During October 1973, four-4000 gallon USTs used for the storage of gasoline (3 tanks), thinner (1 tank), and one 550 gallon used oil UST were reportedly removed from an unidentified area of the subject site according to San Diego Fire Department records. EnvirOmega Consultants' (EOC) observations of on-site ground surface depressions and cracked concrete strongly suggests the USTs were located in the center-east area of the site. On September 15, 2003, SECOR conducted a Phase I Environmental Site Assessment (ESA) on the subject property and during October 2003 conducted a limited Phase II ESA. The result of these assessments led to the discovery of soil and groundwater hydrocarbon contamination in the area of the former location of the USTs. On November 3, 2003, the property owner (Helen Grant), submitted a UST Unauthorized Release (Leak) Contamination Site Report to the Department of Environmental Health (DEH) and DEH opened Unauthorized Release Case H39643-001 for the site. TPH as gasoline (TPHg) of up to 7300 milligrams per kilogram (mg/kg) and TPH as diesel (TPHd) of up to 350 mg/kg were detected in the area of the former location of the USTs. During October and November 2006, EOC, in conjunction with two excavation contractors, completed Interim Remedial Activities (IRA) for the site. The IRA consisted of the removal of approximately 770 cubic yards (1066.01 tons) of petroleum hydrocarbon contaminated soil from the site, the collection and analysis of confirmation soil samples from the resulting excavation, the backfilling of the excavation, and the submittal of an IRA Report dated March 31, 2007. Contaminated soil was removed from the site to the extent practical. The proximity of buildings, a fence, a sidewalk, and Harbor Drive to the remedial excavation limited the removal of soil in several areas on site. Consequently, some contaminated soil remained on the site, necessitating the completion of additional assessment activities to include soil and groundwater monitoring/sampling. Between 2007 and 2010, additional investigations were conducted to define the extent of hydrocarbon impacts. Maximum documented TPHg concentration was 210 mg/kg. Maximum TPHd and benzene concentrations were 31 mg/kg to 0.094 mg/kg, respectively. All fuel oxygenate concentrations were below laboratory detection limits. According to the consultant, approximately 400 to 500 cubic yards of impacted soil remain on site. The site is located in an area that has been designated as having no beneficial groundwater uses. Per the consultant, groundwater ranges to depths of 7.45 to 10.20 feet. On September 8, 2008 and March 31, 2009, the consultant estimated the general direction of groundwater flow to the east with hydraulic gradients of approximately 0.002 and 0.0008 foot per foot, respectively. During the January 25, 2010 groundwater monitoring/sampling event, the estimated direction of groundwater flow was to the northwest at a hydraulic gradient of 0.0004 foot per foot. The consultant believes this shift of groundwater flow was due

to possible tidal influence. To verify hydrocarbon impacts to groundwater, four groundwater monitoring wells were installed on September 3, 2008. No Liquid Phase Hydrocarbons were observed. The maximum TPHg concentrations was 940 micrograms per liter (ug/l) and the maximum benzene concentrations was 63 ug/l. TPHd, ETBE, and TAME concentrations were below laboratory detection limits. Only three groundwater monitoring/sampling events were completed on-site commencing on September 8, 2008 and concluding on January 25, 2010, with no regularly scheduled quarterly or semi-annual monitoring program. The consultant concludes that the delineation of the horizontal and vertical extent of petroleum hydrocarbon impacts to the soil and groundwater at the site have been completed to the extent practical. The consultant also concludes that remediation by natural attenuation is the preferred method for site remediation. In addition, the consultant concludes public health and surface waters are not threatened by the petroleum hydrocarbon contamination remaining in the soil and groundwater at the site. The consultant recommends closure of this case and DEH concurs with their recommendation.

permitting and approvals for the development of a hotel project on the former Cleveland Property and former Cuyamaca Property. In 1998, the CDC drafted the Harbor District Specific Area Plan (SAP) and received certification from the California Coastal Commission. The SAP specified redevelopment land use constraints and approved mitigation of burn ash by consolidating and capping the portion impacted by burn ash. On April 4, 2001, the Site Designation Committee designated the County of San Diego Department of Environmental Health (DEH) as the Administering Agency under Chapter 6.65 of Division 20 of the Health and Safety Code (sections 25260 et seq.) (“Chapter 6.65”), to oversee the Site Investigation and Remedial Action for the following Assessor Parcel Numbers 559-160-30-00, 559-160-31-00, 559-160-32-00, and 559-160-33-00 (Resolution No. 00-06). This Site is located in National City in the area generally bounded by Bay Marina Drive to the north, Marina Way to the west, Highway 5 to the east and Paradise Marsh to the south. This request also specified that the cleanup would be conducted pursuant to the Polanco Act, under DEH supervision. DEH was designated as the administering agency by the committee (See Resolution No. 00-06 attached as Exhibit “A” to this Certificate, dated April 4, 2001), and was also selected by the CDC to provide oversight under the Polanco Act. In the work leading to the construction of the hotel complex, elevated soil lead concentrations at 0.5 to 2 foot below grade were discovered, along with constituents-of-concern (CoCs) (petroleum hydrocarbons, volatile organic compounds (VOCs), metals, polynuclear aromatic hydrocarbons (PAHs), and polychlorinated biphenyls (PCBs)) as well as, an underlying concrete slab of 3 to 4 inches in thickness. Consequently, effort was placed into the on-site management and assessment of CoC contaminated soils as instructed in the multi-agency approved Property Mitigation Plan (PMP). Following remedial activities, a Human Health Risk Assessment (HHRA) was used to evaluate the carcinogenic risk of the property. Results revealed that the likelihood of health risk to future occupants (3.44E-09) is less than the DEH established criterion (1.0E-06). Moreover, lead concentration in soil fell well below the lead California Human Health Screening Level (CHHSL) and the Preliminary Remediation Goal (PRG) indicating that there is no risk present if the soil is to be reused on-site. On March 25, 2003, SCS Engineers (SCS), on behalf of CDC, submitted the Property Mitigation Plan for the Cleveland And Associates Property and The Former Cuyamaca Meats, Inc. Property (PMP). This plan covered the Site, was approved on April 16, 2003, and was based on the Master Workplan which was approved on December 24, 2001. The PMP contains the Post-Closure Monitoring and Maintenance Plan, which is a key element of this Certificate of Completion and was approved in concept in 2003, with the final addendum approved on June 1, 2007. On November 9, 2006, SCS Engineers, on behalf of CDC, submitted the Property Closure Report to DEH. The SCS report covered the Site. Agency notification was conducted under VAP case H23772-002, and a Certificate of Completion was issued by DEH on August 3, 2007. Post-Closure activities included groundwater sampling and the uncovering, demolishing and loading of underlay concrete and asphalt. The residue material was transported to three different locations for proper unloading and disposal; Construction Residue Recycling at 855 Energy Way in Chula Vista; J. Cloud Inc. at 2094 Willow Glen Drive in El Cajon; and Hanson Aggregates Pacific Southwest, Inc.at 9229 Harris Plant Road in San Diego. CoCs concentrations initially found in property soil were determined to have been fully assessed and mitigated as necessary and thus, do not pose a significant risk to human health or to the recognized beneficial uses of the local water resources. Consequently, property soil that may contain low levels of lead was left on-site. The construction of the hotel complex continued given that the property is clear of physical obstructions and the soil CoCs were mitigated to safe standards as described in the PMP. On November 14, 2007, the CDC entered the Voluntary Assistance Program (VAP). The type of assistance requested was technical oversight, recommendations, review of groundwater monitoring reports, and review of post closure reports. Based on the request, DEH opened VAP Case H23772-006. DEH reviewed the groundwater monitoring reports and post-closure documents and determined that the subsurface environmental investigations and remedial actions have been satisfactorily completed and that a permanent remedy to the known hazardous substance releases has been accomplished [CH&SC Section 25264(b)]. Further, DEH has determined that the responsible parties have complied with the requirements of all state and local laws, ordinances, regulations, and standards that are applicable to site investigation and remedial action for which this Certificate of Completion is issued [CH&SC Section 25264(c)]. A description of the environmental actions implemented is provided in the November 28, 2007 Post-Closure Addendum Report (Report), prepared by RORE Inc., on behalf of the CDC. The three groundwater monitoring wells associated with the VAP Case were destroyed under permit DEH2019-LMWP-0038888. In accordance with Health & Safety Code Section 25264, DEH has determined that the Site Investigation and Remedial Action at the above-referenced Site has been satisfactorily completed, and that a permanent remedy has been accomplished [25264(b)]. As the Administering Agency, DEH certifies that applicable remedial action standards and objectives were achieved [25263(b)] at the Site and issues this Certificate of Completion pursuant to Health and Safety Code Sections 25264(b). Except as provided in Health and Safety Code sections 25264(b) and 25265, this Certificate of Completion constitutes a determination that the Responsible Party, CDC, has complied with the requirements of all state and local laws, ordinances, regulations, and standards that are applicable to the Site Investigation and Remedial Action for which this Certificate is issued [25264(c)]. State law limits the actions that agencies other than DEH may take against the Responsible Party, CDC, with respect to the hazardous materials release that was the subject of the Site Investigation and Remedial Action for which this Certificate is issued. See Health and Safety Code Section 25264(c) and (d). This Certificate of Completion is issued effective this January 30, 2020, by DEH as Administering Agency. Additionally, pursuant to DEH authority as the designated agency for purposes of the Polanco Act cleanup program, in accordance with California Health & Safety Code section 33459.3(c), DEH finds that the conditions of California Health & Safety Code section 33459.3(l) have been met. Therefore, DEH hereby certifies that the remedial action plan has been completed, and the immunities provided by California Health & Safety Code section 33459.3 are in effect. These immunities are limited by the provisions set forth in California Health & Safety Code section 33459.3(g)-(k).

Site History:

permitting and approvals for the development of a hotel project on the former Cleveland Property and former Cuyamaca Property. In 1998, the CDC drafted the Harbor District Specific Area Plan (SAP) and received certification from the California Coastal Commission. The SAP specified redevelopment land use constraints and approved mitigation of burn ash by consolidating and capping the portion impacted by burn ash.

On April 4, 2001, the Site Designation Committee designated the County of San Diego Department of Environmental Health (DEH) as the Administering Agency under Chapter 6.65 of Division 20 of the Health and Safety Code (sections 25260 et seq.) ("Chapter 6.65"), to oversee the Site Investigation and Remedial Action for the following Assessor Parcel Numbers 559-160-30-00, 559-160-31-00, 559-160-32-00, and 559-160-33-00 (Resolution No. 00-06). This Site is located in National City in the area generally bounded by Bay Marina Drive to the north, Marina Way to the west, Highway 5 to the east and Paradise Marsh to the south. This request also specified that the cleanup would be conducted pursuant to the Polanco Act, under DEH supervision. DEH was designated as the administering agency by the committee (See Resolution No. 00-06 attached as Exhibit "A" to this Certificate, dated April 4, 2001), and was also selected by the CDC to provide oversight under the Polanco Act.

In the work leading to the construction of the hotel complex, elevated soil lead concentrations at 0.5 to 2 foot below grade were discovered, along with constituents-of-concern (CoCs) (petroleum hydrocarbons, volatile organic compounds (VOCs), metals, polynuclear aromatic hydrocarbons (PAHs), and polychlorinated biphenyls (PCBs)) as well as, an underlying concrete slab of 3 to 4 inches in thickness. Consequently, effort was placed into the on-site management and assessment of CoC contaminated soils as instructed in the multi-agency approved Property Mitigation Plan (PMP).

Following remedial activities, a Human Health Risk Assessment (HHRA) was used to evaluate the carcinogenic risk of the property. Results revealed that the likelihood of health risk to future occupants (3.44E-09) is less than the DEH established criterion (1.0E-06). Moreover, lead concentration in soil fell well below the lead California Human Health Screening Level (CHHSL) and the Preliminary Remediation Goal (PRG) indicating that there is no risk present if the soil is to be reused on-site.

On March 25, 2003, SCS Engineers (SCS), on behalf of CDC, submitted the Property Mitigation Plan for the Cleveland And Associates Property and The Former Cuyamaca Meats, Inc. Property (PMP). This plan covered the Site, was approved on April 16, 2003, and was based on the Master Workplan which was approved on December 24, 2001. The PMP contains the Post-Closure Monitoring and Maintenance Plan, which is a key element of this Certificate of Completion and was approved in concept in 2003, with the final addendum approved on June 1, 2007.

On November 9, 2006, SCS Engineers, on behalf of CDC, submitted the Property Closure Report to DEH. The SCS report covered the Site. Agency notification was conducted under VAP case H23772-002, and a Certificate of Completion was issued by DEH on August 3, 2007.

Post-Closure activities included groundwater sampling and the uncovering, demolishing and loading of underlay concrete and asphalt. The residue material was transported to three different locations for proper unloading and disposal; Construction Residue Recycling at 855 Energy Way in Chula Vista; J. Cloud Inc. at 2094 Willow Glen Drive in El Cajon; and Hanson Aggregates Pacific Southwest, Inc.at 9229 Harris Plant Road in San Diego.

CoCs concentrations initially found in property soil were determined to have been fully assessed and mitigated as necessary and thus, do not pose a significant risk to human health or to the recognized beneficial uses of the local water resources. Consequently, property soil that may contain low levels of lead was left on-site. The construction of the hotel complex continued given that the property is clear of physical obstructions and the soil CoCs were mitigated to safe standards as described in the PMP.

On November 14, 2007, the CDC entered the Voluntary Assistance Program (VAP). The type of assistance requested was technical oversight, recommendations, review of groundwater monitoring reports, and review of post closure reports. Based on the request, DEH opened VAP Case H23772-006.

DEH reviewed the groundwater monitoring reports and post-closure documents and determined that the subsurface environmental investigations and remedial actions have been satisfactorily completed and that a permanent remedy to the known hazardous substance releases has been accomplished [CH&SC Section 25264(b)]. Further, DEH has determined that the responsible parties have complied with the requirements of all state and local laws, ordinances, regulations, and standards that are applicable to site investigation and remedial action for which this Certificate of Completion is issued [CH&SC Section 25264(c)].

A description of the environmental actions implemented is provided in the November 28, 2007 Post-Closure Addendum Report (Report), prepared by RORE Inc., on behalf of the CDC. The three groundwater monitoring wells associated with the VAP Case were destroyed under permit DEH2019-LMWP-0038888.

In accordance with Health & Safety Code Section 25264, DEH has determined that the Site Investigation and Remedial Action at the above-referenced Site has been satisfactorily completed, and that a permanent remedy has been accomplished [25264(b)].

As the Administering Agency, DEH certifies that applicable remedial action standards and objectives were achieved [25263(b)] at the Site and issues this Certificate of Completion pursuant to Health and Safety Code Sections 25264(b). Except as provided in Health and Safety Code sections 25264(b) and 25265, this Certificate of Completion constitutes a determination that the Responsible Party, CDC, has complied with the requirements of all state and local laws, ordinances, regulations, and standards that are applicable to the Site Investigation and Remedial Action for which this Certificate is issued [25264(c)].

State law limits the actions that agencies other than DEH may take against the Responsible Party, CDC, with respect to the hazardous materials release that was the subject of the Site Investigation and Remedial Action for which this Certificate is issued. See Health and Safety Code Section 25264(c) and (d).

This Certificate of Completion is issued effective this January 30, 2020, by DEH as Administering Agency.

Additionally, pursuant to DEH authority as the designated agency for purposes of the Polanco Act cleanup program, in accordance with California Health & Safety Code section 33459.3(c), DEH finds that the conditions of California Health & Safety Code section 33459.3(l) have been met. Therefore, DEH hereby certifies that the remedial action plan has been completed, and the immunities provided by California Health & Safety Code section 33459.3 are in effect. These immunities are limited by the provisions set forth in California Health & Safety Code section 33459.3(g)-(k).

Site History:

In January 2010, releases H03078-001 and H03078-002 (see descriptions below) were administratively consolidated, and release H03078-002 will be administratively closed. Site investigation activities at the Pepper Oil facility for these two releases will be combined and reported under H03078-001. Please see H02078-001 (Global ID #T0607302522) for additional site investigation information. The second release (-002) refers to a 550 gallon capacity steel waste oil UST that was removed on July 21, 1999. Holes were noted on the top and sides of the tank, and minor discoloration of the native soil was noted. Two soil samples were collected from the west and east end of the tank pit, and TRPH concentrations of 5,875 and 5,931 mg/kg were reported in the samples. The UST excavation was reportedly backfilled with excavated fill soil from around the USTS and imported fill.

In January 2010, releases H03078-001 and H03078-002 (see descriptions below) will be administratively consolidated, and release H03078-002 will be administratively closed. Site investigation activities at the Pepper Oil facility for these two releases will be combined and reported under H03078-001. There are two open Local Oversight Program cases that DEH/SAM is overseeing at the Pepper Oil Facility. The first, H03078-001, refers to a release from a 2,000 gallon steel underground storage tank (UST) that was removed on 9/28/1998. The UST, which contained diesel fuel, then later, waste oil, was corroded with holes when removed. The soil in the excavation was heavily stained. Two soil samples were collected from the bottom of the tank pit. The samples had reported Total Recoverable Petroleum Hydrocarbons (TRPH) concentrations of 21,786 and 25,455 milligrams per kilogram (mg/kg), and TPH as diesel concentrations of 16,238 and 12,111 mg/kg (no TPH as gasoline detected). The second release (-002) refers to a 550 gallon capacity steel waste oil UST that was removed on July 21, 1999. Holes were noted on the top and sides of the tank, and minor discoloration of the native soil was noted. Two soil samples were collected from the west and east end of the tank pit, and TRPH concentrations of 5,875 and 5,931 mg/kg were reported in the samples. The UST excavation was reportedly backfilled with excavated fill soil from around the USTS and imported fill. In September 1999 and November 1999, respectively, DEH approved Workplans/Addendum for site assessments for release -001 and -002 (prepared by PIC) (-001 dated Jan 1999, -002 both dated Nov. 1999). However, the workplans were not implemented, apparently due to RP funding problems. Both cases were later put on low priority at SAM so that there would be no overlap of effort with the DTSC investigation. A permit for installation of 28 direct push borings at the facility was submitted by Ninyo and Moore and approved by DEH on Feb. 15, 2005. DTSC is overseeing the closure of Hazardous Waste Management Units at the Pepper Oil facility, and has commented on a Revised Closure Plan for the facility. Ninyo & Moore has conducted soil gas, soil, and groundwater sampling at the facility and has recommended the installation of additional monitoring wells as part of the Field Sampling Plan. As of October 2009, the DTSC had not yet submitted final comments on the Revised Closure Plan. After the Closure Plan and Field Sampling Plan are finalized and results are available, it will be apparent whether additional investigation is required in the specific areas of the UST releases that SAM is overseeing (-001 and -002).

Facility History:

Inactive facility undergoing closure - State: Pepper Oil Company, Incorporated facility is located at 2300 Tidelands Avenue, National City, San Diego County. Pepper Oil legally occupies approximately 65,340 square feet or 1.5 acres. The property owner is San Diego Unified Port District. The site originally was consisted of two administration buildings, a chemical storage area, a waste transfer station, two underground storage tanks for runoff control, and a tank farm. The tank farm included twenty-five (25) above ground storage tanks.

Pepper Oil Company, Incorporated was a non-RCRA transporter, storage and treatment facility from the early 1980's until December of 1989 (they accepted bunker oil, diesel fuel contaminated with water, black oil and bilge water). In December 1989, Pepper Oil stopped accepting waste for storage or treatment.

The soil and groundwater beneath the subject site has been adversely impacted by petroleum hydrocarbons.

A number of tanks have been removed and the facility is going to submit a result of their ground water sampling and a closure plan.

03/19/2018- This facility was issued an Interim Status Document on 05/16/1983, which it operated under until it stopped operation in December of 1989. The facility has been working on cleanup and closure ever since. A draft Corrective Action Consent Agreement was found on the Cleanup EnviroStor and uploaded to Permitting. Based on all this information and documents from Cleanup EnviroStor, the facility is still working on closure.

Site History:

Pepper Oil Company, Incorporated is seeking approval from the California Department of Toxic Substances Control (DTSC) of a closure plan submitted to the DTSC on May 5, 2006 for the facility located at 2300 Tidelands Avenue, National City, California.
The total parcel size is approximately 111,800 square feet (2.6 acres) of the San Diego Unified Port District Tideland. The Pepper Oil facility which regulated units were operated occupies approximately 62,000 square feet, or 1.4 acres, the remainder of which is occupied by Southern California Truck Stop. The facility is bounded by Southern California Truck Stop to the north, Tidelands Avenue to the east, Bay Marina Drive to the south, and the Burlington Northern Santa Fe Railroad to the west, beyond which is the Knight and Carver Yacht Center (Figure 2 of the Closure Plan). The subject site is located within a quarter mile east of the eastern limits of San Diego Bay at an elevation of approximately ten feet above mean sea level.

Pepper Oil Company, Incorporated was a transporter, storage and disposal facility (TSDF) from the early 1980's until December of 1989. In December of 1989 Pepper Oil Company, Incorporated stopped accepting waste for storage or treatment. During the time in which Pepper Oil Company, Incorporated (Pepper Oil) operated, the TSDF portion of Pepper Oil treated and recycled bunker oil, diesel contaminated with water, black oil, bunker oil, and bilge water. The distribution portion of Pepper Oil distributed bulk petroleum fuel products. The types of bulk petroleum fuel products distributed by Pepper Oil included aromatic solvents, diesel, kerosene, and Stoddard solvents. The TSDF and petroleum distribution operations were conducted in the same part of the site.

The site consisted of two administration buildings, a chemical storage area, a waste transfer station, two underground storage tanks for runoff control, and a tank farm. The tank farm included twenty-five (25) above ground storage tanks placed within a three and three quarter feet high retaining wall (Fire Wall) with a permeable base. The tank bottoms are resting on a layer of gravel to deter corrosion.
Pepper Oil has begun closing their facility and no longer has tanks operating for acceptance of off-site waste material. The only waste stored in on-site tanks is that generated from normal facility operations. The facility stopped accepting oily waste material and waste water in December 1989. Since 1989, Pepper Oil has emptied and cleaned all of the twenty-five tanks in the tank farm. Four of the tanks are now used to hold rain water (Tanks 3 and 4), red-dye diesel (Tank 8), and Calumet 400/500 (Tank 7).

The soil beneath the site has been impacted by total petroleum hydrocarbons (TPH) and volatile organic constituents (VOCs) from petroleum releases. The extent of soil and groundwater contamination is currently being assessed. The clean-up standards for the soil will be risk based. Remediation goals for soil and groundwater will be evaluated through an assessment of the potential pathways and receptors of soil and groundwater at the site based on existing and future land use. An ecological risk assessment will be conducted if the results of the groundwater assessment indicate a potential for groundwater contamination impacting San Diego Bay. If the groundwater plume is not migrating off site, an ecological risk assessment may not be warranted. Remediation goals will be set so that the contaminated soil is not a continuing source of contamination to groundwater and does not pose an unacceptable risk to human health. Once the site has been fully characterized, an addendum and modification to the closure plan may be prepared if necessary.
The groundwater beneath the site has been impacted by both TPH and VOCs from petroleum releases. Free product is present on the groundwater surface based on the results of the soil sampling. Since the groundwater has been designated non-beneficial use, groundwater remediation is expected to consist of NAPL removal and remediation of concentrations of contaminants of concern to levels that do not present a threat to human health or the environment. An evaluation of clean up goals for groundwater with respect to protection of resources in San Diego Bay will also be evaluated if the plume appears to be migrating off site. The following steps will be implemented for the groundwater assessment:
• Install a network of groundwater monitoring wells to evaluate the extent of dissolved phase contaminants and NAPL, if present.
• Assess the direction and gradient of groundwater flow.
• Monitor the dissolved phase contaminants in wells not containing NAPL to evaluate if the plume is migrating beyond the site limits. If the plume is migrating beyond the site, a pump and treat system will be implemented to control plume migration and treat the groundwater.
• Remove the NAPL found on the groundwater surface by bailing or pump and treat.
• Once the NAPL has been removed from the groundwater surface, groundwater monitoring will continue to document temporal concentration trends.
Additional in situ methods will be implemented including, but not limited to, injection of oxygen using a commercially available and regulatory-accepted method.
Soil remediation
The clean-up objective for soil will be risk based and will be evaluated based on complete exposure pathways. If a complete exposure pathway exists (e. g., dermal contact, ingestion, inhalation) the pathway and concentrations of contaminants will be evaluated to select clean up levels that do not present an excess risk to site occupants. Prior to initiation of the remediation alternative(s), clean up goals will be developed for DTSC concurrence.
A number of alternatives to achieve remediation goals will be considered including but not limited to excavation, remediation by monitored natural attenuation, natural attenuation by enhanced bioremediation, or excavation and disposal of the contaminated soil. A combination of alternatives may be selected based on site access constraints and feasibility of implementation.

Soil contaminated with TPH, VOCs, and other constituents of concern (COCs) may be excavated to the extent practicable, or until confirmation samples do not contain COCs above the risk-based action levels. Soils will be excavated utilizing a backhoe or excavator. Operators of excavators and other equipment will have current 40-hour Occupational Safety and Health Administration (OSHA) training.

Soil will be excavated in areas of the highest concentrations down to the groundwater surface. Confirmatory soil samples will be obtained as necessary to document the remediation progress and completion. The soil samples will be obtained and analyzed for TPH-E, VOCs, and semi-volatile organic compounds (SVOCs).
Excavated soil will be stockpiled on the site, between layers of 10-mil Visqueen. During the excavating operation, the soils will be kept moist to eliminate nuisance caused by the dust and emissions from the excavation. Air quality will be monitored in accordance with the specifications in the site-specific

health and safety plan. Excavation activities will not be conducted during rain events to minimize contact of rainfall with the contaminated soil.
Upon reaching the limits of the soil contamination, the excavation will be backfilled and compacted with imported material or with material that has been treated and/or bioremediated.
Contaminated soil that cannot be effectively treated on site, will be transported off site based on the waste classification of the soil to an approved facility for disposal or treatment.
The generator will supply the transporter and waste management facility an accurate profile of the material, and will obtain acceptance of the waste, prior to transportation.
Once the site has been fully characterized, an addendum and modification to the closure plan may be prepared to specify the performance standards and soil and groundwater remediation.
If clean closure can not be achieved then a Land Use Covenant (LUC) to restrict uses of the Site would be prepared and recorded with the San Diego County Assessors' Office to protect public health and the environment. The terms of the LUC would be binding on the current owner and all successive owners and occupants of the Site.

