engineer and based upon adequate test borings, for every major subdivision and for each individual lot where critically expansive soils have been identified or are expected to exist.

Policy 8.A.1.3 The County shall prohibit the placement of habitable structures or individual sewage disposal systems on or in critically expansive soils unless suitable mitigation measures are incorporated to prevent the potential risks of these conditions.

Policy 8.A.1.5 The County shall require that the location, design, and construction of any new buildings, facilities, or other development in areas subject to seismic activity minimize exposure to danger from earthquake-induced liquefaction or fault rupture or creep.

Policy 8.A.1.6 In areas subject to severe ground shaking, the County shall require that new structures intended for human occupancy be designed and constructed to minimize risk to the safety of occupants.

Dry Creek-West Placer Community Plan

The following policy from the DCWPCP is applicable to the proposed project.

Environmental Resources Management Element: Natural Resources

Policy 23 Require the application of measures which mitigate soil erosion and air and water pollution from earth-disturbing activities related to land development.

Placer County Code

Articles 15.01, 15.48, and 15.65 of the Placer County Code are applicable to the proposed project and are summarized below.

California Building Codes

Article 15.01, California Building Codes, of the Placer County Code includes definitions, standards, and enforcement guidelines to ensure all new development comply with the latest version of the CBSC. Section 15.04.121 outlines the violations and penalties for any person who violates or fails to comply with any of the provisions in Article 15.01 of the Code.

Grading, Erosion and Sediment Control Ordinance

Article 15.48, Grading, Erosion and Sediment Control, of the Placer County Code, establishes regulations to limit the pollution of watercourses with hazardous materials, nutrients, sediments, and/or other earthen materials on or caused by surface runoff. Pursuant to Section 15.48.580, all drainage facilities must be designed and engineered consistent with the West Placer Storm Water

Quality Design Manual. Section 15.48.630 establishes erosion and sediment controls for grading operations, including, but not limited to, use of stabilization methods to control erosion, preservation of natural features, limiting of runoff discharged from the site, and limiting the transport of dust off the project site, off-site sewer lift station improvements area, and off-site affordable housing parcel or into any drainage course or body of water.

10.4 IMPACTS AND MITIGATION MEASURES

This section describes the standards of significance and methodology used to analyze and determine the proposed project's potential impacts related to geology, soils, and paleontological resources. In addition, a discussion of the project's impacts, as well as mitigation measures where necessary, is also presented.

Standards of Significance

Consistent with Appendix G of the CEQA Guidelines and in coordination with Placer County, a significant impact related to geology and soils would occur if the proposed project would do any of the following:

- Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:
    - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area based on other substantial evidence of a known fault;
    - Strong seismic ground shaking;
    - Seismic-related ground failure, including liquefaction; and
    - Landslides.
- Result in substantial soil erosion or the loss of topsoil;
- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site lateral spreading, subsidence, liquefaction or collapse;
- Be located on expansive soil, as defined in Table 18-1B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property;
- Have soils incapable of supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water (see Chapter 19, Effects Not Found to be Significant);
- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature;
- Result in significant disruptions, displacements, compaction or overcrowding of the soil;
- Result in substantial change in topography or ground surface relief features;
- Result in exposure of people or property to geologic and geomorphological (i.e., Avalanches) hazards, such as earthquakes, landslides, mudslides, seismic-related ground failure or similar hazards (see Chapter 19, Effects Not Found to be Significant);
- Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state (see Chapter 19, Effects Not Found to be Significant); and/or
- Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan (see Chapter 19, Effects Not Found to be Significant).

As noted above, issues related to whether the proposed project would result in any of the following impacts are discussed in Chapter 19, Effects Not Found To Be Significant, of this EIR:

- Have soils incapable of supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water;
- Result in exposure of people or property to geologic and geomorphological (i.e., Avalanches) hazards, such as earthquakes, landslides, mudslides, seismic-related ground failure or similar hazards;
- Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state; and/or
- Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

The analysis in this chapter takes account of the California Supreme Court's decision in *California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369, 377-378, in which the court held that "agencies subject to CEQA generally are not required to analyze how existing environmental conditions will impact a project's future users or residents. But when a proposed project risks exacerbating those environmental hazards or conditions that already exist, an agency must analyze the potential impact of such hazards on future residents or users. In those specific instances, it is the project's impact on the environment—and not the environment's impact on the project—that compels an evaluation of how future residents or users could be affected by exacerbated conditions."

Under this precedent, CEQA does not consider the impact of the environment on a project (such as the impact of existing seismic ground shaking hazards on new project receptors) to be an impact requiring consideration under CEQA. Rather, CEQA is only concerned with the extent to which, if any, a proposed project would exacerbate an existing environmental hazard. Existing hazards are considered to be part of baseline conditions.

Method of Analysis

The analysis for the proposed project's geology and soils impacts is based primarily on the Geotechnical Due Diligence Review prepared by ENGEO for the proposed project. The analysis for the proposed project's impact to paleontological resources is based primarily on the Cultural and Paleontological Resources Assessment prepared by NIC for the proposed project. In addition, information from the Placer County General Plan and associated EIR, and the DCWPCP was used for analysis. Additional details about the Geotechnical Due Diligence Review are provided below.

Geotechnical Due Diligence Review Analysis

A Geotechnical Due Diligence Review was prepared by ENGEO (December 26, 2023), and relied on a number of analytical tasks, including the following:

- Review of relevant data from a Geotechnical Engineering Report for the Vineyard Christian School Project, prepared by Wallace Kuhl and Associates, and dated August 2, 2018;
- Review of geologic maps, historic aerial photographs, topographic maps, and other nearby geotechnical data;
- Site reconnaissance to observe the current surface conditions;

- Collection of seven near-surface soil samples, less than one foot deep, for visual classification and laboratory testing;
- Laboratory testing of a plasticity index and sieve analysis on representative soil samples; and
- Preparation of a geotechnical due diligence review letter with an overview of the geologic and geotechnical issues that may impact site development.

Cultural and Paleontological Resources Assessment Analyses

As part of the Cultural and Paleontological Resources Assessment prepared by NIC, a search of the paleontological records in the UCMP database was conducted by NIC on March 25, 2025, to locate potential fossils documented from within and surrounding the project site. In addition, as part of the Cultural and Paleontological Resources Assessment, NIC conducted a subsequent review of local, site-specific information for the project site and surrounding area to address impacts to paleontological resources during project construction.

Project-Specific Impacts and Mitigation Measures

The following discussion of impacts related to geology and soils is based on implementation of the proposed project and off-site sewer lift station improvements, as well as the two affordable housing options analyzed throughout this EIR, in comparison to existing conditions and the standards of significance presented above. In most cases, potential environmental impacts associated with the proposed project and the 22 on-site ADUs would not differ. Thus, unless otherwise noted, the below analysis applies to both the proposed project and the on-site ADUs.

10-1 Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure, including liquefaction, and landslides. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and the off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could directly or indirectly cause substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, strong seismic ground shaking, and seismic-related ground failure.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the geological conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure, including liquefaction, and landslides would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

According to the PCGP, Placer County lies within a seismically active area of the western U.S., but beyond the influence of the highly active faults found along California's coast. The western portion of the County, in which the proposed project and off-site sewer lift station improvements area are located, is generally characterized by low seismicity, and is not in an area at risk for severe ground shaking associated with earthquakes.[20] As discussed above, the project site and off-site sewer lift station improvements area are not underlain by any active faults, nor are the areas located within an Alquist-Priolo Fault Special Studies Zone. While lower-intensity earthquakes could potentially occur throughout the development areas, the design of project structures would be required to adhere to the provisions of the 2022 CBSC. The 2022 CBSC contains provisions to safeguard against major structural failures or loss of life caused by earthquakes or other geologic hazards. Based on the above, the potential for seismically induced damage due to liquefaction, surface ruptures, and settlement at the project site and off-site sewer lift station improvements area is considered low.

Furthermore, according to the Geotechnical Due Diligence Review, the project site consists of low, hilly terrain. The off-site sewer lift station improvements area consist of previously graded and developed areas. Similar to the proposed project and off-site sewer lift station improvements area, the topography of the off-site affordable housing parcel consists of gently rolling terrain without any steep slopes. Thus, because the project site and off-site sewer lift station improvements area do not contain any steep slopes and are not located at or near any active or potentially active faults, the risk of landslide, liquefaction, and/or ground failure on the site would not be substantial. Nor would the proposed project include any features that would exacerbate any existing risks from on-site geological conditions.

Off-Site Affordable Housing Parcel

As discussed throughout this EIR, the proposed project includes an option to satisfy the project's affordable housing requirements by transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the RVSP. Similar to the project site, the off-site affordable housing parcel is located in the western portion of Placer County, which is generally characterized by low seismicity, and is not in an area at risk for severe ground shaking associated with earthquakes. As discussed above, the off-site affordable housing parcel is not underlain by any active faults, nor is the off-site affordable housing parcel located within an Alquist-Priolo Fault Special Studies Zone. Furthermore, potential future development of the off-site affordable housing parcel would be required to adhere to the provisions of the 2022 CBSC. Thus, the potential for seismically induced damage due to landslide, liquefaction, and/or ground failure at the off-site affordable housing parcel is considered low.

Conclusion

Based on the above, the proposed project, including the off-site sewer lift station improvements area and the potential future development of the off-site affordable housing parcel, would not expose people or structures to the risk of loss, injury, or death involving rupture of an earthquake fault, strong ground shaking, ground failure, liquefaction, or landslides, and a ***less-than-significant*** impact would occur.

[20] Placer County. *Countywide General Plan EIR* [pg. 9-1]. July 1994.

Mitigation Measure(s)
None required.

10-2 Result in substantial soil erosion or the loss of topsoil. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could result in substantial soil erosion or the loss of topsoil.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the geological conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to result in substantial soil erosion or the loss of topsoil would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

Erosion refers to the removal of soil from exposed bedrock surfaces by wind or water. Although naturally occurring, erosion is often accelerated by human activities that disturb soil and vegetation. According to the Geotechnical Due Diligence Review, subsurface soils at the project site predominantly consist of silty or clayey sand or sandy lean clay between four and eight feet in thickness which is underlain by medium dense to very dense sand and silty sand. Portions of the site contain loose/disturbed clay, silt, and sand due to previous discing; borings D7, D8, and D9 encountered portions of the site which were underlain by between approximately four and eight feet of loose soil in the vicinity of Placer Creek, as shown in green in Figure 10-1. Such soil horizons were markedly less dense than at the other portions of the site.

Similarly, according to the DCWPCP EIR, the DCWPCP area consist of clay subsoils at shallow depths. Hazards related to erosion throughout the DCWPCP area, including the areas containing the off-site sewer lift station improvements area, are generally slight to moderate.

Due to the presence of loose surface soils on the project site, the proposed project could be susceptible to erosion. Furthermore, buildout of the project site and off-site sewer lift station improvements area would require grading, excavation, and other construction-related activities, which, during the early stages of construction, could cause topsoil to be exposed, potentially resulting in wind erosion or an accelerated rate of erosion during storm events. Specifically, as discussed in Chapter 12, Hydrology and Water Quality, of this EIR, limited fill would be placed within the floodplain fringes during project development, generally associated with the proposed pedestrian bridge over Placer Creek. However, upon development of the site with buildings and structures, and upon completion of the off-site improvements, the amount of exposed soil that may be lost due to wind or stormwater runoff would be minimized.

Improvement Plans provided to the County prior to authorization of construction would conform to provisions of the County Grading Ordinance (Article 15.48 of the Placer County

Code) and the Stormwater Quality Ordinance (Article 8.38 of the Placer County Code) that are in effect at the time of submittal. The preparation of and compliance with a stormwater pollution prevention plan (SWPPP) would be part of each project component's National Pollutant Discharge Elimination System (NPDES) construction stormwater quality permit, issued by the Central Valley Regional Water Quality Control Board (CVRWQCB). Before Improvement Plan approval, the Placer County Engineering and Surveying Division (ESD) would require evidence of the State-issued Waste Discharge Identification Number or filing of the Notice of Intent and fees. The SWPPP would include strategies to manage stormwater from the construction site, off-site sewer lift station improvements area, and off-site affordable housing parcel, and treat runoff before being discharged from the development areas. The site-specific SWPPP developed for the proposed project, off-site sewer lift station improvements area, and off-site affordable housing parcel, would have protocols to be followed and monitored during construction, including effective response actions if necessary. The SWPPP is considered a "living document" that could be modified as construction activities progress.

Off-Site Affordable Housing Parcel

According to the RVSP, the subsurface soils at the off-site affordable housing parcel consist of Fiddyment-Kaseberg loams. The Fiddyment soil is a well-drained soil that is moderately deep overlying a hardpan. The Kaseberg soil is well-drained, shallow, and overlying a hardpan. According to the RVSP, the permeability of the Fiddyment-Kaseberg loam is moderate, and the potential for erosion is considered slight to moderate.

Similar to the proposed project, potential future buildout of the off-site affordable housing parcel would require grading, excavation, and other construction-related activities, which could cause topsoil to be exposed, potentially resulting in wind erosion or an accelerated rate of erosion during storm events. At such a time when the off-site affordable housing parcel is developed with buildings or structures, the amount of exposed soil that may be lost due to wind exposure or stormwater runoff would be minimized. Therefore, to reduce potential impacts associated with soil erosion and the loss of topsoil, the potential future development of the off-site affordable housing parcel would require improvement plans to be provided to the County prior to authorization of construction; compliance with the provisions of the County Grading Ordinance and Stormwater Quality Ordinance in effect at the time of submittal; preparation of and compliance with a SWPPP; cooperation with the project's NPDES construction stormwater quality permit, issued by the CVRWQCB; and compliance with all provisions therein.

As discussed under Impact 12-3 of the RVSP EIR, buildout of the entire RVSP could result in erosion resulting from construction of residential developments, as well as both onsite and off-site infrastructure. As such, should development of the off-site affordable housing parcel occur, RVSP EIR Mitigation Measures 12-3a through 12-3d, which have been incorporated into this EIR as Mitigation Measures 10-2(d) through 10-2(g), would be required.

Pursuant to RVSP EIR Mitigation Measure 12-3a, the project applicant would be required to identify stockpiling and vehicle staging areas on all project Improvement Plans submitted to the Placer County ESD for review and approval. Mitigation Measure 12-3b and Mitigation Measure 12-3c of the certified RVSP EIR require projects to comply with NPDES requirements for construction and the NPDES Phase II requirements for

operational discharge of stormwater from small municipal separate storm sewer systems. Finally, Mitigation Measure 12-3d of the certified RVSP EIR requires all construction activities which would disturb over an acre of land to prepare a SWPPP for the construction phase of the project.

Conclusion

Although topsoil exposure would be temporary during early construction activities, and would cease once development of buildings and structures occurs, after grading and leveling and prior to overlaying the ground surface with structures and landscaping, the potential exists for erosion to occur, especially within areas of the project site and off-site sewer lift station improvements area which contain loose surficial soils, such as the proposed pedestrian bridge over Placer Creek. Compliance with Mitigation Measures 12-3a through 12-3d of the RVSP EIR would minimize potential impacts related to substantial soil erosion or the loss of topsoil resulting from the potential future development of the off-site affordable housing parcel. However, short-term, construction-related impacts associated with soil erosion and the loss of topsoil would be considered ***significant***. The referenced RVSP mitigation measures are incorporated into this EIR as Mitigation Measures 10-2(d) through 10-2(g) below.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level by ensuring compliance with all applicable State and local regulations and requirements and by avoiding or reducing erosion in a manner that preserves topsoil and avoids adverse effects on water quality.

Project Site, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

10-2(a) *Prior to construction commencing, the applicant shall provide evidence to the ESD of a Waste Discharge Identification (WDID) number generated from the State Regional Water Quality Control Board's Stormwater Multiple Application & Reports Tracking System (SMARTS). This serves as the Regional Water Quality Control Board approval or permit under the National Pollutant Discharge Elimination System (NPDES) construction stormwater quality permit.*

10-2(b) *The applicant shall prepare and submit Improvement Plans, specifications and cost estimates (per the requirements of Section II of the Land Development Manual (LDM) that are in effect at the time of submittal) to the Engineering and Surveying Division (ESD) for review and approval of each project phase. The applicant shall pay plan check and inspection fees and Placer County Fire Department improvement plan review and inspection fees with the 1st Improvement Plan submittal. (NOTE: Prior to plan approval, all applicable recording and reproduction costs shall be paid).*

The Final Subdivision Map(s) shall not be submitted to the Engineering and Surveying Division (ESD) until the Improvement Plans are submitted for the second review. Final technical review of the Final Subdivision Map(s)

shall not conclude until after the Improvement Plans are approved by the ESD.

Any Building Permits associated with this project shall not be issued until, at a minimum, the Improvement Plans are approved by the Engineering and Surveying Division.

Prior to the County's final acceptance of the project's improvements, submit to the Engineering and Surveying Division one copy of the Record Drawings in digital format along with one blackline hardcopy (black print on bond paper) and one PDF copy.

10-2(c) *No grading, clearing, or tree disturbance shall occur until the Improvement Plans are approved and all temporary construction fencing has been installed and inspected by a member of the County.*

The Improvement Plan(s) shall identify the stockpiling and/or vehicle staging areas with locations as far as practical from existing dwellings and protected resources in the area. The applicant shall revegetate all disturbed areas. Revegetation, undertaken from April 1 to October 1, shall include regular watering to ensure adequate growth. A winterization plan shall be provided with project Improvement Plans.

The applicant shall submit to the ESD a letter of credit or cash deposit in the amount of 110 percent of an approved engineer's estimate using the County's current Plan Check and Inspection Fee Spreadsheet for winterization and permanent erosion control work prior to Improvement Plan approval. For an improvement plan with a calculated security that exceeds $100,000, a minimum of $100,000 shall be provided as letter of credit or cash security and the remainder can be bonded.

Off-Site Affordable Housing Parcel

10-2(d) *Implement RVSP EIR Mitigation Measure 12-3a:*

For each construction phase within the Plan Area, stockpiling and/or vehicle staging areas shall be identified on the Improvement Plans. These areas shall be located as far as practical from existing dwellings and protected resources in the area.

10-2(e) *Implement RVSP EIR Mitigation Measure 12-3b:*

This project is subject to construction-related stormwater permit requirements of the federal Clean Water Act NPDES program. Each applicant/developer for future construction projects within the Plan Area shall implement Mitigation Measure 13-1c [the standards of which are included as Mitigation Measure 10-2(g) of this EIR], which requires an applicant to submit a Notice of Intent (NOI) to comply with the NPDES General Permit for Stormwater Discharges associated with Construction Activities to the State Regional Water Quality Control Board if the specific

project would disturb 1 acre of land or more. The project applicant/developer shall provide to the ESD evidence of a state-issued Waste Discharge Identification (WDID) number or filing of a NOI and fees prior to start of construction, as required by the County's Sample Conditions and Improvement Plans, paragraph ip15 (Placer County Community Development Resource Agency, 2006).

10-2(f) *Implement RVSP EIR Mitigation Measure 12-3c:*

Development within the Plan Area must comply with the NPDES Phase II General Permit for the Discharge of Stormwater from small municipal separate storm sewer systems. Placer County is operating under the NPDES Phase II Rule permit, and as such, new development within the County must comply with the permit requirements. New development is subject to Attachment 4 Design Standards of the State Water Resource Control Board NPDES Phase II General Permit. These standards require that new development must be designed so as to minimize, to the maximum extent practicable, the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas, to the stormwater conveyance system as approved by the building official.

10-2(g) *Implement RVSP EIR Mitigation Measure 12-3d:*

For all construction activities that will disturb 1 or more acre of land, a stormwater pollution prevention plan (SWPPP) for the construction phase must be prepared and implemented.

The SWPPP will include development of site-specific structural and operational BMPs to prevent and control impacts to runoff quality, measures to be implemented before each storm event, inspection and maintenance of BMPs, and monitoring of runoff quality by visual and/or analytical means. The contents of the SWPPP are set forth in detail in the permit application package. BMPs shall be designed according to the California Stormwater Quality Association Stormwater Best Management Practice Handbooks for Construction (or other similar source as approved by the DPW). BMPs for the proposed project include, but are not limited to, silt fencing (Sediment Control SE -1), straw bale barriers (Sediment Control SE-9), fiber rolls (Sediment Control SE-5), storm drain inlet protection (Sediment Control SE-10), hydraulic mulch (Erosion Control EC-3), and stabilized construction entrance (Tracking Control TR-1). The SWPPP shall also include erosion control measures, to be implemented during construction, that conform to the NPDES, Storm Drain Standards, and local standards.

10-3 Be located on a geological unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on or off-site lateral spreading, subsidence, or collapse, or be located on expansive soil, as defined in Table 18-1B of the Uniform Building Code. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as potential future development of the off-site affordable housing parcel, which could be located on a geological unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on or off-site lateral spreading, subsidence, or collapse, or be located on expansive soil, as defined in Table 18-1B of the Uniform Building Code. Issues associated with unstable geologic units and/or soils, including expansive soil, loose surficial soil, lateral spreading, subsidence, and collapse are discussed below.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the geological conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to be located on a geological unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on or off-site lateral spreading, subsidence, or collapse, or be located on expansive soil, as defined in Table 18-1B of the Uniform Building Code, would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

Expansive Soils

During the reconnaissance and soil sampling of the project site, including the collection of 12 test borings, ENGEO encountered periodic layers of plastic materials (clay soils) within the project site. Laboratory testing conducted by ENGEO and previous on-site studies of the soil samples collected on the project site identified low to moderate shrink-swell potential with variations in moisture content. According to ENGEO, selective grading and blending of the on-site soils would be necessary to create relatively low expansion potential surface conditions. As an alternative to selective grading, ENGEO recommends the use of properly designed post-tensioned mat foundations bearing on competent native soil or compacted fill to mitigate the effects of expansive soil.

Based on the above, ENGEO recommends that special design considerations for expansive soils, such as those located on the project site and off-site sewer lift station improvements area, be implemented as part of the proposed project. As such, if the recommendations provided by the final geotechnical report are not implemented, the potential exists for expansive soils to adversely affect the proposed project.

Loose Surficial Soils

Surface soil sampling of the project site encountered loose surficial soils in areas where discing has occurred on the site. According to ENGEO, portions of the site appear to have been disced and the upper approximately 0.5 to one foot of soil appears to consist of loose/disturbed clay, silt, and sand. In addition, previous explorations indicate that portions

of the site are underlain by approximately four to eight feet of loose soil. As shown in Figure 10-1, borings D7, D8, and D9 encountered such loose surficial soil horizons that were markedly less dense than at the other portions of the site. According to ENGEO, fill or loose soil horizons greater than one foot thick may need to be partially over-excavated and recompacted in areas to be developed.

Based on the above, ENGEO recommends that a design-level geotechnical exploration be performed to further evaluate the depth and extent of the loose soil to determine if specific engineering measures are necessary for development prior to project approval. As such, the potential exists for loose surficial soils to adversely affect the proposed project.

Lateral Spreading

Lateral spreading is associated with terrain near free faces such as excavations, channels, or open bodies of water. The project site and off-site affordable housing parcel are relatively level and consist of gently rolling terrain, with the exception of the Placer Creek riparian areas, which could be considered to include free faces. While minimal disturbance to Placer Creek may occur during construction of the proposed pedestrian bridge, the free faces of the creek channel would not be disturbed during construction of the span pedestrian bridge.

ENGEO did not observe any indications of slope instability at the project site, such as seeps or springs. Furthermore, groundwater levels at the project site occur at depths of approximately 100 to 120 feet bgs dependent on fluctuations in rainfall, irrigation practice, and other factors. Due to the absence of permanently elevated groundwater table, and the relatively low seismicity of the area, the potential for seismically-induced damage due to lateral spreading at the project site is considered low. Given that the proposed development area does not contain any steep slopes or free faces, the proposed project would not be subject to substantial risks related to lateral spreading.

Collapse

As discussed above, the design of the proposed project and off-site sewer lift station improvements area would be required to adhere to the provisions of the most recent version of the CBSC in effect at the time of building permit issuance. Additionally, the development of the proposed project and off-site sewer lift station improvements area would follow Article 15.04 of the Placer County Government Code. Structures built according to the seismic design provisions of current building codes would be able to resist major earthquakes without collapse, but with some structural, as well as non-structural damage. Given that the development of the proposed project and the off-site sewer lift station improvements would adhere to the CBSC requirements, the proposed project and off-site sewer lift station improvements area would not be subject to substantial risks associated with building collapse.

Off-Site Affordable Housing Parcel

As discussed in the Existing Environmental Setting section of this chapter, the proposed project site and the off-site affordable housing parcel are located in the same general vicinity and are underlain by similar soil types. In addition, according to the RVSP EIR, conditions on the off-site affordable housing parcel related to expansive soil, loose surficial soil, lateral spreading, subsidence, and collapse would be similar to the proposed project

site. The topography of the off-site affordable housing parcel is defined by gently rolling hills and does not contain any steep slopes. The potential for expansive soil in the off-site affordable housing parcel area is moderate, and the depth to groundwater is approximately 100 feet bgs. According to the RVSP EIR, provided that detailed, site-specific investigations are conducted at appropriate times and the recommendations of each investigation are followed, as required by RVSP EIR Mitigation Measure 12-5a, significant impacts related to soil stability would not occur. As such, should development of the off-site affordable housing parcel occur, RVSP EIR Mitigation Measure 12-5a, which has been incorporated into this EIR as Mitigation Measure 10-3(c), would be required.

Pursuant to Mitigation Measure 12-5a of the RVSP EIR, a final geotechnical engineering report produced by a California Registered Civil Engineer or Geotechnical Engineer shall be submitted to the ESD for review and approval for each construction project within the General Plan area. Such geotechnical engineering reports are required to make recommendations regarding road, pavement, and parking area design; structural foundations, including retaining wall design (if applicable); grading practices; erosion/winterization; special problems discovered on site (i.e., groundwater, expansive/unstable soils, etc.); and slope stability. If the soils report indicates the presence of potential soil hazards a certification of completion of the requirements of the soils report is be required prior to issuance of building permits.

Conclusion

Based on the above, the proposed project, off-site sewer lift station improvements, and potential future development of the off-site affordable housing parcel would not likely be subject to issues associated with lateral spreading, subsidence, or collapse, or being located on expansive soil. Nor would either component exacerbate the geological condition associated with such phenomena. However, expansive and loose soils were identified within the project site. Similarly, the potential for expansive soils in the off-site affordable housing parcel area is moderate. The Geotechnical Due Diligence Review includes recommendations to ensure adequate support of the proposed improvements, including recommendations related to expansive and loose soils. Such recommendations include, but are not limited to, selective grading and blending, use of properly designed post-tensioned mat foundations bearing on competent native soil or compacted fill, site clearing and stripping, over-excavation, compaction or re-compaction of subgrade soils, and provision of a design-level geotechnical exploration to further evaluate the depth and extent of loose soils in areas of proposed development. Because a final geotechnical engineering report has not yet been prepared for the proposed project, or the off-site affordable housing parcel pursuant to Mitigation Measure 12-5a of the RVSP EIR, a ***significant*** impact could occur. The referenced RVSP mitigation measure is incorporated into this EIR as Mitigation Measure 10-3(c) below.

Mitigation Measure(s)

Implementation of the following mitigation measures would ensure that the proposed project, off-site sewer lift station improvements, and potential future development of the off-site affordable housing parcel would not be subject to, or increase the risk of, an on- or off-site lateral spreading, subsidence, or collapse. Thus, the potential impact would be *less than significant*.

Project Site and Off-Site Sewer Lift Station Improvements Area

10-3(a) *The Improvement Plan submittal shall include a final geotechnical engineering report produced by a California Registered Civil Engineer or Geotechnical Engineer for ESD review and approval. The report shall address and make recommendations on the following:*

A. *Road, pavement, and parking area design;*
B. *Structural foundations, including retaining wall design (if applicable);*
C. *Grading practices;*
D. *Erosion/winterization;*
E. *Special problems discovered on-site, (i.e., groundwater, expansive/unstable soils, potential for smectite clays etc.); and*
F. *Slope stability.*

It is the responsibility of the developer to provide for engineering inspection and certification that earthwork has been performed in conformity with recommendations contained in the report.

If the geotechnical engineering report indicates the presence of critically expansive or other soil problems that, if not corrected, could lead to structural defects, a certification of completion of the requirements of the soils report shall be required for subdivisions, prior to issuance of Building Permits. This certification may be completed on a lot- by-lot basis or on a Tract basis. This shall be so noted on the Improvement Plans, in the Development Notebook (if required), in the Conditions, Covenants and Restrictions (CC&Rs), and on the Informational Sheet filed with the Final Subdivision Map(s).

10-3(b) *The Geotechnical Due Diligence Review prepared by ENGEO Incorporated, dated December 26, 2023, indicated the presence of expansive and loose soils, and/or other soil problems which, if not corrected, would lead to structural defects.*

- *For pad graded lots, prior to final acceptance of project improvements or consideration of early Building Permits and after the completion of the pad grading for all lots, the applicant shall submit to the ESD for review and approval, a soil investigation of each lot produced by a California Registered Civil or Geotechnical Engineer (Section 17953-17955 California Health and Safety Code).*

The soil investigations shall include recommended corrective action that is likely to prevent structural damage to each proposed dwelling. In addition, the applicant shall include in the Development Notebook the soil problems encountered on each specific lot as well as the recommended corrective actions. A note shall be included on the Improvement Plans, Conditions, Covenants and Restrictions (CC&Rs), and the Informational Sheet filed

with the Final Subdivision Map(s), which indicates the requirements of this condition.

Off-Site Affordable Housing Parcel

10-3(c) *Implement RVSP EIR Mitigation Measure 12-5a:*

For each development phase or construction project within the Plan Area, a geotechnical engineering report produced by a California Registered Civil Engineer or Geotechnical Engineer shall be submitted to the ESD for review and approval. The report shall address and make recommendations on the following:

- *Road, pavement, and parking area design;*
- *Structural foundations, including retaining wall design (if applicable);*
- *Grading practices;*
- *Erosion/winterization;*
- *Special problems discovered on site (i.e., groundwater, expansive/unstable soils, etc.); and*
- *Slope stability.*

When approved by the ESD, two copies of the final report shall be provided to the ESD and one copy to the Building Department for their use. If the soils report indicates the presence of critically expansive soils or other soils problems which, if not corrected, could lead to structural defects, a certification of completion of the requirements of the soils report will be required for subdivisions and other entitlements, prior to issuance of building permits. This certification may be completed on a lot by lot basis or on a tract basis, or other defined project basis. This shall be so noted in the Covenants, Conditions, and Restrictions and on the informational sheet filed with the final map(s). It is the responsibility of the developer to provide for engineering inspection and certification that earthwork has been performed in conformity with recommendations contained in the report.

10-4 Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature. Based on the analysis below and with implementation of mitigation, the impact is *less than significant.*

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel, which could result in directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the geological conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to directly or indirectly destroy a unique paleontological resource or site or unique geologic feature

would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

As previously discussed, the majority of the project site and off-site sewer lift station improvements area are underlain by the Turlock Lake Formation and the Modesto Formation. The Turlock Lake Formation consists of deeply weathered gravel, sand, and silt derived from the western slopes of the Sierra Nevada. The lower member of the Modesto Formation consists of unconsolidated, slightly weathered, tan to light gray alluvium composed of gravel, sand, silt, and clay derived from surrounding mountains.

A Cultural and Paleontological Resources Assessment was prepared for the proposed project by NIC in June 2025.[21] The Cultural and Paleontological Resources Assessment included an intensive field survey of the project site and a search of paleontological records in the University of California Museum of Paleontology (UCMP) database to determine the presence of paleontological resources on the project site and in the project site vicinity.

Paleontological resources were not identified during the field survey conducted on the project site. While results of the records search identified 64 fossil localities within Placer County, the Paleontological Resources Assessment determined that the types of rock units containing such paleontological resources do not occur in the project area. Furthermore, UCMP records do not show any paleontological resources from Quaternary alluvial deposits underlain with metavolcanic formations, such as the Turlock Lake and Modesto Lake Formations underlaying the project site, off-site sewer lift station improvements area, and off-site affordable housing parcel, in Placer County. Based on the foregoing information and the SVP criteria, the Paleontological Resources Assessment determined that the sensitivity for paleontological resources to occur on the project site is low. As discussed above, because the off-site sewer lift station improvements area and off-site affordable housing parcel are located within a two-mile radius of the project site, and are underlain by similar soil formations, the sensitivity for paleontological resources within such areas are similarly low.

Off-Site Affordable Housing Parcel

Because the off-site affordable housing parcel is located approximately 1.68 miles southwest of the project site and is underlain by similar soil formations, the sensitivity for paleontological resources on the off-site affordable housing parcel would be similar to that of the project site. Therefore, the sensitivity for paleontological resources or unique geologic features within the off-site affordable housing parcel is similarly low.

As discussed in the RVSP EIR, vertebrae paleontological sites are not known to exist within the RVSP area. However, previously undiscovered paleontological resources could be exposed through grading or excavation activities associated with construction of the RVSP. According to the RVSP EIR, the potential impact related to paleontological resources would be mitigated to a less-than-significant level by having a qualified professional paleontologist conduct periodic construction monitoring to identify, evaluate, and properly manage potentially exposed resources during grading activities, as required

[21] Natural Investigations Company. *Cultural and Paleontological Resources Assessment for the Estia Dry Creek & Placer Creek Residential Property Development Project, Placer County, California.* June 2025.

by RVSP EIR Mitigation Measures 7-3a and 7-3b. As such, should development of the off-site affordable housing parcel occur, RVSP EIR Mitigation Measures 7-3a and 7-3b, which have been incorporated into this EIR as Mitigation Measures 10-4(c) and 10-4(d), would be required.

Conclusion

Although the project site does not contain any known paleontological resources or unique geologic features, and the potential for the presence of paleontological resources on the project site, off-site sewer lift station improvements area, and off-site affordable housing parcel is low, the potential for unknown paleontological resources to be discovered in Placer County exists. As such, the potential exists that a unique paleontological resource or site could be unearthed during construction activities on the project site, off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel. Thus, a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level by ensuring that, if any unique paleontological resources are encountered during construction, they shall be recovered and transported in a form that would allow scientific institutions to properly curate and preserve them for the benefit of current and future generations.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

10-4(a) *Prior to construction activities, the developer shall retain a qualified paleontologist to prepare a paleontological resources worker environmental awareness plan (WEAP). The WEAP shall be presented to all construction personnel on the first day of construction activities prior to ground disturbance. The WEAP shall serve to educate all personnel involved in the project, particularly construction personnel, of the protocols to be followed if fossils are found at the project site during ground-disturbing activities. A sign-in sheet shall be provided for all personnel in attendance at the WEAP presentation. The WEAP presentation shall be recorded for future use in the circumstance that new personnel start after the WEAP presentation occurs. The language of this mitigation measure shall be included on all future grading plans, utility plans, and improvement plans subject to approval by the Placer County ESD for the proposed project.*

10-4(b) *If paleontological resources are discovered during ground-disturbing activities, work shall be halted in the area within 50 feet of the find. The applicant shall notify the Placer County Community Development Resource Agency and retain a qualified paleontologist to inspect the discovery. If the find is deemed to contain unique paleontological resources under criteria established by the Society for Vertebrate Paleontology with respect to authenticity, completeness, preservation, and identification, the resource(s) shall then be salvaged and deposited in an accredited and permanent scientific institution (e.g., UCMP or Sierra College), where the discovery would be properly curated and preserved for the benefit of current and future generations. The language of this mitigation measure shall be included on any future grading plans, utility plans, and*

improvement plans approved by the Placer County ESD for the proposed project, where excavation work would be required. Construction may continue in areas outside of the buffer zone.

Off-Site Affordable Housing Parcel

10-4(c) Implement RVSP EIR Mitigation Measure 7-3a:

A professional paleontologist shall be retained to develop and implement a plan for managing paleontological resources and periodic monitoring of grading activities. The plan shall also include provisions for salvaging fossils, as necessary. The plan shall also include the timing and extent of monitoring needed. A copy of the plan shall be provided to the Placer County Planning Department prior to any grading occurring on site.

10-4(d) Implement RVSP EIR Mitigation Measure 7-3b:

If paleontological resources are identified at a particular site, the project manager shall cease operation until a qualified professional can provide an evaluation.

1. *Identify and evaluate paleontological resource by intense field survey where impacts are considered high;*
2. *Assess effects on identified sites;*
3. *Consult with the institutional/academic paleontologists conducting research investigations within the geological formations that are slated to be impacted;*
4. *Obtain comments from the researchers; and*
5. *Comply with researchers' recommendations to address any significant adverse effects where determined by the County to be feasible.*

In considering any suggested mitigation proposed by the consulting paleontologist, Placer County Planning Department staff shall determine whether avoidance is necessary and feasible in light of factors such as the nature of the find, project design, costs, Specific Plan policies and land use assumptions, and other considerations. If avoidance is unnecessary or infeasible, other appropriate measures (e.g., data recovery) shall be instituted. Work may proceed on other parts of the project site while mitigation for paleontological resources is carried out.

10-5 Result in significant disruptions, displacements, compaction or overcrowding of the soil, or substantial change in topography or ground surface relief features. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as potential future development of the off-site affordable housing parcel, which could result

in significant disruptions, displacements, compaction or overcrowding of the soil, or substantial change in topography or ground surface relief features.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the geological conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to result in significant disruptions, displacements, compaction or overcrowding of the soil, or substantial change in topography or ground surface relief features. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

Distinct topographic features located on the project site include seasonal wetlands and vernal pools, as well as the un-named tributary of Dry Creek (named "Placer Creek" for this project) which flows east to west in the southern portion of the project site. Aside from the on-site aquatic features and the associated on-site tributaries to Dry Creek, the project site consists of undeveloped annual grassland with gently rolling topography. In addition, the portion of the off-site sewer lift station improvements area north of Dry Creek Community Park, where the off-site emergency wastewater storage improvements could potentially be constructed at the existing Community Facility District #1 Sewer Lift Station, is comprised of undeveloped land containing VFRW and portions of intermittent tributary drainages of Dry Creek. The proposed project would include removal of existing vegetation within the proposed development area, as well as grading for building pads, roads, and other associated on-site and off-site project improvements. However, as discussed in Chapter 3, Project Description, the Placer Creek riparian corridor and the immediate surrounding area would be retained and protected as open space.

Overall, the proposed project and off-site sewer lift station improvements area would include site preparation, grading, paving, utility placement, and various other construction activities which would disrupt on-site and off-site soils. As such, soils within such areas would be reworked as necessary to support the proposed development, potentially resulting in disruptions, displacements, compaction, or overcrowding of the soils.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is approximately four acres in size, is undeveloped, and consists of grassy fields with gently rolling topography. As previously discussed, this affordable housing option would involve an amendment to the RVSP and a rezone of the proposed affordable housing parcel to the RM30 zone, which can result in a maximum development potential of 120 affordable income-restricted units on the off-site affordable housing parcel. Based on the existing topography of the off-site affordable housing parcel, future development of the off-site affordable housing parcel would be similar compared to the proposed project.

Conclusion

The proposed project, off-site sewer lift station improvements area, and potential future development of the off-site affordable housing parcel would include site modifications that would alter the existing topography and ground surface relief features. Thus, significant disruptions, displacements, compaction or overcrowding of on-site and/or off-site soils, and/or substantial change in topography or ground surface relief features could occur, and could result in a ***significant*** impact.

Mitigation Measure(s)

Implementation of the following mitigation measure would reduce the above potential impact to a *less-than-significant* level by ensuring the avoidance of any significant disruptions, displacements, compaction or overcrowding of the soil, or substantial change in topography or ground surface relief features.

Proposed Project, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

10-5 Implement the following Mitigation Measures set forth in this EIR:

- *10-2(b) The applicant shall prepare and submit Improvement Plans, specifications and cost estimates (per the requirements of Section II of the Land Development Manual (LDM) that are in effect at the time of submittal) to the Engineering and Surveying Division (ESD) for review and approval of each project phase. The applicant shall pay plan check and inspection fees and Placer County Fire Department improvement plan review and inspection fees with the 1st Improvement Plan submittal. (NOTE: Prior to plan approval, all applicable recording and reproduction costs shall be paid).*

  The Final Subdivision Map(s) shall not be submitted to the Engineering and Surveying Division (ESD) until the Improvement Plans are submitted for the second review. Final technical review of the Final Subdivision Map(s) shall not conclude until after the Improvement Plans are approved by the ESD. Any Building Permits associated with this project shall not be issued until, at a minimum, the Improvement Plans are approved by the Engineering and Surveying Division.

  Prior to the County's final acceptance of the project's improvements, submit to the Engineering and Surveying Division one copy of the Record Drawings in digital format along with one blackline hardcopy (black print on bond paper) and one PDF copy.

- *10-2(c) No grading, clearing, or tree disturbance shall occur until the Improvement Plans are approved and all temporary construction fencing has been installed and inspected by a member of the County.*

  The Improvement Plan(s) shall identify the stockpiling and/or vehicle staging areas with locations as far as practical from existing dwellings and protected resources in the area. The applicant shall revegetate all disturbed areas. Revegetation, undertaken from April 1 to October 1, shall include regular watering to ensure adequate growth. A winterization plan shall be provided with project Improvement Plans.

  The applicant shall submit to the ESD a letter of credit or cash deposit in the amount of 110 percent of an approved engineer's

estimate using the County's current Plan Check and Inspection Fee Spreadsheet for winterization and permanent erosion control work prior to Improvement Plan approval. For an improvement plan with a calculated security that exceeds $100,000, a minimum of $100,000 shall be provided as letter of credit or cash security and the remainder can be bonded.

- *10-3(a) The Improvement Plan submittal shall include a final geotechnical engineering report produced by a California Registered Civil Engineer or Geotechnical Engineer for ESD review and approval. The report shall address and make recommendations on the following:*

    A. *Road, pavement, and parking area design;*
    B. *Structural foundations, including retaining wall design (if applicable);*
    C. *Grading practices;*
    D. *Erosion/winterization;*
    E. *Special problems discovered on-site, (i.e., groundwater, expansive/unstable soils, potential for smectite clays etc.); and*
    F. *Slope stability.*

    It is the responsibility of the developer to provide for engineering inspection and certification that earthwork has been performed in conformity with recommendations contained in the report.

    If the geotechnical engineering report indicates the presence of critically expansive or other soil problems that, if not corrected, could lead to structural defects, a certification of completion of the requirements of the soils report shall be required for subdivisions, prior to issuance of Building Permits. This certification may be completed on a lot- by-lot basis or on a Tract basis. This shall be so noted on the Improvement Plans, in the Development Notebook (if required), in the Conditions, Covenants and Restrictions (CC&Rs), and on the Informational Sheet filed with the Final Subdivision Map(s).

- *10-3(b)The Geotechnical Due Diligence Review prepared by ENGEO Incorporated, dated December 26, 2023, indicated the presence of expansive and loose soils, and or other soil problems which, if not corrected, would lead to structural defects.*

    - *For pad graded lots, prior to final acceptance of project improvements or consideration of early Building Permits and after the completion of the pad grading for all lots, the applicant shall submit to the ESD for review and approval, a soil investigation of each lot produced by a California*

Registered Civil or Geotechnical Engineer (Section 17953-17955 California Health and Safety Code).

The soil investigations shall include recommended corrective action that is likely to prevent structural damage to each proposed dwelling. In addition, the applicant shall include in the Development Notebook the soil problems encountered on each specific lot as well as the recommended corrective actions. A note shall be included on the Improvement Plans, Conditions, Covenants and Restrictions (CC&Rs), and the Informational Sheet filed with the Final Subdivision Map(s), which indicates the requirements of this condition.

Cumulative Impacts and Mitigation Measures

As defined in Section 15355 of the CEQA Guidelines, "cumulative impacts" refers to two or more individual effects which, when considered together, are considerable, compound, or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Additional detail regarding the cumulative project setting is discussed in Chapter 20, Statutorily Required Sections, of this EIR.

10-6 Cumulative increase in the potential for geological related impacts and hazards. Based on the analysis below, the cumulative impact is *less than significant*.

A project's potential impacts related to geology and soils are individual and localized, depending on the project site and underlying soils. For those reasons, the cumulative geographic context for geology and soils is site-specific, and geologic impacts tend to be localized. Combined or additive cumulative impacts from multiple related or reasonably proximate projects do not exist, as each project has its own localized geologic impacts addressed by site-specific mitigation. Impacts to geology, soils, seismicity, and paleontological resources related to implementation of the proposed project, off-site sewer lift station improvements area, and the potential future development of the off-site affordable housing parcel are analyzed throughout this chapter. As discussed above, existing geological and soil conditions on the site would generally be adequate to support development of the proposed project, including the off-site sewer lift station improvements area and both affordable housing options. In addition, Mitigation Measure 10-3(a), which requires the preparation of a final geotechnical engineering report, would ensure the appropriate recommendations are implemented to reduce project-specific impacts related to geology and soils to a less-than-significant level.

While some geologic characteristics may affect regional construction practices, impacts and mitigation measures are primarily site-specific and project-specific. For example, impacts resulting from development on expansive soils at one project site are not worsened by impacts from development on expansive soils or undocumented fill at another project site. Rather, the soil conditions, and the implications of such conditions for each project, are independent.

As such, the potential for cumulative impacts related to geology, soils, and seismicity, to which implementation of the proposed project, including the off-site sewer lift station improvements area and both affordable housing options, might contribute, is ***less than significant***.

Mitigation Measure(s)

None required.

11. Hazards and Hazardous Materials

11. HAZARDS AND HAZARDOUS MATERIALS

11.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County an approximately four-acre parcel off-site within the Riolo Vineyards Specific Plan (RVSP), which could develop a maximum of 120 affordable income-restricted units.

The Hazards and Hazardous Materials chapter of the EIR describes existing and potentially occurring hazards and hazardous materials within the vicinity of the project site, off-site sewer lift station improvements area, and the off-site affordable housing parcel. The chapter includes a discussion of potential impacts posed by such hazards to the environment. In addition, surrounding land uses are discussed to provide an assessment of whether the project could impact surrounding land uses. However, the question of whether surrounding land uses could impact the project's future residents is not a question requiring analysis under CEQA.[1] The impact discussions and mitigation measures presented in each technical section apply to both the project site and the off-site sewer lift station improvements area, unless otherwise noted.

The Hazards and Hazardous Materials chapter is primarily based on information drawn from a Phase I Environmental Site Assessment (Phase I ESA) (see Appendix F of this EIR)[2] prepared for the proposed project by Environmental Risk Assessors, as well as the Placer County General Plan (PCGP)[3] and associated EIR,[4] RVSP EIR,[5] and the Dry Creek-West Placer Community Plan (DCWPCP).[6]

11.2 EXISTING ENVIRONMENTAL SETTING

The following section includes a definition of hazardous materials and descriptions of the existing conditions associated with the project site, off-site sewer lift station improvements area, and off-site affordable housing parcel related to hazards and hazardous materials.

---

1 Pursuant to the *California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369 (*CBIA*), the California Supreme Court held that "agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents. But when a proposed project risks exacerbating those environmental hazards or conditions that already exist, an agency must analyze the potential impact of such hazards on future residents or users. In those specific instances, it is the project's impact on the environment – and not the environment's impact on the project – that compels an evaluation of how future residents or users could be affected by exacerbated conditions." (*Id.* at pp. 377-378.).

6 Placer County. *Dry Creek-West Placer Community Plan.* Amended May 12, 2009.

Hazardous Materials

The term hazardous substance refers to both hazardous materials and hazardous wastes. A material is defined as hazardous if the material appears on a list of hazardous materials prepared by a federal, State, or local regulatory agency or if the material has characteristics defined as hazardous by such an agency. The California Environmental Protection Agency (Cal-EPA), California Department of Toxic Substance Control (DTSC) defines hazardous waste, as found in the California Health and Safety Code Section 25141(b), as follows:

> […] its quantity, concentration, or physical, chemical, or infectious characteristics: (1) cause, or significantly contribute to an increase in mortality or an increase in serious irreversible, or incapacitating reversible illness; (2) pose a substantial present or potential hazard to human health or the environment, due to factors including, but not limited to, carcinogenicity, acute toxicity, chronic toxicity, bioaccumulative properties, or persistence in the environment, when improperly treated, stored, transported, or disposed of, or otherwise managed.

The following discussion focuses on the potential Recognized Environmental Conditions (RECs) associated with the project site, off-site sewer lift station improvements area, and off-site affordable housing parcel. A REC indicates the presence or likely presence of any hazardous substances in, on, or at a property due to any release into the environment, under conditions indicative of a release to the environment, or under conditions that pose a material threat of a future release to the environment.[7]

Project Area Conditions

As discussed in Chapter 3, Project Description, of this EIR, the project site consists of approximately 92.2 gross (87.6 net) acres and is located south of Baseline Road, immediately east of the abandoned old Walerga Road right-of-way, west of the Fiddyment Road/Baseline Road/Walerga Road intersection and the western portion of Sun Valley Oaks residential subdivision, and north of the Morgan Creek residential subdivision in the DCWPCP area of unincorporated Placer County. The project site is bisected by Walerga Road, which generally curves from northeast to southwest. The 52.3-acre northern portion of the site is bound by Baseline Road to the north and Walerga Road to the south. The northern portion of the site is undeveloped, consists of non-native annual grassland with gently rolling topography, and is interspersed with seasonal wetlands and vernal pools. The 35.3-acre southern portion of the site is bound by Walerga Road to the north and west. The southern portion of the site includes a paved bicycle trail which extends from Vineyard Road to the east and Walerga Road to the west. In addition, the southern portion of the site includes undeveloped annual grassland with gently rolling topography, interspersed with seasonal wetlands and vernal pools, and is bisected by an un-named tributary of Dry Creek (named “Placer Creek” for this project) which flows east to west. The Federal Emergency Management Agency (FEMA) 100-year floodplain, containing approximately 4.7 acres, is located within the Placer Creek tributary area, which bisects the southern portion of the project site. A band of oak woodlands is located along the Placer Creek riparian corridor.

The Phase I ESA identifies records dating back to as early as 1910 that show the site as undeveloped land. Walerga Road had been present along the project site’s western border since at least 1910, and was realigned to bisect the project site by 2006. In 1937 the project site

[7] ASTM International. *ASTM E1527, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.* 2013.

remained undeveloped with a dry pond on the central portion and a line of trees along the path of the creek that traverses the southern portion of the project site. Agricultural uses, specifically dryland farming, appear throughout the project site from 1947 until 1993, except in the area of the creek in the southern portion of the project site. In 1998 an unpaved walking pathway appears on the project site's southern portion. By 2006, the walking pathway appears to be paved with several underground utility covers visible along the pathway, and Walerga Road is under construction across the center of the project site. The project site appears as fallow land from 1998 to 2009 and remained undeveloped from 2009 to 2016. The northern portion of the project site was used for cattle grazing in 2018 and 2019. The area around the project site's northern border was graded by 2020, presumably associated with the widening of Baseline Road. The project site remains undeveloped in the most recent aerial photographs.

Site reconnaissance of the project site was conducted by Environmental Risk Assessors on November 9, 2023, in which small debris piles along Old Walerga Road and two large construction equipment sized vehicle tires on the project site's central portion were observed.

The two-acre off-site sewer lift station improvements area (Assessor's Parcel Numbers [APNs] 023-221-045 and 023-221-052) is located approximately 0.53-mile south of the southern portion of the project site. Aerial imagery shows that the off-site sewer lift station improvements area was historically surrounded by agricultural land until more recent development of the area. The utility area in the off-site sewer lift station improvements area was developed between 1998 and 2002, and has since remained largely unchanged. Surrounding residential development can be seen beginning in 2005, and the Dry Creek Community Park was developed in 2013 to the west of the off-site sewer lift station improvements area. The off-site sewer lift station improvements included in the proposed project would consist of building a third 47,000-gallon emergency storage tank set on concrete slurry below the existing paved access road. The tank would have a 48-inch access manhole from the paved road. In order to place the underground tank, the design would call for 530 cubic yards of cut to be replaced with 530 cubic yards of fill. In addition, the bottom of the storage tank trench would be 23 feet below grade. The Phase I ESA prepared for the proposed project did not evaluate the off-site sewer lift station improvements area.

As discussed throughout this EIR, one of the options the applicant is considering to satisfy the project's affordable housing requirements would involve transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the Riolo Vineyards Specific Plan (RVSP). The off-site affordable housing parcel is approximately four acres in size and is located at the northeast corner of PFE Road and Watt Avenue (APN 023-200-056-000). Aerial imagery shows that the off-site affordable housing parcel has remained undeveloped since at least 1985. Center Preschool, located to the southwest of the affordable housing parcel, has also been present since at least 1985. The surrounding residential development, in particular to the south of the off-site affordable housing parcel, was developed between 1993 and 1998. The off-site affordable housing parcel is currently undeveloped and consists of grassy fields with gently rolling topography. The Phase I ESA prepared for the proposed project did not evaluate the off-site affordable housing parcel. However, as described further below, the off-site affordable housing parcel is located within the RVSP and was analyzed in the RVSP EIR. As part of the RVSP EIR, a Phase I ESA and subsequent Phase II ESA were conducted for the RVSP area.

The other option the applicant is considering to satisfy the project's affordable housing requirements would involve developing ADUs on-site as a part of the proposed project. According to Policy HE-C-3, included in the Housing Element of the County's General Plan, ADUs of less than 750 square feet (sf) are considered to be affordable by design and eligible to satisfy low-

income housing requirements in specific plans and new developments. The County's regulations require a minimum of 10 percent of the units within the proposed project be affordable housing; thus, the proposed project could provide a minimum of 22 ADUs on lots with single-family residential units. ADUs are allowed by-right, pursuant to State and County regulations, within the project site's proposed land use and zoning designations.

Potential On-Site Recognized Environmental Conditions

Based on the Phase I ESA prepared for the project site, Environmental Risk Assessors determined that the project site does not contain any RECs such as aboveground storage tanks (ASTs), underground storage tanks (USTs), septic systems/cesspools, or polychlorinated biphenyl (PCB) containing equipment. Nonetheless, the following potential environmental concerns were identified for the project site.

Dryland Farming

As mentioned above, historical aerial photographs show dryland farming throughout the project site from 1947 through 1993. According to the Phase I ESA, the DTSC determined that crops grown using dryland methods are generally not treated with agricultural chemicals, including environmentally persistent pesticides. Because of the non-irrigated nature of dryland farming, reliance on naturally occurring rainfall, and general lack of pesticide use, typical RECs associated with agricultural use, such as the use of organochlorine pesticides (OCPs), arsenic, and copper applied as termiticides, are unlikely to occur on the project site. Thus, the past agricultural use would not be considered a potential REC.

On-Site Soil Stockpile

The historical aerial photographs reviewed in the Phase I ESA identified a small stockpile of soil and gravel visible near the project site's northeastern corner in the 2020 photograph, which is not visible in the 2021 photograph. The soil and gravel stockpile appears to be related to grading activities along the project site's northern border. The Phase I ESA determined that evidence of chemical or fuel releases was not noted in the area, and the soil and gravel stockpile would not be considered a potential REC.

Vapor Encroachment Conditions

Exposure to vapor intruding from ground sources of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and volatile organic compounds such as mercury can lead to detrimental effects on human health. The Phase I ESA did not find evidence of a potential release of vapor encroachment contaminants of concern into the subsurface due to the current or past on-site operations of the project site. Considering evidence of a release was not found, Environmental Risk Assessors determined that a vapor encroachment condition due to on-site sources would be unlikely to exist. Thus, a vapor encroachment condition would not be considered a potential REC.

Radon

According to the U.S. Environmental Protection Agency (USEPA), radon is found in outdoor air and in the indoor air of buildings of all kinds. Exposure to radon can cause lung cancer in smokers and non-smokers.[8] Radon is the number one cause of lung cancer among non-smokers, according to USEPA estimates, and the second-leading cause, overall, of lung cancer. The

[8] U.S. Environmental Protection Agency. *Health Risk of Radon*. Available at: https://www.epa.gov/radon/health-risk-radon. Accessed October 2025.

USEPA has developed the EPA Map of Radon Zones to assist organizations in implementing radon-resistant building codes. The map assigns each county in the U.S. to one of three zones based on radon potential. The USEPA uses a continuous exposure level of 4.0 picocuries per liter (pCi/L) as an action level at which additional action is recommended. According to the Phase I ESA, the project site is located in a Zone 2-designated area, defined as an area of Moderate Potential, where the average indoor radon screening level is between two and four pCi/L. Such levels do not require action to be taken to reduce radon levels. Thus, radon would not be considered a potential REC.

Nearby RECs

A review of sites located near the project site that are listed in federal, State, and/or local databases of hazardous materials sites was completed as part of the Phase I ESA. The project site is not identified on any local, State, or federally published lists of sites that have had releases of hazardous substances. Based on the Phase I ESA, the only adjacent property surrounding the project site identified during the regulatory agency databases review, Rutan Environmental Safety Services Corporation, located approximately 640 feet to the east of the project site at 8575 Parkwood Court, was established to be a non-generator of hazardous waste in 2018. As chemical or fuel releases have not been reported at the property, Rutan Environmental Safety Services Corporation does not appear to present a significant environmental concern to the project site. Additionally, all sites of concern in the project vicinity, including orphan properties, have received regulatory closure, were determined to be of sufficient distance, and/or situated hydrologically cross- or down-gradient from the project site.

For further details regarding the identified facilities located near the project site that are listed in federal, State, and/or local databases of hazardous materials sites, please see Appendix D of the Phase I ESA (attached as Appendix F to this EIR). A listing on the aforementioned databases is not considered to be indicative of a release of a hazardous material or petroleum product at a property.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is located within the RVSP and was analyzed in the RVSP EIR. As part of the RVSP EIR, a Phase I ESA and subsequent Phase II ESA were conducted for the RVSP area. While several RECs were identified in the parcels surrounding the off-site affordable housing parcel, including former farming facilities, a water tank, disturbance areas, and significant debris, RECs were not identified on the off-site affordable housing parcel. Testing was conducted in relation to the nearby RECs, including metal detector scans, test excavations, and soil sampling; the presence of RECs, such as pesticides, was not detected.

Nearest Airports

The closest public use airport to the project site is McClellan Airport, which is located approximately 4.6 miles southwest of the site. The project site is not located in the vicinity of any private airstrips. McClellan Airport was formerly known as the McClellan Air Force Base, and was operated for more than 60 years as an industrial military facility; however, the airport is currently part of a master-planned community consisting of more than 16 million sf of industrial, research and development, office, aviation, and mixed-use facilities. McClellan Airport's most recent Airport Land Use Compatibility Plan was updated in 1992, when the airport was still operated as an Air

Force base. According to the 1992 Comprehensive Land Use Plan for the McClellan Air Force Base, the project site is not located within an airport overflight zone.[9]

11.3 REGULATORY CONTEXT

The following discussion contains a summary of regulatory controls pertaining to hazardous substances, including federal, State, and local laws and ordinances.

Federal Regulations

Federal agencies that regulate hazardous materials include the USEPA, the Occupational Safety and Health Administration (OSHA), the Department of Transportation (DOT), and the National Institute of Health (NIH). Prior to August 1992, the principal agency at the federal level regulating the generation, transport, and disposal of hazardous waste was the USEPA under the authority of the Resource Conservation and Recovery Act (RCRA). As of August 1, 1992, however, the California DTSC was authorized to implement the State's hazardous waste management program for the USEPA. The USEPA continues to regulate hazardous substances under the Comprehensive Environmental Response Compensation and Liability Act (CERCLA). The following federal laws and related regulations govern hazardous materials.

Occupational Safety and Health Act

Congress passed the Occupational and Safety Health Act (29 U.S.C. Section 651 et seq. [1970]) to ensure worker and workplace safety. Their goal was to make sure employers provide their workers a place of employment free from recognized hazards to safety and health, such as exposure to toxic chemicals, excessive noise levels, mechanical dangers, heat or cold stress, or unsanitary conditions. In order to establish standards for workplace health and safety, the Act also created the National Institute for Occupational Safety and Health (NIOSH) as the research institution for OSHA. OSHA is a division of the U.S. Department of Labor that oversees the administration of the Act and enforces standards in all 50 states. OSHA requires 40 hours of training for hazardous materials operators, as well as an annual eight-hour refresher course, which includes training regarding personal safety, hazardous materials storage and handling, and emergency response.

Comprehensive Environmental Response, Compensation, and Liability Act

The CERCLA (42 U.S.C. Section 9601 et seq. [1980]) provides a federal "Superfund" to clean up uncontrolled or abandoned hazardous-waste sites as well as accidents, spills, and other emergency releases of pollutants and contaminants into the environment. Through CERCLA, the USEPA was given power to seek out those parties responsible for any release and assure their cooperation in the cleanup. The USEPA cleans up orphan sites when potentially responsible parties cannot be identified or located, or when they fail to act. Through various enforcement tools, USEPA obtains private party cleanup through orders, consent decrees, and other small party settlements. The USEPA also recovers costs from financially viable individuals and companies once a response action has been completed. The USEPA is authorized to implement the CERCLA in all 50 states and U.S. territories.

[9] Airport Land Use Commission. *McClellan Air Force Base Comprehensive Land Use Plan.* Amended December 1992.

Superfund Amendments and Reauthorization Act of 1986

The Superfund Amendments and Reauthorization Act (SARA) of 1986, (Title III; Section 305(a)) reauthorized CERCLA to continue cleanup activities around the country. Several site-specific amendments, definitions clarifications, and technical requirements were added to the legislation, including additional enforcement authorities. In addition, Title III of SARA authorized the Emergency Planning and Community Right-to-Know Act (EPCRA). SARA, Title III provides funding for training in emergency planning, preparedness, mitigation, response, and recovery capabilities associated with hazardous chemicals. Title III of SARA addresses concerns about emergency preparedness for hazardous chemicals, and emphasizes helping communities meet their responsibilities in preparing to handle chemical emergencies and increasing public knowledge and access to information on hazardous chemicals present in their communities.

Resource Conservation and Recovery Act

The RCRA (42 U.S.C. Section 6901 et seq. [1976]) gives USEPA the authority to control hazardous waste from the "cradle-to-grave," which includes the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA also set forth a framework for the management of non-hazardous solid wastes. The 1986 amendments to RCRA enabled USEPA to address environmental problems that could result from underground tanks storing petroleum and other hazardous substances. The federal Hazardous and Solid Waste Amendments (HSWA) are the 1984 amendments to RCRA that focused on waste minimization and phasing out land disposal of hazardous waste as well as corrective action for releases. Some of the other mandates of this law include increased enforcement authority for USEPA, more stringent hazardous waste management standards, and a comprehensive UST program. States have the authority to implement individual hazardous waste programs in lieu of the RCRA as long as the state program is as stringent as federal RCRA requirements and is approved by the USEPA.

Toxic Substances Control Act

The Toxic Substances Control Act (TSCA) of 1976 (15 U.S.C. Section 2601 et seq. [1976]) provides USEPA with authority to require reporting, record-keeping and testing requirements, and restrictions relating to chemical substances and/or mixtures. Certain substances are generally excluded from TSCA, including, among others, food, drugs, cosmetics and pesticides. TSCA addresses the production, importation, use, and disposal of specific chemicals including PCBs, asbestos, radon, and lead-based paint (LBP).

U.S. Department of Transportation

Transportation of hazardous materials is regulated by the DOT's Office of Hazardous Materials Safety. The office formulates, issues, and revises hazardous materials regulations under the Federal Hazardous Materials Transportation Law. The hazardous materials regulations cover hazardous materials definitions and classifications, hazard communications, shipper and carrier operations, training and security requirements, and packaging and container specifications. The hazardous materials transportation regulations are codified in 49 Code of Federal Regulations (CFR) Parts 100–185.

The hazardous materials transportation regulations require carriers transporting hazardous materials to receive required training in the handling and transportation of hazardous materials. Training requirements include pre-trip safety inspections, use of vehicle controls and equipment including emergency equipment, procedures for safe operation of the transport vehicle, training on the properties of the hazardous material being transported, and loading and unloading procedures. All drivers must possess a commercial driver's license as required by 49 CFR Part

383. Vehicles transporting hazardous materials must be properly placarded. In addition, the carrier is responsible for the safe unloading of hazardous materials at the site, and operators must follow specific procedures during unloading to minimize the potential for an accidental release of hazardous materials.

Asbestos Hazard Emergency Response Act

The 1986 Asbestos Hazard Emergency Response Act (AHERA) was signed into law as Title II of the TSCA, requiring the Asbestos Model Accreditation Plan (MAP) for accrediting individuals conducting asbestos inspection and corrective-action activities in schools and public and commercial buildings. The MAP provides guidance on the minimum training requirements for accrediting asbestos professionals such as, procedural entry, exit, sampling, and monitoring, safety hazards, and relevant federal, State, and local regulatory standards.

Lead-Based Paint Regulations

Lead pollutants are regulated by several laws administered by the USEPA, including the TSCA, the Residential Lead-Based Paint Hazard Reduction Act of 1992, the Clean Air Act (CAA), the Clean Water Act (CWA), the Safe Drinking Water Act (SDWA), the RCRA, and CERCLA. The aforementioned regulations address lead in paint, dust and soil, lead in air and water, and the disposal of lead wastes. Regulations specific to LBP include, but are not limited to, the Lead Renovation Repair and Painting Program Rule, the Lead Abatement Program, the residential Lead-based Paint Disclosure Program, and Residential Hazards of Lead in Paint, Dust and Soil. Such regulations require risk assessments, inspections, and work practices that work to minimize exposure to lead hazards.

State Regulations

Cal-EPA and the State Water Resources Control Board (SWRCB) establish rules governing the use of hazardous materials and the management of hazardous waste. Within Cal-EPA, DTSC has primary regulatory responsibility, with delegation of enforcement to local jurisdictions that enter into agreements with the State agency, for the management of hazardous materials and the generation, transport, and disposal of hazardous waste under the authority of the Hazardous Waste Control Law (HWCL). The following discussion contains the applicable State laws.

Regional Water Quality Control Board

The Cal-EPA and the Office of Emergency Services (OES) establish regulations governing the use of hazardous materials in California. Within Cal-EPA, DTSC has primary regulatory responsibility for hazardous waste management. Enforcement of regulations can be delegated to local jurisdictions that enter into agreements with DTSC for the generation, transport, and disposal of hazardous materials under the authority of the HWCL. Along with the DTSC, the Regional Water Quality Control Board (RWQCB) is responsible for implementing regulations pertaining to management of soil and groundwater investigation and cleanup. The RWQCB's regulations are contained in Title 27 of the California Code of Regulations (CCR). The DTSC, RWQCB, and/or a local agency typically oversees investigation and cleanup of contaminated sites.

