A. EXECUTIVE SUMMARY

This *Air Quality Study* assesses and discusses the potential air quality impacts that may occur with the Fairfax High School Comprehensive Modernization Project, located in the City of Los Angeles (City). The analysis estimates future emission levels at surrounding land uses resulting from construction and operation of the Project and identifies the potential for significant impacts. An evaluation of the Project's contribution to potential cumulative air quality impacts is also provided. Air quality worksheets are provided in **Appendix 1.0: CalEEMod Air Quality Emission Output Files**.

Standard Air Quality, Energy and GHG Regulatory Conditions

The proposed project would be required to comply with the following regulatory conditions from the South Coast Air Quality Management District (SCAQMD) and State of California (State):

South Coast Air Quality Management District Rules

The following lists the SCAQMD rules that are applicable, but not limited to, the proposed Project:

- ***Rule 402***. *Nuisance*: Controls the emissions of odors and other air contaminants;
- ***Rule 403***. *Fugitive Dust*: Controls the emissions of fugitive dust;
- ***Rule 1186***. *Paved Road and Public Unpaved Roads*: Controls the emissions of fugitive dust generators;
- ***Rule 1113***. *Architectural Coating*: Establishes VOC content limits.

State of California Rules

The following lists the State of California Code of Regulations (CCR) air quality emission rules that are applicable, but not limited to, the proposed project.

- **CCR Title 13, Article 4.8, Chapter 9, Section 2449**: *In-use Off-Road Diesel Vehicles*
- **CCR Title 13, Section 2025**: *On-Road Diesel Truck Fleets*;
- **CCR Title 24, Part 6**: *California Building Energy Standards*; and
- **CCR Title 24, Part 11**: *California Green Building Standards*.

Construction Source Emissions

Construction emissions would not contribute to short- or long-term emissions that would increase the carcinogenic effects on sensitive receptors. Construction-source odor emissions would be temporary, short-term, and intermittent in nature and would not result in persistent impacts that would affect substantial numbers of people. Potential construction-source odor impacts are therefore not considered significant.

Operational Source Emissions

Operational emissions would not contribute to short- or long-term emissions that would increase the carcinogenic effects on sensitive receptors. Emissions associated with operation would not exceed the

SCAQMD-recommended thresholds. Thus, the Project would not result in a regional violation of applicable air quality standards or jeopardize the timely attainment of such standards in the South Coast Air Basin.

B. INTRODUCTION

Context

This *Air Quality Study* was prepared to support an Initial Study (IS) for the Fairfax High School Comprehensive Modernization Project (Project) in the City of Los Angeles, California. The Project includes various renovations, modernizations, and reconfigurations throughout the campus, including demolition of existing facilities, construction of new facilities, site upgrades, and accessibility improvements on a 23.63-acre site. Construction activities are anticipated to begin in the third quarter of 2026, with completion expected in the fourth quarter of 2029.

Ongoing master planning activities and facility site assessments conducted for Los Angeles Unified School District's (LAUSD or District) facilities over the last several years have identified school sites throughout the District that exhibit critical physical conditions. The School Upgrade Program (SUP) implemented by the LAUSD outlines a series of capital improvements intended to rehabilitate and modernize these schools so they are safe and healthy functional places to learn.

The LAUSD prepared a Supplemental Environmental Impact Report (EIR) (SCH No. 2023010013) at the program level of detail to evaluate the direct and indirect environmental effects of the SUP program. The SUP Subsequent Program EIR (SPEIR) was certified as adequate by the LAUSD Board in December 2023. As provided in Section 15168 of the State CEQA Guidelines, a Program EIR may be prepared on a series of actions that can be characterized as one large project. Use of a Program EIR provides the LAUSD (as Lead Agency) with the opportunity to consider broad policy alternatives and program-wide mitigation measures and provides the LAUSD with greater flexibility to address project-specific and cumulative environmental impacts on a comprehensive basis.

Subsequent activities within the program are evaluated to determine whether an additional CEQA document needs to be prepared. However, if the EIR addresses the program's effects specifically and comprehensively, many subsequent activities could be found to be within the Program SEIR scope, and additional environmental documents may not be required.[1] When a Program EIR is relied on for a subsequent activity, the lead agency must incorporate any feasible mitigation measures and alternatives developed in the Program EIR into subsequent activities.[2]

SPEIR Air Quality Summary

Table 1: Air Quality Impacts Identified in the SPEIR summarizes the SPEIR's conclusions regarding the air quality impacts of the SUP.

1 California Code of Regulations (CCR) Title 14 Section 15168(c).

2 CCR Title 14 Section 15168(c)(3).

TABLE 1: AIR QUALITY IMPACTS IDENTIFIED IN THE SPEIR					
No.	**Environmental Threshold**	**Level of Impact Significance**	**Potential Impacts Identified**	**Applicable SCAs**	**Mitigation Measures**
1	**Conflict with or obstruct implementation of the applicable air quality plan.**	Less than Significant	**Impact 5.3-1**: SUP-related projects would be consistent with the applicable air quality management plan.	**SC-AQ-4**	No mitigation measures are required.
2	**Generate short-term air pollutant emissions, either directly or indirectly, that may have a significant impact on the environment.**	**Potentially Significant and Unavoidable**	**Impact 5.3-2**: SUP-related project construction activities may generate short-term emissions that would exceed the South Coast Air Quality Management District's regional significance thresholds and cumulatively contribute to the South Coast Air Basin nonattainment designations	**SC-AQ-2** **SC-AQ-3** **SC-AQ-4**	No feasible mitigation measures are available that would further reduce short-term emissions and impacts to regional air quality.
3	**Generate long-term air pollutant emissions, either directly or indirectly, that may have a significant impact on the environment.**	Less than Significant	**Impact 5.3-3**: SUP-related projects would not generate long-term emissions that would exceed the South Coast Air Quality Management District's regional significance thresholds and would not cumulatively contribute to the South Coast Air Basin nonattainment designations.	**SC-AQ-2** **SC-AQ-3** **SC-AQ-4**	No mitigation measures are required.
4	**Expose sensitive receptors to substantial pollutant concentrations.**	**Potentially Significant and Unavoidable**	**Impact 5.3-4**: Site-specific SUP projects may generate short- term (construction) emissions that exceed South Coast Air Quality Management District's localized significance thresholds and expose sensitive receptors to substantial pollutant concentrations.	**SC-AQ-1**	No feasible mitigation measures are available that would further reduce potentially significant short-term localized emission impacts.
5	**Expose sensitive receptors to substantial pollutant concentrations.**	Less than Significant	**Impact 5.3-5**: Operation of SUP projects would not expose sensitive receptors to substantial pollutant concentrations.	**SC-AQ-1**	No mitigation measures are required.
6	**Create objectionable odors affecting a substantial number of people.**	Less than Significant	**Impact 5.3-6**: Implementation of SUP-related projects would not create objectionable odors.	**SC-AQ-1**	No mitigation measures are required.
7	**Expose sensitive receptors in proximity to freeways and major roadways to substantial pollutant concentrations**	Less than Significant	**Impact 5.3-7**: SUP-related projects would not expose sensitive receptors in proximity to freeways and major roadways to substantial pollutant concentrations.	**SC-AQ-1**	No mitigation measures are required.

Outline of this Study

The purpose of this report is to provide a detailed technical air quality analysis of the Fairfax High School Comprehensive Modernization Project. The analysis was prepared in accordance with the CEQA Air Quality Handbook (Handbook) prepared by the South Coast Air Quality Management District (SCAQMD).[3] Regional climate and meteorology, air quality monitoring data, and the area attainment status with respect to criteria air pollutants are discussed. The report includes a description of federal, State, and local agencies that govern air quality and climate change, and their pertinent statutes and regulations. It identifies potential impacts of air pollutants of concern for this project, including criteria pollutants (i.e., pollutants for which National Ambient Air Quality Standards [NAAQS] have been established by the United States Environmental Protection Agency [USEPA], and their precursors) and mobile source air toxics. The report describes the analytical methodologies and assumptions used for this study as well as the results of these analyses and proposed mitigation measures.

3 Updates to the CEQA *Air Quality Handbook* can be found at the following link: http://www.aqmd.gov/home/rules-compliance/ceqa/ceqa-policy-development-(new).

Project Location

The approximately 23.63-acre proposed Project site is located at 7850 Melrose Avenue (Assessor Parcel Number 5527-021-900) in the Fairfax District of the Hollywood Community Plan Area in the City of Los Angeles in Los Angeles County (County). Regional access to the site is from Melrose Avenue and North Fairfax Avenue (see **Figure 1: Regional and Local Vicinity Map**). The Project site is bound by Melrose Avenue to the north, N. Genesee Avenue to the east, Rosewood Avenue to the south, and N. Fairfax Avenue to the west. Regionally, the Project site is approximately 0.64 miles from State Route 2 (Santa Monica Boulevard) to the north, approximately 3.5 miles from US-101 to the east, and approximately 3.27 miles from Interstate 10 (I-10) to the south.

Campus Setting

Fairfax High School is an L-shaped campus on an approximately 23.63-acre parcel with 12 permanent and 2 arcades, three courtyards, as well as athletic fields and open spaces. Construction for Fairfax High School was completed in 1924. After the initial school was built, several temporary structures buildings were built in the 1930s to accommodate the increasing number of students. A Social Hall was built in 1939, and from 1967 to 1969, the campus was redeveloped with a complex of modern buildings and facilities. Subsequent decades saw incremental enhancements, including the revitalization of the Social Hall in 1996 and the construction of new classroom buildings in 2004 and amenities in 2011.

The school currently serves approximately 1,632 students, with approximately 82 teachers and 6 supporting staffs as of 2022-2023.[4] The programs at Fairfax HS include a 9-12 grade traditional high school program and two magnet schools: the Police Academy Magnet with approximately 250 students and the Visual Arts Magnet with approximately 405 students.[5,6]

Description of Proposed Project

Purpose and Objectives

The purpose of the Project is to provide facilities that are safe, secure, and aligned with the instructional program of Fairfax High School. The Project is designed to address the most critical physical concerns of the buildings and grounds at the campus while providing renovations, modernizations, and reconfigurations that are consistent with the Project definition for Fairfax High School.[7]

On June 13, 2023, the Board approved the Project definition for the "Comprehensive Modernization Project" of Fairfax High School. The proposed improvements would provide facilities that are safe, secure, and better aligned with the current instructional program. Assessments of the campuses within the Comprehensive Modernization Project were done by industry professionals, as well as seismic and historical personnel. The findings of these assessments in addition to input from the Board of Education called for improvements with a budget of $148,789,344. The proposed Project is designed to address the most critical physical concerns of the building and grounds at the Campus while providing renovations, modernizations, and reconfiguration as needed.[8]

Planned Improvements

The proposed Project would include the changes to the Campus Buildings shown in **Table 2: Summary of Planned Improvements** and **Figure 2: Proposed Project Site Plan**.

Demolition and Removal

The proposed Project includes the demolition and/or removal of the following facilities: Shop Building (Building No. 2), Gymnasium (Building No. 3), Ticket Office (Building No. 12), Relocatable Sanitary Building (Building No. 13), and Utility Building (Building No. 14), including foundations and below-grade and above-grade utility infrastructure associated with the demolished buildings/structures Interim facilities will be provided, as required.

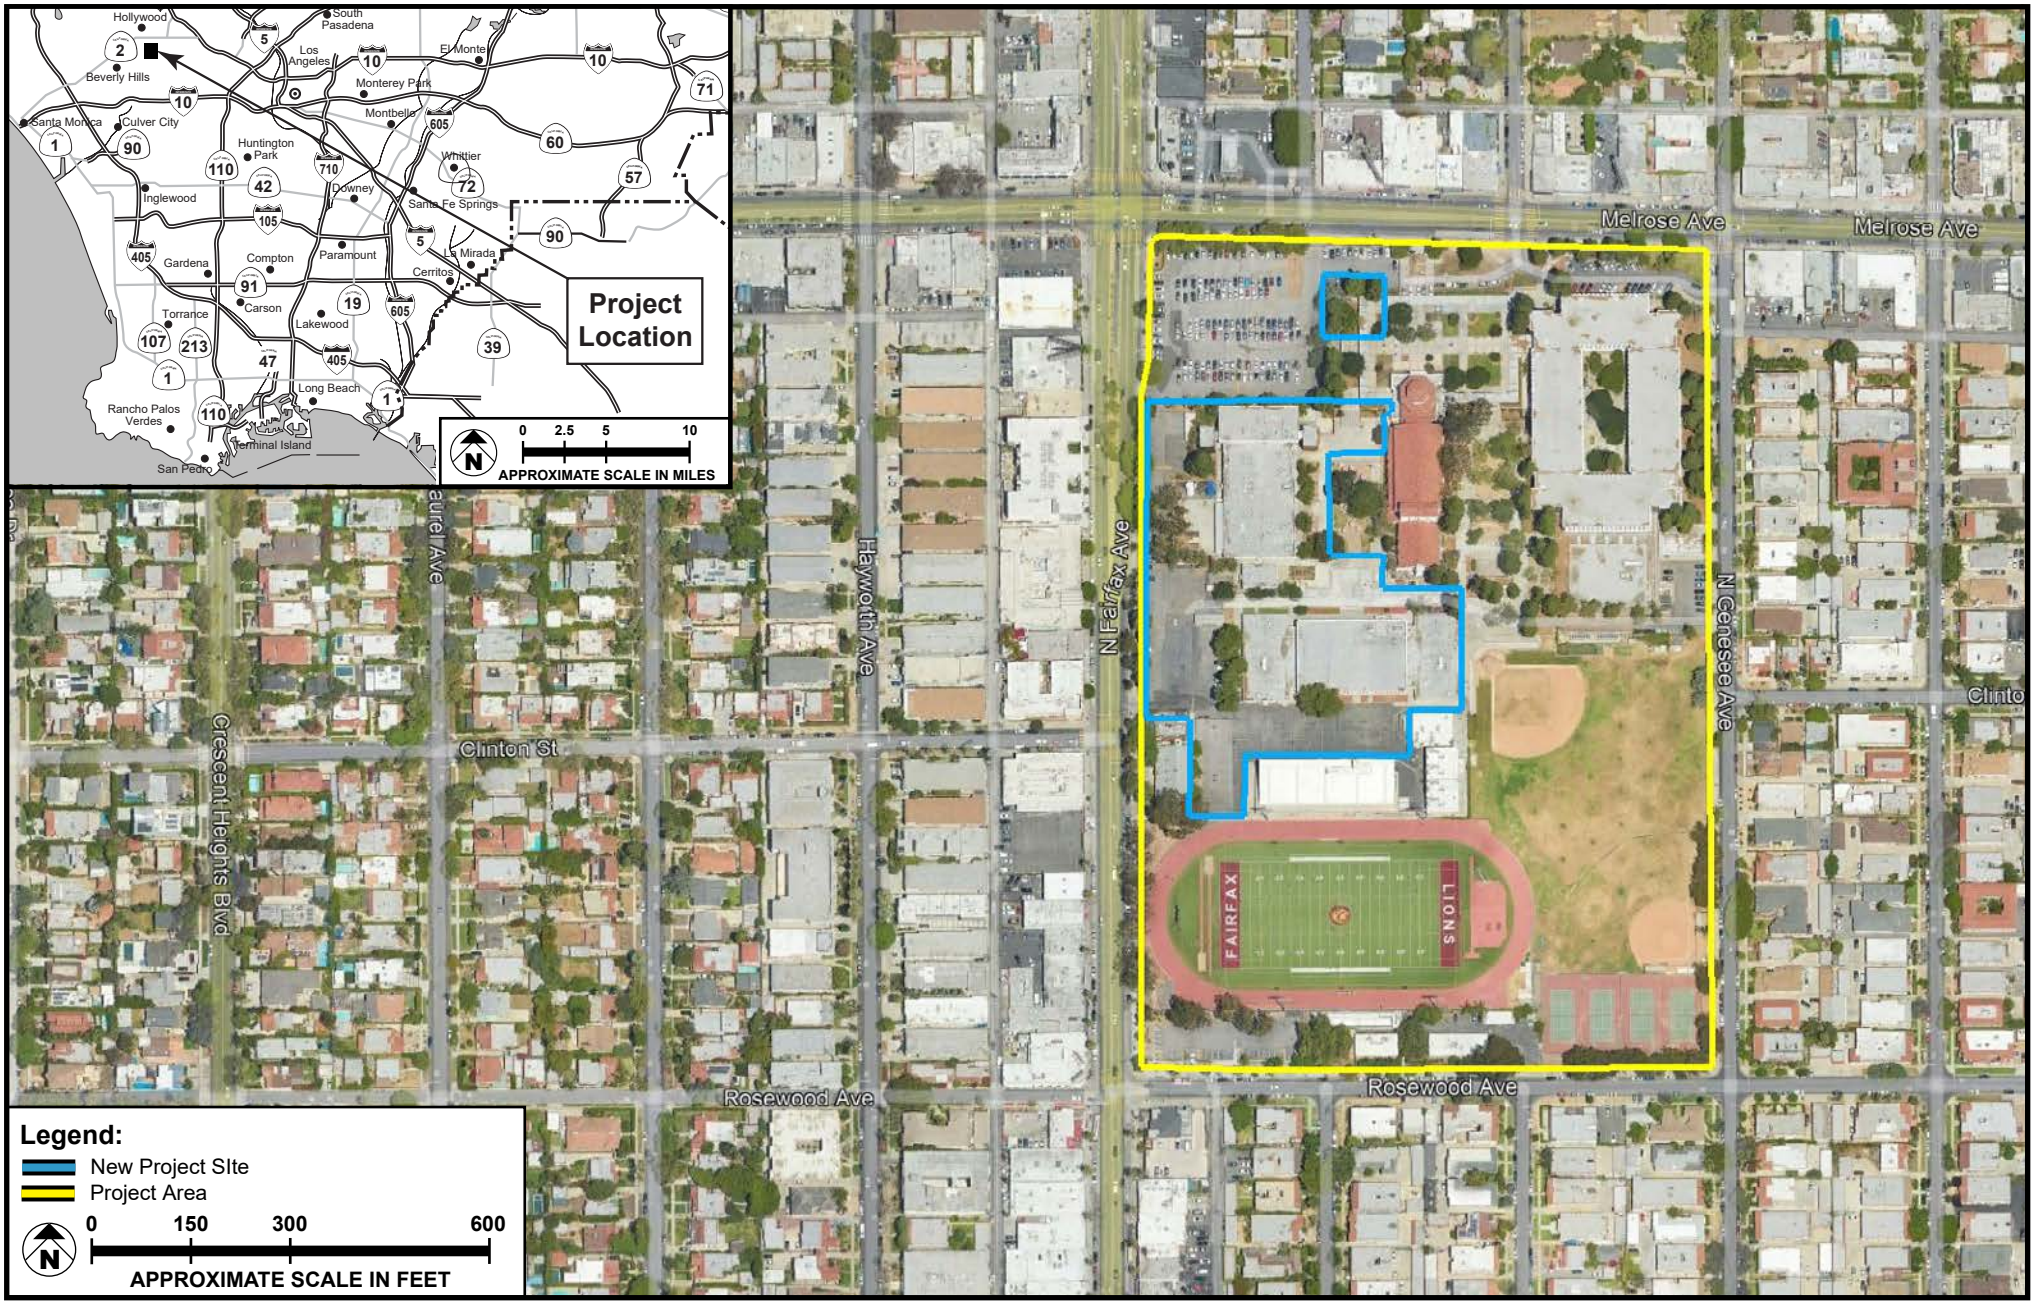

TABLE 2: SUMMARY OF PLANNED IMPROVEMENTS

Bldg. No.	Building	Demolition	New Construction
	Existing Building to be Demolished		
2	**Shop Building**	32,646 SF	
3	**Gymnasium**	41,425 SF	
13	**Relocatable Sanitary Building**	479 SF	
12	**Ticket Booth**	117 SF

Proposed Project Site Plan

176-002-24

New Construction

The scope of the proposed Project includes the construction a new gymnasium building, approximately five specialty classrooms and support spaces, a new art gallery building, and outdoor physical education courts. The new gymnasium building would house team rooms and locker rooms, as well as a public entrance and lobby providing access to the building from the west parking area along Fairfax Avenue. The scope of the proposed Project includes exterior painting of all remaining buildings to provide a uniform appearance; associated landscape, hardscape, parking improvements, and infrastructure upgrades including, but not limited to, sanitary sewer, water, storm water, and electrical utilities. New construction shall comply with the District's design standards and educational specifications and the District's vision for safe, modern, and adequate educational environments.

The Project will be subject to local, State, and/or federal facilities requirements of the American Disabilities Act (ADA), DSA, and the California Department of Education (CDE), as well as all District Standards and Specifications; including those provided in the LAUSD's SUP SPEIR. Any needed improvements to ensure compliance with such legislation will be incorporated within the Project.

Site Access, Circulation, and Parking

At Project completion, campus access, traffic circulation, and drop-off and pick-up locations would remain the same as for the existing campus. The proposed Project does not include any changes to pedestrian circulation, traffic circulation and parking, or student drop-off and pick-up areas. The proposed Project would maintain a fully functional campus during each construction phase which includes efficient and safe circulation throughout the campus for students and staff (including directional signage).

Landscaping

The proposed Project will include removal and replacement of existing landscaping and hardscaping within the footprint of the campus. All landscaping designs and irrigation systems would comply with LAUSD School Design Guidelines and CHPS criteria would be implemented where appropriate. Plant material would comply with the LAUSD approved plant list and plantings would be placed in order to improve the oil quality and water holding capacity.

Sustainability Features

The Project's new buildings and structures would be designed to reduce energy use below current levels by incorporating modernized and energy-efficient features, which may include lighting, windows, electrical transformers, building insulation, or installation of irrigation smart controllers, etc. All new construction would meet or exceed the energy efficiency standards under California Title 24, Part 6 energy efficiency standards consistent with LAUSD standard conditions of approval (**SC-GHG-5**).

Construction Schedule

The Project would be executed through a design-build contract. Construction activities are anticipated to begin in the third quarter of 2026, with completion expected in the fourth quarter of 2029. Schedule details are later presented in **Table 13** to this Air Quality Study. Construction would occur in two phases in order to minimize disruptions to student activities.

Existing Regional Air Quality

The Project site lies within the South Coast Air Basin (Basin) and is under the jurisdiction of the SCAQMD. The Basin is a 6,600-square-mile coastal plain bounded by the Pacific Ocean to the southwest and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The general region lies in a semi-permanent, high-pressure zone of the eastern Pacific, resulting in a mild climate tempered by cool sea breezes with light to average wind speeds.

The vertical dispersion of air pollutants in the Basin is hampered by the presence of persistent temperature inversions. An upper layer of dry air warms as it descends and characterizes high-pressure systems, such as the semi-permanent high-pressure zone in which the Basin is located. This upper layer restricts the mobility of cooler marine-influenced air near the ground surface and results in the formation of subsidence inversions. Such inversions restrict the vertical dispersion of air pollutants released into the marine layer, and, together, with strong sunlight, can produce worst-case conditions for the formation of photochemical smog.

The atmospheric pollution potential of an area is largely dependent on winds, atmospheric stability, solar radiation, and terrain. The combination of low wind speeds and low inversions produces the greatest concentration of air pollutants. On days without inversions, or on days of winds averaging over 15 mph, smog potential is greatly reduced.[9]

The annual average high and low temperatures, as recorded at the Culver City Station are 72.3 and 53.3 degrees Fahrenheit (°F), respectively. Average winter (December, January, and February) high and low temperatures are approximately 67.6 °F and 45.3 °F and average summer (June, July, and August) high and low temperatures are approximately 79.0 °F and 58.0 °F.[10] The annual average of total precipitation is approximately 13.15 inches, which occurs mostly during the winter and relatively infrequently during the summer. Monthly precipitation averages approximately 8.11 inches during the winter (December, January, and February), approximately 3.09 inches during the spring (March, April, and May), approximately 1.87 inch during the fall (September, October, and November), and approximately 0.08 of an inch during the summer (June, July, and August).[11] Winds in the Basin are generally light, tempered by afternoon sea breezes. Severe weather is uncommon in the Basin, but strong easterly winds known as the Santa Ana winds can reach 25 to 35 miles per hour below the passes and canyons. During the spring and summer months, air pollution is carried out of the region through mountain passes in wind currents or is lifted by the warm vertical currents produced by the heating of the mountain slopes. From the late summer through the winter months, because of the average lower wind speeds and temperatures in the

11 Western Regional Climate Center. "Culver City, California (042214). Periods of Record Monthly Climate Summary."

proposed Project area and its vicinity, air contaminants do not readily disperse, thus trapping air pollution in the area.

For evaluation purposes, the SCAQMD territory is divided into 38 source receptor areas (SRAs). These SRAs are designated to provide a general representation of the local meteorological, terrain, and air quality conditions within the particular geographical area.

The Project site is within SRA 1 Central Los Angeles County.[12] The nearest air monitoring station that SCAQMD operates is located at 11301 Wilshire Boulevard in the City of Los Angeles.[13] This station monitors O_3 and NO_2. For this reason, $PM_{2.5}$ and PM_{10} monitoring data was gathered from the next closest monitoring station located at 1630 North Main Street. **Table 3: Ambient Air Quality Monitoring Data** summarizes published monitoring data from 2020 through 2022, the most recent three-year period available. The data shows that during the past few years, the region has exceeded the O_3 and $PM_{2.5}$ standards.

TABLE 3: AMBIENT AIR QUALITY MONITORING DATA

Air Pollutant	Average Time (Units)	2020	2021	2022
Ozone (O_3)	State Max 1 hour (ppm)	0.134	0.095	0.081
	Days > CAAQS threshold (0.09 ppm)	6	1	0
	National Max 8 hour (ppm)	0.092	0.082	0.070
	Days > NAAQS threshold (0.075 ppm)	8	1	0
	State Max 8 hour (ppm)	0.093	0.083	0.070
	Days > CAAQS threshold (0.07 ppm)	8	1	0

Existing Project Site Air Quality

Fairfax High School was originally developed to accommodate for the local population growth in Los Angeles in the 1920s. LAUSD acquired an undeveloped site at the corner of N. Fairfax Avenue and Melrose Avenue for the construction of Fairfax High School in 1923, and the school opened for enrollment in 1924.

Temporary structures, including one-room bungalows, were added beginning in 1929 and 1930 to accommodate the growing student population. In the mid-1960s, seismic safety concerns prompted a comprehensive reassessment, leading to the hiring of Albert C. Martin and Associates to redesign the campus in 1966. The resulting redevelopment, executed between 1967 and 1969, introduced a complex of modern buildings and facilities. Subsequent decades saw incremental enhancements, including the revitalization of the Social Hall in 1996 and the construction of new classroom buildings in 2004 and amenities in 2011.

Currently, Fairfax High School contains 12 permanent buildings, two arcades, and three courtyards, as well as athletic fields and open spaces Most of the buildings are located in the north and central portions of the campus; sports fields occupy most of the south portion. The Auditorium Building is the central feature of the northern portion of the campus, set back from Melrose Avenue by an arcade and courtyard. The Auditorium Building is flanked to the east and west by two more landscaped courtyards and beyond these by the Administration and Classroom Building and the Shop Building, both set back from Melrose Avenue by surface parking lots. Further south are the Utility Building; Ticket Booth; the Gymnasium Building; the Transformer (Stage/Utility) Building; and the Cafeteria Building and arcade. South of the Gymnasium Building are the Social Hall; the Stadium Grandstand and Restroom; and Classroom Buildings A and B. The southwest portion of the campus is occupied by the track and field, and a small surface parking lot; the southeast portion is occupied by a baseball diamond and tennis courts. An estimate of the existing emissions from these uses are provided in **Table 4: Existing Operational Air Quality Emissions**. The most current California Air Resources Board (CARB) approved, SCAQMD-recommended air quality modeling software, the California Emissions Estimator Model (CalEEMod version 2022.1.1.22), was used to estimate existing air quality operational emissions.

TABLE 4: EXISTING OPERATIONAL AIR QUALITY EMISSIONS

Source	VOC	NOx	CO	Sox	PM_{10}	$PM_{2.5}$
	pounds/day

Updated Regulatory Setting

Pollutants of Concern

Ambient air quality emissions present complex environmental issues that require regulatory attention on both large and small scales. The cumulative nature of project-level and localized emissions contributing to greater regional conditions warrants that regulatory policies be instituted on national, State, and regional levels to address air quality concerns.

The USEPA is responsible for federal oversight and enforcement of air quality management policies under the 1970 Clean Air Act (CAA). Each individual state is tasked with preparing and adhering to State Implementation Plans[14] (SIPs) for achieving the goals set forth within the CAA. California has some of the most stringent air quality policies in the country and, through the CARB branch of the California Environmental Protection Agency (CalEPA), has developed its own ambient air quality standards (AAQS).

The State is divided into air quality jurisdictions; each jurisdiction is governed by a regional air district that oversees policy implementation, permitting of air pollution emission sources, and enforcement of regulatory requirements. Six criteria air pollutants (CAPs) are monitored at the federal, State, and regional levels. These six CAPs—ozone, particulate matter PM_{10} and $PM_{2.5}$, nitrogen dioxide, carbon monoxide, lead, and sulfur dioxide—were identified based on a consensus of decades of research that concluded inhalation of each of the chemicals results in adverse health effects in humans. The six pollutants are identified in **Table 5: Sources and Health Effects of Criteria Air Pollutants**, along with their common sources and primary health effects from inhalation exposure.

TABLE 5: SOURCES AND HEALTH EFFECTS OF CRITERIA AIR POLLUTANTS

Pollutants	Sources	Primary Effects
Ozone (O_3)	Formed when VOCs and NOx react in the presence of sunlight; VOC sources include any source that burns fuels (e.g., gasoline, natural gas, wood, oil), solvents, petroleum processing, and storage and pesticides	Breathing difficulties; lung tissue damage; damage to rubber and some plastics
Respirable particulate matter (PM_{10})	Road dust, windblown dust (agriculture) and construction (fireplaces); also formed from other pollutants (e.g., acid rain, NOx, oxides of sulfur [Sox], organics) and from incomplete combustion of any fuel	Increases respiratory disease, lung damage, cancer, premature death; reduced visibility; surface soiling
Fine particulate matter ($PM_{2.5}$)	Fuel combustion in motor vehicles, equipment, and industrial sources; residential and agricultural burning; also formed from reaction of other pollutants (e.g., acid rain, NOx, Sox, organics)	Increases respiratory disease, lung damage, cancer, premature death; reduced visibility; surface soiling
Carbon monoxide (CO)	Any source that burns fuel, such as automobiles, trucks, heavy construction equipment, farming equipment, and residential heating	Chest pain in heart patients; headaches; reduced mental alertness
Nitrogen dioxide (NO_2)	See carbon monoxide.	Lung irritation and damage
Lead (Pb)	Metal smelters, resource recovery, leaded gasoline, deterioration of lead paint	Learning disabilities; brain and kidney damage
Sulfur dioxide (SO_2)	Coal- or oil-burning power plants and industries, refineries, diesel engines	Increases lung disease and breathing problems for asthmatics; reacts in the atmosphere to form acid rain

14 A State Implementation Plan (SIP) is a document prepared by each state describing existing air quality conditions and measures that will be followed to attain and maintain National Ambient Air Quality Standards (NAAQS).

Applicable Air Quality Regulations

Federal

The USEPA sets national vehicle and stationary source emission standards; oversees approval of all SIPs; provides research and guidance for air pollution programs; and sets National Ambient Air Quality Standards (NAAQS). The NAAQS for the six CAPs are shown in **Table 6: Ambient Air Quality Standards** and were identified from provisions of the 1970 CAA. The sections of the CAA that are most applicable to the Project include Title I: Nonattainment Provisions and Title II: Mobile Source Provisions.

The CAA and the promulgated standards have evolved as a living document over time as research into the effects of air pollution has enhanced regulatory understanding of the associated issues. The 1990 amendments to the CAA identify specific emission reduction goals for areas not meeting the NAAQS. These amendments require both a demonstration of reasonable further progress toward attainment and incorporation of additional sanctions for failure to attain or to meet interim milestones. On the national level, the USEPA designates regions as achieving "attainment" or suffering from "nonattainment" of the NAAQS based on air quality monitoring data. Regions that are designated as being in nonattainment are responsible for devising localized strategies for reducing emissions of CAPs and achieving regional attainment within a predetermined timeframe set by the USEPA.

The NAAQS were further amended in July 1997 to add an 8-hour standard for ozone and to adopt NAAQS for $PM_{2.5}$. The NAAQS were amended again in September 2006 to include an established methodology for calculating $PM_{2.5}$, as well as to revoke the annual PM_{10} threshold. In February 2024, the NAAQS for primary annual particulate matter were updated to increase public health protection. Additional revisions to the NAAQS may be implemented in the future as the science of air quality progresses.

TABLE 6: AMBIENT AIR QUALITY STANDARDS

Pollutant	Averaging Time	California Standards		Federal Standards		
		Concentration	Method	Primary	Secondary	Method
Ozone (O_3)	*1 hour*	0.09 ppm (180 µg/m3)	Ultraviolet photometry	–	Same as primary standard	Ultraviolet photometry
	8 hour	0.07 ppm (137 µg/m3)		0.07 ppm (137 µg/m3)		
Respirable particulate matter (PM_{10})	24 hour	50 µg/m3	Gravimetric or beta attenuation	150 µg/m3	Same as primary standard	Inertial separation and gravimetric analysis
	Annual arithmetic mean	20 µg/m3		–		
Fine particulate matter ($PM_{2.5}$)	*24 hours*	No separate State standard		35 µg/m3	Same as primary standard	Inertial separation and gravimetric analysis
	Annual arithmetic mean	12 µg/m3	Gravimetric or beta attenuation	9 µg/m3	15 µg/m3	
Carbon monoxide (CO)	*8 hours*	9.0 ppm (10 mg/m3)	Nondispersive infrared photometry (NDIR)	9 ppm (10 mg/m3)	None	Non-Dispersive Infrared Photometry (NDIR)
	1 hour	20 ppm (23 mg/m3)		35 ppm (40 mg/m3)		
	8 hours (Lake Tahoe)	6 ppm (7 mg/m3)		–	–	–

TABLE 6: AMBIENT AIR QUALITY STANDARDS						
Pollutant	**Averaging Time**	**California Standards**		**Federal Standards**		
		Concentration	**Method**	**Primary**	**Secondary**	**Method**
Nitrogen dioxide (NO_2)	*Annual arithmetic mean*	0.03 ppm (57 µg/m3)	Gas phase chemiluminescence	0.053 ppm (100 µg/m3)	Same as primary standard	Gas phase chemiluminesc-ence
	1 hour	0.18 ppm (339 µg/m3)		0.100 ppm (188 µg/m3)	–	
Lead (Pb)	*30-day average*	1.5 µg/m3	Atomic absorption	–	–	–
	Calendar quarter	–		1.5 µg/m3	Same as primary standard	High volume sampler and atomic absorption
	Rolling 3-month average	–		0.15 µg/m3		
Sulfur dioxide (SO_2)	*24 hours*	0.04 ppm (105 µg/m3)	Ultraviolet fluorescence	–	–	Ultraviolet fluorescence; Spectrophoto-metry (pararosaniline method)
	3 hours	–		–	0.5 ppm (1,300 µg/m3)	
	1 hour	0.25 ppm (655 µg/m3)		0.075 ppm (196 µg/m3)	–	
Visibility reducing particles	*8 hours*	Extinction coefficient of 0.23 per kilometer—visibility of 10 miles or more (0.07–30 miles or more for Lake Tahoe) due to particles when relative humidity is less than 70 percent. Method: Beta attenuation and transmittance through filter tape.		No federal standards		
Sulfates	*24 hours*	25 µg/m3	Ion chromatography			
Hydrogen sulfide	*1 hour*	0.03 ppm (42 µg/m3)	Ultraviolet fluorescence			
Vinyl chloride	*24*	0.01 ppm (26 µg/m3)	Gas chromatography			

Note: ppm = parts per million.

State

The California Clean Air Act, signed into law in 1988, requires all areas of the State to achieve and maintain the California Ambient Air Quality Standards (CAAQS) by the earliest practicable date. The CARB is responsible for the coordination and administration of both State and federal air pollution control programs within California. In this capacity, CARB conducts research, sets CAAQS, compiles emission inventories, develops suggested control measures, and provides oversight of local programs. CARB establishes emissions standards for motor vehicles sold in California, consumer products, and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions and the CAAQS currently in effect for each of the criteria pollutants, as well as other pollutants recognized by the State. The CAAQS are provided in **Table 5**; it should be noted that the CAAQS are generally more stringent than the NAAQS, reflecting California's diligent efforts toward reducing air pollution and improving air quality.

Air Quality Plans

South Coast Air Quality Management District

SCAQMD shares responsibility with CARB for ensuring that all State and federal AAQS are achieved and maintained over an area of approximately 10,743 square miles. This area includes the South Coast and Salton Sea Air Basins, all of Orange County, and the nondesert portions of Los Angeles, Riverside, and San Bernardino Counties. It does not include the Antelope Valley or the nondesert portion of western San Bernardino County.

SCAQMD is responsible for controlling emissions, primarily from stationary sources. SCAQMD maintains air quality monitoring stations throughout the air basins. SCAQMD, in coordination with the Southern California Association of Governments (SCAG), is also responsible for developing, updating, and implementing the Air Quality Management Plan (AQMP) for the air basins. An AQMP is a plan prepared and implemented by an air pollution district for a county or region designated as being in nonattainment of the NAAQS or CAAQS. The term "nonattainment area" is used to refer to an air basin in which one or more AAQS are exceeded. SCAQMD also prepares the SIP for its jurisdiction and promulgates rules and regulations. The SIP includes strategies and tactics to be used to attain the federal ozone standards in the South Coast Air Basin. The SIP elements are taken from the most recent AQMP.

SCAQMD approved a Final 2022 AQMP on December 2, 2022.[15] The 2022 AQMP includes transportation control measures developed by SCAG from its 2029–2045 Regional Transportation Plan/Sustainable Communities Strategy, as well as the integrated strategies and measures needed to meet the NAAQS. The 2022 AQMP demonstrates future attainment of the 1-hour and 8-hour ozone NAAQS.

SCAQMD is responsible for limiting the amount of emissions that can be generated throughout the air basins by various stationary, area, and mobile sources. Specific rules and regulations have been adopted by the SCAQMD Governing Board that limit the emissions that can be generated by various uses/activities and identifying specific pollution-reduction measures that must be implemented in association with various uses and activities. These rules regulate not only the emissions of the federal and State criteria pollutants, but also toxic air contaminants (TACs) and acutely hazardous materials. The rules are also subject to ongoing refinement by SCAQMD.

Among the SCAQMD rules applicable to the Project are *Rule 403—Fugitive Dust* and *Rule 1113—Architectural Coatings*. *Rule 403* requires the use of stringent best available control measures (BACMs) to minimize PM_{10} emissions during grading and construction activities. *Rule 1113* limits the VOC content of coatings, with a VOC content limit for flat coatings of 50 grams per liter (g/L).[16] Additional details regarding these rules and other potentially applicable rules are presented as follows.

15 SCAQMD. "Air Quality Management Plan (AQMP)." Accessed April 2024. https://www.aqmd.gov/home/air-quality/air-quality-management-plans/air-quality-mgt-plan#.

16 SCAQMD. *Rule 1113. Architectural Coatings.* Adopted September 2, 1977 and amended February 5, 2016. Accessed April 2024. http://www.aqmd.gov/docs/default-source/rule-book/reg-xi/r1113.pdf.

***Rule 402**. Nuisance*. This rule states that a "person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or to the public, or which cause, or have a natural tendency to cause, injury or damage to business or property."[17]

***Rule 403**. Fugitive Dust*. This rule requires fugitive dust sources to implement BACMs for all sources and prohibits all forms of visible particulate matter from crossing any property line. BACMs may include application of water or chemical stabilizers to disturbed soils covering haul vehicles; restricting vehicle speeds on unpaved roads to 15 miles per hour (mph); sweeping loose dirt from paved site-access roadways; cessation of construction activity when winds exceed 25 mph; and establishing a permanent ground cover on finished sites. SCAQMD *Rule 403* is intended to reduce PM10 emissions from any transportation, handling, construction, or storage activity that has the potential to generate fugitive dust (see also *Rule 1186*).

***Rule 1113**. Architectural Coatings*. This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories.

***Rule 1146.2**. Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers and Process Heaters*. This rule requires manufacturers, distributors, retailers, refurbishers, installers, and operators of new and existing units to reduce NOx emissions from natural-gas-fired water heaters, boilers, and process heaters as defined in this rule.

***Rule 1186**. PM_{10} Emissions from Paved and Unpaved Roads, and Livestock Operations*. This rule applies to owners and operators of paved and unpaved roads and livestock operations. The rule is intended to reduce PM_{10} emissions by requiring the cleanup of material deposited onto paved roads, use of certified street sweeping equipment, and treatment of high-use unpaved roads (see also *Rule 403*).

Stationary emissions sources subject to these rules are regulated through SCAQMD's permitting process. Through this permitting process, SCAQMD also monitors the amount of stationary emissions being generated and uses this information in developing AQMPs.

Regional Air Quality

The USEPA is the federal agency responsible for overseeing the country's air quality and setting the NAAQS for the CAPs. The NAAQS were devised based on extensive modeling and monitoring of air pollution across the country; they are designed to protect public health and prevent the formation of atmospheric ozone. Air quality of a region is considered to be in attainment of the NAAQS if the measured ambient air pollutant levels do not exceed the applicable concentration threshold. **Table 6** presents the federal and State AAQS.

17 SCAQMD. *Rule 402. Nuisance*. Adopted May 7, 1976. Accessed April 2024. http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-402.pdf.

As noted previously, the CARB is the State agency responsible for setting the CAAQS. Air quality of a region is considered to be in attainment of the CAAQS if the measured ambient air pollutant levels for O_3, CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and Pb are not exceeded, and all other standards are not equaled or exceeded at any time in any consecutive 3-year period. The CAAQS are also presented in **Table 6**.

The USEPA and the CARB designate air basins where AAQS are exceeded as "nonattainment" areas. If standards are met, the area is designated as an "attainment" area. If there is inadequate or inconclusive data to make a definitive attainment designation, they are considered "unclassified." Federal nonattainment areas are further designated as marginal, moderate, serious, severe, or extreme as a function of deviation from standards.

The current attainment designations for the Basin are shown in **Table 7: South Coast Air Basin Attainment Status**. The Basin is currently designated as being in nonattainment at the federal level for O_3 and $PM_{2.5}$; and at the State level for O_3, PM_{10}, and $PM_{2.5}$.

TABLE 7: SOUTH COAST AIR BASIN ATTAINMENT STATUS

Pollutant	State Status	National Status
Ozone (O_3)	**Nonattainment**	**Nonattainment**
Carbon monoxide (CO)	Attainment	Unclassified/Attainment

Los Angeles Unified School District Supplemental Program EIR

The SPEIR for School Upgrade Program establishes Standard Conditions (SCs) for reducing air quality impacts in areas where future projects would be implemented under the SUP. Applicable SCs related to air quality impacts associated with the proposed Project are provided in **Table 8: Air Quality Standard Conditions of Approval**.

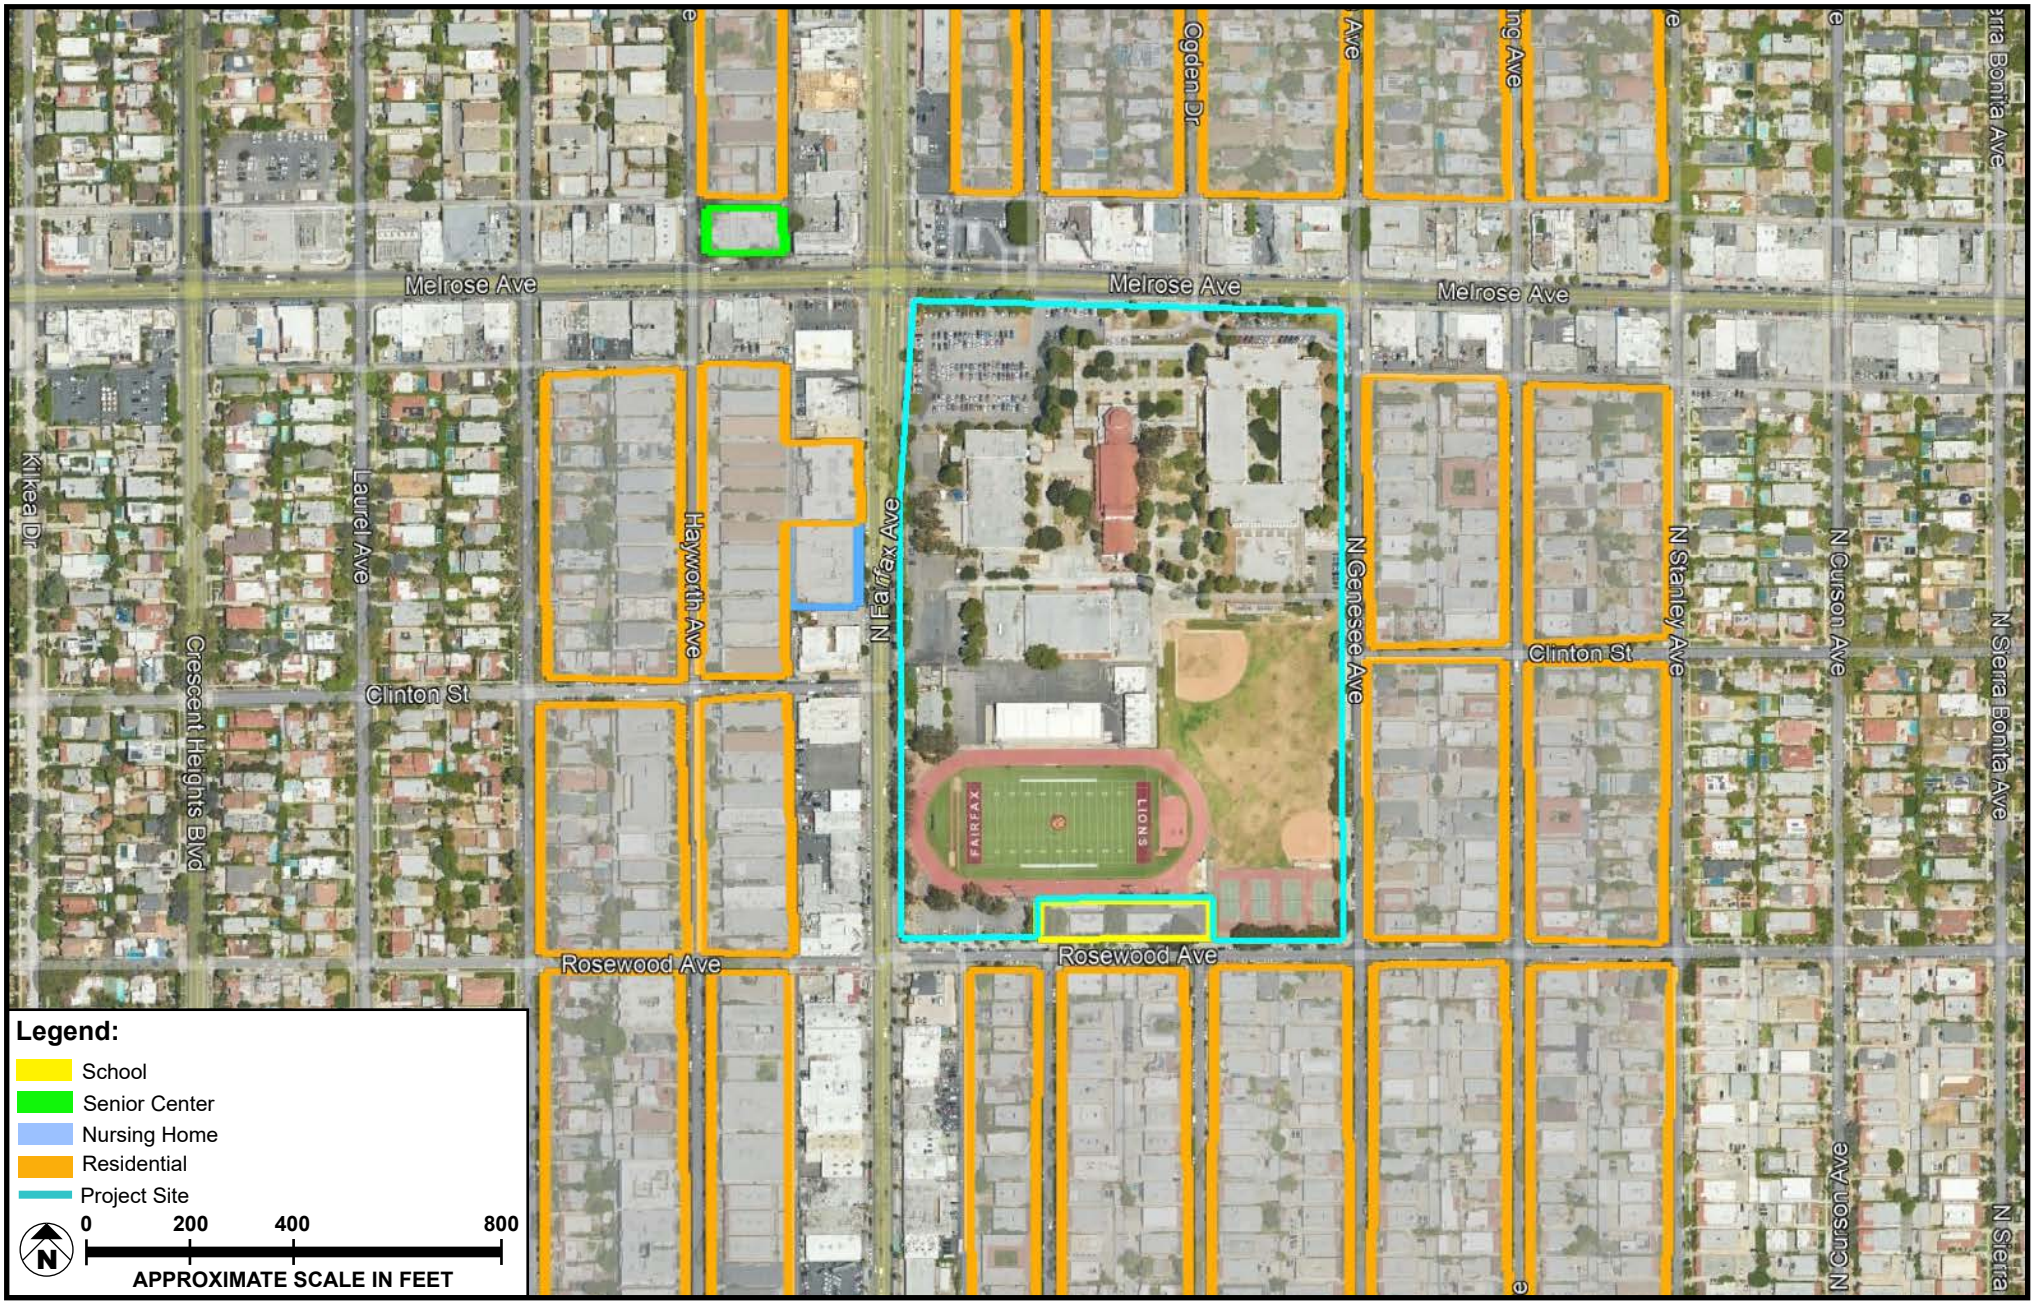
TABLE 8: AIR QUALITY STANDARD CONDITIONS OF APPROVAL

Reference Number	Topic	Trigger for Compliance	Implementation Phase	Standard Conditions
SC-AQ-1	Air Toxics Health Risk	New classrooms or outdoor play areas: • Within 0.25-mile of mobile and stationary emission sources • On the LAUSD priority list of schools most at risk from air pollution • Near an OEHS identified high risk facility	During project design (Planning)	LAUSD shall complete a Health Risk Assessment for new campus locations that would place classrooms or play areas within close proximity (less than 0.25 mile) of existing sources of adverse emissions. LAUSD shall identify all permitted and non-permitted stationary sources, freeways and other busy traffic corridors, railyards, and large agricultural operations within 0.25 mile of the Project. Once identified, make a determination about the need for qualitative evaluation, screening level evaluation in accordance with air district specific guidance and tools, or a refined evaluation with air dispersion modeling, to determine the if risks constitute an actual or potential endangerment of public health to persons who would attend or be employed at the school. *For freeways and other busy traffic corridors within 500 feet, air dispersion modeling must be used to make the health risk determination (no screening, no qualitative discussion, etc.).* Health Risk Assessment shall comply with 'Air Toxics Health Risk Assessment (HRA).' This document includes guidance on HRA protocols for permitted, non-permitted, and mobile sources that might reasonably be anticipated to emit hazardous air emissions and result in potential long-term and short-term health impacts to student and staff at the school site. The HRA must find that health risks are below criteria thresholds. If health risks which exceed air district criteria thresholds are identified, the school campus shall be redesigned or relocated to a site farther from the emissions generator.
SC-AQ-2	Construction Emissions	Diesel-powered construction equipment	During construction (Construction)	Construction Contractor shall ensure that construction equipment is properly tuned and maintained in accordance with manufacturer's specifications, to ensure excessive emissions are not generated by unmaintained equipment.
SC-AQ-3	Construction Emissions	Ground-disturbing activity, such as grading, site preparation, and/or removal action for soil contamination	During construction (Construction)	**Construction Contractor shall**: • Maintain speeds of 15 miles per hour (mph) or less with all vehicles. • Load impacted soil directly into transportation trucks to minimize soil handling. • Water/mist soil as it is being excavated and loaded onto the transportation trucks.

TABLE 8: AIR QUALITY STANDARD CONDITIONS OF APPROVAL				
Reference Number	**Topic**	**Trigger for Compliance**	**Implementation Phase**	**Standard Conditions**
				• Water/mist and/or apply surfactants to soil placed in transportation trucks prior to exiting the site. • Minimize soil drop height into haul trucks or stockpiles during dumping. • During transport, cover or enclose trucks transporting soils, increase freeboard requirements, and repair trucks exhibiting spillage due to leaks. • Cover the bottom of the excavated area with polyethylene sheeting when work is not being performed. • Place stockpiled soil on polyethylene sheeting and cover with similar material. • Place stockpiled soil in areas shielded from prevailing winds.
SC-AQ-4	Construction Emissions	Use of large, heavy or noisy equipment for construction	During construction (Construction)	**LAUSD shall analyze air quality impacts**: If site-specific review or monitoring data of a school construction project identifies potentially significant adverse regional and localized construction air quality impacts, then LAUSD shall implement all feasible measures to reduce air emissions below the South Coast Air Quality Management District's (SCAQMD) regional and localized significance thresholds. Construction bid contracts shall include protocols that reduce construction emissions during high-emission construction phases from vehicles and other fuel driven construction engines, activities that generate fugitive dust, and surface coating operations. The Construction Contractor shall be responsible for documenting compliance with the identified protocols. Specific air emission reduction protocols include, but are not limited to, the following. **Exhaust Emissions** • Schedule construction activities that affect traffic flow to off-peak hours (e.g., between 10:00 AM and 3:00 PM). • Consolidate truck deliveries and limit the number of haul trips per day. • Route construction trucks off congested streets, as permitted by local jurisdiction haul routes. • Employ high pressure fuel injection systems or engine timing retardation.

TABLE 8: AIR QUALITY STANDARD CONDITIONS OF APPROVAL				
Reference Number	Topic	Trigger for Compliance	Implementation Phase	Standard Conditions
				• Use ultra-low sulfur diesel fuel, containing 15 ppm sulfur or less (ULSD) in all diesel construction equipment. • Use construction equipment rated by the United States Environmental Protection Agency as having at least Tier 3 (model year 2006 or newer) or Tier 4 (model year 2008 or newer) emission limits for engines between 50 and 750 horsepower. • Restrict non-essential diesel engine idle time, to not more than five consecutive minutes. • Use electrical power rather than internal combustion engine power generators. • Use electric or alternatively fueled equipment, if feasible. • Use construction equipment with the minimum practical engine size. • Use low-emission on-road construction fleet vehicles. • Ensure construction equipment is properly serviced and maintained to the manufacturer's standards. **Fugitive Dust** • Apply non-toxic soil stabilizers according to manufacturers' specification to all inactive construction areas (previously graded areas inactive for 10 days or more). • Replace ground cover in disturbed areas as quickly as possible. • Sweep streets at the end of the day if visible soil material is carried onto adjacent public paved roads (recommend water sweepers with reclaimed water). • Install wheel washers where vehicles enter and exit unpaved roads onto paved roads, or wash off trucks and any equipment leaving the site each trip. • Pave unimproved construction roads that have a traffic volume of more than 50 daily trips by construction equipment, and/or 150 daily trips for all vehicles. • Pave all unimproved construction access roads for at least 100 feet from the main road to the Project site. • Enclose, cover, water twice daily, or apply non-toxic soil binders according to manufacturers' specifications to exposed piles (i.e., gravel, dirt, and sand) with a 5% or greater silt content.

TABLE 8: AIR QUALITY STANDARD CONDITIONS OF APPROVAL				
Reference Number	**Topic**	**Trigger for Compliance**	**Implementation Phase**	**Standard Conditions**
				• Suspend all excavating and grading operations when wind speeds (as instantaneous gusts) exceed 25 miles per hour (mph). • Water disturbed areas of the active construction and unpaved road surfaces at least three times daily, except during periods of rainfall. • Limit traffic speeds on unpaved roads to 15 mph or less. • Prohibit fugitive dust activities on days where violations of the ambient air quality standard have been forecast by SCAQMD. • Tarp and/or maintain a minimum of 24 inches of freeboard on trucks hauling dirt, sand, soil, or other loose materials. • Limit the amount of daily soil and/or demolition debris loaded and hauled per day. **General Construction** • Use ultra-low VOC or zero-VOC surface coatings. • Phase construction activities to minimize maximum daily emissions. • Configure construction parking to minimize traffic interference. • Provide temporary traffic control during construction activities to improve traffic flow (e.g., flag person). • Prepare and implement a trip reduction plan for construction employees. • Implement a shuttle service to and from retail services and food establishments during lunch hours. • Increase distance between emission sources to reduce near-field emission impacts.



Sensitive Receptors

Some people, such as individuals with respiratory illnesses or impaired lung function because of other illnesses, persons over 65 years of age, and children under 14, are particularly sensitive to certain pollutants. Facilities and structures where these sensitive people live or spend considerable amounts of time are known as sensitive receptors. Land uses identified to be sensitive receptors by the CEQA Air Quality Handbook include residences, schools, playgrounds, childcare centers, athletic facilities, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes. Sensitive receptors may be at risk of being affected by air emissions released from the construction and operation of the proposed Project.

The nearest sensitive receptors to the proposed Project site, with the highest potential to be impacted by the proposed Project, are displayed in **Figure 3: Location of Sensitive Receptors** and listed in **Table 9: Nearest Sensitive Receptors**.

TABLE 9: NEAREST SENSITIVE RECEPTORS

No.	Address	Type	Location	Distance from Project Site (Feet)
1	602 North Genesee Avenue Los Angeles, CA 90036	Residential	East of the Project site across Genesee Avenue	420
2	467 North Orange Grove Avenue Los Angeles, CA 90036	Residential	South of the Project site across Rosewood Avenue	430
3	639 North Fairfax Avenue Los Angeles, CA 90036	Residential	West of the Project site across Fairfax Avenue	85
4	619 North Fairfax Avenue Los Angeles, CA 90036	Nursing Home	West of the Project site across Fairfax Avenue	85
5	715 North Orange Grove Avenue Los Angeles, CA 90046	Residential	North of the Project site across Melrose Avenue	225
6	7929 Melrose Avenue Los Angeles, CA 90046	Senior Center	North of the Project site across Melrose Avenue	265
7	7795 Rosewood Avenue, Los Angeles, CA 90036	School	South of Project Site along Rosewood Avenue	320

CEQA Impact Review Criteria

In accordance with State CEQA Guidelines Appendix G, implementation of the Project would result in a potentially significant impact if it were to:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard;
- Expose sensitive receptors to substantial pollutant concentrations; and/or
- Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Where available, the significance criteria established by the applicable Air Quality Management District (AQMD) or Air Pollution Control District (APCD) may be relied upon to make the significance determinations.

Emission Thresholds for Regional Air Quality Impacts

The thresholds for determining the significance of impacts are set forth by SCAQMD for both construction and operational emissions as described in **Table 10: SCAQMD Emissions Thresholds for Significant Regional Impacts**. The Project will have a significant impact if it exceeds the construction or operation thresholds listed in **Table 10**.

TABLE 10: SCAQMD EMISSIONS THRESHOLDS FOR SIGNIFICANT REGIONAL IMPACTS

Pollutant	Mass Daily Thresholds (Pounds/Day)	
	Construction	Operation
Volatile organic compounds (VOCs)	75	55
Nitrogen dioxide (NO_2)	100	55
Carbon monoxide (CO)	550	550
Sulfur dioxide (SO_2)	150	150
Respirable particulate matter (PM_{10})	150	150
Fine particulate matter ($PM_{2.5}$)	55	55

Source: SCAQMD, South Coast AQMD Air Quality Significance Thresholds, accessed April 2024, http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf.

Emission Thresholds for Localized Air Quality Impacts

The local significance thresholds are based on the SCAQMD's Final Localized Significance Threshold (LST) Methodology (LST Methodology)[18] guidance document for short-duration construction activities. The SCAQMD recommends the evaluation of localized air quality impacts to sensitive receptors in the immediate vicinity of the Project site because of construction activities. The SCAQMD provides voluntary guidance on the evaluation of localized air quality impacts to public agencies conducting environmental review of projects located within its jurisdiction. Localized air quality impacts are evaluated by examining the on-site generation of pollutants and their resulting downwind concentrations. For construction, pollutant concentrations are compared to significance thresholds for particulates (PM_{10} and $PM_{2.5}$), CO, and NO_2. The significance threshold for PM_{10} represents compliance with SCAQMD *Rule 403—Fugitive Dust*. The threshold for $PM_{2.5}$ is designed to limit emissions and to allow progress toward attainment of the AAQS. Thresholds for CO and NO_2 represent the allowable increase in concentrations above background levels that would not cause or contribute to an exceedance of their respective AAQS.

The LST Methodology uses lookup tables based on site-acreage to determine the significance of emissions for CEQA purposes. However, CalEEMod does not allow the user to mitigate construction emissions by directly modifying acreage disturbed. CalEEMod calculates construction emissions (off-road exhaust and fugitive dust) based on the number of equipment hours and the maximum daily soil disturbance activity possible for each piece of equipment. Based on the input parameters during grading, one excavator operating eight (8) hours a day would disturb one (1) acre, two loaders operating eight (8) hours a day would disturb one (1) acre, and two rollers[19] operating eight (8) hours a day would disturb one (1) acre, resulting in a total maximum of three (3) acres disturbed in one day.[20] Thresholds for each criteria pollutant for construction and operational activities are listed in **Table 11: Localized Significance Thresholds**.

TABLE 11: LOCALIZED SIGNIFICANCE THRESHOLDS

Pollutant	Construction	Operation
	pounds/day	
Nitrogen dioxide (NO_2)	121	121
Carbon monoxide (CO)	1,292	1,292
Respirable particulate matter (PM_{10})	11	3
Fine particulate matter ($PM_{2.5}$)	6	2

Notes: Based on a distance to sensitive receptors of 25 meters (82 feet). SCAQMD's Localized Significance Threshold (LST)

TABLE 11: LOCALIZED SIGNIFICANCE THRESHOLDS		
Pollutant	Construction	Operation
	pounds/day	

Methodology for CEQA Evaluations guidance document provides that projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters.

LST values for three-acre site.

Impacts of Carbon Monoxide Hotspots

Because the proposed Project will not result in an increase in traffic at local intersections, the potential for creation of carbon monoxide "hotspots" will be negligible. CO hotspots were therefore omitted from this analysis.

Methodology

Construction

Construction of the Project has the potential to generate temporary criteria pollutant emissions through the use of heavy-duty construction equipment, such as excavators and forklifts, and through vehicle trips generated from workers and haul trucks traveling to and from the Project site. In addition, fugitive dust emissions would result from various soil-handling activities. Mobile-source emissions, primarily NOx, would result from the use of construction equipment, such as dozers and loaders. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of construction activity, and prevailing weather conditions. The assessment of construction air quality impacts considers each of these potential sources.

Daily regional emissions during construction are forecasted by assuming a conservative estimate of construction activities (i.e., assuming all construction occurs at the earliest feasible date) and applying the mobile source and fugitive dust emissions factors. The emissions are estimated using the SCAQMD-recommended CalEEMod software. CalEEMod is based on outputs from the CARB off-road emissions model (OFFROAD) and the CARB on-road vehicle emissions model (EMFAC), which are emissions estimation models developed by CARB and used to calculate emissions from construction activities, including on- and off-road vehicles. The input values used in this analysis are based on conservative assumptions in CalEEMod, with appropriate, Project-specific adjustments based on equipment types and expected construction activities. These values were then applied to the construction phasing assumptions used in the criteria pollutant analysis to generate criteria pollutant emissions values for each construction activity. Detailed construction equipment lists, and emissions calculations are provided in **Table 12**: **Construction Equipment Assumptions**. It was assumed that all construction activities would adhere to SCAQMD *Rule 403—Fugitive Dust* and *Rule 1113—Architectural Coatings*.

TABLE 12: CONSTRUCTION EQUIPMENT ASSUMPTIONS

Table 13: Project Construction Schedule provides the dates and durations of each of the activities that will take place during construction, as well as a brief description of the scope of work. Future dates represent approximations based on the general Project timeline and are subject to change pending unpredictable circumstances that may arise. Construction will occur over two phases to ensure that the demolition of the existing gymnasium will occur after the completion of the new gymnasium, and no disruptions to student activities will occur.

TABLE 13: PROJECT CONSTRUCTION SCHEDULE

Construction Activity	Start Date	End Date	Duration (Days)	Description
Phase 1				
Demolition	7/1/2026	9/22/2026	60	Removal of existing Shop Building (Building No. 2) and Utility Building (Building No. 14), approximately 34,438-sq. ft. building material
Site Preparation	9/23/2026	10/5/2026	9	Site preparation and grading of Phase 1 area
Building Construction	10/6/2026	4/16/2029	660	Construction of new gymnasium, five classrooms, support facilities, and maintenance and operations facility in Phase 1 area
Paving	4/17/2029	5/28/2029	30	Paving of asphalt surfaces in Phase 1 area
Architectural Coating	5/29/2029	7/9/2029	30	Interior building work and application of architectural coatings for new buildings
Phase 2				
Demolition	7/10/2029	10/1/2029	60	Removal of existing Gymnasium (Building No. 3), Ticket Building (Building No. 12), and Relocatable Sanitary Building (Building No. 13), approximately 42,021-sq. ft. building material
Site Preparation	10/2/2029	10/12/2029	9	Site Preparation and grading of Phase 2 area
Paving	10/13/2029	11/23/2029	30	Paving of asphalt surfaces in Phase 2 area

Operation

Operational emissions were estimated using the CalEEMod software, which was used to forecast the daily regional emissions from area sources that would occur during long-term Project operations. Area-source emissions are based on natural gas (building heating and water heaters), landscaping equipment, and consumer product (including paint) usage rates provided in CalEEMod. Natural gas usage factors in CalEEMod are based on the California Energy Commission's California Commercial End Use Survey data set, which provides energy demand by building type and climate zone.

Cumulative

SCAQMD recommends that a project be considered to result in a cumulatively considerable impact to air quality if any construction-related emissions and operational emissions from individual development projects exceed the mass daily emissions thresholds for individual projects.[21]

The SCAQMD neither recommends quantified analyses of the emissions generated by a set of cumulative development projects nor provides thresholds of significance to be used to assess the impacts associated with these emissions.

A project is also considered to result in a cumulatively considerable contribution to significant impacts if the population and employment projections for the project exceed the rate of growth defined in SCAQMD's AQMP.

Air Quality Impacts

Construction

Regional Construction Impacts

Construction has the potential to create air quality impacts through the use of heavy-duty construction equipment and through vehicle trips generated from construction workers, haul trucks, and construction material delivery trucks traveling to and from the Project site. Construction activities would involve the demolition and removal of existing uses, the transport and disposal of these materials and soil, and construction of new structures and related infrastructure. Fugitive dust emissions would result from demolition and construction activities and mobile source emissions would result from the use of haul trucks and on-site construction equipment such as dozers, loaders, and cranes. During the finishing phase of a building, paving operations and the application of architectural coatings (e.g., paints) and other building materials would potentially release VOCs. The assessment of construction air quality impacts considers each of these potential sources. Construction emissions can vary substantially from day to day, depending on the level of activity (e.g., construction schedule), the specific type of operation and, for dust, the prevailing weather conditions.

Construction of the proposed Project would occur in two phases as detailed in **Table 11**. Construction and demolition activities would first take place on the norther portion of the Project site to allow for the demolition and removal of the existing Shop Building (Building No. 2) and Ticket Booth (Building No. 14); this would allow for the construction of the new Gymnasium and classrooms as seen in **Figure 2**. Construction of the new Gymnasium and classrooms would be completed before Phase 2 of demolition and construction activities occur. Phase 2 includes the demolition of the existing Gymnasium (Building No. 3) and Utility Building (Building No. 16) in order for the new Support Facilities and Maintenance and Operations Facility to be constructed on the southern portion of the Project site, as shown in **Figure 2**.

21 SCAQMD. "White Paper on Regulatory Options for Addressing Cumulative Impacts from Air Pollution Emissions." Appendix D, p. D-3. *Board Meeting, Agenda No. 29*. September 5, 2003. Accessed April 2024. http://www3.aqmd.gov/hb/2003/September/030929a.html.

Construction activities would cause short-term emissions of criteria air pollutants. The primary source of NOX, CO, and SOX emissions is the operation of construction equipment. The primary sources of particulate matter (PM_{10} and $PM_{2.5}$) emissions include activities that disturb the soil, such as grading and excavation, as well as building demolition and construction. The primary source of VOC emissions is the application of architectural coating and off-gas emissions associated with asphalt paving.

Emissions for the proposed Project were grouped into two emission sources, on-site and off-site emissions, which are combined to identify the proposed Project's total regional construction emission profile. Additional details of construction activities (i.e., demolition, building construction, and asphalt/paving/finishing) and the equipment that would be used during proposed Project construction are provided in **Appendix 1.0: CalEEMod Air Quality Output Emission Files**.

The emission levels in **Table 14: Unmitigated Maximum Regional Construction Emissions** represent the maximum daily emissions projected to occur taking into consideration all of the construction phases. As presented in **Table 14**, the unmitigated daily maximum regional construction emissions would not exceed the SCAQMD daily significance thresholds for VOC, NOx, CO, SO_2, PM_{10}, and $PM_{2.5}$. Therefore, regional construction would not result in a potentially significant short-term regional air quality impacts during construction without mitigation.

TABLE 14: UNMITIGATED MAXIMUM REGIONAL CONSTRUCTION EMISSIONS

Source	VOC	NOx	CO	SOx	PM_{10}	$PM_{2.5}$
	pounds/day					
Phase 1

Localized Construction Impacts

Construction has the potential to create air quality impacts through the use of heavy-duty construction equipment and through vehicle trips generated from construction workers, haul trucks, and construction material delivery trucks traveling to and from the Project site. Construction activities would involve the demolition and removal of existing uses, the transport and disposal of these materials and soil, and construction of new structures and related infrastructure. Fugitive dust emissions would result from

demolition and construction activities and mobile source emissions would result from the use of haul trucks and on-site construction equipment such as dozers, loaders, and cranes. During the finishing phase of a building, paving operations and the application of architectural coatings (e.g., paints) and other building materials would potentially release VOCs. The assessment of construction air quality impacts considers each of these potential sources. Construction emissions can vary substantially from day to day, depending on the level of activity (e.g., construction schedule), the specific type of operation and, for dust, the prevailing weather conditions.

On-site emissions have the potential to expose nearby sensitive receptors to harmful pollutant concentrations. Pollutant concentrations are compared to significance thresholds for particulates (PM_{10} and $PM_{2.5}$), CO, and NO_2. The significance threshold for PM_{10} represents compliance with SCAQMD *Rule 403—Fugitive Dust*. The threshold for $PM_{2.5}$ is designed to limit emissions and to allow progress toward attainment of the AAQS.

The results of the construction LST analysis are provided in **Table 15: Unmitigated Localized Construction Emissions**. As shown in **Table 15**, the unmitigated emissions would not exceed the localized significance construction thresholds. It is important to note, construction would be required to comply with the SCAQMD's *Rule 403—Fugitive Dust*, which requires watering of the site during dust-generating construction activities, stabilizing disturbed areas with water or chemical stabilizers, and preventing track-out dust from construction vehicles. These measures would further reduce construction localized construction related emissions.

TABLE 15: UNMITIGATED LOCALIZED CONSTRUCTION EMISSIONS

Source	NOx	CO	PM_{10}	$PM_{2.5}$
	On-Site Emissions (pounds/day)			
Phase 1				
Total maximum emissions	25	28	1	1
Phase 2				
Total maximum emissions	24	28	1	1
LST threshold	*121*	*1,292*	*11*	*6*
Threshold Exceeded?	No	No	No	No

Notes:

Totals in table may not appear to add exactly due to rounding in the computer model calculations.

The net area/energy emissions of the Project represent the net difference between the existing operational uses that would be removed and the Project operational emissions.

CO = carbon monoxide; NOx = nitrogen oxide; PM_{10} = particulate matter less than 10 microns; $PM_{2.5}$ = particulate matter less than 2.5 microns.

Source: Refer to ***Appendix 1.2: Proposed Construction Emissions (Phase 1)*** and ***Appendix 1.3: Proposed Construction Emissions (Phase 2)***.

Operational

Regional Operational Impacts

As discussed in the *Methodology* subsection, CalEEMod was used to calculate regional mobile source emissions, on-road fugitive dust, architectural coatings, landscape equipment, and energy use (electricity and natural gas consumption).

The Project would replace and upgrade facilities on the campus, but it will not increase the number of students or faculty and would not introduce major new emission sources. No new vehicle trips would be generated, and there would be no increase in mobile source emissions. Furthermore, building upgrades and replacement of old, energy-efficient structures with those that use less energy would reduce emissions from space heating and other on-site sources.

The Project would be required to comply with the California Green Building Standards Code, also known as the CALGreen Code. The CALGreen Code is a Statewide green building standards code and is applicable to residential and nonresidential buildings throughout California, including schools. The CALGreen Code was developed to reduce GHG from buildings; promote environmentally responsible, cost-effective, healthier places to live and work; reduce energy and water consumption; and respond to the environmental directives of the Department of Housing and Community Development.

Operational air quality impacts are assessed based on the incremental increase in emissions compared to existing conditions. The results of these net calculations are compared to the associated SCAQMD thresholds presented in **Table 16: Unmitigated Maximum Regional Operational Emissions**. As shown in **Table 16**, the proposed Project would not exceed the regional daily significance thresholds for VOC, NOx, CO, SOx, PM_{10}, and $PM_{2.5}$ prior to mitigation and would be less than existing operational emissions and new buildings would be more efficient than the existing buildings. Impacts would be less than significant.

TABLE 16: UNMITIGATED MAXIMUM REGIONAL OPERATIONAL EMISSIONS

Source	VOC	NOx	CO	SOx	PM_{10}	$PM_{2.5}$
	pounds/day					
Mobile	14	8	100	<1	24	6
Area	12	<1	16	<1	<1	<1
Energy	<1	2	2	<1	<1	<1
Total	**26**	**11**	**118**	**<1**	**24**	**6**
Existing	30	15	150	<1	25	6
Net Total	—	—	—	—	—	—
SCAQMD Mass Daily Threshold	*55*	*55*	*550*	*150*	*150*	*55*
Threshold exceeded?	No	No	No	No	No	No

Notes: Totals in table may not appear to add exactly due to rounding in the computer model calculations.

CO = carbon monoxide; NOx = nitrogen oxides; PM_{10} = particulate matter less than 10 microns; $PM_{2.5}$ = particulate matter less than 2.5 microns; SOx = sulfur oxides; VOC = volatile organic compounds.

(—) = Net total would not result in an increase from existing operational emissions.

