Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Eval Notes:	On site for routine hazardous materials and business emergency plan inspection. Consent to enter and inspect was given by AVI SAADA - Administrator. Contact Information: adminstrator@westhollywoodhc.com Observed the facility and inspected hazardous materials storage. Annual employee safety training records were not maintained. Facility has also not electronically disclosed the onsite hazardous materials inventory or submitted a business emergency plan in California Environmental Reporting System (CERS). Please go to https://cersbusiness2.calepa.ca.gov to complete a chemical inventory disclosure and business emergency plan. The facility is responsible for identifying all hazardous materials, to include hazardous wastes, which are above disclosure thresholds. If there is a change in the type or amount of chemicals that are maintained on site, please submit revised documents (electronically) within 30 days of the change.

Environmental Interest/Information System:
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Potential Media Affected: Aquifer used for drinking water supply, Soil
Potential Contaminants of Concern: Benzene, Tetrachloroethylene (PCE), Toluene, Trichloroethylene (TCE), MTBE / TBA / Other Fuel Oxygenates, Gasoline
Site History: The site consists of a rectangular parcel of land occupied by an L-shaped shopping center building. Historical aerial photographs show that the site was vacant prior to at least 1928. It was then occupied by an auto repair and gas station from approximately 1933 to 1985. The gas station maintained three underground storage tanks (USTs) with storage capacities of 1,000 gallons, 3,000 gallons, and 5,000 gallons, respectively. The USTs were removed in approximately 1985 when the gas station was demolished for the construction of the shopping center. After the construction of the shopping center, a dry cleaner occupied one of the units of the building and operated from approximately 1987 to 1991. According to site assessment reports submitted to the Regional Board, the soil and groundwater beneath the site are contaminated with low level volatile organic compounds (VOCs) and petroleum hydrocarbons. After evaluation of the site assessment data and the results of a human health risk assessment, the site has been closed with a deed restriction on the property for commercial/inductrial land use.

LINN HOUSE (WESTSIDE HOSPICE) (Continued) **S118756607**

Completed Document Type:	Phase 1
Completed Date:	07/14/1994
Comments:	Pursuant to the MOU, DTSC has reviewed an environmental site assessment and other documents for the Linn House (Westside Hospice) property. The property, currently two vacant lots that have been combined into one legal parcel, is intended for the location of a new hospice to be owned and operated by the Aids Healthcare Foundation. A Supplemental Phase I Environmental Assessment Report was prepared by DTSC and concluded that no action was needed for this property; there is no contamination on the property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 07/29/2021
Date Data Arrived at EDR: 08/04/2021
Date Made Active in Reports: 08/31/2021
Number of Days to Update: 27

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 07/29/2021
Date Data Arrived at EDR: 08/04/2021
Date Made Active in Reports: 08/31/2021

Last EDR Contact: 11/05/2021
Next Scheduled EDR Contact: 01/10/2022
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994

Data Release Frequency: No Update Planned

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 07/29/2021
Date Data Arrived at EDR: 08/04/2021

Telephone: N/A
Last EDR Contact: 11/05/2021
Next Scheduled EDR Contact: 01/10/2022
Data Release Frequency: Quarterly

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 05/25/2021
Date Data Arrived at EDR: 06/24/2021
Date Made Active in Reports: 09/20/2021
Number of Days to Update: 88

Source: Environmental Protection Agency
Telephone: 703-603-8704
Last EDR Contact: 10/01/2021
Next Scheduled EDR Contact: 01/10/2022
Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 07/29/2021
Date Data Arrived at EDR: 08/04/2021
Date Made Active in Reports: 08/31/2021

Data Release Frequency: Quarterly

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

CERS: CalEPA Regulated Site Portal Data

The CalEPA Regulated Site Portal database combines data about environmentally regulated sites and facilities in California into a single database. It combines data from a variety of state and federal databases, and provides an overview of regulated activities across the spectrum of environmental programs for any given location in California. These activities include hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and toxic materials

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners
EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health

West Map:	12021681 BEVERLY HILLS, CA
Version Date:	2018

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

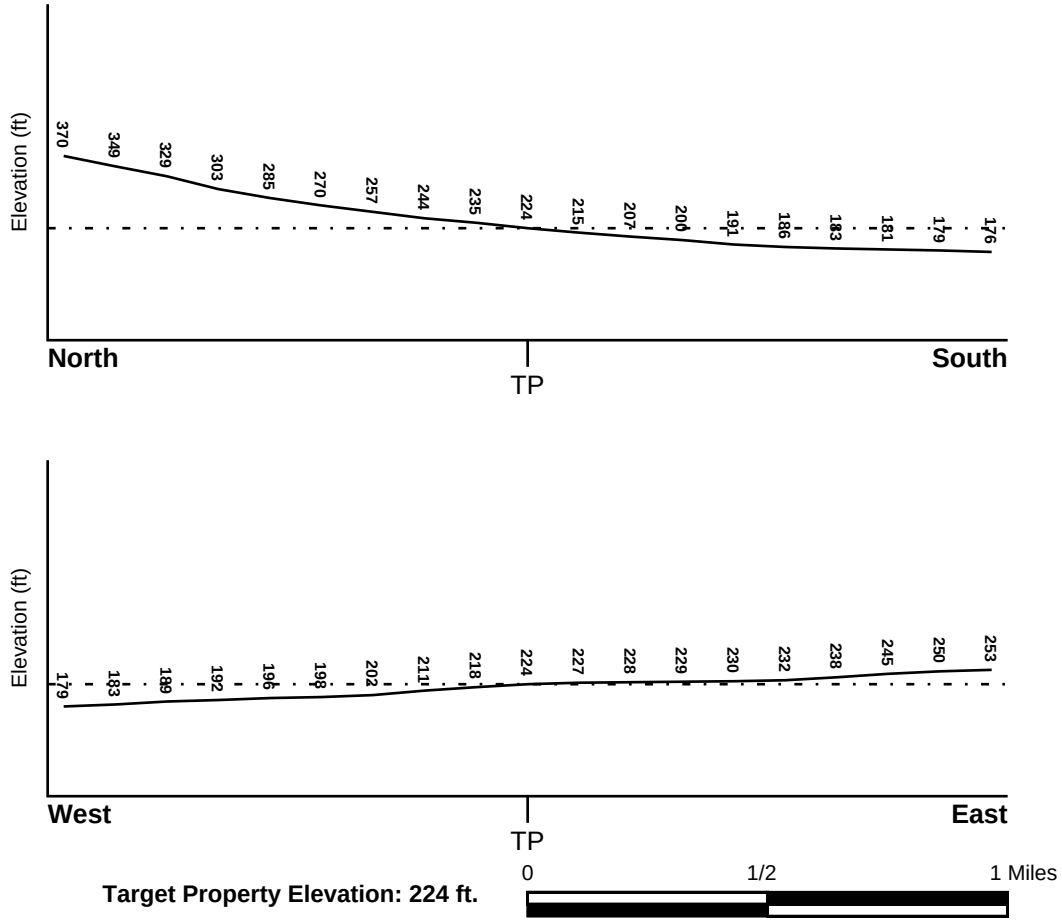
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SSW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06037C1605F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06037C1585F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
HOLLYWOOD	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Quaternary
Series:	Quaternary
Code:	Q *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratifed Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures:
loam
clay
silt loam
loamy sand
sandy loam
fine sand
clay loam
gravelly - sandy loam
coarse sand
gravelly - sand
sand

Surficial Soil Types:
loam
clay
silt loam
loamy sand
sandy loam
fine sand
clay loam
gravelly - sandy loam
coarse sand
gravelly - sand
sand

Shallow Soil Types:
fine sandy loam
gravelly - loam
sand
silty clay

Deeper Soil Types:
stratified
clay loam
silty clay loam
gravelly - sandy loam
coarse sand
sand
weathered bedrock
very fine sandy loam

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

APPENDIX D

CDE Existing Schools Checklist

Preliminary Environmental Screening of Proposed Project at Existing School Site

Project: Fairfax High School 03/22 .

Selection Criteria	Yes	No	Comments
High Voltage Power Transmission Lines [CCR, Title 5, 14010(c)]			
Will the project create or exacerbate any health risks from 50-133 kV power lines within 100 feet of the site?		X	No nearby high voltage power lines identified.
Will the project create or exacerbate any health risks from 220-230 kV power lines within 150 feet of the site?		X	No nearby high voltage power lines identified.
Will the project create or exacerbate any health risks from 500-550 kV power lines within 350 feet of the site?		X	No nearby high voltage power lines identified.
Railroads [CCR, Title 5, 14010(d)]			
Will the project create or exacerbate any safety risks from railroads within 1,500 feet of the site?		X	No railroads within 1,500 of the site
Traffic Noise [CCR, Title 5, 14010(e)]			
Will the project create or exacerbate any noise impacts from adjacent roads or freeways that will adversely affect the educational program?		X	In the opinion of Millennium, this project will not exacerbate any noise impacts
Faults [CCR, Title 5, 14010(f)]			
Will the project create or exacerbate and safety risks from active fault traces which may be onsite?		X	According to the EDR report, no active fault traces are onsite
Flood or Inundation Area [CCR, Title 5, 14010(g)]			
Will the project create or exacerbate safety risks from flooding or dam inundation?		X	In the opinion of Millennium, this project will not exacerbate or create any flooding or dam inundation safety risks
Pipelines and Above Ground Tanks [CCR, Title 5, 14010(h)]			
Will the project create or exacerbate safety risks from nearby above ground water or fuel storage tanks?		X	No nearby above ground water or fuel storage tanks were observed
Will the project create or exacerbate safety risks from high-pressure hazardous material pipelines located within 1,500 feet of the site?		X	No high-pressure hazardous material pipelines should be located within 1,500 feet of an existing school
Liquefaction and Landslides [CCR, Title 5, 14010(i)]			
Will the project create or exacerbate safety risks from liquefaction or landslides?		X	Site is in a liquefaction zone, but not a landslide zone. In the opinion of AECOM the project should not exacerbate these safety risks.
Traffic and Pedestrian Safety [CCR, Title 5, 14010(l)]			
Will the project create or exacerbate traffic/pedestrian safety risks from an adjacent major arterial street?		X	In the opinion of Millennium, the project will not create or exacerbate traffic/pedestrian safety risks from adjacent major arterial streets.

Preliminary Environmental Screening of Proposed Project at Existing School Site

Project: Fairfax High School 03/22 .

Selection Criteria	Yes	No	Comments
Compatible Zoning [CCR, Title 5, 14010(m)]			
Will the project create or exacerbate health or safety risks from the zoning surrounding the site?		X	In the opinion of Millennium, the project should not affect health or safety risks regarding the zoning surrounding the site
Light, Wind, Air Pollution [CCR, Title 5, 14010(q)]			
Will the project create or exacerbate impacts from light, wind, or air pollution?		X	In the opinion of Millennium, the project will not create or exacerbate impacts from light, wind, or air pollution.
Easements [CCR, Title 5, 14010(r)]			
Will the project create or exacerbate impacts from easements on or adjacent to the site which may restrict access or building placement?		X	In Millennium's opinion, the project will not create or exacerbate impacts from easements on or adjacent to the site.
Border Zone Property [CCR, Title 5, 14010(t)]			
Will the project create or exacerbate health and safety risks from a significant disposal of hazardous waste within 2,000 ft. of the site?		X	According to the EDR report no significant disposal of hazardous waste occurs within 2,000 feet of the site
Cellular Phone Towers [LAUSD Board Resolution]			
Will the project create or exacerbate health risks from a cellular phone tower on or adjacent to the site?		X	It is Millennium's opinion the project should not create or exacerbate health risks from cell phone towers on or adjacent to the site.
Methane Zone			
Will the project create or exacerbate health and safety risks from a known methane zone or oil field?	X		The site is within a methane zone, so there is potential it could create or exacerbate health and safety risks.
Oil Wells			
Will the project create or exacerbate health and safety risks from an onsite oil well?		X	There is one abandoned/plugged oil well (1964)at the southwest corner of the Subject Property. However, it is not expected to create or exacerbate health and safety risks.
Air Pollution [LAUSD Board Resolution]			
Will the project create or exacerbate health risks from a major transportation corridor (freeway, major rail line) within 500 feet?		X	There are no major transportation corridors within 500 feet
Will the project create or exacerbate health risks from a major stationary source of emissions within 500 feet?		X	It is Millennium's opinion the project should not create or exacerbate health risks from major stationary sources of emissions within 500 feet of the site.

Preliminary Environmental Screening of Proposed Project at Existing School Site

Project: Fairfax High School 03/22 .

Selection Criteria	Yes	No	Comments
Is the school on the Priority List of Schools Most at Risk from Air Pollution?		X	The school was not found on the priority list of schools most at risk from air pollution.
Will the project create or exacerbate health risks from a high-risk facility previously identified by OEHS?		X	It is Millennium's opinion the project should not create or exacerbate health risks from a high-risk facility previously identified by OEHS.
Airports [CCR, Title 5, 14010(t)]			
Will the project create or exacerbate health and safety risks from an airport within two nautical miles of the site?		X	There is no airport within two nautical miles within the site.

APPENDIX G

Methane Survey Report

CLARK SEIF CLARK, INC.
HEALTH & SAFETY • ENGINEERING • ENVIRONMENTAL

January 19, 2024

Mr. David Bell
Office of Environmental Health and Safety
Los Angeles Unified School District
333 Beaudry Avenue, 21st Floor
Los Angeles, California 90017

Subject: Technical Memorandum - Methane Survey Report
Fairfax High School – Major Modernization Program
7850 Melrose Avenue, Los Angeles, CA 90046

Dear Mr. Bell:

The following technical memorandum presents results of soil gas sampling for methane and other gases conducted by Clark Seif Clark, Inc. (CSC) at Fairfax High School. The purpose of the investigation was to evaluate whether methane is present in the subsurface in areas of future renovations. Sampling activities were conducted December 18 – 27, 2023 during winter break.

New and replacement buildings will be constructed at Fairfax High School as part of a Major Modernization Program at the school (Site). The structures will include a new gymnasium, an M&O Utility Building, and five Specialty Classrooms. The Site is located within a Methane Zone as designated by the City of Los Angeles Department of Building and Safety (LADBS). The northern edge of the school property is located within a designated Methane Buffer Zone. Methane mitigation measures will be required to be incorporated in the design and construction of new structures.

1.0 Introduction

The Site is located at 7850 Melrose Avenue, Los Angeles, California (Figure 1). The primary area of future development is located in the northwestern portion of the existing school property as approximately shown on Figure 2, and is estimated between 150,000 to 200,000 square feet. The LADBS *Site Standards for Methane* requires shallow testing (depth not less than five feet below ground surface (bg)) at a rate of one sample per 10,000 square feet. The standard further requires testing gas probe sets (three probes at 5, 10 and 20 feet bgs) at a rate of one set per 20,000 square feet. Based on the upper estimate of 200,000 square feet for the area of primary development, shallow testing was required at approximately 20 locations and probe sets were required at approximately 10 locations.

Under Ordinance No. 180619, Division 71 of Article 1, Section 91.7104.2, in Chapter IX of Los Angeles Municipal Code, LADBS mandates construction design protocols and mitigation requirements for construction in Methane Zones and Methane Buffer Zones based on methane concentrations and wellhead pressures.

The methane investigation consisted of the following:

- Installing ten shallow borings to approximately five feet bgs using hand auger methods.
- Installing ten triple-completion soil gas probes to 20 feet bgs using direct push drilling.
- Collecting and analyzing soil gas samples, and measuring wellhead pressures.

The results of the soil gas investigation are utilized to determine mitigation requirements needed for the proposed construction.

2.0 Field Methodology

A total of 10 shallow probes (to approximately 5 feet bgs) and 10 triple-completion probes (to approximately 20 feet bgs) were installed on December 18 and 19, 2023 (Figure 2). Prior to drilling, a geophysical survey was completed by ULS CA, Inc. (ULS) to screen boring locations for the presence of underground utilities. In addition, all locations were hand augered to five feet bgs to further screen for underground utilities. A copy of the ULS report is included in Appendix A. Strongarm Environmental Field Services cut 4-inch diameter cores at nine locations to facilitate sampling and provided drilling services. A drilling summary is provided on Table 1.

Soil Gas Probe Installation

Soil gas sampling probes were installed using a combination of hand augering for shallow probes and direct push drilling for deeper probe sets. Shallow probes were installed directly in the ten shallow 5-foot borings. A Geoprobe 6011 DT direct push rig was used to drill and install deeper probe sets. Soil samples were collected using a 4-foot MacroCore sampler containing acrylic liners. A California licensed Professional Geologist logged the observed lithology at each boring.

All vapor probes were constructed with a porous polyethylene filter tip attached to nylon tubing embedded in approximately one foot of #3 Monterey sand. The annular space above the sand pack was sealed with hydrated #8 granular bentonite. Triple completion soil gas probes were built from the bottom up. The deeper 20-foot probe was set near the bottom, and #3 Monterey sand added for a filter pack approximately one foot in thickness. Six inches of dry granular bentonite was placed atop the sand as a transitional layer. The probe was sealed using #8 granular bentonite which was slowly placed downhole and hydrated in intervals, to a level just below the next shallower probe. The shallower probes were installed similarly, and the boring was sealed up to ground surface with hydrated bentonite. Depths of the deeper probe sets were approximately 5, 10, and 20 feet bgs. Three-way valves were connected to the tubing at the surface.

Soil Gas Sample Collection and Analysis

The 40 individual soil gas probes were sampled twice; the first event on December 21 and 22, and the second event on December 27, 2023. Wellhead pressure was measured prior to

sampling. Wellhead pressure was measured at zero inches of water in all probes during both events.

Prior to sampling, probes were purged of three sand filter pack plus tubing volumes at a rate of approximately 0.2 liter per minute (L/min) to introduce formational soil gas into the probes. Samples were collected in clean glass syringes and analyzed for methane in the mobile laboratory, injected into the on-board gas chromatograph/flame ionizing detector (GC/FID) instrumentation. Shut-in tests were performed for each sample, and tracer gas (isobutane) was used to measure potential short-circuiting through the surface seal. High vacuum was recorded in six probes during the first sampling event, and five probes during the second sampling event and a sample could not be collected. Tracer gas was not detected in any sample indicating good seal at each location. In addition, a Landtec GEM5000 was used to test for oxygen and carbon dioxide, and a Jerome 631-X was used to test for hydrogen sulfide.

Field sampling and analysis was performed by a mobile laboratory technician from Optimal Technology, a mobile environmental testing laboratory licensed by City of Los Angeles for methane testing (Testing License 10239).

Barometric pressure and weather conditions were recorded periodically during sampling from the weather app on iPhone. Day one of the first sampling event was conducted during a rain event since sampling schedule was restricted by school break and subcontractor availability. Nevertheless, barometric pressures were stable during the day. The second sampling event was conducted under partly cloudy conditions six days after the last rain. Weather conditions are summarized as follows:

- December 21, 2023 – began partly cloudy turning to rain by around 1100 am. Barometric pressure was 29.99 inches of mercury (in Hg) at 700 am rising to high of 30.01 in Hg by 1100, falling back to 29.99 in Hg by end of the day. Recorded temperature varied between 60^{o} F to 62^{o} F during the day.
- December 22, 2023 – partly cloudy to cloudy all day. Barometric pressure was 29.94 in Hg at 800 am rising to high of 29.95 in Hg by 1000, falling back to 29.93 in Hg by end of the day. Recorded temperature rose from 60^{o} F to 64^{o} F during the day.
- December 27, 2023 – partly cloudy all day with no rain since December 21. Barometric pressure was 30.18 in Hg at 900 am rising to high of 30.19 in Hg by 1000, falling back to 30.15 in Hg by end of the day. Recorded temperature rose from 57^{o} F to 65^{o} F during the day.

Decontamination, Waste Handling and Probe Abandonment

All down-hole sampling equipment (hand auger, direct push sampler) was cleaned between locations using a potable water wash and rinse. Drill cuttings were containerized in two 55-gallon DOT-approved steel drums for characterization and off-site disposal. One sample was collected of the cuttings for waste profiling and results showed the material can be disposed as non-hazardous waste. Disposal was pending at time of this reporting.

Following the second sampling event, the probes were abandoned by pulling out the tubing. All 5-foot and 10-foot tubes were able to pull completely, and 20-tubing was pulled until it snapped below ground surface. The surface was repaired to match existing conditions as well as possible including capping with concrete and dyed-concrete in asphalt and concrete areas.

3.0 Investigation Results

Sampling results are summarized on Table 2 and the mobile laboratory report is provided in Appendix B. Wellhead pressure measurements and analytical results are presented on the LADBS Certificate of Compliance for Methane Test Data form included in Appendix C. Laboratory analytical report for waste characterization sample is provided in Appendix D.

Subsurface Lithology

Fill is common in many borings to approximately 3-4 feet bgs including brick and concrete fragments. Native soil beneath consists predominately of fine-grained olive, brown to dark brown silty to sandy clay with thin layers of sandy silt to silty sand. Clays are typically moist, low to slight plasticity, and moderately stiff. The upper 5-6 feet at FM8 and FM9 contained sandy gravel likely emplaced as part of adjacent ramp construction. Groundwater was not encountered in any boring.

Soil Gas Results

Methane concentrations were not detected at 5 parts per million by volume (ppmV) in all probes during both events. In addition, hydrogen sulfide was not detected at 0.001 ppmV in all probes during both events.

Oxygen ranged between 11.7% and 21.0% and was consistent in each probe between first and second sampling event. Carbon dioxide ranged between 0.2% and 10.5% and was consistent in each probe between first and second sampling event.

4.0 Discussion

The Site lies inside a designated Methane Zone and/or Methane Buffer Zone and is therefore potentially subject to LADBS methane mitigation design requirements for new construction. Per Chapter IX of the Los Angeles Municipal Code, Section 91, Ordinance No. 180619, Table 71, the Site is characterized as Site Design Level I. For this Design Level, Table 71 stipulates a Passive System with the following mitigation components for new construction:

- Impervious membrane
- Perforated horizontal pipes
- 2-inch gravel blanket beneath impervious membrane and surrounding horizontal pipes
- Vent risers
- Trench dams
- Conduit or cable seal fittings

5.0 Conclusions

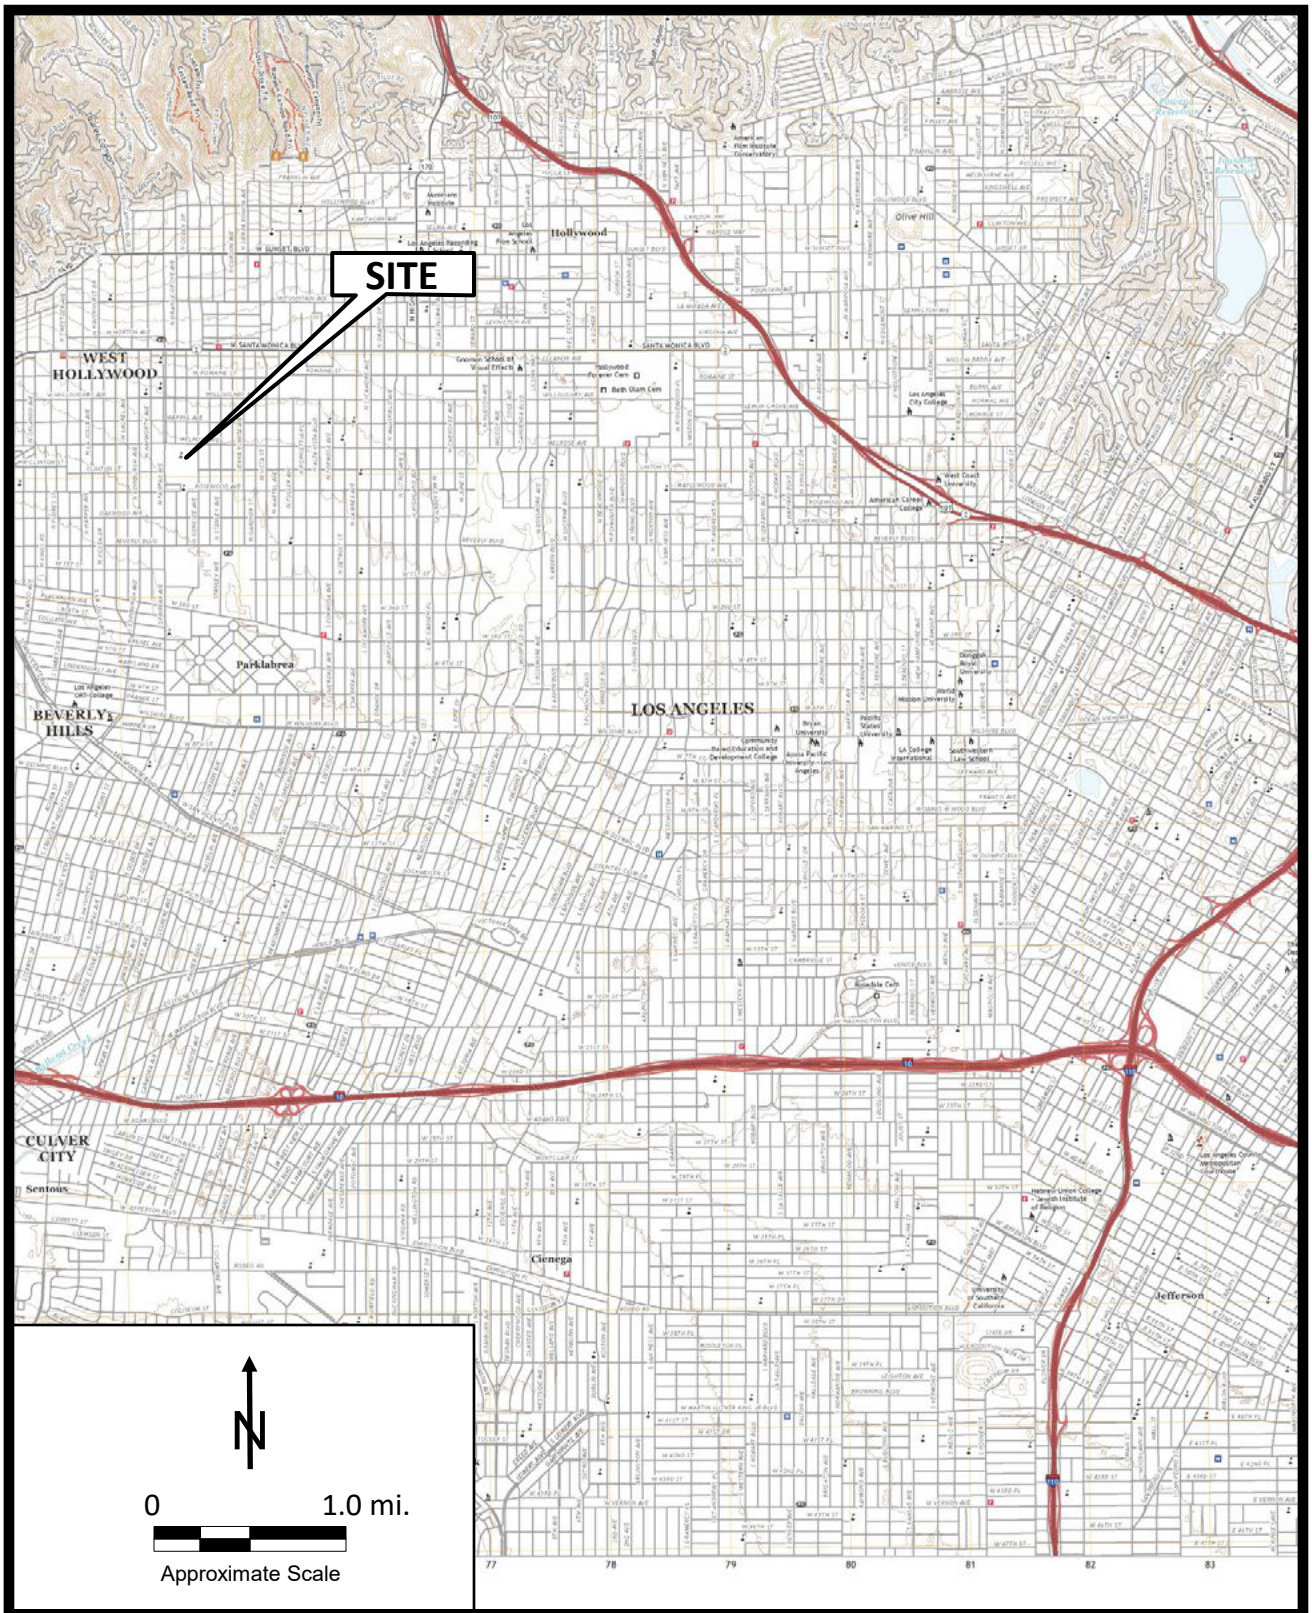
Based on results of this soil gas sampling investigation, methane and hydrogen sulfide was not detected in the study area. The Site is located within a Methane Zone and/or Methane Buffer Zone and is subject to certain LADBS methane mitigation requirements. Based on sampling results, the site is characterized as Site Design Level I.