Department of Toxic Substances Control

The DTSC was established to protect California against threats to public health and degradation to the environment and to restore properties degraded by past environmental contamination. Through statutory mandates, DTSC cleans up existing contamination, regulates management of hazardous wastes, and prevents pollution by working with businesses to reduce hazardous waste and use of toxic materials in California. DTSC regulates the generation, transportation, treatment,

storage, and disposal of hazardous waste in California. In addition, DTSC's Site Mitigation and Brownfields Reuse Program oversees the cleanup of State Superfund sites. State Superfund sites are additionally known as Annual Workplan sites, listed sites, or Cortese List sites. Superfund sites demonstrate evidence of a hazardous substance release or releases that could pose a significant threat to public health and/or the environment. DTSC requires responsible parties to cleanup such sites. When responsible parties cannot be found or where they do not take proper and timely action, DTSC may use State funds to undertake the cleanup.

Cortese List

Pursuant to Government Code Section 65962.5(a), the DTSC shall compile and update as appropriate, but at least annually, and shall submit to the Secretary for Environmental Protection, a list of all of the following:

1. All hazardous waste facilities subject to corrective action pursuant to Section 25187.5 of the Health and Safety Code.
2. All land designated as hazardous waste property or border zone property pursuant to former Article 11 (commencing with Section 25220) of Chapter 6.5 of Division 20 of the Health and Safety Code.
3. All information received by the DTSC pursuant to Section 25242 of the Health and Safety Code on hazardous waste disposals on public land.
4. All sites listed pursuant to Section 25356 of the Health and Safety Code.

California Code of Regulations

Hazardous waste is characterized and defined in CCR, Title 22, Sections 66261.20-24. Soils that meet the descriptions of the characteristics of hazardous waste defined in Sections 66261.20-24 and contain contaminants above regulatory screening levels are considered hazardous waste and must be handled and disposed of as such. The CCR includes the California Health and Safety Code.

California Health and Safety Code

The handling and storage of hazardous materials is regulated at the federal level by the USEPA under CERCLA, as amended by the SARA. Under SARA Title III, a nationwide emergency planning and response program was established that imposed reporting requirements for businesses which store, handle, or produce significant quantities of hazardous or acutely toxic substances as defined under federal laws. SARA Title III required each state to implement a comprehensive system to inform federal authorities, local agencies, and the public when a significant quantity of hazardous, acutely toxic substances are stored or handled at a facility.

Ammonia is an example of an acutely hazardous material (AHM) that is regulated by the California OES under the California Accidental Release Program (CalARP), the USEPA under the Risk Management Program (40 CFR 68), and the OSHA under the Process Safety Management Program (OSHA 1910.119). The CalARP and Risk Management Program require that all facilities that store, handle, or use AHMs above a minimum quantity, known as the threshold planning quantity, are required to develop a plan and prepare supporting documentation that summarizes the facility's potential risk to the local community and identifies safety measures to reduce potential risks to the public.

The HWCL, Chapter 6.5 of the California Health and Safety Code, is administered by the Cal-EPA to regulate hazardous wastes. While the HWCL is generally more stringent than RCRA, until

the USEPA approves the California program, both the State and federal laws apply in California. The HWCL lists 791 chemicals and about 300 common materials that may be hazardous; establishes criteria for identifying, packaging, and labeling hazardous wastes; prescribes management controls; establishes permit requirements for treatment, storage, disposal and transportation; and identifies some wastes that cannot be disposed of in landfills.

In California, the underground storage of hazardous materials is regulated by Chapter 6.7 of the California Health and Safety Code, pursuant to the Underground Storage of Hazardous Substances Act. Under Section 25280, the USTs used for the storage of substances hazardous to public health and safety and to the environment are stored prior to use or disposal in thousands of underground locations in the State. The USTs used for storage are potential sources of contamination of the ground and underlying aquifers, and may pose other dangers to public health and the environment. Chapter 6.7 establishes orderly procedures that will ensure that newly constructed USTs meet appropriate standards and that existing tanks be properly maintained, inspected, tested, and upgraded so that the health, property, and resources of the people of the State will be protected.

California Vehicle Code Section 31303

The California Highway Patrol (CHP) and California Department of Transportation (Caltrans) are the enforcement agencies for hazardous materials transportation regulations. Hazardous materials and waste transporters are responsible for complying with all applicable packaging, labeling, and shipping regulations. California Vehicle Code Section 31303 regulates the transport of hazardous materials.

Emergency Response to Hazardous Materials Incidents

California has developed an emergency response plan to coordinate emergency services provided by federal, State, and local governments and private agencies. Response to hazardous material incidents is one part of this plan. The plan is managed by the Governor's OES, which coordinates the responses of other agencies, including Cal-EPA, CHP, California Department of Fish and Wildlife (CDFW), Central Valley RWQCB, and the Placer County Fire Department.

Unified Hazardous Materials Management Regulatory Program

On January 1, 1996, Cal-EPA adopted implementing regulations and implemented a unified hazardous waste and hazardous materials management regulatory program (Unified Program), to consolidate the administration of specified statutory requirements for the regulation of hazardous wastes and materials. The Unified Program is implemented at the local level by government agencies certified by the Secretary of Cal-EPA. The Certified Unified Program Agency (CUPA) is responsible for implementation of the Unified Program. CUPA is certified and responsible for oversight of the following consolidated programs: Hazardous Materials Release Response Plans and Inventories (Business Plans); California Accidental Release Program; Underground Storage Tank Program; Aboveground Petroleum Storage Act; Hazardous Waste Generator and Onsite Hazardous Waste Treatment (tiered permitting) Programs; and California Uniform Fire Code: Hazardous Materials Management Plans and Hazardous Material Inventory Statements.

Local Regulations

Relevant goals and policies from the PCGP and various other local guidelines and regulations related to hazards and hazardous materials are discussed below. The DCWPCP does not contain specific goals or policies related to hazards and hazardous materials.

Placer County General Plan

The Placer County Board of Supervisors adopted the 2021 Health and Safety Element Update on November 16, 2021 through adoption of Resolution 2021-359. The update includes refinements to the goals, policies, and implementation programs that address potential and existing hazards in the County. The following goals and policies from the 2021 Health and Safety Element Update, a component of the PCGP, are applicable to the proposed project.

Health and Safety Element

Goal 8.F To minimize the risk of loss of life, injury, serious illness, damage to property, and economic and social dislocations resulting from the use, transport, treatment, and disposal of hazardous materials and hazardous materials wastes.

Policy 8.F.1 The County shall review all proposed development projects that manufacture, use, or transport hazardous materials for compliance with the County's Hazardous Waste Management Plan (CHWMP). Such projects shall provide a buffer zone, to be determined by the County, between the installation and property boundaries sufficient to protect public safety.

Policy 8.F.2 The County shall discourage the development of residences or schools near known hazardous waste disposal or handling facilities.

Policy 8.F.3 The County shall require that applications for discretionary development projects that will generate hazardous wastes or utilize hazardous materials include detailed information on hazardous waste reduction, recycling, and storage.

Policy 8.F.5 The County shall strictly regulate the storage of hazardous materials and wastes and shall require secondary containment and period examination for all such materials.

Policy 8.F.8 The County shall ensure that the use and disposal of hazardous materials in the County complies with local, state, and federal safety standards.

Policy 8.F.11 The County shall work with local fire protection and other agencies to ensure an adequate Countywide response capability to hazardous materials emergencies.

Placer County Environmental Health Division

The Placer County Environmental Health Division (PCEHD) is the CUPA for local implementation of the California Accidental Release Prevention Program and several other hazardous materials and hazardous waste programs. The PCEHD is responsible for regulating hazardous materials business plans and chemical inventory, hazardous materials storage, hazardous materials management plans, and risk management plans. The hazardous materials business plan program requires businesses in Placer County to prepare business emergency response plans if

hazardous materials storage equals or exceeds 55 gallons of liquid, 500 pounds of solid, or 200 cubic feet of gas. The goal of PCEHD is to protect human health and the environment by ensuring that hazardous materials and hazardous waste are properly managed.

The PCEHD distributes the information in the hazardous materials business plans and business emergency response plans to emergency response agencies, such as fire departments and Hazardous Materials Response Teams. The PCEHD helps to facilitate the resources necessary for first responders to emergency incidents using emergency response plans and training responders for preparedness.

Placer County Local Hazard Mitigation Plan

The 2016 Local Hazard Mitigation Plan (LHMP) was prepared pursuant to the requirements of the Disaster Mitigation Act of 2000 so that Placer County would be eligible for the FEMA Pre-Disaster Mitigation and Hazard Mitigation Grant Programs, as well as lower flood insurance premiums. The LHMP is a multi-jurisdictional plan that geographically covers the entire area within Placer County's jurisdictional boundaries. The purpose of the LHMP is to guide hazard mitigation planning and to better protect the people and property of the County from the effects of hazard events. The LHMP demonstrates the community's commitment to reducing risks from hazards and serves as a tool to help decisionmakers direct mitigation activities and resources.

A draft Placer County 2021 LHMP Update was submitted for review to both California Governor's OES and FEMA at the end of June 2021. On September 3, 2021, FEMA transmitted an Approval Pending Adoption letter which stipulated that the Placer County 2021 LHMP Update met all the regulatory requirements and was eligible for final adoption. The Placer County Board of Supervisors adopted the Placer County 2021 LHMP on November 16, 2021. The goals of the 2021 LHMP are as follows:

- Goal 1: Minimize risk and vulnerability of Placer County to the impacts of natural hazards and protect lives and reduce damages and losses to property, economy, public health and safety, and the environment;
- Goal 2: Provide protection for critical facilities, infrastructure, utilities and services from hazard impacts;
- Goal 3: Improve public awareness, education, communication, and preparedness for all hazards;
- Goal 4: Increase communities' capabilities to mitigate losses and to be prepared for, respond to, and recover from a disaster event;
- Goal 5: Ensure a more resilient County that can adapt to the hazards created or exacerbated by Climate Change;
- Goal 6: Reduce fire severity and mitigate undesirable fire outcomes in Placer County; and
- Goal 7: Maintain FEMA Eligibility/Position the communities for grant funding.

Placer County and Placer Operational Area Emergency Operations Plan

The *Placer County and Placer Operational Area Emergency Operations Plan* (EOP) provides the guidelines needed for emergency response planning, preparation, training and execution throughout unincorporated Placer County.[10] The EOP is applicable to any natural disaster or

[10] Placer County Office of Emergency Services. *Placer County and Placer Operational Area Emergency Operations Plan.* Adopted December 14, 2010.

manmade emergency occurring in or in the proximity of Placer County that affects, or may affect, the unincorporated area of the County (or the entire operational area, should response require coordination of the emergency response efforts of multiple agencies or jurisdictions). Emergency events range from minor oil spills, brush fires and minor flooding to severe winter storms, floods, wildland fires, earthquakes to countywide public health emergencies all of which have potentially catastrophic long-term public safety, economic, social and political implications.

11.4 IMPACTS AND MITIGATION MEASURES

The following section describes the standards of significance and methodology used to analyze and determine the proposed project's potential impacts related to hazards and hazardous materials. A discussion of the project's impacts, as well as mitigation measures where necessary, is also presented.

Standards of Significance

In accordance with CEQA Guidelines Appendix G, an impact related to hazards and hazardous materials is considered significant if the proposed project would:

- Create a significant hazard to the public or the environment through the routine handling, transport, use, or disposal of hazardous materials;
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment;
- Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;
- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment (see Chapter 19, Effects Not Found to be Significant);
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, result in a safety hazard or excessive noise for people residing or working in the project area (see Chapter 19, Effects Not Found to be Significant);
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; and/or
- Expose people or structures, either directly or indirectly, to the risk of loss, injury or death involving wildland fires.

As noted above, impacts related to the location of the proposed project on a site included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, and safety hazards associated with airports and private airstrips are discussed in Chapter 19, Effects Not Found to be Significant, of this EIR.

Impacts related to wildland fires are addressed in detail in Chapter 18, Wildfire, of this EIR. Thus, further discussion related to exposure of people or structures, either directly or indirectly, to the risk of loss, injury or death involving wildland fires is not discussed in further detail in this chapter.

Method of Analysis

Environmental Risk Assessors prepared a Phase I ESA for the project site (see Appendix F of this EIR). The purpose of the Phase I ESA was to evaluate whether evidence of RECs exists that

may have impacted or could potentially impact the project site. The Phase I ESA was performed in general accordance with the American Society for Testing and Materials (ASTM) E1527-13 standard. The following tasks were performed as part of the Phase I ESA:

- Historical records such as aerial photographs, Sanborn Fire Insurance maps, historical topographic maps, city directories, and other readily-available historical sources were evaluated, as available, to research the history of the site and vicinity;
- Federal, State, and local environmental databases were reviewed to identify sites that use, store, or have released hazardous materials. The database search was performed by Environmental Data Resources, Inc. (EDR), an environmental database research firm. The EDR database report provides federal and State information intended to meet ASTM guidelines for Phase I ESAs. Regulatory files were reviewed for the identified sites, subject to the limitations of the ASTM guidance document;
- A reconnaissance-level site visit of the project site was conducted by Environmental Risk Assessors employees on November 9, 2023; and
- Persons with knowledge of the site were interviewed.

For further details regarding the methodology and results of the Phase I ESA prepared by Environmental Site Assessors for the project site, please see Appendix F of this EIR.

Project-Specific Impacts and Mitigation Measures

The project site conditions, as well as conditions at the off-site sewer lift station improvements area and the off-site affordable housing parcel, have been compared to the standards of significance presented above in order to determine the project's impact significance. If significant impacts are identified for the construction and operational phases of the proposed project, recommended mitigation measures have been included to reduce the identified impacts to less-than-significant levels. In most cases, potential environmental impacts associated with the proposed project and the 22 on-site ADUs would not differ. Thus, unless otherwise noted, the below analysis applies to both the proposed project and the on-site ADUs.

11-1 Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as potential future development of the off-site affordable housing parcel, which could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

Projects that involve the routine transport, use, or disposal of hazardous materials are typically industrial in nature. The proposed project, off-site sewer lift station improvements, and off-site affordable housing parcel do not include industrial development. As such, due to the similarities in the proposed uses of the project site and off-site affordable housing parcel, and the limited utility improvements to the off-site sewer lift station improvements area, all components of the project are discussed below.

Proposed Project, Off-Site Sewer Lift Station Improvements Area, and Off-Site Affordable Housing Parcel

The proposed project would not be industrial in nature. Operations of the proposed project, including 220 single-story multi-family units in the Estia Dry Creek development (Phase 1) and 212 single-family residential lots in the Placer Creek Residential development (Phases 2A, 2B, 3, and 4) would not include any activities that would involve the routine transport, use, disposal, or generation of substantial amounts of hazardous materials. In addition, as discussed throughout this EIR, one of the options the applicant is considering to satisfy the project's affordable housing requirements would involve transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the RVSP. The proposed affordable housing parcel is approximately four acres, located at the northeast corner of PFE Road and Watt Avenue. The construction of the proposed affordable units does not include any site-specific development plans, designs, or proposals at this time. However, as discussed in Chapter 3, Project Description, of this EIR, the proposed RVSP amendment and rezone would result in a maximum development potential of 120 affordable income-restricted units. Thus, similar to the proposed project, the potential future development of the off-site affordable housing parcel would not be industrial in nature.

During operations of the proposed project and the off-site affordable housing parcel, hazardous material use would be limited to landscaping products such as fertilizer and pesticides, as well as typical commercial and maintenance products (cleaning agents, degreasers, paints, batteries, and motor oil). Proper handling and usage of such materials in accordance with label instructions would ensure that adverse impacts to human health or the environment would not occur. Thus, operations of the proposed project and the off-site affordable housing parcel would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

Construction activities associated with implementation of the proposed project, including the off-site sewer lift station improvements area, and the off-site affordable housing parcel, would involve the use of heavy equipment, which would contain fuels and oils, and various other products such as concrete, paints, and adhesives. The project contractor is required to comply with all California Health and Safety Codes and local County ordinances regulating the handling, storage, and transportation of hazardous and toxic materials. Pursuant to California Health and Safety Code Section 25510(a), except as provided in subdivision (b),[11] the handler or an employee, authorized representative, agent, or designee of a handler, shall, upon discovery, immediately report any release or threatened release of a hazardous material to the unified program agency (in the case of the proposed project and off-site affordable housing parcel, PCEHD) in accordance with the regulations adopted pursuant to Section 25510(a). The handler or an employee, authorized representative, agent, or designee of the handler shall provide all State, city, or county fire or public health or safety personnel and emergency response personnel with access to the handler's facilities. In the case of the project site, off-site sewer lift station improvements area, and the off-site affordable housing parcel, the contractors are required to notify the PCEHD in the event of an accidental release of a hazardous material, who would then monitor the conditions and recommend appropriate remediation measures.

[11] Subdivision (a) does not apply to a person engaged in the transportation of a hazardous material on a highway that is subject to, and in compliance with, the requirements of Sections 2453 and 23112.5 of the Vehicle Code.

Conclusion

Based on the above, the proposed project would not create a significant hazard to the public or the environment through the routine handling, transport, use, or disposal of hazardous materials, and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

11-2 Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as potential future development of the off-site affordable housing parcel, which could create a significant hazard to the public or the environment through reasonably foreseeable upset or accident conditions involving the likely release of hazardous materials into the environment.

In *California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369 (*CBIA*), the California Supreme Court held that "agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users. But when a proposed project risks exacerbating those environmental hazards or conditions that already exist, an agency must analyze the potential impact of such hazards on future users. In those specific instances, it is the impact of the project on the environment – and not the impact of the environment on the project – that compels an evaluation of how future residents or users could be affected by exacerbated conditions." (*Id.* at pp. 377-378.). Therefore, where existing hazardous conditions already occur on the project site or vicinity, the discussion below focuses on the proposed project's potential to exacerbate risks associated with such conditions. The proposed project, off-site sewer lift station improvements area, and off-site affordable housing parcel are discussed below.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to create a significant hazard to the public or the environment through reasonably foreseeable upset or accident conditions involving the likely release of hazardous materials into the environment would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

As presented above in the Existing Environmental Setting section of this chapter, the Phase I ESA did not identify RECs on or near the project site. The potential on-site RECs analyzed in the Phase I ESA are detailed below.

The Phase I ESA did not find evidence of a potential release of vapor encroachment contaminants of concern into the subsurface due to the current or past on-site operations of the project site. Considering that evidence of a release was not found, Environmental Risk Assessors determined that a vapor encroachment condition due to on-site sources would be unlikely to exist. With respect to radon, the USEPA uses a continuous exposure level of 4.0 pCi/L as an action level at which additional action is recommended. The project site is located in a Zone 2-designated area, defined as an area of Moderate Potential where the average indoor radon screening level is between two and four pCi/L, and the Phase I ESA did not identify radon levels as a potential REC. Therefore, the proposed ground-disturbing activities would not exacerbate existing hazards related to radon, and the proposed project would not create a significant hazard to the public or environment related to the release of radon.

Environmental Risk Assessors determined that historical resources showed that most of the project site was used for dry-land farming between 1910 and the early 1990s. However, according to the *Interim Guidance for Sampling Agricultural Properties (Third Revision)* dated August 7, 2008, by the DTSC, crops grown using dry-land methods are generally not treated with agricultural chemicals including environmentally persistent pesticides. During the site reconnaissance performed by Environmental Risk Assessors, a soil stockpile was observed near the northeastern corner of the project site and appeared to be related to grading activities along the project site's northern border. Evidence of chemical or fuel releases were not noted in the areas surrounding the soil stockpile. Therefore, the proposed ground-disturbing activities would not exacerbate existing hazards related to the previous dry-land farming on the project site, nor the existing soil stockpile.

The off-site sewer lift station improvements area was not included in the Phase I ESA prepared for the proposed project and, as such, was not evaluated for potential hazards. However, as further discussed in Chapter 15, Public Services and Utilities, of this EIR, the off-site sewer lift station improvements area was included in the Mariposa and Mason Trails at Riolo Vineyard development, in which emergency storage was built at the computational fluid dynamics (CFD) #1 lift station to accommodate the project. Thus, the recent utilities improvements conducted at the off-site sewer lift station improvements area would have detected and addressed any hazardous conditions, including leaks from the existing emergency storage tanks at the CFD #1 lift station. Therefore, it is reasonable to conclude that the proposed utility improvements at the off-site sewer lift station improvements area associated with the proposed project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is located within the RVSP and was analyzed in the RVSP EIR. As part of the RVSP EIR, a Phase I ESA and subsequent Phase II ESA were conducted for the RVSP area. While several RECs were identified in the parcels surrounding the off-site affordable housing parcel, including former farming facilities, a water tank, disturbance areas, and significant debris, RECs were not identified on the off-site affordable housing parcel. Testing was conducted in relation to the nearby RECs, including metal detector scans, test excavations, and soil sampling; the presence of RECs,

such as pesticides, was not detected. Therefore, further action was determined unnecessary, and the potential future development of the off-site affordable housing parcel would not create a significant hazard to the public or environment related to the release of hazardous materials.

Conclusion

Based on the above, implementation of the proposed project, including the off-site sewer lift station improvements area and potential future development of the off-site affordable housing parcel, would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment. Therefore, the proposed project would result in a ***less-than-significant*** impact.

Mitigation Measure(s)

None required.

11-3 Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school. Based on the analysis below, the impact would be *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as potential future development of the off-site affordable housing parcel, which could emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

A significant hazard to the public or the environment could result from projects that emit emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school. The proposed project, off-site improvement area, and off-site affordable housing parcel are discussed below.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

The project site is located approximately 0.25-mile to the southwest of Immersion Academy. Therefore, the proposed project would be located within one-quarter mile of an existing or proposed school. However, as discussed under Impact 11-1, projects that emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste are typically industrial in nature. The proposed project would not be industrial in nature and would, instead, consist of the development of a single-family residential community consisting of 432 residential units. In addition, as discussed under Impact 11-2, the Phase I ESA did not identify RECs on or near the project site. Therefore, implementation of the proposed project would not create a significant hazard to the public

or the environment through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment. Thus, operations of the proposed project would not result in a significant impact to Immersion Academy related to hazardous emissions or the handling of hazardous or acutely hazardous materials, substances, or waste.

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include off-site improvements within the City of Roseville. Such off-site improvements would be located within the existing rights-of-way (ROWs) along Walerga Road and at the intersections of Baseline Road at Crowder Lane, Walerga Road at the proposed project access and Springhill Drive, and Watt Avenue at PFE Road. The off-site improvement located at the intersection of Baseline Road and Crowder Lane would be located approximately 94 feet to the south of Immersion Academy. As such, the off-site improvement at the intersection of Baseline Road and Crowder Lane would be located within one-quarter mile of an existing or proposed school. However, as discussed above, projects that emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste are typically industrial in nature. As the off-site improvement would be limited to improvements within the existing ROW at the Baseline Road and Crowder Lane intersection, and would not include any further operations after construction, the off-site roadway improvement would not result in a significant impact to Immersion Academy related to hazardous emissions or the handling of hazardous or acutely hazardous materials, substances, or waste.

The off-site sewer lift station improvements area is not located within one-quarter mile of an existing or proposed school. The nearest school, Wilson C. Riles Middle School, is located approximately 0.55-mile southwest of the off-site sewer lift station improvements area. Development of the off-site sewer lift station improvements area would include utility improvements and would not involve the routine use or transport of substantial quantities of hazardous materials during operation. Therefore, the off-site sewer lift station improvements area would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

Off-Site Affordable Housing Parcel

The off-site affordable housing parcel is located approximately 187 feet to the northeast of Center Preschool. Therefore, the off-site affordable housing parcel would be located within 0.25-mile of an existing school. However, as discussed under Impact 11-1, projects that emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste are typically industrial in nature. The potential future development of the off-site affordable housing parcel would not be industrial in nature and could, instead, result in a maximum development potential of 120 affordable income-restricted units. Furthermore, the off-site affordable housing parcel is located within the RVSP and was analyzed in the RVSP EIR. As part of the RVSP EIR, a Phase I ESA and subsequent Phase II ESA were conducted for the RVSP area, and RECs were not identified on the off-site affordable housing parcel. Thus, operations of the off-site affordable housing parcel would not result in a significant impact to Center Preschool related to hazardous emissions or the handling of hazardous or acutely hazardous materials, substances, or waste.

Conclusion

Based on the above information, the project site, off-site roadway improvements, and off-site affordable housing parcel are located within 0.25-mile of an existing school. However, future development of the components of the project would not result in substantial adverse effects related to hazardous emissions or the handling of hazardous or acutely hazardous materials, substances, or waste. Therefore, the project would result in a ***less-than-significant*** impact.

Mitigation Measure(s)

None required.

11-4 Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Based on the analysis below, the impact would be *less than significant.*

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as potential future development of the off-site affordable housing parcel, which could impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

Placer County does not have an adopted emergency evacuation plan. However, as noted previously, the County maintains a LHMP, the purpose of which is to reduce or eliminate long-term risk to people and property from hazards consistent with the requirements of the Disaster Mitigation Act of 2000. The potential for the proposed project, off-site sewer lift station improvements area, and off-site affordable housing parcel to impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan is discussed below.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Because the conditions of the proposed project area and off-site sewer lift station improvements area are similar, the potential for either component to impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

Currently, the project site is bisected by Walerga Road, which continues south of the project site and provides connection to Town Center Avenue to the southwest, to Springhill Drive to the west, and to Baseline Road to the northwest. Following project buildout, primary access to the Phase 1 development would be provided by a new driveway located along Baseline Road, to the north of the site. The proposed driveway would be aligned with the future six-lane, fully signalized Upland Drive along the north side of Baseline Road. Access to the Phase 2 development would be provided by a new roadway off of Walerga Road between Springhill Drive and Town Center Avenue, and new street extensions from Wellbrook Place and Bridgestone Crescent Road to the east. Access to the Phase 3 development would be from the eastern/fourth leg of the proposed signalized intersection/access to Walerga at Town Center Avenue. Access to the southern Phase 4 development would be from the western extension of Vineyard Road, which currently

terminates at the southern entry to the Sun Valley Oaks subdivision at White Mill Crescent Road.

An emergency vehicle access (EVA) connection would be developed as part of Phase 1 between Estia Dry Creek and the Phase 2 roadways connecting to Walerga Road. An EVA in Placer Creek Residential Phase 3 would be located from Walerga Road to M Street, opposite the new Phase 2 entrance/J Street. In Phase 4, an EVA would be located from Q Court to Walerga Road in the southwest corner of the project site.

During project construction, temporary lane closures on Baseline Road and Walerga Road may be required; however, any temporary lane closures would be coordinated with County emergency services, and are anticipated to occur at night during off-peak hours. In addition, during project operation, implementation of County emergency response plans would not be impaired and emergency access throughout the project site would be provided by internal circulation.

The off-site sewer lift station improvements area would include utility improvements and, unlike the proposed development of the project site, would not include residential development. Therefore, upon completion of the utilities improvements within the off-site sewer lift station improvements area, surrounding roadways would not be impacted and emergency response plans or evacuation plans would not be disrupted. During construction, temporary lane closures surrounding the off-site sewer lift station improvements area are unlikely due to the site's distance from any public streets.

Off-Site Affordable Housing Parcel

As discussed throughout this EIR, the construction of the proposed affordable units does not include any site-specific development plans, designs, or proposals at this time. However, the proposed RVSP amendment and rezone could result in a maximum development potential of 120 affordable income-restricted units. The roads adjacent to the off-site affordable housing parcel that would serve as primary evacuation routes during an emergency event are Watt Avenue to the west and PFE Road to the south.

Although specific site access plans are not currently available, Section 3.6.2 of the RVSP describes access to the off-site affordable housing parcel through an auxiliary lane and acceleration/deceleration tapers on the eastern side of Watt Avenue, as well as by a driveway near the southeastern corner of the parcel to facilitate right turns from westbound traffic on PFE Road. Whether or not the future access to the off-site affordable housing parcel would be consistent with what was anticipated in the RVSP, roadway construction and driveways would be designed compliant with applicable Placer County standards, which would be confirmed during improvement plan review. Therefore, the potential future development of the off-site affordable housing parcel would not interfere with or impair implementation of an adopted emergency response plan or emergency evacuation plan.

Conclusion

Based on the above, the proposed project, including the off-site sewer lift station improvements area and the potential future development of the off-site affordable housing parcel, would not interfere with or impair implementation of an adopted emergency response plan or emergency evacuation plan. Therefore, the project would result in a ***less-than-significant*** impact.

Mitigation Measure(s)
None required.

Cumulative Impacts and Mitigation Measures

As defined in Section 15355 of the CEQA Guidelines, "cumulative impacts" refers to two or more individual effects which, when considered together, are considerable, compound, or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects.

For more details regarding the cumulative setting, refer to Chapter 20, Statutorily Required Sections, of this EIR.

11-5 Cumulative exposure to potential hazards, including wildfire, and increases in the transport, storage, and use of hazardous materials. Based on the analysis below, the cumulative impact is *less than significant*.

As discussed, project-specific impacts associated with hazardous materials related to implementation of the proposed project and the potential future development of the off-site affordable housing parcel were found to be less than significant. Hazardous materials and other public health and safety issues are generally site-specific and/or project-specific, and would not be significantly affected by other development within the project area. Combined or additive cumulative impacts from multiple related or reasonably proximate projects do not exist, as each project has its own localized hazards-related impacts addressed by site-specific mitigation. Cumulative development projects would be subject to the same federal, State, and local hazardous materials management requirements as would the proposed project, which would minimize potential risks associated with increased hazardous materials use in the community. Therefore, cumulative impacts associated with hazardous materials transport, storage, and use associated with implementation of past, present, and reasonably foreseeable future projects, as well as the proposed project, would be ***less than significant***.

Mitigation Measure(s)
None required.

12. Hydrology and Water Quality

12. HYDROLOGY AND WATER QUALITY

12.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County an approximately four-acre parcel offsite within the Riolo Vineyards Specific Plan (RVSP), which could develop a maximum of 120 affordable income-restricted units.

The Hydrology and Water Quality chapter of the EIR describes existing drainage patterns on the project site, current stormwater flows, and stormwater infrastructure. The impact discussions and mitigation measures presented in each technical section apply to both the project site and the off-site sewer lift station improvements area, unless otherwise stated. The chapter also evaluates potential impacts of the proposed project and potential future maximum development of the off-site affordable housing parcel with respect to increases in impervious surface area and associated stormwater flows, degradation of water quality, and increases in on- and off-site flooding.

Information used for the chapter was primarily drawn from Drainage Reports prepared for each phase of the proposed project by King Engineering (see Appendix G).[1] In addition, information was drawn from the Placer County General Plan (PCGP),[2] the PCGP EIR,[3] the Dry Creek-West Placer Community Plan (DCWPCP),[4] the RVSP EIR,[5] the Dry Creek Watershed Coordinated Resource Management Plan (DCWCRMP),[6] and the Update to the Dry Creek Watershed Flood Control Plan.[7] Water supply availability is addressed in Chapter 15, Public Services and Utilities, of this EIR.

12.2 EXISTING ENVIRONMENTAL SETTING

The section below describes regional hydrology, the existing drainage patterns within the project site, off-site sewer lift station improvement area, and off-site affordable housing parcel, including peak flows, existing water quality, and groundwater conditions.

Regional Hydrology

The project site, off-site sewer lift station improvement area, and off-site affordable housing parcel are located within the DCWPCP area within Placer County, California. According to the DCWPCP, the hydrologic characteristics in the plan area are largely affected by seasonal rainfall. The majority of the watercourses in the area are seasonal, and only support flows during the rainy season. However, Dry Creek, the largest water feature within the DCWPCP area, flows year-round. In all, the Dry Creek watershed drains approximately 101 square miles.[8] The watershed begins west of Auburn and drains into Steelhead Creek. Flows from Steelhead Creek discharge to the American River, and ultimately to the Sacramento River.

According to the DCWCRMP, higher peak flows and total storm flows are not being adequately conveyed through stream channels (and structures) within the Dry Creek watershed that were originally developed (or were modified) for conveyance of lower flows, which results in localized flooding. Additionally, several areas within the watershed have degrading/unstable banks, incising streams, and are experiencing sedimentation of the streambed due, in part, to the modified flow regime caused by increases in impervious surface area that have occurred as a result of development activities in the area.

Modification of watershed hydrology is also compounded by modification of the instream configuration by channelization, levees, dredging, structures (dams, bridges, other), and reduced floodplain area. Such modifications also result in altered stream flow where flow is faster in some areas, contributing to erosion and faster peak flow timing, but slower in other areas (behind dams and other impeding structures), contributing to flooding and sediment deposition.

Dry Creek has an extensive record of flooding and flood damage to areas within the lower portion of the creek's watershed. Historic flooding in the area occurred in 1986, 1995, and 1997. Flooding generally occurs from October through April, when soils become saturated during winter rain events followed by high intensity storm systems. The lower portion of Dry Creek is characterized by high peak flows of moderate duration. Flooding from cloudburst storms of high intensity can occur from late spring to early fall; however, runoff resulting from the summer storms tends to be significantly less in peak and volume. Though significant progress has been made towards reducing flood risks in the Dry Creek watershed through the implementation of local improvement projects, including bridge replacements, flow bypasses, building elevation projects and residential buyouts, numerous flood hazard areas and roadway stream crossings still do not have adequate capacity.[9]

Project Site and Surrounding Area Drainage

The project site is bisected by Walerga Road, which generally curves from northeast to southwest. The 52.3-acre northern portion of the site (APN 023-221-076) is bounded by Baseline Road to the north and Walerga Road to the south. The northern portion of the site is undeveloped, consists of non-native annual grassland with gently rolling topography, and is interspersed with seasonal wetlands and vernal pools. The 35.3-acre southern portion of the site (APN 023-221-074) is bounded by Walerga Road to the north and west. The southern portion of the site includes a paved bicycle trail which extends from Vineyard Road to the east and Walerga Road to the west. In addition, the southern portion of the site includes undeveloped annual grassland with gently

[8] Placer and Sacramento Counties. *Dry Creek Watershed Coordinated Resource Management Plan* [pg. 1]. December 31, 2003.

[9] Placer County Flood Control and Water Conservation District. *Update to the Dry Creek Watershed Flood Control Plan* [pg. ES-2]. November 2011.

rolling topography, interspersed with seasonal wetlands, vernal pools, and is bisected by an un-named tributary of Dry Creek (Placer Creek), which flows east to west.

The project site is located within the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) Panels 06061C0938H and 06061C1026H, effective November 2, 2018 (see Figure 12-1). Based on the FEMA FIRMs, the Placer Creek tributary area within the project site is within the existing 100-year floodplain and classified as Zone AE. The FEMA AE zone is defined as areas subject to inundation by the one percent annual chance flood event, and FEMA provides base flood elevations for such areas.

The off-site sewer lift station improvements area is located within the FEMA FIRM Panel 06061C1026H, effective November 2, 2018 (see Figure 12-2). Based on the FEMA FIRM, the off-site sewer lift station improvements area is located within the Zone AE regulatory floodway with a base flood elevation of 97 feet.

According to the Drainage Reports prepared for the proposed project, approximately 35.6 acres within the northern portion of the project site are located within the Curry Creek watershed, which is part of the greater Cross Canal watershed. As shown in Figure 12-3, the Dry Creek Walerga Road Tributary watershed spans a total of approximately 689.18 acres, and includes the majority of the project site, excluding 35.6 acres, as well as additional land in the project vicinity. Approximately 56.6 acres of the project site currently drains to Dry Creek.

The project site is predominantly undeveloped and characterized by rolling terrain. The soils throughout the site are identified generally as deeply weathered gravel, sand, and silt, and have infiltration rates ranging from moderate to very slow (high runoff potential) when thoroughly wet. The majority of the project site drains towards an un-named tributary of Dry Creek (named "Placer Creek" for this project), and contributes to Dry Creek, which drains overall to the west. Figure 12-4 shows the overall existing drainage shed for the project site and additional land in the project vicinity. Placer Creek flows southwest through an existing box culvert under Walerga Road, then along the northwestern edge of the Doyle Ranch community, into Dry Creek approximately 0.5-mile to the southwest. The stormwater runoff estimates for existing conditions on the project site are summarized in Table 12-1 below.

Table 12-1
On-Site Peak Flow Characteristics – Existing Conditions

Discharge Location[1]	Area (acres)	10-Year Peak Flow (cfs)[2]	100-Year Peak Flow (cfs)[2]
Point A	35.6	18.5	38.0
Point B	20.3	22.5	43.3
Point C	49.7	39.3	75.8
Total	**105.6**	**80.4**	**157.2**

[1] See Figure 12-4 for discharge point locations
[2] cfs = cubic feet per second
Source: King Engineering, 2026.

Point A currently discharges to Curry Creek through an existing 42-inch flared-end storm drain pipe. Point B consists of a 48-inch flared-end storm drain pipe with riprap, north of the on-site Placer Creek tributary, along the eastern edge of Walerga Road. Point C is the Placer Creek tributary, west of Walerga Road.

Figure 12-3
Existing Dry Creek Walerga Road Tributary Watershed

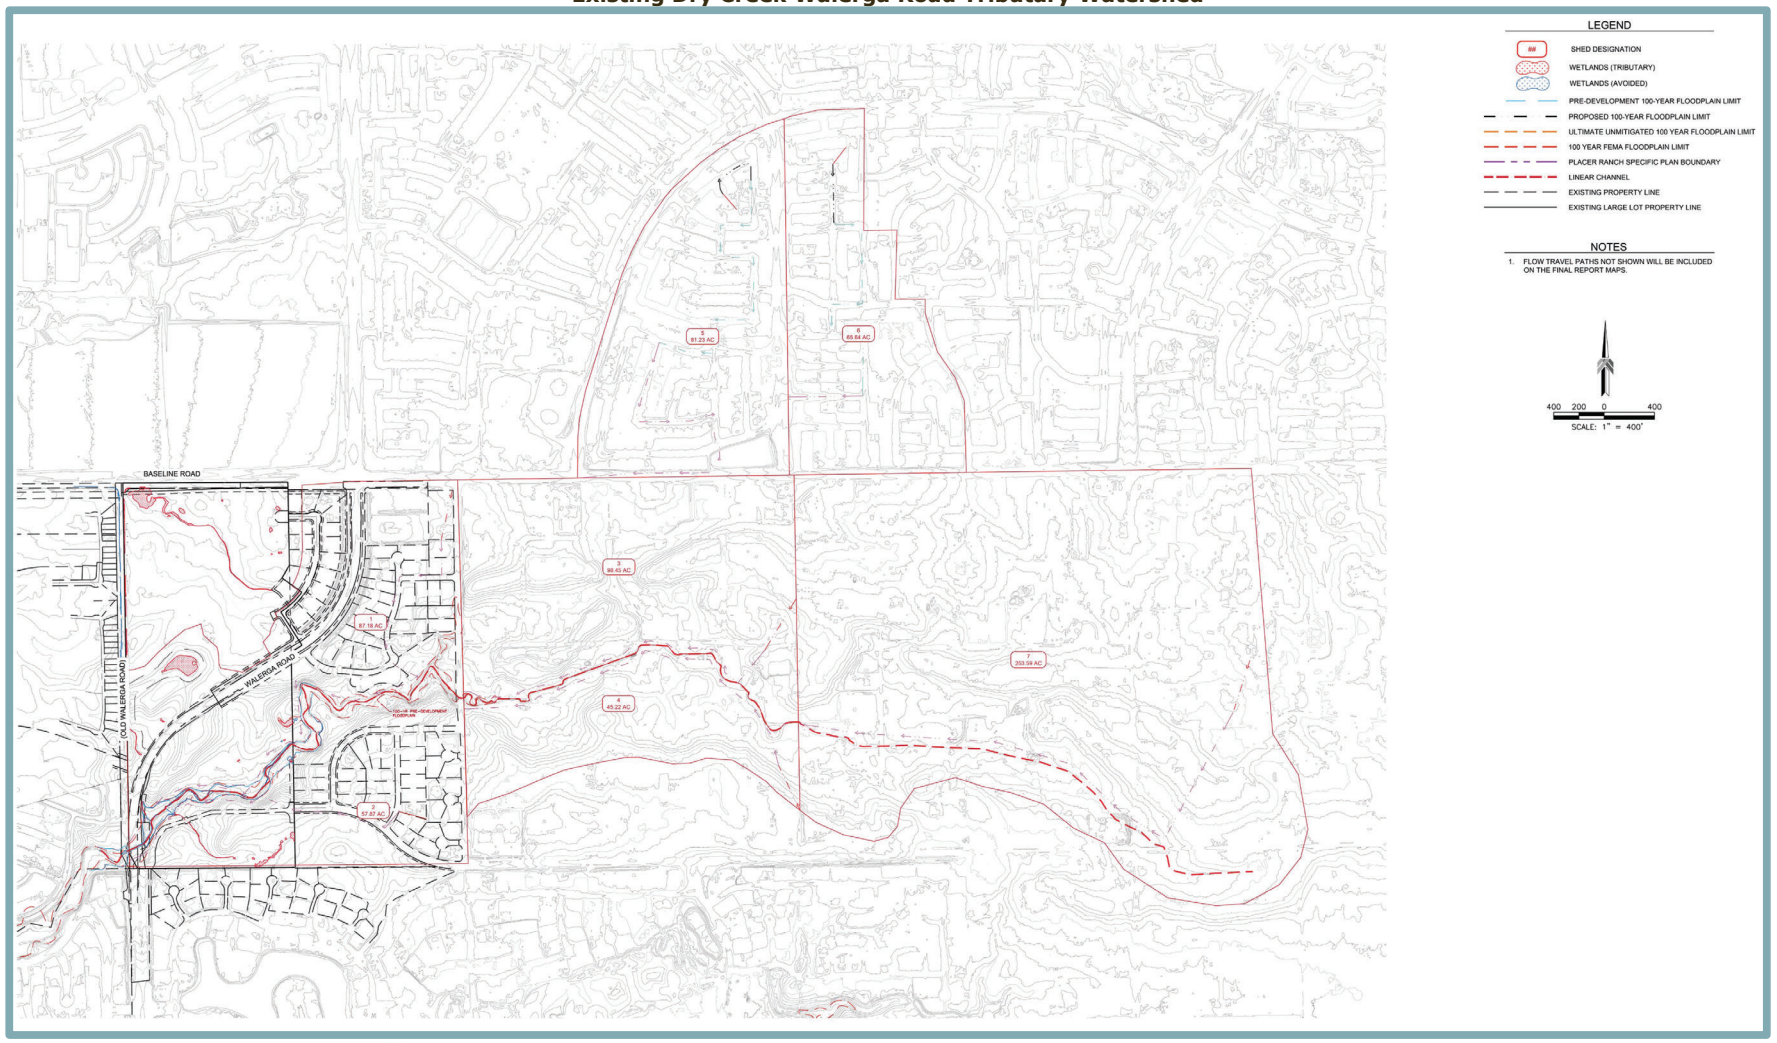

*Figure not OCR compatible.

Figure 12-4
Pre-Development Overall Drainage Shed Map

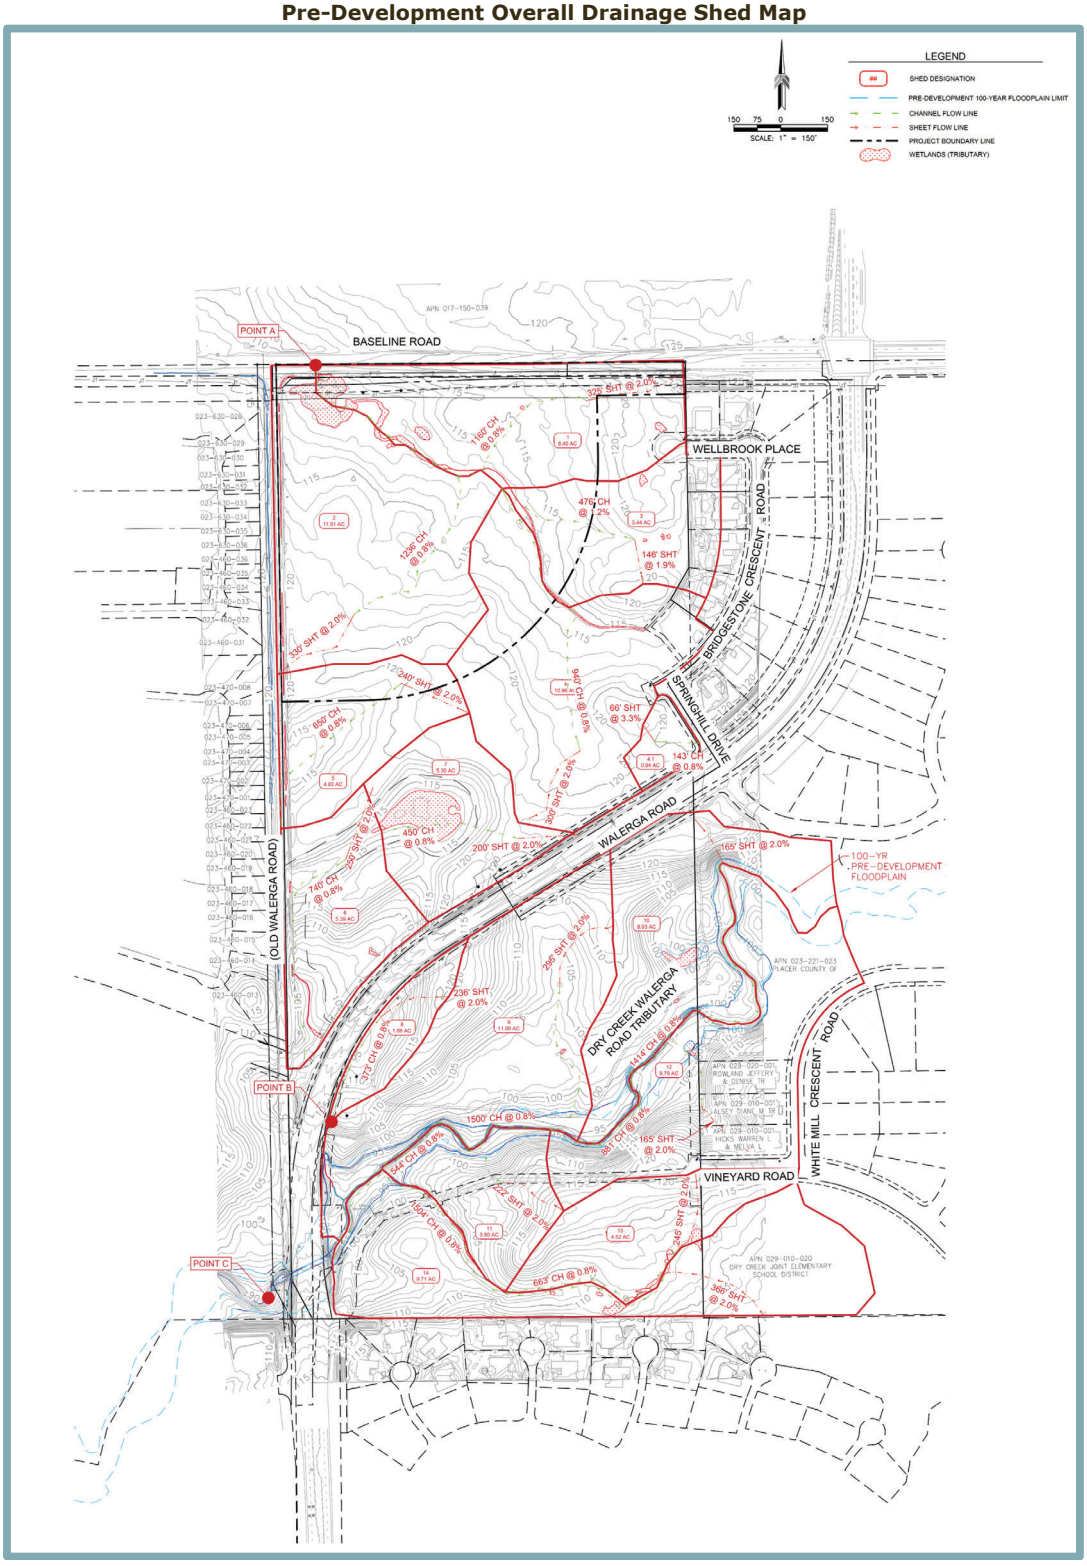

*Figure not OCR compatible.

The off-site affordable housing parcel consists of approximately four acres of undeveloped land with grassy fields and gently rolling topography located at the northeast corner of PFE Road and Watt Avenue. According to Figure 6-1a of the RVSP EIR, the off-site affordable housing parcel consists primarily of annual grasslands with seasonal wetland located on the southeast portion of the parcel. The off-site affordable housing parcel is located within the FEMA FIRM Panel 06061C1007H, effective November 2, 2018 (see Figure 12-5). Based on the FEMA FIRM, the off-site affordable housing parcel is not located within the existing 100-year floodplain.

The off-site affordable housing parcel is located within the Dry Creek watershed. According to Figure 13-2 of the RVSP EIR, the northern portion of the off-site affordable housing parcel drains to a southern tributary of Dry Creek, and the southern portion of the parcel drains southwest through culverts under PFE Road and ultimately drains into Dry Creek downstream of Watt Avenue.

Water Quality

Activities and/or conditions that have the potential to degrade water quality include but are not limited to, construction activities and urban stormwater runoff.

Construction activities have the potential to cause erosion and sedimentation associated with groundbreaking and clearing activities, which could cause unstabilized soil to be washed or wind-blown into nearby surface water. In addition, the use of heavy equipment during construction activities, especially during rainfall events, have the potential to cause petroleum products and other pollutants to enter nearby drainages.

Water quality degradation from urban stormwater runoff is primarily the result of runoff carrying pollutants from the land surface (e.g., streets, parking lots, etc.) to the receiving waters (e.g., streams and lakes). Pollutants typically found in urban runoff include facility maintenance and lawn-care/landscaping chemicals (insecticides, herbicides, fungicides and rodenticides), heavy metals (such as copper, zinc and cadmium), oils and greases from automobiles and other mechanical equipment, and nutrients (nitrogen and phosphorus).

Groundwater

The project site and off-site affordable housing parcel are located within the North American Subbasin and the jurisdiction of the West Placer Groundwater Sustainability Agency (WPGSA). The WPGSA was formed in 2017 as a partnership between Placer County, the cities of Roseville and Lincoln, the Placer County Water Agency, and the California American Water Company to comply with the requirements of the Sustainable Groundwater Management Act (SGMA). The goal of the WPGSA is to manage portions of the North American Subbasin by protecting against overdraft and creating sustainable water supplies.

Groundwater levels in southwestern Placer County and northern Sacramento County have generally decreased in recent history, with many wells experiencing declines at a rate of approximately 2.5 feet per year.[10] However, the North American Subbasin, within which the project site is located, is not identified by the California Department of Water Resources (DWR) as being in a state of overdraft.[11]

[10] California Department of Water Resources. *California's Groundwater, Bulletin 118, Update 2020* [pg. 7-48]. November 2021.
[11] California Department of Water Resources. *California's Critically Overdrafted Groundwater Basins.* January 2020.

Figure 12-5
Off-Site Affordable Housing Parcel FEMA FIRM 06061C1007H

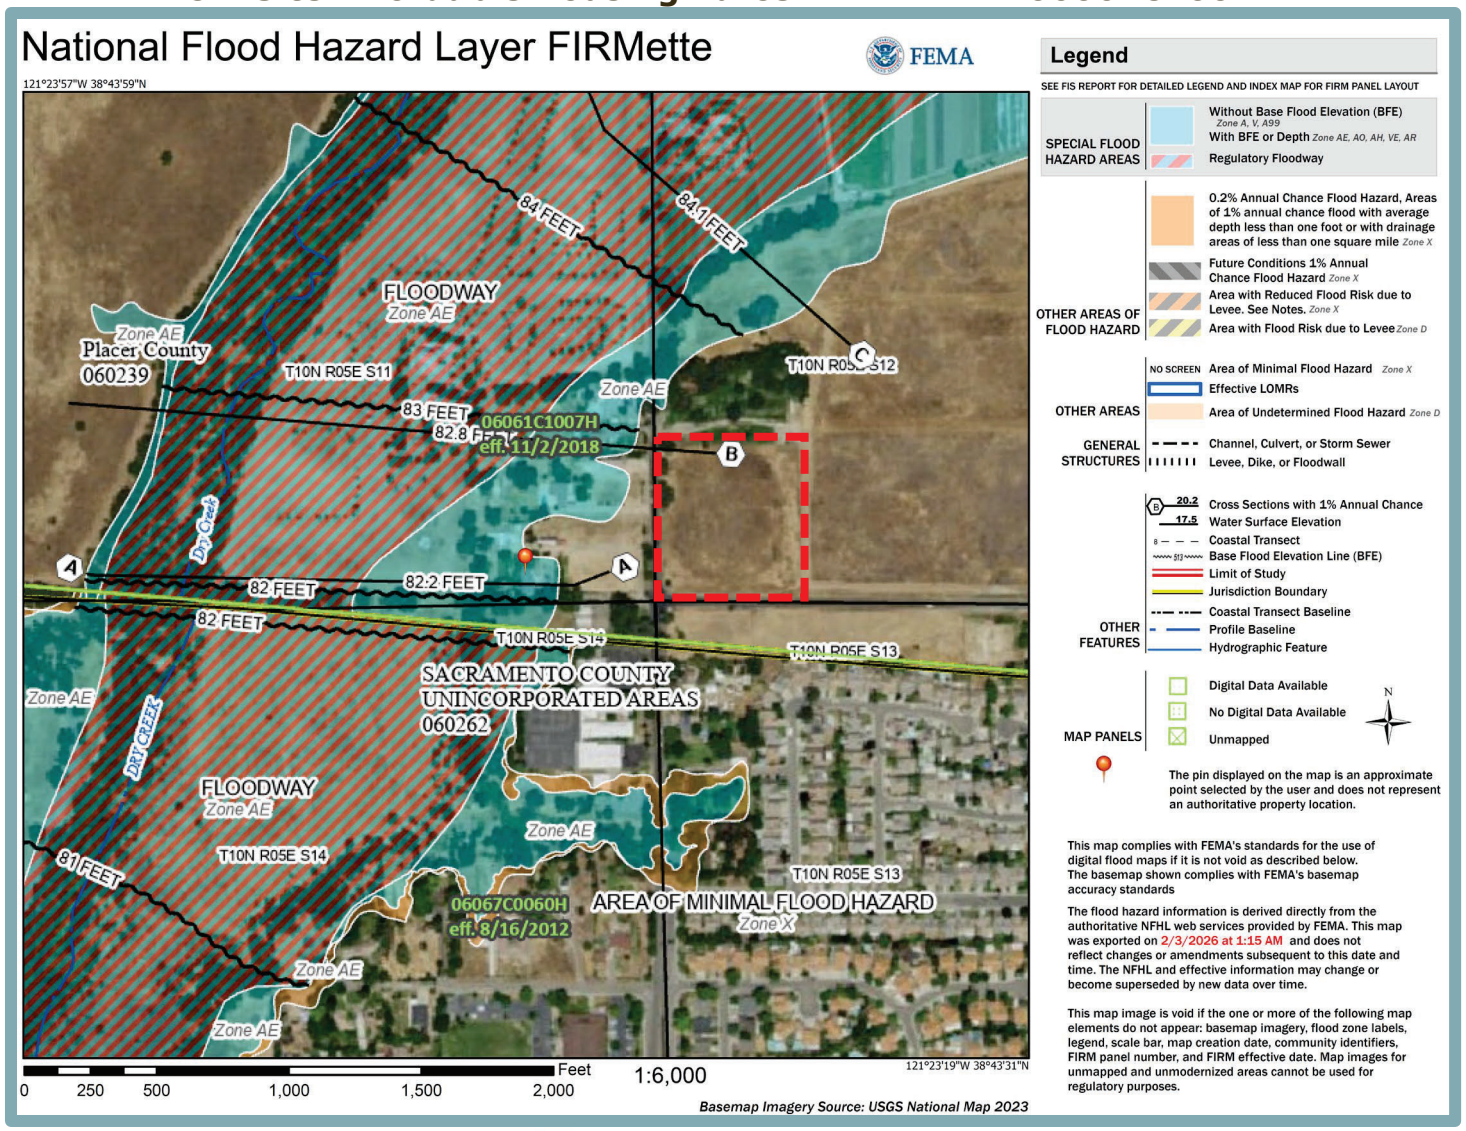

*Figure not OCR compatible.

Groundwater overdraft is a condition within a developed groundwater basin in which the amount of water pumped from the basin exceeds the sustainable yield of the basin over the long term.

According to the Geotechnical Due Diligence Review prepared for the proposed project by ENGEO (see Appendix E),[12] groundwater was not encountered during previous subsurface explorations. According to the SGMA Data Viewer, groundwater in the vicinity occurred at depths of 110 to 120 feet in fall 2021 and 100 to 110 feet in spring 2022. Fluctuations in the level of groundwater may occur due to variations in rainfall, irrigation practice, and other factors not evident at the time measurements were made.

12.3 REGULATORY CONTEXT

The following is a description of federal, State, and local environmental laws and policies that are relevant to the review of hydrology and water quality under the CEQA process.

Federal Regulations

The following section includes federal environmental goals and policies relevant to the CEQA review process pertaining to the hydrology and water quality aspects of the proposed project.

Federal Emergency Management Agency

FEMA is responsible for determining flood elevations and floodplain boundaries based on U.S. Army Corps of Engineers (USACE) studies. FEMA is also responsible for distributing the FIRMs, which are used in the National Flood Insurance Program (NFIP). The FIRMs identify the locations of special flood hazard areas, including the 100-year floodplains.

FEMA allows non-residential development in the floodplain; however, construction activities are restricted within flood hazard areas, depending upon the potential for flooding within each area. Federal regulations governing development in a floodplain are set forth in Title 44, Part 60 of the Code of Federal Regulations (CFR). These standards are implemented at the State level through construction codes and local ordinances; however, these regulations only apply to residential and non-residential structure improvements. Although roadway construction or modification is not explicitly addressed in the FEMA regulations, the California Department of Transportation (Caltrans) has also adopted criteria and standards for roadway drainage systems and projects situated within designated floodplains. Standards that apply to floodplain issues are based on federal regulations (Title 23, Part 650 of the CFR). At the State level, roadway design must comply with drainage standards included in Chapters 800-890 of the Caltrans Highway Design Manual. CFR Section 60.3(c)(10) restricts cumulative development from increasing the water surface elevation of the base flood by more than one foot within the floodplain.

Federal Clean Water Act

The National Pollutant Discharge Elimination System (NPDES) permit system was established in the federal Clean Water Act (CWA) to regulate municipal and industrial discharges to surface waters of the U.S. Each NPDES permit contains limits on allowable concentrations and mass emissions of pollutants contained in the discharge. Sections 401 and 402 of the CWA contain general requirements regarding NPDES permits. Section 307 of the CWA describes the factors that the Environmental Protection Agency (EPA) must consider in setting effluent limits for priority pollutants.

[12] ENGEO. *Estia Walerga, Walerga Road and Baseline Road, Placer County, California, Geotechnical Due Diligence Review.* December 26, 2023.

Nonpoint sources are diffuse and originate over a wide area rather than from a definable point. Nonpoint pollution often enters receiving water in the form of surface runoff, but is not conveyed by way of pipelines or discrete conveyances. As defined in the federal regulations, such nonpoint sources are generally exempt from federal NPDES permit program requirements. However, two types of nonpoint source discharges are controlled by the NPDES program – nonpoint source discharge caused by general construction activities, and the general quality of stormwater in municipal stormwater systems. The 1987 amendments to the CWA directed the federal EPA to implement the stormwater program in two phases. Phase I addressed discharges from large (population 250,000 or above) and medium (population 100,000 to 250,000) municipalities and certain industrial activities. Phase II addresses all other discharges defined by EPA that are not included in Phase I.

Section 402 of the CWA mandates that certain types of construction activities comply with the requirements of the NPDES stormwater program. The Phase II Rule, issued in 1999, requires that construction activities that disturb land equal to or greater than one acre require permitting under the NPDES program. In California, permitting occurs under the General Permit for Stormwater Discharges Associated with Construction Activity, issued to the State Water Resources Control Board (SWRCB), implemented and enforced by the nine Regional Water Quality Control Boards (RWQCBs).

As of July 1, 2010, all dischargers with projects that include clearing, grading or stockpiling activities expected to disturb one or more acres of soil are required to obtain compliance under the NPDES Construction General Permit Order 2009-0009-DWQ. The General Permit requires all dischargers, where construction activity disturbs one or more acres, to take the following measures:

1. Develop and implement a Stormwater Pollution Prevention Plan (SWPPP) to include a site map(s) of existing and proposed building and roadway footprints, drainage patterns and stormwater collection and discharge points, and pre- and post- project topography;
2. Describe types and placement of Best Management Practices (BMPs) in the SWPPP that will be used to protect stormwater quality;
3. Provide a visual and chemical (if non-visible pollutants are expected) monitoring program for implementation upon BMP failure; and
4. Provide a sediment monitoring plan if the area discharges directly to a water body listed on the 303(d) list for sediment.

To obtain coverage, a SWPPP must be submitted to the RWQCB electronically and a copy of the SWPPP must be submitted to Placer County. When project construction is completed, the landowner must file a Notice of Termination (NOT).

State Regulations

The following section includes the State regulations relevant to the CEQA review process pertaining to the hydrology and water quality aspects of the proposed project.

State Water Resources Control Board

The SWRCB and the RWQCBs are responsible for ensuring implementation and compliance with the provisions of the federal CWA and California's Porter-Cologne Water Quality Control Act. The project site is situated within the jurisdictional boundaries of the Central Valley RWQCB (CVRWQCB) (Region 5). The CVRWQCB has the authority to implement water quality protection

standards through the issuance of permits for discharges to waters at locations within their jurisdiction.

Central Valley Regional Water Quality Control Board

As authorized by the Porter-Cologne Water Quality Control Act, the CVRWQCB's primary function is to protect the quality of the waters within its jurisdiction for all beneficial uses. State law defines beneficial uses of California's waters that may be protected against quality degradation to include, but not be limited to: domestic; municipal; agricultural and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves.

The CVRWQCB implements water quality protection measures by formulating and adopting water quality control plans (referred to as basin plans, as discussed below) for specific groundwater and surface water basins, and by prescribing and enforcing requirements on all agricultural, domestic, and industrial waste discharges. The CVRWQCB oversees many programs to support and provide benefit to water quality, including the following major programs: Agricultural Regulatory; Above-Ground Tanks; Basin Planning; CALFED; Confined Animal Facilities; Landfills and Mining; Non-Point Source; Spills, Leaks, Investigations, and Cleanups (SLIC); Stormwater; Total Maximum Daily Load (TMDL); Underground Storage Tanks (UST), Wastewater Discharges (including the NPDES); Water Quality Certification; and Watershed Management.

The CVRWQCB is responsible for issuing permits for a number of varying activities. Activities subject to the CVRWQCB permitting requirements include stormwater, wastewater, and industrial water discharge, disturbance of wetlands, and dewatering. Permits issued and/or enforced by the CVRWQCB include, but are not limited to, the NPDES Construction General Permit, NPDES Municipal Stormwater Permits, Industrial Stormwater General Permits, Clean Water Act Section 401 and 404 Permits, and Dewatering Permits.

Basin Plans and Water Quality Objectives

The Porter-Cologne Water Quality Control Act provides for the development and periodic review of water quality control plans (basin plans) that are prepared by the regional water quality control boards. Basin plans designate beneficial uses of California's major rivers and groundwater basins, and establish narrative and numerical water quality objectives for those waters. Beneficial uses represent the services and qualities of a water body (i.e., the reasons why the water body is considered valuable), while water quality objectives represent the standards necessary to protect and support those beneficial uses. Basin plans are primarily implemented through the NPDES permitting system and by issuing waste discharge regulations to ensure that water quality objectives are met.

Basin plans provide the technical basis for determining waste discharge requirements and taking regulatory enforcement actions if deemed necessary. The project site is located within the jurisdiction of the CVRWQCB. A basin plan has been adopted for the Sacramento and San Joaquin River Basin (Basin Plan), which covers all of the project area.

The Basin Plan sets water quality objectives for the surface waters in its region for the following substances and parameters: ammonia, bacteria, biostimulatory substances, chemical constituents, color, dissolved oxygen, floating material, oil and grease, pH, radioactivity, salinity, sediment, settleable material, suspended material, taste and odor, temperature, toxicity, turbidity, and

pesticides. For groundwater, water quality objectives applicable to all groundwater have been set for bacteria, chemical constituents, radioactivity, taste, odors, and toxicity.

Senate Bill 5

In 2007, the State of California set the 200-year storm event as the Urban Level of Flood Protection (ULOP) for certain portions of the State through a series of laws included in Senate Bill (SB) 5. Along with other related legislation, SB 5 established a mandate for local governments to amend their general plans and zoning codes to be consistent with State law on floodplain management. Specifically, SB 5 requires all cities and counties within the Sacramento-San Joaquin Valley, as defined in California Government Code Sections 65007(h) and (j), to make findings related to an ULOP or the national FEMA standard of flood protection before: (1) entering into a development agreement for any property that is located within a flood hazard zone; (2) approving a discretionary permit or other discretionary entitlement, or a ministerial permit that would result in the construction of a new residence, for a project that is located within a flood hazard zone; or (3) approving a tentative map, or a parcel map for which a tentative map was not required, for any subdivision that is located within a flood hazard zone. The primary purpose of the law is to ensure that appropriate flood protection is provided in urban and urbanizing areas. Placer County has amended the County's flood management policies to bring the County into compliance with State law and provide for increased flood protection for urban areas, consistent with SB 5.

A project would be subject to the requirements of SB 5 if the project would meet all of the following five criteria:

1. Located within an urban area that is a developed area, as defined by CFR Title 44, Section 59.1, with 10,000 residents or more, or an urbanizing area that is a developed area or an area outside a developed area that is planned or anticipated to have 10,000 residents or more within the next 10 years.
2. Located within a flood hazard zone that is mapped as either a special hazard area or an area of moderate hazard on FEMA's official (i.e., effective) FIRM for the NFIP.
3. Located within the Sacramento-San Joaquin Valley.
4. Located within an area with a potential flood depth above 3.0 feet, from sources of flooding other than localized conditions that may occur anywhere in a community, such as localized rainfall, water from stormwater and drainage problems, and water from temporary water and wastewater distribution system failure.
5. Located within a watershed with a contributing area of more than 10 square miles.

With respect to Criteria 1, the project site is in an urban area. With respect to Criteria 2, according to the Drainage Report, the Placer Creek tributary area portion of the project site is located within the Zone AE floodplain, and the project site is also located within the Sacramento Valley, consistent with Criteria 3. However, with respect to Criteria 4 and Criteria 5, according to the Drainage Reports prepared for the proposed project, the project site is not located within an area with a potential flood depth above 3.0 feet, and the Dry Creek Walerga Road Tributary (i.e., the Placer Creek tributary) watershed area is approximately 1.3 square miles. As such, the project site does not meet the foregoing criteria and would not be subject to the SB 5 requirements. Nonetheless, the portions of the site along the Dry Creek Walerga Road Tributary would not be developed with residential uses.