Source: Refer to ***Appendix 1.4: Proposed Operational Emissions***.

Localized Operational Impacts

On-site emissions have the potential to expose nearby sensitive receptors to harmful pollutant concentrations. Pollutant concentrations are compared to significance thresholds for particulates (PM_{10} and $PM_{2.5}$), CO, and NO_2. The significance threshold for PM_{10} represents compliance with SCAQMD *Rule 403—Fugitive Dust*. The threshold for $PM_{2.5}$ is designed to limit emissions and to allow progress toward attainment of the AAQS.

The Project would replace and upgrade facilities on the campus, but it will not increase the number of students or faculty and would not introduce major new emission sources. Furthermore, building upgrades and replacement of old, energy-efficient structures with those that use less energy would reduce emissions from space heating and other on-site sources.

Localized operational air quality impacts are assessed based on the incremental increase in emissions compared to existing conditions. The results of the net operational LST analysis are compared to the localized operational emissions thresholds and provided in **Table 17: Unmitigated Localized Operational Emissions**. As shown in **Table 17**, localized net operational emissions would not exceed the localized significance operational thresholds.

TABLE 17: UNMITIGATED LOCALIZED OPERATIONAL EMISSIONS

Source	NOx	CO	PM_{10}	$PM_{2.5}$
	On-Site Emissions (pounds/day)			
Project area/energy emissions	2	18	<1	<1
Existing area/energy emissions	2	18	<1	<1
Net total area/energy emissions	—	—	—	—
LST threshold	*121*	*1,292*	*3*	*2*
Threshold Exceeded?	No	No	No	No

Notes:

Totals in table may not appear to add exactly due to rounding in the computer model calculations.

The net area/energy emissions of the Project represent the net difference between the existing operational uses that would be removed and the Project operational emissions.

CO = carbon monoxide; NOx = nitrogen oxide; PM_{10} = particulate matter less than 10 microns; $PM_{2.5}$ = particulate matter less than 2.5 microns.

(—) = Net total would not result in an increase from existing operational emissions.

Source: Refer to ***Appendix 1.4: Proposed Operational Emissions***.

Long-Term Impacts

Odors

The SPEIR found that schools are not one of the types of land uses typically associated with malodorous emissions (wastewater treatment plants, fiberglass manufacturing facilities, etc.). Furthermore, while landscaping equipment, such as lawnmowers and leaf blowers, generates exhaust fumes, the odors would temporary. In any event, whatever odors are associated with campus operations will not change because of the Project. Short-term construction-related odors will cease upon drying of architectural coatings or hardening of odor-producing materials.

Any unforeseen odors generated by the Project will be controlled in accordance with SCAQMD *Rule 402*. As previously noted, *Rule 402* prohibits the discharge of air contaminants that harm, endanger, or annoy individuals or the public; endanger the comfort, health or safety of individuals or the public; or cause injury or damage to business or property. Failure to comply with *Rule 402* could subject the offending facility to possible fines and/or operational limitations in an approved odor control or odor abatement plan. Therefore, odor impacts associated with the Project will be less than significant.

Conformity with Air Quality Management Plan

Neither the Project nor the SUP as a whole is a large, regionally significant project that would affect the regional growth projections made by SCAG and use by the SCAQMD in formulating its AQMP. The student and faculty population at the school will not increase as a result of the Project. As shown in **Table 14**, regional construction emissions would not result in potentially significant short-term air quality impacts. Additionally, implementation of the standard conditions approval of approval listed in **Table 8** would further reduce construction emissions. Thus, the Project would not be considered by SCAQMD to be a substantial source of pollutant emissions and would not conflict or obstruct implementation of the AQMP. Impacts would be less than significant.

Cumulative

Development of the Project in conjunction with the related projects near the Project would result in an increase in construction and operational emissions in an already urbanized area of the City. However, cumulative air quality impacts from construction, based on SCAQMD guidelines, are not analyzed in a manner similar to project-specific air quality impacts. Instead, the SCAQMD recommends that a project's potential contribution to cumulative impacts should be assessed utilizing the same significance criteria as those for project-specific impacts. According to the SCAQMD, individual development projects that generate construction or operational emissions that exceed the SCAQMD recommended daily regional or localized thresholds for project-specific impacts would also cause a cumulatively considerable increase in emissions for those pollutants for which the Basin is in nonattainment.

With the implementation of regulatory compliance measures such as *Rule 403—Fugitive Dust* and *Rule 1113—Architectural Coating*, the Project's construction and operational emissions are not expected to significantly contribute to cumulative emissions for CO, NOx, PM_{10}, and $PM_{2.5}$. As such, the Project's contribution to cumulative air quality emissions in combination with the related projects would not be cumulatively considerable.

As discussed previously, the Project would not jeopardize the attainment of air quality standards in the 2022 AQMP for the South Coast Air Basin and the Los Angeles County portion of the South Coast Air Basin. As such, the Project would not have a cumulatively considerable contribution to a potential conflict with or obstruction of the implementation of the AQMP regional reduction plans.

F. EMISSION REDUCTION MEASURES

As shown in **Tables 14** and **15**, both regional and localized construction impacts would be less than significant. Additionally, implementation of the standard conditions approval of approval listed in **Table 8** would further reduce construction emissions. No air quality-specific mitigation measures related to construction would be required for this Project.

As shown in **Tables 16** and **17**, both regional and localized operational impacts would be less than significant. No air quality-specific mitigation measures related to operation would be required for this Project.

Architectural Coating	Hauling	0.00	20.0	HHDT
Architectural Coating	Onsite truck	—	—	HHDT

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Control Strategies Applied	PM10 Reduction	PM2.5 Reduction
Water unpaved roads twice daily	55%	55%
Limit vehicle speeds on unpaved roads to 25 mph	44%	44%
Sweep paved roads once per month	9%	9%

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	0.00	0.00	110,820	36,940	—

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (Ton of Debris)	Material Exported (Ton of Debris)	Acres Graded (acres)	Material Demolished (Building Square Footage)	Acres Paved (acres)
Demolition	0.00	0.00	0.00	34,428	—

Site Preparation	0.00	0.00	0.00	0.00	—
Paving	0.00	0.00	0.00	0.00	0.00

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
High School	0.00	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2026	0.00	690	0.05	0.01
2027	0.00	690	0.05	0.01
2028	0.00	690	0.05	0.01
2029	0.00	690	0.05	0.01

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

8. User Changes to Default Data

Screen	Justification
Land Use	First phase of construction will include demolition of the utility building and shop building and construction of gymnasium, classrooms, support facilities, art gallery, and new maintenance and operations facility over approximately 2.4 acres
Construction: Construction Phases	Construction phases based on default schedule and information provided by LAUSD.
Construction: Off-Road Equipment	Construction equipment list provided by LAUSD.

APPENDIX 1.3

Proposed Construction Emissions (Phase 2)

Fairfax High School - Proposed Construction (Phase 2) Custom Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

2.2. Construction Emissions by Year, Unmitigated

3. Construction Emissions Details

3.1. Demolition (2029) - Unmitigated

3.3. Site Preparation (2029) - Unmitigated

3.5. Paving (2029) - Unmitigated

4. Operations Emissions Details

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Fairfax High School - Proposed Construction (Phase 2)
Construction Start Date	7/6/2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	0.50
Precipitation (days)	19.6
Location	34.08201692933602, -118.36037259208268
County	Los Angeles-South Coast
City	Los Angeles
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	4341
EDFZ	16
Electric Utility	Los Angeles Department of Water & Power
Gas Utility	Southern California Gas
App Version	2022.1.1.22

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
High School	42.0	1000sqft	2.30	42,021	0.00	0.00	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

5. Activity Data

5.1. Construction Schedule

Phase Name	Phase Type	Start Date	End Date	Days Per Week	Work Days per Phase	Phase Description
Demolition	Demolition	7/10/2029	10/1/2029	5.00	60.0	—
Site Preparation	Site Preparation	10/2/2029	10/12/2029	5.00	9.00	—
Paving	Paving	10/13/2029	11/23/2029	5.00	30.0	—

5.2. Off-Road Equipment

5.2.1. Unmitigated

Phase Name	Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor
Demolition	Concrete/Industrial Saws	Diesel	Average	1.00	8.00	33.0	0.73
Demolition	Graders	Diesel	Average	1.00	8.00	148	0.41
Demolition	Rubber Tired Dozers	Diesel	Average	2.00	8.00	367	0.40

Demolition	Tractors/Loaders/Backhoes	Diesel	Average	4.00	8.00	84.0	0.37
Site Preparation	Cranes	Diesel	Average	1.00	7.00	367	0.29
Site Preparation	Forklifts	Diesel	Average	1.00	8.00	82.0	0.20
Site Preparation	Generator Sets	Diesel	Average	1.00	8.00	14.0	0.74
Site Preparation	Tractors/Loaders/Backhoes	Diesel	Average	2.00	8.00	84.0	0.37
Paving	Cement and Mortar Mixers	Diesel	Average	1.00	7.00	10.0	0.56
Paving	Forklifts	Diesel	Average	1.00	7.00	82.0	0.20
Paving	Concrete/Industrial Saws	Diesel	Average	1.00	6.00	33.0	0.73
Paving	Generator Sets	Diesel	Average	1.00	8.00	14.0	0.74
Paving	Graders	Diesel	Average	1.00	8.00	148	0.41
Paving	Pavers	Diesel	Average	1.00	8.00	81.0	0.42
Paving	Rubber Tired Dozers	Diesel	Average	2.00	8.00	367	0.40
Paving	Tractors/Loaders/Backhoes	Diesel	Average	3.00	8.00	84.0	0.37

5.3. Construction Vehicles

5.3.1. Unmitigated

Phase Name	Trip Type	One-Way Trips per Day	Miles per Trip	Vehicle Mix
Demolition	—	—	—	—
Demolition	Worker	20.0	18.5	LDA,LDT1,LDT2
Demolition	Vendor	—	10.2	HHDT,MHDT
Demolition	Hauling	8.07	20.0	HHDT
Demolition	Onsite truck	—	—	HHDT
Site Preparation	—	—	—	—

Site Preparation	Worker	12.5	18.5	LDA,LDT1,LDT2
Site Preparation	Vendor	—	10.2	HHDT,MHDT
Site Preparation	Hauling	0.00	20.0	HHDT
Site Preparation	Onsite truck	—	—	HHDT
Paving	—	—	—	—
Paving	Worker	27.5	18.5	LDA,LDT1,LDT2
Paving	Vendor	—	10.2	HHDT,MHDT
Paving	Hauling	0.00	20.0	HHDT
Paving	Onsite truck	—	—	HHDT

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Control Strategies Applied	PM10 Reduction	PM2.5 Reduction
Water unpaved roads twice daily	55%	55%
Limit vehicle speeds on unpaved roads to 25 mph	44%	44%
Sweep paved roads once per month	9%	9%

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (Ton of Debris)	Material Exported (Ton of Debris)	Acres Graded (acres)	Material Demolished (Building Square Footage)	Acres Paved (acres)

Demolition	0.00	0.00	0.00	42,021	—
Site Preparation	0.00	0.00	0.00	0.00	—
Paving	0.00	0.00	0.00	0.00	0.00

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
High School	0.00	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2029	0.00	690	0.05	0.01

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

8. User Changes to Default Data

Screen	Justification
Land Use	First phase of construction will include demolition of existing structures over approximately 2.3 acres
Construction: Construction Phases	Phase two will include demolition of existing Gymnasium, Relocatable Sanitary Building, and Ticket Booth.
Construction: Off-Road Equipment	Construction equipment list provided by LAUSD.

APPENDIX 1.4

Proposed Operational Emissions

Fairfax High School - Proposed Operation Custom Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.4. Operations Emissions Compared Against Thresholds

2.5. Operations Emissions by Sector, Unmitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.3. Area Emissions by Source

4.3.1. Unmitigated

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

4.9. User Defined Emissions By Equipment Type

4.9.1. Unmitigated

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

5. Activity Data

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.2. Architectural Coatings

5.10.3. Landscape Equipment

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

5.16.2. Process Boilers

5.17. User Defined

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Fairfax High School - Proposed Operation
Operational Year	2030
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	0.50
Precipitation (days)	19.6
Location	34.082194481659016, -118.36007875889433
County	Los Angeles-South Coast
City	Los Angeles
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	4341
EDFZ	16
Electric Utility	Los Angeles Department of Water & Power
Gas Utility	Southern California Gas
App Version	2022.1.1.26

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
High School	373	1000sqft	23.6	373,105	150,000	150,000	—	—
Parking Lot	260	Space	0.00	0.00	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

Re: Fairfax High School Modernization Project, 7850 Melrose Avenue, Los Angeles, CA 90046 – City of Los Angeles Tree Report

Dear Ms. Schwaner,

This letter addresses our office's site visits on July 11 and July 13, 2022, to the property at 7850 Melrose Avenue in Los Angeles, California. Carlberg Associates was retained to visit the property, inventory all qualifying private property trees and prepare a report in accordance with the City of Los Angeles' Tree Preservation Ordinance No. 186,873 (Chapter IV, Article 6 of the Los Angeles Municipal Code) and the guidelines set forth by the City of Los Angeles Planning Department. Protected trees and shrubs as set forth in the Ordinance are coast live oak, western sycamore, Southern California black walnut, California bay laurel, Mexican elderberry and toyon with trunk diameters (measured at 4.5 feet above grade) of 4 inches or greater. The Planning Division requires that all other trees with trunk diameters greater than 8 inches are included in the inventory, as well as any off-site trees whose canopies overhang the subject property.

The table on the following pages sets forth the data for the 370 inventoried trees: all are private property trees. There were no right-of-way trees included in this inventory. There are no additional trees whose canopies overhang the project site. ***Ten (10) of the private property trees are considered protected by the City of Los Angeles' Tree Preservation Ordinance No. 186873.*** By virtue of their trunk diameter size of eight inches and greater, 315 private property trees are considered 'significant' as defined by the City's Planning Division.

Please feel welcome to contact me at our Santa Monica office if you have any immediate questions or concerns.

Respectfully submitted,

Cy Carlberg, Registered Consulting Arborist
Principal, Carlberg Associates

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (DBH)* in inches	Height (feet)	Canopy Spread (N/E/S/W) in feet	Health	Structure	"Protected", "ROW", or "Significant" Tree	Comments
202	Mexican fan palm	*Washingtonia robusta*	BT-50'	55	6/6/6/6	B+	B	Significant	spiked, minor mechanical damage, some dead fronds
203	Canary Island pine	*Pinus canariensis*	23.6	55	13/18/18/15	A	B	Significant	fence and pole embedded in trunk, MPE
204	Canary Island pine	*Pinus canariensis*	19.7	50	11/12/10/10	A	B	Significant	fence and pole embedded in trunk, MPE
205	Canary Island pine	*Pinus canariensis*	23.2	50	12/14/20/16	A	B+	Significant	MPE
206	Canary Island pine	*Pinus canariensis*	16.3	45	12/12/12/12	A	B	Significant	fence and pole embedded in trunk, MPE
207	Southern magnolia	*Magnolia grandiflora*	10.4	20	10/10/10/10	B	B	Significant	MPE, cavity at 5 feet on W, minor dieback
208	Southern magnolia	*Magnolia grandiflora*	7.6	22	15/6/7/12	B	B	No	MPE, minor dieback, partially shaded out by adjacent ash tree
209	Chinese flame tree	*Koelreuteria bipinnata*	9, 12.3	28	18/20/20/15	A	B-	Significant	tagged on S, some exposed roots with decay, some roots cut, fence and poles embedded to trunk, codoms at 3 feet
210	Southern magnolia	*Magnolia grandiflora*	12.6	25	12/13/17/18	A-	B+	Significant	MPE, light fixtures attached to trunk, pruned for building clearance
211	Southern magnolia	*Magnolia grandiflora*	13.8	28	13/18/22/12	B	B	Significant	some upper canopy dieback, MPE
212	lemon-scented gum	*Corymbia citriodora*	24	50	10/7/26/30	A-	B-	Significant	seam in mid canopy with good callus, ants, MPE, COD
213	lemon-scented gum	*Corymbia citriodora*	23.4	50	15/17/28/23	A	B+	Significant	trunk against pole of fence
214	lemon-scented gum	*Corymbia citriodora*	21.6	40	0/0/40/0	A-	B-	Significant	leans S

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (DBH)* in inches	Height (feet)	Canopy Spread (N/E/S/W) in feet	Health	Structure	"Protected", "ROW", or "Significant" Tree	Comments
215	lemon-scented gum	*Corymbia citriodora*	27.8	50	14/26/30/20	A	B	Significant	small GR
216	she oak	*Casuarina cunninghamiana*	4.7	25	7/7/7/7	A	B+	No	tagged on S, likely a volunteer, surrounded by cape honeysuckle
217	Chinese flame tree	*Koelreuteria bipinnata*	9.7, 1.7	25	21/10/6/27	A-	B	Significant	additional SS, pole and fence embedded into trunk, cape honeysuckle surrounding, leans W
218	peach	*Prunus persica*	2.8, 3.1	10	6/8/6/4	B-	C-	No	both trunks topped with EG
219	lemon-scented gum	*Corymbia citriodora*	9	30	10/12/14/13	A	B-	Significant	fence and pole embedded in trunk, possible GR
220	Southern magnolia	*Magnolia grandiflora*	10.7	20	16/18/16/10	A	B+	Significant	EG, MPE
221	Southern magnolia	*Magnolia grandiflora*	10.2, 6.9	20	20/15/16/10	A-	B-	Significant	pole embedded at base, tree engulfing pole, MPE, EG
222	Southern magnolia	*Magnolia grandiflora*	10.6	20	15/14/12/10	A	B+	Significant	MPE
223	Aleppo pine	*Pinus halepensis*	36.4	40	15/16/20/22	A	B	Significant	diameter measured low at 3 feet, MPE, codoms at 5 feet, HOB
224	Aleppo pine	*Pinus halepensis*	20.2	40	25/16/6/11	A-	B-	Significant	trunks lean NE, slightly sparse
225	Aleppo pine	*Pinus halepensis*	21	40	25/28/6/6	A	B-	Significant	large codom removed, cavity with exudation, leans NE
226	floss silk	*Ceiba speciosa*	12.4	20	12/15/10/16	B	B-	Significant	small GR, some upper canopy dieback, MPE
227	Aleppo pine	*Pinus halepensis*	12.2	30	8/16/17/21	A	B+	Significant	partially shaded out

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (DBH)* in inches	Height (feet)	Canopy Spread (N/E/S/W) in feet	Health	Structure	"Protected", "ROW", or "Significant" Tree	Comments
228	Aleppo pine	*Pinus halepensis*	23.5	40	28/18/20/22	A	B	Significant	some exposed roots with decay, trunk leans SE, MPE
229	Aleppo pine	*Pinus halepensis*	28.5	35	13/21/25/23	A	B+	Significant	pruned away from building for clearance, MPE
230	Aleppo pine	*Pinus halepensis*	30.8	42	10/20/30/17	A	B+	Significant	pruned away from building for clearance, MPE, pole embedded and twisting into trunk
231	Western sycamore	*Platanus racemosa*	16.2	45	18/21/7/7	A	B	Protected	some exposed roots with decay, MPE, HOB
232	Western sycamore	*Platanus racemosa*	15.8	40	18/25/7/5	A-	B-	Protected	some exposed roots with decay, MPE, exudation at base, leans NE, some roots cut
233	Western sycamore	*Platanus racemosa*	15.3	45	14/25/12/10	A	B+	Protected	some exposed roots with decay, MPE
234	Western sycamore	*Platanus racemosa*	15	40	18/18/17/10	A	B+	Protected	some exposed roots with decay, MPE
235	Western sycamore	*Platanus racemosa*	14.7	35	20/8/15/8	B	B-	Protected	some exposed roots with decay, MPE, HOB, a bit sparse, unbalanced canopy, EG
236	Canary Island pine	*Pinus canariensis*	17.4	55	4/12/16/13	A	B+	Significant	MPE, pruned for building clearance
237	Canary Island pine	*Pinus canariensis*	21.1	55	13/7/10/8	A	B+	Significant	MPE, pruned for building clearance
238	Canary Island pine	*Pinus canariensis*	22.2	55	8/13/15/7	A	B+	Significant	MPE, pruned for building clearance
239	Canary Island pine	*Pinus canariensis*	13.4	55	5/7/7/4	B	B	Significant	a lot of lower/mid EG, MPE
240	Canary Island pine	*Pinus canariensis*	26.2	55	7/15/15/15	A	B+	Significant	MPE, pruned for building clearance

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (DBH)* in inches	Height (feet)	Canopy Spread (N/E/S/W) in feet	Health	Structure	"Protected", "ROW", or "Significant" Tree	Comments
241	Canary Island pine	*Pinus canariensis*	24.8	60	15/15/15/15	A	B+	Significant	in raised planter
242	coral tree	*Erythrina speciosa*	13.3, 20.3, 12.6, 11.6	35	20/22/18/18	A	B	Significant	codoms at base, MPE
243	coral tree	*Erythrina speciosa*	24.4	35	8/15/24/20	A	B	Significant	one old trunk cut, some exposed roots, in raised planter, MPE
244	coral tree	*Erythrina speciosa*	18.4, 21.9	35	20/18/15/23	A	B	Significant	in raised planter, exposed roots, codoms at 4 feet, MPE
245	coral tree	*Erythrina speciosa*	40.2	35	20/20/23/22	A	B	Significant	in raised planter, diameter measured low at 3 feet (below codoms), MPE
246	weeping fig	*Ficus benjamina*	9.1, 16	32	15/10/22/17	A	B+	Significant	in raised planter, exposed roots, MPE, growing into canopy of adjacent fig tree
247	weeping fig	*Ficus benjamina*	11, 12.9	32	18/10/18/21	A	B+	Significant	in raised planter, exposed roots, MPE, growing into canopy of adjacent fig tree
248	evergreen pear	*Pyrus kawakamii*	11.2	22	12/14/10/12	A	B+	Significant	partially shaded out, MPE
249	evergreen pear	*Pyrus kawakamii*	9.8	25	16/14/7/10	A	B+	Significant	MPE
250	evergreen pear	*Pyrus kawakamii*	9.5	22	10/12/7/16	A	B+	Significant	MPE
251	evergreen pear	*Pyrus kawakamii*	12	28	10/12/12/10	A	B+	Significant	MPE
252	Canary Island pine	*Pinus canariensis*	30.1	60	12/15/14/8	A	B+	Significant	pruned for building clearance, tagged on S
253	Canary Island pine	*Pinus canariensis*	24.5	55	10/18/20/8	A	B	Significant	pruned for building clearance, exposed roots, HOB, tagged on S

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (DBH)* in inches	Height (feet)	Canopy Spread (N/E/S/W) in feet	Health	Structure	"Protected", "ROW", or "Significant" Tree	Comments
254	deodar cedar	*Cedrus deodara*	21.6	32	21/18/10/7	D	C	Significant	in decline, sparse, tagged on W
255	incense cedar	*Calocedrus decurrens*	11.1	22	8/24/3/5	A-	B	Significant	unbalanced canopy to E, tagged on S
256	Aleppo pine	*Pinus halepensis*	12.3	35	6/30/12/3	A	B-	Significant	tagged on W, leans SE, MPE
257	Aleppo pine	*Pinus halepensis*	14.2	35	14/20/12/10	A	B+	Significant	tagged on W
258	Aleppo pine	*Pinus halepensis*	7.5	16	0/32/0/0	A	B-	No	tagged on W, heavy lean E
259	Aleppo pine	*Pinus halepensis*	10.3	20	18/28/8/3	A	B	Significant	tagged on W, unbalanced canopy to E
260	Aleppo pine	*Pinus halepensis*	11.3	18	0/32/0/0	A	B-	Significant	tagged on W, heavy lean E, minimal mechanical damage with decay
261	incense cedar	*Calocedrus decurrens*	6.7	15	10/14/10/0	B-	C	No	HOB, MPE, partially shaded out, sparse, moderate dieback
262	Canary Island pine	*Pinus canariensis*	24	50	10/22/14/7	A	B+	Significant	MPE, tagged on W
263	Canary Island pine	*Pinus canariensis*	22.1	60	13/10/5/8	A	B+	Significant	MPE, tagged on W
264	Canary Island pine	*Pinus canariensis*	26.3	60	14/8/18/15	A	B+	Significant	MPE, tagged on W
265	Canary Island pine	*Pinus canariensis*	20.7	55	8/10/12/8	A	B+	Significant	MPE, tagged on W
266	Canary Island pine	*Pinus canariensis*	22.3	55	10/15/22/7	A	B+	Significant	MPE, tagged on W

364	American sweetgum	*Liquidambar styraciflua*	9.9	20	13/12/5/8	B+	B-	Significant	one large trunk cut
365	American sweetgum	*Liquidambar styraciflua*	6.6	16	10/9/12/8	A-	B-	No	mechanical damage on trunk, MPE
366	American sweetgum	*Liquidambar styraciflua*	9.9	25	12/10/10/10	A	B+	Significant	
367	American sweetgum	*Liquidambar styraciflua*	12.3	25	13/15/15/14	A-	B+	Significant	minor upper canopy dieback
368	London plane	*Platanus* x *hispanica*	9.9	20	8/8/10/8	A-	B+	Significant	likely on public/city property
369	London plane	*Platanus* x *hispanica*	6.1	18	12/12/12/12	A-	B+	No	likely on public/city property
370	London plane	*Platanus* x *hispanica*	9.8	22	15/15/15/15	A-	B+	Significant	likely on public/city property

NOTES:

DBH – Diameter at breast height. A forestry term used to describe a tree's trunk diameter measured at 4.5 feet above grade. Often used as a representation of tree size.

HOB – History of breakage

MBA – Multiple branch attachments

MPE – Multiple pruning events

ROW – Right of Way tree

ST – Street tree

BT – Brown trunk (height)

COD – Column of decay

CLPD – Common leaf pests/diseases

EG – Epicormic growth

0

HEALTH AND STRUCTURE GRADE DEFINITIONS

Health and structure ratings of the trees are based on the archetype tree of the same species through a subjective evaluation of its physiological health, aesthetic quality, and structural integrity.

Overall physiological condition (health) and structural condition were rated A-F:

Health

A. Outstanding – Exceptional trees of good growth form and vigor for their age class; exhibiting very good to excellent health as evidenced by normal to exceptional shoot growth during current season, good bud development and leaf color, lack of leaf, twig or branch dieback throughout the crown, and the absence of decay, bleeding, or cankers. Common leaf and/or twig pests may be noted at very minor levels.

B. Above average – Good to very good trees that exhibit minor necrotic or physiological symptoms of stress and/or disease; shoot growth is less than reasonably expected, leaf color is less than optimal in some areas, the crown may be thinning, minor levels of leaf, twig, and branch dieback may be present, and minor areas of decay, bleeding, or cankers may be manifesting. Minor amounts of epicormic growth may be present. Minor amounts of fire damage or mechanical damage may be present. Still healthy, but with moderately diminished vigor and vitality. No significant decline noted.

C. Average – Average, moderately good trees whose growth habit and physiological or fire-induced symptoms indicate an equal chance to either decline or continue with good health into the near future. Most of these trees exhibit moderate to significant small deadwood in outer crown areas, decreased shoot growth and diminished leaf color and mass. Some stem and branch dieback is usually present and epicormic growth may be moderate to extensive. Cavities, pockets of decay, relatively significant fire damage, bark exfoliation, or cracks may be present. Moderate to significant amounts of insect or disease symptoms may be present; the tree may be shaded or crowded in such a way that it is expected to negatively impact the lifespan of the tree. Tree may be in early decline.

D. Below Average/Poor - trees whose growth habit and physiological or fire-induced symptoms indicate significant, irreversible decline. Most of these trees exhibit significant dieback of wood in the crown, possibly accompanied by significant epicormic sprouting. Shoot growth and leaf color and mass is either significantly diminished or nonexistent throughout the crown. Cavities, pockets of decay, significant fire damage, bark exfoliation, and/or cracks may be present. Significant amounts of insect or disease symptoms may be present; the tree may be shaded or crowded in such a way that it has negatively impacted the lifespan of the tree. Tree appears to be in irreversible decline.

F. Dead or in spiral of decline – this tree exhibits very little to no signs of life.

Structure

A. Outstanding – Trees with outstanding structure for their species exhibit trunk and branch arrangement and orientation that result in a sturdy form or architecture that resists failure under normal circumstances. The spacing, orientation, and size of the branches relative to the trunk are quintessential for the species and free from defects. No outward sign of decay or pathological disease is present. Some trees exhibit naturally inherent branching defects, like multiple, narrow points of attachment from one point on the trunk, which would preclude them from achieving an “A” grade.

B. Above average - Trees with good to very good structure for their species. They exhibit trunk and branch arrangement and orientation that result in a relatively sturdy form or architecture that resists failure under normal circumstances, but may have some mechanical damage, over-pruning, or other minor structural defects. The spacing, orientation, and size of the branches relative to the trunk are still in the normal range for the species, but they exhibit a minor degree of defects. Minor, sub-critical levels of decay or pathological disease may be present, but the degree of damage is not yet structurally significant. Trees that exhibit naturally inherent branching defects, like multiple, narrow points of attachment from one point on the trunk, would generally fall in to this category. A small percentage of the canopy may be shaded or crowded, but not in such a way that it is expected to negatively impact the structural integrity or lifespan of the tree.

C. Average - Trees with moderately good structure for their species, but with obvious defects. They exhibit trunk and branch arrangement and orientation that result in a less than sturdy form or architecture, which reduces their resistance to failure under normal circumstances. Moderate levels of mechanical damage, over-pruning, or other structural defects may be present. The spacing, orientation, and size of some of the branches relative to the trunk are not in the normal range for the species. Moderate to significant levels of decay or pathological disease may be present that increase the likelihood of structural instability. Influences such as an excessive trunk lean, slope erosion, root pruning, or other growth-inhibiting factors may be present. A moderate to significant percentage of the canopy may be shaded or crowded in such a way that it is expected to negatively impact the structural integrity or lifespan of the tree. Risk of full or partial failure in the near future appears to be moderately elevated.

D. Well Below Average/Poor - Trees poor structure for their species and with obvious defects. They exhibit trunk and branch arrangement and orientation that result in a significantly less than sturdy form or architecture, significantly reducing their resistance to failure under normal circumstances. Significant levels of mechanical damage, over-pruning, or other structural defects may be present. The spacing, orientation, and size of many of the branches relative to the trunk are not in the normal range for the species. Significant levels of decay or pathological disease may be present that increase the likelihood of structural instability. Influences such as an excessive trunk lean, slope erosion, root pruning, or other growth-inhibiting factors may be present. A significant percentage of the canopy may be shaded or crowded in such a way that it is expected to negatively impact the structural integrity or lifespan of the tree. Risk of full or partial failure in the near future appears to be advanced.

F. Severely Compromised – trees with very poor structure and numerous or severe defects due to growing conditions, historical or recent pruning, mechanical damage, history of limb or trunk failures, advanced and irreparable decay, disease, or severe fire damage. Trees with this rating are in severe, irreparable decline, or are barely alive. Risk of full or partial failures in the near future may be severe.

ARBORIST DISCLOSURE STATEMENT

Arborists are tree specialists who use their education, knowledge, training and experience to examine trees, recommend measures to enhance the beauty and health of trees, and attempt to reduce the risk of living near trees. Clients may choose to accept or disregard the recommendations of the arborist, or to seek additional advice.

Arborists cannot detect every condition that could possibly lead to the structural failure of a tree. Trees are living organisms that fail in ways we do not fully understand. Conditions are often hidden within trees and below ground. Arborists cannot guarantee that a tree will be healthy or safe under all circumstances, or for a specified period of time. Likewise, remedial treatments, like any medicine, cannot be guaranteed.

Treatment, pruning and removal of trees may involve considerations beyond the scope of the arborist's services such as property boundaries, property ownership, site lines, disputes between neighbors, and other issues. Arborists cannot take such considerations into account unless complete and accurate information is disclosed to the arborist. An arborist should then be expected to reasonably rely upon the completeness and accuracy of the information provided.

Trees contribute greatly to our enjoyment and appreciation of life. Nonetheless, they are subject to the laws of gravity and physiological decline. Therefore, neither arborists nor tree owners can be reasonably expected to warrant unfailing predictability or elimination of risk.

Trees can be managed, but they cannot be controlled. To live near trees is to accept some degree of risk. The only way to eliminate all risk associated with trees is to eliminate all trees.

Risk assessments were neither requested nor performed on any of the trees for this project.

CY CARLBERG
CARLBERG ASSOCIATES
828 Fifth Street, Suite 3 • Santa Monica • California • 90403
cy@cycarlberg.com • o: 310.451.4804 • www.cycarlberg.com

Education
B.S., Landscape Architecture, California State Polytechnic University, Pomona, 1985
Graduate, Arboricultural Consulting Academy, American Society of Consulting Arborists, Chicago, Illinois, February 2002
Graduate, Municipal Forestry Institute, Lied, Nebraska, 2012

Experience
Consulting Arborist, Carlberg Associates, 1998-present
Manager of Grounds Services, California Institute of Technology, Pasadena, 1992-1998
Director of Grounds, Scripps College, Claremont, 1988-1992

Certificates
Certified Arborist (#WE-0575A), International Society of Arboriculture, 1990
Registered Consulting Arborist (#405), American Society of Consulting Arborists, 2002
Certified Urban Forester (#013), California Urban Forests Council, 2004
Qualified Tree Risk Assessor, International Society of Arboriculture, 2011

AREAS OF EXPERTISE

Ms. Carlberg is experienced in the following areas of tree management and preservation:

- Tree health and risk assessment
- Master Planning
- Historic landscape assessments, preservation plans, reports
- Tree inventories and reports to satisfy jurisdictional requirements
- Expert Testimony
- Post-fire assessment, valuation, and mitigation for trees and native plant communities
- Value assessments for native and non-native trees
- Pest and disease identification
- Guidelines for oak preservation
- Selection of appropriate tree species
- Planting, pruning, and maintenance specifications
- Tree and landscape resource mapping – GPS, GIS, and AutoCAD
- Planning Commission, City Council, and community meetings representation

PREVIOUS CONSULTING EXPERIENCE

Ms. Carlberg has overseen residential and commercial construction projects to prevent damage to protected and specimen trees. She has thirty-five years of experience in arboriculture and horticulture and has performed tree health evaluation, value and risk assessment, and expert testimony for private clients, government agencies, cities, school districts, and colleges. Representative clients include:

The Huntington Library and Botanical Gardens
The Los Angeles Zoo and Botanical Gardens
The Rose Bowl and Brookside Golf Course, Pasadena
Walt Disney Concert Hall and Gardens
The Art Center College of Design, Pasadena
Pepperdine University
Loyola Marymount University
The Claremont Colleges (Pomona, Scripps, CMC, Harvey Mudd, Claremont Graduate University, Pitzer, Claremont University Center)
Quinn, Emanuel, Urquhart and Sullivan (attorneys at law)
Getty Trust – Eames House
Historic Resources Group
The City of Claremont
The City of Beverly Hills
The City of Pasadena
The City of Los Angeles
The City of Santa Monica
Santa Monica/Malibu Unified School District
San Diego Gas & Electric
Los Angeles Department of Water and Power
Rancho Santa Ana Botanic Garden, Claremont
Latham & Watkins, LLP (attorneys at law)
Architectural Resources Group
AHBE Landscape Architects
Moule and Polyzoides, Architects and Urbanists

AFFILIATIONS

Ms. Carlberg serves with the following national, state, and community professional organizations:

- California Urban Forests Council, Board Member, 1995-2006
- Street Tree Seminar, Past President, 2000-present
- American Society of Consulting Arborists Academy, Faculty Member, 2003-2005; 2014
- American Society of Consulting Arborists, Board of Directors, 2013-2015
- Member, Los Angeles Oak Woodland Habitat Conservation Strategic Alliance, 2010-present

HISTORIC RESOURCES GROUP

1.0 EXECUTIVE SUMMARY

At the request of the Los Angeles Unified School District (LAUSD), Historic Resources Group (HRG) has evaluated the Fairfax High School campus located at 7850 Melrose Avenue in the City of Los Angeles, California for potential historic significance. This historic assessment analyzes the property's eligibility for listing in the National Register of Historic Places (National Register), California Register of Historical Resources (California Register), and for designation as a City of Los Angeles Historic-Cultural Monument (HCM). One (1) building on the campus, the Auditorium Building, was previously identified as individually eligible for listing in the California Register and for designation as a City of Los Angeles HCM.

Fairfax High School is re-evaluated in this report based on an observation of existing conditions on the property, primary and secondary source research related to the history of the property, review of the relevant historic contexts, and an analysis under the eligibility criteria and integrity thresholds for listing in the National Register, the California Register, and for designation as a City of Los Angeles HCM. A site visit was conducted on March 18, 2022.

HRG has identified two buildings, the Auditorium Building and the Administration and Classroom Building, that appear individually eligible for listing in State and local registers. The Auditorium Building appears individually eligible for listing in the California Register and for designation as a City of Los Angeles HCM under Criterion 1/1, as a 1920s school associated with the establishment and growth of the Jewish community in the Fairfax area, and under Criterion 3/3, for its notable Spanish Colonial Revival style architecture designed by master architects Donald and John Parkinson (Parkinson & Parkinson). The Auditorium Building has a period of significance of 1924, the date it was constructed. In addition to the Auditorium Building, the Administration and Classroom Building also appears individually eligible for listing in the California Register and for designation as a City of Los Angeles HCM under Criterion 1/1, for its association with the notable LGBT program Project 10, and under Criterion 2/2, for its association with Dr. Virginia Uribe, notable LGBT advocate, teacher, and founder of Project 10. The Administration and Classroom Building has a period of significance of 1984, the year that Dr. Uribe founded Project 10 in the building.

The Fairfax High School campus has also been evaluated collectively for its potential eligibility for listing and/or designation as a historic district. HRG has identified a potential historic district at the Fairfax High School that appears eligible for listing in the National Register, California Register, and for designation as a City of Los Angeles HCM under Criteria A/1/1 for its association with community activism and ultimate desegregation of the school. The potential historic district consists of nine (9) contributing buildings, three (3) contributing structures, and three (3) contributing site features with a period of significance of 1967 to 1969, which spans the years the school boundaries were redrawn for desegregation purposes. Contributors to the potential historic district are the Auditorium Building, Social Hall, Administration and Classroom Building, Cafeteria Building, Transformer (Stage/Utility Building), Gymnasium Building, Ticket Booth, Utility Building, Shop Building, Arcades #1 and #2, and Courtyards #1, #2, and #3.

1.1 Project Team

Research, field inspection, and analysis were performed by Alexandra Madsen, Senior Architectural Historian; Christine Lazzaretto, Principal; John LoCascio, Principal Architect; and Ani Mnatsakanyan, Associate Architectural Historian. Additional assistance was provided by Molly Iker-Johnson, Architectural Historian, and Robby Aranguren, Planning Associate. All preparers are qualified professionals who meet the *Secretary of the Interior's Professional Qualification Standards* in their respective fields.

1.2 Methodology

This report was prepared using primary and secondary sources related to the history and development of the City of Los Angeles, the Los Angeles Unified School District (LAUSD), and Fairfax High School.

Documents that were consulted include: historical photographs and aerial images; historical building plans; Sanborn Fire Insurance maps; historic context statements; local histories; the Built Environment Resource Directory (BERD), and the California Historical Resources Information System (CHRIS), Los Angeles County. Additionally, past surveys of the school were consulted including the 2001-2004 historic survey and context statement by Science Applications International Corporation and the 2014 historic survey and context statement by Sapphos Environmental, Inc.

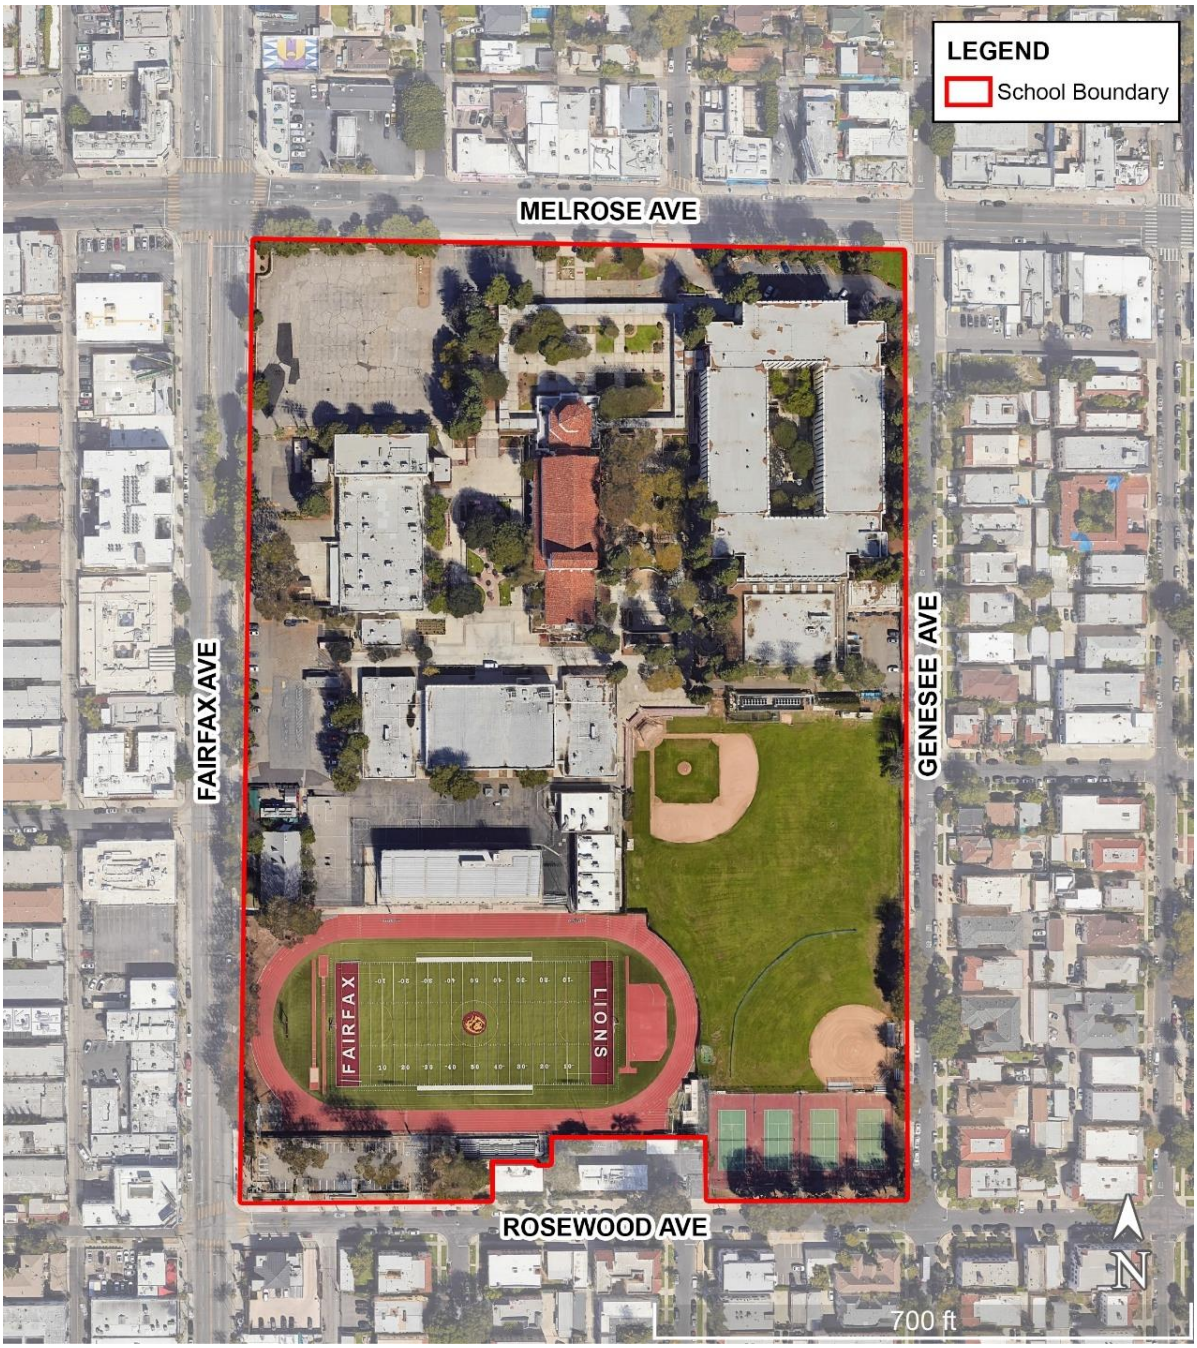
2.0 INTRODUCTION

2.1 Site Location and Description

Fairfax High School is located at 7850 Melrose Avenue in the Fairfax District of Los Angeles County, California. The school occupies a 25-acre rectangular site on a single parcel (Assessor's Parcel Number [APN] 5527-021-900).

The property is located in the Hollywood Community Plan Area (CPA) of the City of Los Angeles. It is bounded by Melrose Avenue to the north, N. Fairfax Avenue to the west, Rosewood Avenue to the south, and N. Genesee Avenue to the east. The site is relatively flat. The location of the campus is shown below in Figure 1.

2.2 Current Historic Status



Fairfax High School has previously been recorded in various LAUSD historic surveys. Between 2001 and 2004, Science Applications International Corporation (SAIC), with funding from the Getty Research Institute, completed a historic resources survey of LAUSD schools. This survey identified the Auditorium Building at Fairfax High School as individually eligible for listing in the California Register and for designation as a City of Los Angeles HCM (3CS Status Code).[1] The 2014 survey of LAUSD schools by Sapphos Environmental, Inc. adopted these findings.[2] However, the 1966-1969 renovated campus and campus additions were not evaluated during these surveys.

The California Office of Historic Preservation (OHP) maintains the BERD, a database of previously evaluated resources throughout the state. The BERD contains information for cultural resources that have been processed through OHP. This includes resources reviewed for eligibility for the National Register of Historic Places and the California Historical Landmarks program through federal and state environmental compliance laws, and resources nominated under federal and state registration programs. Fairfax High School is not identified in the BERD as a potential historic property.

Historic Resources Evaluation Report

HISTORIC RESOURCES GROUP

2.3 Regulatory Framework

Historical Resources under CEQA

The California Environmental Quality Act (CEQA) is the principal statute governing environmental review of projects occurring in the state and is codified in Public Resources Code (PRC) Section 21000 et seq. CEQA requires lead agencies to determine if a proposed project would have a significant effect on the environment, including significant effects on historical or unique archaeological resources. Under CEQA Section 21084.1, a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment.

CEQA Guidelines Section 15064.5 recognizes that historical resources include: (1) resources listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources; (2) resources included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of PRC Section 5024.1(g); and (3) any objects, buildings, structures, sites, areas, places, records, or manuscripts which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California by the lead agency, provided the lead agency's determination is supported by substantial evidence in light of the whole record.

Historic Designations

Historical and cultural resources fall within the jurisdiction of several levels of government. The framework for the identification and, in certain instances, protection of cultural resources is established at the federal level, while the identification, documentation, and protection of such resources are often undertaken by state and local governments. As described below, the principal federal, State, and local laws governing and influencing the preservation of historical resources of national, State, regional, and local significance include:

- The National Historic Preservation Act of 1966, as amended;
- The Secretary of the Interior's Standards for the Treatment of Historic Properties (Secretary's Standards);
- The California Environmental Quality Act (CEQA);
- The California Register of Historical Resources (California Register);
- The California Public Resources Code;
- The City of Los Angeles General Plan;
- The City of Los Angeles Cultural Heritage Ordinance (Los Angeles Administrative Code, Section 22.171);
- The City of Los Angeles Historic Preservation Overlay Zone Ordinance (Los Angeles Municipal Code [LAMC], Section 12.20.3); and
- The City of Los Angeles Historic Resources Survey (SurveyLA).

National Register of Historic Places

The National Historic Preservation Act of 1966 established the National Register of Historic Places (National Register) as "an authoritative guide to be used by federal, state, and local governments, private groups and citizens to identify the Nation's historic resources and to indicate what properties should be considered for protection from destruction or impairment."[3] The National Register recognizes a broad range of historical and cultural resources that are significant at the national, state, and local levels and can include districts, buildings, structures, objects, prehistoric archaeological sites, historic-period archaeological sites, traditional cultural properties, and cultural landscapes.[4] Within the National Register, approximately 2,500 (3 percent) of the more than 90,000 districts, buildings, structures, objects, and sites are recognized as National Historic Landmarks or National Historic Landmark Districts as possessing exceptional national significance in American history and culture.[5]

Whereas individual historic properties derive their significance from one or more of the criteria discussed in the subsequent section, a historic district derives its importance from being a unified entity, even though it is often composed of a variety of resources. With a historic district, the historic resource is the district itself. The identity of a district results from the interrelationship of its resources, which can be an arrangement of historically or functionally related properties.[6] A district is defined as a geographic area of land containing a significant concentration of buildings, sites, structures, or objects united by historic events, architecture, aesthetic, character, and/or physical development. A district's significance and historic integrity determine its boundaries.

A resource that is listed in or eligible for listing in the National Register is considered "historic property" under Section 106 of the National Historic Preservation Act.

Criteria

To be eligible for listing in the National Register, a resource must be at least 50 years of age, unless it is of exceptional importance as defined in Title 36 CFR, Part 60, Section 60.4(g). In addition, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Four criteria for evaluation have been established to determine the significance of a resource: Resources can be considered significant if they:

A. Are associated with events that have made a significant contribution to the broad patterns of our history;

B. Are associated with the lives of persons significant in our past;

[3] 36 Code of Federal Regulations (CFR) 60.
[4] The identification of archaeological sites and traditional cultural properties is outside the scope of this report.
[5] United States Department of the Interior, National Park Service, National Historic Landmarks Frequently Asked Questions. https://www.nps.gov/subjects/nationalhistoriclandmarks/faqs.htm. Accessed October 20, 2021.
[6] United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, page 5.

C. Embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. Have yielded, or may be likely to yield, information important in prehistory or history.[7]

Context

To be eligible for listing in the National Register, a property must be significant within a historic context. National Register Bulletin #15 states that the significance of a historic property can be judged only when it is evaluated within its historic context. Historic contexts are "those patterns, themes, or trends in history by which a specific...property or site is understood and its meaning... is made clear."[8] A property must represent an important aspect of the area's history or prehistory and possess the requisite integrity to qualify for the National Register.

Integrity

In addition to meeting one or more of the criteria of significance, a property must have integrity, which is defined as "the ability of a property to convey its significance."[9] The National Register recognizes seven qualities that, in various combinations, define integrity. The seven factors that define integrity are location, design, setting, materials, workmanship, feeling, and association. To retain historic integrity a property must possess several, and usually most, of these seven aspects. Thus, the retention of the specific aspects of integrity is paramount for a property to convey its significance. In general, the National Register has a higher integrity threshold than State or local registers.

The National Register recognizes seven aspects or qualities that comprise integrity: location, design, setting, materials, workmanship, feeling, and association. These qualities are defined as follows:

- *Location* is the place where the historic property was constructed or the place where the historic event took place.
- *Design* is the combination of elements that create the form, plan, space, structure, and style of a property.
- *Setting* is the physical environment of a historic property.
- *Materials* are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.
- *Workmanship* is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.

---

[7] United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, page 8. Criterion D typically applies to potential archaeological resources, which is outside the scope of this report.
[8] United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, pages 7 and 8.
[9] United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, page 44.

- *Feeling* is a property's expression of the aesthetic or historic sense of a particular period of time.
- *Association* is the direct link between an important historic event or person and a historic property.[10]

California Register of Historical Resources

The California Register of Historical Resources (California Register) is "an authoritative listing and guide to be used by State and local agencies, private groups, and citizens in identifying the existing historical resources of the State and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change."[11] The California Register was enacted in 1992, and its regulations became official on January 1, 1998. The California Register is administered by the California Office of Historic Preservation (OHP). The criteria for eligibility for the California Register are based upon National Register criteria.[12] Certain resources are determined to be automatically included in the California Register, including California properties formally determined eligible for, or listed in, the National Register. To be eligible for the California Register, a prehistoric or historic-period property must be significant at the local, State, and/or federal level under one or more of the following four criteria:

1. It is associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States; or
2. It is associated with the lives of persons important to local, California or national history; or
3. It embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values; or
4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.[13]

A resource eligible for the California Register must meet one of the criteria of significance described above and retain enough of its historic character or appearance (integrity) to be recognizable as a historical resource and to convey the reason for its significance. It is possible that a historic resource may not retain sufficient integrity to meet the criteria for listing in the National Register, but it may still be eligible for listing in the California Register.

Additionally, the California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

---

[10] U.S. Department of the Interior, *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation* (Washington D.C.: National Park Service, 1995), pages 44-45.
[11] California Public Resources Code, Section 5024.1[a].
[12] California Public Resources Code, Section 5024.1[b].
[13] Criterion 4 addresses potential archaeological resources, which is outside the scope of this assessment.

- California properties listed on the National Register and those formally determined eligible for the National Register;
- California Registered Historical Landmarks from No. 770 onward; and,
- Those California Points of Historical Interest that have been evaluated by the State Office of Historic Preservation (OHP) and have been recommended to the State Historical Resources Commission for inclusion on the California Register.

Other resources that may be nominated to the California Register include:

- Historical resources with a significance rating of Category 3 through 5 (those properties identified as eligible for listing in the National Register, the California Register, and/or a local jurisdiction register);
- Individual historical resources;
- Historic districts; and,
- Historical resources designated or listed as local landmarks, or designated under any local ordinance, such as an historic preservation overlay zone.

City of Los Angeles Historic-Cultural Monuments

The Los Angeles City Council adopted the Cultural Heritage Ordinance in 1962 and most recently amended it in 2018 (Sections 22.171 et seq. of the Administrative Code). The Ordinance created a Cultural Heritage Commission (CHC) and criteria for designating a Historic-Cultural Monument (HCM). The CHC is comprised of five citizens, appointed by the Mayor, who have exhibited knowledge of Los Angeles history, culture, and architecture. The City of Los Angeles Cultural Heritage Ordinance states that an HCM designation is reserved for those resources that have a special aesthetic, architectural, or engineering interest or value of a historic nature and meet one of the following criteria:

1. The proposed HCM is identified with important events of national, state, or local history, or exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community;
2. The proposed HCM is associated with the lives of historic personages important to national, state, city, or local history; or
3. The proposed HCM embodies the distinctive characteristics of a style, type, period, or method of construction; or represents a notable work of a master designer, builder, or architect whose individual genius influenced his or her age.[14]

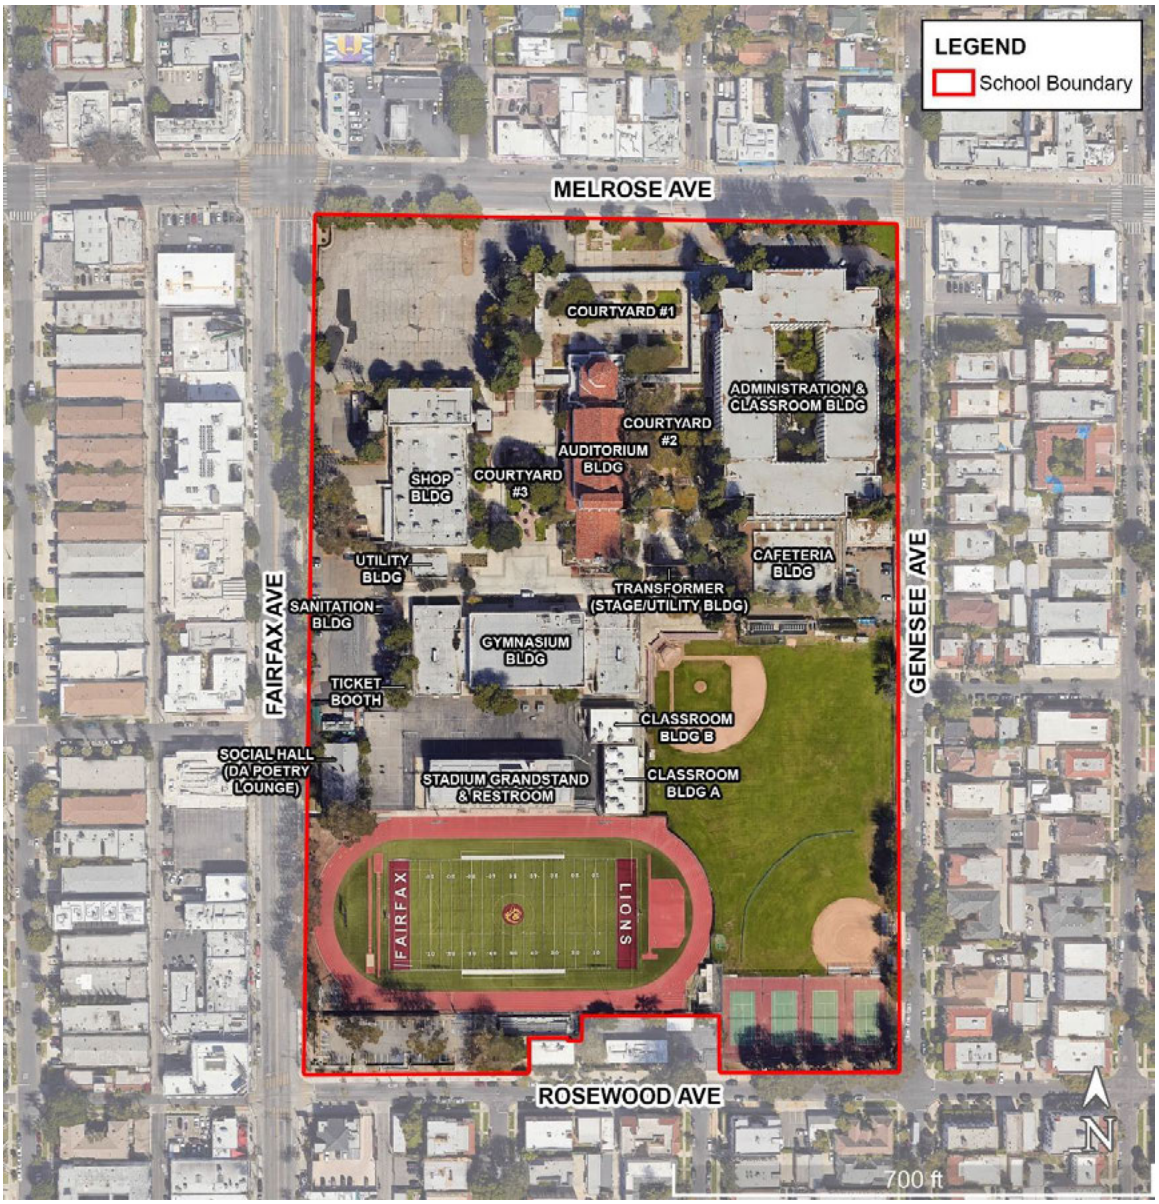
Unlike the National and California Registers, the Cultural Heritage Ordinance makes no mention of concepts such as physical integrity or period of significance. However, in practice, the seven aspects of integrity from the National Register and California Register are applied

[14] City of Los Angeles, Los Angeles Administrative Code, Section 22.171.7.

similarly and the threshold of integrity for individual eligibility is similar. It is common for the CHC to consider alterations to nominated properties in making its recommendations on designations. Moreover, properties do not have to reach a minimum age requirement, such as 50 years, to be designated as HCMs. In addition, the LAMC Section 91.106.4.5 states that the Los Angeles Department of Building and Safety "shall not issue a permit to demolish, alter or remove a building or structure of historical, archaeological or architectural consequence if such building or structure has been officially designated, or has been determined by state or federal action to be eligible for designation, on the National Register of Historic Places, or has been included on the City of Los Angeles list of HCMs, without the department having first determined whether the demolition, alteration or removal may result in the loss of or serious damage to a significant historical or cultural asset. If the department determines that such loss or damage may occur, the applicant shall file an application and pay all fees for the CEQA Initial Study and Check List, as specified in Section 19.05 of the LAMC. If the Initial Study and Check List identifies the historical or cultural asset as significant, the permit shall not be issued without the department first finding that specific economic, social or other considerations make infeasible the preservation of the building or structure."[15]

[15] City of Los Angeles, Los Angeles Municipal Code, Section 91.106.4.5.1.

3.0 CAMPUS SITE DESCRIPTION AND SITE HISTORY



3.1 Architectural Description

Fairfax High School occupies nearly all of the city block bounded to the north by Melrose Avenue, to the east by Genesee Avenue, to the south by Rosewood Avenue, and to the west by Fairfax Avenue; the only exception is a small parcel on Rosewood Avenue occupied by Walt Whitman High School. The campus is comprised of twelve (12) permanent buildings, two (2) arcades, and three (3) courtyards, as well as athletic facilities and open spaces. Existing buildings and features are described below and are summarized in Table 1 ("Existing Conditions").

Most of the buildings are located in the north and central portions of the campus; sports fields occupy most of the south portion. The Auditorium Building (1924) is the central feature of the northern portion of the campus, set back from Melrose Avenue by an arcade and courtyard (Arcade #1 and Courtyard #1). The Auditorium Building is flanked to east and west by two more landscaped courtyards (Courtyards #2 and #3) and beyond these by the Administration and Classroom Building (1968) and the Shop Building (1968), both set back from Melrose Avenue by surface parking lots paved in asphaltic concrete. Further south are the Utility Building (1969); Ticket Booth (1969); the Gymnasium Building (1969), which closes off the south end of Courtyard #3; the Transformer (Stage/Utility Building, 1968) which forms the southern boundary of Courtyard #2; and the Cafeteria Building (1968) and Arcade #2. South of the Gymnasium Building, and defining another surface parking lot, are the Social Hall (Da Poetry Lounge, 1942); the Stadium Grandstand and Restroom (2011); and Classroom Buildings A and B (2004). The southwest portion of the campus is occupied by the track and field, and a small surface parking lot; the southeast portion is occupied by a baseball diamond and tennis courts.

The names and functions of some campus buildings have changed and evolved over the years. To avoid confusion, whenever possible, the buildings discussed in this report have been keyed to the official building naming system of Fairfax High School as shown on the campus site plan and derived from the campus map and inventory documents provided by the school district (Figure 2). Following this figure is an architectural description of each building and feature.

Figure 2. Site Map

Fairfax High School
Historic Resources Evaluation Report

HISTORIC RESOURCES GROUP

Auditorium Building

The Auditorium Building is a Spanish Colonial Revival style building of expressed board-formed concrete construction. It has a linear plan, symmetrical composition, and complex massing composed of three primary elements: a tiered, octagonal Rotunda; the Auditorium proper; and an attached craft building at the rear (south).

The Rotunda has a one-story base, above which rises a two-story tower with a one-story lantern. The base has a square plan with a flat roof and dentil cornice. The tower and lantern have octagonal plans and octagonal roofs with clay barrel tile roofing and eave cornices; the tower is encircled with a frieze of glazed ceramic tile, and the cornice of the lantern is supported on an arched corbel table. Fenestration at the base consists of divided light windows with security grilles, set within vertical recesses with glazed ceramic tile spandrel and transom panels. Fenestration in the tower and lantern consists of divided light, wood sash casement windows in tripartite groupings at the third floor and coupled at the fourth, with Corinthian colonettes at the mullions. The fourth floor (lantern) windows have glazed ceramic tile surrounds. The primary entrance is symmetrically located in a raised central pavilion on the north façade. It consists of a pair of paneled doors with a transom light with a decorative metal grille and glazed ceramic tile surround, recessed within a rectangular aperture with a glazed ceramic tile surround. The preceding entrance vestibule is paved with terra cotta tiles and has a glazed ceramic tile dado.

The Auditorium adjoins the Rotunda to the south. It has a rectangular plan and complex massing consisting of a central three-story nave with a low-pitched front gable roof and flanking two-story aisles with pent roofs. The roofs have clay barrel tile roofing and continuous eave cornices. The aisle walls are articulated with battered buttresses; a corbeled concrete staircase on the west façade accesses the balcony. Fenestration consists primarily of coupled, divided light casement windows. The stage house rises at the south end of the auditorium, with a side gable roof, battered buttresses, and perforated grilles.

The craft wing adjoins the Auditorium Building south of the stage house. It is a two-story volume with a rectangular plan and a moderately-pitched front gable roof with clay barrel tile roofing. There is an exterior chimney on the south façade. The east and west façades are articulated with battered buttresses.

The Rotunda interior is a four-story volume with a rectangular plan, encircled by three stories of superimposed board-formed concrete galleries with segmental arches at the first floor and semicircular at the second and third. The arches spring from piers faced with stylized pilasters and vertical ribs, which continue into the vaulted ceiling above. The second-floor gallery has a parapet of Roman lattice. The floor is paved with terra cotta tiles. A short passage flanked by twin scissor stairs under shouldered arches connects the Rotunda to the Auditorium.

The Auditorium Building has a rectangular plan and rises through three stories, flanked by arcaded aisles with a clerestory above. The walls and columns are of expressed board-formed concrete; the ceiling is of stenciled wood trusses, rafters, and purlins. The raked floor is finished with maple flooring; the aisles are carpeted. Twin segmental arches at the north end

of the space support the balcony. The stage at the south end of the room has a segmental proscenium arch and is accessed from the west by steps with a decorative metal balustrade, and from the east by a mechanical lift.

Courtyard #1

Courtyard #1 is located just off Melrose Avenue to the immediate north of the Auditorium Building and west of the Administration and Classroom Building. The courtyard is a large, rectangular plaza paved in concrete with a grid pattern and interspersed with lawns, planting beds with trees and shrubs, and raised planters forming a forecourt to the Rotunda. There are several cast iron lampposts in this courtyard.

Arcade #1 is located just off Melrose Avenue to the immediate north of the Auditorium Building and west of the Administration and Classroom Building. The one-story arcade is comprised of concrete roof panels supported by concrete columns with metal security screens.

Arcade #1

Arcade #1

Administration and Classroom Building

The Administration and Classroom Building is a four-story Late Modern style building with a hollow rectangular plan enclosing a central courtyard, simple massing, and symmetrical composition. It has a flat roof with a low parapet, and four corner pavilions with rounded corners, veneered in glazed tile. The ground floor is an arcade of shallow, semi-elliptical arches supported on battered, cruciform columns of scored concrete. The upper floors are articulated with a repetitive pattern of full-height vertical strip windows between projecting cast concrete frames. The primary entrances are located on the north façade, each consisting of two pairs of fully-glazed metal storefront doors in full-height vertical strips of metal-framed glass curtain wall. The entrances are accessed by concrete stairs with metal pipe guardrails. The central courtyard has concrete paving and raised concrete planters.

Four imperial staircases, one in each of the corner pavilions, provide vertical circulation and connect the broad, double-loaded corridors that encircle each floor. The stairs have parapets of board-formed concrete. The corridors have resilient tile flooring, plaster walls, and acoustical tile ceilings.

Courtyard #2

Courtyard #2 is located immediately south of Courtyard #1, between the Auditorium Building to the west and the Administration and Classroom Building and Cafeteria Building to the east. It is accessed from Courtyard #1 by three flights of wide concrete steps. It is paved in concrete and landscaped with planting beds, raised concrete planters, and concrete seating walls. The south side of Courtyard #2 has a wide concrete stage with concrete steps and raised concrete planters, backed by the Transformer Building.

Courtyard #2

Courtyard #2

Arcade #2

Arcade #2 is located immediately south of the Cafeteria Building and wraps around it and the Administration and Classroom Building. Arcade #2 is comprised of large, octagonal formed concrete columns.

Arcade #2

Arcade #2

Cafeteria Building

The Cafeteria Building is a one-story Late Modern style building abutting the south façade of the Administration and Classroom Building. It has a rectangular plan, asymmetrical composition, and complex massing composed of a raised central block with a flat roof and clerestory wrapped on the west and south by the lower Arcade #2. There is a loading dock and walled service yard on the east façade. Fenestration consists of coupled vertical strip windows.

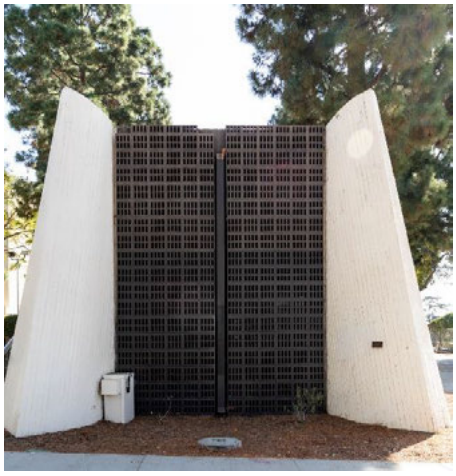
Transformer (Stage/Utility Building)



The Transformer forms the backdrop for the Courtyard #2 stage. It is a one-story utilitarian building with a rectangular plan, simple massing, and symmetrical composition. It has a flat roof with a shallow parapet. The north and south walls are of formed concrete with curved and battered ends. The east and west walls are ventilation grilles. The entrance is located on the south façade and consists of a pair of flush metal doors.

North Façade

West and South Façades

West Façade

Gymnasium Building

The Gymnasium Building is a one-story Late Modern style building with a generally rectangular plan, nearly symmetrical composition, and complex massing consisting of a taller central block flanked to east and west by lower wings with rounded corners. It has low-slope roofs with shallow parapets. The exterior walls of the central block consist of vertical concrete panels with projecting frames; the exterior walls of the wings are of board-formed concrete with a frieze and spandrel panels of glazed ceramic tile. The primary entrance is asymmetrically located on the north façade and consists of a pair of glazed metal storefront doors with sidelights and transom lights, under a cantilevered flat canopy. Secondary entrances in the hyphens consist of pairs of flush metal doors; exterior doors on the wings consist of individual flush metal doors. Fenestration is limited to the wings and consists of rectangular metal-framed windows with metal security grilles.

The primary entrance opens to an L-shaped lobby with resilient tile flooring, plaster walls, and an acoustical tile ceiling with surface-mounted fluorescent light fixtures. There is a service window with a roll-up shutter on the west wall, and a recessed display case on the south. The lobby is flanked to the west by the Big Gym, and to the south by the Little Gym, both accessed by groupings of flush wood doors. Both gyms have maple flooring, plaster walls, and expressed steel roof framing. The Big Gym has retractable seating risers on its north and south walls.

Courtyard #3

Social Hall (Da Poetry Lounge)

The Social Hall is a one-story American Colonial Revival style building with a rectangular plan, simple massing, and nearly symmetrical composition. It has a steeply pitched side gable roof with composition shingle roofing, eave cornice, three gabled dormers with round-arched divided light windows, and an octagonal cupola. The primary (west) façade is clad in wood channel siding; the remaining exterior walls are finished in smooth cement plaster. A shed-roofed verandah with square wood posts and metal fencing extends the full width of the west façade. Fenestration consists primarily of eight-over-eight double hung wood sash windows. The primary entrance consists of three pairs of fully glazed, divided light wood doors with sidelights and transom lights, opening from the verandah. The verandah fronted by a raised concrete planter and is accessed from Fairfax Avenue by a wide flight of concrete steps.

East Façade

Stadium Grandstand and Restroom

The Stadium Grandstand is a utilitarian steel frame structure supporting seating risers. The Restroom is a one-story utilitarian building located under the Grandstand. It has a rectangular plan, asymmetrical composition, and complex maxing composed of the one-story restroom volume and a multi-story elevator tower providing access to the upper levels of the Grandstand. The building has a flat roof and its exterior walls are finished in cement plaster. The entrances consist of flush metal doors.

North Façade

North Façade

Classroom Buildings A and B

Classroom Buildings A and B are two-story utilitarian buildings with rectangular plans, simple massing, and asymmetrical composition. Both have flat roofs; Building A has an overhanging soffit on the east façade, and Building B has one on its north façade. The exterior walls are finished in cement plaster. The buildings are connected by a projecting second-story walkway with a metal balustrade that wraps the north and east façades of Building B and continues along the east façade of Building A. The walkway is accessed by exterior stairs at the southeast corner of the Building A and the northeast and northwest corners of Building B. Fenestration consists primarily of horizontal sliding aluminum sash windows. Classroom entrances consist of flush metal doors.

North Façade

3.2 Site History and Construction Chronology

In 1923, the Los Angeles Board of Education committed over $1 million to the repair and expansion of schools across Hollywood.[16] Of those funds, over $600,000 was allotted to building a new high school at the corner of N. Fairfax Avenue and Melrose Avenue, to be known as Fairfax High School.

For the site of the new school, the Los Angeles Unified School District purchased a twenty-five-acre lot from G. Allen Hancock. The district hired John and Donald B. Parkinson, of the architecture firm of Parkinson & Parkinson, to design the new campus.[17] The news of the school's construction brought attention to the area and led to a real estate and residential development boom in the surrounding neighborhood.[18] Many large residences, small bungalow homes, and multi-family bungalow residential courts were built to take advantage of the new school.[19]

Parkinson & Parkinson's 1923 plans for the school included a 2- to 3-story Auditorium Building (then known as the main building) facing Melrose Avenue with a central rotunda and auditorium that was flanked by east and west wings. Building plans for the Auditorium Building identify several features of the Spanish Colonial Revival-style building, including the ornamental tile border, tile roof, brickwork, and Corinthian pilasters.

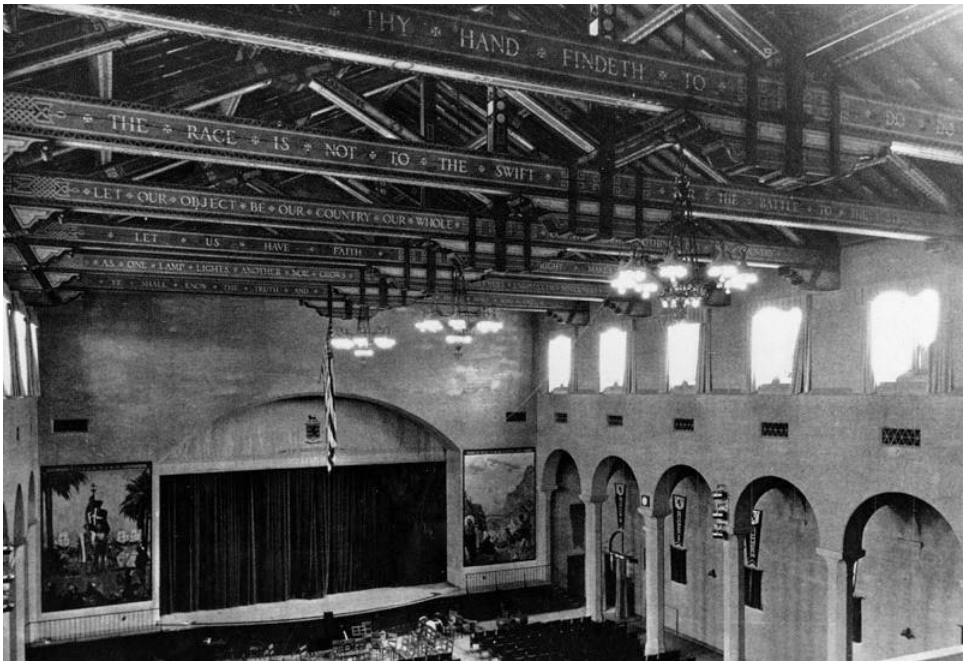
[19] "Building Boom on at Crescent," *Hollywood Daily Citizen*, August 15, 1923.



Fairfax High School Auditorium Building, c. 1924. *California State Library.*

The school featured an auditorium that could seat 1,800 persons; a statue of Abraham Lincoln was placed in the rotunda following its completion.[20] Construction of the building was completed in 1924.

[20] The artist is unknown. The statue was damaged during seismic retrofitting in the 1970s and was removed from the rotunda. Its location is not known. "Fairfax Still Where the Heart Is," *Los Angeles Times,* December 21, 1975, 72.

