SECTION 1

DISCUSSION

INTRODUCTION

The purpose of this study was to determine the impact, if any, of the 100-year storm runoff flow from the watershed tributary to the proposed **expanded** project site as delineated on the map contained in this study. This study also examines measures to intercept the runoff flows and to convey them through the project site to their historical flow locations. The development of the site is an expansion of the existing rock products mining operation.

PROJECT LOCATION

The project site is located southeast of Harper Dry Lake **approximately four miles northwest of Hinkley and 13 miles west of Barstow, California in the unincorporated area of Hinkley in northwesterly San Bernardino County.** The project site is highlighted on the attached vicinity map. **Lynx Cat Mountain Quarry Mine I.D. # 91-36-0049, APN: 0496-011-75 and 0496-011-76, Section 1, Township 10 North, Range 4 West, (T10N, R4W) as indicated on the Hinkley, California 7.5' U.S.G.S. Quadrangle Topographical Map**

METHODOLOGY

The method in determining these peak runoff flows was the rational method and the unit hydrograph method as specified in the 1986 San Bernardino County Hydrology Manual and the 2010 San Bernardino County Hydrology Manual Addendum for Arid Regions. The existing offsite flow was examined and delineated from U.S.G.S. Maps: Twelve Gage Lake and Hinkley and an examination of the project site.

Point rainfalls for the 100-year storms were obtained from the NOAA Atlas 14 per the 2010 Addendum to the County Hydrology Manual. The original hydrology analysis of the project, performed in 2009 incorporated a point rainfall of 1.2" and AMC II. Per the aforementioned 2010 addendum, the off-site unit hydrograph analysis was performed using a 100-year 1-hour point rainfall of 1.11" and AMC II. The soil type was determined to be Soil Type C in the off-site tributaries per the county hydrology manual. Rainfall and soils maps are included as exhibits in Section 3 of this report.

The parameters of the off-site tributary sub-areas examined in this study are shown

Table A

| Sub-area | Elevation Difference (ft.) | Length (ft) | Area (Acres) | Avg. Slope (ft/ft) |
|-----------------|-----------------------------------|--------------------|---------------------|---------------------------|
| Stream 1 | 345 | 1,841 | 61.9 | 0.1874 |
| Stream 2 | 262 | 1,359 | 12.3 | 0.1928 |
| Stream 3 | 7765 | 45,027 | 9,854 | 0.0172 |

EXISTING CONDITIONS

The project site is located south of Harper Dry Lake in an unincorporated area of San Bernardino County. The tributary watershed area to Parcel 1 is generally sloping at approximately 1.5% from south to north towards the dry lakebed. The tributary watershed areas to Parcel 2 are generally sloping at approximately 20% from the southeast towards the northwest and confluence as they approach the project site and the dry lake. Existing vegetation on the site consists of desert brush and vegetation in sandy surface soils.

There is evidence of minor runoff in the form of sheet flows across the project site. There is also some minor evidence of scour, within the tributary area, from larger storm events that generally follows the existing swales as indicated on the enclosed mapping. The 100-year flood plain has not been established for Harper Dry Lake.

The results of the offsite and onsite flow analysis are summarized in Table B.

Table B

| Sub-Area | Q₁₀₀ (cfs) |
|--------------------------|------------------------------|
| Stream 1 | 194 |
| Stream 2 | 41 |
| Off-site Unit Hydrograph | 3,345 |

CONCLUSIONS AND RECOMMENDATIONS

During our field investigation of the site, we observed the existing conditions as stated previously. The calculated 100-year storm runoff flows enter the site along the southern and eastern boundaries of the project as indicated on the attached exhibits.

The existing drainage flows are captured as they enter the project along the project boundaries. This storm runoff flows into the excavated quarry and is captured for infiltration. Excess runoff is recycled and used in the crushing process and for on-site dust control. The locations of mining equipment within the quarry are situated to allow separation from storm water storage areas. It's anticipated that captured storm water runoff will not leave the project site.

The blue line stream which crosses the southern project boundary at Node 33, isn't defined nor mapped north of that location. The flow spreads at this location due to the existing terrain. It's proposed to construct a drainage levee along the western, downstream side of this flow path to direct runoff flows into the quarry area. This runoff will supplement the captured runoff from Streams 1 and 2 and be infiltrated and used in the **mining and dust control processes**.

Facility Info: Lynx Cat Quarry, Hinkley, CA

SIC Code(s):

Waste Discharge Identification Number: **6B36NNA000059**

Date Processed: August 16, 2015

RECEIPT OF YOUR NOTICE OF INTENT (NOI)

The State Water Resources Control Board (State Water Board) received and processed the NOI to comply with the terms of the General Permit for Storm Water Discharges Associated with Industrial Activity Order 2014-0057-DWQ.

Waste Discharger Identification (WDID) number **6B36NNA000059** is assigned to the facility referenced above.

Accordingly, you are required to comply with all applicable permit requirements.

Notice of Termination (NOT) is required to be submitted to the State Water Board should the owner or operator of the facility change or upon closure of the facility. Until an NOT is submitted you will continue and are responsible to pay the annual fee invoiced each .

If you have any further questions, please contact your local Regional Water Board at 760-241-6583.

Please visit the storm water web page at www.waterboards.ca.gov/water_issues/programs/stormwater/industrial.shtml for storm water related information.