Please see Case H03078-001 (Pepper Oil) for related information. The Southern California Truck Stop site is located on the Pepper Oil Company leasehold located at 2250 Tidelands (owner Port of San Diego). Combined site investigations for the adjacent sites have been conducted under the Pepper Oil Closure Plan, overseen by the California Department of Toxic Substances Control. In 2006, DEH agreed that to prevent duplicate investigations, data from delineation efforts at Pepper Oil could be used to assist in delineation of the So Cal Truck Stop site. A single-walled, 12,000 gallon capacity steel diesel underground storage tank was removed from the site on July 1, 1994. During removal, a hole was noted on the south side of the tank, and staining was noticed on the bottom. Three soil samples were collected from the excavation. The soil sample collected from the center of the excavation was observed to be saturated with fuel product and water, and had a reported total petroleum hydrocarbon (TPH) as diesel concentration of 33,900 milligrams per kilogram (mg/kg). Three additional soil samples were collected near the pump island and piping on July 14, 1996, and concentrations of up to 5,000 mg/kg were reported. One sample contained 110 mg/kg TPH as gasoline. An unauthorized release notice was sent to the responsible parties on August 14, 1994. Four borings and a recovery well for free product removal were drilled and sampled in 1995. Two additional USTs were removed from the site on December 18, 1998, and free product was noted in the tank excavation. Free product removal was ongoing at the site. In 2006, DEH agreed that to prevent duplicate investigations, data from delineation efforts at Pepper Oil could be used to assist in delineation of the So Cal Truck Stop site. DEH recently requested reports documenting soil gas survey results and soil and groundwater (hydropunch) sampling results from the consultant, and will be reviewing the documents and preparing a directive letter for the Responsible Parties in Summer 2010.

Please see Case H03078-001 (Pepper Oil) for related information. The Southern California Truck Stop site is located on the Pepper Oil Company leasehold located at 2250 Tidelands (owner Port of San Diego). Combined site investigations for the adjacent sites have been conducted under the Pepper Oil Closure Plan, overseen by the California Department of Toxic Substances Control. In 2006, DEH agreed that to prevent duplicate investigations, data from delineation efforts at Pepper Oil could be used to assist in delineation of the So Cal Truck Stop site.

A single-walled, 12,000 gallon capacity steel diesel underground storage tank was removed from the site on July 1, 1994. During removal, a hole was noted on the south side of the tank, and staining was noticed on the bottom. Three soil samples were collected from the excavation. The soil sample collected from the center of the excavation was observed to be saturated with fuel product and water, and had a reported total petroleum hydrocarbon (TPH) as diesel concentration of 33,900 milligrams per kilogram (mg/kg). Three additional soil samples were collected near the pump island and piping on July 14, 1996, and concentrations of up to 5,000 mg/kg were reported. One sample contained 110 mg/kg TPH as gasoline. An unauthorized release notice was sent to the responsible parties on August 14, 1994. Four borings and a recovery well for free product removal were drilled and sampled in 1995. Two additional USTs were removed from the site on December 18, 1998, and free product was noted in the tank excavation. Free product removal was ongoing at the site.

In 2006, DEH agreed that to prevent duplicate investigations, data from delineation efforts at Pepper Oil could be used to assist in delineation of the So Cal Truck Stop site. DEH recently requested reports documenting soil gas survey results and soil and groundwater (hydropunch) sampling results from the consultant, and will be reviewing the documents and preparing a directive letter for the Responsible Parties in Summer 2010.

Site History:

The Site is currently vacant unpaved land comprising approximately 1.5 acres. The Site is bounded on the north by 23rd Street. To the west of the Site is Harrison Avenue/Marina Way, bordered by the National City Historic Depot. To the east of the Site is Cleveland Avenue, bordered by a vacant lot (former Ace Metals). To the south of the Site is West 24th Street (Bay Marina Drive), bordered by the Best Western Marina Gateway Hotel and the National City Historic Railways building. Structures and manufacturing materials used in conjunction with former operations at the Site have been removed. Overhead power lines traverse the east perimeter of the Site, and there is one pad-mounted transformer located in the northeast corner of the

Site. In 1995, an Environmental Site Assessment (ESA) was conducted for 835-839 West 24th Street, corresponding to APN 559-117-07. The ESA was performed to ascertain if Site impacts had occurred due to use as a foundry (CDC Foundry; 835 West 24th Street) and transformer production facility (Electro Mold & Casting; 839 West 24th Street). Both the foundry and transformer production facility were active at the time of the ESA. The ESA reported that the Site was previously also used as a mattress stuffing factory. The Site contained three wooden structures and one metal structure at the time of the ESA. The ESA stated that historic uses of "the adjacent property to the east" as a dyeing and tanning building were also considered as being a concern to the subject Site. On February 23, 1995, three groundwater monitoring wells (MW-1, MW-2, and MW-3) were installed as part of their ESA. Remediation activities were performed between 3 and 7 January 2011. During this period: • Impacted soil was excavated and confirmation samples were collected; • Approximately 74 tons of concrete foundation material were removed from the Site and recycled at the J. Cloud, Inc. facility; • Approximately 375 cubic yards of impacted soil were exported from the Site and properly disposed at SYCL in Yuma, Arizona; and • Following removal of impacted soil and receipt of final confirmation sample results, the Site was re-graded to match the surrounding ground surface and was compacted. A total of 7 confirmation soil samples were collected following removal of affected soil at the Site. Only one confirmation sample contained arsenic at a concentration that slightly exceeded the Industrial RSL. After additional excavation was performed, an additional confirmation soil sample was collected and analyzed, and a passing result was observed. No other constituents exceeded industrial RSLs. The Site is eligible for a formal regulatory determination of "No Further Action" required for future commercial/industrial development based on the following: • The Site has been adequately characterized; • Sources of soil and groundwater impacts have been removed in accordance with the approved Work Plan; • Detected concentrations in confirmation soil samples after impacted material was excavated and transported offsite for disposal were below the RSLs, ESLs, and upper regional background concentrations for arsenic and total chromium; • Soil characterization results in areas outside of the excavation area are below screening levels for a commercial/industrial scenario; and • Historical soil and groundwater data tables were reviewed, summarized, and compared to current laboratory results and screening levels. The groundwater impacts do not present unacceptable risk, and groundwater beneath the Site is not currently a source of drinking water or expected to be a source in the future. Groundwater beneath the Site is not currently designated as beneficial for drinking water, nor is it expected to be designated as beneficial for drinking water in the future. The existing groundwater monitoring wells were destroyed under permit DEH2018-LSAM-003609. The cleanup objectives for the Site have been achieved and extensive characterization of the Site demonstrates that soil and groundwater at the Site do not pose an unacceptable risk for future site usage under a commercial/industrial scenario. Therefore, regulatory closure is requested for the Voluntary Assistance Program Case H23772-005.

From the 1920's to 1950, the facility was operated as an open dump in which solid waste was sorted, burned, and dispersed into the march. There are no available records of the disposal operation, but there is evidence of burned solid waste within the marsh and within areas adjhacent ot Paradise Creek. The extent of the facility's solid waste appears to extend onto several properties. Analyses performed on waste samples have indicated that the dump contains non-RCRA hazardous levels of metals.

DTSC received a Final Report of Remedial Action Alternatives for National City Narine Terminal, prepared fpr Port of San Diego by Woodward-Clyde. RWQCB, San Diego issued a Cleanup and Abatement Order in 1985. From 1979 to 1985 copper ore concentrate was stockpiled and loaded onto ships at this site. Alternatives are: clamshell sediments over 2000 ppm Cu and transport by rail to Cypress Mines in Arizona; clam-shell sediments between 1000 - 2000ppm Cu and dispose at an approved EPA/COE ocean disposal site. Report was reviewed by Region 4 staff. Since no treatment is anticipated that would require permit or variance, staff recommends referral to RWQCB as lead agency. NFA FOR DTSC.

Site History:

A TSI was conducted at this Site in the 2005-2006 grant year. National City applied for another TSI grant for the 2006-2007 grant year. This application was accepted, but the scope of the TSI was to focus on the southern portion of the property that had not been included in the 2005-2006 TSI.

Information on the 2005-2006 TSI:
TSI activities will be conducted on an approximate 1.5-acre area associated with Park-side property pertaining to the National City Public Works Yard. The address of the National City Public Works Yard is 2100 Hoover Avenue, National City, California 91950. The approximate 1.5-acre area (Subject Area) is situated within the boundaries of the approximate 3.6-acre Park-side Property described in National City's TSI Application dated September 23, 2005. The Subject Area is generally bordered by Paradise Creek Educational Park to the north, additional Park-side Property to the south, Paradise Creek to the east, and residential homes to the west. This area includes all or portions of Assessor Parcel Numbers 5560-206-03, 560-391-05, and 559-104-10. The latitude and longitude coordinates of the center of the Subject Area are approximately 32o 39' 53.62"N and 117o 06' 21.98"W, respectively.

Information on the 2006-2007 TSI:
This PEA focused on a approximate 2.1- acre portion of the Park-side National City Public Works Yard property located at 2100 Hoover Avenue in National City, California.

Historical accounts indicate that the City of National City historically dumped street sweepings and other undocumented fill materials at the Site. Previous site assessment activities associated with a DEH VAP case have indicated the presence of petroleum hydrocarbons and elevated metals concentrations in fill soils at the site. Elevated concentrations of methane gas were also noted in borehole voids, and were attributed to the decay of organic matter in the fill material.

The 2006 human health screening evaluation performed for the neighboring 1.5 acre area indicated an elevated level of risk due to risk drivers such as lead, nickel, SVOCs, and PCBs.

Subsurface releases of fuels have been documented at several properties near the Site. In addition, reported maintenance of equipment cleaning in the southern portion of the Park-side property may have resulted in the release of diesel fuel and solvents. Historical aboveground asphalt emulsion and diesel tanks in the southern portion of the Site may have resulted in the release of diesel fuel. Contaminants associated with these sources may have migrated into soil, soil gas, and/or groundwater at the Site.

Subsurface investigations at the Paradise Creek Educational Park property, located adjacent to the north of the Site, have indicated elevated concentration of lead and OCPs in fill material. Based on the potential that fill materials at the Site and the park property were generated from the same source, there is a potential that similar concentrations of lead and OCPs are present in the undocumented fill soil at the Site.

For this TSI:
• Sixteen (16) soil gas probe locations are planned at the Site.
• Twenty (20) on-site locations are planned for collection of soil matrix samples. Soil samples will be collected from each of these locations at 2 feet bgs and 6 feet bgs.

• Three (3) on-site locations are planned for collection of groundwater samples. Groundwater exists at a depth of approximately 7 to 8 feet bgs. A total of 3 groundwater samples will be collected.

Further Action was recommended.

10/23/2009: National City and DTSC have entered into a Consultative Services Agreement to oversee the collection of additional soil samples that would help define the areas of hotspot removal, and lead the development of a Removal Action Workplan.

10:25 am - Arrived at the site; met Gabriela of E2 and Steve and Lillian of Environ; excavation already started; excavation strategy: remove concrete footing, remove sol at increment depth of 2' throughout until to groundwater (~8'); stained gravels and soils observed (blue/grey); slight hydrocarbon odor; soils stockpiles are divided to overburden and TPH impacted; air monitoring stations around the fence.
11:00 am - down to 4'; more stained soils; walked around the site and found a huge stockpile near entrance gate; Gabriela did not know about it; need to check with Daryl of E2.
11:55 am - down to 4' at the northern portion of the excavation area; liquid flowing out from gravel layer; Gabriela collected liquid sample and will analyze for TPH, PAHs and PCB.
12:25 pm - Daryl of E2 onsite to check on the flowing liquid; another liquid leaking out at further north; the excavation area maybe extend and more days.
13:00 pm - because limited space, the TPH stockpiles need to be transported ASAP; will collect samples for profiling.

SITE HISTORY:

The proposed school site is located on approximately 1/2 acre of vacant land in a redevelopment area on the southwest corner of West 8th Street and National City Boulevard and is currently vacant and graded. Bordering the site to the North is West 8th Street followed by the Holiday Inn. The site is bordered to the east by National City Boulevard followed by the Red Lion Inn Hotel. The site is bordered by vacant land to the South. On the west, the site is bordered by an abandoned Arco gas station. The site has been historically occupied by various commercial/retail businesses including a dry cleaner from 1953 to 1955. The Black and White Cleaners occupied the site from approximately 1953 to 1955. Imported fill from an unknown source is also present at the site. A leaking underground storage tank located on an adjacent property may have impacted the site. The Leaking Underground Storage Tank was used when a Arco gas station was operational.

Appendix: Database Descriptions

Environmental Risk Information Services (ERIS) can search the following databases. The extent of historical information varies with each database and current information is determined by what is publicly available to ERIS at the time of update. ERIS updates databases as set out in ASTM Standard E1527-13 and E1527-21, Section 8.1.8 Sources of Standard Source Information:

"Government information from nongovernmental sources may be considered current if the source updates the information at least every 90 days, or, for information that is updated less frequently than quarterly by the government agency, within 90 days of the date the government agency makes the information available to the public."

National Priority List: NPL

The U.S. Environmental Protection Agency (EPA)'s National Priorities List (NPL) includes the most serious uncontrolled or abandoned hazardous waste sites identified for possible long-term remedial action under the Superfund program, based primarily on the score a site receives from EPA's Hazard Ranking System. A site must be on the NPL to receive money from the Superfund Trust Fund for remedial action. This data includes NPL sites represented as polygons, where available, that can be sourced from the EPA NPL Superfund Site Boundaries dataset, refreshed by the Shared Enterprise Geodata and Services (SEGS). These site boundaries represent the footprint of a whole site, the sum of all the Operable Units (OUs) and the current understanding of the full extent of contamination; for Federal Facility sites, the total site polygon may be the Facility boundary. As site investigation and remediation progress, OUs may be added, modified or refined. Data provided by external parties is not independently verified by EPA. This boundary data is made available to the public strictly for informational purposes. Where there is no polygon boundary data available for a given site, the site is represented as a point.

Government Publication Date: Sep 25, 2024

National Priority List - Proposed: PROPOSED NPL

Sites proposed by the U.S. Environmental Protection Agency (EPA), the state agency, or concerned citizens for addition to the National Priorities List (NPL) due to contamination by hazardous waste and identified by the EPA as a candidate for cleanup because it poses a risk to human health and/or the environment. Sites represented as polygons, where available, can be sourced from the EPA NPL Superfund Site Boundaries dataset, refreshed by the Shared Enterprise Geodata and Services (SEGS). These site boundaries represent the footprint of a whole site, the sum of all the Operable Units (OUs) and the current understanding of the full extent of contamination; for Federal Facility sites, the total site polygon may be the Facility boundary. Data provided by external parties is not independently verified by EPA. This boundary data is made available to the public strictly for informational purposes. Where there is no polygon boundary data available for a given site, the site is represented as a point.

Government Publication Date: Sep 25, 2024

Deleted NPL: DELETED NPL

Sites deleted from the U.S. Environmental Protection Agency (EPA)'s National Priorities List (NPL). The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate. Sites represented as polygons, where available, can be sourced from the EPA NPL Superfund Site Boundaries dataset, refreshed by the Shared Enterprise Geodata and Services (SEGS). These site boundaries represent the footprint of a whole site, the sum of all the Operable Units (OUs) and the current understanding of the full extent of contamination; for Federal Facility sites, the total site polygon may be the Facility boundary. Data provided by external parties is not independently verified by EPA. This boundary data is made available to the public strictly for informational purposes. Where there is no polygon boundary data available for a given site, the site is represented as a point.

This inventory contains active sites evaluated by the Superfund program that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The Active Site Inventory Report displays site and location information at active SEMS sites. An active site is one at which site assessment, removal, remedial, enforcement, cost recovery, or oversight activities are being planned or conducted. This data includes SEMS sites from the List 8R Active file as well as applicable sites from the EPA's Facility Registry Service map tool.

Comprehensive Environmental Response, Compensation and Liability Information System - CERCLIS: rr-CERCLIS-bb CERCLIS

Superfund is a program administered by the United States Environmental Protection Agency (EPA) to locate, investigate, and clean up the worst hazardous waste sites throughout the United States. CERCLIS is a database of potential and confirmed hazardous waste sites at which the EPA Superfund program has some involvement. It contains sites that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The EPA administers the Superfund program in cooperation with individual states and tribal governments; this database is made available by the EPA.

EPA Report on the Status of Open Dumps on Indian Lands: rr-IODI-bb IODI

Public Law 103-399, The Indian Lands Open Dump Cleanup Act of 1994, enacted October 22, 1994, identified congressional concerns that solid waste open dump sites located on American Indian or Alaska Native (AI/AN) lands threaten the health and safety of residents of those lands and contiguous areas. The purpose of the Act is to identify the location of open dumps on Indian lands, assess the relative health and environment hazards posed by those sites, and provide financial and technical assistance to Indian tribal governments to close such dumps in compliance with Federal standards and regulations or standards promulgated by Indian Tribal governments or Alaska Native entities.

Government Publication Date: Dec 31, 1998

CERCLIS - No Further Remedial Action Planned: rr-CERCLIS NFRAP-bb CERCLIS NFRAP

An archived site is one at which EPA has determined that assessment has been completed and no further remedial action is planned under the Superfund program at this time. The Archive designation means that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL). This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Government Publication Date: Oct 25, 2013

CERCLIS Liens: rr-CERCLIS LIENS-bb CERCLIS LIENS

A Federal Superfund lien exists at any property where EPA has incurred Superfund costs to address contamination ("Superfund site") and has provided notice of liability to the property owner. A Federal CERCLA ("Superfund") lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. This database is made available by the United States Environmental Protection Agency (EPA). This database was provided by the United States Environmental Protection Agency (EPA). Refer to SEMS LIEN as the current data source for Superfund Liens.

Federal Institutional Controls- ICs: rr-FED INST-bb

FED INST

List of Institutional controls (ICs) made available by the United States Environmental Protection Agency (EPA). ICs are non-engineered instruments, such as administrative and legal controls, that help minimize the potential for human exposure to contamination and/or protect the integrity of the remedy. Although it is EPA's expectation that treatment or engineering controls will be used to address principal threat wastes and that groundwater will be returned to its beneficial use whenever practicable, ICs play an important role in site remedies because they reduce exposure to contamination by limiting land or resource use and guide human behavior at a site. The IC listing includes remedy component data from Superfund decision documents for applicable sites on the final or deleted on the National Priorities List (NPL); and sites with a Superfund Alternative Approach (SAA) Agreement in place. The only sites included that are not on the NPL; proposed for NPL; or removed from proposed NPL, are those with an SAA Agreement in place.

Formerly Utilized Sites Remedial Action Program: rr-DOE FUSRAP-bb

DOE FUSRAP

The U.S. Department of Energy (DOE) established the Formerly Utilized Sites Remedial Action Program (FUSRAP) in 1974 to remediate sites where radioactive contamination remained from the Manhattan Project and early U.S. Atomic Energy Commission (AEC) operations. The DOE Office of Legacy Management (LM) established long-term surveillance and maintenance (LTS&M) requirements for remediated FUSRAP sites. DOE evaluates the final site conditions of a remediated site on the basis of risk for different future uses. DOE then confirms that LTS&M requirements will maintain protectiveness.

PFOA/PFOS Contaminated Sites: PFAS NPL

This list of Superfund Sites with Per- and Polyfluoroalkyl Substances (PFAS) detections is made available by the U.S. Environmental Protection Agency (EPA) in their PFAS Analytic Tools data, previously the list was obtained by EPA FOIA requests. EPA's Office of Land and Emergency Management and EPA Regional Offices maintain what is known about site investigations, contamination, and remedial actions under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) where PFAS is present in the environment. Limitations: Detections of PFAS at National Priorities List (NPL) sites do not mean that people are at risk from PFAS, are exposed to PFAS, or that the site is the source of the PFAS. The information in the Superfund NPL and Superfund Alternative Agreement (SAA) PFAS detection site list is years old and may not be accurate today. Site information such as site name, site ID, and location has been confirmed for accuracy; however, PFAS-related information such as media sampled, drinking water being above the health advisory, or mitigation efforts has not been verified. For Federal Facilities data, the other Federal agencies (OFA) are the lead agency for their data and provided them to EPA.

Government Publication Date: Sep 18, 2024

Federal Agency Locations with Known or Suspected PFAS Detections: PFAS FED SITES

List of Federal agency locations with known or suspected detections of Per- and Polyfluoroalkyl Substances (PFAS), made available by the U.S. Environmental Protection Agency (EPA) in their PFAS Analytic Tools data. EPA outlines that these data are gathered from several federal entities, such as the Federal Superfund program, Department of Defense (DOD), National Aeronautics and Space Administration, Department of Transportation, and Department of Energy. The dates this data was extracted for the PFAS Analytic Tools range from 2022 to 2024. Sites on this list do not necessarily reflect the source/s of PFAS contamination and detections do not indicate level of risk or human exposure at the site. Agricultural notifications in this data are limited to DOD sites only. At this time, the EPA is aware that this list is not comprehensive of all Federal agencies.

SSEHRI PFAS Contamination Sites: PFAS SSEHRI

This PFAS Contamination Site Tracker database is compiled by the PFAS Project Lab, part of the Social Science Environmental Health Research Institute (SSEHRI) at Northeastern University. According to the SSEHRI, the database records qualitative and quantitative data from each known site of PFAS contamination, including timeline of discovery, sources, levels, health impacts, community response, and government response. The goal of this database is to compile information and support public understanding of the rapidly unfolding issue of PFAS contamination. All data presented was extracted from government websites, news articles, or publicly available documents. Locations for the Known PFAS Contamination Sites are sourced from the PFAS Sites and Community Resources Map by the PFAS-REACH team, credited to PFAS Project Lab, Silent Spring Institute, and PFAS Exchange. Disclaimer: The source conveys the data undergoes regular updates as new information becomes available, some sites may be missing and/or contain information that is incorrect or outdated, as well as their information represents all contamination sites SSEHRI is aware of, not all possible contamination sites. This data is not intended to be used for legal purposes. Access the following source link for the most current information: https://pfasproject.com/pfas-sites-and-community-resources/

National Response Center PFAS Spills: PFAS ERNS

This Per- and Poly-Fluoroalkyl Substances (PFAS) Spills dataset is made available via the U.S. Environmental Protection Agency's (EPA) PFAS Analytic Tools. The National Response Center (NRC), operated by the U.S. Coast Guard, is the designated federal point of contact for reporting all oil, chemical, and other discharges into the environment, for the United States and its territories. This dataset contains NRC spill information from 1990 to the present that is restricted to records associated with PFAS and PFAS-containing materials. Incidents are filtered to include only records with a "Material Involved" or "Incident Description" related to Aqueous Film Forming Foam (AFFF). The keywords used to filter the data included "AFFF," "Fire Fighting Foam," "Aqueous Film Forming Foam," "Fire Suppressant Foam, "PFAS," "PERFL," "PFOA," "PFOS," and "Genx." Limitations: The data from the NRC website contains initial incident data that has not been validated or investigated by a federal/state response agency. Keyword searches may misidentify some incident reports that do not contain PFAS. This dataset should also not be considered to be exhaustive of all PFAS spills/release incidents.

PFAS NPDES Discharge Monitoring: PFAS NPDES

This list of National Pollutant Discharge Elimination System (NPDES) permitted facilities with required monitoring for Per- and Polyfluoroalkyl (PFAS) Substances is made available via the U.S. Environmental Protection Agency (EPA)'s PFAS Analytic Tools. Any point-source wastewater discharger to waters of the United States must have a NPDES permit, which defines a set of parameters for pollutants and monitoring to ensure that the discharge does not degrade water quality or impair human health. This list includes NPDES permitted facilities associated with permits that monitor for Per- and Polyfluoroalkyl Substances (PFAS), limited to the years 2007 - present. EPA further advises the following regarding these data: currently, fewer than half of states have required PFAS monitoring for at least one of their permittees, and fewer states have established PFAS effluent limits for permittees. For states that may have required monitoring, some reporting and data transfer issues may exist on a state-by-state basis.

The EPA's TRI database currently tracks information on disposal or releases of 770 individually listed toxic chemicals and 33 chemical categories from thousands of U.S. facilities and details about how facilities manage those chemicals through recycling, energy recovery, and treatment. This listing includes TRI Reporting Data for calendar years 1987 through 2021 and Preliminary Data for 2022.

PFAS Water Quality Portal Sampling Data: PFAS WATER r-PFAS-WATER-bb

This Per- and Poly-Fluoroalkyl Substances (PFAS) Environmental Media Sampling Data is made available via the U.S. Environmental Protection Agency's (EPA) PFAS Analytic Tools. The Water Quality Portal (WQP), as a cooperative service sponsored by the United States Geological Survey, the EPA, and the National Water Quality Monitoring Council, is part of a modernized repository storing ambient sampling data for all environmental media and tissue samples. A wide range of federal, state, tribal and local governments, academic and non-governmental organizations, and individuals submit project details and sampling results to this public repository. Limitations: EPA did not carry out the sampling or testing of a majority of the data in the WQP PFAS dataset. EPA can only speak to the accuracy and completeness of the data from projects like the National Aquatic Resource Surveys for which EPA is the data owner/organization. Data may exist within the file on Quality Assurance Project Plans (QAPPs) and the approving agency of the QAPP, if a QAPP is entered.

PFAS TSCA Manufacture and Import Facilities: PFAS TSCA r-PFAS-TSCA-bb

The U.S. Environmental Protection Agency (EPA) issued the Chemical Data Reporting (CDR) Rule under the Toxic Substances Control Act (TSCA) and requires chemical manufacturers and facilities that manufacture or import chemical substances to report data to EPA. This list is specific only to TSCA Manufacture and Import Facilities with reported per- and poly-fluoroalkyl (PFAS) substances. Data file is sourced from EPA's PFAS Analytic Tools TSCA dataset which includes CDR/Inventory Update Reporting data from 1998 up to 2020. Disclaimer: This data file includes production and importation data for chemicals identified in EPA's CompTox Chemicals Dashboard list of PFAS without explicit structures and list of PFAS structures in DSSTox. Note that some regulations have specific chemical structure requirements that define PFAS differently than the lists in EPA's CompTox Chemicals Dashboard. Reporting information on manufactured or imported chemical substance amounts should not be compared between facilities, as some companies claim Chemical Data Reporting Rule data fields for PFAS information as Confidential Business Information.

PFAS Waste Transfers from RCRA e-Manifest : PFAS E-MANIFEST r-PFAS-E-MANIFEST-bb

This Per- and Poly-Fluoroalkyl Substances (PFAS) Waste Transfers dataset is made available via the U.S. Environmental Protection Agency's (EPA) PFAS Analytic Tools. Every shipment of hazardous waste in the U.S. must be accompanied by a shipment manifest, which is a critical component of the cradle-to-grave tracking of wastes mandated by the Resource Conservation and Recovery Act (RCRA). According to the EPA, currently no Federal Waste Code exists for any PFAS compounds. To work around the lack of PFAS waste codes in the RCRA database, EPA developed the PFAS Transfers dataset by mining e-Manifest records containing at least one of these common PFAS keywords: • PFAS • PFOA • PFOS • PERFL • AFFF • GENX • GEN-X (plus the Vermont state-specific waste codes). Limitations: Amount or concentration of PFAS being transferred cannot be determined from the manifest information. Keyword searches may misidentify some manifest records that do not contain PFAS. This dataset should also not be considered to be exhaustive of all PFAS waste transfers.