Fairfax High School Auditorium Interior, c. 1924. *Los Angeles Public Library.*

Parkinson & Parkinson also designed a girl's gymnasium (known as Building No. 2), boy's gymnasium (Building No. 3), and a cafeteria. The campus plan also laid out a football field, baseball diamond, tennis courts, and basketball courts.[21] Additional improvements to the campus in 1925-1926 included a 1-story lunch pavilion, bleachers, and addition to the gymnasium.[22] In 1927, a 1-story 9-car private garage was built on the campus.[23]

As the population of the surrounding area grew, Fairfax High School was compelled to build additional education spaces. Temporary 1-room school bungalows were erected in 1929 and 1930 to accommodate the increased student population and "relieve congestion" at the school.[24] Additional bleachers and a storage room were also built in 1930.[25] In 1939, architect A.S. Nibecker Jr. designed a 1-story incinerator for the school.[26]

In 1939, Fairfax High School students built a new social hall with a "homelike atmosphere" as a hands-on class project.[27] The Social Hall (also known as Greenway Court), was designed by A.S. Nibecker, Jr. and built by students from Fairfax High's carpentry class in conjunction with Frank Wiggins Trade School students.[28] The building's design included a cupola, dormer windows, and a full-length veranda.

The Social Hall was designed to replicate the Greenway Court, a hunting lodge built in Virginia in 1760 by Lord Thomas Fairfax, a friend of George Washington. Lord Fairfax's Virginia lodge, which no longer exists, was a 60-foot banquet hall and land sales office named after his family's estate in Hollingbourne, England.[29]

The Social Hall was officially dedicated on October 28, 1942, inaugurated with a dance for the 200 Fairfax High Students.[30]

Several alterations to existing buildings on the Fairfax High School campus were made in the late 1940s and 1950s, including the relocation of two bungalows and unspecified alterations to the Auditorium Building by architect Kenneth N. Bergstrom.[31]

In the mid-1960s, the Los Angeles Board of Education completed a study to determine the feasibility of replacing or structurally strengthening five school buildings on the Fairfax High School campus that did not meet the State Field Act earthquake safety standards enacted in 1934. The study recommended demolition of all buildings on the campus with the exception of the Auditorium Building.

As a result, the school district hired Albert C. Martin and Associates to redesign the campus in 1966.[32] As recorded in the *Los Angeles Times,* "at Fairfax High School, virtually all major existing building will be demolished, with the exception of the three-story octagonal rotunda and auditorium, which will be modernized later."[33] A.C. Martin's 1966-1967 campus plan included the demolition of the cafeteria, garage, gymnasiums, and portable buildings.[34] The Auditorium and rotunda were retained, though Martin designed a new primary entrance and added buttresses along the east and west facades. The east and west wings were demolished. The Social Hall was relocated from the central region to the southwestern region of the

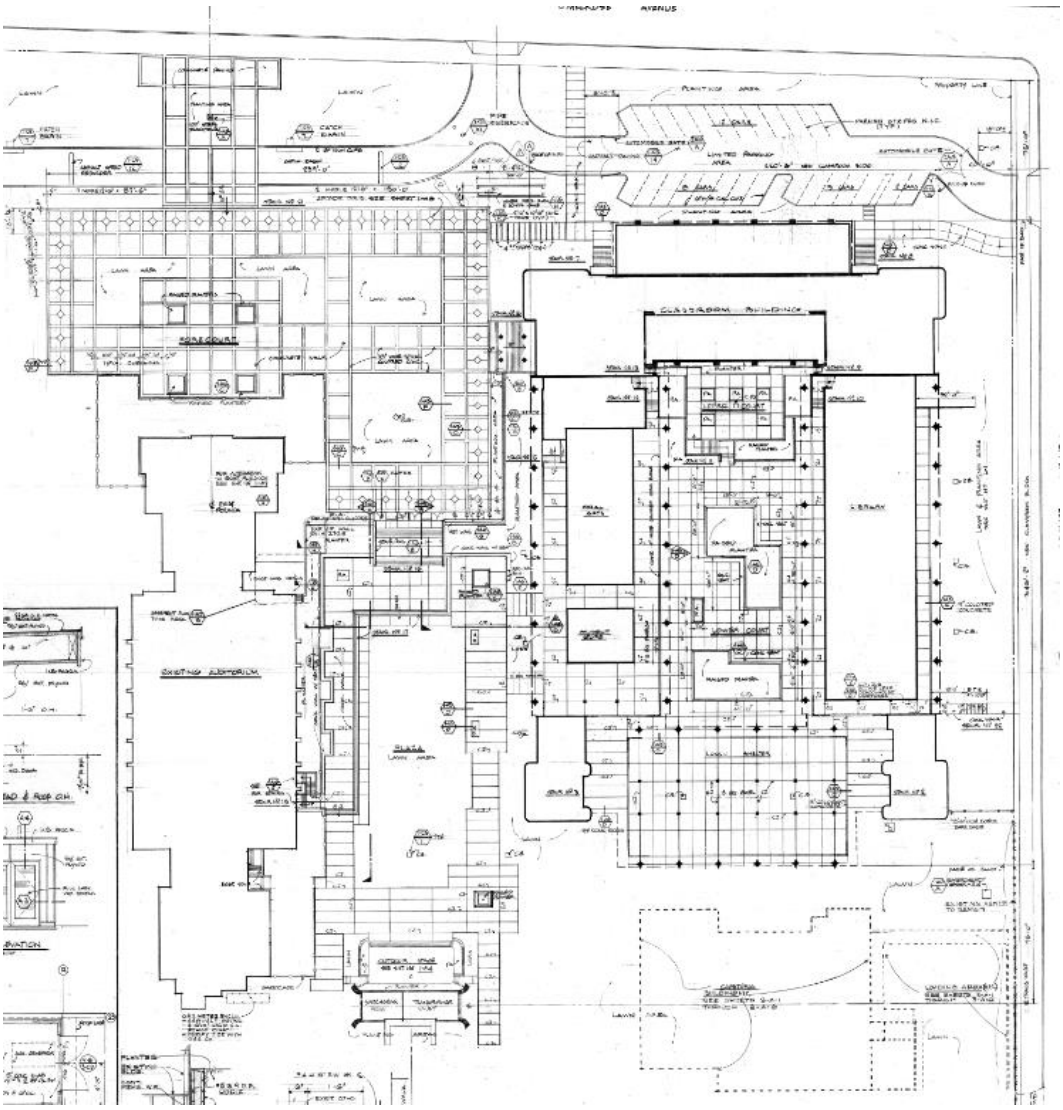
campus. From then on, the Social Hall was used primarily as a storage space and was generally abandoned until the 2000s.[35]

A. C. Martin also completely redesigned the campus with "a complex of modern buildings."[36] Between 1967 and 1969, he completed a phased replacement of buildings on the campus, staggering construction projects to limit interference with the normal instructional program. As new buildings were completed on the campus, older buildings were phased out and eventually demolished.

Architect's Rendering, 1965. *Los Angeles Evening Citizen News.*[37]



Phase I of the building program was authorized by district voters as part of the 1963 bond issue, totaling $127.5 million. Phase I consisted of demolishing the east wing of the Auditorium Building and construction of the $3.9 million Administration and Classroom Building, Courtyard #1, Arcade #1, and Courtyard #2. Phase I was begun in 1967 and completed in March of 1968.[38]

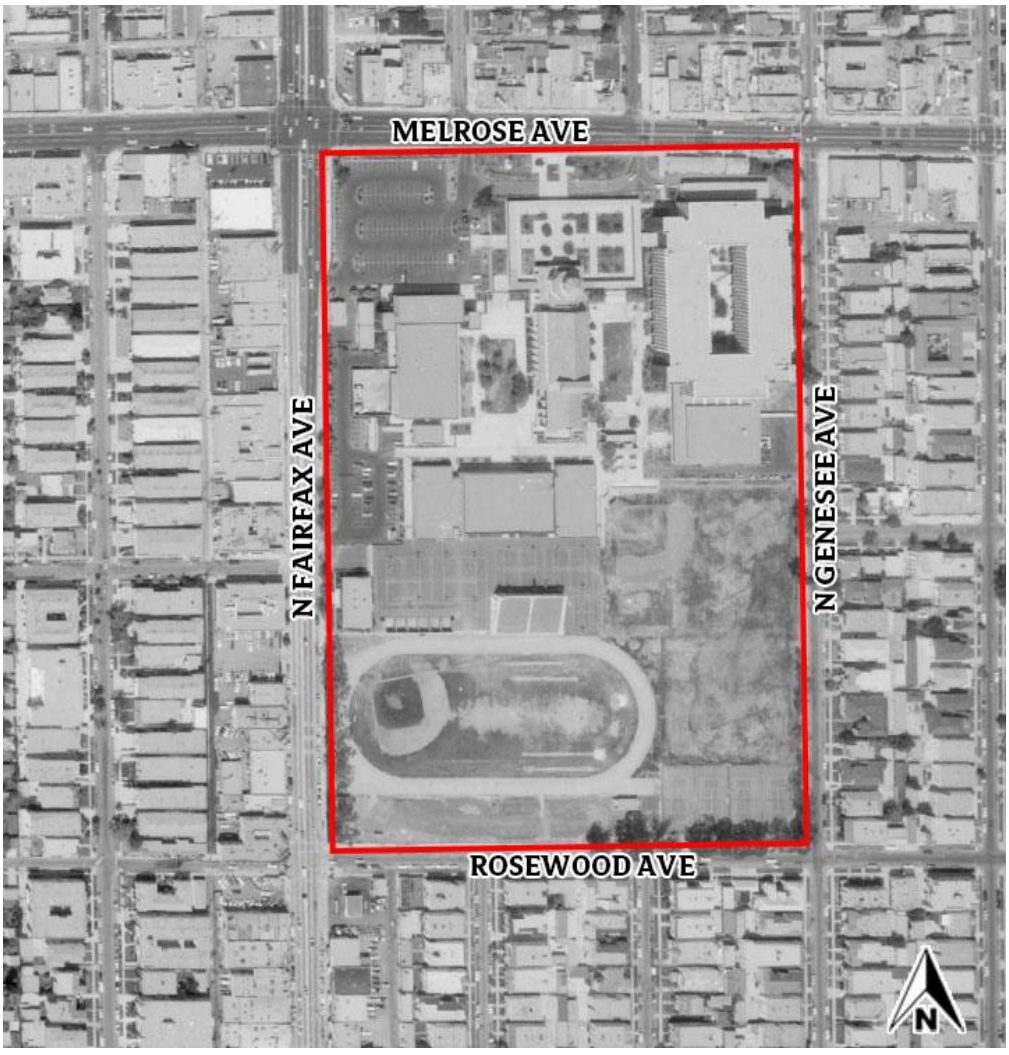
Phase I of the campus design featured extensive landscaping and hardscaping, including planned lawn areas, raised planters, concrete walkways, stairways, plazas, and seating, as visible in building plans and photographs.



A.C. Martin & Associates Campus Plan with Hardscaping and Landscaping, 1967. *Los Angeles Unified School District*

Phase II of the building program was approved as part of the district's 1966 bond issue, totaling $189.5 million. Phase II included modernizing the Auditorium Building, as well as constructing the Cafeteria Building, Arcade #2, and the Transformer (Stage/Utility Building), which were completed in 1968.

In 1969, the Gymnasium Building; Ticket Booth; Utility Building; Shop Building; and Courtyard #3 were constructed. The campus was dedicated in October of 1969.

Aerial View, 1971. *Framefinder UCSB.*

In 1969, A.C. Martin & Associates won an award from the Portland Cement Association and the Southern California Ready-Mix Concrete Association for the firm's creative use of concrete construction at Fairfax High School. As recorded in the *Los Angeles Times,* "Cast-in-place concrete used at Fairfax High School expresses strength, importance, and permanence."[40]

No major alterations or construction was completed at Fairfax High School in the 1970s or 1980s. In 1996, New Attitude Productions, a non-profit theatre group, negotiated a lease deal for the Social Hall with the school officials. In exchange for free rent, the group promised to repair, upgrade, and maintain the building. In addition, they planned to integrate Fairfax High's students in their theatrical productions. They also changed their name to Greenway Arts Alliance to honor the history of the building. Reminiscent of how the building was first constructed, students from Fairfax High's ROTC program helped clean and renovate the theatre. The old Social Hall opened to the public again in 2000.[41] The Social Hall is now leased by Da Poetry Lounge and still retains the same use as a social hall and theatre.

Two new classroom buildings (Classroom Building A and Classroom Building B) were constructed in 2004, located south of the gymnasium. The Stadium Grandstand and Restroom was constructed in 2011.

Jewish American Community

The construction of Fairfax High School encouraged residential development in the community and real estate developers seized the opportunity to build single- and multi-family residences. The school was still incomplete by 1924, but the district was growing so rapidly that officials were concerned that the newly built school would be insufficient to host the large number of students. The chamber of commerce petitioned to extend the Los Angeles Railway to Fairfax to help ease congestion in the new school district.[42] Over 1,200 students were expected to attend in September, and by the second semester the number of students was expected to increase to 2,000.[43]

The Beverly-Fairfax neighborhood had a significant Jewish-American presence since its earliest development in the 1920s. A substantial number of the residences of the neighborhood were owned or rented by members of the Jewish community because there were no restrictive housing covenants or realtor influences as seen in other areas of Los Angeles. After World War II, the Jewish population of Beverly-Fairfax increased exponentially, and many residents who lived in the area were refugees.[44] Over time, the community began moving towards Pico-Robertson.

Since the time it opened in 1924 and through the post-war period, Fairfax High School predominantly served the lower- and middle-class Jewish and white community of Fairfax-Beverly. As later recorded in a *Los Angeles Times* article on the Jewish community in Fairfax-Beverly:

> There was stability to the community, and this was a key. For most, the path was an unbroken 12 years from Laurel Elementary School to Bancroft Junior High, then Fairfax High… Fairfax High School was at the very center of this community, a place where brothers and sister went to school during the day, grandmothers went to school at night, a place for playing ball on weekends with older kids… Fairfax High has been traditionally one of the top academically-rated high schools in the city. Ninety percent of the graduates progressed to college. The Jewish home's regard for education manifested itself dramatically here. Students didn't achieve, they overachieved.[45]

In 1952, Fairfax High School became the only school to teach Modern Hebrew in the West Coast.[46] By 1967, the Modern Hebrew program had expanded to Grant and Beverly Hills High Schools as well.[47] One teacher estimated that the student body was 75% Jewish in the late 1960s.[48] However, the demographics of Fairfax High School shifted in the late 1960s when the issue of the school's boundaries came to the forefront of district discussions.

Racial Integration

In the 1960s, the potential effects of school boundaries on racial demographics had increasingly become a topic of debate in Los Angeles. As recorded in the *Los Angeles Unified School District Historic Context Statement:*

> The issue also touched on school boundaries. In 1963, African-American leaders in Los Angeles staged protests, asking that "elementary and secondary school boundaries be redrawn around these 'Negro districts,' that that minority students be transferred from crowded schools to less crowded ones in a 15-mile radius, and that "barriers" to promotion of certified Negro personnel be eliminated." With the Watts uprising in 1965, attitudes were intensified on all sides of the integration issue. Some citizens became more adamant that de facto segregation should remain in place, while other community members, activists, and students began arguing for and asserting the legal rights of all students to equal educational facilities and opportunities.

In 1967, approximately 250 families residing in the area around Fairfax High School formed a group known as the Neighbors Unlimited and called for the school's boundaries to be redrawn to include the area past Pico Boulevard, which historically served Los Angeles High School. According to parents of students attending the two high schools, the so-called "option" area (which allowed students to choose which high school they wanted to attend) promoted de facto segregation. In 1967, the population of Fairfax High School was 96% white and 1% African American, compared with Los Angeles High School, which was 55% African American and 18% white. Parents claimed that white families in option areas sent their children to Fairfax High School, thereby creating racial imbalance at the schools.[49]

School administrators denied the group's charges but conceded that "little effort has been made to create an 'ethnic balance' between the two schools by redrawing boundary lines," and pointed out that the board policy did not require it.[50] The school district noted that "racial balance" was one factor used in determining where boundaries should be drawn, but that no lines were set for "ethnic reasons." Neighbors Unlimited in turn demanded that the "racial composition of the two schools be made the chief criterion in redrawing their boundaries" and called for a redesign of the north-south corridors, thereby bringing more white students to Los Angeles High School and more African American students to Fairfax High School.[51]

As a result of neighborhood activism, in 1968, the Board of Education established a policy of integration for the city's school system. Consequently, Fairfax High School, Los Angeles High School, and Hamilton High School were the first schools to have their boundaries redrawn, thereby paving the way for desegregation at other schools.[52] The first full year for desegregation was the1968-1969 school year at Fairfax High School. As recorded in the *Los Angeles Times* following the board's decision:

---

[49] "Delay Decision on Fairfax, L.A. High Boundary Issue," *Valley News,* November 10, 1967, 18.
[50] "L.A. School Administrators Hit Charge of Abetting Segregation," *Los Angeles Times,* October 13, 1967, 97.
[51] "L.A. School Administrators Hit Charge of Abetting Segregation," *Los Angeles Times,* October 13, 1967, 97.
[52] Jack McCurdy, "New Boundaries for 14 Schools Proposed as Integration Move," *Los Angeles Times,* April 2, 1968, 3.

> The realignment of boundaries, which will also achieve greater integration for Fairfax High School, represents the first practical application of the boards policy to establish integration in city schools…Under this plan, Fairfax's Negro enrollment will go from less than 1% to 11% within three years and Negro enrollment at Hamilton and Los Angeles High Schools would drop.[53]

As a result of new boundaries, administrators at Fairfax High School created a program called "The Model Plan for a School in Transition," that provided counseling time for students, increased staffing, and created a rumor control center.[54]

By the mid-1970s, the population was comprised of 31% African American, 11% Asian and Latino, and 58% white students; within the white population, the "Jewish student [was] still the core."[55] In 1975, then-principal of Fairfax High School, William Layne stated that:

> [Fairfax High School] has indeed undergone change. It had always been a traditional, very academic school. Today it can truly be called multi-cultural. We're trying to show integration can work in a modern setting... We are no longer a school in transition… We are integrated and have a new program called Educational Excellence in a Multicultural School... This, we hope, will stem flight of the white student. Sure, this school used to be Jewish kids on their way to college. But today it isn't as isolated.[56]

By the mid-1980s, the school enrollment was 25% African American, 15% Asian, 25% Latino, and 31% white.[57] Many of the white students and several of the top teachers at Fairfax High School had left to attend or teach at magnet schools, and the white students that remained were often immigrant students from Russia and Israel.[58]

Despite the school board's early efforts to desegregating schools, some students experienced discrimination at Fairfax High School. In 1988, over 200 Fairfax High School students gathered outside the principal's office to protest discriminatory practices against African American students. Complaints against the school included the administration's refusal to allow the Black Student Union to host a talent show for the school, as well as other broader issues, including poor college counseling, an under-representation of Black students in honor societies, and the cancellation of a Black History course due to low enrollment. In addition, students called for greater contact with recruiters from historically Black universities, expanded after-school activities, and an overall better quality of school life. Principal Warren Steinberg assured students that some concerns would be met, such as reinstating the Black History Course, while other allegations such as racism would be further investigated. In addition to the

Project 10

In 1984, Fairfax High School teacher and counselor Dr. Virginia Uribe organized a school-sponsored counseling program called Project 10 to support LGBT students. Named after the estimated 10% LGBT population of the nation, Project 10 offered a safe space to discuss topics such as the consequences of coming out, the importance of safe sex, AIDS, condoms, and more.[59] At the time of its founding, it was the first of its kind.[60]

Dr. Uribe, a Pasadena native, began teaching in 1959, but concealed her sexual orientation, as being gay or lesbian was ground for dismissal from teaching at the time.[61] Over the course of her teaching career, she saw gay and lesbian students treated with hatred and face bigotry in school due to their sexual orientation. Prior to starting the program, she witnessed a gay

student drop out of school after facing extreme harassment, and realized they are not alone.[62] Many students would often drop out of school, stating that school is the "least of their worries," after facing backlash, abuse, and homelessness when they come out to family and friends.[63]

The program started was a lunchtime session but later extended beyond the lunch break. Uribe formed the program as a high school dropout prevention program to offer emotional support and accurate information to LGBT youth.[64] The program was held in Uribe's third-floor classroom in the Administration and Classroom Building, which also doubled as a science lab classroom. The classroom included a library with information about immune deficiency syndrome as well as novels with homosexual protagonists.[65] It was non-controversial and supported while at Fairfax High School, but by the time the program had extended to other schools in the Los Angeles Unified School District in 1988, it received backlash and condemnation from others, including Catholic Archbishop Roger Mahoney. Dr. Uribe began the non-profit branch of Project 10, known as Friends of Project 10, Inc. in 1986 as a resource for educators, students, parents, across the nation.

In 1988, Assembly Republicans, led by Marian La Follette, voted unanimously to withhold new funds for LAUSD until the project stopped, although no special funds were ever allocated to the program.[66] The low-budget and cost-effective program, as Uribe stated, was "what the district gives me for [teaching] three periods a day."[67] Uribe's goals were to provide students with counseling and hoped to see all schools become tolerant and harassment-free for LGBT students. In addition, Uribe advocated for an anti-slur policy that would extend to sexual taunts.[68] Despite the backlash, the Los Angeles Board of Education strongly backed Project 10 and over 20 city and statewide teacher associations and youth groups voiced their support for the program. The board stated, "We are a public school system, and we should try to meet the needs of all our students. We are talking about civil rights."[69]

Uribe continued to lead training workshops to teachers, counselors, and school staff through the County to encourage advocacy and support for LGBT youth.[70] In 1990, Virginia Uribe was named the grand marshal of the Long Beach Gay Pride Parade and Festival.[71] By 1991, Project 10 had expanded to the Santa Monica-Malibu and San Francisco school districts. In addition, Project 10 implemented the first LGBT prom and later influenced the current state laws to protect California Educators, such as the Fair Education Act.[72]

Project 10's impact is still seen today, as the Los Angeles Unified School District continues its policy to protect the rights of LGBT students.[73] In 1998, Dr. Uribe received the Women in Leadership award from the West Hollywood Chamber of Commerce. In addition, she has also won multiple awards and honors from the state and received the Educator of the Year award from the National Organization of Gay and Lesbian Scientists and Technical Professors. During President Obama's tenure, Dr. Uribe was a finalist for the Presidential Citizens Medal. Dr. Uribe served as a teacher and counselor for LAUSD for 42 years and passed away in 2019.

4.0 FOCUSED NEIGHBORHOOD CONTEXT

4.1 History of Beverly-Fairfax[74]

As in the Hancock Park neighborhood, much of the land that is now part of the Fairfax and Beverly Grove neighborhoods (most commonly referred to as Beverly-Fairfax) was originally part of the massive Rancho La Brea. Most of the Salt Lake Oil Field underlies these neighborhoods in the northwestern portion of the Wilshire CPA, and for many years this area was covered with oil derricks. The La Brea Tar Pits are and were the most visible surface manifestation of the vast below-ground resource.

The Hancock family embarked on the first oil exploration in this area, and in 1900 rancher A.F. Gilmore began doing the same on the piece of the rancho he had acquired. Gilmore owned a relatively small percentage of the rancho land, but he developed it thoroughly; like G. Allan Hancock in Hancock Park, by the 1910s Gilmore saw the value of subdividing and selling off the less productive portions of his land. It soon became clear to Gilmore and his son E.B. Gilmore that housing and commercial development brought in more money than oil production. Between the Hancocks and the A.F. Gilmore Company, by the early 1930s most of the land in the Fairfax neighborhood, north of Wilshire Boulevard, had been subdivided and developed.

In 1934, the Farmers Public Market, operated by Fred Beck and Roger Dahlhjelm at West Third Street and Fairfax Avenue (on land owned by E.B. Gilmore) opened, inviting local farmers to sell their produce out of the backs of their trucks. Soon, the Farmers Public Market became a permanent venue; restaurants, ice cream stands, flower shops, and other retail stores began selling at the market. The Farmers Market still exists in its original location (although it has grown), with an array of food stands and retail shops as ethnically and culturally diverse as the area in which it sits. It is the last remnant of Gilmore commercial and recreational developments that once included a drive-in movie theater, a racetrack, and a stadium.

Like the single-family and multi-family developments in the Mid-Wilshire and Hancock Park neighborhoods, the new neighborhoods of the Beverly-Fairfax area were developed and heavily marketed as discrete subdivisions. They included a high number of multi-family residences, including numerous two-story duplexes and fourplexes, in a variety of Period Revival styles. Most were constructed from the mid-1920s to the early 1930s, though later examples exist; a prominent, unusually intact, and somewhat late example of an apartment house district is Beverly Square, constructed in the 1930s and 1940s as an "ultra-modern" residential development. The Beverly-Fairfax developments were even more automobile-focused than the automobile suburbs further east in the Wilshire CPA, since they were past the outer limit of the Los Angeles Railway's streetcar system.

Where much of west-central Los Angeles did not have a large Jewish American population until after World War II, the Beverly-Fairfax neighborhood had a significant Jewish American presence from its earliest development in the 1920s. For example, research on the residents of the Orange Grove Avenue-Gardner Street area, historically a Jewish enclave, found a diverse Jewish community representative of the overall Beverly-Fairfax area at that time. This

[74] This section has been excerpted and adapted from the "Historic Resources Survey Report: Wilshire Community Plan Area," prepared for the City of Los Angeles by Architectural Resources Group, January 2015.

neighborhood, part of a subdivision developed by G. Allan Hancock, included recent immigrants from outside the U.S., people who had moved from the East Coast, and Angelenos who had moved to the area from other parts of the city (primarily Boyle Heights). It may be that this neighborhood and other known early Jewish residential enclaves in the Beverly-Fairfax area did not see exclusion of Jewish homeowners and renters based on restrictive housing covenants or realtor influence as seen in some other parts of Los Angeles. Permit and census research indicates that a substantial number of properties in these enclaves were built and owned by Jewish individuals, both living on site and renting to tenants. During the postwar period, the Jewish population of Beverly-Fairfax increased substantially, and continued to move westward into neighborhoods like Pico-Robertson. The Beverly-Fairfax neighborhood is still a popular residential area for Jewish families, including members of the Orthodox community who were part of a major movement to the Wilshire CPA starting in the 1980s.

Residential subdivisions in the Fairfax neighborhood were serviced by commercial districts including those along 3rd Street, Beverly Boulevard and Fairfax Avenue. A particularly prominent Jewish business district emerged along North Fairfax Avenue (sometimes referred to as "Kosher Canyon"). Businesses catering to the area's Jewish population began appearing on Fairfax starting in the 1930s, accelerating greatly after World War II. In the postwar years, community centers, neighborhood synagogues, kosher delis, restaurants, and Jewish bakeries were numerous on the street. Several long-time businesses, including Canter's Delicatessen, Schwartz Bakery, and Diamond Bakery, are still in operation. Beverly Boulevard also saw a significant increase in the establishment of Jewish commercial and institutional properties during the postwar period, many of which continue to serve the community today.

4.2 Jewish-American Community[75]

The Depression hit the Jewish community hard, as it did everyone in Los Angeles. Wage earners faced layoffs and businesses went bust. Hellman's pioneer bank was wiped out. Jewish charities did their best to aid the growing number of destitute in the city. By the late 1930s, signs of recovery appeared. Occupationally, Jews showed marked gains among professionals, as the number of doctors, lawyers, accountants, social workers, and teachers rose, along with artists and writers working in the motion picture industry. The Jewish population in Los Angeles nearly doubled during the 1930s. And they increasingly settled in neighborhoods west of downtown, such as the West Adams and Fairfax neighborhoods, which saw rapid Jewish increases, while Hollywood held steady as a solidly Jewish area. By 1940, these neighborhoods west of downtown were more Jewish than Boyle Heights.[76]

An alarming facet of Jewish life in the 1930s was rising anti-Semitism, expressed most fervently in Nazi Germany and less blatantly in Los Angeles. Several fascist groups rose locally during the decade including the Silver Shirts, Friends of New Germany, and German American Bund, which ran an Aryan bookstore. They especially targeted Jews in Hollywood,

[75] This section has been excerpted and adapted from the "Los Angeles Citywide Historic Context Statement: Jewish History," prepared for the City of Los Angeles by GPA Consulting, December 2016.
[76] Vorspan and Gartner, History of the Jews of Los Angeles, 199, 203-205; Allen and Turner, Ethnic Quilt, 49-50, 67; Wilson, "Introduction," 6; Phillips, "Not Quite White," 83-84.

while the anti-Semitic American Nationalist Party blamed Jews for manipulating the country's economy and politics.[77]

Historians Vorspan and Gartner contend that the initial Jewish response in the early 1930s – at the height of the Depression – was withdrawal and "communal paralysis." Yet other sources suggest concerted anti-Nazi activism and Jewish ethnic fortification in the face of rising Nazism and fascism. In 1933, they formed the Jewish Community Committee (later the Community Relations Committee), which hired private investigators to expose local Nazi activity and monitor depictions of Jews in films. That same year, the United Jewish Community was founded, with Rabbi Edgar Magnin as chairman, to focus on fostering Jewish culture in the local community, through attention to kosher food practices, youth groups, and Jewish schools. In Boyle Heights, unionists, activists, writers, and residents worked to strengthen Jewish culture as a means of protecting the Jewish future and fighting rising fascism. The United Jewish Welfare Fund, founded in 1929, focused on both foreign and local philanthropy. Attorneys such as Lester Roth, Isaac Pacht, and Harry Hollzer dominated these groups, signifying their rise as civic leaders, and the declining status of Jewish merchants and manufacturers who were hit hard during the Depression. In 1937, two of these groups were consolidated as the Los Angeles Jewish Community Council (LAJCC). A federation of Jewish service groups, the LAJCC marked a milestone in the consolidation of resources and power among Los Angeles Jews. From 1937 to 1941, the number of affiliated groups in the LAJCC rose from 156 to 350, reflecting rising concern about the Jewish plight in war-torn Europe.[78]

During the postwar years, the Jewish population in Los Angeles surged and diversified. As Karen Wilson summarizes, "Jews became both developers and residents of suburbia, innovators and patrons of high and low culture, and instigators of, and agitators for, social change."[79] The influence of these endeavors spanned from the local to the global.

Jews were part of the postwar population boom that transformed Los Angeles, thrusting it to the forefront of major American cities. The city's Jewish population rose from 130,000 before the war to 315,000 in 1951. In the late 1940s, over 2,000 Jews were arriving each month, representing 13 percent of all immigrants. By the early 1960s, only New York and Tel Aviv housed more Jews than Los Angeles. Many postwar arrivals were former defense plant workers and discharged servicemen, moving from big cities of the East and Midwest. Most were American-born young adults, joined by a small stream of elderly Jews seeking good climate and an easier life in their retirement. After 1945, newcomers came to vastly outnumber the established prewar Jewish population. They were drawn by the casual, informal lifestyle, the sunny climate, booming economy, and possibilities for "new opportunity...not discrimination."[80]

Another notable group of Jewish immigrants were refugees from the war, the "survivors of unbelievable barbarities." Their arrival was aided by the Jewish community's Émigré Service Committee, which worked in concert with several Jewish agencies with funding by the United

Jewish Welfare Fund. In the immediate postwar years, 567 families arrived in Los Angeles with help from these groups, while 10,000 Jewish refugees arrived in total by 1953. While the Jewish community strove to assist them in finding jobs and housing, some also faced unemployment.[81]

Occupationally, Jews as a group experienced upward mobility after 1945. The proportion of Jews employed as professionals and independent businessmen rose substantially, outpacing the general population. By 1959, for example, 25 percent of Jewish heads of household were professionals (such as doctors, attorneys, etc.), and roughly 30 percent were "proprietors, managers, and officials." The numbers of blue-collar workers, in turn, declined. As Vorspan and Gartner conclude, "In simplest terms, they ceased to work for an employer and went into business for themselves."[82] Some of this trend was the result of continued discrimination by large corporations, which excluded Jews from "organization men" positions, a hallmark of postwar American life. Still Jewish Angelenos prospered on their own terms, reflected in their relatively higher income levels than the general population.[83] Among Jewish women who worked outside the home, they concentrated in sales and clerical jobs.[84]

In the postwar years, Jews had a mixed record in terms of social acceptance and status. On the one hand, Jews were widely accepted as suburban residents – a crucial site for upward mobility in postwar America – and they achieved notable economic success. Race restrictions on Jewish residential settlement had mostly disappeared by the late 1940s, and most neighborhoods were open to them. As sociologist Bruce Phillips notes, "Jewish migrants to Los Angeles were making ongoing residential choices" and the city "consistently created more open housing choices, the vast majority of which were open to Jews."[85] On the other hand, a few areas continued to exclude them, including Rolling Hills, San Marino, Rosemead, and parts of Long Beach, where Jews were steered away by realtors or encountered open hostility, such as property defacement. As a result, even as many Jews progressed and moved to the suburbs, they maintained an allegiance to civil rights and forged alliances with other aggrieved minority groups who were not so fortunate.[86]

Residential patterns came to reflect this experience. One was a departure from the old, working-class neighborhoods. In the 1940s, most Jewish residents of Boyle Heights left as large numbers of Mexican American residents moved in. A similar pattern of white flight occurred in the old Central Avenue district, as a growing African American population crowded into this area in the face of rampant exclusion from white suburban neighborhoods. Citywide, Jews were on the move, both away from racially changing neighborhoods and – for new arrivals – toward new housing and employment opportunities that were facilitated by the growing network of freeways.[87]

While dispersal was a crucial aspect of postwar settlement patterns, there were several notable Jewish enclaves between Hollywood and the beach. One was the Fairfax district, between Wilshire and Melrose, settled by Jews in the 1940s and 1950s. The area became a "symbolic

focus" of the Jewish community in the postwar period, anchored by Orthodox synagogues and schools and Jewish oriented shops along Fairfax Avenue. Numerous apartment buildings in the area drew elderly and less affluent Jews. They could walk to the kosher butcher shops, Canter's Deli, the Diamond Bakery, religious book and music stores, newspaper stands selling Russian, Yiddish, and Hebrew papers, and senior service centers. Another hub was two miles south, around the Pico-Robertson intersection. This attracted younger, more affluent families from the Beverlywood and Cheviot Hills neighborhoods. Its kosher meat markets, Jewish day schools, bookstores, and both Orthodox and Conservative synagogues made it another key center of Jewish life.[88]

Donald & John Parkinson

Father-and-son architectural firm, Parkinson & Parkinson, founded by John Parkinson in 1894, was responsible for many of the landmarks in Los Angeles, including the USC campus master plan (1919), Los Angeles Memorial Coliseum (1923/1931), Los Angeles City Hall (with Albert C. Martin and John C. Austin, 1928), Bullock's Wilshire (1929), and later Union Station (1939).

John Parkinson was born in 1861 in Lancashire County, England. He apprenticed to a builder and learned the meaning of craftsmanship and gained a strong knowledge of practical construction. Upon completion of his apprenticeship, he immigrated to North America as an adventure where he built fences in Winnipeg, Manitoba, Canada and learned stair-building in Minneapolis, Minnesota. When he returned to England, he found work hard to come by and decided to return to America. Parkinson traveled to California and first settled in Napa. In 1890, he moved to Seattle, Washington where he opened his first architectural practice. He served as School Board Architect from 1891-1894 and designed numerous schools there. A serious economic depression hit Seattle, so he moved on to Los Angeles in 1895.

Parkinson designed structures to fulfill the needs of that growing city in every conceivable fashion. In 1896 Parkinson designed the first Class "A" fireproof steel-frame office building in Los Angeles, the Homer Laughlin Building at Third Street and Broadway. His design for the 1904 Braly Block at Fourth and Spring Streets became the city's first skyscraper. The 12-story building opened to great acclaim and established Parkinson as the region's leading architect. It held the distinction of being the tallest structure in Los Angeles until the completion of City Hall twenty-four years later.

Parkinson was a key figure in the City Beautiful movement in Southern California, and he influenced civic reform and community planning as a charter member of the Los Angeles Municipal Art Commission, which imposed a building height limit in 1905. Sustained until 1957, it played a significant role in shaping and maintaining the low scale of the city.

In 1905, Parkinson formed a partnership with G. Edwin Bergstrom that lasted ten years. The firm of Parkinson & Bergstrom designed numerous public and private buildings throughout Southern California and designed many of the major office and commercial buildings erected in downtown Los Angeles during this period. Among these were the original Bullock's Department Store (1906), the Pacific Mutual Building (1908), Los Angeles Athletic Club (1911), and the original Broadway Department Store (1913). The firm designed numerous buildings along the city's financial corridor of Spring Street including the Alexandria Hotel (1906), Security Trust and Savings Bank (1907), the Rowan Building (1910), Washington Building (1912), and the Security First National Bank (1915).

Five years after Bergstrom left to establish his own practice, John Parkinson was joined in 1920 by his son Donald B. Parkinson. The relationship between the father and son was highly productive. Together they designed dozens of Los Angeles' most enduring landmarks,

including the original campus master plan for the University of Southern California (1919), the Los Angeles Memorial Coliseum (1923/1931), the Title Insurance Building (1929) in downtown Los Angeles, Bullock's Wilshire (1929), City Hall (1928), and Union Station (1939).

Donald B. Parkinson was a masterful artist formally educated at the Massachusetts Institute of Technology. As their partnership grew the father concentrated on bringing in new business while the son supervised the daily details of the design team. Their extraordinary synergy as architects was highly evident in their designs and the father and son were credited with transforming the city's urban landscape.

John Parkinson died in 1935 while designing the plans for Union Station with his son Donald. Donald and John Parkinson are considered master architects.

Alfred S. Nibecker Jr.[89]

Alfred S. Nibecker Jr. was born 1890 in Spokane, WA. In about 1897-98, the Nibecker family relocated to California and resided in Independence, CA in 1900. By 1908, the Nibeckers lived in Los Angeles. In 1910, he was hired as a draftsman by Mayberry Park Architects. From 1920 to 1921, he was a partner in the firm Montgomery and Nibecker.[90]

Guiding the Los Angeles school districts through rapid expansion in 1920s, disaster and depression during the 1930s, and the great postwar boom through the mid-1950s was district architect and business manager Alfred S. Nibecker, Jr. In the 1920s, Nibecker began private practice in Los Angeles; he joined the Los Angeles City Board of Education as an architect in 1926, where he remained until his retirement in 1955. In his three-decade career with the school district, Nibecker oversaw the construction of, and contributed designs to, hundreds of school plant projects. Many commissions were completed by the district's in-house staff, but many others were handled by a range of the region's best architects and builders, with an increasing number of firms specializing in school design. In addition to his work with the Los Angeles City school districts, Nibecker was a fellow of the American Institute of Architects and served on the National Committee on School House Construction, the National Advisory Council on School Building Problems, run under the auspices of the U.S. Department of the Interior, Office of Education. In 1955, Nibecker was made an honorary member of the Structural Engineers Association of Southern California, the association's highest award. That same year, he retired. Following his retirement, the board appointed Ernst Raymond C. Billerbeck as district architect. Nibecker passed away March 29, 1989 in Pasadena, CA.[91] Nibecker is considered a master architect.

[89] Unless otherwise noted, biography for Alfred S. Nibecker, Jr. is excepted from "Los Angeles Unified School District Historic Context Statement, 1870 to 1969," prepared by Sapphos Environmental for the Los Angeles Unified School District, March 2014.

A.C. Martin & Associates

Albert C. Martin, AIA, was born in La Salle, Illinois, in 1879.[92] He completed his formal education in architecture and engineering at the University of Illinois in 1902. In January of 1904, Martin moved to Los Angeles to work as a superintendent of construction for Carl Leonardt & Company, a major building contractor on the West Coast. A year later he joined the staff of Alfred Rosenheim, FAIA. During Martin's association with Rosenheim, for whom he worked as an engineer, the firm designed the Second Church of Christ Scientist (1905-1910). In 1908, Martin established his own architectural practice. Although he was later recognized for his commercial buildings, during the early part of his career he worked almost exclusively for the Catholic Church. During the 1920s, he designed churches, convents, parish halls, and parochial schools as far north as Fresno and as far east as Arizona. The high point in his career was Los Angeles City Hall (1928), which Martin designed along with two other prominent architects, John C. Austin and John Parkinson.[93] Albert C. Martin, Jr. and John Edward Martin joined their father in the family practice before World War II. The firm had a close relationship with the May Company and designed a number of buildings for them including the iconic May Company building on Wilshire Boulevard (1939) and the Crenshaw Shopping Center (1945, demolished).

When wartime diverted men and materials from the private sector, both Albert C. Martin, Jr. and John Edward Martin joined the war effort, along with most of the firm's drafting and engineering staff. After the war, the influx of returning soldiers into Southern California and the baby boom of the 1950s were boons for A.C. Martin's architectural practice. The firm, alongside commercial developers, responded to the growing demand for single-family housing by proposing a network of shopping centers to support the population sprawl into the suburbs. Opened in 1952, Lakewood Center became one of the first large-scale centers designed with the automobile in mind.

In the late 1950s, the firm began to design space-age research and development laboratories, which would become a significant part of their practice. A.C. Martin, Sr., the firm's patriarch, considered a master architect, died on April 9, 1960. After World War II, he had largely ceded control to A.C. Martin, Jr. and John Edward Martin, and following his death the firm was renamed A.C. Martin and Associates.

The firm's work was featured in a 1962 article in the *Los Angeles Times* which described the development of "think factories" after World War II to foster the aerospace and aviation industries in Southern California.[94] The article described the "special type of architecture" which emerged in the region to meet the "unique needs of the space-age research and development factories," and provide the "ideal environment for the maximum in cerebration."[95] The article names A.C. Martin and Associates as one of the "leading concerns in

[92] A.C. Martin & Associates biography largely adapted and excerpted from Diane Kanner, *AC Martin Partners: One Hundred Years of Architecture* (Los Angeles: AC Martin Partners, Inc., 2006); "A.C. Martin & Associates," Los Angeles Conservancy, https://www.laconservancy.org/architects/c-martin-associates (accessed January 2018).
[93] Teresa Grimes, "Master Architects of Commercial Architecture." Albert C. Martin died in 1960 at the age of 81.
[94] Tom Cameron, "Southland 'Think Factories' Foster Nation's Research," *Los Angeles Times*, March 18, 1962.
[95] "Southland 'Think Factories' Foster Nation's Research."

this field," and notes that they are responsible for "some of the finest examples of 'think factory' trend," designing some five million square feet of research and development facilities in Southern California.[96] These facilities featured "glass-walled office-and-laboratory combinations, more pleasant than anything known before."[97] A notable and early example of the firm's work in this arena was the 1959 Thompson-Ramo-Wooldridge Center in Canoga Park, which was "cited many times…as a prime example of both imaginative and economic planning."[98]

By the end of the 1960s, the firm operated three offices in the Los Angeles area, and diversified its services to include computer-aided design software. The computing and engineering advances of the 1970s, along with the repeal of Los Angeles' longtime height restrictions, changed the landscape of a downtown entering the corporate era. A.C. Martin took the lead during the 1970s and 1980s, a period marked by sleek, self-contained geometric towers, such as ARCO Plaza (1972). A.C. Martin & Associates designed more structures in downtown Los Angeles than any other firm in the years after World War II.

The 1990s brought considerable change to the firm. The commercial real estate bubble of the 1980s burst, and the firm consolidated in response to weak demand for new office space. As more companies continued to leave city centers for suburban business parks, ACMA followed them—to Irvine, Thousand Oaks, Westlake, and beyond. Edward Martin retired from the firm in 1997 and passed away in 2004. Albert C. Martin, Jr. died in 2006 at age 92. Now known as AC Martin, the firm is in its third generation of family leadership, with Christopher C. Martin, FAIA, serving as chairman.

George E. Bergstrom

George Edwin Bergstrom was born in Neenah, Wisconsin in 1876 to Norwegian parents. His father, George O. Bergstrom, was a prominent businessman and political in Neenah Wisconsin. After graduating high school, Bergstrom received a degree in architecture from the Massachusetts Institute of T4echnology (MIT) In 1899 and moved to Los Angeles, CA in 1901.

In 1905, Parkinson formed a partnership with G. Edwin Bergstrom that lasted ten years. The firm of Parkinson & Bergstrom designed numerous public and private buildings throughout Southern California and designed many of the major office and commercial buildings erected in downtown Los Angeles during this period. Among these were the original Bullock's Department Store (1906), the Pacific Mutual Building (1908), Los Angeles Athletic Club (1911), and the original Broadway Department Store (1913). The firm designed numerous buildings along the city's financial corridor of Spring Street including the Alexandria Hotel (1906), Security Trust and Savings Bank (1907), the Rowan Building (1910), Washington Building (1912), and the Security First National Bank (1915).

[96] "Southland 'Think Factories' Foster Nation's Research."
[97] "Southland 'Think Factories' Foster Nation's Research."
[98] "Southland 'Think Factories' Foster Nation's Research."

Five years after Bergstrom left to establish his own practice. From 1915 to 1941, Bergstrom held his offices in Rooms #1127-1129 of the City National Bank Building at 453 South Spring Street. In 1921, Bergstrom founded the Allied Architects Association, which was a coalition of Los Angeles-based architects to design public buildings. Some of the buildings designed by the group included the Los Angeles County-USC Medical Center (1933), Bob Hope Patriotic Hall (1925), and the Los Angeles Hall of Justice (1925). From 1926-1938, Bergstrom served as the AIA's treasurer, and served two terms as AIA president from 1939-1941. In 1941, Bergstrom was instrumental in bringing the AIA National Convention to California, held at Yosemite National Park and Los Angeles. In 1940, he moved to the East Coast to design and supervise the construction of the pentagon. In 1942, Bergstrom resigned as Chief Architect and was taken over by Whitman. He moved to the County of Orange in the later part of his life and passed away in Claremont, CA in 1955.

6.0 SIGNIFICANCE EVALUATION

This evaluation utilizes the framework for historic resource assessments described in the *Los Angeles Unified School District Historic Context Statement* (historic context statement), which "defines themes of significance, eligibility standards, and related property types. Properties sharing a theme of significance are then assessed consistently, in comparison with resources that share similar physical characteristics and historical associations."[99]

In addition to each of the applicable federal, state, and local designation criteria, several evaluation frameworks and their associated eligibility standards and integrity thresholds were identified and applied to this evaluation. These evaluation frameworks relate specifically to the themes of *Pre–1933 Long Beach Earthquake School Plants, 1910-1932*; and *Educating the Baby Boom: The Postwar Modern, Functionalist School Plant, 1945-1969*. These themes were used to analyze buildings on the campus, which primarily were built or substantially altered during these periods. Buildings at Fairfax High School were evaluated using these frameworks for potential eligibility both individually and as contributors to a potential historic district. Additionally, the school was evaluated using the *LAUSD and the Civil Rights Movement, 1954-1980* context theme. Finally, campus buildings that date to the 1920s were evaluated using the *Spanish Colonial* context theme, and buildings that date to the 1960s were evaluated using the *Late Modern* context theme.

Buildings that were found to be potentially eligible for listing in federal, state, or local registers were carried forward for an integrity analysis, which is included in Section 7, to determine if the building retains sufficient integrity to convey its significance.

6.1 Framework for Evaluation

Pre-1933 Long Beach Earthquake School Plants, 1910-1932[100]

Property Type: Institutional/Education
Property Subtypes: Elementary, Junior High Schools, and High School Buildings and Campuses
Period of Significance: 1910 to 1933
Area of Significance: Education
Geographic Location: Citywide
Area of Significance: A/1

Eligibility Standards:

- Embodies LAUSD school planning and design ideals and principles of the era
- One of few remaining schools from the pre–1933 Long Beach earthquake era that was not substantially altered or remodeled

[99] Sapphos Environmental, Inc., *LAUSD Historic Context Statement,* 4.
[100] Sapphos Environmental, Inc., *LAUSD Historic Context Statement,* 135-136.

- Retains most of the associative and character-defining features from the period of significance

Character-Defining Features | Buildings/Structures:

- Articulated buildings plans, facilitating the creation of outdoor spaces (often T-shaped, E-shaped, U-shaped, and H-shaped plans)
- Generally low massing, usually one to two stories (with two to three stories more common for middle and senior high schools)
- Includes designed outdoor spaces, such as courtyards and patios, adjacent to classroom wings
- Exteriors usually lined with rows of grouped windows, including wood-framed multilight windows; expanses of windows often mark the location of classrooms
- Designed in popular period-revival styles of the era (including Spanish Colonial Revival, Renaissance Revival, Mediterranean Revival, and Collegiate Gothic)
- Often designed by prominent architects of the era

Character-Defining Features | Campus/District:

- Emphasis on a more spread-out site plan, with designed outdoor spaces
- More varied collection of buildings, differentiated by function and use (rather than a single building with all functions inside)
- Might include an elaborate administration building, usually the focal point of the campus, as well as classroom wings, auditoriums, gymnasiums, and outdoor recreation areas
- Middle or senior high schools might include a gymnasium designed in the style of the campus overall

Integrity Considerations:

- Most pre-1933 schools were substantially remodeled following the Long Beach earthquake
- Designed outdoor spaces, such as courtyards and patios, should be intact in use, if not with landscape design and hardscaping; development pressures over the years often resulted in these open spaces being in-filled with new construction; overall sense of relationship of building to designed outdoor spaces should be intact
- Should retain integrity of Materials, Design, Workmanship, Feeling, and Association from its period of significance
- Intact campus groupings from a single period of time are not common
- Some materials and features may have been removed or altered
- Modern lighting and fencing of site acceptable

Comments:

Schools from this period generally include additional buildings and structures added after the period of significance (in particular after World War II), which may be non-contributing. Eligible properties under this theme may be a single building (generally the Administration

Building, in combination with a classroom wings) or a grouping (campus) of buildings constructed during the period of significance. Buildings and campuses exhibiting distinctive design features might also qualify under Criteria C/3, as the embodiment of the distinctive characteristics of a type, period, region, or method of construction, an excellent example of the work of a master architect, or for high artistic values.

Educating the Baby Boom: The Postwar Modern, Functionalist School Plant, 1945-1969[101]

Property Type: Institutional/Education
Property Subtypes: Elementary, Junior High Schools, and High School Buildings and Campuses
Period of Significance: 1945 to 1969
Area of Significance: Education
Geographic Location: Citywide, with concentrations in the San Fernando Valley and West Los Angeles
Area of Significance: A/1

Eligibility Standards

- Clearly embodies the characteristics of a postwar modern functionalist school campus
- Displays a unified, functional site design, with buildings extending across the site and oriented in relation to outdoor spaces (courtyards, patios, outdoor play areas)
- One-story massing for elementary schools; up to two-stories for junior/high schools
- Classrooms, in detailing and plans, clearly express their function, with axial, fingerlike wings, plentiful fenestration, and connections to the outdoors
- Retains most of the associative and character-defining features from the period of significance

Character-Defining Features – Buildings/Structures

- Building plans and site design clearly express their function; classroom wings often exhibit one story "finger-like" wings, arranged on an axis
- Easily identifiable indoor-outdoor spaces, connections to classrooms through the incorporation of patios, courtyards, and outdoor canopied corridors
- One-story massing, particularly for elementary schools; up to two to three stories for junior and high schools
- Building types and plans expressive of postwar ideals in school design; these can include (1) finger-plan schools (usually in 1940s through 1950s); (2) cluster-plan schools (beginning in 1950s); and (3) variations and combinations of these typologies clearly expressive of the ideals for informality, indoor-outdoor connections, and zoned planning for the site
- Varying elevations might display differentiated window sizes and configurations, in order to tailor interior light to sun patterns and create cross-lit classrooms

[101] Sapphos Environmental, Inc., *LAUSD Historic Context Statement,* 141-143.

Character-Defining Features – Campus/District

- Unified campus design includes most or all of the following attributes: lack of formality and monumentality; low massing (usually one stories for classrooms and up to two stories for auditoriums/multipurpose rooms); strong geometric ordering of buildings and outdoor spaces; decentralized, pavilion-like layout; rational, function driven site design; buildings extend across the site; buildings are oriented to outdoor spaces (courtyards, patios, outdoor areas), purposeful indoor-outdoor integration
- Automobile traffic/drop-off areas separated from campus; linked to interior via extended canopied corridors
- Buildings often turn inward, toward green spaces and courtyards, lawns
- Outdoor corridors, sheltered beneath simple canopies, forming links between the buildings of the campus
- Classrooms often consist of a series of axial, modular units
- Swaths of patios, terraces, and plantings adjacent to and alternating with buildings
- Generous expanses of windows, including steel- and wood-framed multi-light windows, in awning and hopper casements, clerestories, and fixed panes
- Flat roof or broken-plane roof often used for lighting and acoustical issues
- Modular design, with a rhythmic, asymmetrical but balanced composition
- Usually displays a modern design idiom, usually either regional modernist (with use of native materials such as stone, brick, and wood siding and/or framing), International Style modernist, or, by the early 1960s, Late Modern (more expressive and sculptural)
- Some examples might include some degree of historicist detailing or styles popular in the postwar period (such as American Colonial Revival); these are less common than modernist examples
- May have been designed by a prominent architect of the period
- Often associated with post–World War II suburbanization and growth near major employment centers beyond the city periphery (such as the San Fernando Valley and southwest Los Angeles)
- Often built in residential neighborhoods on large expanses of land, with swaths of land devoted to landscape design and playing fields (in particular for high school campuses)

Integrity Considerations

- Retains most of the essential physical features from the period of significance
- School expansion and new construction over the years, in particular in the postwar period, might have resulted in the addition of in-fill buildings and structures in areas that were originally designed open spaces (such new additions should not interfere with or serve as a visual impairment to the designed connections between buildings, in particular classroom wings, and adjacent outdoor patios and spaces)
- Many postwar schools were designed to be easily expandable as enrollment increased; the original site design and building types and plans should be readily discernible. If

additional wings were added or the campus extended, the additions should be compatible with and visually subordinate to the original

- Some materials may have been removed or altered
- Modern lighting and fencing of site acceptable
- Should retain integrity of setting, materials, design, workmanship, feeling, and association from its period of significance
- Addition of portable or permanent buildings after the period of significance acceptable as long as original campus design is intact

Comments:

This theme would most often apply to a campus evaluated as a historic district. Individual buildings and/or campuses exhibiting distinctive design features might also qualify under Criteria C/3, as the embodiment of the distinctive characteristics of a type/period or method of construction, as an example of the work of a master architect, or for high artistic values.

LAUSD and the Civil Rights Movement, 1954-1980[102]

Property Type: Institutional/Educational
Property Subtypes: Elementary Schools, Junior High Schools, and High Schools Period of Significance: 1954 to 1980
Area of Significance: Education/Ethnic Heritage
Geographic Location: Citywide
Area of Significance: A/1 and/or B/2

Eligibility Standards:

- Was constructed during the theme of significance
- Was the site of significant integration initiatives, challenges, or activities related to the Civil Rights Movement and school integration
- Directly reflects the movement for equal access to schools and/or to employment opportunities in LAUSD schools
- Has a well-established, long-term association with a figure who was significant in the Civil Rights Movement and school integration (eligibility under B/2)

Character-Defining Features:

- Retains most of the associative and character-defining features from the period of significance Integrity Considerations:
- Retains integrity of Location, Design, Setting, Feeling, Association
- Some materials may have been removed or altered
- If there are multiple buildings on campus constructed during the period of significance, these should be evaluated as a potential historic district

[102] Sapphos Environmental, Inc., *LAUSD Historic Context Statement,* 144.

Mission Revival and Spanish Colonial Revival[103]

Beginning with efforts to restore California's missions in the late nineteenth century, Southern Californian architects began looking toward regional history for stylistic cues. The region's climate and Hispanic heritage figured prominently in these new directions. The Mission Revival vocabulary, most popular between 1890 and 1920, drew inspiration from Southwestern missions. Identifying features include curved parapets and red tiled, low-pitched roofs. Arches were used liberally, and wall surfaces commonly displayed smooth stucco.

The Spanish Colonial Revival flourished between 1915 and 1940, reaching its apex during the 1920s and 1930s. This movement was catalyzed by architect Bertram Goodhue's 1915 designs for Panama-California Exposition in San Diego. The Spanish Colonial Revival style became one of the most popular idioms for a range of building types. Architects and builders embraced the style, which was employed for many LAUSD schools. The rise in popularity of the Spanish Colonial Revival style also coincided with the move toward more child-scaled schools, with lower massing and open, expansive campuses. With its emphasis on arcaded corridors and patios, the style fit this movement particularly well.

Spanish Colonial Revival buildings tend to be asymmetrical and sheathed with smooth stucco. Roofs generally consist of gabled, gabled and flat, and (less commonly) hipped roofs, clad in red clay tiles. Arched openings, whether for windows, doors, or gates, are a textbook feature. Secondary materials—including wood, wrought iron, and polychromatic tile— provide decorative accents. Windows are generally wood framed or metal, with molded wood surrounds or lintels.

Typical Character-Defining Features:

- Stucco-clad walls (usually smooth finish); occasionally might have brick or cast stone
- Asymmetrical design
- Use of towers, turrets, or cupolas
- Low-pitched gabled or hipped roof covered in red clay tiles or flat roof with parapet wall
- Shallow eaves or deeper eaves, lined with exposed carved wood brackets
- Arched openings for windows, doors, and use of arcades
- Secondary materials can include wrought iron, polychromatic tile, and cast stone
- Exterior patios and courtyards

Late Modernism[104]

Late Modern is a blanket term used to describe the evolution of Modern architecture from the mid-1950s through the 1970s. It is typically applied to commercial and institutional buildings. Unlike the straightforward, functionalist simplicity of International Style and Mid-century Modernism, Late Modern buildings exhibit a more deliberate sculptural quality with bold geometric volumes, uniform surfaces such as glass skin or concrete, and a sometimes-

[103] Sapphos Environmental, Inc., *LAUSD Historic Context Statement,* 119.
[104] Architectural Resources Group and Historic Resources Group, *Santa Monica Citywide Historic Context Statement,* prepared for the City of Santa Monica, 2017.

exaggerated expression of structure and systems. Significant architects who produced works in the style include Marcel Breuer, Philip Johnson, Cesar Pelli, Piano and Rogers, and John Portman.

Typical Character-Defining Features:

- Bold geometric volumes
- Large expanses of unrelieved wall surfaces
- Uniform use of cladding materials including glass, concrete, or masonry veneer
- Exaggerated expression of structure and systems
- Hooded or deeply set windows
- Little or no applied ornament

6.2 Individual Assessment

The buildings and features of the Fairfax High School campus have been considered for their potential individual eligibility for listing in the National Register, California Register, and/or designation as a City of Los Angeles HCM using applicable federal, State, and local designation criteria and context themes from the *Los Angeles Unified School District Historic Context Statement* (historic context statement). As a result, two (2) buildings on the Fairfax High School campus, the Auditorium Building and the Administration and Classroom Building, appear individually eligible for listing in the State and local registers.

Auditorium Building

Criterion 1/1

Constructed in 1924, the Auditorium Building is associated with the *Pre-1933 Long Beach Earthquake School Plants* context theme of the historic context statement. As outlined in the context theme, the Auditorium Building is a rare pre-1933 building that was designed in a popular period-revival style of the period, the Spanish Colonial Revival style, and designed by prominent architects of the era, Parkinson & Parkinson. At the time of its construction, Fairfax High School was developed as part of a school district expansion program, and brought many new residents to the Fairfax area, who sought to take advantage of the new school. The school's early founding was also associated with the establishment of the Jewish community in the area. This was partially due to the lack of restrictive housing covenants in the area, and the Fairfax-Beverly area increasingly became associated with Fairfax High School. The school became the first public educational school on the West Coast to teach Modern Hebrew and continued to be a majority-Jewish school into the 1960s. Although the building's east and west wings were removed for seismic stability in the 1960s, the Auditorium Building retains sufficient character-defining features to reflect its significance at the State and local level as a rare pre-1933 building that reflects the design ideals of its era.

The Auditorium Building appears individually eligible for listing in the California Register and for designation as a City of Los Angeles HCM under Criterion 1/1 as a pre-1933 school associated with the establishment and growth of the Jewish community in Beverly-Fairfax, with a period of significance of 1924, when the building was constructed. Due to integrity considerations, the building does not appear eligible for listing in the National Register.

Criterion 2/2

No information was found to suggest that the Auditorium Building was associated with any historic personages, nor that any other individuals of historic significance were associated with the building. Therefore, the Auditorium Building does not appear eligible for individual listing under Criterion 2/2.

Criterion 3/3

The Auditorium Building is associated with the *Mission Revival and Spanish Colonial Revival* context theme of the historic context statement. The Auditorium Building was designed in the Spanish Colonial Revival style by master architects Parkinson & Parkinson in 1924, during the apex of the style's popularity. Correlating with character-defining features identified in the

context theme, the building has stucco-clad walls; low-pitched gable roof with red clay tiles; shallow eaves; arched openings; and polychromatic tile. Additional character-defining features of the building that reflect this style include its rotunda with Roman lattice; stylized pilasters; stenciled wood trusses, rafters, and purlins; and wrought iron balustrade, among other features. Moreover, Parkinson & Parkinson are considered master architects, known for their work on institutional and municipal buildings throughout Southern California. The exceptional design and workmanship of the Auditorium Building is expressed from its overall design to its small details.

The Auditorium Building appears individually eligible for listing in the California Register and for designation as a City of Los Angeles HCM under Criterion 3/3 as an excellent example of the Spanish Colonial Revival institutional building designed by master architects Parkinson & Parkinson, with a period of significance of 1924, when the building was constructed. Due to integrity considerations, the building does not appear eligible for listing in the National Register.

Administration and Classroom Building

Criterion 1/1

The Administration and Classroom Building at Fairfax High School is significant as the location of Project 10, a groundbreaking program designed for LGBT students in public school. Project 10 was started in 1984 by Dr. Virginia Uribe, a science teacher and counselor, as a dropout prevention program to help LGBT high school students access support services and education. Project 10 was located out of Dr. Uribe's science classroom on the third floor of the building. It the first program of its kind and, despite some backlash from members in the community, expanded to additional schools in the Los Angeles Unified School District as well as other school districts, including Santa Monica-Malibu and San Francisco. Project 10 was also the inspiration behind the FAIR Education Act, which is committed to portraying the cultural and racial diversity of American society accurately and equitably. As the home of Project 10 and the LGTB rights movement in the Los Angeles Unified School District, and subsequently other schools, Fairfax High School is an institution that played a significant role in the civil rights and social life of the LGBT Community.

The Administration and Classroom Building appears individually eligible for listing in the California Register and for designation as a City of Los Angeles HCM under Criterion 1/1 for its association with Project 10 and LGBT social history, with a period of significance of 1984, when Project 10 was founded.[105] Because the building's period of significance is not yet 50 years of age, it does not appear eligible for listing in the National Register.[106]

[105] Although this period of significance is less than 50 years old, the school appears eligible for listing in the California Register as sufficient time has passed to understand the school's historical importance within the greater LGBT social history in Los Angeles. For additional information see: Office of Historic Preservation Department of Parks and Recreation, "Technical Assistance Series #6 California and National Register: A Comparison," 3.

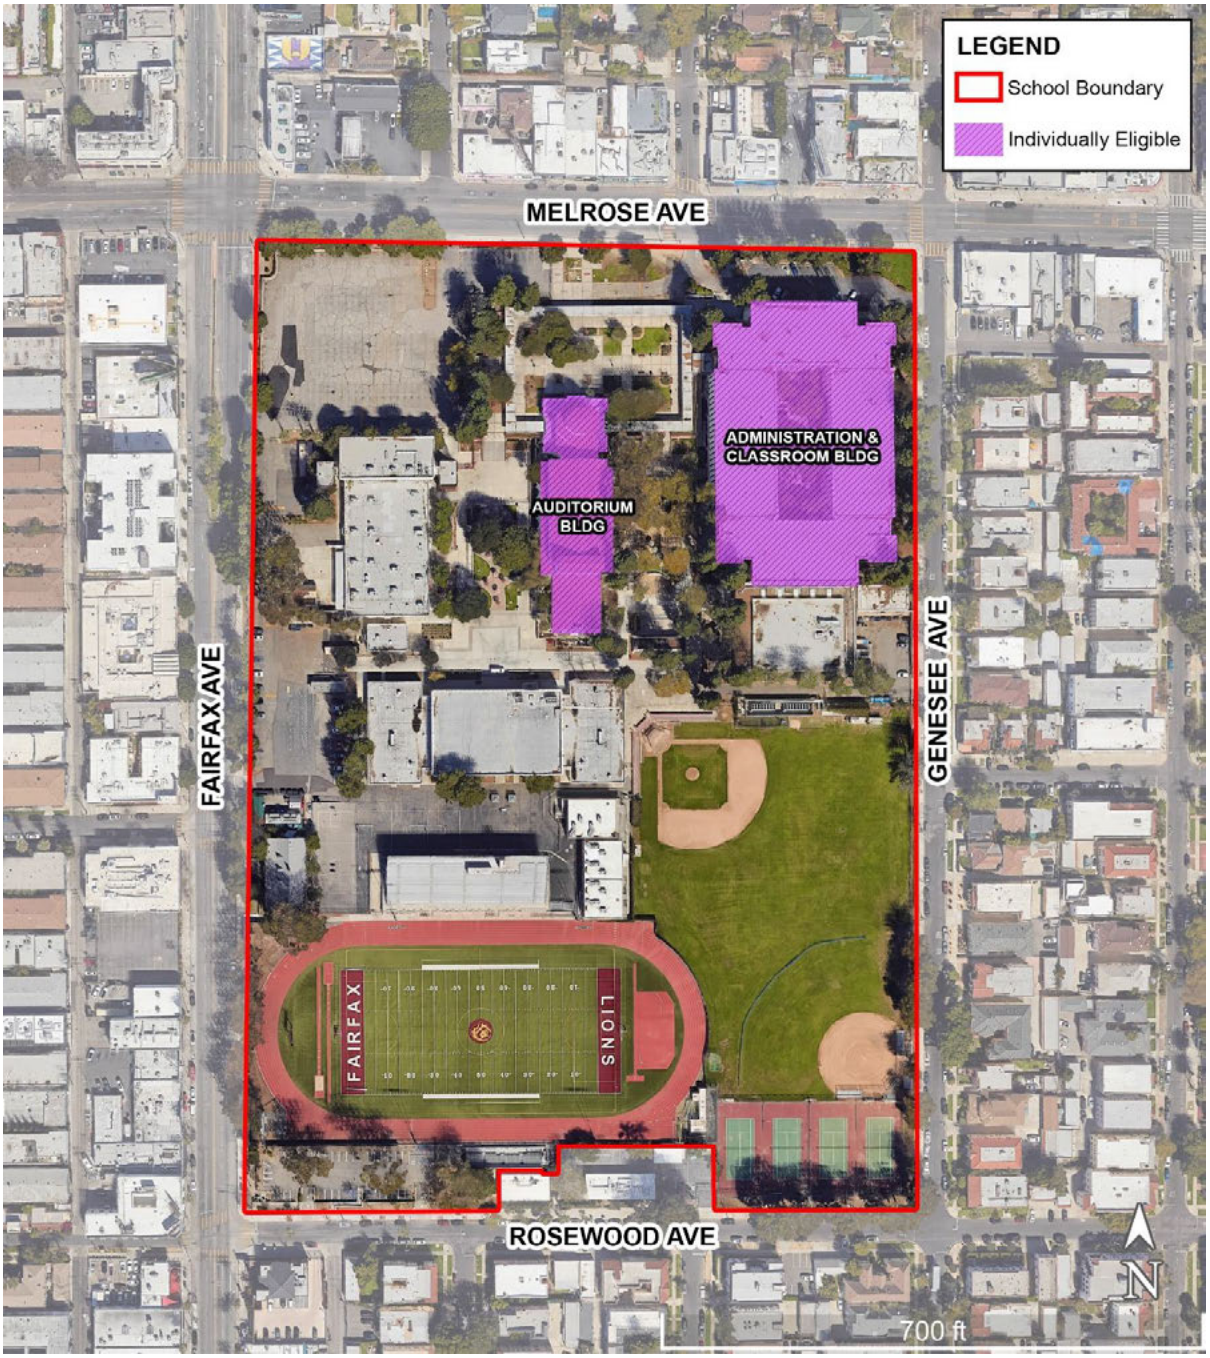
[106] Information did not imply that the building is eligible for listing on the National Register under Criterion G.

Criterion 2/2

The Administration and Classroom Building at Fairfax High School is significant for its association with Dr. Virginia Uribe, who founded Project 10 in the building. Dr. Virginia Uribe played a significant role in the LGBT movement for high school students. Dr. Uribe began teaching at Fairfax High School in 1959, while hiding her sexual orientation, as being gay or lesbian was grounds for dismissal. Dr. Uribe founded Project 10 in 1984, a dropout prevention program and LGBT support services organization to provide a safe space for LGBT students. After the program expanded to other schools, Project 10 received negative backlash, but Dr. Uribe continued her work, and in 1986, she founded the nationwide non-profit, Friends of Project 10, Inc. to offer supportive services to LGBT youth, educators, parents, and community members. Through her career, she wrote various papers about LGBT education and received numerous awards and honors for her work as an LGBT liberation and rights activist. Due to Dr. Uribe's work, most LAUSD schools now have supportive services for LGBT youth. Dr. Uribe taught in the Los Angeles Unified School District for 42 years and her legacy has impacted state laws and continues to provide support for LGBT students beyond the Los Angeles Unified School District.

The Administration and Classroom Building appears individually eligible for listing in the California Register and for designation as a City of Los Angeles HCM under Criterion 2/2 for its association with Dr. Virginia Uribe, with a period of significance of 1984, when Project 10 was founded.[107] Because the building's period of significance is not yet 50 years of age, it does not appear eligible for listing in the National Register.[108]

Criterion 3/3



The Administration and Classroom Building was designed by the architectural firm of Albert C. Martin & Associates in 1968 as part of a larger campus-wide redesign effort. As such, the architectural design of the Administration and Classroom Building is better evaluated as part of a larger potential historic district. This evaluation is included below in Section 6.3.

Table 2: Individually Eligible Buildings

Current Feature Name	Year Built	Integrity	Criteria	Period of Significance
Auditorium Building	1924	Fair	1/1 3/3	1924
Administration and Classroom Building	1968	Good	1/1 2/2	1984

[107] Although this period of significance is less than 50 years old, the school appears eligible for listing in the California Register as sufficient time has passed to understand the school's historical importance within the greater LGBT social history in Los Angeles. For additional information see: Office of Historic Preservation Department of Parks and Recreation, "Technical Assistance Series #6 California and National Register: A Comparison," 3.
[108] Information did not imply that the building is eligible for listing in the National Register under Criterion G.

Figure 3. Map of Individually Eligible Buildings at Fairfax High School

6.3 Historic District Assessment

The National Park Service defines a *historic district* as "a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development."[109] Additionally, school campuses are noted as a potential example of a historic district. School campuses in the United States, especially those built in the 20th century often have definable spaces and unified site plans that were constructed as institutional complexes for educational purposes. The combination of space and purpose reflects individual school buildings' interconnectedness and functionality as a larger grouping.

Because the Fairfax High School campus contains a grouping of related buildings and features and was originally developed as a high school, consideration of this property as a potential historic district is an appropriate analytical framework for its evaluation.[110]

Potential Historic District

The buildings and features of the Fairfax High School campus have been considered collectively for their potential eligibility for listing in the National Register, California Register, and/or for designation as a City of Los Angeles HCM.

As a result, HRG identified a potential historic district on the campus, that consists of nine (9) contributing buildings, two (2) contributing structures, and three (3) contributing site features with a period of significance of 1967 to 1969. Contributors to the potential historic district are the Auditorium Building, Social Hall, Administration and Classroom Building, Cafeteria Building, Transformer (Stage/Utility Building), Gymnasium Building, Ticket Booth, Utility Building, Shop Building, Arcades #1 and #2, and Courtyards #1, #2, and #3.

Criterion A/1/1

Fairfax High School had a largely white, Jewish population from the 1920s until its boundaries were redrawn in the 1960s. In late 1968, following community activism regarding inequality and segregation at the Fairfax and Los Angeles High Schools, Fairfax High School was one of the first schools to have its district redrawn to encourage desegregation. Championed by local parents of the Neighbors Unlimited group, the impetus behind the school board's decision to redraw school lines was a grass-roots effort led by families of students. As noted within the historic context statement's theme *LAUSD and the Civil Rights Movement, 1954-1980*, the initial period of school desegregation in the district was an era "of intense debate and activism on the part of community members, parents, politicians, and jurists, as well as teachers and administrators." Fairfax High School is a notable example of community activism, and the site of major initiatives for desegregation.

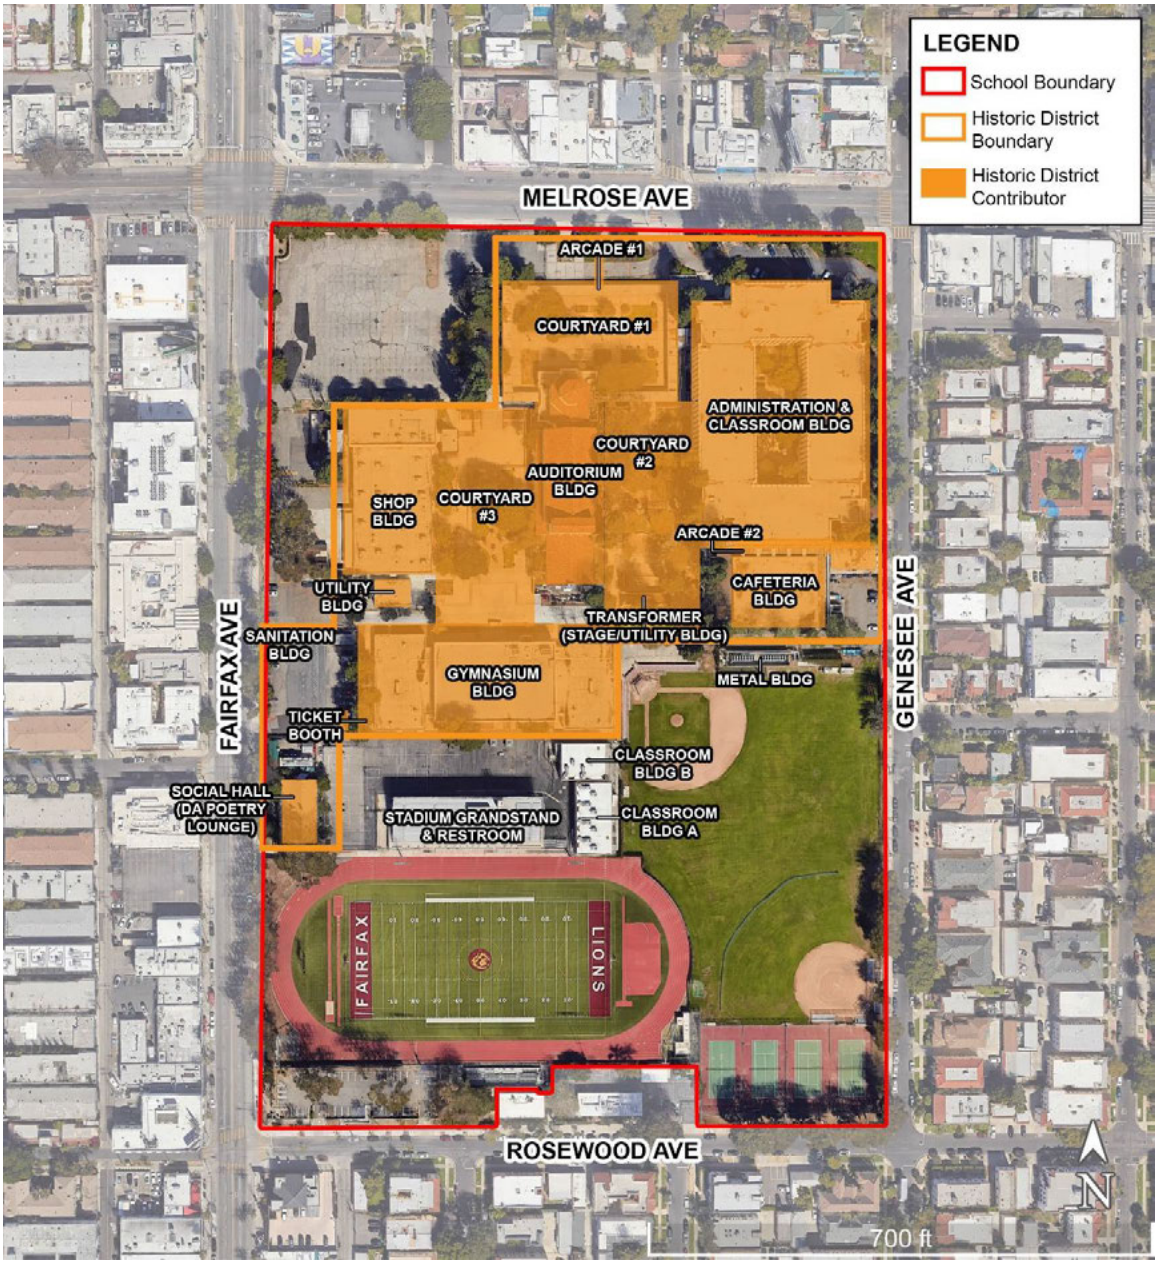
Fairfax High School appears eligible for listing as a potential historic district in the National Register, California Register, and for designation as a City of Los Angeles HCM under Criterion A/1/1 for its association with the desegregation of schools, with a period of

[109] *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation.* Washington D.C.: National Park Service, U. S. Department of the Interior, 1997. (5)
[110] Ibid.

significance of 1967, when community activism demanded the school district redraw school boundaries, to 1969, the first year with new desegregated boundaries.