Local Regulations

Relevant goals and policies from the PCGP and the DCWPCP, as well as various other local guidelines and regulations related to hydrology and water quality, are discussed below.

Placer County General Plan

The following policies from the PCGP related to hydrology and water quality are applicable to the proposed project:

Public Facilities and Services Element

Goal 4.E To collect and dispose of stormwater in a manner that least inconveniences the public, reduces potential water-related damage, and enhances the environment.

Policy 4.E.1 The County shall encourage the use of natural stormwater drainage systems to preserve and enhance natural features.

Policy 4.E.2 The County shall support efforts to acquire land or obtain easements for drainage and other public uses of floodplains where it is desirable to maintain drainage channels in a natural state.

Policy 4.E.4 The County shall ensure that new storm drainage systems are designed in conformance with the Placer County Flood Control and Water Conservation District's Stormwater Management Manual and the County Land Development Manual.

Policy 4.E.8 The County shall consider recreational opportunities and aesthetics in the design of stormwater ponds and conveyance facilities.

Policy 4.E.9 The County shall encourage good soil conservation practices in agricultural and urban areas and carefully examine the impact of proposed urban developments with regard to drainage courses.

Policy 4.E.10 The County shall strive to improve the quality of runoff from urban and suburban development through use of appropriate and feasible mitigation measures including, but not limited to, artificial wetlands, grassy swales, infiltration/sedimentation basins, riparian setbacks, oil/grit separators, and other best management practices (BMPs).

Policy 4.E.11 The County shall require new development to adequately mitigate increases in stormwater peak flows and/or volume. Mitigation measures should take into consideration impacts on adjoining lands in the unincorporated area and on properties in jurisdictions within and immediately adjacent to Placer County.

Policy 4.E.12 The County shall encourage project designs that minimize drainage concentrations and impervious coverage and maintain, to the extent feasible, natural site drainage conditions.

Policy 4.E.13 The County shall require that new development conforms with the applicable programs, policies, recommendations, and plans of the Placer County Flood Control and Water Conservation District.

Policy 4.E.14 The County shall require projects that have significant impacts on the quantity and quality of surface water runoff to allocate land as necessary for the purpose of detaining post-project flows and/or for the incorporation of mitigation measures for water quality impacts related to urban runoff.

Policy 4.E.15 The County shall identify and coordinate mitigation measures with responsible agencies for the control of storm sewers, monitoring of discharges, and implementation of measures to control pollutant loads in urban storm water runoff (e.g., California Regional Water Quality Control Board, Placer County Division of Environmental Health, Placer County Department of Public Works, Placer County Flood Control and Water Conservation District).

Goal 4.F To protect the lives and property of the citizens of Placer County from hazards associated with development in floodplains and manage floodplains for their natural resource values.

Policy 4.F.1 The County shall require that arterial roadways and expressways, residences, commercial and industrial uses and emergency facilities be protected, at a minimum, from a 100-year storm event.

Policy 4.F.4 The County shall require evaluation of potential flood hazards prior to approval of development projects. The County shall require proponents of new development to submit accurate topographic and flow characteristics information and depiction of the 100-year floodplain boundaries under fully-developed, unmitigated runoff conditions.

Policy 4.F.5 The County shall attempt to maintain natural conditions within the 100-year floodplain of all rivers and streams except under the following circumstances:

a. Where work is required to manage and maintain the stream's drainage characteristics and where such work is done in accordance with the Placer County Flood Damage Prevention Ordinance, California Department of Fish and Game regulations, and Clean Water Act

provisions administered by the U.S. Army Corps of Engineers.

Policy 4.F.14 The County shall ensure that new storm drainage systems are designed in conformance with the Placer County Flood Control and Water Conservation District's Stormwater Management Manual and the County's Land Development Manual.

Natural Resources Element

Goal 6.A To protect and enhance the natural qualities of Placer County's streams, creeks and groundwater.

Policy 6.A.2 The County shall require all development in the 100-year floodplain to comply with the provisions of the Placer County Flood Damage Prevention Ordinance.

Policy 6.A.4 Where stream protection is required or proposed, the County should require public and private development to:

a. Preserve creek corridors and creek setback areas through easements or dedication. Parcel lines (in the case of a subdivision) or easements (in the case of a subdivision or other development) shall be located to optimize resource protection. If a creek is proposed to be included within an open space parcel or easement, allowed uses and maintenance responsibilities within that parcel or easement should be clearly defined and conditioned prior to map or project approval;
b. Designate such easement or dedication acres (as described in a. above) as open space;
c. Protect creek corridors and their habitat value by actions such as: 1) providing an adequate creek setback, 2) maintaining creek corridors in an essentially natural state, 3) employing creek restoration techniques where restoration is needed to achieve a natural creek corridor, 4) utilizing riparian vegetation within creek corridors, and where possible, within creek setback areas, 5) prohibiting the planting of invasive, non-native plants (such as Vinca major and eucalyptus) within creek corridors or creek setbacks, and 6) avoiding tree removal within creek corridors;
d. Provide recreation and public access near creeks consistent with other General Plan policies;
e. Use design, construction, and maintenance techniques that ensure development near a creek will not cause or worsen natural hazards (such as erosion, sedimentation, flooding, or water pollution) and will include erosion and sediment control practices such as: 1) turbidity screens and other management practices,

which shall be used as necessary to minimize siltation, sedimentation, and erosion, and shall be left in place until disturbed areas; and/or are stabilized with permanent vegetation that will prevent the transport of sediment off site; and 2) temporary vegetation sufficient to stabilize disturbed areas.

f. Provide for long-term creek corridor maintenance by providing a guaranteed financial commitment to the County which accounts for all anticipated activities.

Policy 6.A.5 The County shall continue to require the use of feasible and practical best management practices (BMPs) to protect streams from the adverse effects of construction activities and urban runoff and to encourage the use of BMPs for agricultural activities.

Policy 6.A.6 The County shall require development projects to comply with the municipal and construction stormwater permit requirements of the Federal Clean Water Act National Pollutant Discharge Elimination System (NPDES) Phase I and II programs and the State General Municipal and Construction permits. Municipal requirements affecting project design and construction practices are enacted through the County's Stormwater Quality Ordinance. Separate construction permits may be required by and obtained through the State Water Resources Control Board.

Policy 6.A.7 All new development and redevelopment projects shall be designed so as to minimize the introduction of pollutants into stormwater runoff, to the maximum extent practicable, as well as minimize the amount of runoff through the incorporation of appropriate Best Management Practices.

Policy 6.A.8 The County shall support implementation of Low Impact Development site design and Watershed Process Management requirements for new and redevelopment projects in accordance with the NPDES Phase I and II programs, and applicable NPDES permits.

Policy 6.A.9 The County shall require that natural watercourses be integrated into new development in such a way that they are accessible to the public and provide a positive visual element.

Policy 6.A.10 The County shall discourage grading activities during the rainy season, unless adequately mitigated, to avoid sedimentation of creeks and damage to riparian habitat.

Policy 6.A.12 The County shall require that newly-created parcels include adequate space outside of watercourses' setback areas to ensure that property owners will not place improvements (e.g.,

pools, patios, and appurtenant structures), within areas that require protection.

Health and Safety Element

Goal 8.B.1 To minimize the risk of loss of life, injury, damage to property, and economic and social dislocations resulting from flood hazards year-round.

Policy 8.B.1.1 The County shall require flood proofing of new and substantially improved structures in areas subject to flooding to be built in accordance with the Flood Damage Prevention Ordinance (Placer County Code Chapter 15, Article 15.52).

Policy 8.B.1.2 The County shall prohibit the construction of projects, including public facilities and other facilities essential for emergencies and large public assembly, within the County's Regulatory Floodway, unless the structure and access to the structure is adequately protected from flood hazards, incorporates all required flood protection specific to that area in accordance with County ordinances and guidelines, and will not result in any significant adverse impacts.

Policy 8.B.1.3 The County shall require evaluation of potential flood hazards prior to approval of a discretionary or ministerial permit that would result in the construction or modification of structures, to determine whether the proposed project is consistent with the protection standards for the County Regulatory Floodplain. The County will not approve any discretionary project or any ministerial permit that would result in the construction or modification of structures for any property within the County Regulatory Floodplain, unless the required flood protection specific to that area has been demonstrated in accordance with County ordinances and guidelines.

Policy 8.B.1.4 New construction shall not be permitted within 100 feet of the centerline of permanent streams and within 50 feet of intermittent streams, or within the 100-year floodplain, whichever distance is greater.

Policy 8.B.1.6 The County shall ensure new development projects incorporate design strategies and features to reduce the area of impervious surfaces.

Goal 8.B.2 To ensure that natural systems and flood-control infrastructure can handle floodwater year-round and are adaptable to new and changing conditions. (Addresses California Government Code Section 65302(g)(4)(B)).

Policy 8.B.2.1 The County shall promote flood- control measures that maintain natural conditions within the County's Regulatory Floodplain of rivers and streams.

Policy 8.B.2.2 The County shall implement the adaptation strategies as contained in the Placer County Sustainability Plan necessary to ensure that natural systems and flood control infrastructure can handle floodwater year-round.

Policy 8.B.2.3 The County shall require that flood management programs avoid alteration of waterways and adjacent areas, whenever possible.

Dry Creek-West Placer Community Plan

The following goals and policies from the Community Development and Environmental Resources Management Elements of the DCWPCP related to hydrology and water quality are applicable to the proposed project:

Community Development Element: The Land Use Plan

Policy 25 Continue to implement zoning policies which minimize potential loss of property and threat to human life caused by flooding and prohibit the creation of new building sites within the floodplain.

Policy 29 Review proposed developments for their potential adverse affect on air and water quality.

Policy 30 Encourage application of measures to mitigate erosion and water pollution from earth disturbing activities such as grading and road construction.

Community Development Element: Public Services

Goal Flood Control: Protect the lives and property of the citizens of the Dry Creek West Placer area from unacceptable impacts from development in the Dry Creek drainage basin or other watershed in the Plan Area.

Policy 2 Evaluate potential flood hazards in an area prior to approval of any future development by requiring submittal of accurate topographic information and depiction of the 100-year floodplain boundaries.

Policy 4 Maintain natural conditions within the 100-year floodplain of all streams except where work is required to maintain the stream's drainage characteristics and where such work is done in accordance with the Placer County Flood Damage Prevention Ordinance, Department of Fish and Game regulations and Clean Water Act provisions administered by the U.S. Army Corps of Engineers, or when facilities for the treatment of urban runoff can be located in the floodplain providing that there is no destruction of riparian vegetation.

Policy 5 Designate the 100-year floodplain of Dry Creek, including the major tributaries as open space, and provide for some compatible use of these areas in order to encourage their preservation.

Policy 9 Provide storm drains which can collect water for appropriate conveyance to Dry Creek for developing areas with a higher density than Rural-Residential.

Policy 11 Require a water quality analysis for all projects which have a density in excess of one unit per acre and/or have the potential of contaminating surface waters or the aquifer.

Policy 12 Require a feasibility analysis of improving the water quality of urban run-off for all commercial and industrial projects and those residential projects with densities of 1 d.u./acre or greater before run-off enters the Dry Creek watercourse. Said analysis shall consider all feasible mitigation measures including, but not limited to, artificial wetlands, infiltration/sedimentation basins, riparian setbacks, oil/grit separators, or other effective means, where appropriate.

Policy 13 Require the allocation of land, when necessary, for all projects which have significant impacts on the quantity and quality of surface water runoff, for the purpose of detaining post project flows and/or for the incorporation of mitigation measures for water quality impacts related to urban runoff.

Policy 14 Identify and coordinate mitigation measures with responsible agencies for the control of storm sewers, monitoring of discharges and implementation of measures to control pollutant loads in urban storm water runoff (e.g., California Regional Water Quality Control Board, Placer County Division of Environmental Health, Placer County Department of Public Works, etc.).

Environmental Resources Management Element: Natural Resources

Goal 3 Manage the groundwater resource in such a way as to protect it from degradation and to maintain the water table.

Goal 4 Safeguard and maintain natural waterways to ensure water quality, species diversity, and unique habitat preservation.

Policy 2 Preserve in their natural condition all stream environment zones, including floodplains, and riparian vegetation areas.

Policy 3 Seek to maintain or improve the quality of water in the major creeks, especially Dry Creek and its tributaries.

Policy 4 Make every attempt to maintain the existing high quality of the groundwater and preserve aquifer recharge areas.

Policy 10 Improve water quality in the aquifer and the Dry Creek watershed by eliminating existing water pollution sources and by discouraging

activities which include the use of hazardous materials around wetland and recharge areas.

Policy 25 Intermittent streams often become permanent streams concurrent with the development of an area. Therefore, these waterways shall be protected from land development activities which have a potential for detrimental impacts (e.g., grading, channelization, etc.).

NPDES Small Municipal Separate Storm Sewer System (MS4) General Permit

The NPDES Municipal Stormwater Permitting Program regulates stormwater discharges from separate storm sewer systems. NPDES Municipal Stormwater Permits are issued in two phases. Phase I regulates stormwater discharges from large- and medium-sized municipal separate storm sewer systems (those serving more than 100,000 persons). Most Phase I permits are issued to a group of co-permittees encompassing an entire metropolitan area. Phase II provides coverage for smaller municipalities, including nontraditional small storm sewer systems, which include governmental facilities such as military bases, public campuses, and prison and hospital complexes. The NPDES Municipal Stormwater Permits require the discharger to develop and implement a Stormwater Management Plan/Program with the goal of reducing the discharge of pollutants to the maximum extent practicable.

The CVRWQCB issued the NPDES General Permit No. CAS000004 Waste Discharge Requirements for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems, which became effective on July 1, 2013. An “MS4” is a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains): (i) designed or used for collecting or conveying stormwater; (ii) which is not a combined sewer; and (iii) which is not part of a Publicly Owned Treatment Works (POTW). Both Placer County and the City of Roseville are Phase II MS4 permittees. Projects subject to the requirements of the Phase II MS4 NPDES permit must submit the appropriate Post-Construction Stormwater Plan based on the project type/development category. Regulated Projects include projects that create or replace 5,000 square feet (sf) or more of impervious surface. Regulated Projects that create and/or replace one or more acres of impervious surface are considered regulated hydromodification management projects. The proposed project would create more than one acre of impervious area, and, thus, is considered a Regulated Hydromodification Management Project subject to Phase II MS4 NPDES permit post-construction stormwater treatment requirements.

Regulated Projects are required to divide the project area into Drainage Management Areas (DMAs) and implement and direct water to appropriately sized Site Design Measures (SDMs) and Baseline Hydromodification Measures to each DMA to the Maximum Extent Practicable (MEP). Regulated Projects must additionally include Source Control BMPs where possible. SDMs and Baseline Hydromodification Measures include, but are not limited to:

- Rooftop and impervious area disconnection;
- Porous pavement;
- Rain barrels and cisterns;
- Vegetated swales;
- Bio-retention facilities;

- Green roofs; or
- Other equivalent measures.

A detailed description of the requirements for Regulated Hydromodification Management Projects, such as the proposed project, is included in the *West Placer Storm Water Quality Design Manual.*[13]

Placer County Flood Control and Water Conservation District

Formed by SB 1312, the Placer County Flood Control and Water Conservation District (PCFCWCD) is responsible for regional strategies for flood control management. A Stormwater Management Manual (SWMM) was developed by the PCFCWCD to relate the policies, guidelines, and specific criteria for evaluating hydrologic conditions associated with new development projects. In 2011, the PCFCWCD published the *Update to the Dry Creek Watershed Flood Control Plan*, which identifies potential flooding issues associated with the Dry Creek watershed and provides recommendations for means to reduce future flood damages.[14]

Placer County Land Development Manual

Section 5 of the Placer County Land Development Manual (2023) provides supplemental design considerations for drainage facilities, and includes specific criteria used for preparation of drainage reports identical to those in the SWMM (as described above under Placer County Flood Control and Water Conservation District). The Land Development Manual states that in case of conflict with the SWMM, the most stringent requirement shall apply. The Land Development Manual also contains general information with regard to erosion control and BMPs for stormwater drainage.

Placer County Code

Chapter 15, Building and Development, of the Placer County Code includes ordinances associated with hydrology and water quality. The applicable ordinances are discussed in further detail below.

Stormwater Quality Ordinance

Article 8.28, Stormwater Quality Ordinance, is intended to ensure that Placer County is compliant with State and federal laws related to stormwater quality by enhancing and protecting the quality of waters of the State in Placer County through reducing pollutants in stormwater discharges to the maximum extent practicable and controlling non-stormwater discharges to the storm drain system. The Stormwater Quality Ordinance requires the use of BMPs to reduce adverse effects of polluted runoff discharges on waters of the State, and prohibits illicit discharges to the storm drain system. The Stormwater Quality Ordinance establishes the County's authority to adopt requirements for stormwater management, including source control requirements, to reduce pollution to the maximum extent practicable; requirements for development projects to reduce stormwater pollution and erosion both during construction and after the project is complete; and enable the County to implement and enforce any stormwater management plan adopted by the County.

---

[13] Placer County, City of Roseville, City of Lincoln, City of Auburn, Town of Loomis. *West Placer Storm Water Quality Design Manual.* April 2016.

[14] Placer County Flood Control and Water Conservation District. *Update to the Dry Creek Watershed Flood Control Plan.* November 2011.

County Grading and Erosion Prevention Ordinance

Article 15.48, Grading, Erosion and Sediment Control, of the Placer County Code regulates grading on property within the unincorporated area of Placer County to safeguard life, limb, health, property and public welfare; to avoid pollution of watercourses with hazardous materials, nutrients, sediments, or other earthen materials generated on or caused by surface runoff on or across the permit area; and to ensure that the intended use of a graded site is consistent with the PCGP, any specific plans adopted thereto and applicable Placer County ordinances including the Zoning Ordinance, Flood Damage Prevention Ordinance (Article 15.52 of the Placer County Code), Environmental Review Ordinance (Chapter 18 of the Placer County Code), and applicable chapters of the California Building Code. In the event of conflict between applicable chapters and Article 15.48, the most restrictive shall prevail. Part 6 of Article 15.48 sets forth design standards for grading activities such as excavation, slopes, fill soil, setbacks, and drainage.

Dry Creek Watershed Drainage Improvement Zone

Placer County Code, Chapter 15, Article 15.32 (Dry Creek Watershed Drainage Improvement Zone) establishes a drainage improvement zone for the Dry Creek watershed. In addition, the Ordinance requires the payment of specified fees and annual assessments as a condition of new development within the watershed area; such fees and assessments are used for the installation and maintenance of roadway drainage and stormwater drainage improvements. Mitigation fees are required for new development, and the expansion of existing development, within portions of the Dry Creek watershed that impose a burden on the creeks and drainage infrastructure within the watershed by adding additional impervious surface and accelerating runoff, thereby increasing discharge rates.

Flood Damage Prevention Ordinance

Article 15.52, Flood Damage Prevention Ordinance, is intended to minimize public and private losses due to flood conditions in specific areas by provisions designed to protect human life and health; minimize the need for rescue and relief efforts associated with flooding; minimize prolonged business interruptions; minimize damage to public facilities and utilities such as water and gas mains, electric, telephone and sewer lines, streets, and bridges located in areas of special flood hazard; provide for the sound use and development of areas of special flood hazard so as to minimize future flood blight areas; ensure that potential buyers are notified that property is in an area of special flood hazard; and ensure that those who occupy areas of special flood hazard assume responsibility for their actions. The Flood Damage Prevention Ordinance provides methods for reducing flood losses, and sets forth standards for construction in all areas of special flood hazards.

12.4 IMPACTS AND MITIGATION MEASURES

This section describes the standards of significance and methodology used to analyze and determine the proposed project's potential impacts related to hydrology and water quality. In addition, a discussion of the project's impacts, as well as mitigation measures where necessary, is also presented.

Standards of Significance

Consistent with Appendix G of the CEQA Guidelines, a significant impact would occur if the proposed project would do any of the following:

- Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality;

- Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin or conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan;
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
    - Result in substantial erosion or siltation on- or off-site;
    - Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite; or
    - Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff either during construction or in the post-construction condition.
- Place housing or improvements within a 100-year flood hazard area either as mapped on a federal Flood Hazard boundary or Flood Insurance Rate Map or other flood hazard delineation map which would:
    - Impede or redirect flood flows;
    - Expose people or structures to risk of loss, injury or death involving flooding; or
    - risk release of pollutants due to project inundation; and/or
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

The proposed project's impacts associated with erosion or siltation on- or off-site are discussed in Chapter 10, Geology and Soils, of this EIR. In addition, water supply availability is addressed in Chapter 15, Public Services and Utilities, of this EIR.

Method of Analysis

The impacts analysis for this chapter is based primarily on the Drainage Reports prepared for each phase of the proposed project by King Engineering. The Drainage Reports included hydrologic modeling for the proposed project (both pre-project and post-project conditions) using the Hydraulic Engineering Center (HEC) computer program. In particular, King Engineering used a combination of the HEC-HMS and HEC River Analysis System (HEC-RAS) software. The HEC-HMS was used to calculate peak flows for individual drainage sheds for the pre-construction and post-construction conditions during the 10-year and 100-year storm events. The post-project hydraulic modeling included in the Drainage Reports represents existing flows, the proposed project flows, and flows associated with future buildout of the remaining Dry Creek Walerga Road Tributary shed area pursuant to DCWPCP land use designations. Detailed calculations are provided in the Drainage Reports prepared for the proposed project by King Engineering (see Appendix G). The river hydraulics and cross section profiles for the creek and tributaries provided in the Drainage Reports were derived from the GeoHECRAS software provided by CivilGeo. The Drainage Reports also evaluated both an on-site volumetric retention option for the Phase 1 development, as well as an option for potential regional retention for the Phase 1 development that flows north to the Curry Creek watershed.

To evaluate storm water quality and BMPs within the project limits, the West Placer Storm Water Quality Design Manual was referenced and used as a guideline for BMP locations.

As noted throughout this EIR, the potential future development of the off-site affordable housing parcel does not include any site-specific development plans, designs, or proposals at this time.

Therefore, impacts associated with the potential future development of the off-site affordable housing parcel were evaluated on a programmatic level with the assumption that a maximum of 120 multi-family residential units could be developed.

Project Impacts and Mitigation Measures

The following discussion of impacts is based on the implementation of the proposed project in comparison with the standards of significance identified above. The potential environmental impacts associated with the proposed project and the potential 22 on-site ADUs would not differ. Thus, the below analysis applies to both the proposed project and the on-site ADUs.

12-1 Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality during construction. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to violating any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality during construction of the proposed project and the off-site sewer lift station improvements area, and during potential construction of the off-site affordable housing parcel.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

The construction of the proposed project area and off-site sewer lift station improvements would include similar ground disturbing activities within floodplain areas, and, therefore, construction of either component could result in pollutants entering Dry Creek. Therefore, the potential for either component to violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality during construction would be similar. Thus, the following discussion applies to both the proposed project and the off-site sewer lift station improvements area.

Construction of the proposed project would include grading, excavation, trenching for utilities, and other construction-related activities that could cause soil erosion at an accelerated rate during storm events. In addition, soil would be disturbed during construction of the proposed off-site sewer lift station improvements. All such activities have the potential to affect water quality and contribute to localized violations of water quality standards if impacted stormwater runoff from construction activities enters the Dry Creek tributaries in the project area, which eventually drain to Dry Creek.

Soils exposed by the aforementioned types of construction activities have the potential to affect water quality in two ways: 1) suspended soil particles and sediments transported through runoff; or 2) sediments transported as dust that eventually reach local water bodies. Spills or leaks from heavy equipment and machinery, staging areas, or building sites also have the potential to enter runoff. Typical pollutants include, but are not limited to, petroleum and heavy metals from equipment and products such as paints, solvents, and cleaning agents, which could contain hazardous constituents. Sediment from erosion of graded or excavated surface materials, leaks or spills from equipment, or inadvertent releases of building products could result in water quality degradation if runoff containing the sediment or contaminants should enter receiving waters in sufficient quantities.

Discharge of polluted stormwater or non-stormwater runoff could violate waste discharge requirements. However, impacts from construction-related activities would generally be short-term and of limited duration.

Because the proposed project would require construction activities that would result in a land disturbance greater than one acre, the State would require the project to comply with the most current Construction General Permit requirements. Pursuant to the requirements, a SWPPP would be prepared for the overall project, which would include the site map, drainage patterns and stormwater collection and discharge points, BMPs, and a monitoring and reporting framework for implementation of BMPs, as necessary. In addition, a Notice of Intent (NOI) would be filed with RWQCB. The SWPPP would include strategies to manage stormwater from the construction site and off-site sewer lift station improvements area, and treat runoff before being discharged from the development areas. The site-specific SWPPP developed for the proposed project and off-site sewer lift station improvements area would have protocols to be followed and monitored during construction, including effective response actions if necessary. The SWPPP is considered a "living document" that could be modified as construction activities progress.

As discussed in further depth in Chapter 10, Geology and Soils, of this EIR, the proposed project would be subject to State guidelines, Articles 8.28 and 15.48 of the Placer County Code, and Policy 6.A.5 of the PCGP, which require project implementation of BMPs designed to control erosion and other non-stormwater management and materials management BMPs. Implementation of BMPs to control erosion, and, thus, sediment related pollution, is further mandated by Mitigation Measures 10-2(c) and 10-2(d) within Chapter 10 of this EIR.

Non-stormwater management and material management controls reduce non-sediment-related pollutants from potentially leaving the construction site to the extent practicable. The Construction General Permit prohibits the discharge of materials other than stormwater and authorized non-stormwater discharges (such as irrigation and pipe flushing and testing). Non-stormwater BMPs tend to be management practices with the purpose of preventing stormwater from coming into contact with potential pollutants. Examples of non-stormwater BMPs include preventing illicit discharges, and implementing good practices for vehicle and equipment maintenance, cleaning, and fueling operations, such as using drip pans under vehicles. Waste and materials management BMPs include implementing practices and procedures to prevent pollution from materials used on construction sites. Examples of materials management BMPs include the following:

- Good housekeeping activities such as storing of materials covered and elevated off the ground, in a central location;
- Securely locating portable toilets away from the storm drainage system and performing routine maintenance;
- Providing a central location for concrete washout and performing routine maintenance;
- Providing several dumpsters and trash cans throughout the construction site for litter/floatable management; and
- Covering and/or containing stockpiled materials and overall good housekeeping on the site.

While the final materials management BMPs to be used during construction of the proposed project are currently unknown, as discussed below, the SWPPP for the project would likely include a combination of the BMP examples listed above. Final BMPs for the proposed project construction would be chosen in consultation with the applicable California Stormwater Quality Association Stormwater BMP Handbooks and implemented by the project contractor.

In accordance with the Construction General Permit, the project site would also be inspected during construction before and after storm events and every 24 hours during extended storm events to identify maintenance requirements for the implemented BMPs and to determine the effectiveness of the implemented BMPs. As a "living document", the site-specific SWPPP that would be prepared for the proposed project would be modified as construction activities progress. A Qualified SWPPP Practitioner (QSP) would ensure compliance with the SWPPP through regular monitoring and visual inspections during construction activities. The QSP for the project would amend the SWPPP and revise project BMPs, as determined necessary through field inspections, to protect against substantial erosion or siltation on- or off-site.

Off-Site Affordable Housing Parcel

Similar to the proposed project, buildout of the off-site affordable housing parcel would require grading, excavation, and other construction-related activities, which could cause topsoil to be exposed, potentially resulting in wind erosion or an accelerated rate of erosion during storm events. Upon development of the site with structures, the amount of exposed soil that may be lost due to wind or stormwater runoff would be minimized. As discussed in the RVSP EIR, to reduce potential impacts associated with soil erosion and the loss of topsoil, development within the RVSP area would be required to: provide improvement plans to the County prior to authorization of construction; comply with the provisions of the County Grading Ordinance and Stormwater Quality Ordinance in effect at the time of submittal; prepare and comply with a SWPPP; cooperate with the project's NPDES construction stormwater quality permit, issued by the CVRWQCB; and comply with all provisions therein. As such, should the off-site affordable housing parcel occur as part of the proposed project, construction activities related to such would be required to comply with the following applicable RVSP Mitigation Measures 12-1b, 12-3b, and 12-3d, which have been incorporated into this EIR as Mitigation Measures 12-1(b), 10-2(f), and 10-2(h), respectively. Mitigation Measure 12-1b would require compliance with the County Grading Ordinance; Mitigation Measure 12-3b would require compliance with NPDES requirements for construction; and Mitigation Measure 12-3d would require preparation and implementation of a SWPPP for construction.

Conclusion

Compliance with the State NPDES Construction General Permit and Articles 8.28 and 15.48 of the Placer County Code, as described above and required by Mitigation Measures 10-2(a) through 10-2(c) within Chapter 10, Geology and Soils, of this EIR, and Mitigation Measures 12-1b, 12-3b, and 12-3d of the RVSP EIR, which have been incorporated into this EIR as Mitigation Measures 12-1(b), 12-1(c), and 12-1(d), would minimize the potential degradation of stormwater quality and downstream surface water associated with construction of the proposed project, off-site sewer lift station improvements area, and off-site affordable housing parcel. In addition, BMPs would be required to be designed in accordance with the California Stormwater Quality Association

Stormwater Best Management Practice Handbooks for Construction and for New Development/Redevelopment (or other similar source as approved by the Engineering and Surveying Division). Therefore, with implementation of the following mitigation measures, the proposed project, off-site sewer lift station improvements area, and off-site affordable housing parcel would avoid a ***significant*** impact related to short-term construction-related water quality.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level by ensuring compliance with federal, State, and County regulatory requirements intended to reduce pollution and erosion from stormwater during the construction phase of the project and off-site affordable housing parcel.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

12-1(a) Implement the following Mitigation Measures set forth in this EIR:

- *10-2(a) Prior to construction commencing, the applicant shall provide evidence to the ESD of a Waste Discharge Identification (WDID) number generated from the State Regional Water Quality Control Board's Stormwater Multiple Application & Reports Tracking System (SMARTS). This serves as the Regional Water Quality Control Board approval or permit under the National Pollutant Discharge Elimination System (NPDES) construction stormwater quality permit.*

- *10-2(b) The applicant shall prepare and submit Improvement Plans, specifications and cost estimates (per the requirements of Section II of the Land Development Manual (LDM) that are in effect at the time of submittal) to the Engineering and Surveying Division (ESD) for review and approval of each project phase. The applicant shall pay plan check and inspection fees and Placer County Fire Department improvement plan review and inspection fees with the 1st Improvement Plan submittal. (NOTE: Prior to plan approval, all applicable recording and reproduction costs shall be paid).*

  The Final Subdivision Map(s) shall not be submitted to the Engineering and Surveying Division (ESD) until the Improvement Plans are submitted for the second review. Final technical review of the Final Subdivision Map(s) shall not conclude until after the Improvement Plans are approved by the ESD.

  Any Building Permits associated with this project shall not be issued until, at a minimum, the Improvement Plans are approved by the Engineering and Surveying Division.

  Prior to the County's final acceptance of the project's improvements, submit to the Engineering and Surveying Division one copy of the Record Drawings in digital format along with one blackline hardcopy (black print on bond paper) and one PDF copy.

- *10-2(c) No grading, clearing, or tree disturbance shall occur until the Improvement Plans are approved and all temporary construction fencing has been installed and inspected by a member of the County.*

  The Improvement Plan(s) shall identify the stockpiling and/or vehicle staging areas with locations as far as practical from existing dwellings and protected resources in the area. The applicant shall revegetate all disturbed areas. Revegetation, undertaken from April 1 to October 1, shall include regular watering to ensure adequate growth. A winterization plan shall be provided with project Improvement Plans.

  The applicant shall submit to the ESD a letter of credit or cash deposit in the amount of 110 percent of an approved engineer's estimate using the County's current Plan Check and Inspection Fee Spreadsheet for winterization and permanent erosion control work prior to Improvement Plan approval. For an improvement plan with a calculated security that exceeds $100,000, a minimum of $100,000 shall be provided as letter of credit or cash security and the remainder can be bonded.

Off-Site Affordable Housing Parcel

12-1(b) Implement RVSP EIR Mitigation Measure 12-1b:

All proposed grading, drainage improvements, vegetation, and tree removal shall be shown on the proposed project's Improvement Plans, and all work shall conform to provisions of the County Grading Ordinance (Ref. Article 15.48, Placer County Code) that is in effect at the time of submittal. No grading, clearing, or tree disturbance shall occur until the Improvement Plans are approved and all temporary construction fencing has been installed and inspected by a member of the DRC. All cut/fill slopes shall be at a maximum of 2:1 (horizontal:vertical) unless a soils report supports a steeper slope and the ESD concurs with said recommendation.

The Applicant shall revegetate all disturbed areas. Revegetation undertaken from April 1 to October 1 shall include regular watering to ensure adequate growth. A winterization plan shall be provided with project Improvement Plans. It will be the Applicant's responsibility to ensure proper installation and maintenance of erosion control/winterization during project construction. Where soil stockpiling or borrow areas are to remain for more than one construction season, proper erosion control measures shall be applied as specified in the Improvement Plans/Grading Plans. Where roadside drainage is off of the pavement, erosion control shall be provided for to the satisfaction of the ESD.

The Applicant shall submit to the ESD a letter of credit or cash deposit in the amount of 110 percent of an approved engineer's estimate for

winterization and permanent erosion control work, prior to Improvement Plan approval, to guarantee protection against erosion and improper grading practices. Upon the County's acceptance of improvements and satisfactory completion of a one-year maintenance period, unused portions of this deposit will be refunded to the Applicant or authorized agent.

If at any time during construction a field review by County personnel indicates a significant deviation from the proposed grading shown on the Improvement Plans, specifically with regard to slope heights, slope ratios, erosion control, winterization, tree disturbance, and/or pad elevations and configurations, the plans shall be reviewed by the DRC/ESD for a determination of substantial conformance to the project approvals prior to any further work proceeding. Failure of the DRC/ESD to make a determination of substantial conformance may serve as grounds for the revocation/modification of the project approval by the appropriate hearing body (Placer County Community Development Resource Agency, 2006).

The project's erosion control plan shall indicate that proper control of siltation, sedimentation, and other pollutants will be implemented in accordance with National Pollutant Discharge and Elimination System (NPDES) permit requirements and County ordinance standards. The plan shall propose best management practices (BMPs) to reduce erosion and water quality degradation during construction to the maximum extent practicable.

12-1(c) *Implement the following Mitigation Measure set forth in this EIR:*

- *<u>10-2(e)</u> Implement RVSP EIR Mitigation Measure 12-3b:*

  This project is subject to construction-related stormwater permit requirements of the federal Clean Water Act NPDES program. Each applicant/developer for future construction projects within the Plan Area shall implement Mitigation Measure 13-1c [the standards of which are included as Mitigation Measure 10-2(g) of this EIR], which requires an applicant to submit a Notice of Intent (NOI) to comply with the NPDES General Permit for Stormwater Discharges associated with Construction Activities to the State Regional Water Quality Control Board if the specific project would disturb 1 acre of land or more. The project applicant/developer shall provide to the ESD evidence of a state-issued Waste Discharge Identification (WDID) number or filing of a NOI and fees prior to start of construction, as required by the County's Sample Conditions and Improvement Plans, paragraph ip15 (Placer County Community Development Resource Agency, 2006).

12-1(d) *Implement the following Mitigation Measure set forth in this EIR:*

- *<u>10-2(g)</u> Implement RVSP EIR Mitigation Measure 12-3d:*

For all construction activities that will disturb 1 or more acre of land, a stormwater pollution prevention plan (SWPPP) for the construction phase must be prepared and implemented.

The SWPPP will include development of site-specific structural and operational BMPs to prevent and control impacts to runoff quality, measures to be implemented before each storm event, inspection and maintenance of BMPs, and monitoring of runoff quality by visual and/or analytical means. The contents of the SWPPP are set forth in detail in the permit application package. BMPs shall be designed according to the California Stormwater Quality Association Stormwater Best Management Practice Handbooks for Construction (or other similar source as approved by the DPW). BMPs for the proposed project include, but are not limited to, silt fencing (Sediment Control SE -1), straw bale barriers (Sediment Control SE-9), fiber rolls (Sediment Control SE-5), storm drain inlet protection (Sediment Control SE-10), hydraulic mulch (Erosion Control EC-3), and stabilized construction entrance (Tracking Control TR-1). The SWPPP shall also include erosion control measures, to be implemented during construction, that conform to the NPDES, Storm Drain Standards, and local standards.

12-2 Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality during operations. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to violating any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality during operation of the proposed project and during potential operation of the off-site affordable housing parcel. Because development of the off-site sewer lift station improvements area would be limited to upgrades to the existing underground storage tanks, the operation of the improvements area would not result in new stormwater pollutants introduced to the area. As such, water quality impacts during operation of the off-site sewer lift station improvements area are not discussed further herein.

Proposed Project

Development of the proposed project would result in the conversion of an undeveloped area to single-family and multi-family residential uses and associated amenities, such as parks and landscaping. Such new land uses could result in new stormwater pollutants being introduced to the project area. Pollutants associated with the operational phase of the proposed project could include nutrients, oil and grease, metals, organics, pesticides, bacteria, sediment, trash, and other debris. Nutrients that could be present in post-construction stormwater include nitrogen and phosphorous resulting from fertilizers applied to landscaping. Excess nutrients could affect water quality by promoting excessive and/or a rapid growth of aquatic vegetation, which reduces water clarity and results in oxygen depletion. Pesticides, which are toxic to aquatic organisms and can bioaccumulate

in larger species, such as birds and fish, can potentially enter stormwater after application to landscaped areas within the project site. Oil and grease could enter stormwater from vehicle leaks, traffic, and maintenance activities. Metals could enter stormwater as surfaces corrode, decay, or leach. Clippings associated with landscape maintenance and street litter could be carried into storm drainage systems. Pathogens (from pets, wildlife, and human activities) have the potential to affect downstream water quality.

Development of the proposed project could also increase polluted non-stormwater runoff (e.g., car wash water, other wash water, and landscape irrigation runoff). Such non-stormwater runoff could flow down sidewalks, parking areas, and streets, and pick up additional pollutants deposited on impervious surfaces prior to discharge into the storm drain system and surface waters. Discharge of polluted stormwater or non-stormwater runoff could violate waste discharge requirements.

Phase II MS4 Permit Requirements

As discussed previously, the proposed project is located within the permit area covered by Placer County's MS4 Permit (NPDES General Permit No. CAS000004, Order No. 2013-0001-DWQ), pursuant to the NPDES Phase II program. Project-related stormwater discharges are subject to all applicable requirements of said permit. Specifically, as noted above, regulated projects are required to divide the project area into DMAs and implement and direct water to appropriately sized SDMs and Baseline Hydromodification Measures to each DMA. Source control measures must be designed for pollutant-generating activities or sources consistent with recommendations from the California Stormwater Quality Association (CASQA) Stormwater BMP Handbook for New Development and Redevelopment, or equivalent manual, and must be shown on the Improvement Plans. Additional details related to hydromodification management requirements associated with the Phase II MS4 permit are discussed under Impact 12-4 below.

Proposed Storm Drain System

The proposed project would include an on-site storm drain system composed of Low Impact Development (LID) components. LID components refer to systems and practices that use or mimic natural processes that result in the infiltration, evapotranspiration or use of stormwater to protect water quality and associated aquatic habitat. The majority of the project site is currently located within the Dry Creek watershed (56.6 acres), with the northern portion of the project site located within the Curry Creek watershed (35.6 acres). The project proposes a shed shift of approximately 25.7 acres (portions of Phases 1 and 2) from the Curry Creek watershed to the Dry Creek watershed due to design constraints and adjacent project drainage analysis assumptions, as discussed further under Impact 12-4 below. The re-directed flows would be routed to Basin B in the southern portion of Phase 1 and Basin C at the southwest corner of Phase 2 for treatment and infiltration prior to discharging into "Placer Creek".

Impervious surfaces proposed as part of the project include building roofs, driveways, parking and circulation areas, roadways, and sidewalks. Consistent with MS4 permit requirements and the *West Placer Storm Water Quality Design Manual*, the project site would be divided into seven DMAs for stormwater quality treatment (see Figure 12-6). The seven DMAs include the portions of the project site that would be developed. The Estia Dry Creek portion of the project site (i.e., Phase 1) is divided into two DMAs: A and B.

Figure 12-6
Drainage Management Areas

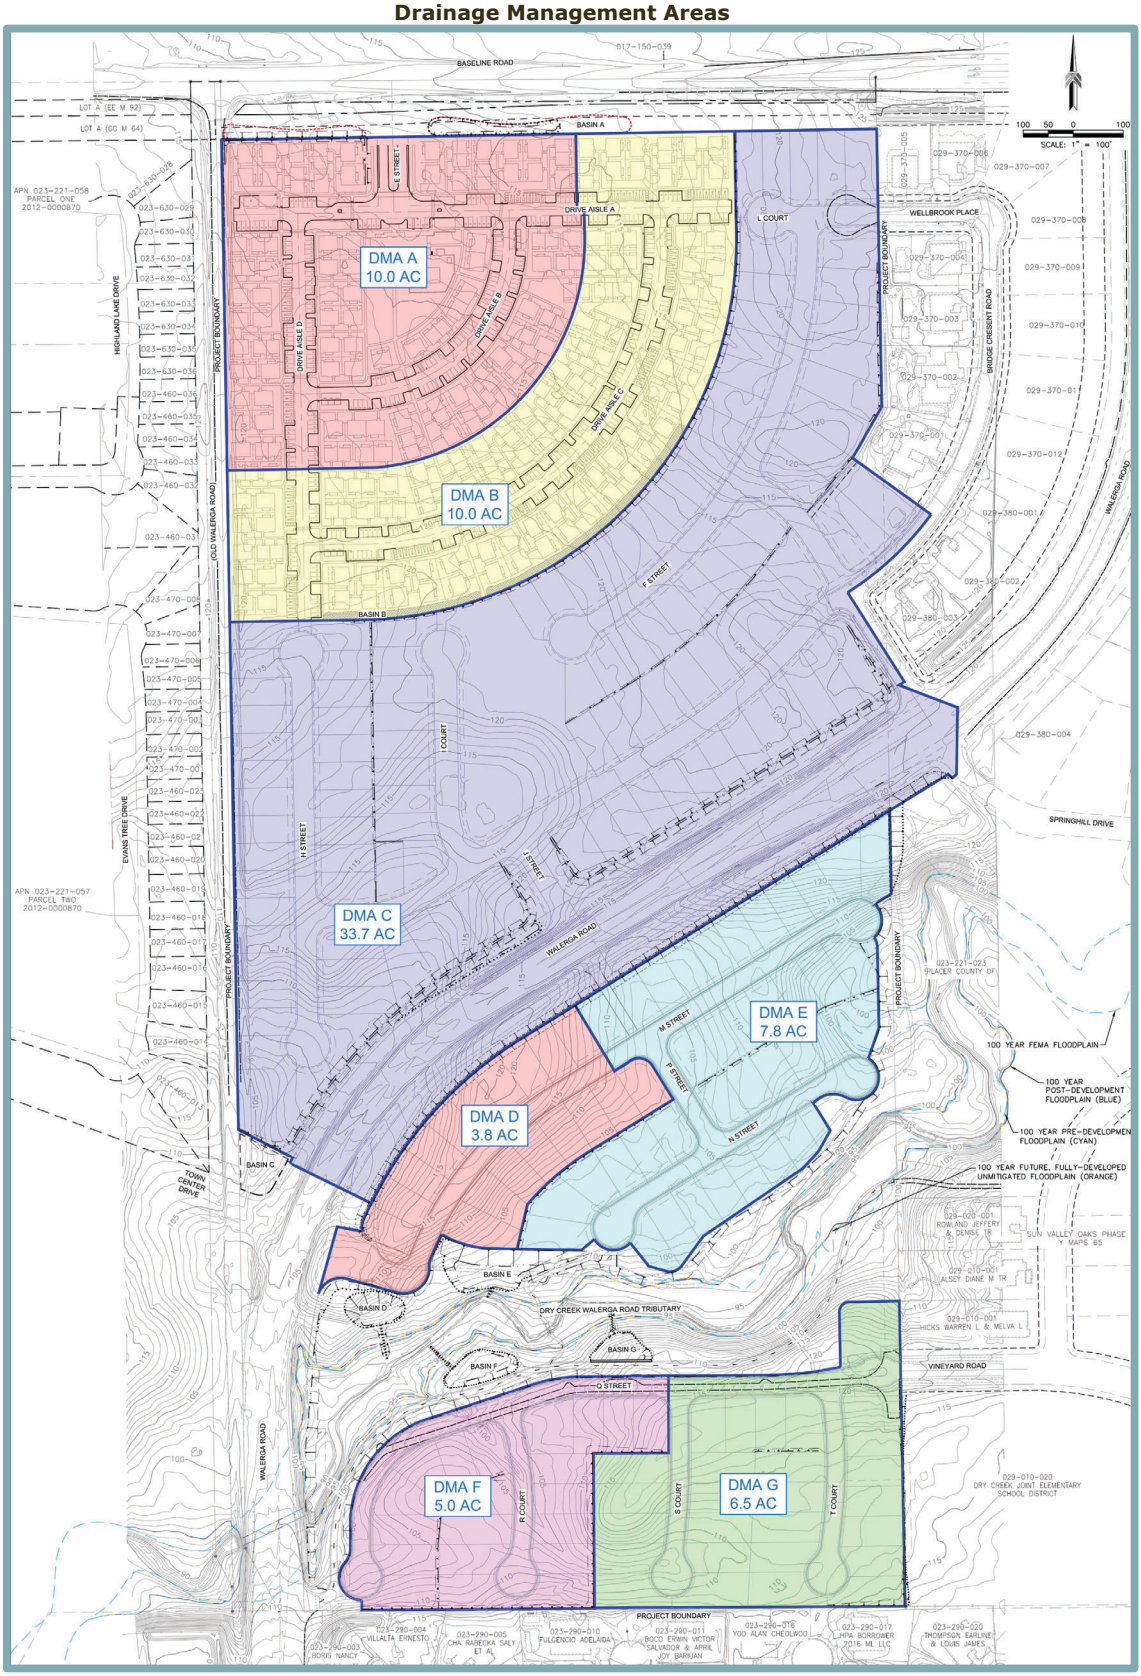

*Figure not OCR compatible

Both DMAs would provide stormwater quality treatment through bioretention basins at the north and south boundaries of the Estia Dry Creek portion of the project site.

Runoff within Phase 2 of Placer Creek Residential would be routed to a new storm drain pipe within Walerga Road, which would discharge into proposed Basin C in the southwest portion of the Phase 2 area. Additional flows from Walerga Road would also be directed toward underground infiltration Basin C. During large storm events, excess runoff that does not infiltrate within Basin C would discharge into a new 24-inch storm drain pipe that would connect to an existing 48-inch pipe in Walerga Road that currently outfalls into the on-site "Placer Creek" tributary between Phases 3 and 4. The existing 48-inch outfall would be extended to accommodate the Walerga Road improvements to be completed as part of the proposed project. In addition, the existing box culvert underneath Walerga Road would be extended.

The "Placer Creek" tributary to Dry Creek is located between the Placer Creek Residential Phases 3 and 4 residential neighborhoods and flows southwest to Dry Creek. Development of the project site would require installation of on-site drainage facilities and alteration of site topography to accommodate the proposed land uses. Phase 3 and Phase 4 would include water quality Basins D through F, which would each outfall to the Placer Creek tributary through 24-inch and 18-inch storm drains during large storm events.

Stormwater Quality Plans (SWQPs) prepared for proposed projects should specify source control measures to be implemented for each potential pollutant-generating activity or source present on the project site.

The source control measures may include, but are not limited to, measures related to proper storage of all project materials, use of environmentally friendly materials for indoor and structural pest control, and compliance with manufacturer recommendations and regulations related to pesticide use. The source control measures should be designed consistent with the recommendations from the CASQA Stormwater BMP Handbook for New Development and Redevelopment, or from another equivalent manual.

The proposed stormwater basins would be sized to treat the runoff from the 85th percentile, 24-hour storm event, which includes a majority of the larger pollutants (sand, soil, silt, grease and trash) as well as smaller pollutants (sediment, nutrient, metals, pesticides and organics). Thus, project runoff entering the Dry Creek tributary or Curry Creek would be properly treated, and would not pollute downstream waterways.

Maintenance and Inspection

To ensure continued operation of the proposed stormwater basins, the SWQP must include detailed, site-specific inspection and maintenance procedures to be implemented by the project applicant. For example, plants and vegetation within the stormwater basins should be inspected monthly, and the basins should be inspected for the presence of standing water 72 hours after rain events.

Required maintenance activity should include, but not necessarily be limited to, removal of debris from stormwater basins and removal of debris from outlets of stormwater basins. Without implementation of such measures, the stormwater basins could fail to ensure that

polluted runoff would not enter downstream water bodies during the continued operation of the project.

Off-Site Affordable Housing Parcel

As discussed throughout this EIR, the construction of the proposed affordable units does not include any site-specific development plans, designs, or proposals at this time. However, similar to the proposed project, the potential residential development could result in new stormwater pollutants being introduced to the project area.

As discussed above, Placer County is covered by a MS4 Permit (NPDES General Permit No. CAS000004, Order No. 2013-0001-DWQ), pursuant to the NPDES Phase II program. As such, stormwater discharges associated with the potential future residential development of the off-site affordable housing parcel are subject to all applicable requirements of said permit. Specifically, regulated projects are required to divide the project area into DMAs and implement and direct water to appropriately sized SDMs and Baseline Hydromodification Measures to each DMA. Source control measures must be designed for pollutant-generating activities or sources consistent with recommendations from the CASQA Stormwater BMP Handbook for New Development and Redevelopment, or equivalent manual, and must be shown on the Improvement Plans. In addition, all future residential development associated with the proposed project would be required to comply with all requirements of the PCSWMM and the RWQCB.

Compliance with all stormwater discharge requirements of the County's MS4 Permit, PCSWMM, and the RWQCB, as described above, would minimize the potential degradation of stormwater quality and downstream surface water associated with construction and operation of future on-site development. In addition, BMPs designed in accordance with the California Stormwater Quality Association Stormwater Best Management Practice Handbooks for Construction and for New Development/Redevelopment would further reduce the potential for degradation of stormwater quality and downstream surface water in the project vicinity.

Should development of the off-site affordable housing parcel occur, RVSP Mitigation Measures 12-3c, 13-4b, 13-4c, and 14-4a would be required in order to ensure source control and water quality treatment of runoff from paved and other developed areas is included prior to discharge into the swales and streams that ultimately discharge into Dry Creek. Mitigation Measure 12-3c would require compliance with NPDES Phase II requirements; Mitigation Measure 13-4b would require preparation of a site-specific BMP plan; Mitigation Measure 13-4c would require maintenance of BMPs; and Mitigation Measure 14-4a would require on-site and off-site pipelines to have watertight joints in accordance with Placer County standards. The aforementioned RVSP EIR mitigation measures have been applied in this EIR as Mitigation Measures 10-2(g), and 12-2(d) through 12-2(h), respectively.

Conclusion

Based on the above, the proposed project includes site design measures to ensure that stormwater runoff is properly treated prior to discharge to the Curry Creek watershed and Dry Creek tributary. Thus, urban pollutants entering and potentially degrading local water quality would not be expected to occur as a result of the project. However, because a final SWQP has not been prepared, ongoing maintenance of the proposed stormwater basins

and the incorporation of proper source control measures cannot be ensured. In addition, pursuant to RVSP EIR mitigation measures, the potential future development of the off-site affordable housing parcel would require compliance with NPDES Phase II requirements, preparation of a site-specific BMP plan, maintenance of BMPs, and watertight joints in accordance with Placer County standards.

Should the project applicant fail to prepare and implement such documentation and comply with such measures, the proposed project could result in a ***significant*** impact related to a violation of water quality standards or waste discharge requirements or otherwise substantial degradation of surface or ground water quality during operations.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level by ensuring that storm drainage shall be collected and routed through source control measures to avoid or reduce water quality degradation before stormwater enters the landscape. In addition, the following mitigation measures would ensure compliance with mitigation measures included in the RVSP EIR related to water quality during operations of the off-site affordable housing parcel.

Proposed Project

12-2(a) *This project is located within the permit area covered by Placer County's Small Municipal Separate Storm Sewer System (MS4) Permit (State Water Resources Control Board National Pollutant Discharge Elimination System (NPDES)). Project-related storm water discharges are subject to all applicable requirements of said permit. The project shall implement permanent and operational source control measures and Low Impact Development (LID) standards designed to reduce runoff, treat storm water, and provide baseline hydromodification management. Water quality measures shall be designed for pollutant generating activities or sources consistent with recommendations from the West Placer Storm Water Quality Design Manual and shall be shown on the Improvement Plans.*

Storm drainage from on- and off-site impervious surfaces (including roads) shall be collected and routed through specially designed facilities, as approved by the Engineering and Surveying Division (ESD). No water quality facility construction shall be permitted within any identified wetlands area, floodplain, right-of-way, or Multi-Purpose easement, except as authorized by project approvals.

All permanent BMPs shall be maintained as required to ensure effectiveness. The applicant shall provide for the establishment of vegetation, where specified, by means of proper irrigation. The project owners/permittees shall provide maintenance of these facilities and annually report a certification of completed maintenance to the County DPW Stormwater Coordinator. (For Phase 1, Contractual evidence of a monthly parking lot sweeping and vacuuming, and catch basin cleaning program is required.) Prior to Improvement Plan approval or Final Subdivision Map recordation, easements shall be created and offered for

dedication to the County for maintenance and access to these facilities in anticipation of possible County maintenance.

Per the State of California NPDES Phase II MS4 Permit, this project creates and/or replaces 2,500 square feet or more of impervious surface. A final Storm Water Quality Plan (SWQP) shall be submitted, either within the final Drainage Report or as a separate document that identifies how this project will meet the Phase II MS4 permit obligations.

12-2(b) *The Improvement Plans shall include the message details, placement, and locations showing that all storm drain inlets and catch basins within the project area shall be permanently marked/embossed with prohibitive language such as "No Dumping! Flows to Creek." or other language /graphical icons to discourage illegal dumping as approved by the Engineering and Surveying Division (ESD). ESD-approved signs and prohibitive language and/or graphical icons, which prohibit illegal dumping, shall be posted at public access points along channels and creeks within the project area. The Homeowners'/Property Owners' association is responsible for maintaining the legibility of stamped messages and signs.*

Off-Site Affordable Housing Parcel

12-2(c) *Implement the following Mitigation Measure set forth in this EIR:*

- *<u>10-2(f)</u> Implement RVSP EIR Mitigation Measure 12-3c:*

  Development within the Plan Area must comply with the NPDES Phase II General Permit for the Discharge of Stormwater from small municipal separate storm sewer systems. Placer County is operating under the NPDES Phase II Rule permit, and as such, new development within the County must comply with the permit requirements. New development is subject to Attachment 4 Design Standards of the State Water Resource Control Board NPDES Phase II General Permit. These standards require that new development must be designed so as to minimize, to the maximum extent practicable, the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas, to the stormwater conveyance system as approved by the building official.

12-2(d) *Implement RVSP EIR Mitigation Measure 13-4b:*

Each applicant/developer for each construction phase within the Plan Area shall submit a project-specific BMP Plan with the project improvement plans showing the onsite locations and effectiveness of the BMP facilities proposed for long-term water quality impact reduction during the Subsequent Conformity Review process and prior to Improvement Plan approval. The plan shall include a method for financing the long-term maintenance of the proposed project-specific facilities.

All BMPs for water quality protection, source control, and treatment control shall be developed in accordance with the California Stormwater Quality Association Stormwater Best Management Practice Handbook for New Development/Redevelopment (or other similar source approved by the Engineering and Surveying Division) for the applicable type of development and/or improvement. BMPs shall be designed to mitigate (minimize, infiltrate, filter, or treat) stormwater runoff. Flow or volume based post-construction BMPs shall be designed at a minimum in accordance with the Placer County Guidance Document for Volume and Flow-Based Sizing of Permanent Post-Construction Best Management Practices for Stormwater Quality Protection. Provisions shall be included for long-term maintenance of BMPs. BMPs shall reflect improvements in techniques and opportunities made available over time and shall reflect site-specific limitations. The County shall make the final determinations as to the appropriateness of the BMPs proposed for each project.

Source control BMPs should be incorporated into the design of each future construction project within the Plan Area. These BMPs emphasize reducing or eliminating pollutant in stormwater runoff at their source through runoff reduction and by segregating pollutants from stormwater runoff. Examples of source control BMPs that should be evaluated during design and could be incorporated into the project-specific BMP Plan as feasible include the following:

- *Incorporate landscaping into the design, including planting of native and drought-tolerant plants to maximize natural water storage and infiltration opportunities and protect slopes and channels (Source Control SD-10);*
- *Direct roof runoff to grassy areas and away from paved areas or storm drains to promote overland flow of stormwater runoff and reduce velocities and peak flow rates (Source Control SD-11);*
- *Incorporate pervious pavement to promote infiltration and reduce runoff (Source Control SD-20);*
- *Provide enclosed commercial trash areas to avoid contact with stormwater runoff (Source Control SD-32);*
- *Design parking lots to direct storm water to storm drain inlets and away from garbage disposal areas (Source Control SD-32);*
- *Perform street and parking lot cleaning to remove potential debris and pollutants that could be picked up and conveyed by storm water;*
- *Where practical, install drip and low-flow irrigation systems to provide efficient irrigation and minimize runoff of excess irrigation water (Source Control SD-12); and*
- *Select building materials that do not introduce sources of pollutants (Source Control SD-21).*

In addition, storm drainage from onsite and offsite impervious surfaces (including roads) shall be collected and routed through specially designed

water quality treatment facilities (i.e., treatment control BMPs) for removal of pollutants of concern (i.e., sediment, oil/grease, etc.), as approved by the County's Engineering and Surveying Division. Treatment control BMPs should be integrated into and throughout the site to enhance the removal of pollutants that have entered the stormwater runoff. Examples of treatment control BMPs that should be evaluated during design include the following:

- *Provide vegetative swale or buffer areas, which could be incorporated into landscaped areas, to slow down runoff velocities and allow sediments and other pollutants to settle (Treatment Control TC-30, TC-31);*
- *Install water quality inlets (e.g., oil/water separators) to remove "first flush" pollutants, including oil and grease (Treatment Control TC-50); and*
- *Incorporate biofiltration facilities to capture stormwater runoff from impervious areas and remove pollutants (Source Control TC-32).*

With the Improvement Plans, the applicant/developer for the construction project shall verify that proposed BMPs are appropriate to treat the pollutants of concern from the project. The applicant/developer shall provide for the establishment of vegetation, where specified, by means of proper irrigation, for effective performance of BMPs. No water quality facility construction shall be permitted within any identified wetlands area, floodplain, or right-of-way except as authorized by the project approvals or subsequent amendments approved by the County.

12-2(e) *Implement RVSP EIR Mitigation Measure 13-4c:*

Storm drainage from impervious surfaces proposed with the project shall be collected and routed through specially designed catchbasins, vegetated swales, vaults, infiltration basins, water quality basins, filters, etc., for entrapment of sediment, debris, and oils/greases or other identified pollutants, as approved by the Placer County ESD. The Applicant shall provide for the establishment of vegetation, where specified, by means of proper irrigation, for effective performance of BMPs. Contractual evidence of a monthly parking lot sweeping and vacuuming, and catch basin cleaning program shall be provided to ESD upon request. Failure to do so will be grounds for discretionary permit revocation. Maintenance of BMP facilities shall be provided by the project owners/permittees for each future construction project within the Plan Area unless, and until, a County Service Area is created and said facilities are accepted by the County for maintenance. Prior to approval of improvement plans, final maps shall show easements to be created and offered for dedication to the County for maintenance and access to these facilities in anticipation of possible County maintenance. No water quality facility construction shall be permitted within any identified wetlands area, floodplain, or right-of-way,

except as authorized by project approval or subsequent amendments approved by the County.

12-2(f) Implement RVSP EIR Mitigation Measure 14-4a:

To reduce the potential for any of the proposed water or recycled water supply or wastewater transmission pipelines to leak and affect service and environmental conditions of surrounding areas, Placer County standards specify material type; wall thicknesses; connection methods, including coupling information; backfill material type and placement methods; and installation location relative to other utilities. Adhering to these standards will reduce the likelihood that the project pipelines would affect adjacent or sensitive areas. However, in areas where the groundwater table is close to the pipeline, additional measures may be needed to protect groundwater quality, including more robust pipe joint details, use of fusible C-900/905 pipe sections, pipe wrap, or cathodic protection.

12-3 Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin or conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to the proposed project, off-site sewer lift station improvements area, and the potential future development of the off-site affordable housing parcel substantially decreasing groundwater supplies or interfering substantially with groundwater recharge.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

The proposed project would result in an increase in on-site impervious surfaces, which would reduce the infiltration of groundwater as compared to existing conditions. Because the off-site sewer lift station improvements would be limited to the expansion of underground emergency sewer storage capacity, such improvements would not include additional impervious surfaces that would reduce the infiltration of groundwater. Groundwater relies on annual rainfall and percolation through pervious soils to recharge the system. As shown in the Web Soil Survey results included in the Drainage Reports, soils throughout most of the site have very slow infiltration rates with high runoff potential during storm events. Thus, the project site would not be considered an area of substantial contribution to groundwater recharge in the region. Furthermore, the proposed project would not include any development within the Dry Creek tributary on-site; thus, infiltration of water moving through the tributaries would continue to occur and contribute to groundwater recharge.

Given the limited recharge potential of the portion of the project site that would be developed with impervious surfaces, the proposed project would not interfere substantially with groundwater recharge. Furthermore, the groundwater subbasin within which the project site is located is not currently in a state of overdraft. As further discussed in Chapter

15, Public Services and Utilities, of this EIR, the water supply for the proposed project would not be derived from groundwater sources. Considering that the project site is not considered an important groundwater recharge area, stormwater from the project site would continue to replenish groundwater through percolation into soils within the Placer Creek tributary and on-site stormwater infiltration basins, and that the project would not involve increased demand on groundwater supplies within an area in a state of overdraft, the proposed project would not create a conflict with, or impede the implementation of, a sustainable groundwater plan.

Off-Site Affordable Housing Parcel

As discussed in the RVSP EIR, while development and urbanization of the RVSP area could reduce pervious area, which in turn would limit the percolation process and reduce groundwater recharge, Type D soils, which have slow infiltration rates with high runoff potential, are present in the off-site affordable housing parcel. As such, similar to the project site, the off-site affordable housing parcel would not be considered an important groundwater recharge area, and development of residential uses would not interfere substantially with groundwater recharge. Furthermore, the potential future development of the off-site affordable housing parcel similarly would not involve increased demand on groundwater supplies within an area in a state of overdraft.

Conclusion

Based on the above, the proposed project and the potential future development of the off-site affordable housing parcel would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin or conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan, and impacts related to groundwater would be ***less than significant***.

Mitigation Measure(s)

None required.

12-4 Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site; or create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff either during construction or in the post-construction condition. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to the proposed project, off-site sewer lift station improvements area, and the off-site affordable housing parcel substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of

impervious surfaces, in a manner which would: substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site; or create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff either during construction or in the post-construction condition.

Proposed Project

The only impervious surfaces that currently exist within the project site are those related to Walerga Road. Implementation of the proposed project would result in a substantial increase in the amount of impervious surfaces related to roofs, driveways, and roadways. As such, the project has the potential to substantially alter the existing drainage pattern of the site and increase runoff water.

The potential for the proposed project to result in substantial additional sources of polluted runoff, including erosion, is addressed under Impacts 12-1 and 12-2 above. Further discussion regarding erosion is provided in Chapter 10, Geology and Soils, of this EIR.

Peak Flows and Volumes

Increases to peak runoff flows or volumes resulting from alterations to the existing drainage pattern of the site have the potential to result in the exceedance of existing or planned stormwater drainage systems or flooding on- or off-site.

The design of the proposed project divides the site into seven DMAs where development would occur (see Figure 12-6 above). Within the DMAs that encompass areas of the site proposed for development, stormwater runoff would be directed to 15- to 30-inch storm drains located within the internal roadway system. The storm drains within each DMA would then convey runoff to the DMA's associated stormwater basin. Storm drain inlets and manholes would also be developed within the on-site stormwater drainage system to capture on-site runoff. If the proposed project does not participate in a regional retention program for the portion of Phase 1 flows that are directed to the Curry Creek watershed, underground volumetric retention would be required for the runoff within DMA A in order to mitigate impacts from the eight-day, 100-year storm event based on the potential downstream impacts on the Curry Creek Cross Canal watershed. The conceptual design of the underground retention system is shown below in Figure 12-7.

The project proposes a shed shift of approximately 25.7 acres (for portions of Phases 1 and 2) from the Curry Creek watershed to the Dry Creek watershed due to design constraints and adjacent project drainage analysis assumptions, as described in the preliminary Drainage Reports prepared by King Engineering. The shed shift would increase flows in the Dry Creek watershed by approximately 30.7 cfs for the 10-year storm event and approximately 64.5 cfs for the 100-year storm event. The re-directed flows would be routed to Basin B in the southern portion of the Phase 1 and Basin C at the southwest corner of Phase 2 for treatment and infiltration prior to discharging into "Placer Creek".

Other drainage options were considered to maintain the existing shed boundaries, but ultimately determined to be impractical. The proposed project is required to direct sewage to the south where the existing Placer County sewer facilities are located.