Government Publication Date: Sep 22, 2024

PFAS Industry Sectors: PFAS IND r-PFAS-IND-bb

This Per- and Poly-Fluoroalkyl Substances (PFAS) Industry Sectors dataset is made available via the U.S. Environmental Protection Agency's (EPA) PFAS Analytic Tools. The EPA developed the dataset from various sources that show which industries may be handling PFAS including: EPA's Enforcement and Compliance History Online (ECHO) records restricted to potential PFAS-handling industry sectors; ECHO records for Fire Training Sites identified where fire-fighting foam may have been used in training exercises; and 14 CFR Part 139 Airports compiled from historic and current records from the FAA Airport Data and Information Portal. Since July 2006, all certificated Part 139 Airports are required to have fire-fighting foam onsite that meet certain military specifications, which to date have been fluorinated (Aqueous Film Forming Foam). Limitations: Inclusion in this dataset does not indicate that PFAS are being manufactured, processed, used, or released by the facility. Listed facilities potentially handle PFAS based on their industrial profile, but are unconfirmed by the EPA. Toxic Substances Control Act: TSCA

The U.S. Environmental Protection Agency (EPA) is amending the Toxic Substances Control Act (TSCA) section 8(a) Inventory Update Reporting (IUR) rule and changing its name to the Chemical Data Reporting (CDR) rule. The CDR enables EPA to collect and publish information on the manufacturing, processing, and use of commercial chemical substances and mixtures (referred to hereafter as chemical substances) on the TSCA Chemical Substance Inventory (TSCA Inventory). This includes current information on chemical substance production volumes, manufacturing sites, and how the chemical substances are used. This information helps the Agency determine whether people or the environment are potentially exposed to reported chemical substances. EPA publishes submitted CDR data that is not Confidential Business Information (CBI). EPA CDR collections occur approximately every four years and reporting requirements change per collection.

Integrated Compliance Information System (ICIS): rr-ICIS-bb

ICIS

The Integrated Compliance Information System (ICIS) database contains integrated enforcement and compliance information across most of U.S. Environmental Protection Agency's (EPA) programs. The vision for ICIS is to replace EPA's independent databases that contain enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions and a subset of the Permit Compliance System (PCS), which supports the National Pollutant Discharge Elimination System (NPDES). This information is maintained by the EPA Headquarters and at the Regional offices. A future release of ICIS will completely replace PCS and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities that support compliance and enforcement programs, including incident tracking, compliance assistance, and compliance monitoring.

The quantities of material a disposed of and procedures for disposal are not documented in published reports. Virtually all information concerning the potential for contamination at Nike sites is confined to personnel who were assigned to Nike sites. During deactivation most hardware was shipped to depot-level supply points. There were reportedly instances where excess materials were disposed of on or near the site itself at closure. There was reportedly no routine site decontamination.

Definitions

Database Descriptions: This section provides a detailed explanation for each database including: source, information available, time coverage, and acronyms used. They are listed in alphabetic order.

Detail Report: This is the section of the report which provides the most detail for each individual record. Records are summarized by location, starting with the project property followed by records in closest proximity.

Distance: The distance value is the distance between plotted points, not necessarily the distance between the sites' boundaries. All values are an approximation.

Direction: The direction value is the compass direction of the site in respect to the project property and/or center point of the report.

Elevation: The elevation value is taken from the location at which the records for the site address have been plotted. All values are an approximation. Source: Google Elevation API.

Executive Summary: This portion of the report is divided into 3 sections:

'Report Summary'- Displays a chart indicating how many records fall on the project property and, within the report search radii.

'Site Report Summary'-Project Property'- This section lists all the records which fall on the project property. For more details, see the 'Detail Report' section.

'Site Report Summary-Surrounding Properties'- This section summarizes all records on adjacent properties, listing them in order of proximity from the project property. For more details, see the 'Detail Report' section.

Map Key: The map key number is assigned according to closest proximity from the project property. Map Key numbers always start at #1. The project property will always have a map key of '1' if records are available. If there is a number in brackets beside the main number, this will indicate the number of records on that specific property. If there is no number in brackets, there is only one record for that property.

The symbol and colour used indicates 'elevation': the red inverted triangle will dictate 'ERIS Sites with Lower Elevation', the yellow triangle will dictate 'ERIS Sites with Higher Elevation' and the orange square will dictate 'ERIS Sites with Same Elevation.'

Unplottables: These are records that could not be mapped due to various reasons, including limited geographic information. These records may or may not be in your study area, and are included as reference.

APPENDIX 6 - QUESTIONNAIRES/PROVIDED INFORMATION

ASTM E1527-21
User Questionnaire
Property location: 1640 Tidelands Ave., National City, California (Assessor's Parcel Number: 7600445100)

This questionnaire is utilized In order to qualify for one of the Landowner Liability Protections (LLPs) offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "Brownfields Amendments"). LLPs is the term used to describe the three types of potential defenses to Superfund liability in EPA's *Interim Guidance Regarding Criteria Landowners Must Meet in order to Qualify for Bona Fide Prospective Purchaser, Contiguous Property Owner, or Innocent Landowner Limitations on CERCLA Liability* issued on March 6, 2003. The user must provide the following information (if available) to the environmental professional. Failure to provide this information could result in a determination that "all appropriate inquiry" is not complete.

1. **Environmental cleanup liens that are filed or recorded against the subject property (40 CFR 312.25).**
   Did a search of recorded land title records (or judicial records where appropriate) identify any environmental liens filed or recorded against the property under federal, tribal, state or local law? If such documentation is available, please provide.

   No

2. **Activity and use limitations that are in place on the subject property or that have been filed or recorded against the subject property**

   Did a search of land title records (or judicial records where appropriate, identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the subject property and/or have been filed or recorded against the subject property under federal, tribal, state or local law?

   Property is "Tidelands" property as defined in California Civil Code §§ 670, 830, and is subject to land use restrictions under state law.

3. **Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).**
   Do you have any specialized knowledge or experience related to the subject property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the subject property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

   No

NV5
4580 Stephen Circle, Suite 300
Canton, OH 44718
Fax: 866-486-2388
Phone: 800-787-8397

4. **Relationship of the purchase price to the fair market value of the subject property if it were not contaminated (40 CFR 312.29).**

Does the purchase price being paid for this subject property reasonably reflect the fair market value of the subject property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the subject property?

Land is being leased. The currently proposed lease payment reasonably reflects the fair market value of the property if the property were not contaminated.

5. **Commonly known or reasonably ascertainable information about the subject property (40 CFR 312.30).**

Are you aware of commonly known or reasonably ascertainable information about the subject property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example, as user,

a) Do you know the past use of the subject property?

The subject property has been used for industrial purposes by the United States Navy and the Port of San Diego. Based on commonly known information about such historice uses, it seems likely that discharges of hazardouse wastes, including liquid hydrocarbons and marine paints and solvents, occurred on the property

b) Do you know the specific chemicals that are present or once were present at the subject property?

No

c) Do you know of spills or other chemical releases that have taken place at the subject property?

No

d) Do you know of any environmental cleanups that have taken place at the subject property?

No

6. **The degree of obviousness of the presence or likely presence of the contamination at the subject property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).**

Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of contamination at the property?

See 5 above. The land has historically been used by the United States Navy and the Port of San Diego for purposes related to loading and unloading of marine cargo and the maintenance of naval and civilian vessels.

3.0 CURRENT PICKUP LEVEL AND TIME DLEAY SETTING

RELAY SETTINGS WERE TEMPORARILY MADE FOR SERVICE ENERGIZATION. THE DESIGN ENGINEER SHOULD BE CONSULTED FOR THE FINAL SETTINGS.

THE AS LEFT SETTINGS ARE 300 AMPS, 6 CYCLES DELAY.

4.0 PROCEDURES

4.1 VISUAL INSPECTION

.1 INSPECTED COMPONENTS FOR PHYSICAL DAMAGE, AND INSTALLATION IN COMPLIANCE WITH MANUFACTURER'S INSTRUCTIONS.

.2 DETERMINED GROUND SENSOR WAS LOCATED PROPERLY AROUND APPROPRIATE CONDUCTORS. ZERO SEQUENCE SENSING REQUIRES ALL PHASES AND THE NEUTRAL TO BE ENCIRCLED BY THE SENSOR.

.3 INSPECTED MAIN BONDING JUMPER TO ASSURE:

- PROPER SIZE
- TERMINATION ON LINE SIDE OF NEUTRAL DISCONNECT LINK.
- TERMINATION ON LINE SIDE OF SENSOR ON ZERO SEQUENCE SYSTEMS.

.4 INSPECTED GROUNDING ELECTRODE CONDUCTOR TO ASSURE:

- PROPER SIZE
- CORRECT SWITCHBOARD TERMINATION

.5 INSPECTED GROUND FAULT CONTROL POWER TRANSFORMER FOR PROPER INSTALLATION AND SIZE.

- WHEN CONTROL TRANSFORMER IS SUPPLIED FROM LINE SIDE OF GROUND FAULT PROTECTION CIRCUIT INTERRUPTING DEVICE, OVERCURRENT PROTECTION AND A CIRCUIT DISCONNECTING MEANS MUST BE PROVIDED.

.6 VISUALLY INSPECTED NEUTRAL DOWNSTREAM OF NEUTRAL DISCONNECT LINK TO VERIFY ABSENCE OF GROUNDS.

4.2 ELECTRICAL TESTS

.1 GROUND FAULT SYSTEM PERFORMANCE INCLUDING CORRECT RESPONSE OF THE CIRCUIT INTERRUPTING DEVICE WAS CONFIRMED BY PRIMARY GROUND SENSOR CURRENT INJECTION.

- RELAY PICKUP CURRENT WAS MEASURED.
- RELAY TIME DELAY WAS MEASURED AT TWO VALUES ABOVE PICKUP.

.2 TESTED SYSTEM OPERATION AT FIFTY-SEVEN PERCENT (57%) RATED VOLTAGE.

.3 FUNCTIONALLY CHECKED OPERATION OF GROUND FAULT RELAY TEST MONITOR PANEL FOR:

- TRIP TEST
- NO TRIP TEST
- NON-AUTOMATIC RESET

5.0 TEST RESULT EVALUATION

5.1 SYSTEM NEUTRAL INSULATION RESISTANCE SHOULD BE ABOVE 100 OHMS, AND PREFERRABLY 1 MEGOHM OR GREATER.

5.2 THE MAXIMUM PICKUP SETTING OF THE GROUND FAULT PROTECTION SHALL BE 1200 AMPERES, AND THE MAXIMUM TIME DELAY SHALL BE ONE SECOND FOR GROUND FAULT CURRENTS EQUAL TO OR GREATER THAN 3000 AMPERES (NEC 230-95A).

5.3 THE RELAY PICKUP CURRENT SHOULD BE WITHIN TEN PERCENT (10%) OF THE MANUFACTURER'S CALIBRATION MARKS OR FIXED SETTING.

5.4 RELAY TIMING SHOULD BE IN ACCORDANCE WITH THE MANUFACTURER'S PUBLISHED TIME CURRENT CHARACTERISITC CURVES.

6.0 RESULTS

A NEUTRAL FEEDER CONDUCTOR WAS FOUND INSTALLED BETWEEN THE 480/277 VOLT SWITCHBOARD AND THE SECONDARY SIDE OF TRANSFORMER "A". THIS IS AN IMPROPER INSTALLATION WHICH GROUNDS THE NEUTRAL DOWNSTREAM OF THE NEUTRAL DISCONNECT LINK AND ALSO ELIMINATES THE ISOLATION BETWEEN THE 480/277 VOLT SERVICE AND THE 208/120 SERVICE. THIS CONDUCTOR WAS REMOVED DURING TESTING AND A PROPER BOND JUMPER INSTALLED FROM THE TRANSFORMER ENCLOSURE TO THE X_0 TERMINAL. RESULTS INDICATE THE GROUND FAULT SYSTEM TO BE INSTALLED CORRECTLY AND TO BE OPERATIONAL.

(3) Off Street Parking: Private garage and/or automobile storage space required by the Zoning Ordinance of the City of National City will be built concurrently with the main buildings of which such garage or automobile storage spaces are accessory and will be maintained as private garages and/or automobile storage space for such main buildings. Automobile storage space 8' x 16' will be observed for each unit in the main buildings and will be completed for occupancy (curb cut, driveway installed and area levelled, oiled, blacktopped or concreted) prior to the final inspection and clearance by the Building Inspector.

(4) General: I will obtain full information from the City on sewer locations and depths, and street grades so that the building, plumbing and driveways will meet same.

I further agree that I will abide by the conditions imposed on the plot plan and site development by the City Building Inspector, City Planner and/or the City Engineer and agree that the City may delay any requested inspection and/or cease construction until such conditions are fulfilled. All information shown on the plot plan is accurate and correct. No construction will be commenced until the filing of this agreement and the final approval of the plot plan.

X. GENERAL COMMENTS

This case was opened in February 2012, because data collected as part of a site investigation for voluntary assistance case H39776-001 indicated that releases had occurred at the locations of reported former underground storage tanks known as UST #4 and UST #5. There were no available records documenting proper removal of these tanks. Diesel fuel and motor oil were detected in soil samples at 5 and 9 feet below ground surface near the former tank area UST #4. Gasoline was detected in soil below the water table (at 11 ft below ground surface) near the former location of UST #5. Earlier site assessments had been conducted at the site that had included soil sampling in these areas that were not previously reported to DEH.

Additional research indicated that the gasoline detected in the soil sample near former UST #5 may be attributable to the BNSF site

to the north, located at 1700 Cleveland Avenue, National City, CA, where a large area of petroleum hydrocarbon contaminated soil had been removed.

Additional investigation in the area of UST #4 indicated that the soil contamination was limited to diesel and motor oils, and the vertical and lateral extent of contamination was limited to the vicinity of the reported former underground tank. A total of five borings were drilled to fifteen feet below ground surface and soil samples were collected and analyzed. Volatile organic compounds naphthalene, n-butyl benzene and acetone were detected in one soil sample at low concentrations. The contaminated soil was found between 5 and 9 feet below ground surface. The consultant estimated that the total volume of contaminated soil in this area is approximately 45 cubic yards.

Diesel fuel, motor oil and VOCs with the exception of MTBE, were not detected in groundwater samples from three monitoring wells installed as part of the initial site investigation. MTBE was detected in one groundwater sample at a concentration of 13.3 ug/l, which is slightly above the maximum contaminant level of 12 ug/l. The consultant concluded there were no significant impacts to groundwater from the release. Groundwater beneath the site and in the area is classified as non-beneficial use.

The nearest surface water body is San Diego Bay. The lateral extent of the soil contamination does not exceed the building footprint on the northwest of the site, therefore it would not likely impact the water or life in the Bay.

There are electric, sewer and water lines around the perimeter of the site. These lines are usually buried between 1 and 8 feet below ground surface. While it is possible that some sewer lines and an electric line are located within the area of contaminated soil, the contaminants are large molecules and not likely to migrate far with infiltrating precipitation or runoff.

The consultant has concluded that the gasoline contamination detected in the soil at the water table at former UST #5 was from the adjacent property to the north, and that the diesel/oil contaminated soil remaining in the area of former UST #4 was limited in extent and had limited potential to migrate. They further stated the contaminated soil posed no apparent risks to human health, groundwater or the environment and requested no further action for the case. DEH concurs with this recommendation considering that natural attenuation should occur over time.

X. GENERAL COMMENTS

This case was opened to resolve environmental issues that were hindering the sale of the property. The property owner contacted DEH for assistance in determining resolution of the following environmental issues: there were reportedly 5 underground storage tanks (USTs) that were removed from the site, three of these removals were documented by DEH, two others did not have records for closure; additionally there was a former sump and dip tank area on the property which was used for the cleaning of wood sanding belts during furniture manufacturing. The USTs that were properly closed were done so prior to the time when DEH required soil sampling.

Soil, groundwater and soil vapor samples were collected from the former UST areas and the sump area during several environmental assessments (2001 – 2005) that were conducted for property transactions and gasoline, diesel fuel, motor oil and low levels of volatile organic compounds were detected in all media. Diesel fuel, motor oil and some volatile organic compounds were detected in surface soil samples (0.5 feet) collected in the area of the sump. The subsurface soil samples collected from the

sump area did not contain contaminants of concern (VOCs, fuels). In addition, gasoline, diesel fuel and motor oil were detected at several former UST locations.

Additional soil and groundwater sampling was conducted as part of the VAP investigation. Three monitoring wells and ten soil borings were installed and soil and groundwater samples were collected and analyzed. The ten soil borings were drilled to depths of approximately 15 feet. Diesel fuel and motor oil were detected in soil samples in the vicinity of former UST #4 and gasoline was detected in the vicinity of former UST #5; therefore LOP case no. H39776-002 was opened to investigate these unauthorized releases. Please see the closure documents for that case for additional information.

Groundwater samples were collected and MTBE was detected in one sample from well MW2 at a concentration of 13.3 ug/l, which is slightly above the maximum contaminant level. The source of the MTBE is unknown, however since the groundwater in the area is classified as non-beneficial use, the consultant did not consider it a cause for concern. The concentration of MTBE in groundwater would not pose an excess cancer risk to human health based on vapor intrusion.

There are electric, sewer and water lines around the perimeter of the site. These lines are usually buried between 1 and 8 feet below ground surface. There does not appear to be a threat to utilities based on the lack of contaminants found at the site. Groundwater is present at depths of 6.98 to 9.94 feet below ground surface. Although utilities could potentially be buried below the water table, the consultant concluded that the contaminants present are not likely to migrate with groundwater.

The nearest surface water body is San Diego Bay which is 1200 feet to the west. There should not be any impacts to the Bay from this site.

The consultant has concluded that the surface soil contamination associated with the sump was limited in areal and vertical extent and did not represent a significant environmental condition. The MTBE detected in groundwater was low in concentration and not necessarily attributable to the site. Therefore, the consultant concluded that the site did not pose a risk to human health, utilities, surface water or other sensitive receptors in the area of the site, and requested no further action for the case. DEH concurs with this recommendation.

X. GENERAL COMMENTS

Site 1, as originally identified, consisted of two buried former ship repair basins between Piers 11 and 12 Basins 3 and 4 each about 400 feet long, 80 feet wide, and 38 feet deep. These basins have sheet piling sides and unlined bottoms, and are enclosed on the west end by a steel-reinforced concrete quay wall. Between 1945 and 1972 some reportedly hazardous materials were discarded into the basins. Based on results of field studies of both soil and groundwater, a removal action was completed in 1997 at Basin 4, in which contaminated soil and debris were excavated and removed from the upper 10 feet of the basin. The excavated material was transported off site to permitted waste disposal facilities. Basin 4 was backfilled with clean soil and paved over for parking. A removal site evaluation report was finalized in 2000 that addressed soil and groundwater at both Basins 3 and 4, and further action was recommended due to levels of metals and semi-volatile organic compounds. Preparation of a work plan for carrying out a remedial investigation at Basins 3 and 4 is underway. The fieldwork will address possible contamination of both soil and groundwater. In an effort to thoroughly investigate past operations, the Navy conducted an additional review of historical aerial photographs. An April 1945 aerial photograph revealed two new basins at Site 1, now identified as Basins 1 and 2. (The current Basins 3 and 4 were formerly called North and South Basins.) Basins 1 and 2 lie approximately 300 feet north of Basin 3, between Piers 10 and 11. Base records show these basins were discontinued in 1946 and backfilled with unknown material. Former ship repair Basins 1 and 2 were recommended for no further action in the remedial investigation (RI) report in 2008. Ground water sampling at Basins 3 and 4 is scheduled for 2019 as part of the feasibility study. Objectives of the revised FS of IRP Site 1 are to evaluate current conditions, including the extent of VOC, SVOC, PAH, metals (including mercury and hexavalent chromium), pesticides, and PCB contamination in groundwater, and to assess potential risks posed to human health and the environment.

ADDITIONAL COMMENTS: In 1987 a 1000 gallon Bunker C oil tank was removed near the location of Area #2. At the time of the removal, the inspector did not observe any release associated with that tank.

An site assessment investigation was initiated by the property owner between 1988 and 1989 during grading operations at the site. During site construction, contaminated soil in the impacted areas were removed. The soil was taken to Casmalia for disposal. The soil was removed to a depth of 6 feet below ground surface over the entire site. Confirmation samples were collected in Area 1 and the results verified clean-up in that area. In the current investigation, a confirmation sample was collected at the HA-3-1 to verify clean-up. The results confirmed that clean-up was during achieved the soil removal activities in 1989. No further action was required.

Case Closure Summary
Leaking Underground Fuel Storage Tank Program

H39766-002

Comments:

This case was opened in February 2012, because data collected as part of a site investigation for voluntary assistance case H39776-001 indicated that releases had occurred at the locations of reported former underground storage tanks known as UST #4 and UST #5. There were no available records documenting proper removal of these tanks. Diesel fuel and motor oil were detected in soil samples at 5 and 9 feet below ground surface near the former tank area UST #4. Gasoline was detected in soil below the water table (at 11 ft below ground surface) near the former location of UST #5. Earlier site assessments had been conducted at the site that had included soil sampling in these areas that were not previously reported to DEH.

Additional research indicated that the gasoline detected in the soil sample near former UST #5 may be attributable to the BNSF site to the north, located at 1700 Cleveland Avenue, National City, CA, where a large area of petroleum hydrocarbon contaminated soil had been removed.

Additional investigation in the area of UST #4 indicated that the soil contamination was limited to diesel and motor oils, and the vertical and lateral extent of contamination was limited to the vicinity of the reported former underground tank. A total of five borings were drilled to fifteen feet below ground surface and soil samples were collected and analyzed. Volatile organic compounds naphthalene, n-butyl benzene and acetone were detected in one soil sample at low concentrations. The contaminated soil was found between 5 and 9 feet below ground surface. The consultant estimated that the total volume of contaminated soil in this area is approximately 45 cubic yards.

Diesel fuel, motor oil and VOCs with the exception of MTBE, were not detected in groundwater samples from three monitoring wells installed as part of the initial site investigation. MTBE was detected in one groundwater sample at a concentration of 13.3 ug/l, which is slightly above the maximum contaminant level of 12 ug/l. The consultant concluded there were no significant impacts to groundwater from the release. Groundwater beneath the site and in the area is classified as non-beneficial use.

The nearest surface water body is San Diego Bay. The lateral extent of the soil contamination does not exceed the building footprint on the northwest of the site, therefore it would not likely impact the water or life in the Bay.

There are electric, sewer and water lines around the perimeter of the site. These lines are usually buried between 1 and 8 feet below ground surface. While it is possible that some sewer lines and an electric line are located within the area of contaminated soil, the contaminants are large molecules and not likely to migrate far with infiltrating precipitation or runoff.

The consultant has concluded that the gasoline contamination detected in the soil at the water table at former UST #5 was from the adjacent property to the north, and that the diesel/oil contaminated soil remaining in the area of former UST #4 was limited in extent and had limited potential to migrate. They further stated the contaminated soil posed no apparent risks to human health, groundwater or the environment and requested no further action for the case. DEH concurs with this recommendation considering that natural attenuation should occur over time.

Comments:

This case was opened to resolve environmental issues that were hindering the sale of the property. The property owner contacted DEH for assistance in determining resolution of the following environmental issues: there were reportedly 5 underground storage tanks (USTs) that were removed from the site, three of these removals were documented by DEH, two others did not have records for closure; additionally there was a former sump and dip tank area on the property which was used for the cleaning of wood sanding belts during furniture manufacturing. The USTs that were properly closed were done so prior to the time when DEH required soil sampling.

Soil, groundwater and soil vapor samples were collected from the former UST areas and the sump area during several environmental assessments (2001 – 2005) that were conducted for property transactions and gasoline, diesel fuel, motor oil and low levels of volatile organic compounds were detected in all media. Diesel fuel, motor oil and some volatile organic compounds were detected in surface soil samples (0.5 feet) collected in the area of the sump. The subsurface soil samples collected from the sump area did not contain contaminants of concern (VOCs, fuels). In addition, gasoline, diesel fuel and motor oil were detected at several former UST locations.

Additional soil and groundwater sampling was conducted as part of the VAP investigation. Three monitoring wells and ten soil borings were installed and soil and groundwater samples were collected and analyzed. The ten soil borings were drilled to depths of approximately 15 feet. Diesel fuel and motor oil were detected in soil samples in the vicinity of former UST #4 and gasoline was detected in the vicinity of former UST #5; therefore LOP case no. H39776-002 was opened to investigate these unauthorized releases. Please see the closure documents for that case for additional information.

Groundwater samples were collected and MTBE was detected in one sample from well MW2 at a concentration of 13.3 ug/l, which is slightly above the maximum contaminant level. The source of the MTBE is unknown, however since the groundwater in the area is classified as non-beneficial use, the consultant did not consider it a cause for concern. The concentration of MTBE in groundwater would not pose an excess cancer risk to human health based on vapor intrusion.

There are electric, sewer and water lines around the perimeter of the site. These lines are usually buried between 1 and 8 feet below ground surface. There does not appear to be a threat to utilities based on the lack of contaminants found at the site. Groundwater is present at depths of 6.98 to 9.94 feet below ground surface. Although utilities could potentially be buried below the water table, the consultant concluded that the contaminants present are not likely to migrate with groundwater.

The nearest surface water body is San Diego Bay which is 1200 feet to the west. There should not be any impacts to the Bay from this site.

The consultant has concluded that the surface soil contamination associated with the sump was limited in areal and vertical extent and did not represent a significant environmental condition. The MTBE detected in groundwater was low in concentration and not necessarily attributable to the site. Therefore, the consultant concluded that the site did not pose a risk to human health, utilities, surface water or other sensitive receptors in the area of the site, and requested no further action for the case. DEH concurs with this recommendation.

Executive Summary

This Sampling and Analysis Plan (SAP) was prepared by CH2M HILL, Inc. (CH2M), a wholly owned subsidiary of Jacobs, under Naval Facilities Engineering Systems Command (NAVFAC) Atlantic's Comprehensive Long-Term Environmental Action–Navy (CLEAN) Contract N62470-21-D-0007, Contract Task Order N6247322F4619, for submittal to NAVFAC Southwest. This SAP presents the post Record of Decision (ROD) groundwater long-term monitoring (LTM) at Installation Restoration Program (IRP) Site 1, Former Ship Repair Basins 3 and 4 at Naval Base San Diego (NBSD) in San Diego, California. NBSD is located at the southeastern section of San Diego Bay.