Criterion B/2/2

No information was found to suggest that the potential historic district was associated with any historic personages, nor that any other individuals of historic significance were associated with the district. Although Dr. Virginia Uribe was a significant professor and founder of Project 10 at Fairfax High School, her significance is best represented for its association with the individually eligible Administration and Classroom Building, where Project 10 meetings were held, rather than the larger historic district. Therefore, the potential historic district does not appear eligible for listing in the National Register, California Register, and for designation as a City of Los Angeles HCM under Criterion B/2/2.



Criterion C/3/3

Fairfax High School was redesigned in the 1960s by the architectural firm of A. C. Martin & Associates. The campus redesign was completed in the Late Modern style of architecture and constructed between 1967 and 1969. The campus redesign included buildings as well as designed landscaping and hardscaping features, such as central courtyards with raised concrete planters, stairs, and arcades. Buildings designed by the firm of Albert C. Martin & Associates during this period are not excellent or distinctive examples of a style and are not notable examples of work within the firm's greater oeuvre. These buildings are intact but otherwise not distinguishable examples of the Late Modern style of architecture. Therefore, the potential historic district does not appear eligible for listing in the National Register, California Register, or for designation as a City of Los Angeles HCM under Criterion C/3/3 for architecture.

Table 3: Historic District Contributors

Current Feature Name	Year Built	Integrity	Criteria	Period of Significance	Contributing Level
Auditorium Building	1924	Fair	A/1/1	1967-1969	Primary
Social Hall (Da Poetry Lounge)	1942	Fair	A/1/1	1967-1969	Secondary
Courtyard #1	1968	Good	A/1/1	1967-1969	Tertiary
Arcade #1	1968	Good	A/1/1	1967-1969	Tertiary
Administration and Classroom Building	1968	Good	A/1/1	1967-1969	Primary
Courtyard #2	1968	Good	A/1/1	1967-1969	Tertiary
Arcade #2	1968	Good	A/1/1	1967-1969	Tertiary
Cafeteria Building	1968	Fair	A/1/1	1967-1969	Secondary
Transformer (Stage/Utility Building)	1968	Good	A/1/1	1967-1969	Tertiary
Courtyard #3	1968	Good	A/1/1	1967-1969	Tertiary
Gymnasium Building	1969	Good	A/1/1	1967-1969	Secondary
Ticket Booth	1969	Good	A/1/1	1967-1969	Tertiary
Utility Building	1969	Good	A/1/1	1967-1969	Tertiary
Shop Building	1969	Good	A/1/1	1967-1969	Secondary

Figure 4. Map of Potential Historic District at Fairfax High School

7.0 Historic Integrity

Historic integrity is the ability of a property to convey its significance. It is defined as the "authenticity of a property's historic identity, evidenced by the survival of physical characteristics that existed during the property's historic period."[111] The National Park Service defines seven aspects of integrity: location, design, setting, materials, workmanship, feeling, and association.

Assessment of Integrity

Auditorium Building

- **Location:** The Auditorium Building remains in its original location on the campus. Therefore, it retains integrity of *location*.
- **Design:** The Auditorium Building retains many of its character-defining features from the time of its erection in 1924. Designed in the Spanish Colonial Revival style by Parkinson & Parkinson, the building is highly intact with a tiered, octagonal rotunda connected to the main auditorium. Features include clay barrel tile roofing, glazed ceramic tile, Corinthian colonettes, arches, and trussed ceiling. Despite some alterations, including the removal of two wings, the extant Auditorium Building retains a majority of the essential physical features reflecting its original design. However, the east and west wings of the building were both demolished in the 1960s, altering the integrity of design. Therefore, the integrity of *design* has been compromised.
- **Setting:** The Auditorium Building is located in the central region of the school property. Although additional buildings have been added to the campus since the time of its erection, the property continues to function as a public high school. Therefore, it retains integrity of *setting*.
- **Materials:** The Auditorium Building retains most of its original materials. Original materials include the building's expressed board formed concrete construction, clay tiles roofs, glazed tile decoration, wood sash casement windows, wrought iron balustrades, and stenciled wood trusses, rafters, and purlins, among others. Although the east and west wings of the building were demolished in the 1960s, the building's material components are still thoroughly expressed in the extant construction. Therefore, it retains integrity of *materials*.
- **Workmanship:** The Auditorium Building retains the physical evidence of crafts of a particular culture or people during a given period in history. This includes the building's specific octagonal and concrete construction, choice of a period-revival style of architecture popular at the time (Spanish Colonial Revival), and use of other accessible materials such as wood beams for the ceiling. Moreover, most exterior cladding and even detail work have been retained. The building continues to retain substantial physical evidence of period construction techniques, including finishes and design elements, such as the use of arcades and a truss ceiling, that reflect the character and identity of the building. Therefore, it retains integrity of *workmanship*.

[111] United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, pages 7 and 8.

- **Feeling:** The Auditorium Building retains most of the character-defining features of its original construction, including a central rotunda, large auditorium, and extensive ornamentation. Because it retains all the preceding aspects, it continues to express the aesthetic or historic sense of a 1924 Spanish Colonial Revival school building. Therefore, it retains integrity of *feeling*.
- **Association:** Association is the direct link between an important historic event or person and a historic property. Because the Auditorium Building retains integrity of *location, setting, materials, workmanship,* and *feeling,* it continues to convey its direct link to 1920s Spanish Colonial Revival style institutional architecture by noted architects Parkinson & Parkinson. Therefore, it retains integrity of *association*.

Administration and Classroom Building

- **Location:** The Administration and Classroom Building remains in its original location on the campus. Therefore, it retains integrity of *location*.
- **Design:** The Administration and Classroom Building retains many of its character-defining features from the time of its erection in 1967-1968. Designed in the Late Modern style, the building continues to reflect its original design with its central courtyard, simple massing, and symmetrical composition. The building features large volumes, semi-elliptical arches, central courtyard, and rounded corners that reflect the Late Modern design aesthetic. Despite some alterations, the Administration and Classroom Building retains a majority of the essential physical features reflecting its original design. Therefore, it retains integrity of *design*.
- **Setting:** The Administration and Classroom Building is located in the northeastern region of the school property. Although additional buildings have been added to the campus since the time of its erection, the property continues to function as a public high school. Therefore, it retains integrity of *setting*.
- **Materials:** The Administration and Classroom Building retains most of its original materials. Original materials include the building's concrete construction, metal windows, and glazed tile. Although some features have been replaced over time, such as storefront doors, the building continues to express its original materials. Therefore, it retains integrity of *materials*.
- **Workmanship:** The Administration and Classroom Building retains the physical evidence of crafts of a particular culture or people during a given period in history. This includes the building's specific Late Modern design with the use of large volumes and specific materials popular at the time, such as concrete and expanses of windows. The treatment of concrete also reflects workmanship of the time; concrete is scored and board-formed, two methods that accentuate the use of this material. These features reflect the character and identity of the building. Therefore, it retains integrity of *workmanship*.
- **Feeling:** The Administration and Classroom Building retains most of the character-defining features of its original construction, including its large volumes, semi-elliptical arches, and open, central courtyard. Because it retains all the preceding aspects, it continues to express the aesthetic or historic sense of a Late Modern 1960s school building. Therefore, it retains integrity of *feeling*.

- **Association:** Association is the direct link between an important historic event or person and a historic property. Because the Administration and Classroom Building retains integrity of *location, design, setting, materials, workmanship,* and *feeling,* it continues to convey its direct link to 1960s Late Modern style of architecture. Therefore, it retains integrity of *association*.

Potential Historic District

Fairfax High School contains a cohesive concentration of nine contributing buildings, two contributing structures, and three contributing site features that dates from the period of significance and has been identified as the potential historic district. Integrity of the property's individual buildings is varied, and all buildings and features have been subject to varying levels of alteration. However, despite some degree of alteration, the district retains much of the spatial relationships established during the period of significance that characterize the potential historic district as a whole. A detailed assessment of the integrity of the potential historic district is discussed below.

- **Location:** The buildings constructed during the period of significance remain in their original locations in the campus. Therefore, the campus retains integrity of *location*.
- **Design:** The campus retains the buildings, arcades, and courtyards that were extant during the desegregation of the school. These include the Auditorium Building, Social Hall, Administration and Classroom Building, Cafeteria Building, Transformer (Stage/Utility Building), Gymnasium Building, Ticket Booth, Utility Building, Shop Building, Arcades #1 and #2, and Courtyards #1, #2, and #3. These buildings/structures/features retain most of their character-defining features. Despite some alterations, a majority of the essential physical features reflecting the original design and organization of the property as a school remain intact within the potential historic district. Therefore, the campus retains integrity of *design*.
- **Setting:** The potential historic district is located in the central region of the school property. The property continues to function as a public high school. The surrounding area of the Beverly-Fairfax neighborhood has a whole has experienced some development but remains a commercial and residential area. Therefore, the campus retains integrity of *setting*.
- **Materials:** The potential historic district retains most of its original materials. Contributors typically retain some physical elements from the period of significance, including original concrete panel exteriors, glazed tiles, and some original windows and doors. Therefore, the campus retains integrity of *materials*.
- **Workmanship:** The potential historic district retains the physical evidence of crafts of a particular culture or people during a given period in history. This includes the contributors' construction methods and design choices, such as the wood trusses in the Administration Building and later large volumes and design features that reflect the Late Modern style of architecture. Moreover, most exterior cladding and even detail work have been retained. Overall, the buildings continue to retain substantial physical evidence of period construction techniques, including finishes and design elements,

that reflect the character and identity of the potential historic district. Therefore, the campus retains integrity of *workmanship*.

- **Feeling:** The potential historic district retains most of the character-defining features of its original construction, including representative building types as well as spatial relationships and outdoors spaces common to the late 1960s. during the period of desegregation. Because it retains all the preceding aspects, it continues to express the aesthetic or historic sense of a high school. Therefore, the campus retains integrity of *feeling*.
- **Association:** Association is the direct link between an important historic event or person and a historic property. Because the campus retains integrity of *location, design, setting, materials, workmanship,* and *feeling,* it continues to convey its direct link to a newly desegregated campus. Therefore, the campus retains integrity of *association*.

The potential historic district at Fairfax High School retains integrity of *location, design, setting, materials, workmanship, feeling,* and *association* from the identified period of significance. It therefore continues to convey its significance as an early desegregated school in Los Angeles.

8.0 CHARACTER-DEFINING FEATURES

8.1 Character-Defining Features

Character-defining features are distinctive elements and physical features that convey the historical appearance of a property and are required for it to convey its historical significance. According to Preservation Brief 17, there is a stepped process to identifying character-defining features.[112] The first step involves assessing the distinguishing physical aspects of the building as a whole. This second step involves examining the building more closely. While on their own each of the elements above may not convey historical significance, in combination they define the property and convey the associations for which it is significant.

Tables 4 through 18 below are included to provide the character-defining features of each individually eligible building and each contributor to the potential historic district. These include aspects of each building's shape/form, roof, openings, projections, secondary features, materials, setting, and, if applicable, interior features. Additionally, as required by LAUSD, character-defining features are ranked according to primary, secondary, and tertiary importance in order to inform advanced planning.

Fairfax High School is located at 7850 Melrose Avenue in the Fairfax District of Los Angeles County, California. The school occupies a 25-acre rectangular site on a single parcel (Assessor's Parcel Number [APN] 5527-021-900).

Fairfax High School occupies nearly all of the city block bounded to the north by Melrose Avenue, to the east by Genesee Avenue, to the south by Rosewood Avenue, and to the west by Fairfax Avenue; the only exception is a small parcel on Rosewood Avenue occupied by Walt Whitman High School. The campus is comprised of twelve (12) permanent buildings, two (2) arcades, and three (3) courtyards, as well as athletic facilities and open spaces. Most of the buildings are located in the north and central portions of the campus; sports fields occupy most of the south portion. *(See Continuation Sheet)*

***B5. Architectural Style:** Spanish Colonial Revival; Late Modern
***B6. Construction History:**
In 1923, the Los Angeles Board of Education committed over $1 million to the repair and expansion of schools across Hollywood. Of those funds, over $600,000 was allotted to building a new high school at the corner of N. Fairfax Avenue and Melrose Avenue, to be known as Fairfax High School.

For the site of the new school, the Los Angeles Unified School District purchased a twenty-five-acre lot from G. Allen Hancock. The district hired John and Donald B. Parkinson, of the architecture firm of Parkinson & Parkinson, to design the new campus. The news of the school's construction brought attention to the area and led to a real estate and residential development boom in the surrounding neighborhood. Many large residences, small bungalow homes, and multi-family bungalow residential courts were built to take advantage of the new school. *(See Continuation Sheet)*

Findings
HRG has identified two buildings, the Auditorium Building and the Administration and Classroom Building, that appear individually eligible for listing in the California Register and for designation as a City of Los Angeles HCM. HRG also identified a single potential historic district at Fairfax High School that appears eligible for listing in the National Register and California Register, and for designation as a City of Los Angeles HCM. Contributors to the potential historic district are the Auditorium Building, Social Hall, Administration and Classroom Building, Cafeteria Building, Transformer (Stage/Utility Building), Gymnasium Building, Ticket Booth, Utility Building, Shop Building, Arcades #1 and #2, and Courtyards #1, #2, and #3. *(See Continuation Sheet)*

***P3a. Description: (Continued…)**

Auditorium Building

The Auditorium Building (1924) is the central feature of the northern portion of the campus, set back from Melrose Avenue by an arcade and courtyard (Arcade #1 and Courtyard #1). The Auditorium Building is flanked to east and west by two more landscaped courtyards (Courtyards #2 and #3) and beyond these by the Administration and Classroom Building (1968) and the Shop Building (1968), both set back from Melrose Avenue by surface parking lots paved in asphaltic concrete. Further south are the Utility Building (1969); Ticket Booth (1969); the Gymnasium Building (1969), which closes off the south end of Courtyard #3; the Transformer (Stage/Utility Building, 1968) which forms the southern boundary of Courtyard #2; and the Cafeteria Building (1968) and Arcade #2. South of the Gymnasium Building, and defining another surface parking lot, are the Social Hall (Da Poetry Lounge, 1942); the Stadium Grandstand and Restroom (2011); and Classroom Buildings A and B (2004). The southwest portion of the campus is occupied by the track and field, and a small surface parking lot; the southeast portion is occupied by a baseball diamond and tennis courts.

The names and functions of some campus buildings have changed and evolved over the years. To avoid confusion, whenever possible, the buildings discussed in this report have been keyed to the official building naming system of Fairfax High School as shown on the campus site plan and derived from the campus map and inventory documents provided by the school district.

The Auditorium Building is a Spanish Colonial Revival style building of expressed board-formed concrete construction. It has a linear plan, symmetrical composition, and complex massing composed of three primary elements: a tiered, octagonal Rotunda; the Auditorium proper; and an attached craft building at the rear (south). The Rotunda has a one-story base, above which rises a two-story tower with a one-story lantern. The base has a square plan with a flat roof and dentil cornice. The tower and lantern have octagonal plans and octagonal roofs with clay barrel tile roofing and eave cornices; the tower is encircled with a frieze of glazed ceramic tile, and the cornice of the lantern is supported on an arched corbel table. Fenestration at the base consists of divided light windows with security grilles, set within vertical recesses with glazed ceramic tile spandrel and transom panels. Fenestration in the tower and lantern consists of divided light, wood sash casement windows in tripartite groupings at the third floor and coupled at the fourth, with Corinthian colonettes at the mullions. The fourth floor (lantern) windows have glazed ceramic tile surrounds. The primary entrance is symmetrically located in a raised central pavilion on the north façade. It consists of a pair of paneled doors with a transom light with a decorative metal grille and glazed ceramic tile surround, recessed within a rectangular aperture with a glazed ceramic tile surround. The preceding entrance vestibule is paved with terra cotta tiles and has a glazed ceramic tile dado.

The Auditorium adjoins the Rotunda to the south. It has a rectangular plan and complex massing consisting of a central three-story nave with a low-pitched front gable roof and flanking two-story aisles with pent roofs. The roofs have clay barrel tile roofing and continuous eave cornices. The aisle walls are articulated with battered buttresses; a corbeled concrete staircase on the west façade accesses the balcony. Fenestration consists primarily of coupled, divided light casement windows. The stage house rises at the south end of the auditorium, with a side gable roof, battered buttresses, and perforated grilles. The craft wing adjoins the Auditorium Building south of the stage house. It is a two-story volume with a rectangular plan and a moderately-pitched front gable roof with clay barrel tile roofing. There is an exterior chimney on the south façade. The east and west façades are articulated with battered buttresses.

The Rotunda interior is a four-story volume with a rectangular plan, encircled by three stories of superimposed board-formed concrete galleries with segmental arches at the first floor and semicircular at the second and third. The arches spring from piers faced with stylized pilasters and vertical ribs, which continue into the vaulted ceiling above. The second-floor gallery has a parapet of Roman lattice. The floor is paved with terra cotta tiles. A short passage flanked by twin scissor stairs under shouldered arches connects the Rotunda to the Auditorium.

The Auditorium Building has a rectangular plan and rises through three stories, flanked by arcaded aisles with a clerestory above. The walls and columns are of expressed board-formed concrete; the ceiling is of stenciled wood trusses, rafters, and purlins. The raked floor is finished with maple flooring; the aisles are carpeted. Twin segmental arches at the north end of the space support the balcony. The stage at the south end of the room has a segmental proscenium arch and is accessed from the west by steps with a decorative metal balustrade, and from the east by a mechanical lift.

***P3a. Description: (Continued…)**

Courtyard #1

Courtyard #1 is located just off Melrose Avenue to the immediate north of the Auditorium Building and west of the Administration and Classroom Building. The courtyard is a large, rectangular plaza paved in concrete with a grid pattern and interspersed with lawns, planting beds with trees and shrubs, and raised planters forming a forecourt to the Rotunda. There are several cast iron lampposts in this courtyard.

Arcade #1

Arcade #1 is located just off Melrose Avenue to the immediate north of the Auditorium Building and west of the Administration and Classroom Building. The one-story arcade is comprised of concrete roof panels supported by concrete columns with metal security screens

Administration and Classroom Building

The Administration and Classroom Building is a four-story Late Modern style building with a hollow rectangular plan enclosing a central courtyard, simple massing, and symmetrical composition. It has a flat roof with a low parapet, and four corner pavilions with rounded corners, veneered in glazed tile. The ground floor is an arcade of shallow, semi-elliptical arches supported on battered, cruciform columns of scored concrete. The upper floors are articulated with a repetitive pattern of full-height vertical strip windows between projecting cast concrete frames. The primary entrances are located on the north façade, each consisting of two pairs of fully-glazed metal storefront doors in full-height vertical strips of metal-framed glass curtain wall. The entrances are accessed by concrete stairs with metal pipe guardrails. The central courtyard has concrete paving and raised concrete planters.

Four imperial staircases, one in each of the corner pavilions, provide vertical circulation and connect the broad, double-loaded corridors that encircle each floor. The stairs have parapets of board-formed concrete. The corridors have resilient tile flooring, plaster walls, and acoustical tile ceilings.

Courtyard #2

Courtyard #2 is located immediately south of Courtyard #1, between the Auditorium Building to the west and the Administration and Classroom Building and Cafeteria Building to the east. It is accessed from Courtyard #1 by three flights of wide concrete steps. It is paved in concrete and landscaped with planting beds, raised concrete planters, and concrete seating walls. The south side of Courtyard #2 has a wide concrete stage with concrete steps and raised concrete planters, backed by the Transformer Building.

Arcade #2

Arcade #2 is located immediately south of the Cafeteria Building and wraps around it and the Administration and Classroom Building. Arcade #2 is comprised of large, octagonal formed concrete columns.

Cafeteria Building

The Cafeteria Building is a one-story Late Modern style building abutting the south façade of the Administration and Classroom Building. It has a rectangular plan, asymmetrical composition, and complex massing composed of a raised central block with a flat roof and clerestory wrapped on the west and south by the lower Arcade #2. There is a loading dock and walled service yard on the east façade. Fenestration consists of coupled vertical strip windows.

Transformer (Stage/Utility Building)

The Transformer forms the backdrop for the Courtyard #2 stage. It is a one-story utilitarian building with a rectangular plan, simple massing, and symmetrical composition. It has a flat roof with a shallow parapet. The north and south walls are of formed concrete with curved and battered ends. The east and west walls are ventilation grilles. The entrance is located on the south façade and consists of a pair of flush metal doors.

***P3a. Description: (Continued…)**

Gymnasium Building

The Gymnasium Building is a one-story Late Modern style building with a generally rectangular plan, nearly symmetrical composition, and complex massing consisting of a taller central block flanked to east and west by lower wings with rounded corners. It has low-slope roofs with shallow parapets. The exterior walls of the central block consist of vertical concrete panels with projecting frames; the exterior walls of the wings are of board-formed concrete with a frieze and spandrel panels of glazed ceramic tile. The primary entrance is asymmetrically located on the north façade and consists of a pair of glazed metal storefront doors with sidelights and transom lights, under a cantilevered flat canopy. Secondary entrances in the hyphens consist of pairs of flush metal doors; exterior doors on the wings consist of individual flush metal doors. Fenestration is limited to the wings and consists of rectangular metal-framed windows with metal security grilles. The primary entrance opens to an L-shaped lobby with resilient tile flooring, plaster walls, and an acoustical tile ceiling with surface-mounted fluorescent light fixtures. There is a service window with a roll-up shutter on the west wall, and a recessed display case on the south. The lobby is flanked to the west by the Big Gym, and to the south by the Little Gym, both accessed by groupings of flush wood doors. Both gyms have maple flooring, plaster walls, and expressed steel roof framing. The Big Gym has retractable seating risers on its north and south walls.

Ticket Booth

The Ticket Booth is a one-story Late Modern building with a square plan and rounded corners, symmetrical composition, and simple massing. It has a flat roof with a shallow parapet. The exterior walls are of expressed board-formed concrete construction with a frieze and transom panels of glazed ceramic tile. Fenestration consists of two rectangular service windows on the west façade.

Utility Building

The Utility Building is a one-story Late Modern style building with a rectangular plan and rounded corners, symmetrical composition, and simple massing. It has a flat roof with a shallow parapet. The exterior walls are of board-formed concrete with a frieze and transom panels of glazed ceramic tile. There is a pair of flush metal doors symmetrically located on the west façade, under a flat cantilevered canopy; the doors are accessed by a concrete loading dock and ramp. There is a metal rollup door symmetrically located on the east façade.

Shop Building

The Shop Building is a one- and two-story Late Modern style building with a generally rectangular plan, nearly symmetrical composition, and complex massing. It has a flat roof with a shallow parapet. The exterior walls are of board-formed concrete with a continuous frieze and transom panels of glazed ceramic tile. A second-story volume on the north end of the building has walls of cast concrete panels with projecting frames. The building is flanked by two, two-story pavilions with rectangular plans and rounded corners, and exterior walls finished in glazed ceramic tile. Fenestration consists primarily of rectangular, metal-framed windows with metal security grilles. There are multiple entrances consisting of pairs of flush metal doors under cantilevered flat canopies.

Courtyard #3

Courtyard #3 is located southwest of Courtyard #1, between the Auditorium Building to the east and the Shop Building to the west. It is accessed from Courtyard #1 by a wide concrete staircase. Courtyard #3 consists of a series of brick and concrete terraces with planting beds, raised planters, paths, and lawns, connected by wide concrete steps.

Social Hall (Da Poetry Lounge)

The Social Hall is a one-story American Colonial Revival style building with a rectangular plan, simple massing, and nearly symmetrical composition. It has a steeply pitched side gable roof with composition shingle roofing, eave cornice, three gabled dormers with round-arched divided light windows, and an octagonal cupola. The primary (west) façade is clad in wood channel siding; the remaining exterior walls are finished in smooth cement plaster. A shed-roofed verandah with square wood posts and metal fencing extends the full width of the west façade. Fenestration consists primarily of eight-over-eight double hung wood sash windows. The primary entrance consists of three pairs of fully glazed, divided light wood doors with sidelights and transom lights, opening from the verandah.

***P3a. Description: (Continued…)**

Stadium Grandstand and Restroom

The Stadium Grandstand is a utilitarian steel frame structure supporting seating risers. The Restroom is a one-story utilitarian building located under the Grandstand. It has a rectangular plan, asymmetrical composition, and complex maxing composed of the one-story restroom volume and a multi-story elevator tower providing access to the upper levels of the Grandstand. The building has a flat roof and its exterior walls are finished in cement plaster. The entrances consist of flush metal doors.

Classroom Buildings A and B

Classroom Buildings A and B are two-story utilitarian buildings with rectangular plans, simple massing, and asymmetrical composition. Both have flat roofs; Building A has an overhanging soffit on the east façade, and Building B has one on its north façade. The exterior walls are finished in cement plaster. The buildings are connected by a projecting second-story walkway with a metal balustrade that wraps the north and east façades of Building B and continues along the east façade of Building A. The walkway is accessed by exterior stairs at the southeast corner of the Building A and the northeast and northwest corners of Building B. Fenestration consists primarily of horizontal sliding aluminum sash windows. Classroom entrances consist of flush metal doors.

***B6. Construction History (Continued…):**

Parkinson & Parkinson's 1923 plans for the school included a 2- to 3-story Auditorium Building (then known as the main building) facing Melrose Avenue with a central rotunda and auditorium that was flanked by east and west wings. Building plans for the Auditorium Building identify several features of the Spanish Colonial Revival-style building, including the ornamental tile border, tile roof, brickwork, and Corinthian pilasters. The school featured and auditorium that could seat 1,800 persons; a statue of Abraham Lincoln was placed in the rotunda following its completion. Construction fo the building was completed in 1924.

Parkinson & Parkinson also designed a girl's gymnasium (known as Building No. 2), boy's gymnasium (Building No. 3), and a cafeteria. The campus plan also laid out a football field, baseball diamond, tennis courts, and basketball courts. Additional improvements to the campus in 1925-1926 included a 1-story lunch pavilion, bleachers, and addition to the gymnasium. In 1927, a 1-story 9-car private garage was built on the campus.

As the population of the surrounding area grew, Fairfax High School was compelled to build additional education spaces. Temporary 1-room school bungalows were erected in 1929 and 1930 to accommodate the increased student population and "relieve congestion" at the school. Additional bleachers and a storage room were also built in 1930. In 1939, architect A.S. Nibecker Jr. designed a 1-story incinerator for the school. In 1939, Fairfax High School students built a new social hall with a "homelike atmosphere" as a hands-on class project. The Social Hall (also known as Greenway Court), was designed by A.S. Nibecker, Jr. and built by students from Fairfax High's carpentry class in conjunction with Frank Wiggins Trade School students. The building's design included a cupola, dormer windows, and a full-length veranda.

The Social Hall was designed to replicate the Greenway Court, a hunting lodge built in Virginia in 1760 by Lord Thomas Fairfax, a friend of George Washington. Lord Fairfax's Virginia lodge, which no longer exists, was a 60-foot banquet hall and land sales office named after his family's estate in Hollingbourne, England.The Social Hall was officially dedicated on October 28, 1942, inaugurated with a dance for the 200 Fairfax High Students. Several alterations to existing buildings on the Fairfax High School campus were made in the late 1940s and 1950s, including the relocation of two bungalows and unspecified alterations to the Auditorium Building by architect Kenneth N. Bergstrom.

In the mid-1960s, the Los Angeles Board of Education completed a study to determine the feasibility of replacing or structurally strengthening five school buildings on the Fairfax High School campus that did not meet the State Field Act earthquake safety standards enacted in 1934. The study recommended demolition of all buildings on the campus with the exception of the Auditorium Building. As a result, the school district hired Albert C. Martin and Associates to redesign the campus in 1966. As recorded in the *Los Angeles Times,* "at Fairfax High School, virtually all major existing building will be demolished, with the exception of the three-story octagonal rotunda and auditorium, which will be modernized later." A.C. Martin's 1966-1967 campus plan included the demolition of the cafeteria, garage, gymnasiums, and portable buildings. The Auditorium and rotunda were retained, though Martin designed a new primary entrance and added buttresses along the east and west facades. The east and west wings were demolished. The Social Hall was relocated from the central region to the southwestern region of the campus.

***B6. Construction History (Continued…):**

A. C. Martin also completely redesigned the campus with "a complex of modern buildings." Between 1967 and 1969, he completed a phased replacement of buildings on the campus, staggering construction projects to limit interference with the normal instructional program. As new buildings were completed on the campus, older buildings were phased out and eventually demolished.

Phase I of the building program was authorized by district voters as part of the 1963 bond issue, totaling $127.5 million. Phase I consisted of demolishing the east wing of the Auditorium Building and construction of the $3.9 million Administration and Classroom Building, Courtyard #1, Arcade #1, and Courtyard #2. Phase I was begun in 1967 and completed in March of 1968. Phase I of the campus design featured extensive landscaping and hardscaping, including planned lawn areas, raised planters, concrete walkways, stairways, plazas, and seating, as visible in building plans and photographs.

Phase II of the building program was approved as part of the district's 1966 bond issue, totaling $189.5 million. Phase II included modernizing the Auditorium Building, as well as constructing the Cafeteria Building, Arcade #2, and the Transformer (Stage/Utility Building), which were completed in 1968.

In 1969, the Gymnasium Building; Ticket Booth; Utility Building; Shop Building; and Courtyard #3 were constructed. The campus was dedicated in October of 1969. In 1969, A.C. Martin & Associates won an award from the Portland Cement Association and the Southern California Ready-Mix Concrete Association for the firm's creative use of concrete construction at Fairfax High School. As recorded in the *Los Angeles Times,* "Cast-in-place concrete used at Fairfax High School expresses strength, importance, and permanence."

No major alterations or construction was completed at Fairfax High School in the 1970s or 1980s. In 1996, New Attitude Productions, a non-profit theatre group, negotiated a lease deal for the Social Hall with the school officials. In exchange for free rent, the group promised to repair, upgrade, and maintain the building. In addition, they planned to integrate Fairfax High's students in their theatrical productions. They also changed their name to Greenway Arts Alliance to honor the history of the building. Reminiscent of how the building was first constructed, students from Fairfax High's ROTC program helped clean and renovate the theatre. The old Social Hall opened to the public again in 2000. The Social Hall is now leased by Da Poetry Lounge and still retains the same use as a social hall and theatre.

Two new classroom buildings (Classroom Building A and Classroom Building B) were constructed in 2004, located south of the gymnasium. The Stadium Grandstand and Restroom was constructed in 2011.

***B10. Significance (Continued…):**

JEWISH AMERICAN COMMUNITY

The construction of Fairfax High School encouraged residential development in the community and real estate developers seized the opportunity to build single- and multi-family residences. The school was still incomplete by 1924, but the district was growing so rapidly that officials were concerned that the newly built school would be insufficient to host the large number of students. The chamber of commerce petitioned to extend the Los Angeles Railway to Fairfax to help ease congestion in the new school district. Over 1,200 students were expected to attend in September, and by the second semester the number of students was expected to increase to 2,000.

The Beverly-Fairfax neighborhood had a significant Jewish-American presence since its earliest development in the 1920s. A substantial number of the residences of the neighborhood were owned or rented by members of the Jewish community because there were no restrictive housing covenants or realtor influences as seen in other areas of Los Angeles. After World War II, the Jewish population of Beverly-Fairfax increased exponentially, and many residents who lived in the area were refugees. Over time, the community began moving towards Pico-Robertson.

Since the time it opened in 1924 and through the post-war period, Fairfax High School predominantly served the lower- and middle-class Jewish and white community of Fairfax-Beverly.

***B10. Significance (Continued…):**

JEWISH AMERICAN COMMUNITY (CONTINUED)

As later recorded in a *Los Angeles Times* article on the Jewish community in Fairfax-Beverly:

"There was stability to the community, and this was a key. For most, the path was an unbroken 12 years from Laurel Elementary School to Bancroft Junior High, then Fairfax High… Fairfax High School was at the very center of this community, a place where brothers and sister went to school during the day, grandmothers went to school at night, a place for playing ball on weekends with older kids… Fairfax High has been traditionally one of the top academically-rated high schools in the city. Ninety percent of the graduates progressed to college. The Jewish home's regard for education manifested itself dramatically here. Students didn't achieve, they overachieved."

In 1952, Fairfax High School became the only school to teach Modern Hebrew in the West Coast. By 1967, the Modern Hebrew program had expanded to Grant and Beverly Hills High Schools as well. One teacher estimated that the student body was 75% Jewish in the late 1960s. However, the demographics of Fairfax High School shifted in the late 1960s when the issue of the school's boundaries came to the forefront of district discussions.

RACIAL INTEGRATION

In the 1960s, the potential effects of school boundaries on racial demographics had increasingly become a topic of debate in Los Angeles. As recorded in the *Los Angeles Unified School District Historic Context Statement:*

"The issue also touched on school boundaries. In 1963, African-American leaders in Los Angeles staged protests, asking that "elementary and secondary school boundaries be redrawn around these 'Negro districts,' that that minority students be transferred from crowded schools to less crowded ones in a 15-mile radius, and that "barriers" to promotion of certified Negro personnel be eliminated." With the Watts uprising in 1965, attitudes were intensified on all sides of the integration issue. Some citizens became more adamant that de facto segregation should remain in place, while other community members, activists, and students began arguing for and asserting the legal rights of all students to equal educational facilities and opportunities."

group known as the Neighbors Unlimited and called for the school's boundaries to be redrawn to include the area past Pico Boulevard, which historically served Los Angeles High School. According to parents of students attending the two high schools, the so-called "option" area (which allowed students to choose which high school they wanted to attend) promoted de facto segregation. In 1967, the population of Fairfax High School was 96% white and 1% African American, compared with Los Angeles High School, which was 55% African American and 18% white. Parents claimed that white families in option areas sent their children to Fairfax High School, thereby creating racial imbalance at the schools.

School administrators denied the group's charges but conceded that "little effort has been made to create an 'ethnic balance' between the two schools by redrawing boundary lines," and pointed out that the board policy did not require it. The school district noted that "racial balance" was one factor used in determining where boundaries should be drawn, but that no lines were set for "ethnic reasons." Neighbors Unlimited in turn demanded that the "racial composition of the two schools be made the chief criterion in redrawing their boundaries" and called for a redesign of the north-south corridors, thereby bringing more white students to Los Angeles High School and more African American students to Fairfax High School.

As a result of neighborhood activism, in 1968, the Board of Education established a policy of integration for the city's school system. Consequently, Fairfax High School, Los Angeles High School, and Hamilton High School were the first schools to have their boundaries redrawn, thereby paving the way for desegregation at other schools. The first full year for desegregation was the1968-1969 school year at Fairfax High School. As recorded in the *Los Angeles Times* following the board's decision:

"The realignment of boundaries, which will also achieve greater integration for Fairfax High School, represents the first practical application of the boards policy to establish integration in city schools…Under this plan, Fairfax's Negro enrollment will go from less than 1% to 11% within three years and Negro enrollment at Hamilton and Los Angeles High Schools would drop."

As a result of new boundaries, administrators at Fairfax High School created a program called "The Model Plan for a School in Transition," that provided counseling time for students, increased staffing, and created a rumor control center.

***B10. Significance (Continued…):**

RACIAL INTEGRATION (CONTINUED)

By the mid-1970s, the population was comprised of 31% African American, 11% Asian and Latino, and 58% white students; within the white population, the "Jewish student [was] still the core." In 1975, then-principal of Fairfax High School, William Layne stated that:

"[Fairfax High School] has indeed undergone change. It had always been a traditional, very academic school. Today it can truly be called multi-cultural. We're trying to show integration can work in a modern setting... We are no longer a school in transition… We are integrated and have a new program called Educational Excellence in a Multicultural School... This, we hope, will stem flight of the white student. Sure, this school used to be Jewish kids on their way to college. But today it isn't as isolated."

By the mid-1980s, the school enrollment was 25% African American, 15% Asian, 25% Latino, and 31% white. Many of the white students and several of the top teachers at Fairfax High School had left to attend or teach at magnet schools, and the white students that remained were often immigrant students from Russia and Israel.

Despite the school board's early efforts to desegregating schools, some students experienced discrimination at Fairfax High School. In 1988, over 200 Fairfax High School students gathered outside the principal's office to protest discriminatory practices against African American students. Complaints against the school included the administration's refusal to allow the Black Student Union to host a talent show for the school, as well as other broader issues, including poor college counseling, an under-representation of Black students in honor societies, and the cancellation of a Black History course due to low enrollment. In addition, students called for greater contact with recruiters from historically Black universities, expanded after-school activities, and an overall better quality of school life. Principal Warren Steinberg assured students that some concerns would be met, such as reinstating the Black History Course, while other allegations such as racism would be further investigated. In addition to the Black History Course, the principal also reinstated a Holocaust course, which had also been cancelled due to low enrollment.

PROJECT 10

In 1984, Fairfax High School teacher and counselor Dr. Virginia Uribe organized a school-sponsored counseling program called Project 10 to support LGBT students. Named after the estimated 10% LGBT population of the nation, Project 10 offered a safe space to discuss topics such as the consequences of coming out, the importance of safe sex, AIDS, condoms, and more. At the time of its founding, it was the first of its kind.

Dr. Uribe, a Pasadena native, began teaching in 1959, but concealed her sexual orientation, as being gay or lesbian was ground for dismissal from teaching at the time. Over the course of her teaching career, she saw gay and lesbian students treated with hatred and face bigotry in school due to their sexual orientation. Prior to starting the program, she witnessed a gay student drop out of school after facing extreme harassment, and realized they are not alone. Many students would often drop out of school, stating that school is the "least of their worries," after facing backlash, abuse, and homelessness when they come out to family and friends.

The program started was a lunchtime session but later extended beyond the lunch break. Uribe formed the program as a high school dropout prevention program to offer emotional support and accurate information to LGBT youth. The program was held in Uribe's third-floor classroom in the Administration and Classroom Building, which also doubled as a science lab classroom. The classroom included a library with information about immune deficiency syndrome as well as novels with homosexual protagonists. It was non-controversial and supported while at Fairfax High School, but by the time the program had extended to other schools in the Los Angeles Unified School District in 1988, it received backlash and condemnation from others, including Catholic Archbishop Roger Mahoney. Dr. Uribe began the non-profit branch of Project 10, known as Friends of Project 10, Inc. in 1986 as a resource for educators, students, parents, across the nation.

In 1988, Assembly Republicans, led by Marian La Follette, voted unanimously to withhold new funds for LAUSD until the project stopped, although no special funds were ever allocated to the program. The low-budget and cost-effective program, as Uribe stated, was "what the district gives me for [teaching] three periods a day."

***B10. Significance (Continued…):**

PROJECT 10 (CONTINUED)

Uribe's goals were to provide students with counseling and hoped to see all schools become tolerant and harassment-free for LGBT students. In addition, Uribe advocated for an anti-slur policy that would extend to sexual taunts. Despite the backlash, the Los Angeles Board of Education strongly backed Project 10 and over 20 city and statewide teacher associations and youth groups voiced their support for the program. The board stated, "We are a public school system, and we should try to meet the needs of all our students. We are talking about civil rights."

Uribe continued to lead training workshops to teachers, counselors, and school staff through the County to encourage advocacy and support for LGBT youth. In 1990, Virginia Uribe was named the grand marshal of the Long Beach Gay Pride Parade and Festival. By 1991, Project 10 had expanded to the Santa Monica-Malibu and San Francisco school districts. In addition, Project 10 implemented the first LGBT prom and later influenced the current state laws to protect California Educators, such as the Fair Education Act.

Project 10's impact is still seen today, as the Los Angeles Unified School District continues its policy to protect the rights of LGBT students. In 1998, Dr. Uribe received the Women in Leadership award from the West Hollywood Chamber of Commerce. In addition, she has also won multiple awards and honors from the state and received the Educator of the Year award from the National Organization of Gay and Lesbian Scientists and Technical Professors. During President Obama's tenure, Dr. Uribe was a finalist for the Presidential Citizens Medal. Dr. Uribe served as a teacher and counselor for LAUSD for 42 years and passed away in 2019.

DONALD & JOHN PARKINSON

Father-and-son architectural firm, Parkinson & Parkinson, founded by John Parkinson in 1894, was responsible for many of the landmarks in Los Angeles, including the USC campus master plan (1919), Los Angeles Memorial Coliseum (1923/1931), Los Angeles City Hall (with Albert C. Martin and John C. Austin, 1928), Bullock's Wilshire (1929), and later Union Station (1939).

John Parkinson was born in 1861 in Lancashire County, England. He apprenticed to a builder and learned the meaning of craftsmanship and gained a strong knowledge of practical construction. Upon completion of his apprenticeship, he immigrated to North America as an adventure where he built fences in Winnipeg, Manitoba, Canada and learned stair-building in Minneapolis, Minnesota. When he returned to England, he found work hard to come by and decided to return to America. Parkinson traveled to California and first settled in Napa. In 1890, he moved to Seattle, Washington where he opened his first architectural practice. He served as School Board Architect from 1891-1894 and designed numerous schools there. A serious economic depression hit Seattle, so he moved on to Los Angeles in 1895.

Parkinson designed structures to fulfill the needs of that growing city in every conceivable fashion. In 1896 Parkinson designed the first Class "A" fireproof steel-frame office building in Los Angeles, the Homer Laughlin Building at Third Street and Broadway. His design for the 1904 Braly Block at Fourth and Spring Streets became the city's first skyscraper. The 12-story building opened to great acclaim and established Parkinson as the region's leading architect. It held the distinction of being the tallest structure in Los Angeles until the completion of City Hall twenty-four years later.

Parkinson was a key figure in the City Beautiful movement in Southern California, and he influenced civic reform and community planning as a charter member of the Los Angeles Municipal Art Commission, which imposed a building height limit in 1905. Sustained until 1957, it played a significant role in shaping and maintaining the low scale of the city.

In 1905, Parkinson formed a partnership with G. Edwin Bergstrom that lasted ten years. The firm of Parkinson & Bergstrom designed numerous public and private buildings throughout Southern California and designed many of the major office and commercial buildings erected in downtown Los Angeles during this period. Among these were the original Bullock's Department Store (1906), the Pacific Mutual Building (1908), Los Angeles Athletic Club (1911), and the original Broadway Department Store (1913). The firm designed numerous buildings along the city's financial corridor of Spring Street including the Alexandria Hotel (1906), Security Trust and Savings Bank (1907), the Rowan Building (1910), Washington Building (1912), and the Security First National Bank (1915).

Five years after Bergstrom left to establish his own practice, John Parkinson was joined in 1920 by his son Donald B. Parkinson. The relationship between the father and son was highly productive.

DONALD AND JOHN PARKINSON (CONTINUED)

Five years after Bergstrom left to establish his own practice, John Parkinson was joined in 1920 by his son Donald B. Parkinson. The relationship between the father and son was highly productive. Together they designed dozens of Los Angeles' most enduring landmarks, including the original campus master plan for the University of Southern California (1919), the Los Angeles Memorial Coliseum (1923/1931), the Title Insurance Building (1929) in downtown Los Angeles, Bullock's Wilshire (1929), City Hall (1928), and Union Station (1939).

Donald B. Parkinson was a masterful artist formally educated at the Massachusetts Institute of Technology. As their partnership grew the father concentrated on bringing in new business while the son supervised the daily details of the design team. Their extraordinary synergy as architects was highly evident in their designs and the father and son were credited with transforming the city's urban landscape.

John Parkinson died in 1935 while designing the plans for Union Station with his son Donald. Donald and John Parkinson are considered master architects.

ALFRED S. NIBECKER JR.

Alfred S. Nibecker Jr. was born 1890 in Spokane, WA. In about 1897-98, the Nibecker family relocated to California and resided in Independence, CA in 1900. By 1908, the Nibeckers lived in Los Angeles. In 1910, he was hired as a draftsman by Mayberry Park Architects. From 1920 to 1921, he was a partner in the firm Montgomery and Nibecker.

Guiding the Los Angeles school districts through rapid expansion in 1920s, disaster and depression during the 1930s, and the great postwar boom through the mid-1950s was district architect and business manager Alfred S. Nibecker, Jr. In the 1920s, Nibecker began private practice in Los Angeles; he joined the Los Angeles City Board of Education as an architect in 1926, where he remained until his retirement in 1955. In his three-decade career with the school district, Nibecker oversaw the construction of, and contributed designs to, hundreds of school plant projects. Many commissions were completed by the district's in-house staff, but many others were handled by a range of the region's best architects and builders, with an increasing number of firms specializing in school design. In addition to his work with the Los Angeles City school districts, Nibecker was a fellow of the American Institute of Architects and served on the National Committee on School House Construction, the National Advisory Council on School Building Problems, run under the auspices of the U.S. Department of the Interior, Office of Education. In 1955, Nibecker was made an honorary member of the Structural Engineers Association of Southern California, the association's highest award. That same year, he retired. Following his retirement, the board appointed Ernst Raymond C. Billerbeck as district architect. Nibecker passed away March 29, 1989 in Pasadena, CA. Nibecker is considered a master architect.

ALBERT C. MARTIN

Albert C. Martin, AIA, was born in La Salle, Illinois, in 1879. He completed his formal education in architecture and engineering at the University of Illinois in 1902. In January of 1904, Martin moved to Los Angeles to work as a superintendent of construction for Carl Leonardt & Company, a major building contractor on the West Coast. A year later he joined the staff of Alfred Rosenheim, FAIA. During Martin's association with Rosenheim, for whom he worked as an engineer, the firm designed the Second Church of Christ Scientist (1905-1910). In 1908, Martin established his own architectural practice. Although he was later recognized for his commercial buildings, during the early part of his career he worked almost exclusively for the Catholic Church. During the 1920s, he designed churches, convents, parish halls, and parochial schools as far north as Fresno and as far east as Arizona. The high point in his career was Los Angeles City Hall (1928), which Martin designed along with two other prominent architects, John C. Austin and John Parkinson. Albert C. Martin, Jr. and John Edward Martin joined their father in the family practice before World War II. The firm had a close relationship with the May Company and designed a number of buildings for them including the iconic May Company building on Wilshire Boulevard (1939) and the Crenshaw Shopping Center (1945, demolished).

When wartime diverted men and materials from the private sector, both Albert C. Martin, Jr. and John Edward Martin joined the war effort, along with most of the firm's drafting and engineering staff. After the war, the influx of returning soldiers into Southern California and the baby boom of the 1950s were boons for A.C. Martin's architectural practice. The firm, alongside commercial developers, responded to the growing demand for single-family housing by proposing a network of shopping centers to support the population sprawl into the suburbs.

ALBERT C. MARTIN (CONTINUED)

Opened in 1952, Lakewood Center became one of the first large-scale centers designed with the automobile in mind.

In the late 1950s, the firm began to design space-age research and development laboratories, which would become a significant part of their practice. A.C. Martin, Sr., the firm's patriarch, considered a master architect, died on April 9, 1960. After World War II, he had largely ceded control to A.C. Martin, Jr. and John Edward Martin, and following his death the firm was renamed A.C. Martin and Associates.

The firm's work was featured in a 1962 article in the *Los Angeles Times* which described the development of "think factories" after World War II to foster the aerospace and aviation industries in Southern California. The article described the "special type of architecture" which emerged in the region to meet the "unique needs of the space-age research and development factories," and provide the "ideal environment for the maximum in cerebration." The article names A.C. Martin and Associates as one of the "leading concerns in this field," and notes that they are responsible for "some of the finest examples of 'think factory' trend," designing some five million square feet of research and development facilities in Southern California. These facilities featured "glass-walled office-and-laboratory combinations, more pleasant than anything known before." A notable and early example of the firm's work in this arena was the 1959 Thompson-Ramo-Wooldridge Center in Canoga Park, which was "cited many times…as a prime example of both imaginative and economic planning."

By the end of the 1960s, the firm operated three offices in the Los Angeles area, and diversified its services to include computer-aided design software. The computing and engineering advances of the 1970s, along with the repeal of Los Angeles' longtime height restrictions, changed the landscape of a downtown entering the corporate era. A.C. Martin took the lead during the 1970s and 1980s, a period marked by sleek, self-contained geometric towers, such as ARCO Plaza (1972). A.C. Martin & Associates designed more structures in downtown Los Angeles than any other firm in the years after World War II.

The 1990s brought considerable change to the firm. The commercial real estate bubble of the 1980s burst, and the firm consolidated in response to weak demand for new office space. As more companies continued to leave city centers for suburban business parks, ACMA followed them—to Irvine, Thousand Oaks, Westlake, and beyond. Edward Martin retired from the firm in 1997 and passed away in 2004. Albert C. Martin, Jr. died in 2006 at age 92. Now known as AC Martin, the firm is in its third generation of family leadership, with Christopher C. Martin, FAIA, serving as chairman.

GEORGE E. BERGSTROM

George Edwin Bergstrom was born in Neenah, Wisconsin in 1876 to Norwegian parents. His father, George O. Bergstrom, was a prominent businessman and political in Neenah Wisconsin. After graduating high school, Bergstrom received a degree in architecture from the Massachusetts Institute of T4echnology (MIT) In 1899 and moved to Los Angeles, CA in 1901.

In 1905, Parkinson formed a partnership with G. Edwin Bergstrom that lasted ten years. The firm of Parkinson & Bergstrom designed numerous public and private buildings throughout Southern California and designed many of the major office and commercial buildings erected in downtown Los Angeles during this period. Among these were the original Bullock's Department Store (1906), the Pacific Mutual Building (1908), Los Angeles Athletic Club (1911), and the original Broadway Department Store (1913). The firm designed numerous buildings along the city's financial corridor of Spring Street including the Alexandria Hotel (1906), Security Trust and Savings Bank (1907), the Rowan Building (1910), Washington Building (1912), and the Security First National Bank (1915).

Five years after Bergstrom left to establish his own practice. From 1915 to 1941, Bergstrom held his offices in Rooms #1127-1129 of the City National Bank Building at 453 South Spring Street. In 1921, Bergstrom founded the Allied Architects Association, which was a coalition of Los Angeles-based architects to design public buildings. Some of the buildings designed by the group included the Los Angeles County-USC Medical Center (1933), Bob Hope Patriotic Hall (1925), and the Los Angeles Hall of Justice (1925). From 1926-1938, Bergstrom served as the AIA's treasurer, and served two terms as AIA president from 1939-1941. In 1941, Bergstrom was instrumental in bringing the AIA National Convention to California, held at Yosemite National Park and Los Angeles. In 1940, he moved to the East Coast to design and supervise the construction of the pentagon. In 1942, Bergstrom resigned as Chief Architect and was taken over by Whitman. He moved to the County of Orange in the later part of his life and passed away in Claremont, CA in 1955.

***B10. Significance (Continued…):**

EVALUATION

This evaluation utilizes the framework for historic resource assessments described in the *Los Angeles Unified School District Historic Context Statement* (historic context statement), which "defines themes of significance, eligibility standards, and related property types. Properties sharing a theme of significance are then assessed consistently, in comparison with resources that share similar physical characteristics and historical associations."

In addition to each of the applicable federal, state, and local designation criteria, several evaluation frameworks and their associated eligibility standards and integrity thresholds were identified and applied to this evaluation. These evaluation frameworks relate specifically to the themes of *Pre–1933 Long Beach Earthquake School Plants, 1910-1932*; and *Educating the Baby Boom: The Postwar Modern, Functionalist School Plant, 1945-1969*. These themes were used to analyze buildings on the campus, which primarily were built or substantially altered during these periods. Buildings at Fairfax High School were evaluated using these frameworks for potential eligibility both individually and as contributors to a potential historic district. Additionally, the school was evaluated using the *LAUSD and the Civil Rights Movement, 1954-1980* context theme. Finally, campus buildings that date to the 1920s were evaluated using the *Spanish Colonial* context theme, and buildings that date to the 1960s were evaluated using the *Late Modern* context theme.

INDIVIDUAL ASSESSMENT

The buildings and features of the Fairfax High School campus have been considered for their potential individual eligibility for listing in the National Register, California Register, and/or designation as a City of Los Angeles HCM using applicable federal, State, and local designation criteria and context themes from the *Los Angeles Unified School District Historic Context Statement* (historic context statement). As a result, two (2) buildings on the Fairfax High School campus, the Auditorium Building and the Administration and Classroom Building, appear individually eligible for listing in the State and local registers.

Auditorium Building

Criterion 1/1

Constructed in 1924, the Auditorium Building is associated with the *Pre-1933 Long Beach Earthquake School Plants* context theme of the historic context statement. As outlined in the context theme, the Auditorium Building is a rare pre-1933 building that was designed in a popular period-revival style of the period, the Spanish Colonial Revival style, and designed by prominent architects of the era, Parkinson & Parkinson. At the time of its construction, Fairfax High School was developed as part of a school district expansion program, and brought many new residents to the Fairfax area, who sought to take advantage of the new school. The school's early founding was also associated with the establishment of the Jewish community in the area. This was partially due to the lack of restrictive housing covenants in the area, and the Fairfax-Beverly area increasingly became associated with Fairfax High School. The school became the first public educational school on the West Coast to teach Modern Hebrew and continued to be a majority-Jewish school into the 1960s. Although the building's east and west wings were removed for seismic stability in the 1960s, the Auditorium Building retains sufficient character-defining features to reflect its significance at the State and local level as a rare pre-1933 building that reflects the design ideals of its era.

The Auditorium Building appears individually eligible for listing in the California Register and for designation as a City of Los Angeles HCM under Criterion 1/1 as a pre-1933 school associated with the establishment and growth of the Jewish community in Beverly-Fairfax, with a period of significance of 1924, when the building was constructed. Due to integrity considerations, the building does not appear eligible for listing in the National Register.

Criterion 2/2

No information was found to suggest that the Auditorium Building was associated with any historic personages, nor that any other individuals of historic significance were associated with the building. Therefore, the Auditorium Building does not appear eligible for individual listing under Criterion 2/2.

Criterion 3/3

The Auditorium Building is associated with the *Mission Revival and Spanish Colonial Revival* context theme of the historic context statement. The Auditorium Building was designed in the Spanish Colonial Revival style by master architects Parkinson & Parkinson in 1924, during the apex of the style's popularity.

*B10. Significance (Continued…):

Auditorium Building

Criterion 3/3 (Contined)

Correlating with character-defining features identified in the context theme, the building has stucco-clad walls; low-pitched gable roof with red clay tiles; shallow eaves; arched openings; and polychromatic tile. Additional character-defining features of the building that reflect this style include its rotunda with Roman lattice; stylized pilasters; stenciled wood trusses, rafters, and purlins; and wrought iron balustrade, among other features. Moreover, Parkinson & Parkinson are considered master architects, known for their work on institutional and municipal buildings throughout Southern California. The exceptional design and workmanship of the Auditorium Building is expressed from its overall design to its small details.

The Auditorium Building appears individually eligible for listing in the California Register and for designation as a City of Los Angeles HCM under Criterion 3/3 as an excellent example of the Spanish Colonial Revival institutional building designed by master architects Parkinson & Parkinson, with a period of significance of 1924, when the building was constructed. Due to integrity considerations, the building does not appear eligible for listing in the National Register.

Administration and Classroom Building

Criterion 1/1

The Administration and Classroom Building at Fairfax High School is significant as the location of Project 10, a groundbreaking program designed for LGBT students in public school. Project 10 was started in 1984 by Dr. Virginia Uribe, a science teacher and counselor, as a dropout prevention program to help LGBT high school students access support services and education. Project 10 was located out of Dr. Uribe's science classroom on the third floor of the building. It the first program of its kind and, despite some backlash from members in the community, expanded to additional schools in the Los Angeles Unified School District as well as other school districts, including Santa Monica-Malibu and San Francisco. Project 10 was also the inspiration behind the FAIR Education Act, which is committed to portraying the cultural and racial diversity of American society accurately and equitably. As the home of Project 10 and the LGTB rights movement in the Los Angeles Unified School District, and subsequently other schools, Fairfax High School is an institution that played a significant role in the civil rights and social life of the LGBT Community.

The Administration and Classroom Building appears individually eligible for listing in the California Register and for designation as a City of Los Angeles HCM under Criterion 1/1 for its association with Project 10 and LGBT social history, with a period of significance of 1984, when Project 10 was founded. Because the building's period of significance is not yet 50 years of age, it does not appear eligible for listing in the National Register.

Criterion 2/2

The Administration and Classroom Building at Fairfax High School is significant for its association with Dr. Virginia Uribe, who founded Project 10 in the building. Dr. Virginia Uribe played a significant role in the LGBT movement for high school students. Dr. Uribe began teaching at Fairfax High School in 1959, while hiding her sexual orientation, as being gay or lesbian was grounds for dismissal. Dr. Uribe founded Project 10 in 1984, a dropout prevention program and LGBT support services organization to provide a safe space for LGBT students. After the program expanded to other schools, Project 10 received negative backlash, but Dr. Uribe continued her work, and in 1986, she founded the nationwide non-profit, Friends of Project 10, Inc. to offer supportive services to LGBT youth, educators, parents, and community members. Through her career, she wrote various papers about LGBT education and received numerous awards and honors for her work as an LGBT liberation and rights activist. Due to Dr. Uribe's work, most LAUSD schools now have supportive services for LGBT youth. Dr. Uribe taught in the Los Angeles Unified School District for 42 years and her legacy has impacted state laws and continues to provide support for LGBT students beyond the Los Angeles Unified School District.

The Administration and Classroom Building appears individually eligible for listing in the California Register and for designation as a City of Los Angeles HCM under Criterion 2/2 for its association with Dr. Virginia Uribe, with a period of significance of 1984, when Project 10 was founded. Because the building's period of significance is not yet 50 years of age, it does not appear eligible for listing in the National Register.

***B10. Significance (Continued…):**

Administration and Classroom Building

Criterion 3/3 (Contined)

The Administration and Classroom Building was designed by the architectural firm of Albert C. Martin & Associates in 1968 as part of a larger campus-wide redesign effort. As such, the architectural design of the Administration and Classroom Building is better evaluated as part of a larger potential historic district.

HISTORIC DISTRICT ASSESSMENT

The National Park Service defines a *historic district* as "a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development." Additionally, school campuses are noted as a potential example of a historic district. School campuses in the United States, especially those built in the 20th century often have definable spaces and unified site plans that were constructed as institutional complexes for educational purposes. The combination of space and purpose reflects individual school buildings' interconnectedness and functionality as a larger grouping.

Because the Fairfax High School campus contains a grouping of related buildings and features and was originally developed as a high school, consideration of this property as a potential historic district is an appropriate analytical framework for its evaluation.

Potential Historic District

The buildings and features of the Fairfax High School campus have been considered collectively for their potential eligibility for listing in the National Register, California Register, and/or for designation as a City of Los Angeles HCM.

As a result, HRG identified a potential historic district on the campus, that consists of nine (9) contributing buildings, three (3) contributing structures, and three (3) contributing site features with a period of significance of 1967 to 1969. Contributors to the potential historic district are the Auditorium Building, Social Hall, Administration and Classroom Building, Cafeteria Building, Transformer (Stage/Utility Building), Gymnasium Building, Ticket Booth, Utility Building, Shop Building, Arcades #1 and #2, and Courtyards #1, #2, and #3.

Criterion A/1/1

Fairfax High School had a largely white, Jewish population from the 1920s until its boundaries were redrawn in the 1960s. In late 1968, following community activism regarding inequality and segregation at the Fairfax and Los Angeles High Schools, Fairfax High School was one of the first schools to have its district redrawn to encourage desegregation. Championed by local parents of the Neighbors Unlimited group, the impetus behind the school board's decision to redraw school lines was a grass-roots effort led by families of students. As noted within the historic context statement's theme *LAUSD and the Civil Rights Movement, 1954-1980*, the initial period of school desegregation in the district was an era "of intense debate and activism on the part of community members, parents, politicians, and jurists, as well as teachers and administrators." Fairfax High School is a notable example of community activism, and the site of major initiatives for desegregation.

Fairfax High School appears eligible for listing as a potential historic district in the National Register, California Register, and for designation as a City of Los Angeles HCM under Criterion A/1/1 for its association with the desegregation of schools, with a period of significance of 1967, when community activism demanded the school district redraw school boundaries, to 1969, the first year with new desegregated boundaries.

Criterion B/2/2

No information was found to suggest that the potential historic district was associated with any historic personages, nor that any other individuals of historic significance were associated with the district. Although Dr. Virginia Uribe was a significant professor and founder of Project 10 at Fairfax High School, her significance is best represented for its association with the individually eligible Administration and Classroom Building, where Project 10 meetings were held, rather than the larger historic district. Therefore, the potential historic district does not appear eligible for listing in the National Register, California Register, and for designation as a City of Los Angeles HCM under Criterion B/2/2.

***B10. Significance (Continued…):**

Potential Historic District

Criterion C/3/3

Fairfax High School was redesigned in the 1960s by the architectural firm of A. C. Martin & Associates. The campus redesign was completed in the Late Modern style of architecture and constructed between 1967 and 1969. The campus redesign included buildings as well as designed landscaping and hardscaping features, such as central courtyards with raised concrete planters, stairs, and arcades. Buildings designed by the firm of Albert C. Martin & Associates during this period are not excellent or distinctive examples of a style and are not notable examples of work within the firm's greater oeuvre. These buildings are intact but otherwise not distinguishable examples of the Late Modern style of architecture. Therefore, the potential historic district does not appear eligible for listing in the National Register, California Register, or for designation as a City of Los Angeles HCM under Criterion C/3/3 for architecture.

Table 1. Historic District Contributors

Current Feature Name	Year Built	Integrity	Criteria	Period of Significance	Contributing Level
Auditorium Building	1924	Fair	A/1/1	1967-1969	Primary
Social Hall (Da Poetry Lounge)	1942	Fair	A/1/1	1967-1969	Secondary
Courtyard #1	1968	Good	A/1/1	1967-1969	Tertiary
Arcade #1	1968	Good	A/1/1	1967-1969	Tertiary
Administration and Classroom Building	1968	Good	A/1/1	1967-1969	Primary
Courtyard #2	1968	Good	A/1/1	1967-1969	Tertiary
Arcade #2	1968	Good	A/1/1	1967-1969	Tertiary
Cafeteria Building	1968	Fair	A/1/1	1967-1969	Secondary
Transformer (Stage/Utility Building)	1968	Good	A/1/1	1967-1969	Tertiary
Courtyard #3	1968	Good	A/1/1	1967-1969	Tertiary
Gymnasium Building	1969	Good	A/1/1	1967-1969	Secondary

Shop Building	1969	Good	A/1/1	1967-1969	Secondary

***B10. Significance (Continued…):**

INTEGRITY

Auditorium Building

Location: The Auditorium Building remains in its original location on the campus. Therefore, it retains integrity of *location*.

Design: The Auditorium Building retains many of its character-defining features from the time of its erection in 1924. Designed in the Spanish Colonial Revival style by Parkinson & Parkinson, the building is highly intact with a tiered, octagonal rotunda connected to the main auditorium. Features include clay barrel tile roofing, glazed ceramic tile, Corinthian colonettes, arches, and trussed ceiling. Despite some alterations, including the removal of two wings, the extant Auditorium Building retains a majority of the essential physical features reflecting its original design. However, the east and west wings of the building were both demolished in the 1960s, altering the integrity of design. Therefore, the integrity of *design* has been compromised.

Setting: The Auditorium Building is located in the central region of the school property. Although additional buildings have been added to the campus since the time of its erection, the property continues to function as a public high school. Therefore, it retains integrity of *setting*.

Materials: The Auditorium Building retains most of its original materials. Original materials include the building's expressed board formed concrete construction, clay tiles roofs, glazed tile decoration, wood sash casement windows, wrought iron balustrades, and stenciled wood trusses, rafters, and purlins, among others. Although the east and west wings of the building were demolished in the 1960s, the building's material components are still thoroughly expressed in the extant construction. Therefore, it retains integrity of *materials.*

Workmanship: The Auditorium Building retains the physical evidence of crafts of a particular culture or people during a given period in history. This includes the building's specific octagonal and concrete construction, choice of a period-revival style of architecture popular at the time (Spanish Colonial Revival), and use of other accessible materials such as wood beams for the ceiling. Moreover, most exterior cladding and even detail work have been retained. The building continues to retain substantial physical evidence of period construction techniques, including finishes and design elements, such as the use of arcades and a truss ceiling, that reflect the character and identity of the building. Therefore, it retains integrity of *workmanship.*

Feeling: The Auditorium Building retains most of the character-defining features of its original construction, including a central rotunda, large auditorium, and extensive ornamentation. Because it retains all the preceding aspects, it continues to express the aesthetic or historic sense of a 1924 Spanish Colonial Revival school building. Therefore, it retains integrity of *feeling*.

Association: Association is the direct link between an important historic event or person and a historic property. Because the Auditorium Building retains integrity of *location*, *setting*, *materials, workmanship,* and *feeling*, it continues to convey its direct link to 1920s Spanish Colonial Revival style institutional architecture by noted architects Parkinson & Parkinson. Therefore, it retains integrity of *association*.

Administration and Classroom Building

Location: The Administration and Classroom Building remains in its original location on the campus. Therefore, it retains integrity of *location*.

Design: The Administration and Classroom Building retains many of its character-defining features from the time of its erection in 1967-1968. Designed in the Late Modern style, the building continues to reflect its original design with its central courtyard, simple massing, and symmetrical composition. The building features large volumes, semi-elliptical arches, central courtyard, and rounded corners that reflect the Late Modern design aesthetic. Despite some alterations, the Administration and Classroom Building retains a majority of the essential physical features reflecting its original design. Therefore, it retains integrity of *design*.

Setting: The Administration and Classroom Building is located in the northeastern region of the school property. Although additional buildings have been added to the campus since the time of its erection, the property continues to function as a public high school. Therefore, it retains integrity of *setting*.

Materials: The Administration and Classroom Building retains most of its original materials. Original materials include the building's concrete construction, metal windows, and glazed tile. Although some features have been replaced over time, such as storefront doors, the building continues to express its original materials. Therefore, it retains integrity of *materials.*

***B10. Significance (Continued…):**

INTEGRITY (Continued)

Administration and Classroom Building (Continued)

Workmanship: The Administration and Classroom Building retains the physical evidence of crafts of a particular culture or people during a given period in history. This includes the building's specific Late Modern design with the use of large volumes and specific materials popular at the time, such as concrete and expanses of windows. The treatment of concrete also reflects workmanship of the time; concrete is scored and board-formed, two methods that accentuate the use of this material. These features reflect the character and identity of the building. Therefore, it retains integrity of *workmanship*.

Feeling: The Administration and Classroom Building retains most of the character-defining features of its original construction, including its large volumes, semi-elliptical arches, and open, central courtyard. Because it retains all the preceding aspects, it continues to express the aesthetic or historic sense of a Late Modern 1960s school building. Therefore, it retains integrity of *feeling*.

Association: Association is the direct link between an important historic event or person and a historic property. Because the Administration and Classroom Building retains integrity of *location*, *design*, *setting*, *materials, workmanship,* and *feeling*, it continues to convey its direct link to 1960s Late Modern style of architecture. Therefore, it retains integrity of *association*.

Potential Historic District

Location: The buildings constructed during the period of significance remain in their original locations in the campus. Therefore, the campus retains integrity of *location*.

Design: The campus retains the buildings, arcades, and courtyards that were extant during the desegregation of the school. These include the Auditorium Building, Social Hall, Administration and Classroom Building, Cafeteria Building, Transformer (Stage/Utility Building), Gymnasium Building, Ticket Booth, Utility Building, Shop Building, Arcades #1 and #2, and Courtyards #1, #2, and #3. These buildings/structures/features retain most of their character-defining features. Despite some alterations, a majority of the essential physical features reflecting the original design and organization of the property as a school remain intact within the potential historic district. Therefore, the campus retains integrity of *design*.

Setting: The potential historic district is located in the central region of the school property. The property continues to function as a public high school. The surrounding area of the Beverly-Fairfax neighborhood has a whole has experienced some development but remains a commercial and residential area. Therefore, the campus retains integrity of *setting*.

Materials: The potential historic district retains most of its original materials. Contributors typically retain some physical elements from the period of significance, including original concrete panel exteriors, glazed tiles, and some original windows and doors. Therefore, the campus retains integrity of *materials.*

Workmanship: The potential historic district retains the physical evidence of crafts of a particular culture or people during a given period in history. This includes the contributors' construction methods and design choices, such as the wood trusses in the Administration Building and later large volumes and design features that reflect the Late Modern style of architecture. Moreover, most exterior cladding and even detail work have been retained. Overall, the buildings continue to retain substantial physical evidence of period construction techniques, including finishes and design elements, that reflect the character and identity of the potential historic district. Therefore, the campus retains integrity of *workmanship*.

Feeling: The potential historic district retains most of the character-defining features of its original construction, including representative building types as well as spatial relationships and outdoors spaces common to the late 1960s. during the period of desegregation. Because it retains all the preceding aspects, it continues to express the aesthetic or historic sense of a high school. Therefore, the campus retains integrity of *feeling*.

Association: Association is the direct link between an important historic event or person and a historic property. Because the campus retains integrity of *location*, *design*, *setting*, *materials, workmanship,* and *feeling*, it continues to convey its direct link to a newly desegregated campus. Therefore, the campus retains integrity of *association*.

1 Project Description

The Los Angeles Unified School District (LAUSD or District) proposes to complete a modernization project of the campus of Fairfax High School (HS). Fairfax HS is an approximately 23.63-acre rectangular-shaped campus at 7850 Melrose Avenue in the City of Los Angeles (City), California. The campus currently comprises a grades 9-12 traditional high school program, the Police Academy Magnet, and the Visual Arts Magnet. The campus is bordered by Melrose Avenue to the north, Genesee Avenue to the east, Rosewood Avenue to the south and Fairfax Avenue to the west. Enrollment at the campus for the 2022–2023 school year was 1,640 students, and the planned enrollment for the campus is approximately 1,800 students. The Project is not designed or expected to increase the current capacity of the campus.

Most of the buildings are in the north and central portions of the campus, with sports fields occupying the southern portion of the campus. The campus has 11 permanent buildings with 111 classrooms, and two portable buildings with an additional two classrooms, for a total of 113 classrooms on the campus. The buildings were constructed between 1924 and 2011. The Auditorium Building was constructed in 1924 and is the central feature of the northern portion of the campus, setback from Melrose Avenue by Arcade No. 1 and Courtyard No.1. To the east of the Auditorium Building is the Administration and Classroom Building (1968), and to the west is the Shop Building (1968). The Cafeteria Building (1968) is to the south of the Administrative and Classroom Building, and the Gymnasium Building (1969) is south of the Auditorium Building. Additional buildings include the Utility Building (1969), the Ticket Booth (1969), the Social Hall/Da Poetry Lounge (1942), Classroom Buildings A and B (2004), and the Stadium Grandstand and Restroom (2011).

The history of the campus and its current structures are documented in a Historical Resources Evaluation Report that LAUSD completed for the campus.[1] The Auditorium Building and the Administration and Classroom Building have been determined to be individually eligible for listing in state and local registers. Additionally, the campus is eligible for listing as a historic district under the national, California, and City criteria. The potential historic district consists of nine contributing buildings, three contributing structures, and three contributing site features (Courtyards Nos. 1-3 and associated hardscape and landscaping) with a period of significance of 1967 to 1969. Contributors to the potential historic district are the Auditorium Building, Social Hall, Administration and Classroom Buildings, Cafeteria Building, Transformer (Stage/Utility Building), Gymnasium Building, Ticket Booth, Utility Building, Shop Building, Arcades Nos. 1 and 2, and Courtyards Nos. 1, 2, and 3.

2 Project Background

Fairfax HS is in the Hollywood Community Plan Area in the city of Los Angeles. The school has been identified under the LAUSD Board of Education's School Upgrade Program (SUP) as one of the schools most in need of critical upgrades and improvements. The goal of the LAUSD SUP is to improve student health, safety, and education through the modernization of school facilities. The core principles of comprehensive modernization Project scoping are as follows:

[1] Historic Resources Group, "Fairfax High School Historic Resources Evaluation Report," Prepared for Los Angeles Unified School District, Office of Health and Safety, 2022.

1. The buildings identified to be seismically vulnerable must be addressed. These buildings will be retrofitted, modernized, and/or demolished and replaced depending on the level of effort required to address the seismic vulnerabilities, the historic context of the building/site, and the approach that best ensures compliance with Division of the State Architect (DSA) requirements.
2. The buildings, grounds, and site infrastructure that have significant/severe physical conditions that already do, or are highly likely in the near future, to pose a health and safety risk, or negatively impact a school's ability to deliver the instructional program and/or operate should be addressed. The broken or failing systems, infrastructure, and/or components in these buildings will be repaired and/or replaced. The comprehensive modernization project will not significantly modernize and update the building as a whole, nor will the project demolish and replace with a new building with a few exceptions. The exceptions to this principle are ancillary buildings such as, but not limited to, lunch shelters, storage units, maintenance and operations (M&O) buildings, and outdated and inaccessible federal buildings.
3. The District school's reliance on relocatable buildings, especially for K-12 instruction, should be significantly reduced.
4. Necessary and prioritized upgrades must be made throughout the school site in order to comply with the program accessibility requirements of the Americans with Disabilities Act (ADA) Title II Regulations, and the provisions of the Modified Consent Decree.
5. The exterior conditions of the school site will be addressed to improve the visual appearance including landscape, hardscape, and painting.
6. The interior of classrooms and adjacent interior corridors that would otherwise not be addressed will be improved. Improvements may include new interior paint, improvements to flooring systems, and upgraded permanent classroom fixtures such as window treatments/blinds and whiteboards.

3 Proposed Project

The proposed Project involves building replacement, renovation, modernization, and reconfiguration on the Fairfax HS campus as part of the SUP. The scope consists of the modernization of the approximately 23.63 acres of the Fairfax HS campus to provide facilities that are safe, secure, and aligned with the instructional program. The Project is designed to address the most critical physical concerns of the building and grounds at the campus while providing renovations, modernizations, and reconfigurations. Specifically, the proposed Project includes demolition of the existing Shop Building, Gymnasium, Utility Building, Ticket Office, and Relocatable Sanitary Building (Figure 3-1), and the construction of a new gymnasium, specialty classrooms, outdoor physical education courts, M&O facilities, and art gallery building (Figure 3-2). The proposed Project also includes exterior painting of existing buildings, and various landscape and hardscape improvements (Figure 3-3), and other accessibility upgrades as required.