6.0 Limitations

Please note that results and conclusions derived from this investigation are limited to the locations, media, and intervals sampled. As such, we cannot rule out the possibility of undetected localized impacts and do not characterize the Site as "clean."

Please feel free to contact me at (818) 727-2553 (jbannon@csceng.com) if you have any questions or comments on this report.

Sincerely,



Jeffrey L. Bannon, PG
Vice President of Environmental Services

GENERAL LIMITATIONS

NOTE: The work described herein is performed to industry standards (or higher) using multiple methodology and QA/QC protocol. ULS cannot guarantee the accuracy or the ability to detect all underground facilities and potential interferences. Non-conductive or conductive utilities/facilities may not be detected due to variables and constraints beyond ULS control. Where known, constraints and limitations will be brought to the client's attention. Excavation work may result in injury to persons and/or damage to facilities. Client and/or excavator are advised to take all steps necessary to avoid contact with underground facilities. This includes, but is not limited to, safe digging practices, hand tooling in congested areas and within two feet on side of marked utilities (distance may vary by law), utility drawing review, site facilities representative review, and "one-call" utilities notification. ULS and its representatives are not responsible for injury to persons or damage to facilities. This document and accompanying pages will be delivered to the client before commencement of intrusive work for the client's review. If any questions arise, please notify our office immediately.

NOTE: Specific comments/limitations/constraints, known and recognized will be recorded on attached pages (field notes). Caution – some facilities (conductive or non- conductive) may not be detected. Not all limitations and constraints may be recognized.

METHODS AND GENERAL OBSERVATIONS:

ARRIVED SITE AND COMPLETED H&S TAILGATE AND/OR PERMIT TO WORK WITH CLIENT. SET UP DELINEATORS AROUND VEHICLE AND NEAR BLINDSPOTS AND ENTRY WAYS. MADE GENERAL SITE WALK TO REVIEW SURVEY AREAS (PROPOSED ZONES). CHECKED FOR SURFACE UTILITY MANIFESTATIONS SUCH AS VALVES, METERS, CONDUITS, TRENCHING SEAMS, VAULT LIDS AND EXISTING ONE CALL MARKINGS. BEGAN MARKOUT WORK.

METHODS UTILIZED INCLUDE: EM PIPE AND CABLE LOCATOR USING AMBIENT, GROUND INDUCTION AND CONNNECTION MODE SWEEPS. EM INDUCTION METAL DETECTOR AND GPR. A CARTISIAN GRID PATH IS WALKED AT EACH PROPOSED ZONE USING ALL METHODOLOGY. OBSERVATIONS ARE MARKED WITH WHITE AND/OR PINK PAINT. ZONE IS MARKED OUT WITH WHITE AND/OR PINK MARKINGS (REFER TO PHOTOS).

MOBILE LABORATORY REPORT

OPTIMAL TECHNOLOGY
Specializing in Environmental Field Services

December 28, 2023

Jeffrey Bannon
Clark Seif Clark, Inc.
21732 Devonshire Street, Suite B
Chatsworth, CA 91311

Dear Jeff:

This letter presents the results of the soil vapor investigation conducted by Optimal Technology (Optimal), for Clark Seif Clark, Inc. on December 21-22 & 27, 2023. The study was performed at 7850 Melrose Ave., Los Angeles, California.

Optimal was contracted to perform a soil vapor survey at this site to screen for possible Methane.

Gas Sampling Method

At each sampling location, an electric vacuum pump set to draw 0.2 liters per minute (L/min) of soil vapor was attached to the existing well and purged prior to sample collection. Vapor samples were obtained in gas-tight syringes by drawing the sample through a luer-lock connection which connects the sampling probe and the vacuum pump. Samples were immediately injected into the gas chromatograph/purge and trap after collection. New tubing was used at each sampling point to prevent cross contamination.

All analyses were performed on a laboratory grade Agilent model 6890N gas chromatograph equipped with a Flame Ionization Detector (FID). A Restek column using Nitrogen as the carrier gas was used to perform all analysis. All results were collected on a personal computer utilizing Agilent's chromatographic data collection and handling system. Additionally, a Landtec GEM5000 was used to test for Oxygen, Carbon Dioxide, & Methane and a Jerome 631-X was used to test for Hydrogen Sulfide.

Quality Assurance

5-Point Calibration
The initial five-point calibration consisted of 20, 50, 100, 200 and 500 ul injections of the calibration standard. A calibration factor on each analyte was generated using a best fit line

method using the Agilent data system. If the r^2 factor generated from this line was not greater than 0.990, an additional five-point calibration would have been performed. Method reporting limits were calculated to be 5.0 parts per million by volume (ppmV) for Methane.

A daily calibration check was performed by preparing a calibration gas from Airgas and from a pre-mixed standard supplied by CPI International.

Sample Replicates
A replicate analysis (duplicate) was run to evaluate the reproducibility of the sampling system and instrument. The difference between samples did not vary more than 20%.

Equipment Blanks
Blanks were run at the beginning of each workday and after calibrations. The blanks were collected using an ambient air sample. These blanks checked the septum, syringe, GC column, GC detector and the ambient air. Contamination was not found in any of the blanks analyzed during this investigation. Blank results are given along with the sample results.

Tracer Gas Leak Test
A tracer gas was applied to the soil gas probes at each point of connection in which ambient air could enter the sampling system. These points include the top of the sampling probe where the tubing meets the probe connection and the surface bentonite seals. Isobutane was used as the tracer gas. No Isobutane was found in any of the samples collected.

Purge Volume
The standard purge volume of three volumes was purged in accordance with the July 2015 DTSC/RWQCB Advisory for Active Soil Gas Investigations.

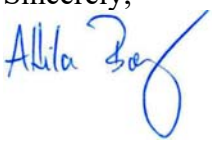
Shut-in Test
A shut-in test was conducted prior to purging or sampling each location to check for leaks in the above-ground sampling system. The system was evaluated to a minimum measured vacuum of 100 inches of water. The vacuum gauge was calibrated and sensitive enough to indicate a water pressure change of at least 0.5 inches.

Scope of Work

To achieve the objective of this investigation a total of 77 vapor samples were collected from locations throughout the site. Sampling depths, vacuum readings, purge volume and sampling volumes are given on the analytical results page. All the collected vapor samples were analyzed on-site using Optimal's mobile laboratory.

Subsurface Conditions

Subsurface soil conditions at this site offered sampling flows at 0" water vacuum.



Results

During this vapor investigation, no Methane was detected above the listed reporting limit. A complete table of analytical results is included with this report.

Disclaimer

All conclusions presented in this letter are based solely on the information collected by the soil vapor survey conducted by Optimal Technology. Soil vapor testing is only a subsurface screening tool and does not represent actual contaminant concentrations in either the soil and/or groundwater. We enjoyed working with you on this project and look forward to future projects. If you have any questions, please contact me at (877) 764-5427.

Sincerely,

Attila Baly
Project Manager

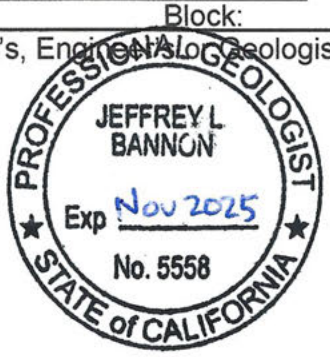
APPENDIX C

LADBS FORM 1 - CERTIFICATE OF COMPLIANCE FOR METHANE TEST DATA

FORM 1 - CERTIFICATE OF COMPLIANCE FOR METHANE TEST DATA



Part 1: Certification Sheet

Site Address: 7850 Melrose Ave., Los Angeles, CA

Legal Description: Tract: _____ Lot: _____ Block: _____

Building Use: _____

Architect's, Engineer's or Geologist's Stamp:

Name of Architect, Engineer, or Geologist:
Jeffrey L. Bannon, PG

Mailing Address:
Clark Seif Clark, Inc.
P.O. Box 4299, Chatsworth, CA 91313

Telephone: 818-727-2553

Name of Testing Laboratory:
Optimal Technology

City Test Lab License #: 10239

Telephone: 818-734-6230

I hereby certify that I have tested the above site for the purpose of methane mitigation and that all procedures were conducted by a City of Los Angeles licensed testing agency in conformity with the requirements of the LADBS Information Bulletin P/BC 2014-101. Where the inspection and testing of all or part of the work above is delegated, full responsibility shall be assumed by the architect, engineer or geologist whose signature is affixed thereon.

Signed: _____ date 12/27/23

Required Data:

- Project is in the (Methane Zone) or (Methane Buffer Zone).
- Depth of ground water observed during testing: >20 feet below the Impervious Membrane.
- Depth of Historical High Ground Water Table Elevation*: ~40* feet below the Impervious Membrane.
- Design Methane Concentration**: 0 parts per million in volume (ppmv).
- Design Methane Pressure***: 0 inches of water column.
- Site Design Level: (Level I, Level II, Level III, Level IV, Level V) with 0 inches of water column.

De-watering:

- De-watering (is) (is not) required per Section 7104.3.7.
- Pump discharge rate _____ cubic feet per minute per reference geology or soil report: _____ dated _____.

Additional Investigation:

- Additional investigation (was) (was not) conducted.

Latest Grading on Site:

- Date of last grading on site (was) (was not) more than 30 days before Site Testing.
- See Attached explanation of the effect on soil gas survey results by grading operations.

Notes:

* Historical High Ground Water Table Elevation shall mean the highest recorded elevation of ground water table based on historical records and field investigations as determined by the engineer for the methane mitigation system. * Depth to water from site at 801 N. Fairfax, approx. 800' north of site

** Design Methane Concentration shall mean the highest recorded measured methane concentration from either Shallow Soil Gas Test or any Gas Probe Set on the site.

*** Design Methane Pressure shall mean the highest total pressure measured from any Gas Probe Set on the site.

As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability and, upon request, will provide reasonable accommodation to ensure equal access to its programs, services and activities. For efficient handling of information internally and in the internet, conversion to this new format of code related and administrative information bulletins including MGD and RGA that were previously issued will allow flexibility and timely distribution of information to the public.

FORM 1 (CONTINUED) - CERTIFICATE OF COMPLIANCE FOR METHANE TEST DATA

Part 2: Test Data - Shallow Soil Gas Test and Gas Probe Test

Site Address: 7850 Melrose Ave., Los Angeles, CA
Description of Gas Analysis Instrument(s): GC-FID
Instrument Name and Model: Agilent 6890N-FID Instrument Accuracy: ± 1.0 ppmv.
City of Los Angeles Testing License #: 10239

AETL Job Number: BEL0183

Date Received: 12-20-2023 Received by: Greta G

Carrier: ☐ AETL Courier ☑ Client ☐ GSL ☐ FedEx ☐ UPS

☐Others:

Samples were received in: ☑ Cooler (1) ☐ Other (Specify):

Sample Container Temperature: 5.4 °C IR Gun S/N: 51941909MV

Type of sample containers: ☐ VOA, ☐ Glass bottles, ☑Wide mouth jars, ☐HDPE bottles, ☐ Metal sleeves, ☐ Acetate sleeves, ☐ 5035 Kit: ☐ AETL or ☐ Client, ☐ Tedlar Bags, Summa Canister: ☐ 6L, ☐ 3L, ☐ 1L, Others (Specify): _____

How are samples preserved: ☐ None, ☑ Ice, ☐ Blue Ice, ☐ Dry Ice

☑ None, ☐ HNO_3, ☐ NaOH, ☐ ZnOAc, ☐ HCl, ☐ $Na_2S_2O_3$, ☐ MeOH, ☐ $NaHSO_4$

☐ Other (Specify):

	Yes	No*	N/A	Note or Comment
1. Are the COCs Correct?	✔			
2. Are Sample labels legible & indelible ink?	✔			
3. Do samples match the COC?	✔			
4. Are the required analyses clear?	✔			
5. Is there enough samples for required analysis?	✔			
6. Does cooler or samples have custody seal(s)?			✔	
7. Are sample containers intact and in good condition?	✔			
8. Are samples preserved?	✔			
9. Are samples preserved properly for the intended analysis?	✔			
10. Are the VOAs free of headspace? See footnote.			✔	
11. Are the jars free of headspace?			✔	
12. Are there any samples with short hold times?			✔	

* = see note below. N/A = Not Applicable

PLEASE NOTE ALL SAMPLES WILL BE DISPOSED OF 30 DAYS AFTER RECEIVING DATE. IF AETL IS INFORMED OTHERWISE, THERE WILL BE A STORAGE CHARGE PER SAMPLE PER MONTH FOR ANY SAMPLE HELD BEYOND 30 DAYS.

◯ Example maximum headspace bubble size; acceptance criteria not to exceed 5-6 mm in diameter.

For headspace bubbles exceeding 6 mm in diameter, sample receiving will tag the VOA and notify the Project Manager (PM). The PM will contact the client for Analyze or Resample instructions.

* For samples generating a "No" answer, the Project Manager is notified, and the PM will contact the client for Analyze or Resample instructions.

Case Narrative

The following "Sample Received" Section summarizes the samples received and associated analyses requested as specified on the enclosed chain of custody.

Results as reported by the laboratory apply only to 1) the items tested, 2) as the samples are received, and 3) the accuracy of information provided. Information supplied by the customer that may affect validity of results and may be contained in this report include Project Name/Number, Site Location, Sample Locations, Sampling Dates/Times, Sample ID, Sample Preservation, Sample Matrix, Sample Properties, Field Blanks, Field Duplicates, Field Spikes, and Site Historical Data.

Accreditation applies only to the test methods listed on each scope of accreditation held by the laboratory; certifications held by the laboratory may not apply to results supplied in this report.

Unless otherwise noted, all results of soil and solid samples are based on wet weight.

Qualifiers are noted in the report.

The contents of this report apply to the sample(s) analyzed in accordance with the chain of custody document.
No duplication of this report is allowed, except in its entirety without written approval of the laboratory.

A. EXECUTIVE SUMMARY

This Noise Study assesses and discusses the potential noise and vibration impacts that may occur with the Fairfax High School Comprehensive Modernization Project (Project), located in the City of Los Angeles (City), California. The analysis describes the existing environment in the Project area; estimates future noise and vibration levels at surrounding land uses resulting from construction and operation of the Project; and identifies the potential for significant impacts. An evaluation of the Project's contribution to potential cumulative noise impacts is also provided. The study summarizes the potential for the Project to conflict with applicable noise and vibration regulations, standards, or thresholds, and to identify any measures that may be necessary to reduce potentially significant impacts.

On-Site Construction Noise

Construction noise levels would be reduced via compliance with the City's Noise Ordinance and *SC-N-5* from the *Los Angeles Unified School District (LAUSD) School Upgrade Program (SUP) Program EIR (PEIR)*. *SC-N-5* states that the LAUSD Facilities Division or its construction contractor shall consult and coordinate prior to construction with the school principal or site administrator, and other nearby noise-sensitive land uses, to schedule high-noise or vibration-producing activities to minimize disruption. Coordination between the school, nearby land uses and the construction contractor shall continue on an as-needed basis throughout the construction phase of the Project to reduce school and other noise-sensitive land use disruptions. Additionally, the Project would comply with Los Angeles Municipal Code (LAMC) Section 41.40, which prohibits construction between the hours of 9:00 PM to 7:00 AM Monday through Friday, 6:00 PM to 8:00 AM on Saturday, and at any time on Sunday (i.e., construction is allowed Monday through Friday between 7:00 AM to 9:00 PM; and Saturdays and National Holidays between 8:00 AM to 6:00 PM). As such, on-site construction noise impacts would not be considered significant.

Off-Site Construction Noise

Construction of the Project would require worker, haul, and vendor truck trips to and from the site to work on the site, export soil, and deliver supplies. Trucks traveling to and from the Project site would be required to travel along a haul route approved by the City. At the maximum, approximately 15 hauling trips per day would take place during the demolition phases based on construction schedule assumptions. Haul-truck traffic would take the most direct route to the appropriate freeway ramp. The noise level increases from truck trips would be below the significance threshold of 5 dBA above ambient levels. As such, off-site construction noise impacts would not be considered significant.

Operational Noise

No changes to the operation of Fairfax High School would occur as a result of the proposed Project. The Project would replace and upgrade facilities on the campus, but it will not increase the number of students or faculty, and would not introduce new noise sources. For this reason, no operational noise impacts would occur.

Construction Vibration

The Project site is surrounded by residential uses to the north, south, east, and west across Melrose Avenue, Rosewood Avenue, Genesee Avenue, and Fairfax Avenue, respectively. Other nearby uses include a nursing home on Fairfax Avenue, a senior center on Melrose Avenue, and other retail and commercial uses. The forecasted vibration levels due to on-site construction activities would not exceed the building damage significance threshold of 0.2 Peak Particle Velocity (PPV) inches per second (ips) at the nearby residential uses. As such, vibration impacts would not be considered significant.

B. INTRODUCTION

Context

This Noise Study was prepared to support an Initial Study (IS) for the Fairfax High School Comprehensive Modernization Project (Project) in the City of Los Angeles, California. The Project includes various renovations, modernizations, and reconfigurations throughout the campus, including demolition of existing facilities, construction of new facilities, site upgrades, and accessibility improvements on a 23.63-acre site. Construction activities are anticipated to begin in the third quarter of 2026, with completion expected in the fourth quarter of 2029.

Ongoing master planning activities and facility site assessments conducted for LAUSD facilities over the last several years have identified school sites throughout the District that exhibit critical physical conditions. The SUP implemented by LAUSD outlines a series of capital improvements—intended to rehabilitate and modernize these schools—so they are safe, healthy, and functional places to learn.

The LAUSD prepared a Supplemental Environmental Impact Report (EIR) (SCH No. 2023010013) at the program level of detail to evaluate the direct and indirect environmental effects of the SUP program. The SUP Subsequent Program EIR (SPEIR) was certified as adequate by the LAUSD Board in December 2023. As provided in Section 15168 of the State CEQA Guidelines, a Program EIR may be prepared on a series of actions that can be characterized as one large project. Use of a Program EIR provides the LAUSD (as Lead Agency) with the opportunity to consider broad policy alternatives and program-wide mitigation measures and provides the LAUSD with greater flexibility to address project-specific and cumulative environmental impacts on a comprehensive basis.

Subsequent activities within the program are evaluated to determine whether an additional CEQA document needs to be prepared. However, if the PEIR addresses the program's effects as specifically and comprehensively as possible, many subsequent activities could be found to be within the PEIR scope, and additional environmental documents may not be required.[1] When a PEIR is relied on for a subsequent activity, the lead agency must incorporate any feasible mitigation measures and alternatives developed in the PEIR into the subsequent activities.[2]

PEIR Noise Summary

Table 1: Noise and Vibration Impacts Identified in the PEIR summarizes the PEIR's conclusions regarding noise and vibration impacts of the SUP.

1 California Code of Regulations (CCR). Title 14, Section 15168(c).

2 CCR. Title 14, Section 15168(c)(3).

TABLE 1: NOISE AND VIBRATION IMPACTS IDENTIFIED IN THE PEIR					
No.	**Environmental Threshold**	**Level of Impact Significance**	**Potential Impacts Identified**	**Applicable SCAs**	**Mitigation Measures**
1	Exposure of persons to or generation of substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	**Potentially Significant**	Noise impacts may occur from new or an increased number of sports events, use of athletic fields, and parking. The location of schools in residential neighborhoods makes it difficult to reduce exposures to less-than-significant levels, even with the methods prescribed in *SC-N-3*.	*SC-N-1* *SC-N-2* *SC-N-3* *SC-N-4* *SC-N-8* *SC-N-9*	Given the proximity of sensitive receivers, it may not be practical to reduce exposures further after implementing *SC-N-1 through SC-N-4, and SC-N-8 and SC-N-9*.
2	Exposure of persons to or generation of excessive ground borne vibration or ground borne noise levels.	**Potentially Significant**	School operations do not involve sources that cause substantial ground-borne vibration. However, certain types of construction activity, such as pile driving and use of explosives for rock blasting-which almost never occurs on school sites-can be annoying and can damage fragile structures. Construction methods other than these two are far less likely to have significant vibration impacts during construction.	*SC-N-4* *SC-N-5* *SC-N-6* *SC-N-7*	Given the proximity of sensitive receivers, it may not be practical to reduce vibration annoyance and structural damage further after implementing *SC-N-4* through *SC-N-7*.
3	For a project located within an airport land use plan or where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels. For a project within the vicinity of a private airstrip, expose people residing or working in the project area to excessive noise levels	Less Than Significant	Although several District schools are within two nautical miles of an airport, projects conducted on existing campuses that do not involve acquisition of new property would not need to be reviewed for airport noise. It should also be noted that Education Code Section 17215 does not apply to school sites acquired prior to January 1, 1966, nor to any additions or extensions to those sites. However, exterior and interior (classroom) maximum noise exposure limits would still apply to new construction, such as a classroom, on an existing campus. Implementation of LAUSD *SC-N-2* would ensure that interior noise standards related to airport noise are identified and properly addressed prior to Project construction. Exterior areas at existing school campuses are already exposed to airport noise, therefore new SUP-related projects would not exacerbate the airport noise.	*SC-N-2*	No mitigation measures are required.

Focus of this Study

This Noise Study focuses on those noise impacts that the PEIR found to be potentially significant for the SUP in general; the questions to be answered are:

- Do the findings apply in the specific case of the Fairfax High School Comprehensive Modernization Project?
- If noise impacts are potentially significant, what combination of standard conditions of approval and Project-specific mitigation measures could reduce the impacts to a less-than-significant level?

Seismic Safety

The Project site is located within the seismically active Southern California region and is likely to experience strong ground-shaking from seismic events generated on regionally active faults. In addition to site-specific geotechnical recommendations, the Project design and construction of new buildings will comply with seismic safety requirements of the Division of State Architect (DSA) and California Building Code (CBC). Compliance with DSA and CBC requirements, as well as implementation of the PEIR's *SC-GE0-1*, would ensure that potential hazards from strong seismic ground-shaking are addressed through the design of the new building, structures, and modifications. Specifically, *SC-GEO-1* would require LAUSD to prepare a Geohazard Assessment for the Project prior to construction.