The ROD for IRP Site 1 (Navy, 2022) was signed in 2022. Land use controls (LUCs) are the final remedy selected for soil in Basin 3 and a portion of Basin 4 and LUCs with groundwater monitoring are the final remedy selected for groundwater for Basin 3 and a portion of Basin 4 pursuant to the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) and the National Oil and Hazardous Substances Pollution Contingency Plan.

As stipulated in the ROD, groundwater monitoring will be conducted every 5 years during the Five-Year Review for the duration of the groundwater LUCs to assess the protectiveness of the LUCs and progress of natural degradation to achieve the remedial goals (RGs) for the groundwater chemicals of concern (COCs). This SAP covers one sampling event of the CERCLA five-year review process.

RGs were developed based on reasonable maximum exposure for a construction worker exposed to COCs in shallow groundwater via inhalation or dermal contact (Navy, 2023). Groundwater is not used as a drinking water supply at or near IRP Site 1 or NBSD. The California Regional Water Quality Control Board, San Diego Region (SD-RWQCB) has determined in the Basin Plan (SD-RWQCB, 1994) that, because of hydrogeologic conditions, the naturally poor quality groundwater underlying NBSD has no beneficial use. There is no plan to develop underlying groundwater resources for drinking water or any other beneficial uses.

Project Objectives

The objectives of the post ROD groundwater monitoring are to confirm that concentrations of groundwater COCs downgradient and outside of the LUC boundaries for IRP Site 1 Basins 3 and 4 remain below RGs, which are protective of construction worker exposure to groundwater and evaluate if concentrations of groundwater COCs inside of the LUC boundary are stable or attenuating.

Planned Activities at IRP Site 1

Groundwater sampling will be conducted during one event at 28 existing monitoring wells located within or adjacent to the LUC boundaries of Basins 3 and 4, as described in the LUC Remedial Design (RD) (Navy, 2023). The groundwater sample locations provide a representative distribution of site conditions including monitoring wells located within the soil source areas and upgradient, downgradient and cross-gradient locations. Groundwater samples will be analyzed for the following groundwater COCs:

- Basin 3: benzene, 2-methylnaphthalene, benzo(a)anthracene, dibenzofuran, and naphthalene

- Basin 4: benzo(a)anthracene, naphthalene, pentachlorophenol

Data collected will be incorporated into the Five-Year Review protectiveness evaluation. COC concentrations will be compared to the RGs and the progress of natural degradation to achieve the RGs for the groundwater COCs will be assessed by evaluating concentration trends over time as they compare to the RGs. The LTM program will be optimized in collaboration with California Department of Toxic Substances Control (DTSC) and the SD-RWQCB as the RGs for COCs are met.

Organization of the Sampling and Analysis Plan

This SAP is organized according to the *Uniform Federal Policy for Quality Assurance Project Plans: Evaluating, Assessing, and Documenting Environmental Data Collection and Use Programs - Part 1: UFP-QAPP Manual* (UFP-QAPP) (EPA, 2005b). The UFP-QAPP is the companion to the *Uniform Federal Policy for Implementing Environmental Quality Systems: Evaluating, Assessing, and Documenting Environmental Data Collection/Use and Technology Programs* (EPA, 2005a) and was developed to consistently implement the quality system requirements of *American National Standard: Quality Systems for Environmental Data and Technology Programs – Requirements with Guidance for Use* (ASQ, 2004).

This document consists of the 37 worksheets specific to the SAP. All tables are embedded within the worksheets. All figures are provided at the end of the worksheets. The following are provided as appendixes:

SAP Worksheet #10—Conceptual Site Model

A conceptual site model (CSM) has been developed to guide the post ROD groundwater long-term monitoring (LTM) for IRP Site 1 at NBSD. The CSM is summarized in **Table 10-1.**

Table 10-1. Conceptual Site Model for Installation Restoration Program Site 1

NBSD Location	NBSD occupies approximately 1,355 acres of land and water along the eastern shore of San Diego Bay (**Figure 10-1**). It straddles the boundaries of the cities of San Diego and National City.
Site Name	IRP Site 1, Former Ship Repair Basins 3 and 4 (**Figure 10-2**)
Site Location	IRP Site 1 is roughly bordered to the north by 10th Street (Basin 3 borders 11th Street), east by Kidd Street, south by 12th Street, and west by San Diego Bay (**Figure 10-3**). The western sides of the former basins are enclosed by a quay wall that separates the basins from San Diego Bay.
Size	IRP Site 1, Former Basins 3 and 4 were each approximately 28 to 29 feet deep, 400 feet long, and 80 feet wide (Blaylock-Willis and Associates, 1989) (**Figure 10-3**).
Access	IRP Site 1 is located on NBSD, with access through a main gate.
Terrain	The ground surface at former Basins 3 and 4 are paved asphalt parking areas.
Vegetation	None
Hydrology/ Surface Water	Much of the waterfront property at NBSD is reclaimed marshland and tidal flats. NBSD is generally characterized by low relief. Because IRP Site 1 Former Ship Repair Basins 3 and 4 are paved and occupied by parking lots, the pavement inhibits infiltration of surface water into the underlying soil. Topography and drainage at the site are relatively flat with a slight slope to the west toward San Diego Bay. Stormwater is directed via sheet flow to catch basins that feed into Navy-owned and Navy-maintained storm drain systems, which direct the flow away from IRP Site 1 and eventually to San Diego Bay. The catch basins and storm drains do not intersect any of the former basins (Navy, 2023).
Geology/ Hydrogeology	Three main types of fill material are present in the upper soil at IRP Site 1: fill derived from dredging San Diego Bay, waste material disposed of in former Basins 3 and 4, and conventional fill obtained from other offsite sources to a depth of approximately 28 feet below ground surface (bgs). Native material immediately underlying the fill at IRP Site 1 is composed of silt, clay, and silty sand bay deposits to 30 feet bgs at the eastern end of the site and 33 to 37 feet bgs at the western end of the site. Three water-bearing zones characterize groundwater in the vicinity of IRP Site 1 to a depth of approximately 85 feet bgs. The shallow water-bearing zone is an unconfined perched groundwater zone present at approximately 10 to 20 feet bgs is situated within the fill material and the upper part of the bay deposits and is in contact with the wastes in former Basin 3 and a portion of Basin 4. The intermediate water-bearing zone is approximately 37 to 47 feet bgs, and the deep water-bearing zone is approximately 58 to 82 feet bgs. The intermediate and deep water-bearing zones are confined aquifers. These water-bearing zones are separated by lower-permeability, apparently continuous, silts and clays. Groundwater flow is generally toward the west across the site in the shallow and intermediate-depth wells. Groundwater in the deep wells flows toward the east (Navy, 2023).

SAP Worksheet #10—Conceptual Site Model (continued)

Table 10-1. Conceptual Site Model for Installation Restoration Program Site 1

Historical Use	IRP Site 1, Former Ship Repair Basins, was used to construct concrete barges during World War II. IRP Site 1 consists of four former ship repair basins located in two distinct areas: former Basins 1 and 2 to the north, and former Basins 3 and 4 to the south (**Figure 10-3**). Before the development of NBSD, the general area in the vicinity of IRP Site 1 was undeveloped and was part of San Diego Bay. By approximately 1942, IRP Site 1 and the surrounding land had been constructed of artificial fill. The site was owned and occupied by Concrete Ship Constructors of National City from 1942 until 1946, when the Navy acquired the property. Concrete Ship Constructors built 22 concrete barges for the Navy inside the former basins between October 1942 and May 1944. The former basins are approximately 28 feet deep, 400 feet long, and 80 feet wide. The quay wall consists of concrete-reinforced, steel sheet pile to a depth of approximately 60 feet bgs. The former basins are not visible at the ground surface. Wood pilings extend below the bottoms of the basins to a depth of approximately 36 to 39 feet bgs (Navy, 2022). The former basins have steel sheet piling and concrete sides to approximately 28 feet bgs on the north, south, and east sides. During use, the western sides of the basins could be opened to allow ships to enter for repairs and to allow repaired ships and constructed concrete barges to exit the basins and to allow water to enter and exit the basins to facilitate repairs and barge construction. The western sides of former Basins 3 and 4 are enclosed by a steel-reinforced concrete quay wall that separates the former basins and San Diego Bay. Plans for the quay wall indicate dual-wall construction and a total depth of approximately 60 feet bgs. Subsurface quay wall structural reinforcements and supports (tieback system) extend approximately 70 to 80 feet into the former basins (Tetra Tech, 2020). Use of former Basins 1 and 2 was discontinued in 1946, and in 1947, they were filled and abandoned with no indications of waste disposal. In the 1990s, the area above former Basins 1 and 2 was paved. Currently, the eastern and western portions of former Basins 1 and 2 are paved with asphalt and concrete, whereas the central portion of the basins is occupied with parking areas and buildings (Navy, 2023). From 1940 to 1972, IRP Site 1 Former Ship Repair Basins 3 and 4 were used as informal waste disposal pits for a wide variety of solid and liquid wastes generated from various industrial, maintenance, training, and construction activities at NBSD. Wastes disposed at former Basins 3 and 4 included scrap metals, lubricants, and oils from decommissioned ships, as well as undocumented wastes from other facilities at NBSD. By 1972, the surfaces of former Basins 3 and 4 were graded and paved with asphalt and used as parking areas. In 1997, the upper 10 feet of soil were excavated during a time-critical removal action (TCRA) from the eastern approximately 80 percent of former Basin 4 (Navy, 2023).
Current Land Use	Current land use at IRP Site 1 is commercial and industrial. Former Basins 3 and 4 have facilities for the parking areas including roadways, curbs, lighting, and underground utilities. A building overlies the easternmost portion of former Basin 3 (Navy, 2022).
Future Land Use	Reasonably anticipated future land use is continued industrial and parking use (Navy, 2022).
Source/Release Mechanisms	Infiltration to groundwater

Table 10-1. Conceptual Site Model for Installation Restoration Program Site 1

Historical Reports	• Initial Assessment Study (NEESA, 1986) • Site Inspection (Jacobs, 1993) • Background Study (Bechtel National, 1996) • TCRA (OHM, 1998) • Removal Site Evaluation (Bechtel National, 2000) • Remedial Investigation (RI) (Bechtel Environmental, 2008) • Feasibility Study (Trevet, 2011) • Addendum to the Feasibility Study (Tetra Tech, 2020) • Proposed Plan (Navy, 2021) • ROD (Navy, 2022) • LUC RD (Navy, 2023)
Time-Critical Removal Action	A TCRA was conducted in 1997 (OHM, 1998) to address contamination at IRP Site 1 Former Ship Repair Basin 4. Approximately 17,200 tons of polycyclic aromatic hydrocarbon (PAH)-, polychlorinated biphenyl (PCB)-, and metal-impacted soil from the eastern 80 percent of former Basin 4 were excavated and transported offsite for disposal. Because of subsurface utilities and the subsurface tieback system anchored to the quay wall, the westernmost portion of former Basin 4 was not excavated (Navy, 2023).
RI: Nature and Extent of Contamination in Soil	The nature and extent of soil contamination were evaluated in the RI (Bechtel Environmental, 2008). The RI concluded that: • Semivolatile organic compounds (SVOCs), PAHs, PCBs, and metals are present in soil at IRP Site 1 Former Basins 3 and 4. • Soil impacts at IRP Site 1 are confined within the boundaries of former Basins 3 and 4, ranging from near the ground surface (below the pavement of the parking lot) to a depth of 28 feet bgs within former Basin 3, from 10 to 28 feet bgs in the eastern 80 percent of former Basin 4 (previous TCRA area), and from 1 to 28 feet bgs in the western portion of former Basin 4.). • Waste material and associated soil contamination are not present outside the former basin footprints.
RI: Nature and Extent of Contamination in Groundwater	The nature and extent of groundwater contamination was evaluated in the RI (Bechtel Environmental, 2008). The RI concluded that: • Volatile organic compounds (VOCs), SVOCs, and PAHs were present in groundwater at IRP Site 1 Former Basins 3 and 4. • The presence of PAHs was likely the result of placement of dredged sediment from San Diego Bay and possible leaching from creosote-treated wood at and below the bottom of the basins. • The highest concentrations of VOCs were primarily associated with low-pH conditions in monitoring wells screened in the intermediate water-bearing zone. • SVOCs were primarily detected in deeper groundwater (40 feet bgs) below the bottom of the former basins. The distribution of SVOCs indicates they are likely associated with the creosote-treated timber piles that extend from the bottom of the former basins to depths estimated at 10 to 15 feet below the bottom of the basins.

Table 10-1. Conceptual Site Model for Installation Restoration Program Site 1

RI: Conclusions from the Human Health Risk Assessment	The baseline human health risk assessment (HHRA) conducted during the RI (Bechtel Environmental, 2008) evaluated risks associated with applicable receptors and exposure pathways, including future hypothetical residential use, to determine whether land use restrictions were needed (Navy, 2022). The HHRA evaluated former Basins 3 and 4 as separate units. The HHRA for soil exposure at former Basin 4 only evaluated the western 20 percent of the basin (the eastern 80 percent had been addressed previously under the TCRA), while the HHRA for soil at former Basin 3 evaluated all of former Basin 3. The following receptors and pathways were evaluated in the baseline HHRA: • Hypothetical residents and office/industrial workers through dermal contact with, incidental ingestion of, and particulate inhalation of impacted soil; and through inhalation of chemical vapors in soil gas inside buildings. • Construction/utility workers through dermal contact with, incidental ingestion of, and particulate inhalation of impacted soil; through inhalation of vapors in soil gas in outdoor air; and through dermal contact with shallow groundwater. The baseline HHRA did not evaluate exposure of future residents and site receptors to contaminants using groundwater as a drinking water source. This exposure pathway was not assessed because of the lack of beneficial use, current controls prohibiting development of underlying groundwater resources, and the naturally poor quality groundwater (Tetra Tech, 2020). For former Basin 3, the baseline HHRA concluded that cancer risk estimates for the industrial workers, construction/utility workers, and hypothetical residents exceed the United States Environmental Protection Agency (EPA) target risk range and the DTSC risk management range of 1×10^{-6} to 1×10^{-4}. For former Basin 4, the cancer risk estimates for the industrial workers and construction/utility workers are within the EPA target risk range and the DTSC risk management range but exceeds the EPA target risk range and the DTSC risk management range for hypothetical residents. The noncancer HI exceeded 1 for hypothetical residents, industrial workers, and construction workers in both basins, except for the industrial worker in former Basin 4. The chemicals that contributed to the former Basin 3 cancer risk and noncancer HI estimates for a construction worker exposed to groundwater (that is, risk drivers) included VOCs (benzene, naphthalene), PAHs (benzo(a)anthracene), and SVOCs (dibenzofuran and 2-methylnaphthalene). The chemicals that contributed to the former Basin 3 cancer risk and noncancer HI estimates for a construction worker, resident or industrial worker exposed to soil include PAHs (benzo(a)pyrene), PCBs (Aroclor 1260), and metals (arsenic (construction worker, resident or industrial worker) and manganese (resident only)). The chemicals that contributed to the former Basin 4 cancer risk and noncancer HI estimates for a construction worker exposed to groundwater (that is, risk drivers) include VOCs (naphthalene) and SVOCs (pentachlorophenol). The chemicals that contributed to the former Basin 4 cancer risk and noncancer HI estimates for a construction worker, resident or industrial worker exposed to soil include PAHs (benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(ah)anthracene and chrysene), PCBs (Aroclor 1254 (residential and construction)), and metals (arsenic (construction worker, resident or industrial worker) and hexavalent chromium and manganese (resident only)). The chemicals that contributed to the former Basin 4 cancer risk and noncancer HI estimates for a resident exposed to soil gas (via vapor intrusion) include VOCs (1,3-butadiene).

SAP Worksheet #10—Conceptual Site Model (continued)

Table 10-1. Conceptual Site Model for Installation Restoration Program Site 1

RI: Conclusions from the Ecological Risk Assessment	The screening level ecological risk assessment in the RI (Bechtel Environmental, 2008) concluded that IRP Site 1 poses no unacceptable ecological risk and no action is necessary to ensure protection of ecological receptors.
ROD	The ROD for IRP Site 1 was finalized in 2022 (Navy, 2022). • Selected Remedy - **Soil:** The selected remedy for soil at IRP Site 1 Former Ship Repair Basin 3 and the western portion of Basin 4 is LUCs comprising institutional controls to mitigate receptor exposure to contaminants in soil. Implementation and enforcement of LUCs will reduce the potential for human exposure to contaminated soil and will allow for continuation of current and reasonably anticipated future site uses. - **Groundwater:** The selected remedy for groundwater at IRP Site 1 Former Ship Repair Basin 3 and the western portion of Basin 4 was LUCs comprising institutional controls with groundwater monitoring. Groundwater monitoring will be conducted, and LUCs will be maintained, until the concentrations of hazardous substances in groundwater have been reduced to levels that allow for unlimited use and unrestricted exposure. • Remedial Action Objectives - **Soil:** Protect human health by preventing dermal contact and ingestion of soil and waste in former Basin 3 and in the unexcavated western portion of former Basin 4 (the portion not already addressed by the previous TCRA), which contain SVOCs, PAHs, PCBs, and metals that may present unacceptable risk. - **Groundwater:** Protect human health by preventing dermal contact with groundwater in the shallow unconfined water-bearing zone, within the boundaries of former Basin 3 and the western portion of Basin 4, which contain VOCs, SVOCs, and PAHs and that may present unacceptable risk.
LUC RD	The LUC RD was developed in 2023 (Navy, 2023) to address LUC implementation actions along with LTM at former Basins 3 and 4 in accordance with the IRP Site 1 ROD (Navy, 2022) and the NBSD Federal Facilities Site Remediation Agreement. Because the ROD did not specify groundwater remedial goals (RGs) to evaluate the effectiveness of the ICs protective of construction workers, the LUC RD documents remedy component details for groundwater including chemicals of concern (COCs), groundwater RGs, and groundwater LTM. The LUC RD specified the following: • Based on the HHRA (Bechtel, 2008), benzene, 2-methylnaphthalene, benzo(a)anthracene, dibenzofuran, and naphthalene were identified as the COCs for former Basin 3 shallow groundwater; and benzo(a)anthracene, naphthalene, and pentachlorophenol were identified as the COCs for former Basin 4 shallow groundwater. • RGs were developed based on reasonable maximum exposure for a construction worker exposed to COCs in shallow groundwater via dermal contact and potential inhalation of off-gassing vapors to ensure the protectiveness of the groundwater LUC boundaries. The ICs in place prohibit residential use within the LUC boundaries. In addition, groundwater is not used as a drinking water supply at or near IRP Site 1 or NBSD. The SD-RWQCB has determined in the Basin Plan (SD-RWQCB, 1994) that, because of hydrogeologic conditions, the naturally poor quality groundwater underlying NBSD has no beneficial use. There is no plan to develop underlying groundwater resources for drinking water or any other beneficial uses.

SAP Worksheet #10—Conceptual Site Model (continued)

Table 10-1. Conceptual Site Model for Installation Restoration Program Site 1

LUC RD (continued)	• The following RGs are based on a target cancer risk of $1x10^{-6}$ or a target noncancer hazard quotient of 1 using DTSC (2019a, 2019b) and EPA (2014, 2022) exposure parameters and toxicity factors for construction worker exposure: **Basin 3 COCs** - Benzene – 790 micrograms per liter (µg/L) - 2-methylnaphthalene – 1,300 µg/L - Benzo(a)anthracene – 1,500 µg/L - Dibenzofuran – 930 µg/L - Naphthalene – 210 µg/L **Basin 4 COCs** - Benzo(a)anthracene – 1,500 µg/L - Naphthalene – 210 µg/L - Pentachlorophenol – 18 µg/L • Groundwater monitoring will be conducted until the concentrations of COCs in groundwater no longer exceed the RGs. The monitoring approach focuses on 28 existing monitoring wells within and adjacent to the footprint of former Basins 3 and 4 (**Figure 10-4**). The groundwater sampling locations provide a representative distribution of site conditions including wells within the soil source areas and upgradient, downgradient and cross-gradient locations. • Groundwater sampling will be conducted once every 5 years during the Five-Year Review for the duration of the groundwater LUCs to evaluate whether concentrations of groundwater COCs downgradient and outside of the LUC boundaries remain below groundwater RGs protective of construction worker potential exposures and to evaluate the progress toward achieving the RGs for the groundwater COCs. The LTM program will be optimized in collaboration with DTSC and the SD-RWQCB as the RGs for COCs are met. Historical analytical data for Basins 3 and 4 for the COCs are included in **Appendix A** (Tables A-1 through A-6).

SAP Worksheet #11—Project Quality Objectives/Systematic Planning Process Statements

STEP 1: State the Problem

The selected remedy for groundwater at IRP Site 1 Former Ship Repair Basins 3 and 4 is LUCs with long-term groundwater monitoring. Groundwater monitoring is to be conducted every 5 years for the duration of the LUCs to assess the progress toward achieving the RGs for the groundwater COCs. As a result, groundwater monitoring is necessary to support development of the first Five-Year Review for IRP Site 1 in 2024.

STEP 2: Identify the Goals of the Study

1. Are concentrations of groundwater COCs downgradient and outside of the LUC boundaries for IRP Site 1 Basins 3 and 4 below RGs protective for construction worker exposure?
2. Are concentrations of groundwater COCs inside of the LUC boundary stable or naturally degrading (that is, attenuating)?

STEP 3: Identify Information Inputs

The following are information inputs for this groundwater monitoring event:

- Validated historical groundwater analytical data collected during previous investigations (**Worksheet #13, Appendix A**)
- Validated groundwater analytical data collected during this investigation
- LUC RD (Navy, 2023)
- Basin-specific COCs (Navy, 2022, 2023)
- RGs (**Worksheet #15**)
- Groundwater elevation surveys performed during this investigation
- Data quality indicators (DQIs) (**Worksheet #37)**

STEP 4: Define the Study Boundaries

- The lateral boundary for the investigation is limited to the existing monitoring wells located within the LUC boundaries as well as the existing monitoring wells outside (upgradient, downgradient, and cross gradient) of the LUC boundaries of IRP Site 1 Basins 3 and 4.
- The vertical boundary for the investigation ranges from the ground surface to approximately 77 feet bgs, which is the depth of the deepest monitoring well.
- The medium of interest is groundwater.
- The temporal boundary for the investigation will be one sampling event in 2023 coinciding with the CERCLA Five-Year Review process. (**Worksheet #16**).

SAP Worksheet #11—Project Quality Objectives/Systematic Planning Process Statements(continued)

STEP 5: Develop the Analytical Approach

1a. If concentrations of groundwater COCs downgradient and outside of the LUC boundaries for IRP Site 1 Basins 3 and 4 are below RGs (**Worksheet #15**), then the existing LUC boundaries are protective of human health (construction worker exposure).

1b. If concentrations of groundwater COCs downgradient and outside of the LUC boundaries for IRP Site 1 Basins 3 and 4 are above RGs (**Worksheet #15)**, then the Navy would consider modifying the LUC boundary to ensure protection of human health (construction worker exposure).

2a. If concentrations of groundwater COCs are stable or naturally degrading (that is, attenuating) inside of the LUC boundary based on an evaluation of concentration trends over time compared to analytical data collected during this Five-Year Review, then groundwater monitoring will continue as part of Five-Year Reviews to assess the progress of the remedy to achieve RGs.

2b. If concentrations of groundwater COCs are not stable or naturally degrading (that is, attenuating) inside of the LUC boundary based on evaluation of concentration trends over time compared to analytical data collected during this Five-Year Review, then the Navy may consider expanding the groundwater monitoring network prior to the next Five-Year Review period.

STEP 6: Specify Performance or Acceptance Criteria

Per the ROD, the sample locations for this investigation include the 28 existing monitoring wells located within and adjacent to the footprint of former Basins 3 and 4 at IRP Site 1 (**Figure 10-4**). The groundwater sample locations were identified in the ROD as providing a representative distribution of site conditions including monitoring wells within the soil source areas and upgradient, downgradient, and cross-gradient locations.

Groundwater samples will be collected using the field sampling and processing methods as described in **Worksheet #14**. For reproducibility and comparability of analytical data, standard EPA-approved analytical methods will generally be used.

Performance criteria for this investigation are based on the following DQIs: precision, accuracy, representativeness, completeness, comparability, and sensitivity (PARCCS). Sensitivity requirements are established by the RGs presented in **Worksheet #15**. The limit of quantitation (LOQ), which is defined as the lowest calibrated concentration for a target analyte, will be the metric to define whether an analytical result is quantifiable. The laboratory will report all nondetected analytes at the limit of detection (LOD), which is the minimum concentration of a substance reliably detected by the given analytical method. The laboratory detection limit (DL) is the statistically lowest concentration above zero (that is, a blank concentration) at which the laboratory will report detected results. Concentrations will be reported as estimated values (“J” qualified) if the concentrations are less than the LOQ but greater than the DL or LOD. Estimated data are considered usable data for data evaluation. However, the increased uncertainties associated with estimated (“J” qualified) concentrations relative to unqualified data, will be

SAP Worksheet #11—Project Quality Objectives/Systematic Planning Process Statements(continued)

discussed as part of the Data Quality Assessment (DQA) (**Worksheet #37**) in the groundwater sampling summary report.

Requirements for other DQIs are presented in **Worksheets #12, #28,** and **#37**. Application of data verification/validation steps and DQIs in the overall assessment of data quality and usability is described in **Worksheet #37**.

STEP 7: Develop the Plan for Obtaining Data

The sampling design and rationale are discussed in detail in **Worksheet #17.** The general sampling plan at IRP Site 1 includes the following:

- Groundwater samples will be collected from 28 existing monitoring wells located within, upgradient, downgradient, and cross-gradient of former Basins 3 and 4 at IRP Site 1.
- Groundwater samples will be analyzed for the COCs identified in the LUC RD (Navy, 2023), by basin:
  - Basin 3: benzene, 2-methylnaphthalene, benzo(a)anthracene, dibenzofuran, and naphthalene.
  - Basin 4: benzo(a)anthracene, naphthalene, and pentachlorophenol.
- Samples will be collected during one event to coincide with the Five-Year Review process.
- Groundwater samples will be submitted to a laboratory that is certified by the State of California Environmental Laboratory Accreditation Program (ELAP) and accredited by the DoD ELAP.

14.1 Preparatory Activities

Before conducting field activities, the NAVFAC Southwest RPM and appropriate NBSD personnel will be notified of the anticipated fieldwork and schedule. A field kickoff meeting will be conducted and will include (but may not be limited to) the NAVFAC Southwest RPM, PM, FTL, SSHO, field personnel, and HSM. The primary discussion points for the meeting will include scope of work, schedule, logistics, and field coordination issues, and safe access to the monitoring well locations. Subcontractors with qualifications capable of meeting all procedures identified within this SAP will be procured for groundwater sampling services, laboratory analysis, data validation, and IDW management (characterization and transportation to an approved disposal facility).