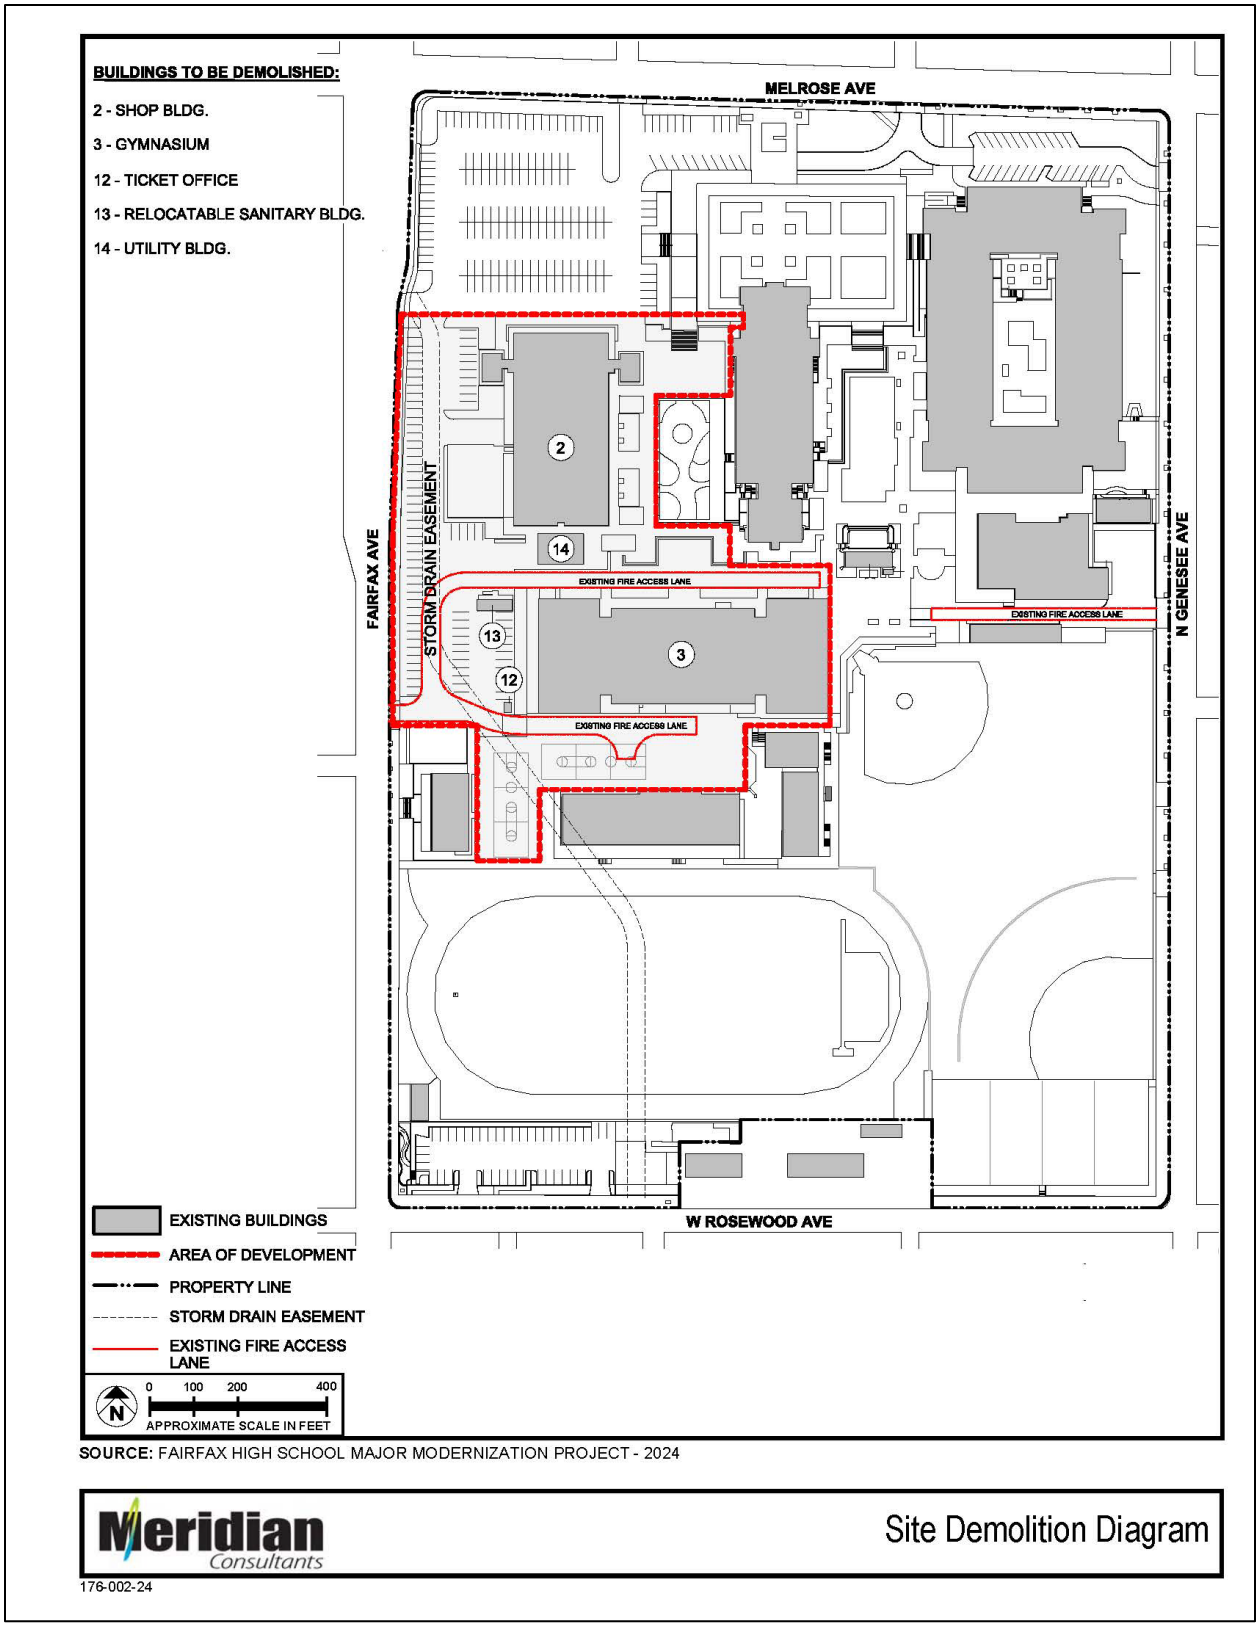

Figure 3-1. Site demolition diagram.

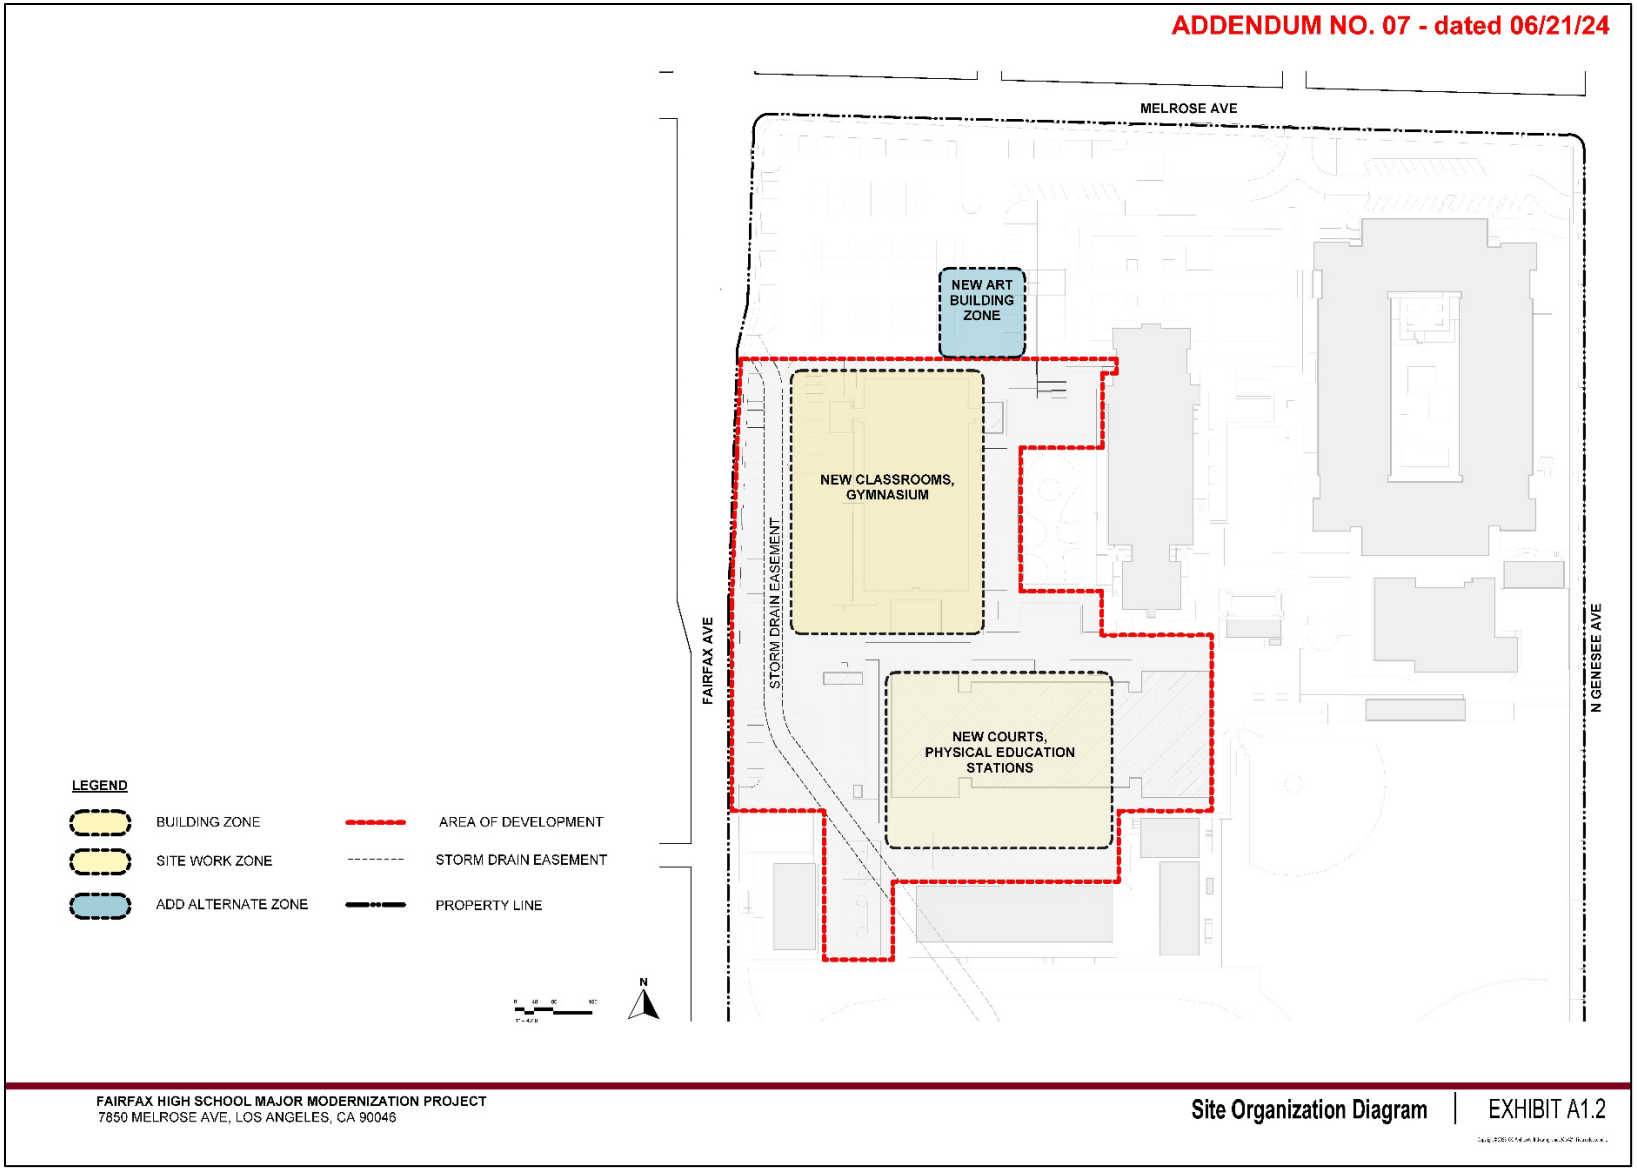

Figure 3-2. Proposed Project site plan.

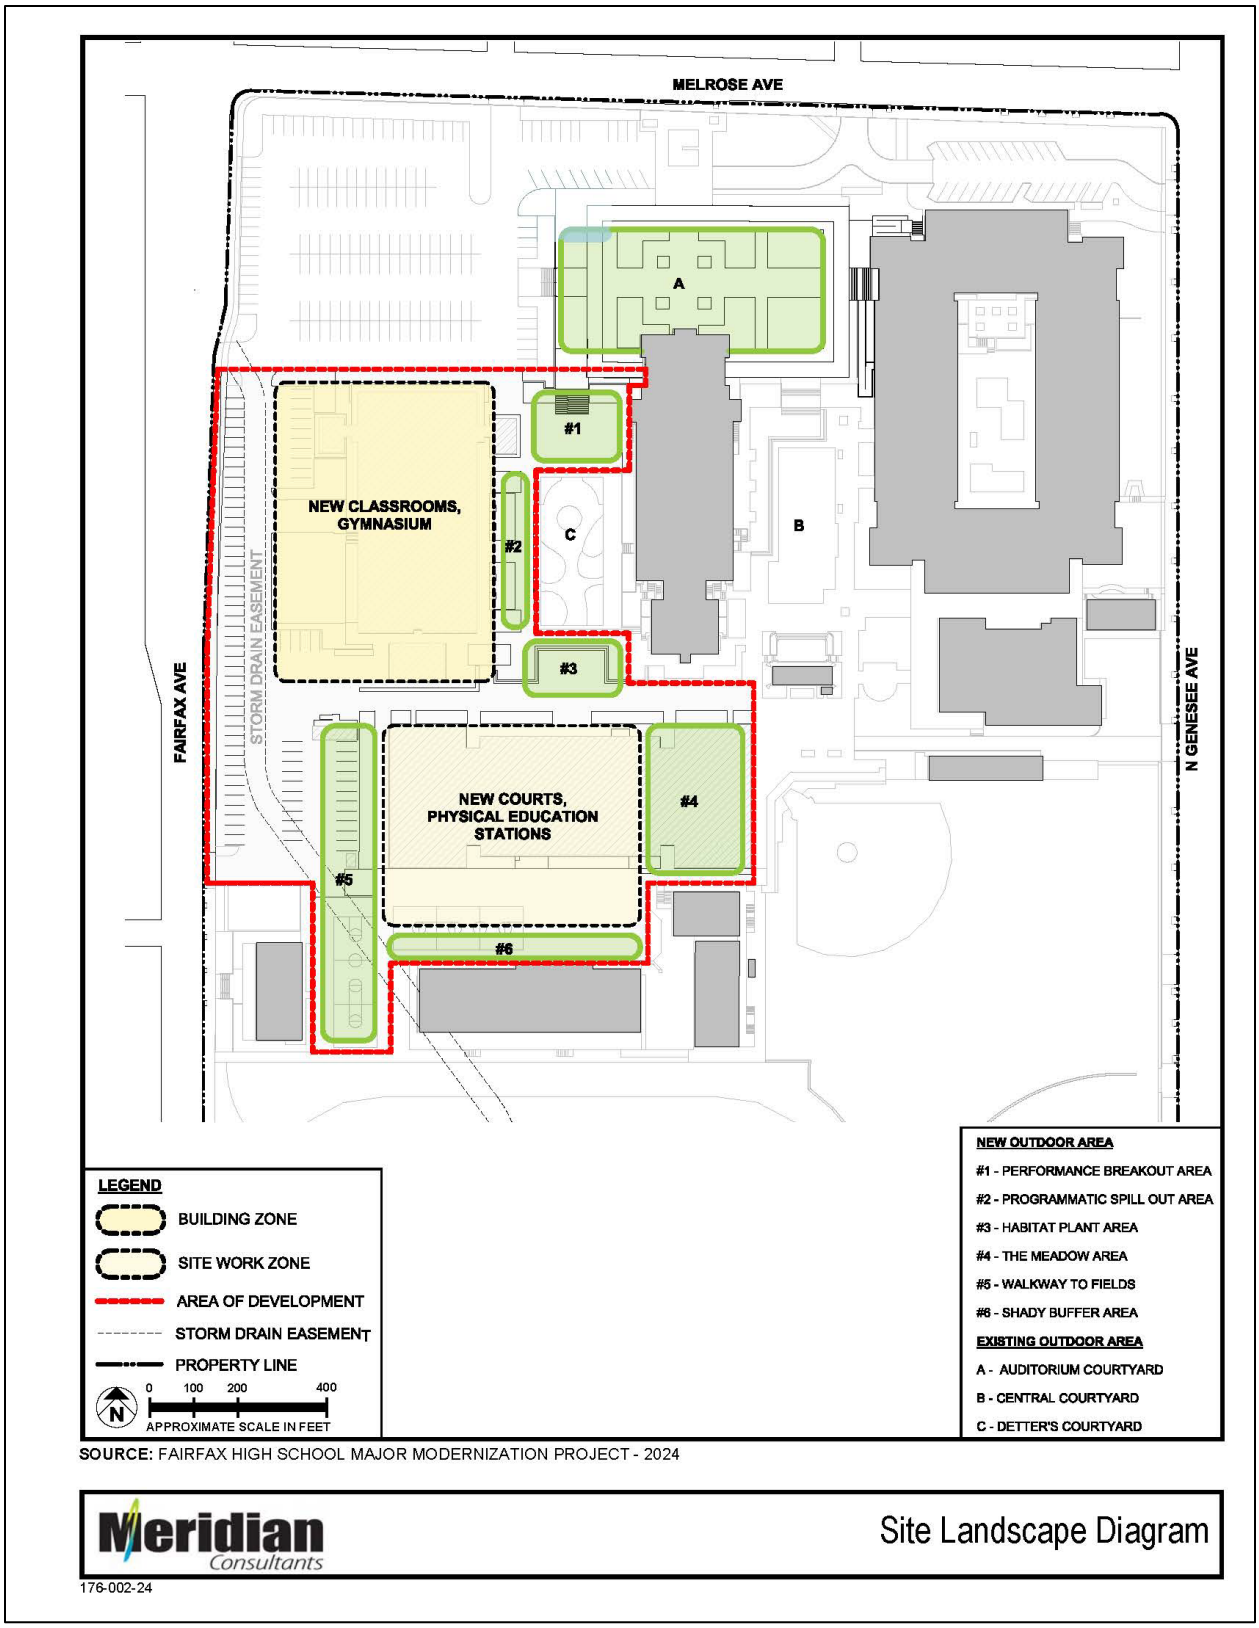

Figure 3-3. Site landscape diagram.

3.1 Campus Improvements

The proposed Project would include the changes to the campus buildings identified in Figure 3-2.

3.2 Demolition and Removal

The proposed Project includes the demolition and removal of the Shop Building, Gymnasium, Utility Building, Ticket Office, and Relocatable Sanitary Building, including foundations and below-grade and above-grade utility infrastructure associated with these buildings and structures (Figure 3-1). Interim facilities would be provided, as required.

Unused utilities would be capped and abandoned-in-place if they do not conflict with any interim or permanent construction within the Development Zone. All existing site easements would be maintained, and HVAC services, wet/dry utilities, communication services, connectivity services, fire alarms, public address/intercom systems, and intrusion detection systems in active areas of campus would be maintained during demolition and construction.

3.3 New Construction

The proposed Project includes the construction of a new gymnasium building, approximately five specialty classrooms and support spaces, outdoor physical education courts, and art gallery building. The new gymnasium building would house team rooms and locker rooms, as well as a public entrance and lobby providing access to the building from the west parking area along Fairfax Avenue. The five new classrooms will host Ceramics, Drama, Instrumental Music, Sports Medicine, and Dance classes. These programs may be incorporated into the Gymnasium building or be housed in a separate wing or adjacent building. The outdoor physical education courts would be composed of approximately six basketball/volleyball courts, adjacent areas with trees and seating, and Physical Education equipment storage facilities. The proposed Project would include the construction of new M&O facilities, which would be close to the loading area, trash area, and the school's service entrance. Finally, the Project will include the construction of a 2,939.85 square foot (sf) art gallery building, with the 1,598 sf used as gallery space.

3.4 Building Upgrades

The proposed Project also includes exterior painting of all remaining buildings to provide a uniform appearance; associated landscape, hardscape, parking improvements, and related infrastructure upgrades including, but not limited to, sanitary sewer, water, storm water, and electrical utilities; and improvements related to requirements from the ADA, DSA, California Environmental Quality Act (CEQA), Department of Toxic Substances Control, or other improvements to ensure compliance with local, state, and federal requirements.

Specifically, the proposed Project would include the changes to the campus buildings shown in Figure 3-2.

3.5 Site Access, Circulation, and Parking

The proposed Project does not include any changes to pedestrian circulation, traffic circulation and parking, or student drop-off and pick-up areas. The proposed Project would maintain a fully functional campus during each construction phase, which includes efficient and safe circulation throughout the campus for students and staff (including directional signage). The Melrose Trading Post flea market would continue to operate each Sunday throughout construction. Currently, 260

parking spaces exist on site, and the proposed Project would maintain approximately the same number of parking spaces.

As shown in Figure 3-4, within the Development Zone there are approximately 106 trees. No protected trees are in the Development Zone, and it is not anticipated that the proposed Project would result in any impacts to protected trees.

3.6 Landscaping

The proposed Project will include removal and replacement of existing landscaping and hardscape areas within the footprint of the campus. All landscaping and irrigation systems would comply with LAUSD School Design Guidelines, and Collaborative for High Performance Schools criteria would be implemented where appropriate. Plant material would comply with the LAUSD approved plant list and plantings would be placed to improve the oil quality and water holding capacity. New canopy and accent trees would be installed to increase canopy coverage and provide shade while complimenting the aesthetics of hardscape areas throughout the campus.

A tree survey was conducted for the Project site by Carlberg Associates in September 2022. The survey inventoried 370 existing trees on the campus. As shown in Figure 3-4, there are approximately 106 trees within the Development Zone. No protected trees are in the Development Zone, and it is not anticipated that the proposed Project would result in any impacts to protected trees. Although as many existing trees will be preserved as possible, it is probable that some will need to be removed to accommodate implementation of the proposed Project. Any required tree removal activities would follow the procedure outlined in the LAUSD Tree Trimming and Removal Procedure.[2] If removal of a significant tree (8 inches in diameter at 54 inches above grade) is required, a 1:1 replacement ratio would be required. If impacts to a protected tree are unavoidable and removal of the tree is required, a minimum 4:1 replacement ratio would be required, which is consistent with the City's replacement mitigation ratio.

As shown in Figure 3-3, the proposed landscape plan includes six new areas for outdoor learning and gathering spaces for students set in or surrounded by planted areas and trees, with amenities such as integrated seating, power, lighting, and data connectivity. Outdoor Area No. 1 would provide an outdoor performance breakout space for the Performing Arts programs. Outdoor Area No. 2 would provide an outdoor zone with programmatic spill out onto the campus with integrated site seating and a connection between Detter's Courtyard and the proposed new building. Outdoor Area No. 3 would provide a Habitat Plant Area offering a hands-on learning lab experience where students may experience native or pollinator plant environments. Outdoor Area #4 would be a multi-use outdoor environment that is primarily open lawn meant to be a place where students can sit on the grass informally as a hang-out space any time between activities and classes. Outdoor Area No. 5 would serve as a transition between the athletic courts and the west parking lot, and a walkway to the football field from the Gymnasium. Outdoor Area No. 6 would provide a green wall of plants and trees to screen the back of the bleachers, including site furniture for students to gather. The three existing courtyards are to be protected in place, with improvements such as updated irrigation and landscaping.

[2] All tree trimming and removal conducted on District property is required to adhere to the procedures described in the LAUSD Office of Environmental Health and Safety (OEHS) Tree Trimming and Removal Procedure. Compliance with this procedure will ensure that District activities will not conflict with any tree preservation policies while ensuring the protection of breeding and nesting habitat of protected birds. Written approval from the Director of OEHS, Director of Maintenance & Operations, Local District Superintendent, and School Principal is required before any protected tree is relocated or removed. For more information, please contact OEHS at (213) 241-3199 or the District Arborist at (213) 745-1422.

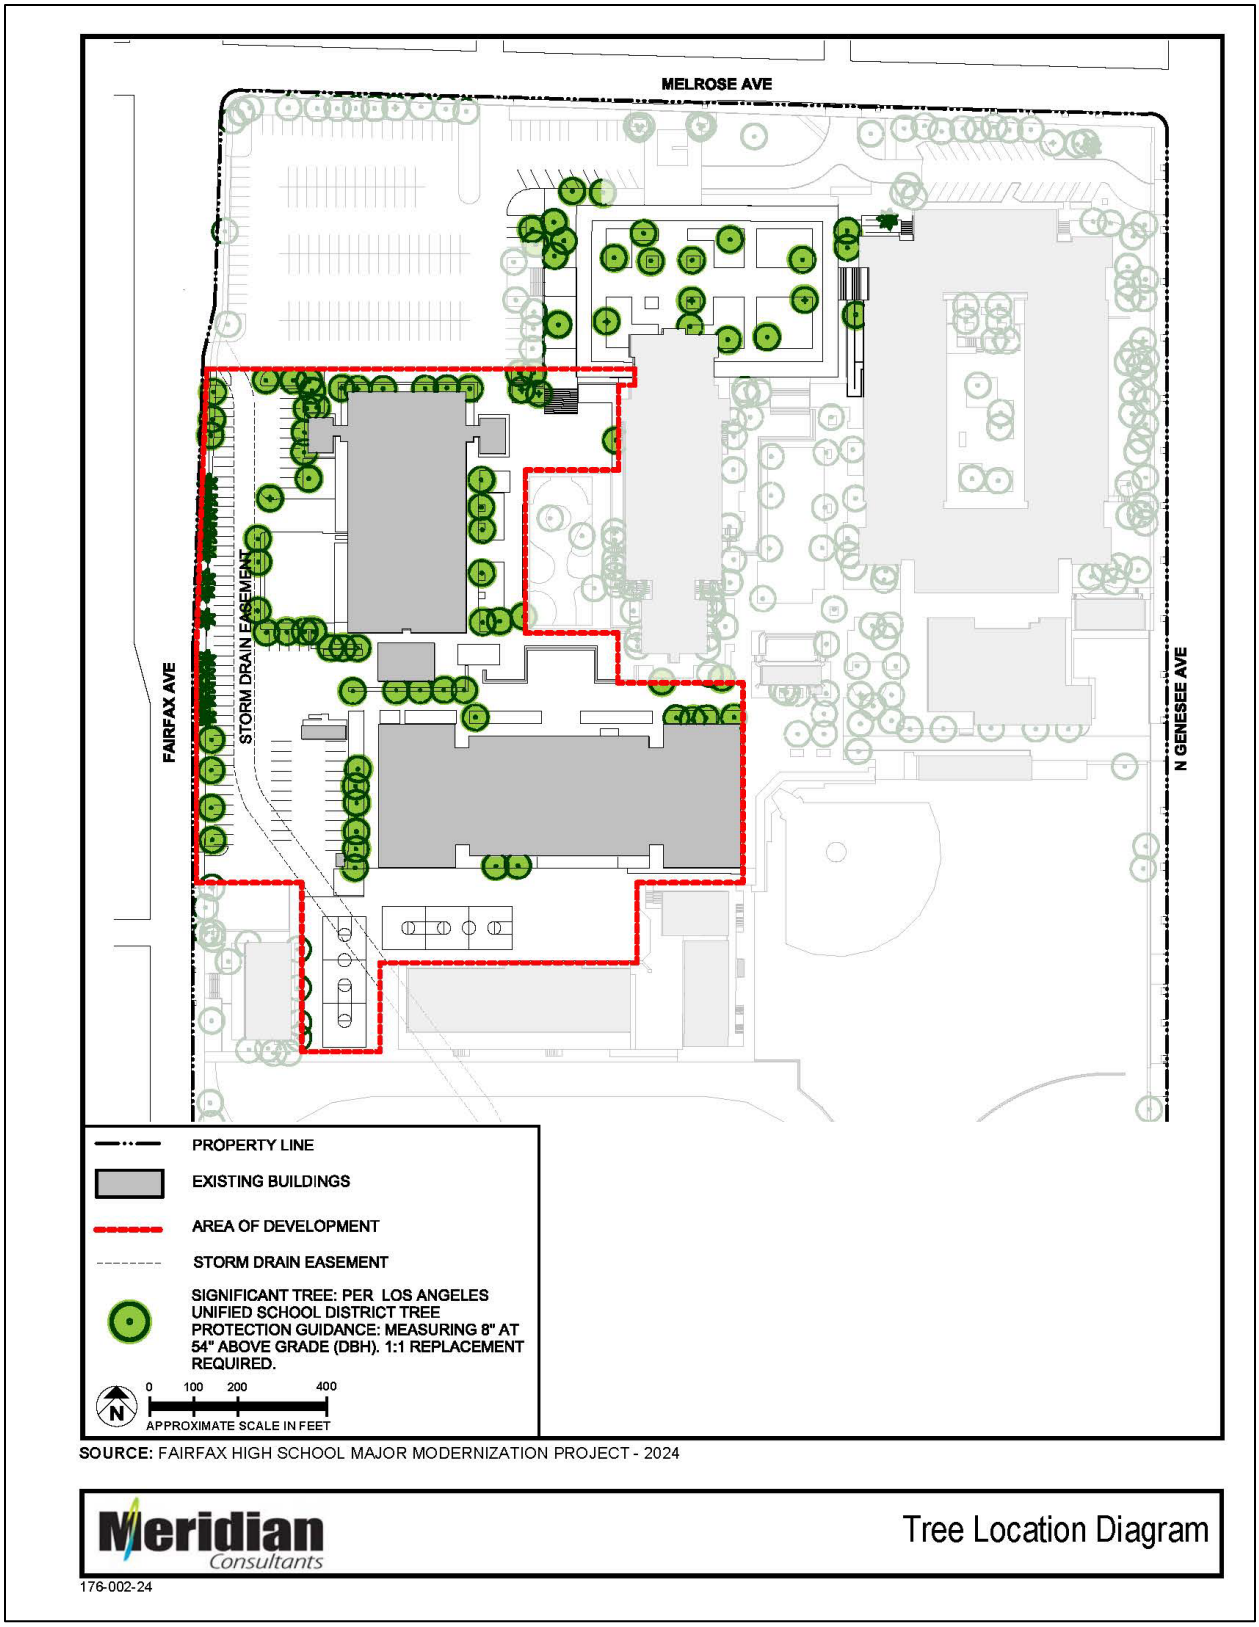

Figure 3-4. Tree location diagram.

4 Fairfax High School Project Site

The proposed modernization Project will result in the loss of the Gymnasium, Shop Building, and Utility Building. The proposed Project would also include various landscape and hardscape additions that will be associated with the new construction (Figure 3-2). Refer to Figure 3-1, Figure 3-3, and Figure 3-4 for views of the planned modernization Project, buildings, hardscape, and landscape orientation. The red border identifies the Area of Development (AOD) in each diagram.

4.1 Buildings Planned for Demolition and Associated Common Area Spaces (Detter's Courtyard)

4.1.1 Shop Building

The Shop Building is a one- and two-story Late Modern style building with a generally rectangular footprint, nearly symmetrical composition, and complex massing. It has a flat roof with a shallow parapet. The exterior walls are of board-formed concrete with a continuous frieze and transom panels of glazed ceramic tile. A second-story volume on the north end of the building has walls of cast concrete panels with projecting frames. The building is flanked by a pair of two-story pavilions with rectangular plans and rounded corners, and exterior walls finished in glazed ceramic tile. Fenestration consists primarily of rectangular, metal-framed windows with metal security grilles. There are multiple entrances consisting of pairs of flush metal doors under cantilevered flat canopies (Figure 4-1 through Figure 4-5).

Figure 4-1. Shop Building, facing southeast.

Figure 4-2. Shop Building, facing south.

Figure 4-3. Shop Building, facing west from Detter's Courtyard

Figure 4-4. Shop Building, facing northwest.

Figure 4-5. Shop Building, facing east.

4.1.2 Utility Building

The Utility Building is a single-story Late Modern style building with a rectangular footprint and rounded corners, symmetrical composition, and simple massing. The building reveals a flat roof with a shallow parapet. The exterior walls are of board-formed concrete with a frieze and transom panels of glazed ceramic tile. There is a pair of flush metal doors on the western facade, under a flat cantilevered canopy; the doors are accessible from a concrete loading dock and ramp. There is a metal roll-up door on the eastern façade (Figure 4-6 through Figure 4-8).

Figure 4-6. Utility Building, facing north.

Figure 4-7. Utility Building, facing east.

Figure 4-8. Utility Building, facing west.

4.1.3 Ticket Booth

The Ticket Booth is a one-story Late Modern building with a square footprint and rounded corners, and simple massing. It has a flat roof with a shallow parapet. The exterior walls are of board-formed concrete construction with a frieze and transom panels of glazed ceramic tile. The fenestration pattern consists of two rectangular service windows on the western façade (Figure 4-9).

Figure 4-9. Ticket Booth, facing east.

4.1.4 Gymnasium Building

The Gymnasium Building is a one-story Late Modern style building with a generally rectangular footprint, nearly symmetrical composition, and complex massing consisting of a taller central block flanked to east and west by lower wings with rounded corners. The building reveals low-slope roofs with shallow parapets. The exterior walls of the central block consist of vertical concrete panels with projecting frames; the exterior walls of the wings are of board-formed concrete with a frieze and spandrel panels of glazed ceramic tile. The primary entrance is asymmetrically located on the north facade and consists of a pair of glazed metal storefront doors with sidelights and transom lights, under a cantilevered flat canopy. Secondary entrances in the hyphens consist of pairs of flush metal doors; exterior doors on the wings consist of individual flush metal doors. Fenestration is limited to the wings and consists of rectangular metal-framed windows with metal security grilles (Figure 4-10 through Figure 4-14).

Figure 4-10. Gymnasium, facing south.

Figure 4-11. West wing of Gymnasium Building, facing southwest.

Figure 4-12. West wing, facing northwest.

Figure 4-13. East wing, facing northeast.

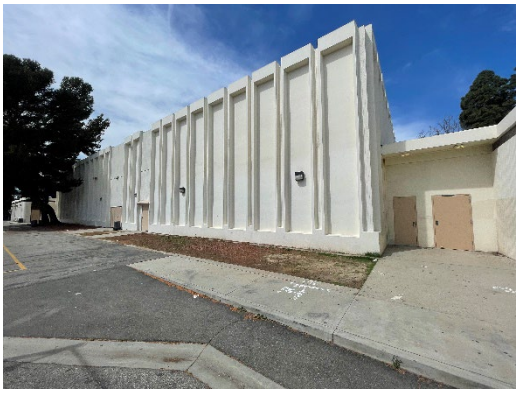

Figure 4-14. Gymnasium Building, facing northwest.

4.1.5 Detter's Courtyard

Detter's Courtyard is southwest of the Auditorium Courtyard, between the Auditorium Building to the east and the Shop Building to the west. It is accessed from the Auditorium by a wide concrete staircase. Detter's Courtyard consists of a series of brick and concrete terraces with planting beds, raised planters, paths, and lawns connected by wide concrete steps (Figure 4-15 through Figure 4-16).

Figure 4-15. Detter's Courtyard, facing south.

Figure 4-16. Detter's Courtyard, facing south.

Figure 4-18. Detter's Courtyard, facing from north end of shop building.

5 Regulatory Setting

5.1 California Environmental Quality Act[3]

15064.5. DETERMINING THE SIGNIFICANCE OF IMPACTS TO ARCHAEOLOGICAL AND HISTORICAL RESOURCES (a) For purposes of this section, the term "historical resources" shall include the following:

(1) A resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources [CRHR] (Pub. Res. Code § 5024.1, Title 14 CCR, Section 4850 et seq.).

(2) A resource included in a local register of historical resources, as defined in section 5020.1(k) of the Public Resources Code or identified as significant in an historical resource survey meeting the requirements section 5024.1(g) of the Public Resources Code, shall be presumed to be historically or culturally significant. Public agencies must treat any such resource as significant unless the preponderance of evidence demonstrates that it is not historically or culturally significant.

(3) Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be an historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets the criteria for listing on the [CRHR] (Pub. Res. Code § 5024.1, Title 14 CCR, Section 4852) including the following:

> *(A) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;*
>
> *(B) Is associated with the lives of persons important in our past;*
>
> *(C) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or*

[3] Association of Environmental Professionals, "2023 California Environmental Quality Act (CEQA) Statute and Guidelines" (Palm Desert, California, 2023).

(D) Has yielded, or may be likely to yield, information important in prehistory or history.

(4) The fact that a resource is not listed in, or determined to be eligible for listing in the [CRHR], not included in a local register of historical resources (pursuant to section 5020.1(k) of the Public Resources Code), or identified in an historical resources survey (meeting the criteria in section 5024.1(g) of the Public Resources Code) does not preclude a lead agency from determining that the resource may be an historical resource as defined in Public Resources Code sections 5020.1(j) or 5024.1.

(b) A project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment.

(1) Substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired.

(2) The significance of an historical resource is materially impaired when a project:

(A) Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the [CRHR]; or

(B) Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

(C) Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the [CRHR] as determined by a lead agency for purposes of CEQA.

(3) Generally, a project that follows the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings or the Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings (1995), Weeks and Grimmer, shall be considered as mitigated to a level of less than a significant impact on the historical resource.

(4) A lead agency shall identify potentially feasible measures to mitigate significant adverse changes in the significance of an historical resource. The lead agency shall ensure that any adopted measures to mitigate or avoid significant adverse changes are fully enforceable through permit conditions, agreements, or other measures.

(5) When a project will affect state-owned historical resources, as described in Public Resources Code Section 5024, and the lead agency is a state agency, the lead agency shall consult with the State Historic Preservation Officer as provided in Public Resources Code Section 5024.5. Consultation should be coordinated in a timely fashion with the preparation of environmental documents.

6 Setting

6.1 Environmental Setting

The Project area is at an elevation of approximately 220 ft above mean sea level in the Los Angeles Basin, a sedimentary depression currently composed of coastal lowlands at the intersection of the Peninsular and Transverse Ranges. The lowlands of the basin are composed of alluvium deposited by rivers and streams. The Los Angeles Basin can be further divided into four structural blocks: the northeastern block, the northwestern block, the central block, and the southwestern block.

The climate of the Los Angeles Basin is considered Mediterranean, characterized by mild, sunny winters, and warm, dry summers. Extreme heat and cold are suppressed by the Pacific Ocean and the coastal mountain ranges, which act as buffers from these climatic extremes. Urbanization has largely resulted in the planting of non-native vegetation such as lawn grass, hedges, and citrus and ornamental trees.

6.1.1 Prehistoric Setting

For nearly a century, archaeologists have developed chronological sequences to explain prehistoric cultural changes within all or portions of southern California.[4] Wallace devised a prehistoric chronology for the southern California coastal region based on early studies and focused on data synthesis that included four horizons: Early Man, Milling Stone, Intermediate, and Late Prehistoric.[5] Though initially lacking the chronological precision of absolute dates,[6] Wallace's synthesis has been modified and improved using thousands of radiocarbon dates obtained by southern California researchers over recent decades.[7][8] The prehistoric chronological sequence for

southern California presented below is a composite based on Wallace and Warren as well as on later studies, including Koerper and Drover.[9][10][11]

Early Man Horizon (ca. 10,000–6,000 B.C.)

Numerous pre-8000 B.C. sites have been identified along the mainland coast and on the Channel Islands of southern California (e.g., Erlandson 1991; Johnson et al. 2002; Jones and Klar 2007; Moratto 2004; Rick et al. 2001:609). The Arlington Springs site on Santa Rosa Island produced human femurs dated to approximately 13,000 years ago.[12] On nearby San Miguel Island, human occupation at Daisy Cave (SMI-261) has been dated to nearly 13,000 years ago and included basketry greater than 12,000 years old, the earliest on the Pacific Coast.[13]

Although few Clovis or Folsom-style fluted points have been found in southern California.[14] Early Man Horizon sites are generally associated with a greater emphasis on hunting than in later horizons. Recent data indicates that the Early Man economy was a diverse mixture of hunting and gathering, including a significant focus on aquatic resources in coastal areas and on inland Pleistocene lakeshores.[15][16] A warm and dry 3,000-year period called the Altithermal began around 6000 B.C. The conditions of the Altithermal are likely responsible for the change in human subsistence patterns at this time, including a greater emphasis on plant foods and small game.

Milling Stone Horizon (6000–3000 B.C.)

Wallace defined the Milling Stone Horizon as, "marked by extensive use of milling stones and mullers, a general lack of well-made projectile points, and burials with rock cairns."[17] The

dominance of such artifact types indicates a subsistence strategy oriented around collecting plant foods and small animals. A broad spectrum of food resources was consumed, including small and large terrestrial mammals, sea mammals, birds, shellfish and other littoral and estuarine species, near-shore fishes, yucca, agave, and seeds and other plant products.[18] Variability in artifact collections over time, and from the coast to inland sites, indicates that Milling Stone Horizon subsistence strategies adapted to environmental conditions (Byrd and Raab 2007:220). Lithic artifacts associated with Milling Stone Horizon sites are dominated by locally available tool stone. In addition, ground stone tools, such as manos and metates, and chopping, scraping, and cutting tools, are very common. Kowta (1969) attributes the presence of numerous scraper-plane tools in Milling Stone Horizon collections to the processing of agave or yucca for food or fiber. The mortar and pestle, associated with acorns or other foods processed through pounding, were first used during the Milling Stone Horizon, and their use increased dramatically in later periods (Wallace 1955, 1978; Warren 1968).

Two types of artifacts that are considered diagnostic of the Milling Stone period are the cogged stone and discoidal, most of which have been found within sites dating to between 4,000–1,000 B.C. (Moratto 2004:149), though some may date possibly as far back as 5,500 B.C.[19] The cogged stone is a ground stone object that has gear-like teeth on the perimeter and is produced from a variety of materials. The function of cogged stones is unknown, but many scholars have postulated ritualistic or ceremonial uses.[20] Similar to cogged stones, discoidals are found in the archaeological record subsequent to the introduction of the cogged stone. Cogged stones and discoidals were often purposefully buried, or "cached." They are most common in sites along the coastal drainages from southern Ventura County southward and are particularly abundant at some Orange County sites, although a few specimens have been found inland at Cajon Pass (Dixon 1968:63; Moratto 2004:149). Discoidals and cogged stones have been found together at some Orange County sites, such as CA-ORA-83/86/144 and Los Cerritos Ranch.[21][22]

Intermediate Horizon (3000 B.C.–A.D. 500)

The Intermediate Horizon, as defined by Wallace, dates from approximately 3000 B.C.–A.D. 500 and is characterized by a shift toward a hunting and maritime subsistence strategy, as well as greater use of plant foods. During the Intermediate Horizon, a noticeable trend occurred toward greater adaptation to local resources, including a broad variety of fish, land mammal, and sea

mammal remains along the coast. Tool kits for hunting, fishing, and processing food and materials reflect this increased diversity, with flake scrapers, drills, various projectile points, and shell fishhooks being manufactured.

Mortars and pestles became more common during this transitional period, gradually replacing manos and metates as the dominant milling equipment. Many archaeologists believe this change in milling stones signals a change from the processing and consuming of hard seed resources to the increasing reliance on acorn (e.g., Glassow et al. 1988; True 1993). Mortuary practices during the Intermediate typically included fully flexed burials oriented toward the north or west (Warren 1968:2-3).

Late Prehistoric Horizon (A.D. 500–Historic Contact)

During Wallace's Late Prehistoric Horizon, the diversity of plant food resources and land and sea mammal hunting increased even more than during the Intermediate Horizon.[23] More classes of artifacts were observed during this period, and high-quality exotic lithic materials were used for small, finely worked projectile points associated with the bow and arrow. Steatite containers were made for cooking and storage, and an increased use of asphalt for waterproofing is noted. The largest steatite quarry in California was on Santa Catalina Island, and its steatite was traded throughout southern California.[24] More artistic artifacts were recovered from Late Prehistoric sites, and cremation became a common mortuary custom. Larger, more permanent villages supported an increased population size and social structure (Wallace 1955:223).

Warren (1968) attributes this dramatic change in material culture, burial practices, and subsistence focus to the westward migration of desert people he called the Takic, or Numic, Tradition in Los Angeles, Orange, and western Riverside counties. This Takic Tradition was formerly referred to as the "Shoshonean wedge" (Warren 1968), but this nomenclature is no longer used to avoid confusion with ethnohistoric and modern Shoshonean groups.[25] Modern Cahuilla are generally considered by archaeologists to be descendants of these prehistoric Uto-Aztecan, Takic-speaking populations that settled in the southern California mountains and desert during the Late Prehistoric Horizon.

6.1.2 Ethnographic Setting

Gabrielino (Tongva)

Traditionally, the Gabrielino occupied a large territory, including the entire Los Angeles Basin, the coast from Malibu to Aliso Creek, parts of the Santa Monica Mountains, the San Fernando Valley, the San Gabriel Valley, the San Bernardino Valley, the northern part of the Santa Ana Mountains, and much of the middle and lower Santa Ana River reaches. In addition, the Gabrielino also

Sturtevant, General Editor (Washington, D.C.: Smithsonian Institution Press, 1978); William Shipley, "Native Languages of California," in *California*, ed. Robert F. Heizer, Handbook of North American Indians, Vol. 8, William C. Sturtevant, General Editor (Washington, D.C.: Smithsonian Institution Press, 1978), 88, 90.

inhabited the islands of Santa Catalina, San Clemente, and San Nicolas. The Gabrielino language was a Cupan language, which is part of the Takic language family and part of a larger language group called Uto-Aztecan.[26]

It is believed that more than 50 communities with populations that ranged from 50–150 individuals inhabited the traditional territory of the Gabrielino before contact with Europeans. Each autonomous community or village consisted of one or more patrilineages that maintained permanent placement and were responsible for the maintenance of surrounding hunting and gathering areas, as well as ceremonial sites. The chief, his family, and elite members were typically the epicenter of the village sites. The village members would encompass and surround the homes of the chief and elite with smaller houses/structures. Other common structures found in Gabrielino villages included sweathouses, clearings for ceremonies and playing fields, and cemeteries or burial grounds.[27] Management of food and resources was implemented by the chief, and food stores were also kept for each family when supply was low.

The material culture of the Gabrielino is elaborate and has been compared to that of the Chumash. Sources, including Padre Geronimo Boscana's accounts, Hugo Reid's 1852 letters to the Los Angeles Star, and Harrington's early twentieth century interviews (Harrington 1981), describe the use of shell ornaments and beads, baskets, bone tools, flint weapons and drills, fishhooks, mortars and pestles, wooden bowls and paddles, shell spoons, wooden war clubs, and a variety of steatite items (cooking vessels, comals, ornaments) as common in Gabrielino culture.[28][29][30]. Additionally, artesian development has been observed in the artifact assemblage, with the implementation of shell inlay techniques (using asphalt) and in the steatite items from production centers on Catalina Island.

Trade was an important element of the Gabrielino economy. Although the principal Gabrielino-produced commodity—steatite vessels from centers on Catalina Island—originated well outside the defined study region, trade in steatite items was conducted throughout local territory and involved external relations with desert, Southwestern, mountain, and coastal groups beyond Gabrielino borders (Kroeber 1925). Subsistence resources were also supplemented by additional supplies of deer skins, seeds, and acorns from interior groups such as the Serrano (Kroeber 1925). Additionally, *Olivella* shell callus beads, manufactured on the northern Channel Islands by the Chumash and their predecessors, were reportedly used quite frequently as a currency or status symbol by the Gabrielino and other southern California groups.

As described in ethnographic sources, the subsistence resource base for the Gabrielino people included native grass seeds, six or more types of acorns, pinyon pine nuts, seeds and berries from various shrubs, fresh greens and shoots, mule deer, pronghorn, mountain sheep, rabbits and

rodents, quail and waterfowl, snakes, lizards, insects, and freshwater fish, plus a wide variety of marine fish, shellfish, and sea mammals in coastal zones. Resource exploitation techniques were also described in ethnographic accounts and include rabbit drives in conjunction with seasonal controlled burning of chaparral, and the use of throwing sticks or nets in the capture of waterfowl in the low-lying marshlands. Reed rafts may have been employed for marshland hunting.[31]

The first contact between Europeans and the Gabrielino is thought to have occurred in 1542, when Juan Rodriguez Cabrillo's small fleet arrived at Santa Catalina Island. Spanish exploration of North America began in the early 1500s, and Juan Rodriguez Cabrillo began exploring the Alta California coastline in 1542. Additionally, contact between the Gabrieleno and the Spanish likely occurred again in 1602 with the Sebastían Vizcaíno expedition (McCawley 1996) and in 1769 with the Gaspar de Portolá expedition.

Mission San Gabriel was founded on September 8, 1771, but moved to its present location around 1774, due to the second location consisting of more suitable land for agriculture. A second mission, San Fernando, was established within Gabrielino territory in 1797. The assimilation of the Gabrielino people into the mission system had gross negative affect on the traditional Gabrielino communities, as they were depopulated and became estranged from many of their traditional cultural practices, lands, and political autonomy; many Gabrielino were enslaved, or even killed, and suffered from epidemics caused by the introduction of European diseases, which further reduced the Indigenous population. Between 1832 and 1834, the displacement of the Gabrielino further increased, a consequence of secularization of the former mission lands, which was theoretically designed to turn over ownership of some of the lands back to the Native peoples of California (McCawley 1996). The establishment of California as a state in 1850 brought further hardships to the Gabrielino, forcing many to eventually settle into smaller groups of Native American and Mexican settlements in places like the Eagle Rock and Highland Park districts of Los Angeles as well as in Pauma, Pala, Temecula, Pechanga, and San Jacinto.

6.1.3 Historic Setting

The historic period for the state of California generally begins with the establishment of the first Spanish mission and presidio in San Diego in 1769. This marks the beginning of the Spanish period of California history, which lasted until 1822 when news of Mexico's independence from Spain in 1821 finally reached California. The Spanish period saw the establishment of a permanent European presence in California in the form of 21 missions along the coast between San Diego and Sonoma; four military presidios in San Diego, Monterey, San Francisco, and Santa Barbara; and three pueblos (towns) that later became the cities of Los Angeles, San Jose, and Santa Cruz.[32]

The Mexican period of California history saw the seizure of lands once held by the missions through the Mexican Secularization Act of 1833, and the redistribution of those lands to individuals in the form of land grants known as "ranchos" (Robinson 1948). During this period, the Mexican government in California issued about 700 land grants to Mexican citizens and foreign immigrants.[33] In the early 1800s, several Mexican land grants included lands within Corona,

including Rancho La Sierra, Rancho Jurupa, Rancho El Rincon, and Rancho El Sobrante de San Jacinto.[34]

War between the United States and Mexico led to the signing of the Treaty of Guadalupe Hidalgo in 1848, which ended the Mexican period and signaled the beginning of the American period of California history. The early American period is marked by the discovery of gold at Sutter's Mill in 1848, resulting in a gold rush that saw a massive influx of settlers from other parts of the United States and around the world, greatly impacting California's Native population. In 1869, the transcontinental railroad was completed, linking California with the rest of the United States. The gold rush and the establishment of the railroad played major roles in the development of California into a national and worldwide leader in agricultural and industrial production. Today, California has the top gross domestic product of any state in the union as well as a vibrant and diverse culture.

Fairfax Highschool

The brief history of Fairfax Highschool was adapted from the Fairfax Highschool Historic Resources Evaluation Report.[35]

In 1923, the Los Angeles Board of Education committed over $1 million to the repair and expansion of schools across Hollywood.[36] Of those funds, over $600,000 was allotted to building a new high school at the corner of N. Fairfax Avenue and Melrose Avenue, to be known as Fairfax High School.

For the site of the new school, the Los Angeles Unified School District purchased a 25-acre lot from G. Allen Hancock. The district hired John and Donald B. Parkinson, of the architecture firm of Parkinson & Parkinson, to design the new campus.[37] The news of the school's construction brought attention to the area and led to a real estate and residential development boom in the surrounding neighborhood.[38] Many large residences, small bungalow homes, and multi-family bungalow residential courts were built to take advantage of the new school.[39]

Parkinson & Parkinson's 1923 plans for the school included a 2- to 3-story Auditorium Building (then known as the main building) facing Melrose Avenue with a central rotunda and auditorium that was flanked by east and west wings. Building plans for the Auditorium Building identify several features of the Spanish Colonial Revival-style building, including the ornamental tile border, tile roof, brickwork, and Corinthian pilasters. The school featured an auditorium that could seat 1,800 persons; a statue of Abraham Lincoln was placed in the rotunda following its completion. Construction of the building was completed in 1924.

Parkinson & Parkinson also designed a girl's gymnasium (known as Building No. 2), boy's gymnasium (Building No. 3), and a cafeteria. The campus plan also laid out a football field, baseball diamond, tennis courts, and basketball courts.[40] Additional improvements to the campus in 1925-1926 included a 1-story lunch pavilion, bleachers, and addition to the gymnasium.[22] In 1927, a 1-story 9-car private garage was built on the campus.[41]

[41] City of Los Angeles, building permit LA29028, issued October 3, 1927.

In 1939, Fairfax High School students built a new social hall with a "homelike atmosphere" as a hands-on class project.[42] 21 The Social Hall (also known as Greenway Court), was designed by A.S. Nibecker, Jr. and built by students from Fairfax High's carpentry class in conjunction with Frank Wiggins Trade School students.[43] The building's design included a cupola, dormer windows, and a full-length veranda.

The Social Hall was designed to replicate the Greenway Court, a hunting lodge built in Virginia in 1760 by Lord Thomas Fairfax, a friend of George Washington. Lord Fairfax's Virginia lodge, which no longer exists, was a 60-foot banquet hall and land sales office named after his family's estate in Hollingbourne, England.[44]

Several alterations to existing buildings on the Fairfax High School campus were made in the late 1940s and 1950s, including the relocation of two bungalows and unspecified alterations to the Auditorium Building by architect Kenneth N. Bergstrom.[45] In the mid-1960s, the Los Angeles Board of Education completed a study to determine the feasibility of replacing or structurally strengthening five school buildings on the Fairfax High School campus that did not meet the State Field Act earthquake safety standards enacted in 1934. The study recommended demolition of all buildings on the campus with the exception of the Auditorium Building.

As a result, the school district hired Albert C. Martin and Associates to redesign the campus in 1966.[46] A.C. Martin's 1966-1967 campus plan included the demolition of the cafeteria, garage, gymnasiums, and portable buildings.[47] 34The Auditorium and rotunda were retained, though Martin designed a new primary entrance and added buttresses along the east and west facades. The east and west wings were demolished. The Social Hall was relocated from the central region to the southwestern region of the campus. From then on, the Social Hall was used primarily as a storage space and was generally abandoned until the 2000s.

Between 1967 and 1969, A.C. Martin redesigned the campus with a complex of modern buildings. A.C. Martin completed a phased replacement of the buildings on the campus, and staggered construction projects to limit interference with day-to-day instruction. As new buildings were completed on the campus, older buildings were phased out and eventually demolished.

7 Cultural Resources Inventory

Chronicle Heritage conducted a records search of the California Historical Resources Information System (CHRIS) at the South Central Coastal Information Center (SCCIC), at the University of California, Fullerton. The search was conducted to identify previous cultural resources studies and previously recorded cultural resources within a 0.25-mi radius of the Project area. The CHRIS search was conducted on May 21, 2024, and included a review of the NRHP, the CRHR, the California Points of Historical Interest list, the California Historical Landmarks list, the Archaeological Determinations of Eligibility list, and the California State Historic Resources Inventory list. The records search also included a review of all available historical USGS 7.5-, 15-,

and 30-minute quadrangle maps. A summary of the results of the record search and background research are provided below.

7.1 Previous Cultural Resource Studies

The records search results indicate that 17 previous investigations have been conducted and documented within the 0.25-mi search radius of the Project area between 1983–2012 (Table 7-1). Of these studies, one study (LA-08005), intersects the Project area. This study is briefly summarized below.

Note: Cultural resource studies in ***bold*** italics intersect the Project area.

7.1.1 LA-08005

In 2003, a study referencing McKenna et al. conducted a cultural resources records search, Native American outreach, and a pedestrian survey of the Fairfax High School in the city of Los Angeles. The study involved a general cultural resources overview to document any impacts resulting from the proposed placement of portable structures. The proposed portable structures are to be placed north of the east side of the existing football field, beyond the original core of the campus and away from the historic period academic buildings. The study documented that the original 1924 campus exhibits a combination of architectural styles including modern additions, with the core of campus located in the center of the Melrose Avenue frontage. The study did not identify any significant historical resources, as defined by CEQA, that would be impacted by the proposed placement of the portable structures. However, other buildings within the campus beyond the study's project site may be considered significant resources.

7.2 Previously Identified Cultural Resources

The records search indicated that seven cultural resources have been previously documented within the 0.25-mi search radius of the Project area (Table 7-2). The seven cultural resources date to the historic period and include six buildings and one district, none of which are within or intersect the Project area.

Table 7-2. Previously Documented Cultural Resources within 0.25-mi of the Project Area

7.3 Native American Outreach

Chronicle Heritage requested an SLF search of the Project area on May 21, 2024. The NAHC responded on June 5, 2024, stating that the results of the SLF search results were negative and included a list of 16 individuals representing seven Tribes/Bands who may have knowledge of cultural resources within or near the Project area (Appendix A). Letters summarizing the Project description and location were sent via email to the NAHC-listed contacts on May 21, 2024, and June 6, 2024. Follow-up phone calls and emails to contacts who had not responded to the initial outreach letters were conducted on May 28, 2024. To date, four responses have been received and are summarized below.

Steven Estrada, Tribal Chairman for the Santa Rosa Band of Cahuilla Indians, responded via email on May 21, 2024, stating the Tribe defers further consultation and monitoring to the Soboba Band of Luiseno Indians.

Christina Conley, Cultural Resource Administrator for the Gabrielino Tongva Indians of California Tribal Council, responded via email on May 22, 2024, stating the Project is in the footprint of a working tribal village site. Conley further stated that they would like to receive the cultural report when completed.

Christina Swindall Martinez, Secretary for the Gabrieleno Band of Mission Indians Kizh Nation, responded via email on May 24, 2024, stating an email response was sent. On May 24, 2024, Brandy Salas responded via email requesting the contact information for the representative from the Los Angeles Unified School District as the Tribe would like to initiate a government-to-government consultation regarding important and sensitive information.

BobbyRay Esparza, Cultural Director for the Cahuilla Band of Indians, responded via email on June 6, 2024, requesting to be sent all cultural materials for the Project for review.

To date, no additional responses have been received. Native American correspondence conducted for this study is presented in Appendix A.

7.4 Historical Aerial Review

A review of historical aerial imagery and topographic maps was conducted on May 23, 2024.[48] The 1894 topographic map depicts the Project as undeveloped, with sparse residential structures located in the vicinity. Between 1915 and 1921, urban development to the north and south of the Project is apparent. By 1924, "Farifax School" is depicted on the topographic map with associated structures situated in the northern half of the Project. Aerial imagery as early as 1948 depict the Project as a developed campus with athletic fields occupying the southern portion of the Project and various buildings in the northern portion, surrounded by dense urban development and roadways. Between 1964 and 1972, existing buildings in the norther half of the Project are replaced by larger buildings in the northeast and northwest corners. No obvious improvements are evident from aerials until 2012, at which point the existing athletic fields appear to have undergone renovation[49].

7.5 Previous Evaluations and Designations[50]

Historic Resources Group (HRG) completed a Historic Resources Evaluation Report (HRER) in August 2022 for Fairfax HS. The HRER initially acknowledged the auditorium building was previously identified as individually eligible for listing in the CRHR and for designation as a City Historic-Cultural Monument (HCM). The 2022 HRER expanded on the previous findings of eligibility and concluded that the Auditorium Building and the Administration and Classroom Building appear individually eligible for listing in state and local registers. The Auditorium Building appears individually eligible for listing in the CRHR and for designation as a City HCM under Criterion I/ I, as a 1920s school associated with the establishment and growth of the Jewish community in the Fairfax area, and under Criterion 3/3, for its notable Spanish Colonial Revival style architecture designed by master architects Donald and John Parkinson (Parkinson & Parkinson). The Auditorium Building has a period of significance of 1 924, the date it was constructed. In addition to the Auditorium Building, the Administration and Classroom Building also appears individually eligible for listing in the CRHR and for designation as a City HCM under Criterion I / 1, for its association with the notable LGBT program Project 10, and under Criterion 2/2, for its association with Dr. Virginia Uribe, notable LGBT advocate, teacher, and founder of Project 10. The Administration and Classroom Building has a period of significance of 1984, the year that Dr. Uribe founded Project 10 in the building.

The 2022 report also found the Fairfax HS campus potentially eligible for listing and/or designation as a historic district. HRG identified a potential historic district at the Fairfax HS that appears eligible for listing in the National Register of Historic Places, CRHR, and for designation as a City HCM under Criteria A/ 1 / 1 for its association with community activism and the ultimate desegregation of the school. The potential historic district consists of nine contributing buildings, three contributing structures, and three contributing site features with a period of significance of 1967 to 1969, which spans the years the school boundaries were redrawn for desegregation purposes. Contributors to the potential historic district are the Auditorium Building, Social Hall, Administration and Classroom Building, Cafeteria Building, Transformer (Stage/Utility Building),

8 Fieldwork

8.1 Survey Methods

Chronicle Heritage Associate Architectural Historian Scott Torres conducted a pedestrian survey of the Project area on March 26, 2024, Torres surveyed the entire Project, which is developed with academic buildings, athletic fields, and landscaped lawns and planters.

Mr. Torres examined any remaining exposed ground surface for artifacts (e.g., flaked stone tools and tool-manufacture debris, ground stone tools, ceramic sherds, fire-altered rock), ecofacts (marine shell, bone), soil discoloration that could indicate the presence of a cultural midden, soil depressions, and features indicative of the former presence of structures or buildings (e.g., standing exterior walls, postholes, foundations) or historic period debris (e.g., metal, glass, ceramic sherds, cut bone). Photographs documenting the Project area are maintained by Chronicle Heritage in online cloud storage. Mr. Torres surveyed four historic age buildings and one courtyard in the project area and eight additional historic age buildings located on campus adjacent to

project area. Field notes were made and digital photographs were taken of each building and setting.

8.2 Results

Results of the survey revealed that indicate that the Project area has been subject to development as an academic campus. Ground visibility was poor (0–10 percent%) because all unpaved portions of the Project were subject to extensive grading and landscaping. No prehistoric or historical archaeological resources were identified in the project area during the survey; however, the historic-age buildings and courtyard in the project area were photo-documented. The buildings and courtyard in the project area was evaluated for NRHP, CRHR, and local eligibility in 2022.

9 Impact Analysis

Based on a review of the updated *School Upgrade Program EIR: Los Angeles Unified School District*[51] *(SUP)* that was prepared in 2023 by Tetratec, the proposed school upgrade modernization Project will result in a less than significant impact to a historical resource. The demolition of four of the fourteen district contributors that include the Shop Building, Gymnasium, Utility Building, and Ticket Office will not result in a loss of significance to the historic district. The buildings that are going to be removed, are located to the west and continue along the southwest boundary of the campus. The contributing buildings that will be removed are not primary contributors to the district. The shop and gymnasium buildings were identified as secondary contributors. The ticket booth and utility buildings were identified as tertiary contributors. Furthermore, the location of the shop, utility, ticket booth, and gymnasium buildings do not primarily face onto Melrose Avenue and are set back from the campuses arcade and auditorium that remain the primary entry and focal point of the campus on Melrose Avenue.

The remaining contributing campus features include the auditorium, administration/classroom, social hall, cafeteria, transformer (utility stage), arcades 1 and 2, and courtyards 1, 2, and 3 will sufficiently convey the feeling of significance the historic district possesses in its entirety. The historic district was determined eligible for listing in the NRHP, CRHR, and as a City of Los Angeles HCM pursuant to Criterion A/1/1, for its association with desegregation within the context of the Civil Rights Movement, 1954-1980. The significance of the period reflects initial desegregation within the LAUSD. The remaining contributing features will continue to convey the campuses association with the desegregation of schools because of community activism during the period of significance, 1967-1969.

Furthermore the auditorium, administration and classroom buildings were determined individually eligible for listing in the CRHR and as City of Los Angeles HCM. The Auditorium Building and the Administration and Classroom Building, that appear individually eligible for listing in State and local registers. The Auditorium Building appears individually eligible for listing in the California Register and for designation as a City of Los Angeles HCM under Criterion I/ I, as a 1920s school associated with the establishment and growth of the Jewish community in the Fairfax area, and under Criterion 3/3, for its notable Spanish Colonial Revival style architecture designed by master architects Donald and John Parkinson (Parkinson & Parkinson). The Auditorium Building has a period of significance of 1 924, the date it was constructed. In addition to the Auditorium Building, the Administration and Classroom Building also appears individually eligible for listing in the

[51] Placeworks, "School Upgrade Program EIR: Los Angeles Unified School District," Prepared for Los Angeles Unified School District, 2015.

California Register and for designation as a City of Los Angeles HCM under Criterion 1/1, for its association with the notable LGBT program Project 10, and under Criterion 2/2, for its association with Dr. Virginia Uribe, notable LGBT advocate, teacher, and founder of Project 10. The Administration and Classroom Building has a period of significance of 1984, the year that Dr. Uribe founded Project 10 in the building.

Based on the determination of significance and eligibility for listing buildings individually and as contributors to a historic district as a whole, the removal of two secondary buildings and two tertiary buildings would not impact the remaining contributing buildings ability to convey the districts association with the period of significance and event (1967-1969) they remain associated with.

According to the SUP, this potential result of a less than significant impact to the historic district was disclosed to the public through the EIR process as required by CEQA. The benefits of the Project program were found to outweigh the potential impact to a historical resource, resulting in the issuance of a Statement of Overriding Considerations.

The Standard Conditions of Approval documented in the SUP[52] regarding direct or indirect effect on historical resources and new construction require:

SC-CUL-1

For new construction, the Historic Architect shall work with the Design Team and LAUSD to identify options and opportunities for: (1) ensuring compatibility of scale and character for new construction, site and landscape features, and circulation corridors, and (2) ensuring that new construction is designed and sited in such a way that reinforces and strengthens, as much as feasible, character-defining site plan features, landscaping, and circulation corridors throughout campus.

For modernization and upgrade projects involving contributing (significant) buildings or features, the Historic Architect shall work with the Design Team and LAUSD to ensure that specifications for design and implementation of projects comply with the applicable historic preservation standards.

Historic Architect

For projects involving structural upgrades to historic resources, the Design Team shall include a qualified Historic Architect with demonstrated project-level experience in historic projects.

For campuses with qualifying historical resources under CEQA, the Design Team shall include a LAUSD-qualified Historic Architect. The Historic Architect/s shall meet the Secretary of the Interior's Professional Qualifications Standards and the standards described on page 8 of the LAUSD Design Guidelines and Treatment Approaches for Historic Schools.

Throughout the project design progress the Historic Architect shall provide input to ensure compliance with the Secretary of the Interior's Standards for the Treatment of Historic Properties and LAUSD requirements and guidelines for the treatment of historical resources.

[52] Los Angeles Unified School District, "Standard Conditions of Approval for District Construction, Upgrade, and Improvement Projects," 2023. 13-15.

Role of the Historic Architect

The tasks of the Historic Architect on the Design Team shall include, but are not limited to:

- The Historic Architect shall work with the Design Team (including the Structural Engineer) and LAUSD to ensure that project components, including new construction and modernization of existing facilities, comply with the Secretary of the Interior's Standards for the Treatment of Historic Properties and LAUSD Design Guidelines and Treatment Approaches for Historic Schools. The Historic Architect shall work with the Design Team and LAUSD throughout the design process to develop project options that facilitate compliance with the applicable historic preservation standards.
- For new construction, the Historic Architect shall work with the Design Team and LAUSD to identify options and opportunities for: (1) ensuring compatibility of scale and character for new construction, site and landscape features, and circulation corridors, and (2) ensuring that new construction is designed and sited in such a way that reinforces and strengthens, as much as feasible, character-defining site plan features, landscaping, and circulation corridors throughout campus.
- For modernization and upgrade projects involving contributing (significant) buildings or features, the Historic Architect shall work with the Design Team and LAUSD to ensure that specifications for design and implementation of projects comply with the applicable historic preservation standards.
- The Historic Architect shall participate in Design Team meetings during all phases of the project through 100% construction drawings, pre-construction, and construction phases, as applicable.
- The Historic Architect shall prepare a memo at the 50% and at the 100% construction drawings stages, demonstrating how principal project components and treatment approaches comply with applicable historic preservation standards, including the Secretary of the Interior's Standards for the Treatment of Historic Properties and LAUSD Design Guidelines and Treatment Approaches for Historic Schools. The memos shall be submitted to LAUSD OEHS for review.
- The Historic Architect shall participate in pre-construction and construction monitoring activities, as appropriate, to ensure continuing conformance with Secretary's Standards and/or avoidance of a material impairment of the historical resources.
- The Historic Architect shall provide specifications for architectural features or materials requiring restoration or removal, maintaining and protecting relevant features in place, or on-site storage. Specifications shall include detailed drawings or instructions where historic features may be impacted.
- The Design Team and Historic Architect shall be responsible for incorporating LAUSD's recommended updates and revisions during the design development and review process.

SC-CUL-3:

Prior to any major alteration to or adjacent to a historic resource that may potentially damage historic resources (or previously identified historic features), the Historic Architect shall develop a Temporary Protection Plan that identifies

potential risks to the historic resource. The Temporary Protection Plan shall be prepared in coordination with the Construction Contractor and LAUSD prior to demolition or construction. The Temporary Protection Plan may include, but not be limited to, the following components:

- Notation of the historic resource on construction plans.
- Pre-construction survey to document the existing physical condition of the historic resource.
- Procedures and timing for the placement and removal of temporary protection features, around the historic resource.
- Monitoring of the installation and removal of temporary protection features by the Historic Architect, or designee.
- Post-construction survey to document the condition of the historic resource after Project completion.
- Preparation of a technical memorandum documenting the pre-construction and post-construction conditions of the historic resource and compliance with protective measures outlined Temporary Protection Plan.

SC-CUL-4:

Documentation of Historic Resources, regarding demolition or potential damage to any historic resources. Prior to demolition or major alteration

Prior to significant alteration or demolition of a historical resource, LAUSD shall retain an Architectural Photographer and/or a Historian or Architectural Historian who meet the Secretary of the Interior's Professional Qualifications Standards and who shall prepare a HABS-like Historic Documentation Package (Package).

The Package shall include photographs and descriptive narrative. Documentation will draw upon primary- and secondary-source research including available studies prepared for the property (measured drawings are not required). The specifications for the Package include:

- Photographs: Photographic documentation shall focus on the historical resources/features proposed to be significantly altered or demolished, with overview and context photographs for the campus and adjacent setting. A professional-quality camera will be used to take photographs of interior and exterior features of the buildings. Photographs will include context views, elevations/exteriors, architectural details, overall interiors, and interior details (if warranted). Digital photographs will be in black and white (as well as in color or as requested by the District) and provided in an electronic format.
- Descriptive and Historic Narrative: The Historian or Architectural Historian shall prepare descriptive and historic narrative of the historical resources/features. Physical descriptions will detail each resource, elevation by elevation, with accompanying photographs and information on how the resource fits within the broader campus during its period of significance. The historic narrative will include available information on the campus design, history, architect/contractor/designer as appropriate, history of the area, and historic context. In addition, the narrative will include a methodology section specifying the name of researcher, date of research,

and sources/archives visited, as well as a bibliography. Within the written history, statements shall be footnoted as to their sources, where appropriate.

- Historic Documentation Package Submittal: Upon completion of the descriptive and historic narrative, all materials will be compiled in electronic format and presented to LAUSD for review and comment. Upon approval, one electronic copy and one hard copy shall be submitted to LAUSD OEHS. Photographs will be individually labeled and provided to LAUSD in electronic format.

SC-CUL-5:

Salvage and Reuse of Historical Resources, regarding demolition or potential damage to any historic resources. Prior to demolition or major alteration

LAUSD shall comply with Design Specification 01 3591, Historic Treatment Procedures, as applicable. This Specification requires the Construction Contractor to submit a Historic Treatment Plan to the District for the protection, repair, and replacement of historic materials and features.

CONCLUSION

The Standard Conditions of Approval documented in the SUP state the replacement Project shall meet the Secretary of the Interior's Standards for Treatment of Historic Properties: Rehabilitation as a Treatment and Standards for Rehabilitation[53] (SOIS Standards) and the LAUSD SUP (SC-CUL-1,SC-CUL-3, SC-CUL-4, and SC_CUL-5) to be considered mitigated to a level of less than significant under CEQA Guidelines 15064.5 (b). LAUSD need not adopt any such alternative unless the LAUSD Board of Education determines that the alternative is feasible within the meaning of PRC Section 21061.1 and necessary to avoid a significant impact on historical resources.

The SOIS Standards No.9 recommends "new additions, exterior alterations, or related new construction will not destroy historic materials, features, and spatial relationships that characterize the property. The new work will be differentiated from the old and will be compatible with the historic materials, features, size, scale and proportion, and massing to protect the integrity of the property and its environment."[54]

The LAUSD Design Guidelines recommend "New additions should be compatible with but differentiated from historically significant properties and site features"[55] and " early in the process, consult a qualified architectural historian to review project plans and identify best options for expanding buildings or adding new space that minimize impacts to historic resources, including campus buildings and associated site design and landscaping features."[56] Additionally the LAUSD Design Guidelines also recommend that "new construction should avoid overwhelming the

[53] National Park Service [NPS], "The Secretary of the Interior's Standards for the Treatment of Historic Properties: Rehabilitation as a Treatment and Standards for Rehabilitation," 2024, https://www.nps.gov/articles/000/treatment-standards-rehabilitation.htm.
[54] National Park Service [NPS], "The Secretary of the Interior's Standards for the Treatment of Historic Properties."
[55] SWCA Environmental Consultants, "Los Angeles Unified School District Design Guidelines and Treatment Approaches for Historic Schools."
[56] SWCA Environmental Consultants, "Los Angeles Unified School District Design Guidelines and Treatment Approaches for Historic Schools."

historic resource, in terms of both scale and design"[57] and "avoid creating a stylistic carbon copy of original historic building; make the new construction compatible but differentiated. Modern (i.e., current) design can be appropriate if it is contextually sensitive, in terms of placement, massing, scale, materials, etc."[58]

The modernization Project that shall result in the construction of four new buildings and the addition of landscaping throughout the western and southwestern ends of the campus. The modernization project will satisfy the SOIS Standard No. 9 by differentiating the new work from the old and maintaining compatibility with historic materials, features, size, scale, and proportion, and massing to protect the integrity of remaining contributing buildings, hardscape, landscape, and spatial relations.

The demolition of two secondary buildings, two tertiary buildings, and redevelopment of landscape/hardscape features in an adjacent courtyard will result in the loss of approximately 40 percent of the historic district's contributing features and will retain 60 percent of contributing features that were identified as significant. Overall, the historic district will retain a sufficient percentage of contributing features to continue to qualify for designation as a historic district. Although the buildings proposed for demolition are minimally visible from Fairfax Avenue, an arterial roadway, the primary facades and associated character-defining features of these buildings face an interior courtyard and therefore do not contribute to the character of the property as seen from Fairfax Avenue. The buildings are also minimally visible from Melrose and Genesse avenues and demolition of these buildings will result in a less than significant impact for these same reasons. The proposed demolition of these buildings would not materially impair Fairfax High School such that the project would result in a substantial change to a historical resource.

The concept modernization plans shall replace four buildings and add landscaping features that will be differentiated from the remaining buildings on the campus. The landscape concept proposes to add green spaces into Detter's courtyard. The buildings and landscape will not obscure views of the remaining buildings that contribute to the historic district from the public right-of-way on along Melrose Avenue, North Genesee Avenue, or from Courtyards No. 1-2. The orientation of the new buildings will not alter the existing spatial relationship between the campus buildings, nor will the newly added landscape features alter the flow of student and faculty traffic throughout the western side of the campus or to the athletic field to the southwest. The modernization concept appears to be consistent with the massing and scale of the buildings that will remain . Because the proposed new construction is compatible with the existing, it would result in a less than significant impact to a historical resource.

[57] SWCA Environmental Consultants, "Los Angeles Unified School District Design Guidelines and Treatment Approaches for Historic Schools," 35.
[58] SWCA Environmental Consultants, "Los Angeles Unified School District Design Guidelines and Treatment Approaches for Historic Schools."