Figure 12-7
Phase 1 Underground Volumetric Retention Option

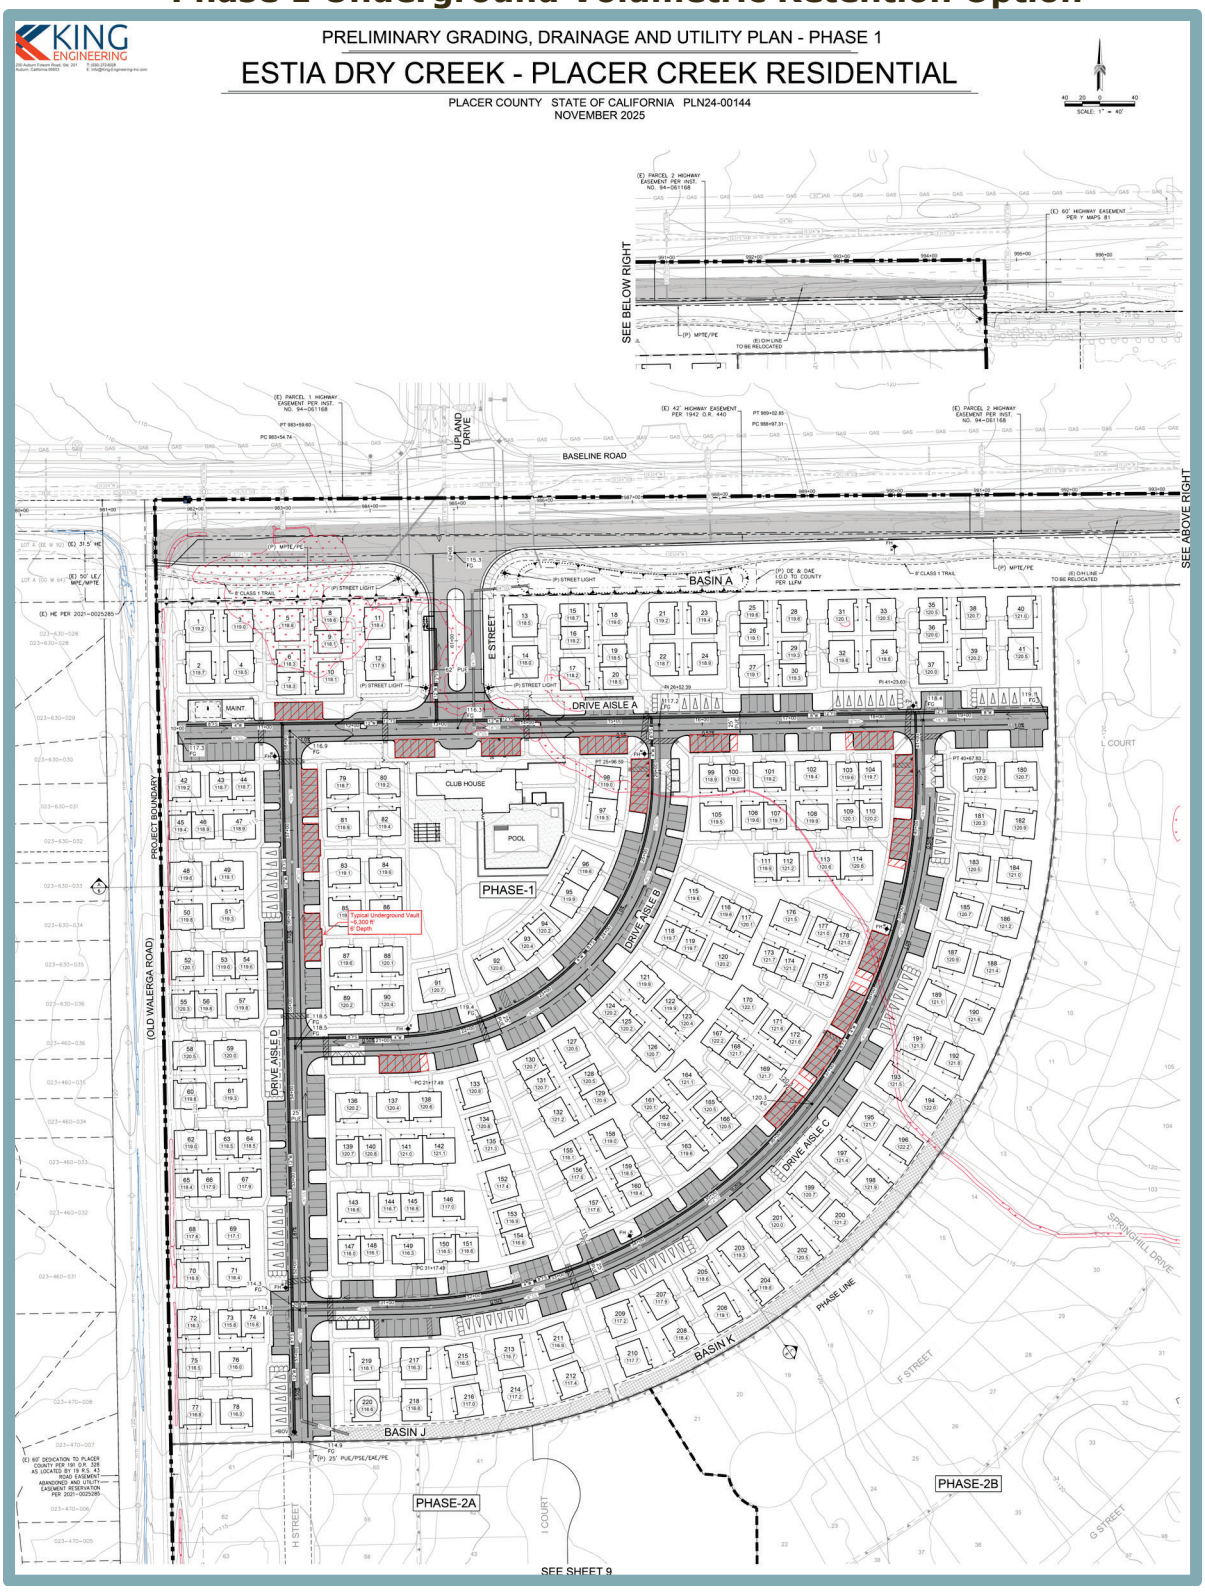

*Figure not OCR compatible.

Maintaining stormwater drainage to the north to the existing Curry Creek watershed would raise some areas of the project site by as much as 10 feet. Raising the project site would require a significant import of material, approximately 240,000 cubic yards. Transporting such large import quantities could result in significant air quality impacts, and would also result in steep road grades and potential noncompliance with Americans with Disabilities Act (ADA) regulations.

Another drainage option evaluated was a permanent storm drain pump facility. The pump facility would pump drainage from the existing shed boundary north toward the Baseline Road storm drain system. Long-term maintenance requirements and electricity demands are higher with pump systems. Performance and reliability of such types of pump facilities over time can also be problematic, requiring special equipment and ongoing maintenance to function properly. Section 5-11(J) of the Placer County Land Development Manual states “The use of drainage pumps shall be avoided if at all possible, and is allowed only with approval of the Engineer.” The Placer County Flood Control and Water Conservation District Stormwater Management Manual (SWMM) also states in Section VI-4, Drainage Systems, “Underground drainage systems shall be designed for ease of maintenance and repair.” Therefore, the use of a permanent storm drain pump facility was determined to be impractical for the proposed project.

The County requires "compelling justification" to allow a shed shift, with supporting documentation and confirmation that the project does not negatively impact upstream or downstream drainage facilities. This project has coordinated with the County and Flood Control District for approval of this unique exception to SWMM policies (Section II(C)(3); Section IV(B)(3); Section VI(B)(1)(a)).

To assess the changes in runoff volumes from the project site that could occur due to the proposed project, King Engineering calculated the pre- and post-construction peak flows and volumes for on-site drainage sheds under cumulative buildout conditions within the greater watershed boundaries. Pre-construction and post-construction peak flows are presented in Table 12-2. The locations of the post-development discharge locations and sheds are shown below in Figure 12-8 through Figure 12-13. The proposed Dry Creek Walerga Road Tributary Watershed, including the proposed shed shift, is shown in Figure 12-14.

Point A is the existing Baseline Road flared-end storm drain. Phases 1 and 2 of the proposed project would split the existing 35.6-acre shed that currently directs flow north to Curry Creek and would direct the majority of the flow south to Point B. Upon development, only 10 acres of the Phase 1 area would direct flows north to Curry Creek and the remainder of the project site would direct flows south to the Dry Creek watershed. As such, peak flows at the existing Point A would be reduced with implementation of the proposed project. Point B would be the new 48-inch flared-end storm drain pipe that would connect to an existing pipe in Walerga Road that currently outfalls into the on-site “Placer Creek” tributary. Point C, associated with Phases 3 and 4 of the proposed project, represents a portion of the Placer Creek tributary, west of Walerga Road.

Proposed Dry Creek Walerga Road Tributary Watershed

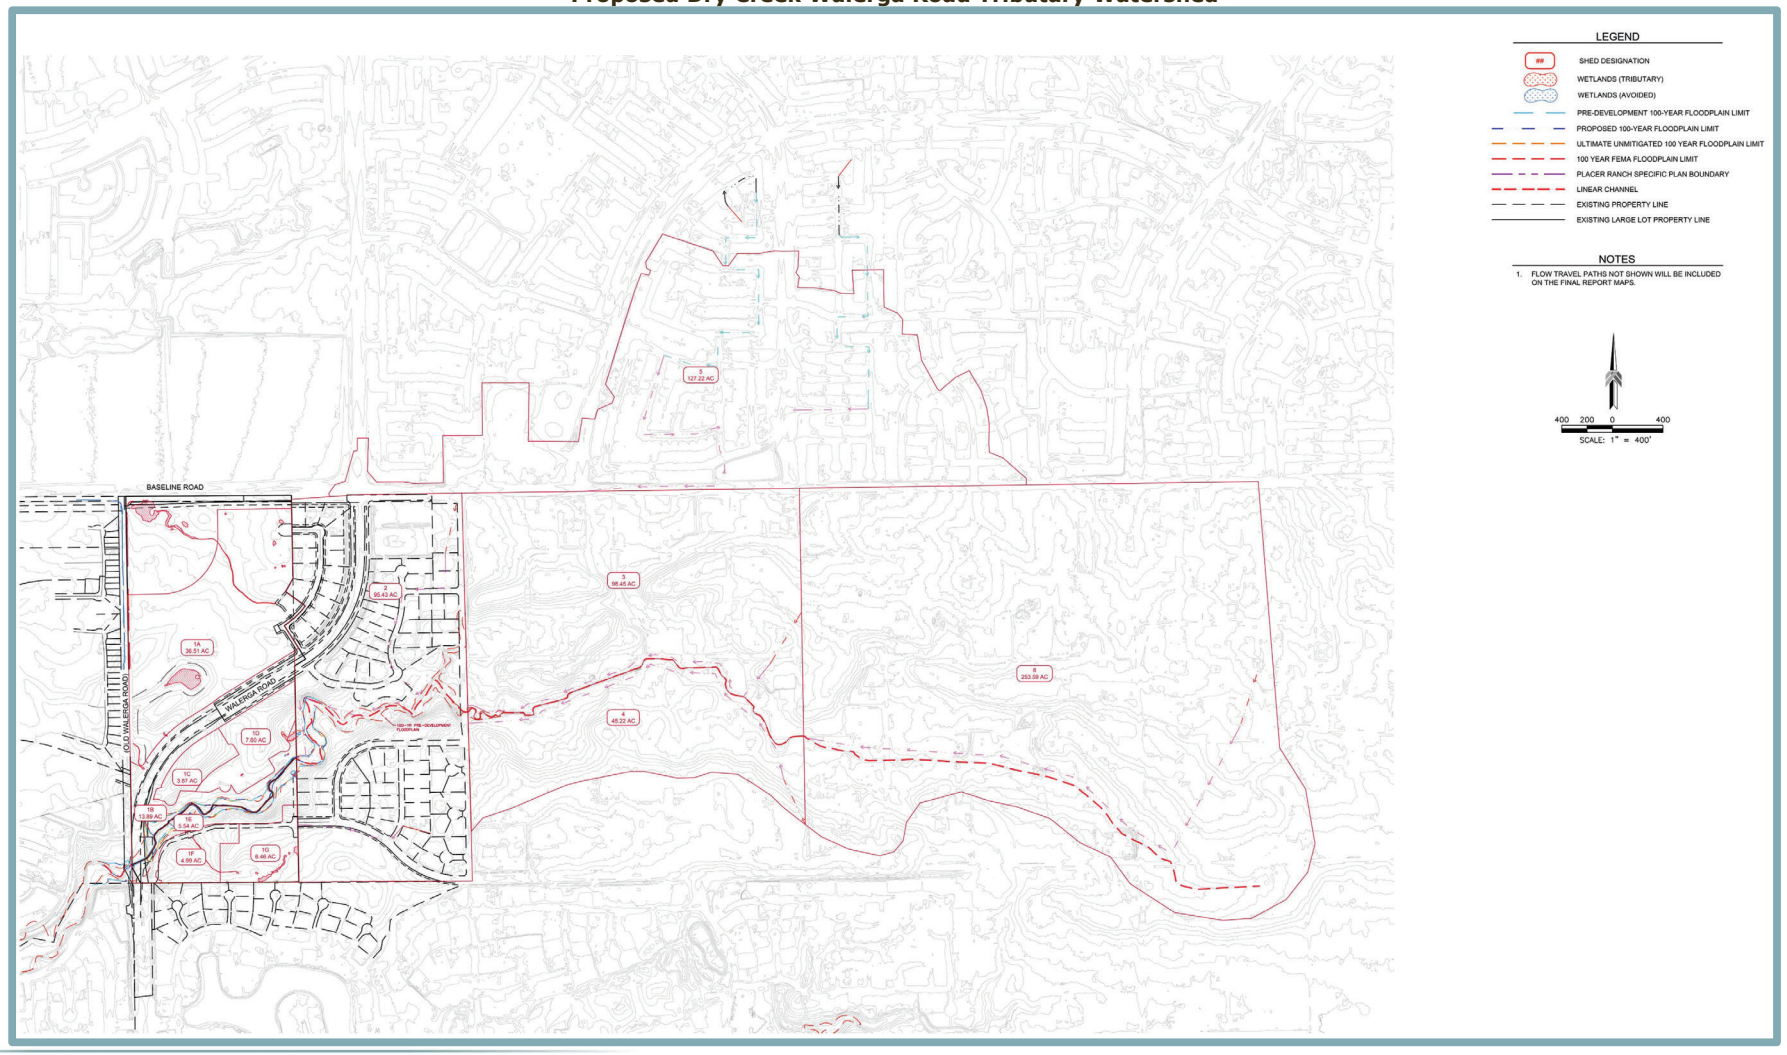

*Figure not OCR compatible.

As shown above in Table 12-2, implementation of the proposed project would result in an increase in peak flows at the Walerga Road discharge point. However, projects within the Dry Creek watershed are not required to detain peak flow runoff to pre-development levels. The Dry Creek Watershed Flood Control Plan notes that the use of local detention basins to limit peak runoff has the potential to result in higher overall peak flows within Dry Creek, which could result in off-site flooding.[15]

Specifically, detaining flows in the lower portion of the Dry Creek watershed, within which the project site is located, could delay the time when the peak flow in lower portions of the Dry Creek watershed occurs such that the peak flow would coincide with the arrival of peak flows from the upper portion of the watershed. Thus, the proposed project would not include detention of on-site stormwater runoff, unless otherwise determined to be necessary by the Flood Control District during the final design and the analysis provided with the Final Drainage Report.

Nonetheless, the proposed project would be required to comply with Placer County's Dry Creek Watershed Drainage Improvement Ordinance, which requires new development that increases impervious surface areas within the Dry Creek watershed to pay fees to fund regional flood control and future drainage improvement projects within the watershed. District flood control projects include the Miners Ravine Off-Chanel Detention Basin and Antelope Creek Flood Control Project. These regional flood control projects were constructed to mitigate increased runoff associated with development within the Dry Creek watershed.

The fees include a one-time fee that is paid prior to start of construction and an annual fee that is included in the parcel's property tax. There are no currently applicable Placer County fees for the Curry Creek Watershed.

Downstream Conveyance Capacity

King Engineering analyzed the potential for the proposed project to result in impacts related to increases in water surface elevation (WSE) within the Dry Creek Walerga Road Tributary Watershed. As shown above in Figure 12-3, the existing Dry Creek Walerga Road Tributary Watershed spans a total of approximately 689.18 acres, and includes the entirety of the project site, as well as additional land in the project vicinity.

According to King Engineering and as discussed below, any minor shed shift from Curry Creek to Dry Creek would not impact Dry Creek and any downstream properties. The shed shift would include approximately 25.7 acres towards Walerga Tributary/Dry Creek, with 10.0 acres toward Curry Creek at the master planned location in Baseline Road. Table 12-3 presents the WSEs, measured in feet, for the Dry Creek Walerga Road Tributary (i.e., Placer Creek) stations, which represent a stream cross section.

As shown in Table 12-3, King Engineering determined based on preliminary modeling that, during a 100-year storm event, the WSEs within the Dry Creek Walerga Road Tributary (Placer Creek) would be raised at most up to 0.09 feet within the project area. Pursuant to Mitigation Measure 12-4(e), final modeling completed with the final drainage report will

[15] Placer County Flood Control and Water Conservation District. *Update to the Dry Creek Watershed Flood Control Plan* [pg. 66]. November 2011.

be required to demonstrate that no increases in upstream or downstream water surface elevations would occur as a result of the proposed project.

The peak flood wave in the Dry Creek Walerga Road Tributary (Placer Creek) would occur at approximately 13 hours into the 100-year, 24-hour storm, well ahead of the Dry Creek regional flood wave at approximately 17 hours. Thus, downstream properties would not experience impacts to the base flood elevation as a result of the proposed project. In the post-development condition, the Phase 2, Phase 3, and Phase 4 areas would discharge to the Dry Creek watershed; therefore, detention and retention are not required. Detention and retention are only required for projects draining to the Curry Creek watershed.

Overall, King Engineering has confirmed that while the proposed project would alter the existing hydrology of the project area and include a shed shift from the Curry Creek watershed to the Dry Creek watershed, the post-construction 100-year increases would be contained in the natural channels of the tributary, and several vertical feet of freeboard (the vertical distance between the flood level and the top of the embankment) would be maintained for existing structures, as well as provided for the proposed building pads. Furthermore, King Engineering has confirmed that the anticipated increase in flows on-site would be contained within a relatively deep channel, and would not impact on- or off-site development. In addition, Figure 12-15 shows water surface cross sections for tributary stations 4100, 3975.67, and 3851. As shown therein, adequate capacity for post-development project flows exist through the culvert under Walerga Road, and upsizing would not be required.

As discussed above, if the proposed project does not participate in the regional retention basin, underground volumetric retention would be required for the runoff within DMA A in order to mitigate impacts from the eight-day, 100-year storm event based on the potential downstream impacts on the Curry Creek Cross Canal watershed.

The estimated retention required is 69,220 cubic feet. The underground retention option would provide approximately 100,800 cubic feet of possible retention with capacity on-site for additional retention. The final retention volumes would be provided and analyzed with the improvement plans.

Based on the above, the proposed project is not anticipated to substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site or create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems.

Off-Site Sewer Lift Station Improvements Area

As discussed in Chapter 15, Public Services and Utilities, the proposed project would require an emergency storage upgrade to the existing Dry Creek/West Placer CFD #1 lift station, located east of Walerga Road and south of Dry Creek within Dry Creek Community Park, approximately 0.53-mile to the south. As part of the emergency storage upgrade, additional grading would be required in the floodplain, which would result in compensatory cut in the floodplain. As shown in Table 12-4, the HEC-RAS analysis determined that such improvements would result in a No Rise condition at the lift station. Thus, the off-site sewer lift station improvements and associated cut in the floodplain would not substantially alter the existing drainage pattern of the site or area.

Off-Site Affordable Housing Parcel

As discussed throughout this EIR, the construction of the proposed affordable units does not include any site-specific development plans, designs, or proposals at this time. However, similar to the proposed project, the potential residential development and the associated impervious surfaces could result in increased rate and volume of stormwater runoff downstream.

The RVSP EIR analyzed the potential for buildout of the RVSP with 30 percent impervious surfaces to increase the runoff rate and volume downstream of the plan area. With development of the site and its associated increase in impervious surfaces, peak flows and runoff volumes from the plan area would increase. However, the additional runoff from the plan area would be relatively small compared to the flows in Dry Creek. A slight increase of approximately less than one percent would occur in mitigated post-RVSP flows compared with pre-RVSP flows, which would not result in any significant increase in the 100-year water surface elevations in Dry Creek. Similar to the proposed project, the RVSP plan area is located within the lower portion of the Dry Creek watershed, where detention is not recommended. Detaining flows in the lower portion of the watershed could delay the time when the peak flow occurs such that the peak flow would coincide with the arrival of peak flows from the upper portion of the watershed.

As discussed on page 13-7 of the RVSP EIR, a portion of the off-site affordable housing parcel currently drains south toward PFE Road through culverts under the road, and ultimately discharges to Dry Creek downstream of Watt Avenue. In order to meet the County's street encroachment requirements at PFE Road and because of downstream

flow constrictions, development of the parcel would include on-site detention to reduce post-project flow rates to less than pre-project flow rates. On-site detention would be developed during design of the development and included in project-specific drainage studies that would be prepared in accordance with the County's SWMM and submitted to ESD for review and approval. On-site detention would be provided using a combination of above ground detention, parking area storage, and below ground vault and pipe storage.

Similar to the proposed project, the off-site affordable parcel would be required to comply with the Placer County's Dry Creek Watershed Drainage Improvement ordinance, including payment of a one-time fee prior to start of construction and an annual fee included in the parcel's property tax. Both fees are based on the amount of impervious area created by the proposed development.

Should development of the off-site affordable housing parcel occur, RVSP Mitigation Measures 13-2a, 13-2b, 13-2c, and 13-2d would be required in order to ensure runoff rate and volume do not exceed existing limits, and payment of required fees. Mitigation Measure 13-2a would require a project-specific drainage report; Mitigation Measure 13-2b would require evaluation of downstream off-site drainage facilities; Mitigation Measure 13-2c would require payment of a one-time Dry Creek watershed drainage improvement fee; and Mitigation Measure 13-2d would require payment of an annual Dry Creek watershed drainage improvement fee. The aforementioned RVSP EIR mitigation measures have been applied in this EIR as Mitigation Measures 12-4(g) through 12-4(j).

Conclusion

Based on the above, the off-site sewer lift station improvements would not substantially alter the existing drainage pattern of the site or area. Although the proposed project would result in an increase in on- and off-site peak runoff flows as well as an increase in WSEs within the Dry Creek Walerga Road Tributary (Placer Creek) relative to existing conditions during a 100-year storm event, the post-construction 100-year increases would be contained in the natural channel on-site, and off-site floodplain limits within Dry Creek would not be increased. Several vertical feet of freeboard would be maintained for existing structures on-site, and provided for the proposed building pads. The potential future development of the off-site affordable housing parcel and its associated increase in impervious surfaces, peak flows and runoff volumes would be relatively small compared to the flows in Dry Creek, and detention is not recommended. In addition, the project applicant would be required to pay fees in accordance with the Dry Creek Watershed Drainage Improvement Ordinance. Payment of such fees would help to fund regional flood control and future drainage facility improvement projects within the Dry Creek watershed. Nevertheless, a final drainage report would be required with the project Improvement Plans to substantiate the preliminary drainage design. Without approval of a final drainage report for the proposed project and the off-site affordable housing parcel, a ***significant*** impact could occur.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level by ensuring that increased on- and off-site peak runoff flows resulting from the project will not result in flooding on- or off-site, will not create or contribute runoff water that would exceed the capacity of existing or planned stormwater

drainage systems, and will not provide substantial additional sources of polluted runoff either during construction or in the post-construction condition.

Proposed Project

12-4(a) *As part of the Improvement Plan submittal process, the preliminary Drainage Report provided during environmental review shall be submitted in final format in conformance with the requirements of the Land Development Manual and the Placer County Stormwater Management Manual that are in effect at the time of submittal. The final Drainage Report may require more detail than that provided in the preliminary report and will be reviewed in concert with the Improvement Plans to confirm conformity between the two.*

12-4(b) *This project is subject to the one-time payment of drainage improvement and flood control fees pursuant to the "Dry Creek Watershed Interim Drainage Improvement Ordinance" (Ref. Article 15.32, Placer County Code). Fees shall be made payable to the Engineering and Surveying Division (ESD) prior to Building Permit issuance. The fees to be paid shall be based on the fee program in effect at the time that the Building Permit is issued.*

12-4(c) *This project is subject to payment of annual drainage improvement and flood control fees pursuant to the "Dry Creek Watershed Interim Drainage Improvement Ordinance" (Ref. Chapter 15, Article 15.32, Placer County Code). Prior to Building Permit issuance, the applicant shall cause the subject property to become a participant in the existing Dry Creek Watershed County Service Area for purposes of collecting such annual assessments.*

12-4(d) *On the Improvement Plans and Informational Sheet(s) filed with the appropriate Final Subdivision Map(s), show:*

- *A) The limits of the future, unmitigated, fully developed, 100-year floodplain (after grading) for the Dry Creek Walerga Road Tributary Reach and designate same as a building setback line unless greater setbacks are required by other conditions contained herein. The Improvement Plans shall also show the limits of the future, unmitigated, fully developed, 100-year floodplain for the existing project site conditions.*
- *B) That finished house pad elevations for Tentative Map all Lot's for all lots along the floodplain shall be a minimum of two feet above the 100-year floodplain line (or finished floor -three feet above the 100-year floodplain line). The final pad elevation shall be certified by a California registered civil engineer or licensed land surveyor and submitted to the Engineering and Surveying Division. This certification shall be done prior to construction of the foundation or at the completion of final grading, whichever comes first. No building construction is allowed until the certification has been received by the Engineering and Surveying Division.*

12-4(e) *The final Drainage Report shall demonstrate that the proposed project will not increase the limits or water surface elevation of the off-site 100 year floodplain upstream and downstream of the project site, on both sides, to the satisfaction of the Engineering and Surveying Department and Placer County Flood Control District.*

Off-Site Affordable Housing Parcel

12-4(f) *Implement RVSP EIR Mitigation Measure 13-2a:*

Each applicant/developer for future construction projects within the Plan Area shall prepare and submit with their project Improvement Plans a project-specific drainage report in conformance with the requirements of Section 5 of the Land Development Manual and the Placer County Stormwater Management Manual (SWMM) that are in effect at the time of submittal, to the Placer County ESD for review and approval. The project-specific drainage reports shall be consistent with the Drainage Master Plan and Development Standards for Plan Area. The report shall be prepared by a Registered Civil Engineer and shall, at a minimum, include:

- *Written text describing existing conditions and proposed improvements,*
- *The effects of the improvements,*
- *All appropriate calculations,*
- *A watershed map,*
- *Increases in downstream flows, and*
- *Proposed onsite and offsite improvements and drainage easements to accommodate flows from the project.*

The report shall identify water quality protection features and methods to be used both during construction and for long-term post-construction water quality protection. "Best Management Practice" (BMP) measures shall be provided to reduce erosion, water quality degradation, and prevent the discharge of pollutants to stormwater to the maximum extent practicable.

No construction shall be permitted within any identified wetlands area, floodplain, or right-of-way, except as authorized by project approvals. The project-specific drainage report shall demonstrate compliance with all relevant mitigation measures included in this Draft EIR.

12-4(g) *Implement RVSP EIR Mitigation Measure 13-2b:*

The project-specific drainage reports prepared for each future construction project within the Plan Area shall evaluate offsite drainage facilities for conditions and capacity and shall be upgraded, replaced, or mitigated as specified by the Placer County ESD. Each future construction project shall upgrade or replace drainage facilities, or mitigate drainage impacts in other ways as needed and as specified by Placer County ESD. This includes any existing drainage facilities located immediately downstream of the project

that would receive drainage and would be changed by the proposed project. The analysis must include any existing roadside ditches and/or culverts along Walerga Road, PFE Road, and Watt Avenue. While the Plan Area is within the Dry Creek watershed and as such onsite detention is not required to reduce peak flow rates due to development, onsite detention may be required in order to comply with the County's requirements regarding road encroachments. In accordance with the SWMM, all travel lanes of Watt Avenue, PFE Road, and Walerga Road may be required to remain clear of stormwater flow for all storm events, including the 100-year event. In addition, the Applicant will be required to mitigate peak flow rates to pre-development levels for 10- and 100-year storm events (per the Placer County Stormwater Management Manual) for only the portion of the Riolo Vineyards Plan Area that drains south towards PFE Road.

12-4(h) *Implement RVSP EIR Mitigation Measure 13-2c:*

New development in the Plan Area shall be subject to the one-time payment of drainage improvement and flood control fees pursuant to the Dry Creek Watershed Interim Drainage Improvements Ordinance (Ref. Article 15.32, formerly Chapter 4, Subchapter 20, Placer County Code). This fee is used to fund installation and maintenance of roadway drainage and stormwater drainage improvements within the watershed. The actual fees to be paid will be those in effect at the time the payment occurs and are assessed on the amount of development area. Each developer will be responsible for submitting the appropriate fee for the specific land development project to the Placer County ESD. The one-time fee shall be paid prior to issuance of the building permit or approval of improvement plans.

12-4(i) *Implement RVSP EIR Mitigation Measure 13-2d:*

New development in the Plan Area shall be subject to payment of annual drainage improvement and flood control fees pursuant to the Dry Creek Watershed Interim Drainage Improvements Ordinance (Ref. Article 15.32, formerly Chapter 4, Subchapter 20, Placer County Code). These fees are used to fund installation and maintenance of roadway drainage and stormwater drainage improvements within the watershed. The Applicant will be required to form a County Service Area zone, if one currently does not cover the Plan Area, for collecting the annual special assessment. The actual fees to be paid will be those in effect at the time the payment occurs and are assessed on the basis of the new development acreage. The annual fee is a yearly charge and will be included on a parcel's property tax bill.

12-5 Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows or expose people or structures to risk of loss, injury or death involving flooding through the placement of housing in a flood hazard area, or risk release of pollutants due to project inundation. Based on the analysis below and with implementation of mitigation, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to the proposed project, off-site sewer lift station improvements area, and the off-site affordable housing parcel substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows or expose people or structures to risk of loss, injury or death involving flooding through the placement of housing in a flood hazard area, or risk release of pollutants due to project inundation.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

As shown in Figure 12-1, the majority of the project site is within FEMA zone X, which is outside of a floodplain. However, the Placer Creek tributary area portion of the project site is within a FEMA mapped AE floodplain zone. In addition, the off-site sewer lift station improvements area is located within Zone AE. The FEMA AE zone is defined as being areas subject to inundation by the one percent annual chance flood event, and FEMA provides base flood elevations for such areas. The proposed project would not place housing within the future, fully developed, unmitigated 100-year floodplain.

Limited fill would be placed within the floodplain fringes during project development, generally associated with the proposed pedestrian bridge over Placer Creek. The limited fill has been accounted for in the hydraulic model for the proposed project and is reflected in the values presented in Table 12-3. In addition, as part of the emergency storage upgrade at the off-site sewer lift station improvements area, additional grading would be required in the floodplain, which would result in compensatory cut in the floodplain. The cut in the floodplain has been accounted for in the hydraulic model for the proposed project and is reflected in the values presented in Table 12-4. As a result of the proposed limited fill, cut in the floodplain, and proposed changes in hydrology, a Conditional Letter of Map Revision (CLOMR) would be required to be submitted to FEMA to update the floodplain information to reflect the proposed conditions.

Furthermore, as discussed in the Regulatory Context section of this chapter, the proposed project would not meet all five criteria to be subject to SB 5 and would not place residences within a 200-year floodplain with a potential flood depth above three feet; all such on-site areas would be contained within the open space corridors. As such, the proposed project would not be subject to the requirements of the ULOP, and the 200-year storm event level of flood protection would not be required. In addition, all of the proposed improvements would be subject to Article 15.52, Flood Damage Prevention Regulations, of the Placer County Code, which is intended to minimize public and private losses due to flood

conditions, including where public facilities and utilities are located within areas of special flood hazard. The Flood Damage Prevention Regulations provide methods for reducing flood losses and sets forth standards for construction in all areas of special flood hazards.

With respect to risking release of pollutants due to project inundation, residential projects do not involve the storage of large amounts of pollutants, and all stormwater exiting the project site would be directed to on-site stormwater quality features to ensure that any pollutants entrained within stormwater from the project site are removed prior to discharge.

Off-Site Affordable Housing Parcel

As shown in Figure 13-3 of the RVSP EIR, the off-site affordable housing parcel is not located with the 100-year floodplain, and fill is not proposed within the development area. Therefore, people or structures associated with the off-site affordable housing parcel would not be exposed to flood hazards. As such, the off-site affordable housing parcel would not result in the impediment or redirection of flood flows such that on- or off-site structures would be exposed to flood risk, and Mitigation Measures 13-5a, 13-5b, 13-5c, 13-5d, 13-5e, and 13-5f included in the RVSP EIR would not be required.

Conclusion

Considering the above, the proposed project is not anticipated to result in the impediment or redirection of flood flows such that on- or off-site structures would be exposed to flood risk. However, a CLOMR would be required prior to Improvement Plan approval in order to ensure the project's compliance with existing regulations. Therefore, in the absence of a CLOMR submitted to FEMA, a ***significant*** impact could occur related to alteration of the existing drainage pattern of the site or area, including through alteration of a course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level by ensuring that the project complies with all regulations needed to ensure that new impervious surfaces created by the project do not impede or redirect flood flows.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

12-5(a) *Prior to Improvement Plan approval, if required by the Federal Emergency Management Agency (FEMA), the Placer County Flood Control District, or the County Floodplain Administrator, the applicant shall obtain from FEMA, a Conditional Letter of Map Revision (CLOMR) or Conditional Letter of Map Revision based on Fill (CLOMR-F) for fill within a Special Flood Hazard Area. A copy of the letter shall be provided to the Engineering and Surveying Division. A Letter of Map Revision (LOMR), or a Letter of Map Revision based on Fill (LOMR-F) from FEMA shall be provided to the Engineering and Surveying Division (ESD) prior to acceptance of project improvements as complete.*

12-5(b) *Implement the following Mitigation Measure set forth in this EIR:*

- *12-4(d) On the Improvement Plans and Informational Sheet(s) filed with the appropriate Final Subdivision Map(s), show:*

  A) The limits of the future, unmitigated, fully developed, 100-year floodplain (after grading) for the Dry Creek Walerga Road Tributary Reach and designate same as a building setback line unless greater setbacks are required by other conditions contained herein. The Improvement Plans shall also show the limits of the future, unmitigated, fully developed, 100-year floodplain for the existing project site conditions.

  B) That finished house pad elevations for Tentative Map all Lot's for all lots along the floodplain shall be a minimum of two feet above the 100-year floodplain line (or finished floor -three feet above the 100-year floodplain line). The final pad elevation shall be certified by a California registered civil engineer or licensed land surveyor and submitted to the Engineering and Surveying Division. This certification shall be done prior to construction of the foundation or at the completion of final grading, whichever comes first. No building construction is allowed until the certification has been received by the Engineering and Surveying Division.

12-5(c) Implement the following Mitigation Measure set forth in this EIR:

- *12-4(e) The final Drainage Report shall demonstrate that the proposed project will not increase the limits or water surface elevation of the off-site 100 year floodplain upstream and downstream of the project site, on both sides, to the satisfaction of the Engineering and Surveying Department and Placer County Flood Control District.*

Cumulative Impacts and Mitigation Measures

As defined in Section 15355 of the CEQA Guidelines, "cumulative impacts" refers to two or more individual effects which, when considered together, are considerable, compound, or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects.

The cumulative setting for impacts related to hydrology and water quality encompasses the Dry Creek Walerga Road Tributary drainage shed, which, as discussed above, spans a total of approximately 689.18 acres, and includes the entirety of the project site, as well as additional land in the project vicinity.

12-6 Cumulative impacts related to the violation of water quality standards or waste discharge requirements, groundwater quality, management, and recharge, and impacts resulting from the alteration of existing drainage patterns. Based on the analysis below, the project's incremental contribution to this significant cumulative impact is *less than cumulatively considerable*.

Impacts of the proposed project, off-site sewer lift station improvements, and off-site affordable housing parcel related to stormwater quality, groundwater, and drainage patterns are discussed below.

Stormwater Quality

Construction activities have the potential to affect water quality and contribute to localized violations of water quality standards if stormwater runoff from construction activities enters receiving waters. Runoff from additional construction sites within the project area could carry sediment from erosion of graded or excavated surface materials, leaks or spills from equipment, or inadvertent releases of building products, which could result in water quality degradation if runoff containing such sediment or contaminants should enter receiving waters in sufficient quantities. Thus, construction activities associated with the proposed project, off-site sewer lift station improvements, and off-site affordable housing parcel, in combination with construction activities associated with other reasonably foreseeable projects in the Dry Creek watershed, could result in cumulative impacts related to water quality. However, all construction projects resulting in disturbance of more than one acre of land are required to comply with the most current Construction General Permit requirements. Conformance with the Construction General Permit would require preparation of SWPPPs for all such projects, and subsequent implementation of BMPs to prevent the discharge of pollutants. Considering the existing permitting requirements for construction activity in the project area, cumulative construction within the Dry Creek watershed would be heavily regulated and impacts related to the degradation of water quality would be minimized.

Similar to the proposed project, off-site sewer lift station improvements, and off-site affordable housing parcel, cumulative development within the DCWPCP would be subject to Phase II MS4 stormwater requirements, including source control and treatment control features. Specifically, regulated projects are required to divide the project area into DMAs and implement and direct water to appropriately sized SDMs and Baseline Hydromodification Measures to each DMA. Source control measures must be designed for pollutant-generating activities or sources consistent with recommendations from the CASQA Stormwater BMP Handbook for New Development and Redevelopment, or equivalent manual, and must be shown on improvement plans.

Based on the conceptual stormwater design, during operations, the stormwater runoff would be properly treated prior to discharge from the site. Thus, urban pollutants entering and potentially polluting the local drainage system would not be expected to occur as a result of the project. A final drainage report for the proposed project, off-site sewer lift station improvements, and the off-site affordable housing parcel would be required with submittal of the Improvement Plans for County review and approval to substantiate the

preliminary report's LID sizing calculations. In addition, pursuant to Phase II MS4 requirements, a Post Construction Stormwater Control Plan would be required for the proposed project. The project, off-site sewer lift station improvements, and the off-site affordable housing parcel would be subject to NPDES Construction General Permit requirements, including implementation of BMPs and preparation of a site-specific SWPPP. Cumulative development projects within the project area would also be subject to Phase II MS4 stormwater requirements, as well as all County requirements related to stormwater treatment and control. Compliance with the foregoing regulations would ensure that impacts related to the alteration of drainage patterns, the discharge of pollutants, and flooding are minimized.

Groundwater

Cumulative development within the project region would result in increased amounts of impervious surface, which would reduce the infiltration of groundwater within the project region. Although cumulative development would increase the number of impervious surfaces in the project region, stormwater would continue to be discharged to the Dry Creek Walerga Road Tributary (Placer Creek), and other local waterways, where stormwater could infiltrate into the soil and recharge groundwater. In addition, regulations require installation of stormwater infiltration BMPs to moderate impact to surface/groundwater flows for all projects by infiltrating stormwater into the soil and recharging groundwater. Furthermore, the project site, off-site sewer lift station improvements area, and the off-site affordable housing parcel themselves are not considered a site of substantial groundwater recharge; thus, development of the project and the off-site affordable housing parcel would not result in a significant cumulative loss of groundwater recharge.

Groundwater in the project region is managed on a subbasin level. The North American Subbasin, within which the project is located, is not in a state of overdraft, and the WPGSA will continue to manage groundwater in the region.

Because groundwater is managed on a subbasin level, and the project would not result in a substantial site-specific loss of groundwater recharge, the proposed project, off-site sewer lift station improvements, and the off-site affordable housing parcel, in combination with cumulative development within the region, would not result in a significant cumulative impact to groundwater recharge.

Drainage Patterns

Concurrent implementation of the proposed project, the off-site affordable housing parcel, and cumulative development within the Dry Creek Walerga Road Tributary drainage shed area would result in the conversion of pervious surfaces to impervious surfaces. The hydraulic analysis prepared for the proposed project by King Engineering, as discussed in Impact 12-4 above, assessed cumulative conditions (i.e., buildout of properties within the watershed area consistent with DCWPCP land use designations). This was done to assess the potential worst-case impact of the proposed project's incremental effects on future peak flows and WSEs in the cumulative setting. As such, the analysis presented above reflects existing flows, the proposed project flows, and flows associated with future buildout of the remaining Dry Creek Walerga Road Tributary shed area (as shown in Figure 12-3) pursuant to DCWPCP land use designations.

King Engineering determined that although the post-construction peak flows during the 100-year storm event, as well as the peak WSEs, would increase relative to existing conditions, such increases would be contained in the natural channels of the tributary on-site, several vertical feet of freeboard would be maintained to existing structures, as well as provided to all new pads, and the project would not increase floodplain limits or WSEs upstream or downstream of the project.

Therefore, as described above, the ultimate buildout flows would not result in inundation of any on- or off-site structures or improvements. Consequently, the proposed project, off-site sewer lift station improvements, and off-site affordable housing parcel would not result in a cumulatively significant impact to drainage patterns in the drainage shed.

Conclusion

As discussed throughout this chapter, implementation of the proposed project, off-site sewer lift station improvements, and off-site affordable housing parcel would include LIDs and BMPs to minimize the potential for the proposed project to result in impacts related to hydrology and water quality. Moreover, King Engineering estimated drainage conditions under cumulative conditions for the Dry Creek Walerga Road Tributary (Placer Creek) and concluded that implementation of the proposed project would not result in a significant incremental contribution to cumulative impacts related to peak flows or flooding due to changes in drainage patterns at the project site.

Given the analysis presented in this chapter, the conclusions reached by King Engineering, and the highly regulated nature of cumulative development in the project region, the project's incremental contribution to the significant cumulative impact would be ***less than cumulatively considerable***.

Mitigation Measure(s)

None required.

13. Land Use and Planning / Population and Housing

13. LAND USE AND PLANNING/ POPULATION AND HOUSING

13.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County for an approximately four-acre parcel offsite within the Riolo Vineyards Specific Plan (RVSP), which could develop a maximum of 120 affordable income-restricted units.

The purpose of the Land Use and Planning/Population and Housing chapter of the EIR is to examine the proposed project's compatibility with existing land uses in the area and identify any incompatibilities with applicable land use plans, policies and regulations adopted by the County for the purpose of avoiding or mitigating environmental effects, including the Placer County General Plan (PCGP)[1] and the Dry Creek-West Placer Community Plan (DCWPCP).[2] Furthermore, the chapter includes discussion of the potential for the project to induce substantial population growth in the project area, either directly or indirectly. The reader is referred to the various environmental resource evaluations presented in the other technical chapters of this EIR for a discussion of potential physical/environmental effects that may result from the proposed land use changes.

In addition, the proposed project would include improvements to the off-site Community Facilities District #1 Sewer Lift Station, which would also require embankment work to raise the access and maintenance areas out of the adjacent Dry Creek 100-year floodplain. However, because the proposed improvements to the existing lift station within the off-site sewer lift station improvements area would not result in land use changes or additional population in the DCWPCP area, impacts related to such are not discussed further herein.

The primary documents referenced to prepare this chapter include the PCGP, the PCGP EIR,[3] the Placer County Housing Element 2021-2029,[4] the RVSP[5] and associated EIR,[6] and the DCWPCP.

13.2 EXISTING ENVIRONMENTAL SETTING

This section describes the existing land uses on the project site and off-site affordable housing parcel, as well as within the surrounding area. In addition, the existing plans and policies that guide the development of the project site and off-site affordable housing parcel are discussed

1 Placer County. *Countywide General Plan Policy Document*. August 1994 (updated May 2013).
2 Placer County. *Dry Creek-West Placer Community Plan.* Amended May 12, 2009.
3 Placer County. *Countywide General Plan EIR*. July 1994.
4 Placer County. *Placer County Housing Element 2021-2029.* Adopted May 11, 2021.
5 Placer County. *Riolo Vineyard Specific Plan Update*. October 2015.
6 Placer County. *Riolo Vineyard Specific Plan Environmental Impact Report*. January 2008.

below. Lastly, the Existing Environmental Setting section describes current population and housing trends in the project region.

Project Site Characteristics and Surrounding Land Uses

The project site consists of approximately 92.2 gross acres located in the DCWPCP area of unincorporated Placer County. The project site is bisected by Walerga Road, which generally curves from northeast to southwest. The 52.3-acre northern portion of the site (APN 023-221-076) is bounded by Baseline Road to the north and Walerga Road to the south. The northern portion of the site is undeveloped, consists of non-native annual grassland with gently rolling topography, and is interspersed with seasonal wetlands and vernal pools. The 35.3-acre southern portion of the site (APN 023-221-074) is bounded by Walerga Road to the north and west. The southern portion of the site includes a paved bicycle trail which extends from Vineyard Road to the east and Walerga Road to the west. In addition, the southern portion of the site includes undeveloped annual grassland with gently rolling topography, interspersed with seasonal wetlands, vernal pools, and is bisected by an un-named tributary of Dry Creek (named "Placer Creek" for this project) which flows east to west.

Roadways in the immediate project vicinity include Baseline Road to the north, Walerga Road bisecting the project site from the southwest to the northeast, Town Center Avenue to the west, and Vineyard Road to the southeast. Additionally, the northern boundary of the project site is adjacent to the Roseville City Limits, and the southern boundary of the project site is located approximately 1.2 miles from the Placer County/Sacramento County line.

Surrounding existing land uses for the project site include the under-construction Baseline Marketplace to the north, across Baseline Road; single-family residences associated with the Sun Valley Oaks residential neighborhood and Dry Creek tributaries to the east; single-family residences associated with the Morgan Creek residential neighborhood to the south; and the under-construction Property 1A of the Placer Vineyards Specific Plan (PVSP), which will include 1,285 residential units to the west.

Off-Site Affordable Housing Parcel Characteristics and Surrounding Uses

As discussed above, one option for the project to meet the County's affordable housing regulations includes an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County for the off-site affordable housing parcel, which could result in the potential future development of a maximum of 120 affordable income-restricted units. The off-site affordable housing parcel consists of approximately four acres of undeveloped land with grassy fields and gently rolling topography located at the northeast corner of PFE Road and Watt Avenue (Assessor's Parcel Number [APN] 023-200-056-000) within the RVSP. Several trees are present along the northern and western boundaries of the off-site affordable housing parcel. The southern boundary of the project site is located approximately 160 feet from the Placer County/Sacramento County line.

Surrounding existing land uses for the site include the Union Cemetery to the north, vacant land designated by the RVSP as Medium Density Residential (MDR) to the east; single-family residences and the Creekside Meadows wedding service business to the west; and vacant land designated by the PCGP/DCWPCP as Commercial (C) to the south, across PFE Road, with single-family residences further south, within Sacramento County.

Land Use Designations and Zoning Districts

The PCGP/DCWPCP land use designations for the project site are Rural-Low Density Residential (1-2.3 acre minimum) (RLDR), and Greenbelt and Open Space (OS). The site is zoned Residential Single-Family, combining Agriculture, combining a minimum Building Site of 40,000 square feet, combining Planned Residential Development of one dwelling unit per acre (RS-AG-B-40 PD=1) and Open Space, combining Planned Residential Development of one dwelling unit per acre (O PD=1). (see Figure 13-1). While the areas to the east, west, and south of the site are located within the DCWPCP area in unincorporated Placer County, the land uses to the north of the site are located within the City of Roseville. Table 13-1 provides a summary of the current DCWPCP and the City of Roseville land use designations and zoning districts of the properties surrounding the project site, as applicable.

Table 13-1
Summary of Adjacent Community Plan Land Use Designations and Zoning Districts

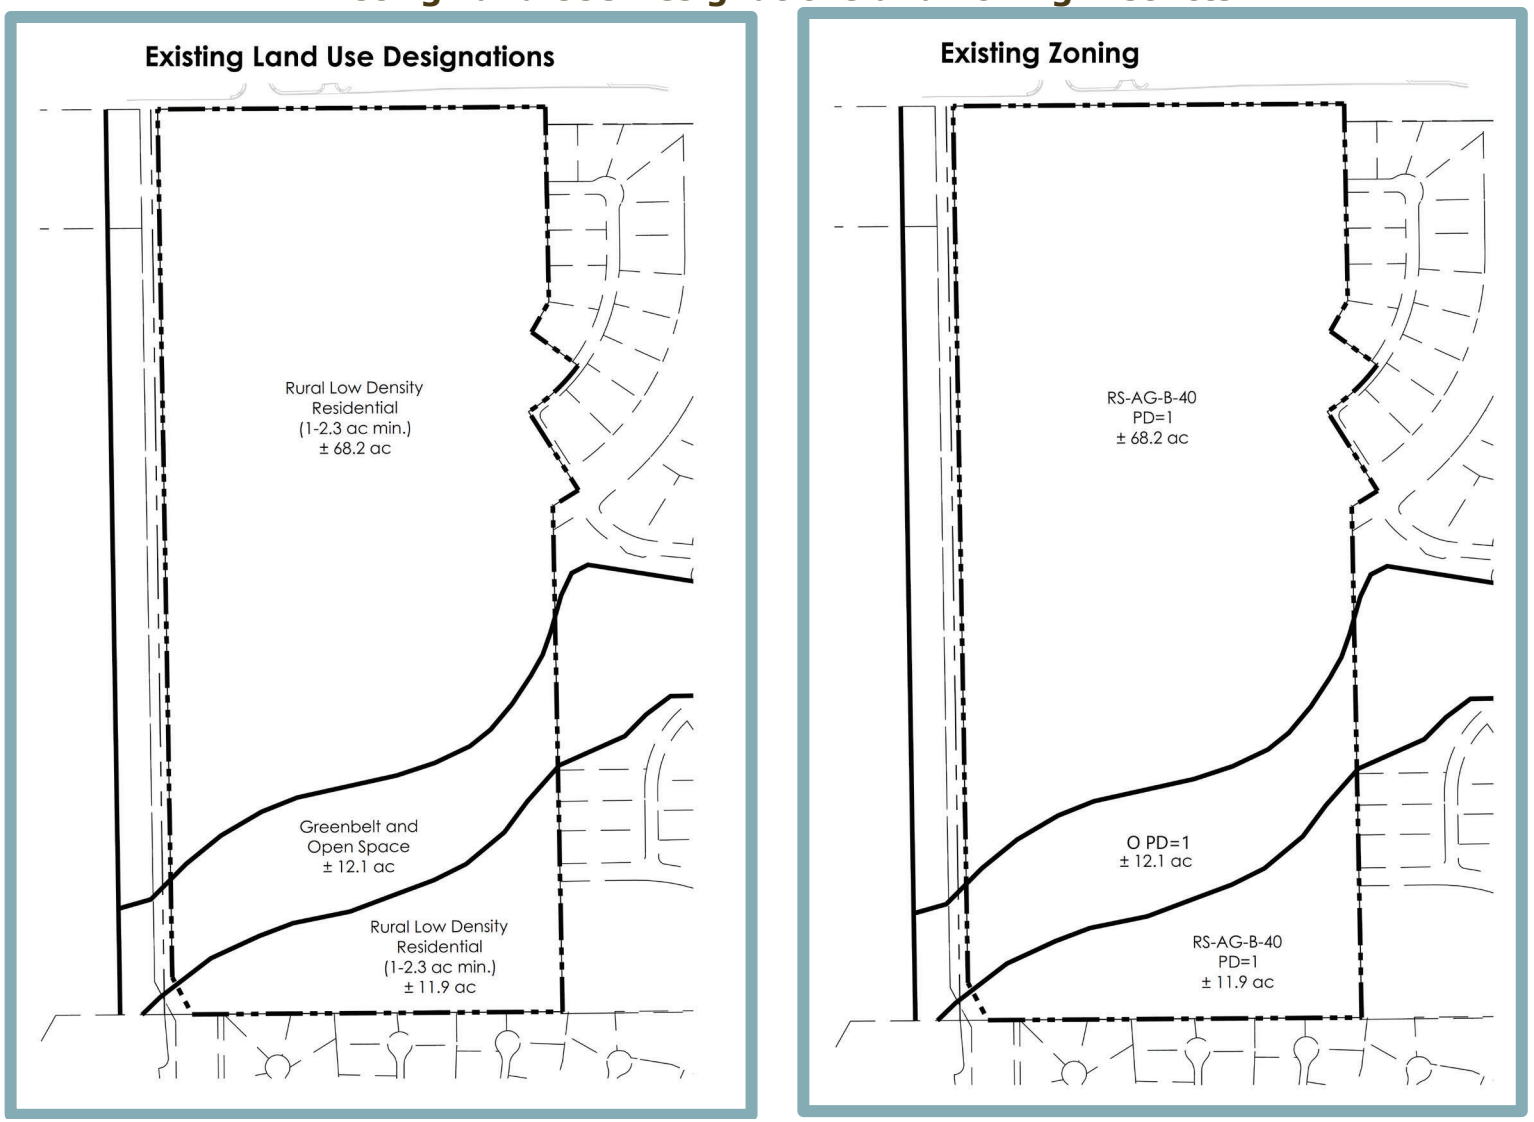
Relationship to Project Site	Present Land Use	Land Use Designation	Zoning District
North of the Project Site	Baseline Road, Under-Construction Baseline Marketplace	City of Roseville: Community Commercial (CC)	City of Roseville: General Commercial (GC)
South of the Project Site	Single-Family Residential	Placer County: RLDR	Placer County: RS-AG-B-40 PD=1
East of the Project Site	Single-Family Residential	Placer County: RLDR	Placer County: RS-AG-B-40 PD=1, O PD=1
West of the Project Site	Under-Construction Single-Family Residential	Placer County: Specific Plan, PVSP	Placer County: Specific Plan, Placer Vineyards Specific Plan (SPL-PVSP)

Off-Site Affordable Housing Parcel Land Use Designation and Zoning

The PCGP/DCWPCP land use designation for the off-site affordable housing parcel is RVSP, and the parcel is zoned Specific Plan, Riolo Vineyard Specific Plan (SPL-RVSP). In addition, the RVSP designation for the off-site affordable housing parcel is Commercial (CO). The areas immediately surrounding the parcel are located within the DCWPCP area in unincorporated Placer County, and the land uses to the north and east of the parcel are also located within the RVSP. Table 13-2 provides a summary of the current DCWPCP and RVSP land use designations and zoning districts of the properties surrounding the off-site affordable housing parcel, as applicable.

Land Use Designation Definitions

The following sections provide definitions of the land use designations noted above, as summarized from the PCGP/DCWPCP, the City of Roseville General Plan, and the RVSP.



PCGP/DCWPCP

The DCWPCP definitions of the RLDR, OS, C, and P land use designations noted above are summarized as follows:

Rural-Low Density Residential (RLDR)

The RLDR land use designation is intended to allow additional development in the DCWPCP area without introducing a density which is incompatible with the existing development.

Figure 13-1
Existing Land Use Designations and Zoning Districts

* Figure not OCR Compatible

Table 13-2
Off-Site Affordable Housing Parcel Summary of Adjacent Community Plan Land Use Designations and Zoning Districts

Relationship to Project Site	Present Land Use	Land Use Designation	Zoning District
North of the Project Site	Union Cemetery	DCWPCP: Specific Plan, RVSP RVSP: Public or Quasi Public (PQP) (Cemetery)	Residential Single-Family, combining Agriculture, combining a minimum Building Site of 20,000 square feet, combining Development Reserve, combining Planned Residential Development of two dwelling units per acre (RS-AG-B-20-DR PD=2)
South of the Project Site	PFE Road, Vacant Land	DCWPCP: Commercial (C)	Neighborhood Commercial, combining Design Scenic Corridor (C1-Dc)
East of the Project Site	Vacant Land	DCWPCP: RVSP RVSP: MDR	SPL-RVSP
West of the Project Site	Single-Family Residential, Creekside Meadows Wedding Service Business	DCWPCP: Professional Office (P)	Office and Professional, combining Design Scenic Corridor (OP-Dc)

The RLDR land use designation also allows the rural character of the DCWPCP area to be maintained while also making the provision of necessary public services feasible. The RLDR land use designation allows for a range of densities from one to 2.3 acres per dwelling unit, and thus could permit a total of up to 1,400 dwelling units within the DCWPCP area. The RLDR allows for the development of a housing type at a density which is not found in the new developments occurring in Roseville and the Antelope areas.

Greenbelt and Open Space (OS)

The OS land use designation is generally identified as the approximate 100-year floodplain of Dry Creek and the creek's tributaries. The OS-designated areas within the DCWPCP area are often heavily wooded, and are intended to improve the design of subdivisions adjoining such areas. The OS land use designation is also compatible with certain public and private recreation facilities, in some areas.

Commercial (C)

The C land use designation is identified in five different and distinct places within the DCWPCP, strategically located to provide commercial services to the existing and future residents of the DCWPCP area and in some cases, to those using the major transportation corridors which pass through the area.

Professional Office (P)

Two P areas have been designated within the DCWPCP area in order to allow an opportunity for small office-park developments which could meet the service needs of the area and in some cases to provide buffers of less intense uses between commercial and residential properties.

City of Roseville General Plan

The City of Roseville General Plan definition of the CC land use designation noted above is summarized as follows:

Community Commercial (CC)

The CC land use designation provides for a broader range of goods and services to an expanded service area. Primary uses within the CC designation include retail stores and businesses selling a full range of goods and services including auto sales and repair, and commercial child care facilities, and secondary uses include professional office uses. Typically, acreages of lots within the CC land use designation range from five to 25 acres, the square footage ranges from 50,000 to 250,000 square feet (sf), and the floor area ratio ranges from 20 percent to 40 percent.

Riolo Vineyard Specific Plan

The RVSP definitions of the CO, PQP and MDR land use designations noted above are summarized as follows:

Commercial (CO)

The CO designation is intended to provide village retail, restaurants, services, and/or business-professional uses, which support the needs of residents within the RVSP area.

Public or Quasi Public (PQP)

The PQP land use designation is intended to define sites devoted to public use, including the existing Union Cemetery. Cemetery land is property that may be designed as cemetery lots and sold for burial purposes.

Medium Density Residential (MDR)

The MDR designation allows for a variety of detached and attached housing products on lot sizes of 2,000 to 5,499 sf. MDR villages will provide a denser approach than Low Density Residential (LDR) areas. A variety of housing types will give the MDR areas a distinctive character, and alternative housing products and designs (duplex units, shallow-wide lots, and angled lots) are encouraged. The allowable density range within the MDR land use designation is 5-10 dwelling units per acre (du/ac). Agricultural use of lands designated as MDR may continue as interim use until development occurs, pursuant to the RVSP.

Zoning District Definitions

The following sections provide definitions of the zoning designations noted above, as summarized from the Placer County Zoning Ordinance (Title 17 of the Placer County Code) and the City of Roseville Zoning Ordinance (Title 19 of the City's Municipal Code).

Placer County Zoning Ordinance

The County defines the RS-AG-B, -PD, O, SPL, C1, OP, -DR, and -Dc zoning designations as follows:

Residential Single-Family (RS)

The RS zoning district is intended to provide areas for residential development characterized by detached single-family homes in standard subdivision form. Minimum lot areas within the RS zoning district are typically 10,000 sf but may be smaller with a -B combining district overlay.

Agriculture (-AG)
The purpose of the -AG combining district is to identify residential areas where parcel sizes and neighborhood conditions are suitable for the raising and keeping of a variety of farm and exotic animals, in addition to household pets, without compatibility problems with surrounding residential uses.

Minimum Building Site Size (-B)
The purpose of the -B combining district is to provide for different parcel sizes in new subdivisions than would otherwise be required by an applicable zoning district, based upon special characteristics of the site or area to which the combining district is applied, including but not limited to sensitive environmental characteristics, limited resource capacities, and community character.

Open Space (O)
The purpose of the O zoning district is to protect important open space lands within Placer County by limiting allowable land uses to low intensity agricultural and public recreational uses, with structural development being restricted to accessory structures necessary to support the primary allowed uses, and critical public facilities.

Planned Residential Development (-PD)
The purpose of the -PD combining district is to identify areas where development can occur within the context of a planned development and where a residential density for the planned unit development must be determined by the County to guide the design of a proposed project pursuant to the requirements and standards of Placer County Code Section 17.54.080 (Planned residential developments). The number following “PD” shall mean the maximum number of dwelling units per acre allowed in the area so designated on the zoning maps.

Specific Plan (SPL)
The purpose of the SPL district is to allow unique zone districts to be established consistent with an adopted specific plan, providing more flexibility in the designation of allowable uses, development standards, and other regulations than would be possible through application of other base and combining zone districts. Development within the SPL district shall be authorized only through the approval of a specific plan as set forth in Placer County Code Section 17.58.200 and in California Government Code Section 66450 et seq. The specific plan (and/or companion documents thereto) shall contain the zoning regulations for properties within the specific plan area. The specific plan shall specify all permitted uses and land use permit requirements for the SPL district.

Neighborhood Commercial (C1)
The purpose of the C1 district is to provide areas for small-scale, day-to-day convenience shopping and services for residents of the immediate neighborhood, which encourages pedestrian and bicycle access, and which is planned and designed to be compatible with surrounding residential areas.

Office and Professional (OP)
The OP district is intended primarily for the development and operation of professional and administrative offices and personal services, rather than retail trade. New development in such areas is intended to be planned and designed so as to be relatively compatible with residential uses.

Development Reserve (DR)

The purpose of the development reserve (-DR) combining district is to provide for the future development of limited residential, commercial or industrial uses in areas that are identified by the General Plan or a community plan.

Design Scenic Corridor (-Dc)

The purpose of the design review (-Dc, -Dh, -Ds) combining districts is to provide special regulations to protect and enhance the aesthetic character of lands and buildings within public view; to protect historic buildings; to minimize any adverse impacts of conflicting land uses; to enhance tourism through the protection of lands and buildings having unique aesthetic characteristics; and to provide special project review procedures for lands and uses which by their nature require special attention to architectural design and massing, landscaping, circulation, and/or energy conservation. The Dc designation shall be applied only to areas of special natural beauty and aesthetic interest that constitute a basic resource in the county economy, the preservation of which in its most nearly natural state would enhance tourism; or areas, places, sites, structures or uses, including multi-family and mixed-use projects where application of the design review combining district will serve to carry out the other purposes of the design review combining district.

City of Roseville Zoning Ordinance

The City of Roseville defines the GC zoning designation as follows:

General Commercial (GC)

The GC zoning district is intended to serve the entire community by providing areas for commercial facilities that are more of a service or heavy commercial character than are permitted in the community commercial district, and may involve outdoor display, storage or activity areas.

Population and Housing

Population growth assumptions, average household sizes, and vacancy rates for Placer County and the DCWPCP area are discussed below.

Historical and Current Population

The DCWPCP included population projections for the DCWPCP area until the plan horizon year of 2010. Population projections for the DCWPCP were based on three different growth rates. The lowest growth rate was assumed to be three percent, which was the growth rate throughout Placer County at the time that the DCWPCP was prepared, in 1990. The mid-range growth rate was based on the growth rate experienced by the City of Roseville between 1980 and 1988, which was six percent. Finally, the highest growth rate used in the DCWPCP was assumed to be the 10 percent growth rate that was occurring in the City of Roseville at the time that the DCWPCP was prepared. The three growth rates resulted in a range of projected populations as shown in Table 13-3.

Table 13-3
DCWPCP Projected 2010 Population

Growth Rate (%)	Projected 2010 Population (residents)
3	3,400
6	5,550
10	9,836

Source: Placer County. Dry Creek-West Placer Community Plan. Amended May 12, 2009.

As shown in Table 13-4, the DCWPCP area's observed population more than tripled between 1980 and 2010, adding approximately 3,647 new residents and 955 households. Compared to Placer County as a whole, from 1980 to 2010 the population of the DCWPCP area grew much more slowly than the County in general, which experienced a 50 percent increase in population during the same period.[7]

The observed population change within the DCWPCP, presented in Table 13-4, falls within the range of growth anticipated by the DCWPCP. In fact, the actual 2010 population of 4,602 residents within the DCWPCP area was close, but slightly below, the mid-range six percent growth rate scenario projected in the DCWPCP. Growth continued during the 15-year period including 2010 and 2025, when 3,750 new residents and 1,361 households were added to the DCWPCP area, which represents a 81.48 percent increase in population over that period.[8] The DCWPCP area's population in 2025 was 8,352, which is above the DCWPCP's mid-range projection for the area's population in 2010, but within the maximum growth scenario estimate of the DCWPCP for 2010. Therefore, while significant growth in the DCWPCP area has occurred since approval of the Plan, the area's actual 2025 population is in line with buildout assumptions for horizon year 2010.

Table 13-4
DCWPCP Area Population and Household Growth

Year	Population	Households	Persons Per Households
1980	1,378	700	1.97
2000	1,516	554	2.74
2010	4,602	1,478	3.11
2025	8,352	2,839	2.94

Sources:
- ***ESRI Business Analyst. Housing Profile, DCWPCP Area. January 2026.***
- ***Placer County. Dry Creek-West Placer Community Plan. Amended May 12, 2009.***

Projected Population and Housing Growth

As seen in Table 13-3, the population of the DCWPCP area was anticipated to experience a maximum growth scenario of 9,836 residents by 2010. While Table 13-4 demonstrates that growth within the DCWPCP did not reach the maximum growth scenario by 2010, the population within the DCWPCP is anticipated to continue to grow with buildout of the DCWPCP area, in particular, due to the growth within the approved PVSP, RVSP, and various subdivisions completed, under construction, or approved yet unbuilt. The Sacramento Area Council of Governments (SACOG) has anticipated growth within the six-county Sacramento region through the 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS).[9]

The MTP/SCS identifies the portion of the DCWPCP area, not including the PVSP and RVSP, as one of the Established Communities within the MTP/SCS study area. As of 2020, Established Communities within Placer County included 21,440 housing units, and such communities are anticipated to grow to 24,200 units by 2035, 24,600 units by 2040, and 30,650 housing units at buildout.[10] Buildout of the DCWPCP, including the project site, was included in the foregoing MTP/SCS growth estimates.

8 ESRI Business Analyst. *Family Profile, DCWPCP Area*. October 2024.
9 Sacramento Area Council of Governments. *2020 Metropolitan Transportation Plan/Sustainable Communities Strategy*. Adopted November 18, 2019.
10 *Ibid.*

Average Household Size

The average size of households is a function of the number of residents living in households within a given area divided by the number of occupied housing units within the given area. As shown in Table 13-5, average household sizes in California slightly decreased between 2010 and 2025 by approximately 0.11 persons/household. Concurrently, the average household size within Placer County decreased by 0.12 persons/household. Within the DCWPCP area, the average household size decreased by 0.17 persons/household.