Characteristics of Sound

Sound is a pressure wave transmitted through the air. It is described in terms of loudness or amplitude (measured in decibels [dB]), frequency or pitch (measured in hertz [Hz] or cycles per second), and duration (measured in seconds or minutes). The decibel scale is a logarithmic scale that describes the physical intensity of the pressure vibrations that make up any sound. The pitch of the sound is related to the frequency of the pressure vibration. Because the human ear is not equally sensitive to all frequencies, a special frequency-dependent rating scale is used to relate noise to human sensitivity. The A-weighted decibel scale (dBA) provides this compensation by discriminating against upper and lower frequencies in a manner approximating the sensitivity of the human ear. The scale is based on a reference pressure level of 20 micropascals (zero dBA). The scale ranges from zero (for the average least perceptible sound) to about 130 dBA (for the average human pain level).

The normal range of conversation is between 34 and 66 dBA. Between 70 and 90 dBA, sound is distracting and presents an obstacle to conversation, thinking, or learning. Above 90 dBA, sound can cause permanent hearing loss. Examples of various sound levels in different environments are shown in **Table 2: Typical Sound Levels**.

TABLE 2: TYPICAL SOUND LEVELS

Common Sounds	A-Weighted Sound Level in Decibels	Subjective Impression
Oxygen Torch	120	Pain Threshold
Rock Band	110	
Pile Driver at 50 feet	100	Very Loud
Ambulance Siren at 100 feet	90	
Garbage disposal	80	Moderately Loud
Vacuum Cleaner at 10 feet	70	
Air Conditioner at 100 feet	60

Source: Aviation Planning Associates, 1978. *Calculations of Maximum A-weighted Sound Levels (dBA) Resulting from Civil Aircraft Operations.*

A noise environment consists of a base of steady "background" noise that is the sum of many distant and indistinguishable noise sources. Superimposed on this background noise is the sound from individual local sources. These can vary from an occasional aircraft or train passing by to virtually continuous noise from, for example, traffic on a major highway.

To the human ear, a sound 10 dBA higher than another is judged to be twice as loud; 20 dBA higher is four times as loud; and so forth. According to the US Environmental Protection Agency (USEPA), a difference of more than 3 dBA is a perceptible change in environmental noise, a 5-dBA difference typically causes a change in community reaction, and an increase of 10 dBA is perceived by people as doubling of loudness.[3]

Noise Measurement Scales

Several rating scales have been developed to analyze adverse effects of community noise on people. Since environmental noise fluctuates over time, these scales consider that the effect of noise on people depends largely upon the total acoustical energy content of the noise, as well as the time of day when the noise occurs. Those that are applicable to this analysis are as follows:

- **Leq**, the equivalent noise level, is an average of sound level over a defined time period (such as 1 minute, 15 minutes, 1 hour, or 24 hours). Thus, the Leq of a time-varying noise and that of a steady noise are the same if they deliver the same acoustic energy to the ear during exposure.
- **L90** is a noise level that is exceeded 90 percent of the time at a given location; it is often used as a measure of "background" noise.

3 United States Environmental Protection Agency (USEPA). *Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety*. March 1974. Accessed April 2024. https://www.nrc.gov/docs/ML1224/ML12241A393.pdf.

- **Lmax** is the root mean square (RMS) maximum noise level during the measurement interval. This measurement is calculated by taking the RMS of all peak noise levels within the sampling interval. Lmax is distinct from the peak noise level, which only includes the single highest measurement within a measurement interval.
- **CNEL**, the Community Noise Equivalent Level, is a 24-hour average Leq with a 4.77-dBA "penalty" added to noise during the hours of 7:00 PM to 10:00 PM, and a 10-dBA penalty added to noise during the hours of 10:00 PM to 7:00 AM, to account for noise sensitivity in the evening and nighttime.[4] The logarithmic effect of these additions (60-dBA / 24-hour Leq) would result in a calculation of 66.7 dBA CNEL.
- **Lctn**, the day-night average noise, is a 24-hour average Leq with an additional 10-dBA "penalty" added to noise that occurs between 10:00 PM and 7:00 AM. The Lctn metric yields values within 1 dBA of the CNEL metric. As a matter of practice, Lctn and CNEL values are considered to be equivalent, and are treated as such in this assessment.

Noise Attenuation

The noise level from a particular source generally declines as the distance to the receiver increases. Other factors such as the weather and reflecting or shielding also intensify or reduce the noise level at any given location. Typically, a single row of buildings between the receiver and the noise source reduces the noise level by about 5 dBA. The US Department of Housing and Urban Development (HUD) has stated that exterior noise levels can normally be reduced by 15 dBA inside buildings constructed with no special noise insulation.[5] The USEPA estimates that residences in "warm" climates provide at least 12 dBA of exterior-to-interior noise attenuation with windows open, and 24 dBA with windows closed.[6]

Noise from traffic on roads depends on the volume, speed, and the distance of the traffic. A commonly used rule-of-thumb for traffic noise is that for every doubling of distance from the road, atmospheric spreading over "hard" or "soft" sites reduces the noise level by about 3 or 4.5 dBA, respectively. For a stationary source, the noise is reduced by at least 6 dBA for each doubling of distance. Further, because of the logarithmic nature of the decibel scale, a doubling of traffic on any given roadway or doubling of a stationary source would cause a noise increase of approximately 3 dBA.

Project Location

The approximately 23.63-acre proposed Project site is located at 7850 Melrose Avenue (Assessor Parcel Number [APN] 5527-021-900) in the Fairfax District of the Hollywood Community Plan Area in the City of Los Angeles in Los Angeles County (County). Regional access to the site is from Melrose Avenue and North Fairfax Avenue (see **Figure 1: Regional and Local Vicinity Map**). The Project site is bound by Melrose Avenue to the north, North Genesee Avenue to the east, Rosewood Avenue to the south, and North Fairfax Avenue to the west. Regionally, the Project site is approximately 0.64 miles from State Route 2 (Santa Monica Boulevard) to the north, approximately 3.5 miles from US-101 to the east, and approximately 3.27 miles from Interstate 10 (I-10) to the south.

Campus Setting

Fairfax High School is an L-shaped campus on an approximately 23.63-acre parcel with 12 permanent buildings and two arcades, three courtyards, as well as athletic fields and open spaces. Construction for Fairfax High School was completed in 1924. After the initial school was built, several temporary structures were built in the 1930s to accommodate the increasing number of students. A Social Hall was built in 1939, and, from 1967 to 1969, the campus was redeveloped with a complex of modern buildings and facilities. Subsequent decades saw incremental enhancements, including the revitalization of the Social Hall in 1996, the construction of new classroom buildings in 2004, and added amenities in 2011.

The school currently serves approximately 1,632 students, with approximately 82 teachers and six supporting staff members as of 2022-2023.[7] The programs at Fairfax High School include a 9-12 grade traditional high school program and two magnet schools: the Police Academy Magnet, with approximately 250 students, and the Visual Arts Magnet, with approximately 405 students.[8,9]

Description of Proposed Project

Purpose and Objectives

The purpose of the Project is to provide facilities that are safe, secure, and aligned with the instructional program of Fairfax High School. The Project is designed to address the most critical physical concerns of

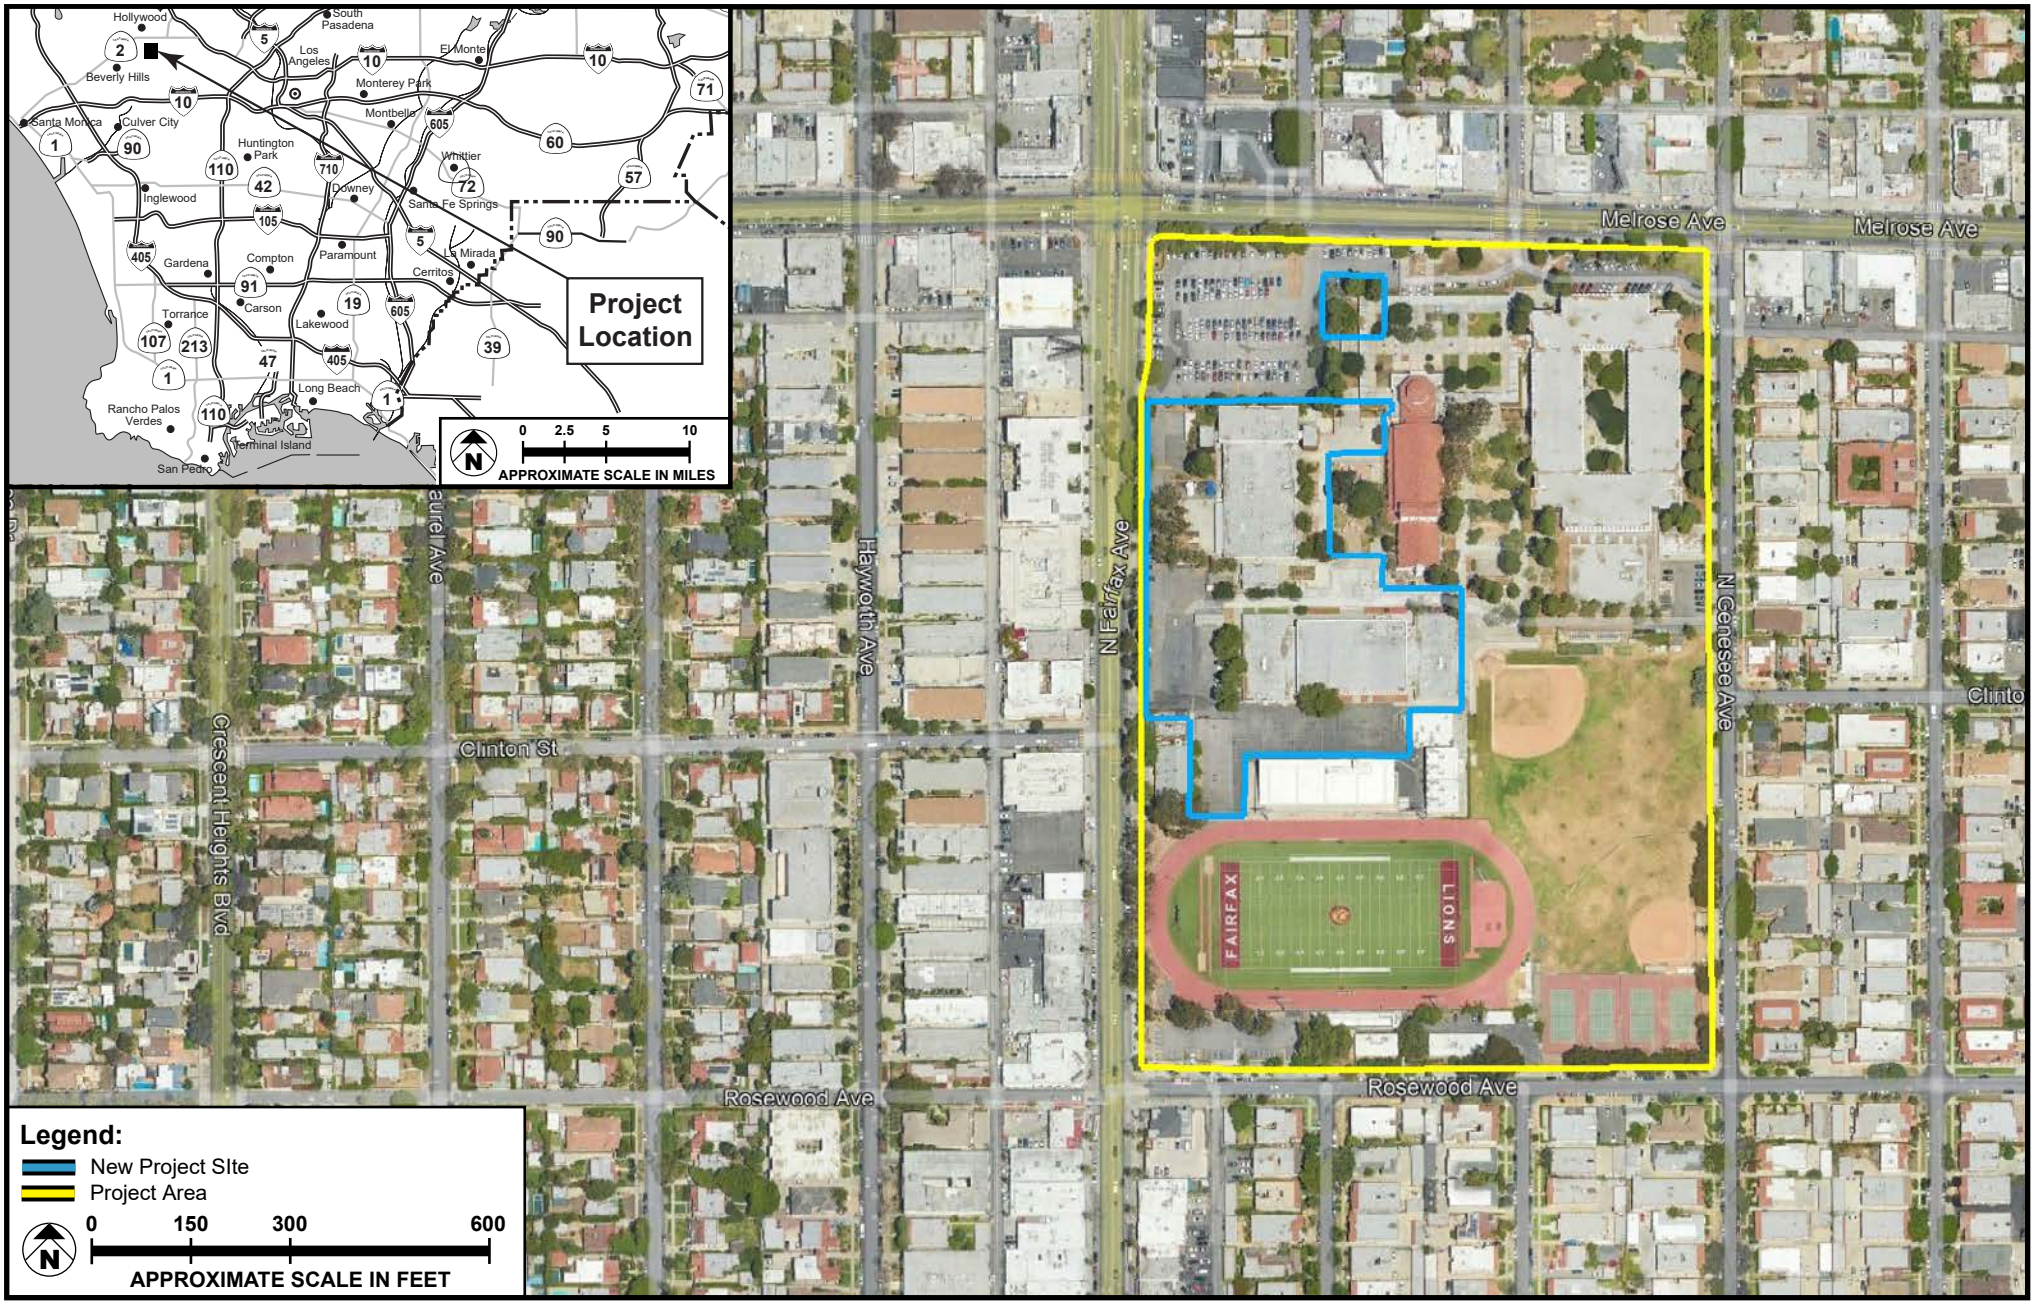
the buildings and grounds at the campus while providing renovations, modernizations, and reconfigurations that are consistent with the Project definition for Fairfax High School.[10]

On June 13, 2023, the Board approved the Project definition for the Fairfax High School Comprehensive Modernization Project for Fairfax High School. The proposed improvements would provide facilities that are safe, secure, and better aligned with the current instructional program. Assessments of the campuses within the Comprehensive Modernization Project were done by industry professionals, as well as seismic and historical personnel. The findings of these assessments in addition to input from the Board of Education called for improvements with a budget of $148,789,344. The proposed Project is designed to address the most critical physical concerns of the building and grounds at the Campus while providing renovations, modernizations, and reconfiguration as needed.[11]

Planned Improvements

The proposed Project would include changes to the Campus Buildings as shown in **Figure 2**: **Proposed Project Site Plan** and **Table 3**: **Summary of Planned Improvements**.

Demolition and Removal



The proposed Project includes the demolition and/or removal of the following facilities: Shop Building (Building No. 2), Gymnasium (Building No. 3), Ticket Office (Building No. 2), Relocatable Sanitary Building (Building No. 13), and Utility Building (Building No. 14), including foundations and below- and above-grade utility infrastructure associated with the demolished buildings/structures. Interim facilities will be provided, as required.

TABLE 3: SUMMARY OF PLANNED IMPROVEMENTS (CONTINUED)			
Bldg. No.	**Building**	**Demolition**	**New Construction**
	New Building Construction		
	New Classrooms (5)		14,486 SF
	Support Facilities		2,636 SF
	New Gymnasium		49,281 SF
	New Maintenance and Operations Facility		3,031 SF
	New Art Gallery Building		4,537 SF
	Campus Total* (does not include outdoor space)	**76,449 SF**	**73,880 SF**

Note: All numbers are in square feet. All new square footages are approximate and subject to change during final site and architectural planning and design phases. These square footage changes would not significantly change the environmental analysis or findings in this IS.

* *Square footage totals may not add up exactly due to rounding and the way usable space is calculated. All numbers are based on LAUSD Fairfax High School Comprehensive Modernization Project – Space Program. January 24, 2024.*

New Construction

The scope of the proposed Project includes the construction a new gymnasium building, approximately five specialty classrooms and support spaces, a new art gallery building, and outdoor physical education courts. The new gymnasium building would house team rooms and locker rooms, as well as a public entrance and lobby that would provide access to the building from the west parking area along Fairfax Avenue. The scope of the proposed Project includes exterior painting of all remaining buildings to provide a uniform appearance; associated landscape, hardscape, parking improvements, and infrastructure upgrades including but not limited to sanitary sewer, water, stormwater, and electrical utilities. New construction shall comply with the District's design standards and educational specifications and the District's vision for safe, modern, and adequate educational environments.

The Project will be subject to local, State, and/or federal facilities requirements of the American Disabilities Act (ADA), DSA, and the California Department of Education (CDE), as well as all District Standards and Specifications, including those provided in the LAUSD's SUP PEIR. Any needed improvements to ensure compliance with such legislation will be incorporated within the Project.

Site Access, Circulation, and Parking

At Project completion, campus access, traffic circulation, and drop-off and pick-up locations would remain the same as for the existing campus, as the proposed Project does not include any changes to them. The proposed Project would maintain a fully functional campus during each construction phase which includes efficient and safe circulation throughout the campus for students and staff (including directional signage).

Landscaping

The proposed Project will include removal and replacement of existing landscaping and hardscaping within the footprint of the campus. All landscaping designs and irrigation systems would comply with LAUSD School Design Guidelines and CHPS criteria would be implemented where appropriate. Plant material would comply with the LAUSD approved plant list and plantings would be placed in order to improve the oil quality and water holding capacity.

Sustainability Features

The Project's new buildings and structures would be designed to reduce energy use below current levels by incorporating modernized and energy-efficient features, which may include lighting, windows, electrical transformers, building insulation, or installation of irrigation smart controllers, etc. All new construction would meet or exceed the energy efficiency standards under California Title 24, Part 6 energy efficiency standards consistent with LAUSD standard conditions of approval (*SC-GHG-5*).

Construction Characteristics and Schedule

The Project would be executed through a design-build contract. Construction activities are anticipated to begin in the third quarter of 2026, with completion expected in the fourth quarter of 2029. Detailed construction equipment lists, and emissions calculations are provided in **Table 4: Construction Equipment Assumptions** below. Construction would occur in two phases in order to minimize disruptions to student activities.

TABLE 4: CONSTRUCTION EQUIPMENT ASSUMPTIONS

Phase	Off-Road Equipment Type	Amount	Usage Hours (per day)	Noise Level at 25 feet (dBA Leq 1-hour)	Calculated Average Noise Level (dBA Leq 1-hour)

Table 5: **Project Construction Schedule** provides the dates and durations of each of the activities that will take place during construction, as well as a brief description of the scope of work. Future dates represent approximations based on the general Project timeline and are subject to change pending unpredictable circumstances that may arise. Construction would occur in two phases in order to minimize disruptions to student activities.

TABLE 5: PROJECT CONSTRUCTION SCHEDULE				
Construction Activity	**Start Date**	**End Date**	**Duration (Days)**	**Description**
		Phase 1		
Demolition	7/1/2026	9/22/2026	60	Removal of existing Shop Building (Building No. 2) and Utility Building (Building No. 14), approximately 34,438-sq. ft. building material
Site Preparation	9/23/2026	10/5/2026	9	Site preparation and grading of Phase 1 area
Building Construction	10/6/2026	4/16/2029	660	Construction of new Gymnasium and five Classrooms in Phase 1 area
Paving	4/17/2029	5/28/2029	30	Paving of asphalt surfaces in Phase 1 area
Architectural Coating	5/29/2029	7/9/2029	30	Interior building work and application of architectural coatings for new Gymnasium and five Classrooms
		Phase 2		
Demolition	7/10/2029	10/1/2029	60	Removal of existing Gymnasium (Building No. 3), Ticket Building (Building No. 12), and Relocatable Sanitary Building (Building No. 13), approximately 42,021-sq. ft. building material
Site Preparation	10/2/2029	10/12/2029	9	Site Preparation and grading of Phase 2 area
Paving	10/13/2029	11/23/2029	30	Paving of asphalt surfaces in Phase 2 area

The proposed Project would also comply with all of the applicable federal, State, and local rules and regulations as well as with the following LAUSD Construction Best Management Practices (BMPs; which are consistent with *SC-AQ-2*, and *SC-N-4* through *SC-N-9* in the PEIR), in carrying out construction of the proposed Project.

- Construction contractors shall keep properly functioning mufflers on all internal combustion and vehicle engines used in construction. To the extent feasible, the construction contractor shall store and maintain equipment, including portable equipment, as far away as possible from sensitive noise receptors. Temporary barriers capable of reducing temporary construction related noise shall be installed when construction equipment or activities are anticipated to exceed 75 dBA at 50 feet from the nearest sensitive receptor,
- Construction contractors shall provide advance notice of the start of construction to the school administration and to all noise-sensitive receptors (immediately surrounding noise-sensitive residences) adjacent to the school, including specifically where and when construction activities would occur and provide contact information for filing noise complaints.

To the extent feasible, construction-related activities would be scheduled to occur during daylight hours. Construction-related traffic and deliveries would be scheduled to avoid student pick-up, drop-off hours, and during noise sensitive times, as coordinated with the school administration. Consistent with the City of Los Angeles Municipal Code, all nonemergency construction activities would occur between 7:00 AM

and 9:00 PM, Monday through Friday and 8:00 AM to 6:00 PM on Saturdays and national holidays.[12] Construction would be prohibited on Sundays.[13]

Existing Noise Environment

The predominant source of noise in the area of Fairfax High School is motor vehicle traffic. The Project site is located adjacent to Melrose Avenue to the north and Fairfax Avenue.

Noise-level monitoring was conducted by Meridian Consultants on April 25, 2024, at three (3) locations within the Project vicinity, as shown in **Figures 4a**–**4b**: **Noise Monitoring Locations (Sites 1** through **3)**. Noise-level monitoring was conducted for 15-minute intervals at each location using a Larson Davis Model 831 sound-level meter. This meter satisfies the American National Standards Institute (ANSI) standard for general environmental noise measurement instrumentation. The ANSI specifies several types of sound-level meters according to their precision. Types 1, 2, and 3 are referred to as "precision," "general-purpose," and "survey" meters, respectively. Most measurements carefully taken with a Type 1 sound-level meter will have a margin of error not exceeding 1 dB.

The Larson Davis Model 831 is a Type 1 precision sound-level meter. This meter meets all requirements of ANSI S1.4-1983 and ANSI 1.43-1997 Type 1 standards, as well as International Electrotechnical Commission (IEC) IEC61672-1 Ed. 1.0, IEC60651 Ed 1.2, and IEC60804 Type 1, Group X standards.

The sound-level meter was located approximately 5 feet above ground and was covered with a Larson Davis windscreen. The sound-level meter was field calibrated with an external calibrator prior to operation.

Short-term sound monitoring was conducted at three (3) locations to measure the ambient sound environment in the Project vicinity, as shown in **Figures 4a**–**4b**. Measurements were taken at each location between the hours of 9:56 AM and 10:54 AM on April 25, 2024, as indicated in **Table 6**: **Ambient Noise Measurements**. As shown in **Table 6**, ambient noise levels ranged from a low of 58.1 dBA east of the Project site at the North Genesee Avenue and Clinton Street intersection (Site 3) to a high of 74.1 dBA west of the Project site at across Fairfax Avenue (Site 1).