Before conducting field activities, field personnel will review the applicable sections of the SAP, schedule, and APP-SSHP, and sign the SAP Project Personnel Sign-off Sheet (**Worksheet #4**). Safety considerations for proposed field tasks are discussed in the project-specific APP-SSHP (submitted under separate cover).

14.2 Field Notes

Field notes will be taken in accordance with the SOP 001, *Preparing Field Logbooks* (provided in **Worksheet #21; Appendix B**).

Field notes will be kept in bound, weatherproof notebooks. Notes will be taken with waterproof, non-erasable ink. Field staff completing separate tasks will keep separate notes, as necessary, according to the following protocol:

- Company name, address, author, activity, location, project name, PM, and emergency contact information will be included on the first page of notes.
- All lines of all pages will be used. Any line not used will be marked through with a line and initialed and dated. Pages not used will be marked through with a line, the author’s initials, the date, and the note “This page intentionally left blank.”
- If errors are made in the field notes, a single line will be crossed through the error and the correct information entered. All corrections will be initialed and dated by the personnel performing the correction.
- Daily entries will be made chronologically and will be recorded in the field notes during the work activity.
- Each page of field notes will have the project name, date of the work, and the notetaker’s initials.
- The final page of each day’s notes will include the notetaker’s legible name, signature, and the date.
- Only information relevant to the subject project will be added to the field notes.

SAP Worksheet #14—Summary of Project Tasks (continued)

- Entries into the field notes will be as detailed and descriptive as possible so that a particular situation can be recalled without reliance on the collector's memory.
- Entries must be legible and complete.
- The field notes will be copied, scanned, or photographed and sent to the PM daily, unless otherwise approved by the PM.

The following general information will be recorded in the field notes:

- The general scope of work to be performed each day
- The weather conditions and significant changes in the weather during the day
- Summary of tailgate health and safety meetings or other meetings onsite
- Level of personal protective equipment being used
- Instrument calibration (ICAL) (if applicable)
- A detailed, chronological account of activities each day
- Complete names, arrival times, departure times, roles, and affiliations of personnel who enter the site; acronyms may be used after established in the field notes
- Communications (visitors, phone, subcontractors, field staff members) that may affect performance of the project
- Deviations from the SAP and the reason deviations were required
- Health and safety incidents
- Quantities of consumable equipment used, if it is to be billed to the project
- Problems encountered during the fieldwork and the CAs taken to address these problems
- Conditions that may adversely affect the work or data obtained
- Sample dates, times, and identifications (IDs)

Use of electronic devices such as tablets for recording of field data will require the implementation of measures to preserve data integrity and guard against data loss. Such measures will include regular backup and upload of electronic data (at a minimum frequency of once daily), regular verification of data integrity and security by offsite data management staff that support the field team, and the hand-entry of essential duplicate data in the field log book, to allow for re-creation of field datasets in the event of electronic data loss.

14.3 Groundwater Level Measurements

Before groundwater quality sampling events, a synoptic groundwater level survey will be performed. Manual depth-to-groundwater measurements will be collected (consistent with the SOP 056, *Water Level Measurements* in **Worksheet #21** and **Appendix B**), at all existing monitoring wells within and adjacent to IRP Site 1 former Basins 3 and 4. Groundwater levels at the monitoring wells will be collected in as short a time period as possible so that the data are comparable.

SAP Worksheet #14—Summary of Project Tasks (continued)

Before groundwater sampling, the static depth to groundwater will be measured to the nearest 0.01 foot from each of the monitoring wells proposed for sampling in accordance with the SOP (**Worksheet #21** and **Appendix B**). Measurements will be made from the top of the polyvinyl chloride well casing riser, which will be notched. If during removal of the locking well cap, the monitoring well demonstrates signs of being under pressure (escaping air sounds or cap being pushed off by pressure), then the depth to water in that monitoring well will be measured repeatedly over a period of several minutes to determine whether the water level is still changing. If over several minutes the water level continues to change, the water level in that well will not be measured for a period of 1 hour to allow the water level to equilibrate. Depth to water and time measured will be recorded in the field notes. In addition, the depth to the bottom of each well will measured and verified against the well depth indicated in the well construction details. Observations will be recorded in a field logbook when measuring the depth to the bottom of the well casing (including whether the bottom is soft and whether the measurement does not match the well construction log). The measured groundwater and well bottom measurements will be used to calculate the volume of water within the saturated screen section of the well.

14.4 Monitoring Well Redevelopment

Because of the amount of time since the last groundwater monitoring event (either 2006 or 2019, depending on the well), a minimum of 3 well volumes (and until water quality parameters stabilize) will be purged from each monitoring well to redevelop the well before sampling. The redevelopment will occur a minimum of 24 hours before low-flow sampling each well.

A submersible pump will be used for the redevelopment. The pump intake will be placed within the saturated well screen at a position to be determined by the FTL based on observed monitoring well conditions (for example, water levels) at the time of sampling. Downhole equipment will be decontaminated before and after each use in accordance with the procedures described in SOP 003, *Decontamination of Personnel and Equipment* (**Appendix B**). New, clean Teflon sample tubing will then be inserted into the well and the well will be purged.

Depth-to-water readings and water quality parameters will be measured and recorded (approximately every 3 minutes) before sampling using a depth-to-water meter and water quality meter, calibrated daily (at a minimum). If excessive drawdown occurs at moderate flow rates, then the monitoring well will be purged dry, allowed to recover to 90 percent of initial water level, and purge again until 3 well volumes are removed and water quality parameters have stabilized for three consecutive readings, as follows:

- Temperature within 3 percent
- pH within 0.1 pH unit
- Specific conductance within 3 percent
- Dissolved oxygen (DO) within 10 percent
- Oxidation-reduction potential (ORP) within 10 millivolts (mV)

SAP Worksheet #14—Summary of Project Tasks (continued)

- Turbidity measurements within 10 percent; if 3 turbidity values are less than 5 nephelometric turbidity units (NTU), consider the values as stabilized. The turbidity reading is desired to stabilize at a value below 10 NTU (EPA, 2002a)

Depth to water, water quality parameters, and total well depth (to monitor potential accumulation of sediment within the well) measurements and total volume removed will be recorded on Well Development Data Sheets (**Appendix C**).

Purge and decontamination water will be transferred to Department of Transportation (DOT)-approved 55-gallon drums or totes, which will be sealed, labeled, and stored in a secured central staging area.

14.5 Low-flow Groundwater Sampling

Groundwater samples will be collected from existing monitoring wells, according to procedures outlined in the following SOP 025, *Low-Flow Groundwater Sampling from Monitoring Wells*; SOP 018, *Field Measurement of pH, Specific Conductance, Turbidity, Dissolved Oxygen, ORP, and Temperature Using a Horiba or YSI Water Quality Parameter Meter with Flow-through Cell,* SOP 070, *VOC Sampling-Water*; and SOP 066, *Equipment Blank and Field Blank Preparation* (**Worksheet #21** and **Appendix B**). A bladder pump will be used for low-flow sampling. The pump intake will be placed within the saturated well screen at a position to be determined by the FTL based on observed monitoring well conditions (for example, water levels) at the time of sampling. Sampling equipment will be decontaminated before and after each use in accordance with the procedures described in SOP 003, *Decontamination of Personnel and Equipment* (**Appendix B**). New, clean Teflon sample tubing will then be inserted into the well, and well will be purged as described in **Worksheet #21** and **Appendix B**.

Depth-to-water readings and water quality parameters will be measured and recorded (approximately every 3 minutes) before sampling using a depth-to-water meter and water quality meter, calibrated daily (at a minimum). If excessive drawdown occurs at very low-flow rates, then the monitoring well will be purged dry and sampled once recovered to the extent where a sample can be obtained. Sampling will begin when minimal water level drawdown requirements are met and water quality parameters have stabilized for three consecutive readings, as follows:

- Temperature within 3 percent
- pH within 0.1 pH unit
- Specific conductance within 3 percent
- DO within 10 percent
- ORP within 10 mV
- Turbidity measurements within 10 percent; if 3 turbidity values are less than 5 NTU, consider the values as stabilized. The turbidity reading is desired to stabilize at a value below 10 NTU (EPA, 2002a)

Depth to water, water quality parameters, and total well depth (to monitor potential accumulation of sediment within the well) measurements will be recorded on Groundwater Sampling Data Sheets (**Appendix C**).

SAP Worksheet #14—Summary of Project Tasks (continued)

Groundwater samples will be handled consistent with the SOP 067, *Chain-of-Custody* and *Packaging and Shipping Procedures for Low-Concentration Samples (***Worksheet #21** and **Appendix B***)*, and the procedures outlined in **Worksheet #27**. Sample labels will be filled out clearly and completely and attached to each sample container (**Worksheet #19**) after the container has been closed. Samples will be placed in resealable plastic bags and stored in a cooler with ice. The chain-of-custody documentation will be completed as samples are collected. At the end of the day, chain-of-custody documentation will be verified against sample labels in the associated cooler by designated field personnel and noted in the field notes.

Purge and decontamination water will be transferred to DOT-approved 55-gallon drums or totes, which will be sealed, labeled, and stored in a secured central staging area.

14.6 Field Equipment Decontamination

The SOP for equipment decontamination is included in **Worksheet #21** and **Appendix B**. Before the onset of sampling activities, between each monitoring well, and before leaving any site, workers will decontaminate nondedicated equipment using the following process:

1. Rinse with tap water or distilled water and Liquinox solution
2. Rinse with tap water or distilled water
3. Rinse with laboratory grade deionized water

Decontamination water will be managed as IDW and transferred to DOT-approved 55-gallon drums. The drums will be stored in a location designated by the Navy.

14.7 Management of Investigation-derived Waste

IDW generated during this investigation will include decontamination water, purge water, soiled personal protective equipment, and tubing for the sampling pumps. IDW will be disposed of in accordance with all federal, state, and local laws, and disposal facility requirements.

Decontamination and purge water (from groundwater sampling) will be containerized in drums at the well site and will be clearly labeled and transported to a central, secure staging area designated by the Navy until offsite disposal can be arranged. The Navy will sign all waste profiles and manifests.

Waste will be transported off-Base to an approved facility within 90 days of the analytical characterization data having been received. An internal waste management plan will be developed before the field groundwater sampling is initiated.

14.8 Analytical Data Validation and Evaluation

Analytical data validation will be conducted by an independent third-party data validation subcontractor consistent with *General Data Validation Guidelines* (DoD, 2019), and NAVFAC Southwest EWI No. 1, *Chemical Data Validation* (NAVFAC Southwest, 2022), where applicable. As specific modules for the analytical methods in this project are published, the data validators will refer to those modules for guidance, such as *Data Validation Guidelines Module 1: Data Validation Procedure for Organic Analysis by GC/MS* (DoD, 2020), and *Data Validation Guidelines Modules 1, 2, 3, 4, and 6 Revised Table for Sample Qualification in the presence of Blank Contamination* (DoD, 2023) will be applied as appropriate.

SAP Worksheet #14—Summary of Project Tasks (continued)

In the meantime, if specific guidance is not given for these methods in the General Data Validation Guidelines, the data validator may adapt the guidance from *National Functional Guidelines for Superfund Organic Methods Data Review* (EPA, 2020).

Stage 4 data validation will be performed on 10 percent of the data and will follow the protocols and criteria set forth in the *General Data Validation Guidelines* (DoD, 2019) and the module-specific guidelines. These guidelines apply to analytical data packages that include the raw data (for example, spectra and chromatograms) and backup documentation for calibration standards, analysis run logs, laboratory control samples (LCSs), dilution factors, and other types of information. This additional information is used in the Stage 4 data validation process for checking calculations of quantified analytical data. Calculations are checked for QC samples (for example, MS/MSD and LCS data) and routine field samples (including field duplicates, field and equipment rinsate blanks, and trip blanks). To ensure that the DL and data values are appropriate, an evaluation is made of instrument performance, method of calibration, and the original data for calibration standards.

Under the Stage 2B data validation effort, which will be performed on the remaining 90 percent of the data, the data values for primary and QC samples are generally assumed to be correctly reported by the laboratory. Data quality is assessed by comparing the QC parameters listed in the previous paragraph to the appropriate criteria (or limits) as specified in this SAP, by DoD/DOE QSM Version 5.4 (DoD/DOE, 2021), or by method-specific requirements. If calculations for quantitation are verified, it is done on a limited basis and may require raw data.

14.9 Data Management

Data management will begin upon collection of field measurements, which will be recorded in the site-specific field notes and field forms, and retained in the project files, to the final submittal of the analytical data that is checked for accuracy through the validation process. Throughout the data lifecycle, the project team and project subcontractors (for example, laboratory and data validation) will be responsible for performing data verification so that the data are complete, correct, and compliant with project objectives and contractual requirements.

Analytical data will be provided by the analytical laboratory in the hard copy and electronic CH2M required formats. If the electronic data have successfully passed the data checker, the laboratory will provide the analytical data in the contractually required EDD format, which will then be loaded to the CH2M data management system for further verification and validation.

The data will not be released to the project team until the data are final with data validation qualifiers applied. Once the data are deemed final and complete, the data will be prepared in the required Naval EDD format and uploaded to the NIRIS, consistent with the NAVFAC Southwest EWI No. 6, *Environmental Data Management and Required Electronic Delivery Standards* (NAVFAC Southwest, 2023) and *Environmental Restoration Data Submission Guidance* (Navy, 2018a).

SAP Worksheet #14—Summary of Project Tasks (continued)

14.10 Reporting

At the conclusion of all field activities and validation of the laboratory data, the data will be incorporated in a groundwater monitoring report. The groundwater monitoring report will include a data usability assessment (**Worksheet #37**). Conclusions from the groundwater monitoring report will be discussed in the Five-Year Review Report. The groundwater monitoring report will include the following:

- Description of field activities, including the procedures used for sample collection, field QC samples, decontamination procedures, laboratory analysis, and IDW management. Any deviations from the SAP also will be addressed.
- Summary and interpretation of analytical results. Evaluation of results will be limited to the Basins 3- and 4-specific COCs:
  - Basin 3: benzene, 2-methylnaphthalene, benzo(a)anthracene, dibenzofuran, and naphthalene.
  - Basin 4: benzo(a)anthracene, naphthalene, and pentachlorophenol.
- Analytical data will be compared to RGs (**Worksheet #15**).
- Analytical data will be evaluated in the Five-Year Review Report to assess whether concentrations of groundwater COCs inside of the LUC boundary are stable or attenuating relative to historical concentration data. Data analysis may apply methods recommended in the NAVFAC Environmental Statistics Fact Sheet (2019), where appropriate.

SAP Worksheet #17—Sampling Design and Rationale

The sampling design was specifically developed to address the objectives of the groundwater LTM for IRP Site 1 former Basins 3 and 4, as specified in the ROD and LUC RD and as established in **Worksheet #11.**

Groundwater samples will be collected from 28 existing monitoring wells, as identified in the ROD (Navy, 2022) and analyzed for the following basin-specific COCs identified in the LUC RD (Navy, 2023):

- Basin 3 COCs: benzene, 2-methylnaphthalene, benzo(a)anthracene, dibenzofuran, and naphthalene.
- Basin 4 COCs: benzo(a)anthracene, naphthalene, and pentachlorophenol.

While the COCs are specific to Basins 3 and 4 (**Worksheet #10**), because of the proximity of Basins 3 and 4 to each other, one monitoring well (NS1-MW09) will be analyzed for the combined list of COCs [benzene, 2-methylnaphthalene, benzo(a)anthracene, dibenzofuran, naphthalene, and pentachlorophenol] in order to evaluate cross-gradient and downgradient groundwater concentrations outside and between the basins and groundwater LUC boundaries. COCs are specific to shallow zone groundwater (potential construction worker exposure). However, intermediate and deep monitoring wells will be sampled, per the ROD (Navy, 2022) and LUC RD (CH2M, 2023).

The planned sampling strategy and rationale for IRP Site 1 former Basins 3 and 4 sample locations is presented in **Table 17-1**. Sample locations are presented on **Figure 10-4.**

[a] The number of field QC samples to be collected depends on the number of parent samples and the number of days of the sampling event. Numbers shown are estimated based on assumed field production rates.

- Field duplicates will be collected at a frequency of 1 per 10 samples.
- MS/MSD pairs are collected at a frequency of 1 per 20 samples sent to the laboratory. MS/MSDs will be selected at random while ensuring the appropriate frequency is met per this worksheet. Samples selected to be analyzed with an MS/MSD will be selected by the Project Chemist before fieldwork. Variations and flexibility of selected samples are necessary based on field conditions. MS/MSD samples are laboratory QC samples; however, they are included in **Worksheet #20** to account for the additional sample volume required for analysis.
- Source Blanks are collected one per water source used for decontamination of equipment and for collection of equipment blanks.
- Equipment blanks for decontaminated, nondisposable equipment are collected once per day of sampling, per type of equipment.
- Field blanks will be collected at a frequency of one per week per Basin.
- Trip Blanks are submitted in each cooler to the laboratory containing VOC samples.

[b] Monitoring well NS1-MW09 is referenced for both Basins 3 and 4 because it is located in the middle of both basins. Sample analysis will include COCs for both Basins 3 and 4. The sample count for NS1-MW09 is included in Basin 3 to avoid double counting the monitoring well.

SAP Worksheet #27—Sample Custody Requirements

Sample Identification Procedures

Each sample will be given a unique ID number that is carried through the entire process, from sample collection to data reporting (**Worksheet #18**). Samples will be assigned an alpha-numeric identifier that will be tied to the sampling location and sampling depth in separate field notes that will be maintained in the field by the field sampling personnel. The field sampling personnel's field notes will be kept in addition to the chain-of-custody form.

As an example, the following information will be recorded in a table in the Sample Coordinator's field notes, for each sample:

Example:

Sequential ID on Label and Chain-of-Custody	Date	Time	Location	Depth (feet bgs)	Matrix	Type[a]	Chain-of-Custody No.[b]
NS1-GW1-2-1123	11/15/23	0845	NS1-GW1-2	TBD	Water	N	4619-111523
NS1-EB01-111523	11/15/23	1555	N/A	N/A	Water	EB	4619-111523
NS1-SB01-111523	11/15/23	1600	N/A	N/A	Water	SB	4619-111523
NS1-FB01-111523	11/15/23	16:05	N/A	N/A	Water	FB	4619-111523
NS1-TB01-111523	11/15/23	18:00	N/A	N/A	Water	TB	4619-111523

[a] For Sample Type: N = normal sample, EB = equipment rinsate, FB = field blank, SB = source blank, TB = trip blank

[b] The chain-of-custody number will be the Contract Task Order (4619), followed by the date the chain-of-custody was initiated.

N/A = not applicable

Sequential IDs may be prepopulated on the table and on waterproof sample labels, as described in **Worksheet #14**. The table will be copied or scanned daily and submitted to the Data Manager with copies of chains of custody. The original table will be maintained in the field until sampling is complete.

Field Sample Custody Procedures

Field sample custody procedures include sample collection, packaging, shipment, and delivery to the laboratory. Custody of field samples will be maintained, and custody transfer will be documented from the time of sample collection through receipt of samples at the analytical laboratory using chain-of-custody and custody seal procedures. These requirements will be fulfilled by the CH2M Sample Management Coordinator. Each sample will be considered to be in the sampler's custody if the following occur:

- The sample is in the person's physical possession
- The sample is in view of the person after that person has taken possession
- The sample is secured so that no one can tamper with the sample
- The sample is secured in an area that is restricted to authorized personnel

SAP Worksheet #27—Sample Custody Requirements (continued)

Field samples will be handled and prepared in the field for submittal to the analytical laboratory for analysis. Field personnel will use the following procedures when packing and transporting samples to the laboratory:

- Samples will be checked for proper labeling and sample information.
- Metal or equivalent strength plastic coolers will be used for samples.
- Coolers will be lined with double garbage bags.
- Samples will be placed in resealable bags and placed inside of the garbage-bag-lined cooler.
- Samples that have similar holding times or special handling requirements will be packaged in the same cooler under the same chain-of-custody record.
- A temperature blank will be placed in the bottom of each cooler with the samples.
- Samples will be checked for proper labeling and sample information.
- Ice will be double-bagged using double resealable plastic bags and placed on top of and between the sample bags until the cooler is full.
- Paperwork (that is, associated chain-of-custody records) will be placed in a double resealable plastic bag and taped to the inside lid of the cooler.
- The cooler will be taped and secured using signed custody seals.
- Signed custody seals will be placed on the front or both sides of the cooler before the custody of the cooler is relinquished to the overnight carrier or courier.

Chain-of-Custody Procedures

The chain-of-custody record (an example is provided in **Appendix B**, SOP 067, *Chain-of-Custody*) will document the transfer of sample custody from the time of sample collection to laboratory receipt and will accompany the samples from the field to the analytical laboratory. Samples will be shipped directly from the field to each analytical laboratory.

When custody of the samples is relinquished from one party to another, the individuals involved will sign, date, and record the time of transfer on the chain-of-custody record. The chain-of-custody records may consist of an original top copy and two carbonless copies, or the records may be in a prepopulated electronic format. When using the carbonless chain-of-custody format, the original and first copies will be transmitted to the primary analytical laboratory with the samples. The second copy will be retained in project files for the FTL and Project Chemist. Upon transfer of the samples to the primary analytical laboratory, field personnel will sign and date the chain-of-custody forms. Field personnel will make a copy of the signed form and scan a copy of each chain-of-custody record to be saved electronically in the project files under the associated sampling event files.

SAP Worksheet #27—Sample Custody Requirements (continued)

The chain-of-custody record will be completed by each field sampling team in ink. Corrections will be made with a single line-out, the error will be initialed and dated, and then the correct information will be entered. Empty fields on the chain-of-custody record will be crossed out with a single line or "Z'd" out, with the date and signature entered by the field sampling team. If samples are to be delivered to the laboratory by an overnight carrier, the airbill number will be recorded, and the chain-of-custody records will be placed in a plastic bag and taped to the inside lid of the sample cooler before sealing with appropriate secure tape and custody seals. These requirements will be fulfilled by the CH2M field sampling personnel.

Custody Seals

Custody seals will be placed on the outside of each sample cooler so that the seals must be broken to open. After field samples are placed into coolers, two or more custody seals will be placed on the outside of the cooler before shipment or transport. Each custody seal will be initialed and dated by the field sampling team, affixed to the cooler, and taped over, using clear strapping tape.

Laboratory Sample Custody Procedures

Laboratory sample custody procedures include the receipt of samples, archiving, and disposal. Custody of samples will be maintained, and custody transfer will be documented from the time of sample receipt through sample disposal by the analytical laboratory, consistent with the analytical laboratory's SOPs.

The analytical laboratories will have established custody procedures, which include the following:

- Designation of a sample custodian
- Completion by the custodian of the chain-of-custody record, any sample tags, and laboratory request sheets, including documentation of sample condition upon receipt
- Laboratory sample tracking and documentation procedures
- Secure sample storage with the appropriate environment (for example, refrigerated, dry), consistent with analytical method requirements
- Proper data-logging and documentation procedures, including custody of original laboratory records

Upon arrival of the samples at the analytical laboratory, a sample custodian will take custody of the samples, assess the integrity of sample containers, and verify that the information on the sample labels matches the information on the associated chain-of-custody record. The laboratory will restrict access to the storage areas to authorized laboratory personnel only, to prevent unauthorized contact with samples, extracts, or documentation. The sample custodian will maintain security of the samples in accordance with the analytical laboratory SOP.

Groundwater samples will be retained for 60 days after final sample results are reported, unless a request to archive a sample has been made, or previous arrangements have been made to archive the sample. The sample custodian will dispose of samples consistent with the analytical laboratory SOP.

As specific modules for the analytical methods in this project are published, the data validators will refer to those modules for guidance. In the meantime, if specific guidance is not given for these methods in the General Data Validation Guidelines, the data validator may adapt the guidance from *National Functional Guidelines for Superfund Organic Methods Data Review* (EPA, 2020). SAP Worksheet #34-36—Data Verification and Validation (Steps I and IIa/IIb) Process Table (continued)

[a] Verification (Step I) is a completeness check that is performed before the data review process continues to determine whether the required information (complete data package) is available for further review. Validation (Step IIa) is a review that makes sure the data generated is in compliance with analytical methods, procedures, and contracts. Validation (Step IIb) is a comparison of generated data against measurement performance criteria in the SAP (both sampling and analytical).

[b] Internal or external is in relation to the data generator.

SAP Worksheet #37—Usability Assessment

The usability assessment process will evaluate and document the usability of the data by considering the project DQIs or the PARCCS parameters, and whether the data will be suitable for the intended needs of the project. Every data type (for example, sampling, field screening data, and laboratory analytical data) will be relevant to the usability assessment. Data usability will include the entry of analytical data validation flags and selection of the final result in the event of dilutions, re-extractions, or re-runs, as well as an overall assessment of the analytical data and field QC samples.

The usability assessment will be performed after data validation is complete. The assessment will consider each type of data and the relationship to the entire dataset. Additionally, the assessment will evaluate the adequacy of the data to refine the CSM, fulfill the project DQOs (equivalent to the project quality objectives described in **Worksheet #11**), and evaluate other parameters not considered during the data validation process.

Data Quality Indicators

Quantifiable criteria, known as measurement performance criteria, are presented in **Worksheet #12**. The PARCCS criteria will be the qualitative and quantitative indicators of data quality. The PARCCS criteria are defined and discussed following.

Precision

Precision is a measure of mutual agreement among individual measurements of the same property, usually under prescribed, similar conditions. Precision will be measured by using laboratory duplicates, field duplicates, and MS/MSD samples. It will be expressed in terms of the RPD as follows:

$$RPD = \frac{|C_1 - C_2|}{(C_1 + C_2)/2} \times 100$$

where:

RPD = relative percent difference
C_1 = concentration of sample or MS
C_2 = concentration of duplicate or MSD

Accuracy

Accuracy is the degree of agreement of an observed measurement (or an average of the same measurement type) with an accepted reference or true value. Accuracy of analytical determinations will be measured using laboratory QC analyses, such as LCSs and surrogate spikes. Accuracy will be measured by evaluating the actual result against the known concentration added to a spiked sample and will be expressed as percent recovery, as shown in the following equation:

$$R = \frac{S - U}{C_{sa}} \times 100$$

SAP Worksheet #37—Usability Assessment (continued)

where:

- $\%R$ = Percent Recovery
- S = Measured concentration of spiked aliquot
- U = Measured concentration of unspiked aliquot
- C_{sa} = Concentration of spike added

Representativeness

Representativeness is the reliability with which a measurement or measurement system reflects the true conditions under investigation. Representativeness is influenced by the number and location of the sampling points, sampling timing and frequency of monitoring efforts, and the field and laboratory procedures. The representativeness of data will be maintained by the use of established field and laboratory procedures and their consistent application.

Comparability

Comparability expresses the confidence with which one dataset can be compared to another based on using EPA-defined procedures, where available. If EPA procedures are not available, the procedures have been defined or referenced in this SAP.