Table 13-5
Average Household Size (Persons Per Household)

Area	2010	2025
California	2.87	2.76
Placer County	2.63	2.51
DCWPCP	3.11	2.94

- ***California Department of Finance. Report E-5: Population and Housing Estimates for Cities Counties and the State, January 1, 2021-2025, with 2020 Benchmark. Released May 1, 2025.***

Vacancy Rate

In 2010, Placer County experienced an overall vacancy rate of 13.1 percent, which was higher than the statewide average of 8.1 percent.[11] While the County's overall vacancy rate of 13.1 percent is relatively high, the countywide vacancy rate includes units held vacant for seasonal or recreational uses, which are generally not open for long-term residential occupancy. Excluding the units held for seasonal or recreational uses, unincorporated portions of the County experienced a vacancy rate of 5.24 percent for units classified as for rent, for sale, or already rented or sold but not occupied. The PCGP Housing Element considers a six percent vacancy rate for rental units and a two percent vacancy rate for owner-occupied units generally sufficient to keep prices down and ensure availability of units for new or relocating residents.[12]

The California Department of Finance reports that the overall vacancy rate within the County has decreased since 2010 to approximately 11.5 percent.[13] In 2025, 3,007 housing units existed within the DCWPCP area and approximately 168 units were vacant, representing a vacancy rate of approximately 5.6 percent.[14]

Regional Housing Needs Plan

The Regional Housing Needs Allocation (RHNA) is a minimum projection of additional housing units needed to accommodate projected household growth of all income levels by the end of the housing element's statutory planning period. Based on the adopted RHNA, each city and county must update the housing element of their General Plan to demonstrate how the jurisdiction will meet the expected growth in housing need over the planning period.

According to the U.S. Department of Housing and Urban Development (HUD), housing is classified as "affordable" if households do not pay more than 30 percent of income for payment

11 ESRI Business Analyst. *Comparison Reports, Placer County, CA*. April 2023.
12 Placer County. *Placer County Housing Element 2021-2029*. Adopted May 11, 2021.
13 California Department of Finance. *Report E-5: Population and Housing Estimates for Cities Counties and the State, January 1, 2021-2025, with 2020 Benchmark*. Released May 1, 2025.
14 ESRI Business Analyst. *Housing Profile, DCWPCP Area*. January 2026.

of rent (including utilities) or monthly homeownership costs (including mortgage payments, taxes, and insurance). SACOG adopted their RHNP on March 20, 2020, which officially assigns the allocations to cities and counties in the six-county Sacramento region. SACOG's RHNA covers the planning period from 2021 to 2029, and defines the lower income unit categories as follows:

- Very Low-Income Unit: is one that is affordable to a household whose combined gross household income is at or lower than 50 percent of the Placer County median income.
- Low-Income Unit: is one that is affordable to a household whose combined gross household income is at or between 50 and 80 percent of the Placer County median income.
- Moderate Income Unit: is one that is affordable to a household whose combined gross household income is at or between 81 and 120 percent of the Placer County median income.
- Above Moderate Income Unit: is one that is affordable to a housing whose combined gross household income is at or greater than 120 percent of the Placer County median income.

In 2024, the median household income for Placer County was $115,442.[15] Within the DCWPCP area, the median household income was $157,363.[16] According to SACOG's RHNP, Placer County's RHNA number for combined low- and very-low-income levels is 15,372 dwelling units (see Table 13-6).[17]

Table 13-6
Placer County Regional Housing Needs Allocations (2021-2029)

Jurisdiction	Total Units[1]	Very Low Income		Low Income		Moderate		Above Moderate		Combined Low and Very Low	
		#	%	#	%	#	%	#	%	#	%
Placer County Unincorporated Areas[2]	7,419	2,017	27.9	1,215	16.4	1,242	16.7	2,945	39.7	3,232	43.6
Placer County Total	31,460	9,591	30.5	5,781	18.4	4,773	15.2	11,315	36	15,372	48.9

13.3 REGULATORY CONTEXT

Federal laws or regulations pertaining to land use and planning or population and housing are not applicable for this analysis. However, the existing State and local laws and regulations are listed below, as applicable.

State Regulations

The following are applicable State regulations related to land use and planning, and population and housing.

[15] U.S. Census Bureau. *Placer County, California Income and Poverty*. Available at: https://data.census.gov/all?q=placer+county&t=Income+and+Poverty. Accessed October 2025.
[16] ESRI Business Analyst. *Family Profile, DCWPCP Area*. October 2024.
[17] Sacramento Area Council of Governments. *Regional Housing Needs Plan 2021-2029*. Adopted March 2020.

Title 14 California Code of Regulations Section 15131

Title 14, California Code of Regulations (CCR) Section 15131, provides that economic or social information may be included in an EIR, but those economic or social effects shall not be considered significant effects on the environment. In an EIR, the lead agency is responsible for researching economic or social changes resulting from a project, which may eventually lead to physical changes in the environment. Such economic or social changes can be used to determine the significance of physical changes on the environment.

Regional Housing Needs Plan

California General Plan law requires each city and county to have land zoned to accommodate a fair share of the regional housing need. The share is known as RHNA and is based on a RHNP developed by councils of government. The State-mandated RHNA process (Government Code Sections 65580 et seq.) requires SACOG to develop a methodology that determines how to divide and distribute an overall allocation that the region receives from the State.

Local Regulations

The following are the local regulations and standards relevant to the CEQA review process with respect to land use and planning, and population and housing. The most relevant local regulations and standards related to land use, planning, population, and housing are the goals and policies set forth within the PCGP, including the County's Housing Element 2021-2029, and DCWPCP. Specific goals and policies from the PCGP, including the County's Housing Element 2021-2029, and DCWPCP are listed in Table 13-7 at the end of this chapter. Local regulations and standards relevant to the CEQA review process and related to land use, planning, population, and housing for the off-site affordable housing parcel are set forth in the RVSP. Consistency with such RVSP policies is discussed below under Impact 13-2.

Sacramento Area Council of Governments

SACOG is responsible for the preparation of, and updates to, the MTP/SCS for the region and the corresponding Metropolitan Transportation Improvement Program (MTIP). The MTIP identifies short-term projects (seven-year horizon) in more detail.

Metropolitan Transportation Plan/Sustainable Communities Strategy

The 2020 MTP/SCS was adopted by the SACOG board on November 18, 2019.[18] The MTP/SCS is a long-range plan for transportation improvements in the region and provides a 20-year transportation vision and corresponding list of projects. The plan is based on projections for growth in population, housing, and jobs. SACOG determines the regional growth projections by evaluating baseline data (existing housing units and employees, jobs/housing ratio, and percent of regional growth share for housing units and employees), historic reference data (based upon five- and ten-year residential building permit averages and historic county-level employment statistics), capacity data (General Plan data for each jurisdiction), and current MTIP data about assumptions used in the most recent MTP/SCS. SACOG staff then meets with each jurisdiction to discuss and incorporate more subjective considerations about planned growth for each area. Finally, SACOG makes a regional growth forecast for new homes and new jobs, based upon an economic analysis provided by a recognized expert in order to estimate regional growth potential based on market analysis and related economic data, which is incorporated into the MTP/SCS.

[18] Sacramento Area Council of Governments. *2020 Metropolitan Transportation Plan/Sustainable Communities Strategy*. Adopted November 18, 2019.

Placer County Code

Pursuant to Placer County Code Section 15.65.060(A), if a residential project exceeds 100 units, at least 10 percent of all dwelling units included must be affordable, as set forth in Placer County Code Sections 15.65.070 and 15.65.080, as applicable. Such dwelling units must include a regulatory agreement recorded on title, requiring that each dwelling unit be affordable for at least 55 years. For fractions of affordable units, the owner of the property must construct the next higher whole number of affordable units or perform an alternative action, pursuant to Placer County Code Section 15.65.120. Placer County Code 15.65.080 sets forth the County's inclusionary housing requirements for residential for-sale affordable units. As set forth by subsection (B), at least 10 percent of all for-sale units must be affordable to very low-, low-, and moderate-income households.

The Estia Dry Creek development is exempt from the Placer County Inclusionary Housing Ordinance (County Code 15.65.050.B.16) due to the unit sizes averaging less than 1,600 sf. According to General Plan Policy HE-C-3, included in the Housing Element of the County's General Plan, ADUs of less than 750 sf are considered to be affordable by design and eligible to satisfy low-income housing requirements in specific plans and new developments. Thus, the potential development of ADUs on lots with single-family residential units would count toward the County's affordable housing requirements for the 212 single-family units.

Riolo Vineyard Specific Plan

The off-site affordable housing parcel is located within the RVSP Plan Area, which is comprised of approximately 525.8 acres located in the southern portion of Placer County, within the DCWPCP. The DCWPCP requires Specific Plans to address a variety of issues related to development. The RVSP includes discussions related to land use, circulation, green space, resource management, public facilities, and implementation. The primary objective of the RVSP is to establish a framework for logical and sensitive growth, and the RVSP provides a comprehensive set of goals and policies to ensure the development of a fully integrated community that respects and enhances the site's natural features. The RVSP is a comprehensive and definitive guideline for the ultimate development of the Plan Area.

13.4 IMPACTS AND MITIGATION MEASURES

The following section describes the standards of significance and methodology used to analyze and determine the proposed project's potential impacts related to land use and planning, and population and housing. A discussion of the project's impacts, as well as mitigation measures where necessary, is also presented.

Standards of Significance

Consistent with Appendix G of the CEQA Guidelines and Placer County's Initial Study Checklist, an impact related to land use and planning and/or population and housing is considered significant if the proposed project would:

- Physically divide an established community;
- Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect;
- Result in the development of incompatible uses and/or the creation of land use conflicts;
- Cause economic or social changes that would result in significant adverse physical changes to the environment such as urban decay or deterioration (see Chapter 19, Effects Not Found to be Significant);

- Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (e.g., through projects in an undeveloped area or extension of major infrastructure); or
- Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere (see Chapter 19, Effects Not Found to be Significant).

As noted above, issues related to whether the proposed project would result in any of the following impacts are discussed in Chapter 19, Effects Not Found to be Significant, of this EIR:

- Cause economic or social changes that would result in significant adverse physical changes to the environment such as urban decay or deterioration; and/or
- Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.

Method of Analysis

The following section describes the method of analysis used to evaluate potential impacts of the proposed project related to land use and planning, and population and housing.

One option the project is considering to satisfy the project's affordable housing requirements is by transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the RVSP. If this option is chosen, the project applicant would seek an amendment to the RVSP and a rezone of the proposed off-site affordable housing parcel to Residential Multifamily 30, combining Design Scenic Corridor (RM30-Dc) zone, which can result in a maximum development potential of 120 affordable income-restricted units.

This EIR also evaluates an alternative means by which the proposed project can meet the County's affordable housing regulations. In addition to the 212 single-family residential units and 220 multi-family units included in the proposed project, the Project Description chapter of this EIR recognizes that 22 ADUs could be included in the project in order to meet the County's affordable housing requirements. However, the total number of residential lots would remain unchanged, as would the overall disturbance area associated with the project. The 22 ADUs are anticipated to include a smaller household size (less than 750 square feet) relative to standard market-rate single-family units. Therefore, the inclusion of an additional 22 units on-site would not result in new impacts or substantially more severe impacts beyond the analysis presented herein.

Land Use and Planning

This chapter analyzes the compatibility of the proposed project with surrounding land uses and compliance of the proposed project with adopted plans and policies adopted for the purpose of avoiding or mitigating an environmental effect. Environmental impacts resulting from the proposed project are discussed in the respective environmental categories. This discussion complies with Section 15125(d) of the CEQA Guidelines, which requires that EIRs discuss inconsistencies with adopted local plans as part of the environmental setting. The ultimate determination of consistency rests with the Placer County Board of Supervisors.

Compatibility with Existing Uses

The proposed project is evaluated for compatibility with the existing land uses adjacent to the project site and off-site affordable housing parcel. The evaluation considers the existing type and intensity of uses in the project vicinity and those proposed for the project site and the off-site affordable housing parcel. The analysis assumes the construction and implementation of the

proposed project within the existing environment to determine if the project is compatible with those existing uses surrounding the project site.

Consistency with the Applicable Land Use Regulations

The proposed project is examined for consistency with the PCGP and the DCWPCP based on the relevant policies adopted for the purpose of avoiding or mitigating an environmental effect contained within both documents. The project's consistency with the Placer County Zoning Ordinance is also discussed. Potential future development of the off-site affordable housing parcel is examined for consistency with the RVSP based on the relevant policies adopted for the purpose of avoiding or mitigating an environmental effect contained within the RVSP. Chapter 5, Agricultural Resources, and Chapter 7, Biological Resources, of this EIR examine the proposed project's consistency with the Placer County Conservation Program (PCCP).

Population and Housing

The level of significance of the impacts related to population and housing is determined by evaluating whether the proposed project, either directly (for example, by proposing new homes and businesses) or indirectly (e.g., through projects in an undeveloped area or extension of major infrastructure), would induce substantial unplanned population growth in the project area.

Project-Specific Impacts and Mitigation Measures

The following discussion of impacts is based on implementation of the proposed project, as well as the two affordable housing options analyzed throughout this EIR, in comparison with the existing conditions and standards of significance identified above. In most cases, potential environmental impacts associated with the proposed project and the 22 on-site ADUs would not differ. Thus, unless otherwise noted, the below analysis applies to both the proposed project and the on-site ADUs.

13-1 Physically divide an established community. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of the potential for the proposed project and potential future development of the off-site affordable housing parcel to result in impacts related to physically dividing an established community.

Proposed Project

A project risks dividing an established community if the project would introduce infrastructure or alter land use so as to change the land use conditions in the surrounding community or isolate an existing land use. The proposed project would involve the construction of a residential development with 432 units and potentially 22 ADUs on a site that is currently undeveloped with non-native annual grassland, seasonal wetlands, vernal pools, and a Dry Creek tributary. Development of the proposed project would also require various associated improvements, including, but not limited to parks, trails, landscaping, and utility installation. Surrounding uses in the project site vicinity include the under-construction Baseline Marketplace to the north, across Baseline Road; single-family residences associated with the Sun Valley Oaks residential neighborhood and Dry Creek tributaries to the east; single-family residences associated with the Morgan Creek residential neighborhood to the south; and the under-construction Property 1A of the PVSP, which will include 1,285 residential units, to the west.

Development of the proposed residential uses would essentially serve as an extension of the existing community in the project area within the DCWPCP. Furthermore, within the DCWPCP, the County previously anticipated development of the project site, albeit at a lower residential density. Nevertheless, the DCWPCP's planned development of the site is indicative that the site has been envisioned as an extension of the existing community. Thus, development of the proposed project would not physically divide an established community.

Off-Site Affordable Housing Parcel

The potential future development of the off-site affordable housing parcel could result in a maximum of 120 affordable income-restricted units on a four-acre parcel. While the off-site affordable housing parcel is currently designated for commercial uses due to a 2015 RVSP Amendment, and the project applicant has 39 density reserve units available towards the off-site affordable housing parcel, the RVSP EIR assumed development of the site with 60 HDR units. Development of the affordable residential uses would essentially serve as an extension of the existing community in the project area within the RVSP and the DCWPCP. Furthermore, within the DCWPCP, as well as the RVSP, the County previously anticipated residential development of the off-site affordable housing parcel. The affordable residential development would differ in density from what was originally planned for the project site. Nevertheless, the RVSP and the DCWPCP's planned development of the off-site affordable housing parcel is indicative that the site has been envisioned as an extension of the existing community. Thus, the potential future development of the off-site affordable housing parcel would not physically divide an established community.

Conclusion

Based on the above, the proposed project and the potential future development of the off-site affordable housing parcel would not physically divide an established community. Thus, a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

13-2 Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of the potential for the proposed project and potential future development of the off-site affordable housing parcel to cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

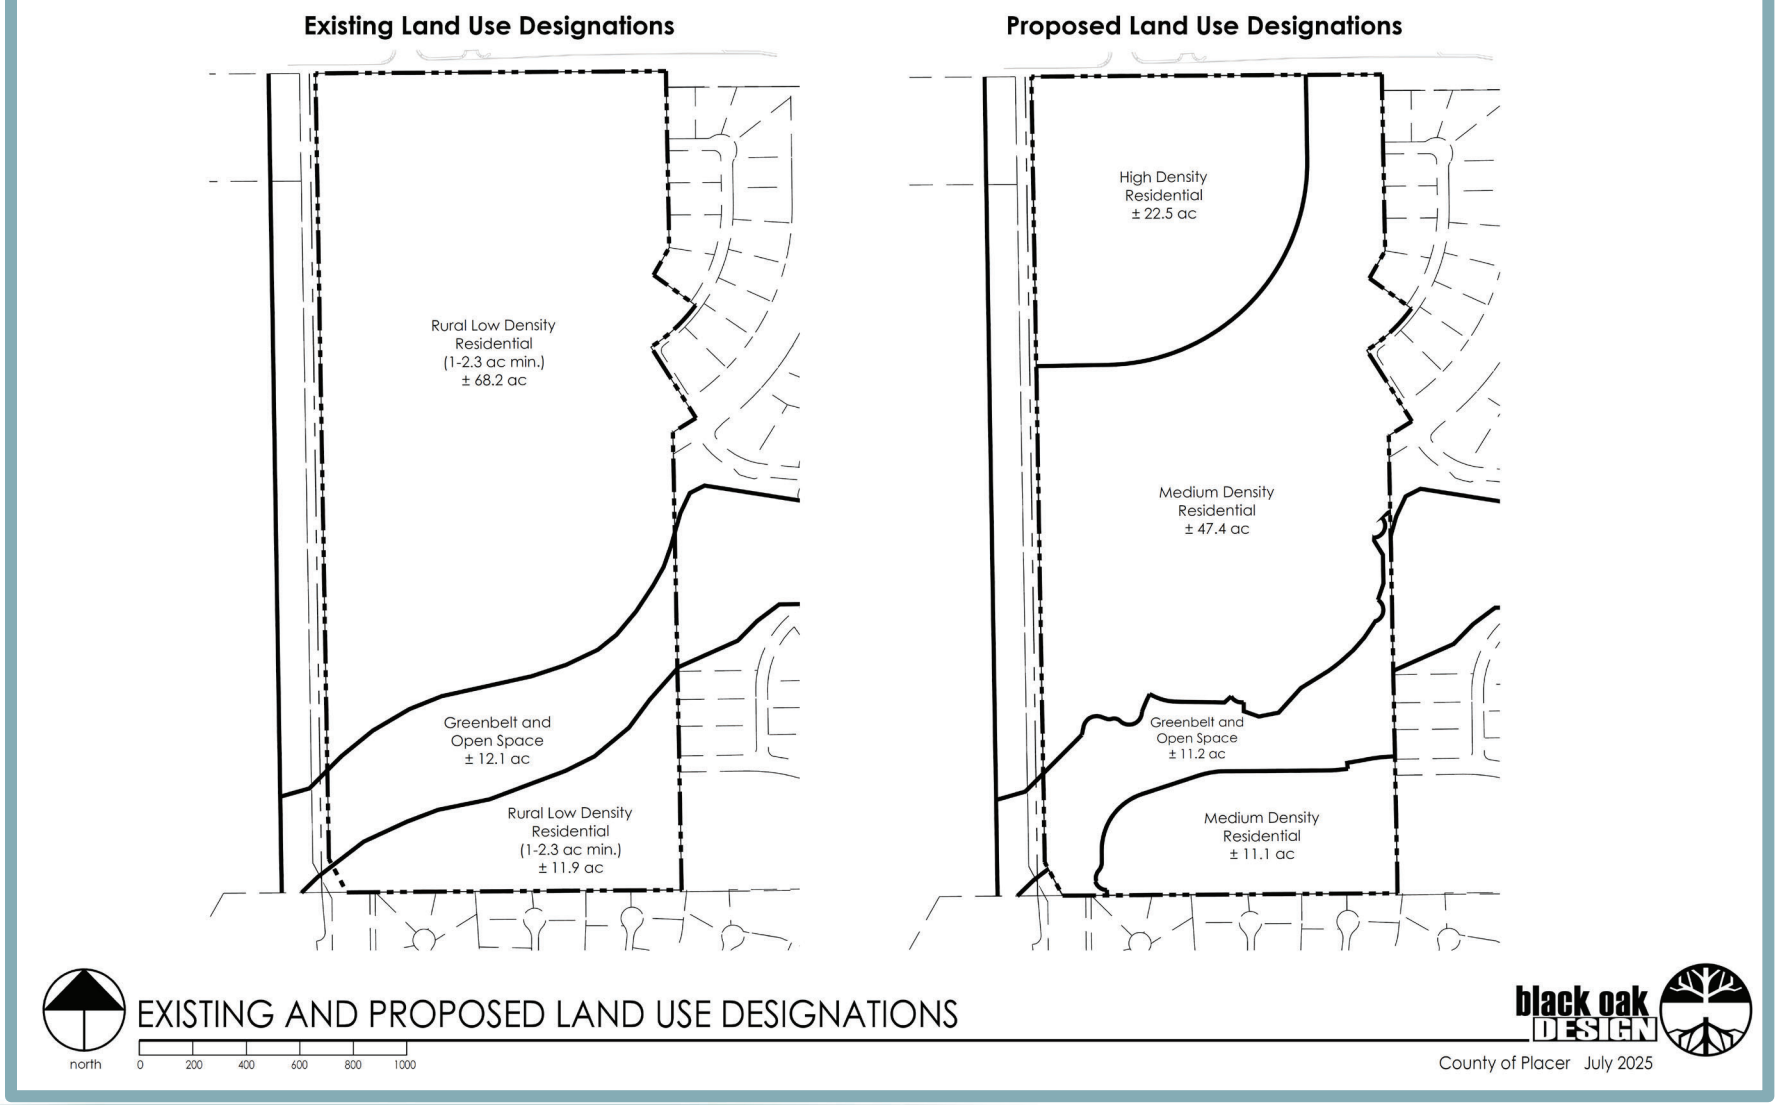
Proposed Project

The General Plan Guidelines published by the State Office of Land Use and Climate Innovation (LCI) define consistency as follows, "An action, program, or project is consistent with the general plan if, considering all its aspects, it will further the objectives and policies of the general plan and not obstruct their attainment." Therefore, the standard

for analysis used in this EIR is in general agreement with the policy language and furtherance of the policy intent (as determined by a review of the policy context).

The determination that the project is consistent or inconsistent with the PCGP policies or other County plans and policies is ultimately the decision of the Placer County Board of Supervisors. Furthermore, although CEQA analysis may identify some areas of general consistency with County policies, the County has the ability to impose additional requirements or conditions of approval on a project, at the time of its approval, to bring a project into more complete conformance with existing policies. A discussion of the project's general agreement with policy language and furtherance of policy intent is provided in further detail below.

The DCWPCP and the County's Zoning Ordinance carry out the policies of the PCGP by classifying and regulating the uses of land and structures within the unincorporated County, consistent with the PCGP. As noted previously, the project site is currently designated RLDR (80.1 acres) and OS (12.1 acres). The project site is currently zoned RS-AG-B-40 PD=1 (80.1 acres) and O PD=1 (12.1 acres). The proposed project would include a PCGP/DCWPCP Land Use Map Amendment to change the site's land use designations to High Density Residential (HDR) (23.2 acres), Medium Density Residential (MDR) (57.8 acres), and OS (11.2 acres) (see Figure 13-2).



The HDR designation allows for residential neighborhoods of grouped or clustered single-family dwellings, duplexes, apartments, and other multiple-family attached dwellings such as condominiums at a density up to 10 du/ac. The HDR designation is applied within urban areas where residential development will be near transportation corridors, downtowns, village centers, other major commercial centers, schools and community services. Typical land uses allowed include detached and attached single-family dwellings, secondary dwellings, all types of multi-family dwellings (e.g., duplexes, apartments, senior housing projects, etc.), and residential accessory uses; churches, schools, parks, golf courses, childcare facilities; and necessary public utility and safety facilities.

The MDR designation allows for moderate-density housing, either as attached or detached units, at a density range of two to four du/ac. It may include a range and mix of dwelling types, including single-family detached houses and multi-family residential development, such as duplexes. The primary intent of the MDR designation is to provide for residential neighborhood development in an efficient urban pattern of well-connected streets and at greater dwelling unit density than the LDR designation.

As discussed above, the OS land use designation is generally identified as the approximate 100-year floodplain of Dry Creek and the creek's tributaries. The OS-designated areas within the DCWPCP area are often heavily wooded, and are intended to improve the design of subdivisions adjoining such areas. The OS land use designation is also compatible with certain public and private recreation facilities, in some areas.

In addition, the proposed project would require a Rezone, Vesting Large Lot Tentative Subdivision Map, Vesting Phased Small Lot Tentative Subdivision Map, and County approval of a Design Review for the Estia Dry Creek portion of the project.

Figure 13-2
Existing and Proposed PCGP/DCWPCP Land Use Designations

* Figure not OCR Compatible

The proposed project would also require approval of annexation into Placer County Service Area 28, Zone 173 for sanitary sewer service; annexation into Placer County Service Area 28, Zone 169 for ongoing maintenance of public parks, trails and open space recreation amenities within the Dry Creek community; and annexation into the Dry Creek Fire Zone of Benefit (County Service Area 28, Zone of Benefit 165) for provision of fire protection services. Approval of the aforementioned entitlements would allow for the development of the proposed project.

As shown in Table 13-7 at the end of this chapter, County staff and its environmental consultant, Raney Planning and Management, Inc., have concluded that the project would be generally consistent with the applicable policies outlined in the PCGP and DCWPCP. Furthermore, the project is generally consistent with and implements all other applicable plans and policies. The conclusions expressed in Table 13-7 reflect the best judgment of County staff and the County's consultant.

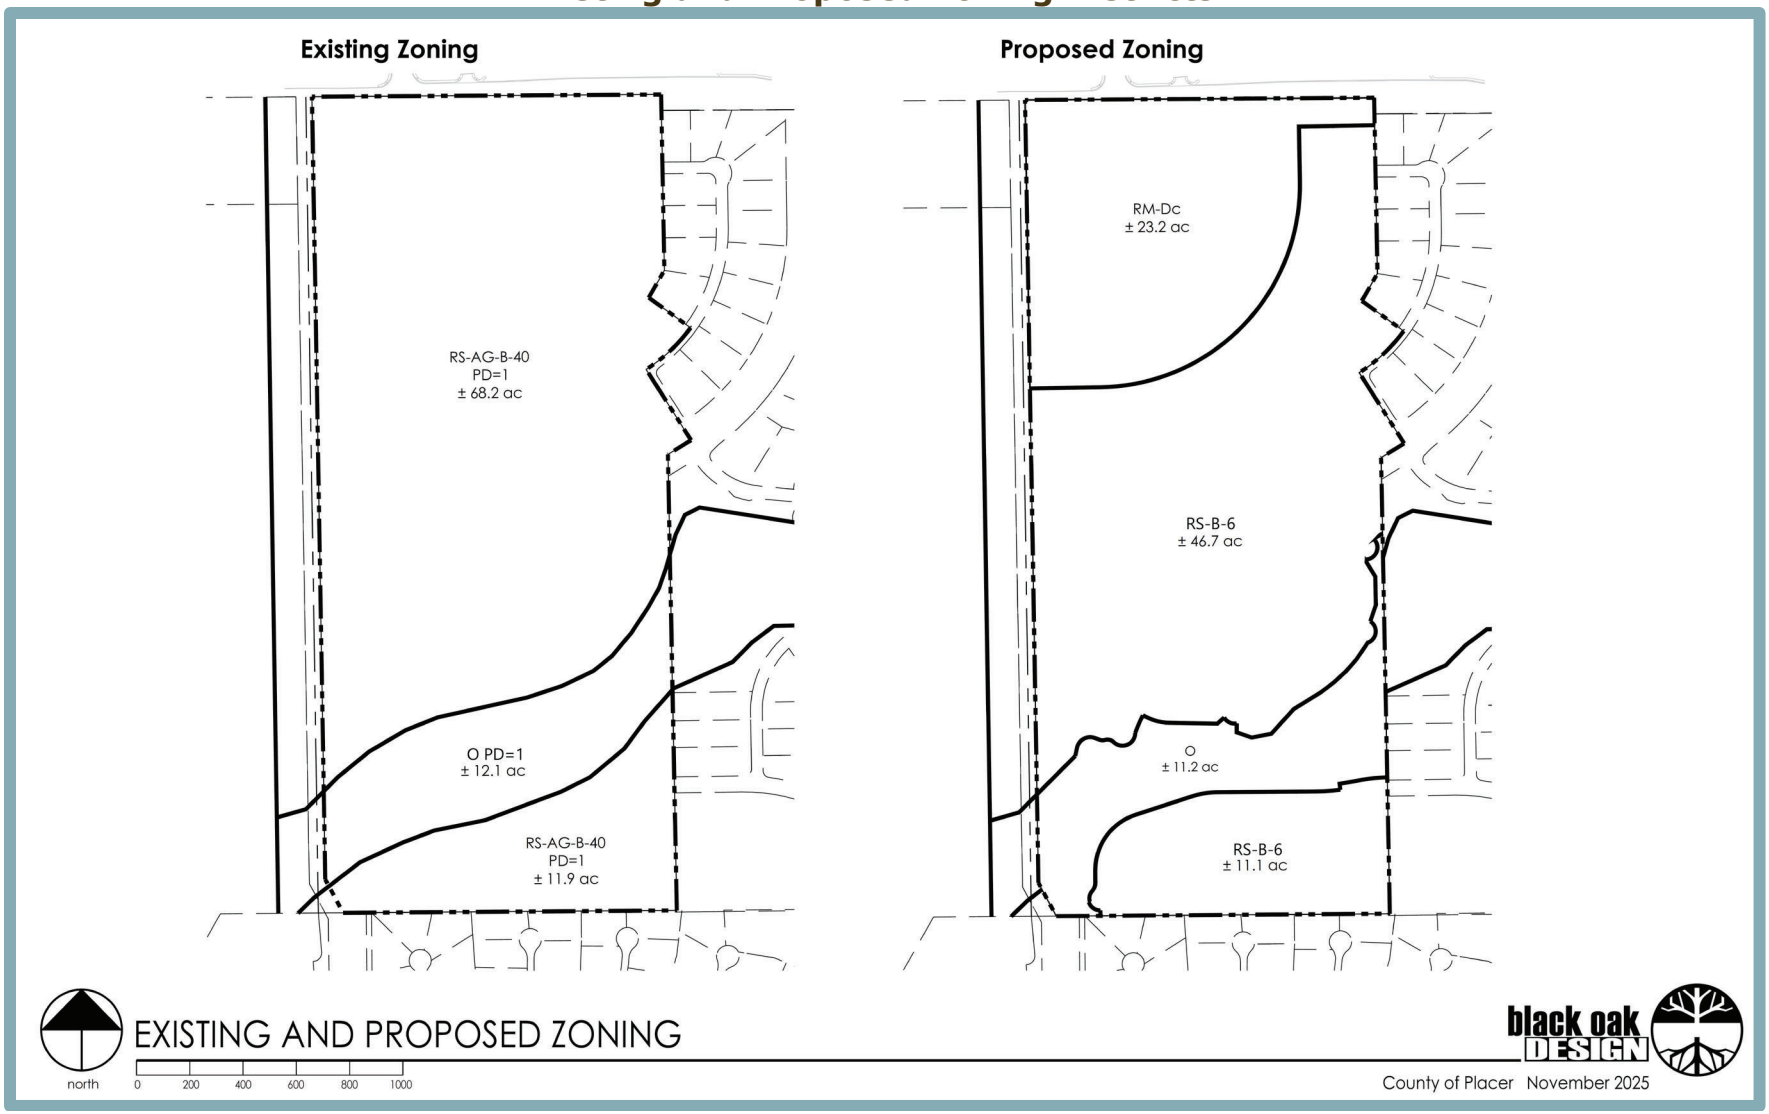
As noted above, the ultimate question of the meaning of particular General Plan policies, and thus the proposed project's consistency with them, lies with the Board of Supervisors. It is worth noting, however, that the language found in general plans is sometimes susceptible to varying interpretations, and reasonable minds may differ as to the meaning of particular policies and how to apply them to proposed projects. Case law interpreting the Planning and Zoning Law (Gov. Code, § 65000 et seq.) makes it clear that: (i) the ultimate meaning of such policies is to be determined by the elected legislative body or a lower tier decision-making body such as a planning commission, as opposed to County staff and EIR consultants, applicants, or members of the public; and (ii) the decision-making body's interpretations of such policies will prevail in court (if challenged) if the interpretations are "reasonable," even though other reasonable interpretations are also possible (see *No Oil, Inc. v. City of Los Angeles* (1987) 196 Cal.App.3d 223, 245-246, 249). Courts also have recognized that, because general plans often contain numerous policies adopted to address differing or competing legislative goals, a development project may be "consistent" with a general plan, taken as a whole, even though the project appears to be inconsistent or is arguably inconsistent with some specific policies within a given general plan (*Sequoyah Hills Homeowners Association v. City of Oakland* (1993) 23 Cal.App.4th 704, 719). Furthermore, courts strive to "reconcile" or harmonize seemingly disparate general plan policies to the extent reasonably possible (*No Oil*, *supra*, 196 Cal.App.3d at p. 244). Agencies should do the same.

Some policies, in fact, may be irreconcilable. As the courts have said, "it is beyond cavil that no project could completely satisfy every policy stated in the [General Plan], and that state law does not impose such a requirement" (*Sequoyah, supra*, 23 Cal.App.4th 704, 719, citing *Greenebaum v. City of Los Angeles* (1984) 153 Cal.App.3d 391, 406-407 and 59 Ops.Cal.Atty.Gen. 129, 131 (1976)). "A general plan must try to accommodate a wide range of competing interests—including those of developers, neighboring homeowners, prospective homebuyers, environmentalists, current and prospective business owners, jobseekers, taxpayers, and providers and recipients of all types of city-provided services—and to present a clear and comprehensive set of principles to guide development decisions. Once a general plan is in place, it is the province of elected [county] officials to examine the specifics of a proposed project to determine whether it would be 'in harmony' with the policies stated in the plan" (*Sequoyah*, *supra*, 23 Cal.App.4th at p. 719, citing *Greenebaum*, *supra*, 153 Cal.App.3d at p. 406). Nevertheless, proposed projects are required to be consistent with all General Plan policies that are "fundamental, mandatory,

and clear" (*Families Unafraid to Uphold Rural El Dorado County v. El Dorado County Bd. of Supervisors* (1998) 62 Cal.App.4th 1332, 1341-1342; *Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 782 ["[a] project is inconsistent if it conflicts with a general plan policy that is fundamental, mandatory, and clear"]).

Should the Board of Supervisors choose to approve the proposed project, the Board may rely on the analysis in Table 13-7 as support for the conclusion that the project, which includes proposed PCGP amendments (see below), is consistent with the PCGP as amended. Certification of the Final EIR will be indicative of agreement with the conclusions in the table.

The project would also require approval of a Rezone to change the site's zoning designations from RS-AG-B-40 PD=1 (80.1 acres) and O PD=1 (12.1 acres), to Residential Multifamily, combining Design Scenic Corridor (RM-Dc) (23.2 acres), Residential Single Family, combining minimum Building Site of 6,000 sf (RS-B-6) (57.8 acres), and Open Space (O) (11.2 acres) (see Figure 13-3).



While an inconsistency may indicate a significant physical impact, the inconsistency is not itself an impact. The physical impacts of the project are analyzed in Chapters 4 through 18 of this EIR.

Approval of the aforementioned entitlements for the proposed project are discretionary actions subject to approval by the Placer County Board of Supervisors. Should the Placer County Board of Supervisors approve the requested entitlements, the project would be rendered consistent with the County's DCWPCP and the County's Zoning Ordinance.

From a policy perspective, Table 13-7 at the end of this chapter sets forth the reasoning for County staff's determination that the proposed project would be generally consistent with the applicable policies in the PCGP and the DCWPCP adopted for the purpose of avoiding or mitigating an environmental effect.

Furthermore, pursuant to Placer County Code Section 15.65.060(A), if a residential project exceeds 100 units, at least 10 percent of all dwelling units included must be affordable, as set forth in Placer County Code Sections 15.65.070 and 15.65.080, as applicable. The 220 multi-family residential units associated with the Estia Dry Creek development would be exempt from the Placer County Inclusionary Housing Ordinance (County Code 15.65.050.B.16) due to the unit sizes averaging less than 1,600 sf. Accordingly, 10 percent of the 212 single-family residential units included as part of the Placer Creek Residential development would be 22 units. As noted previously, the project could include 22 ADUs on-site in order to meet the County's affordable housing requirements. Construction of the ADUs could occur within any phase of development. According to Placer County's Housing Element Policy HE-C-3, the County considers ADUs of less than 750 sf to be affordable by design and eligible to satisfy low-income housing requirements in specific plans and new developments. The 22 ADUs would be 750 sf or less. Therefore, the ADUs would meet the County's affordable housing requirements. The off-site affordable housing parcel option's consistency with applicable land use plans, policies, or regulations is discussed below.

Figure 13-3
Existing and Proposed Zoning Districts

* Figure not OCR Compatible

Based on the above, the proposed project would not cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

Off-Site Affordable Housing Parcel

One option for the project to meet the County's affordable housing regulations includes an amendment to the RVSP and a rezone of the proposed affordable housing parcel to Residential Multifamily 30, combining Design Scenic Corridor (RM30-Dc) zone, which could result in a maximum development potential of 120 affordable income-restricted units. Development of the off-site affordable housing parcel would implement the Placer County Inclusionary Housing Ordinance (County Code 15.65.050.B.16).

As stated in the RM30 zoning district regulations, all new development in the RM30 zone, except where otherwise provided by Articles 17.54 (General Development Standards) or 17.56 (Specific Use Requirements) for a particular use or situation shall meet the requirements established in the Multifamily and Mixed Use Design Manual for lot area, site width, setbacks, floor area ratio, and height limit and other applicable standards. Compliance with these standards (e.g., exterior lighting, landscaping and drainage, EV charging, etc.) would help ensure that potential impacts associated with future residential development on the off-site affordable housing parcel would be minimized.

Similar to the proposed project, the determination that development of the off-site affordable housing parcel is consistent or inconsistent with the PCGP policies or other County plans and policies is ultimately the decision of the County Board of Supervisors. Furthermore, although CEQA analysis may identify some areas of general consistency with County policies, the County has the ability to impose additional requirements or conditions of approval on a project, at the time of its approval, to bring a project into more complete conformance with existing policies. Appendix G of the CEQA Guidelines explicitly focuses on environmental policies and plans, asking if the project would "cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect."

As discussed in the RSVP EIR, the RVSP is generally consistent with the PCGP and the DCWPCP. Therefore, the RVSP policies were determined to be consistent with the goals of the PCGP and DCWPCP. Table 13-7 below is focused on proposed project consistency with the PCGP and DCWPCP policies, and the following discussion of the off-site affordable housing parcel appropriately focuses on consistency with the RVSP policies adopted for the purpose of avoiding or mitigating environmental effects.

With respect to Circulation Policy 3 and Resource Management Policies 18 and 23 of the RVSP related to establishing a network for alternative modes of transportation, the County would require the future developer to construct frontage improvements, including any planned bicycle and/or pedestrian facility improvements, upon development of the off-site affordable housing parcel. With respect to policies related to preserving wetlands, native trees, and sensitive habitats, including Green Space Policy 7, and Resource Management Policies 1, 3, 6, 7, and 8, the future development of the off-site affordable housing parcel would be subject to Mitigation Measures 7-1 and 7-2, and RVSP EIR Mitigation Measures 6-4a, 6-8a, 6-10a, 6-11a, 6-12a, which require pre-construction surveys for special-status plant and wildlife species, applicable avoidance measures, and compensation for the loss

of habitat. In addition, the future developer would be required by the County to implement the adopted RVSP EIR Mitigation Measures 6-1a, 6-1c, and 6-1d, which are intended to prevent the loss of jurisdictional and potentially non-jurisdictional wetlands, and RVSP EIR Mitigation Measures 6-13a and 6-13b, which are intended to prevent the loss of protected native trees.

Future development of the off-site affordable housing parcel would be consistent with Resource Management Policies 8, 10,11, and 13 related to erosion control and water quality, pursuant to compliance with RVSP EIR Mitigation Measures 12-1b, 12-3b, 12-3c, 12-3d, 13-2a, 13-4b, 13-4c, which require compliance with the County Grading Ordinance and National Pollutant Discharge Elimination System (NPDES) requirements, preparation and implementation of a stormwater pollution prevention plan, preparation of a project-specific drainage report, and implementation of Best Management Practices (BMPs). In addition, consistent with Resource Management Policies 14 and 16 related to water conservation in landscaping, future development of the off-site affordable housing parcel would comply with the County's Water Efficient Landscape Ordinance (WELO), which would be ensured during the design review process through submission of a landscape package to the County for review and approval. The landscape package would include water budget calculations, a soil management report, landscape design plan, irrigation design plan, and other documents related to the proposed landscaping, irrigation, and grading plans. Consistent with Resource Management Policy 14 related to indoor water conservation, future development of the off-site affordable housing parcel would be subject to all applicable California Green Building Standards Code (CALGreen) requirements related to low-flow fixtures.

With respect to Resource Management Policies 19 and 20 related to energy efficiency, future development of the off-site affordable housing parcel would be required to comply with the requirements of the California Building Standards Code (CBSC) and Assembly Bill (AB) 1346. With respect to Resource Management Policy 21 related to restrictive lighting measures, pursuant to Section 17.54.070(A)(2)(i) of the Placer County Code, future development of the off-site affordable housing parcel would be subject to compliance with the applicable sections of the Placer County Design Guidelines related to light pollution, including, but not limited to, shielding of fixtures such that direct rays do not pass property lines. The off-site affordable housing parcel would also be required to comply with the lighting policies of the RVSP Design Guidelines, which requires the following: that street lighting standards shall be spaced according to County requirements; lighting shall be provided to ensure a safe environment, but shall not result in excessive light or glare; that lighting shall be sensitive to adjacent land uses and viewsheds; and that fixtures that provide down-lighting shall be shielded from adjacent uses where feasible. With respect to Resource Management Policy 25 related to noise impacts on sensitive uses, the future potential development of the off-site affordable housing parcel is not anticipated to contribute any excessive operational noise level increases to the existing ambient noise environment at any sensitive receptor locations.

Lastly, with respect to Public Services and Utilities Policies 1, 2, 3, and 4 related utility infrastructure, recycled water, solid waste, and public services, future development of the off-site affordable housing parcel would be subject to RVSP EIR Mitigation Measures 14-1a, 14-1b, 14-5a, 14-13a, and 14-14a, which require payment of applicable development impact fees, water connection fees, and a written certification from the water service provider and wastewater treatment provider that either existing services are available for

the off-site affordable housing parcel or that needed improvements will be in place prior to occupancy. In addition, the project applicant would be required to pay sewer connection fees, the Traffic Impact Fee, and the Public Facilities Impact Fee. The future residential uses associated with the off-site affordable housing parcel would also be subject to all applicable recycling regulations, including Senate Bill (SB) 1383.

Based on the above, developing the off-site affordable housing parcel with an additional 60 HDR units as compared to what was assumed for the parcel in the RVSP EIR would not result in an inconsistency with the RVSP policies adopted for the purpose of avoiding or mitigating environmental effects.

Conclusion

Based on the above, the proposed project and potential future development of the off-site affordable housing parcel would not cause a significant environmental impact due to conflicts with a land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect (including the policies discussed in Table 13-7), and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

13-3 Result in the development of incompatible uses and/or the creation of land use conflicts. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of the potential for the proposed project and potential future development of the off-site affordable housing parcel to result in the development of incompatible uses and/or the creation of land use conflicts.

Proposed Project

The determination of compatibility of land uses typically relies on a general discussion of the types of adjacent uses to a proposed project and whether any sensitive receptors are located either on the adjacent properties or associated with the proposed project. Surrounding existing land uses consist of the following:

North:	Under-construction Baseline Marketplace across Baseline Road
South:	Single-family residences
East:	Single-family residences and Dry Creek tributaries
West:	Under-construction Property 1A of the PVSP, which will include single-family residential uses

The proposed project would involve construction of 432 residential units, including 212 single-family lots and 220 multi-family units, and, potentially, an additional 22 ADUs. As noted above, some of the areas surrounding the project site consist of residential development. The proposed project's residential uses would be compatible with the existing and approved residential development within the project area; thus, the following discussion focuses on the limited areas where the proposed residences would be juxtaposed with non-residential uses, such as the Baseline Marketplace to the north, across Baseline Road, and Dry Creek tributaries to the east.

The PCGP includes additional buffer requirements for sensitive habitat areas such as the Dry Creek tributaries within and to the east of the site. Consistency with the County's sensitive habitat buffers is discussed in Chapter 7, Biological Resources, of this EIR. The PCGP also requires that new non-agricultural development immediately adjacent to agricultural lands be designed to provide a buffer in the form of a setback of sufficient distance to avoid land use conflicts between urban/suburban and agricultural areas. As discussed in Chapter 5, Agricultural Resources, of this EIR, the surrounding existing uses do not include agricultural operations.

While the project would introduce more intensive uses when compared to existing conditions, the proposed project would be generally compatible with the uses and intensity of the surrounding development, and would be required to comply with all applicable County design standards. The ultimate Baseline Road configuration from improvements associated with the Baseline Marketplace and the PVSP would be 96 feet wide, which would separate the project site from the Baseline Marketplace to the north. The project frontage on the south side of Baseline Road would include a landscaped corridor with a six-foot tall concrete masonry unit (CMU) wall, which would help screen the proposed development from surrounding areas, including the Baseline Marketplace to the north, across Baseline Road. The proposed project would also include landscaping with native vegetation at the Phase 1 and Phase 2 entries on Baseline Road and Walerga Road. The landscaping would include materials consistent with the DCWPCP and the Placer County Landscape Guidelines. Trees and shrubs would also be planted along both sides of Walerga Road within the project site. A six-foot tall tubular open view fence would also be located along the western boundary of the Estia Dry Creek development, and a six-foot tall privacy fence along the southern boundary. In addition to landscaping, an approximately 1,300-foot-long Class I meandering trail would be located along the Baseline Road frontage, and an approximately 2,300-foot-long Class I meandering trail would be located along the southern/eastern Walerga Road frontage. Together, the landscaped trail, sidewalk, and CMU wall would provide screening between the residences adjacent to the roadways and the commercial uses to the north of the project site.

In addition, the Old Walerga Road corridor separates the proposed Estia and Phase 2 portions of the project from the existing residential community to the west within the broader Placer Vineyards area. The proposed project aims to implement minor enhancements within the abandoned road corridor. The corridor is privately-owned and encumbered by existing public utility easements; accordingly, any proposed enhancements would be subject to landowner consent. Proposed enhancements would be limited to areas previously disturbed by the former roadway and may include linkages on the north side to the planned Class I trail along Baseline Road and on the south side to Town Center Drive, limited pavement surface treatments (such as slurry seal or comparable non-structural applications), signage, and striping to accommodate pedestrians and bicyclists. If implemented, the improvements to the Old Walerga Road corridor would enhance connectivity of local residents to nearby retail and commercial centers, provide additional safety for pedestrians and cyclists, support multimodal access, and contribute to the overall functionality and integration of the local trail network.

During construction activities, the proposed project would retain and protect existing native trees within the project site where possible. Where new plantings are proposed, the project would use native plants that are indigenous and adapted to the region. As a Condition of

Approval, the project architecture would be designed to be compatible with the existing residential character of the area. As discussed in Chapter 14, Noise, of this EIR, the project would not introduce a substantial permanent increase in ambient noise levels in the project vicinity above levels occurring under the existing conditions.

Therefore, the project would not introduce an incompatible use to the project area or create land use conflicts, and would not result in any adverse environmental effects associated with such development.

Off-Site Affordable Housing Parcel

As discussed previously, one option for the project to meet the County's affordable housing regulations includes an amendment to the RVSP and a rezone of the off-site affordable housing parcel to the RM30 zone, which would result in a maximum development potential of 120 affordable income-restricted units. While the proposed project would include a Rezone to allow for development of the aforementioned units, the County has previously planned for buildout of the site, as evidenced by the site's previous designations of HDR and Commercial, pursuant to the RVSP. Rezoning of the off-site affordable housing parcel does not include any site-specific development plans, designs, or proposals at this time. However, future development of the off-site affordable housing parcel would be subject to County review and compliance with the applicable development standards for the RM30 zoning district included in Article 17.49 of the Placer County Code. As discussed therein, any residential multi-family development within the RM30 zone district is required to be developed at a minimum density of 20 units per acre and maximum density of 30 units per acre, and would be subject to the requirements established in the Multifamily and Mixed Use Design Manual (June 2021) for lot area, site width, setbacks, floor area ratio, height limit, and other applicable standards.

With respect to the uses surrounding the off-site affordable housing parcel, an existing cemetery is located to the north of the parcel, and future MDR uses associated with the approved 120-lot Frisvold Subdivision would be located to the east of the parcel. The areas to the west and south of the off-site affordable housing parcel are located outside of the RVSP. Single-family residential uses are located to west of the off-site affordable housing parcel, and to the south of the parcel, within Sacramento County and south of PFE Road and vacant land. According to the RVSP EIR, the uses in the RVSP area, including the HDR uses assumed for the off-site affordable housing parcel, would be compatible with the aforementioned surrounding land uses.

Conclusion

Based on the above, the proposed project and the potential future development of the off-site affordable housing parcel would not result in the development of incompatible uses and/or the creation of land use conflicts, and a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.

13-4 Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (e.g., through projects in an undeveloped area or extension of major infrastructure). Based on the analysis below, the impact is *less than significant*.

Growth can be induced in a number of ways, including through the elimination of obstacles to growth or through the stimulation of economic activity within the region. Examples of projects likely to have growth-inducing impacts include extensions or expansions of infrastructure systems beyond what is needed to serve project-specific demand, and development of new residential subdivisions or office complexes in areas that are currently only sparsely developed or are undeveloped. The following sections describe potential effects related to direct and indirect population growth associated with implementation of the proposed project and potential future development of the off-site affordable housing parcel.

Direct Population Growth

The following sections describe potential effects related to direct population growth associated with implementation of the proposed project and potential future development of the off-site affordable housing parcel.

Proposed Project

The proposed 432-unit single-family and multi-family development would increase the available housing within the DCWPCP area, which would be expected to increase population in the area. Using the 2.94 persons/household average household size for the DCWPCP area (see Table 13-5), the proposed 432 residential units could house an estimated 1,270 residents.

Residential development is allowed within the 80.1-acre portion of the project site designated as RLDR. The maximum density for single-family dwellings in the RLDR designation is one du/ac. Under the current RLDR designation for the 80.1-acre portion of the project site, up to 80 single-family residences could be built, resulting in a population increase of approximately 235 residents (80 units x 2.94 persons per household). Thus, development of the proposed project could result in a net increase of approximately 352 units, or 1,035 residents beyond what is currently anticipated for the site.

As noted previously, the project could potentially include 22 ADUs on-site in order to meet the County's affordable housing requirements. Because the 22 ADUs are anticipated to be smaller than the proposed 212 single-family units, a lower person per household rate of 1.91 persons per household is applied to the ADUs. Thus, development of 22 ADUs would likely result in approximately 42 additional residents (22 units x 1.91 persons per household) within the project site. The total population of the project site with 432 units and 22 ADUs would be an estimated 1,312 residents, or 1,077 residents beyond what is currently estimated for the site based on current land use designations.

Development of 432 residential units and 22 ADUs, and the associated addition of approximately 1,312 residents would increase the total current population of the DCWPCP area from 8,352 to approximately 9,664, or a 15.7 percent increase. However, as discussed in the Existing Environmental Setting section of this chapter, the DCWPCP

projected that the area's population could grow to as much as 9,836 residents by buildout. Thus, the increase in population that could be generated by the proposed project would still be within the range of growth projections assumed in the DCWPCP. Impacts associated with the growth anticipated in the DCWPCP area were analyzed in the EIR for the adopted DCWPCP.

While the anticipated population growth resulting from the proposed project would be within the maximum growth anticipated by the DCWPCP buildout, the 2010 growth estimates within the DCWPCP do not include more recent projects approved in the DCWPCP, namely the RVSP and the PVSP. In addition, several new residential subdivisions have been completed, are underway, or approved within the Plan area. Growth related to buildout of the project in conjunction with the foregoing Specific Plans is considered in further depth within Impact 13-6 below.

In addition to the growth anticipated in the DCWPCP, SACOG also anticipates growth within Established Communities, including the DCWPCP area. As discussed within the Existing Environmental Setting section of this chapter, Established Communities throughout the unincorporated area of Placer County are anticipated to grow by 2,760 units between 2020 and 2035.[19] The 432 units included in the proposed project, as well as the 22 ADUs that could be included in the project to meet the County's affordable housing requirements, would be within SACOG's growth estimates for Established Communities within Placer County by 2035. Additionally, growth in the DCWPCP area and other unincorporated areas of Placer County was anticipated by the Placer County Housing Element. As shown in Table 13-6, the County's Housing Element includes allocation for market-rate and below market-rate units within unincorporated portions of the County. The proposed 212 single-family units would be within the Housing Elements' allocation of market-rate units for the County.

Therefore, the population growth generated by the proposed project would be within the buildout and growth projections for the DCWPCP area, as well as unincorporated areas within Placer County.

Off-Site Affordable Housing Parcel

As discussed previously, one option for the project to meet the County's affordable housing regulations includes an amendment to the RVSP and a rezone of the off-site affordable housing parcel to the RM30 zone, which would result in a maximum development potential of 120 affordable income-restricted units. While the proposed project would include a Rezone to allow for development of the aforementioned units, the County has previously planned for buildout of the site, as evidenced by the site's previous designations of HDR and Commercial. The RVSP EIR evaluated development of the off-site affordable housing parcel with 60 HDR units, and determined that such development would result in 120 residents, which would not be an introduction of substantial new population.

Using the same estimated number of persons by household used within the RVSP EIR, a doubling in HDR units within the off-site affordable housing parcel could result in a total of 240 future residents associated with the potential future development of the off-site

[19] Sacramento Area Council of Governments. *2020 Metropolitan Transportation Plan/Sustainable Communities Strategy* [Appendix C, pg. 8]. Adopted November 18, 2019.

affordable housing parcel. Nonetheless, similar to the proposed project, the increase in population that could be generated by development of the off-site affordable housing parcel would still be within the range of growth projections assumed in the DCWPCP and by SACOG.

Indirect Population Growth

The following sections describe potential effects related to indirect population growth associated with implementation of the proposed project and potential future development of the off-site affordable housing parcel.

Proposed Project and Off-Site Affordable Housing Parcel

The proposed project could result in an increase of the permanent population on the project site by an estimated 1,312 residents, and the potential future development of the off-site affordable housing parcel could result in a permanent population increase of approximately 240 residents. The new residential population would likely support local businesses and services in the area, fostering economic growth. While development of the proposed project and off-site affordable housing parcel would result in increased employment opportunities in the construction field, employment patterns of construction workers are such that construction workers would not likely, to any significant degree, relocate their households as a result of the construction-related employment opportunities associated with the proposed project and off-site affordable housing parcel. As a result, permanent jobs would not be directly created by the proposed project or off-site affordable housing parcel and the project would not result in long-term employment growth in the area.

The residential population generated by the proposed project and off-site affordable housing parcel would also result in an increased demand for public services. However, as discussed in Chapter 15, Public Services and Utilities, the increase in population associated with development of the proposed project and off-site affordable housing parcel and associated demand for utility services could be accommodated by existing services and would not create a need for new or altered governmental facilities. In addition, the proposed project would be annexed into the Dry Creek Zone of Benefit (County Service Area 28, Zone 165) for provision of fire protection services to the project site. The proposed project would also require annexation into Placer County Service Area 28, Zone 169, for ongoing maintenance and the generation of funds for public parks, trails, and open space recreation amenities within the Dry Creek community.

The DCWPCP included measures to ensure that adequate utilities and services were provided for development within the DCWPCP area. Consistent with the DCWPCP, the project would be annexed into Placer County Service Area 28, Zone 173, for sanitary sewer service. Underground infrastructure improvements for the proposed project would include new water mains on-site, as well as on-site gravity sanitary sewer and storm drain collection systems. Development of the project site would also require installation of on-site drainage facilities and alteration of site topography to accommodate the proposed land uses. The proposed project would connect to an existing eight-inch sewer line to the south of the project site.

Given that the majority of the project site is currently anticipated for development with residential uses according to the DCWPCP, such utilities have been designed to

accommodate additional demand associated with buildout of the site pursuant to the approved DCWPCP land use designations. In addition, the proposed project would include improvements to the existing lift station located approximately 0.53-mile south of the project site, including increasing the emergency storage capacity. The improvements and upgrades to be conducted at the lift station would support the proposed project and future development within the sewer shed. The proposed upgrades to the existing lift station would occur once the existing capacity is reached to ensure adequate capacity for the proposed project.

Furthermore, the infrastructure included in the potential future development of the off-site affordable housing parcel would be sized to accommodate only the associated residential uses and would not add capacity beyond what is needed to serve the site. The utility improvements included in the potential future development of the off-site affordable housing parcel would be designed to serve the proposed residences only, and would not induce any significant indirect population growth within the DCWPCP area.

Conclusion

Considering the above, the proposed project and potential future development of the off-site affordable housing parcel would include development that would result in direct on-site population growth. Population growth resulting from the proposed project would be within the DCWPCP, SACOG, and Placer County growth estimates for the project area. Furthermore, the infrastructure included in the proposed project would be sized to accommodate the development of the proposed project and the improvements to the existing lift station would support the proposed project and future approved and planned development within the sewer shed. As a result, the proposed project would not be considered to induce substantial unplanned population growth, and a ***less-than-significant*** impact would result. Potential impacts related to growth inducement are discussed further within Chapter 20, Statutorily Required Sections, of this EIR, consistent with Section 15126.2(d) of the CEQA Guidelines.

Mitigation Measure(s)

None required.

Cumulative Impacts and Mitigation Measures

As defined in Section 15355 of the CEQA Guidelines, “cumulative impacts” refers to two or more individual effects which, when considered together, are considerable, compound, or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Additional detail regarding the cumulative setting is included in Chapter 20, Statutorily Required Sections, of this EIR.

13-5 Cause a significant cumulative environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Based on the analysis below, the cumulative impact is *less than significant*.

A cumulative analysis of land use is not included because land use plans or policies and zoning generally do not combine to result in cumulative impacts. The determination of significance for impacts related to such issues is whether the project or the off-site affordable housing parcel would cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Such a conflict is site-specific, and, thus, is only addressed on a project-by-project basis. As shown in Table 13-7 of this chapter, the proposed project would be generally consistent with relevant policies in the PCGP and the DCWPCP. In addition, as discussed in the RSVP EIR, the RVSP is generally consistent with the PCGP and the DCWPCP. Developing the off-site affordable housing parcel with an additional 60 HDR units as compared to what was assumed for the parcel in the RVSP EIR would not result in an inconsistency with the applicable policies and plans adopted for the purpose of avoiding or mitigating an environmental effect. As discussed throughout this EIR, the potential future development of the off-site affordable housing parcel would be generally consistent with RVSP policies adopted for the purpose of avoiding or mitigating environmental effects. Therefore, the proposed project would not cause or contribute to a significant cumulative environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect, and the cumulative impact would be ***less than significant***.

Mitigation Measure(s)

None required.

13-6 Cumulative unplanned population growth. Based on the analysis below, the cumulative impact is *less than significant*.

Buildout of the DCWPCP was anticipated to result in population growth within the plan area through the buildout of urban and rural developments throughout the DCWPCP, including the project site. Since approval of the DCWPCP, the Placer Vineyard Specific Plan and RVSP have been approved, which have increased the amount of land designated for urban development within the DCWPCP area. In addition, several new residential subdivisions including the Creekview Ranch Project, the Double S Ranch Project, The Ranch Project, and the Mill Creek Project have been completed, are underway, or approved within the Plan area. The MTP/SCS, prepared by the SACOG, provides regional growth projections for the six-county Sacramento region, including the DCWPCP.

The MTP/SCS identifies the portions of the DCWPCP, excluding the RVSP and PVSP areas, as Established Communities. As discussed within Impact 13-4 above, the population growth related to implementation of the proposed project and off-site affordable housing parcel has been anticipated for the region by the MTP/SCS. Concurrently, the MTP/SCS explicitly anticipates growth within the Developing Communities of Placer

Vineyards and Riolo Vineyard within the total growth anticipated for Placer County.[20] Thus, the DCWPCP anticipated cumulative growth of the plan area, and increased urbanization within the DCWPCP area has been anticipated by regional planning such as the MTP/SCS. Because development of the project site, off-site affordable housing parcel, and buildout of the DCWPCP area has been anticipated in regional development forecasts, buildout of the proposed project and off-site affordable housing parcel in combination with other approved developments within the project area would not result in a cumulatively considerable incremental contribution to population growth within the project area or region.

Population growth itself does not constitute a significant physical environmental effect. Rather, the determination of significance is based on whether population growth associated with a project has been previously planned for, and whether such growth could result in indirect impacts from associated development. As such, the cumulative analysis within each technical chapter of this EIR evaluates the physical environmental impacts of cumulative development.

Considering the above, implementation of the proposed project, in combination with future development occurring under buildout of the DCWPCP, would result in a ***less-than-significant*** cumulative impact related to substantial unplanned population growth.

Mitigation Measure(s)

None required.