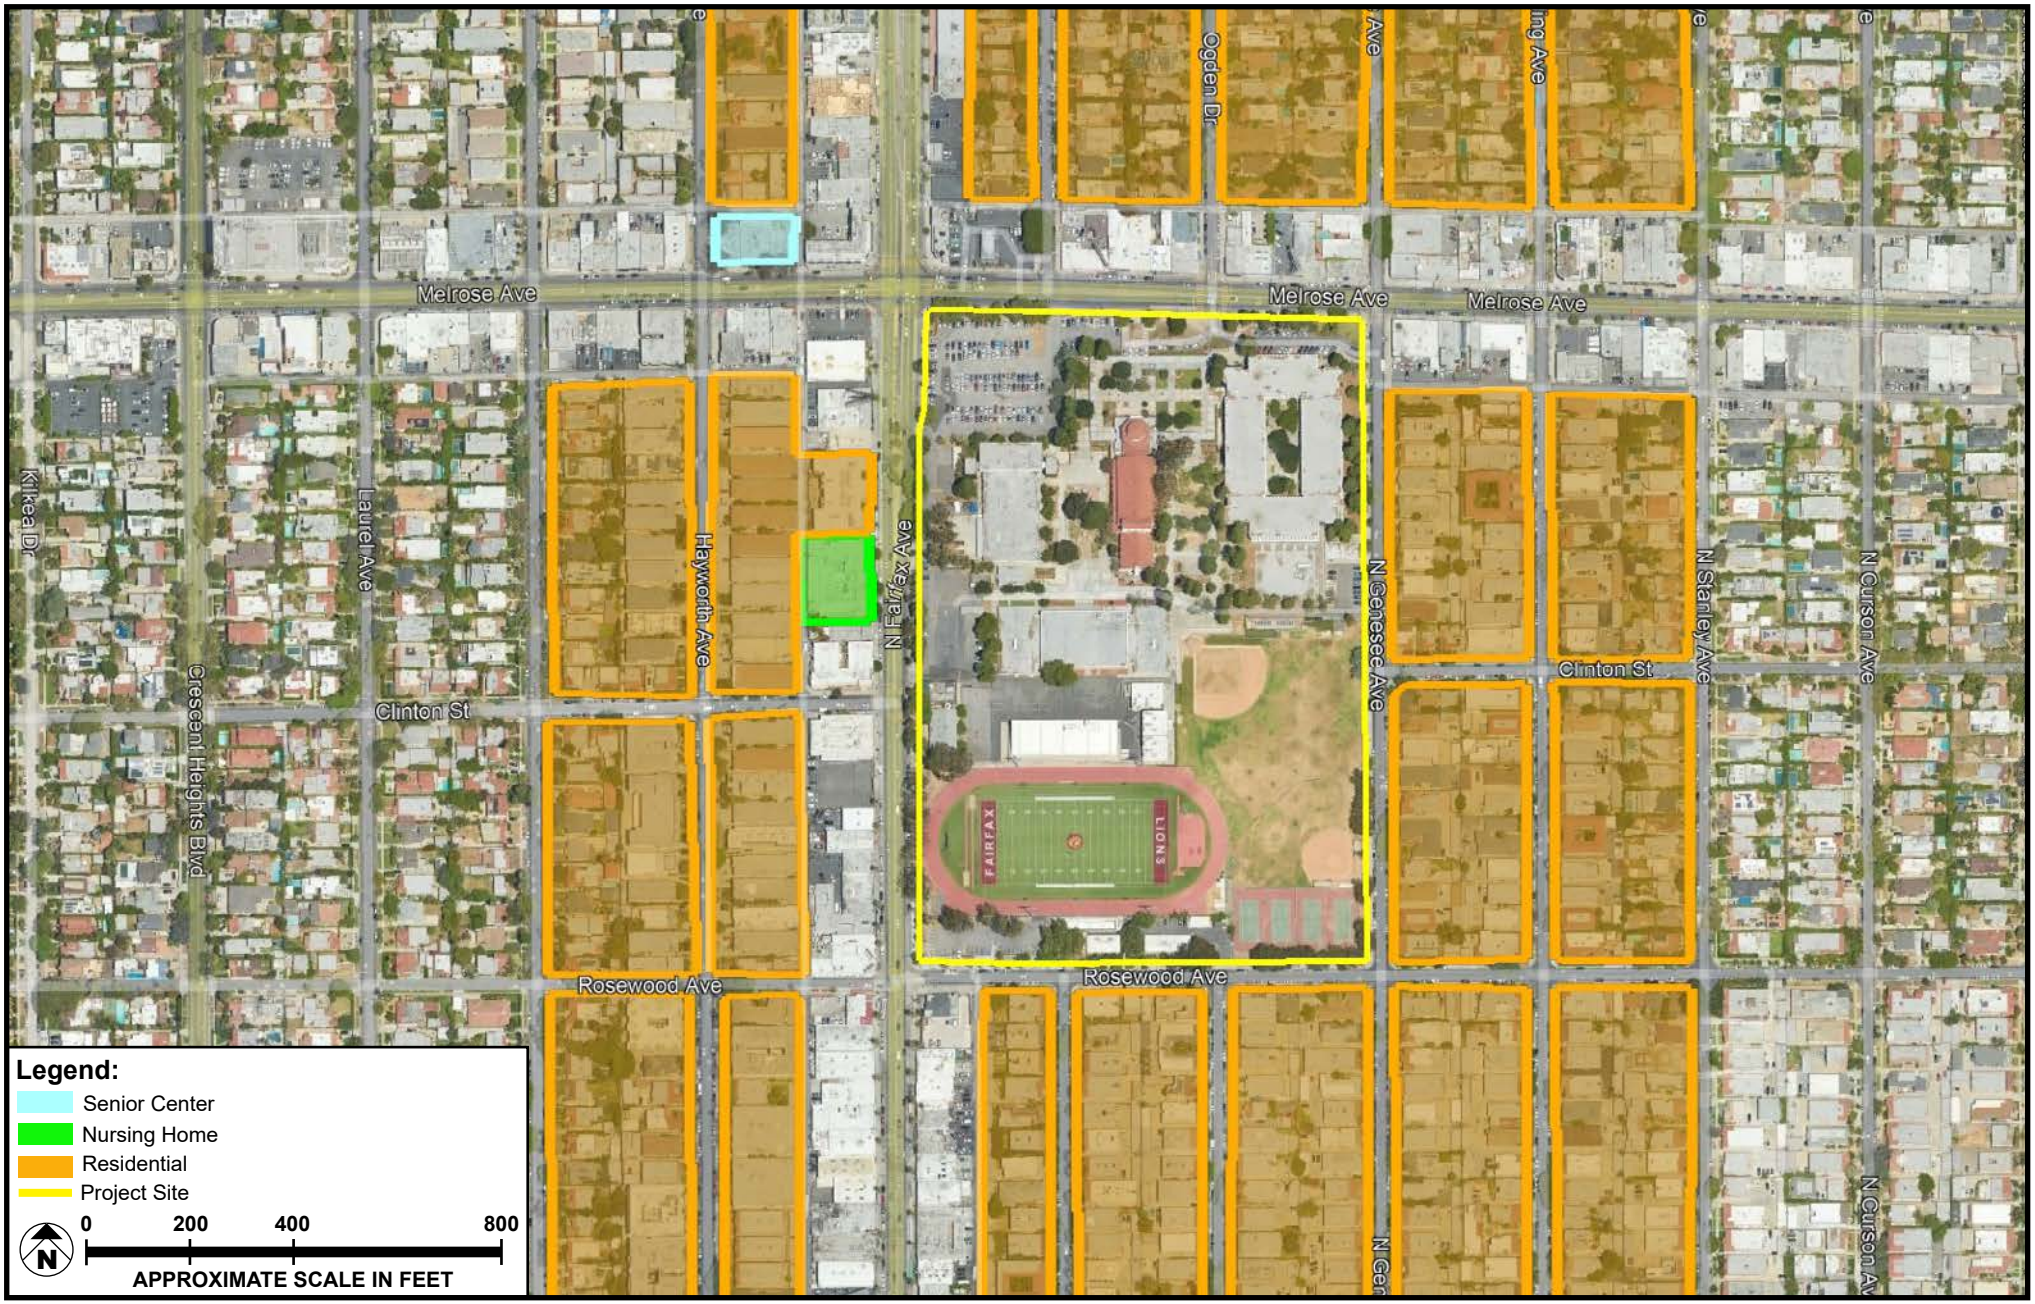
12 City of Los Angeles. Los Angeles Municipal Code (LAMC). Section 4l.40(b).

13 City of Los Angeles. LAMC. Section 4l.40(b).

TABLE 6: AMBIENT NOISE MEASUREMENTS					
	Location Number/Description	Nearest Use	Time Period	Noise Source	dBA Leq
1	**West of the Project site across Fairfax Avenue**	Residential / School / Nursing home	9:56 AM–10:11 AM	Pedestrian flow and high traffic along Fairfax Avenue, light school activity	74.1
2	**South of the Project site across Rosewood Avenue**	Residential / School	10:17 AM–10:32 AM	Pedestrian flow and light traffic along Rosewood Avenue, light school activity	58.1
3	**East of the Project site across Genesee Avenue**	Residential / School	10:39 AM–10:54 AM	Pedestrian flow and light traffic along North Genesee Avenue and Clinton Street, light school activity	62.6

Notes: dBA = A-weighted decibels; Leq = average equivalent sound level.
Source: Refer to **Appendix 1.0** for noise monitoring data sheets.

Sensitive Land Uses



The Noise Element of the City of Los Angeles *General Plan* deems the following land uses noise sensitive:[14]

- Single-family and multiunit dwellings.
- Long-term care facilities (including convalescent and retirement facilities).
- Dormitories, motels, hotels, transient lodgings and other residential uses.
- Houses of worship.
- Hospitals.
- Libraries.
- Schools.
- Auditoriums; concert halls; outdoor theaters.
- Nature and wildlife preserves.
- Parks.

The nearest sensitive receptors with the highest potential to be impacted by the proposed Project, are displayed below in **Figure 3**: **Location of Sensitive Receptors** and listed in **Table 7**: **Nearest Sensitive Receptors**.

14 City of Los Angeles. *Noise Element of the Los Angeles City General Plan.* February 3, 1999. Accessed April 2024. https://planning.lacity.org/odocument/b49a8631-19b2-4477-8c7f-08b48093cddd/Noise_Element.pdf.

TABLE 7: NEAREST SENSITIVE RECEPTORS				
No.	**Address**	**Type**	**Location**	**Distance from Project site (Feet)**
1	**602 North Genesee Avenue Los Angeles, CA 90036**	Residential	East of the Project site across Genesee Avenue	420
2	**467 North Orange Grove Avenue Los Angeles, CA 90036**	Residential	South of the Project site across Rosewood Avenue	430
3	**639 North Fairfax Avenue Los Angeles, CA 90036**	Residential	West of the Project site across Fairfax Avenue	85
4	**619 North Fairfax Avenue Los Angeles, CA 90036**	Nursing Home	West of the Project site across Fairfax Avenue	85
5	**715 North Orange Grove Avenue Los Angeles, CA 90046**	Residential	North of the Project site across Melrose Avenue	225

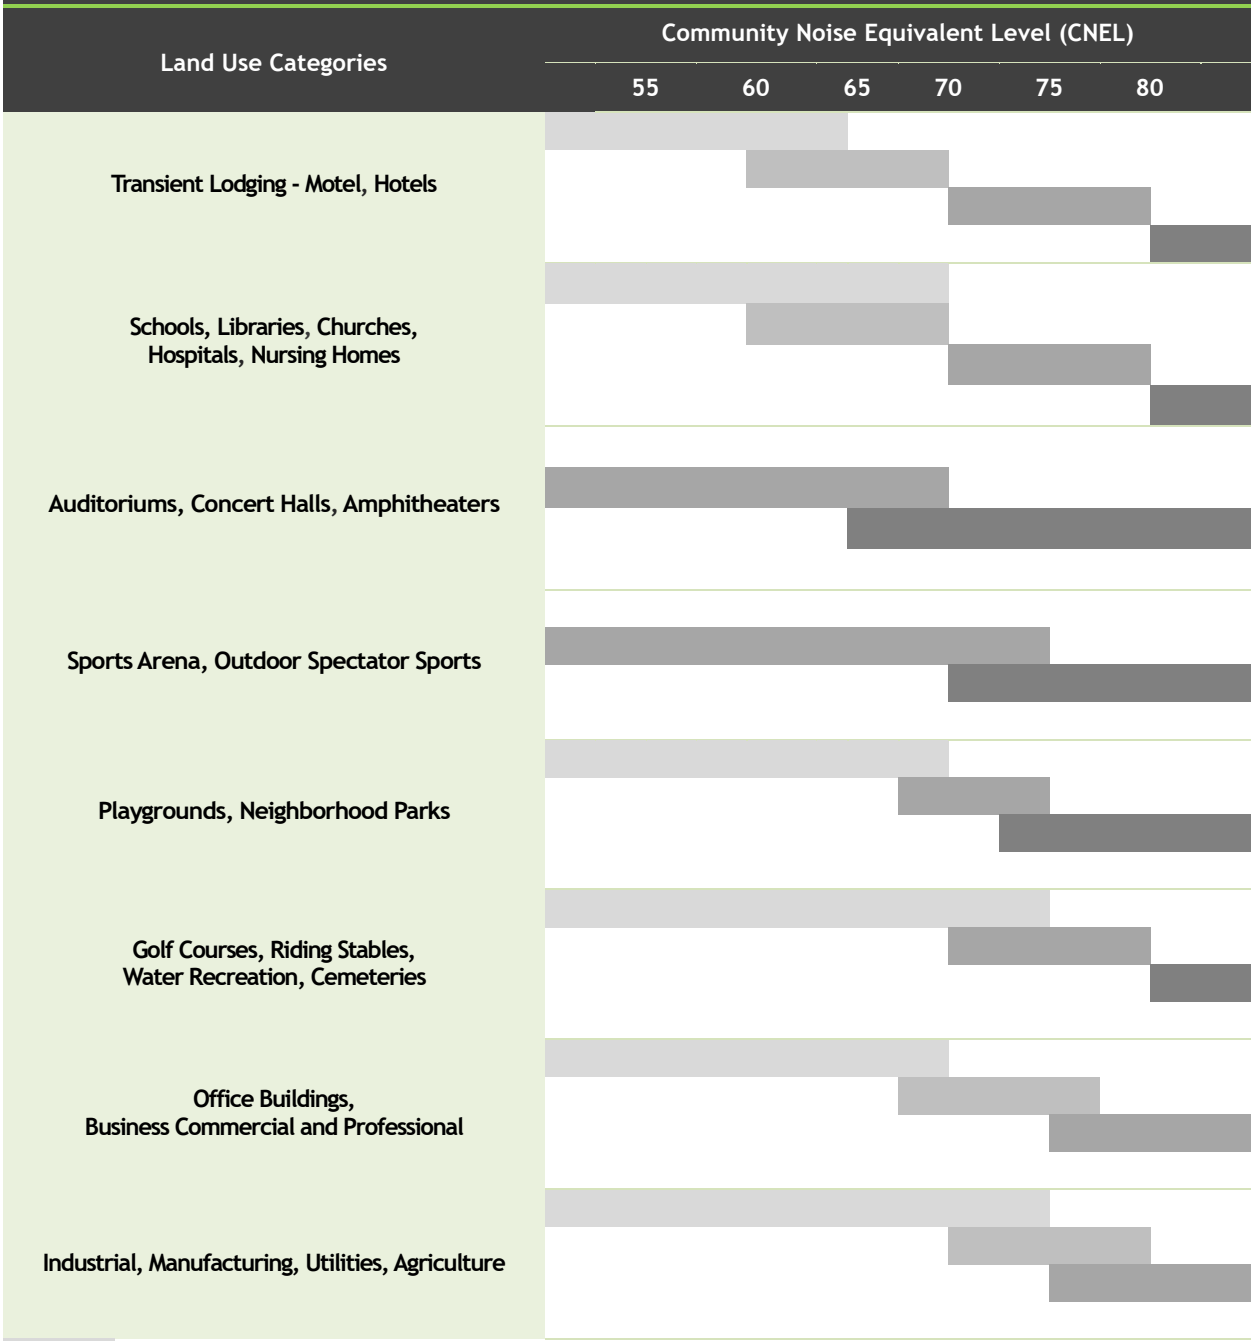
Federal

Because Fairfax High School is surrounded on four sides primarily by residences that could be affected by construction noise from the Project, the US Department of Housing and Urban Development's goal of 45 dBA Lctn as a desirable maximum interior standard for residential units developed under HUD funding is pertinent.[15] While HUD does not specify acceptable exterior noise levels, standard construction of residential dwellings constructed under Title 24 of the California Code of Regulations typically provides 20 dBA of acoustical attenuation with the windows closed and 10 dBA with the windows open. Based on this assumption, the exterior Lctn or CNEL should not exceed 65 dBA under normal conditions.

State of California

The California Governor's Office of Planning and Research (OPR) has studied the correlation of noise levels with effects on various land uses. The most current guidelines prepared by the State noise officer are contained in the *General Plan Guidelines: 2017 Update*. These guidelines establish four categories for judging the severity of noise intrusion on specified land uses:

- **Normally Acceptable:** Is generally acceptable, with no mitigation necessary.
- **Conditionally Acceptable:** May require some mitigation, as established through a noise study.
- **Normally Unacceptable:** Requires substantial mitigation.
- **Clearly unacceptable:** Probably cannot be mitigated to a less-than-significant level.



The types of land uses addressed by the State standards, and the acceptable noise categories for each are presented in **Table 8**: **Land Use Compatibility for Community Noise Sources**. There is some overlap between categories, which indicates that some judgment is required in determining the applicability of the numbers in every situation.

TABLE 8: LAND USE COMPATIBILITY FOR COMMUNITY NOISE SOURCES

Land Use Categories	Community Noise Equivalent Level (CNEL)					
	55	60	65	70	75	80
Residential—Low-Density Single-Family, Duplex, Mobile Homes						
Residential—Multiple Family						

15 HUD. *The Noise Guidebook: A Reference Document for Implementing the Department of Housing and Urban Development's Noise Policy*. 1985.

TABLE 8: LAND USE COMPATIBILITY FOR COMMUNITY NOISE SOURCES

Normally Acceptable: *Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.*

Conditionally Acceptable: *New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will suffice.*

Normally Unacceptable: *New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insultation features included in the design.*

Clearly Unacceptable: *New construction or development should generally not be undertaken.*

Source: Governor's Office of Planning and Research. *General Plan Guidelines: 2017*. Appendix D.

City of Los Angeles

The Noise Element of the City of Los Angeles *General Plan* uses a scheme similar to that of **Table 8** to classify the acceptability of different long-term noise levels for sensitive land uses.[16] For the single-family houses immediately surrounding Fairfax High School, 24-hour averages below 55 dBA CNEL are normally acceptable, and levels between 55 and 70 dBA CNEL are conditionally acceptable. For multifamily housing, 24-hour averages below 60 dBA CNEL are normally acceptable, and levels between 60 and 70 dBA CNEL are conditionally acceptable.

As described in the PEIR, the City of Los Angeles Municipal Code (LAMC) has short-term noise exposure standards for various types of sources, but none appears to be relevant to this analysis. Section 41.40(a) of the LAMC restricts construction operations to 7:00 AM to 9:00 PM, Monday through Friday, 8:00 AM to 6 PM on Saturdays and national holidays. Construction is prohibited on Sundays. Variances for construction during normally prohibited hours may be obtained from the Executive Officer of the Los Angeles Board of Police Commissioners.[17]

Section 112.05(a) of the LAMC limits noise exposures from construction equipment to 75 dBA at a distance of 50 feet. Almost all common types of construction equipment exceed that limit. The LAMC allows exceedance of the limit upon demonstration that compliance is technically infeasible.

Los Angeles Unified School District Program EIR

In 2023, the Supplemental Program EIR for School Upgrade Program established Standard Conditions (SCs) for reducing impacts in areas where future projects would be implemented under the SUP. The SCs were updated from the original Board-adopted Standard Conditions of Approval in 2015. The updated SCs were compiled from established LAUSD standards, guidelines, specifications, practices, plans, policies, and programs, as well as typically applied mitigation measures. For each SC, compliance is triggered by factors such as the project type, existing conditions, and type of environmental impact. Applicable SCs related to noise impacts associated with the proposed Project are provided in **Table 9**: **Noise Standard Conditions of Approval**.

TABLE 9: NOISE STANDARD CONDITIONS OF APPROVAL

Reference Number		Topic	Trigger for Compliance	Implementation Phase	Standard Conditions
SC-N-1	Exterior Campus Noise	On-campus exterior noise levels would be greater than 67 dBA Leq	During project design (Planning)		LAUSD shall design new buildings and other noise-generating sources to include features such as sound walls, building configuration, and other design features that attenuate exterior noise levels on a school campus to less than 67 dBA Leq.
SC-N-2	Interior Classroom Noise	Interior classroom noise levels would be greater than 45 dBA Leq	During project design (Planning)		LAUSD shall analyze the acoustical environment of the site (such as traffic) and the characteristics of planned building components (such as Heating, Ventilation, and Air Conditioning [HVAC]), and

16 City of Los Angeles. "Noise Element." *Los Angeles City General Plan*. https://planning.lacity.org/plans-policies/general-plan-overview

17 City of Los Angeles. LAMC. Section 4l.40(b).

TABLE 9: NOISE STANDARD CONDITIONS OF APPROVAL

Reference Number	Topic	Trigger for Compliance	Implementation Phase	Standard Conditions
				designs shall achieve interior classroom noise levels of less than 45 dBA Leq with a target of 40 dBA Leq (unoccupied), and a reverberation time of 0.6 seconds. Noise reduction methods shall include, but are not limited to, sound walls, building and/or classroom insulation, HVAC modifications, double-paned windows, and other design features. • New construction should achieve classroom acoustical quality consistent with the current School Design Guide and CHPS (California High Performance Schools) standard of 45 dBA Leq. • New HVAC installations should be designed to achieve the lowest possible noise level consistent with the current School Design Guide. HVAC systems shall be designed so that noise from the system does not cause the ambient noise in a classroom to exceed the current School Design Guide and CHPS standard of 45 dBA Leq • Modernization of existing facilities and/or HVAC replacement projects should improve the sound performance of the HVAC system over the existing system. • The District's purchase of new units should give preference to HVAC manufacturers that sell the lowest noise level units at the lowest cost. • Existing HVAC units operating in excess of 45 dBA Leq inside classrooms should be modified.
SC-N-3	Operational Noise	Operational noise levels from new source exceeds local noise standards, policies, or ordinances at adjacent noise-sensitive land uses	During project design and construction (Planning, Construction)	LAUSD shall incorporate long-term permanent noise attenuation measures between new playgrounds, stadiums, and other noise-generating facilities and adjacent noise-sensitive land uses, to reduce noise levels to meet jurisdictional standards or an increase of 3 dB or less over ambient. Operational noise attenuation measures include, but are not limited to: • Buffer zones; • Berms; • Sound barriers; • Buildings; • Masonry walls; • Enclosed bleacher foot wells; and/or • Other site-specific project design features.
SC-N-4	Construction Noise and Vibration (Annoyance)	Construction on an existing school campus	Prior to and during construction (Construction)	LAUSD or its Construction Contractor shall consult and coordinate with the school principal or site administrator, and other nearby noise sensitive land uses prior to construction to schedule high noise or vibration producing activities to minimize disruption. Coordination between the school, nearby land uses and the Construction Contractor shall continue on an as-needed basis throughout

TABLE 9: NOISE STANDARD CONDITIONS OF APPROVAL

Reference Number		Topic	Trigger for Compliance	Implementation Phase	Standard Conditions
					the construction phase of the project to reduce school and other noise sensitive land use disruptions.
SC-N-5	Vibration (Structural Damage)	Rock blasting	During construction	(Construction)	LAUSD shall require the Construction Contractor to minimize blasting for all demolition and construction activities, where feasible.
SC-N-6	Vibration (Structural Damage)	Pile driving or heavy vibration activities	During construction	(Construction)	For projects where pile driving activities are required within 150 feet of a structure, a detailed vibration assessment shall be provided by an acoustical engineer to analyze potential impacts related to vibration to nearby structures and to determine feasible mitigation measures to eliminate potential risk of architectural damage.
SC-N-7	Vibration (Structural Damage)	Vibration intensive activities are planned within 25 feet of a historic building or structure	Prior to and during construction	(Construction)	LAUSD shall meet with the Construction Contractor to discuss alternative methods of demolition and construction for activities within 25 feet of a historic building to reduce vibration impacts. During the preconstruction meeting, the Construction Contractor shall identify demolition methods not involving vibration-intensive construction equipment or activities. For example: sawing into sections that can be loaded onto trucks results in lower vibration levels than demolition by hydraulic hammers. • Prior to construction activities, the Construction Contractor shall inspect and report on the current foundation and structural condition of the historic building. • The Construction Contractor shall implement alternative methods identified in the preconstruction meeting during demolition, excavation, and construction, such as mechanical methods using hydraulic crushers or deconstruction techniques. • The Construction Contractor shall avoid use of vibratory rollers and packers adjacent to the building. • During demolition, the Construction Contractor shall not phase any ground-impacting operations near the building to occur at the same time as any ground impacting operation associated with demolition and construction. During demolition and construction, if any vibration levels cause cosmetic or structural damage to the building or structure, a "stop-work" order shall be issued to the Construction Contractor immediately to prevent further damage. Work shall not restart until the building is stabilized and/or preventive measures to relieve further damage to the building are implemented.
SC-N-8	Construction Noise	Use of large, heavy or noisy construction equipment within 500 feet of a non-LAUSD	During construction	(Construction)	Projects within 500 feet of a non-LAUSD sensitive receptor, such as a residence, shall be reviewed by OEHS to determine what, if any, feasible project

TABLE 9: NOISE STANDARD CONDITIONS OF APPROVAL

Reference Number	Topic	Trigger for Compliance	Implementation Phase	Standard Conditions
	sensitive receptor			specific noise reduction measures are needed. The Construction Contractor shall implement project specific noise reduction measures identified by OEHS. Noise reduction measures may include, but are not limited to, the following: <u>Source Controls</u> • Time Constraints – prohibiting work during sensitive nighttime hours. • Scheduling – performing noisy work during less sensitive time periods (on operating campus: delay the loudest noise generation until class instruction at the nearest classrooms has ended; residential: only between 7:00 AM and 7:00 PM). • Equipment Restrictions – restricting the type of equipment used. • Substitute Methods – using quieter methods and/or equipment. • Exhaust Mufflers – ensuring equipment has quality mufflers installed. • Lubrication & Maintenance – well maintained equipment is quieter. • Reduced Power Operation – use only necessary size and power. • Limit Equipment On-Site – only have necessary equipment on-site. • Noise Compliance Monitoring – technician on site to ensure compliance. • Quieter Backup Alarms – manually-adjustable or ambient sensitive types. <u>Path Controls</u> • Noise Barriers – semi-permanent or portable wooden or concrete barriers. • Noise Curtains – flexible intervening curtain systems hung from supports. • Enclosures – encasing localized and stationary noise sources. • Increased Distance – perform noisy activities farther away from receptors, including operation of portable equipment, storage and maintenance of equipment. <u>Receptor Controls</u> • Window Treatments – reinforcing the building's noise reduction ability. • Community Participation – open dialog to involve affected residents. • Noise Complaint Process – ability to log and respond to noise complaints. Advance notice of the start of construction shall be delivered

TABLE 9: NOISE STANDARD CONDITIONS OF APPROVAL				
Reference Number	Topic	Trigger for Compliance	Implementation Phase	Standard Conditions
				to all noise sensitive receptors adjacent to the project area. The notice shall state specifically where and when construction activities will occur, and provide contact information for filing noise complaints with the Construction Contractor and the District. In the event of noise complaints noise shall be monitored from the construction activity to ensure that construction noise is not obtrusive.
SC-N-9	Construction Noise	Use of large, heavy or noisy construction equipment on an operating LAUSD campus	During construction (Construction)	Construction Contractor shall ensure that LAUSD interior classroom noise and exterior noise standards are met to the maximum extent feasible, or that construction noise is not disruptive to the school environment, through implementation of noise control measures, as necessary.5 Noise control measures may include, but are not limited to: Path Controls • Noise Attenuation Barriers6 – Temporary noise attenuation barriers installed blocking the line of sight between the noise source and the receiver. Intervening barriers already present, such as berms or buildings, may provide sufficient noise attenuation, eliminating the need for installing noise attenuation barriers.