10 Conclusion

The proposed modernization Project will demolish four buildings, construct three new buildings, and add hardscape and landscaping features to the western third of the Fairfax HS campus. Based on the determination of significance and eligibility for listing buildings individually and as contributors to a historic district as a whole, the removal of two secondary buildings and two tertiary buildings would not impact the remaining contributing building's ability to convey the historic district's association with the period of significance and events for which the campus is significant (1967-1969).

It is understood that the new construction will result in the removal of four contributing buildings and therefore diminish a percentage of the historic materials, features, and spatial relationships that characterize the historic district. Architectural plans remain conceptual and will adhere to the SOIS Standards and Guidelines established by the LAUSD. The modernization project will satisfy the SOIS Standard No. 9 by differentiating the new work from the old and maintaining compatibility with historic materials, features, size, scale, and proportion, and massing to protect the integrity of remaining contributing buildings, hardscape, landscape, and spatial relations.

Therefore, the demolition of the four buildings in the AOD will result in a less than significant impact to the historic district that is mitigated by the Standard Conditions and adherence to SOIS Standard No.9. The modernization Project has been evaluated against the SOIS Standards and the LAUSD Design Guidelines and Treatment for Historic Schools (SC-CUL-1-5) and meets those requirements. Therefore, the Fairfax HS Modernization Project shall be considered mitigated to a level of less than significant as required by the SUP.

Re: Fairfax High School Modernization Project, Los Angeles County

To Whom It May Concern:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

RE: Historical Resources Technical Report (HRTR) in Support of the Fairfax High School Major Modernization Project, Los Angeles County, California

Dear Mr. Alvarez,

Chronicle Heritage is preparing a HRTR on behalf of the Los Angeles Unified School District (LAUSD) in support of the Fairfax High School Major Modernization Project (Project), in Los Angeles County, California. The Project involves the complete modernization of the campus of Fairfax High School, including the demolition of the present Gymnasium Building. Specifically, the Project site includes an approximately 23.63-acre rectangular-shaped campus at 7850 Melrose Avenue in the City of Los Angeles (City), California. The Project is depicted within the La Brea Land Grant and Section 16 of Township (T) 1 South (S), Range (R) 14 West (W), San Bernardino Base and Meridian on a portion of the U.S. Geological Survey (USGS) *Hollywood, California*, 7.5-minute topographical map (see attached map). The Project is subject to the California Environmental Quality Act with LAUSD acting as the lead agency.

On May 21, 2024, Chronicle Heritage submitted a Sacred Land File (SLF) search request to the Native American Heritage Commission (NAHC). A response from the NAHC has not yet been received, however, we are writing to request any knowledge you may have of cultural resources that may be impacted by the proposed Project.

If you would like to share any information pertaining to the proposed Project, please contact me at 562-310-0153 or ggranger@chronicleheritage.com.

RE: Historical Resources Technical Report (HRTR) in Support of the Fairfax High School Major Modernization Project, Los Angeles County, California

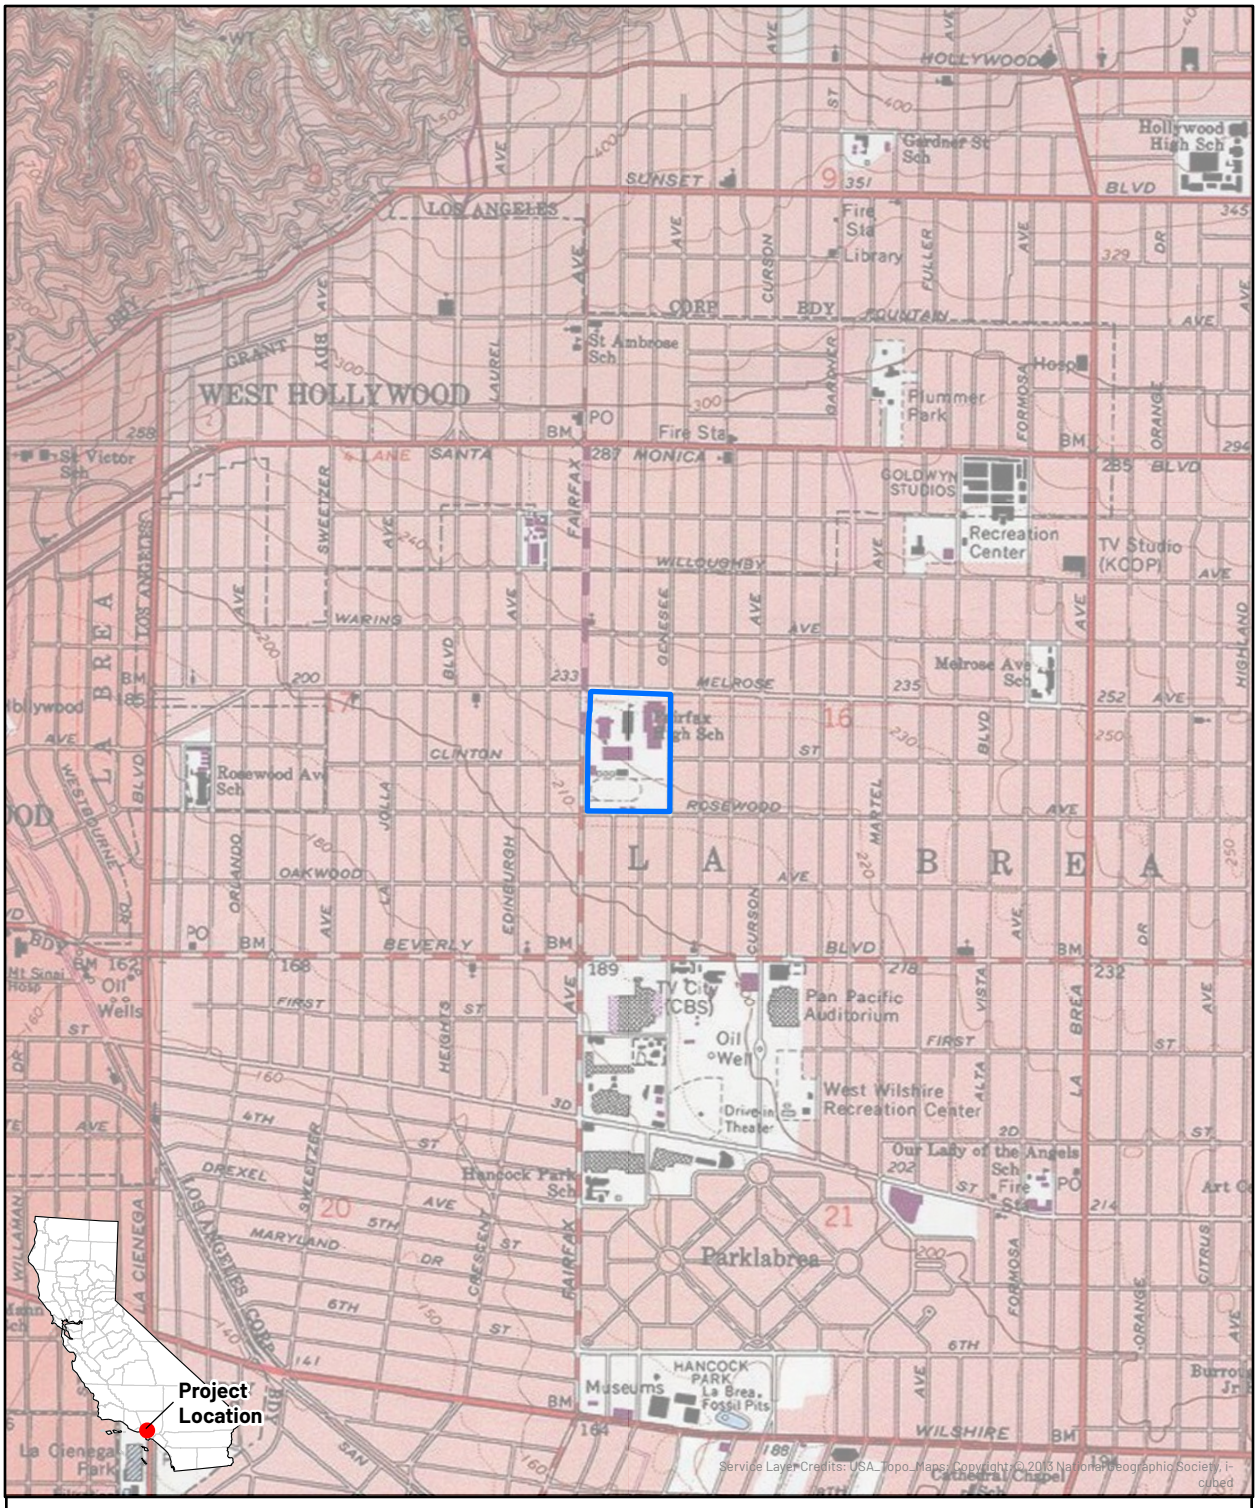
Dear Ms. Schenk,

Chronicle Heritage is preparing a HRTR on behalf of the Los Angeles Unified School District (LAUSD) in support of the Fairfax High School Major Modernization Project (Project), in Los Angeles County, California. The Project involves the complete modernization of the campus of Fairfax High School, including the demolition of the present Gymnasium Building. Specifically, the Project site includes an approximately 23.63-acre rectangular-shaped campus at 7850 Melrose Avenue in the City of Los Angeles (City), California. The Project is depicted within the La Brea Land Grant and Section 16 of Township (T) 1 South (S), Range (R) 14 West (W), San Bernardino Base and Meridian on a portion of the U.S. Geological Survey (USGS) *Hollywood, California*, 7.5-minute topographical map (see attached map). The Project is subject to the California Environmental Quality Act with LAUSD acting as the lead agency.



On May 21, 2024, Chronicle Heritage submitted a Sacred Land File (SLF) search request to the Native American Heritage Commission (NAHC). A response from the NAHC was received June 5, 2024 with negative results. We are writing to request any knowledge you may have of cultural resources that may be impacted by the proposed Project.

If you would like to share any information pertaining to the proposed Project, please contact me at 562-310-0153 or ggranger@chronicleheritage.com.

Please note that this letter ***does not*** constitute government-to-government consultation pursuant to Assembly Bill 52.

Sincerely,

Gena Severen, M.A., RPA

DRAFT

Dear Mr. Moghadam:

We (Wood Environment & Infrastructure Solutions, Inc., Wood) are pleased to submit the results of our geotechnical investigation for the proposed school modernization project at the Fairfax High School in Los Angeles, California. This investigation was conducted in general accordance with our proposal dated October 7, 2021 and Task Order 033, dated October 20, 2021, under Professional Services Agreement No. 2090025/4400008131 between the Los Angeles Unified School District and our firm.

The scope of our services was planned with Ms. Cristina Cho of your office. Ms. Cho previously provided us with a site plan illustrating the existing buildings on the school campus, suggested exploration locations, as well as drawing sets containing the as-built structural plans for buildings proposed to be seismically upgraded.

The results of our investigation and design recommendations are presented in this report. Please note that you or your representative should submit copies of this report to the appropriate governmental agencies for their review and approval prior to obtaining a permit.

'Wood' is a trading name for John Wood Group PLC and its subsidiaries

It has been a pleasure to be of professional service to you. Please contact us if you have any questions or if we can be of further assistance.

Sincerely,

Wood Environment & Infrastructure Solutions, Inc.

EXECUTIVE SUMMARY

We have completed our geotechnical investigation for the proposed school modernization project on the campus of Fairfax High School in Los Angeles, California. Our current and prior subsurface explorations, engineering analyses, and geotechnical recommendations are summarized below.

The schematic site design of the proposed modernization project is still being developed and information regarding specific locations, building configurations, and structural loads of the design elements are not available at this time; however, it is our understanding that three of the existing buildings (the Auditorium, the Gymnasium and Shops Buildings) are proposed to be seismically upgraded. New buildings as part of the proposed modernization project could contain up to two above-grade levels and may contain one basement level.

We explored the site by drilling seven exploration borings to depths of 36 to 52 feet below ground surface and advancing four Cone Penetration Test soundings to depths of 50 feet below ground surface. Fill soils, up to 6 feet thick, were encountered in the current borings drilled at the school campus. Data were also available from our prior borings drilled at the site. Our prior borings encountered fill to a maximum depth of 4 feet below ground surface. The natural soils encountered generally consist of medium stiff to stiff silty and sandy lean clay with layers of medium dense to dense silty and clayey sand and sand to the maximum depth explored. The upper clayey soils are expansive and will shrink and swell with fluctuations in moisture content. Groundwater was measured in our current explorations at depths between 23 feet and 35 feet below ground surface. Our prior exploratory borings encountered moderate water seepage at depths between 21 and 29 feet below ground surface. The historic-high groundwater level at the site is mapped at a depth of 30 to 40 feet bgs. The corrosion studies indicate that the on-site soils are moderately corrosive to ferrous metals and that the potential for sulfate attack on portland cement concrete is considered negligible.

The site is relatively level, and the absence of nearby slopes precludes slope stability hazards. The site is within an area identified as having a potential for inundation, however recent studies indicate that a breach of the upstream dam would not affect the site. The site is located within the limits of the active Salt Lake Oil Field; therefore, a possibility exists of encountering undocumented wells during any grading or construction. Any well encountered would need to be appropriately abandoned in accordance with the current requirements of CalGEM. The site is also within a City of Los Angeles Methane Zone; therefore, the potential exists for methane and other volatile gases to occur beneath the site. A separate subsurface methane investigation may be required. The potential for other geologic hazards such as liquefaction, seismically-induced settlement, tsunamis, seiches, subsidence, volcanism, and radon gas affecting the site is considered low.

Records documenting the placement and compaction of the existing fill soils are not available. Ttherefore, the existing fill soils are not considered suitable for support of new structures on conventional spread/continuous footings or for support of building slabs on grade, paving, or other exterior concrete walks and slabs on grade. If the existing fill soils are excavated and replaced with properly compacted fill, new structures may be supported on conventional spread/continuous footings underlain by undisturbed natural soil and/or properly compacted fill and floor slabs may be supported on grade. As an alternative to the excavation and compaction of existing fill soils and/or to resist uplift loading, drilled cast-in-place concrete pile foundations may be utilized for support of new structures; however, where existing fill soils are left in place, building floor slabs should be structurally supported.

DRAFT

As previously stated, the upper clayey soils are expansive, and will shrink and swell with fluctuations in moisture content. The upper clayey soils should be excavated to allow for the placement of at least 2 feet of relatively non-expansive soils beneath floor slabs, pavement, and other exterior concrete walks and slabs on grade. For structurally-supported floor slabs, as an alternative to the 2-foot thick layer of relatively non-expansive soil, the floor slab could be constructed with a gap of at least 6 inches between the floor slab and the underlying soils; this could be accomplished through the use of compressible cardboard or foam forms.

Ideally, to provide support for new paving and other exterior concrete walks and slabs on grade, all existing uncertified fill soils should be excavated and replaced as properly compacted fill. However, in consideration of the relatively good condition of the existing paving throughout the campus, the removal of the existing uncertified fill soils may be limited to the upper 2 feet beneath the pavement section. Where uncertified fill soils are to be left in place, after the 2-foot removal is completed, the exposed subgrade should be carefully observed by a representative of our firm to identify any areas that may require additional excavation and compaction. To further improve design life and reduce (but not eliminate) possible maintenance costs resulting from the above-described limited improvement, a layer of geogrid material (Tensar BX-1200, or equivalent) could be placed immediately below the recommended 2-foot thick layer of properly compacted fill and immediately below the base course layer. As stated above, the 2-foot thick layer of properly compacted fill beneath pavement and other concrete walks and slabs on grade should consist of relatively non-expansive soil.

DRAFT

1.0 SCOPE

This report provides geotechnical recommendations for the proposed modernization of the Fairfax High School campus located in Los Angeles, California. The location of the project site is illustrated on Figure 1, Site Vicinity Map. The locations of our current and relevant prior explorations in relation to the locations of the existing site features are shown on Figure 2, Plot Plan.

Our predecessor firms of LeRoy Crandall and Associates (LCA) and AMEC Environment & Infrastructure, Inc. previously performed several geotechnical investigations at the school site. The results of our prior investigations were submitted in the following reports:

- Report of Geotechnical Evaluation: Existing Boiler Room Slab, Fairfax High School, 7850 Melrose Avenue, Los Angeles, California; for the Los Angeles Unified School District; report dated May 9, 2014; Project No. 4953-14-0381 (submitted under the name of AMEC, a Wood legacy company);

- Report of Foundation Investigation; Proposed Gymnasium and Shop Building, Fairfax High School, Fairfax and Melrose Avenues, Los Angeles, California; for the Los Angeles City Board of Education; report dated August 24, 1966; Project No. A-66235 (submitted under the name of LeRoy Crandall and Associates., a Wood legacy company);

- Report of Foundation Investigation: Proposed Cafeteria Building, Fairfax High School, Melrose Avenue and Genese Street, Los Angeles, California; for the Los Angeles City Board of Education; report dated April 21, 1965; Project No. A-65119 (submitted under the name of LeRoy Crandall and Associates, a Wood legacy company);

- Report of Foundation Investigation: Proposed New Classroom Building and Parking Structure Development; Fairfax Senior High School, Melrose Avenue and Genese Street, Los Angeles, California; for the Los Angeles City Board of Education; report dated August 21, 1964; Project No. 64463 (under the name of LeRoy Crandall and Associates, a Wood legacy company);

The recommendations presented in this report were developed in part using the geotechnical information from the above-referenced previous investigations. We acknowledge that we have reviewed the referenced reports and we concur with the data and findings contained therein.

This investigation was authorized to supplement the available geotechnical data at the school site to further evaluate the physical characteristics of the soils underlying the site, and to provide recommendations for analysis of existing foundations and design of new foundations and retaining walls/walls below grade, for floor slab and paving support, for infiltration feasibility, and for grading for the project. More specifically, the scope of this investigation included the following:

- Review of prior data at and in the vicinity of the site;

- Perform subsurface exploration, and laboratory testing, and provide a description of the soil and groundwater conditions encountered;

DRAFT

- Perform a geologic-seismic hazards evaluation in general conformance with Title 24 of the California Code of Regulations and with the California Geological Survey Checklist for Review of Geologic-Seismic Reports for California Public Schools, Hospitals, and Essential Services Buildings (CGS Note 48);

- Provide recommendations for an appropriate foundation system together with the necessary design parameters, including frictional resistance, passive resistance, and anticipated total and differential settlements due to expected structural loadings;

- Provide recommendations for analysis of existing foundations;

- Determine the applicable seismic design parameters based on the 2019 California Building Code (CBC);

- Perform a site-specific ground motion hazard analysis in accordance with the requirements of the 2019 CBC/ASCE 7-16 and ASCE 41-17;

- Provide recommendations for subgrade preparation and floor slab support;

- Provide recommendations for design of retaining walls and walls below grade;

- Provide recommendations for design of temporary shoring;

- Provide recommendation for design of asphalt and portland cement concrete paving;

- Provide recommendations for grading, including site preparation, excavation and slopes, the placing of compacted fill, and quality control measures relating to earthwork.

The scope of this geotechnical investigation did not include the assessment of general site environmental conditions for the presence of contaminants in the soils and groundwater of the site.

Our recommendations are based on the results of our current and previous field explorations, laboratory tests, and appropriate engineering analyses. The results of the current field exploration and laboratory tests, which, together with the relevant data obtained from our previous investigations, form the basis of our recommendations.

The results of our current field exploratory borings and laboratory tests are presented in Appendix A. The results of our Cone Penetration Test soundings are presented in Appendix B. The results of our previous field explorations and laboratory tests are presented in Appendix C.

Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable geotechnical consultants practicing in this or similar localities. No other warranty, express or implied, is made as to the professional advice included in this report. This report has been prepared for Los Angeles Unified School District and their design consultants to be used solely in the design of the proposed modernization of Fairfax High School in Los Angeles, California. This report has not been prepared for use by other parties, and may not contain sufficient information for purpose of other parties or other uses.

DRAFT

2.0 PROJECT DESCRIPTION

The campus of Fairfax High School consists of numerous existing one- to three-story reinforced concrete and masonry buildings and modular-type structures supported on conventional spread footings and pile foundations. The original buildings, including the existing auditorium building and boiler room and several other buildings, were constructed in the late 1920's and several additions and upgrades have been constructed over the years.

The schematic site design of the proposed modernization project is still being developed and information regarding specific locations, building configurations, and structural loads of the design elements are not available at this time; however, it is our understanding that three of the existing buildings (the Auditorium, the Gymnasium and Shops Buildings) are proposed to be seismically upgraded. For the purposes of this investigation, we have assumed that new buildings could contain up to two above-grade levels and may contain one basement level. We have assumed that the maximum dead-plus-live columns loads will be on the order of 200 to 300 kips.

DRAFT

3.0 SITE CONDITIONS

The campus of Fairfax High School encompasses approximately 24 acres of land and consists of numerous existing one- to three-story reinforced concrete and masonry buildings and modular-type structures supported on conventional spread footings and pile foundations.

The ground surface slopes down from approximately Elevation 224.5 feet near the intersection of Melrose Avenue and Fairfax Avenue to approximately Elevation 210 feet near Genesee and Rosewood Avenues.

The ground surface surrounding the cluster of the Auditorium, Gymansium and Shop Buildings located in the center and western half of the school property is paved with asphalt or portland cement concrete with ground surface elevations ranging from approximately 224 to 218.

Based on the as-built plans that were provided to us, the Auditorium building was constructed in the early 1920's as part of the original construction of the school campus. The existing Auditorium buiding is a two -story building with a raised floor with the first floor established at an elevation of 229.65 feet, which is elevated approximately 7 feet above the adjacent grade. The southern portion of the building is underlain by a partial subterranean boiler room with a finished floor elevation established at Elevation 217, which is approximately 5 feet below the surrounding grade level. The auditorium building is supported on shallow foundations consisting of spread and continuous footings which extend into firm natural soils with pile foundations that were added when the building was structurally upgraded in 1970.

The current Gymnasium building was constructed in the 1970s and is a one- to two-story building with a raised finished floor established at Elevation 218.75. The building has a central portion and eastern and western wings. The center portion has a first floor plan area of approximately 19,600 square feet; the eastern and western wings each have approximately 8,800 square feet of first floor area. The existing gymasium building is primarily supported on drilled pile foundations; however, lightly loaded wall footings were originally designed to impose an allowable dead-plus-live load bearing pressures of 1,000 and 1,500 pounds per square foot.

The existing Shops Building was constructed during the same time period as the seismic upgrade of the Auditorium and the construction of the Gymansium Building. The Shops Building is a one-story structure with a partial second story. The existing building has a first floor footprint area of approximately 25,870 square feet. The Shops Building is supported on drilled pile foundations and the lowest finished floor is established at Elevation 221.5.

Although the as-built drawings for the Gymansium and Shop buildings are available, the drawing sets were missing the pile foundation details.

DRAFT

4.0 FIELD EXPLORATION AND LABORATORY TESTS

To supplement our existing geotechnical data at the site, the soil conditions beneath the site were explored by drilling seven additional exploration borings to depths of 36 to 52 feet below ground surface (bgs). Four Cone Penetration Test (CPT) soundings were also advanced to depths of 50 feet bgs. The locations of our current and prior exploration borings and CPTs are shown on Figure 2. Details of our current explorations and the logs of our borings are presented in Appendix A. The results of our Cone Penetration Tests are presented in Appendix B. The results of our prior explorations on the school campus are presented in Appendix C.

Laboratory tests were performed on selected samples obtained from our current borings to aid in the classification of the soils and to determine the pertinent engineering properties of the foundation soils. The following tests were performed:

- Moisture content and dry density determinations.
- Fines content.
- Atterberg Limits.
- Direct shear.
- Consolidation.
- Hydroconsolidation.
- Stabilometer (R-value).
- Compaction.

All testing was performed in general accordance with applicable ASTM specifications at the time of testing. Details of our current laboratory testing program and test results are presented in Appendix A. The results for our prior laboratory testing are presented in Appendix C. The results of corrosivity testing, performed for us by HDR, are presented in Appendix D, along with a discussion of the corrosion potential of the soils, and potential mitigation measures.

DRAFT

5.0 SOIL CONDITIONS

Fill soils, up to 6 feet thick, were encountered in the current borings drilled at the school campus. Prior borings encountered fill to a maximum depth of 4 feet bgs. The fill soils encountered generally consist of silty and clayey sand, silty clay, and sandy lean clay with varying amounts of concrete and brick fragments. Deeper fill could occur between borings and in other unexplored areas, particularly in areas near existing utilities, foundations, and/or basements.

The natural soils encountered underlying the fill in the majority of our current and prior borings generally consist of medium stiff to stiff silty and sandy lean clay with layers of medium dense to dense silty and clayey sand and sand to the maximum depth explored. The upper clayey soils are expansive and will shrink and swell with fluctuations in moisture content.

Groundwater was measured in our current exploratory borings at depths between 23 feet and 35 feet bgs. Groundwater was measured in the open holes of the current CPT soundings (after testing) at depths of about 28 feet bgelow the existing ground surface. Our prior exploratory borings encountered moderate water seepage at depths between 21 and 29 feet bgs.

The historic-high groundwater level at the site is mapped at a depth of 30 to 40 feet bgs.

The corrosion studies indicate that the on-site soils are moderately corrosive to ferrous metals and that the potential for sulfate attack on portland cement concrete is considered negligible. The report of corrosion studies presented in Appendix D should be referred to for a discussion of the corrosion potential of the soils, and for potential mitigation measures for buildings within the campus.

DRAFT

6.0 GEOLOGY

6.1 Geologic Setting

The site is located in the northern portion of the Los Angeles Basin. The basin is a major elongated northwest-trending structural depression that has been filled with sediments up to 13,000 feet thick since middle Miocene time (Yerkes et al., 1965). On a regional scale, the site lies within the northernmost portion of the Peninsular Ranges Geomorphic Province near its boundary with the Transverse Ranges Geomorphic Province. The southern margin of the Transverse Ranges Geomorphic Province is bounded by the Malibu Coast, Santa Monica, Hollywood, Raymond, Sierra Madre, and Cucamonga faults. The Peninsular Ranges Geomorphic Province is characterized by northwest/southeast trending alignments of mountains and hills and intervening basins, reflecting the influence of northwest trending major faults and folds controlling the general geologic structural fabric of the region. The Hollywood fault zone is the major structural feature in the vicinity of the site (Crook and Proctor, 1992). This east-west trending fault zone – near the base of the Santa Monica Mountains' southern flank – is generally considered to be the boundary between the Transverse Ranges Geomorphic Province to the north and the Peninsular Ranges Geomorphic Province to the south.

Locally, the project site is situated on a gently sloping alluvial plain approximately one mile southeast of the Santa Monica Mountains at elevations from 225 to 230 feet above mean sea level (AMSL) (NAVD 88).

The location of the site in relation to the regional topography is shown on Figure 1, Site Vicinity Map. The limits of the project site are shown on Figure 2. Local geology is shown on Figure 3, Local Geologic Map. The regional geologic conditions around the project site, including the distribution of geologic units, are shown in Figure 4, Regional Geologic Map. The project site in relation to major regional faults and earthquake epicentres is shown on Figure 5, Regional Fault and Seismicity Map.

6.2 Geologic Materials

According to published geologic maps and reports, the site is underlain by late Pleistocene-age alluvial fan deposits (Campbell et al., 2014; Dibblee and Ehrenspeck, 1991; Yerkes, 1997). The alluvial sediments are derived from the weathering and erosion of the Santa Monica Mountains to the north.

Exploratory borings drilled for this investigation encountered up to6 feet of artificial fill. Exploratory borings drilled by our predecessor firm for the main building, shop building, cafeteria, and auditorium encountered fill thicknesses of 1 to 4 feet (AMEC, 2014; LeRoy Crandall & Associates, 1964 and 1965). The fill generally consists of silty and clayey sand, silty clay and sandy lean clay with varying amounts of concrete and brick fragments. Deeper fill could occur between borings and in other unexplored areas, particularly in areas near existing utilities, foundations, and/or basements. The alluvial deposits encountered beneath the artificial fill consisted of medium stiff to stiff silty and sandy lean clay with layers of medium dense to dense silty and clayey sand and sand to the maximum drilled depth of 52 feet bgs. Some loose clayey sands and soft clay zones were observed at 27 to 32 feet and 40 to 50 feet bgs.

6.3 Groundwater

The site is located in the Hollywood Subbasin of the Coastal Plain of the Los Angeles Groundwater Basin. The Pleistocene-age sediments beneath the site are part of the upper water-bearing deposits of the basin [California Department of Water Resources (DWR), 2003]. Groundwater was encountered in the current exploratory borings between 23 and 35 feet bgs at the completion of drilling. Prior exploratory borings at the campus encountered groundwater as seepage between 21 and 29 feet bgs. According to the California Geological Survey (CGS), formerly the California Division of Mines and Geology (CDMG), the historic-high groundwater level is between 30 and 40 feet bgs (CDMG, 1998).

DRAFT

6.4 Faults

Numerous faults in Southern California have been previously characterized as active or potentially active. The criteria for these major groups were based on criteria developed by the California Geological Survey (CGS), for the Alquist-Priolo (A-P) Earthquake Fault Zoning Program (Bryant and Hart, 2007; CGS, 2018a). According to Bryant and Hart, an active fault is one with surface displacement within Holocene time (about the last 11,000 years); and a potentially active fault is a fault that has demonstrated surface displacement of Quaternary age deposits (last 1.6 million years) (Jennings and Bryant, 2010, Bryant and Hart, 2007). More recently the CGS has revised fault activity designations for the purpose of the A-P Earthquake Fault Zoning Program (CGS, 2018a). A Holocene-active fault is one that has had surface displacement within Holocene time (about the last 11,700 years). A pre-Holocene fault is a fault that has been demonstrated to not have Holocene surface displacement. An age-undetermined fault is one where the recency of fault movement has not been determined.

Many fault systems in Southern California are considered to be active with Holocene activity (Field et al., 2013; USGS-CGS, 2020) but are not included in an A-P Zone. Many late Quaternary faults are also included in Field et al. 2013 and USGS-CGS 2020. The faults in the vicinity of the site are shown in Figure 5.

Major Holocene and Late Quaternary Faults

Hollywood Fault

The active Hollywood fault, located 1.1 miles northwest of the site, trends approximately east-west near the base of the Santa Monica Mountains from the West Hollywood-Beverly Hills area (Dolan and Sieh, 1992) to the Los Feliz area of Los Angeles. The fault is a groundwater barrier within Holocene sediments (Converse et al., 1981). Studies by many investigators (Dolan et al., 2000a; Dolan et al., 1997; Dolan and Sieh, 1992; and Crook and Proctor, 1992) have indicated that the fault is active, based on geomorphic evidence, stratigraphic correlation between exploratory borings, and fault trenching studies. As of November 6, 2014, the Hollywood fault zone has been included in an A-P Earthquake Fault Zone within the Hollywood 7.5-minute quadrangle by the CGS (CGS, 2017).

Until recently, the approximately 15 kilometer-long Hollywood fault zone was considered to be expressed as a series of linear scarps and faceted south-facing ridges along the south margin of the eastern Santa Monica Mountains and the Hollywood Hills. Multiple recent fault rupture hazard investigations have shown that the Hollywood fault zone is located south of the faceted ridges and bedrock outcrops along Sunset Boulevard (Harza, 1998, William Lettis & Associates, 1998a and 1998b). Active deposition of numerous small alluvial fans at the mountain front and a lack of fan incision suggest late Quaternary uplift of the Santa Monica Mountains along the Hollywood fault zone (Dolan et al., 2000a, Dolan et al., 1997, Crook et al., 1992 and 1987). The fault dips steeply to the north and has juxtaposed Tertiary and Cretaceous age rocks over young sedimentary deposits of the northern Los Angeles basin (Hernandez and Treiman, 2014a and 2014b, Hernandez, 2017; Hernandez and Olson, 2015). The Hollywood fault zone has not produced any damaging earthquakes during the historical period and has had relatively minor micro-seismic activity. An average slip rate of 0.9 millimeters per year and a maximum moment magnitude of 6.4 are estimated by the CGS (Cao et al., 2003; Field et al., 2013) for the Hollywood fault.

Santa Monica Fault

The active Santa Monica fault, a left lateral, reverse oblique slip fault, is located approximately 2.1 miles west-southwest of the project site. The Santa Monica and Hollywood fault zones form a portion of the Transverse

DRAFT

Ranges Southern Boundary fault system. The Transverse Ranges Southern Boundary fault system also includes the Malibu Coast-Anacapa-Dume faults to the west of the Santa Monica fault and the Raymond and Cucamonga faults to the east of the Hollywood fault (Dolan et al., 2000b). The Santa Monica fault zone is the western segment of the Santa Monica-Hollywood fault zone. The fault zone trends east-west from the Santa Monica coastline on the west to the Hollywood area on the east. Urbanization and development within the greater Los Angeles area has resulted in a poor understanding of the lateral extent, location, and rupture history of the Santa Monica fault zone. However, the surface expression of the Santa Monica fault zone includes fault-related geomorphic features, offset stratigraphy, and ground water barriers within late Quaternary deposits (Hill et al., 1979, and Dolan et al., 2000b).

As of January 11, 2018, the Santa Monica fault zone has been included in an Alquist-Priolo Earthquake Fault Zone within the Beverly Hills 7.5-minute quadrangle by the CGS (CGS, 2018b). An average slip rate of 1.0 millimeters per year and a maximum moment magnitude of 6.6 are estimated by the CGS (Cao et al., 2003; Field et al., 2013) for the Santa Monica fault.

Newport-Inglewood Fault Zone

The active South Los Angeles Basin section of the Newport-Inglewood fault zone is located approximately 3.1 miles to the southwest of the site. The Newport-Inglewood fault zone is composed of a series of discontinuous northwest-trending en echelon faults extending from the Ballona Gap south-eastward past the Santa Ana River in Newport Beach, where it extends off-shore. This zone is reflected at the surface by a line of geomorphically young anticlinal hills and mesas formed by the folding and faulting of a thick sequence of Pleistocene-age sediments and Tertiary-age sedimentary rocks (Bryant, 1985; Barrows, 1974). Fault-plane solutions for 39 small earthquakes (between 1977 and 1985) show mostly strike-slip faulting with some reverse faulting along the north section (north of Dominguez Hills) and some normal faulting along the south section (south of Dominguez Hills to Newport Beach) (Treiman, 1993: Hauksson, 1987). Prior fault investigations by Law/Crandall (1993) in the Huntington Beach area indicate that the on-shore South Los Angeles Basin section of the Newport-Inglewood fault zone offsets Holocene age alluvial deposits in the vicinity of the Santa Ana River. An average slip rate of 1.0 millimeters per year and a maximum moment magnitude of 7.1 are estimated by the CGS (Cao et al., 2003; Field et al., 2013) for the Newport-Inglewood fault.

Raymond Fault

The active Raymond fault is located approximately 7.9 miles northeast of the site. The fault is primarily a left-lateral strike-slip fault with a minor component of high-angle reverse offset, placing basement rocks north of the fault over alluvial sediments south of the fault (Hernandez, 2017). The Raymond fault has long been recognized as a groundwater barrier in the Pasadena/San Marino area and numerous geomorphic features along its entire length (such as fault scarps, sag ponds, springs, and pressure ridges) attest to the fault's activity during the Holocene epoch (last 11,700 years) (Hernandez and Olson, 2015). Within the last 36,000 to 41,000 years, five to eight separate earthquake events have been recognized along the Raymond fault (Crook et al., 1987, Weaver and Dolan, 2000). The most recent fault movement, based on radiocarbon ages from materials collected in an excavation exposing the fault, occurred sometime between 2,160 ± 105 and 1,630 ± 100 years before present (LeRoy Crandall and Associates, 1978; Crook et al., 1987; Weaver and Dolan, 2000). An average slip rate of 2.0 millimeters per year and a maximum moment magnitude of 6.5 are estimated by the CGS (Cao et al., 2003; Field et al., 2013) for the Raymond fault.

DRAFT

Verdugo Fault

The active Verdugo fault zone, located approximately 8.2 miles northeast of the project site, is composed of several reverse oblique faults including the Verdugo fault, the San Rafael fault, and the Eagle Rock fault. The most recent documented activity along this fault occurs in the Holocene age alluvial deposits along the western flank of the Verdugo Mountains in the Burbank area (County of Los Angeles, 1990a). Additionally, this portion of the fault is considered active by the State (Jennings and Bryant, 2010). An Alquist-Priolo Earthquake Fault Zone has not currently been established for the Verdugo fault by the State. According to the CGS (Cao et al., 2003; Field et al., 2013), the Verdugo fault is capable of a moment magnitude 6.9 earthquake and has a slip rate of 0.4 millimeters per year.

Sierra Madre Fault Zone

The active Sierra Madre fault is located 13 miles northeast of the site. This fault zone borders the southern front of the San Gabriel Mountains and consists of a series of discontinuous reverse faults that separate pre-Tertiary crystalline rocks on the north from Tertiary and Quaternary sedimentary deposits on the south. The various faults exhibit northerly dips from 15 degrees to vertical, with the crystalline rocks thrust upward toward the south over sediments as young as upper-Pleistocene age. The Sierra Madre fault zone extends approximately 80 kilometers along the southern flank of the San Gabriel Mountains from Big Tujunga Canyon on the west to Cajon Pass on the east. The fault zone, which includes the active Cucamonga fault, consists of a series of reverse fault segments that are believed to have been active at different times in the geologic past (Crook et al., 1987). The moderate magnitude 5.8 1991 Sierra Madre earthquake is believed to be a result of movement on a small portion of the Sierra Madre fault zone. Recent paleoseismic investigations in Altadena (Rubin et al., 1998) have shown that the Sierra Madre fault fails in large, infrequent earthquakes. The past two ruptures in Altadena produced about 4.5 to 5 m of slip at the ground surface and occurred within the past ~18,000 years. Farther east in San Dimas, Tucker and Dolan (2001) documented the occurrence of two large-slip earthquakes during the period between ~8,000 and ~24,000 years ago. The most recent event on the eastern portion of the Sierra Madre fault zone occurred prior to ~8,000 years ago and a minimum slip rate of 0.6 to 0.9 millimeters per year was estimated (Tucker and Dolan, 2001). The CGS considers the Sierra Madre fault to be capable of a moment magnitude 7.2 earthquake and estimates an annual slip rate of 2 millimeters per year (Cao et al. 2003; Field et al. 2013).

San Fernando Fault

The active San Fernando section of the Sierra Madre fault zone is located approximately 13 miles north-northeast of the site. The San Fernando fault zone comprises one of a number of left lateral/reverse frontal faults bounding the southern margin of the San Gabriel and Santa Susana Mountains. An earthquake of magnitude 6.6 occurred along this fault zone on February 9, 1971 (SCEDC, 2022a). Surface rupture occurred along the Tujunga, Sylmar, and Mission Wells segments of the San Fernando fault zone during this earthquake. According to the CGS, the San Fernando fault is capable of a moment magnitude 6.7 earthquake and has a slip rate of 2 millimeters per year (Field et al., 2013; Cao et al., 2003).

San Gabriel Fault

The active San Gabriel fault zone is located approximately 15 miles to the north-northeast of the project site. This fault zone extends southeasterly approximately 130 kilometers from near Bear Mountain in Ventura County to San Antonio Canyon in San Bernardino County (Weber, 1982). Estimates of the amount of total offset along the fault zone range from approximately 9.5 kilometers (6 miles) of right lateral displacement (Weber, 1982) to approximately 40 kilometers of right lateral displacement since the Pliocene age, as hypothesized by Crowell (1952), however Yeats (1983) estimate that less than a kilometer of displacement has occurred along the San Gabriel fault zone during late Quaternary time. Work by Cotton et al. (1983), Yeats (1983), and Cotton and Seward (1984) indicates that this fault has been active within the Holocene epoch (last 11,000 years). The CGS

DRAFT

estimates an average slip rate of 0.39 millimeters per year and maximum moment magnitude of 7.2 (Cao et al., 2003; Field et al., 2013).

Whittier Fault

The active Whittier fault is located approximately 18 miles east-southeast of the site. The northwest-trending Whittier fault extends along the south flank of the Puente Hills from the Santa Ana River on the southeast to Whittier Narrows on the northwest. According to Yeats, 2004, and Treiman, 1991, the Whittier fault turns more northwesterly at Whittier Narrows becoming the East Montebello fault beneath the Whittier Narrows towards the Alhambra Wash. The East Montebello fault is approximately 14 miles east of the site. The main Whittier fault trace is a high-angle reverse fault, with the north side uplifted over the south side at an angle of approximately 70 degrees, although late Quaternary movement has been nearly pure strike slip and total right displacement may be around 8 to 9 kilometers (Yeats, 2004). In the Brea-Olinda Oil Field, the Whittier fault displaces Pleistocene age alluvium, and Carbon Canyon Creek is offset in a right lateral sense by the Whittier fault. The CGS considers the Whittier fault to be capable of a moment magnitude 6.8 earthquake and estimates an annual slip rate of 2.5 millimeters per year (Cao et al. 2003; Field et al. 2013).

San Andreas Fault Zone

The active Glen Ivy section of the San Andreas fault zone is located about 43 miles east-southeast of the site. This fault zone is California's most prominent structural feature, trending in a general northwest direction for almost the entire length of the state. The southern section of the fault is approximately 450 kilometers long and extends from the Transverse Ranges west of Tejon Pass on the north to the Mexican border and beyond on the south. The last major earthquake along the San Andreas fault zone in Southern California was the 1857 Magnitude 8.3 Fort Tejon earthquake. The CGS considers the Mojave section to be capable of a moment magnitude 7.5 earthquake and estimates an annual slip rate of 19 millimeters per year (Cao et al., 2003; Field et al., 2013).

Blind Thrust Fault Zones

Several buried thrust faults, commonly referred to as blind thrusts; underlie the Los Angeles Basin at depth. These faults are not exposed at the ground surface and are typically identified at depths greater than 3 kilometers. These faults do not present a potential surface fault rupture hazard. However, the following described blind thrust faults are considered active and potential sources for future earthquakes.

Upper Elysian Park Thrust

The Upper Elysian Park fault is a blind thrust fault that overlies the Los Angeles and Santa Fe Springs sections of the Puente Hills Thrust (Oskin et al., 2000 and Shaw et al., 2002). The eastern edge of the Upper Elysian Park fault is defined by the northwest-trending Whittier fault zone. The vertical surface projection of the Upper Elysian Park fault upper limb is approximately 3.6 miles southeast of the site (USGS-CGS, 2020). Like other blind thrust faults in the Los Angeles area, the Upper Elysian Park fault is not exposed at the surface and does not present a potential surface rupture hazard; however, the Upper Elysian Park fault should be considered an active feature capable of generating future earthquakes. An average slip rate of 1.9 millimeters per year and a maximum moment magnitude of 6.4 are estimated by Cao et al. (2003) and Field et al. (2013) for the Upper Elysian Park fault.

Puente Hills Blind Thrust

The active Puente Hills Blind Thrust (PHBT) is defined based on seismic reflection profiles, petroleum well data, and precisely located seismicity (Dolan et al., 2003; Shaw et al., 2002). The site is approximately 5.2 miles south-

DRAFT

southeast of the surface projection of the Puente Hills Blind Thrust upper limb (USGS-CGS, 2020). This blind thrust extends eastward from downtown Los Angeles to Brea in northern Orange County. The PHBT includes three north-dipping segments, named from east to west the Coyote Hills segment, the Santa Fe Springs segment, and the Los Angeles segment. These segments are overlain by folds expressed at the surface as the Coyote Hills, Santa Fe Springs Anticline, and the Montebello Hills. The Santa Fe Springs segment of the PHBT was the causative fault of the October 1, 1987 Whittier Narrows (Shaw et al., 2002) and March 29, 2014 La Habra earthquakes. The PHBT is not exposed at the ground surface and does not present a potential for surface fault rupture. However, based on deformation of late Quaternary age sediments above this fault system and the occurrence of the Whittier Narrows earthquake, the PHBT is considered an active fault capable of generating future earthquakes beneath the Los Angeles Basin. An average slip rate of 0.9 millimeters per year and a moment magnitude of 7.1 are estimated by the CGS (Cao et al., 2003; Field et al., 2013), for a multiple segment fault rupture of the Puente Hills Blind Thrust; a single segment fault rupture may produce an earthquake of moment magnitude 6.5 to 6.6.

Compton Thrust

The Compton blind thrust has been defined from seismic reflection profiles and borehole data (Leon et al., 2009) as a northeast-dipping structure. The vertical surface projection of the Compton thrust upper limb is approximately 16 miles southwest of the site. This blind thrust fault system extends approximately 28 miles from southwest Los Angeles County to northern Orange County in a southeastern direction. Leon et al. (2009) has correlated blind faulting at depth to near-surface folding. Several uplift events have been observed by investigating deformed Holocene layers along buried fold scarps. The cumulative uplift from the observed events ranged from 2 to 6 feet or approximately 4 to 14 feet of thrust displacement (Leon et al., 2009). Although the CGS (Cao et al., 2003) estimates a moment magnitude 7.6 earthquake, Leon et al. (2009) estimates moment magnitudes of 7.0 to 7.4 (Leon et al., 2009). Slip rate is estimated to be 0.9 millimeters per year (Field et al., 2013). Like other blind thrust faults in the Los Angeles area, the Compton blind thrust is not exposed at the surface and does not present a potential surface rupture hazard; however, the Compton thrust should be considered an active feature capable of generating future earthquakes.

Northridge Thrust

The Northridge Thrust is located beneath the majority of the San Fernando Valley and is the causative fault of the January 19, 1994 maximum moment magnitude 6.7 Northridge earthquake. This thrust fault is not exposed at the surface and does not present a potential surface fault rupture hazard. However, the Northridge Thrust is an active feature that can generate future earthquakes. The vertical surface projection of the Northridge thrust upper limb is approximately 16 miles north of the site (USGS-CGS, 2020). An average slip rate of 1.5 millimeters per year and a maximum moment magnitude of 7.0 are estimated by Cao et al. (2003) and Field et al. (2013) for the Northridge Thrust.

6.5 Geologic-Seismic Hazards

Surface Fault Rupture

The site is not within a currently established Alquist-Priolo Earthquake Fault Zone (A-P Zone) for surface fault rupture hazard (CGS 2022a, 2002). An A-P Zone is an area which requires investigation to evaluate whether the potential for surface fault rupture is present near an active fault (CGS, 2018a; Bryant and Hart, 2007). An active fault is defined as a fault with surface displacement within the last 11,700 years (Holocene). The closest active fault is located 1.1 miles northwest of the site for a section of the Hollywood fault (USGS-CGS, 2020; Jennings and Bryant, 2010; CGS, 2017). The closest Earthquake Fault Zone, established for a section of the Hollywood fault, is located approximately 1 mile northwest of the project site (CGS, 2022a and 2017). Blind thrust faults are not

DRAFT

exposed at the ground surface and are typically identified at depths greater than 3 kilometers. Therefore, these faults do not present a potential surface fault rupture hazard.

Based on the available geologic data, active faults with the potential for surface fault rupture are not known to be located directly beneath or projecting toward the project site. Therefore, the potential for surface rupture due to fault plane displacement propagating to the surface at the project site during the design life of the proposed development is considered low.

Seismicity and Ground Shaking

Earthquake Catalog Data

The seismicity of the region surrounding the project site was determined from research of a computer catalog of seismic data compiled by the Southern California Earthquake Data Center (SCEDC, 2022b). This database includes earthquake data compiled by the California Institute of Technology for 1932 to 2021. We have also utilized data from 1769 to 1931 compiled by the CGS (CDMG, 2001). The search for earthquakes that have occurred within 100 kilometers (62.1 miles) of the project site indicates that 446 earthquakes of Magnitude 4.0 and greater occurred between 1932 and 2021; 34 earthquakes of Magnitude 6.0 or greater occurred between 1769 and 1931. Faults and epicenters of earthquakes greater than Magnitude 5 in the greater Los Angeles area are shown in Figure 5.

A number of earthquakes of moderate to major magnitude have occurred in the Southern California area within about the last 115 years. A partial list of these earthquakes is included in the following table.

Earthquake (Oldest to Youngest)	Date of Earthquake	Magnitude	Distance to Epicenter (mi)	Direction to Epicenter
Long Beach	March 11, 1933	6.4	39	SSE
Tehachapi	July 21, 1952	7.5	74	NW
San Fernando	February 9, 1971	6.6	23	NW
Whittier Narrows	October 1, 1987	5.9	16	SE
Sierra Madre	June 28, 1991	5.8	25	NNE
Landers	June 28, 1992	7.3	110	ENE
Big Bear	June 28, 1992	6.3	88	ENE
Northridge	January 19, 1994	6.7	14	NW
Hector Mine	October 16, 1999	7.1	124	NE
Sierra El Mayor	April 4, 2010	7.2	233	SE
La Habra	March 29, 2014	5.1	27	SE
Borrego Springs	June 10, 2016	5.2	119	SE
Ridgecrest	July 6, 2019	7.1	124	NNE

The proximity of the site relative to known active faults indicates the site could be subjected to significant ground shaking caused by earthquakes. This hazard is common in Southern California and the effects of ground shaking can be mitigated by proper engineering design and construction in conformance with current building codes and engineering practices.

Liquefaction and Seismic-Induced Settlement

Liquefaction potential is greatest where the groundwater level is shallow, and submerged loose, fine sands occur within a depth of about 50 feet or less. Liquefaction potential decreases as grain size and clay and gravel content

DRAFT

increase. As ground acceleration and shaking duration increase during an earthquake, liquefaction potential increases. According to the City of Los Angeles (2022), Los Angeles County (2022a), and the CGS (CGS, 2017), the site is not within an area identified as having a potential for liquefaction. Groundwater was encountered in our current exploratory borings at depths between 23 and 35 feet; and as seepage at depths between 21 and 29 feet bgs in our prior borings. The deposits at these depths are late Pleistocene age and are generally not considered to be susceptible to liquefaction. Nevertheless, we evaluatied the site-specific liquefaction potential using the groundwater levels discussed above. The geometric mean peak ground acceleration (PGA_M) for the Maximum Considered Earthquake (MCE_G) was computed as described in ASCE 7-16. The appropriate earthquake magntide for use in our liquefaction evaluation was obtained from the USGS Interactive Deaggregation website. The site-specific MCE_G PGA was determined to be 0.98g and an earthquake magnitude of 6.8 was used in our evaluation.

Based on the results of our CPTs, SPTs, and laboratory testing of soil samples, because of the clayey nature of the soils below the current and historic-high groundwater levels, the liquefaction potential beneath the site is considered low. We estimate that the liquefaction-induced settlement will be on the order of ½ inch or less in the event of the Maximum Considered Earthquake.

We have also evaluated the potential for seismically-induced settlement of the soils above the groundwater level beneath the site in the event of the Maximum Considered Earthquake. Based on the results of our analyses, we estimate that the seismically-induced settlement of the soils above the groundwater level beneath the site will be less than ½ inch in the event of the Maximum Considered Earthquake.

Slope Stability

The relatively flat-lying topography at the site precludes both stability problems and the potential for lurching (earth movement at right angles to a cliff or steep slope during ground shaking). According to the City of Los Angeles (2022) and the County of Los Angeles (2022b), the site is not within an area identified as having a potential for landslide susceptibility. According to the CGS, the site is not within a mapped CGS landslide hazard zone, there are no known landslides near the site (CGS, 2022b and 2022c; CGS, 2017). Therefore, the potential for seismic slope instability is considered low.

Tsunamis, Inundation, Seiches, Flooding and Subsidence

The site is not in a coastal area and at approximate elevations ranging from 225 to 230 feet AMSL. The site is not in a Tsunami Inundation Area. Therefore, tsunamis (seismic sea waves) are not considered a hazard at the site.

According to the City of Los Angeles Seismic Safety Element of the General Plan (1996), the County of Los Angeles (1990b), and the California Office of Emergency of Services (CalOES, 2007), the project site is partially within inundation boundaries for Mulholland Dam. The Mulholland Dam and Reservoir are located approximately 2.9 miles northeast of the project site and within the foothills of the Santa Monica Mountains. According to the State of California Division of Safety of Dams, the dam is classified with a downstream hazard potential of "Extremely High" (DSOD, 2021). The classification indicates that at least one loss of human life is expected and one of the following:

- result in an inundation area with a population of 1,000 or more; or
- result in the inundation of facilities or infrastructure, the inundation of which poses a significant threat to public safety as determined by the department on a case-by-case basis

Recent studies and inundation modeling by the Los Angeles Department of Water and Power (LADWP) indicate that a breach of the Mulholland Dam would not reach the project site (LADWP, 2013). The California Department

DRAFT

of Water Resources' Division of Safety of Dams (DSOD) has reviewed and approved the inundation analyses by the LADWP for the Mulholland Dam (DSOD, 2021). These facilities, as well as others in California, are continually monitored by various governmental agencies (such as the State of California Division of Safety of Dams and the U.S. Army Corps of Engineers) to guard against the threat of dam failure. Therefore, the potential for inundation at the project site as a result of an earthquake-induced dam failure is considered low. Furthermore, there are no other large bodies of water near the project site that could adversely affect the site in the event of earthquake-induced seiches (wave oscillations in an enclosed or semi-enclosed body of water).

The site is in an area of minimal flooding potential (Zone X). Zone X, as defined by the Federal Emergency Management Agency (FEMA, 2022), is an area outside of the 0.2% annual chance flood. Therefore, the potential for flooding at the site is considered low.

The site is not within an area of known subsidence associated with fluid withdrawal (groundwater or petroleum), peat oxidation, or hydrocompaction..obvious

Oil Wells and Methane Gas

Oil and gas wells are potential concerns when they seep oil or gas, are not abandoned to current regulations, or have associated surface contamination. They may also be associated with methane hazards. The site is located within the administrative limits of the Salt Lake Oil Field according to the Well Finder system of the California Geologic Energy Management Division [CalGEM, 2021, previously the California Division of Oil, Gas, and Geothermal Resources (DOGGR)]. The closest known oil production well is approximately 0.5-mile southeast of the site and is categorized as a "plugged oil and gas" location. The closest active oil wells are approximately 1.1 miles southwest of the project site within the Beverly Center. There is a remote possibility that undocumented wells could be encountered during any grading and construction at the site. Any well encountered would need to be properly abandoned in accordance with the current requirements of CalGEM.

The site is within a City of Los Angeles Methane Zone according to the City of Los Angeles' NavigateLA online database (2022); therefore, the potential exists for methane and other volatile gases to occur beneath the site. The CGS may require a subsurface methane investigation and if testing indicates that methane is present at the site, then a permanent methane gas control system may be necessary.

Volcanic Hazards

Due to the distance between the project site and known active volcanic areas, there are no significant potential impacts related to volcanic hazards. The proposed development will not result in or expose people to significant impacts related to volcanic hazards.

Radon

The project site is in a Low Potential for Indoor Radon Levels above 4.0 Picocuries per Liter zone, defined as all areas that are not designated as High Potential or Moderate Potential (CGS, 2022d).

6.6 Geologic Conclusions

Based on the available geologic data, active faults with the potential for surface fault rupture are not known to be located directly beneath or projecting toward the site. Therefore, the potential for surface rupture due to fault plane displacement propagating to the surface at the site during the design life of the building is considered low.

DRAFT

Although the site could be subjected to strong ground shaking in the event of an earthquake, this hazard is common in Southern California and the effects of ground shaking can be mitigated by proper engineering design and construction in conformance with current building codes and engineering practices.

The site is relatively level, and the absence of nearby slopes precludes slope stability hazards. The site is within an area identified as having a potential for inundation, however recent studies indicate that a breach of the upstream dam would not affect the site. The site is located within the limits of the active Salt Lake Oil Field; therefore, a possibility exists of encountering undocumented wells during any grading or construction. Any well encountered would need to be appropriately abandoned in accordance with the current requirements of CalGEM. The site is also within a City of Los Angeles Methane Zone; therefore, the potential exists for methane and other volatile gases to occur beneath the site. A separate subsurface methane investigation may be required. The potential for other geologic hazards such as liquefaction, seismically-induced settlement, tsunamis, seiches, subsidence, volcanism, and radon gas affecting the site is considered low.

DRAFT

7.0 RECOMMENDATIONS

7.1 General

Records documenting the placement and compaction of the existing fill soils are not available. Ttherefore, the existing fill soils are not considered suitable for support of new structures on conventional spread/continuous footings or for support of building slabs on grade, paving, or other exterior concrete walks and slabs on grade. If the existing fill soils are excavated and replaced with properly compacted fill, new structures may be supported on conventional spread/continuous footings underlain by undisturbed natural soil and/or properly compacted fill and floor slabs may be supported on grade. As an alternative to the excavation and compaction of existing fill soils and/or to resist uplift loading, drilled cast-in-place concrete pile foundations may be utilized for support of new structures; however, where existing fill soils are left in place, building floor slabs should be structurally supported.

As previously stated, the upper clayey soils are expansive, and will shrink and swell with fluctuations in moisture content. The upper clayey soils should be excavated to allow for the placement of at least 2 feet of relatively non-expansive soils beneath floor slabs, pavement, and other exterior concrete walks and slabs on grade. For structurally-supported floor slabs, as an alternative to the 2-foot thick layer of relatively non-expansive soil, the floor slab could be constructed with a gap of at least 6 inches between the floor slab and the underlying soils; this could be accomplished through the use of compressible cardboard or foam forms.

Ideally, to provide support for new paving and other exterior concrete walks and slabs on grade, all existing uncertified fill soils should be excavated and replaced as properly compacted fill. However, in consideration of the relatively good condition of the existing paving throughout the campus, the removal of the existing uncertified fill soils may be limited to the upper 2 feet beneath the pavement section. Where uncertified fill soils are to be left in place, after the 2-foot removal is completed, the exposed subgrade should be carefully observed by a representative of our firm to identify any areas that may require additional excavation and compaction. To further improve design life and reduce (but not eliminate) possible maintenance costs resulting from the above-described limited improvement, a layer of geogrid material (Tensar BX-1200, or equivalent) could be placed immediately below the recommended 2-foot thick layer of properly compacted fill and immediately below the base course layer. As stated above, the 2-foot thick layer of properly compacted fill beneath pavement and other concrete walks and slabs on grade should consist of relatively non-expansive soil.

7.2 Foundations

New Shallow Foundations

Bearing Value

If the existing fill soils are excavated and replaced as properly compacted fill soils, new buildings constructed at grade may be supported on conventional spread/continuous footings underlain by properly compacted fill and/or undisturbed natural materials. Such footings, carried at least 2 feet below the lowest adjacent grade or floor level, may be designed to impose a net dead-plus-live load pressure of 3,500 pounds per square foot. The excavations should be deepened as necessary to extend into satisfactory soils.

A one-third increase may be used for wind or seismic loads. The recommended bearing value is a net value, and the weight of concrete in the footings may be taken as 50 pounds per cubic foot; the weight of soil backfill may be neglected when determining the downward loads.

Settlement

Based on the assumed structural loads, we estimate that the settlement of new structures, supported on spread footings in the manner recommended above, will be on the order of 1 inch or less with differential settlements

DRAFT

on the order of ¼ inch between adjacent columns. We should be provided with the actual structural loads when they are available so that we can make adjustments to our recommendations, if necessary.

Lateral Resistance

Lateral loads may be resisted by soil friction and by the passive resistance of the soils. A coefficient of friction of 0.4 may be used between the footings and the floor slab and the supporting soils. The passive resistance of the soils may be assumed to be equal to the pressure developed by a fluid with a density of 300 pounds per cubic foot. This passive resistance may also be used for design of thrust blocks, up to a maximum value of 3,000 pounds per square foot. A one-third increase in the passive value may be used for wind or seismic loads. The frictional resistance and the passive resistance of the soils may be combined without reduction in determining the total lateral resistance.

Modulus of Subgrade Reaction

For structural analyses of spread or continuous footings supported on compacted fill and/or undisturbed natural soils as recommended, a vertical modulus of subgrade reaction of 25 pounds per cubic inch may be used.

Minor Structures

Minor structures that are structurally separate from the proposed buildings may be supported on spread or continuous footings underlain by at properly compacted fill and/or undisturbed natural soils. All existing fill soil beneath the footings of minor structures should be removed and replaced as properly compacted fill. Such footings may be designed to impose a dead plus live load pressure of 1,500 pounds per square foot at a depth of 1½ feet below the lowest adjacent grade.

A one-third increase in the the above bearing value may be used for wind or seismic loads. Since the recommended bearing value is a net value, the weight of concrete in the footings may be taken as 50 pounds per cubic foot, and the weight of soil backfill may be neglected when determining the downward loads on the footings.

Foundation Observation

To verify the presence of satisfactory soils at the design elevations, the bottoms of the foundations should be observed by personnel of our firm. Foundations should be deepened as necessary to reach satisfactory supporting soils, as discussed above. The exposed soils should be inspected to confirm that the bottom of the excavation is free of loose soil and other unsuitable materials before footing construction.

Inspection of the foundation excavations may also be required by the appropriate reviewing governmental agencies. The contractor should be familiar with the inspection requirements of the reviewing agencies.

Drilled Cast-in-Place Concrete Pile Foundations

Axial Capacity

The downward and upward capacities of 16-, 24-, and 30-inch-diameter drilled cast-in-place concrete piles are presented as a function of penetration into natural soil on Figure 6, Drilled Pile Capacities. Dead-plus-live load capacities are shown; a one-third increase may be used for wind or seismic loads. The recommended capacities are based on the strength of the soils; the compressive and tensile strength of the pile section itself should be checked to verify the structural capacity of the piles.

DRAFT

Piles in groups should be spaced at least 3 pile diameters on centers. If the piles are so spaced, no reduction in the axial capacity of the piles due to group action need be considered in the design.

The axial pile capacities recommended above may also be utilized for analysis of existing pile foundations. The axial capacities of different diameter piles may be assumed to be proportional to the diameter.

Settlement

We estimate the settlement of the proposed structures, supported on drilled piles in the manner recommended, will be less than ½ inch. Differential settlement between adjacent columns is expected to be less than ¼ inch between adjacent columns/walls.

Lateral Resistance

Lateral loads may be resisted by the piles and by the passive resistance of the soils against pile caps and grade beams. The resistance of the piles and the passive resistance of the soils against pile caps and grade beams may be combined without reduction in determining the total lateral resistance.

We have computed the lateral capacities of the piles using the computer program LPILE by ENSOFT, Inc. Resistance of the soils adjacent to the 16-, 24-, and 30-inch-diameter drilled piles are shown in the following tables for top of pile deflections of ¼ and ½ inch. These resistances have been calculated assuming free- and fixed-head pile conditions. The minimum pile length may be taken as the length required to reach the depth to zero moment given in the tables below.

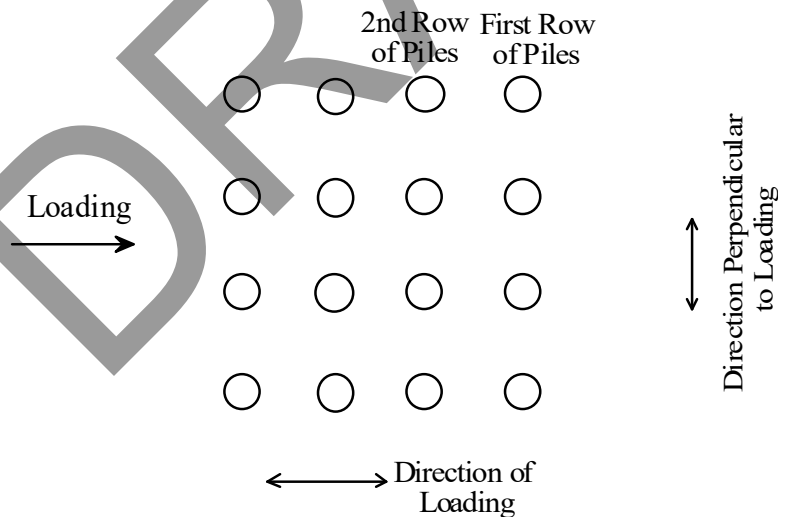
Lateral Load Design Data
16-inch-diameter Drilled Concrete Pile

	Pile Head Deflection (inches)			
	¼		½	
Pile Head Condition	**Free**	**Fixed**	**Free**	**Fixed**
Lateral Load (kips)	15	40	25	65
Maximum Moment (inch-kips)	530	1650	1030	3010
Depth to Maximum Moment (ft)	4½	0	4½	0
Depth to Zero Moment (ft)	15	17	15	17

Lateral Load Design Data
24-inch-diameter Drilled Concrete Pile

	Pile Head Deflection (inches)			
	¼		½	
Pile Head Condition	**Free**	**Fixed**	**Free**	**Fixed**
Lateral Load (kips)	30	80	55	145
Maximum Moment (inch-kips)	1,395	4,380	1,900	8,405
Depth to Maximum Moment (ft)	6½	0	6½	0
Depth to Zero Moment (ft)	19	22	19	22

DRAFT



Lateral Load Design Data
30-inch-diameter Drilled Pile

	Pile Head Deflection (inches)			
	¼		½	
Pile Head Condition	**Free**	**Fixed**	**Free**	**Fixed**
Lateral Load (kips)	40	115	85	215
Maximum Moment (inch-kips)	2,375	7,480	4,730	14,605
Depth to Maximum Moment (ft)	7½	0	7½	0
Depth to Zero Moment (ft)	23	26½	23	26½

Prepared by: GW checked by: LT

The preceding lateral capacities have been calculated based on the strength of the soils; the shear and moment capacities of the pile sections should be checked to verify the structural capacity of the piles. The lateral pile capacities recommended above may also be utilized for analysis of existing pile foundations. The lateral capacities of different diameter piles may be assumed to be proportional to the diameter.

For piles in groups spaced as shown below and at least 3 pile diameters on centers, no reduction in the lateral capacities need be considered for the first (leading) row of piles in the direction perpendicular to loading. For subsequent rows in the direction of loading, piles in groups spaced closer than 8 pile diameters on centers will have a reduction in lateral capacity due to group effects. Therefore, the lateral capacity of piles in groups, except for the first row of piles, spaced at 3 pile diameters on centers, may be assumed to be reduced by half. The reduction of lateral capacity in the direction of loading for other pile spacing may be interpolated.

As an alternative to the above lateral resistance values for pile foundations, the lateral resistance of pole-type foundations may be determined using the simplified approach given in Section 1807A.3 of the 2019 CBC (Pole Formula). In this case, when using the pole formular, the lateral resistance of natural soils or properly compacted fill may be assumed to be equal to the pressure developed by a fulid with a density of 600 pounds per cubic foot, up to a maximum of 6,000 pounds per square foot. The lateral resistance of the existing fill soils may be assumed to be equal to the pressure developed by a fluid with a density of 300 pounds per cubic foot, up to a maximum of 3,000 pounds per square foot.

DRAFT

Where existing fill soils are left in place, friction may not be used between the structurally supported floor slab and the underlying fill soil. The passive resistance of the natural soils or properly compacted fill against pile caps and grade beams may be assumed to be equal to the pressure developed by a fluid with a density of 300 pounds per cubic foot. The passive resistance of the existing fill soils may be assumed to be equal to the pressure developed by a fluid with a density of 150 pounds per cubic foot. A one-third increase in the passive values may be used when considering wind or seismic loads.

Installation

Because of the likely presence of groundwater, the installation of drilled cast-in-place concrete piling may require the use of drilling mud to reduce caving potential during the drilling and the placing of concrete, unless the pile lengths are restricted to not extend below the current groundwater level. Piles spaced less than five diameters on center should be drilled and filled alternately, with the concrete permitted to set at least eight hours before drilling an adjacent hole. Pile excavations should be filled with concrete as soon after drilling and inspection as possible; the holes should not be left open overnight.

Concrete should be pumped from the bottom up through a rigid pipe extending to the bottom of the drilled excavation, with the pipe being slowly withdrawn as the concrete level rises. The discharge end of the pipe should be at least 5 feet below the surface of the concrete at all times during placement. The discharge pipe should be kept full of concrete during the entire placing operation and should not be removed from the concrete until all of the concrete is placed and fresh concrete appears at the top of the pile. The volume of concrete pumped into the hole should be recorded and compared to design volume.

Only competent drilling contractors with experience in the installation of drilled cast-in-place piles in similar soil and groundwater conditions should be considered for the pile construction. We suggest requesting the piling contractor to submit a list of similar projects along with references for each project.

The drilling of the pile excavations and the placing of the concrete should be observed continuously by a representative of our firm to verify that the desired diameter and depth of piles are achieved.

Existing Shallow Foundations

Bearing Value

Based on our review of the as-built plans, the structures to be seismically upgraded are supported on spread/continuous footings. Based on the results of our nearby explorations, these footings are anticipated to be established in the natural materials underlying the site. The existing and/or enlarged footings may be analyzed using an allowable net dead-plus-live load pressure of 1,500 pounds per square foot. The existing foundations may be able to impose greater allowable bearing pressures if additional settlement can be tolerated.

A one-third increase may be used for wind or seismic loads. The recommended bearing value is a net value, and the weight of concrete in the footings may be taken as 50 pounds per cubic foot; the weight of soil backfill may be neglected when determining the downward loads.

Settlement

It is anticipated that any new dead-plus-live loads imposed on existing foundations as a result of the proposed seismic upgrades will consist of only the self-weight of the new structural lateral force-resisting elements. Therefore, the additional settlement of existing footings as a result of the proposed seismic upgrade is expected

DRAFT

to be relatively minor and within acceptable limits. However, we should be provided with the structural loading when it is available so that we can perform settlement analyses to confirm this conclusion.

Lateral Resistance

Lateral loads may be resisted by soil friction and by the passive resistance of the soils. A coefficient of friction of 0.4 may be used between the footings and the floor slab and the supporting soils. The passive resistance of the soils may be assumed to be equal to the pressure developed by a fluid with a density of 300 pounds per cubic foot. A one-third increase in the passive value may be used for wind or seismic loads. The frictional resistance and the passive resistance of the soils may be combined without reduction in determining the total lateral resistance.

Ultimate Design Factors

When considering an ultimate design approach, the recommended design values provided in the previous sections may be multiplied by the factors shown in the table below:

Design Item	Ultimate Design Factor
Footing Bearing Value	3.0
Axial Capacity (Pile Foundations)	2.0
Lateral Capacity (Pile Foundations)	1.0
Passive Resistance	1.5
Coefficient of Friction	1.5

In no event, however, shall new foundation sizes be less than those required for dead-plus-live loads when using the working stress design values.

DRAFT

7.3 Dynamic Site Characteristics

Mapped Seismic Design Parameters

We have determined the seismic design parameters in accordance with the Section 2.4 of ASCE 41-17 Standard (ASCE, 2014) using the United States Geological Survey program, U.S. Seismic Design Maps Web Application (USGS, 2021). The site may be classified as Site Class D, as specified in the 2019 California Building Code (CBC), based the results of our explorations and shear wave velocity measurements and a review of the local soil and geologic conditions. The mapped seismic design parameters, along with the values from the site-specific procedure discussed in the following subsection, are presented in the following table:

Parameter	Mapped Value	Site-Specific Value
S_s	2.09g	-
S_1	0.75g	-
Project Site Class	D	-
F_a	1.0	-
F_v	1.7	-
$S_{MS} = F_a S_S$ (0.2 second period)	2.09g	2.32g
$S_{M1} = F_v S_1$ (1.0 second period)	1.27g	1.49g
$S_{DS} = 2/3 \times S_{MS}$ (0.2 second period)	1.39g	1.55g
$S_{D1} = 2/3 \times S_{M1}$ (1.0 second period)	0.85g	1.00g

DRAFT

Site-Specific Ground Motion Hazard Analysis (ASCE 7-16)

We have performed a Probabilistic Seismic Hazard Analyses (PSHA) and a Deterministic Seismic Hazard Analyses (DSHA) using the computer programs OpenSHA (Field et al., 2003) and EZ-FRISK (Risk Engineering, 2019), respectively, in order to develop site-specific response spectra in accordance with the 2019 CBC and Chapter 21 of ASCE 7-16.

The ergodic ground motion models (GMMs) selected for use in this analysis were those developed for the Pacific Earthquake Engineering Research Center (PEER) Next Generation Attenuation (NGA) West 2 project. Four of the five NGA West 2 GMMs were used – Abrahamson et al. (2014), Boore et al. (2014), Campbell and Bozorgnia (2014), and Chiou and Youngs (2014); an equal weighting of 0.25 was used for each of these GMMs. For all four of the GMMs, the shear wave velocity of the materials beneath the site (i.e., depth range of existing ground surface to 100 feet below ground surface, referred to as V_{S30}) to be used was computed to be 343 meters per second (1,125 feet per second) based on the shear wave velocity measurements performed at the site that were extrapolated using a regression presented by Boore (2004). We have used a depth to a shear wave velocity of 1,000 meters per second beneath the site ($Z_{1.0}$) of 350 meters and a depth to a shear wave velocity of 2,500 meters per second ($Z_{2.5}$) of 2.1 kilometers based on the Southern California Earthquake Center's Community Shear Wave Velocity Model-Harvard (Plesch et al., 2011).The fifth NGA West 2 GMM (Idriss, 2014) was not used because the model is only based on data from "quasi-linear sites" where the V_{s30} is greater than 450 meters per second and it is therefore not considered appropriate for this site. The GMMs provide ergodic estimated median

component ground motions over all orientations (RotD50) with 5% of critical damping as a function of the V_{S30}, $Z_{1.0}$ and $Z_{2.5}$.

The site-specific probabilistic response spectra were developed using the OpenSHA program. An average of Fault Models 3.1 and 3.2 from the Third Uniform California Earthquake Rupture Forecast (UCERF3) was used as the earthquake rupture forecast model for the PSHA (Field et al., 2013). In addition to known fault sources, background seismicity was also included in the PSHA. The site-specific deterministic response spectrum was computed as the maximum of the 84th percentile spectral ordinates computed for all known active faults in EZ-FRISK.

The deterministic spectrum is controlled by the Santa Monica fault for all oscillator periods between PGA and 10 seconds. The computed 5%-damped probabilistic and deterministic ground motions were converted to maximum direction ground motions (RotD100) using the amplification factors given in Shahi and Baker (2014), as shown in Table 2.

In accordance with Chapter 21 of ASCE 7-16, the probabilistic Risk-Targeted Maximum Considered Earthquake (MCE_R) response spectrum was taken as the maximum direction response spectrum with a 2% probability of being exceeded in 50 years multiplied by the risk coefficients C_{RS} and C_{R1}. The risk-targeted coefficients, C_{RS} and C_{R1} were taken from Figures 22-18 and 22-19 in ASCE 7-16. The C_{RS} and C_{R1} values for this project were both determined to be 0.898 for the site.

ASCE 7-16 defines the deterministic MCE_R response spectrum as the maximum of the composite deterministic response spectrum and the deterministic lower limit, as defined on Figure 21.2-1 of ASCE 7-16, as presented in Table 3 (the deterministic lower limit requirement was removed in Supplement 1 to ASCE 7-16 so long as the largest spectral acceleration of the composite deterministic response spectrum is greater than $1.5F_a$). The site-specific MCE_R response spectrum was then taken as a composite of the probabilistic and deterministic MCE_R response spectra, determined as described above, which consisted of the lesser of the spectral ordinates between the two spectra, as presented in Table 4, with a lower limit of 150% of the site-specific design response spectrum. The site-specific design response spectrum was computed by multiplying the ordinates of the site-specific MCE_R response spectrum by two-thirds, with a lower limit at all periods of 80% of the spectral ordinates of the general design response spectrum determined in accordance with Section 11.4.6 of ASCE 7-16, as presented in Table 5. The 5% damped site-specific MCE_R and design response spectrum are shown on Figure 7.

The site-specific design acceleration parameters were determined in accordance with Chapter 21.4 of ASCE 7-16. The parameter S_{DS} is taken as 90% of the maximum spectral acceleration obtained from the site-specific spectrum within the oscillator period range 0.2 to 5 seconds. S_{D1} is taken as the maximum value of the product of the spectral period and the spectral acceleration for spectral periods from 1 to 5 seconds. S_{MS} and S_{M1} are taken as 1.5 times S_{DS} and S_{D1}, respectively. The site-specific values are presented in the table in the preceding subsection.