The comparability of data will be established through well-documented methods and procedures, standard reference materials, QC samples, performance evaluation study results, and by reporting each data type in consistent units.

Completeness

Completeness is a measure of the amount of valid data obtained from a measurement system compared to the amount that was expected to be obtained under correct, normal conditions. Analytical data validation and DQA will determine which data will be valid and which data will be rejected. Percent completeness will be defined as follows:

$$\textit{Percent Completeness} = \frac{V}{T} \times 100$$

where:

- V = Number of valid (not rejected) measurements over a given time
- T = Total number of planned measurements

The completeness goal for this project will be 100 percent for valid, usable data. If the completeness goal of the project is not achieved, a discussion on the limitations on the use of the project data will be included in the Usability Assessment section of the final reports.

Sensitivity

Sensitivity is the measure of a concentration at which an analytical method can positively identify and report analytical results. The sensitivity of an analytical method will be indicated by the LOQ, LOD, and DL, as compared to the project screening limits (PSLs). Analytical methods selected for this investigation meet the PSLs. The sensitivity analysis in the DQA will evaluate all the analytical data collected as part of the groundwater monitoring event and indicate

SAP Worksheet #37—Usability Assessment (continued)

instances where the laboratory limits did not meet the PSL and the potential impacts to project decisions.

Detection and Quantitation Limits

The DL is the minimum concentration of an analyte that can be demonstrated to be different from zero, or a blank concentration with 99 percent confidence from background noise for a specific analytical method (that is, 1 percent chance of false positive). The LOD is the minimum concentration of an analyte that can be demonstrated to be present with 99 percent confidence from background noise (that is, 1 percent chance of false negative). The LOQ represents the lowest concentration of an analyte that can be quantified within specified limits of precision and accuracy during routine laboratory operating conditions in a sample matrix. The LOQs are contractually specified minimum quantitation limits for specific analytical methods and sample matrixes, such as soil or water, and will typically be several times the DL to allow for sample matrixes.

Selected analytical methods and associated LOQs are typically capable of quantifying constituents of concern at concentrations below the most stringent screening criteria. The LOQs will reflect the maximum sensitivity of current, routinely used analytical methods.

For this project, concentrations will be reported as estimated values (“J” qualified) if the concentrations are less than the LOQs but greater than the DLs or LODs. Concentrations below the DL will be reported as “U” to the LOD.

Describe the evaluative procedures used to assess overall measurement error associated with the project:

The usability assessment process will consist of reviewing the analytical data validation reports and assessing analytical data that were qualified as estimated (“J”/“UJ” qualifiers) as a result of QC deficiencies. In addition, field and analytical data will be reviewed for discrepancies and deviations. Analytical data qualified with an “X” during data validation will be evaluated during the data usability assessment to determine if the data should be rejected (“R” qualified), based on the DQOs, field procedures, and site conditions. The usability assessment will evaluate the impact of the discrepancies or deviations on the usability of the data and assess whether the necessary information has been provided for use in the decision-making process. The assessment will evaluate whether there were deviations in sampling activities (for example, incorrect sample location, improper or malfunctioning sampling equipment, or incorrect analysis performed), chain-of-custody documentation, or holding times; compromised samples (that is, damaged or lost samples) and the need to resample; or changes to SOPs or methods that could potentially affect data quality.

An evaluation of QC sample results will be performed to assess whether unacceptable QC results (for example, blank contamination) affect data usability.

SAP Worksheet #37—Usability Assessment (continued)

Other parameters to be evaluated during the usability assessment may include, but will not be limited to, the following:

- Matrix effects: matrix conditions that might have affected the performance of the extraction or analytical method
- Site conditions: unusual weather conditions or site conditions that might have affected the sampling plan
- Field procedures
- Identifying critical and noncritical samples or target analytes
- Background or historical data
- Data restrictions: data that do not meet the project DQOs might be restricted, but usable
- Data restrictions: data that were rejected or recommended for rejection

The data will be evaluated for overall PARCCS criteria for each matrix, analytical group, and concentration level, and data use limitations will be discussed in the DQA report for data that do not meet the project DQOs or DQIs.

Identify the personnel responsible for performing the usability assessment:

Project Chemist in coordination with project team.

Describe the documentation that will be generated during usability assessment and how usability assessment results will be presented, so that they identify trends, relationships (correlations), and anomalies:

- Usability assessment results will be reported in the DQA report as an appendix to the groundwater sampling summary report.

STANDARD OPERATING PROCEDURE 001

Preparing Field Logbooks

I. Purpose

This SOP provides general guidelines for entering field data into logbooks (hard copy and electronic) during site investigation and remediation activities.

II. Scope

This is a general description of data requirements and format for field logbooks. Logbooks are needed to properly document all field activities in support of data evaluation and possible legal activities. Field notes may be recorded in field logbooks or electronically on computer tablets.

III. Equipment and Materials

- Logbook
- Indelible pen
- Jacobs supplied electronic tablet or laptop with notebook software

IV. Procedures and Guidelines

Properly completed field logbooks are a requirement for all of the work we perform under the Navy CLEAN contract. Logbooks are legal documents and, as such, must be prepared following specific procedures and must contain required information to ensure their integrity and legitimacy. This SOP describes the basic requirements for field logbook entries.

A. Procedures for Completing Field Logbooks

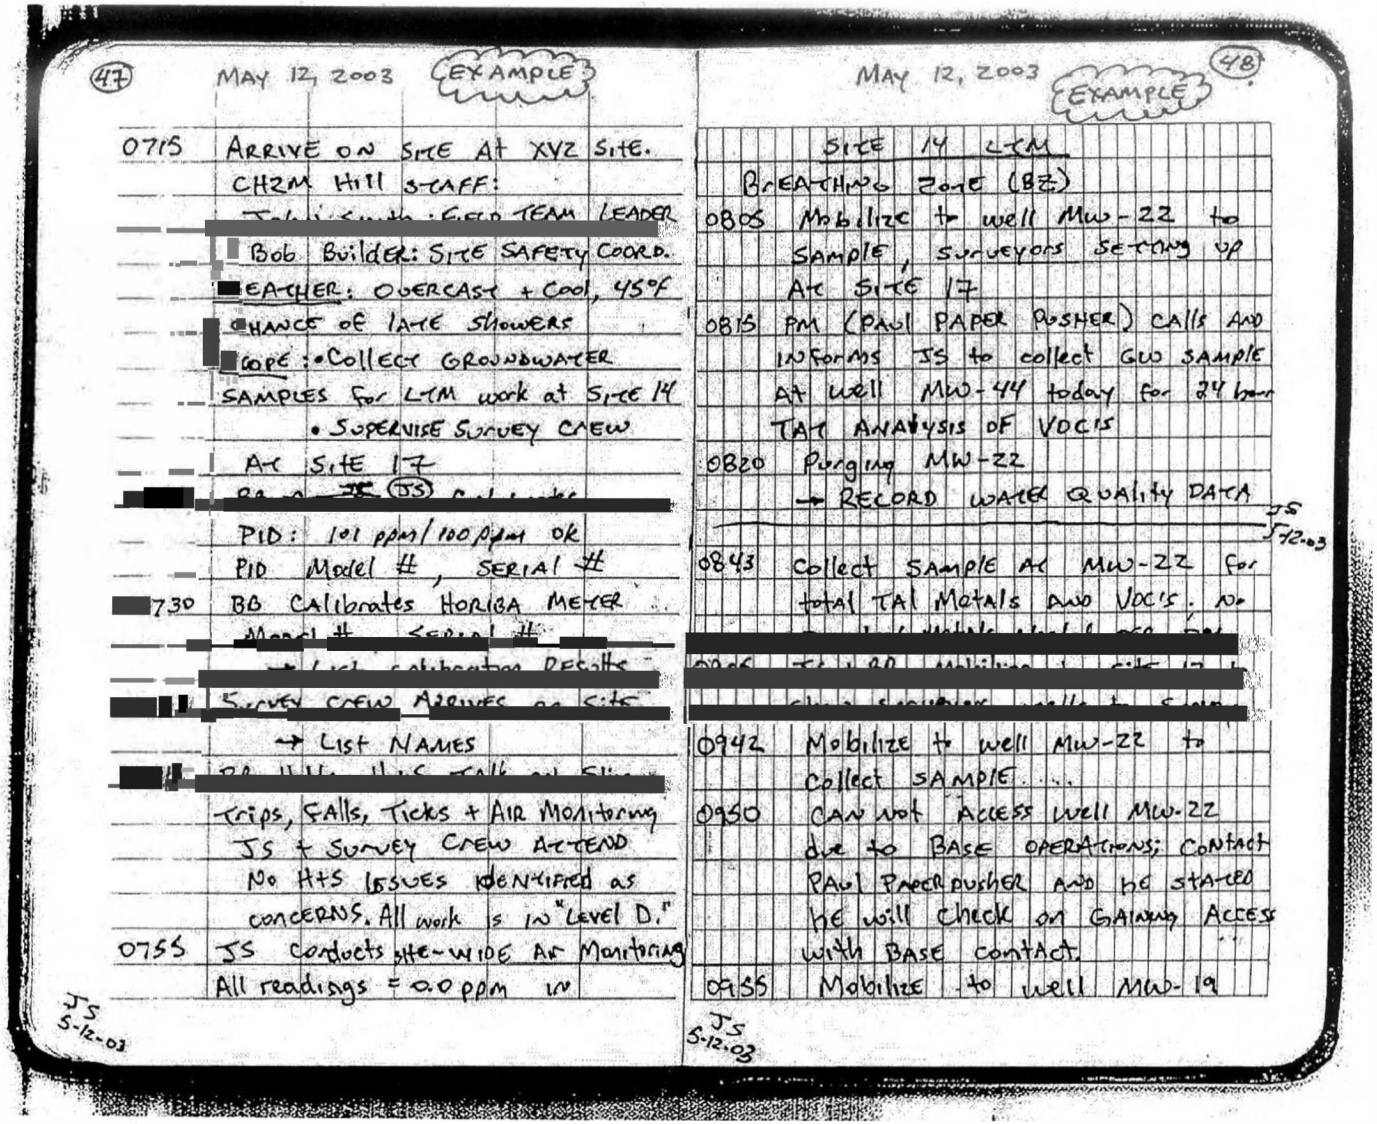
1. Field notes commonly are kept in bound, hard-cover logbooks used by surveyors and produced, for example, by Peninsular Publishing Company and Sesco, Inc. Pages should be water resistant and notes should be taken only with water-proof, non-erasable permanent ink, such as that provided in Rite in the Rain or Sanford Sharpie permanent markers. Note: for sites where PFC is being analyzed for, Rite-in-the-Rain, Sanford Sharpie, or anything water-resistant or with Teflon cannot be used in the field. All field book materials must be “fluorine free”. Acceptable substitutes would be a sewn notebook without a plastic cover, or loose-leaf notebook paper.
2. Alternatively, field notes may be recorded electronically in Jacobs provided field tablets or laptop computers. Notes are recorded in appropriate note collection software; e.g., Microsoft One Note. At the end of each day, the electronic notes must be digitally signed by the author and downloaded for electronic file storage. The notes may be converted to an Adobe pdf file prior to storage. It is important that the field notes be downloaded daily to ensure the electronic time stamp of the notes is the same as the day the notes were recorded.

3. On the inside cover of the logbook the following information should be included:
   - Company name and address
   - Log-holders name if logbook was assigned specifically to that person
   - Activity or location
   - Project name
   - Project manager's name
   - Phone numbers of the company, supervisors, emergency response, etc.
4. All lines of all pages should be used to prevent later additions of text, which could later be questioned. Any line not used should be marked through with a line and initialed and dated. Any pages not used should be marked through with a line, the author's initials, the date, and the note "Intentionally Left Blank."
5. If field notes are recorded electronically, the author will not have any spaces between entries.
6. If errors are made in the logbook, cross a single line through the error and enter the correct information. All corrections shall be initialed and dated by the personnel performing the correction. If possible, all corrections should be made by the individual who made the error.
7. Daily entries will be made chronologically.
8. Information will be recorded directly in the field logbook during the work activity. Information will not be written on a separate sheet and then later transcribed into the logbook.
9. Each page of the logbook will have the date of the work and the note takers initials.
10. The final page of each day's notes will include the note-takers signature as well as the date.
11. Only information relevant to the subject project will be added to the logbook.
12. The field notes will be copied and the copies sent to the Project Manager or designee in a timely manner (at least by the end of each week of work being performed).

B. Information to be Included in Field Logbooks

1. Entries into the logbook should be as detailed and descriptive as possible so that a particular situation can be recalled without reliance on the collector's memory. Entries must be legible and complete.
2. General project information will be recorded at the beginning of each field project. This will include the project title, the project number, and project staff.
3. Scope: Describe the general scope of work to be performed each day.
4. Weather: Record the weather conditions and any significant changes in the weather during the day.

5. Tail Gate Safety Meetings: Record time and location of meeting, who was present, topics discussed, issues/problems/concerns identified, and corrective actions or adjustments made to address concerns/ problems, and other pertinent information.
6. Standard Health and Safety Procedures: Record level of personal protection being used (e.g., level D PPE), record air monitoring data on a regular basis and note where data were recording (e.g., reading in borehole, reading in breathing zone, etc). Also record other required health and safety procedures as specified in the project specific health and safety plan.
7. Instrument Calibration; Record calibration information for each piece of health and safety and field equipment.
8. Personnel: Record names of all personnel present during field activities and list their roles and their affiliation. Record when personnel and visitors enter and leave a project site and their level of personal protection.
9. Communications: Record communications with project manager, subcontractors, regulators, facility personnel, and others that impact performance of the project.
10. Time: Keep a running time log explaining field activities as they occur chronologically throughout the day.
11. Deviations from the Work Plan: Record any deviations from the work plan and document why these were required and any communications authorizing these deviations.
12. Health and Safety Incidents: Record any health and safety incidents and immediately report any incidents to the Project Manager.
13. Subcontractor Information: Record name of company, record names and roles of subcontractor personnel, list type of equipment being used and general scope of work. List times of starting and stopping work and quantities of consumable equipment used if it is to be billed to the project.
14. Problems and Corrective Actions: Clearly describe any problems encountered during the field work and the corrective actions taken to address these problems.
15. Technical and Project Information: Describe the details of the work being performed. The technical information recorded will vary significantly between projects. The project work plan will describe the specific activities to be performed and may also list requirements for note taking. Discuss note-taking expectations with the Project Manager prior to beginning the field work.
16. Any conditions that might adversely affect the work or any data obtained (e.g., nearby construction that might have introduced excessive amounts of dust into the air).
17. Sampling Information: Specific information that will be relevant to most sampling jobs includes the following:
    - Description of the general sampling area – site name, buildings and streets in the area, etc.
    - Station/Location identifier



- Description of the sample location – estimate location in comparison to two fixed points – draw a diagram in the field logbook indicating sample location relative to these fixed points – include distances in feet.
- Sample matrix and type
- Sample date and time
- Sample identifier
- Draw a box around the sample ID so that it stands out in the field notes
- Information on how the sample was collected – distinguish between "grab," "composite," and "discrete" samples
- Number and type of sample containers collected
- Record of any field measurements taken (i.e., pH, turbidity, dissolved oxygen, and temperature, and conductivity)
- Parameters to be analyzed for, if appropriate
- Descriptions of soil samples and drilling cuttings can be entered in depth sequence, along with PID readings and other observations. Include any unusual appearances of the samples.

C. Suggested Format for Recording Field Data

1. Use the left side border to record times and the remainder of the page to record information (see attached example).
2. Use tables to record sampling information and field data from multiple samples.
3. Sketch sampling locations and other pertinent information.
4. Sketch well construction diagrams.

V. Attachments

- Example field notes.

STANDARD OPERATING PROCEDURE 003

Decontamination of Personnel and Equipment

I. Purpose

To provide general guidelines for the decontamination of personnel, sampling equipment, and monitoring equipment used in potentially contaminated environments.

II. Scope

This is a general description of decontamination procedures.

III. Equipment and Materials

- Demonstrated analyte-free, deionized ("DI") water (specifically, ASTM Type II water or lab-grade DI water)
- Potable water; must be from a municipal water supplier, otherwise an analysis must be run for appropriate volatile and semivolatile organic compounds and inorganic chemicals (e.g., Target Compound List and Target Analyte List chemicals)
- 2.5% (W/W) Liquinox and water solution
- Pesticide-grade (90%) isopropanol in squeeze bottle
- Large plastic pails or tubs for Liquinox and water, scrub brushes, squirt bottles for Liquinox solution, and water, plastic bags and sheets
- DOT approved 55-gallon drum for disposal of waste
- Personal Protective Equipment as specified by the Health and Safety Plan
- Decontamination pad and steam cleaner/high pressure cleaner for large equipment

IV. Procedures and Guidelines

A. Personnel Decontamination

To be performed after completion of tasks whenever potential for contamination exists, and upon leaving the exclusion zone.

1. Wash boots in Liquinox solution, then rinse with water. If disposable latex booties are worn over boots in the work area, rinse with Liquinox solution, remove, and discard into DOT-approved 55-gallon drum.
2. Wash outer gloves in Liquinox solution, rinse, remove, and discard into DOT-approved 55-gallon drum.
3. Remove disposable coveralls ("Tyvek") and discard into DOT-approved 55-gallon drum.

4. Remove respirator (if worn).
5. Remove inner gloves and discard.
6. At the end of the workday, shower entire body, including hair, either at the work site or at home.
7. Sanitize respirator if worn.

B. Sampling Equipment Decontamination—Groundwater Sampling Pumps

Sampling pumps are decontaminated after each use as follows.

1. Don phthalate-free gloves.
2. Spread plastic on the ground to keep equipment from touching the ground
3. Turn off pump after sampling. Remove pump from well and remove and dispose of tubing. Place pump in decontamination tube.
4. Turn pump back on and recirculate 1 gallon of Liquinox solution through the sampling pump for a minute. Turn off the pump and containerize the used solution.
5. Turn pump back on and recirculate 1 gallon of tap water for a minute (deionized water may be substituted for tap water) Turn off the pump and containerize the used solution.
6. If pump was exposed to non-aqueous phase liquids remove pump from the tube and rinse lightly (a few cc's of solvent is sufficient) with isopropanol, over and through the pump, and allow to air dry. Note that isopropanol is highly flammable and should be used very sparingly and away from potential sources of ignition.
7. *Turn pump back on and recirculate 1 gallon of tap water for a minute (deionized water may be substituted for tap water) Turn off the pump and containerize the used solution.*
8. Keep decontaminated pump in decontamination tube or remove and wrap in aluminum foil or clean plastic sheeting.
9. Collect all rinsate and dispose of in a DOT-approved 55-gallon drum.
10. Decontamination materials (e.g., plastic sheeting, tubing, etc.) that have come in contact with used decontamination fluids or sampling equipment will be disposed of in either DOT-approved 55-gallon drums or with solid waste in garbage bags, dependent on Facility/project requirements.

C. Sampling Equipment Decontamination—Other Equipment

Reusable sampling equipment is decontaminated after each use as follows.

1. Don phthalate-free gloves.
2. Before entering the potentially contaminated zone, wrap soil contact points in aluminum foil (shiny side out).

3. Rinse and scrub with potable water.
4. Wash all equipment surfaces that contacted the potentially contaminated soil/water with Liquinox solution.
5. Rinse with potable water.
6. If equipment was exposed to non-aqueous phase liquids rinse lightly with isopropanol and allow to air dry.
7. Rinse with deionized water.
8. Completely air dry and wrap exposed areas with aluminum foil (shiny side out) for transport and handling if equipment will not be used immediately.
9. Collect all rinsate and dispose of in a DOT-approved 55-gallon drum.
10. Decontamination materials (e.g., plastic sheeting, tubing, etc.) that have come in contact with used decontamination fluids or sampling equipment will be disposed of in DOT-approved 55-gallon drums or with solid waste in garbage bags, dependent on Facility/project requirements.

D. Health And Safety Monitoring Equipment Decontamination

1. Before use, wrap soil contact points in plastic to reduce need for subsequent cleaning.
2. Wipe all surfaces that had possible contact with contaminated materials with a paper towel wet with Liquinox solution, and finally three times with a towel wet with distilled water. Solvents should not be used to clean plastic instruments as they could cause damage. Dispose of all used paper towels in a DOT-approved 55-gallon drum or with solid waste in garbage bags, dependent on Facility/project requirements.

E. Sample Container Decontamination

The outsides of sample bottles or containers filled in the field may need to be decontaminated before being packed for shipment or handled by personnel without hand protection. The procedure is:

1. Wipe container with a paper towel dampened with Liquinox solution or immerse in the solution AFTER THE CONTAINERS HAVE BEEN SEALED. Repeat the above steps using potable water.
2. Dispose of all used paper towels in a DOT-approved 55-gallon drum or with solid waste in garbage bags, dependent on Facility/project requirements.

F. Heavy Equipment and Tools

Heavy equipment such as drilling rigs, drilling rods/tools, and the backhoe will be decontaminated upon arrival at the site and between locations as follows:

1. Set up a decontamination pad in area designated by the Facility
2. Steam clean heavy equipment until no visible signs of dirt are observed. This may require wire or stiff brushes to dislodge dirt from some areas.

V. Attachments

None.

VI. Key Checks and Items

- Clean with solutions of Liquinox and distilled water.
- Use isopropanol only if heavy organic contamination is present, and then sparingly. Isopropanol should be allowed to evaporate rather than contained as it may render liquid investigation derived waste ignitable.
- Drum all contaminated rinsate and materials.
- Decontaminate filled sample bottles before relinquishing them to anyone.

STANDARD OPERATING PROCEDURE 018

Field Measurement of pH, Specific Conductance, Turbidity, Dissolved Oxygen, ORP, and Temperature Using a Horiba or YSI Water Quality Parameter Meter with Flow-through Cell

I. Purpose and Scope

The purpose of this procedure is to provide a general guideline for using a water quality parameter meter (e.g., Horiba® or YSI) for field measurements of pH, specific conductance, turbidity, dissolved oxygen, oxidation-reduction potential (ORP), and temperature of aqueous samples. The YSI instrument does not measure turbidity. A separate turbidity meter (i.e., Hach 2100Q Turbidity Meter) will need to be used in conjunction with the YSI meter. The operator's manual should be consulted for detailed operating procedures.

II. Equipment and Materials

- Water Quality Parameter Meter such as a Horiba® Water Quality Monitoring System or YSI with flow-through cell
- Calibration Standard Solutions (provided by rental company)
- Deionized water in spray bottle

III. Procedures and Guidelines

A. Parameters and Specifications:

Parameter	Range of measurement	Accuracy
pH	0 to 14 pH units	+/- 0.1 pH units
Specific conductance	0 to 9.99 S/m	+/- 3 % full scale
Turbidity	0 to 800 NTU	+/- 5 % full scale
Dissolved oxygen	0 to 19.99 mg/l	+/- 0.2 mg/l
Temperature	0 to 55 °C	+/- 1.0 °C
ORP	-999 to +999 mV	+/- 15 mV
Salinity	0 to 4 %	+/- 0.3 %

B. Calibration:

Prior to each day's use, clean the probe and flow-through cell using deionized water and calibrate using the Standard Solution.

1. Horiba Calibration Procedure

a) Fill a calibration beaker with standard solution to the recommended fill line.

b) Insert the probe into the beaker. All the parameter sensors will now be immersed in the standard solution except the D.O. sensor; the D.O. calibration is done using atmospheric air.

c) Turn power on and allow some time for the machine to warm-up prior to starting the calibration. When the initial readings appear to stabilize the instrument is ready to calibrate.

d) Press CAL key to put the unit in the calibration mode.

e) Press the ENT key to start automatic calibration. Wait a moment, and the upper cursor will gradually move across the four auto-calibration parameters one by one: pH, COND, TURB, and DO. When the calibration is complete, the readout will briefly show END. The instrument is now calibrated.

f) If the unit is calibrated properly the instrument readings, while immersed in the standard solution, will match the standard solution values provided on the solution container. The typical standard solution values are: pH = 4.0 +/- 3%, conductivity 4.49 mS/cm +/- 3%, and turbidity = 0 NTU +/- 3%.

g) Record the calibration data (e.g., time, instrument ID, solution lot number and expiration date, final calibrated readings, and solution temperature in the field logbook.

2. YSI Calibration Procedure

a) Press the **On/off** key to display the run screen

b) Press the **Escape** key to display the main menu screen

c) Use the arrow keys to highlight the **Calibrate**

d) Press the **Enter** key. The Calibrate screen is displayed

e) Choose the parameter to calibrate

3. Conductivity Calibration

This procedure calibrates specific conductance (recommended), conductivity and salinity. Calibrating any one option automatically calibrates the other two.

a) Use the arrow keys to highlight the **Conductivity** selection

b) Press **Enter.** The Conductivity Calibration Selection Screen is displayed.

c) Use the arrow keys to highlight the Specific Conductance selection.

d) Press **Enter.** The Conductivity Calibration Entry Screen is displayed.

e) Place the correct amount of conductivity standard (see Instrument Manual) into a clean, dry or pre-rinsed transport/calibration cup.

f) Carefully immerse the sensor end of the probe module into the solution.

g) Gently rotate and/or move the probe module up and down to remove any bubbles from the conductivity cell.

NOTE: The sensor must be completely immersed past its vent hole. Using the recommended volumes from the Instrument Manual Calibration Volumes should ensure that the vent hole is covered.

h) Screw the transport/calibration cup on the threaded end of the probe module and securely tighten.

NOTE: Do not over tighten as this could cause damage to the threaded portions.

i) Use the keypad to enter the calibration value of the standard you are using.

NOTE: Be sure to enter the value in **mS/cm at 25°C**.

j) Press **Enter**. The Conductivity Calibration Screen is displayed.

k) Allow at least one minute for temperature equilibration before proceeding. The current values of all enabled sensors will appear on the screen and will change with time as they stabilize.

l) Observe the reading under Specific Conductance. When the reading shows no significant change for approximately 30 seconds, press **Enter**. The screen will indicate that the calibration has been accepted and prompt you to press **Enter** again to Continue.

m) Press **Enter**. This returns you to the Conductivity Calibrate Selection Screen

n) Press **Escape** to return to the calibrate menu.

o) Rinse the probe module and sensors in tap or purified water and dry.

4. Dissolved Oxygen Calibration

This procedure calibrates dissolved oxygen. Calibrating any one option (% or mg/L) automatically calibrates the other.

a) Go to the calibrate screen as described in Section

NOTE: The instrument must be on for at least 20 minutes to polarize the DO sensor before calibrating.

b) Use the arrow keys to highlight the **Dissolved Oxygen** selection.

c) Press **Enter**. The dissolved oxygen calibration screen is displayed.

d) DO calibration in mg/L is carried out in a water sample which has a known concentration of dissolved oxygen (usually determined by a Winkler titration).

e) Use the arrow keys to highlight the **DO mg/L** selection.

f) Press **Enter**. The DO mg/L Entry Screen is displayed.

g) Place the probe module in water with a known DO concentration.