Thresholds of Significance

Noise

Construction

The City has not established noise limits for temporary construction noise. As shown in **Table 10: General Assessment Construction Noise Criteria**, the FTA recommends criteria related to construction noise.

TABLE 10: GENERAL ASSESSMENT CONSTRUCTION NOISE CRITERIA		
Land Use	Leq Equip (1-hr) dBA	
	Day	Night
Residential	90	80
Commercial	100	100
Industrial	100	100

Source: Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, September 2018, Table 7-2: General Assessment Construction Noise Criteria.

Operation

Two criteria were used for judging noise impacts. First, noise levels generated by the proposed Project must comply with all relevant federal, State, and local standards and regulations. Noise impacts on the

surrounding community are limited by local noise ordinances, which are implemented through investigations in response to nuisance complaints. It is assumed that all existing regulations for the construction and operation of the proposed Project will be enforced. In addition, the proposed Project should not produce noise levels that are incompatible with adjacent noise-sensitive land uses.

The second measure of impact used in this analysis is a significant increase in noise levels above existing ambient noise levels as a result of the introduction of a new noise source. An increase in noise levels due to a new noise source has a potential to adversely impact people. According to LAUSD guidelines[18] a proposed project would have a significant noise impact if it would do any of the following:

- Create a maximum exterior noise level exceeding 67 dBA Leq
- Result in a maximum interior classroom noise level exceeding 45 dBA Leq
- Result in a permanent increase in noise levels at nearby sensitive land uses exceeding 3 dBA CNEL.

The following additional criteria are from the City of Los Angeles. A proposed project would have a significant noise impact if it would do any of the following:

- Generate operational noise from traffic and on-site sources that would cause the ambient noise levels at the property line of affected uses to increase by 3 dBA CNEL, and noise levels reach, or are within, the "normally unacceptable" or "clearly unacceptable" category, or increase by 5 dBA CNEL or greater.
- Generate noise from operational stationary sources that causes ambient levels to increase by more than 5 dB.

Vibration

There are no adopted City standards or thresholds of significance for vibration. The evaluation of potential building damage impacts related to construction vibration levels is based on the published data in the US Federal Transit Administration (FTA) guidance.[19] While ground vibrations from construction activities do not often reach the levels that can damage structures, fragile buildings must receive special consideration. As such, the vibration damage criteria adopted by the FTA and applied in this analysis are listed below. Vibration impacts could be potentially significant if the vibration velocity exceeds the following:

- Reinforced-concrete, steel, or timber (no plaster) would exceed 0.5 PPV (inches per second);[20]
- Engineered concrete and masonry (no plaster) would exceed 0.3 PPV;
- Nonengineered timber and masonry buildings would exceed 0.2 PPV; or
- Buildings extremely susceptible to vibration damage would exceed 0.12 PPV

19 United States Federal Transit Administration (FTA). *Transit Noise and Vibration Impact Assessment Manual*. September 2018. Accessed February 2024. https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf.

20 When assessing vibration source levels from construction equipment, vibration is generally assessed in terms of PPV. PPV is defined as the peak signal value of an oscillating vibration velocity waveform, expressed in inches per second.

Noise impacts associated with school upgrade projects include short-term and long-term impacts. Construction activities, especially heavy equipment operation, would create noise effects on and adjacent to the construction site. Long-term noise impacts include Project-generated on- and off-site operational noise sources. On-site (stationary) noise sources would include operation of mechanical equipment such as air conditioners, landscape, building maintenance, and sports and recreational activities. Off-site noise would be attributable to Project-induced traffic, which would cause an incremental increase in noise levels within and near the Project vicinity.

This section also evaluates potential ground-borne vibration that would be generated from the construction or operation of the proposed Project.

Construction Impacts

On-Site Construction Noise

Noise from construction activities would be affected by the amount of construction equipment, the location of this equipment, the timing and duration of construction activities, and the relative distance to noise-sensitive receptors. Construction activities that would occur during the construction phases would generate both steady-state and episodic noise that would be heard both on and off the Project site. Each construction phase involves the use of different types of construction equipment and, therefore, has its own distinct noise characteristics. The Project would be constructed using typical construction techniques; no blasting or impact pile driving would be required.

The construction equipment reference noise levels provided in **Table 4** are based on measured noise data compiled by the Federal Highway Administration (FHWA) and would occur when equipment is operating under full power conditions. However, equipment used on construction sites typically operate at less than full power. The acoustical usage factor is the percentage of time that each type of construction equipment is anticipated to be in full power operation during a typical construction day. These values are estimates and will vary based on the actual construction process and schedule.

Construction equipment operates at its noisiest levels for certain percentages of time during operation. As such, equipment would operate at different percentages over the course of an hour.[21] During a construction day, the highest noise levels would be generated when multiple pieces of construction equipment are operated concurrently.

To characterize construction-period noise levels, the average (hourly Leq) noise level associated with each construction stage was calculated based on the quantity, type, and usage factors for each type of

21 United States Department of Transportation, *FHWA Highway Construction Noise Handbook. August* 2006. Accessed June 2024. https://acrobat.adobe.com/id/urn:aaid:sc:VA6C2:89eb2f48-15a3-425b-82b1-583bbad4bdbe.

equipment that would be used during each construction stage. These noise levels are typically associated with multiple pieces of equipment operating simultaneously.

As discussed previously, Construction of the proposed Project would occur in two phases as detailed in **Table 11: Construction Maximum Noise Estimates**. Construction and demolition activities would first take place on the norther portion of the Project site to allow for the demolition and removal of the existing Shop Building (Building No. 2) and Ticket Booth (Building No. 14); this would allow for the construction of the new Gymnasium and classrooms as seen in **Figure 2**. Construction of the new Gymnasium and classrooms would be completed before Phase 2 of demolition and construction activities occur. Phase 2 includes the demolition of the existing Gymnasium (Building No. 3) and Utility Building (Building No. 16) in order for the new Support Facilities and Maintenance and Operations Facility to be constructed on the southern portion of the Project site, as shown in **Figure 2**.

The estimated construction noise levels were calculated for each of the analyzed receptors (refer to **Figure 3**) during each of the construction phases. As mentioned previously, given the physical size of the Project site and logistical limitations, and with the noise equipment located at the construction area nearest to the affected receptors to present a conservative impact analysis. This is considered a worst-case evaluation because construction of the Project would typically use fewer pieces of equipment simultaneously at any given time as well as operating throughout the construction site (i.e., most of the time construction equipment would be operating at distances further away from the off-site receptors than that assumed in the forecasting of Project construction noise levels). As such, Project construction would often generate lower noise levels than reported herein.

Impacts to Neighborhood Sensitive Receptors

The potential noise impact generated during construction depends on the phase of construction and the percentage of time the equipment operates over the workday. However, construction noise estimates used for the analysis are representative of worst-case conditions because it is unlikely that all the equipment contained on site would operate simultaneously. As would be the case for construction of most land use development projects, construction of the proposed Project would require the use of heavy-duty equipment with the potential to generate audible noise above the ambient background noise level.

The noise levels from construction activity at the previously identified sensitive receptors are shown in **Table 11**. As shown, construction noise levels would not exceed the residential significance threshold. Additionally, the implementation of LAUSD's SCs would further reduce noise levels.

The proposed Project requires compliance with *SC-N-4* and *SC-N-8* which would require site-specific noise control measures to be implemented during construction. Implementation of *SC-N-8* would schedule the noisiest operations to occur between 7:00 AM to 7:00 PM and would delay noise generation until class instruction at the nearest classrooms has ended. Additionally, *SC-N-8* includes the use of exhaust mufflers

would reduce construction noise levels by approximately 10 dB or more.[22] As such, maximum construction noise levels would not exceed the daytime noise level criteria of 90 dBA Leq (10-hour) for residential receptors. Impacts would be less than significant.

TABLE 11: CONSTRUCTION MAXIMUM NOISE ESTIMATES

Nearest Off-Site Building Structures	Calculated Noise Level (Leq 1-hour) by Construction Phase						Increase Above Significance Threshold

Impacts to On-site Sensitive Receptors

Existing buildings will be demolished and new structures will be built on a functioning, full-time high school campus. Most of the noise-generating construction activities will, for several days at a time, be near classroom buildings which would create potential for noise disturbance. Per LAUSD standards, interior classroom noise levels are supposed to be at 45 dBA Leq or below. Compliance with the City's Noise Ordinance and *SC-N-5* from the PEIR will minimize noise-related disruptions to school operations during construction. Specifically, *SC-N-5* states that the LAUSD Facilities Division or its construction contractor shall, prior to construction, consult and coordinate with the school principal or site administrator, and other nearby noise-sensitive land uses, to schedule high-noise or vibration-producing activities to minimize disruption. Coordination between the school, nearby land uses, and the construction contractor shall continue on an as-needed basis throughout the construction phase of the Project to reduce school and other noise-sensitive land use disruptions.

Off-Site Construction Noise

Construction of the Project would require haul and vendor truck trips to and from the site to export demolition debris and soil and deliver supplies to the site. Trucks traveling to and from the Project site would be required to travel along a haul route approved by the City. Approximately 906 total hauling trips would take place during the demolition phase. Haul truck traffic would take the most direct route to the appropriate freeway ramp.

Noise associated with construction truck trips were estimated using the Caltrans FHWA Traffic Noise Model based on the maximum number of truck trips in a day. Project truck trips which includes medium- and heavy-duty trucks would generate noise levels of approximately 50.6 to 54.5 dBA, respectively, measured at a distance of 25 feet along Melrose Avenue. As shown in **Table 7**, existing noise levels at the Project site ranged from 58.1 dBA to 74.1 dBA. The noise level increases from truck trips would be below the significance threshold of 5 dBA.

Construction Vibration

Table 12: On-Site Construction Vibration ImpactsöBuilding Damage present construction vibration impacts associated with on-site construction in terms of building damage. As shown in **Table 12**, the forecasted vibration levels due to on-site construction activities would not exceed the building damage significance threshold of 0.2 PPV ips at the nearby residential uses. Furthermore, the proposed Project requires compliance with the Program EIR Recommendations and LAUSD SCs, including *SC-N-4* through *SC-N-7* which include site-specific vibration control measures. As such vibration impacts would not be considered significant.

TABLE 12: ON-SITE CONSTRUCTION VIBRATION IMPACTS—BUILDING DAMAGE

Operation Impacts

As stated in the PEIR, school operations do not involve sources that cause substantial ground-borne vibration. Therefore, the modernization Project at Fairfax High School will not result in long-term significant impacts due to ground-borne vibration or noise levels.

Cumulative Noise

For purposes of this analysis, development of the related projects will be considered to contribute to cumulative noise impacts. Noise, by definition, is a localized phenomenon and drastically reduces as distance from the source increases. As a result, only related projects and growth in the general area of the Project site would contribute to cumulative noise impacts. Cumulative construction-noise impacts have the potential to occur when multiple construction projects in the local area generate noise within the same time frame and contribute to the local ambient noise environment. It is expected that, as with the Project, the related projects would implement BMPs, which would minimize any noise-related nuisances during construction. Therefore, the combined construction noise impacts of related projects and the Project's contribution would not cause a significant cumulative impact.

With regard to stationary sources, cumulative significant noise impacts may result from cumulative development. Stationary sources of noise that could be introduced in the area by cumulative projects could include mechanical equipment, loading docks, and parking lots. Given that these projects would be required to adhere to the City's noise standards, all stationary sources would be required to have shielding or other noise-abatement measures so as not to cause a substantial increase in ambient noise levels. Moreover, due to distance, it is unlikely that noise from multiple cumulative projects would interact to create a significant combined noise impact. As such, it is not anticipated that a significant cumulative increase in permanent ambient noise levels would occur.

G. MITIGATION MEASURES

The standard conditions of approval cited in this *Noise Stud*y will be adequate to reduce all potentially significant impacts to less-than-significant levels. No noise mitigation measures are required for the Project.

Re: Fairfax High School Modernization Project, Los Angeles County

To Whom It May Concern:

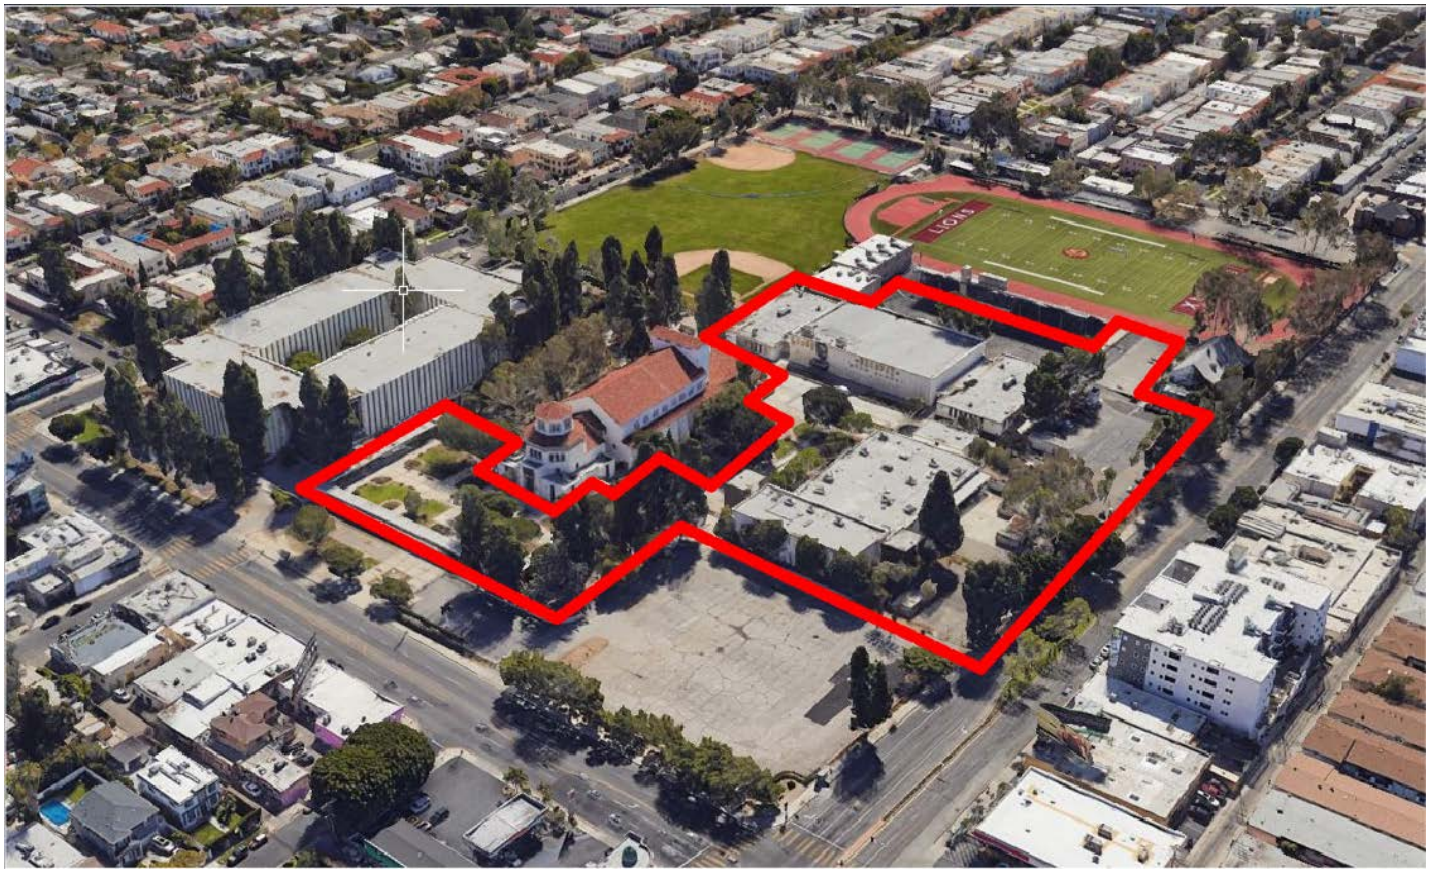
A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,



Andrew Green

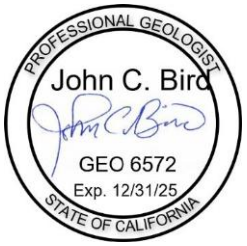
Re: Preliminary Environmental Assessment – Equivalent (PEA-E) Fairfax High School 7850 Melrose Avenue, Los Angeles, California 90046

Mr. Morrill,

Millennium Consulting Associates (Millennium) is pleased to submit Preliminary Environmental Assessment - Equivalent (PEA-E) Report in response to the Office of Environmental Health and Safety and LAUSD for the property located at 7850 Melrose Avenue, Los Angeles, California.

If you have comments or questions regarding this Report, please do not hesitate to contact the undersigned at 925-808-6700.

Sincerely,



Millennium Consulting Associates

1.0 INTRODUCTION

At the request of the Los Angeles Unified School District (LAUSD), Millennium Consulting Associates (Millennium) has completed this Preliminary Environment Assessment-Equivalent (PEA-E) for the Major Modernization Project at Fairfax High School, 7850 Melrose Avenue, Los Angeles, California 90046 (Figure 1). The main objective of this PEA-E is to identify potential environmental contamination associated with existing and historical onsite activities and any offsite contamination that may impact the school property. Any contamination found is to be remediated to LAUSD standards prior or during the new construction.

Fairfax High School is located at 7850 Melrose Avenue, Los Angeles, California 90046, near the border of West Hollywood in the Fairfax District (Figure 1). Fairfax High School is also defined by Los Angeles County Assessor parcel numbers 5527-021-900. The school property is approximately 24.45 acres of land with various school buildings and recreational fields, including parking lots throughout. The school is surrounded by residential and commercial businesses.

The Major Modification Project at Fairfax High School includes the following:

1. The demolition and removal of the Shop Building, Gymnasium, Utility Building, Ticket Office, and Relocatable Sanitary Building.
2. The construction of a new gymnasium building, approximately five specialty classrooms and support spaces, outdoor physical education courts, and art gallery building.
3. Exterior painting of all remaining buildings to provide a uniform appearance; associated landscape, hardscape, parking improvements, and related infrastructure upgrades including, but not limited to, sanitary sewer, water, storm water, and electrical utilities.
4. Improvements related to requirements from the Americans with Disabilities Act (ADA), Division of the State and Architecture (DSA), California Environmental Quality Act (CEQA), Department of Toxic Substances Control (DTSC), or other improvements to ensure compliance with local, state, and federal requirements.

The boundaries of the Major Modification Project at Fairfax High School (the "Site") are identified in Figure 2.

1.1 Site History and Background

The Site is approximately 24.45 acres of land with various school buildings and athletic fields, including parking lots throughout. Historical records dating back to 1894 show the Site as undeveloped land with no signs of infrastructure until 1924, where it is associated with Fairfax High School. Currently, the Site is an active high school located adjacent to retail markets and residential properties. Historical aerial photographs dating back to 1923 depict the Site as undeveloped land until approximately 1928, where the land is shown to have multiple structures onsite including what resembles a recreational

field on its southwest corner. By at least 1977, the Site changes its configuration, where an additional athletic field is depicted adjacent to the southwest corner field in the southeast corner with a much larger multi-story structure occupying the northeast corner. An additional structure on the west side of the Subject Property is shown replacing the previous structure with an added parking lot. Aerial photos dated 2012 show the athletic fields in the southwest corner and southeast corner are clearly defined and marked as a football field and baseball field with the rest of the subject property in its present-day configuration.

Millennium is tasked with creating this PEA-E in order to analyze subsurface conditions. It is our understanding that the Site will continue to operate as Fairfax High School.

1.2 Previous Environmental Investigations

Previous environmental investigations for Fairfax High School (HS) include a South Coast Air Quality Management District (SCAQMD) Rule 1466 Soil Sampling Report for the ADA Improvement Project (ALTA Environmental, March 11, 2020), a Methane Survey Report for the Major Modernization Project (Clark Seif Clark, January 19, 2024), and a Phase I Environmental Site Assessment (Millennium, March 4, 2022).

There were no identified Toxic Air Contaminants (TACs) identified within the Major Modernization Project boundaries in the SCAQMD Rule 1466 Soil Sampling Report (ALTA, 2020). No methane or hydrogen sulfide were detected during the methane survey conducted for the Major Modernization Project (CSC, 2024); however, the Fairfax High School is located in a SCAQMD Methane Zone and sub-slab methane barriers systems will be designed and installed for the new building construction.

The Phase I Environmental Site Assessment (ESA) (Millennium, 2022) identified the following historical and current environmental issues for the Major Modernization Project.

- Three-stage clarifier and hydraulic hoists associated with the former autobody shop building operations.
- Records identifying a historic autobody shop, woodworking shop, paint shop, and electrical shop buildings formerly located on the west portion of the Subject Property.
- Various Southern California Edison transformers located in the quad area (potential PCB containing materials based on date of construction).
- The Subject Property is located within a City of Los Angeles Methane Zone.
- Potential for organochloride pesticides, lead, and arsenic contamination of shallow soils around drip lines of buildings resulting from the use of termiticides, herbicides, and pesticides at locations where buildings may be demolished.

- Site plans from March 1927 indicated various cesspools at the northwest, northeast, and northcenter portion of the campus. The disposition of the cesspools is not known.

1.3 Objective and Scope

The purpose of the PEA-E is to conduct soil and soil vapor sampling and laboratory analysis for the Major Modernization Project to investigate the environmental concerns identified during the Phase I ESA. The objective of the PEA-E was to:

- Determine through sampling and analyses whether current and historical uses at the Site resulted in the deposition of Chemicals of Potential Concern (CPOCs) in soil and soil vapor.
- Determine the amount, concentration, and extent of COPC onsite.
- Evaluate potential risks posed by identified impacts.
- Recommend further action or no further action based on the findings of this PEA-E.

Environmental soil sampling was completed for organochlorine pesticides (OCPs), polychlorinated biphenyls (PCBs), asbestos containing materials (ACMs), volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), total petroleum hydrocarbons (TPHs), Title 22 Metals, arsenic, lead, and hexavalent chromium. One hundred and two soil samples and twenty-nine vapor samples were analyzed across the Site. The PEA-E investigation results are outlined in the following sections.

2.0 GEOLOGICAL AND HYDROGEOLOGICAL SETTING

The Site is approximately 224 feet above sea level (United States Geological Survey [USGS] Topographic Map, Beverly Hills, California, 2015). The Site is located within the Los Angeles Basin in a relatively low-lying area filled with unconsolidated alluvial fan deposits. The soil at the Site consists of wet moderately well-drained soil of silty clay loam. Regional geologic mapping designates the level area of the Site as alluvium from the early Holocene and late Pleistocene (Division of Mines and Geology, Geologic Map of California, 2010).

The Subject Property is located inside the Los Angeles Basin within the California Coastal Basin Aquifer (American Geosciences Institute, 2022). The soils presented at the Subject Property have moderate infiltration rates. The surrounding area of the Subject Property has been improved by grading. Surface water flow is controlled by the existing grading and pavement systems. Storm water is primarily controlled by existing surface topography and storm water collection devices (area drains). Runoff water is expected to flow south-southwest on the Subject Property (USGS Topographic Map, Beverly Hills, California, 2015). According to Geotracker well data of adjacent properties within 0.5 miles of the Subject Property, the general movement of groundwater is expected to flow west-southwest in line with the general topographic gradient. Depth to groundwater is estimated to be 20-40 feet below ground surface.