Site-Specific Ground Motion Hazard Analysis (ASCE 41-17)

Site-specific response spectra were also developed in accordance with the requirements of ASCE 41-17. The PSHA and DSHA were performed in the same manner (i.e. the V_{s30}, $Z_{2.5}$, $Z_{1.0}$ values used and the programs, GMMs, and fault models used) as described in the preceding subsection describing our site-specific ground motion hazard analysis performed in accordance with the requirements of ASCE 7-16.
The Basic Safety Earthquake (BSE)-2N is defined in Section 2.4.2.1.4 of ASCE 41-17 as being equivalent to the risk-targeted maximum considered earthquake (MCE_R) defined in Chapter 21 of ASCE 7-16 described in the

DRAFT

preceding subsection, Accordingly, the site-specific BSE-2N response spectrum was taken as the maximum of 80% of the BSE-2N general response spectrum and the site-specific MCE_R, to comply with Section 2.4.2.1.2 of ASCE 41-17, as shown in Table 6. The site-specific BSE-1N response spectrum was computed by taking the maximum of 80% of the BSE-1N general response spectrum and the spectrum obtained by multiplying the ordinates of the site-specific BSE-2N response spectrum by two-thirds, as shown in Table 8. The site-specific BSE-1N response spectrum may be assumed to be equivalent to the design earthquake response spectrum specified in Chapter 21 of ASCE 7-16.

The site-specific response spectrum for the BSE-2E Seismic Hazard Level was taken as the lesser of the following:

- The geometric mean probabilistic site-specific spectrum with a 5% probability of being exceeded in 50 years, adjusted for maximum direction, or
- The site-specific spectrum for the BSE-2N Seismic Hazard Level adjusted for maximum direction.

The development of the site-specific response spectrum for the BSE-2E Seismic Hazard Level is shown in Table 7 and Figure 10.

The site-specific response spectrum for the BSE-1E Seismic Hazard Level was taken as the lesser of the following:

- The mean probabilistic site-specific spectrum with a 20% probability of being exceeded in 50 years adjusted for maximum direction, or
- The site-specific spectrum for the BSE-1N Seismic Hazard Level adjusted for maximum direction.

The development of the site-specific response spectrum for the BSE-1E Seismic Hazard Level is shown in Table 8 and Figure 11.

The mapped and site-specific seismic design parameters in accordance with ASCE 41-17 are summarized in the following table.

Parameter	BSE-1E		BSE-2E		BSE-1N		BSE-2N	
	Mapped	Site-Specific	Mapped	Site-Specific	Mapped	Site-Specific	Mapped	Site-Specific
S_s	0.76g	-	1.60g	-	-	-	2.09g	-

DRAFT

7.4 Floor Slab Support

The subgrade for building floor slabs should b prepared in accordance with the recommendations in the following section on grading.

The building slab thicknesses and reinforcing details should be determined by the structural engineer. However, we suggest, at a minimum, the building slabs should consist of a 4-inch thick slab reinforced with No. 3 reinfocing bars spaced at 16 inches on center each way.

Construction activities and exposure to the environment can cause deterioration of the prepared subgrade. Therefore, we recommend that our field representative observe the condition of the final subgrade soils immediately prior to slab-on-grade construction, and, if necessary, perform further density and moisture content tests to determine the suitability of the final prepared subgrade.

Where vinyl or other moisture-sensitive floor covering is planned, we recommend that the floor slab in those areas be underlain by a capillary break consisting of a vapor-retarding membrane over a 4-inch-thick layer of gravel. A 2-inch-thick layer of sand should be placed between the gravel and the membrane to decrease the possibility of damage to the membrane. We suggest the following gradation for the gravel:

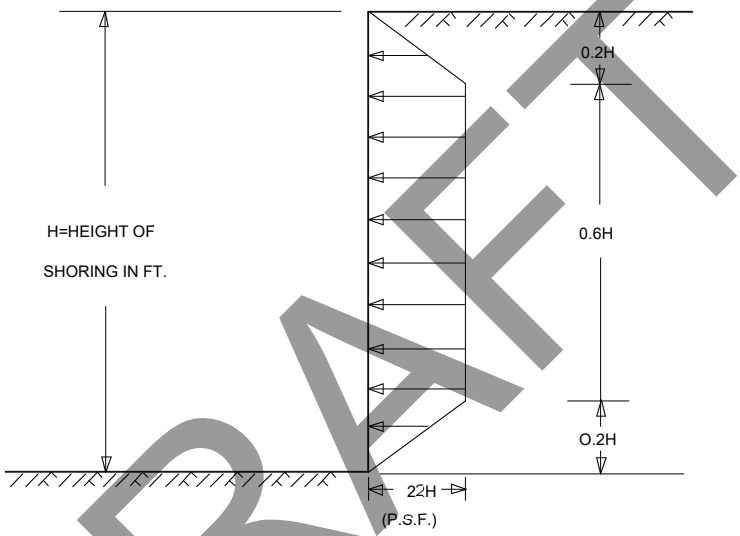
Sieve Size	Percent Passing
¾″	90–100
No. 4	0–10
No. 100	0–3

Measures to reduce concrete shrinkage, such as the use of a low-slump concrete (i.e. less than 2 inches), should be implemented in order to minimize possible curling of the slab. A 2-inch-thick layer of coarse sand (having a Sand Equivalent of at least 30) should be placed over the vapor retarding membrane to reduce slab curling. If this sand bedding is used, care should be taken during the placement of the concrete to prevent displacement of the sand. The concrete slab should be allowed to cure properly before placing vinyl or other moisture-sensitive floor covering. The sand and gravel layers should not be considered part of the recommended non-expansive soil layer under concrete slabs. The vapor retarding membrane should meet the minimum requirements of ASTM E-1745 (either Class A, B, or C), as stated in ACI 302.1R, regardless of thickness.

7.5 Temporary Shoring

General

Where there is not sufficient space for sloped embankments, shoring will be required. One method of shoring would consist of steel soldier piles placed in drilled holes and backfilled with concrete. Based on the anticipated depth of excavation, cantilevered soldier piles are anticipated to be sufficient; however, should deeper excavations be required, tie-back anchors or internal bracing may be required. We can provide recommendations for design of such shoring elements should they become necessary.



The following information on the design and installation of the shoring is as complete as possible at this time. We can furnish any additional required data as the design progresses. Also, we suggest that our firm review the final shoring plans and specifications prior to bidding or negotiating with a shoring contractor.

DRAFT

Lateral Pressures

For design of cantilevered shoring, a triangular distribution of lateral earth pressure may be used. It may be assumed that the retained soils with a level surface behind the cantilevered shoring will exert a lateral pressure equal to that developed by a fluid with a density of 30 pounds per cubic foot. Where a combination of sloped embankment and shoring is used, the pressure would be greater and must be determined for each combination.

For temporary support of trench excavations, internally braced hydraulic shoring could be used. The hydraulic shoring system should be capable of resisting a trapezoidal distribution of lateral earth pressure. The recommended trapezoidal distribution of lateral earth pressure for the case where the grade is level behind the shoring is illustrated in the following diagram, where the maximum lateral pressure will be 22H in pounds per square foot, where H is the shored height in feet.

DRAFT

In addition to the recommended earth pressure, the upper 10 feet of shoring adjacent to the streets or traffic areas should be designed to resist a uniform lateral pressure of 100 pounds per square foot, acting as a result of an assumed 300 pounds per square foot surcharge behind the shoring due to normal traffic. If the traffic is kept back at least 10 feet from the shoring, the traffic surcharge may be neglected. The shoring system should also be designed to support the lateral surcharge pressures imposed by the foundations of adjacent structures. In addition, the shoring system should be designed to support the lateral surcharge pressures imposed by concrete trucks and other heavy construction equipment or storage loads placed near the shoring system.

Design of Soldier Piles

For the design of soldier piles spaced at least two diameters on centers, the allowable lateral bearing value (passive value) of the soils below the level of excavation but above the groundwater level may be assumed to be 600 pounds per square foot per foot of depth at the excavated surface, up to a maximum of 6,000 pounds per square foot. The allowable passive value of the soils below the level of excavation and below the groundwater level may be assumed to be 400 pounds per square foot per foot of depth at the excavated surface, up to a maximum of 4,000 pounds per square foot. To develop the full lateral value, provisions should be taken to assure firm contact between the soldier piles and the undisturbed soils. The concrete placed in the soldier pile excavations may be a lean-mix concrete. However, the concrete used in that portion of the soldier pile which is below the planned excavated level should be of sufficient strength to adequately transfer the imposed loads to the surrounding soils.

Lagging
Continuous lagging will be required between the soldier piles. The soldier piles and anchors should be designed for the full anticipated lateral pressure.

Deflection
The deflection of a cantilevered shoring system may be estimated by the shoring engineer. If greater than the estimated deflection occurs during construction, additional bracing may be necessary to minimize settlement of any adjacent structures. If desired to reduce the deflection of the shoring, a greater active pressure could be used in the shoring design.

Monitoring
Some means of monitoring the performance of the shoring system is recommended. The monitoring should consist of periodic surveying of the lateral and vertical locations of the tops of all the soldier piles. We will be pleased to discuss this further with you and the design consultants when the design of the shoring system has been finalized.

7.6 Retaining Walls and Walls Below Grade

General
Retaining wall foundations and free-standing wall foundations should be designed in accordance with the recommendations for new foundations contained in Section 7.2 of this report.

Lateral Earth Pressure
For design of cantilevered retaining walls, where the surface of the backfill is level, it may be assumed that drained soils will exert a lateral pressure equal to that developed by a fluid with a density of 30 pounds per cubic foot. Where the backfill slopes upward away from the wall at an inclination of 2:1 (horizontal:vertical), it may be assumed that drained soils will exert a lateral pressure equal to that developed by a fluid with a density of 45 pounds per cubic foot.

As required by the CBC, restrained retaining walls and building walls below grade must be designed to resist at-rest earth pressures unless. For the case where the grade is level behind the restrained wall, the at-rest pressure may be taken as a triangular distribution of lateral earth pressure equivalent to that developed by a fluid with a density of 55 pounds per cubic foot.

In addition to the recommended earth pressures, the upper 10 feet of walls adjacent to streets or vehicular traffic areas should be designed to resist a uniform lateral pressure of 100 pounds per square foot, acting as a result of an assumed 300 pounds per square foot surcharge behind the walls due to normal traffic. If the traffic is kept back at least 10 feet (or a distance equal to the hieght of the wall, whichever is less) from the walls, the traffic surcharge may be neglected. Furthermore, retaining walls and walls below grade should be designed to support the lateral surcharge pressures imposed by the foundations of adjacent existing structures as well as any adjacent heavy equipment or storage loads.

Seismic Lateral Earth Pressure
Based on the generally cohesive nature of the upper on-site materials and the design level of ground shaking, we estimate that the seismic lateral earth pressures on retaining walls up to 10 feet in retained height will be negligible. Retaining walls with retained heights between 10 and 15 feet should be designed to support an active

DRAFT

seismic lateral earth pressure. The combined active static and seismic lateral earth pressure based on the design level earthquake may be assumed to be equivalent to that developed by a fluid with a density of 40 pounds per cubic foot; the drained active static lateral earth pressure may be taken as equivalent to that developed by a fluid with adensity of 30 pounds per cubic foot.

Drainage

Retaining walls should be designed to resist hydrostatic pressures or be provided with a drain pipe or weepholes. The drain could consist of a 4-inch-diameter perforated pipe placed with perforations down at the base of the wall. The pipe should be sloped at least 2 inches in 100 feet and surrounded by ¾-inch crushed rock or gravel separated from the on-site soils by an appropriate filter fabric. The crushed rock or gravel should have less than 5% passing a No. 200 sieve. In any event, the retaining walls should be waterproofed.

For building walls below grade, where the walls are formed, drainage may be provided by a 1-foot wide vertical strip of granular soils or continuous geosynthetic drainage panels, such as Miradrain 6000 (or equivalent), attached to the back of the wall before backfilling. The geosynthetic drainage panels should be terminated at 3 feet below the ground surface. A drainage collection system, such as Quickdrain (or equivalent) should be placed at the base of the wall and connected to the drainage panels and discharge to a solid pipe at least 4 inches in diameter. As an alternative, the drainage collection system may consist of a 4-inch-diameter perforated pipe placed at the base of the wall with the perforations down and surrounded by at least 4 inches of crushed rock. The rock should be separated from the adjacent soils by an appropriate filter fabric. The 1-foot strip of granular soils or the drainage panels should extend to the drainage collection system.

If the braced building walls below grade are not formed and are shotcreted (single-formed), the drainage system may consist of continuous geosynthetic drainage panels, such as Miradrain 6000 (or equivalent), placed at a depth starting at about 3 feet below the existing grade. The drainage panels should be connected to a drainage collection system, such as Quickdrain (or equivalent) placed at the base of the wall and connected to a solid discharge pipe at least 4 inches in diameter. As an alternative, the drainage panels could be connected to weep holes at the bottom of the excavation. The weep holes should consist of solid pipes that are spaced at 10 feet on centers. At the connection of the weep holes and the drainage panels, the weep holes should be embedded in 1 cubic foot of crushed rock placed into the face of the excavation. The crushed rock should be surrounded by an appropriate filter fabric. The weep holes should drain into a solid pipe, at least 4 inches in diameter, placed beneath the edges of the floor slab.

The solid discharge pipes may drain by gravity into the nearest storm drain or into a sump-pump system that drains into the storm drain. The flow of water to the nearest storm drain should meet the requirements of the appropriate governmental agencies. The installed drainage system should be observed by personnel from our firm prior to being backfilled. Inspection of the drainage system may also be required by the reviewing governmental agencies.

7.7 Paving

To provide support for paving, the subgrade soils should be prepared as recommended in the following section on grading. Compaction of the subgrade, including trench backfills, to at least 90%, and achieving a firm, hard, and unyielding surface will be important for paving support. The preparation of the paving area subgrade should be performed immediately prior to placement of the base course. Proper drainage of the paved areas should be provided since this will reduce moisture infiltration into the subgrade and increase the life of the paving.

DRAFT

To provide data for design of paving sections, the R-value of two samples of the upper soils collected during our current investigation was determined. The test result, which indicated R-values of 24 and less than 5, are presented in Appendix A. The paving sections below are also considered suitable to support emergency vehicle traffic.

Asphalt Concrete Paving

The required paving and base thicknesses will depend on the expected wheel loads and volume of traffic (Traffic Index or TI). Assuming that the paving subgrade will consist of at least 2 feet of relatively non-expansive soils compacted to at least 90% as recommented, the minimum recommended paving thicknesses are presented in the following table.

Assumed Traffic Index	Asphalt Concrete (Inches)	Base Course (Inches)
4 and 5 (Automobile Parking and Driveways with Light Truck Traffic)	3	4
6 (Driveways with Heavy Truck Traffic, including Fire Truck)	4	4½
7	5	5

The asphalt paving sections were determined using the Caltrans design method. We can determine the recommended paving and base course thicknesses for other Traffic Indices if required. Careful inspection is recommended to verify that the recommended thicknesses or greater are achieved, and that proper construction procedures are followed.

Portland Cement Concrete Paving

Portland cement concrete paving sections were determined in accordance with procedures developed by the Portland Cement Association. Concrete paving sections for a range of Traffic Indices are presented in the following table. We have assumed that the paving subgrade will consist of at least 2 feet of relatively non-expansive soils compacted to at least 90% as recommented and that the portland cement concrete will have a compressive strength of at least 3,000 pounds per square inch.

Assumed Traffic Index	Concrete Paving (Inches)	Base Course (Inches)
4 (Automobile Parking)	6½	4
5 and 6 (Driveways with Light or Heavy Truck Traffic, including Fire Truck)	7	4
7	7½	4

For pedestrian-only concrete sidewalks, paving sections consisting of 4 inches of concrete underlain by 4 inches of base course may be used.

The paving should be provided with joints at regular intervals no more than 15 feet in each direction. Load transfer devices, such as dowels or keys, are suggested at joints in the paving to reduce possible offsets. However, the joints could be either construction joints (with dowels or keys) or contraction joints. The paving sections in the above table have been developed based on the strength of unreinforced concrete. Steel reinforcing may be added to the paving to reduce cracking and to prolong the life of the paving. Where refinofrcing is planned, we suggest that No. 3 reinforcing bars spaced at 16 inches on center each way be used.

DRAFT

Base Course

The base course should meet the specifications for Class 2 Aggregate Base as defined in Section 26 of the latest edition of the State of California, Department of Transportation, Standard Specifications. Alternatively, the base course could meet the specifications for untreated base as defined in Section 200-2 of the latest edition of the Standard Specifications for Public Works Construction. The base course should be compacted to at least 95%.

7.8 Stormwater Infiltration

The on-site soils above the groundwater level generally consist of clayey sand, silty clay, and sandy lean clay soils, which are anticipated to be relatively impervious. In addition, as previously stated, the upper clayey soils are expansive and will shrink and swell with fluctuations in moisture content. Therefore, any attempt at stormwater infiltration at relatively shallow depths could result in distress to nearby foundations, floor slabs, pavement, or other concrete walks and slabs on grade. Deeper infiltration systems, such as dry wells, are not considered feasible due to the groundwater level and the relative impermeability of the on-site soils above the groundwater level.

7.9 Grading

General

Records documenting the placement and compaction of the existing fill soils are not available. Ttherefore, the existing fill soils are not considered suitable for support of new structures on conventional spread/continuous footings or for support of building slabs on grade, paving, or other exterior concrete walks and slabs on grade. If the existing fill soils are excavated and replaced with properly compacted fill, new structures may be supported on conventional spread/continuous footings underlain by undisturbed natural soil and/or properly compacted fill and floor slabs may be supported on grade. Where existing fill soils are left in place and buildings are pile-supported, building floor slabs should be structurally supported.

As previously stated, the upper clayey soils are expansive, and will shrink and swell with fluctuations in moisture content. The upper clayey soils should be excavated to allow for the placement of at least 2 feet of relatively non-expansive soils beneath floor slabs, pavement, and other exterior concrete walks and slabs on grade. For structurally-supported floor slabs, as an alternative to the 2-foot thick layer of relatively non-expansive soil, the floor slab could be constructed with a gap of at least 6 inches between the floor slab and the underlying soils; this could be accomplished through the use of compressible cardboard or foam forms.

Ideally, to provide support for new paving and other exterior concrete walks and slabs on grade, all existing uncertified fill soils should be excavated and replaced as properly compacted fill. However, in consideration of the relatively good condition of the existing paving throughout the campus, the removal of the existing uncertified fill soils may be limited to the upper 2 feet beneath the pavement section. Where uncertified fill soils are to be left in place, after the 2-foot removal is completed, the exposed subgrade should be carefully observed by a representative of our firm to identify any areas that may require additional excavation and compaction. To further improve design life and reduce (but not eliminate) possible maintenance costs resulting from the above-described limited improvement, a layer of geogrid material (Tensar BX-1200, or equivalent) could be placed immediately below the recommended 2-foot thick layer of properly compacted fill and immediately below the base course layer. As stated above, the 2-foot thick layer of properly compacted fill beneath pavement and other concrete walks and slabs on grade should consist of relatively non-expansive soil.

The excavation of existing fill soils should extend laterally beyond foundations a distance equal to the depth of removal beneath the foundation; the excavation need not extend laterally beyond pavement and concrete walks and slabs.

DRAFT

All required fill should be uniformly well compacted and observed and tested during placement. The on-site soils may be used in any required fill, excepted as noted above and in the following subsections.

Site Preparation

After the site is cleared and any existing fill soils are excavated as recommended, the exposed soils should be carefully observed for the removal of all unsuitable deposits. Next, where fill soils are to be placed, the exposed soils should be scarified to a depth of 6 inches, brought to near-optimum moisture content (by either adding water or by drying out the soils), and rolled with heavy compaction equipment. At least the upper 6 inches of the exposed soils should be compacted to at least 90% of the maximum dry density obtainable by the ASTM Designation D1557 method of compaction. Where fill soils are to be placed below a 1:1 plane extending downward and outward from spread/continuous footings, the exposed soils should be compacted to 95%. The moisture content of some of the upper clayey soils currently exceeds the optimum moisture content. Accordingly, this material may be wet and spongy when exposed to construction activities and may be difficult to compact; this situation will be even more critical if the excavation is performed during the rainy season. In these areas, to provide a working base for men and equipment, a layer of 1½-inch crushed rock, 12 inches or more in thickness, may be necessary over the excavated surface.

Good drainage of surface water should be provided by adequately sloping all surfaces. Such drainage will be important to minimize infiltration of water beneath floor slabs and pavement.

Excavations and Temporary Slopes

Where excavations are deeper than about 4 feet, the sides of the excavations should be sloped back at 1:1 (horizontal to vertical) or shored for safety. Unshored excavations should not extend below a plane drawn at 1½:1 (horizontal to vertical) extending downward from adjacent existing footings. Data for design of shoring is presented in Section 7.5.

Excavations should be observed by personnel of our firm so that any necessary modifications based on variations in the soil conditions can be made. All applicable safety requirements and regulations, including OSHA regulations, should be met.

Compaction

All required fill should be placed in loose lifts not more than 8-inches-thick and compacted. The fill should be compacted to at least 90% of the maximum density obtainable by the ASTM Designation D1557 method of compaction. Fill soils placed below a 1:1 plane extending downward and outward from spread/continuous footings should be compacted to 95%. The moisture content of on-site or imported sandy soils at the time of compaction should vary no more than 2% below or above optimum moisture content. The moisture content of on-site clayey soils at the time of compaction should be between 2% and 4% above optimum moisture content.

Backfill

All required backfill should be mechanically compacted in layers; flooding should not be permitted. Bedding material within utility pipe zones should have a minimum Sand Equivalent of 30. The pipe-zone backfill may be compacted by vibration, or, as an alternative, the pipe-zone may be backfill with sand-slurry containing at least 1½ sacks of cement per cubic yard. However, beneath foundations, the sand-cement slurry should contain at least 3 sacks of cement per cubic yard.

DRAFT

Proper compaction of backfill will be necessary to minimize settlement of the backfill and to reduce settlement of overlying slabs and paving. Backfill should be compacted to at least 90% of the maximum dry density obtainable by the ASTM Designation D1557 method of compaction. Fill soils placed below a 1:1 plane extending downward and outward from spread/continuous footings should be compacted to 95%. The on-site soils may be used in the compacted backfill. The exterior grades should be sloped to drain away from the foundations to prevent ponding of water.

The standard LAUSD specifications should be referenced for additional details not addressed above.

Some settlement of the backfill should be expected. Provisions should be made for some settlement of pavement and concrete walks supported on backfill; proper compaction of trench backfill will be important to minimize settlement of overlying pavement and concrete walks.

Material of Fill

The on-site soils, less any debris or organic matter, may be used in required fills. However, because of their expansive characteristics, the on-site clayey soils should not be used within 2 feet of the subgrade for floor slabs, pavement, or other exterior concrete walks and slabs. Cobbles larger than 4 inches in diameter should not be used in the fill. Any required import material should consist of relatively non-expansive soils with an expansion index of less than 35. The imported materials should contain sufficient fines (at least 15% passing the No. 200 sieve) so as to be relatively impermeable and result in a stable subgrade when compacted. All proposed import materials should be approved by our personnel prior to being placed at the site.

7.10 Geotechnical Observation

The reworking of the upper soils and the compaction of all required fill should be observed and tested during placement by a representative of our firm. This representative should perform at least the following duties:

- Observe the clearing and grubbing operations for proper removal of all unsuitable materials.
- Observe the exposed subgrade in areas to receive fill and in areas where excavation has resulted in the desired finished subgrade. The representative should also observe proofrolling and delineation of areas requiring overexcavation.
- Evaluate the suitability of on-site and import soils for fill placement; collect and submit soil samples for required or recommended laboratory testing where necessary.
- Observe the fill and backfill for uniformity during placement.
- Test backfill for field density and compaction to determine the percentage of compaction achieved during backfill placement.
- Observe and probe foundation materials to confirm that suitable bearing materials are present at the design foundation depths.
- Observe the installation of temporary shoring, if necessary.
- Observe the installation of drilled cast-in-place concrete piles, if used, to confirm that the design diameter and depth are achieved.

DRAFT

The governmental agencies having jurisdiction over the project should be notified prior to commencement of grading so that the necessary grading permits can be obtained and arrangements can be made for required inspection(s). The contractor should be familiar with the inspection requirements of the reviewing agencies.

DRAFT

8.0 BASIS FOR RECOMMENDATIONS

The recommendations provided in this report are based upon our understanding of the described project information and on our interpretation of the data collected during our subsurface explorations. We have made our recommendations based upon experience with similar subsurface conditions under similar loading conditions. The recommendations apply to the specific project discussed in this report; therefore, any change in the structure configuration, loads, location, or the site grades should be provided to us so that we can review our conclusions and recommendations and make any necessary modifications.

The recommendations provided in this report are also based upon the assumption that the necessary geotechnical observations and testing during construction will be performed by representatives of our firm. The field observation services are considered a continuation of the geotechnical investigation and essential to verify that the actual soil conditions are as expected. This also provides for the procedure whereby the client can be advised of unexpected or changed conditions that would require modifications of our original recommendations. In addition, the presence of our representative at the site provides the client with an independent professional opinion regarding the geotechnically-related construction procedures. If another firm is retained for the geotechnical observation services, our professional responsibility and liability would be limited to the extent that we would not be the geotechnical engineer of record.

Project labor agreements are often written in such a manner to preclude non-union firms from providing inspection and testing services during construction. If your project is considering being signatory to a project labor agreement or other union labor agreement, it would be beneficial for the labor agreement to include language that specifically excludes construction soils and materials inspection. Failure to exclude construction inspection from the project labor agreement would likely preclude the geotechnical engineer of record from continuing services during construction and limit construction inspection and testing to union firms. We would be pleased to meet with you to discuss the implications associated with project labor agreements.

Figure 6

Drilled Pile Capacities

DRAFT

NOTES:

(1) A one-third increase to the above values may be used for wind or seismic loads.

(2) Piles in groups should be spaced a minimum of 3 pile diameters on centers.

(3) The indicated values are based on the strength of the soils; the actual pile capacities may be limited to lesser values by the strength of the piles.

Appendix A
Current Field Explorations and Laboratory Test Results

Field Explorations

To supplement the prior data, the soil conditions beneath the site were further explored by drilling seven borings to depths of approximately 36 to 52 feet below ground surface (bgs). The borings were drilled using 8-inch-diameter hollow stem auger-type drilling equipment. Four Cone Penetration Test (CPTs) soundings were also advanced to depths of 50 feet bgs. The locations of the borings and CPT soundings are shown on Figure 2.

The soils encountered were logged by our field technician, and undisturbed and bulk samples were obtained for laboratory inspection and testing. The logs of the borings are presented on Figures A-1.1 through 1.7; the depths at which undisturbed samples were obtained are indicated to the left of the boring logs. The number of blows required to drive the Crandall sampler 12 inches using a 140-pound automatic hammer falling 30 inches is indicated on the logs. In addition to obtaining undisturbed samples, standard penetration tests (SPT) were also performed; the results of the tests are indicated on the logs. The soils are classified in the accordance with the Unified Soil Classification System described on Figure A-2.

Laboratory Test Results

Laboratory tests were performed on selected samples obtained from the borings to aid in the classification of the soils and to evaluate their engineering properties.

The field moisture content and dry density of the soils encountered were determined by performing tests on the undisturbed samples. The results of the tests are presented to the left of the boring logs.

To aid in classification of the soils and to define the plasticity characteristics of the materials, Atterberg Limits tests were performed to determine the liquid limit and plastic limit of several of the samples. The testing procedure was in general accordance with ASTM Designation D4318. The results of the tests are shown on the boring logs.

Direct shear tests were performed on selected undisturbed samples to determine the strength of the soils. The tests were performed after soaking to near-saturated moisture content and at various surcharge pressures. Remolded samples, compacted to 90% of the maximum dry density obtainable by the ASTM Designation D1557 method of compaction, were tested after soaking to near-saturated moisture content. The testing procedure was in general accordance with ASTM Designation D3080. The results of the tests are presented on Figure A-3, Direct Shear Test Data.

Confined consolidation testing was performed on six undisturbed samples to determine the compressibility of the soils. Water was added to the samples during the tests to illustrate the effect of moisture on the compressibility. The testing procedure was in general accordance with ASTM Designation D2435. The results of the tests are presented on Figure A-4.1 through 4.3, Consolidation Test Data.

The optimum moisture content and maximum dry density of the upper soils were determined by performing a compaction test on two selected samples. The tests were performed in accordance with the ASTM Designation D1557 method of compaction. The results of the tests are presented on Figure A-5, Compaction Test Data.

DRAFT

To determine the particle size distribution of the soils and to aid in classifying the soils, mechanical analyses was performed on a selected sample of the on-site soils. The results of the mechanical analyses are presented on Figure A-6, Particle Size Distribution. In addition to the full mechanical analyses, tests to determine the percentage of fines (material passing through a -200 sieve) of selected samples were performed. The results of these tests are presented on the boring logs.

The collapse potential of the soils was determined by testing one selected relatively undisturbed. The test was performed by confining the sample under a normal surcharge pressure, allowing the sample to consolidate at its field moisture content, and the saturating the sample and measuring the consolidation resulting from the addition of water. The results of the test are shown on Figure A-7, Hydroconsolidation Test Data.

To provide information for paving design, a stabilometer test ("R" value test) was performed on two samples of the upper soils. The tests were performed for us by LaBelle·Marvin Professional Pavement Engineering. The results of the tests are presented on Figures A-8.1 and 8.2, R-Value Test Data.

SUMMARY
OF
CONE PENETRATION TEST DATA

DRAFT

1. INTRODUCTION

This report presents the results of a Cone Penetration Test (CPT) program carried out for the LAUSD Fairfax HS Modernization project located in Los Angeles, California. The work was performed by Kehoe Testing & Engineering (KTE) on November 24, 2021. The scope of work was performed as directed by Wood Group personnel.

2. SUMMARY OF FIELD WORK

The fieldwork consisted of performing CPT soundings at four locations to determine the soil lithology. A summary is provided in **TABLE 2.1**.

LOCATION	DEPTH OF CPT (ft)	COMMENTS/NOTES:
CPT-1	50	
CPT-2	50	
CPT-3	50	
CPT-4	50	

TABLE 2.1 - Summary of CPT Soundings

3. FIELD EQUIPMENT & PROCEDURES

The CPT soundings were carried out by **KTE** using an integrated electronic cone system manufactured by Vertek. The CPT soundings were performed in accordance with ASTM standards (D5778). The cone penetrometers were pushed using a 30-ton CPT rig. The cone used during the program was a 15 cm^2 cone with a cone net area ratio of 0.83. The following parameters were recorded at approximately 2.5 cm depth intervals:

- Cone Resistance (qc)
- Sleeve Friction (fs)
- Dynamic Pore Pressure (u)
- Inclination
- Penetration Speed

At location CPT-3, shear wave measurements were obtained at approximately 5-foot intervals. The shear wave is generated using an air-actuated hammer, which is located inside the front jack of the CPT rig. The cone has a triaxial geophone, which recorded the shear wave signal generated by the air hammer.

The above parameters were recorded and viewed in real time using a laptop computer. Data is stored at the KTE office for up to 2 years for future analysis and reference. A complete set of baseline readings was taken prior to each sounding to determine temperature shifts and any zero load offsets. Monitoring base line readings ensures that the cone electronics are operating properly.

4. CONE PENETRATION TEST DATA & INTERPRETATION

The Cone Penetration Test data is presented in graphical form in the attached Appendix. These plots were generated using the CPeT-IT program. Penetration depths are referenced to ground surface. The soil behavior type on the CPT plots is derived from the attached CPT SBT plot (Robertson, "Interpretation of Cone Penetration Test…", 2009) and presents major soil lithologic changes. The stratigraphic interpretation is based on relationships between cone resistance (qc), sleeve friction (fs), and penetration pore pressure (u). The friction ratio (Rf), which is sleeve friction divided by cone resistance, is a calculated parameter that is used along with cone resistance to infer soil behavior type. Generally, cohesive soils (clays) have high friction ratios, low cone resistance and generate excess pore water pressures. Cohesionless soils (sands) have lower friction ratios, high cone bearing and generate little (or negative) excess pore water pressures.

The CPT data files have also been provided. These files can be imported in CPeT-IT (software by GeoLogismiki) and other programs to calculate various geotechnical parameters.

It should be noted that it is not always possible to clearly identify a soil type based on qc, fs and u. In these situations, experience, judgement and an assessment of the pore pressure data should be used to infer the soil behavior type.

If you have any questions regarding this information, please do not hesitate to call our office at (714) 901-7270.

Sincerely,

KEHOE TESTING & ENGINEERING

Steven P. Kehoe
President

Sample ID			B-1 @ 1/2' Fill-SM	B-2 @ 1/2' Fill-CL/SC	B-3 @ 1/2' Fill-CL/SC	B-3 @ 3 1/2' SC/SM
Resistivity		**Units**				
as-received		ohm-cm	248,000	104,000	112,000	21,200
saturated		ohm-cm	2,600	1,400	1,520	1,920
pH			7.8	7.2	7.4	7.2
Electrical Conductivity		mS/cm	0.16	0.10	0.16	0.08
Chemical Analyses						
Cations						
calcium	Ca^{2+}	mg/kg	62	28	35	27
magnesium	Mg^{2+}	mg/kg	21	7.5	13	11
sodium	Na^{1+}	mg/kg	105	94	127	70
potassium	K^{1+}	mg/kg	10	6.3	10	9.3
Anions						
carbonate	CO_3^{2-}	mg/kg	ND	ND	ND	ND
bicarbonate	HCO_3^{1-}	mg/kg	409	85	79	55
fluoride	F^{1-}	mg/kg	2.2	2.9	2.1	1.0
chloride	Cl^{1-}	mg/kg	6.0	30	76	44
sulfate	SO_4^{2-}	mg/kg	30	76	117	49
phosphate	PO_4^{3-}	mg/kg	16	15	17	13
Other Tests						
ammonium	NH_4^{1+}	mg/kg	ND	ND	ND	ND
nitrate	NO_3^{1-}	mg/kg	1.9	ND	ND	0.6
sulfide	S^{2-}	qual	na	na	na	na
Redox		mV	na	na	na	na

DRAFT

Electrical conductivity in millisiemens/cm and chemical analysis were made on a 1:5 soil-to-water extract.
mg/kg = milligrams per kilogram (parts per million) of dry soil.
Redox = oxidation-reduction potential in millivolts
ND = not detected
na = not analyzed

PLATE A-7

MAJOR DIVISIONS			GROUP SYMBOLS	TYPICAL NAMES
COARSE GRAINED SOILS (More than 50% of material is LARGER than No. 200 sieve size)	GRAVELS (More than 50% of coarse fraction is LARGER than the No. 4 sieve size)	CLEAN GRAVELS (Little or no fines)	GW	Well graded gravels, gravel-sand mixtures, little or no fines.
			GP	Poorly graded gravels or gravel-sand mixtures, little or no fines.
		GRAVELS WITH FINES (Appreciable amt. of fines)	GM	Silty gravels, gravel-sand-silt mixtures.
			GC	Clayey gravels, gravel-sand-clay mixtures.
	SANDS (More than 50% of coarse fraction is SMALLER than the No. 4 sieve size)	CLEAN SANDS (Little or no fines)	SW	Well graded sands, gravelly sands, little or no fines.
			SP	Poorly graded sands or gravelly sands, little or no fines.
		SANDS WITH FINES (Appreciable amt. of fines)	SM	Silty sands, sand-silt mixtures.
			SC	Clayey sands, sand-clay mixtures.
FINE GRAINED SOILS (More than 50% of material is SMALLER than No. 200 sieve size)	SILTS AND CLAYS (Liquid limit LESS than 50)		ML	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with slight plasticity.
			CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays.
			OL	Organic silts and organic silty clays of low plasticity.
	SILTS AND CLAYS (Liquid limit GREATER than 50)		MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts.
			CH	Inorganic clays of high plasticity, fat clays.
			OH	Organic clays of medium to high plasticity, organic silts.
HIGHLY ORGANIC SOILS			Pt	Peat and other highly organic soils.

COARSE GRAINED SOILS (More than 50% of material is LARGER than No. 200 sieve size)	GRAVELS (More than 50% of coarse fraction is LARGER than the No. 4 sieve size)	CLEAN GRAVELS (Little or no fines)		GW	Well graded gravels, gravel-sand mixtures, little or no fines.
				GP	Poorly graded gravels or gravel-sand mixtures, little or no fines.
		GRAVELS WITH FINES (Appreciable amt of fines)		GM	Silty gravels, gravel-sand-silt mixtures.
				GC	Clayey gravels, gravel-sand-clay mixtures.
	SANDS (More than 50% of coarse fraction is SMALLER than the No. 4 sieve size)	CLEAN SANDS (Little or no fines)		SW	Well graded sands, gravelly sands, little or no fines.
				SP	Poorly graded sands or gravelly sands, little or no fines.
		SANDS WITH FINES (Appreciable amt of fines)		SM	Silty sands, sand-silt mixtures.
				SC	Clayey sands, sand-clay mixtures.
FINE GRAINED SOILS (More than 50% of material is SMALLER than No. 200 sieve size)	SILTS AND CLAYS (Liquid limit LESS than 50)			ML	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with slight plasticity.
				CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays.
				OL	Organic silts and organic silty clays of low plasticity.
	SILTS AND CLAYS (Liquid limit GREATER than 50)			MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts.
				CH	Inorganic clays of high plasticity, fat clays.
				OH	Organic clays of medium to high plasticity, organic silts.
HIGHLY ORGANIC SOILS				Pt	Peat and other highly organic soils.

BOUNDARY CLASSIFICATIONS: Soils possessing characteristics of two groups are designated by combinations of group symbols.

SOIL CORROSIVITY REPORT

January 4, 2022 via email: gwendolyn.arreguin@woodplc.com

WOOD, PLC
6001 Rickenbacker Road
Los Angeles, CA, 90040

Attention: Gwendolyn Arreguin

Re: Soil Corrosivity Study
Fairfax High School
Los Angeles, CA
HDR #22-0015SCS, WOOD #4953210641.01.024953.57300

Introduction

Laboratory tests have been completed on two soil samples provided for the Fairfax High School Modernization project. The purpose of these tests was to determine whether the soils are likely to have deleterious effects on concrete structures. HDR assumes that the provided samples are representative of the most corrosive soils at the site.

The proposed structures have one or two stories and no subterranean levels. The site is located at 7850 Melrose Avenue in Los Angeles, California, and the water table is reportedly 36 feet deep.

The scope of this study is limited to a determination of soil corrosivity and general corrosion control recommendations for materials likely to be used for construction. HDR's recommendations do not constitute, and are not meant as a substitute for, design documents for the purpose of construction. If the architects and/or engineers desire more specific information, designs, specifications, or review of design, HDR will be happy to work with them as a separate phase of this project.

DRAFT

Soil Corrosivity Testing

Laboratory Testing

The electrical resistivity of each sample was measured in a soil box per ASTM International (ASTM) G187 in its as-received condition and again after saturation with distilled water. Resistivities are at about their lowest value when the soil is saturated. The pH of the saturated samples was measured per ASTM G51. A 5:1 water:soil extract from each sample was chemically analyzed for the major soluble salts commonly found in soil per ASTM D4327, ASTM D6919, and American Water Works Association (AWWA) Standard Method 2320-B.

The laboratory analyses were performed under HDR laboratory number 22-0015SCS. The full set of test results are shown in the attached Table 1.

Discussion

A major factor in determining soil corrosivity is electrical resistivity. The electrical resistivity of a soil is a measure of its resistance to the flow of electrical current. Corrosion of buried metal is an electrochemical process in which the amount of metal loss due to corrosion is directly proportional to the flow of electrical current (DC) from the metal into the soil. Corrosion currents, following Ohm's Law, are inversely proportional to soil resistivity. Lower electrical resistivities result from higher moisture and soluble salt contents and indicate corrosive soil. A correlation between electrical resistivity and corrosivity toward ferrous metals is shown in Table 1.[1]

Table 1: Soil Corrosivity Categories.

Soil Resistivity (ohm-cm)	Corrosivity Category
Greater than 10,000	Mildly Corrosive
2,001 to 10,000	Moderately Corrosive
1,001 to 2,000	Corrosive
0 to 1,000	Severely Corrosive

Other soil characteristics that may influence corrosivity towards metals are pH, soluble salt content, soil types, aeration, anaerobic conditions, and site drainage.

Electrical resistivities were in the moderately corrosive and mildly corrosive categories with as-received moisture. When saturated, the resistivities were in the moderately corrosive category. The resistivities dropped considerably with added moisture because the samples were dry as-received.

Soil pH values varied from 6.6 to 6.9. This range is neutral.[2] These values do not particularly increase soil corrosivity.

The soluble salt content of the samples was low.

Per ACI-318, the soil is classified as S0 with respect to sulfate concentration.[3]

Nitrate was detected in low concentrations. Ammonium was not detected.

Tests were not made for sulfide and oxidation-reduction (redox) potential because these samples did not exhibit characteristics typically associated with anaerobic conditions.

In conclusion, this soil is classified as moderately corrosive to ferrous metals and negligible (S0) for sulfate attack on concrete.

Corrosion Control Recommendations

The life of buried materials depends on thickness, strength, loads, construction details, soil moisture, etc., in addition to soil corrosivity, and is, therefore, difficult to predict. Of more practical value are corrosion control methods that will increase the life of materials that would be subject to significant corrosion. The following recommendations are based on the evaluation of soil corrosivity described above. Unless otherwise indicated, these recommendations apply to the entire site or alignment.

Concrete Structures

1. From a corrosion standpoint, any type of ASTM C150 cement may be used for concrete structures because the sulfate concentration is negligible (S0), from 0 to 0.10 percent. Use a minimum strength of 2,500 psi per applicable codes.[4,5,6]

2. Standard concrete cover over reinforcing steel may be used for concrete structures and pipe in contact with these soils due to the low chloride concentrations found on site.[7] Limit the water-soluble chloride ion content in the concrete mix design to less than 0.3 percent by weight of cement.

Closure

The analysis and recommendations presented in this report are based upon data obtained from the laboratory samples. This report does not reflect variations that may occur across the site or due to the modifying effects of construction. If variations appear, HDR should be notified immediately so that further evaluation and supplemental recommendations can be provided.

HDR's services have been performed with the usual thoroughness and competence of the engineering profession. No other warranty or representation, either expressed or implied, is included or intended.

Please call if you have any questions.

RE: P**HASE I ENVIRONMENTAL SITE ASSESSMENT**

Fairfax High School
7850 Melrose Avenue
Los Angeles, California

Dear Ms. Jennifer Hilario:

This document consists of the Millennium Consulting Associates, Inc. (Millennium) Phase I Environmental Site Assessment for the Fairfax High School located in Los Angeles, CA. Please contact us at (424) 293-8845 should you have questions regarding this report. Millennium appreciates the opportunity to work with you on this project.

Sincerely,
MILLENNIUM CONSULTING ASSOCIATES

Scott M. Nunes, CAC, CDPH I/A
Director of Building Sciences, SoCal Division

EXECUTIVE SUMMARY

At the request of the Los Angeles Unified School District Office of Environmental Health and Safety (LAUSD OEHS), Millennium Consulting Associates (Millennium) has performed a Phase I Environmental Site Assessment (ESA) at Fairfax High School located at 7850 Melrose Avenue, Los Angeles, CA 90036, herein referred to as the Subject Property (See Figure 1). LAUSD OEHS intends to renovate (modernization and demolition of various buildings) the school campus at various locations, as well as update a prior ESA performed by Converse Consultants and dated September 7, 2018. The Subject Property is bound by Melrose Avenue to the north; Genesee Avenue to the east; Rosewood Avenue to the south; and Fairfax Avenue to the west. The Subject Property is surrounded by various residential homes and commercial businesses. The Subject Property has an Assessor's Parcel Number (APN) of 5527-021-900. The Subject Property is approximately 24.5 acres of land used as a high school campus. The main objective of this ESA is to identify Recognized Environmental Conditions on the Subject Property. Recognized Environmental Conditions are defined in the ASTM E1527-13 Standard Practice for Environmental Site Assessments as the presence or likely presence of any hazardous substances or petroleum products that indicate an existing release, a past release, or a material threat of a release.

SITE HISTORY

The Subject Property is approximately 24.5 acres of land with various school buildings and recreational fields, including parking lots throughout. Currently, the Subject Property is an active high school located adjacent to retail markets and residential properties. Historical aerial photographs dating back to at least 1923 depict the Subject Property as undeveloped land until at least 1928, where the land is shown to have multiple structures onsite including what resembles a recreational field on its southwest corner. By at least 1977, the Subject Property changes its configuration, where an additional recreational field is depicted adjacent to the southwest corner field in the southeast corner with a much larger multi-story structure occupying the northeast corner. An additional structure on the west side of the Subject Property is shown replacing the previous structure with an added parking lot. Aerial photos dated 2012 show the recreational fields in the southwest corner and southeast corner are clearly defined and marked as a football field and baseball field with the rest of the subject property in its present-day configuration.

FINDINGS

Millennium has performed a Phase I ESA in general conformance with the scope and limitations of the ASTM Standard Practice for the Subject Property. The assessment has identified the following RECs:

- 3-stage clarifier and hydraulic hoists associated with the former autobody shop building operations
- Records identifying a historic autobody shop, woodworking shop, paint shop, and electrical shop buildings formerly located on the west portion of the Subject Property

- Various Southern California Edison transformers located in the quad area (potential PCB-containing materials based on date of construction)
- The Subject Property is located within a City of Los Angeles Methane Buffer Zone
- Potential for organochloride pesticides, lead, and arsenic contamination of shallow soils around drip lines of buildings resulting from the use of termiticides, herbicides, and pesticides at locations where buildings may be demolished.
- Site plans from March 1927 indicated various cesspools at the northwest, northeast, and north-center portion of the campus. The disposition of the cesspools is not known.

RECOMMENDATIONS

Recognized Environmental Conditions were identified at the Subject Property. A Preliminary Environmental Assessment (PEA) equivalent is recommended at locations/buildings that are to be impacted by the pending modernization/demolition. The RECS are noted below:

- 3-stage clarifier and hydraulic hoists associated with the former autobody shop building operations
- Records identifying a historic autobody shop, woodworking shop, paint shop, and electrical shop buildings formerly located on the west portion of the Subject Property
- Various Southern California Edison transformers located in the quad area (potential PCB-containing materials based on date of construction)
- The Subject Property is located within a City of Los Angeles Methane Buffer Zone
- Potential for organochloride pesticides, lead, and arsenic contamination of shallow soils around drip lines of buildings resulting from the use of termiticides, herbicides, and pesticides at locations where buildings may be demolished.
- Site plans from March 1927 indicated various cesspools at the northwest, northeast, and north-center portion of the campus. The disposition of the cesspools is not known.

1.0 INTRODUCTION

This report presents the findings of a Phase I Environmental Site Assessment (Phase I ESA) conducted by Millennium Consulting Associates (Millennium) for the Los Angeles Unified School District Office of Environmental Health and Safety at Fairfax High School located at 7850 Melrose Avenue, Los Angeles, California. The general location of the Subject Property is shown in Figure 1 (Vicinity Map). This work was performed for the LAUSD OEHS.

1.1. Purpose

This Phase I ESA was prepared in general accordance with the ASTM E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessments (ASTM Standard Practice). The ASTM Standard Practice is in general compliance with the 40 CFR Part 312 rule entitled, "Standards and Practices for All Appropriate Inquiries: Final Rule" (AAI Rule). The purpose of this Phase I ESA is to identify Recognized Environmental Conditions (RECs) at the Subject Property. The term Recognized Environmental Conditions is defined in the ASTM Standard Practice as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. *De minimis* conditions are not Recognized Environmental Conditions.

Millennium is performing this Phase I ESA to assist the LAUSD OEHS in identifying RECs at the Subject Property. This Phase I ESA is intended to reduce, but not eliminate, uncertainty regarding the potential for Recognized Environmental Conditions at the Subject Property.

1.2. Scope of Work

As discussed in the statement of work, the scope of work performed by Millennium included the following activities:

- Perform a review of available environmental records and Freedom of Information Act (FOIA) requests for information of existing of existing or potential environmental conditions on, in, under, or near the Subject Property.
- Perform a search of Federal, State, and local regulatory agency electronic databases which identifies locations that are regulated under various laws, notably CERCLA, RCRA, and the Toxic Substances Control Act (TSCA). It also identifies locations where a release of hazardous substances has occurred or is suspected.
- Perform a review of available historical maps and photographs for information of existing of existing or potential environmental conditions on, in, under, or near the Subject Property
- Perform an on-site and surrounding land use site reconnaissance visit to determine current conditions at the Subject Property and at adjacent properties.
- Conduct interviews with local and state officials, current and/or past owners and/or occupants of the Subject Property.
- Prepare a comprehensive written Phase I ESA report summarizing our findings and recommendations.

- Additional tasks to be completed as texts or appendices to the Phase I ESA include:
    - Define site and surrounding zoning classifications and describe surrounding land use (include site photos in report photo log as Appendix B)
    - Describe in the report text any wetlands and floodplains concerns.
    - Describe in the report radon potential with recommendations and conclusions.
    - Describe in the report text vapor intrusion (VI) potential with recommendations and conclusions.
    - Describe in the report text the presence of high-voltage power lines (<100-ft from the Subject Property boundary) with recommendations and conclusions.

1.3. Special Terms and Conditions

This Phase I ESA was conducted in general accordance with the ASTM Standard Practice. There are no additional special terms or conditions associated with this report, with the exception of flood plains.

-

1.4. Environmental Professional

This Phase I ESA was performed by Millennium under the management and direction of Scott Nunes, who meets the qualification requirements of an Environmental Professional as described in the ASTM Standard Practice and the AAI Rule based on professional licensing, education, training, and experience to assess a property's environmental conditions and to assess the potential liability for any contamination.

1.5. Organization

This Phase I ESA report is organized into eight sections. Section 1 provides an introduction and identifies specific objectives. Section 2 provides a description of the Subject Property, including zoning and land use discussion, current and past uses of the property, information regarding site geology, hydrogeology, and topological information. Section 3 provides information gained from the site reconnaissance visits. Section 4 describes the results of the environmental records review. Section 5 presents our findings and opinions. Section 6 presents our conclusions and recommendations about on- and off-site conditions. Section 7 provides a summary of environmental records, and the signature of the report preparer and Section 8 provides a list of references used in the generation of the report. Backup material such as additional forms and questionnaires, photographic log, environmental database report, and resumes for the report preparer are provided as Appendices.

2.0 SUBJECT PROPERTY LOCATION AND PHYSICAL DESCRIPTION

2.1. Methane

According to the City of Los Angeles Planning Department's ZIMAS interactive mapping tool (http://zimas.lacity.org) accessed on (January 10th, 2022), the school property is identified as or within a Methane Hazard site.

2.2. Location and Description, Including Zoning and Land Use Discussion

The Subject Property is located at 7850 Melrose Avenue, Los Angeles. The Subject Property is currently an approximately 1,052,119 square feet parcel of land currently utilized as a high school campus (Fairfax High School). Figure 1 provides a general location map of the Subject Property and Figure 2 provides a general site map of the Subject Property. Table 1 describes the physical location and ownership of the Subject Property. Per EDR's Environmental Lien and AUL Search report, the Subject Property title is currently vested in the Los Angeles Unified School District.

Table 2-1 – Subject Property Information

Subject Property Name and Addresses:	Fairfax High School, 7850 Melrose Avenue, Los Angeles, CA
Current Occupants:	Los Angeles Unified School District
Land Use:	Commercial
Zoning	QPF-1XL, Transit Priority Area (City of Los Angeles, Planning Department)
County, State:	Los Angeles County, State of California
USGS Quadrangle(s):	7.5-Minute Hollywood,
Latitude/Longitude:	34.0819710 - 34° 4' 55.09" N and 118.3599220 - 118° 21' 35.71"
Assessor's Parcel Numbers:	5527-021-900 (LA County Assessor)

2.3. Site and Vicinity Characteristics

The Subject Property is approximately 24.5 acres of land currently utilized as a high school campus. The Subject Property is bound by Melrose Avenue to the north, followed by commercial development and a Unocal 76 gas station; Genesee Avenue to the east, followed by residential development; several educational structures and Rosewood Avenue to the south, followed by residential development; and Fairfax Avenue to the west, followed by commercial development.

2.4. Current and Past Uses of the Property

Historical records dating back to at least 1894 show the Subject Property as undeveloped land with no signs of infrastructure until at least 1924, where it is associated with Fairfax High School. Aerial photographs up to at least 1966 indicate the Subject Property with additional structures onsite. By at least 1966, structures on the west and east sides of the Subject Property are removed and it is in its present-day configuration by 1972. Present day configuration was observed to be the Administrative and classroom structure on the north eastern portion of the Subject Property, the auditorium located in the center of the property, the auto shop structure located on the western portion of the Subject Property, gymnasium located south of the auditorium, the recreational fields on the south end portion

of the Subject Property, and the cafeteria south of the administrative and classroom building on the eastern portion of the Subject Property. Records and photos indicate the Subject Property to have an autobody shop, wood shop, paint and electrical shop onsite as of 1950, however by at least 1966 the building associated with the autobody shop is removed.

2.5. Current and Past Uses of Adjoining Properties

Based on the review of the historical information available (EDR Aerial Photographs in appendix A), as early as 1894, the Subject Property is surrounded by undeveloped land up until at least 1924, where residential infrastructure is shown to occupy the surrounding areas. By 1950, the surrounding residential (east and south) and commercial areas (north and west) further develop and increase in density up to present day.

2.6. Geology

The Subject Property is approximately 224 feet above sea level (United States Geological Survey [USGS] Topographic Map, Beverly Hills, California, 2015). The Subject Property is located within the Los Angeles Basin in a relatively low-lying area filled with unconsolidated alluvial fan deposits. The soil at the Subject Property consists of wet moderately well-drained soil of silty clay loam. Regional geologic mapping designates the level area of the Subject Property as alluvium from the early Holocene and late Pleistocene (Division of Mines and Geology, Geologic Map of California, 2010).

2.7. Hydrogeology

The Subject Property is located within the Los Angeles Basin within the California Coastal Basin Aquifer (American Geosciences Institute, 2022). The soils presented at the Subject Property have moderate infiltration rates. The surrounding area of the Subject Property has been improved by grading. Surface water flow is controlled by the existing grading and pavement systems. Storm water is primarily controlled by existing surface topography and storm water collection devices (area drains). Runoff water is generally expected to flow south-southwest on the Subject Property (United States Geological Survey [USGS] Topographic Map, Beverly Hills, California, 2015). Groundwater is expected to flow to the west-southwest, in line with the general topographic gradient. According to Geotracker well data of adjacent properties within 0.5 miles of the Subject Property, the general movement of groundwater beneath the Subject Property would be expected to flow west-southwest. Depth to groundwater is estimated be 20-40 feet below ground surface.

2.8. Earthquake/ Faults/Seismicity

Per the published Earthquake Fault Zone maps prepared by the California Geological Survey, the Subject Property is not located within an earthquake fault zone. The closest active fault is the Hollywood Fault, located approximately 1 mile northwest of the Subject Property. The slip rate of this left lateral reverse oblique, poorly constrained fault is between 1.0 and 5.0 mm/yr. The presence and location of this fault does not pose a threat to the Subject Property.

2.9. Landslides

The Subject Property is not located within a landslide hazard zone. The site is also not located within an earthquake-induced landslide area since the site is relatively level and the flat site topography limits this potential risk (USGS U.S. Landslide Inventory, 2022).

2.10. Historical Topographic Maps

Millennium reviewed the United States Geological Survey (USGS) Beverly Hills Quadrangle maps covering the Subject Property (dated 2012). The Subject Property is at an elevation of approximately 224 ft. above sea level. The site is generally flat and the general topographic gradient surrounding the site slopes toward the south-southwest.

Information regarding the history of the Subject Property was obtained by reviewing 21 historical topographic maps received from EDR (see Appendix C). The maps reviewed are dated as follows:

- 1894 Los Angeles (15-Minute)
- 1896 Santa Monica (15-Minute)
- 1898 Santa Monica (15-Minute)
- 1900 Los Angeles (15-Minute)
- 1902 Santa Monica (15-Minute)
- 1920 Santa Monica (15-Minute)
- 1921 Santa Monica (15-Minute)
- 1924 Hollywood (7.5-Minute)
- 1926 Burbank/Hollywood (7.5-Minute)
- 1953 Hollywood (7.5-Minute)
- 1966 Beverly Hills/Hollywood (7.5-Minute)
- 1972 Hollywood/Beverly Hills (7.5-Minute)
- 1981 Beverly Hills/Hollywood (7.5-Minute)
- 1991/1994 Hollywood/Beverly Hills (7.5-Minute)
- 2012 Hollywood/Beverly Hills (7.5-Minute)

Land use associated with Fairfax High School was depicted at the Subject Property from 1924 onward according to topographic maps. Potential RECs were noted on the Subject Property from historical auto body shop, woodworking shop, painting shop, and electrical shop buildings.

2.10 Sanborn Maps

Millennium reviewed the Sanborn Maps on the Subject Property (dated 1926 – 1969, see Appendix C). Review of the 1926 Sanborn Map shows the Subject Property associated as current day Fairfax High School with one single large main building which consisted of a woodworking building on the west end of the structure and the Auditorium making up the center of the structure. A Boiler Room

is behind the Auditorium with a classroom building and Girls' Gymnasium on the southeast area of the Subject Property and a Boys' Gymnasium on the southwest area.

The 1950 Sanborn Map shows the Subject Property expanded upon with multiple classrooms occupying the southeast and southwest areas of the campus. In the southeast corner of the Subject Property an auto repair shop, electrical shop, print shop, and woodworking shop is depicted on campus with the Gymnasium expanded to the south, creating one contiguous building consisting of the Boys' and Girls' Gyms. An additional building labeled as an Armory Grandstand with an athletic field beyond is also depicted on the property, with two vacant structures in the extreme southwest corner.

The 1969 Sanborn Map depicts the Subject Property in similar configuration to present day. The Auditorium structure is in present day configuration with an additional structure existing to the east side, with the cafeteria adjacent behind it. The gymnasium is depicted in current day configuration with the multiple classrooms removed and vacant structures in the extreme southwest corner removed and replaced with bleachers in the south portion of the Subject Property adjacent to the athletic field. Potential RECS were noted on or around the Subject Property from the review of the Sanborn Map from the historical presence of auto body shop, woodworking shop, electrical shop, and paint shop buildings.

2.11 Surface Water Bodies (Wetlands, Steams, and Ponds)

No surface water bodies are located within a mile of the Subject Property.

2.12 Wetlands

According to the National Wetlands Inventory, no wetlands exist in proximity to the Subject Property. The Subject Property is not within a designated wetlands area, nor would its re-development or continued use as-is, be anticipated to impact nearby wetlands.

2.13 Floodplains

A review of the FEMA flood zone map indicates that the Subject Property is listed under zone X. This means that the Subject Property is located within an area with a 0.2% annual chance of flood. This area has been designated a minimal flood hazard area. No part of the Subject Property is located within the 100-year or 500-year flood plain (see Figure 3). The flood zone designation does not represent a REC at the Subject Property.

2.14 Radon

The Subject Property is located within an EPA Radon Zone 2 area (California Geologic Survey Radon Potential Zone Map prepared for the California Department of Health Services Environmental Health Division). No radon sampling results were available for the Subject Property. Based upon location in EPA Radon Zone 2 and slab-on-grade construction, radon is not expected to represent a REC at the Subject Property.

3 SITE INFORMATION, SITE RECONNAISSANCE, AND INTERVIEWS

On December 2, 2021, Millennium completed a site visit of the Subject Property accompanied by Ms. Jennifer Hilario of LAUSD OEHS and Fernando Romero, Plant Manager of Fairfax High School. A photolog documenting observations during the site visit (see Appendix A). Mr. Romero was unaware of any environmental concerns on the Subject Property.

3.1 User Provided Information

Historical plans provided by Ms. Jennifer Hilario of LAUSD OEHS, dated as far back as 1927.

These plans were reviewed for features such as cut/fil grading, oil wells, catch basins, sump drainages, etc.

It was revealed that cesspools were formerly located in the northern portion of the Subject Property. The disposition of the cesspools is not known.

3.2 Storage Tanks and Drum Storage

A backup diesel generator was observed outside behind the boiler room at the southern end of the Auditorium in the central portion of the campus. Various 55-gallon drums of fuel and oil were observed in a storage facility near the Auditorium. No leaks or staining were observed.

3.3 Hazardous Substances, Petroleum Products, Oil Wells

Various chemical storages exist in various buildings on the Subject Property. Due to proper storage and secondary containments within storage areas, no existing storage of chemicals or fuels onsite are anticipated to impact the subject property.

In addition, according to the DOGGR Well Finder database, there was one abandoned and plugged oil well located on the southwest portion of the campus (approximately at the southwest corner of the football field). The well was drilled and plugged on the same day (November 20, 1964) and properly closed. The well was operated by Chevron U.S.A, Inc. The oil well is not considered a REC.

3.4 Used Oil Management

Oil storage drums were observed at the Subject Property in the auto body shop yard. No stains or spills were observed.

3.5 Pesticides, Herbicides

No herbicides and pesticides were observed at the Subject Property.

3.6 Unidentified Substance Containers

No containers of unidentified substances were observed at the Subject Property.

3.7 Air Quality

No major air quality concerns were observed at the Subject Property.

3.8 Potable Water Supply Wells

No potable water supply wells were observed at the Subject Property. According to the Geotracker website, the nearest public water supply well is approximately ¼-mile to the northwest.

3.9 Wastewater

No wastewater was observed at the Subject Property.

3.10 Storm Water

No storm water drains were identified during site reconnaissance, on the Subject Property.

3.11 Sewage Disposal Systems; Septic Systems

No sewage disposal systems or septic systems were observed at the Subject Property. The property is connected to city water and wastewater services.

3.12 Drains, Sumps, Pits

Two floor drains were observed at the Subject Property, one in the loading dock areas of the autobody building and one in the cafeteria loading dock area of campus. In addition, drains and a sump were observed in the boiler room. No staining or oily sheen was observed. These are not anticipated to have any impacts to the Subject Property.

3.13 Solid Waste

Solid waste dumpsters were observed on the Subject Property (including the loading dock area and Autobody Shop Yard, Cafeteria). Solid waste does not represent a REC at the Subject Property.

3.14 Transformers and PCB Containing Equipment

Two transformers (in the central quad areas) and three utility poles (on perimeters) were observed on the Subject Property. No leaks or staining were observed. Their presence on the Subject Property poses no apparent impacts to the site.

3.15 Stained Soils, Stains, Stressed Vegetation

No stained soils or stressed vegetation was observed at the Subject Property.

3.16 Odors, Pools of Liquids

No odors or pools of liquids were observed on the Subject Property.

3.17 Vapor Intrusion

Vapor intrusion was not identified as a concern due to no apparent off-site sources or contamination plumes identified. Further, the water supply is public, thus helping to prevent any vapor intrusion concerns.

3.18 Indoor Air Quality/Mold/Water Intrusion

The Subject Property appears to be in good condition from visible inspection. Indoor air quality, mold, and water intrusion is not identified as a concern.

3.19 Asbestos

Asbestos testing/sampling was not performed as part of this assessment (not part of the scope of work) and is a Non-Scope Issue as defined in ASTM 1527-15 Phase I Environmental Site Assessment Guidelines.

3.20 Lead-Based Paint

Lead-Based Paint testing/sampling was not performed as part of this assessment (not a part of the scope of work) and is a Non-Scope Issue as defined in ASTM 1527-15 Phase I Environmental Site Assessment Guidelines.

3.21 Electromagnetic Radiation

Two high voltage electric transition lines were observed at or within 100 feet of the Subject Property. Their presence on the Subject Property does not pose any apparent impacts to the Subject Property.

3.22 Lead in Drinking Water

A lead in drinking water survey was not requested.

3.23 Compliance Issues

No compliance issues were identified.

3.24 Summary of Findings from Aerial Photographs

Historical aerial photographs dating back to at least 1923 (see Appendix A) depict the Subject Property as vacant undeveloped land up until at least 1928 where it is then associated with present day Fairfax High School. The Subject Property is developed with the current day auditorium and east/west wings of the main building. Structures also occupy the southwest and south areas of the campus with the remaining lot being grassy fields.

By at least 1952 the Subject Property is shown to have current day configuration of the main structures. Additional structures are developed onsite associated with the historic auto body shop, woodworking shop, paint shop, and electrical shop located on the southwest corner of the campus beyond the auditorium.

By at least 1966 the east and west wings are removed, and the current day administration building and classroom buildings are located on the northeast portion of campus. Asphalt parking lots are seen to the northwest and west areas of the Subject Property. By at least 1972, the Subject Property is shown in its present-day configuration with no significant changes depicted up to present day.

4.0 RECORDS REVIEW

4.1. Standard Federal, State, and Tribal Environmental Records

A records review of the standard environmental databases maintained by federal, state, and tribal offices was performed by EDR. The databases were searched for properties with reported environmental conditions located within the approximate minimum search distances as specified by the ASTM Standard Practice. This was done by using geocoded information that identified the coordinates of the properties in the databases or by checking the street addresses of practically reviewable non-geocoded "orphan" properties within the same zip code. For the purposes of the records review, the specified search distances are from the property lines of the Subject Property. The EDR report is presented as Appendix G. The following table provides a summary of the findings of the environmental records review.

Table 4-1 - Review of Standard Federal, State, and Tribal Environmental Records

4.2. Standard Federal Environmental Records

In accordance with the ASTM Standard Practice, the following standard federal environmental records were searched for sites within the appropriate minimum search distance. The following listings comprise the NPL database.

4.2.1. Federal NPL Site List

The US Environmental Protection Agency (USEPA) maintains the National Priority List (NPL) database, which is a subset of the CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System). The NPL is a listing of sites that are ranked as high priority for cleanup under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA; Superfund) program.

4.2.1.1. Federal National Priority List Sites (NPL)

The NPL database contains information on sites that are currently listed on the NPL. A review of NPL database, as provided by EDR, revealed that no listed site is located within a 1.0-mile search radius of the Subject Property.

4.2.1.2. Federal Proposed National Priority List Sites (Proposed NPL)

The Proposed NPL database contains information on sites that have been proposed for listing on the NPL through the issuance of a proposed rule in the Federal Register. The EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing. A review of Proposed NPL database, as provided by EDR, revealed that no listed sites are located within a 1.0-mile search radius of the Subject Property.

4.2.1.3. Federal Superfund Liens (NPL LIENS)

The NPL LIENS database contains information on liens that have been filed by the USEPA against real property to recover remedial action expenditures or when the property owner received notification of potential liability. The USEPA compiles and maintains a listing of filed notices of Superfund Liens. A review of the NPL LIENS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.2.1.4. National Priority List Deletions (Delisted NPL)

The Delisted NPL sites database contains information on sites that have been deleted from the NPL when the USEPA has concurred that no further response was required. The USEPA compiles and maintains a database of delisted NPL sites. A review of Delisted NPL database, as provided by EDR, revealed that no listed sites are located within a 1.0-mile search radius of the Subject Property.

4.2.2. Federal CERCLIS List

The USEPA investigates known or suspected uncontrolled or abandoned hazardous substance facilities under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The USEPA maintained a comprehensive list of these facilities in a database known as the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS). In 2015, the USEPA renamed CERCLIS to the Superfund Enterprise Management System (SEMS) Site List. This list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies, and private persons, pursuant to

CERCLA Section 103. This dataset also contains sites which are either proposed to the NPL and the sites which are in the screening and assessment phase for possible inclusion on the NPL. These sites have either been investigated or are currently under investigation by the USEPA for release or threatened release of hazardous substances. Once a site was placed in CERCLIS, it may be subjected to several levels of review and evaluation and ultimately placed on the NPL. The following databases comprised the CERCLIS database.

4.2.2.1. Federal Facility Site Information Listing (FEDERAL FACILITY)

The Federal Facility Site Information Listing (FEDERAL FACILITY) contains NPL and Base Realignment and Closure (BRAC) sites found in the CERCLIS database where the USEPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities. A review of the FEDERAL FACILITY database, as provided by EDR, revealed that no listed sites are located within a 0.5-mile search radius of the Subject Property.

4.2.2.2. Superfund Enterprise Management System Site List (SEMS)

The Superfund Enterprise Management System (SEMS) tracks hazardous waste sites, potentially hazardous waste sites and remedial activities performed in support of the USEPA's Superfund Program. This list was formerly known as CERCLIS and was renamed to SEMS by the USEPA in 2015. This list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies, and private persons, pursuant to CERCLA Section 103. This dataset also contains sites which are either proposed to the NPL and the sites which are in the screening and assessment phase for possible inclusion on the NPL. A review of the SEMS database, as provided by EDR, revealed that no listed sites are located within a 0.5-mile search radius of the Subject Property.

4.2.2.3. Superfund Enterprise Management System Archive Site List (SEMS-ARCHIVE)

The Superfund Enterprise Management System Archive (SEMS-ARCHIVE) tracks sites that have no further interest under the USEPA Superfund Program based on available information. The list was formerly known as the CERCLIS No Further Remedial Action Planned (CERLIS-NFRAP) and was renamed to SEMS-ARCHIVE in 2015. The SEMS-ARCHIVE sites may include sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the site being placed on the NPL, or the contamination was deemed not serious enough to require Federal Superfund action or NPL consideration. The USEPA has removed these sites from SEMS to lift unintended barriers to the redevelopment of these properties. This policy change is part of the USEPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens promote economic redevelopment of unproductive urban sites. A review of the SEMS-ARCHIVE database, as provided by EDR, revealed that no listed sites are located within a 0.5-mile search radius of the Subject Property.

4.2.3. Federal RCRA Corrective Action Reports Facilities List (CORRACTS)

The USEPA regulates hazardous waste under the Resource Conservation and Recovery Act (RCRA). The USEPA maintains the Corrective Action Reports (CORRACTS) database, which is a listing of RCRA facilities that are undergoing corrective action. A corrective action order is issued pursuant to RCRA Section 3008(h) when there has been a release of hazardous waste or constituents into the environment from a RCRA facility. Corrective actions may be required beyond the boundary of the facility and can be required even if the release predated RCRA. A review of the CORRACTS database, as provided by EDR, revealed that no listed sites are located within a 1.0-mile search radius of the Subject Property.

4.2.3.1. Federal RCRA Treatment, Storage, and Disposal Facilities List (RCRA TSDF)

The USEPA regulates hazardous waste under RCRA and identifies and tracks hazardous waste from the point of generation to the point of disposal. RCRA info is EPA's comprehensive information system, providing access to data supporting RCRA and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by RCRA. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. A review of the RCRA TSDF database, as provided by EDR, revealed that no listed sites are located within a 0.5-mile search radius of the Subject Property.

4.2.3.2. Federal RCRA Generators List (RCRA-LQG, RCRA-SQG, and RCRA-CESQG)

The USEPA regulates hazardous waste under RCRA and maintains a database of facilities, which generate hazardous waste or treat, store, and/or dispose of hazardous wastes. Large Quantity Generators (LQG) generate 1,000 kilograms or greater of hazardous waste per month, or greater than 1 kilogram of acutely hazardous waste per month. Small Quantity Generators (SQG) generate more than 100 kilograms, but less than 1,000 kilograms of hazardous waste per month. Conditionally Exempt Small Quantity Generators (CESQG) generate 100 kilograms or less of hazardous waste per month, or 1 kilogram or less of acutely hazardous waste per month. A review of the RCRA-LQG, as provided by EDR, revealed that 1 listed site (in addition to the Subject Property) is located within a 0.25-mile search radius of the Subject Property.

Table 1 – RCRA-LQG List

Dist. (mi)	Elev.	Site	Site Address	EPA ID	Facility Status	SP REC
0.002 SSE	Lower	Whitman Continuation	7795 Rosewood Ave.	CAR000198432	No Violations	No

A review of the RCRA-SQG as provided by EDR, revealed that 5 listed sites are located within a 0.25-mile search radius of the Subject Property.

Table 2 – RCRA-SQG List

Dist. (mi)	Elev.	Site	Site Address	EPA ID	Facility Status	SP REC
0.010 NNW	Equal/Higher	Chevron Station 9	7861 Melrose Ave	CAD983608993	No Violations	No
0.042 NW	Equal/Higher	Beverly Plus Cleaner	703 N Fairfax Ave	CAR000066936	No Violations	No
0.142 NNW	Equal/Higher	Digos Auto	801 N Fairfax Ave	CAD982334245	No Violations	No
0.136 SE	Lower	LAA Coop Living	414 Spaulding Ave	CAD981987084	No Violations	No
0.222 SSW	Lower	LA Mohr Multi Purpos	330 Fairfax Ave	CAD981986797	No Violations	No

A review of the RCRA-CESQG as provided by EDR, revealed that no listed sites are located within a 0.25-mile search radius of the Subject Property.

A review of the RCRA-VSQG as provided by EDR, revealed that 1 listed site is located within a 0.25-mile radius of the Subject Property.

Table 3 – RCRA-VSQG List

Dist. (mi)	Elev.	Site	Site Address	EPA ID	Facility Status	SP REC
0.233 SSW	Lower	Silverado Senior Living	330 North Hayworth Ave	CAR000290221	No Violations	No

Due to their status (no violations reported), distance, and/or downgradient to the Subject Property, the listed sites do not constitute a REC regarding the Subject Property.

4.2.3.3. Federal Institutional Controls/Engineering Control Registries (LUCIS, US ENG CONTROLS, and US INST CONTROLS)

The Federal Institutional Control/Engineering Control Registries consist of three separate databases. The Land Use Control Information System (LUCIS) is operated by the Department of the Navy and contains records of land use control information pertaining to former Navy Base Realignment and Closure (BRAC) properties. The US Sites with Institutional Controls List is operated by the USEPA and is a listing of sites with institutional controls in place. Institutional controls include administrative measures such as groundwater use restrictions, construction restrictions, property use restrictions, and post-remediation requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls. The US Engineering Controls Sites List is operated by the USEPA and is a listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or to

affect human health. A review of the LUCIS, US ENG CONTROLS, and US INST CONTROLS database, as provided by EDR, revealed that no listed sites are located within a 0.5-mile search radius of the Subject Property.

4.2.4. Federal Emergency Response Notification List (ERNS)

The Emergency Response Notification System (ERNS) is a national database used to collect and store information on unauthorized releases of oil and hazardous substances. The program is a cooperative effort of the USEPA, the Department of Transportation Volpe National Transportation System Center and the US Coast Guard National Response Center. There are primarily five (5) Federal statutes that require release reporting: CERCLA section 103; the Superfund Amendments and Reauthorization Act (SARA) Title III Section 304; the Clean Water Act of 1972 (CWA) Section 311(b)(3); and the Hazardous Material Transportation Act of 1974 (HMTA) section 1808(b). A review of the ERNS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.2.5. State and Tribal-Equivalent NPL Site List (RESPONSE)

The California DTSC maintains the RESPONSE database, which is a listing of hazardous substance sites targeted for cleanup. The RESPONSE database identifies release sites where DTSC is involved in remediation, either as a lead or an oversight capacity. These confirmed release sites are generally considered to be high priority and present a high potential risk to human health. A review of the RESPONSE database, as provided by EDR, revealed that no listed site is located within a 1.0-mile search radius of the Subject Property.

4.2.6. State and Tribal-Equivalent CERCLIS List (ENVIROSTOR)

The DTSC maintains the ENVIROSTOR database, which is a listing of sites with known contamination or sites which are under consideration for further investigation. The ENVIROSTOR database includes the following site types: Federal Superfund sites (National Priorities List; NPL); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and school sites. ENVIROSTOR provides similar information to that was previously available in CalSites, as well as additional information, including, but not limited to identification of formerly contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land use, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites. A review of the ENVIROSTOR database, as provided by EDR, revealed that 5 listed sites are located within a 1.0-mile search radius of the Subject Property.