[20] Sacramento Area Council of Governments. *2020 Metropolitan Transportation Plan/Sustainable Communities Strategy* [Appendix C, pg. 8]. Adopted November 18, 2019.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
PCGP		
Land Use		
1.B.1	The County shall promote the concentration of new residential development in higher density residential areas located along major transportation corridors and transit routes.	The project site is located along Baseline Road, which provides a major point of connection between the southern boundary of the City of Roseville and the northern boundary of the DCWPCP area. The project site is also bisected by Walerga Road, which provides north to south access between the City of Roseville and the DCWPCP area. Furthermore, Roseville Transit services Route D with a stop approximately 0.70-mile from the project site at Baseline Road and Woodcreek Oaks Boulevard. Route D traverses the western neighborhoods of the City of Roseville and connects to the Civic Center Junction, which provides connections to commuter buses. While the project site is not located within a high-density residential area, the proposed project would be generally consistent with existing and approved residential development trends in the project vicinity.
1.B.5	The County shall require residential project design to reflect and consider natural features, noise exposure of residents, visibility of structures, circulation, access, and the relationship of the project to surrounding uses. Residential densities and lot patterns will be determined by these and other factors. As a result, the maximum density specified by General Plan designations or zoning for a given parcel of land may not be realized.	The project site includes various natural features, including wetlands, vernal pools, Placer Creek, and a band of oak woodlands located along the Placer Creek riparian corridor. The proposed project would preserve the Placer Creek riparian corridor as open space. Pursuant to Mitigation Measure 14-1(a) within this EIR, temporary sound walls would be constructed during project construction to reduce noise exposure. The other components of this policy are design-related and not focused on the physical environment.
1.K.4	The County shall require that new development incorporates sound soil conservation practices and minimizes land alterations. Land alterations should comply with the following guidelines: a. Limit cuts and fills; b. Limit grading to the smallest practical area of land; c. Limit land exposure to the shortest practical amount of time; d. Replant graded areas to ensure establishment of plant cover before the next rainy season; and e. Create grading contours that blend with the natural contours on site or with contours on property immediately adjacent to the area of development; and	Mitigation Measure 10-2(c) of this EIR requires that all proposed grading, drainage improvements, and vegetation and tree removal shall conform to provisions of the County Grading Ordinance (Ref. Article 15.48, Placer County Code) and Stormwater Quality Ordinance (Ref. Article 8.28, Placer County Code) that are in effect at the time of Improvement Plan submittal. Any grading, clearing, or tree disturbance shall not occur until the Improvement Plans are approved and all temporary construction fencing has been installed and inspected by the County. All cut/fill slopes shall be at a maximum of 2:1 (horizontal: vertical) unless a soils report supports a steeper slope and the Engineering and Surveying Division (ESD) concurs with said recommendation.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	f. Provide and maintain site-specific construction Best Management Practices (BMPs).	Pursuant to the mitigation requirements, the applicant must also revegetate all disturbed areas. Revegetation, undertaken from April 1 to October 1, shall include regular watering to ensure adequate growth. A winterization plan shall be provided with project Improvement Plans.
1.O.9	The County shall discourage the use of outdoor lighting that shines unnecessarily onto adjacent properties or into the night sky.	The proposed project would be subject to Mitigation Measure 4-3(a), which requires the project applicant to submit a lighting plan for the project to Placer County for review and approval, demonstrating that proposed lighting is Dark-Sky compliant as specified by the International Dark-Sky Association.
Transportation and Circulation		
3.A.11	The County shall require an analysis of the effects of traffic from all land development projects. Each such project shall construct or fund improvements necessary to mitigate the effects of traffic from the project consistent with Policy 3.A.7. Such improvements may include a fair share of improvements that provide benefits to others.	A Vehicle Miles Traveled (VMT) Memorandum (VMT Memorandum) (see Appendix K of this EIR) and a Local Transportation Analysis (LTA) (see Appendix L) were prepared for the proposed project. The VMT Memorandum was used for analysis of impacts related to transportation pursuant to CEQA requirements, and the LTA includes an analysis of level of service (LOS) to address consistency with PCGP goals and policies, including PCGP Policy 3.A.7. The analysis in Chapter 16, Transportation, of this EIR is based on the technical reports, and includes an assessment of the proposed project's impacts related to transportation during construction activities and operations. As discussed therein, impacts related to transportation were determined to be less-than-significant, with the exception of short-term construction related traffic, which would be mitigated to less-than-significant with implementation of Mitigation Measure 16-1(a). The County would condition the project to comply with all recommended improvements and/or payment of fair share fees towards improvements identified in the LTA.
3.A.13	The County shall assess fees on new development sufficient to cover the fair share portion of that development's impacts on the local and regional transportation system. Exceptions may be made when new development generates significant public benefits (e.g., low income housing, needed health facilities) and	See response to PCGP Policy 3.A.11 above.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	when alternative sources of funding can be identified to offset foregone revenues.	
3.C.1	The County shall promote the use of transportation systems management (TSM) programs that divert automobile commute trips to transit, walking, and bicycling.	As discussed in Chapter 16, Transportation, of this EIR, impacts related to VMT would be less than significant, and the proposed project would not be required to implement measures to reduce project vehicle trips. The proposed project would improve bicycle access in the project vicinity. Such improvements would include the construction of a seven-foot Class II bike lane on the south side of Baseline Road. In addition, the proposed project would also include frontage improvements for the six-lane reconfiguration of Walerga Road. Frontage improvements would include the development of two, seven-foot-wide bike lanes and an approximately 2,300-foot-long Class I meandering trail along the southern/eastern Walerga Road frontage. The proposed project would also include the construction of an approximately 1,300-foot-long Class I meandering trail along the Baseline Road frontage. Placer Creek Residential Phase 4 would also include an approximately 1,600-foot-long extension of the existing trail within the open space portion of the project site. Furthermore, if implemented, the minor enhancements to the Old Walerga Road corridor would improve the connectivity of local residents to nearby retail and commercial centers, provide additional safety for pedestrians and cyclists, support multimodal access, and contribute to the overall functionality and integration of the local trail network. The proposed project would also include installation of sidewalks adjacent to all internal roadways. Thus, the proposed project would be expected to promote walking and bicycling. In addition, Roseville Transit Route D includes a stop approximately 0.70-mile from the project site along Junction Boulevard near Baseline Road.
3.C.2	The County shall promote the use, by both the public and private sectors, of TSM programs that increase the average occupancy of vehicles.	See response to PCGP Policy 3.C.1.
3.D.1	The County shall promote the development of a comprehensive and safe system of recreational and commuter bicycle routes that provides connections between the County's major employment and housing areas and between its existing and planned bikeways.	See response to PCGP Policy 3.C.1.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
3.D.5	The County shall continue to require developers to finance and install pedestrian walkways, equestrian trails, and multi-purpose paths in new development, as appropriate.	See response to PCGP Policy 3.C.1.
3.D.7	The County shall, where appropriate, require new development to provide sheltered public transit stops, with turnouts.	As discussed under Impact 16-2 within Chapter 16, Transportation, the proposed project is not anticipated to conflict with the goals, policies, and objectives of the Placer County Transportation Planning Agency (PCTPA). Additionally, the proposed project would not include features that would conflict with existing or planned transit services. Therefore, development and operation of the proposed project would not adversely affect transit service and facilities, such that new public transit stops would be required.
3.D.8.	The CDRA Engineering and Surveying Division and the Department of Public Works shall view all transportation improvements as opportunities to improve safety, access, and mobility for all travelers and recognize cycling, pedestrian, and transit modes as integral elements of the transportation system.	The project site's Baseline Road entrance would be aligned with the future six-lane, fully signalized Upland Drive. The proposed project would also widen Walerga Road to include two, seven-foot-wide bike lanes, three 12-foot-wide travel lanes in each direction, a Class I trail or sidewalk, and a 13- to 24-foot-wide center landscaped median. The proposed improvements are intended to provide safe pedestrian and cyclist circulation in the project area, thereby reducing potential hazards related to vehicle safety and reducing speeds. All internal roadways and frontage improvements would be designed consistent with applicable Placer County standards, which would be confirmed during improvement plan review. As discussed above in response to PCGP Policy 3.C.1, the proposed project would include a number of pedestrian and bicycle infrastructure improvements.
3.D.9	Consider Complete Streets infrastructure and design features in street design and construction to create safe and inviting environments for all users consistent with the land uses to be served.	See response to PCGP Policy 3.D.8.
3.D.11	The County shall work to achieve equality of convenience and choice among all modes of transportation – pedestrian, cycling, transit and motor vehicles, through a balanced and interconnected transportation system.	See response to PCGP Policy 3.C.1.
Public Facilities and Services		
4.A.1	Where new development requires the construction of new public facilities, the new development shall fund its fair share of the	As discussed in Chapter 15, Public Services and Utilities, the proposed project would be subject to payment of applicable fees used to fund the provision of fire protection services, sheriff protection services, and other

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	construction. The County shall require dedication of land within newly developing areas for public facilities, where necessary.	public services. In addition, the project would be subject to California American Water Company (CAL-AM) fees, sewer connection fees, and monthly sewer services fees used to fund ongoing maintenance of existing water and sewer infrastructure. As discussed throughout this EIR, the proposed project would also include improvements to the existing Community Facilities District #1 Sewer Lift Station to provide for the proposed project's fair share portion of emergency wastewater storage at the lift station. All emergency wastewater storage improvements required to serve the proposed project would be funded by the project applicant.
4.A.2	The County shall ensure through the development review process that adequate public facilities and services are available to serve new development. The County shall not approve new development where existing facilities are inadequate unless the following conditions are met: a. The applicant can demonstrate that all necessary public facilities will be installed or adequately financed (through fees or other means); b. The facilities improvements are consistent with applicable facility plans approved by the County or with agency plans where the County is a participant; and c. The facilities improvements are designed and built to the current standards of the agency providing service.	As discussed in Chapter 15, Public Services and Utilities, of this EIR, adequate public services and utilities would be available to serve the proposed development.
4.B.1	The County shall require that new development pay its fair share of the cost of all existing facilities it uses based on the demand for these facilities attributable to the new development; exceptions may be made when new development generates significant public benefits (e.g., low income housing, needed health facilities) and when alternative sources of funding can be identified to offset foregone revenues.	See response to PCGP Policy 4.A.1.
4.B.2	The County shall require that new development pay the cost of upgrading existing public facilities or construction of new facilities that are needed to serve the new development; exceptions may be made when new development generates significant public benefits (e.g., low income housing, needed health facilities) and	See response to PCGP Policy 4.A.1. Furthermore, as discussed in Chapter 15, Public Services and Utilities, of this EIR, while the proposed project would be subject to payment of applicable fair share fees and in lieu of fees to fund public services and

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	when alternative sources of funding can be identified to offset foregone revenues.	utilities, the proposed project would not increase the population such that new or altered facilities for fire protection services, police protection services, other government services and/or facilities would be required. In addition, the proposed project would not require or result in the relocation or construction of new or expanded water, storm water drainage, electric power, natural gas, or telecommunications facilities. All emergency wastewater storage improvements to the existing Community Facilities District #1 Sewer Lift Station required to serve the proposed project would be funded by the project applicant.
4.C.1	The County shall require proponents of new development to demonstrate the availability of a long-term, reliable water supply. The County shall require written certification from the service provider that either existing services are available or needed improvements will be made prior to occupancy. Where the County will approve groundwater as the domestic water source, test wells, appropriate testing, and/or report(s) from qualified professionals will be required substantiating the long-term availability of suitable groundwater.	As discussed under Impact 15-7 included in Chapter 15, Public Services and Utilities, of this EIR, based on the water supply and demand projections included in the Placer County Water Agency (PCWA) 2020 Urban Water Management Plan (UWMP) and the CAL-AM 2020 UWMP, implementation of the proposed project could be accommodated by the 604 AFY surplus anticipated by PCWA for the West Placer Service Area. By the year 2040, the surplus is anticipated to increase to approximately 5,356 AFY. Based on the historic pattern by which PCWA, as a wholesaler, has been able to supply CAL-AM, as a retailer, with the water that CAL-AM needs in its West Placer Service Area, the County concludes that sufficient water supplies would be available to available to serve the proposed project through its buildout in addition to other relevant reasonably foreseeable future development during normal, dry, and multiple dry years. During droughts, CAL-AM will have the opportunity to reduce demand through voluntary and mandatory cutbacks, which will substantially reduce demand. Furthermore, CAL-AM has provided a conditional Will Serve Letter for the proposed project, indicating that water supply would be provided for the proposed project. Lastly, the proposed project is not anticipated to use groundwater as a water source.
4.C.2	The County shall approve new development based on the following guidelines for water supply: a. Urban and suburban development should rely on public water systems using surface supply. b. Rural communities should rely on public water systems. In cases where parcels are larger than those defined as	See response to PCGP Policy 4.C.1.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	suburban and no public water system exists or can be extended to the property, individual wells may be permitted. c. Agricultural areas should rely on public water systems where available, otherwise individual water wells are acceptable.	
4.C.6	The County shall promote efficient water use and reduced water demand by: a. Requiring water-conserving design and equipment in new construction; b. Encouraging water-conserving landscaping and other conservation measures; c. Encouraging retrofitting existing development with water-conserving devices; and, d. Encouraging water-conserving agricultural irrigation practices.	As discussed in Chapter 15, Public Services and Utilities, of this EIR, the proposed project would comply with the County's WELO, which would be ensured during the design review process through submission of a landscape package to the County for review and approval. The landscape package would include water budget calculations, a soil management report, landscape design plan, irrigation design plan, and other documents related to the proposed landscaping, irrigation, and grading plans. Compliance with the County's WELO would ensure that irrigation water consumption is minimized and occurs in compliance with the County's standards.
4.D.2	The County shall require developments outside of an existing sewer service area and needing new connections to public conveyance and treatment facilities to be annexed into the sewer service area providing service.	As discussed in Chapter 3, Project Description, of this EIR, the project site would be annexed into Placer County Service Area 28, Zone 173 for sanitary sewer service. Annexation of the project site into Placer County Service Area 28, Zone 173 for sanitary sewer service would be subject to County approval.
4.D.4	The County shall require developments needing new connections to construct wastewater conveyance facilities which are sized and located to provide sewer service based on permitted densities and applicable sewer shed area. Wastewater conveyance systems shall be designed for gravity flow. Where gravity conveyance systems are not feasible, the agency providing service may approve pumping service where a site specific engineering analysis demonstrates the long-term cost effectiveness of pumped facilities.	As discussed under Impact 15-6 included in Chapter 15, Public Services and Utilities, of this EIR, the proposed project would be served by the Dry Creek WWTP. Flows from the project site would be conveyed through existing eight-inch "Sewer B" gravity lines within Walerga Road to the Dry Creek WWTP. The proposed project would include the development of an eight-inch sewer line extending across Placer Creek. Eight-inch sanitary sewer lines would be included throughout the project site and would connect to an existing eight-inch sewer line to the south of the project site. The existing Community Facility District #1 Sewer Lift Station is located east of Walerga Road and south of Dry Creek, approximately 0.53-mile to the south at the Dry Creek Community Park. The Emergency Wastewater Storage Plan prepared for the proposed project would include a third 47,000-gallon underground tank adjacent to the existing lift station to be

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		developed, either as part of the proposed project or another future development. Should another future development construct the third tank, the proposed project would be responsible for developing a 47,000-gallon portion of an additional future planned tank in order to accommodate the emergency storage required to serve the proposed project. All sewer improvements would be consistent with the South Placer Regional Wastewater and Recycled Water Systems Evaluation. Pumped sewer lots are not proposed as part of the multi-family Estia Dry Creek development, as the lots would have gravity sewer service.
4.D.6	The County shall promote efficient water use and reduced wastewater system demand by: a. Requiring water-conserving design and equipment in new construction as required in California law (AB 1881); b. Encouraging retrofitting with water-conserving devices; and c. Designing wastewater systems to minimize inflow and infiltration.	The proposed project would be subject to all applicable water conservation requirements, including those pursuant to AB 1881, and the proposed wastewater system would be designed in accordance with the Placer County Land Development Manual sanitary sewer requirements.
4.D.10	The County shall require all public wastewater facilities to be designed and built to the current standards of the agency providing service.	According to the Wastewater Report prepared for the proposed project, the emergency storage required for the proposed project would be 46,267 gallons. The proposed project would either include a third 47,000 gallon underground tank adjacent to the existing Community Facility District #1 Sewer Lift Station, or, should another future development construct the third tank, the proposed project would be responsible for developing a 47,000-gallon portion of an additional future planned tank in order to accommodate the emergency storage required to serve the proposed project. Therefore, all proposed wastewater improvements would be designed to serve only the project, and all improvements would be consistent with the South Placer Regional Wastewater and Recycled Water Systems Evaluation.
4.E.1	The County shall encourage the use of natural stormwater drainage systems to preserve and enhance natural features.	The majority of the project site would drain to the existing on-site Placer Creek tributary after treatment of stormwater.
4.E.2	The County shall support efforts to acquire land or obtain easements for drainage and other public uses of floodplains	Portions of the project site are located within the existing 100-year floodplain. In addition, the Placer Creek tributary area is classified as Zone AE. The Federal Emergency Management Agency's (FEMA) AE zone is

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	where it is desirable to maintain drainage channels in a natural state.	defined as areas subject to inundation by the one percent annual chance flood event, and FEMA provides base flood elevations for such areas. The proposed project would include approximately 9.9 acres of open space bisected by Placer Creek and situated between the Placer Creek Residential Phases 3 and 4 neighborhoods (Lot 5/Lot OS-1). The open space area would be preserved as natural open space by virtue of the underlying zoning and an open space easement to be recorded with the final map. Placer Creek Residential parks, trails and open space would be open to the public.
4.E.4	The County shall ensure that new storm drainage systems are designed in conformance with the Placer County Flood Control and Water Conservation District's Stormwater Management Manual and the County Land Development Manual.	Mitigation Measure 12-4(a) requires that final drainage reports be prepared to finalize the project's drainage system design in a manner that conforms with the requirements of the Placer County Flood Control and Water Conservation District's Stormwater Management Manual and the County Land Development Manual.
4.E.9	The County shall encourage good soil conservation practices in agricultural and urban areas and carefully examine the impact of proposed urban developments with regard to drainage courses.	The impact of the proposed project on existing drainage courses is evaluated in detail within Chapter 12, Hydrology and Water Quality, of this EIR. As discussed therein, with preparation and implementation of a final drainage report and a Conditional Letter of Map Revision (CLOMR), the proposed project would not substantially alter the existing drainage pattern of the site or area in a manner that could: result in flooding on- or off-site; create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems; provide substantial additional sources of polluted runoff either during construction or in the post-construction condition; impede or redirect flood flows; expose people or structures to risk of loss, injury or death involving flooding through the placement of housing in a flood hazard area; or risk release of pollutants due to project inundation. In addition, see response to PCGP Policy 1.K.4.
4.E.10	The County shall strive to improve the quality of runoff from urban and suburban development through use of appropriate and feasible mitigation measures including, but not limited to, artificial wetlands, grassy swales, infiltration/sedimentation basins, riparian setbacks, oil/grit separators, and other best management practices (BMPs).	As discussed under Impacts 12-1 and 12-2 of Chapter 12, Hydrology and Water Quality of this EIR, with implementation of mitigation, the proposed project would not result in significant impacts related to a violation of water quality standards or waste discharge requirements or otherwise substantial degradation of surface or ground water quality during construction or operations. Specifically, Mitigation Measure 12-1 would require Improvement Plans provided to the County prior to authorization of construction; compliance with the provisions of the County Grading

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		Ordinance and Stormwater Quality Ordinance; and preparation of and compliance with a Stormwater Pollution Prevention Plan (SWPPP). Mitigation Measures 12-2(a) through 12-2(d) require the proposed project to incorporate BMPs designed according to the guidance of the California Stormwater Quality Association Stormwater Best Management Practice Handbooks for Construction, for New Development/Redevelopment, and for Industrial and Commercial, as well as require the preparation of a final Stormwater Quality Plan designed in compliance with Placer County's Small Municipal Separate Storm Sewer System (MS4) Permit (State Water Resources Control Board [SWRCB] NPDES).
4.E.11	The County shall require new development to adequately mitigate increases in stormwater peak flows and/or volume. Mitigation measures should take into consideration impacts on adjoining lands in the unincorporated area and on properties in jurisdictions within and immediately adjacent to Placer County.	As discussed in Impact 12-4 of the Hydrology and Water Quality chapter, although the proposed project would result in an increase in on- and off-site peak runoff flows, as well as an increase in on-site water surface elevations (WSEs) within the Dry Creek Walerga Road Tributary relative to existing conditions during a 100-year storm event, such an increase is acceptable for the Dry Creek watershed. The post-construction 100-year increases would be contained in the natural channels of the tributary on-site, and several vertical feet of freeboard would be maintained for existing structures, and provided for the proposed building pads. Mitigation Measure 12-4(h) requires that the final Drainage Report demonstrate that the proposed project will not induce off-site flooding, to the satisfaction of the Engineering and Surveying Department and Placer County Flood Control District. Therefore, the proposed project is not anticipated to substantially increase the rate or amount of surface runoff water which would exceed the capacity of existing or planned stormwater drainage systems. Nonetheless, as required by Mitigation Measure 12-4(a), submittal of a final drainage report would be required to substantiate the preliminary drainage design. Additionally, as required by Mitigation Measures 12-4(d) and 12-4(e), the proposed project would be required to comply with Placer County's Dry Creek Watershed Drainage Improvement Ordinance, which requires new development that increases impervious surface areas within the Dry Creek Watershed to pay fees to fund future regional flood control and future drainage improvement projects within the watershed. District

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		flood control projects include the Miners Ravine Off-Chanel Detention Basin and Antelope Creek Flood Control Project, which were constructed to mitigate for increased runoff associated with development within the Dry Creek watershed. Payment of such fees would help to fund regional flood control and future drainage facility improvement projects within the Dry Creek watershed.
4.E.12	The County shall encourage project designs that minimize drainage concentrations and impervious coverage and maintain, to the extent feasible, natural site drainage conditions.	While the proposed project would alter the existing hydrology of the project area and include a shed shift from the Curry Creek watershed to the Dry Creek watershed, the post-construction 100-year increases would be contained in the natural channel of Placer Creek on-site, and several vertical feet of freeboard (the vertical distance between the flood level and the top of the embankment) would be maintained for existing structures, as well as provided for the proposed building pads. Furthermore, the project design would maintain the on-site Dry Creek tributaries in their natural condition and would not increase floodplain limits off-site.
4.E.14	The County shall require projects that have significant impacts on the quantity and quality of surface water runoff to allocate land as necessary for the purpose of detaining post-project flows and/or for the incorporation of mitigation measures for water quality impacts related to urban runoff.	See responses to PCGP Policies 4.E.10 and 4.E.11.
4.F.1	The County shall require that arterial roadways and expressways, residences, commercial and industrial uses and emergency facilities be protected, at a minimum, from a 100-year storm event.	See response to PCGP Policy 4.E.11.
4.F.4	The County shall require evaluation of potential flood hazards prior to approval of development projects. The County shall require proponents of new development to submit accurate topographic and flow characteristics information and depiction of the 100-year floodplain boundaries under fully-developed, unmitigated runoff conditions.	Potential flood hazards are evaluated in detail in Impact 12-5 of the Hydrology and Water Quality chapter. Mitigation Measure 12-5 requires the project applicant to submit an application for, and subsequently obtain, a Conditional Letter of Map Revision (CLOMR) or Conditional Letter of Map Revision based on Fill (CLOMR-F) from FEMA for the placement of fill within a Special Flood Hazard Area. In addition, consistent with Policy 4.F.4, Mitigation Measure 12-4(f) requires that Improvement Plans show the limits of the future, unmitigated, fully developed, 100-year flood plain (after grading) for the Dry Creek Walerga Road Tributary Reach and the FEMA floodplain. Mitigation Measure 12-4(f) further requires that the Improvement Plans show the finished house pad elevations for all lots

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		along the floodplain to be a minimum of two feet above the 100-year flood plain line (or finished floor -three feet above the 100-year floodplain line). Mitigation Measure 12-4(g) requires that off-site floodplain limits do not exceed the existing condition.
4.F.5	The County shall attempt to maintain natural conditions within the 100-year floodplain of all rivers and streams except under the following circumstances: a. Where work is required to manage and maintain the stream's drainage characteristics and where such work is done in accordance with the Placer County Flood Damage Prevention Ordinance, California Department of Fish and Game regulations, and Clean Water Act provisions administered by the U.S. Army Corps of Engineers.	See response to PCGP Policies 4.E.2 and 6.B.1.
4.G.2	The County shall promote maximum use of solid waste source reduction, recycling, composting, and environmentally-safe transformation of wastes.	The CALGreen Code requires at least 65 percent diversion of construction waste for projects permitted after January 1, 2017. As discussed in Chapter 15, Public Services and Utilities, of this EIR, a minimum of approximately 1,093 tons of waste would be diverted away from landfill disposal during construction of the proposed project.
4.H.2	The County Sheriff shall strive to maintain the following average response times for emergency calls for service: a. 6 minutes in urban areas b. 8 minutes in suburban areas c. 15 minutes in rural areas d. 20 minutes in remote areas	As discussed under Impact 15-2 in Chapter 15, Public Services and Utilities, of this EIR, although response times are dependent upon the location of patrol officers at the time of the emergency call, on average, response times to the project site would be anticipated to be within the PCGP's eight-minute response time standard for suburban areas with development of the new West Placer Sheriff's Station.
4.I.2	The County shall encourage local fire protection agencies in the County to maintain the following standards (expressed as average response times to emergency calls): a. 4 minutes in urban areas b. 6 minutes in suburban areas c. 10 minutes in rural areas	As discussed under Impact 15-1 of Chapter 15, Public Services and Utilities, of this EIR, fire protection services for the project site would be provided by way of Station 100, located at 8350 Cook Riolo Road. Station 100 is located approximately 1.8 miles from the project site. Given the proximity of the project site to Station 100, the response time to the project site would be within the achievable response time goal. In addition, two new fire stations are proposed as part of the PVSP, to the west across Walerga Road.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
4.I.9	The County shall ensure that all proposed developments are reviewed for compliance with fire safety standards by responsible local fire agencies per the Uniform Fire Code and other County and local ordinances.	As discussed under Impact 15-1 of Chapter 15, Public Services and Utilities, of this EIR, all structures included in the proposed project would be constructed consistent with the CBSC and California Fire Code (CFC). In compliance with the CBSC (specifically Section 903.2.1.3, Group A-3), the design of the residences would include the installation and use of automatic fire sprinklers, and fire alarm systems would be incorporated pursuant to CFC requirements. Such features would reduce the potential for fires to occur within the proposed structures, which would reduce the demand for fire protection services from the project site. Development within the project site, as well as other future development throughout Placer County and the DCWPCP area, would be required to comply with all applicable regulations imposed by the Placer County Fire Department (PCFD) and the CFC, as adopted by Section 15.04.510 of the Placer County Code.
Recreation and Cultural Resources		
5.A.1	The County shall strive to achieve and maintain a standard of 10 acres of improved parkland per 1,000 population. The standard shall be comprised of the following: • 5 acres of improved active parkland per 1,000 population • 5 acres of passive recreation area or open space per 1,000 population	The proposed project would include development of a public, 2.1-acre neighborhood park in the Placer Creek Residential Phase 2 development (Lot PARK-1). Additional park areas would be provided in pockets along Placer Creek. The proposed project would include approximately 9.9 acres of open space bisected by "Placer Creek" and situated between the Placer Creek Residential Phase 3 and 4 neighborhoods (Lot 5/Lot OS-1). As discussed under Impact 15-4 in Chapter 15, Public Services and Utilities, of this EIR, the proposed project would be required to provide a minimum of approximately 5.36 acres of parkland (0.005 acres/resident X 1,072 estimated residents), and with the inclusion of 22 ADUs, would require a total of 5.64 acres of parkland. Thus, by providing 2.1 acres of neighborhood park area, the proposed project would not meet the park requirements and payment of an in-lieu fee would be required. In addition, a minimum of approximately 5.64 acres of passive recreation area or open space would be required for the proposed project. Because the project would include approximately 9.9 acres of open space areas, the project would comply with PCGP Policy 5.A.1 related to the provision of passive recreation area or open space.
5.A.3	The County shall require new development to provide a minimum of 5 acres of improved parkland and 5 acres of passive recreation	See response to PCGP Policy 5.A.1 above.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	area or open space for every 1,000 new residents of the area covered by the development. The park classification system shown in Table 5-1 should be used as a guide to the type of the facilities to be developed in achieving these standards.	
5.A.4	The County shall consider the use of the following open space areas as passive parks to be applied to the requirement for 5 acres of passive park area for every 1,000 residents. • Floodways • Protected riparian corridors and stream environment zones • Protected wildlife corridors • Greenways with the potential for trail development • Open water (e.g., ponds, lakes, and reservoirs) • Protected woodland areas • Protected sensitive habitat areas providing that interpretive displays are provided (e.g., wetlands and habitat for rare, threatened or endangered species) Buffer areas are not considered as passive park areas if such areas are delineated by setbacks within private property. Where such areas are delineated by public easements or are held as common areas with homeowner/property owner access or public access, they will be considered as passive park areas provided that there are opportunities for passive recreational use.	See response to PCGP Policy 5.A.1 above.
5.D.2	The County shall solicit the cooperation of the owners of cultural and paleontological resources, encourage those owners to treat these resources as assets rather than liabilities, and encourage the support of the general public for the preservation and enhancement of these resources.	As discussed in Chapter 8, Cultural Resources, of this EIR, unknown archaeological resources could exist beneath the ground surface of the site and have the potential to be uncovered during ground-disturbing activities of the proposed project or development of the off-site sewer lift station improvements area. Therefore, implementation of Mitigation Measures 8-2(a) and 8-2(b) would be required to account for unanticipated discoveries of potential subsurface archaeological resources during all elements of project construction.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		As discussed under Impact 10-4 of Chapter 10, Geology and Soils of this EIR, geologic rock units known to produce paleontological resources do not occur in the project area and that, based on Society of Vertebrate Paleontology (SVP) criteria, the sensitivity for paleontological resources on the project site is low. Mitigation Measure 10-4(b) of this EIR requires that in the event that paleontological resources are discovered during ground-disturbing activities associated with the proposed project, the applicant shall notify the Placer County Community Development Resource Agency and retain a qualified paleontologist to inspect the discovery. If the find is deemed to contain unique paleontological resources under criteria the resource(s) shall then be salvaged and deposited in an accredited and permanent scientific institution. The aforementioned mitigation measures are required to be included on any future grading plans, utility plans, and improvement plans subject to approval by the Placer County ESD for the proposed project, where excavation work would be required.
5.D.3	The County shall solicit the views of the Native American Heritage Commission, State Office of Historic Preservation, North Central Information Center, and/or the local Native American community in cases where development may result in disturbance to sites containing evidence of Native American activity and/or to sites of cultural importance.	As discussed in Chapter 17, Tribal Cultural Resources, pursuant to Assembly Bill (AB) 52 and Senate Bill (SB) 18, invitations to consult were sent to tribes who requested notification of proposed projects within the geographic area on January 22, 2025. Specifically, AB 52 notification letters were sent to the Ione Band of Miwok Indians, United Auburn Indian Community (UAIC), Washoe Tribe of Nevada and California, Colfax-Todds Valley Consolidated Tribe, Shingle Springs Band of Miwok Indians, T'Si-Akim Maidu, and Wilton Rancheria. In addition, SB 18 notification letters were sent to the Shingle Springs Band of Miwok Indians, T'Si-Akim Maidu, and Wilton Rancheria. A response was received from the UAIC on February 4, 2025. The UAIC provided a sensitivity map to the County showing where the tribe would like to monitor during on-site construction. This monitoring requirement has been incorporated into Chapter 17 as mitigation. On May 7, 2026, Placer County initiated tribal consultation pursuant to AB 52 and SB 18 specifically for the off-site sewer lift station improvements area and the off-site affordable housing parcel. The UAIC requested site-

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		specific mitigation measures for the off-site sewer lift station location. The tribal cultural awareness training and inadvertent discoveries measure requested for the off-site sewer lift station improvements area have been incorporated into Chapter 17 as mitigation. No site visit nor any additional mitigation for the off-site affordable housing parcel was requested. In addition, a Cultural and Paleontological Resources Assessment was prepared for the proposed project by Natural Investigations Company and included a cultural resources literature search at the North Central Information Center (NCIC); archival research; consultation with the Native American Heritage Commission (NAHC), including a Sacred Lands File (SLF) search; and a field survey of the approximately 88-acre development area and two-acre off-site sewer lift station improvements area. Furthermore, as discussed in Chapter 17, Tribal Cultural Resources, of this EIR, unknown subsurface tribal cultural resources could potentially be identified in the project site during project construction activities. Therefore, implementation of Mitigation Measures 17-1(a) and 17-1(b) would be required to account for unanticipated discoveries of potential, subsurface tribal cultural resources during project construction.
5.D.6	The County shall require that discretionary development projects identify and protect from damage, destruction, and abuse, important historical, archaeological, paleontological, and cultural sites and their contributing environment. Such assessments shall be incorporated into a County-wide cultural resource database, to be maintained by the Division of Museums.	A Cultural and Paleontological Resources Assessment was prepared by Natural Investigations Company for the proposed project, which included recommendations for the treatment of historical, archaeological, and cultural resources. The results of the report are incorporated into Chapter 8, Cultural Resources, of this EIR. As discussed therein, impacts related to historic resources are addressed under Impact 8-1 and were determined to be less-than-significant. Impacts related to archaeological resources and human remains associated with the proposed project and off-site sewer lift station improvements area are addressed under Impacts 8-2 and 8-3, respectively, and were determined to be less-than-significant with implementation of Mitigation Measures 8-2(a), 8-2(b), and 8-3(a), which include avoidance and preservation measures should cultural, archaeological, or tribal cultural resources be inadvertently discovered during construction activities. Furthermore, as discussed in Chapter 10, Geology and Soils, of this EIR, impacts related to paleontological resources

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		were determined to be less-than-significant with implementation of Mitigation Measures 10-4(a) and 10-4(b), which require preparation of a WEAP, as well as avoidance and preservation measures should paleontological resources be inadvertently discovered during construction activities.
5.D.7	The County shall require that discretionary development projects are designed to avoid potential impacts to significant paleontological or cultural resources whenever possible. Unavoidable impacts, whenever possible, shall be reduced to a less than significant level and/or shall be mitigated by extracting maximum recoverable data. Determinations of impacts, significance, and mitigation shall be made by qualified archaeological (in consultation with recognized local Native American groups), historical, or paleontological consultants, depending on the type of resource in question.	See responses to PCGP Policies 5.D.2, 5.D.3, and 5.D.6.
Natural Resources		
6.A.1	The County shall require the provision of sensitive habitat buffers which shall, at a minimum, be measured as follows: 100 feet from the centerline of perennial streams, 50 feet from centerline of intermittent streams, and 50 feet from the edge of sensitive habitats to be protected, including riparian zones, wetlands, old growth woodlands, and the habitat of special status, threatened or endangered species (see discussion of sensitive habitat buffers in Part I of this Policy Document). Based on more detailed information supplied as a part of the review for a specific project or input from state or federal regulatory agency, the County may determine that such setbacks are not applicable in a particular instance or should be modified based on the new information provided. The County may, however, allow exceptions, such as in the following cases: 1. Reasonable use of the property would otherwise be denied; 2. The location is necessary to avoid or mitigate hazards to the public;	The project site is located within the PCCP area. Therefore, impacts to PCCP special habitats located within the project site are allowed within the County Aquatic Resources Program (CARP) Drainage Setbacks and Riparian Buffer, but those impacts must be associated with certain allowable facilities. Although the proposed project would result in permanent impacts within the CARP Drainage Setbacks and Riparian Buffer, all of the impacts in such areas are associated with a sewer line and trail creek crossing, water quality purposes, storm drainage outfalls, and roadway impacts that cannot be avoided. As some of the impacts are associated with a creek crossing and outfalls, some of the work occurs immediately adjacent to the drainage. Furthermore, Chapter 7 includes mitigation measures that require species-specific buffers for the avoidance of potential impacts to special-status species. Finally, the mitigation measures set forth in Chapter 7 require the proposed project to comply with all applicable PCCP Avoidance and Minimization Measures (AMMs) and payment of all applicable fees to address potential impacts to biological resources within the project site.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	3. The location is necessary for the repair of roads, bridges, trails, or similar infrastructure; or, 4. The location is necessary for the construction of new roads, bridges, trails, or similar infrastructure where the County determines there is no feasible alternative and the project has minimized environmental impacts through project design and infrastructure placement.	
6.A.2	The County shall require all development in the 100-year floodplain to comply with the provisions of the Placer County Flood Damage Prevention Ordinance.	As discussed in Chapter 12, Hydrology and Water Quality, of this EIR, all of the proposed project's open space area would be located along the Dry Creek tributary, and the placement of any structures within the 100-year floodplain would not occur. The proposed project would not include development of habitable structures within a flood hazard zone; as such, the proposed residential structures would not conflict with the Placer County Flood Damage Prevention Ordinance. See response to Policy 4.F.4 above regarding development within the 100-year floodplain.
6.A.3	The County shall require development projects proposing to encroach into a stream zone or stream setback to do one or more of the following, in descending order of desirability: a. Avoid the disturbance of riparian vegetation; b. Replace all functions of the existing riparian vegetation (on-site, in-kind); c. Restore another section of stream (in-kind); and/or d. Pay a mitigation fee for in-kind restoration elsewhere (e.g., mitigation banks).	See response to PCGP Policy 6.A.1.
6.A.4	Where stream protection is required or proposed, the County should require public and private development to: a. Preserve stream zones and stream setback areas through easements or dedications. Parcel lines (in the case of a subdivision) or easements (in the case of a subdivision or other development) shall be located to optimize resource protection. If a stream is proposed to be included within an open space parcel or easement, allowed uses and maintenance responsibilities within	See response to PCGP Policies 4.E.10 and 6.A.1.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	that parcel or easement should be clearly defined and conditioned prior to map or project approval; b. Designate such easement or dedication areas (as described in a. above) as open space; c. Protect stream zones and their habitat value by actions such as: 1) providing an adequate stream setback, 2) maintaining creek corridors in an essentially natural state, 3) employing stream restoration techniques where restoration is needed to achieve a natural stream zone, 4) utilizing riparian vegetation within stream zones, and where possible, within stream setback areas, 5) prohibiting the planting of invasive, non-native plants (such as Vinca major and eucalyptus) within stream zones or stream setbacks, and 6) avoiding tree removal within stream zones; d. Provide recreation and public access near streams consistent with other PCGP policies; e. Use design, construction, and maintenance techniques that ensure development near a creek will not cause or worsen natural hazards (such as erosion, sedimentation, flooding, or water pollution) and will include erosion and sediment control practices such as: 1) turbidity screens and other management practices, which shall be used as necessary to minimize siltation, sedimentation, and erosion, and shall be left in place until disturbed areas; and/or are stabilized with permanent vegetation that will prevent the transport of sediment off site; and 2) temporary vegetation sufficient to stabilize disturbed areas. f. Provide for long-term stream zone maintenance by providing a guaranteed financial commitment to the County which accounts for all anticipated maintenance activities.	
6.A.5	The County shall continue to require the use of feasible and practical best management practices (BMPs) to protect streams	BMPs to protect the on-site tributary of Dry Creek (i.e., Placer Creek) during construction and from urban pollutants will be required through

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	from the adverse effects of construction activities and urban runoff and to encourage the use of BMPs for agricultural activities.	Mitigation Measures 7-11(a) through 7-11(c), 7-12(a) through 7-12(h), 10-2(a) through 10-2(d) and 12-2(a) through 12-2(d).
6.A.6	The County shall require development projects to comply with the municipal and construction stormwater permit requirements of the Federal Clean Water Act National Pollutant Discharge Elimination System (NPDES) Phase I and II programs and the State General Municipal and Construction permits. Municipal requirements affecting project design and construction practices are enacted through the County's Stormwater Quality Ordinance. Separate construction permits may be required by and obtained through the State Water Resources Control Board.	See response to PCGP Policy 4.E.10.
6.A.7	All new development and redevelopment projects shall be designed so as to minimize the introduction of pollutants into stormwater runoff, to the maximum extent practicable, as well as minimize the amount of runoff through the incorporation of appropriate Best Management Practices.	See response to PCGP Policy 4.E.10.
6.A.8	The County shall support implementation of Low Impact Development site design and Watershed Process Management requirements for new and redevelopment projects in accordance with the NPDES Phase I and II programs, and applicable NPDES permits.	See response to PCGP Policy 4.E.10.
6.A.9	The County shall require that natural watercourses be integrated into new development in such a way that they are accessible to the public and provide a positive visual element.	The southern portion of the site is bisected by Placer Creek which flows east to west. The Placer Creek riparian corridor would separate the Phase 3 and 4 developments. Phase 4 would include the development of 46 single-family lots and the western extension of Vineyard Road, which would provide site access, along with trails and the seven-acre oak woodlands area along the Placer Creek riparian corridor, which would be preserved as open space by virtue of the underlying zoning and an open space easement to be recorded with the final map. Additional park areas would be provided in pockets along Placer Creek. Placer Creek Residential parks, trails and open space would be open to the public.
6.A.10	The County shall discourage grading activities during the rainy season, unless adequately mitigated, to avoid sedimentation of creeks and damage to riparian habitat.	Mitigation Measure 7-12(h) would require implementation of PCCP CARP Authorization Conditions, which requires that all work in aquatic resources within the Stream System be restricted to periods of low flow and dry

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		weather between April 15 and October 15, unless otherwise permitted by the Placer County Community Development Resource Agency and approved by the appropriate State and federal regulatory agency.
6.A.12	The County shall require that newly-created parcels include adequate space outside of watercourses' setback areas to ensure that property owners will not place improvements (e.g., pools, patios, and appurtenant structures), within areas that require protection.	See response to PCGP Policy 6.A.1.
6.B.1	The County shall support the "no net loss" policy for wetland areas regulated by the U.S. Army Corps of Engineers, the U.S. Fish and Wildlife Service, and the California Department of Fish and Wildlife. Coordination with these agencies at all levels of project review shall continue to ensure that appropriate mitigation measures and the concerns of these agencies are adequately addressed.	As discussed under Impact 7-12 in Chapter 7, Biological Resources, of this EIR, a total of 2.07 acres of aquatic resources have been mapped within the study area, 1.84 acres of which would be permanently impacted by the proposed project. The PCCP would result in the protection, enhancement, and management of vernal pool complexes as a specific wetland habitat type and in the protection, enhancement, and management of emergent marshes, seasonal wetlands, and lacustrine habitats (e.g., ponds), as well as riverine/riparian habitat, including streams. For covered projects under the PCCP, impacts to Section 404 jurisdictional waters are addressed under the CARP, which allows a streamlined Section 404 permitting process for covered activities under the PCCP that will result in impacts to aquatic resources subject to Section 404 jurisdiction. Mitigation Measure 7-11(c) requires the project applicant to apply for a Section 1600 Lake or Streambed Alteration Agreement from CDFW and to implement mitigation to result in no net loss of habitat. Mitigation Measures 7-12(a) through 7-12(f) and 7-12(i) require project compliance with PCCP conditions related to wetlands. More specifically, Mitigation Measure 7-12(b) requires payment of fees for non-vernal pool wetlands or their buffers affected by the proposed project. In addition, Mitigation Measure 7-12(c) requires construction of the proposed project to avoid disturbance of wetlands to the maximum extent possible. Mitigation Measure 7-12(d) would allow the Placer Conservation Authority (PCA) to salvage topsoil from on-site vernal pool wetland. Furthermore, Mitigation Measure 7-12(g) requires that, depending on the acreage of aquatic resources within the project area the USACE considers

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		jurisdiction when project permitting occurs, the project applicant shall either apply for coverage under the streamlined PCCP LOP process, or the applicant shall use the Western Placer County Habitat Conservation Plan/Natural Community Conservation Plan (HCP/NCCP) Programmatic General Permit 18 in compliance with the CARP7-12(h) require coverage under the streamlined PCCP Letter of Permission (LOP) process. Mitigation Measure 7-12(h) requires application to the RWQCB for water quality certification of the PCCP LOP or use of General Order R5-2020-0048, the Waste Discharge Requirements of the Clean Water Act Section 401 Water Quality Certification for the Western Placer County HCP/NCCP Programmatic General Permit, as applicable. Mitigation Measure 7-12(i) would require compliance with the PCCP CARP Authorization conditions.
6.B.2.	The County shall require new development to mitigate wetland loss in both federal jurisdictional and non-jurisdictional wetlands to achieve "no net loss" through any combination of the following, in descending order of desirability: (1) avoidance; (2) where avoidance is not possible, minimization of impacts on the resource; or (3) compensation, including use of a mitigation and conservation banking program that provides the opportunity to mitigate impacts to special status, threatened, and endangered species and/or the habitat which supports these species in wetland and riparian areas. Non-jurisdictional wetlands may include riparian areas that are not federal “waters of the United States” as defined by the Clean Water Act.	See response to PCGP Policy 6.B.1.
6.B.4	The County shall strive to identify and conserve remaining upland habitat areas adjacent to wetlands and riparian areas that are critical to the survival and nesting of wetland and riparian species.	See responses to PCGP Policies 6.A.1 and 6.B.1.
6.B.5	The County shall require development that may affect a wetland to employ avoidance, minimization, and/or compensatory mitigation techniques. In evaluating the level of compensation to be required with respect to any given project, (a) on-site mitigation shall be preferred to off-site, and in-kind mitigation shall be preferred to out-of-kind; (b) functional replacement ratios may vary to the extent necessary to incorporate a margin of	See response to PCGP Policy 6.B.1

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	safety reflecting the expected degree of success associated with the mitigation plan; and (c) acreage replacement ratios may vary depending on the relative functions and values of those wetlands being lost and those being supplied, including compensation for temporal losses. Consideration shall be given to out-of-kind compensatory mitigation for wetland impacts when larger landscape-level goals and objectives may be met by doing so. The County shall continue to implement and refine criteria for determining when an alteration to a wetland is considered a less-than significant impact under CEQA.	
6.C.1	The County shall identify and protect significant ecological resource areas and other unique wildlife habitats critical to protecting and sustaining wildlife populations. Significant ecological resource areas include the following: a. Wetland areas including vernal pools. b. Stream zones. c. Any habitat for special status, threatened, or endangered animals or plants. d. Critical deer winter ranges (winter and summer), migratory routes and fawning habitat. e. Large areas of non-fragmented natural habitat, including blue oak woodlands, valley foothill and montane riparian, valley oak woodlands, annual grasslands, and vernal pool/grassland complexes. f. Identifiable wildlife movement zones, including but not limited to, non-fragmented stream environment zones, avian mammalian migratory routes, and known concentration areas of waterfowl within the Pacific Flyway. g. Important spawning and rearing areas for anadromous fish. h. Habitat necessary to protect and recover populations of the Covered Species identified in the Placer County Conservation Program.	See responses to PCGP Policies 6.A.1 and 6.B.1. The BRA prepared for the proposed project by Madrone Ecological Consulting delineated the vegetation communities, PCCP land covers, and aquatic resources on-site. Development of the proposed project would result in potential impacts to approximately 1.2 acres of valley foothill riparian woodland (VFRW), whereas 2.6 acres of VFRW would be fully avoided. In order to reduce the project's potential impact on riparian habitat to a less-than-significant level, the proposed project would be required to comply with the provisions of CARP and California Fish and Game Code (CFGC) Section 1600, et seq, as well as implement Mitigation Measures 7-11(a) though 7-11(c).

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
6.C.2	The County shall require development in areas known to have particular value for wildlife to be carefully planned and, where possible, located so that the reasonable value of the habitat for wildlife is maintained.	See response to PCGP Policy 6.A.1 above.
6.C.6	The County shall support programs that preserve the habitats of threatened, endangered, and/or other special status species including the implementation of the Placer County Conservation Program. Where County acquisition and maintenance is not practicable or feasible, federal and state agencies, as well as other resource conservation organizations, shall be encouraged to acquire and manage endangered species' habitats.	The project site is located within the PCCP area. As such, the mitigation measures set forth in Chapter 7, Biological Resources, of this EIR require the proposed project to comply with all applicable PCCP Avoidance and Minimization Measures (AMMs) and pay all applicable fees to address potential impacts to biological resources within the project site.
6.C.7	The County shall support the maintenance of suitable habitats for all indigenous species of wildlife, without preference to game or non-game species, through maintenance of habitat diversity.	See responses to PCGP Policies 6.C.1 and 6.C.6 above.
6.C.9	The County shall require new private or public developments to preserve and enhance existing riparian habitat unless public safety concerns require removal of habitat for flood control or other essential public purposes (See Policy 6.A.1.). In cases where new private or public development results in modification or destruction of riparian habitat the developers shall be responsible for acquiring, restoring, and enhancing at least an equivalent amount of like habitat within or near the project area.	See response to PCGP Policy 6.A.1. Consistent with PCCP Community Condition 2.1, Mitigation Measure 7-6(f) requires the proposed project to not modify any area within a buffer that extends 50 feet outward from the outermost bounds of riparian vegetation. In addition, consistent with PCCP Community Condition 2.2, Mitigation Measure 7-6(c) requires the project applicant to pay special habitat fees proportional to the 2.83 acres of riparian habitat that would be permanently impacted by project buildout.
6.D.2	The County shall require developers to use native and compatible non-native species, especially drought-resistant species, to the extent possible in fulfilling landscaping requirements imposed as conditions of discretionary permits or for project mitigation.	The proposed project would be required to comply with all applicable standards established in the Placer County Landscape Design Guidelines, as well as the landscaping standards established by the DCWPCP. As discussed in Chapter 15, Public Services and Utilities, of this EIR, the proposed landscaping would be designed in compliance with the County's WELO, including the species planted on-site.
6.D.3	The County shall support the preservation of outstanding areas of natural vegetation, including, but not limited to, oak woodlands, riparian areas, vernal pools, and habitat necessary to protect and recover populations of the Covered Species identified in the Placer County Conservation Program.	As discussed under Impact 7-3, impacts related to vernal pool fairy shrimp and vernal pool tadpole shrimp, which are both PCCP Covered Species, would be less than significant with implementation of Mitigation Measures 7-3(a) and 7-3(b), which require implementation of PCCP General Condition 3 and Community Condition 1.1. Such conditions would require payment of land conversion and special habitat fees.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		As discussed under Impact 7-4, impacts related to valley elderberry longhorn beetle, a PCCP Covered Species, would be less than significant with implementation of Mitigation Measure 7-4, which requires avoidance and minimization measures. As discussed under Impact 7-6, impacts related to northwestern pond turtle, a PCCP Covered Species, would be less than significant with implementation of Mitigation Measures 7-6(a) through 7-6(g), which require preconstruction surveys and PCCP conditions related to land conversion, erosion control, avoidance of riparian vegetation, and avoiding the stream system. As discussed under Impacts 7-7, 7-8, and 7-8, impacts related to Swainson's hawk, burrowing owl, and tricolored blackbird, all PCCP Covered Species, would be less than significant with implementation of Mitigation Measures 7-7(a), 7-7(b), 7-8(a), 7-8(b), and 7-9(a) through 7-9(d). The mitigation measures require implementation of PCCP General Condition 3 and Species Conditions 1, 3, and 4. Such conditions would require payment of land conversion fees, preconstruction surveys, and monitoring and avoidance during construction activities. As discussed under Impact 7-11, impacts related to riparian habitat would be less than significant with implementation of Mitigation Measures 7-11(a) through 7-11(d), which require payment of applicable PCCP fees, compliance with the provisions of the CARP, and a Section 1600 Lake or Streambed Alteration Agreement from CDFW. In addition, with respect to vernal pools specifically, as discussed under Impact 7-12, impacts related to aquatic resources would be less than significant. PCCP Community Condition 1.1 would require payment of special habitat fees for unavoidable effects to vernal pools and their buffers.
6.D.8	The County shall require that new development preserve natural woodlands to the maximum extent possible.	Development of the proposed project would result in potential impacts to approximately 1.3 acres of VFRW, whereas 2.5 acres of VFRW would be fully avoided. In order to reduce the project's potential impact on riparian habitat to a less-than-significant level, the proposed project would be required to comply with the provisions of CARP and California Fish and

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		Game Code (CFGC) Section 1600, et seq, as well as implement Mitigation Measures 7-11(a) though 7-11(c). These impacts are balanced against the need for housing and a backdrop that the majority of the site has a RS-AG-B-40 PD=1 zoning designation. As previously discussed, the purpose of the -PD combining district is to identify areas where development can occur within the context of a planned development. The -PD zoning designation is a planning tool to ensure that development occurs in a logical, organized pattern, which increases the ability for public services and infrastructure to be provided to new development with the greatest efficiency possible.
6.E.1	The County shall support the preservation and enhancement of natural land forms, natural vegetation, and natural resources as open space to the maximum extent feasible. The County shall permanently protect, as open space, areas of natural resource value, including wetlands, riparian corridors, unfragmented woodlands, and floodplains.	See responses to PCGP Policies 6.A.1 and 6.C.9.
6.E.3	The County shall support the maintenance of open space and natural areas that are interconnected and of sufficient size to protect biodiversity sustain viable populations, accommodate wildlife movement, and sustain ecosystems	As discussed under Impact 7-13 in Chapter 7, Biological Resources, of this EIR, the proposed project would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. In addition, the proposed project would be required to comply with PCCP Community Condition 2, which requires a 50-foot buffer be established between construction activities and the outermost bounds of riparian vegetation, thus further ensuring that interconnected wildlife corridors would be preserved.
6.F.2	The County shall develop mitigation measures to minimize stationary source and area source emissions.	See response to PCGP Policy 6.F.6 below.
6.F.5	The County shall encourage project proponents to consult early in the planning process with the County regarding the applicability of Countywide indirect and areawide source programs and transportation control measures (TCM) programs. Project review shall also address energy-efficient building and site designs and proper storage, use, and disposal of hazardous materials.	See response to PCGP Policies 3.A.11 and 8.F.1. In addition, as discussed in Chapter 9, Energy, of this EIR, the proposed project is required to comply with all applicable standards and regulations regarding energy conservation and fuel efficiency, including the CBSC and CARB standards, which would ensure that the future uses would be designed to be energy efficient to the maximum extent practicable. Adherence to the most recent CALGreen Code and the Building Energy Efficiency Standards would

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		ensure that the proposed development would consume energy efficiently through the incorporation of such features as efficient water heating systems, high performance attics and walls, and high efficacy lighting. In addition, the 2022 CBSC requires that newly constructed residential buildings be developed to include a solar photovoltaic system.
6.F.6.	The County shall require project-level environmental review to include identification of potential air quality impacts and designation of design and other appropriate mitigation measures or offset fees to reduce impacts. The County shall dedicate staff to work with project proponents and other agencies in identifying, ensuring the implementation of, and monitoring the success of mitigation measures.	An analysis of environmental air quality impacts is provided in Chapter 6, Air Quality and Greenhouse Gas Emissions, of this EIR. As presented in Table 6-8 of Chapter 6, the project's total maximum daily construction-related emissions would be below the applicable PCAPCD thresholds of significance for reactive organic gases (ROG), oxides of nitrogen (NO_X), and particulate matter 10 micrometers in diameter or smaller (PM_{10}). As presented in Table 6-11 of Chapter 6, the maximum unmitigated operational emissions associated with the proposed project would be below the PCAPCD thresholds of significance for ROG, NO_X, and PM_{10}. As such, the proposed project would result in a less-than-significant impact associated with criteria pollutant emissions during construction and operations. All other impacts related to air quality, including impacts associated with localized carbon monoxide (CO), toxic air contaminants (TACs), and odors, were also determined to be less than significant. Therefore, the proposed project would not require any mitigation measures to reduce impacts associated with air quality.
6.F.7	The County shall encourage development to be located and designed to minimize direct and indirect air pollutants.	See response to PCGP Policy 6.F.6.
6.F.9	In reviewing project applications, the County shall consider alternatives or amendments that reduce emissions of air pollutants.	As discussed in Chapter 21, Alternatives Analysis, of this EIR, reasonable alternatives to the project must be capable of reducing the magnitude of, or avoiding, identified significant environmental impacts of the proposed project. This EIR determined that the proposed project would result in less-than-significant impacts for all issues related to air quality and greenhouse gas (GHG) emissions, including cumulative impacts. Because the proposed project would not result in significant impacts related to air quality and GHG emissions, a comparison of potential impacts associated with such as a result of project alternatives versus the proposed project is not warranted, and, thus, is not provided in this EIR. Rather, the Alternatives Analysis chapter focuses on the resource areas and specific impacts listed therein that have been identified for the proposed project as requiring

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		mitigation to reduce significant impacts to less than significant, or have been found to remain significant and unavoidable. Nevertheless, impacts related to air quality and GHG emissions would be reduced under the Alternatives evaluated in this EIR because development under the Alternatives would result in fewer residential units.
6.F.10	The County may require new development projects to submit an air quality analysis for review and approval. Based on this analysis, the County shall require appropriate mitigation measures consistent with the PCAPCD's 1991 Air Quality Attainment Plan (or updated edition).	See response to PCGP Policy 6.F.6.
6.G.3	The County shall encourage the use of alternative modes of transportation by incorporating public transit, bicycle, and pedestrian modes in County transportation planning and by requiring new development to provide adequate pedestrian and bikeway facilities.	See response to PCGP Policy 3.D.8.
6.G.5	The County shall endeavor to secure adequate funding for transit services so that transit is a viable transportation alternative. New development shall pay its fair share of the cost of transit equipment and facilities required to serve new projects.	As discussed within Chapter 16, Transportation, of this EIR, the Placer County Board of Supervisors adopted the Countywide Traffic Impact Fee Program, which requires new development within the County to reduce impacts on the roadway system by paying traffic impact fees. Additionally, the County's Capital Improvement Program (CIP) and City-County Traffic Fee ensure adequate funding for roadway improvements and transit services. Payment of such applicable fees would be required for the proposed project.
Health and Safety		
8.A.1.1	The County shall require the preparation of a soils engineering and geologic-seismic analysis prior to permitting development in areas prone to geological or seismic hazards (e.g., ground shaking, landslides, liquefaction, critically expansive soils, avalanche), prepared by a California registered civil engineer and based upon adequate test borings as needed.	A Geotechnical Due Diligence Review was prepared for the proposed project by ENGEO on December 26, 2023. The Geotechnical Due Diligence Review included review of data from 12 soil borings and seven bulk soil samples conducted previously for the project site. As discussed under Impact 10-3 in Chapter 10, Geology and Soils, of this EIR, development of the proposed project and off-site sewer lift station improvements area would not likely be subject to issues associated with lateral spreading, subsidence, liquefaction, or collapse, and the proposed project would not exacerbate the geological condition associated with such phenomena. However, expansive and loose soils were identified within the project site. As such, Mitigation Measures 10-3(a) and 10-3(b) require

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		preparation of a final geotechnical engineering report and compliance with all engineering recommendations related to expansive soils.
8.A.1.2	The County shall require submission of a preliminary soils report, prepared by a California registered civil engineer and based upon adequate test borings, for every major subdivision and for each individual lot where critically expansive soils have been identified or are expected to exist.	See response to PCGP Policy 8.A.1.1.
8.A.1.5	The County shall require that the location, design, and construction of any new buildings, facilities, or other development in areas subject to seismic activity minimize exposure to danger from earthquake-induced liquefaction or fault rupture or creep.	As discussed under Impact 10-1 in Chapter 10, Geology and Soils, of this EIR, while lower-intensity earthquakes could potentially occur throughout the development areas, the design of project structures would be required to adhere to the provisions of the 2022 CBSC. The 2022 CBSC contains provisions to safeguard against major structural failures or loss of life caused by earthquakes or other geologic hazards. Thus, the potential for seismically induced damage due to liquefaction, surface ruptures, and settlement at the project site and off-site sewer lift station improvements area is considered low.
8.A.1.6	In areas subject to severe ground shaking, the County shall require that new structures intended for human occupancy be designed and constructed to minimize risk to the safety of occupants.	The western portion of the County, in which the proposed project and off-site sewer lift station improvements area are located, is generally characterized by low seismicity, and is not in an area at risk for severe ground shaking associated with earthquakes. See response to PCGP Policy 8.A.1.5.
8.B.1.1	The County shall require flood proofing of new and substantially improved structures in areas subject to flooding to be built in accordance with the Flood Damage Prevention Ordinance (Placer County Code Chapter 15, Article 15.52).	See response to PCGP Policy 6.A.2. The proposed project would not include new and substantially improved structures in areas subject to flooding.
8.B.1.2	The County shall prohibit the construction of projects, including public facilities and other facilities essential for emergencies and large public assembly, within the County's Regulatory Floodway, unless the structure and access to the structure is adequately protected from flood hazards, incorporates all required flood protection specific to that area in accordance with County ordinances and guidelines, and will not result in any significant adverse impacts.	The proposed project would not place housing within the future, fully-developed, unmitigated 100-year floodplain. In addition, public facilities and other facilities essential for emergencies and large public assembly are not proposed as part of the project.
8.B.1.3	The County shall require evaluation of potential flood hazards prior to approval of a discretionary or ministerial permit that	As discussed under Impact 12-5 in Chapter 12, Hydrology and Water Quality, of this EIR, the majority of the project site is within FEMA zone X,

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	would result in the construction or modification of structures, to determine whether the proposed project is consistent with the protection standards for the County Regulatory Floodplain. The County will not approve any discretionary project or any ministerial permit that would result in the construction or modification of structures for any property within the County Regulatory Floodplain, unless the required flood protection specific to that area has been demonstrated in accordance with County ordinances and guidelines.	which is outside of a floodplain. However, a portion of the project site is within a FEMA mapped AE floodplain zone. The FEMA AE zone is defined as being areas subject to inundation by the one percent annual chance flood event, and FEMA provides base flood elevations for such areas. The proposed project would not place housing within the future, fully developed, unmitigated 100-year floodplain. However, limited fill would be placed within the floodplain fringes during project development, generally associated with the proposed pedestrian bridge over Placer Creek, as well as the proposed changes in hydrology. Thus, a CLOMR would be required prior to Improvement Plan approval to ensure the project's compliance with existing regulations and to update the floodplain information to reflect the proposed conditions. In addition, see response to PCGP Policies 4.E.11 and 6.A.2.
8.B.1.6	The County shall ensure new development projects incorporate design strategies and features to reduce the area of impervious surfaces.	Although the proposed project would result in an increase in on-site impervious surfaces, the proposed project would include pervious surfaces throughout the site, such as landscaping throughout the project site and on the project frontage on the south side of Baseline Road. A 2.1-acre neighborhood park would be included in the Placer Creek Residential Phase 2 development, which would include landscaping throughout, and approximately 9.9 acres of open space, bisected by Placer Creek, would be maintained as part of the proposed project.
8.B.2.1	The County shall promote flood-control measures that maintain natural conditions within the County's Regulatory Floodplain of rivers and streams.	See responses to PCGP Policy 6.A.1.
8.B.2.2	The County shall implement the adaptation strategies as contained in the Placer County Sustainability Plan necessary to ensure that natural systems and flood control infrastructure can handle floodwater year-round.	See response to PCGP Policy 4.E.11 above.
8.C.1.1	The County shall require that new development meet State, County, and local fire district standards for fire protection, including the California Building Standards Code, the International Wildland-Urban Interface Code, and the Placer County Municipal Code as applicable.	See response to PCGP Policy 4.I.9.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
8.C.1.2	The County shall refer applicants of development projects in the unincorporated county to the appropriate local fire agencies for review for compliance with fire safety standards. If dual responsibility exists, then both agencies shall review and comment relative to their area of responsibility. If standards are different or conflicting, the more stringent standards shall be applied. All development in high fire hazard areas shall be designed and constructed to minimize the risk from fire hazards.	See response to PCGP Policy 4.I.9.
8.C.1.6	The County shall continue to implement State fire safety standards through enforcement of the applicable standards contained in the Placer County Land Development Manual.	See response to PCGP Policy 4.I.9 above. The proposed project would be subject to the applicable standards contained in the Placer County Land Development Manual.
Noise		
9.A.1	New development of noise-sensitive uses shall not be permitted where the noise level due to non-transportation noise sources will exceed the noise level standards of Table 9-1 as measured immediately within the property line of the new development, unless effective noise mitigation measures have been incorporated into the development design to achieve the standards specified in Table 9-1.	As discussed in Chapter 3, Project Description, of this EIR, surrounding existing land uses for the project site include the under-construction Baseline Marketplace to the north, across Baseline Road; single-family residences associated with the Sun Valley Oaks residential neighborhood and Dry Creek tributaries to the east; single-family residences associated with the Morgan Creek residential neighborhood to the south; and the under-construction Property 1A of the PVSP, which will include 1,285 residential units, to the west, across Walerga Road. Therefore, the proposed project would not be anticipated to be subject to noise levels due to non-transportation noise sources exceeding the 50 L_{dn} noise level standards for residential uses included in Table 9-1 of the PCGP.
9.A.2	Noise created by new proposed non-transportation noise sources shall be mitigated so as not to exceed the noise level standards of Table 9-1 as measured immediately within the property line of lands designated for noise-sensitive uses: provided, however, the noise created by occasional events occurring within a stadium on land zoned for university purposes may temporarily exceed these standards as provided in an approved Specific Plan.	As demonstrated in Chapter 14, Noise, of this EIR, the proposed project would not result in the generation of a substantial permanent increase in ambient noise at existing residences located within the immediate project vicinity or along project area roadways.
9.A.5	Where proposed non-residential land uses are likely to produce noise levels exceeding the performance standards of Table 9-1 at existing or planned noise-sensitive uses, the County shall require submission of an acoustical analysis as part of the	Chapter 14, Noise, of the Draft EIR is primarily based on the Noise Technical Report (Noise Report) prepared for the proposed project by RCH Group Planning and Environmental Consulting (RCH) (see Appendix H of this EIR). The Noise Report included an acoustical analysis for anticipated

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	environmental review process so that noise mitigation may be included in the project design.	noise sources that could impact sensitive receptors in the project site vicinity. Regarding the potential noise impacts of non-residential land uses such as the proposed pickleball courts, the estimated noise levels generated by the two pickleball counts included as part of the Phase 2 outdoor recreation facilities would be well below the County's daytime outdoor noise level threshold of 70 dB L_{max}.
9.A.6	The feasibility of proposed projects with respect to existing and future transportation noise levels shall be evaluated by comparison to Table 9-3.	The Noise Report prepared for the proposed project determined that the increase in traffic noise levels at existing sensitive receptors due to the proposed project would be considered less than significant. In addition, while not a CEQA concern, the County shall condition the project to construct noise barriers to reduce the existing and future transportation noise levels at the proposed residential areas in closest proximity to Baseline Road and Walerga Road.
9.A.8	New development of noise-sensitive land uses shall not be permitted in areas exposed to existing or projected levels of noise from transportation noise sources, including airports, which exceed the levels specified in Table 9-3, unless the project design includes effective mitigation measures to reduce noise in outdoor activity areas and interior spaces to the levels specified in Table 9-3.	See response to PCGP Policy 9.A.6. In addition, as discussed in Chapter 19, Effects Not Found to be Significant, of this EIR, the proposed project is not located within the vicinity of a private airstrip or an airport land use plan or within two miles of a public airport or public use, and as such would not be exposed to excessive noise levels from such transportation sources.
9.A.9	Noise created by new transportation noise sources, including roadway improvement projects, shall be mitigated so as not to exceed the levels specified in Table 9-3 or the performance standards in Table 9-3 at outdoor activity areas or interior spaces of existing noise sensitive land uses.	See responses to PCGP Policies 9.A.6 and 9.A.8.
9.A.12	Where noise mitigation measures are required to achieve the standards of Tables 9-1 and 9-3, the emphasis of such measure shall be placed upon site planning and project design. The use of noise barriers shall be considered as a means of achieving the noise standards only after all other practical design-related noise mitigation measures have been integrated into the project.	See response to PCGP Policies 9.A.2 and 9.A.6 above.
Placer County Housing Element 2021-2029		
New Residential Construction		
HE-A-5	**Infill Development.** The County shall promote and maintain balanced growth by encouraging compatible residential	The proposed project would involve construction of 432 residential units, which includes 212 single-family units and 220 multi-family units, as well

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	development on infill sites within established communities where urban services are in place.	as the potential 22 on-site ADUs. The project site is surrounded by existing and planned development, including the under-construction Baseline Marketplace to the north, across Baseline Road; single-family residences associated with the Sun Valley Oaks residential neighborhood and Dry Creek tributaries to the east; single-family residences associated with the Morgan Creek residential neighborhood to the south; and the under-construction Property 1A of the PVSP, which will include 1,285 residential units, to the west, across Walerga Road. The proposed project's residential uses would be compatible with the existing residential development within the project area. Furthermore, the proposed project is located within an established community where urban services are in place. The proposed project would require annexation into the Placer County Service Area 28, Zone 173, for sanitary sewer service, subject to approval by the County Board of Supervisors. The proposed project would also require annexation into the Placer County Service Area 28, Zone 169, for ongoing maintenance and the generation of funds for public parks, trails, and open space recreation amenities within the Dry Creek community, and annexation into the Dry Creek Fire Zone of Benefit (County Service Area 28, Zone of Benefit 165) for provision of fire protection services, subject to Placer County approval.
Affordable Housing		
HE-B-13	**Affordable Housing Requirement for New Development.** The County shall require all new discretionary residential development projects to provide for at least 10 percent of the total approved units to accommodate housing needs that are affordable to very-low-, low-, and moderate-income households.	One option the project is considering to satisfy the project's affordable housing requirements is by transferring in fee title to the County an off-site vacant parcel under Homes by Towne ownership, within the RVSP. If this option is chosen, the project applicant would seek an amendment to the RVSP and a rezone of the proposed off-site affordable housing parcel to the RM30 zone, which can result in a maximum development potential of 120 affordable income-restricted units. This EIR also evaluates an alternative means by which the proposed project can meet the County's affordable housing regulations. According to Policy HE-C-3, included in the Housing Element of the County's PCGP, ADUs of less than 750 sf are considered to be affordable by design and eligible to satisfy low-income housing requirements in specific plans and new developments. The County's regulations require a minimum of 10 percent of the units within the proposed project be affordable housing; thus, the proposed project

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
		could provide a minimum of 22 ADUs on lots with single-family residential units.
	Innovative Housing Types	
HE-C-3	**Accessory Dwelling Units Affordable by Design.** The County shall consider ADUs of less than 750 square feet to be affordable by design and eligible to satisfy low-income housing requirements in specific plans and new developments alike.	See response to Housing Element Policy HE-B-13.
	DCWPCP	
	Community Development: Population and Housing	
1	Encourage residential development in areas which provide an adequate and accessible transportation network and which reduce commuting distances to areas of employment.	As discussed in Chapter 16, Transportation, of this EIR, according to the results of the Placer County VMT Estimation Tool, the VMT per capita for the proposed project would be 18.98 VMT per capita, which is below the 25.86 VMT per capita threshold for Western Placer County. The comparatively low VMT for the proposed project would occur because the project site is located closer to major employment/retail centers in the Sacramento and South Placer County areas, as compared to most of unincorporated Placer County.
3	Encourage the use of passive and direct solar collection and incorporate home design innovations which limit energy consumption.	As discussed in Chapter 9, Energy, of this EIR, the proposed project would comply with the provisions of the CBSC, which would require all new residential structures to include on-site solar systems, reducing building energy demand.
	Community Development: Land Use Plan	
8	Residential areas should be located where a full range of services and facilities can be provided most efficiently and economically.	The project site is located in the vicinity of existing development in the City of Roseville and unincorporated Placer County, and as a result, existing water and sewer infrastructure exists in surrounding roadways. In addition, the proposed project would include upgrades to the existing Community Facilities District #1 Sewer Lift Station. The proposed project would not increase population such that governmental services and/or facilities, such as fire protection services, law enforcement, schools, recreational facilities, and public facilities would require new or altered facilities. Thus, the project would not result in the inefficient extension of utility infrastructure or public services. Additional information related to the provision of utilities and public services is provided in Chapter 15, Public Services and Utilities, of this EIR.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
27	Promote energy and resource conservation in any future land development project especially through consideration of alternative energy sources (i.e. passive solar collection) or state of the art energy and water conservation measures.	See response to DCWPCP Policy 3 (Community Development: Population and Housing).
28	Continue to monitor and control existing land uses that could deteriorate air and water quality.	See responses to PCGP Policies 4.E.10 and 6.F.3.
29	Review proposed developments for their potential adverse effect on air and water quality.	See responses to PCGP Policies 4.E.10 and 6.F.3.
30	Encourage application of measures to mitigate erosion and water pollution from earth disturbing activities such as grading and road construction.	See responses to PCGP Policies 1.K.4 and 4.E.10.
43	To allow for continued increased commercial and residential development only where all public services can be provided in an adequate and timely manner.	See response to DCWPCP Policy 4 (Community Development: Land Use Plan).
44	The rate of development and location of projects shall not exceed the capacity of the community, special districts and utility companies to provide all needed services and facilities in an orderly and economic manner.	See response to DCWPCP Policy 4 (Community Development: Land Use Plan).
Community Development: Community Design		
1	Wherever possible, natural features should be retained as buffers between different, potentially incompatible uses. Where natural features are not available, landscaped buffer yards shall be provided to minimize the adverse effects of higher intensity uses upon lower intensity uses.	See response to PCGP Policy 1.B.5.
3	Preservation of natural features, noise exposure, road access, and relationship to the surrounding properties shall be considered in preparing subdivision designs. Subdivision density, or total number of lots, will ultimately be determined by these factors. The development of the maximum number of lots permitted by the zoning will not be possible in most cases due to these and other design considerations required by this Plan.	See response to PCGP Policy 1.B.5.
14	Where possible preserve native trees and support the use of native drought tolerant plant materials in all revegetation/landscaping projects.	See responses to PCGP Policies 6.D.2 and 6.D.4.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
15	In place of sound wall construction, require, wherever possible, the use of greater setbacks to provide a scenic corridor for all parcels fronting on all the major circulation routes (2, 4, or 6 lanes of traffic). Long expanses of sound walls are not consistent with the desired character of the Plan area and the use of open space setbacks and landscaping instead, will be a major difference between this area and surrounding areas to the north and south.	See response to PCGP Policy 1.B.5. The County shall condition the project to construct noise barriers, including a six-foot-tall sound wall between the northern lots of Phase 1 and Baseline Road; 12-foot-tall sound wall between the southern lots of Phase 2 and Walerga Road; and a nine-foot-tall sound wall between the northern lots of Phase 3 and Walerga Road. The noise barriers could take the form of masonry wall, earthen berm, or a combination of the two.
18	Utility lines shall be installed underground to ensure minimum disruption to the environment and as little disturbance as possible to vegetation, particularly in scenic corridors.	See response to PCGP Policy 1.K.5.
Environmental Resources Management: Natural Resources		
12	Conservation of the natural landscape, including minimizing disturbance to natural terrain and vegetation, shall be an overriding consideration in the design of any subdivision or land development project, paying particular attention to the protection and preservation of existing vegetation.	See responses to PCGP Policies 1.B.10, 6.A.9, 6.B.1, 6.C.1, and 6.D.4.
14	No construction activities shall occur within the Dry Creek floodplain and only limited alteration of its tributaries shall be permitted except as part of the development of the floodplain as a recreational area, or for stream enhancement, or where work is done in accordance with the Placer County Flood Damage Prevention Ordinance, Department of Fish and Game Regulations, and Clean Water Act Provisions administered by the U.S. Army Corps of Engineers.	See responses to PCGP Policies 4.E.11 and 6.B.1.
19	Support the “no net loss” policy for wetland areas administered by the U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service and the State Department of Fish and Game. Continue to coordinate with these agencies at all levels of project review to ensure that their concerns are adequately addressed.	See response to PCGP Policy 6.B.1.
25	Intermittent streams often become permanent streams concurrent with the development of an area. Therefore, these waterways shall be protected from land development activities which have a potential for detrimental impacts (e.g., grading, channelization, etc.).	See response to PCGP Policy 6.A.1.