Millennium's PEA-E logged 12 Vapor Soil borings, VP1 through to VP13 (VP-7 was not logged) to a depth of 15 feet bgs with the exceptions of VP11 and VP12, which had depths of 13 feet bgs. Nineteen soil borings from SB1 to SB20 (SB14 was omitted and not logged) were drilled to a depth of 5 feet bgs, with the exceptions of SB11, SB12, and SB13. Soil Boring 11 hit a utility box at 1 foot bgs and was terminated while SB12 and SB13 hit refusal at 2.25 feet bgs. Stepping out to complete the borings was not an option due to site conditions. Three Primary Source borings (PS2, PS3, and PS5) were drilled to a depth of 15 feet bgs, while twenty Drip Line borings (DL1 through DL21), were drilled to a depth of 3 feet bgs, except DL15, which was omitted at the client's request. Millennium described the upper five feet as Silty Sand (SM) followed by Clay with coarse gravel (CL) down to approximately 15 feet bgs.

3.0 *FIELD ACTIVITIES*

3.1 Pre-Field Activities

Prior to initiating field work, the investigation area was marked and DigAlert® (Underground Service Alert of Southern California or USA/SC) was notified at least 72 hours prior to initiation of intrusive field tasks. A Geophysical survey of each location was performed ahead of boring. Due to the shallow nature of the proposed borings, permits were not necessary.

However, according to the County of Los Angeles, a work plan approval is necessary. Therefore, Millenium submitted a work plan approval form to the County of Los Angeles Public Health. The work plan was accepted, and the permit (SR0375708) was issued. The on-Site staff, students, and workers were notified at least 72 hours prior to commencing PEA-E sampling activities at the Site. The Plant Manager, Mr. Jose Trujillo, was notified prior to any Site visit.

A Site-specific health and safety plan (HASP) was prepared by the selected sampling contractor pursuant to 29 CFR 1910.120. All on-Site activities were performed by individuals with appropriate training (CFR 1910.120), in accordance with the site-specific HASP. The HASP is intended to aid in the safe handling of soils potentially containing elevated levels of constituents of concern. It is designed to: (1) identify and describe potentially hazardous substances that may be encountered during field activities; (2) specify protective equipment for onsite activities; (3) specify personnel decontamination procedures; and (4) outline measures to be implemented in the event of an emergency. Field personnel and all subcontractors reviewed and were briefed about job health and safety measures and the contents of the HASP prior to commencing fieldwork each day.

3.2 Field Activities – Drilling and Soil Sampling Methods and Procedures

Millennium was on-site on June 13, June 14, June 17, November 26, and November 27, 2024, to collect samples as part of the site investigation. During these visits, samples were gathered from

designated locations following standard procedures. The samples collected were analyzed to evaluate site conditions and support the overall assessment process.

Under the observation of a Millennium representative Millenium Environmental, Inc. utilized hand auguring methods and Geoprobe rig 7822 DT to advance nineteen soil borings (SB1–SB20, SB14 was omitted at the client's request) to a depth of 5 feet bgs, twenty drip line locations (DL1– DL21, DL 15 was not drilled) to a depth of 3 feet bgs, three primary source location (PS2, PS3, and PS5), and twelve soil vapor locations (VP1 – VP13, not including VP-7) to a depth of approximately 16 feet bgs at the Site from June 12 to June 14 and November 26 to November 27, 2024. Direct push with a drill bit size of 2.25 inches was chosen as the method for drilling, and continuous soil samples were collected in disposable polyethylene liners inserted into the steel probe rods at each interval. The liners preserved soil sample integrity and prevented sample cross-contamination. Liners containing soil samples were split vertically upon recovery; the recovered soil was measured, examined, and classified based on American Society for Testing and Materials (ASTM) D2488 at the Site. Millenium Environmental, Inc. assumed that VP locations would require coring through either asphalt or concrete. Each soil vapor well location was completed with a 6-inch permanent well box. The respective information was entered in soil boring logs (Appendix B).

*Notes – Sample ID indicates depth; SB1-3 is location 1 depth 3 feet bgs. DUP indicates duplicate and REP indicates representative.

The following Quality Assurance/Quality Control (QA/QC) procedures were followed during sampling and analysis:

- In accordance with PEA-E guidance, duplicate soil samples were collected and analyzed at a frequency of approximately 10 percent of the primary samples. The duplicate soil samples were analyzed for the same parameters as the primary samples.
- Equipment blank samples were collected daily for each type of sampling equipment and analyzed for the same parameters as the soil samples being analyzed on that day.
- Trip blank samples were included in each cooler with shipment of samples for VOC analysis.

- Samples were transferred under chain-of-custody control and were subject to the laboratory's conventional QA/QC analytical procedures, including method blanks, laboratory control samples, and sample duplicate analyses.

Soil samples were placed in jars; based on the sampling program, some samples were placed "on hold." This sampling rationale was developed to obtain a general assessment of soil conditions at the Site and allow for depth-specific follow-up analysis. Soil samples were transported in two coolers on ice to Enthalpy Analytical. No visual/olfactory evidence of contamination (i.e., staining and sheen) was recorded during soil sampling collection.

Soil Vapor samples were analyzed onsite using mobile laboratory Jones Environmental, Inc. by a modified Environmental Protection Agency (EPA) Method 8260B. The soil vapor sampling shall include 10% duplicates for EPA Method 8260B by Jones Environmental, Inc., and 2 Summa canister samples for quality assurance were analyzed by EPA Method TO-15 at Enthalpy Analytical Laboratory.

As expected, groundwater was not encountered during the drilling and sampling; local groundwater is estimated to be between 40 and 45 feet bgs. Borings, sample intervals, and identifications are summarized in Table 3.1 above.

4.0 RESULTS

4.1 Soil Analytical Results

A total of one hundred and two soil samples were collected across 43 borings were analyzed per Table 3.1.

The Site will continue to be used for the LAUSD, and the safety of students, faculty, and staff will be considered during any construction and/or renovations. Therefore, Millennium has compared the soil analytical results from this investigation to the EPA Regional Screening Levels (Residential Soils) (RSLs) and the DTSC Screening level for Residential Soil, and the Southern California Ambient Arsenic Screening Lever (DTSC, 2020). 2 :

1. Background Concentrations of Trace and Major Elements in California Soils, Kearney Foundation of Soil Science (March 1996)
2. US Environmental Protection Agency Regional Screening Levels (Residential Soils): Cancer Risk RSL
3. Department of Toxic Substance Control (DTSC) Screening level for Residential Soil: Cancer Endpoint

4.1.1 TPHs, OCPs, PCBS, PAHs, and VOCs

Total petroleum hydrocarbons (TPH), organochlorine pesticides, polychlorinated biphenyls (PCB), polynuclear aromatic hydrocarbons (PAH), and volatile organic compounds (VOCs) concentrations for the soil samples were predominantly non-detect except for TPH-mo in sample SB3-3 (66 mg/kg), PS2-1 (43 mg/kg), and PS2-5 (20 mg/kg), which are all well below the EPA RSL of 2,400 mg/kg. Benzene was detected in four soil samples—VP10-15, VP5-15, VP6-15, and PS5-15—with concentrations of 3.9 µg/kg, 6.9 µg/kg, 5.7 µg/kg, and 4.1 µg/kg, respectively. All detected concentrations are below both the DTSC screening level for residential soil (cancer endpoint) and the EPA residential cancer risk RSL, which are each set at 330 µg/kg. Vapor samples that exceeded the benzene RSLs are discussed further below.

4.1.2 Title 22 Metals

The concentrations of arsenic were generally within the acceptable ranges of the established background level, ranging from 2.1 to 11 mg/kg (Kearney, 1996). The arsenic results of the discrete soil samples ranged from 1.4 to 10 mg/kg.

Lead was detected in every sample in which it was analyzed. Concentrations ranged from 1.9 mg/kg (SB17-1 and SB18-1) to 46 mg/kg (DL12-3), with the exception of DL5-1 DUP, which initially reported a concentration of 100 mg/kg—exceeding the RSL of 80 mg/kg. However, reanalysis of the duplicate sample yielded a concentration of 50 mg/kg, and the corresponding primary sample (DL5-1) had a concentration of only 32 mg/kg. Given that both the primary sample and the reanalysis of the duplicate were below the RSL, the original exceedance is likely an outlier and not representative of lead concentrations at the Site.

Hexavalent chromium concentrations in soil samples ranged from 0.41 mg/kg (PS5-10) to 0.78 mg/kg (DL7-1), all of which are below the updated RSL of 0.95 mg/kg. Therefore, all detected concentrations were within acceptable limits.

4.1.3 Pesticide Analytical Results

A total of five shallow soil samples were analyzed for pesticides across the site.

Chlordane (Technical) was detected in seven samples DL6-3, DL7-3, DL10-1, DL12-3, DL13-1, PS2-1, and PS3-1 while 4,4'-DDE concentrations were only detected in sample DL13-1 and PS3-1. All concentrations were below the EPA Regional Screening Levels of 1.7 mg/kg and 2.0 mg/kg, respectively. Most of the samples did not have any measurable concentrations and of those samples that had measurable concentrations most were below the RSLs.

4.1.4 Asbestos

Asbestos was tested in 36 samples by Polarized Light Microscopy (PLM) across 24 borings; however, asbestos was not detected in any of the samples, which included DL, SP, SB borings, and VP10 soils.

4.2 Soil Vapor Analytical Results

A total of 29 soil vapor samples were collected across 13 locations including REP and DUP samples.

Benzene concentrations in nine samples VP1-15, VP2-15, VP3-5, VP3-15, VP5-5, VP6-5, VP6-5 REP, VP13-5, and VP13-15 are over EPA regional screening levels. A maximum of 43 $\mu g/m^3$ was observed in sample VP13-15.

Tetrachloroethene (PCE) concentrations in 16 samples VP1-5, VP2-5, VP3-15, VP4-5, VP4-15, VP4-15 REP, VP5-5, VP5-15, VP6-15, VP8-15, VP9-5, VP9-15, VP10-15, VP11-13, VP12-5, and VP13-15 are above the DTSC Screening levels of 15 $\mu g/m^3$; however, the values are all below the EPA RSL of 360 $\mu g/m^3$. A maximum of 75 ug/m^3 was observed in sample VP10-15. Since PCE was detected above DTSC screening levels, PCE is identified as a COPC and will be further evaluated with a risk assessment.

Carbon Disulfide, Chloroform, Cyclohexane, Ethyl Acetate, Ethylbenzene, Freon 11, Freon 12, 4-isopropyltoluene, Naphthalene, n-Propyl benzene, Styrene, Toluene, 1,2,4-Trimethlybenzene, 1,1,1-Trichloroethane, Trichloroethene (TCE), 1,3,5-Trimethylbenzene, m,p-Xylene, and o-Xylene were detected in trace amounts in at least one vapor sample, but all these concentrations are below EPA and DTSC RLSs for soil vapor.

In summary, benzene and PCE are identified as COPCs and will be further evaluated in a risk assessment for a residential exposure scenario.

The Laboratory analytical reports are included in Appendix A.

5.0 Risk Assessment

The following section discusses the human health risk assessment for the constituents that exceeded screening criteria.

5.1 Soil Vapor Risk Calculations

Millennium has been directed by LAUSD to utilize the California Department of Toxic Substances Control (DTSC) Johnson & Ettinger (J&E) Model to estimate the risk associated with volatile organic compounds detected in the soil vapor beneath the Site. Millennium used the current versions of DTSC spreadsheet model, dated October 2024.

The J&E model simulates the transport of VOC vapors from a subsurface source (e.g., groundwater or soil gas) into indoor air through diffusion and advection. It assumes steady-state conditions and provides an attenuation factor (α), which represents the ratio of indoor air concentration to the source concentration. The model can be used in two modes:

- Forward calculation: Estimates indoor air concentration and risk from a known source concentration.
- Reverse calculation: Determines an acceptable source concentration based on a target risk level.

For PCE, a known carcinogen and neurotoxicant, Millennium focused on both cancer risk and non-cancer hazards, using health-based thresholds from regulatory sources of the DTSC and U.S. EPA.

The DTSC has released this version of JE Model spreadsheet for practitioners working on vapor-forming chemical (VFC) release sites in California. The DTSC recommends a multiple-lines-of-evidence (LOE) approach to evaluate the vapor intrusion (VI) pathway (DTSC, 2011; USEPA, 2015; CalEPA, 2023). Mathematical modeling, such as the appropriate application of the JE Model, should not be the sole LOE to assess the VI pathway but may be used in conjunction with other LOEs when interpreting investigation data, assessing potential health risk, and making risk management decisions. This DTSC-modified JE Model spreadsheet and accompanying User's Guide are not regulation or policy. The spreadsheet equations, model parameter values, instructions, and User's Guide describe an approach for using the JE Model as one of the lines of evidence for evaluating the vapor intrusion pathway, but not to the exclusion of alternate methodologies. These materials do not supersede or implement laws or regulations and are not binding on DTSC staff or on stakeholders and other members of the public.

Millennium utilized the J&E model for PCE and Benzene, using the following site-specific and chemical-specific inputs. Below are the critical parameters, with PCE-specific values where applicable:

Chemical-Specific Parameters for PCE

- Henry's Law Constant (H): Dimensionless value for PCE ≈ 0.72 at 25°C (EPA data). This governs partitioning from groundwater to vapor phase.
- Diffusion Coefficient in Air (D_a): ≈ 0.078 cm^2/s for PCE.
- Diffusion Coefficient in Water (D_x): ≈ 9.2×10^{-6} cm^2/s for PCE.
- Toxicity Values (EPA Integrated Risk Information System [IRIS], 2012):
- Inhalation Unit Risk (IUR): 2.6×10^{-7} per $\mu g/m^3$ (cancer risk).
- Reference Concentration (RfC): 0.04 mg/m^3 (40 $\mu g/m^3$) for non-cancer effects (neurotoxicity).

Chemical-Specific Parameters for Benzene

- Henry's Law Constant (H): Dimensionless value for Benzene ≈ 0.152 at 15°C (EPA data). This governs partitioning from groundwater to vapor phase.
- Diffusion Coefficient in Air (D_a): ≈ 0.085 cm^2/s for Benzene.
- Diffusion Coefficient in Water (D_x): ≈ 1.66×10^{-5} cm^2/s for Benzene.
- Toxicity Values (EPA IRIS, 2012):
- Inhalation Unit Risk (IUR): 7.8×10^{-6} per $\mu g/m^3$ (cancer risk).
- Reference Concentration (RfC): 0.003 mg/m^3 for non-cancer effects (neurotoxicity).

Site-Specific Parameters

These are based school scenario and Site- specific:

- Source Depth (L_t): Distance from source (e.g., groundwater table) to foundation (e.g., 200 cm for shallow groundwater).
- Building Ventilation Rate (Q_x/Q_x): Ratio of soil gas entry rate to building air exchange rate (e.g., 0.01–0.1, literature range).
- Foundation Type: Slab-on-grade (common default), with slab thickness (L_{xxxxx}) ≈ 10 cm.
- Soil Type: Sandy loam (default), with effective diffusivity (D_{xxx})** adjusted based on porosity and moisture content.
- Building Air Exchange Rate (ER): 0.5 exchanges/hour (residential default).
- Exposure Parameters:
- Exposure duration: 8 years (residential).
- Exposure frequency: 220 days/year.
- Averaging time: 72 years (lifetime cancer risk).

Source Concentration

Max. Soil Gas Concentration (C_{PCE}):	75 ug/m^3
Max. Soil Gas Concentration ($C_{benzene}$):	43 ug/m^3

Model Results

The results of the J&E modeling for PCE estimates that the predicted vapor concentration of PCE in indoor air is 1.4 X 10^{-2} ug/m^3 , which is significantly below the residential risk number for PCE.

The results of the J&E modeling for Benzene estimates that the predicted vapor concentration of Benzene in indoor air is 1.4 X 10^{-2} ug/m^3 , which is significantly below the residential risk number for Benzene.

5.2 Calculation of Site-Specific Screening Levels for Hexavalent Chromium

Millennium has calculated a site-specific screening level (SSCL) for potential exposure to hexavalent chromium (CrVI) in soil. This section was prepared at the direction of Los Angeles Unified School District (LAUSD). This SSCL supports the soil sampling and evaluation of South Coast Air Quality Management District (SCAQMD) Rule 1466 – Control of Particulate Emissions from Soils with Toxic Air Contaminants applicability. The SSCL for CrVI is calculated to be protective of potential exposure to soil containing CrVI after the completion of the planned construction. These SSCLs do not consider direct exposure of construction workers because that population is protected by worker health and safety rules.

As presented below, the SSCLs are calculated using conservative industry standard approaches published by United States Environmental Protection Agency (USEPA) and the California Department of Toxic Substances Control (DTSC) and inputs that are described herein.

This Risk Assessment section is prepared in support of calculated site-specific risk-based screening levels for CrVI. This screening levels have been calculated to be representative of the potential receptor populations and associated exposures at Fairfax High School in Los Angeles, CA.

This report: has been prepared for LAUSD and may only be used and relied on by LAUSD for the purpose as outlined above. The opinions, conclusions and any recommendations in this report are based on:

- conditions encountered and information reviewed at the date of preparation of the report and on assumptions made by Millennium described in this report;
- on the basis of information or data provided by LAUSD and/or others who provided information to Millennium (including Government authorities and/or stakeholder engagements)], which Millennium has not independently verified or checked beyond the agreed scope of work; and
- the particular site conditions, e.g., the location of buildings, utilities, vegetation, at the portions of the site evaluated.

Millennium has no responsibility or obligation to update this report to account for events or changes occurring after the date that the report was prepared, or as further information or data becomes available. Millennium disclaims liability arising from any of the assumptions in this report being incorrect, in connection with unverified information provided by others, and responsibility to any person other than LAUSD arising in connection with this report. Millennium also excludes implied warranties and conditions, to the extent legally permissible.

The section outlines the current and potential future receptor populations that could be exposed to CrVI in soil. Soil samples from the Site are currently located beneath pavement. As described in the

Soil Sampling Memo, the samples were collected in construction areas where there are planned ADA modifications that will include removal of the existing pavement, cutting and grading of soil, and new pavement. Current and potential future receptor populations that may be exposed to soil containing CrVI after construction activities are complete include the following:

- High School Students
- Workers/Staff

Students and Workers/Staff, currently the largest and most common receptor populations at the school, work primarily inside the buildings and also have the ability to spend some time outdoors. During time outdoors, they could be exposed to surface soil in unpaved or uncovered areas. Potential routes of exposure to surface soil would include incidental ingestion, dermal contact, and inhalation of airborne particulates. CrVI is not volatile; therefore, inhalation of soil-derived vapors was not considered.

SSCLs were calculated using the USEPA Regional Screening Level (RSL) calculator (dated May 2024; accessed June 26, 2024). The inputs used in this calculator are described in the following sections. The calculations for potential Student exposures used the generic "resident" calculation in the RSL calculator with the below identified exposure factors. The calculations for the potential Worker/Staff exposures used the generic "composite worker" calculation in the RSL calculator with the below identified exposure factors.

The fate and transport of vapors and particulates was calculated using USEPA's particulate emission factor (PEF) and volatilization factor (VF) terms in the RSL calculator. Both of these terms were calculated using the climatic zone for Los Angeles, California.

The exposure factors for evaluating the exposure scenarios summarized in the conceptual site model (CSM) for potential human exposure are discussed further in this section. Standard default exposure factors recommended by USEPA for estimating reasonable maximum exposure (RME) are used where available and appropriate for the exposure scenarios. Where standard default exposure factors are not available or appropriate for an exposure scenario, similarly conservative exposure factors are developed based on site-specific considerations and professional judgment.

Students and Workers/Staff will not be able to access active construction areas. Therefore, only future exposure after construction activities are complete are considered when selecting exposure factors. The exposure factors used for Student and Worker/Staff exposures are summarized the table below.

Several receptors (e.g., construction workers and landscapers) may also be in contact with soils and/or dust generated during construction activities. However, given the limited exposure duration and frequency of these receptors, their exposure may be considered de minimis relative to Students and full-time Workers/Staff at the Site.

Students

Students, which are limited to Grade 9th through Grade 12th (or up to four years), where 9th graders are often at least 14 years old, could be exposed to soil and soil-derived dust outdoors or indoors. Potential exposure of Students to shallow soil is conservatively evaluated using the standard default exposure factors for a resident that USEPA (2014) and DTSC recommend (DTSC, 2019b) for estimating RME, except as described below. According to USEPA (1992), the standard default exposure factors are conservative assumptions about the magnitude, frequency, and duration of exposures, which, in combination, are intended to provide estimates of exposures that are higher than actual exposures to a large portion (90% to 98%) of a potentially exposed population.

The incidental soil ingestion rate of 100 mg/day is the default value for a residential adult, which is aged 6 to 26 years, from DTSC and USEPA (DTSC, 2019b; USEPA, 1991). The exposed skin area of 3,900 cm^2 is calculated for the face, forearms, lower legs, and hands of adolescents aged 14 to 18 years using the mean values for body surface area from USEPA (2004; 2011). The soil-to-skin adherence

Exposure Parameter	Units	Default/ Site-Specific	Input Value	Reference
Skin Adherence Factor (AF)	mg/cm^2	Default	0.07	USEPA (2002); DTSC (2019)
Body Weight (BW)	kg	Site-specific	50.6	USEPA (2011)
Exposure Duration (ED)	years	Site-specific	4	Professional judgement
Exposure Frequency (EF)	days/year	Site-specific	210	Professional judgement
Exposure Time (ET)	hours/day	Site-specific	8	Professional judgement
Target Hazard Quotient (THQ)	(unitless)	Default	1	DTSC (2022)

factor of 0.07 mg/cm^2 is the adherence factor used for adult residents from DTSC and USEPA for evaluating high-end contact with soil (USEPA, 2002)(DTSC, 2019).

The exposure duration (ED) for Students should be four (4) years based on the grades taught. However, these calculations conservatively assumed five (5) years to account for potential repeats or if the number of grades taught at Fairfax High School was to expand in the future. The exposure

frequency (EF) was assumed to be 210 days/year, based on 180 days of instruction at Fairfax High School (based on the 2024-2025 school calendar) and conservatively including 30 additional days to account for summer school.

The body weight (BW) of 50.6 kg represents the mean body weight of 11 to <16-year-old and 71.6 kg represents the mean body weight of 16 to <21-year-old from Table 8-1 of USEPA, 2011. Assuming High school-aged Students aged approximately 14-18 years, Millennium has averaged the two BW for both age ranges and will use 61.1 kg of BW.

Workers/Staff

Workers/Staff, which can include teachers, administrators, maintenance, or custodial workers, could be exposed to soil and soil-derived dust outdoors or indoors. Potential exposure of Workers/Staff to shallow soil is conservatively evaluated using the standard default exposure factors that USEPA (2014) and DTSC recommend (DTSC, 2019b) for estimating RME. According to USEPA, the standard default exposure factors are conservative assumptions about the magnitude, frequency, and duration of exposures, which, in combination, are intended to provide estimates of exposures that are higher than actual exposures to a large portion (90% to 99%) of a potentially exposed population.

For this receptor, the exposure factors used are default values for adult workers, except for the incidental soil ingestion rate, which is conservatively used the adult residential rate. A summary of the exposure parameters with references are in Table 1.

A toxicity assessment identifies potential adverse health effects that are associated with exposure to chemicals and determines the dose-response relationship between exposure and the occurrence of adverse effects. The toxicity values used in this calculation are the generic default values from USEPA RSL tables, which generally follow USEPA's hierarchy of sources from Office of Solid Waste and Emergency Response (OSWER) Directive 9285.7-53 (USEPA, 2003), with one exception. Instead of using the unit risk factor from the RSLs, the DTSC Human Health Risk Assessment (HHRA) Note Number 10 value of 1.5x10-1 (µg/m3)-1 was used consistent with the Toxicity Criteria for Human Health Risk Assessments, Screening Levels, and Remediation Goals rule; Title 22, California Code of Regulations, sections 68400.5, 69020-69022 (effective date September 4, 2018). The remaining toxicity values from the RSLs are also the same as those in Table 1 of DTSC HHRA Note Number 10 (DTSC, 2019a). Toxicity values utilized are shown in Attachments A and B.

Physical/Chemical Parameters

The physical and chemical parameters used in this calculation are the generic default values in USEPA RSL calculator, which are not necessarily consistent with those recommended based on USEPA's hierarchy from the Soil Screening Guidance (USEPA, 1996). Physical and chemical parameters utilized are shown in Attachments A and B. There is no default dermal absorption value (ABS) for CrVI

presented in Risk Assessment Guidance for Superfund (RAGS)-E (USEPA, 2004); therefore, dermal exposure to CrVI was unable to be calculated.

Risk Characterization

A target hazard quotient of 1 and target risk of 10-6 were used to calculate the SSCLs. These values were conservatively used in accordance with DTSC Human Health Risk Assessment (HHRA) Note Number 3 (DTSC, 2022).

Exposure Factors

Most of the individual default exposure factors used to calculate the SSCL are high-end (i.e., 90th to 95th percentile) estimates of the magnitude, frequency, and duration of potential exposures. When several such high-end factors are multiplied, the resulting estimates of dose will be higher than the 90th percentile of the distribution of exposures in the potentially exposed population and could be higher than the exposure to the maximally exposed individual.

Also, the use of generic default exposure factors for evaluation of potential exposure of staff to soil is conservative and may overestimate RME assumed in calculating the SSCLs. For example, an exposure frequency of 250 days/year was utilized for the staff SSCL, which assumes a 5-day work week and only two weeks off per year (50 weeks total). However, school closures (holidays and summer), in addition to sick or vacation time, typically result in fewer than 250 days of exposure per year. This likely overestimates the exposure frequency at the Site and thus results in a lower (more conservative) SSCL than is necessary to be protective.