Sincerely,
Storm Water Program
Division of Water Quality

MINING PLAN NOTES

- This proposal is for expanding the existing Lynx Cat Mountain Quarry from 48.2 acres to 241.7 acres utilizing private surrounding land owned by the proponent.
- The site will consist of an expanded quarry area and a processing/product stockpiling area to support large upcoming construction projects in the high desert. Due to the size of these projects, large amounts of aggregates must be produced, staged and made ready for transport by both truck and by rail prior to the beginning of the planned construction operations in the high desert.
- Lynx Cat Mountain Operations LLC (Lessee and Operator of Lynx Cat Mountain Quarry) has tentative commitments from various customers to produce large amounts of aggregates for delivery by both truck and rail prior to the start of construction to meet customer requirements and schedules.
- The plan for this Lynx Cat Mountain Quarry expansion is to continue mining and production of high quality construction aggregates needed to meet the expanding demand for these products in the Barstow area and to support the ongoing construction projects in the high desert for the next 50 years of quarry operations.
- During peak construction schedules, up to 4 million tons of stockpiled aggregates may be exported from the site on an annual basis to supply the upcoming construction projects.
- The maximum height of the aggregate product stockpiles will be 40 feet. The location and size of the aggregate product stockpiles may vary from what is shown on this map in size and location.
- The project site will be carefully prepared and cleared of any desert tortoises discovered and a desert tortoise exclusion fence will be installed along the entire perimeter of the project area.
- A second portable scale and scalehouse will be installed as shown (Scale #002) in the south central portion of the project site. Parking will be provided for any employees and a truck staging area will be provided southwest of the scale. A truck load trim area will also be placed in an area between the two scales to ensure proper highway legal loaded weights leaving the site.
- Water will be used for dust suppression activities on the project site as needed. All water needed for the project will be provided by the existing permitted well located within the approved Lynx Cat Mountain Quarry boundary.
- Stormwater drainage on and across the project site will be as shown. Currently, the quarry has a Water Quality Board NONA Identification number of 6B36NNA000059.
- A continuous 4-5 ft. perimeter offset earthen berm consisting of topsoil and surface material will be installed to minimize flows from entering the site and to collect and retain flows that occur within the site boundary and prevent stormwater flows into the site. Water flows will only occur during localized storm events. There are no blueline streams, swales or drainage areas that will be impacted by this project.

***SAN BERNARDINO COUNTY
FLOOD CONTROL DISTRICT
CHANNEL SECTIONS***

**SAN BERNARDINO COUNTY FLOOD CONTROL DISTRICT
DESIGN CRITERIA**

- 1) Hydrology calculations shall adhere to the San Bernardino County Hydrology Manual.
- 2) Structural calculations shall adhere to the Los Angeles County Flood Control District Structural Design Manual and to the State of California Department of Transportation Bridge Planning and Design Manuals and the Standard Plans.
- 3) Basin structural design shall adhere to the Los Angeles County Flood Control District Design Manual for Debris Dams and Basins.
- 4) Hydraulic design shall adhere to the Los Angeles County Flood Control District Hydraulic Design Manual and to the State of California Department of Transportation Highway Design Manual. Lined drainage facilities shall be designed with a bulking factor of 50% increase in water depth when there are no facilities to remove debris. Closed conduit systems shall be designed with a surface backup system to handle a Q₁₀₀ frequency storm, a bulking factor of 50% increase in Q₁₀₀ and a debris basin system to remove debris. Culverts under roadways, except when connected to lined open channels, shall be designed in accordance with Caltrans Highway Design Manual.
- 5) Earth channel design shall adhere to the following:
 - a) Bulk depth
 - i) For graded earth channels, use $d_{bulk} = 1.5d_{water}$
 - ii) For natural drainage courses, compute d_{bulk} based upon $Q_{bulk} = 2 Q_{100}$
 - b) For total depth use $*d_{total} = d_{bulk} + \text{freeboard}$
 - * When "V" < 6 f.p.s. - use $d_{water} + 2'$ freeboard
 - 8 f.p.s. > "V" > 6 f.p.s. use $d_{bulk} + 2'$ freeboard "V" = velocity
 - "V" > 8 f.p.s. use $d_{bulk} + 3'$ freeboard
 - c) Dike width
 - When bottom width = 12' to 40' use dike width = 15'
 - bottom width = 40' or more use dike width = 18'

| 45-day | 1.74 (1.54-2.00) | 2.49 (2.20-2.86) | 3.48 (3.08-4.02) | 4.30 (3.77-5.00) | 5.41 (4.59-6.51) | 6.27 (5.21-7.71) | 7.14 (5.79-9.00) | 8.04 (6.33-10.4) | 9.24 (6.98-12.5) | 10.2 (7.42-14.2) |
| 60-day | 1.91 (1.69-2.19) | 2.74 (2.43-3.16) | 3.85 (3.41-4.45) | 4.77 (4.18-5.55) | 6.04 (5.12-7.27) | 7.02 (5.83-8.63) | 8.04 (6.51-10.1) | 9.08 (7.15-11.8) | 10.5 (7.93-14.2) | 11.6 (8.46-16.2) |

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS). Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values. Please refer to NOAA Atlas 14 document for more information.