Table 4 – ENVIROSTOR List

Dist. (mi)	Elev.	Site	Site Address	Facility ID	Facility Status	SP REC
0.531 NE	Equal/Higher	Linn House	1001 N Martel Ave	19830005	No Action Required	No

0.731 NW	Equal/Higher	Peters Magnolia Cleaners	8301-8305 Santa Monica	60003129	Active	No
0.887 NE	Equal/Higher	Faith Plating	7141 And 7155 Santa Monica	60000429 71002584	Certifed No Action Required	No
0.946 NE	Lower	Essex Monarch Site	7113 & 7119 Santa Monica	60001653	No Further Action	No
0.742 S	Lower	Hancock Park Element	408 South Fairfax Ave.	19000014	Inactive-Needs Evaluation	No

Due to their status (no violations reported), distance, and/or downgradient to the Subject Property, the listed sites do not constitute a REC regarding the Subject Property.

4.2.7. State and Tribal-Equivalent Landfill and/or Solid Waste Disposal Site Lists (SWF/LF)

The Solid Waste Facilities/Landfill Sites (SWF/LF) database contains information on active, closed, and inactive landfills. The SWF/LF database typically contains an inventory of solid waste disposal facilities or landfills. These may be inactive or active facilities or open dumps that failed to meet RCRA Section 2004 criteria for solid waste landfills or disposal sites. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database. A review of the SWF/LF database, as provided by EDR, revealed that no listed sites are located within a 0.5-mile search radius of the Subject Property.

4.2.8. State and Tribal-Equivalent Leaking Underground Storage Tank Lists (LUST)

The California State Water Resources Control Board (Water Board) Leaking Underground Storage Tank (LUST). Incident Reports database contains an inventory of reported leaking underground storage tanks. A review of the LUST database as provided by EDR, revealed that the Subject Property is not a listed site and that 17 listed sites are located within a 0.5-mile search radius of the Subject Property.

Table 5 – State and Tribal-Equivalent Leaking Underground Storage Tank List

Dist. (mi)	Elev.	Site	Site Address	Facility Status	SP REC
0.010 NNW	Equal/Higher	Chevron 9-4959	7861 Melrose Ave	Completed-Case Closed	No
0.142 NNW	Equal/Higher	Vacant Lot	801 Fairfax Ave	Completed-Case Closed	No
0.355 ENE	Equal/Higher	Colonia Investment	7450-54 Melrose Ave	Completed-Case Closed	No
0.486 NNW	Equal/Higher	76 Products Station	7960 Santa Monica Blvd.	Completed-Case Closed	No
0.166 SSW	Lower	Mas Auto Service	371 Fairfax Ave	Remediation Plan	No
0.268 S	Lower	Tosco-76 Station	7751 Beverly Blvd.	Completed-Case Closed	No

0.286 S	Lower	Tosco-76 Station	7751 Beverly Blvd.	Remediation Plan	No
0.300 SSE	Lower	Texaco	7718 Beverly Blvd.	Remediation Plan	No
0.300 SSE	Lower	Texaco	7718 Beverly Blvd.	Completed-Case Closed	No
0.310 SSW	Lower	Former World Oil 6	7900 Beverly Blvd.	Completed-Case Closed	No
0.310 SSW	Lower	World Oil Co.	7900 Beverly Blvd.	Completed-Case Closed	No
0.310 SSW	Lower	Apro Station 02	7900 Beverly Blvd.	Remedial Action Underway	No
0.368 S	Lower	CBS Television City	7800 Beverly Blvd.	Completed-Case Closed	No
0.368 S	Lower	Television City LLC	7800 Beverly Blvd.	Completed-Case Closed	No
0.404 SW	Lower	Chevron 9-6472	8105 Beverly Blvd.	Completed-Case Closed	No
0.481 S	Lower	Farmers Market Auto	166 Fairfax Ave	Completed-Case Closed	No
0.491 S	Lower	Farmers Market Car Wash	118 S Fairfax Ave	Completed-Case Closed	No

Due to their status (case closed), distance, and/or downgradient to the Subject Property, the listed sites do not constitute a REC regarding the Subject Property.

4.2.9. State and Tribal-Equivalent Leaks, Investigations, and Cleanup List (CPS-SLIC)

The State Water Board Spills, Leaks, Investigations and Cleanup (SLIC) program is designed to protect and restore water quality from spills, leaks, and similar discharges. The statewide SLIC database contains a listing of sites that impact groundwater or have the potential to impact groundwater. The California Regional Water Quality Control Board San Francisco Bay Area Region maintains the regional database. A review of the SLIC database, as provided by EDR, revealed that 1 listed site is located within a 0.5-mile search radius of the Subject Property.

Table 6 – CPS-SLIC List

Dist. (mi)	Elev.	Site	Site Address	Facility Status	SP REC
0.323 SW	Lower	Al Simon	8023 Beverly Blvd	Completed-Case Closed	No

Due to its status (case closed), distance, and/or downgradient to the Subject Property, the listed site does not constitute a REC regarding the Subject Property.

4.2.10. Federal, State, and Tribal Registered Storage Tank Lists

4.2.10.1. Federal Emergency Management Agency (FEMA) Underground Storage Tank List (FEMA UST)

The Federal Emergency Management Agency (FEMA) maintains the FEMA UST database, which is a listing of FEMA-owned underground storage tanks (USTs). A review of the FEMA UST database, as provided by EDR, revealed that no listed sites are located within a 0.25-mile search radius of the Subject Property.

4.2.10.2. State Active Underground Storage Tank Facilities (UST)

The State Water Board maintains an Underground Storage Tank (CA UST) database, which is a listing of active permitted UST facilities provided to the Water Board from the local regulatory agencies. Per the Water Board GeoTracker data management system, the CA UST listings are no longer being kept up to date. A review of the UST database, as provided by EDR, revealed that 18 listed sites are located within a 0.25-mile search radius of the Subject Property.

Table 7 – State Active Underground Storage Tank Facilities List

Dist. (mi)	Elev.	Site	Site Address	Facility ID	SP REC
0.010 NNW	Equal/Higher	Chevron Station 9-4	7861 Melrose Ave	23789	No
0.010 NNW	Equal/Higher	United 048	7861 Melrose Ave	FA0007684	No
0.023 WNW	Equal/Higher	Not Reported	639 N Fairfax Ave	Not Reported	No
0.026 NNW	Equal/Higher	Not Reported	7851-53 Melrose Ave	Not Reported	No
0.037 NW	Equal/Higher	Not Reported	7901 Melrose Ave	Not Reported	No
0.101 ENE	Equal/Higher	Not reported	7656 Melrose Ave	Not Reported	No
0.127 ENE	Equal/Higher	Not Reported	660 N Stanley Ave	Not Reported	No
0.142 NNW	Equal/Higher	Vacant	801 N Fairfax Ave	FA0023159	No
0.157 ENE	Equal/Higher	Not Reported	7611 Melrose Ave	Not reported	No
0.170 ENE	Equal/Higher	Not Reported	7600 Melrose Ave	Not Reported	No
0.172 ENE	Equal/Higher	Not Reported	7601 Melrose Ave	Not reported	No
0.197 ENE	Equal/Higher	Not Reported	7580 Melrose Ave	Not Reported	No
0.0019 WNW	Lower	Not reported	625 N Fairfax Ave	Not Reported	No

0.050 SSW	Lower	Not Reported	449 N Fairfax Ave	Not Reported	No
0.127 SSW	Lower	Not Reported	404 N Fairfax Ave	Not Reported	No
0.158 SSW	Lower	Not Reported	369 N Fairfax Ave	Not Reported	No
0.216 WNW	Lower	Not Reported	8051 Melrose Ave	Not Reported	No
0.233 WNW	Lower	Not Reported	8068 Melrose Ave	Not Reported	No

No leaks or violations are reported from any property. Due to their status (no violations reported), distance, and/or downgradient to the Subject Property, the listed sites do not constitute a REC regarding the Subject Property.

4.2.10.3. State Aboveground Petroleum Storage Tank (AST) Facilities

The California Environmental Protection Agency (Cal/EPA) maintains a listing (AST) of aboveground petroleum storage tank facilities. A review of the AST database, as provided by EDR revealed that no listed sites were located within a 0.25-mile search radius of the Subject Property.

4.2.10.4. Underground Storage Tank Facilities on Indian Land (INDIAN UST)

The USEPA maintains the Indian Underground Storage Tank (INDIAN UST) facilities database which provides information about underground storage tanks in USEPA Region 9 (Arizona, California, Hawaii, Nevada, the Pacific Islands, and Tribal Nations). A review of the INDIAN UST database, as provided by EDR, revealed that no listed sites are located within a 0.25-mile search radius of the Subject Property.

4.2.11. State and Tribal Voluntary Cleanup Sites

4.2.11.1. DTSC Voluntary Cleanup Program Properties (VCP)

The DTSC maintains the voluntary cleanup property (VCP) database which is a listing of properties that post a low threat due to either confirmed or unconfirmed releases and where the project proponents have requested that the DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for reimbursing the DTSC's costs. A review of the VCP database, as provided by EDR, revealed no listed sites were located within a 0.5-mile search radius of the Subject Property.

4.2.11.2. Indian Voluntary Cleanup Priority Site List (INDIAN VCP)

The USEPA maintains the Indian Voluntary Cleanup Priority (INDIAN VCP) database, which is a listing of voluntary cleanup priority sites located in EPA Region 9 (Arizona, California, Hawaii,

Nevada, the Pacific Islands, and Tribal Nations). A review of the VCP database, as provided by EDR, revealed that no listed sites are located within a 0.5-mile search radius of the Subject Property.

4.2.12. State and Tribal Brownfields Sites

4.2.12.1. State and Tribal Brownfields Site Listing (BROWNFIELDS)

The State Water Board Brownfields Program maintains a listing of Brownfields (CA BROWNFIELDS) sites. Brownfields are underutilized properties where reuse is hindered by the actual or suspected presence of pollution/contamination. Cleanup and redevelopment of these sites benefits the environment and communities by eliminating pollution/contamination problems, allowing economic growth, and revitalizing neighborhoods. A review of the BROWNFIELDS list, as provided by EDR, revealed that 1 listed site is located within a 0.5-mile search radius of the Subject Property.

Table 8 – Brownfield List

Dist. (mi)	Elev.	Site	Site Address	Status	SP REC
0.323 SW	Lower	Al Simon	8023 Beverly Blvd	Completed – Case Closed	No

Based on compliance status (no current violations, no documented leaks, case closed), the listed site does not constitute a REC regarding the Subject Property

4.3. Additional Environmental Records

4.3.1. Local Brownfields Sites

4.3.1.1. USEPA Brownfields Sites (US BROWNFIELDS)

The USEPA maintains a listing of brownfields sites in the Assessment, Cleanup, and Redevelopment Exchange System (ACRES) database. ACRES stores information reported by USEPA Brownfields grants recipients as well as Targeted Brownfields Assessments performed by USEPA Regional offices. A review of the US BROWNFIELDS list, as provided by EDR, revealed 2 listed sites are located within a 0.5-mile search radius of the Subject Property.

Table 9 – US Brownfield List

Dist. (mi)	Elev.	Site	Site Address	ACRES ID	SP REC
0.283 NNW	Equal/Higher	Angelo and Patricia	919 Fairfax Ave	35721	No
0.496 N	Equal/Higher	7819-25 Santa Monica	7819-25 Santa Monica	36021	No

Due to their status (no violations) and distance, , the listed sites do not constitute a REC regarding the Subject Property.

4.3.2. Local Lists of Landfill and Solid Waste Disposal Sites

4.3.2.1. Water Board Waste Management Unit Database (WMUDS/SWAT)

The State and Regional Water Boards maintain the Waste Management Unit Database System (WMUDS) for program tracking and inventory of waste management units. WMUDS is used to maintain information on facilities, scheduled inspections, waste management units, solid waste assessment test (SWAT) programs, SWAT report data and summaries, Chapter 15 monitoring parameters, Toxic Pits Cleanup Act of 1984 (TPCA) programs, RCRA Programs, closure information, and Interested Parties. A review of WMUDS/SWAT database, as provided by EDR, revealed that no listed sites are located within a 0.5-mile search radius of the Subject Property.

4.3.2.2. State Waste and Recycling Facilities Database (SWRCY)

The California Department of Conservation maintains the State Waste and Recycling Facilities (SWRCY) database of recycling facilities in California. A review of the SWRCY database, as provided by EDR, revealed no sites are located within a 0.5-mile search radius of the Subject Property.

4.3.2.3. State Registered Waste Tire Haulers Database (HAULERS)

The California Integrated Waste Management Board (CalRecycle) maintains a listing of registered waste tire haulers. A review of the HAULERS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.2.4. Report on the Status of Dumps on Indian Lands (INDIAN ODI)

The USEPA maintains the INDIAN ODI database, which is a listing of open dumps on Indian land. A review of the INDIAN ODI database, as provided by EDR, revealed that no listed sites are located within a 0.5-mile search radius of the Subject Property.

4.3.2.5. Open Dump Inventory (ODI)

The USEPA created the Open Dump Inventory (ODI) which is a listing of open dumps as a disposal facility that does not comply with one or more of Part 257 or 258 Subtitle D criteria. The ODI was last updated in 2004. A review of the ODI database, as provided by EDR, revealed that no listed sites are located within a 0.5-mile search radius of the Subject Property.

4.3.3. Local Lists of Hazardous Waste / Contaminated Sites

4.3.3.1. Historical National Clandestine Laboratory Register (US HIST CDL)

The US Drug Enforcement Agency (US DEA) maintains the US HIST CDL database, which is a listing of clandestine drug lab locations that have been removed from the US DEA National

Clandestine Laboratory Register. A review of the US HIST CDL database, as provided by EDR, reveals that the Subject Property is not a listed site.

4.3.3.2. Historical Cal-Sites Database (HIST Cal-Sites)

The DTSC created the Cal-Sites database which lists properties where potential or confirmed releases of hazardous substance have occurred. The Cal-Sites database is no longer being updated by the DTSC and has been replaced with EnviroStor. A review of the HIST Cal-Sites database, as provided by EDR, revealed that no listed site is located within a 1.0-mile search radius of the Subject Property.

School Property Evaluation Program (SCH)

The DTSC SCH database contains proposed and existing school sites that are being evaluated by the DTSC for possible hazardous materials contamination. A review of the SCH database, as provided by EDR, revealed that no listed sites are located within a 0.25-mile search radius of the Subject Property.

4.3.3.3. Clandestine Drug Labs (CDL)

The DTSC maintains the CDL database which is a listing of clandestine drug lab locations. The listing of a property in the CDL database does not indicate that any illegal drug lab materials were or were not present at the property and does not constitute a determination that the location requires additional cleanup work. A review of the CDL database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.3.4. Toxic Pits Cleanup Act Sites (Toxic Pits)

The State Water Board maintains the Toxic Pits database, which identifies sites suspected of containing hazardous substances where cleanup activities have not yet been completed. The State Water Board has not updated the Toxic Pits database since 2009. A review of the Toxic Pits database, as provided by EDR, revealed that no listed sites are located within a 1.0-mile search radius of the Subject Property.

4.3.3.5. California Environmental Reporting System Hazardous Waste (CERS HAZ WASTE)

CalEPA maintains the CERS HAZ WASTE database, which is a listing of locations where which fall under the Hazardous Chemical Management, Hazardous Waste Onsite Treatment, Household Hazardous Waste Collection, Hazardous Waste Generator, and RCRA LQ HW Generator programs. A review of the CERS HAZ WASTE database, as provided by EDR, revealed 4 listed sites (in addition to the Subject Property) are located within 0.25 miles of the Subject Property.

Table 10 – CERS HAZ WASTE List

Dist. (mi)	Elev.	Site	Site Address	CERS ID	Violations	SP REC
0.010 NNW	Equal/Higher	Apro LLC 48	7861 Melrose Ave	10261633	No	No

0.010 NNW	Equal/Higher	United 48	7861 W Melrose Ave	10243342	No	No
0.042 NW	Equal/Higher	Beverly Plus Cleaner	703 N Fairfax Ave	10256836	No	No
0.203 NNW	Equal/Higher	Crown Cleaners	840 N Fairfax Ave	10252657	No	No

Based on compliance status (no current violations, no documented leaks), the listed sites do not constitute a REC regarding the Subject Property.

4.3.3.6. Clandestine Drug Labs (US CDL)

The US DEA maintains the US CDL database, which is a listing of locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. A review of the US CDL database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.4. Local Lists of Registered Storage Tanks

4.3.4.1. Statewide Environmental Evaluation and Planning System (SWEEPS UST)

The State Water Board created the SWEEPS UST database, which is a statewide listing of registered USTs. The database was created in the early-1990s and is no longer maintained. A review of the SWEEPS UST database, as provided by EDR, revealed that 6 listed sites are located within a 0.25-mile radius of the Subject Property.

Table 11 – Statewide Environmental Evaluation and Planning System List

Dist. (mi)	Elev.	Comp. Number	Site	Site Address	Status	Reported Leaks	SP REC
0.010 NNW	Equal/Higher	3571	Chevron 9-4959	7861 Melrose	Completed-Case Closed	Yes	No
0.037 NW	Equal/Higher	7191	Amir Novian	7901 Melrose Ave	Not Reported	Not Reported	No
0.101 ENE	Equal/Higher	7089	Tom Davies	7656 Melrose Ave	Not Reported	Not Reported	No
0.157 ENE	Equal/Higher	4862	Melrose & Courson	7611 Melrose Ave	Not Reported	Not Reported	No
0.170 ENE	Equal/Higher	4087	Moses/Yetta Feiner	7600 Melrose Ave	Not Reported	Not Reported	No
0.197 ENE	Equal/Higher	7961	The Carlyle Group	7580 Melrose Ave	Not Reported	Not Reported	No

Based on compliance status (no listed violations, no documented leaks, case closed), and/or distance, the listed sites do not constitute a REC regarding the Subject Property.

4.3.4.2. Hazardous Substance Storage Container Database (HIST UST)

The State Water Board Hazardous Substance Storage Container Database is a historical listing of UST sites. The database was created in the early-1990s and is no longer being maintained. A review of the HIST UST database, as provided by EDR, revealed that 1 listed site is located within a 0.25-mile radius of the Subject Property.

Table 12 – Historical Underground Storage Tank List

Dist. (mi)	Elev.	Facility ID	Site	Site Address	SP REC
0.010 NNW	Equal/Higher	00000062695	Chevron USA Inc.	7861 Melrose Ave	No

Based on compliance status (no listed violations, no documented leaks, case closed), the listed site does not constitute a REC regarding the Subject Property.

4.3.4.3. Facility Inventory Database (CA FID UST)

The State Water Board Facility Inventory Database (CA FID UST) contains a historical listing of active and inactive UST locations. This database was created in the mid-1990s and is no longer being maintained. A review of the CA FID UST database, as provided by EDR, revealed that the Subject Property is not a listed site. A review of the CA FID UST database, as provided by EDR, revealed that 6 listed sites are located within a 0.25-mile search radius of the Subject Property.

Table 13 – California Facility Inventory Database List

Dist. (mi)	Elev.	Facility ID	Site	Site Address	Tank Status	SP REC
0.010 NNW	Equal/Higher	19002421	Apro LLC DBA United	7861 Melrose Ave	Inactive	No
0.037 NW	Equal/Higher	19005957	Amir Novian	7901 Melrose Ave	Inactive	No
0.101 ENE	Equal/Higher	19054580	Tom Davies	7656 Melrose Ave	Inactive	No
0.157 ENE	Equal/Higher	19007594	Melrose & Courson	7611 Melrose Ave	Inactive	No
0.170 ENE	Equal/Higher	19054325	Moses/Yetta Feiner	7600 Melrose Ave	Inactive	No
0.197 ENE	Equal/Higher	19015341	The Carlyle Group	7580 Melrose Ave	Inactive	No

Based on compliance status (no current violations, no documented leaks) and/or distance, the listed sites do not constitute a REC regarding the Subject Property.

4.3.4.4. California Environmental Reporting System (CERS TANKS)

The California Environmental Protection Agency (CalEPA) maintains a list of sites that all under the Aboveground Petroleum Storage and underground Storage Tank regulatory programs. A review of the HIST UST database, as provided by EDR, revealed that 1 listed site is located within a 0.250-mile search radius of the Subject Property.

Table 14 – CERS Tanks List

Dist. (mi)	Elev.	Site	Site Address	CERS ID	Status	SP REC
0.010 NNW	Equal/Higher	United 48	7861 W Melrose Ave	10243342	Active	No

These site does not constitute a REC due to its regulatory status (no violations).

4.3.5. Local Land Records

4.3.5.1. DTSC Environmental Liens Listing (LIENS)

The DTSC maintains a listing of property locations with environmental liens in California where the DTSC is a lien holder. A review of the LIENS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.5.2. USEPA CERLCA Liens Listing (LIENS 2)

The USEPA maintains a listing of property locations with CERCLA liens. A review of the LIENS 2 database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.5.3. Deed Restriction Listings (DEED)

The DTSC and the State Water Board maintain a listing of brownfield sites and remediated properties with land use restrictions that were required because of the presence of hazardous substances that remained on site after the facility (or part of the facility) has been closed or cleaned up. These types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners. A review of the DEED database, as provided by EDR, revealed that no listed sites were located within a 0.5-mile search radius of the Subject Property.

4.3.6. Records of Emergency Release Reports

4.3.6.1. Hazardous Materials Information Reporting System (HMIRS)

The US Department of Transportation (US DOT) maintains the Hazardous Materials Information Reporting System (HMIRS) database, which contains a listing of reported hazardous spill incidents. A review of the HMIRS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.6.2. California Hazardous Materials Information Reporting System (CHMIRS)

The California Office of Emergency Services (OES) maintains the California Hazardous Material Incident Reporting System (CHIMRS) database which is a listing of reported accidental releases or spills of hazardous materials. A review of the CHIMRS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.6.3. Land Disposal Sites Listing (LDS)

The State Water Board maintains the Land Disposal Sites (LDS) database, which is a listing of sites where waste is discharged to land for treatment, storage, and disposal in WMUs. A review of the LDS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.6.4. Military Cleanup Sites Listing (MCS)

The State and Regional Water Boards partner with the United States Department of Defense (US DOD) through the Defense and State Memorandum of Agreement (DSMOA) to oversee the investigation and remediation of water quality issues at military facilities. A review of the MCS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.6.5. State Spills Listing (SPILLS 90)

The SPILLS90 database is maintained by FirstSearch Technology Corporation and is a listing of hazardous materials spills reported to the Regional Water Boards. A review of the SPILLS90 database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7. Other Ascertainable Records

4.3.7.1. RCRA Non-Generators/No Longer Regulated (RCRA NONGEN/NLR)

The USEPA maintains the RCRAInfo database which is a listing of sites that generate, store, and dispose of hazardous waste as defined by RCRA. RCRA non-generators do not presently generate hazardous waste. A review of the RCRAInfo database, as provided by EDR, revealed that the Subject Property is not a listed site and that 46 listed sites are located within a 0.25-mile search radius of the Subject Property.

Table 15 – RCRA Non-Generators/No Longer Regulated List

Dist. (mi)	Elev.	EPA ID	Handler Name	Site Address	Active Violations	SP REC
0.010 NNW	Equal/Higher	CAL000398649	Apro LLC United	7861 Melrose Ave	No	No
0.010 NNW	Equal/Higher	CAL000071396	Chevron Service	7861 Melrose Ave	No	No
0.030 NW	Equal/Higher	CAC003074224	Bank of America	7900 Melrose Ave	No	No

0.222 SSW	Lower	CAL000431907	Jewish Family Services	330 N Fairfax Ave	No	No
0.225 WNW	Lower	CAC002970292	8060 Melrose Ave	8060 Melrose Ave	No	No
0.225 SSE	Lower	CAC002996540	Brad Holtzman	336-338 N Spaulding Ave	No	No
0.233 SSW	Lower	CAL000409472	Silverado Senior Place	330 N Hayworth Ave	No	No
0.244 SE	Lower	CAC002985142	Borris Geiger	357 ½ N Curson Ave	No	No
0.247 WSW	Lower	CAC002978528	Jenny Song	510 Crescent Ave	No	No

Based on compliance status (no listed violations, no documented leaks), distance, and/or downgradient, the listed sites do not constitute a REC regarding the Subject Property.

4.3.7.2. Formerly Used Defense Sites (FUDS)

The US Army Corps of Engineers (US ACE) maintains the formerly used defense sites (FUDS) database, which is a listing of former military sites actively performing or planning to perform cleanup actions. A review of the FUDS database, as provided by EDR, revealed that no listed sites are located within a 1.0-mile search radius of the Subject Property.

4.3.7.3. Department of Defense Sites (DOD)

The US Geological Survey (USGS) maintains the US DOD sites (DOD) database, which is a listing of federally owned or US DOD administered lands in the United States, Puerto Rico, or the US Virgin

Islands that have an area equal or greater than 640 acres. A review of the FUDS database, as provided by EDR, revealed that no listed sites are located within a 1.0-mile search radius of the Subject Property.

4.3.7.4. State Coalition for Remediation of Drycleaners Listing (SCRD DRYCLEANERS)

The USEPA maintains the State Coalition for Remediation of Drycleaners Listing (SCRD DRYCLEANERS) database. A review of the SCRD DRYCLEANERS database, as provided by EDR, revealed that no listed sites are located within a 0.5-mile search radius of the Subject Property.

4.3.7.5. Financial Assurance Information (US FIN ASSUR)

The USEPA maintains the Financial Assurance Information database (US FIN ASSUR), which is a listing of hazardous waste facilities which are required to provide financial proof that they will have sufficient funds to pay for the cleanup, closure, and post-closure care of their facilities. A review of the US FIN ASSUR database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.6. USEPA Watch List (EPA WATCH LIST)

The USEPA maintains a "watch list" to facilitate dialogue between the USEPA, state, and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as being either significant or of high priority. A review of the EPA WATCH LIST database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.7. USEPA 2020 Corrective Action Program List (2020 COR ACTION)

The USEPA maintains the 2020 RCRA Corrective Action Universe (2020 COR ACTION) which is a listing of facilities expected to require corrective action. A review of the 2020 COR ACTION database, as provided by EDR, revealed that no listed sites located within a 0.25-mile search radius of the Subject Property.

4.3.7.8. Toxic Substances Control Act Chemical Substance Inventory List (TSCA)

The USEPA maintains the Toxic Substances Control Act (TSCA) Chemical Substance Inventory List which includes data on the production volume of TSCA-regulated substances by plant site. A review of the TSCA database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.9. Toxic Chemical Release Inventory System (TRIS)

The USEPA maintains the Toxic Chemical Release Inventory System (TRIS) database, which is a listing of facilities which release toxic chemicals to the air, water, and land in reportable quantities under the Superfund Amendments and Reauthorization Act (SARA) Title III Section 313. A review of the TRIS database, as performed by EDR, revealed that the Subject Property is not a listed site.

4.3.7.10. Section 7 Tracking Systems (SSTS)

The USEPA maintains the Section 7 Tracking Systems (SSTS) database, which is a listing of facilities that produce registered pesticides under Section 7 of the Federal Insecticide, Fungicide, and Rodenticide Act. A review of the SSTS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.11. USEPA Records of Decision (ROD)

The USEPA maintains the Records of Decision (ROD) database, which is a listing of ROD documents that mandate permanent remedies at NPL sites. A review of the ROD database, as provided by EDR revealed that no listed sites are located within a 1.0-mile search radius of the Subject Property.

4.3.7.12. USEPA Risk Management Plans (RMP)

The USEPA maintains the Risk Management Plan (RMP) database, which is a listing of regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The RMP database includes a listing of accidents at a listed facility for the previous five (5) years. A review of the RMP database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.13. RCRA Administrative Action Tracking System (RAATS)

The USEPA maintains the RCRA Administrative Action Tracking System (RAATS) database, which is a listing of records of enforcement actions pertaining to major violations under RCRA. The USEPA has not updated the RAATS database since 1995. A review of the RAATS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.14. Potentially Responsible Parties (PRP)

The USEPA maintains the Potentially Responsible Parties (PRP) database, which is a listing of verified PRPs. A review of the PRP database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.15. PCB Activity Database System (PADS)

The USEPA maintains the PCB Activity Database System (PADS) database, which is a listing of generators, transporters, commercial stores and/or brokers, and disposers of PCBs who are required to notify the USEPA of such activities. A review of the PADS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.16. Integrated Compliance Information System (ICIS)

The USEPA maintains the Integrated Compliance Information System (ICIS), which is a listing of facilities which have been issued permits to discharge wastewater under the National Pollutant Discharge Elimination System (NPDES). A review of the ICIS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.17. FIFRA/TSCA Tracking System (FTTS)

The USEPA maintains the FIFRA/TSCA Tracking System (FTTS), which is a listing of administrative cases and pesticide enforcement actions and compliance activities related to FIFRA, TSCA, and the Emergency Planning and Community Right-to-Know Act (EPCRA). A review of the FTTS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.18. Material Licensing Tracking System (MLTS)

The US Nuclear Regulatory Commission (US NRC) maintains the Material Licensing Tracking System (MLTS) database, which is a listing of approximately 8,100 sites which possess or use radioactive materials and are subject to NRC licensing requirements. A review of the FTTS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.19. Steam-Electric Plant Operations Data (COAL ASH DOE)

The US Department of Energy (US DOE) maintains the Steam-Electric Plant Operations Data (COAL ASH DOE) database, which is a listing of power plants that store coal ash in surface impoundments. A review of the COAL ASH DOE database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.20. Coal Combustion Residues Surface Impoundments List (COAL ASH EPA)

The USEPA maintains the Coal Combustion Residues Surface Impoundments List (COAL ASH EPA) which is a listing of coal combustion surface impoundments with high hazard potential ratings. A review of the COAL ASH EPA database, as provided by EDR, revealed that no listed sites are located within a 0.5-mile search radius of the Subject Property.

4.3.7.21. PCB Transformer Registration Database (PCB TRANSFORMER)

The USEPA maintains the PCB Transformer Registration Database (PCB TRANSFORMER) which is a listing of all PCB transformer registration submittals. A review of the PCB TRANSFORMER database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.22. Radiation Information Database (RADINFO)

The USEPA maintains the Radiation Information Database (RADINFO), which is a listing of facilities that are regulated by the USEPA for radiation and radioactivity. A review of the RADINFO database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.23. Incident and Accident Data (DOT OPS)

The US DOT Office of Pipeline Safety maintains the Incident and Accident Data (DOT OPS) database. A review of the DOT OPS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.24. Superfund Consent Decrees (CONSENT)

The USEPA maintains the Superfund Consent Decree (CONSENT) database, which is a listing of consent degrees for cleanup of NPL sites. A review of the CONSENT database, as provided by EDR, revealed that no listed sites are located within a 1.0-mile search radius of the Subject Property.

4.3.7.25. Indian Reservations (INDIAN RESERV)

The USGS maintains the Indian Reservations (INDIAN RESERV) database, which is a listing of Indian administered lands in the United States that have an area equal or greater than 640 acres. A review of the INDIAN RESERV database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.26. Former Utilized Sites Remedial Action Program (FUSRAP)

The US DOE maintains the Former Utilized Sites Remedial Action Program (FUSRAP) database, which is a listing of contaminated US DOE legacy sites. A review of the FUSRAP database, as provided by EDR, revealed that 1 listed site is located within a 1.0-mile search radius of the Subject Property.

Table 16 – FUSRAP List

Dist. (mi)	Elev.	SITE ID	Site Address	Site Status	SP REC
0.651 NE	Equal/Higher	CA.0-03	7356 Santa Monica Blvd.	Eliminated from Consideration	No

- Due to site status (eliminated from consideration) this site is not considered a potential REC.

4.3.7.27. Uranium Mill Tailings Remedial Action Sites (UMTRA)

The US DOE maintains the Uranium Mill Tailing Remedial Action Sites (UMTRA) database, which is a listing of sites contaminated by mill tailings following the extraction of uranium. A review of the UMTRA database, as provided by EDR, revealed that no listed sites are located within a 0.5-mile search radius of the Subject Property.

4.3.7.28. Lead Smelter Sites (LEAD SMELTERS)

The USEPA maintains the Lead Smelter Sites database, which is a listing of former lead smelter sites. The American Journal of Public Health published a listing of sites where secondary lead smelting was performed between 1931 and 1964. These two listings constitute the LEAD SMELTERS database. A review of the LEAD SMELTERS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.29. Aerometric Information Retrieval System Facility Subsystem (US AIRS)

The USEPA maintains the Aerometric Information Retrieval System Facility Subsystem database (AFS) which is a subset of the Aerometric Information Retrieval System (AIRS). The AFS database contains listings of facilities which are stationary sources of air pollution such as electric power plants, steel mills, and factories. A review of the US AIRS database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.30. Mines Master Index File (US MINES)

The US Department of Labor (USDOL) Mine Safety and Health Administration maintains the Mines Master Index File (US MINES) database, which is a listing of all mines active or opened since 1971. The database also includes information regarding violations. A review of the US MINES database, as provided by EDR, revealed that no listed mines are located within a 0.25-mile search radius of the Subject Property.

4.3.7.31. Abandoned Mines Database (ABANDONED MINES)

The US Department of the Interior (DOI) maintains the Abandoned Mines (ABANDONED MINES) database, which is a listing of land and water impacted by past mining activities. A review of the ABANDONED MINES database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.32. USEPA Facility Index System Database (FINDS)

The USEPA maintains the Facility Index Systems (FINDS) database, which since has been replaced with the Facility Registry Service (FRS) database. A review of the FINDS database, as provided by EDR, revealed that the Subject Property is a listed site. However, due to the type if listing and no violations, it is not considered a REC.

4.3.7.33. Unexploded Ordinance Sites (UXO)

The US DOD maintains the Unexploded Ordinance Sites (UXO) database, which is a listing of sites with unexploded ordinance. A review of the UXO database, as provided by EDR, revealed that no listed sites are located within a 1.0-mile search radius of the Subject Property.

4.3.7.34. Enforcement and Compliance History Online (ECHO)

The USEPA maintains the Enforcement & Compliance History Online (ECHO) database, which is a listing of enforcement information for approximately 800,000 regulated facilities in the United States. A review of the ECHO database, as provided by EDR, revealed the Subject Property is not a listed site.

4.3.7.35. Hazardous Waste Compliance Docket Listing (DOCKET HWC)

The USEPA maintains the Hazardous Waste Compliance Docket Listing (DOCKET HWC) database, which is a listing of Federal Agency Hazardous Waste Compliance Docket Facilities. A review of the DOCKET HWC database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.36. Bond Expenditure Plan (CA BOND EXP PLAN)

The California Department of Health Services developed a site-specific expenditure plan as the basis for an appropriation of Hazardous Substance Cleanup Act funds. This information has not been updated since 1994. A review of the CA BOND EXP PLAN database, as provided by EDR, revealed no listed site is located within a 1.0-mile search radius of the Subject Property. No issues are found with this site.

4.3.7.37. "Cortese" Hazardous Waste & Substances Site (Cortese)

The "Cortese" Hazardous Waste & Substances Site List (Cortese) is a listing of sites designated by the State Water Board (LUST), the Integrated Waste Board (SWF/LS), and the DTSC (Cal-Sites). A review of the Cortese database, as provided by EDR, revealed that 12 listed sites were located within a 0.5-mile search radius of the Subject Property.

Table 17 – Cortese List

Dist. (mi)	Elev.	Site Name	Site Address	Global ID	Facility Status	SP REC
0.010 NNW	Equal/Higher	Chevron 9-4959	7861 Melrose Ave	T0603700921	Completed-Case Closed	No
0.142 NNW	Equal/Higher	Vacant Lot	801 Fairfax Ave	T0603780077	Completed-Case Closed	No
0.355 ENE	Equal/Higher	Colonia Investment	7450-54 Melrose Ave	T0603791303	Completed-Case Closed	No
0.486 NNW	Equal/Higher	76 Products Station	7960 Santa Monica Blvd	T0603704893	Completed-Case Closed	No
0.268 S	Lower	Tosco 76 Station	7751 Beverly Blvd	T0603700900	Completed-Case Closed	No
0.300 SSE	Lower	Texaco	7718 Beverly Blvd	T0603704395	Completed-Case Closed	No
0.310 SSW	Lower	Former World oil 6	7900 Beverly Blvd	T0603788529	Completed-Case Closed	No
0.310 SSW	Lower	World Oil Co.	7900 Beverly Blvd	T0603701107	Completed-Case Closed	No
0.368 S	Lower	Television City LLC	7800 Beverly Blvd	T0603700889	Completed-Case Closed	No

0.404 SW	Lower	Chevron 9-6472	8105 Beverly Blvd	T0603701106	Completed-Case Closed	No
0.481 S	Lower	Farmers Market Auto	166 S Fairfax Ave	T0603700901	Completed-Case Closed	No
0.491 S	Lower	Farmers Market Car Wash	118 S Fairfax Ave	T060377671	Completed-Case Closed	No

These sites do not constitute a REC due to their distance, location with respect to groundwater flow, and/or regulatory status (No Further Action/Case Closed).

4.3.7.38. CUPA Listings

Californians are protected from hazardous waste and hazardous materials by a Unified Program that ensures consistency throughout the state regarding administrative requirements, permits, inspections, and enforcement. CalEPA oversees the statewide implementation of the Unified Program and its 81 certified local government agencies, known as Certified Unified Program Agencies (CUPAs), which apply regulatory standards established by five different state agencies.

Effective January 1, 2009, all regulated businesses and local government Unified Program Agencies (UPAs) are required to submit Unified Program information electronically, either to the local regulatory agency or to the California Environmental Reporting System (CERS). The law requires all regulated businesses and all regulated local government Unified Program Agencies (UPAs), to use the Internet to electronically report and submit required Unified Program information previously recorded on paper forms. This includes facility data regarding hazardous material regulatory activities, chemical inventories, underground and aboveground storage tanks, and hazardous waste generation. It also includes UPA data such as inspections and enforcement actions.

A review of CUPA Listings, as provided by EDR, revealed that the Subject Property is not listed, and that there is no site within a 0.25-mile search radius of the Subject Property.

4.3.7.39. Cleaner Facilities (DRYCLEANERS)

The USEPA maintains the Cleaner Facilities (DRYCLEANERS) database, which is a listing of drycleaner related facilities with EPA ID numbers and drycleaner related Standard Industrial Classification (SIC) codes. A review of the DRYCLEANERS database, as provided by EDR, revealed that there are 4 listed sites within a 0.25-mile search radius of the Subject Property.

Table 18 – Drycleaners List

Dist. (mi)	Elev.	Site Name	EPA ID	Site Address	Violations	SP REC
0.042 NW	Equal/Higher	Beverly Plus Cleaner	155374	703 N Fairfax Ave	No	No
0.203 NNW	Equal/Higher	Crown Cleaners	CAL000040793	840 N Fairfax Ave	No	No

0.203 NNW	Equal/Higher	Crown Cleaners	CAL000438125	840 N Fairfax Ave	No	No
0.204 SSW	Lower	Neighborhood Fairfax Cleaners	37432	339 N Fairfax Ave	No	No

Based on compliance status (no listed violations, no documented leaks), distance, and/or location with respect to groundwater flow, the listed sites do not constitute a REC regarding the Subject Property.

4.3.7.40. Emissions Inventory Data (EMI)

The California Air Resources Board (ARB) maintains the Emissions Inventory Data (EMI) database, which is a listing of air toxics and criteria pollutant emissions data collected by the ARB and local air pollution agencies. A review of the EMI database, as provided by EDR, revealed that Subject Property is a listed site.

4.3.7.41. Enforcement Action Listing (ENF)

The State Water Board maintains the Enforcement Action Listing (ENF) database, which is a listing of enforcement actions. A review of the ENF database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.42. DTSC Financial Assurance Information Listing (Financial Assurance)

The DTSC and CalRecycle maintain the Financial Assurance Information Listing (Financial Assurance) database, which is a listing of financial assurance information for solid waste facilities. A review of the Financial Assurance database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.43. Facility and Manifest Data (HAZNET)

The DTSC maintains the Facility and Manifest Data (HAZNET), which is a listing of data from hazardous waste manifests received by the DTSC. A review of the HAZNET database, as provided by EDR, revealed that no listed sites are located within a 1.0-mile radius search. The Subject Property is listed. However, no violations were reported and is not considered a REC.

4.3.7.44. Inspections Complaints and Enforcement Database (ICE)

The DTSC maintains the ICE database, which is a listing of RCRA inspection and enforcement actions. A review of the ICE database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.45. Hazardous Waste & Substance Site List (HIST CORTESE)

The sites for the list are designated by the State Water Board (LUST), CalRecycle (SWF/LS), and the DTSC (Cal-Sites). This listing is no longer updated by Cal/EPA. A review of the HIST CORTESE database, as provided by EDR, revealed that 9 listed sites are located within a 0.5-mile search radius of the Subject Property.

Table 19 – Hist Cortese List

Dist. (mi)	Elev.	Site Name	Reg. ID	Site Address	Violations	SP REC
0.010 NNW	Equal/Higher	Chevron 9-4959	900380107	7861 Melrose Ave	No	No
0.486 NNW	Equal/Higher	76 Products Station	R-10016	7960 Santa Monica Blvd	No	No
0.166 SSW	Lower	Mas Auto Service	900360107	371 S Fairfax Ave	No	No
0.268 S	Lower	Tosco-76 Station	900360198	7751 Beverly Blvd	No	No
0.300 SSE	Lower	Texaco	I-16219	7718 Beverly Blvd	No	No
0.310 SSW	Lower	Former World Oil 6	900480070	7900 Beverly Blvd	No	No
0.368 S	Lower	CBS Television City	900360089	7800 Beverly Blvd	No	No
0.404 SW	Lower	Chevron 9-6472	900480061	8105 Beverly Blvd	No	No
0.481 S	Lower	Farmers Market Auto	900360207	166 Fairfax Ave	No	No

Based on compliance status (no listed violations, no documented leaks), distance, and/or downgradient, the listed sites do not constitute a REC regarding the Subject Property.

4.3.7.46. EnviroStor Permitted Facilities Listing (HWP)

The DTSC maintains the EnviroStor Permitted Facilities (HWP) database, which is a listing of permitted hazardous waste facilities and corrective actions. A review of the HWP database, as provided by EDR, revealed that no listed sites are located within a 1.0-mile search radius of the Subject Property.

4.3.7.47. Registered Hazardous Waste Transporter Database (HWT)

The DTSC maintains the Registered Hazardous Waste Transporter Database (HWT) database, which is a listing of registered hazardous waste transporters. A review of the HWT database, as provided by EDR, revealed that no listed sites are located within a 0.25-mile search radius of the Subject Property.

4.3.7.48. Mine Site Location Listing (MINES)

The California Department of Conservation maintains the Mines Site Location (MINES) database, which is a listing of mine site locations obtained from the Office of Mine Reclamation. A review of the MINES database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.49. Medical Waste Management Program Listing (MWMP)

The California Department of Public Health maintains the Medical Waste Management Program (MWMP) database, which is a listing of medical waste off-site treatment facilities and transfer stations. A review of the MWMP database, as provided by EDR, revealed that no listed sites are located within a 0.25-mile search radius of the Subject Property.

4.3.7.50. NPDES Permits Listing (NPDES)

The State Water Board maintains the NPDES Permits (NPDES) database, which is a listing of facilities that have been issued permits to discharge wastewater under the NPDES program. A review of the NPDES database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.51. Pesticide Regulation Licenses Listing (PEST LIC)

The California Department of Pesticide Regulation (DPR) maintains the Pesticide Regulation Licenses (CA PEST LIC) database, which is a listing of licenses and certificates issued by the DPR to persons and businesses that apply or sell pesticides, pest control dealers and brokers, and persons who advise on agricultural pesticide applications. A review of the PEST LIC database, as provided by EDR, revealed that the Subject Property is not a listed site.

4.3.7.52. Certified Processors Database (PROC)

CalRecycle maintains the Certified Processors (PROC) database, which is a listing of certified processors that participate in the California Beverage Container Recycling Program. A review of the CA PROC database, as provided by EDR, revealed that no listed sites located within a 0.5-mile search radius of the Subject Property.

4.3.7.53. Proposition 65 Records (NOTIFY 65)

The State and Regional Water Boards created the Proposition 65 Records (NOTIFY 65) database, which was a listing of all Proposition 65 incidents reported to counties by the Water Boards. This database is no longer being updated. A review of the NOTIFY 65 database, as provided by EDR, revealed that there is no listed site within a 1.0-mile search radius of the Subject Property.

4.3.7.54. Underground Injection Wells (UIC)

The California Department of Conservation maintains the Underground Injection Wells (UIC) database, which is a listing of underground injection wells in the California Oil and Gas Wells database. A review of the UIC database, as provided by EDR, revealed that no listed wells are located on the Subject Property.

4.3.7.55. Waste Discharge System (CERS)

The State Water Board maintains the Waste Discharge System (CA WDS) database, which is a listing of sites which have been issued waste discharge requirements. A review of the WDS database, as

provided by EDR, revealed Subject Property is not a listed site, and revealed that no listed sites were within a 0.25-mile search radius of the Subject Property.

4.3.7.56. Hazardous Waste Tracking System (HWTS)

The Hazardous Waste Tracking System (HWTS) is the Department of Toxic Substances Control data repository for hazardous waste Identification (ID) numbers and manifest information. HWTS generates reports on hazardous waste shipments for generators, transporters, and TSDFs. A review of the EDR HWTS database, revealed that no listed sites are within a 0.25-mile search radius of the Subject Property. The Subject Property was listed, however, no violations were reported.

4.4. EDR High Risk Historical Records

4.4.1.1. EDR Manufactured Gas Plant Database (EDR MGP)

The EDR Proprietary Manufactured Gas Plant (EDR MGP) database includes records of coal gas plants. MGPs were used in the United States from the 1800s to 1950s to produce a gas that could be distributed and used as fuel. Many of the byproducts of the gas production, such as coal tar, sludge, oils, and other compounds, are potentially hazardous to human health and the environment. These byproducts were frequently disposed of directly at the MGP site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination. A review of the EDR MGP database, revealed that 1 listed MGP site is located within a 1.0-mile search radius of the Subject Property.

Table 20 – EDR MGP List

Dist. (mi)	Elev.	Site Name	Site Address	Status	SP REC
0.836 NE	Equal/Higher	Los Angeles Gas and Elec. Co.	N Formosa Ave	Not Reported	No

Due to its distance, this site is not considered a REC.

4.4.1.2. EDR Historic Gas Stations Database (EDR Hist Auto)

The EDR Historic Gas Stations (EDR Hist Auto) database is a listing of historical gas stations obtained by searching and analyzing selected collections of business directories. The database listing includes gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas stations, gasoline stations, filling stations, automobile repair, auto service stations, and service stations. A review of the EDR Hist Auto database, revealed that 13 potentially historic gas stations are located within a 0.125-mile search radius of the Subject Property.

Table 21 – Historical Auto List

Dist. (mi)	Elev.	Site Name	Site Address	Violations	SP REC
0.010 NNW	Equal/Higher	Hollywood Club Service	7861Melrose Ave	No	No
0.015 NE	Equal/Higher	Thomas A R JR	7733 Melrose Ave	No	No
0.022 NE	Equal/Higher	Hirschy Herman	7718 Melrose Ave	No	No
0.026 NNW	Equal/Higher	Blythe Lawrence	7851Melrose Ave	No	No
0.053 NE	Equal/Higher	Hurchella John	7703 Melrose Ave	No	No
0.055 NW	Equal/Higher	Brown J N	7919 Melrose Ave	No	No
0.061 NE	Equal/Higher	Rainbow Super Service	7701 Melrose Ave	No	No
0.073 NNW	Equal/Higher	Lobe Edwin	731 N Fairfax Ave	No	No
0.094 WNW	Equal/Higher	Pfeifer C F	7950 Melrose Ave	No	No
0.022 SSW	Equal/Higher	Ikes Auto Repair	464 N Fairfax Ave	No	No
0.026 W	Equal/Higher	Zahn H M	603 N Fairfax Ave	No	No
0.042 SSW	Lower	Hively W E	455 N Fairfax Ave	No	No
0.098 SSW	Lower	Talcott Jack	424 N Fairfax Ave	No	No

Based on compliance status (no listed violations, no documented leaks) and/or downgradient, the listed sites do not constitute a REC regarding the Subject Property.

4.4.1.3. EDR Historic Dry Cleaners Database (EDR Hist Cleaner)

The EDR Historic Dry Cleaners (EDR Hist Cleaner) database is a listing of historical dry cleaners obtained by searching and analyzing collections of business directories. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. A review of the EDR Hist Cleaners database, revealed that no potentially historic dry cleaners are located within a 0.125-mile search radius of the Subject Property.

Table 22 – Historical Cleaners List

Dist. (mi)	Elev.	Site Name	Site Address	Violations	SP REC
0.019 NW	Equal/Higher	Beverly Plus Cleaner	701 N Fairfax Ave	No	No
0.030 NW	Equal/Higher	Baer David	7900 Melrose Ave	No	No
0.037 NNW	Equal/Higher	Wong John	702 N Fairfax Ave	No	No
0.042 NW	Equal/Higher	Beverly Plus Cleaner	703 N Fairfax Ave	No	No
0.047 NW	Equal/Higher	Leidner Elias	7903 Melrose Ave	No	No
0.047 NW	Equal/Higher	Bane J B	7906 Melrose Ave	No	No
0.048 NW	Equal/Higher	Leider Minnie	7905 Melrose Ave	No	No

0.061 NW	Equal/Higher	A Cleaners	661 N Spaulding Ave	No	No
0.067 NNW	Equal/Higher	Bane J B	724 N Fairfax Ave	No	No
0.069 NW	Equal/Higher	Rose Cleaners	7928 Melrose Ave	No	No
0.040 SSW	Lower	USA Dry Cleaners	457 N Fairfax Ave	No	No
0.070 SSW	Lower	Goldstein Max	436 N Fairfax Ave	No	No
0.109 SSW	Lower	Cochran Ray	416 N Fairfax Ave	No	No
0.112 SSW	Lower	Tuck Two	414 N Fairfax Ave	No	No
0.113 SSW	Lower	Levine Sam	412 N Fairfax Ave	No	No

Based on compliance status (no listed violations, no documented leaks) and/or downgradient, the listed sites do not constitute a REC regarding the Subject Property.

4.4.1.4. Recovered Government Archive Solid Waste Facilities List (RGA LF)

The EDR Recovered Government Archive Landfill (RGA LF) database provides a list of landfills derived from historical databases and includes many records that no longer appear in current government lists. This database was compiled from records formerly available from the California Department of Resources Recycling and Recovery. A review of the RGA LF database, revealed that the Subject Property is not a listed facility.

4.4.1.5. Recovered Government Archive Leaking Underground Storage Tanks List (RGA LUST)

The EDR Recovered Government Archive Leaking Underground Storage Tank (RGA LUST) database provides a list of LUST incidents derived from historical databases and includes many records that no longer appear in current government lists. This database was compiled from records formerly available from the California Water Board. A review of the RGA LUST database, revealed that the Subject Property is not a listed facility.

4.6. Other Reviewed Environmental Documents

A Phase I Environmental Site Assessment Report dated September 2018 performed by Converse Consultants was provided for review. The report scope primarily addressed areas and items to be potentially impacted by the ADA upgrades around campus:

- Potential presence of lead-based residue, arsenic, and organochlorine pesticides in shallow soils located around the drip lines of each building

The report additionally identified items outside of scope for consideration as potential RECS recommending supplemental investigation:

- 3-stage clarifier and hydraulic hoists associated with the former autobody shop building operations (potential source of PCB-containing materials, OCPS/arsenic, and lead-based materials)
- Records identifying a historic autobody shop, woodworking shop, paint shop, and electrical shop buildings formerly located on the west portion of the Subject Property (potential PCB-containing materials based on date of construction)
- Southern California Edison transformers located in the quad area (potential PCB-containing materials based on date of construction)
- Asbestos and Lead-Based Paint containing construction materials (based on age of construction)
- Subject Property located within a City of Los Angeles Methane Buffer Zone
- Possible unknown quantities of organochloride pesticides, and arsenic contamination of shallow soils around drip lines of buildings resulting from the use of termiticides, herbicides, and pesticides (based on LAUSD past practices)

5.0 FINDINGS AND OPINIONS

This section describes the findings and opinions resulting from the performance of this Phase I ESA for Fairfax High School located at 7850 Melrose Avenue, Los Angeles, CA 90036.

5.1. On-Site Conditions

The following RECS were noted during the investigation:

- 3-stage clarifier and hydraulic hoists associated with the former autobody shop building operations
- Records identifying a historic autobody shop, woodworking shop, paint shop, and electrical shop buildings formerly located on the west portion of the Subject Property
- Various Southern California Edison transformers located in the quad area (potential PCB-containing materials based on date of construction)
- The Subject Property is located within a City of Los Angeles Methane Buffer Zone
- Potential for organochloride pesticides, lead, and arsenic contamination of shallow soils around drip lines of buildings resulting from the use of termiticides, herbicides, and pesticides at locations where buildings may be demolished.
- Storage of various chemicals on the Subject Property.
- Site plans from March 1927 indicated various cesspools at the northwest, northeast, and north-center portion of the campus. The disposition of the cesspools is not known.

5.2. Off-Site Conditions

No RECs have been identified.

5.3. Deviation from ASTM Standards

Due to the COVID-19 pandemic, certain aspects such as agency visits were not readily accessible.

6.0 CONCLUSIONS & RECOMMENDATIONS

This section describes the findings and opinions resulting from the performance of this Phase I ESA for Fairfax High School located at 7850 Melrose Avenue, Los Angeles, CA 90036.

6.1. On-Site Conditions

Recognized Environmental Conditions were identified at the Subject Property. A Preliminary Environmental Assessment (PEA) equivalent is recommended at locations/buildings that are to be impacted by the pending modernization/demolition.

6.2. Off-Site Conditions

No off-site conditions were noted as a risk or concern to the Subject Property.

7.0 SUMMARY OF ENVIRONMENTAL RECORDS & SIGNATURES OF PREPARERS

Millennium has reviewed the environmental records supplied in the EDR report as well as records obtained from the California Regional Water Quality Control Board.

ENVIRONMENTAL PROFESSIONAL STATEMENT

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR Part 312.

I have the specific qualifications based on education, training and experience to assess a property of the nature, history and setting of the Subject Property. I have developed and performed all appropriate inquiries in conformance with the standard and practices set forth in 40 CFR Part 312.

Scott Nunes
Director of Building Sciences SoCal Division

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

APPENDIX B
PHOTOGRAPHIC LOG

South entrance facing South.

Ground floor main halls of Admin building.

Chemical storage room on 3rd floor of Admin building.

North end of campus facing south at Auditorium.

Auditorium front facing east to Admin building

Center campus facing north. Generator room with fuel storage (right).

Main campus generators in generator room.

Petroleum fuel storage in storage room adjacent to generator room (Secondary containment observed within).

Center campus facing gym.

Diesel Generator behind Auditorium.

Main gas lines behind Auditorium, adjacent diesel generator.

Transformer room behind Auditorium.

Workout room in Auto Shop building (hydraulic lift wells observed in floor, oil smell in wells noted).

Inside view of hydraulic lift wells. (Auto Shop Building)

Chemical storage in Auto Shop building.

Former painting booth repurposed as storage room. (Auto Shop Building)

Loading dock area at west end of auto shop.

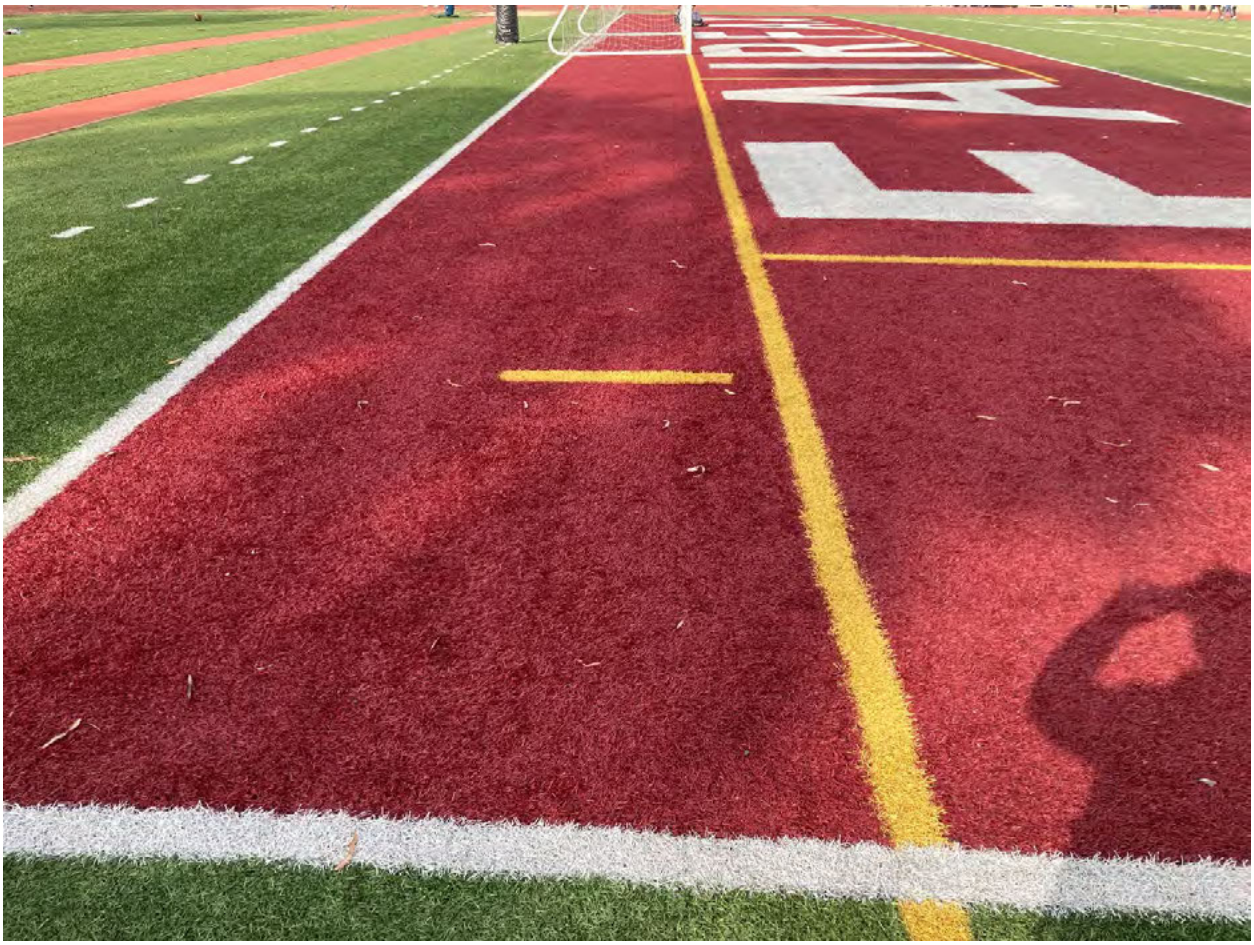
3-stage clarifier in Auto Shop Yard southwest corner.

Loading dock area facing Utility building and Auto Shop Building backside.

Chiller area located behind quad.

Corrosion inhibitor chemicals in chiller area.

SCE Utility box located adjacent to quad and chiller area.



Loading dock area with floor drain at the south end of campus facing west.

East end behind football stadium facing west.

Dry transformer in storage under the football stadium.

Football field location of former oil well.

South entry of campus facing north at Melrose Ave. (Various commercial businesses)

North end of Subject Property facing north towards 76 Gas Station.

East end of Subject Property facing east towards Genesse Ave. (Residential homes)

East end of football field facing east towards Genesse Ave.

South end of campus football field facing south towards Rosewood Ave. (Residential homes)

Southwest corner of Subject Property facing southwest towards Fairfax Ave.

West end of Subject Property facing west towards Fairfax Ave. (Commercial Businesses).

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Millennium Environmental Consulting were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

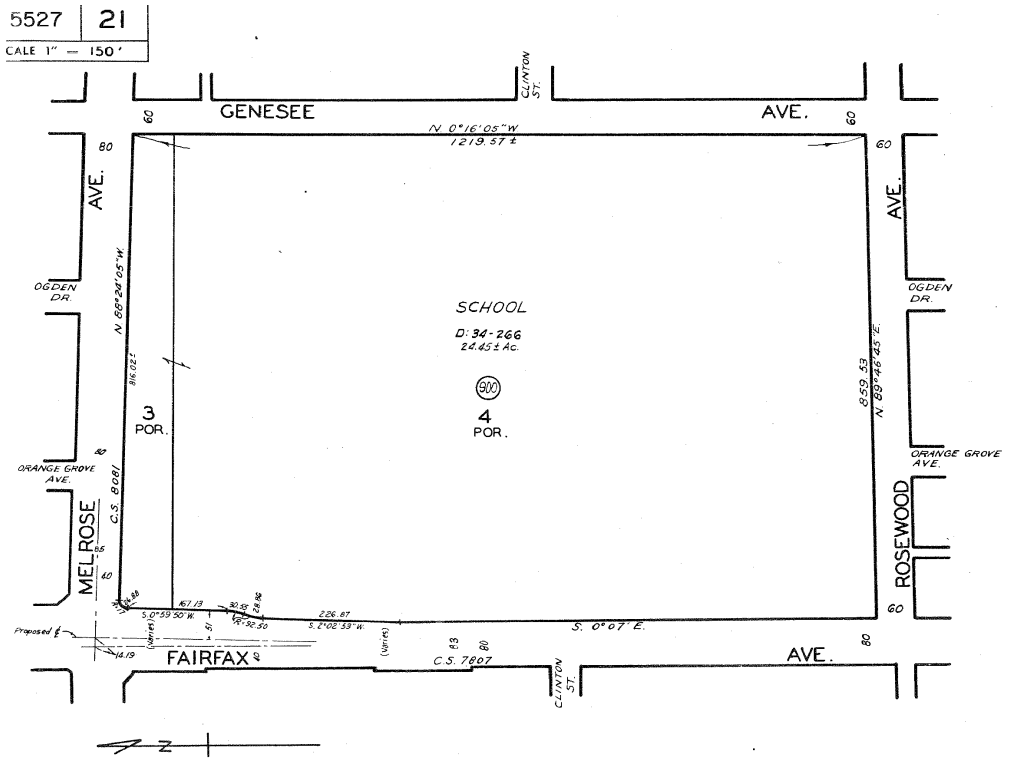
EDR Property Tax Map Report

Environmental Data Resources, Inc.'s EDR Property Tax Map Report is designed to assist environmental professionals in evaluating potential environmental conditions on a target property by understanding property boundaries and other characteristics. The report includes a search of available property tax maps, which include information on boundaries for the target property and neighboring properties, addresses, parcel identification numbers, as well as other data typically used in property location and identification.



Thank you for your business.

EDR BUILDING PERMIT REPORT

About This Report

The EDR Building Permit Report provides a practical and efficient method to search building department records for indications of environmental conditions. Generated via a search of municipal building permit records gathered from more than 1,600 cities nationwide, this report will assist you in meeting the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

Building permit data can be used to identify current and/or former operations and structures/features of environmental concern. The data can provide information on a target property and adjoining properties such as the presence of underground storage tanks, pump islands, sumps, drywells, etc., as well as information regarding water, sewer, natural gas, electrical connection dates, and current/former septic tanks.

ASTM and EPA Requirements

ASTM E 1527-13 lists building department records as a "standard historical source," as detailed in § 8.3.4.7: "Building Department Records - The term building department records means those records of the local government in which the property is located indicating permission of the local government to construct, alter, or demolish improvements on the property." ASTM also states that "Uses in the area surrounding the property shall be identified in the report, but this task is required only to the extent that this information is revealed in the course of researching the property itself."

EPA's Standards and Practices for All Appropriate Inquires (AAI) states: "§312.24: Reviews of historical sources of information. (a) Historical documents and records must be reviewed for the purposes of achieving the objectives and performance factors of §312.20(e) and (f). Historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps, building department records, chain of title documents, and land use records."

Methodology

EDR has developed the EDR Building Permit Report through our partnership with BuildFax, the nation's largest repository of building department records. BuildFax collects, updates, and manages building department records from local municipal governments. The database now includes 30 million permits, on more than 10 million properties across 1,600 cities in the United States.

The EDR Building Permit Report comprises local municipal building permit records, gathered directly from local jurisdictions, including both target property and adjoining properties. Years of coverage vary by municipality. Data reported includes (where available): date of permit, permit type, permit number, status, valuation, contractor company, contractor name, and description.

Incoming permit data is checked at seven stages in a regimented quality control process, from initial data source interview, to data preparation, through final auditing. To ensure the building department is accurate, each of the seven quality control stages contains, on average, 15 additional quality checks, resulting in a process of approximately 105 quality control "touch points."

For more information about the EDR Building Permit Report, please contact your EDR Account Executive at (800) 352-0050.

EDR® Environmental Data Resources Inc

BUILD FAX PROPERTY HISTORY

EXECUTIVE SUMMARY: SEARCH DOCUMENTATION

A search of building department records was conducted by Environmental Data Resources, Inc (EDR) on behalf of Millennium Environmental Consulting on Nov 15, 2021.

TARGET PROPERTY

7850 Melrose Avenue
Los Angeles, CA 90036

SEARCH METHODS

EDR searches available lists for both the Target Property and Surrounding Properties.

RESEARCH SUMMARY

Building permits identified: **YES**

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

GLOSSARY

General Building Department concepts

- **ICC:** The International Code Council. The governing body for the building/development codes used by all jurisdictions who've adopted the ICC guidelines. MOST of the US has done this. Canada, Mexico, and other countries use ICC codes books and guides as well. There are a few states who have added guidelines to the ICC codes to better fit their needs. For example, California has added seismic retrofit requirements for most commercial structures.
- **Building Department (Permitting Authority, Building Codes, Inspections Department, Building and Inspections):** This is the department in a jurisdiction where an owner or contractor goes to obtain permits and inspections for building, tearing down, remodeling, adding to, re-roofing, moving or otherwise making changes to any structure, Residential or Commercial.
- **Jurisdiction:** This is the geographic area representing the properties over which a Permitting Authority has responsibility.
- **GC:** General Contractor. Usually the primary contractor hired for any Residential or Commercial construction work.
- **Sub:** Subordinate contracting companies or subcontractors. Usually a "trades" contractor working for the GC. These contractors generally have an area of expertise in which they are licensed like Plumbing, Electrical, Heating and Air systems, Gas Systems, Pools etc. (called "trades").
- **Journeymen:** Sub contractors who have their own personal licenses in one or more trades and work for different contracting companies, wherever they are needed or there is work.
- **HVAC (Mechanical, Heating & Air companies):** HVAC = Heating, Ventilation, and Air Conditioning.
- **ELEC (Electrical, TempPole, TPole, TPower, Temporary Power, Panel, AMP Change, Power Release):** Electrical permits can be pulled for many reasons. The most common reason is to increase the AMPs of power in an electrical power panel. This requires a permit in almost every jurisdiction. Other commons reason for Electrical permits is to insert a temporary power pole at a new construction site. Construction requires electricity, and in a new development, power has yet to be run to the lot. The temporary power pole is usually the very first permit pulled for new development. The power is released to the home owner when construction is complete and this sometimes takes the form of a Power Release permit or inspection.
- **"Pull" a permit:** To obtain and pay for a building permit.
- **CBO:** Chief Building Official
- **Planning Department:** The department in the development process where the building /structural plans are reviewed for their completeness and compliance with building codes
- **Zoning Department:** The department in the development process where the site plans are reviewed for their compliance with the regulations associated with the zoning district in which they are situated.
- **Zoning District:** A pre-determined geographic boundary within a jurisdiction where certain types of structures are permitted / prohibited. Examples are Residential structure, Commercial/Retail structures, Industrial/Manufacturing structures etc. Each zoning district has regulations associated with it like the sizes of the lots, the density of the structures on the lots, the number of parking spaces required for certain types of structures on the lots etc.
- **PIN (TMS, GIS ID, Parcel#):** Property Identification Number and Tax Map System number.
- **State Card (Business license):** A license card issued to a contractor to conduct business.
- **Building Inspector (Inspector):** The inspector is a building department employee that inspects building construction for compliance to codes.
- **C.O.:** Certificate of Occupancy. This is the end of the construction process and designates that the owners now have permission to occupy a structure after its building is complete. Sometimes also referred to as a Certificate of Compliance.

GLOSSARY

Permit Content Definitions

- Permit Number: The alphanumerical designation assigned to a permit for tracking within the building department system. Sometimes the permit number gives clues to its role, e.g. a "PL" prefix may designate a plumbing permit.
- Description: A field on the permit form that allows the building department to give a brief description of the work being done. More often than not, this is the most important field for EP's to find clues to the prior use (s) of the property.
- Permit Type: Generally a brief designation of the type of job being done. For example BLDG-RES, BLDG-COM, ELEC, MECH etc.

Sample Building Permit Data

Date: Nov 09, 2000
Permit Type: Bldg -
New Permit Number: 101000000405
Status: Valuation: $1,000,000.00
Contractor Company: OWNER-BUILDER
Contractor Name:

Description: New one store retail (SAV-ON) with drive-thru pharmacy. Certificate of Occupancy.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2015. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 332 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

EDR Environmental Lien and AUL Search

The EDR Environmental Lien Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

EXECUTIVE SUMMARY

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 09/13/2021 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
WHITMAN CONTINUATION EPA ID:: CAR000198432	***7795 ROSEWOOD AVE***	***SSE 0 - 1/8 (0.002 mi.)***	***B5***	***56***

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 09/13/2021 has revealed that there are 5 RCRA-SQG sites within approximately 0.25 miles of the target property.

EPA ID:: CAD981986797

RCRA-VSQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-VSQG list, as provided by EDR, and dated 09/13/2021 has revealed that there is 1 RCRA-VSQG site within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 07/22/2021 has revealed that there are 5 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal leaking storage tank lists

LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the LUST list, as provided by EDR, has revealed that there are 17 LUST sites within approximately 0.5 miles of the target property.

CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CPS-SLIC list, as provided by EDR, has revealed that there is 1 CPS-SLIC site within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 18 UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 09/13/2021 has revealed that there are 46 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

Cleanup Status: COMPLETED - CASE CLOSED

DRYCLEANERS: A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaners' agents; linen supply; coin-operated laundries and cleaning; drycleaning plants except rugs; carpet and upholster cleaning; industrial launderers; laundry and garment services.

A review of the DRYCLEANERS list, as provided by EDR, has revealed that there are 4 DRYCLEANERS sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there is 1 EDR MGP site within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
LOS ANGELES GAS AND	N FORMOSE AVE BTWN R	NE 1/2 - 1 (0.836 mi.)	154	454

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 13 EDR Hist Auto sites within approximately 0.125 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 16 EDR Hist Cleaner sites within approximately 0.125 miles of the target property.

Environmental Interest/Information System:
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site Name: UNITED #048
Violation Date: 05-05-2016
Citation: 23 CCR 16 2665 - California Code of Regulations, Title 23, Chapter 16, Section(s) 2665
Violation Description: Failure of the overfill prevention system to meet one of the following requirements: 1. Alert the transfer operator when the tank is 90 percent full by restricting the flow into the tank or triggering an audible and visual alarm; or 2. Restrict delivery of flow to the tank at least 30 minutes before the tank overfills, provided the restriction occurs when the tank is filled to no more than 95 percent of capacity; and activate an audible alarm at least five minutes before the tank overfills; or 3. Provide positive shut-off of flow to the tank when the tank is filled to no more than 95 percent of capacity; or 4. Provide positive shut-off of flow to the tank so that none of the fittings located on the top of the tank are exposed to product due to overfilling.
Violation Notes: Returned to compliance on 05/05/2016. OBSERVATION: SITE HAS AUDIBLE/VISUAL ALARM TO PREVENT OVERFILL. WHEN ATG'S WERE TESTED FOR SIMULATED OVERFILL, AUDIBLE/VISUAL ALARM DID NOT ACTIVATE. TECHNICIAN FOUND THAT THE BREAKER FOR THE AUDIBLE/VISUAL ALARM WAS OFF. BREAKER WAS TURNED ON AND AUDIBLE/VISUAL ALARM ACTIVATED. CORRECTIVE ACTION: CIRCUIT BREAKER FOR THE AUDIBLE/VISUAL ALARM MUST ALWAYS BE IN THE ON POSITION. THE AUDIBLE/VISUAL ALARM IS THE ONLY OVERFILL PREVENTION FOR THE SITE.

The Business Activities, Owner/Operator Identification, Hazardous Materials Inventory, Site Map, Emergency Response/Contingency Plan and Employee Training Plan sections were reviewed in CERS and field verified. Review and correct any violations indicated previously in this report, on or before the COMPLY BY date associated with each violation. NOTE: The LAMC, Sections (L.A.M.C. SECTION 57.105.1.4; 57.120.3; 57.121.2 and 57.121.2.1.) requires businesses that store, use or handle hazardous materials in the City of Los Angeles to obtain a Consolidated Permit from the Los Angeles Fire Department CUPA **** Annual submission of a Hazardous Materials Business Plan into California Environmental Reporting System (CERS) is required between January 1 and March 1 of every year. Per L.A.M.C. 57.121.3.5, failure to submit the required hazardous material business plan (HMBP) information annually into CERS within [Truncated]

Evaluation:
Eval General Type: Compliance Evaluation Inspection
Eval Date: 11-21-2018
Violations Found: Yes
Eval Type: Routine done by local agency
Eval Notes: Consent to enter, inspect and take photographs was given by: Trina Presutti The Business Activities, Owner/Operator Identification, Hazardous Materials Inventory, Site Map, Emergency Response/Contingency Plan and Employee Training Plan sections were reviewed in CERS and field verified. Review and correct any violations indicated previously in this report, on or before the COMPLY BY date associated with each violation. NOTE: The LAMC, Sections (L.A.M.C. SECTION 57.105.1.4; 57.120.3; 57.121.2 and 57.121.2.1.) requires businesses that store, use or handle hazardous materials in the City of Los Angeles to obtain a Consolidated Permit from the Los Angeles Fire Department CUPA **** Annual submission of a Hazardous Materials Business Plan into CERS is required between January 1 and March 1 of every year. Please remember that any change in inventory of greater than 100 percent will require new submission within 30 days of that

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA

DIGOS AUTO (Continued) **1000698062**

program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

- Address: 840 N FAIRFAX AVE
- City,State,Zip: LOS ANGELES, CA 90046
- Site ID: 22646
- CERS ID: 10252657
- CERS Description: Hazardous Waste Generator

Violations:
- Site ID: 22646
- Site Name: CROWN CLEANERS
- Violation Date: 08-18-2020
- Citation: 22 CCR 12 66262.40(a) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.40(a)
- Violation Description: Failure to keep a copy of each properly signed manifest for at least three years from the date the waste was accepted by the initial transporter. The manifest signed at the time the waste was accepted for transport shall be kept until receiving a signed copy from the designated facility which received the waste.
- Violation Notes: Returned to compliance on 11/10/2020. OBSERVATION: Uniform Hazardous Waste Manifests for waste hydrocarbons were not available at the time of inspection. CORRECTIVE ACTION: Locate a copy of all manifests for waste manifest and submit copies to the CUPA.
- Violation Division: Los Angeles County Fire Department
- Violation Program: HW

CROWN CLEANERS (Continued) **S113037965**

Violation Source: CERS

Site ID: 22646
Site Name: CROWN CLEANERS
Violation Date: 08-18-2020
Citation: HSC 6.5 25123.3(h)(1) - California Health and Safety Code, Chapter 6.5, Section(s) 25123.3(h)(1)
Violation Description: Failure to send hazardous waste offsite for treatment, storage, or disposal within 180 days (or 270 days if waste is transported over 200 miles) for a generator who generates less than 1000 kilogram per month if all of the following conditions are met: (1) The quantity of hazardous waste accumulated onsite never exceeds 6,000 kilograms. (2) The generator complies with the requirements of 40 Code of Federal Regulations section 262.34(d), (e) and (f). (3) The generator does not hold acutely hazardous waste or extremely hazardous waste in an amount greater than one kilogram for more than 90 days.
Violation Notes: Returned to compliance on 11/10/2020. OBSERVATION: Owner/Operator is a small quantity generator and failed to send hazardous waste offsite for treatment, storage, or disposal within 180 days (or 270 days if waste is transported over 200 miles), or has failed to comply with the conditions of CCR 66262.34(d) and has stored hazardous waste over 90 days. Observed two 55 gallon waste hydrocarbon containers past the accumulation time limit. CORRECTIVE ACTION: Dispose of hazardous waste that has been stored over the applicable time limit and provide documentation that the violation has been corrected.