NOTE: Be sure to completely immerse all the sensors.

h) Use the keypad to enter the known DO concentration of the water.

i) Press **Enter**. The Dissolved Oxygen mg/L Calibration Screen is displayed.

j) Stir the water with a stir bar, or by rapidly moving the probe module, to provide fresh sample to the DO sensor.

k) Allow at least one minute for temperature equilibration before proceeding. The current values of all enabled sensors will appear on the screen and will change with time as they stabilize.

l) Observe the DO mg/L reading, when the reading is stable (shows no significant change for approximately 30 seconds), press **Enter**. The screen will indicate that the calibration has been accepted and prompt you to press **Enter** again to Continue.

m) Press **Enter**. This returns you to the DO calibration screen.

n) Press **Escape** to return to the calibrate menu.

o) Rinse the probe module and sensors in tap or purified water and dry.

5. pH Calibration

a) Go to the calibrate screen.

b) Use the arrow keys to highlight the **pH** selection.

c) Press **Enter**. The pH calibration screen is displayed.

- Select the **1-point** option only if you are adjusting a previous calibration. If a 2-point or 3-point calibration has been performed previously, you can adjust the calibration by carrying out a one point calibration. The procedure for this calibration is the same as for a 2-point calibration, but the software will prompt you to select only one pH buffer.
- Select the **2-point** option to calibrate the pH sensor using only two calibration standards. Use this option if the media being monitored is known to be either basic or acidic. For example, if the pH of a pond is known to vary between 5.5 and 7, a two-point calibration with pH 7 and pH 4 buffers is sufficient. A three point calibration with an additional pH 10 buffer will not increase the accuracy of this measurement since the pH is not within this higher range.
- Select the **3-point** option to calibrate the pH sensor using three calibration solutions. In this procedure, the pH sensor is calibrated with a pH 7 buffer and two additional buffers. The 3-point calibration method assures maximum accuracy when the pH of the media to be monitored cannot be anticipated. The

procedure for this calibration is the same as for a 2-point calibration, but the software will prompt you to select a third pH buffer.

d) Use the arrow keys to highlight the **2-point** selection.

e) Press **Enter**. The pH Entry Screen is displayed.

f) Place the correct amount of pH buffer into a clean, dry or pre-rinsed transport/calibration cup.

NOTE: For maximum accuracy, the pH buffers you choose should be within the same pH range as the water you are preparing to sample.

NOTE: Before proceeding, ensure that the sensor is as dry as possible. Ideally, rinse the pH sensor with a small amount of buffer that can be discarded. Be certain that you avoid cross-contamination of buffers with other solutions.

g) Carefully immerse the sensor end of the probe module into the solution.

h) Gently rotate and/or move the probe module up and down to remove any bubbles from the pH sensor.

NOTE: The sensor must be completely immersed. Using the recommended volumes from Table 6.1 Calibration Volumes, should ensure that the sensor is covered.

i) Screw the transport/calibration cup on the threaded end of the probe module and securely tighten.

NOTE: Do not over tighten as this could cause damage to the threaded portions.

j) Use the keypad to enter the calibration value of the buffer you are using **at the current temperature**.

NOTE: pH vs. temperature values are printed on the labels of all YSI pH buffers.

k) Press **Enter**. The pH calibration screen is displayed.

l) Allow at least one minute for temperature equilibration before proceeding. The current values of all enabled sensors will appear on the screen and will change with time as they stabilize.

m) Observe the reading under pH, when the reading shows no significant change for approximately 30 seconds, press **Enter**. The screen will indicate that the calibration has been accepted and prompt you to press **Enter** again to Continue.

n) Press **Enter**. This returns you to the Specified pH Calibration Screen.

o) Rinse the probe module, transport/calibration cup and sensors in tap or purified water and dry.

p) Repeat steps 6 through 13 above using a second pH buffer.

q) Press **Enter**. This returns you to the pH Calibration Screen.

r) Press **Escape** to return to the calibrate menu.

s) Rinse the probe module and sensors in tap or purified water and dry.

6. ORP Calibration

a) Go to the calibrate screen.

b) Use the arrow keys to highlight the **ORP** selection.

c) Press **Enter**. The ORP calibration screen is displayed.

d) Place the correct amount of a known ORP solution into a clean, dry or pre-rinsed transport/calibration cup.

NOTE: Before proceeding, ensure that the sensor is as dry as possible. Ideally, rinse the ORP sensor with a small amount of solution that can be discarded. Be certain that you avoid cross-contamination with other solutions.

e) Carefully immerse the sensor end of the probe module into the solution.

f) Gently rotate and/or move the probe module up and down to remove any bubbles from the ORP sensor.

NOTE: The sensor must be completely immersed.

g) Screw the transport/calibration cup on the threaded end of the probe module and securely tighten.

h) Use the keypad to enter the correct value of the calibration solution you are using at the current temperature.

i) Press **Enter**. The ORP calibration screen is displayed.

j) Allow at least one minute for temperature equilibration before proceeding. The current values of all enabled sensors will appear on the screen and will change with time as they stabilize.

k) Observe the reading under ORP, when the reading shows no significant change for approximately 30 seconds, press **Enter**. The screen will indicate that the calibration has been accepted and prompt you to press **Enter** again to Continue.

l) Press **Enter**. This returns you to the Calibrate Screen.

m) Rinse the probe module and sensors in tap or purified water and dry.

n) Record the calibration data (e.g. time, instrument ID, solution lot number and expiration date, initial readings, final calibrated readings, and solution temperature) in the field logbook.

C. Sample Measurement:

1. Horiba Measurement Procedure

As water passes through the flow-through the flow cell, press MEAS to obtain reading; record data in a field notebook.

2. YSI Measurement Procedure

As water passes through the flow-through the flow cell, the readings are displayed for each parameter. Record the water quality parameter data in a field notebook. In addition, the data is recorded in the YSI and can be downloaded to a computer following completion of the sampling event.

IV. Key Checks and Preventive Maintenance

- Calibrate meter
- Clean probe with deionized water when done
- Refer to operations manual for recommended maintenance and troubleshooting
- Check batteries, and have a replacement set on hand
- Due to the importance of obtaining these parameters, the field team should have a spare unit readily available in case of an equipment malfunction

STANDARD OPERATING PROCEDURE 025

Low-Flow Groundwater Sampling from Monitoring Wells

I. Purpose and Scope

This SOP presents general guidelines for the collection of groundwater samples from monitoring wells using low-flow purging and sampling procedures.

II. Equipment and Materials

- Adjustable-rate positive-displacement pump, electric submersible pump, or peristaltic pump[1]
- Multi parameter water quality meter and flow through cell to monitor pH, specific conductance, turbidity, dissolved oxygen, oxidation-reduction potential (ORP), and temperature
- Air monitoring equipment
- Personal protective equipment
- Generator or alternate power source depending on pump type
- Hand tools (9/16-inch socket, screwdrivers, tubing cutter, scissors)
- Water-level indicator
- Disposable Teflon, Teflon-lined polyethylene tubing or polyethylene tubing for metals and other inorganics
- Plastic sheeting
- Well-construction information
- Calibrated container and stopwatch to determine flow rate
- Purged water containers
- Sample containers
- Waste container labels
- In-line disposable 0.45µm filters (QED® FF8100 or equivalent)
- Shipping supplies (labels, coolers, and ice)
- Aluminum foil
- Field book

1 If minor differences in the groundwater concentrations could affect the decision, such as to continue or terminate groundwater cleanup or whether the cleanup goals have been reached, then a peristaltic pump should NOT be used for VOC/dissolved gases sampling. In these cases, centrifugal or bladder pumps are a better choice for more accurate results (EPA Region 1 Low-Stress (Low Flow) SOP, 2017).

III. Procedures and Guidelines

A. Setup and Purging

1. Obtain information on well location, diameter(s), depth, and screen interval(s), and the method for disposal of purged water.
2. Calibrate instruments according to manufacturer's instructions.
3. Record well number, site, date, and condition in the field logbook.
4. Place plastic sheeting on the ground surrounding well head. All decontaminated equipment to be used in sampling will be placed only on the plastic sheeting until after the sampling has been completed. Do not let any downhole equipment touch the ground.
5. Open the well and begin screening breathing zone with air monitoring device until sampling is complete, in accordance with the HASP.
6. All sampling equipment and any other equipment to be placed in the well must cleaned and decontaminated before sampling in accordance with SOP *Decontamination of Personnel and Equipment*.
7. Water level measurements are collected in accordance with the *Water Level Measurements* SOP. **Do not measure the depth to the bottom of the well at this time**; this reduces the possibility that any accumulated sediment in the well will be disturbed. Obtain depth to bottom information from well construction log.
8. Attach and secure the tubing to the pump. Lower the pump slowly into the well and set it at approximately the middle of the screen, or wetted screen interval, and at least two feet above the bottom of the well to avoid disturbance of sediment. Submersible pumps should be lowered by the suspension cable rather than the discharge tubing.
9. Insert the water quality measurement probes into the flow-through cell and place in a shaded area. The purged groundwater must enter the flow through the cell by the lower port and exit via the upper port. Wrap exposed tubing and the flow through cell in aluminum foil to minimize heat loss/gain due to environmental conditions.
10. Generators and fuel, if used, must be located at least 30 feet downwind from the well to avoid exhaust fumes contaminating the samples.
11. Begin purging the well at 0.2 to 0.5 liters per minute. Avoid surging. Purging rates for more transmissive formations could be started at 0.5-liter to 1 liter per minute. The initial field parameters of pH, specific conductance, dissolved oxygen, ORP, turbidity, and temperature of water are measured and recorded in the field logbook.
12. Contain purged water for placement in labeled 55-gallon drum or tank, as appropriate.
13. The water level should be monitored frequently during purging, and, ideally, the purge rate should equal the well recharge rate so that there is little or no drawdown in the well (i.e., less than 0.3-foot). The water level should stabilize for the specific purge rate; if the water level cannot be stabilized, purging should be conducted using the 'well volume' method in accordance with SOP *Groundwater Sampling from Monitoring Wells*. There should be at

least 1 foot of water over the pump intake so there is no risk of the pump suction being broken, or entrainment of air in the sample. Record adjustments in the purge rate and changes in depth to water in the logbook. Purge rates should, if needed, be decreased to the minimum capabilities of the pump (0.1- to 0.2-liter per minute) to minimize water level drawdown.

14. During purging, the field parameters must be measured frequently (every 5 minutes) until the parameters have stabilized. Field parameters are considered stable when three consecutive measurements meet the following criteria:

    - pH: within 0.1 Standard Units
    - Specific conductance: within 3 percent
    - Dissolved oxygen: within 10 percent
    - Turbidity: within 10 percent for values greater than 5 NTU; if 3 turbidity values are less than 5 NTU, consider the values as stabilized
    - ORP: within 10 mV
    - Temperature: within 3 percent

B. Sample Collection

Once purging is complete the well is ready to sample. The pump should be allowed to operate at the same rate as the purge cycle until sampling begins, whereupon the discharge should be reduced to 0.1 L/m.

Samples will be placed in sample containers that have been cleaned to laboratory standards and are preserved in accordance with the analytical method. The containers are typically pre-preserved, if required.

VOC samples are normally collected first and directly into pre-preserved sample containers.

The steps to be followed for sample collection are as follows:

1. The cap is removed from the sample bottle, and the bottle is tilted slightly.
2. The sample is slowly poured so that it runs down the inside of the sample bottle with a minimum of splashing. The pumping rate should be reduced to approximately 100 ml per minute when sampling VOCs.
3. Inorganics, including metals, may be collected and preserved in the filtered form as well as the unfiltered form. Disposable in-line filters (0.45 micron filter), connected to the end of the sample tubing, are typically used for field filtration. Samples are field filtered as the water is being placed into the sample container.
4. Adequate space is left in the bottle to allow for expansion, except for VOC vials, which are filled to the top with a positive meniscus. VOC vials should be capped slowly to prevent introduction of air bubbles in the sample. Once capped, the VOC vial should be inverted and tapped to detect the presence of air bubbles.

5. Immediately upon collection, all samples for chemical analysis are to be labeled and placed on ice.

6. Re-usable equipment must be cleaned and decontaminated in accordance with the *Decontamination of Personnel and Equipment* SOP.

The following information, at a minimum, must be recorded in the log book:

1. Sample identification (site name, location, and project number; sample name/number and location; sample type and matrix; time and date; sampler's identity)
2. Sample source and description
3. Field observations and measurements (appearance, field screening, field chemistry, sampling method), volume of water purged prior to sampling, and field parameter measurements
4. Sample disposition (preservative; laboratory name, date and time sent; laboratory sample number, chain-of-custody number, sample bottle lot number)

C. Additional remarks

1. If the well goes dry during purging, wait until it recovers sufficiently to remove the required volumes to sample all parameters. It may be necessary to return periodically to the well but a particular sample (e.g., large amber bottles for semivolatile analysis) should be filled at one time rather than over the course of two or more visits to the well.
2. 2. Disposable tubing is disposed of with PPE and other site trash.

IV. Attachments

- White paper on reasons and rationale for low-flow sampling.

V. Key Checks and Preventative Maintenance

- The drawdown in the well should be minimized as much as possible (preferably no more than 0.5-foot to 1 foot) so that natural groundwater-flow conditions are maintained as closely as possible.
- The highest purging rate should not exceed 1 liter per minute. This is to keep the drawdown minimized.
- Stirring up of sediment in the well should be avoided so that turbidity containing adsorbed chemicals is not suspended in the well and taken in by the pump.
- Overheating of the pump should be avoided to minimize the potential for losing VOCs through volatilization. Submersible pumps used in large diameter wells should be equipped with a shroud to force water flow across the pump motor to dissipate heat build-up.
- Keep the working space clean with plastic sheeting and good housekeeping.
- Maintain field equipment in accordance with the manufacturer's recommendations. This will include, but is not limited to:
  - Inspect sampling pump regularly and replace as warranted

- Inspect quick-connects regularly and replace as warranted
- Verify battery charge, calibration, and proper working order of field measurement equipment prior to initial mobilization and daily during field efforts

Reasons and Rationale For Low-Flow Sampling

EPA recommends low-flow sampling as a means of collecting groundwater samples in a way that minimizes the disturbance to the natural groundwater flow system and minimizes the introduction of contamination into the samples from extraneous sources. The following are details about these issues.

When a pump removes groundwater from the well at the same rate that groundwater enters the well through the screen, the natural groundwater-flow system around the well experiences a minimum of disturbance. Some disturbance is bound to occur because you are causing groundwater to flow to the well in a radial fashion that otherwise would have flowed past it. However, the resulting low-flow sample provides the most-representative indication we can get of groundwater quality in the immediate vicinity of the well.

Normally, when a well is pumped at an excessive rate that drops the water level in the well below the water level in the aquifer, the water cascades down the inside of the well screen when it enters the well. The turbulence from this cascading causes gases such as oxygen and carbon dioxide to mix with the water in concentrations that are not representative of the native groundwater and are higher than expected. This causes geochemical changes in the nature of the water that can change the concentrations of some analytes, particularly metals, in the groundwater sample, not mention it's effect on the dissolved oxygen levels that then will be measured in the flow-through cell. Such turbulence also may cause lower-than-expected concentrations of volatile organic compounds due to volatilization.

For wells in which the water level is above the top of the screen, the water up in the riser is out of the natural circulation of the groundwater and, therefore, can become stagnant. This stagnant water is no longer representative of natural groundwater quality because its pH, dissolved-oxygen content, and other geochemical characteristics change as it contacts the air in the riser. If we minimize the drawdown in the well when we pump, then we minimize the amount of this stagnant water that is brought down into the well screen and potentially into the pump. As a result, a more-representative sample is obtained.

Typically, wells contain some sediment in the bottom of the well, either as a residue from development that has settled out of the water column or that has sifted through the sand pack and screen since the well was installed. This sediment commonly has adsorbed on it such analytes as metals, SVOCs, and dioxins that normally would not be dissolved in the groundwater. If these sediments are picked up in the groundwater when the well is disturbed by excessive pumping, they can:

- Make filtering the samples for metals analysis more difficult
- Add unreasonably to the measured concentration of SVOCs and other organic compounds

The SOP for low-flow sampling has been modified recently and should be consulted for additional information about low-flow sampling and ways of dealing with wells in which the water level cannot be maintained at a constant level.

STANDARD OPERATING PROCEDURE 056

Water-Level Measurements

I. Purpose and Scope

The purpose of this procedure is to provide a guideline for the measurement of the depth to groundwater in piezometers and monitoring wells, even where a second phase of floating liquid (e.g., gasoline) is encountered, and on staff gauges in surface-water bodies. This SOP includes guidelines for discrete measurements of static water levels and does not cover the use of continuously recording loggers (see SOP *Use of Data Loggers and Pressure Transducers)*.

II. Equipment and Materials

- Electronic water-level meter (Solinst® or equivalent) with a minimum 100-foot tape; the tape should have graduations in increments of 0.01 feet or less
- Interface probe (Solinst® Model 122 Interface Meter or equivalent)

III. Procedures and Guidelines

Verify that the unit is turned on and functioning properly. Slowly lower the probe on its cable into the piezometer or well until the probe just contacts the water surface; the unit will respond with a solid tone or light signal. Note the depth from a reference point indicated on the piezometer or well riser. Typically, this is the top of the PVC casing. If no reference is clearly visible, measure the depth to water from the northern edge of the PVC casing. If access to the top of the PVC casing is difficult, sight across the top of the locking casing adjacent to the measuring point, recording the position of the cable when the probe is at the water surface.

Measure the distance from this point to the closest interval marker on the tape and record the water level reading in the logbook. Water levels will be measured to the nearest 0.01-foot. Also, when specified in the project plans, measure and record the depth of the piezometer or well. The depth of the piezometer or well may be measured using the water-level probe with the instrument turned off.

Free product light or dense nonaqueous phase liquid may be present in the piezometer or well. If the presence of free product is suspected, the thickness of the product should be determined using appropriate equipment (e.g., Solinst® Model 122 Interface Meter). The depth to water also is determined with this equipment and the water-level meter should not be used in the piezometer or well as long as product is present. Typically, a constant sound is emitted from the device when free product is encountered and an alternating on/off beep sound is emitted when water is encountered.

The apparent elevation of the water level in the well or piezometer is determined by measuring both the apparent depth to water and the thickness of free product. The corrected water-level elevation is calculated by the following equation:

$WL_c = Wl_a$ + (Free-product thickness x 0.80)

Where WL_c = Corrected water-level elevation

Wl_a = Apparent water-level elevation

0.80 = Typical value for the density of petroleum hydrocarbon products.

If free product is detected on the surface of the water in the piezometer or well, the value of sampling should be reconsidered because of the potential for contaminating the sampling equipment.

Staff gauges may be installed in some surface-water bodies. These facilities typically are constructed by attaching a calibrated, marked staff gage to a wood or metal post, driving the post into the bottom of the surface-water body, and surveying the elevation of the top of the post to a resolution or 0.01-foot. The elevation of the water in the surface-water body then can be determined by reading off the distance the water level is from the top of the post. A shield or other protection may be needed to calm the fluctuations in water level if the gauge is installed at a location exposed to wind or wave.

IV. Attachments

None.

V. Key Checks

- Before each use, verify that the battery is charged by pressing the test button on the water-level meter.
- Verify that the unit is operating correctly by testing the probe in distilled or de-ionized water. Leave the unit turned off when not in use.

STANDARD OPERATING PROCEDURE 066

Equipment Blank and Field Blank Preparation

I. Purpose

To prepare blanks to determine whether decontamination procedures are adequate and whether any cross-contamination is occurring during sampling due to contaminated air and dust.

II. Scope

The general protocols for preparing the blanks are outlined. The actual equipment to be rinsed will depend on the requirements of the specific sampling procedure.

III. Equipment and Materials

- Blank liquid (use ASTM Type II or lab grade deionized water)
- Sample bottles as appropriate
- Gloves
- Preservatives as appropriate

IV. Procedures and Guidelines

A. Decontaminate all sampling equipment that has come in contact with sample according to Standard Operating Procedure 003, *Decontamination of Personnel and Equipment.*

B. To collect an equipment blank for volatile analysis from the surfaces of sampling equipment other than pumps, pour blank water over one piece of equipment and into two or three (laboratory dependent) 40-millilter vials until there is a positive meniscus, then seal the vials. Note the sample number and associated piece of equipment in the field notes as well as the type and lot number of the water used.

For non-volatiles analyses, one aliquot is to be used for equipment. For example, if a pan and trowel are used, place trowel in pan and pour blank fluid in pan such that pan and trowel surfaces which contacted the sample are contacted by the blank fluid. Pour blank fluid from pan into appropriate sample bottles.

Do not let the blank fluid come in contact with any equipment that has not been decontaminated.

C. When collecting an equipment blank from a pump, run an extra gallon of deionized water through the pump while collecting the pump outflow into appropriate containers. Make sure the flow rate is low when sampling volatile organic compounds. If a submersible pump with disposable tubing is used, remove the disposable tubing after sampling but before decontamination. When decontamination is complete, put a 3- to 5-foot segment of new tubing onto the pump to collect the equipment blank.

D. To collect a field blank, slowly pour ASTM Type II or laboratory grade deionized water directly into sample containers.

E. Document and ship samples in accordance with the procedures for other samples.

F. Collect next field sample.

V. Attachments

None.

VI. Key Checks and Items

- Wear gloves.
- Do not use any non-decontaminated equipment to prepare blank.
- Use ASTM-Type II or laboratory grade deionized water.

STANDARD OPERATING PROCEDURE 067

Chain-of-Custody

I. Purpose

The purpose of this SOP is to provide information on chain-of-custody procedures to be used under the CLEAN Program.

II. Scope

This procedure describes the steps necessary for transferring samples using Chain-of-Custody Records. A Chain-of-Custody Record is required, without exception, for the tracking and recording of samples collected for on-site or off-site analysis (chemical or geotechnical) during program activities (except wellhead samples taken for measurement of field parameters). Use of the Chain-of-Custody Record Form creates an accurate written record that can be used to trace the possession and handling of the sample from the moment of its collection through analysis. This procedure identifies the necessary custody records and describes their completion. This procedure does not take precedence over region specific or site-specific requirements for chain-of-custody.

III. Definitions

Chain-of-Custody Record Form - A Chain-of-Custody Record Form is a printed two-part form that accompanies a sample or group of samples as custody of the sample(s) is transferred from one custodian to another custodian. One copy of the form must be retained in the project file.

Custodian - The person responsible for the custody of samples at a particular time, until custody is transferred to another person (and so documented), who then becomes custodian. A sample is under one's custody if:

- It is in one's actual possession.
- It is in one's view, after being in one's physical possession.
- It was in one's physical possession and then they locked it up to prevent tampering.
- It is in a designated and identified secure area.

Sample - A sample is physical evidence collected from a facility or the environment, which is representative of conditions at the point and time that it was collected.

IV. Procedures

The term "chain-of-custody" refers to procedures which ensure that evidence presented in a court of law is valid. The chain-of-custody procedures track the evidence from the time and place it is first obtained to the courtroom, as well as providing security for the evidence as it is moved and/or passed from the custody of one individual to another.

Chain-of-custody procedures, recordkeeping, and documentation are an important part of the management control of samples. Regulatory agencies must be able to provide the chain-of-possession and custody of any samples that are offered for evidence, or that form the basis of analytical test results introduced as evidence. Written procedures must be available and followed whenever evidence samples are collected, transferred, stored, analyzed, or destroyed.

A. Sample Identification

The method of identification of a sample depends on the type of measurement or analysis performed. When in situ measurements are made, the data are recorded directly in bound logbooks or other field data records with identifying information.

Information which shall be recorded in the field logbook, when in-situ measurements or samples for laboratory analysis are collected, includes:

- Field Sampler(s),
- Contract Task Order (CTO) Number,
- Project Sample Number,
- Sample location or sampling station number,
- Date and time of sample collection and/or measurement,
- Field observations,
- Equipment used to collect samples and measurements, and
- Calibration data for equipment used

Measurements and observations shall be recorded using waterproof ink.

B. Sample Label

Samples, other than for in situ measurements, are removed and transported from the sample location to a laboratory or other location for analysis. Before removal, however, a sample is often divided into portions, depending upon the analyses to be performed. Each portion is preserved in accordance with the Sampling and Analysis Plan. Each sample container is identified by a sample label (**Attachment 1**). Sample labels are provided, along with sample containers, by the analytical laboratory. The information recorded on the sample label includes:

- **Project:** Name of project site.
- **Sample Identification:** The unique sample number identifying this sample.
- **Date:** A six-digit number indicating the day, month, and year of sample collection (for example, 05/21/17).
- **Time:** A four-digit number indicating the 24-hour time of collection (for example: 0954 is 9:54 a.m., and 1629 is 4:29 p.m.).
- **Medium:** Water, soil, sediment, sludge, waste, etc.
- **Sample Type:** Grab or composite.
- **Preservation:** Type and quantity of preservation added.

- **Analysis:** VOA, BNAs, PCBs, pesticides, metals, cyanide, other.
- **Sampled By:** Printed name or initials of the sampler.
- **Remarks:** Any pertinent additional information.

The field team should always follow the sample ID system prepared by the Project Chemist and reviewed by the Project Manager.

C. Chain-of-Custody Procedures

After collection, separation, identification, and preservation, the sample is maintained under chain-of-custody procedures until it is in the custody of the analytical laboratory and has been stored or disposed.

D. Field Custody Procedures

- Samples are collected as described in the site Sampling and Analysis Plan. Care must be taken to precisely record the sample location and to ensure that the sample number on the label matches the Chain-of-Custody Record exactly.
- A Chain-of-Custody Record will be prepared for each individual cooler shipped and will include only the samples contained within that cooler. The Chain-of-Custody Record for that cooler will then be sealed in a zip-log bag and placed in the cooler prior to sealing. This ensures that the laboratory properly attributes trip blanks with the correct cooler and allows for easier tracking should a cooler become lost during transit.
- The person undertaking the actual sampling in the field is responsible for the care and custody of the samples collected until they are properly transferred or dispatched.
- When photographs are taken of the sampling as part of the documentation procedure, the name of the photographer, date, time, site location, and site description are entered sequentially in the site logbook as photos are taken. Once downloaded to the server or developed, the electronic files or photographic prints shall be serially numbered, corresponding to the logbook descriptions; photographic prints will be stored in the project files. To identify sample locations in photographs, an easily read sign with the appropriate sample location number should be included.
- Sample labels shall be completed for each sample, using waterproof ink unless prohibited by weather conditions (e.g., a logbook notation would explain that a pencil was used to fill out the sample label if the pen would not function in freezing weather.)