The incidental ingestion rate of 100 mg/day soil is USEPA's generic default value for residential exposure for adults. This value is considered protective of incidental ingestion of outdoor soil and soil-derived dust indoors. For staff, this value is twice the generic rate USEPA uses for indoor workers, but is conservatively used here.

Toxicity Values

Cancer slope factors (SFs) and unit risk factors (URFs) represent 95% upper confidence bounds on the probability of getting cancer over a lifetime per unit dose. As recognized by USEPA, there is significant scientific evidence that some of the SFs and URFs may be overly conservative and may ignore the potential existence of threshold doses. Nonetheless, they are used here as conservative assessment tools. Further, the URF used from DTSC (1.5x10-1 [µg/m3]-1) is nearly two times more restrictive than the generic default value of 8.42x10-2 (µg/m3)-1 in the RSLs and over ten times (10x) more restrictive than USEPA's recommended value from IRIS (1.2x10-2 [µg/m3]-1). This results in SSCLs that are more conservative that would be calculated for identical exposures at sites not located in California.

Calculated SSCLs

The calculated SSCLs for potential Student and Worker/Staff exposures are presented in Attachment A and Attachment B, respectively. As shown in these attachments, which include the inputs and outputs from the RSL calculator, the SSCLs for potential Student and Worker/Staff exposure are 10.3 mg/kg and 6.5 mg/kg, respectively. The lower of these levels (6.5 mg/kg) is conservatively used as the Final SSCL for CrVI in soil at Fairfax High School.

6.0 RECOMMENDATIONS

The results of the field investigation and laboratory analysis shows that all soil sample results are below the EPA and DTSC Screening Levels and no COPCs were identified for soil. Both benzene and PCE were identified as a COPC for soil vapor since the maximum detected concentrations in soil vapor were above DTSC Screening Levels. As a result, the maximum detected concentration for benzene and PCE were further evaluated with the recently released Johnson & Ettinger Model (DTSC, 2024). The results of the screening health risk assessment indicate that the maximum detected concentrations of benzene and PCE are below residential soil vapor screening levels and are therefore not considered COPCs. The only anomaly identified in the PEA is that the lead concentrations at DL-5 at 1-foot bgs in the primary and duplicate sample were 32 mg/kg and 100 mg/kg, respectively. The 100 mg/kg lead concentration detected in the duplicate sample is above the lead screening level of 80 mg/kg. Millennium recommends a minor soil cleanup (or "Housekeeping") at DL-5 prior to any soil grading at this location. As part of any site demolition and related earth-disturbing activities, Millennium offers the following recommendations:

- Implementation of appropriate soil management procedures and construction work practices, including dust control, air monitoring, appropriate Personal Protective Equipment (PPE).
- Preparation of a soil management plan and a site-specific health and safety plan for construction and demolition activities.

Millennium recommends no further investigation regarding detected contamination at the Site, as outlined above. The Site historical operations and soil sampling described in this report do not indicate the subject Site as the source of soil contamination. In the event that any suspected contaminated soil or suspicious objects such as piping, underground storage tanks, or structures are observed, or any unusual odor is detected during any construction, the contractor should inform the owner and an Environmental Consultant immediately.

8.0 LIMITATIONS

The conclusions and recommendations contained in this report are based on professional opinions regarding the subject matter. These opinions have been arrived at using currently accepted environmental, hydrogeologic and engineering standards and practices applicable to this location.

Millennium obtained, reviewed, and evaluated available information used in this report from sources that were believed to be reliable. Millennium's conclusions, opinions, and recommendations are based in part on such information. Millennium's scope of services did not include verification of its accuracy or authenticity. Should the information upon which Millennium relied prove to be inaccurate or unreliable, Millennium reserves the right to amend or revise its conclusions, opinions, and/or recommendations. Millennium performed a reconnaissance and/or characterization of the Site that is the subject of this report to document current conditions. Millennium focused on areas deemed more likely to exhibit hazardous materials conditions. Contamination may exist in other areas of the Site that were not investigated or were inaccessible. Site activities beyond Millennium's control could change at any time after the completion of this report. For the foregoing reasons, Millennium cannot and does not warrant or guarantee that the Site is free of hazardous or potentially hazardous substances or conditions, or that latent or undiscovered conditions will not become evident in the future. Millennium's observations, conclusions, opinions, and recommendations can be considered valid only as of the date of the letter report.

This report has been prepared in accordance with the contract for services between Millennium and LAUSD and currently accepted industry standards. No other warranties, representations, or certifications are made. This report has been prepared for the exclusive use of LAUSD to address the consulting needs at the Site at this specific point in time.

If you have any questions, please call the undersigned at (925) 808-6700 ext. 215.

DL5-1, DUP: Lead=100 (mg/Kg)
DL5-3: Lead=14 (mg/Kg

Within this area is one Dripline Soil Sample (DL5-1, DUP=100 (mg/Kg)) that exceeds the DTSC Screening Level for Residential soils – the lab is in the process of reevaluating the results to clarify the discrepancy between the duplicate samples (32 mg/kg and 100 mg/kg).

Outside of this zone Lead was detected at concentrations ranging from 0.3 mg/Kg to 46 mg/Kg and down to 15 ft bgs (below ground surface).

Case Narrative

Millenium Consulting Associates 4683 Chabot Drive, Suite 380 Pleasanton, CA 94588 Parya Saneipoor	Lab Job Number: 510194 Project No: LAUSD FAIRFAX Location: LAUSD Fairfax HS, 12060.2010 Date Received: 06/12/24

This data package contains sample and QC results for thirteen soil samples and two water samples, requested for the above referenced project on 06/12/24. The samples were received cold and intact.

Volatile Organics by GC/MS (EPA 8260B) Water:
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Soil:
No analytical problems were encountered.

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: Millennium Consulting Project: Cornelius Harris

Date Received: 6/13/24 Sampler's Name Present: ☑ Yes ☐ No

Section 2

Sample(s) received in a cooler? ☑ Yes, How many? 1 ☐ No (skip section 2) Sample Temp (°C) (No Cooler): _____

Sample Temp (°C), One from each cooler: #1: 3.3 #2: _____ #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: ☑ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: 3.8 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?	✓		
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

Additional labels were added to the 5035 vials on the field; the weight of the additional labels is not included in the final calculation and the labels obscures the tared weights.

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____ ☐ Email (email sent to/on): _____ / _____

Project Manager's response:

Completed By: _____ Date: 6/13/24

Case Narrative

Millenium Consulting Associates 4683 Chabot Drive, Suite 380 Pleasanton, CA 94588 Parya Saneipoor	Lab Job Number: 510325 Project No: LAUSD FAIRFAX Location: LAUSD Fairfax HS, 12060.2010 Date Received: 06/13/24

This data package contains sample and QC results for thirty five soil samples and two water samples, requested for the above referenced project on 06/13/24. The samples were received cold and intact.

TPH-Extractables by GC (EPA 8015M):

- High surrogate recoveries were observed for n-triacontane in lab numbers 510325-001, 510325-002, 510325-003, 510325-004, 510325-013, 510325-015, and the method blank for batch 342833; no target analytes were detected in these samples.
- No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Water:

- Low recoveries were observed for 1,1-dichloroethene in the MS/MSD for batch 342980; the parent sample was not a project sample, the LCS was within limits, and the associated RPD was within limits.
- No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Soil:
No analytical problems were encountered.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):
No analytical problems were encountered.

Pesticides (EPA 8081A):

- High recovery was observed for endrin ketone in the MSD of SB12-1 (lab # 510441-001); the LCS was within limits, and this analyte was not detected at or above the RL in the associated samples. High RPD was observed for a number of analytes in the MS/MSD of SB12-1 (lab # 510441-001); these analytes were not detected at or above the RL in the associated samples.
- High surrogate recoveries were observed for decachlorobiphenyl in DL12-1 (lab # 510325-038), DL12-3 (lab # 510325-039), and the MS/MSD of SB12-1 (lab # 510441-001); the corresponding TCMX surrogate recoveries were within limits.
- No other analytical problems were encountered.

PCBs (EPA 8082):
No analytical problems were encountered.

Metals (EPA 6010B, EPA 6020, and EPA 7471A):

- Low recoveries were observed for antimony in the MS/MSD of DL4-1 (lab # 510325-005); the LCS was within limits, and the associated RPD was within limits.
- Low recoveries were observed for many analytes in the MS/MSD of DL20-3 (lab # 510325-024); the LCS was within limits. High recoveries were observed for barium and zinc in the MSD of DL20-3 (lab # 510325-024); the LCS was within limits, and these high recoveries were not associated with any reported results. High RPD was observed for many analytes in the MS/MSD of DL20-3 (lab # 510325-024).
- Low recovery was observed for arsenic in the MS of DL20-3 (lab # 510325-024); the LCS was within limits. High RPD was also observed for arsenic in the MS/MSD of DL20-3 (lab # 510325-024).
- No other analytical problems were encountered.

Hexavalent Chromium by Ion Chromatograph (EPA 7199):
No analytical problems were encountered.

Asbestos by PLM (EPA 600/R-93-116):
AmeriSci in Carson, CA performed the analysis (see sublab report section for certifications). Please see the AmeriSci case narrative.

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: Millenium Consulting Associates 510325 Project: LAUSD Fairfax HS, 12060.2010

Date Received: 6/14/24 Sampler's Name Present: ☑ Yes ☐ No

Section 2

Sample(s) received in a cooler? ☑ Yes, How many? (2) 3 ☐ No (skip section 2) Sample Temp (°C) (No Cooler): _____

Sample Temp (°C), One from each cooler: #1: 3.7 #2: 4.1 #3: 4.4 #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: ☑ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: 1.3 #2: 2.1 #3: 2.3 #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?	✓		
If custody seals are present, were they intact?	✓		
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			✓
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?	✓		
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

THE CLIENT USED THEIR OWN LABELS ON THE 5035 VIALS, ADDING WEIGHT AND OBSCURING THE TARE WEIGHT.

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____

☑ Email (email sent to/on): AMM / 6/14/24

Project Manager's response:

Completed By: _____ Date: 6/14/24

[External] - Corrections on COC from 6/13-Fairfax soil samples

Parya Saneipoor <psaneipoor@mecaenviro.com>

Thu 6/13/2024 5:56 PM

To:Patty Mata <patty.mata@enthalpy.com>
Cc:Cornelius Harris <charris@mecaenviro.com>;Ryne Adams <radams@mecaenviro.com>

Hi Patty,

I compared the COC with our table, and I would appreciate if you could make some corrections for us on the COC

1. Pg 1 of 5: SB2-1 needs OCP
2. Pg 2 of 5: SB4-1 doesn't need to be tested for Asbestos
3. Pg 4 of 5: DL10-1 needs Asbestos test

Regards,

Parya Saneipoor, QSD/QSP
Project Engineer

PLM Bulk Asbestos Report

EO-510325; (Report Amended 6/24/2024)

Client No. / HGA	Lab No.	Asbestos Present	Total % Asbestos
510325-040	924061189-12	***No***	NVA [1]

Location: SB13-1

by Thu M. Nguyen
on 06/20/24

Analyst Description: Brown, Heterogeneous, Non-Fibrous, Soil
Asbestos Types:
Other Material: NVA NAD

Reporting Notes:

(1) Qualitative PLM result may not be reliable for soil, tape, dust or debris samples due to high variability in particle and aggregate size.

Analyzed by: Thu M. Nguyen
Date: 6/20/2024

Reviewed by: Lateef McIntosh

*NAD = no asbestos detected; Detection Limit <1%; Reporting Limits: CVES = 1%, 400 Pt Ct = 0.25%, 1000 Pt Ct = 0.1%; NA = not analyzed; NA/PS = not analyzed / positive stop; NVA = No Visible Asbestos; PLM (polarized light microscopy) Bulk Asbestos Analysis by EPA 600/R-93/116, including requirements for EPA 600/M4-82-020 per 40 CFR 763 (NVLAP Lab #200346-0); Note: PLM is not consistently reliable in detecting asbestos in floor coverings and similar NOB materials. TEM is currently the only method that can be used to determine if this material can be considered or treated as non-asbestos-containing in New York State (also see EPA Advisory for floor tile, FR 59, 146, 38970, 8/1/94). NIST Accreditation requirements mandate that this report must not be reproduced except in full with the approval of the laboratory. This PLM report relates ONLY to the items tested.

ENTHALPY ANALYTICAL

Case Narrative

Millenium Consulting Associates 4683 Chabot Drive, Suite 380 Pleasanton, CA 94588 Parya Saneipoor	Lab Job Number: 510406 Project No: LAUSD FAIRFAX Location: LAUSD Fairfax HS, 12060.2010 Date Received: 06/14/24

This data package contains sample and QC results for thirty five soil samples and two water samples, requested for the above referenced project on 06/15/24. The samples were received cold and intact. Sample SB15-3 was used as batch QC source for PCB method and PCB results were reported for this sample due to software requirement.

Volatile Organics by GC/MS (EPA 8260B) Water:
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Soil:
No analytical problems were encountered.

Pesticides (EPA 8081A):

- High recovery was observed for 4,4'-DDE in the MS for batch 343190; the parent sample was not a project sample, the LCS was within limits, the associated RPD was within limits, and this analyte was not detected at or above the RL in the associated samples.
- High surrogate recoveries were observed for decachlorobiphenyl in the MS/MSD for batch 343190; the corresponding TCMX surrogate recoveries were within limits, and the parent sample was not a project sample.
- Lab numbers 510406-003, 510406-004, 510406-006, 510406-007, 510406-008, 510406-014, 510406-019, 510406-020, and 510406-026 were diluted due to the color of the sample extracts. Extract color and/or viscosity are used as indicators of possible matrix interference. Elevated reporting limits were due to the necessary dilutions.
- No other analytical problems were encountered.

PCBs (EPA 8082):
No analytical problems were encountered.

Metals (EPA 6010B, EPA 6020, and EPA 7471A):

- Low recoveries were observed for antimony in the MS/MSD of SB19-3 (lab # 510441-023); the LCS was within limits, and the associated RPD was within limits.
- Low recoveries were observed for barium and antimony in the MS/MSD of DL11-1 (lab # 510406-032); the LCS was within limits, and these low recoveries were not associated with any reported results. High recovery was observed for zinc in the MSD of DL11-1 (lab # 510406-032); the LCS was within limits, the associated RPD was within limits, and the high recovery was not associated with any reported results. High RPD was observed for barium in the MS/MSD of DL11-1 (lab # 510406-032); the high RPD was not associated with any reported results.
- No other analytical problems were encountered.

Hexavalent Chromium by Ion Chromatograph (EPA 7199):
No analytical problems were encountered.

Asbestos by PLM (EPA 600/R-93-116):
AmeriSci in Carson, CA performed the analysis (see sublab report section for certifications). Please see the AmeriSci case narrative.

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: Millenium Consulting Associates Project: LAUSD Fairfax HS

Date Received: 6/17/24 Sampler's Name Present: ☑ Yes ☐ No

Section 2

Sample(s) received in a cooler? ☑ Yes, How many? 3 ☐ No (skip section 2) Sample Temp (°C) (No Cooler): _____

Sample Temp (°C), One from each cooler: #1: 3.6 #2: 4.2 #3: 3.3 #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: ☑ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: 1.3 #2: 2.1 #3: 1.4 #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			✓
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

510406

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____

☐ Email (email sent to/on): _____ / _____

Project Manager's response:

Completed By: _____ Date: 6/17/24

To:Patty Mata <patty.mata@enthalpy.com>;Cornelius Harris <charris@mecaenviro.com>;Ryne Adams <radams@mecaenviro.com>
Cc:John Bird <jbird@mecaenviro.com>

Hello,

Thank you for logging the samples.

Please add Hexavalent **Chromium** and **PCBs** to the two samples for analysis. They are missing from our COC :

- SB5-1
- SB11-1

Regards,

Reporting Notes:

(1) Qualitative PLM result may not be reliable for soil, tape, dust or debris samples due to high variability in particle and aggregate size.

Analyzed by: Thu M. Nguyen Thum nguyen Reviewed by: Lateef McIntosh
Date: 6/20/2024

*NAD = no asbestos detected; Detection Limit <1%; Reporting Limits: CVES = 1%, 400 Pt Ct = 0.25%, 1000 Pt Ct = 0.1%; NA = not analyzed; NA/PS = not analyzed / positive stop; NVA = No Visible Asbestos; PLM (polarized light microscopy) Bulk Asbestos Analysis by EPA 600/R-93/116, including requirements for EPA 600/M4-82-020 per 40 CFR 763 (NVLAP Lab #200346-0); Note: PLM is not consistently reliable in detecting asbestos in floor coverings and similar NOB materials. TEM is currently the only method that can be used to determine if this material can be considered or treated as non-asbestos-containing in New York State (also see EPA Advisory for floor tile, FR 59, 146, 38970, 8/1/94). NIST Accreditation requirements mandate that this report must not be reproduced except in full with the approval of the laboratory. This PLM report relates ONLY to the items tested.

Case Narrative

Millenium Consulting Associates 4683 Chabot Drive, Suite 380 Pleasanton, CA 94588 Parya Saneipoor	Lab Job Number: 510441 Project No: LAUSD FAIRFAX Location: LAUSD Fairfax HS, 12060.2010 Date Received: 06/17/24

This data package contains sample and QC results for twenty one soil samples and three water samples, requested for the above referenced project on 06/17/24. The samples were received cold and intact.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B) Water:
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015M) Soil:

- High recovery was observed for diesel C10-C28 in the MSD of SD1 (lab # 510441-029); the LCS was within limits, and the high recovery was not associated with any reported results. High RPD was also observed for diesel C10-C28 in the MS/MSD of SD1 (lab # 510441-029); the high RPD was not associated with any reported results.
- No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Water:

- WD1 (lab # 510441-030) was diluted due to foaming seen during purge step of analysis. Elevated reporting limits were due to necessary dilution.
- No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Soil:
No analytical problems were encountered.

Pesticides (EPA 8081A):

- High recovery was observed for endrin ketone in the MSD of SB12-1 (lab # 510441-001); the LCS was within limits, and this analyte was not detected at or above the RL in the associated samples. High RPD was observed for a number of analytes in the MS/MSD of SB12-1 (lab # 510441-001); these analytes were not detected at or above the RL in the associated samples.
- High surrogate recoveries were observed for decachlorobiphenyl in SB12-1 (lab # 510441-001), SB17-3 (lab # 510441-005), and the MS/MSD of SB12-1 (lab # 510441-001); the corresponding TCMX surrogate recoveries were within limits.
- DL13-1 (lab # 510441-011) was diluted due to the color of the sample extract. Extract color and/or viscosity are used as indicators of possible matrix interference. Elevated reporting limits were due to the necessary dilution.
- No other analytical problems were encountered.

PCBs (EPA 8082):

- DL13-1 (lab # 510441-011) was treated with sulfuric acid to reduce analytical interferences or due to the presence of color.
- No other analytical problems were encountered.

Metals (EPA 6010B and EPA 7470A) Water:
No analytical problems were encountered.

Metals (EPA 6010B, EPA 6020, and EPA 7471A) Soil:

- Low recoveries were observed for antimony in the MS/MSD of SB12-1 (lab # 510441-001); the LCS was within limits, the associated RPD was within limits, and these low recoveries were not associated with any reported results.
- Low recoveries were observed for antimony in the MS/MSD of SB19-3 (lab # 510441-023); the LCS was within limits, and the associated RPD was within limits.
- No other analytical problems were encountered.

Hexavalent Chromium by Ion Chromatograph (EPA 7199):
No analytical problems were encountered.

Asbestos by PLM (EPA 600/R-93-116):
AmeriSci in Carson, CA performed the analysis (see sublab report section for certifications). Please see the AmeriSci case narrative.

Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			✓
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?	✓		
Is there headspace in the VOA vials greater than 5-6 mm in diameter?		✓	
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

Labeled over 5035 kit's weight.

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____

☑ Email (email sent to/on): PM / 6/17/24

Project Manager's response:

Completed By: _____ Date: 6/17/24

RE: Enthalpy Analytical
Job Number 924061197
P.O. #067437
EO-510441; (Report Amended 6/24/2024)

Dear Project Manager:

Enclosed are the results of Asbestos Analysis - Bulk Qualitative Protocol of the following Enthalpy Analytical samples, received at AmeriSci on Tuesday, June 18, 2024, for a 5 day turnaround:

510441-004, 510441-011, 510441-022, 510441-027

The 4 samples, placed in glass vial, were shipped to AmeriSci via 1. Enthalpy Analytical requested Bulk-Qualitative analysis of these samples. The samples, as submitted, were prepared and analyzed by using a Standard Operating Procedure developed by AmeriSci, Inc.. After preparation, using non-quantitative matrix reduction if necessary, the presence or absence of asbestos is determined by PLM and/or TEM as indicated on the attached summary table. Quantification after the fact is not possible without a new preparation. This report relates ONLY to the analysis expressed as "asbestos present" or "no asbestos visible".

This report must not be used to claim product endorsement or approval by AmeriSci, NVLAP, ELAP or any other associated AmeriSci certifying agency. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the approval of the laboratory.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or with any questions.

Sincerely,

Mary S. Rivero

PLM Bulk Asbestos Report

EO-510441; (Report Amended 6/24/2024)

Reporting Notes:

(1) Qualitative PLM result may not be reliable for soil, tape, dust or debris samples due to high variability in particle and aggregate size.

Analyzed by: Thu M. Nguyen Thum nguyen Reviewed by: Lateef McIntosh

Date: 6/20/2024

*NAD = no asbestos detected; Detection Limit <1%; Reporting Limits: CVES = 1%, 400 Pt Ct = 0.25%, 1000 Pt Ct = 0.1%; NA = not analyzed; NA/PS = not analyzed / positive stop; NVA = No Visible Asbestos; PLM (polarized light microscopy) Bulk Asbestos Analysis by EPA 600/R-93/116, including requirements for EPA 600/M4-82-020 per 40 CFR 763 (NVLAP Lab #200346-0); Note: PLM is not consistently reliable in detecting asbestos in floor coverings and similar NOB materials. TEM is currently the only method that can be used to determine if this material can be considered or treated as non-asbestos-containing in New York State (also see EPA Advisory for floor tile, FR 59, 146, 38970, 8/1/94). NIST Accreditation requirements mandate that this report must not be reproduced except in full with the approval of the laboratory. This PLM report relates ONLY to the items tested.

Pleasanton, CA 94588	Project Manager:	Parya Saneipoor	06/18/24 14:27

Notes and Definitions

ND	Analyte NOT DETECTED at or above the reporting limit
RPD	Relative Percent Difference
E	Estimated Concentration; concentration exceeds calibration range.
LCC	Leak Check Compound
MDL	Compound Reported to Method Detection Limit
1	Recovery outside of acceptable limits. LCS/LCSD recoveries and %RSD were within QC limits, therefore data was accepted.
SMSR	Sample matrix prevented adequate surrogate recovery.
J	Value less then PQL but greater than MDL.
HHSR	High hydrocarbon concentration in this sample prevented adequate surrogate recovery.
SMTAR	Sample matrix prevented adequate recovery of target analytes.
OV	Sample was filtered in the lab before extraction.
HHTAR	High hydrocarbon concentration prevented in-range recovery of target analytes.
IHRPD	Target analyte recoveries were outside of range but accepted due to passing RPDs
AROL	Target analyte recovery exceeded recovery range but was accepted due to ND of that analyte in MB and sample(s).
ISO-H	Isomers could not be sufficiently chromatographically resolved according to method requirements due to hydrocarbon interference or other matrix effects. The isomers' reported individual concentrations were each calculated as the average of each of the individual isomers' concentrations.
2	Recovery outside of acceptable limits for either LCS or LCSD. CCV and LCS or LCSD recoveries were within limits; therefore data was accepted.
3	RPD outside of acceptable limits. Target analyte recoveries were within QC limits; therefore, data was accepted.
4	LCS and/or LCSD recoveries exceeded acceptability ranges. Target analyte recoveries were accepted due to passing CCV, in-range LCS/LCSD RPDs, and a clean MB in which all target analytes were < RL.
SMTAR	Sample matrix prevented adequate recovery of target analytes.
RV	Surrogate recovery outside of control limits due to required dilution.