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
Environmental Resources Management: Open Space		
5	Protect natural areas along creeks and canals through the use of non-development setback with setback distances varying according to the significance of the area to be protected.	See response to PCGP Policy 6.A.1.
11	Open spaces should be linked visually and physically to form a system of open spaces. Where appropriate, trails shall connect open space areas. Dedication of easements shall be encouraged and in many cases required as lands are developed and built.	See responses to PCGP Policies 3.C.1 and 5.A.1.
12	Development on private lands should be planned and designed to provide for preservation of open space.	See response to PCGP Policy 1.B.10.
17	Stream corridors shall be left in an open, natural condition, except for structures or uses which are compatible with stream corridors.	See response to PCGP Policy 6.A.1.
18	In the design and development of new subdivisions the following types of areas and features shall be preserved as open spaces to the maximum extent feasible: high hazard areas, scenic and trail corridors, streams, streamside vegetation, other significant stands of beneficial native vegetation, and any areas of special ecological significance.	See responses to PCGP Policies 6.A.1 and 6.C.9.
21	Where impacts to stream environment zones or wetland are unavoidable, project specific mitigation shall include the identification and quantification of vegetation impacted, the preparation or revegetation plans to assure no net loss of riparian or wetland acreage or values, and the specific monitoring of pans to assure compliance and satisfactory results.	See responses to PCGP Policies 6.A.1 and 6.C.9.
Transportation and Circulation		
6	The rights-of-way for roads shall be wide enough to accommodate roadways, trails, bikeways, drainage, public utilities, landscaping/vegetation, and suitable separation between facilities. Minimum right-of-way widths are shown in the following table for roadways within the Community Plan area. The County may modify these right-of-way standards at their discretion, and may elect to exclude landscaped areas, sidewalks, utilities, and other roadway appurtenances from the	See responses to PCGP Policies 3.C.1 and 3.D.8..

Table 13-7
PCGP and DCWPCP Policy Discussion

Policy		Project Consistency
	defined public right-of-way.	
13	Community Plan area roadways shall be designed and maintained to encourage safe, alternative forms of transportation that contribute to a rural atmosphere (such as walking, biking, horseback riding, etc.). Roadways which provide access to the linear "parkway" along Dry Creek and residential areas shall be designed to discourage through traffic. Alignment, width, signage, etc., shall all be appropriate for a minor residential street rather than a major arterial.	See response to PCGP Policy 3.D.8.
14	As development of the Community Plan area occurs, public dedication of rights-of-way shall be required for the roads, trails, and bikeways identified in this Community Plan. Construction of such roads, trails, and bikeways shall be required as conditions of approval placed on land development project approvals.	See response to PCGP Policy 3.C.1.
18	Land development projects shall be designed to minimize the number of access points onto major roadways.	The most major roadways in the project area are Baseline Road and Walerga Road. The project site would add one entrance along Baseline Road to the Phase 1 area, and two along Walerga Road to the Phase 2 and Phase 3 areas. One existing access onto Walerga Road from the project site is provided by Springhill Drive.
19	Adequate safety precautions shall be provided at major intersections. Such precautions may include crossing guards, signalization, and other measures to improve the safety for pedestrians and reduce the risk of accidents.	See responses to PCGP Policies 3.A.1 and 3.D.8.

14. Noise

14. NOISE

14.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County for an approximately four-acre parcel off-site within the Riolo Vineyards Specific Plan (RVSP), which could develop a maximum of 120 affordable income-restricted units.

The Noise chapter of the EIR describes the existing noise environment in the project vicinity and identifies potential impacts and mitigation measures related to noise and vibration associated with construction and operation of the proposed project, including the off-site sewer lift station improvements area and potential future development of the off-site affordable housing parcel. The method by which the potential impacts are analyzed is discussed, followed by the identification of potential impacts and the recommended mitigation measures designed to reduce significant noise and vibration impacts to less-than-significant levels, if required. The Noise chapter is primarily based on the Noise Technical Report (Noise Report) prepared for the proposed project by RCH Group Planning and Environmental Consulting (RCH) (see Appendix H of this EIR).[1] Other sources of information used in this chapter include the Placer County General Plan (PCGP),[2] PCGP EIR,[3] the RVSP EIR,[4] and the Dry Creek-West Placer Community Plan (DCWPCP).[5]

14.2 EXISTING ENVIRONMENTAL SETTING

The Existing Environmental Setting section provides background information on noise and vibration, a discussion of acoustical terminology and the effects of noise on people, existing sensitive receptors in the project vicinity, existing sources and noise levels in the project vicinity, and groundborne vibration.

Fundamentals of Noise

Sound is mechanical energy transmitted by pressure waves through a medium, such as air. Sound pressure level has become the most common descriptor used to characterize the "loudness" of an ambient sound level. Sound pressure level is measured in decibels (dB), with zero dB corresponding roughly to the threshold of human hearing, and 120 to 140 dB corresponding to the threshold of pain. Decibels are measured using different scales, and the A-weighting of sound levels best reflects the human ear's reduced sensitivity to low frequencies and correlates well with human perceptions of the annoying aspects of noise. The use of A-weighted

4 Placer County. *Riolo Vineyard Specific Plan Environmental Impact Report*. January 2008.
5 Placer County. *Dry Creek-West Placer Community Plan.* Amended May 12, 2009.

sound level, expressed as dBA, has become the standard tool of environmental noise assessments. Noise levels associated with common noise sources are provided in Table 14-1.

Table 14-1
Typical Noise Levels

Noise Level (dB)	Outdoor Activity	Indoor Activity
90+	Gas lawn mower at three feet, jet flyover at 1,000 feet	Rock band
80-90	Diesel truck at 50 feet	Loud television at three feet
70-80	Gas lawn mower at 100 feet, noisy urban area	Garbage disposal at three feet, vacuum cleaner at 10 feet
60-70	Commercial area	–
40-60	Quiet urban daytime, traffic at 300 feet	Large business office, dishwasher in next room
20-40	Quiet rural, suburban nighttime	Concert hall in background, library, bedroom at night
10-20	–	Broadcast/recording studio
0	Lowest threshold of human hearing	Lowest threshold of human hearing

Source: RCH, October 2025.

Several time-averaged scales represent noise environments and consequences of human activities. The most commonly used noise descriptors are the average, or equivalent, A-weighted sound level over a given time period (L_{eq}); the average day-night 24-hour sound level (L_{dn}) with an increase of 10 dB to account for increased sensitivity to noise during the nighttime hours as compared to daytime hours (10:00 PM to 7:00 AM); and community noise equivalent level (CNEL), a weighted average noise level over 24 hours. Finally, the highest root-mean-square (RMS) sound level measured over a given period of time is expressed as L_{max}. With regard to increases in A-weighted noise level, the following relationships occur:

- Under controlled conditions in an acoustics laboratory, the trained healthy human ear is able to discern changes in sound levels of 1.0 dB;
- Outside of such controlled conditions, the trained ear can detect changes of 2.0 dB in normal environmental noise;
- It is widely accepted that the average healthy ear, however, can barely perceive noise level changes of 3.0 dB;
- A change in level of 5.0 dB is a readily perceptible increase in noise level; and
- A 10-dB change is recognized as twice as loud as the original source.

Stationary sources of noise, including construction equipment, attenuate at a rate of six to 7.5 dB per doubling of distance from the source depending on ground absorption. Physical barriers located between a noise source and the noise receptor, such as berms or sound walls, increase the efficacy of noise attenuation that occurs by distance alone. According to the Noise Report, noise from large construction sites would have characteristics of both “point” and “line” sources, so attenuation would likely range between 4.5 and 7.5 dB per doubling of distance.

Existing Sensitive Receptors

Noise-sensitive land uses are generally defined as locations where people reside or where the presence of unwanted sound could adversely affect the primary intended use of the land. Places where people live, sleep, recreate, worship, and study are generally considered to be sensitive to noise, because intrusive noise can be disruptive to such activities. Sensitivity to ambient noise

levels is also related to the amount of noise exposure (in terms of both exposure time and shielding from noise sources). Noise-sensitive land uses typically include residences, schools, child care centers, hospitals, long-term health care facilities, convalescent centers, retirement homes, and recreation areas.

The nearest sensitive land uses to the project site are the single-family residences to the east, west, and south. The nearest of the surrounding single-family residences would be located directly east of the proposed Phase 2 lots (along Wellbrook Place and Bridgestone Crescent Road) and directly south of the proposed Phase 4 lots (along French Creek Court, Eagle Creek Court, Marsh Creek Court, and Rockporte Court).

Existing Ambient Noise Environment

The existing ambient noise environment at the project site is defined primarily by noise from traffic on Baseline Road along the northern project site boundary and Walerga Road, which bisects the site from the southwest to the northeast.

In order to quantify existing ambient noise levels within the project site vicinity, RCH conducted three long-term (72-hour) and four short-term (10-minute) noise level measurements at three locations from June 24 to June 27, 2024. The equipment and approach used to evaluate existing noise levels are discussed in the Method of Analysis section of this chapter. The noise survey locations are shown on Figure 14-1. The results of the ambient noise survey are summarized in Table 14-2. As shown in the table, 24-hour noise levels at the project site ranged from 67 to 74 dB CNEL. The main source of noise was traffic noise from Baseline Road and Walerga Road.

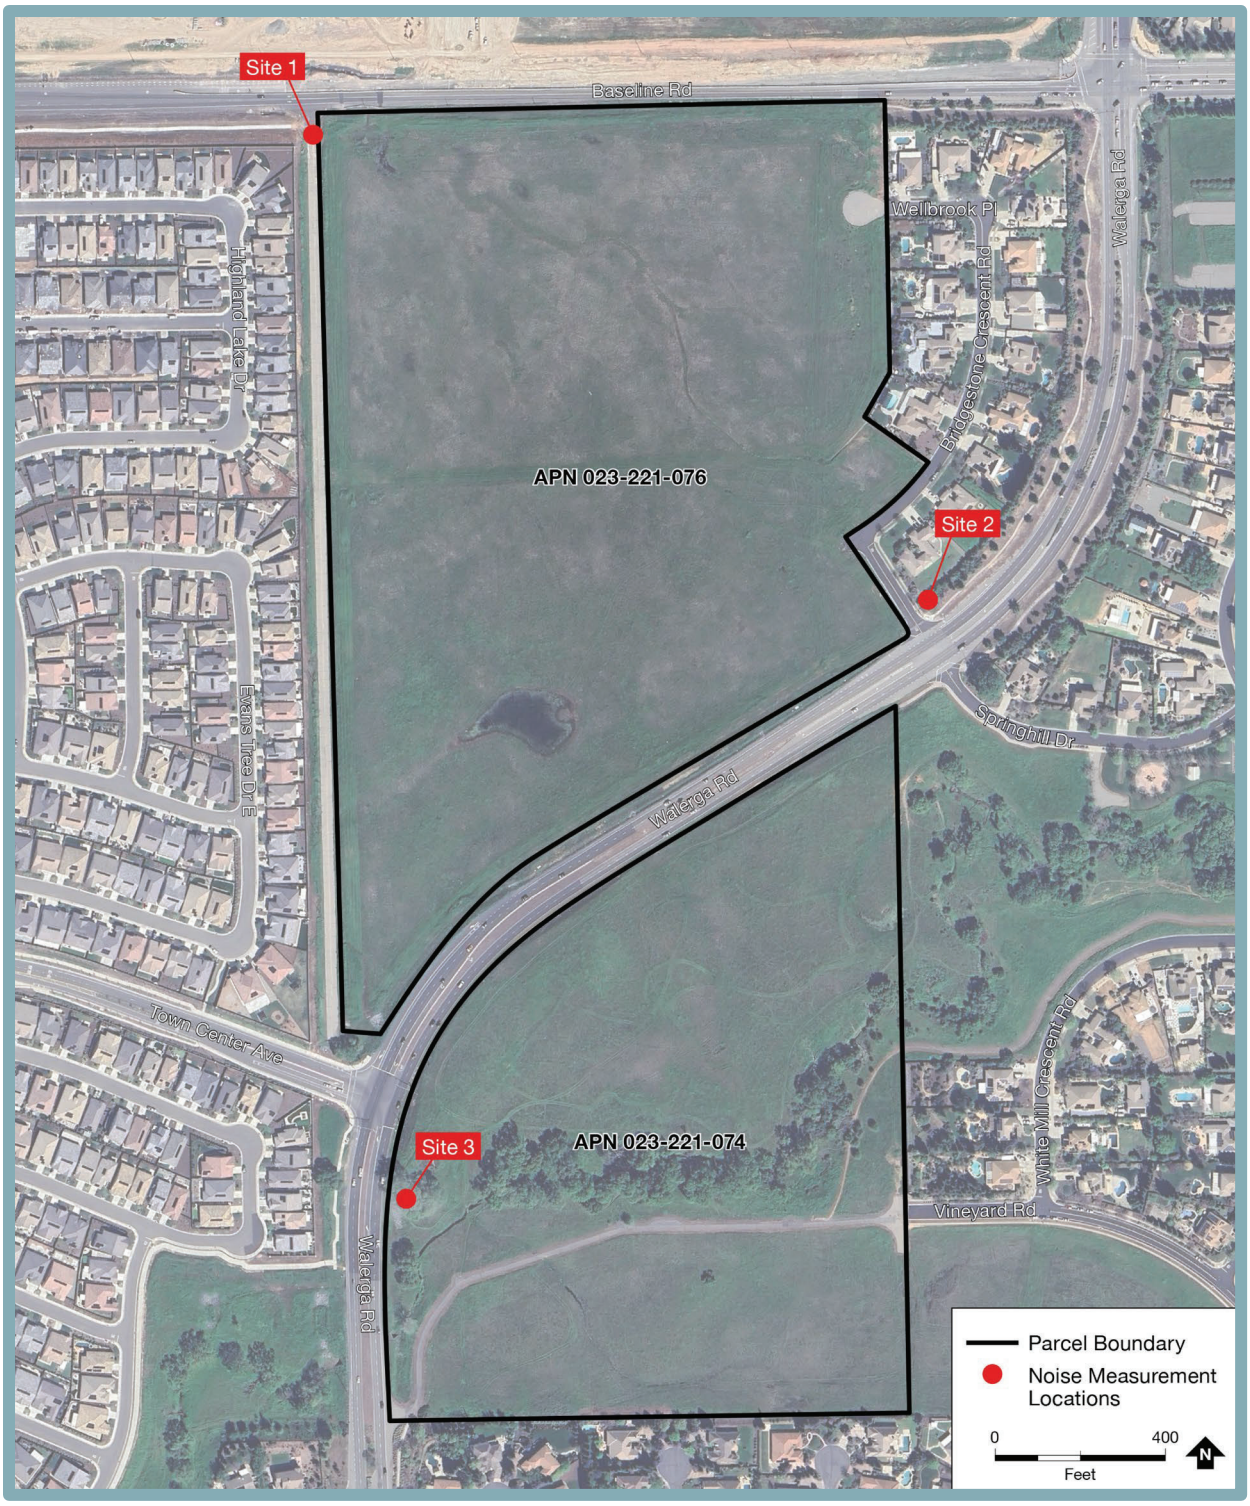

Table 14-2
Existing Noise Survey Results[1]

Location	Time Period	Noise Levels (dB)	Noise Sources
Site 1: Northwest corner of the site, approximately 100 feet south of the Baseline Road centerline	June 25, 12:00 AM through June 27, 11:59 PM, 2024 (72-hour measurement)	Daytime L_{eq} ranged from 61 to 65 Nighttime L_{eq} ranged from 54 to 65 CNELs: 67, 68, 68	Unattended noise measurements do not specifically identify noise sources
	June 24, 2024 9:11 AM to 9:21 AM	Five-minute L_{eq}: 58, 59	Traffic on Baseline Road (58 to 71 dB)
Site 2: Walerga Road/ Springhill Drive intersection, approximately 70 feet north of the Walerga Road centerline	June 25, 12:00 AM through June 27, 11:59 PM, 2024 (72-hour measurement)	Daytime L_{eq} ranged from 69 to 73 Nighttime L_{eq} ranged from 59 to 71 CNELs: 73, 74, 74	Unattended noise measurements do not specifically identify noise sources
	June 24, 2024 9:33 AM to 9:43 AM	Five-minute L_{eq}: 69, 70	Traffic on Walerga Road (65 to 80 dB)
Site 3: Approximately 100 feet east of the Walerga Road centerline	June 25, 12:00 AM through June 27, 11:59 PM, 2024 (72-hour measurement)	Daytime L_{eq} ranged from 67 to 70 Nighttime L_{eq} ranged from 58 to 71 CNELs: 72, 72, 73	Unattended noise measurements do not specifically identify noise sources
	June 24, 2024 9:53 AM to 10:03 AM	Five-minute L_{eq}: 66, 71	Traffic on Walerga Road (65 to 86 dB)

[1] Detailed summaries of the noise monitoring results are provided in the Noise Appendix of the Noise Report.

Noise Measurement Locations

* Figure not OCR Compatible

Existing Traffic Noise Levels

The Federal Highway Administration (FHWA) Traffic Noise Model (FHWA-RD-77-108) was used to develop existing noise contours, expressed in CNEL, for major roadways within the project vicinity. The approach used to evaluate existing traffic noise levels is discussed in the Method of Analysis section of this chapter. Table 14-3 summarizes the existing AM/PM peak hour traffic noise levels along roadways in the project vicinity. As shown in the table, traffic noise levels in the vicinity range from 41.1 to 71.3 dBA CNEL.

Table 14-3
Existing AM/PM Peak Hour Traffic Noise Levels Along Roadways in the Project Vicinity

Roadway	Segment	Hour	Existing Noise Level (dBA CNEL)
Baseline Road	East of Santucci Boulevard/Watt Avenue	AM	67.5
		PM	68.9
Baseline Road	East of Westbrook Boulevard	AM	67.4

Off-Site Affordable Housing Parcel

The nearest sensitive receptors to the off-site affordable housing parcel are the single-family residences to the west, across Watt Avenue. The existing ambient noise environment at the off-

site affordable housing parcel is defined primarily by noise from traffic along Watt Avenue and PFE Road.

Vibration

Vibration is an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. Several different methods are used to quantify vibration, including peak particle velocity (PPV), defined as the maximum instantaneous peak of the vibration signal and is typically expressed in units of inches per second (in/sec). PPV is most frequently used to describe vibration impacts on buildings. Common sources of ground-borne vibration include trains, heavy trucks traveling on rough roads, and construction activities such as blasting, pile driving, and operation of heavy earthmoving equipment.

14.3 REGULATORY CONTEXT

In order to limit exposure to physically and/or psychologically damaging noise levels, the State of California, various county governments, and most municipalities in the State have established standards and ordinances to control noise. Applicable federal laws or regulations pertaining to noise or vibration that would directly apply to the proposed project do not exist. The following provides a general overview of the existing State and local regulations that are relevant to the proposed project.

State Regulations

The following are the State environmental laws and policies relevant to noise and vibration.

California Building Code

The California Building Code (Title 24, Part 2 of the California Code of Regulations [CCR]) establishes uniform minimum noise insulation performance standards to protect persons within new buildings that house people, including hotels, motels, dormitories, apartment houses, and dwellings other than single-family dwellings.

Title 24 mandates that interior noise levels attributable to exterior sources shall not exceed 45 dB L_{dn} or CNEL in any habitable room. Title 24 also requires that for structures containing noise-sensitive uses to be located where the L_{dn} or CNEL exceeds 60 dB, an acoustical analysis must be prepared to identify mechanisms for limiting exterior noise to the prescribed allowable interior levels. If the interior allowable noise levels are met by requiring that windows be kept closed, the design for the structure must also specify a ventilation or air conditioning system to provide a habitable interior environment.

Local Regulations

The following are the local environmental goals and policies relevant to noise and vibration.

Placer County General Plan

The relevant goals and policies from the PCGP related to noise and vibration are presented below.

Noise Element

Goal 9.A To protect County residents from the harmful and annoying effects of exposure to excessive noise.

Policy 9.A.1 The County shall not allow development of new noise-sensitive uses where the noise level due to non-transportation noise sources will exceed the noise level standards of Table 9-1 (see Table 14-4) as measured immediately within the property line of the new development, unless effective noise mitigation measures have been incorporated into the development design to achieve the standards specified in Table 9-1 (see Table 14-4).

Table 14-4
Allowable L_{dn} Noise Levels Within Specified Zone Districts Applicable to New Projects Affected by or Including Non-Transportation Noise Sources[1]

Zone District of Receptor	Property Line of Receiving Use (L_{dn}, dB)	Interior Spaces[2]
Residential Adjacent to Industrial[3]	60	45
Other Residential[4]	50	45
Office/Professional	70	45
Transient Lodging	65	45
Neighborhood Commercial	70	45
General Commercial	70	45
Heavy Commercial	75	45
Limited Industrial	75	45
Highway Service	75	45
Shopping Center	70	45
Industrial	---	45
Industrial Park	75	45
Industrial Reserve	---	---
Airport	---	45
Unclassified	---	---
Farm	---[6]	---
Agriculture Exclusive	---[6]	---
Forestry	---	---
Timberland Preserve	---	---
Recreation & Forestry	70	---
Open Space	---	---
Mineral Reserve	---	---

Notes:

- Except where noted otherwise, noise exposures will be those which occur at the property line of the receiving use.
- Where existing transportation noise levels exceed the standards of this table, the allowable L_{dn} shall be raised to the same level as that of the ambient level.
- If the noise source generated by, or affecting, the uses shown above consists primarily of speech or music, or if the noise source is impulsive in nature, the noise standards shown above shall be decreased by 5 dB.
- Where a use permit has established noise level standards for an existing use, those standards shall supersede the levels specified in Table 9-1 and Table 9-3 (see Table 14-4 and see Table 14-5). Similarly, where an existing use which is not subject to a use permit causes noise in excess of the allowable levels in Tables 9-1 and 9-3 (see Table 14-4 and see Table 14-5), said excess noise shall be considered the allowable level. If a new development is proposed which will be affected by noise from such an existing use, it will ordinarily be assumed that the noise levels already existing or those levels allowed by the existing use permit, whichever are greater, are those levels actually produced by the existing use.

(Continues on next page)

Table 14-4
Allowable L_{dn} Noise Levels Within Specified Zone Districts Applicable to New Projects Affected by or Including Non-Transportation Noise Sources[1]

- Existing industry located in industrial zones will be given the benefit of the doubt in being allowed to emit increased noise consistent with the state of the art[5] at the time of expansion. In no case will expansion of an existing industrial operation because to decrease allowable noise emission limits. Increased emissions above those normally allowable should be limited to a one-time 5 dB increase at the discretion of the decision-making body.
- The noise level standards applicable to land uses containing incidental residential uses, such as caretaker dwellings at industrial facilities and homes on agriculturally zoned land, shall be the standards applicable to the zone district, not those applicable to residential uses.
- Where no noise level standards have been provided for a specific zone district, it is assumed that the interior and/or exterior spaces of these uses are effectively insensitive to noise.

1 Overriding policy on interpretation of allowable noise levels: Industrial-zoned properties are confined to unique areas of the County, and are irreplaceable. Industries which provide primary wage-earner jobs in the County, if forced to relocate, will likely be forced to leave the County. For this reason, industries operating upon industrial zoned properties must be afforded reasonable opportunity to exercise the rights/privileges conferred upon them be their zoning. Whenever the allowable noise levels herein fall subject to interpretation relative to industrial activities, the benefit of the doubt shall be afforded to the industrial use.

Where an industrial use is subject to infrequent and unplanned upset or breakdown of operations resulting in increased noise emissions, where such upsets and breakdowns are reasonable considering the type of industry, and where the industrial use exercises due diligence in preventing as well as correcting such upsets and breakdowns, noise generated during such upsets and breakdowns shall not be included in calculations to determine conformance with allowable noise levels.

2 Interior spaces are defined as any locations where some degree of noise-sensitivity exists. Examples include all habitable rooms of residences, and areas where communication and speech intelligibility are essential, such as classrooms and offices.

3 Noise from industrial operations may be difficult to mitigate in a cost-effective manner. In recognition of this fact, the exterior noise standards for residential zone districts immediately adjacent to industrial, limited industrial, industrial park, and industrial reserve zone districts have been increased by 10 dB as compared to residential districts adjacent to other land uses.

For purposes of the Noise Element, residential zone districts are defined to include the following zoning classifications: AR, R-1, R-2, R-3, FR, RP, TR-1, TR-2, TR-3, and TR-4.

4 Where a residential zone district is located within an -SP combining district, the exterior noise level standards are applied at the outer boundary of the -SP district. If an existing industrial operation within an -SP district is expanded or modified, the noise level standards at the outer boundary of the -SP district may be increased as described above in these standards.

Where a new residential use is proposed in an -SP zone, an Administrative Review Permit is required, which may require mitigation measures at the residence for noise levels existing and/or allowed by use permit as described under "NOTES," above, in these standards.

5 State of the art should include the use of modern equipment with lower noise emissions, site design, and plant orientation to mitigate offsite noise impacts, and similar methodology.

6 Normally, agricultural uses are noise insensitive and will be treated in this way. However, conflicts with agricultural noise emissions can occur where single-family residences exist within agricultural zone districts. Therefore, where effects of agricultural noise upon residences located in these agricultural zones is a concern, an L_{dn} of 70 dBA will be considered acceptable outdoor exposure at a residence.

Source: Placer County General Plan, 2013.

Policy 9.A.2 Noise created by new proposed non-transportation noise sources shall be mitigated so as not to exceed the noise level standards of Table 9-1 (see Table 14-4) as measured immediately within the property line of lands designated for noise-sensitive uses: provided, however, the noise created by occasional events occurring within a stadium on land zoned for university purposes may temporarily exceed these standards as provided in an approved Specific Plan.

Policy 9.A.6 The feasibility of proposed projects with respect to existing and future transportation noise levels shall be evaluated by comparison to Table 9-3 (see Table 14-5).

Table 14-5
Maximum Allowable Noise Exposure for Transportation Noise Sources

Noise-Sensitive Land Uses	Outdoor Activity Area[1]	Interior Spaces	
	L_{dn}, dB	L_{dn}/CNEL, dB	L_{eq}, dB[2]
Residential	60[3]	45	--
Transient Lodging	60[3]	45	--
Hospitals, Nursing Homes	60[3]	45	--
Theaters, Auditoriums, Music Halls	--	--	35
Churches, Meeting Halls	60[3]	--	40
Office Buildings	--	--	45
Schools, Libraries, Museums	--	--	45
Playgrounds, Neighborhood Parks	70	--	--

1 Where the location of outdoor activity areas is unknown, the exterior noise level standard shall be applied to the property line of the receiving land use.
2 As determined for a typical worst-case hour during periods of use.
3 Where it is not possible to reduce noise in outdoor activity areas to 60 dB L_{dn}/CNEL or less using a practical application of the best-available noise reduction measures, an exterior noise level of up to 65 dB L_{dn}/CNEL may be allowed provided that available exterior noise level reduction measures have been implemented and interior noise levels are in compliance with this table.

Source: Placer County General Plan, 2013.

Policy 9.A.8 New development of noise-sensitive land uses shall not be permitted in areas exposed to existing or projected levels of noise from transportation noise sources, including airports, which exceed the levels specified in Table 9-3 (see Table 14-5), unless the project design includes effective mitigation measures to reduce noise in outdoor activity areas and interior spaces to the levels specified in Table 9-3 (see Table 14-5).

Policy 9.A.9 Noise created by new transportation noise sources, including roadway improvement projects, shall be mitigated so as not to exceed the levels specified in Table 9-3 (see Table 14-5) or the performance standards in Table 9-3 (see Table 14-5) at outdoor activity areas or interior spaces of existing noise sensitive land uses.

Policy 9.A.11 The County shall require one or more of the following mitigation measures where existing noise levels significantly impact existing noise-sensitive land uses, or where the cumulative increase in noise levels resulting from new development significantly impacts noise-sensitive land uses:

a. Rerouting traffic onto streets that have available traffic capacity and that do not adjoin noise-sensitive land uses;
b. Lowering speed limits, if feasible and practical;
c. Programs to pay for noise mitigation such as low cost loans to owners of noise-impacted property or establishment of developer fees;
d. Acoustical treatment of buildings; or,
e. Construction of noise barriers.

Policy 9.A.12 Where noise mitigation measures are required to achieve the standards of Tables 9-1 and 9-3 (see Table 14-4 and Table 14-5), the emphasis of such measure shall be placed upon site planning and project design. The use of noise barriers shall be considered as a means of achieving the noise standards only after all other practical design-related noise mitigation measures have been integrated into the project.

Dry Creek-West Placer Community Plan

The relevant goals and policies from the DCWPCP related to noise and vibration are presented below.

Community Development Element: The Land Use Plan

Goal 4 To locate noise sensitive land uses within areas of acceptable noise levels.

Policy 5 Encourage the use of greenbelts or landscaped areas along roadways as a design feature of any development in order to mitigate noise impacts and provide valuable open space.

Community Development Element: Community Design Element

Goal 2 It is a goal of the Plan to encourage and support projects which exemplify good design characteristics when judged against the goals and policies of this Plan as well as other applicable design and landscape guidelines.

Policy 15 In place of sound wall construction, require, wherever possible, the use of greater setbacks to provide a scenic corridor for all parcels fronting on all the major circulation routes (2, 4, or 6 lanes of traffic). Long expanses of sound walls are not consistent with the desired character of the Plan area and the use of open space setbacks and

landscaping instead, will be a major difference between this area and surrounding areas to the north and south.

Community Development Element: Noise

Goal 1 To protect the health, safety, and welfare of the Dry Creek-West Placer Area residents by providing a livable environment free from excessive noise.

Goal 2 Locate noise-sensitive land uses within areas of acceptable community noise equivalent levels (CNEL).

Goal 3 Correlate noise concerns with community design, land use, and circulation and open space.

Policy 1 Encourage the use of green belts or natural areas along roadways as a design feature of any development in order to mitigate noise impacts.

Policy 2 Continue a program of monitoring noise sources to assure conformance with noise standards adopted in the Placer County Noise Element.

Policy 3 Avoid the interface of noise-producing and noise-sensitive land uses.

Policy 4 Require implementation of noise abatement techniques within new projects where warranted.

Policy 6 Require project specific noise studies for most commercial, office, public, institutional and residential projects.

Policy 7 Limit construction activities to daytime hours (7:00 a.m. to 7:00 p.m. Monday through Friday).

Policy 8 Where noise levels have a potential to be in excess of normally acceptable CNEL levels, landscaped setbacks should be considered versus sound walls for noise mitigation.

Policy 11 Protect existing residential areas from excessive noise levels generated by the development of the Plan Area.

Policy 12 The burden of noise mitigation measures shall be borne by project proponents whenever the temporary and permanent effects of land development should cause noise levels to be in excess of normally acceptable levels for surrounding uses.

Policy 13 The location and design of transportation facilities shall be developed in a manner which minimizes the effects of noise on adjacent land uses.

Placer County Noise Ordinance

Section 9.36.060 of the Placer County Code establishes non-transportation noise level standards for noise-sensitive receptors. The purpose of the Noise Ordinance is to implement the noise level standards identified in the PCGP.

The specific language of Section 9.36.060 is provided below:

A. It is unlawful for any person at any location to create any sound, or to allow the creation of any sound, on property owned, leased, occupied or otherwise controlled by such person that:

1. Causes the exterior sound levels when measured at the property line of any affected sensitive receptor to exceed the ambient sound level by five dBA; or

2. Exceeds the sound level standards as set forth in Table 1 (see Table 14-6), whichever is the greater.

Table 14-6
Noise Level Standards for Non-Transportation Noise Sources

Sound Level Descriptor	Daytime (7 a.m. to 10 p.m.)	Nighttime (10 p.m. to 7 a.m.)
Hourly L_{eq}, dB	55	45
L_{max}, dB	70	65

Source*: *Placer County Noise Ordinance.

B. Each of the sound level standards specified in Table 1 (see Table 14-6) shall be reduced by five dB for simple tone noises, consisting of speech and music. However, in no case shall the sound level standard be lower than the ambient sound level plus five dB.

C. If the intruding sound source is continuous and cannot reasonably be discontinued or stopped for a time period whereby the ambient sound level can be measured, the sound level measured while the source is in operation shall be compared directly to the sound level standards of Table 1 (see Table 14-6).

Pursuant to Section 9.36.030 of the Placer County Code (Exemptions), sound or noise emanating from construction activities between the hours of 6:00 AM and 8:00 PM Monday through Friday, and between the hours of 8:00 AM and 8:00 PM Saturday and Sunday, is exempt from Section 9.36.060 of the Placer County Code Noise Ordinance, provided that all construction equipment is fitted with factory installed muffling devices and that all construction equipment is maintained in good working order.

With regard to exceptions for non-construction noise sources, Section 9.36.080 of the Placer County Code states the following:

A. An exception may be requested from any provision of this article. Requests for exceptions shall be made on forms provided by the county. Notice of the request for exception must be given to all the surrounding properties that would be impacted by the exception, i.e., those properties that would experience a noise level at their property line that exceeds Table 1 of Section 9.36.060.

B. If the applicant can show to the county that a diligent investigation of available sound suppression techniques for construction-related noise indicates that immediate compliance with the requirements of this article would be impractical or unreasonable, due to the temporary nature or short duration of the exception, a permit to allow exception from the provisions contained in all or a portion of this article may be issued. Factors that the approving authority must consider for construction related exceptions shall include but not be limited to the following:

1. Conformance with the intent of this article;
2. Uses of property and existence of sensitive receptors within the area affected by sound;
3. Factors related to initiating and completing all remedial work;
4. The time of the day or night the exception will occur;
5. The duration of the exception; and
6. The general public interest, welfare and safety.

C. If the applicant can show to the county that the characteristics of a special event indicate that immediate compliance with the requirements of this article would be impractical due to the type of event or unreasonable due to its temporary nature or short duration, a permit allowing an exception from the provisions of this article may be issued. Factors considered for special events related exceptions shall include but not be limited to the following:

1. Conformance with the intent of this article;
2. Uses of property and existence of sensitive receptors within the area affected by sound;
3. Hardship to the applicant, or community of not granting the exception;
4. The time of the day or night the exception will occur;
5. The duration of the exception; and
6. The general public interest, welfare and safety.

D. If the applicant can show to the County, or his or her designee that immediate compliance with the requirements of this chapter would not result in a hazardous condition or nuisance, and strict compliance would be unreasonable due to the circumstances of the requested exception, a permit to allow exception from the provisions contained in all or a portion of this chapter may be issued. Factors considered for all requests for exceptions, other than construction or special events, shall include but not be limited to the following:

1. Conformance with the intent of this chapter and General Plan Policies;
2. Uses of property and existence of sensitive receptors within the area affected by sound;
3. Factors related to initiating and completing all remedial work;
4. Age and useful life of the existing sound source;
5. Hardship to the applicant, or community of not granting the exception;
6. The time of day or night the exception will occur;
7. The duration of the exception; and
8. The general public interest, welfare, and safety.

14.4 IMPACTS AND MITIGATION MEASURES

The following section describes the standards of significance and methodology used to analyze and determine the proposed project's potential impacts related to noise and vibration. In addition, a discussion of the project's impacts, as well as mitigation measures where necessary, is also presented.

Impacts of the environment on a project (as opposed to impacts of a project on the environment) are beyond the scope of required California Environmental Quality Act (CEQA) review, with some exceptions. "[T]he purpose of an EIR is to identify the significant effects of a project on the environment, not the significant effects of the environment on the project." (*Ballona Wetlands Land Trust v. City of Los Angeles,* [2011] 201 Cal.App.4th 455, 473 [*Ballona*]). The California Supreme Court has held that "CEQA does not generally require an agency to consider the effects of existing environmental conditions on a proposed project's future users or residents. What CEQA does mandate… is an analysis of how a project might exacerbate existing environmental hazards." (*California Building Industry Assn. v. Bay Area Air Quality Management Dist.* [2015] 62 Cal.4th 369, 392; see also *Mission Bay Alliance v. Office of Community Investment & Infrastructure* [2016] 6 Cal.App.5th 160, 197 ["identifying the effects on the project and its users of locating the project in a particular environmental setting is neither consistent with CEQA's legislative purpose nor required by the CEQA statutes"], quoting *Ballona*, *supra*, 201 Cal.App.4th at p. 474).

The Supreme Court also recognized that the Legislature, by statute, has made a small number of exceptions to the above general principles. One of the exceptions relates to land use planning in areas influenced by airport-generated noise. As the Court explained, Public Resources Code Section (PRC) 21096 "requires a lead agency to use certain technical resources when addressing airport-related safety hazards and noise problems in EIRs for projects near airports (PRC Section 21096[a]), and prohibits a lead agency from adopting a negative declaration without considering 'whether the project will result in a safety hazard or noise problem for persons using the airport or for persons residing or working in the project area'" (62 Cal.4th at p. 391). This exception is not relevant to the proposed project, as discussed below.

Therefore, for the purposes of the CEQA analysis, the relevant inquiry is not whether the proposed project's future residents will be exposed to pre-existing environmental noise-related hazards, but instead whether, and the extent to which, project-generated noise would exacerbate the pre-existing conditions. Nonetheless, for informational purposes, this chapter considers both the proposed project's contribution to on- and off-site noise levels, as well as exposure of future residents of the proposed project to potential hazards associated with the preexisting noise environment, in order to demonstrate General Plan compliance.

Standards of Significance

Consistent with Appendix G of the CEQA Guidelines, the PCGP and the County's Noise Ordinance, and professional judgment, the effects of a project are evaluated to determine if they would result in a significant adverse impact on the environment. For the purposes of this EIR, an impact is considered significant if the proposed project would result in any of the following:

- Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;

- Generation of a substantial temporary or permanent increase in ambient noise levels in noise-sensitive locations in the vicinity of the project;
- Generation of excessive groundborne vibration or groundborne noise levels; or
- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels (see Chapter 19, Effects Not Found to be Significant).

As noted above, issues related to whether the proposed project would result in the following are discussed in Chapter 19, Effects Not Found to be Significant, of this EIR:

- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels.

Summary of Applicable Noise Standards

Applicable noise level standards from the PCGP and the County Code are summarized below.

Construction Noise Criteria

Pursuant to Placer County Code Section 9.36.030(A)(7), noise-generating construction activities that occur between 6:00 AM and 8:00 PM, Monday through Friday, and 8:00 AM to 8:00 PM on Saturdays and Sundays, are exempt from the regulations established by the Placer County Code Noise Ordinance, provided that all construction equipment has factory installed muffling devices and that all construction equipment is maintained in good working order. A five dB standard is used as a substantial noise increase criteria for the purposes of assessing construction noise, which is discussed further below.

Transportation Noise Criteria

The Placer County General Plan Noise Element applies 60 dB L_{dn}/CNEL exterior and 45 dB L_{dn}/CNEL interior noise level standards for residential uses affected by transportation noise sources. The County may conditionally allow exterior noise levels between 60 and 65 dB L_{dn} for residential uses, provided that practical noise reduction measures have been implemented and interior noise levels remain in compliance with the 45 dB L_{dn} interior standard.

Substantial Increase Criteria

Generally, a project may have a significant effect on the environment if it substantially increases the ambient noise levels for adjoining areas or exposes people to measurably severe noise levels. In practice, a noise impact may be considered significant if it would generate noise that would conflict with local project criteria or ordinances, or substantially increase existing noise levels at noise-sensitive land uses, even if resulting noise levels are permissible under local criteria or ordinances. The potential increase in transportation noise associated with the proposed project is a factor in determining significance.

Placer County, like many jurisdictions, does not have an adopted policy regarding significant increases in ambient noise. A common practice in many jurisdictions is to use a three to five dB increase as a threshold of significance. However, a limitation of using a single noise level increase value to evaluate noise impacts is that it fails to account for pre-project noise conditions.

The following table was developed by the Federal Interagency Committee on Noise (FICON) as a means of developing thresholds for identifying project-related noise level increases. The rationale for the graduated scales is that test subjects' reactions to increases in noise levels varied depending on the starting level of noise. Specifically, with lower ambient noise environments, such as those below 60 dB L_{dn}, a larger increase in noise levels was required to achieve a negative reaction than was necessary in environments where noise levels were already elevated. Therefore, because the County does not have defined thresholds for what would be considered a substantial increase in traffic noise levels, information from Table 14-7 is used.

Table 14-7
Significance of Changes in Cumulative Noise Exposure (dB DNL)

Ambient Noise Level Without Project	Increase Required for Significant Impact
<60	+5.0 or more
60 to 65	+3.0 or more
>65	+1.5 or more

Source: Federal Interagency Committee on Noise.

The approach to assessing the significance of increases in off-site traffic noise is consistent with other recent Placer County EIRs and the industry-standard approach in general. The use of the FICON standards is considered conservative relative to thresholds used by other agencies in the State. For example, Caltrans requires a project-related traffic noise level increase of 12 dB for a finding of significance, and the California Energy Commission (CEC) considers project-related noise level increases between five to 10 dB significant, depending on local factors. Therefore, the use of the FICON standards, which set the threshold for finding of significant noise impacts as low as 1.5 dB, provides a conservative approach to impact assessment for the proposed project.

Vibration Criteria

Placer County does not have specific policies or standards pertaining to vibration levels. However, vibration levels associated with construction activities and project operations are addressed as potential vibration impacts associated with project implementation. Human and structural response to different vibration levels is influenced by a number of factors, including ground type, distance between source and receptor, duration, and the number of perceived vibration events.

Construction operations have the potential to result in varying degrees of temporary ground vibration depending on the specific construction equipment used and operations involved. A significant impact would be identified if project construction activities or proposed on-site operations would expose sensitive receptors to excessive groundborne vibration levels. Specifically, an impact would be identified if groundborne vibration levels due to such sources would exceed the vibration impact criteria established by the Federal Transit Administration (FTA) of 0.5 PPV in/sec for damage to residential and commercial structures.

Method of Analysis

Below are descriptions of the methodologies used in the Noise Report (see Appendix H of this EIR) to measure background and ambient noise and to estimate construction noise and vibration, future traffic noise, pickleball noise, and on-site stationary noise generated from heating, ventilation, and air conditioning (HVAC) equipment. Further modeling details and calculations are provided in Appendix H of this EIR. The results of the noise and vibration impact analyses were compared to the standards of significance discussed above in order to determine the associated level of impact.

On-Site Existing Ambient Noise Levels

To quantify existing ambient noise levels within the project site, RCH conducted three long-term (72-hour) and three short-term (10-minute) noise level measurements at three locations (see Figure 14-1) from June 24 to June 27, 2024. Metrosonics db308 precision and Larson Davis Laboratories (LDL) Soundtrack LxT integrating sound level meters were used to complete the long-term and short-term noise level measurements, respectively. Both sound level meters were calibrated immediately before and after use to ensure the accuracy of the measurements. The results of the noise level measurements are shown numerically and graphically in the Noise Appendix to the Noise Report and are summarized in Table 14-2 above.

Project Construction Noise and Vibration Levels

Construction noise and vibration were analyzed using data compiled for various pieces of construction equipment at distances of 50 feet, as well as at the nearest sensitive receptor, based on equipment noise data published by the FHWA. The FHWA Roadway Construction Noise Model (RCNM), Version 1.1, was used due to the robust inventory of off-road equipment and reference noise levels common to large-scale construction projects. Estimates of noise from construction of the proposed project were based on the maximum amount of equipment used on a given day. Therefore, the noise level associated with the equipment is based on general noise levels typical of the type of equipment and not based on any specific make or model. Construction noise is discussed relative to the applicable policies and standards presented above.

For daytime construction, the grading phase was assumed to be the loudest construction phase. Cumulative daytime construction noise levels were modeled at 50, 200, 400, 600, and 800 feet. For nighttime construction, underground work and aboveground work would both occur, the latter of which would be the loudest phase of nighttime work. Distances for nighttime construction were modeled at 50, 150, and 300 feet. In order to provide a conservative analysis, the RCNM conducted as part of the Noise Report assumed that all equipment used during both daytime and nighttime construction activities would be present and operating simultaneously.

Project Traffic Noise Level Increases

The FHWA-RD-77-108 traffic noise model was used to develop existing noise contours, expressed in CNEL, for major roadways within the project vicinity (i.e., Baseline Road and Walerga Road). Traffic data in the form of AM and PM peak hour intersection turning movements for existing and cumulative conditions were obtained from the project traffic consultant, Kimley-Horn. Existing and cumulative traffic noise levels were calculated using the aforementioned data and the FHWA Model. A complete listing of the traffic noise level inputs are provided in the Noise Appendix of the Noise Report (see Appendix H of this EIR).

The proposed project could also develop up to 22 ADUs to satisfy affordable housing requirements. Because the number of ADUs to be developed is currently unknown, the additional traffic volume that could be generated by the ADUs was not included in the traffic noise modeling. However, according to the Noise Report, the addition of 22 ADUs would increase project trip generation by less than five percent and the resulting traffic noise contribution distributed throughout the analyzed roadway segments would be negligible.

Pickleball Noise

In order to analyze potential outdoor noise impacts from the proposed pickleball courts, which would be located within a neighborhood park in the Placer Creek Residential Phase 2 development, short-term measurements were conducted during a two-player pickleball gameplay

event on September 30, 2025, at the Oasis Park Pickleball Courts in Elk Grove, California. The short-term noise measurements were taken at 50 feet from the center of the court. The primary source of noise originated from the contact between the paddle and the ball, and ranged from 52 to 61 dB, L_{max} at 50 feet. The secondary source of noise was player conversation, which ranged from 50 to 54 dB, L_{max} at 50 feet.

On-Site Stationary Noise

For the purposes of noise modeling, the proposed HVAC equipment was assumed by the Noise Report to be rooftop mounted at the Estia Dry Creek multi-family apartment units and ground-level at the Placer Creek Residential single-family residential lots. RCH observed noise from a typical residential single-stage HVAC unit operating at full capacity, which produced a constant noise level of 54 dB at 15 feet.

Project-Specific Impacts and Mitigation Measures

The following discussion of impacts is based on implementation of the proposed project and off-site sewer lift station improvements, as well as the two affordable housing options analyzed throughout this EIR, in comparison with the baseline and standards of significance identified above. In most cases, potential environmental impacts associated with the proposed project and the 22 on-site ADUs would not differ. Thus, unless otherwise noted, the below analysis applies to both the proposed project and the on-site ADUs.

14-1 Generation of a substantial temporary increase in ambient noise levels in noise-sensitive locations in the vicinity of the project or a substantial temporary increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. Based on the analysis below and even with implementation of mitigation, the impact is *significant and unavoidable.*

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as potential future development of the off-site affordable housing parcel, which could generate a substantial temporary increase in ambient noise levels in noise-sensitive locations in the vicinity of the project or in excess of applicable standards.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Construction activities associated with the proposed project, including off-site roadway improvements, would require the use of numerous pieces of noise-generating equipment, such as excavating machinery (e.g., backhoes, bulldozers, excavators, front loaders) and other construction equipment (e.g., compactors, scrapers, graders). Construction worker traffic and construction-related material haul trips would raise ambient noise levels along local haul routes. Noise levels would vary depending on the type and operation of equipment and how well the equipment is maintained. Noise exposure at any single point outside the project site would also vary depending on the distance from the source.

The nearest existing noise-sensitive uses to the project site are the single-family residences surrounding the site to the east, west, and south. Table 14-8 includes the typical noise levels (L_{eq}) for equipment commonly used in general residential construction

projects at full-power operation at a distance of 50 feet. As shown in the table, average noise levels generated by construction equipment that could be used for the proposed project would range from 73 to 83 dB L_{eq} at 50 feet.

Table 14-8
Typical Noise Levels from Construction Equipment

Equipment Description	Noise Level at 50 Feet (dB L_{eq})
Backhoe	74
Dozer	78
Forklift	77
Crane	73
Excavator	77
Dump Truck	73
Paver	74
Air compressor	74
Generator	78
Roller	73
Concrete Mixer Truck	75
Front End Loader	75
Tractor	80
Concrete Saw	83

Source: RCH, October 2025.

Placer County Code Section 9.36.030(A)(7) exempts noise sources associated with construction activities, provided that such activities occur between the hours of 6:00 AM and 8:00 PM, Monday through Friday and 8:00 AM to 8:00 PM on Saturdays and Sundays. However, the exemption is provided on the basis that all construction equipment is fitted with factory-installed muffling devices and maintained in good working order. In addition, DCWPCP Noise Policy 7 restricts construction activities within the DCWPCP area to daytime 7:00 AM to 7:00 PM, Monday through Friday.

All noise-generating project construction equipment and activities would operate in accordance with Placer County Code Section 9.36.030(A)(7) and DCWPCP Noise Policy 7, thereby gaining exemption from the applicable noise level criteria. Nevertheless, Appendix G of the CEQA Guidelines (Section XIII, question ‘a’) requires a lead agency to determine if a project would result in the generation of a substantial temporary increase in ambient noise levels. Despite the exemption, in terms of determining the temporary noise increase due to project-related construction activities, an impact would occur if construction activity would noticeably increase ambient noise levels above background levels. The threshold of perception of the human ear is approximately three to five dB with a five dB change being clearly noticeable. Therefore, for the purposes of this analysis, a noticeable increase in existing ambient noise levels is assumed to occur when noise levels increase by five dB or more; therefore, an increase in noise levels of five dB or more equates to a significant impact.

The construction noise analysis assumes that Phases 1 through 4 would occur separately and not simultaneously. The equipment and activities required for construction of the proposed project would be typical of large-scale residential construction projects, and no noise-generating heavy equipment, such as pile drivers, would be used. Table 14-9 shows the predicted daytime construction noise impacts from grading activities, which would be

the loudest construction phase. As shown in the table, daytime grading activities occurring near existing residences adjacent to Phases 3 and 4 would increase the exterior noise level by approximately three to 10 dB L_{eq}. Figure 14-2 through Figure 14-4 show the average noise contours for daytime construction noise levels for Phases 1 through 4.

Other non-grading construction activities would occur closer to nearby existing sensitive receptors (e.g., homes along Wellbrook Place and Bridgestone Crescent Road, and along French Creek Court, Eagle Creek Court, Marsh Creek Court, and Rockporte Court) and, thus, would expose such receptors to increased noise levels. Specifically, Phases 2 and 4 would require work directly adjacent to existing sensitive receptors; even though construction noise is anticipated by the Noise Report to be less than the noise generated by grading activities (as shown in Table 14-9), other construction phases (e.g., foundations, framing, and post-construction finishing) could also exceed the exterior noise increase threshold of 5.0 dB, depending on the activity being performed and the duration of the construction phase.

The off-site sewer lift station improvements area at the existing Community Facility District #1 Sewer Lift Station in Dry Creek Community Park is located approximately 300 feet from the nearest single-family residence, which is located to the southeast. Based on the limited nature of the improvements, the distance to the closest sensitive receptor, and the tree buffer between the improvement site and the nearest receptor, significant construction noise impacts associated with the off-site sewer lift station improvements are not anticipated to occur.

According to the Noise Report, the proposed project would likely require nighttime work, subject to County approval, for the construction of roadway improvements at three different locations to minimize daytime traffic circulation impacts on Walerga Road and Baseline Road, as the roads have a high volume of traffic during the daytime.

Nighttime work would be short-term and is expected to last approximately one to two weeks at each location and would occur at varying times. Similarly to daytime construction noise level increases, nighttime construction activities would result in a potentially significant impact if such activities would result in an increase of five dB or more over existing exterior noise levels at the nearest sensitive receptors. In addition, a significant impact would occur if nighttime construction exposed nearby sensitive receptors to noise levels exceeding an interior noise level of 45 dB L_{dn}. Table 14-10 shows the predicted exterior and interior noise levels from nighttime construction activities. As shown in the table, nighttime construction activities at Location 1 could result in exterior noise level increases greater than five dB and interior noise levels above 45 dB. According to the Noise Report, any noise-sensitive receptor within 600 feet of the center of Location 1 during nighttime aboveground work could experience noise level increases greater than the five dB exterior noise threshold.
a
In addition, any noise-sensitive receptor within 300 feet of the center of Location 1 during nighttime aboveground work could experience noise levels greater than the interior noise level threshold of 45 dB. Figure 14-5 shows the homes within 300 feet and 600 feet of the center of nighttime construction Location 1.

Table 14-9
Predicted Daytime Construction Noise Levels from Grading Activities (dB, L_{eq})

Phase	Construction Noise Level (at 50 feet)	Construction Noise Level (at Nearest Receptor)	Existing Daytime Exterior Noise Level	Change from Existing Noise Levels	Results in Five dB L_{eq} Increase or More?
1	84	52[1]	61 to 65[2]	0	No[1]
2	84	64[3]	69 to 73[4]	0	No
3	84	65[5]	58 to 62[6]	3 to 7	Yes
4	84	70[7]	60 to 64[8]	6 to 10	Yes

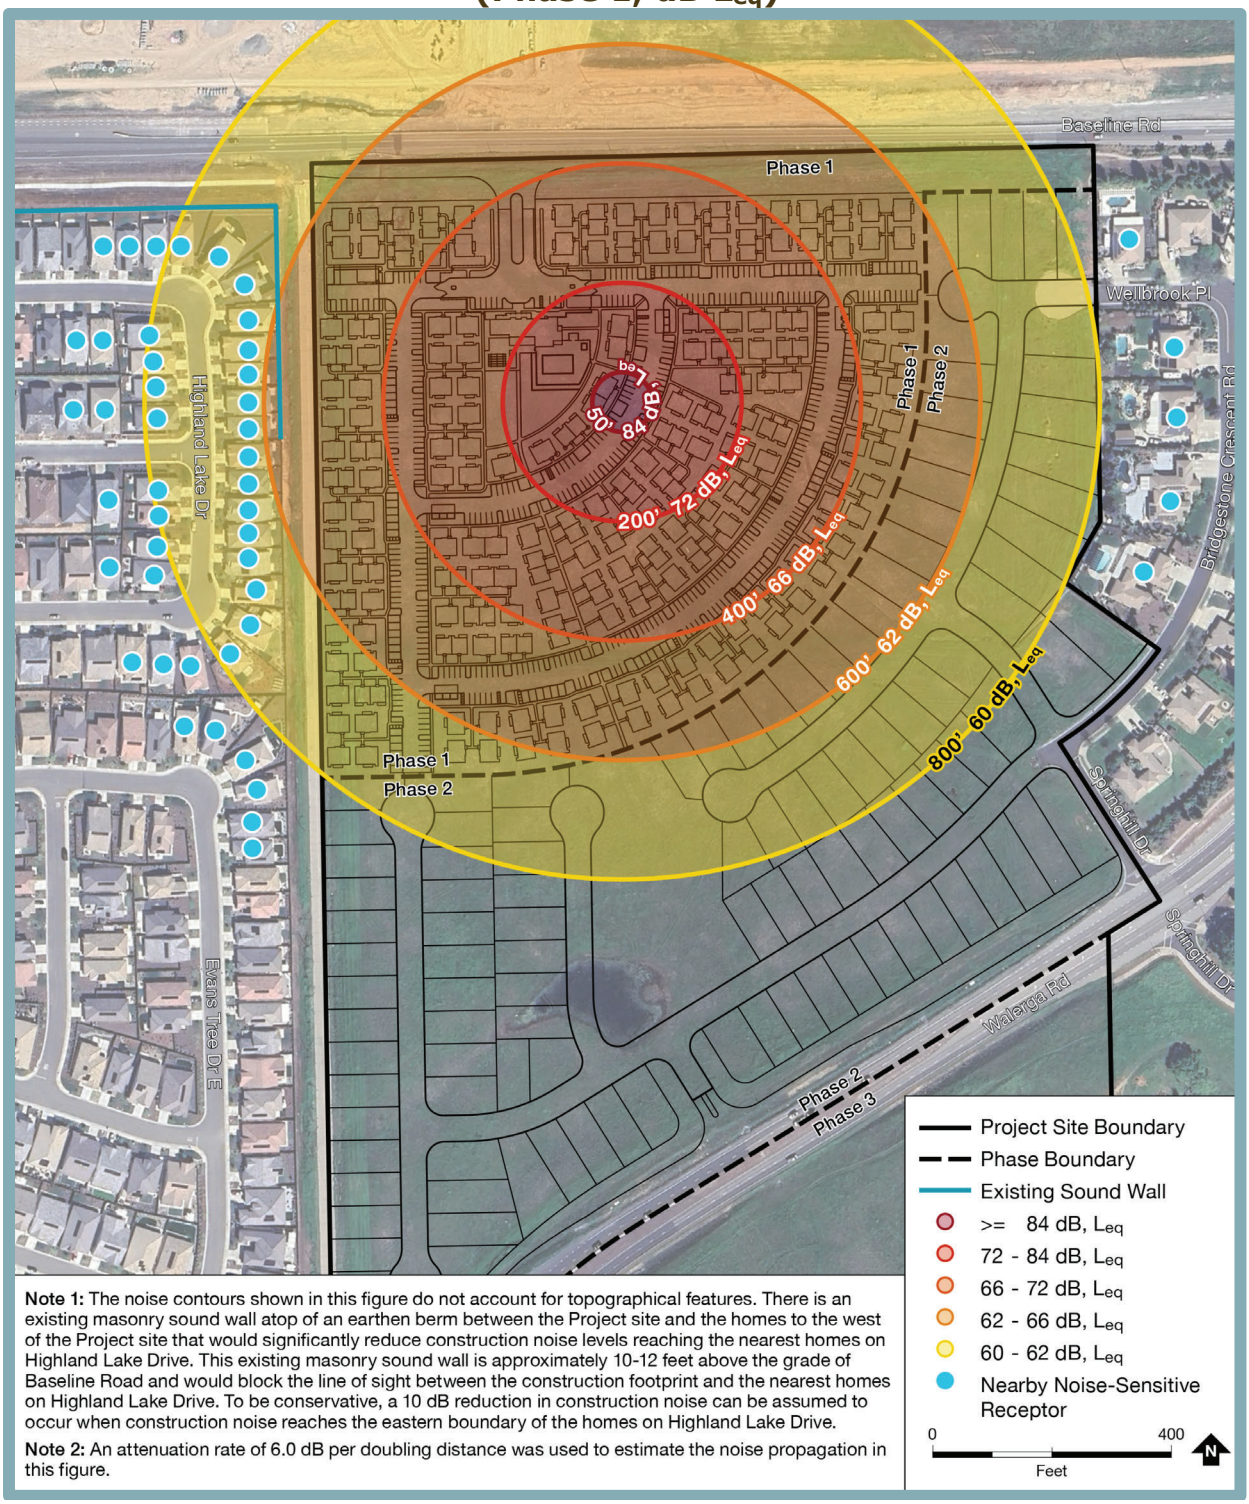
1 Distance is assumed to be 600 feet between the center of the Phase 1 construction site and the nearest home to the west on Highland Lake Drive. The resulting noise level would be 62 dB, L_{eq}. However, there is an existing masonry sound wall atop of an earthen berm that would significantly reduce nighttime construction noise levels reaching the nearest homes on Highland Lake Drive. This existing masonry sound wall is approximately 10-12 feet above the grade of Baseline Road and would block the line of sight between the construction footprint and the nearest homes on Highland Lake Drive; therefore, a conservative 10 dB reduction can be applied. Thus, the resulting noise levels would be approximately 52 dB, L_{eq}.

2 See Table 14-2, Site 1 for daytime hourly L_{eq}'s which were taken nearby the nearest homes to the west of Phase 1 construction.

3 Distance was assumed to be 500 feet between the center of the Phase 2 site and the nearest residence to the east on Bridgestone Crescent Road.

4 See Table 14-2, Site 2 for daytime hourly L_{eq}'s which were taken nearby the homes adjacent to Walerga Road and west of Phase 2 construction.

5 Distance was assumed to be 450 feet between the center of the Phase 3 site and the nearest residence to the east on White Mill Crescent Road.



6 Daytime hourly L_{eq}'s were estimated based on the daytime hourly L_{eq}'s taken at Site 3. These noise levels were attenuated to the nearest home to the east on White Mill Crescent Road located closest to Phase 3 construction.

7 Distance was assumed to be 250 feet between the center of the Phase 4 site and the nearest residence to the south on Marsh Creek Court.

8 Daytime hourly L_{eq}'s were estimated based on the daytime hourly L_{eq}'s taken at Site 3. These noise levels were attenuated to the nearest home to the east on Marsh Creek Court located closest to Phase 4 construction.