Soil-Gas Chain-of-Custody Record

Client: Millenium Consulting Associates
Project Name: Environmental Assessment
Project Address: 7850 Melrose, Los Angeles, CA 90046
Email:
Phone:
Report To: Parya Saneipoor
Sampler: Christian Aceves

Date: 6/14/2024
Client Project #: 12060.201

Purge Number: □ 1P ☒ 3P □ 7P □ 10P
Shut-In Test: (Y) / N

Report Options: EDD ____ EDF* - 10% Surcharge____ *Global ID _____

Turn Around Requested: □ Immediate Attention □ Rush 24 Hours □ Rush 48 Hours □ Rush 72 Hours □ Normal ☒ Mobile Lab

Tracer: ☒ n-pentane ☒ n-hexane □ n-heptane □ Isopropyl Alcohol ☒ Acetone □ 1,1-DFA

Reporting Limits: ☒ Standard □ Low Level* □ Ultra-Low* *surcharge for these limits

Units: ug/m3

Analysis Requested

LAB USE ONLY
Jones Project # J241716

Pleasanton, CA 94588	Project Manager:	Parya Saneipoor	06/21/24 13:52

Notes and Definitions

ND	Analyte NOT DETECTED at or above the reporting limit
RPD	Relative Percent Difference
E	Estimated Concentration; concentration exceeds calibration range.
LCC	Leak Check Compound
MDL	Compound Reported to Method Detection Limit
1	Recovery outside of acceptable limits. LCS/LCSD recoveries and %RSD were within QC limits, therefore data was accepted.
SMSR	Sample matrix prevented adequate surrogate recovery.
J	Value less then PQL but greater than MDL.
HHSR	High hydrocarbon concentration in this sample prevented adequate surrogate recovery.
SMTAR	Sample matrix prevented adequate recovery of target analytes.
OV	Sample was filtered in the lab before extraction.
HHTAR	High hydrocarbon concentration prevented in-range recovery of target analytes.
IHRPD	Target analyte recoveries were outside of range but accepted due to passing RPDs
AROL	Target analyte recovery exceeded recovery range but was accepted due to ND of that analyte in MB and sample(s).
ISO-H	Isomers could not be sufficiently chromatographically resolved according to method requirements due to hydrocarbon interference or other matrix effects. The isomers' reported individual concentrations were each calculated as the average of each of the individual isomers' concentrations.
2	Recovery outside of acceptable limits for either LCS or LCSD. CCV and LCS or LCSD recoveries were within limits; therefore data was accepted.
3	RPD outside of acceptable limits. Target analyte recoveries were within QC limits; therefore, data was accepted.
4	LCS and/or LCSD recoveries exceeded acceptability ranges. Target analyte recoveries were accepted due to passing CCV, in-range LCS/LCSD RPDs, and a clean MB in which all target analytes were < RL.
SMTAR	Sample matrix prevented adequate recovery of target analytes.
RV	Surrogate recovery outside of control limits due to required dilution.

SAMPLE CONDITION RECORD

1. Are the samples within correct temperature criteria? (0 - 6°C)	N/A
2. If not within temp. criteria, were samples received on ice?	N/A
3. If not within temp. criteria, were samples received chilled on same day of sampling?	N/A
4. Is the Chain of Custody (COC) received filled out completely?	Yes
5. Does the total number of containers received match COC?	Yes
6. Are the sample container label(s) consistent with COC?	Yes
7. Are the sample container(s) intact and in good condition?	Yes
8. Were the proper containers & sufficient volume for analyses requested on COC?	Yes
9. Was the proper preservative indicated on COC/container for analyses requested?	N/A
10. Are the containers for volatile analysis free of headspace? (EPA 8260 water)	N/A
EDF Requested	No

Case Narrative

Millennium Consulting Associates 14241 E. Firestone Blvd, Ste 300 La Mirada, CA 90638 Jenice Feiner	Lab Job Number: 521233 Location: 12060.2010, LAUSD Fairfax HS Date Received: 11/26/24

- This data package contains sample and QC results for twelve soil samples, requested for the above referenced project on 11/26/24. The samples were received cold and intact.
- Revised report on 12/6/24 to include the asbestos test results.

TPH-Extractables by GC (EPA 8015M):
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):

- Low recoveries were observed for many analytes in the MSD for batch 356769; the parent sample was not a project sample, and the LCS/LCSD were within limits. High RPD was also observed for many analytes in the MS/MSD for batch 356769; the RPD was acceptable in the LCS/LCSD, and these analytes were not detected at or above the RL in the associated sample.
- High surrogate recovery was observed for dibromofluoromethane in the method blank for batch 356769; no target analytes were detected in the sample.
- No other analytical problems were encountered.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):

- Low surrogate recovery was observed for terphenyl-d14 in VP10-10' (lab # 521233-011).
- PS2-1' (lab # 521233-001) and PS3-1' (lab # 521233-005) were diluted due to the dark color of the sample extracts. Extract color and/or viscosity are used as indicators of possible matrix interference. Elevated reporting limits were due to the necessary dilution.
- No other analytical problems were encountered.

Pesticides (EPA 8081A):
No analytical problems were encountered.

PCBs (EPA 8082):
No analytical problems were encountered.

Metals (EPA 6010B, EPA 6020, and EPA 7471A):

- Low recoveries were observed for antimony in the MS/MSD of PS2-1' (lab # 521233-001); the LCS was within limits, and the associated RPD was within limits.
- No other analytical problems were encountered.

Hexavalent Chromium by Ion Chromatograph (EPA 7199):
No analytical problems were encountered.

Asbestos by PLM (EPA 600/R-93-116):
AmeriSci in Carson, CA performed the analysis (see sublab report section for certifications). Please see the AmeriSci case narrative.

SAMPLE RECEIPT CHECKLIST

Section 1: General Info

Date Received: 11/26/24 WO# 521233 Client: MILLENIUM CONSULTING ASSOCIATES

Section 2: Shipping / Custody **Are custody seals present?** ☐ Yes ☑ No

Custody seals intact on arrival? ☑ N/A ☐ Yes ☐ No ☐ On cooler / box ☐ On samples

Shipping Info: _____

Section 3a: Condition / Packaging ☐ **Outside 0.0 - 6.0°C (0.0 - 10.0°C for microbiology) (PM notified)**

Date Opened 11/26/24 By (initials) JKC Type of ice used : ☑ Wet ☐ Blue/Gel ☐ None

☐ Samples received on ice directly from the field; cooling process had begun. (if checked, skip temperatures)

☐ Sample matrix doesn't require cooling (e.g. air, bulk PCB). (if checked, skip temperatures)

If no cooler: Observed/Adjusted Temp (°C): _____ / _____ Thermometer/IR Gun: IR11 CF: +0.1

Cooler Temp (°C) #1: 5.8 / 5.9 #2: ____/____ #3: ____/____ #4: ____/____ #5: ____/____ #6: ____/____

Section 3b: Microbiology Samples ☑ **No microbiology samples submitted (skip 3b)**

☐ Within temp range 0.0 - 10.0°C or received on ice directly from field.

☐ Adequate headspace for microbiology analysis.

Section 3c: Air Samples ☑ **No air samples submitted (skip 3c)**

☐ 1.4L Canisters ☐ 6L Canisters ☐ Tedlar Bags ☐ MCE Cassettes ☐ Sorbent Tubes ☐ Other _____

Section 4: Containers / Labels / Samples	YES	NO	N/A
1) Were custody papers present, filled properly, and legible?	✓		
2) Is the sampler's name present on the CoC?	✓		
3) Were containers received in good condition (unbroken / unopened / uncompromised)?	✓		
4) Were the samples bagged? (required for microbiology samples; recommended for soil samples)	✓		
5) Were all of, and only, the correct samples received?	✓		
6) Are sample labels present, legible, and in agreement with the CoC?		✓	
7) Does the container count match the CoC?	✓		
8) Was sufficient sample volume / mass received for the analyses requested?	✓		
9) Were samples received in proper containers for the analyses requested?	✓		
10) Were samples received with > 1/2 holding time remaining?	✓		
11) Are samples properly preserved as indicated by CoC / labels?	✓		
12) Unpreserved VOAs received - If necessary, was the hold time changed in LIMS?			✓
13) Are VOA vials free from headspace/bubbles > 6mm?			

Section 5: Explanations / Comments ☐ **PM notified**

4 6 VIALS ARE NOT LABELED. BAG ALL THE CONTAINERS CAME IN WAS LABELED HOWEVER THE SAMPLES HAVE BEEN PARTIALLY TAKEN OUT AND MIXED. UNABLE TO IDENTIFY WHICH VIALS BELONG TO WHICH SAMPLES.

Date Logged 11/26/24 **By (print)** JETH CO **(sign)** [signature]

Reporting Notes:

Analyzed by: Lateef McIntosh
Date: 12/5/2024

Reviewed by: Lateef McIntosh

*NAD = no asbestos detected; Detection Limit <1%; Reporting Limits: CVES = 1%, 400 Pt Ct = 0.25%, 1000 Pt Ct = 0.1%; NA = not analyzed; NA/PS = not analyzed / positive stop; NVA = No Visible Asbestos; PLM (polarized light microscopy) Bulk Asbestos Analysis by EPA 600/R-93/116, including requirements for EPA 600/M4-82-020 per 40 CFR 763 (NVLAP Lab #200346-0); Note: PLM is not consistently reliable in detecting asbestos in floor coverings and similar NOB materials. TEM is currently the only method that can be used to determine if this material can be considered or treated as non-asbestos-containing in New York State (also see EPA Advisory for floor tile, FR 59, 146, 38970, 8/1/94). NIST Accreditation requirements mandate that this report must not be reproduced except in full with the approval of the laboratory. This PLM report relates ONLY to the items tested.

HUMAN HEALTH RISK ASSESSMENT (HHRA) NOTE NUMBER 11 Southern California Ambient Arsenic Screening Level

HUMAN HEALTH RISK ASSESSMENT (HHRA) NOTE NUMBER 11
Southern California Ambient Arsenic Screening Level

CALIFORNIA DEPARTMENT OF TOXIC SUBSTANCES CONTROL (DTSC)
HUMAN AND ECOLOGICAL RISK OFFICE (HERO)

RELEASE DATE: December 28, 2020

ISSUE

Mitigation or remediation is usually not undertaken to reduce the concentration of contaminants below ambient levels, which comprise both naturally occurring background with added anthropogenic source inputs (i.e., ambient) (US EPA, 2002). Background and ambient concentrations of some inorganic elements can exceed risk-based concentrations. This includes arsenic, where background as well as ambient concentrations exceed the risk-based soil concentration of 0.11 mg/kg (residential soils screening level, DTSC 2019).

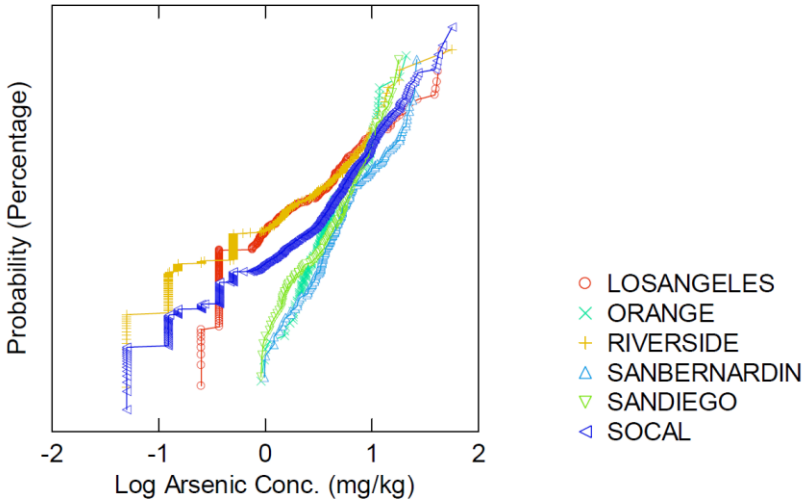
SUMMARY OF AMBIENT ARSENIC SCREENING LEVEL DEVELOPMENT

Background inorganic elements in soil can prove problematic for risk assessment purposes because these elements detected at a site may be comprised of naturally occurring metals, regional anthropogenic contributions or a site-specific release. Arsenic is especially problematic since the risk-based soil concentration is 100-times below typical background and ambient soil concentrations at southern California sites not subject to site-specific releases of arsenic. DTSC collated a data set of soil concentrations from five southern California counties (Los Angeles, Orange, Riverside, San Bernardino and San Diego) and developed an upper-bound estimate of the regional ambient arsenic soil concentration that can be used as a screening tool for sites throughout southern California. Los Angeles County had the largest number of sites (19 school sites under DTSC regulation (Los Angeles Unified School District (LAUSD Data Set)) and the most robust arsenic data set (1097 discrete samples). This evaluation was initiated by the former DTSC Schools Division because the largest number of new schools in the State occurred within the LAUSD. The summary statistics for the LAUSD arsenic data set, excluding outliers, were calculated and the upper-bound arsenic concentration estimated using 1) the 95% Upper Confidence Limit of the 99th percentile ($\boldsymbol{UL_{0.95}(X_{0.99})}$) of the arsenic data set, assuming a lognormal data distribution; and 2) the distribution-free, nonparametric estimate of the theoretical $\boldsymbol{UL_{0.95}(X_{0.99})}$. Both statistical methods resulted in an upper-bound arsenic concentration

of approximately 12 mg/kg for the Los Angeles County data set (LAUSD Data Set). The detailed statistical evaluation of the LAUSD arsenic data set can be found at https://dtsc.ca.gov/wp-content/uploads/sites/31/2018/01/Arsenic-Cleanup-Goals-Jan09-A.pdf. The 95% upper confidence limit of the mean (95% UCL) arsenic soil concentration was 2.4 mg/kg, for the Los Angeles County data set (Table 3). The DTSC residential use soil screening level for arsenic in soil is 0.11 mg/kg (DTSC 2019) resulting in a residential cancer risk estimate of 1E-04 for the upper-bound arsenic background screening concentration of 12 mg/kg and a residential cancer risk of 2E-05 for the 95% UCL arsenic concentration of 2.4 mg/kg.

Table 1, below, summarizes the county-based arsenic data sets for southern California.

Table 1



County	No. of School Sites	No. of Arsenic Samples (after outlier removal)
Los Angeles (LAUSD Study)	19	1086
Orange County	7	224
Riverside County	15	263
San Bernardino County	6	143
San Diego County	3	179
SoCal, Excluding LAUSD[1]	31	809

[1] All data sets were combined, excluding LAUSD, in order to compare them to the benchmark LAUSD data set.

The upper-bound arsenic concentrations were similar to LA County samples for each of the other southern California counties (Orange, Riverside, San Bernardino and San Diego counties), based on the graphical interpretation of the probability plots summarized in Figure 1.

Figure 1

Probability Plots of Arsenic Data Sets by County

The upper bound arsenic concentration for each data set converges around 12 mg/kg. The differences observed in the lower tails of the data sets reflect the differences and variability in detection limits for non-detected values in data collected over a 10-year period. Figure 2 presents the probability plots for the LAUSD and combined southern California data sets. The data sets show generally good overlap and the combined southern California arsenic data set (i.e., arsenic samples from counties other than Los Angeles) is consistent with the upper bound arsenic concentration of 12 mg/kg derived from the larger LAUSD data set.

Figure 2

Probability Plots for LAUSD and Combined southern California County Data Sets

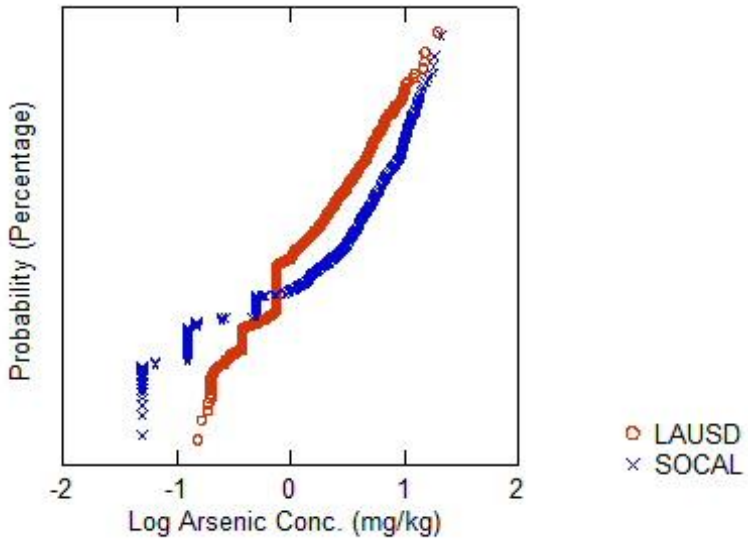


Figure 3 presents the box and whisker plots for the LAUSD Data Set and the southern California individual county data sets providing a comparison of the distributions of arsenic concentrations for each data set. All arsenic data sets were evaluated for outliers using graphical methods (probability plots and Q-Q plots) and outlier tests (Fourth Spread and ProUCL 5.1 Outlier Tests). While the data distributions are not identical, there is overall good overlap, as was shown by the distributions in the cumulative probability plots in Figures 1 and 2. The data sets with larger numbers of sites showed better overlap with the LAUSD Data Set, while data sets with fewer sites showed greater spread and variability.

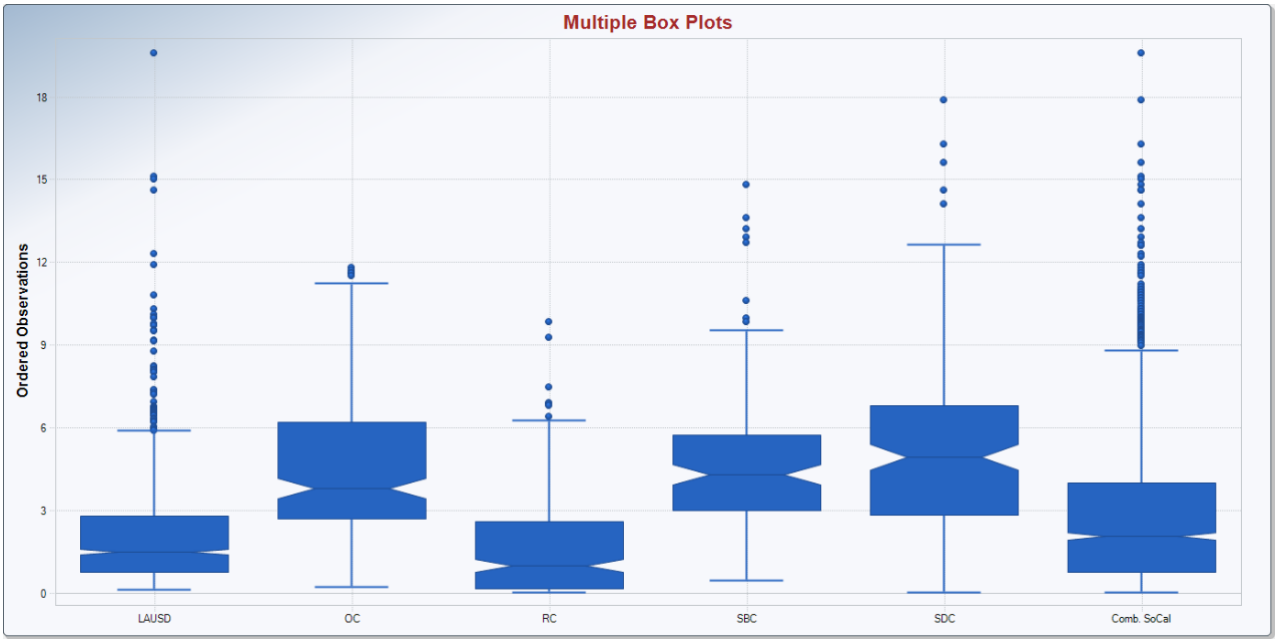
Figure 3

Box Plots of the Southern California Data Sets



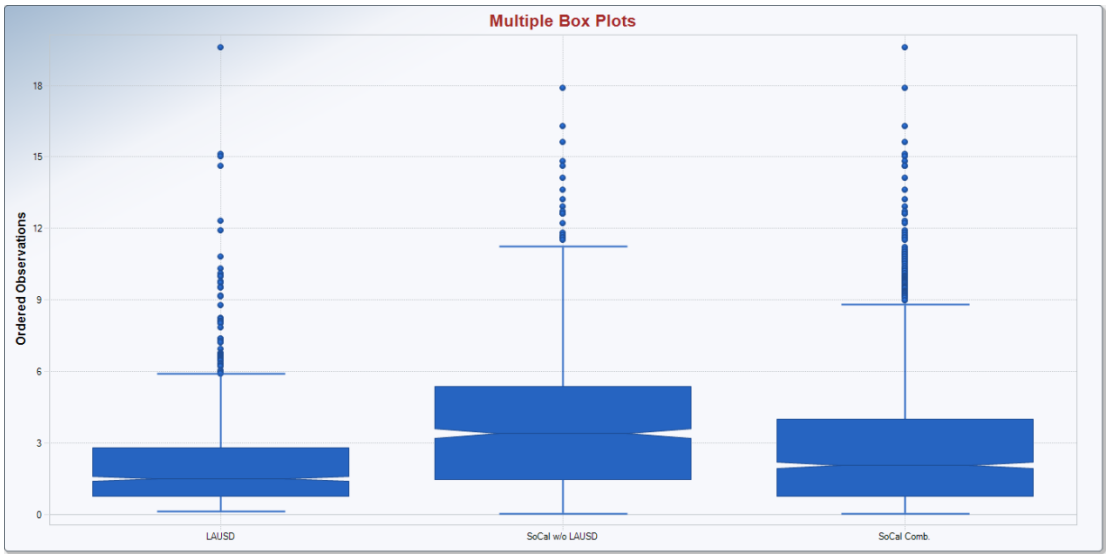


Figure 4 presents the box and whisker plots for the LAUSD data set, southern California data set without LAUSD, and the combined southern California data set.

Figure 4

Box Plots, Southern California Data Sets

To further evaluate the southern California arsenic data sets, ProUCL version 5.1 was used to estimate the Upper Tolerance Limit (UTL) arsenic concentrations, consistent with the original statistical evaluations described previously. The ProUCL UTL Outputs are included in Attachment 1. Table 2 summarizes the arsenic UTL estimates for the original LAUSD Data Set, the southern California Data Set excluding LAUSD and the Combined southern California Data Set. Given the robust number of samples in each data set, the 95% BCA Bootstrap UTL with 99th Percentile was used, consistent with the original statistical evaluations performed and described previously.

Table 2

ProUCL 5.1 Arsenic UTL Estimates, Southern California Arsenic Data

Summary Statistic	LA USD Data Set	SoCal Data Set, Excluding LAUSD	Combined SoCal Data Set
UTL with 99% Coverage	9.8 mg/kg	12.9	11.8

The ProUCL UTL estimates are consistent with the previous statistical evaluations and support an estimate of 12 mg/kg for the Combined Southern California Arsenic Data Set.

Table 3 summarizes the arsenic 95% UCL concentration estimates for the original LAUSD Data Set, the southern California Data Set excluding LAUSD and the Combined southern California Data Set. ProUCL Outputs are included in Attachment 2.

Table 3

Arsenic 95% UCL Estimates, Southern California Arsenic Data

Summary Statistic	LAUSD Data Set	SoCal Data Set, Excluding LAUSD	Combined SoCal Data Set
95% UCL Conc.	2.4 mg/kg	4.3 mg/kg	3.1 mg/kg

CONCLUSIONS AND RECOMMENDED USE:

The DTSC Site Mitigation and Restoration Program (SMRP) made a risk management decision on the acceptability of estimated risk associated with the upper-bound arsenic screening level for southern California soils.

Southern California site-specific soil concentrations which exceed 12 mg/kg may be indicative of releases of arsenic. Comparison of a site-specific 95% UCL of the mean to the 12 mg/kg upper bound concentration are statistically incorrect. The comparison, or statistical test, of site-specific 95%UCL of the mean should be to the southern California 95%UCL of the mean arsenic soil concentration of 3.1 mg/kg.

Some sites may exhibit higher levels of arsenic due to naturally occurring arsenic associated with certain geologic formations. The appropriate ambient arsenic level for these sites should be determined on a site-specific basis in consultation with the DTSC Geological Services Unit (GSU) Project Geologist and Human and Ecological Risk Office (HERO) Toxicologist. Site-specific soil arsenic concentrations, including site-specific background arsenic levels, will be evaluated on a site-by-site basis, again in consultation with the project Geologist and Toxicologist.

Specific issues which may need to be addressed to determine the applicability of the southern California ambient arsenic data set are:

1. The location of the site be within the geographic five-County distribution of the samples used to set the 12 mg/kg upper bound on the ambient arsenic concentration; or,

2. GSU confirm that the lithology of the site is similar enough to the lithology of the samples used to set the southern California ambient soil arsenic metrics, that a comparison is appropriate; and,

3. GSU confirm there are no outcroppings of rock at the site with elevated arsenic concentrations that would make the southern California ambient soil arsenic metrics comparison inappropriate.

95% Chebyshev UPL	10.93	99% Percentile	9.82
95% USL	19.6		

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

95% Hall's Bootstrap UCL	4.012	95% Percentile Bootstrap UCL	4.009
95% BCA Bootstrap UCL	4.026		
90% Chebyshev(Mean, Sd) UCL	4.155	95% Chebyshev(Mean, Sd) UCL	4.302
97.5% Chebyshev(Mean, Sd) UCL	4.505	99% Chebyshev(Mean, Sd) UCL	4.904

Suggested UCL to Use

95% Chebyshev (Mean, Sd) UCL	4.302

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

General Statistics

Total Number of Observations	1895	Number of Distinct Observations	677
		Number of Missing Observations	0
Minimum	0.05	Mean	2.862
Maximum	19.6	Median	2.05
SD	2.653	Std. Error of Mean	0.061
Coefficient of Variation	0.927	Skewness	1.755
Mean of logged Data	0.592	SD of logged Data	1.066

Nonparametric Distribution Free UCL Statistics

Data do not follow a Discernible Distribution (0.05)

Assuming Normal Distribution

95% Normal UCL		95% UCLs (Adjusted for Skewness)	
95% Student's-t UCL	2.962	95% Adjusted-CLT UCL (Chen-1995)	2.965
		95% Modified-t UCL (Johnson-1978)	2.963

Nonparametric Distribution Free UCLs

95% CLT UCL	2.962	95% Jackknife UCL	2.962
95% Standard Bootstrap UCL	2.962	95% Bootstrap-t UCL	2.966
95% Hall's Bootstrap UCL	2.97	95% Percentile Bootstrap UCL	2.966
95% BCA Bootstrap UCL	2.961		
90% Chebyshev(Mean, Sd) UCL	3.045	95% Chebyshev(Mean, Sd) UCL	3.128
97.5% Chebyshev(Mean, Sd) UCL	3.243	99% Chebyshev(Mean, Sd) UCL	3.469

Suggested UCL to Use

95% Chebyshev (Mean, Sd) UCL	3.128

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