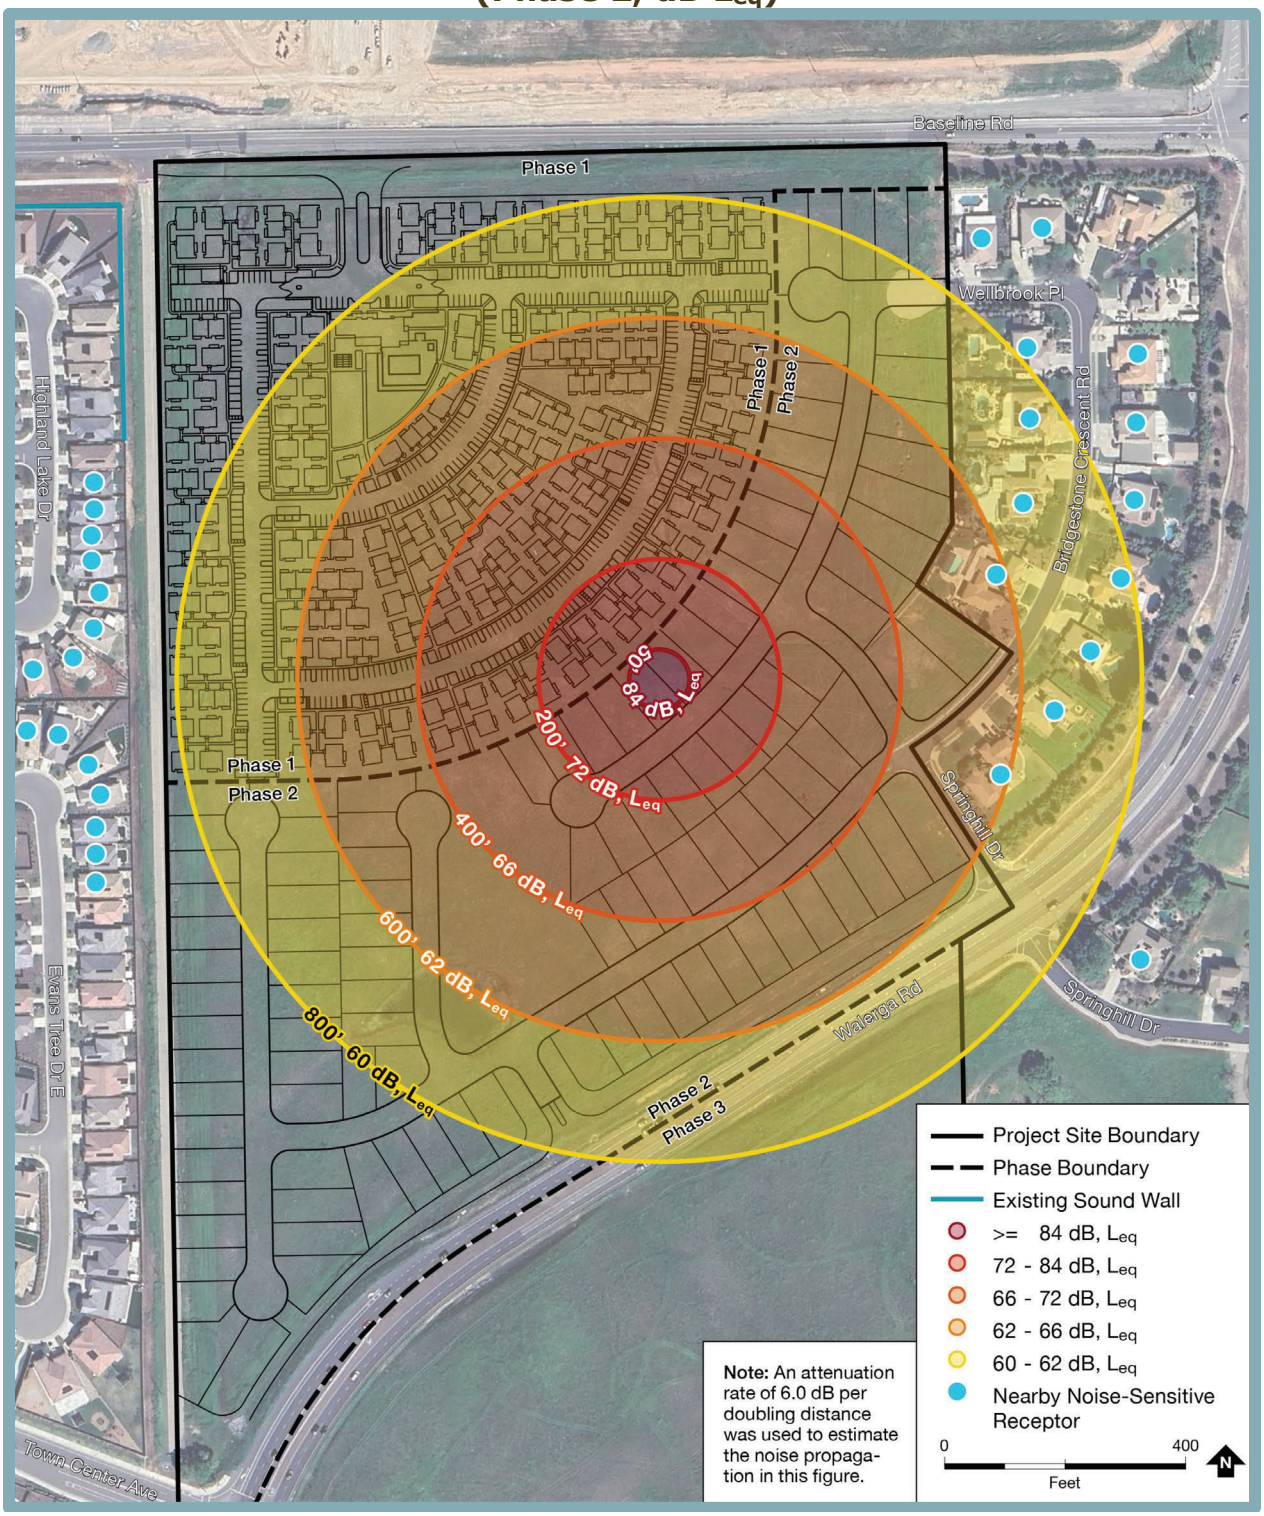
Figure 14-2
Average Noise Contours for Daytime Construction Noise Levels (Phase 1, dB L_{eq})



Note 1: The noise contours shown in this figure do not account for topographical features. There is an existing masonry sound wall atop of an earthen berm between the Project site and the homes to the west of the Project site that would significantly reduce construction noise levels reaching the nearest homes on Highland Lake Drive. This existing masonry sound wall is approximately 10-12 feet above the grade of Baseline Road and would block the line of sight between the construction footprint and the nearest homes on Highland Lake Drive. To be conservative, a 10 dB reduction in construction noise can be assumed to occur when construction noise reaches the eastern boundary of the homes on Highland Lake Drive.

Note 2: An attenuation rate of 6.0 dB per doubling distance was used to estimate the noise propagation in this figure.

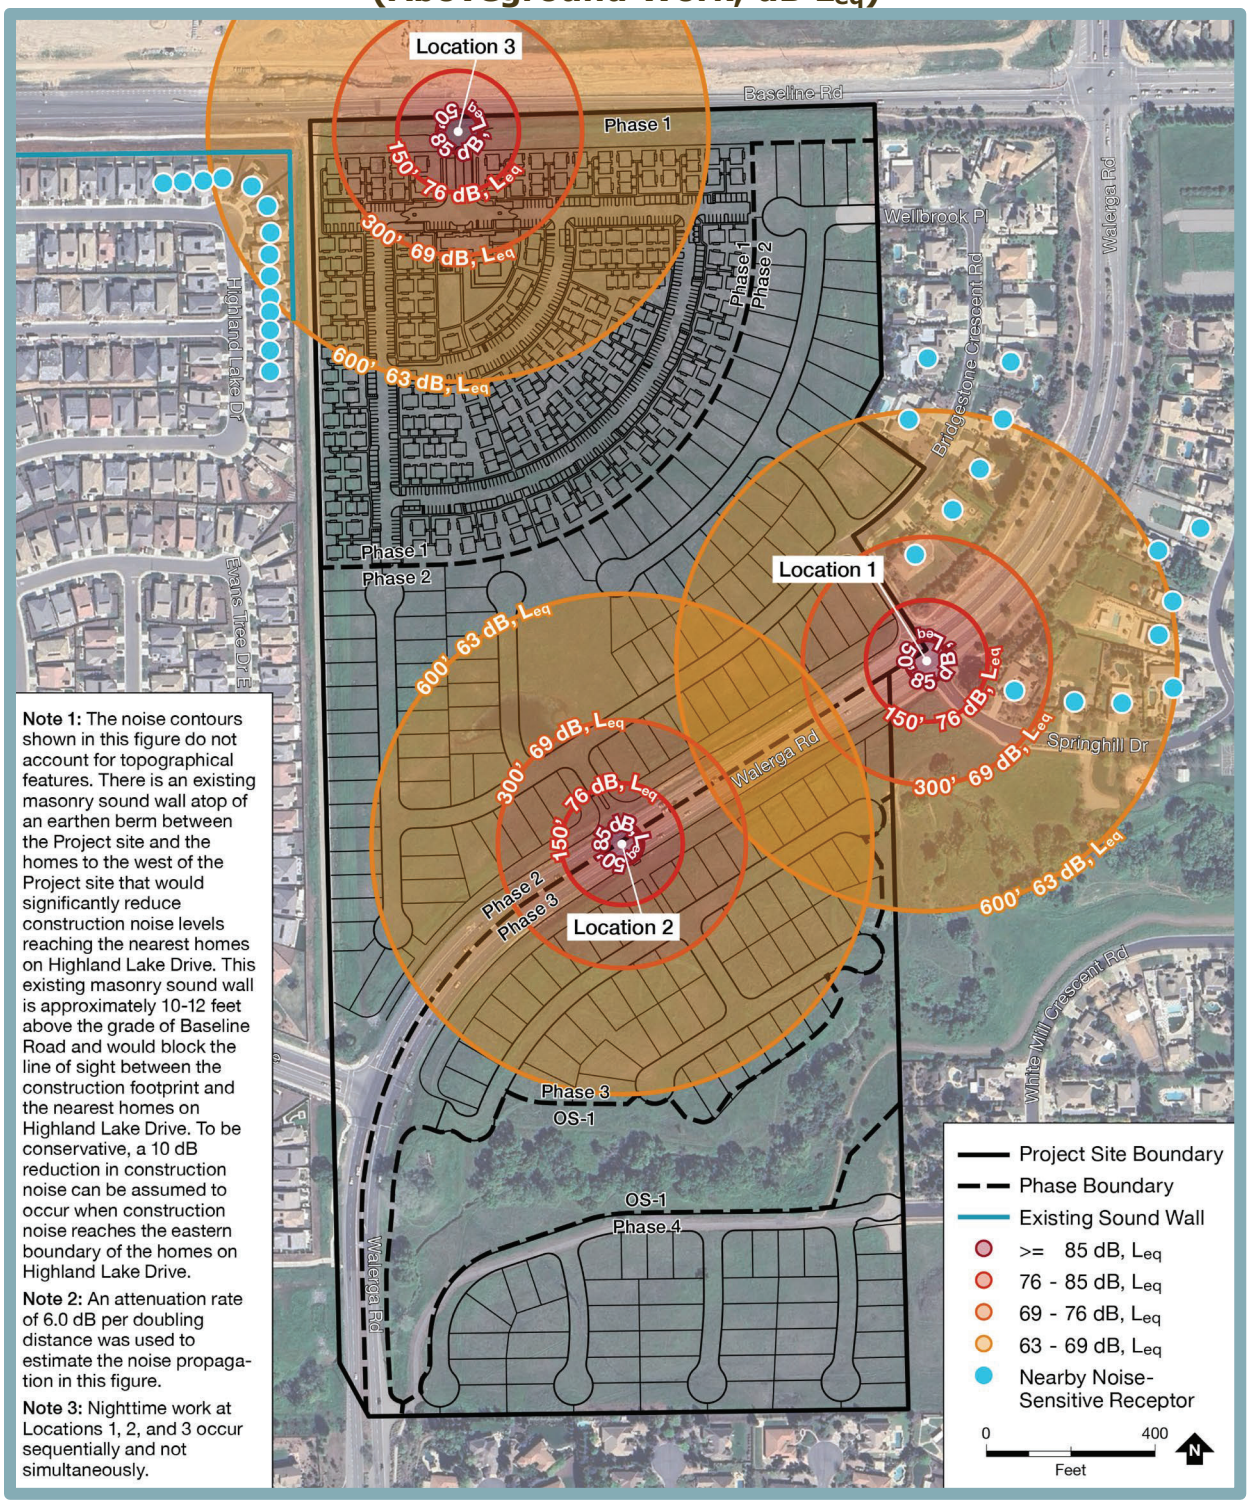
Table 14-10
Predicted Nighttime Construction Noise Levels (dB, L_{eq})



Exterior Noise Levels for Aboveground Work					
Location	**Construction Noise Level (at 50 feet)**	**Construction Noise Level (at Nearest Receptor)**	**Existing Nighttime Exterior Noise Level**	**Change from Existing Noise Levels**	**Results in Five dB L_{eq} Increase or More?**
1	85	76[1]	59 to 71[2]	5 to 17	Yes
2	85	61[3]	59 to 71[2]	0 to 2	No
3	85	56[4]	54 to 65[6]	0 to 2	No[4]

Interior Noise Levels				
Location	**Construction Noise Level (at 50 feet)**	**Construction Noise Level (at Nearest Receptor)**	**Predicted Interior Noise Level at the Nearest Receptor**	**Results in Noise Levels Over 45 dB L_{dn}?**
1	85	76[1]	46 to 51[6]	Yes
2	85	61[3]	31 to 36[6]	No
3	85	56[7]	26 to 31[6]	No

1 Distance is assumed to be 150 feet between the center of nighttime construction Location 1 and the nearest home to the north on Springhill Drive and Walerga Road.
2 See Table 14-2, Site 2 for nighttime hourly L_{eq}'s which were taken nearby the nearest homes to the north of Walerga Road on Springhill Drive.
3 Distance is assumed to be 800 feet between the center of nighttime construction Location 2 and the nearest home to the northeast on Springhill Drive.
4 Distance is assumed to be 450 feet between the center of nighttime construction Location 3 and the nearest home to the southwest on Highland Lake Drive. The resulting noise level would be 66 dB, L_{eq}. However, there is an existing masonry sound wall atop of an earthen berm that would significantly reduce nighttime construction noise levels reaching the nearest homes on Highland Lake Drive. This existing masonry sound wall is approximately 10-12 feet above the grade of Baseline Road and would block the line of sight between the construction footprint and the nearest homes on Highland Lake Drive; therefore, a conservative 10 dB reduction can be applied. Thus, the resulting noise levels would be approximately 56 dB, L_{eq}.
5 See Table 14-2, Site 1 for nighttime hourly L_{eq}'s which were taken nearby the nearest homes on Highland Lake Drive.
6 Noise reductions afforded by building construction can vary depending on construction materials and techniques. Standard construction practices typically provide approximately 25 to 30 dB exterior-to-interior reduction (with windows and doors closed). The nearest noise-sensitive receptors to nighttime construction are assumed to be built with materials that would provide a 25 to 30 dB exterior-to-interior noise reduction (with windows and doors closed).
7 Distance is assumed to be 450 feet between the center of nighttime construction Location 3 and the nearest home to the southwest on Highland Lake Drive. The resulting noise level would be 66 dB, L_{eq}. However, there is an existing masonry sound wall atop of an earthen berm that would significantly reduce nighttime construction noise levels reaching the nearest homes on Highland Lake Drive. This existing masonry sound wall is approximately 10-12 feet above the grade of Baseline Road, therefore, a conservative 10 dB reduction can be applied. Thus, the resulting noise levels would be approximately 56 dB, L_{eq}.

Figure 14-5
Average Noise Contours for Nighttime Construction Noise Levels (Aboveground Work, dB L_{eq})

* Figure not OCR Compatible

Based on the above, project construction noise levels associated with on-site and off-site construction activities could result in a significant noise level increase at the nearest sensitive receptor(s).

Off-Site Affordable Housing Parcel

During future construction activities within the off-site affordable housing parcel, heavy equipment could be used for grading, excavation, paving, and structure construction, all of which would temporarily increase ambient noise levels when in use. Noise levels would vary depending on the type and operation of equipment and how well the equipment is maintained. Noise exposure at any single point outside the project site would also vary depending on the distance from the source. As shown in Table 14-8, activities involved in typical residential construction would generate noise levels ranging from 73 to 83 dB at a distance of 50 feet. The nearest sensitive receptor to the off-site affordable housing parcel is located approximately 100 feet from the parcel to the west, across Watt Avenue.

Construction activities would be temporary in nature and are anticipated to occur during normal daytime working hours. Noise would also be generated during the construction phase by increased truck traffic on area roadways associated with transport of heavy materials and equipment to and from the construction site. Placer County Code Section 9.36.030(A)(7) exempts noise sources associated with construction activities, provided that such activities occur between applicable hours and that construction equipment is fitted with muffling devices and maintained in good working order. All noise-generating project construction equipment and activities are reasonably assumed to comply and would, thereby, be exempt from the applicable noise level criteria. Nonetheless, at such time the off-site affordable housing parcel gets developed, RVSP EIR Mitigation Measure 11-1a, which has been incorporated into this EIR as Mitigation Measure 14-1(c), would be required.

Conclusion

Based on the above, the proposed project and the off-site affordable housing component could generate a substantial temporary increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. Thus, a ***significant*** impact could occur.

Mitigation Measure(s)

According to the Noise Report, implementation of Mitigation Measure 14-1(a) would reduce daytime construction noise impacts at the single-family residences east of the proposed Phase 2 lots (along Wellbrook Place and Bridgestone Crescent Road) to a less-than-significant level. However, even with the implementation of Mitigation Measure 14-1(a), daytime construction noise levels reaching nearby sensitive receptors south of the Phase 4 lots (along French Creek Court, Eagle Creek Court, Marsh Creek Court, and Rockporte Court) would still exceed the exterior noise increase threshold of five dB L_{eq}.

With respect to nighttime noise, Mitigation Measure 14-1(a) would reduce nighttime construction noise levels at nearby noise-sensitive locations. However, the Noise Report concluded that constructing temporary sound walls along the existing single-family residences on Springhill Drive, though helpful to reduce nighttime construction noise impacts, would not be feasible due to the existing topography. Implementation of Mitigation Measure 14-1(b) is intended to reduce interior noise levels at nearby receptors.

However, according to the Noise Report, nighttime construction noise at nearby sensitive receptors would likely still exceed the exterior noise increase threshold of five dB L_{eq} (i.e., a readily perceptible increase) and the interior noise level threshold of 45 dB L_{dn} CNEL.

Furthermore, as previously discussed, potential future development within the off-site affordable housing parcel would be required to comply with Mitigation Measure 11-1a from the RVSP EIR, which requires the development and implementation of a construction noise abatement program, and is incorporated into this EIR as Mitigation Measure 14-1(c) below. However, the RVSP EIR concluded that implementation of Mitigation Measure 11-1a would not reduce the identified short-term significant impact related to noise level increases associated with construction equipment to a less-than-significant level.

Based on the above, the proposed project and off-site affordable housing parcel could generate a substantial temporary increase in ambient noise levels in noise-sensitive locations in the vicinity of the project. Therefore, the impact would remain *significant and unavoidable*.

Proposed Project

14-1(a) *Prior to commencement of on-site construction activities (including tree removal), the project applicant shall implement the following construction noise reduction measures, subject to review and approval by the Community Development Resource Agency Director:*

- *Noise-generating construction activities (e.g., construction, alteration, or repair activities) shall be limited to the hours exempted/required by Placer County Code Section 9.36.030(A)(7) and DCWPCP Noise Policy 7.*
- *All mobile or fixed noise-producing equipment used on the project site that are regulated for noise output by a federal, State, or local agency shall comply with such regulations while in the course of project activity.*
- *Electrically powered equipment shall be used instead of pneumatic or internal combustion-powered equipment, where feasible.*
- *Material stockpiles and mobile equipment staging, parking, and maintenance areas shall be located as far as practicable from noise-sensitive receptors.*
- *Construction site and access road speed limits shall be established and enforced during the construction period.*
- *A six-foot-tall temporary sound wall shall be constructed on the eastern site boundary of the proposed Phase 2 lots along the fenceline of the existing single-family residences on Wellbrook Place and Bridgestone Crescent Road to the east.*
- *A six-foot-tall temporary sound wall shall be constructed on the southern site boundary of the proposed Phase 4 lots along the fenceline of the single-family residences on French Creek Court, Eagle Creek Court, Marsh Creek Court, and Rockporte Court to the south.*
- *The sound wall fencing shall consist of 0.5-inch plywood or minimum Sound Transmission Class (STC) 27 sound curtains placed to shield nearby noise-sensitive receptors from construction*

noise. The plywood barrier shall be free from gaps, openings, or penetrations to ensure maximum performance. The temporary construction sound wall shall be constructed prior to any tree removal or other ground-disturbing activities associated with project construction.

- *The Construction Contractor shall designate a "Construction Noise Coordinator" to be responsible for responding to any local complaints about construction noise. The Construction Noise Coordinator shall determine the cause of the complaint and shall require implementation of reasonable measures to correct the problem. The telephone number for the Construction Noise Coordinator shall be conspicuously posted at the construction site.*
- *At least three weeks prior to the start of construction activities, the Construction Contractor shall provide written notification to residences within 500 feet of the construction site informing them of the estimated start date and duration of construction activities, the role of the Construction Noise Coordinator, and how to contact the Construction Noise Coordinator.*
- *All construction equipment shall be properly maintained and in good working order.*
- *Staging areas shall be located at the greatest feasible distances away from nearby noise-sensitive receptors.*
- *Noise-reducing enclosures or acoustic barriers shall be used around stationary noise-generating equipment (e.g., generators, air compressors).*
- *All construction equipment powered by gasoline or diesel engines shall be fitted with sound control devices (i.e., mufflers) that are at least as effective as those originally provided by the manufacturer and all equipment shall be operated and maintained to minimize noise generation.*
- *Heavy-duty construction equipment shall be operated at the lowest operating power possible.*

14-1(b) *At least two weeks prior to any project-related nighttime construction, the Construction Contractor shall provide written notification to residences within 600 feet of the nighttime construction footprint. The written notification shall provide the estimated start time and duration of the nighttime construction, recommendations to these residences to keep windows and doors closed during nighttime construction events, the role of the Construction Noise Coordinator, and how to contact the Construction Noise Coordinator. Proof of compliance with the foregoing measure shall be submitted to the Placer County Community Development Resource Agency.*

Off-Site Affordable Housing Parcel

14-1(c) *Implement RVSP EIR Mitigation Measure 11-1a:*

Prior to construction plan approval, the Department of Public Works (DPW) will develop and implement a construction noise abatement program

acceptable to Placer County Division of Environmental Health (DEH) and conforming to Minute Order 98-08. The plan shall require that:

- *All construction vehicles or equipment, fixed or mobile, shall be equipped with properly operating and maintained mufflers;*
- *Stockpiling and/or vehicle staging areas shall be identified on the improvement plans and shall be located as far as is practical from existing occupied dwellings;*
- *Construction noise emanating from any construction activities for which a Grading or Building Permit is required is prohibited on Sundays and federal holidays, and shall only occur during the following times:*
    - *Monday through Friday, 6:00 a.m. to 8:00 p.m. (during daylight savings)*
    - *Monday through Friday, 7:00 a.m. to 8:00 p.m. (during standard time)*
    - *Saturdays, 8:00 a.m. to 6:00 p.m.*

These parameters are standard construction times set by the County's Planning Commission.

- *Specific noise-control measures shall be identified that will reduce the hourly noise level to 70 dBA or lower at all schools during periods when schools are in session;*
- *Specific noise-control measures shall be identified that will reduce the hourly average noise level to 70 dBA or lower at other noise-sensitive receptors where feasible. The construction contractor shall consider implementation of the following measures in the construction noise control plan:*
    1. *Select equipment capable of performing the necessary tasks with the lowest noise-emission level and the lowest possible height for the acoustic center of noise emissions.*
    2. *Noise barriers may be required to block the line of sight from noise sources to noise-sensitive receivers of concern or to further reduce noise levels beyond that provided by line-of-sight breaks afforded by topographical features. The noise barriers could be constructed using either plywood sheets or other solid material that provides sufficient mass per unit surface area (perhaps approaching 4 pounds per square foot) and has minimal openings between the top of barrier and ground surface (perhaps as little as 1 percent). Noise barriers of a given height are generally most effective when placed as close as possible to either the source or receiver, and perhaps at two such separate locations. The least desirable location is generally at a middle distance between sources and receptors. The plan shall identify the proper height, location, and effectiveness of a noise barrier in terms*

of the expected hourly average noise level due to construction activity at noise-sensitive receivers of concern, with the objective of reducing contributions from construction activity to an hourly average of 70 dBA or less.

14-2 Generation of a substantial permanent increase in ambient noise levels in noise-sensitive locations in the vicinity of the project or generation of a substantial permanent increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. Based on the analysis below, the impact is *less than significant.*

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as the off-site affordable housing parcel, which could generate a substantial permanent increase in ambient noise levels in noise-sensitive locations in the vicinity of the project or in excess of standards.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

Given the residential nature of the proposed project, noise sources associated with operation of the proposed project would primarily consist of noise from project-generated traffic along roadways in the project vicinity, as well as on-site stationary noise generated from HVAC equipment and the proposed pickleball courts within the Phase 2 park lot. Potential impacts related to project-generated traffic noise, pickleball court noise, and stationary noise from HVAC equipment at existing sensitive receptors are discussed separately below. The proposed off-site sewer lift station improvements are related to providing additional underground emergency sewer storage capacity, and would not result in operational noise. Therefore, the below discussion focuses on operational noise sources associated with the proposed project.

In addition, as discussed previously, CEQA does not require an analysis of the environment's impact on the proposed project; however, effects to future residents of the project due to traffic noise along local roadways are evaluated for the purposes of considering the project's consistency with noise-related policies in the Placer County General Plan. While not an environmental issue required for analysis under CEQA, the County would condition the proposed project to address identified noise effects on future residents of the project as part of project approval.

Traffic Noise at Existing Noise-Sensitive Receptors

Using the methodology described above in the Method of Analysis section, traffic noise levels under Existing Plus Project conditions were estimated as part of the Noise Report and are shown in Table 14-11, in comparison to existing conditions.

Table 14-11
Estimated AM/PM Peak Hour Traffic Noise Levels Along Roadways in the Project Vicinity (dB CNEL)

Roadway	Segment	Hour	Existing	Existing + Project	Incremental Increase	Significance Threshold[1]	Threshold Exceeded?
Baseline Road	East of Santucci Boulevard/Watt Avenue	AM	67.5	67.9	0.4	+1.5	No
		PM	68.9	69.2	0.3	+1.5	No
Baseline Road	East of Westbrook Boulevard	AM	67.4	67.6	0.2	+1.5	No
		PM	69.0	69.2	0.2	+1.5	No
Westbrook Boulevard	North of Baseline Road	AM	60.4	60.4	0.0	+3.0	No
		PM	60.0	60.0	0.0	+3.0	No
Market Street	North of Baseline Road	AM	62.4	62.4	0.0	+3.0	No
		PM	62.5	62.5	0.0	+3.0	No
Baseline Road	West of Upland Drive	AM	67.0	67.2	0.2	+1.5	No
		PM	69.8	69.9	0.1	+1.5	No
Baseline Road	East of Upland Drive	AM	67.0	67.3	0.3	+1.5	No
		PM	70.3	70.5	0.2	+1.5	No
Fiddyment Road	North of Baseline Road	AM	71.3	71.4	0.1	+1.5	No
		PM	70.4	71.5	1.1	+1.5	No
Crowder Lane	South of Baseline Road	AM	55.2	56.3	1.1	+5.0	No
		PM	53.9	55.7	1.8	+5.0	No
Vineyard Road	West of Crowder Lane	AM	49.0	52.7	3.7	+5.0	No
		PM	51.4	53.3	1.9	+5.0	No
Crowder Lane	North of Vineyard Road	AM	55.6	56.5	0.9	+5.0	No
		PM	54.4	55.3	0.9	+5.0	No
Walerga Road	South of Springhill Drive	AM	68.9	69.1	0.2	+1.5	No
		PM	68.8	69.1	0.3	+1.5	No
Springhill Drive	West of Walerga Road	AM	41.1	49.0	7.9	+5.0	Yes
		PM	39.5	46.2	6.7	+5.0	Yes
Springhill Drive	East of Walerga Road	AM	44.1	44.1	0.0	+5.0	No
		PM	43.7	44.3	0.6	+5.0	No
Town Center Avenue	West of Walerga Road	AM	57.8	57.8	0.0	+5.0	No
		PM	57.0	57.0	0.0	+5.0	No
PFE Road	East of Walerga Road	AM	63.3	63.6	0.3	+3.0	No
		PM	63.3	63.7	0.4	+3.0	No
PFE Road	West of Walerga Road	AM	63.2	63.6	0.4	+3.0	No
		PM	62.7	63.3	0.6	+3.0	No

[1] Significance thresholds established by FICON shown in Table 14-7.

Source: RCH, October 2025.

The estimated noise levels are provided in terms of CNEL at distances representing the nearest noise-sensitive land uses to the project vicinity roadways. The table evaluates the traffic noise level increases against the thresholds summarized in Table 14-7. As shown within the table, the majority of the traffic noise level increases attributable to the proposed project would be below the FICON increase significance criteria. The modeled results for the Springhill Drive roadway segment west of Walerga Road indicate a 7.9 dB CNEL increase for the Existing plus Project AM peak hour and a 6.7 dB CNEL increase for Existing plus Project PM peak hour. Such traffic noise level increases exceed the five dB increase threshold (see Table 14-7). However, the roadway segment is only approximately 230 feet long before intersecting with Bridgestone Crescent Road to the north, and only one existing single-family residence is located along the roadway (north of the corner of Walerga Road and Springhill Drive).

The noise modeling conducted for the Noise Report indicates that the maximum noise level on the roadway segment would be 50.0 dB CNEL under cumulative buildout conditions. A noise level of 50 dB CNEL is well below the existing traffic noise on Walerga Road (approximately 73 to 74 dB CNEL), which already reaches the existing sensitive receptor. Therefore, according to the Noise Report, the maximum 50 dB CNEL noise level at the roadway segment would be completely masked by the traffic noise that already exists on Walerga Road and the noise level increase would be negligible compared to the existing traffic noise.

Based on the above, the increase in traffic noise levels at existing sensitive receptors due to the proposed project would be considered less than significant.

Pickleball Noise at Existing Noise-Sensitive Receptors

The proposed project would include two pickleball courts as part of the Phase 2 outdoor recreation amenities. Noise generated by pickleball gameplay would be required to comply with Section 9.36.060 of the County Code for daytime noise levels, which establishes a maximum daytime (7:00 AM to 10:00 PM) outdoor noise level of 70 dB L_{max} when measured from the nearest property line.

The nearest off-site residential property line is located approximately 500 feet away from the proposed pickleball courts. Based on the representative measurements taken during a pickleball gameplay event, pickleball gameplay noise would be expected to range between 25 to 36 dB L_{max} at the nearest off-site residential property line. The estimated noise levels would be well below the County's daytime outdoor noise level threshold of 70 dB L_{max} and would likely not be perceptible over other outdoor noise sources. Therefore, the Noise Report concluded that noise from pickleball gameplay would be less than significant.

On-Site Stationary Noise

According to the Noise Report, rooftop-mounted HVAC equipment could be as close as 130 feet from the nearest existing residential property line. At such a distance, noise levels associated with the rooftop-mounted HVAC equipment would attenuate to approximately 35 dB. Ground-level HVAC equipment could be as close as 50 feet from the nearest existing residential property line, which would attenuate to approximately 44 dB. The foregoing noise levels would not exceed the 45 dB hourly L_{eq} nighttime threshold.

Therefore, noise from mechanical HVAC equipment would result in a less-than-significant impact.

Traffic Noise at Proposed Noise-Sensitive Receptors

Using the methodology described above in the Method of Analysis section, future traffic noise levels were estimated at the proposed residential backyard areas. The future Cumulative Plus Project noise modeling showed that the exterior areas closest to Baseline Road would have a noise level of approximately 72 dB CNEL, and that the exterior areas closest to Walerga Road would have a noise level of approximately 78 dB CNEL. Therefore, future traffic noise level exposure is predicted to exceed the County's conditionally acceptable 65 dB L_{dn} exterior noise level standard at the nearest proposed backyard areas to the road without the inclusion of noise-reducing features.

According to the Noise Report, sound walls would reduce the existing and future transportation noise levels at the proposed residential areas in closest proximity to Baseline Road and Walerga Road. Current project plans include sound walls between the northern lots of Phase 1 and Baseline Road, between the southern lots of Phase 2 and Walerga Road, and between the northern lots of Phase 3 and Walerga Road. Table 14-12 summarizes the results of noise attenuation analysis of various sound wall heights.

As previously discussed, such noise effects are not environmental issues required for analysis under CEQA. In order to comply with the Placer County 65 dB DNL conditionally acceptable exterior noise level standard, the proposed project, at a minimum, would require construction of sound walls. As such, the County shall condition the project to construct noise barriers, as set forth in the project conditions of approval below:

- The project applicant shall construct a six-foot-tall sound wall between the northern lots of Phase 1 and Baseline Road. The noise barrier could take the form of masonry wall, earthen berm, or a combination of the two.
- The project applicant shall construct a 12-foot-tall sound wall between the southern lots of Phase 2 and Walerga Road. The noise barriers could take the form of masonry wall, earthen berm, or a combination of the two.
- The project applicant shall construct a nine-foot-tall sound wall between the northern lots of Phase 3 and Walerga Road. The noise barriers could take the form of masonry wall, earthen berm, or a combination of the two.

The construction of the abovementioned sound walls would ensure traffic noise levels at exterior areas associated with the residences proposed closest to the project area roadways would meet the County's 65 dB L_{dn} conditionally acceptable threshold. With respect to the residential interiors, building facades typically provide a minimum exterior-to-interior noise reduction of 25 to 30 dB with windows closed. Because the exterior noise levels are all estimated to be 65 dB or below in the future (with construction of the sound walls), the additional 25 dB noise reduction would reduce interior noise levels below 40 dB CNEL.

Therefore, interior noise levels at the proposed residences would be less than the County's 45 dB CNEL noise standard, and additional noise control measures are not required to reduce interior noise to acceptable levels.

Table 14-12
Noise Modeling for Project Area Roadway Traffic Noise (dB CNEL)

Sound Wall Height	Existing Noise Level	Future Noise Level	Meets County Exterior Noise Standard?
Baseline Road Traffic Noise (Phase 1 Lots)[1,2]			
No wall	68	72	No
5 feet	63	67	No
6 feet	61	65	Yes
Walerga Road Traffic Noise (Phase 2 Lots)[1,3]			
No wall	74	78	No
5 feet	69	73	No
6 feet	67	71	No
7 feet	66	70	No
8 feet	65	69	No
9 feet	64	68	No
10 feet	64	68	No
11 feet	63	67	No
12 feet	61	65	Yes
Walerga Road Traffic Noise (Phase 3 Lots)[3,4]			
No wall	74	78	No
5 feet	65	69	No
6 feet	64	68	No
7 feet	63	67	No
8 feet	62	66	No
9 feet	61	65	Yes

Notes: Sound walls less than five feet tall were not estimated because they would not break the line of sight between vehicles and backyards. Noise levels were rounded to nearest dB.

1 The modeled sound walls assumed flat site conditions where elevations, base of wall elevations, and building pad elevations are approximately equivalent.
2 Outdoor activity area noise levels were modeled in the center of the backyards of the proposed Phase 1 Lots closest to the sound wall, closest backyards to Baseline Road.
3 The modeled sound walls assumed that the building pad elevations along the Phase 3 lots are an average of four feet below the grade of Walerga Road.
4 Outdoor activity area noise levels were modeled in the center of the backyards of the proposed Phase 2 lots closest to the sound wall, closest backyards to Walerga Road.

Source: RCH, October 2025.

Off-Site Affordable Housing Parcel

The RVSP included traffic noise level calculations at nearby sensitive receptors to the RVSP planning area, including existing levels and existing plus project conditions. The closest receptors to the off-site affordable housing parcel are receptors NP1/ST3, located approximately 150 feet south of the parcel's southern site boundary, and NP8, within the cemetery north of the parcel (see Figure 14-6).

As noted in Table 11-6 of the RVSP, the existing noise level calculations at both locations are 56 dBA L_{dn}, largely from traffic noise on surrounding roads (i.e., PFE Road and Watt Avenue). Exterior noise level increases were calculated to be one dBA for the Existing Plus Project condition, both with and without six-foot masonry walls. Therefore, the RVSP notes under Impact 11-2 that noise levels under Existing Plus Project conditions would not exceed the County's noise threshold of 60 dBA L_{dn}. In addition, due to the nature of the affordable housing units and relatively small size of the parcel, new trips associated with the affordable housing units are not anticipated to double traffic volumes (generally required to increase traffic noise levels by five dB).

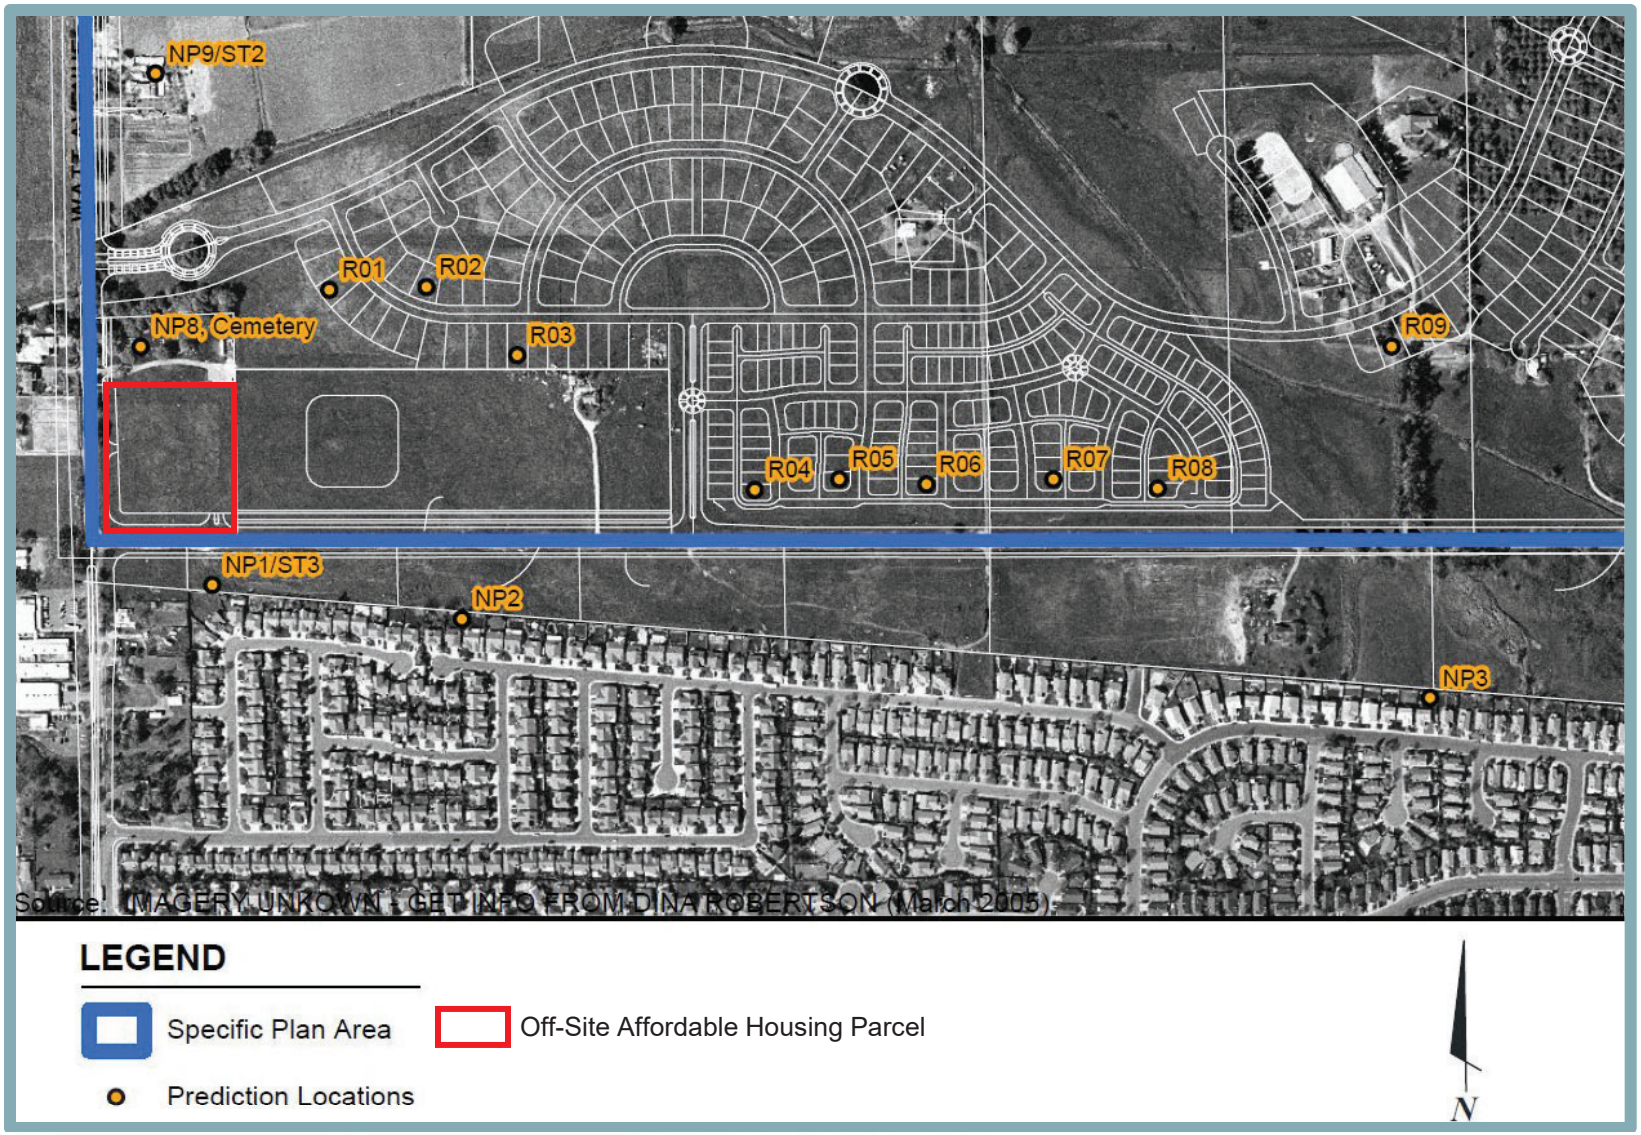
Residences are not typically associated with the generation of substantial noise. Operation of the off-site affordable housing parcel would include typical residential noise, which would be compatible with the existing residential uses in the area. The off-site affordable housing units are not anticipated to contribute a measurable operational noise level increase to the existing ambient noise environment at any sensitive receptor locations.

Conclusion

Based on the above, the proposed project, off-site sewer lift improvements, and the off-site affordable housing parcel would not result in the generation of a substantial permanent increase in ambient noise at existing residences located within the immediate project vicinity or the generation of a substantial permanent increase in ambient noise levels in excess of applicable standards. Therefore, a ***less-than-significant*** impact would occur.

Mitigation Measure(s)

None required.



14-3 Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels. Based on the analysis below, the impact is *less than significant*.

The following discussion includes an analysis of potential impacts related to development of the proposed project and off-site sewer lift station improvements area, as well as the off-site affordable housing parcel, which could expose people to or generate excessive groundborne vibration or noise levels.

Proposed Project and Off-Site Sewer Lift Station Improvements Area

The proposed project would consist of a residential community and the proposed off-site sewer lift station improvements would provide additional underground emergency sewer storage capacity. Such uses do not typically involve equipment that generates appreciable vibration. Overall, operations associated with the proposed project and off-site sewer lift station improvements would not result in the generation of excessive groundborne vibration or groundborne noise levels.

Figure 14-6
RVSP Noise Prediction Locations

* Figure not OCR Compatible

However, construction activities associated with the proposed project would have the potential to result in varying degrees of temporary ground vibration depending on the specific construction equipment used and operations involved. Accordingly, the analysis below focuses on construction vibration only.

During on-site project construction, heavy equipment would be used for grading, excavation, paving, and building construction. Use of heavy equipment associated with the aforementioned construction activities would generate localized vibration in the immediate vicinity of the project site. Sensitive receptors are not located near the off-site sewer lift station improvements area. The nearest existing sensitive receptors (east of the Phase 2 lots and south of the Phase 4 lots) are located as closely as 25 feet from where vibration-generating activities could occur. Table 14-13 presents the estimated vibration levels in PPV for equipment commonly used in residential construction projects at a distance of 25 feet.

Table 14-13
Vibration Levels During Construction (PPV)

Construction Equipment	PPV at 25 Feet	Exceeds 0.5 in/sec Threshold?
Roller	0.210	No
Excavator	0.175	No
Loaded Trucks	0.076	No
Backhoe	0.028	No
Loader	0.026	No

Source: RCH, October 2025.

As shown in Table 14-13, vibration levels generated by on-site construction activities at the nearest sensitive receptors would be well below the applicable thresholds for damage to structures of 0.5 in/sec PPV. Therefore, project construction would not result in excessive groundborne vibration levels at nearby existing receptors.

Off-Site Affordable Housing Parcel

Due to the residential nature of the proposed project, reasonably foreseeable operational activities that would result in the generation of substantial groundborne vibration do not exist. However, construction activity associated with the potential future affordable housing units would have the potential to result in varying degrees of temporary ground vibration depending on the specific construction equipment used and operations involved. Construction would use typical construction equipment and would not require significant sources of vibration such as pile driving or blasting. The vibration levels generated by construction equipment shown in Table 14-13 would also represent the typical vibration levels produced during construction of the off-site affordable housing units. As previously discussed, the nearest sensitive receptor to the off-site affordable housing parcel is located approximately 100 feet from the parcel to the west, across Watt Avenue. Therefore, future construction of the off-site affordable housing units would not result in excessive groundborne vibration levels at nearby existing receptors.

Conclusion

Based on the above, construction and operation of the proposed project, off-site sewer lift station improvements, and the off-site affordable housing parcel would not result in the

generation of excessive groundborne vibration or groundborne noise levels. As such, a ***less-than-significant*** impact would occur.

Mitigation Measure(s)
None required.

Cumulative Impacts and Mitigation Measures

As defined in Section 15355 of the CEQA Guidelines, "cumulative impacts" refers to two or more individual effects which, when considered together, are considerable, compound, or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Given the short-term nature of construction activities, noise-level increases generated during project construction would be site-specific and would not contribute to ambient noise level increases in conjunction with cumulative development in the DCWPCP. For this reason, the following analysis evaluates project-related traffic noise level increases under cumulative conditions.

For further detail related to the cumulative setting of the proposed project, refer to Chapter 20, Statutorily Required Sections, of this EIR.

14-4 Generation of a substantial permanent increase in ambient noise levels associated with cumulative development of the proposed project in combination with future buildout of the DCWPCP. Based on the analysis below, the cumulative impact is *less than significant*.

Future development projects within the DCWPCP area, including the proposed project, would incrementally affect the future cumulative ambient noise environment. Given the residential nature of the proposed project, the primary project component that could combine with noise impacts from surrounding development in the project region would be associated with vehicle traffic generated by the project and other planned development projects, which together, could potentially result in a significant cumulative impact related to transportation noise.

Using the methodology described above in the Method of Analysis section, traffic noise levels under Cumulative (No Project) and Cumulative Plus Project conditions were estimated as part of the Noise Report and are shown in Table 14-14. The modeled results for the Springhill Drive roadway segment west of Walerga Road indicate a five dB CNEL increase for the Cumulative Plus Project AM peak hour and a 5.1 dB CNEL increase for Cumulative Plus Project PM peak hour. Such traffic noise level increases would meet or exceed the five dB increase threshold (see Table 14-7). However, as previously discussed, the roadway segment is only approximately 230 feet long and only one existing single-family residence is located along the roadway. As shown in Table 14-14, the maximum noise level on the roadway segment would be 50 dB CNEL under cumulative buildout conditions, which is well below the existing traffic noise on Walerga Road (approximately 73 to 74 dB CNEL). Therefore, according to the Noise Report, the maximum 50 dB CNEL noise level at the roadway segment would be completely masked by the traffic noise that already exists on Walerga Road.

Table 14-14
Estimated AM/PM Cumulative Peak Hour Traffic Noise Levels Along Roadways in the Project Vicinity (dB CNEL)

Roadway	Segment	Hour	Cumulative 2044 Buildout (No Project)	Cumulative 2044 Buildout Plus Project	Incremental Increase	Significance Threshold	Significant?	Cumulatively Considerable?

		PM	45.0	45.0	0.0	+5.0	No	No
Town Center Avenue	West of Walerga Road	AM	58.1	58.1	0.0	+5.0	No	No
		PM	57.2	57.2	0.0	+5.0	No	No
PFE Road	East of Walerga Road	AM	64.2	64.4	0.2	+3.0	No	No
		PM	64.6	64.9	0.3	+3.0	No	No
PFE Road	West of Walerga Road	AM	64.2	64.4	0.2	+3.0	No	No
		PM	67.1	67.3	0.2	+1.5	No	No

[1] Significance thresholds established by FICON shown in Table 14-7.

Source: RCH, October 2025.

Based on the above, under Cumulative Plus Project conditions, the proposed project would not result in a substantial permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. Therefore, overall, the cumulative impact associated with the proposed project, in conjunction with cumulative development in the region, would be ***less than significant***.

Mitigation Measure(s)

None required.

15. Public Services and Utilities

15. PUBLIC SERVICES AND UTILITIES

15.1 INTRODUCTION

As discussed in Chapter 3, Project Description, of this EIR, the proposed project would include a total of 432 residential units and associated improvements, off-site sewer lift station improvements, and two options to meet the County's affordable housing regulations. The affordable housing options include the provision of a minimum of 22 Accessory Dwelling Units (ADUs) on lots proposed for development with single-family residential units, or an off-site proposal wherein Homes by Towne would rezone and transfer the fee title to the County an approximately four-acre parcel off-site within the Riolo Vineyards Specific Plan (RVSP), which could develop a maximum of 120 affordable income-restricted units.

In addition, the proposed project would include improvements to the off-site Community Facilities District #1 Sewer Lift Station, which would also require embankment work to raise the access and maintenance areas out of the adjacent Dry Creek 100-year floodplain. However, because the proposed improvements to the existing lift station within the off-site sewer list station improvements area would not result in increased demand for public services or utilities in the DCWPCP area, impacts related to such are not discussed further herein. However, a discussion of the required improvements necessary to serve the proposed project is included under Impact 15-6 related to wastewater infrastructure.

The Public Services and Utilities chapter of the EIR summarizes the setting information and identifies potential new demands resulting from the proposed project, off-site affordable housing parcel, and potential 22 ADUs on fire and law enforcement protection services, schools, parks, recreation facilities, and other public facilities such as libraries. The chapter also evaluates the sufficiency of water supplies to meet the water demand associated with all components of the project and assesses the adequacy of the wastewater system, solid waste disposal, and gas, electric, and telecommunication utilities required to serve all components of the project. Potential impacts to public services are identified if any component of the proposed project would require the development of new facilities or expansion of existing facilities, the construction of which could have adverse physical effects on the environment. Information for the Public Services and Utilities chapter was drawn from the following documents:

- Placer County General Plan (PCGP);[1]
- PCGP EIR;[2]
- Dry Creek-West Placer Community Plan (DCWPCP);[3]
- RVSP EIR;[4]
- Placer County Local Agency Formation Commission (LAFCo) Municipal Service Review for Fire and Emergency Services;[5]

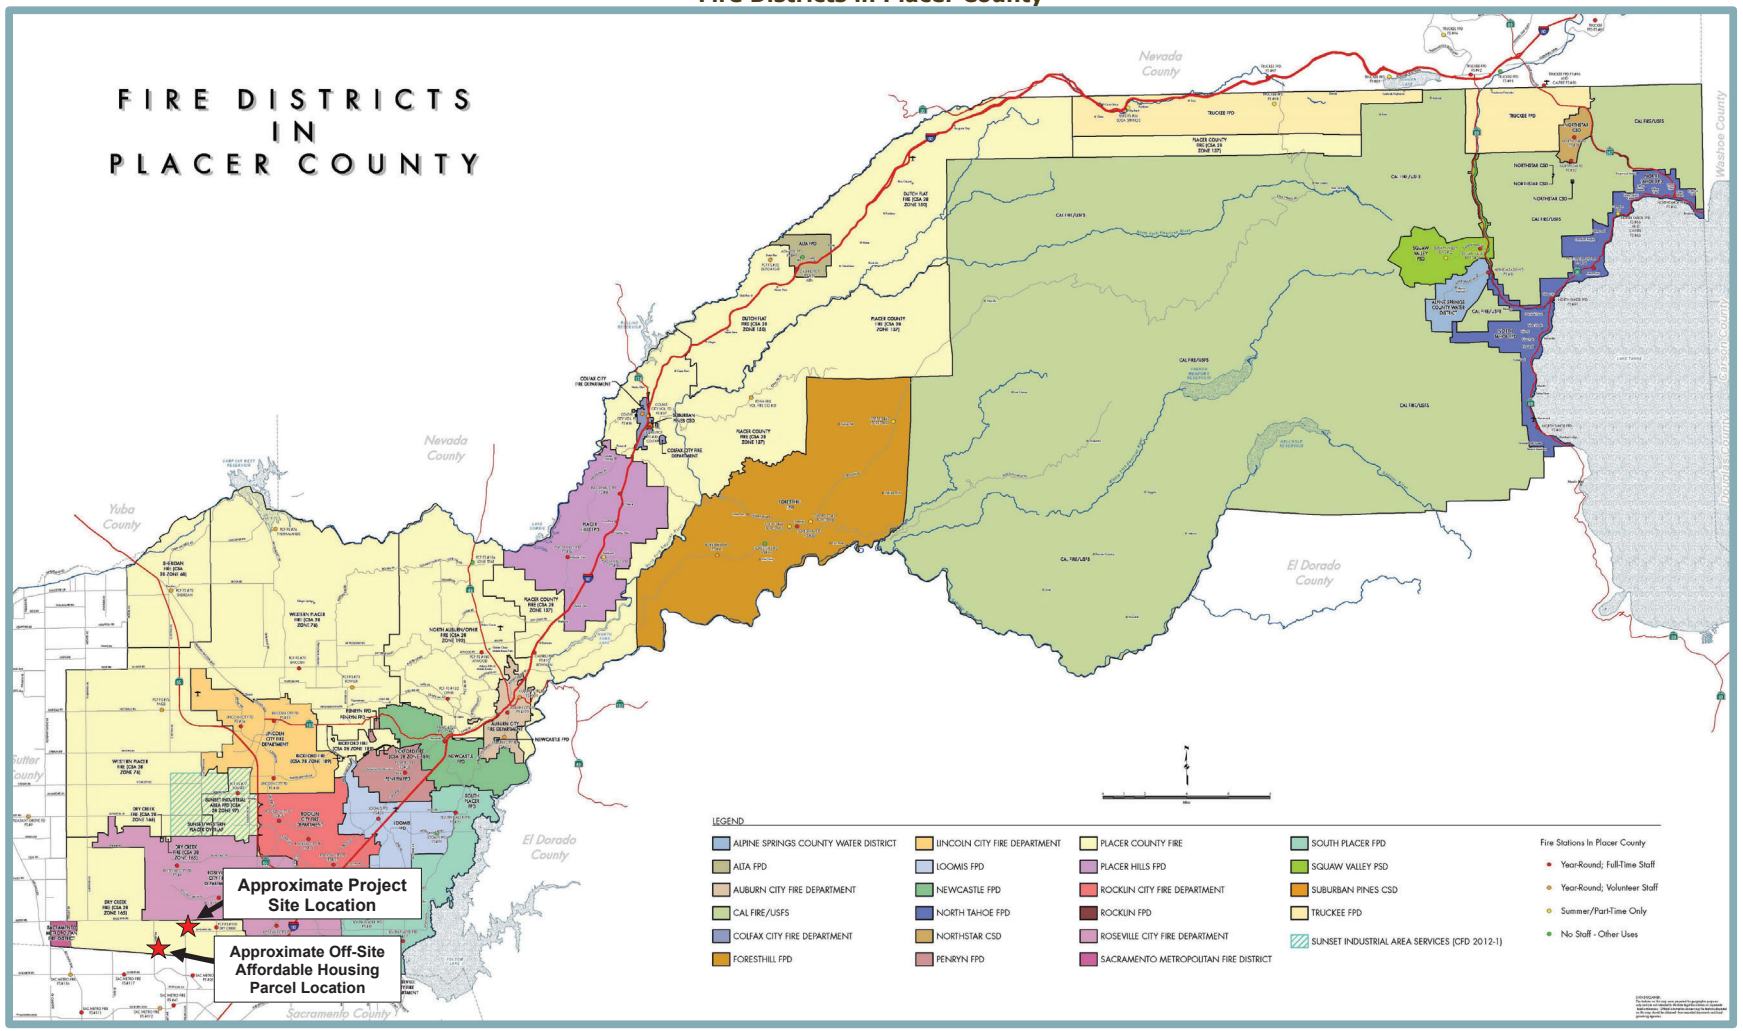
15.2 EXISTING ENVIRONMENTAL SETTING

The following section describes the existing public services in the area, including fire and law enforcement protection services, schools, parks, and recreation facilities, as well as the existing utilities and service systems in the project area, including water supply, wastewater conveyance and treatment, solid waste, and gas, electric, and telecommunication infrastructure. The project site is located to the south of the City of Roseville limits and is within the DCWPCP area. The off-site affordable housing parcel is located approximately 1.75 miles to the southwest of the project site at the northeast corner of PFE Road and Watt Avenue, within the RVSP area.

Fire Protection Services

The Placer County Fire Department (PCFD) services are administered by the County Office of Emergency Services, and the PCFD is responsible for fire protection and rescue and emergency response services for approximately 475 square miles of unincorporated area in Placer County. The territory served by the PCFD is consistent with the boundaries of County Service Area (CSA) 28, which is used as a means to fund the services offered by the PCFD, and the nearest Zone of Benefit to the project site and the off-site affordable housing parcel is Zone 165 (see Figure 15-1). However, the project site is located outside of existing CSA 28, Zone 165 boundaries. Thus, the entitlements for the proposed project include a request for annexation into the Dry Creek Fire Zone of Benefit (CSA 28, Zone 165) for the provision of fire protection services, subject to approval by the Placer County Board of Supervisors. Therefore, the sections below discuss the fire protection and rescue and emergency response services currently provided by the PCFD within the project area.



The various zones of benefit within CSA 28 represent areas previously served by independent fire districts that were dissolved at some point in the past with services transferred to the County, as well as areas originally served by the County. The zones of benefit are intended to fill the services funding gap between general County services and special services. Zone 165 covers approximately 19,800 acres and was established in September of 2001, at which point Placer County assumed responsibility for providing fire protection and emergency medical services within the area.[9] Fire prevention and protection in areas of Placer County not served by independent fire protection districts or municipal fire departments are provided by a combination of a contract with the California Department of Forestry and Fire Protection (CAL FIRE) and eight volunteer companies, all operated by CAL FIRE under the name PCFD.

Services provided include fire suppression, emergency medical, fire prevention, and rescue, among others. Additionally, PCFD, by way of its contract with CAL FIRE, conducts fire inspections and assists with land development functions within the PCFD service area.

Figure 15-1
Fire Districts in Placer County

* Figure not OCR Compatible

All fire agencies within Placer County, including within the cities, operate under a mutual aid system, defined as a pre-arranged plan and contract between agencies for reciprocal assistance upon request by the first-response agency.

The nearest CAL FIRE station to the project site is the Dry Creek Fire Station (Station 100), located approximately 1.8 miles east of the proposed eastern site entry point at 8350 Cook Riolo Road. Station 100 is a full-time staffed station and would provide fire protection services to the proposed project. According to the RVSP EIR, Station 100 provides service to the RVSP plan area, including the off-site affordable housing parcel, which is located approximately four miles southwest of the station.

PCFD collects a development impact fee specific to fire services for each sub area within the PCFD service area. The development impact fee is calculated based on a "fair share portion" of anticipated capital needs through 2060. Currently, the PCFD's Fire Facilities Fee is $1.05 per square foot (sf) of residential development. The fee was last updated April 15, 2025.[10]

Sheriff Protection Services

The Placer County Sheriff's Office (PCSO) provides law enforcement services to the unincorporated areas of Placer County, including the areas in the vicinity of the project site and off-site affordable housing parcel. In addition, the California Highway Patrol provides traffic enforcement and accident investigations along the Interstate 80 (I-80) corridor to the east of the project site and off-site affordable housing parcel.

The Auburn Justice Center (AJC), located at 2929 Richardson Drive, is the main office for the PCSO's operations and is located approximately 25 miles northeast of the project site and off-site affordable housing parcel. The PCSO has continued to work with the West Roseville community to provide increased law enforcement presence in the DCWPCP/West Roseville area. In May 2016, the Dry Creek Joint Elementary School District (DCJESD) and PCSO identified an opportunity to locate a community service station within the former Dry Creek Elementary School site at the corner of PFE Road and Cook Riolo Road, southeast of the project site. To allow this, the DCJESD provided the PCSO with a License Agreement (License) authorizing the use of approximately 2,030 sf within the former school offices. The premises are used by PCSO deputies and volunteers and as a general service center functioning as an extended office to write reports, meet with citizens, take reports, and provide a more easily identifiable law enforcement presence within the DCWPCP/West Roseville community as a whole. The former school office site was recently sold by the DCJESD to a private party; however, subsequent to the sale, PCSO entered into a lease agreement with the private party, and the operations at the community service station remain unchanged.

According to the PCGP, the PCSO is organized into five divisions: patrol services, investigations/coroner, corrections, marshal, and a Tahoe sub-station. Patrol and investigation services operate in the Placer County Government Center and various substations in Loomis, Foresthill, and near Lake Tahoe.

The nearest existing PCSO station is the West Placer Sheriff's Station, located at 5750 West Oaks Boulevard in Rocklin, approximately eight miles to the northwest of the project site and 12 miles to the northwest of the off-site affordable housing parcel. The West Placer Sheriff's Station

[10] Placer County Executive Office Land Development Division. *FY 2025-26 Fire Facilities Impact Fee Annual Capital Improvement Plan and Inflationary Adjustment*. April 15, 2025.

operates a limited number of patrols, enhancing patrol response times, and limited County services will be available in early 2026, with plans to expand.[11] In addition, the South Placer Substation, located in Loomis at the intersection of Horseshoe Bar Road and I-80, is approximately 14 miles to the northeast of the project site and 17 miles to the northeast of the off-site affordable housing parcel. Staffing of the substation includes 34 patrol positions, three detectives, six patrol sergeants, a community services/school safety sergeant, eight school resource deputies, one field community services officer, six community services officers, and numerous volunteers and other professional staff.[12] Policies 4.H.1 and 4.H.2 of the PCGP call for a staffing ratio of one officer per 1,000 residents in unincorporated areas and a response time for emergency calls of eight minutes in suburban areas. According to the *Placer County Sheriff's Office 2024 Annual Report*, the Dispatch Services Unit handled a total of 119,838 calls for service in 2021, with 41,925 calls being 911 calls.[13]

Schools

The project would be served by three school districts. The portion of the project site to the north of Walerga Road, as well as the off-site affordable housing parcel, would be served by Center Joint Unified School District (CJUSD) (kindergarten through grade 12). The portion of the project site to the south of Walerga Road would be served by DCJESD (kindergarten through grade eight) and the Roseville Joint Union High School District (RJUHSD) (grades nine through 12). Based on the most recently updated attendance areas for each district, the northern portion of the project site and the off-site affordable housing parcel are within the CJUSD Rex Fortune Elementary School attendance area, Wilson C. Riles Middle School attendance area, and Center High School attendance area. The southern portion of the project site is within the DCJESD Creekview Ranch K-8 attendance area and the RJUHSD Oakmont High School attendance area. Table 15-1 below provides enrollment and capacity information for the schools.

Table 15-1
Schools Serving the Project Site

School	District	Grades	Enrollment	Capacity
Rex Fortune Elementary School	CJUSD	K-6	565	800
Wilson C. Riles Middle School	CJUSD	7-8	740	1,100
Center High School	CJUSD	9-12	1,289	2,000
Creekview Ranch School	DCJESD	K-8	840	924
Oakmont High School	RJUHSD	9-12	1,400	1,800

Parks and Recreational Facilities

Recreational opportunities are provided by numerous federal, State, and local jurisdictions and private entities in Placer County. At the federal level, the U.S. Forest Service (USFS) manages over 300,000 acres in portions of the Tahoe National Forest, El Dorado National Forest, and portions of the Tahoe Basin, including recreation facilities and campgrounds generally near rivers,

streams, reservoirs, and lakes along the I-80 and State Route (SR) 89 corridors. At the State level, the California Department of Parks and Recreation operates eight State parks and recreation areas throughout Placer County. At the local level, the proposed project area is served by the Parks, Trails, and Open Space Division of the Placer County Department of Agriculture, Parks, and Natural Resources. The nearest public Placer County park to the project site and off-site affordable housing parcel is Dry Creek Community Park, located approximately 0.5-mile south of the site and 1.85 miles northeast of the off-site affordable housing parcel.

The Placer County Parks and Trails Master Plan (Master Plan), which is intended to guide future park and trail development in the County, was adopted in late 2019 and subsequently updated in 2021 to reflect the updated Hidden Falls Regional Park Trails Expansion Project.[14] Currently, funding for maintenance of parks and recreational facilities within the project area is provided through CSA 28, Zone 169. However, the project site is located outside of existing CSA 28, Zone 169 boundaries. Thus, the entitlements for the proposed project include a request for annexation into CSA 28, Zone 169 for the purposes of generating funds for the maintenance of public park and open space facilities in the Dry Creek area, subject to approval by the Placer County Board of Supervisors.

Other Public Facilities

The Placer County Public Works Department is responsible for repairs and maintenance of over 1,000 miles of roadways within unincorporated Placer County from Roseville to Tahoe. The Public Works Department provides roadside tree and vegetation control, emergency roadway hazard response, bridge maintenance, maintenance of roadway signs, and striping and traffic signals. In addition to public roads, Placer County maintains various public facilities, such as public libraries and community buildings, which could potentially be used by residents of the proposed project.

The nearest library is the Martha Riley Community Library, located approximately 2.5 miles north of the project site and approximately 5.6 miles north of the off-site affordable housing parcel. The Roseville Public Library is located approximately 7.3 miles east of the site and nine miles east of the off-site affordable housing parcel. Placer County also operates the Placer County Library, located in the City of Auburn, approximately 20 miles northeast of the project site and off-site affordable housing parcel along I-80, and the Granite Bay Library on Douglas Boulevard, approximately 10 miles east of the project site and 13 miles east of the off-site affordable housing parcel.

Water Supply and Delivery Infrastructure

Water supply for the project area is provided by the Northern Division Sacramento District of the California American Water Company (CAL-AM) through an agreement with the Placer County Water Agency (PCWA). The Sacramento District of CAL-AM's Northern Division is comprised of ten service areas, each of which contains a Public Water System (PWS). All of the PWS within CAL-AM's Northern Division are regulated by the State Water Resources Control Board's (SWRCB) Division of Drinking Water (DDW). The project site and off-site affordable housing parcel are located within the West Placer PWS. CAL-AM's West Placer Service Area encompasses 11,154 acres within western Placer County, bounded by the City of Roseville limits to the east and the Sutter County line to the west. The Antelope Service Area bounds the West Placer Service Area to the south. According to the 2020 UWMP, CAL-AM has approximately 1,393 municipal water service connections within the West Placer Service Area.[15]

[14] Placer County. *Parks and Trails Master Plan.* April 2022.
[15] California American Water Company, Sacramento Main District. *2020 Urban Water Management Plan*. June 2021.

Water Supply and Demand

In 2016, CAL-AM and PCWA entered into a wholesale water supply agreement, which includes an agreement that PCWA will supply CAL-AM with surface water through December 2034.[16] The PCWA's estimated average year supply is presented in Table 15-2 below, in units of acre-feet per year (AFY). A portion of the total PCWA supply presented in Table 15-2 would be directed to CAL-AM for use in supplying the West Placer Service Area. CAL-AM is required to use only surface water within the West Placer Service Area pursuant to the CAL-AM's franchise agreement with Placer County, with the exception of a specific part of the service area not inclusive of the project site or off-site affordable housing parcel. Thus, the project area does not rely on groundwater as a water supply source.

Table 15-2
PCWA Average Year Supply (AFY)

PCWA Supply Source	2020	2025	2030	2035	2040
Middle Fork Project	120,000	120,000	120,000	120,000	120,000
Central Valley Project[1]	0	0	35,000	35,000	35,000
Pacific Gas & Electric Co. (PG&E)	125,400	125,400	125,400	125,400	125,400
Pre-1914 Appropriations	3,400	3,400	3,400	3,400	3,400
Recycled Water	0	0	2,500	5,000	7,000
Groundwater	2,000	2,000	4,000	4,000	5,000
Total	**250,800**	**250,800**	**290,300**	**292,800**	**295,800**

[1] Central Valley Project supply is not currently available due to physical limitations. Supply from Central Valley Project is 0 AFY until infrastructure is in place to access this supply, which is assumed to be in 2030.