E. Transfer of Custody and Shipment

Samples are accompanied by a Chain-of-Custody Record Form. A Chain-of-Custody Record Form must be completed for each cooler and should include only the samples contained within that cooler. A Chain-of-Custody Record Form example is shown in **Attachment 2**. When transferring the possession of samples, the individuals relinquishing and receiving will sign, date, and note the time on the Record. This Record documents sample custody transfer from the sampler,

often through another person, to the analyst in the laboratory. The Chain-of-Custody Record is filled out as given below:

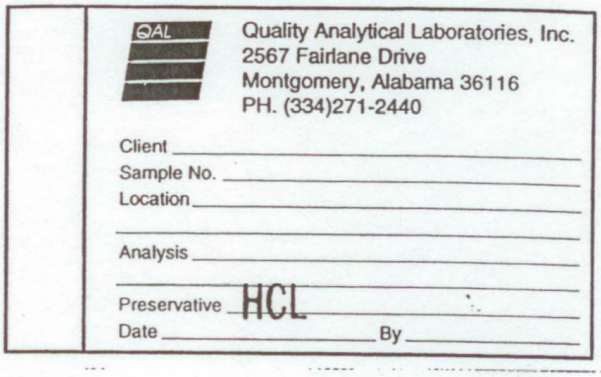
- Enter header information (CTO number, samplers, and project name).
- Enter sample specific information (sample number, media, sample analysis required and analytical method grab or composite, number and type of sample containers, and date/time sample was collected).
- Sign, date, and enter the time under "Relinquished by" entry.
- Have the person receiving the sample sign the "Received by" entry. If shipping samples by a common carrier, print the carrier to be used and enter the airbill number under "Remarks," in the bottom right corner.
- Place the original (top, signed copy) of the Chain-of-Custody Record Form in a plastic zipper-type bag or other appropriate sample-shipping package. Retain the copy with field records.
- Sign and date the custody seal, a 1-inch by 3-inch white paper label with black lettering and an adhesive backing. **Attachment 3** is an example of a custody seal. The custody seal is part of the chain-of-custody process and is used to prevent tampering with samples after they have been collected in the field. Custody seals shall be provided by the analytical laboratory.
- Place the seal across the shipping container opening (front and back) so that it would be broken if the container were to be opened.
- Complete other carrier-required shipping papers.

The custody record is completed using waterproof ink. Any corrections are made by drawing a line through and initialing and dating the change, then entering the correct information. Erasures are not permitted.

Common carriers will usually not accept responsibility for handling Chain-of-Custody Record Forms; this necessitates packing the record in the shipping container (enclosed with other documentation in a plastic zipper-type bag). If custody forms are sealed inside the shipping container and the custody seals are intact, commercial carriers are not required to sign the custody form.

The laboratory representative who accepts the incoming sample shipment signs and dates the Chain-of-Custody Record, completing the sample transfer process. It is then the laboratory's responsibility to maintain internal logbooks and custody records throughout sample preparation and analysis.

V. Quality Assurance Records



Once samples have been packaged and shipped, the Chain-of-Custody copy and airbill receipt become part of the quality assurance record.

STANDARD OPERATING PROCEDURE 069

Packaging and Shipping Procedures for Low-Concentration Samples

I. Purpose and Scope

The purpose of this guideline is to describe the packaging and shipping of low-concentration samples of various media to a laboratory for analysis.

II. Scope

The guideline only discusses the packaging and shipping of samples that are anticipated to have low concentrations of chemical constituents. Whether or not samples should be classified as low-concentration or otherwise will depend upon the site history, observation of the samples in the field, odor, and photoionization-detector readings.

If the site is known to have produced high-concentration samples in the past or the sampler suspects that high concentrations of contaminants might be present in the samples, then the sampler should conservatively assume that the samples cannot be classified as low-concentration. Samples that are anticipated to have medium to high concentrations of constituents should be packaged and shipped accordingly.

If warranted, procedures for dangerous-goods shipping may be implemented. Dangerous goods and hazardous materials pose an unreasonable risk to health, safety, or property during transportation without special handling. As a result only employees who are trained under Jacobs Dangerous Goods Shipping course may ship or transport dangerous goods. Employees should contact a designated Jacobs HazMat advisor with questions.

A. Equipment and Materials

- Coolers
- Clear tape
- Strapping tape
- Contractor bags
- Absorbent pads or equivalent
- Resealable bags
- Bubble bags (for glass bottle ware)
- Bubble wrap (if needed)
- Ice
- Chain-of-Custody form (completed)
- Custody seals

B. Procedures and Guidelines

1. Low-Concentration Samples

   A. Prepare coolers for shipment:

      - Tape drains shut.
      - Place mailing label with laboratory address on top of coolers.
      - Fill bottom of coolers with absorbent pads or similar material.
      - Place a contractor bag inside the cooler.

   B. Affix appropriate adhesive sample labels to each container. Protect with clear packing tape.

   C. Arrange decontaminated sample containers in groups by sample number. Consolidate VOC samples into one cooler to minimize the need for trip blanks. Cross check CoC to ensure all samples are present.

   D. Seal each glass sample bottle within a separate bubble bag (VOCs grouped per sample location). Sample labels should be visible through the bag. Whenever possible, group samples per location for all analytes and place in resealable bags. Make sure to release as much air as practicable from the bag before sealing.

   E. Arrange sample bottles in coolers so that they do not touch.

   F. If ice is required to preserve the samples, cubes should be repackaged in resealable bags and placed on and around the containers.

   G. Fill remaining spaces with bubble wrap if needed.

   H. Complete and sign chain-of-custody form (or obtain signature) and indicate the time and date it was relinquished to Federal Express or the courier.

   I. Close lid and latch.

   J. Carefully peel custody seals from backings and place intact over lid openings (right front and left back). Cover seals with clear packing tape.

   K. Tape cooler shut on both ends, making several complete revolutions with strapping tape. Cover custody seals with clear packing tape to avoid seals being able to be peeled from the cooler.

   L. Relinquish to Federal Express or to a courier arranged with the laboratory. Scan air bill receipt and CoC and send to the sample documentation coordinator along with the other documentation.

C. Medium- and High-Concentration Samples:

Medium- and high-concentration samples are packaged using the same techniques used to package low-concentration samples, with potential additional restrictions. If applicable, the sample handler must refer to instructions associated with the shipping of dangerous goods for the necessary procedures for shipping by Federal Express (preferred) or other overnight carrier (if necessary). If warranted, procedures for

dangerous-goods shipping may be implemented. Dangerous goods and hazardous materials pose an unreasonable risk to health, safety, or property during transportation without special handling. As a result, only employees who are trained under Jacobs Dangerous Goods Shipping course may ship or transport dangerous goods. Employees should contact a designated Jacobs HazMat advisor with questions.

III. Attachments

None.

IV. Key Checks and Items

- Be sure laboratory address is correct on the mailing label
- Pack sample bottles carefully, with adequate packaging and without allowing bottles to touch
- Be sure there is adequate ice
- Include chain-of-custody form
- Include custody seals

STANDARD OPERATING PROCEDURE 070

VOC Sampling-Water

I. Purpose

To provide general guidelines for sampling aqueous volatile organic compounds.

II. Scope

Standard techniques for collecting representative samples are summarized. Site-specific details are discussed in the Field Sampling Plan.

III. Equipment and Materials

- Sample vials pre-preserved at laboratory with hydrochloric acid (HCL)
- Surgical or latex gloves

IV. Procedures and Guidelines

1. Sample VOCs before sampling other analyte groups.
2. When sampling for VOCs, especially residential wells, evaluate the area around the sampling point for possible sources of air contamination by VOCs. Products that may give off VOCs and possibly contaminate a sample include perfumes and cosmetics, skin applied pharmaceuticals, automotive products (gasoline, starting fluid, windshield deicers, carburetor cleaners, etc.) and household paint products (paint strippers, thinners, turpentine, etc.).
3. Keep the caps off the sample vials for as short a time as possible.
4. Wear clean latex or surgical gloves.
5. Fill the sample vial immediately, allowing the water stream to strike the inner wall of the vial to minimize formation of air bubbles. DO NOT RINSE THE SAMPLE VIALS BEFORE FILLING.
6. Fill the sample vial with a minimum of turbulence, until the water forms a positive meniscus at the brim. Do not overfill the sample vial as this may wash the preservative from the vial.
7. Replace the cap by gently setting it on the water meniscus. Tighten firmly, but DO NOT OVERTIGHTEN.
8. Invert the vial and tap it briskly on the palm of your hand. If you see air bubbles in the sample, do not add more sample. Use another vial to collect another sample. If unable to collect vial in another sample, add more sample as necessary until you obtain a proper sample; however, repetition more than twice may result in washing the preservative from the vial.

V. Attachments

None.

VI. Key Checks and Items

- Check for possible sources of contamination.
- Fill slowly, with as little turbulence as possible.
- Check for air bubbles.

CONCRETE
Red-e-Mix (10 bags)

BENTONITE GROUT (150 gallons and 6 bags of bentonite)

Boring initially advanced using 12.5-inch diameter air rotary technique with driven steel casing to 25.5 feet bgs. The concrete caisson was drilled with uncased air rotary to 30 feet bgs. The conductor casing was left in place temporarily, and drilling was changed to hollow stem auger (8-inch diameter). Boring terminated at 78 feet bgs. Boring converted to a 2-inch monitoring well by the tremie method. Conductor casing removed during well completion.

CONCRETE
Red-e-Mix (10 bags)

BENTONITE GROUT (150 gallons and 6 bags of bentonite)

Boring initially advanced using 12.5-inch diameter air rotary technique with driven steel casing to 25.5 feet bgs. The concrete caisson was drilled with uncased air rotary to 30 feet bgs. The conductor casing was left in place temporarily, and drilling was changed to hollow stem auger (8-inch diameter). Boring terminated at 78 feet bgs. Boring converted to a 2-inch monitoring well by the tremie method. Conductor casing removed during well completion.

SUBJECT: DRAFT SAMPLING & ANALYSIS PLAN, POST RECORD OF DECISION, GROUNDWATER LONG-TERM MONITORING, INSTALLATION RESTORATION PROGRAM SITE 1, FORMER SHIP REPAIR BASINS 3 & 4, NAVAL BASE SAN DIEGO, SAN DIEGO, CALIFORNIA DATED AUGUST 2023

DOCUMENT REVIEWED

Draft Sampling and Analysis Plan, Installation Restoration Program (IRP) Site 1, Former Ship Repair Basins 3 and 4" (SAP), Naval Base San Diego, San Diego, Contract Number N62470-21-D-0007; Task Order No. N6247322F4619. The SAP was prepared by CH2M Hill, Inc. (CH2M), for Department of Navy (DON), Naval Facilities Engineering Systems Command Southwest, and dated August 2023.

BACKGROUND

The 1,355-acre Naval Base San Diego (NBSD) is located approximately 3 miles southeast of downtown San Diego occupying approximately 1,029 acres of land and 326 acres of water along the eastern shore of San Diego Bay. Groundwater beneath NBSD has a significant tidal influence from the adjacent San Diego Bay. IRP Site 1 consists of four Former Ship Repair Basins that were used to construct concrete barges during World War II. Former Basins 3 and 4 were approximately 28 to 29 feet (ft) deep,

Printed on Recycled Paper

400 ft long, and 80 ft wide. Three water-bearing zones characterize the groundwater beneath the site to 85 ft below ground surface (bgs). The shallow, perched zone is present from approximately 10 to 20 feet bgs. The intermediate zone is approximately 37 to 47 ft bgs and the deep zone is approximately 58 to 82 ft bgs. Groundwater flow is generally toward the west in the shallow and intermediate zones and toward the east in the deep zone. Anticipated future land use is continued industrial and parking use. Chemicals of concern (COCs) in groundwater include volatile organic compounds (VOCs), semi-VOCs (SVOCs), and polycyclic aromatic hydrocarbons (PAHs). These remain at levels posing an unacceptable risk to human health at IRP Site 1.

The purpose of the long-term groundwater monitoring is to identify whether COCs are below remedial goals, protective for construction worker exposure and to determine whether concentrations of COCs are stable or attenuating.

COMMENTS

1. SAP Worksheet #12, page 43, Field Quality Control (QC) Samples: The field QC samples listed include 1) Field Duplicate, 2) Equipment Blank, 3) Source Blank, i.e., water used prior to equipment rinsate blank sample collection, and 4) Temperature Blank. GSB recommends including Trip and Field Blanks to evaluate conditions during transport and ambient conditions during sampling, respectively. Please revise the Worksheet to include these additional recommended QC samples and provide their collection frequency and purpose.

2. Appendix B-29, Standard Operating Procedure (SOP) 066, Field QC Sampling: This SOP describes equipment blank and field blank preparation. Note that field blanks are not described on Worksheet #12. GSB recommends SOP 066 and SAP Worksheet #12 describe the same QC samples: 1) Field Duplicate, 2) Equipment Blank, 3) Source Blank, 4) Temperature Blank, 5) Trip Blank, and 6) Field Blank. The laboratory-supplied trip blank and temperature blank may be combined. Both the SOP and Worksheet should include purpose, collection frequency, and analyses.

3. SAP Worksheet #14, page 49, Section 14.4 Silt Accumulation: The worksheet describes the possibility of significant silt accumulation between monitoring events. GSB recommends the silt settled in the groundwater monitoring well sump be bailed out so there is a hard bottom and the total depth can be measured after sample collection.

4. Appendix B-22, SOP 025, Well Bottom: During setup and purging but prior to sample collection Item 7 warns, "**Do not measure the depth to the bottom of the well at this time**… Obtain depth to bottom information from the well construction log." Because silt can accumulate over time in the well bottom sump, the screen/or well casing can be damaged by roots, and/or become bio-fouled affecting collection of representative samples, GSB recommends

measuring the bottom of the well and comparing it to the well construction log. The sampling form should note whether the bottom is soft, i.e., presence of silt, and implement well re-development. It may be necessary to measure well bottoms prior to the sampling events so that the wells can be properly restored prior to sample collection.

5. Groundwater Monitoring Frequency Checklist: Although the groundwater is de-designated for beneficial use according to the Basin Plan because of poor groundwater quality (elevated salinity) underlying NBSD, it should be protected from surface contaminant infiltration. The following aboveground wellhead items should be checked and documented on an annual basis (between 5-Year Review sampling events): operational and secure bolts, presence or evidence of standing water, competent concrete apron, free of significant decay/rust, and crash posts (for non-flush mounted wells) in good condition. Should there be issues noted for the aboveground items, additional inspection of the wellhead may be warranted by opening the well lid and examining the bolt tabs, gasket, and that the well box is free of standing water.

   GSB recommends the following:
   a) In addition to sampling groundwater monitoring wells in Basins 3 and 4 every 5 years, that an annual visual inspection be conducted for all wells at IRP Site 1 as illustrated on Figure 10-4 IRP Site Layout.
   b) The annual inspection report should include the date of inspection, photographs, any issues observed in the field, and a repair/replacement schedule.

6. Table of Contents: For organization and completeness, GSB recommends adding table of contents to all appendices.

7. Field Notification: Please ensure field activities are scheduled when DON personnel are available to escort DTSC and Regional Water Quality Control Board (RWQCB) staff to provide oversight and that DTSC staff continue to be informed 2 weeks prior to fieldwork, including 5-Year Review groundwater monitoring and annual groundwater monitoring wellhead inspection events. Additionally, please ensure DTSC approval of documents precedes field implementation.

CLOSING

Aside from the comments described above, the GSB finds the SAP adequately describes the proposed activities. Please revise the SAP, provide a response to comments table in the Final SAP.

All comments and recommendations in this memorandum are site-specific and should not be considered as a general policy decision applicable to other sites. If you have any questions, you may contact me at Dina.Kourda@dtsc.ca.gov.

Sara

HERO has reviewed the Draft Sampling and Analysis Plan Post Record of Decision Groundwater Long-Term Monitoring, Installation Restoration Program (IRP) Site 1, Former Ship Repair Basins 3 and 4 at Naval Base San Diego as it relates to human health risk assessment and has the following Comments:

1. Worksheet 10 – Conceptual Site Model: Worksheet 10, Table 10-1 says that "Land Use Controls (LUCs) will be maintained, until the concentrations of hazardous substances in groundwater have been reduced to levels that allow for unlimited use and unrestricted exposure (UU/UE)." HERO does not concur with this statement in that the remedial goals that have been presented in this SAP were designed to be protective of the construction worker receptor and not a resident. HERO recommends that new remedial goals be created to be protective of a resident receptor if the aim for IRP Site 1 is UU/UE.
2. HERO recommends that the LUC be amended to include a restriction for digging activities at areas at IRP Site 1 that result in a hazard of greater than 1.0 or a cancer risk greater than 1E-6 to the construction worker receptor.
3. HERO concurs with the remedial goals provided in Table 10-1 for groundwater as protective of the construction worker receptor. Meeting these remedial goals through groundwater monitoring would result in potentially removing the requested digging restriction from the amended LUC (See Comment 2) but would not make the site appropriate for UU/UE (See Comment 1).

Specific Comments			
1	SAP Worksheet #12, page 43, Field Quality Control (QC) Samples	The field QC samples listed include 1) Field Duplicate, 2) Equipment Blank, 3) Source Blank, i.e., water used prior to equipment rinsate blank sample collection, and 4) Temperature Blank. GSB recommends including Trip and Field Blanks to evaluate conditions during transport and ambient conditions during sampling, respectively. Please revise the Worksheet to include these additional recommended QC samples and provide their collection frequency and purpose.	Trip blanks and field blanks were added to Worksheet #12. Worksheet #20 was also updated to include field blanks (trip blanks were already included in this worksheet).
2	Appendix B-29, Standard Operating Procedure (SOP) 066, Field QC Sampling	This SOP describes equipment blank and field blank preparation. Note that field blanks are not described on Worksheet #12. GSB recommends SOP 066 and SAP Worksheet #12 describe the same QC samples: 1) Field Duplicate, 2) Equipment Blank, 3) Source Blank, 4) Temperature Blank, 5) Trip Blank, and 6) Field Blank. The laboratory-supplied trip blank and temperature blank may be combined. Both the SOP and Worksheet should include purpose, collection frequency, and analyses.	Please see response to Comment 1. The SOP is meant to provide non-site-specific information and was not updated. The information requested is included in Sampling and Analysis Plan (SAP) Worksheets #12 and #20.

3	SAP Worksheet #14, page 49, Section 14.4 Silt Accumulation	The worksheet describes the possibility of significant silt accumulation between monitoring events. GSB recommends the silt settled in the groundwater monitoring well sump be bailed out so there is a hard bottom and the total depth can be measured after sample collection.	This SAP only includes sampling during one monitoring event. Monitoring wells will be redeveloped before groundwater sampling.
4	Appendix B-22, SOP 025, Well Bottom:	During setup and purging but prior to sample collection Item 7 warns, “Do not measure the depth to the bottom of the well at this time… Obtain depth to bottom information from the well construction log.” Because silt can accumulate over time in the well bottom sump, the screen/or well casing can be damaged by roots, and/or become bio- fouled affecting collection of representative samples, GSB recommends measuring the bottom of the well and comparing it to the well construction log. The sampling form should note whether the bottom is soft, i.e., presence of silt, and implement well re-development. It may be necessary to measure well bottoms prior to the sampling events so that the wells can be properly restored prior to sample collection.	The total depth of the monitoring well will be measured during the synoptic groundwater level survey, which will be performed at all monitoring wells before each groundwater sampling event. Section 14.3 of the SAP indicates that “the depth to the bottom of each well will measured and verified against the well depth indicated in the well construction details. Additional text was added to indicate that observations made during measuring the depth to the bottom of the well casing (including whether the bottom is soft, or the measurement doesn’t match the well construction log) will be recorded in the field logbook.” Monitoring well redevelopment is planned to occur before groundwater sampling (Worksheet #14, Section 14.4 of the SAP).

5	Groundwater Monitoring Frequency Checklist:	Although the groundwater is de- designated for beneficial use according to the Basin Plan because of poor groundwater quality (elevated salinity) underlying NBSD, it should be protected from surface contaminant infiltration. The following aboveground wellhead items should be checked and documented on an annual basis (between 5-Year Review sampling events): operational and secure bolts, presence or evidence of standing water, competent concrete apron, free of significant decay/rust, and crash posts (for non-flush mounted wells) in good condition. Should there be issues noted for the aboveground items, additional inspection of the wellhead may be warranted by opening the well lid and examining the bolt tabs, gasket, and that the well box is free of standing water. GSB recommends the following: a) In addition to sampling groundwater monitoring wells in Basins 3 and 4 every 5 years, that an annual visual inspection be conducted for all wells at IRP Site 1 as illustrated on Figure 10-4 IRP Site Layout. b) The annual inspection report should include the date of inspection, photographs, any issues observed in the field, and a repair/replacement schedule.	The provision for an annual wellhead inspection is included in the Land Use Control Remedial Design (LUC RD) (CH2M, 2023). The results of the annual inspections will be documented in the 5-Year Review Report, as noted in the LUC RD. A separate annual inspection report will not be produced.
6	Table of Contents	For organization and completeness, GSB recommends adding table of contents to all appendices.	A table of contents was added to all appendixes, as requested.
7	Field Notification	Please ensure field activities are scheduled when DON personnel are available to escort DTSC and Regional Water Quality Control Board (RWQCB) staff to provide oversight and that DTSC staff continue to be informed 2 weeks prior to fieldwork, including 5-Year Review groundwater monitoring and annual groundwater monitoring wellhead inspection events. Additionally, please ensure DTSC approval of documents precedes field implementation.	Comment noted.

1	Worksheet 10	Conceptual Site Model: Worksheet 10, Table 10-1 says that "Land Use Controls (LUCs) will be maintained, until the concentrations of hazardous substances in groundwater have been reduced to levels that allow for unlimited use and unrestricted exposure (UU/UE)." HERO does not concur with this statement in that the remedial goals that have been presented in this SAP were designed to be protective of the construction worker receptor and not a resident. HERO recommends that new remedial goals be created to be protective of a resident receptor if the aim for IRP Site 1 is UU/UE.	The cited text in the Record of Decision (ROD) section of Worksheet #10 comes directly from the ROD and is the condition to lift the LUCs. The SAP is for groundwater sampling during the 5-Year Review to address maintenance of the LUCs and not to achieve UU/UE. The remedial goals developed in the LUC RD (CH2M, 2023) do not represent UU/UE. They were developed to ensure the LUC boundaries are protective of construction workers. This was clarified in the LUC RD section of Worksheet #10, as follows: "The LUC RD was developed in 2023 (Navy, 2023) to address LUC implementation actions along with long-term monitoring (LTM) at former Basins 3 and 4 in accordance with the IRP Site 1 ROD (Navy, 2022) and the NBSD Federal Facilities Site Remediation Agreement. Because the ROD did not specify groundwater remedial goals (RGs) **to evaluate the effectiveness of the ICs protective of construction workers,** the LUC RD documents remedy component details for groundwater including chemicals of concern (COCs), groundwater RGs, and groundwater LTM. The LUC RD specified the following: • Based on the HHRA (Bechtel, 2008), benzene, 2-methylnaphthalene, benzo(a)anthracene, dibenzofuran, and naphthalene were identified as the COCs for former Basin 3 shallow groundwater; and benzo(a)anthracene, naphthalene, and pentachlorophenol were identified as the COCs for former Basin 4 shallow groundwater.

Comment Number	Section/ Page	Comment	Response
			• RGs were developed based on reasonable maximum exposure for a construction worker exposed to COCs in shallow groundwater via dermal contact and potential inhalation of off-gassing vapors **to ensure the protectiveness of the groundwater LUC boundaries. ICs in place prohibit residential use within the LUC boundaries. In addition,** groundwater is not used as a drinking water supply at or near IRP Site 1 or NBSD. The San Diego Regional Water Quality Control Board (SD-RWQCB) has determined in the Basin Plan (SD-RWQCB, 1994) that, because of hydrogeologic conditions, the naturally poor quality groundwater underlying NBSD has no beneficial use. There is no plan to develop underlying groundwater resources for drinking water or any other beneficial uses.
2	N/A	HERO recommends that the LUC be amended to include a restriction for digging activities at areas at IRP Site 1 that result in a hazard of greater than 1.0 or a cancer risk greater than 1E-6 to the construction worker receptor.	The ROD (CH2M, 2022) established institutional controls as the remedy for former Basins 3 and 4 soil and groundwater, as discussed in the following excerpt: "ICs (Alternative S2) involve implementation of invasive activity controls that protect potential receptors from contaminants in soil at IRP Site 1 Former Basins 3 and 4. ICs will reduce the potential for human exposure to contaminated soil by prohibiting disturbance of the contaminated soil through unauthorized excavation. Formal written approval from the Navy will be required for subsurface activities to be performed. Environmental controls and worker safety measures must be implemented during subsurface work. Materials excavated from IRP Site 1 Former Basins 3 and 4 during future construction activities will need to be managed in accordance with applicable federal, state, and local regulations for proper waste handling, characterization, and disposal. The ICs will allow the site to continue to be used for industrial purposes. Although residential use is not anticipated, ICs will prohibit residential use. The asphalt pavement will be maintained. No physical access barriers will be included, and commercial and industrial uses of the site will still be permitted by the Navy." The LUC RD (CH2M, 2023) prohibits disturbance of soil and extraction of groundwater through uncontrolled excavation or subsurface construction within the LUC boundaries of former Basins 3 and 4. Excavation, digging, disturbance of soil, construction activities, and other subsurface work could be executed only if environmental and worker safety control measures are implemented during Navy-approved subsurface work. These provisions are protective of worker safety, so the Navy maintains that no revisions to the LUC RD are needed.

Comment Number	Section/ Page	Comment	Response
3	N/A	HERO concurs with the remedial goals provided in Table 10-1 for groundwater as protective of the construction worker receptor. Meeting these remedial goals through groundwater monitoring would result in potentially removing the requested digging restriction from the amended LUC (See Comment 2) but would not make the site appropriate for UU/UE (See Comment 1).	See response to Comments 1 and 2.

Subject: Response to the Draft Sampling and Analysis Plan Post Record of Decision Groundwater Long-Term Monitoring Installation Restoration Program Site 1 Former Ship Repair Basins 3 and 4 Naval Base San Diego, San Diego, California

Dear Ryan Maclure,

The California Regional Water Quality Control Board, San Diego Region (San Diego Water Board) reviewed the U.S. Department of the Navy (Navy) *Draft Sampling and Analysis Plan Post Record of Decision Groundwater Long-Term Monitoring Installation Restoration Program Site 1 Former Ship Repair Basins 3 and 4 Naval Base San Diego, San Diego, California* (Draft SAP), submitted August 16, 2023. The Draft SAP details field procedures and sampling schedule for the long-term monitoring at Installation Restoration Program Site 1 at Naval Base San Diego (Site). In accordance with the Final Record of Decision, groundwater sampling will be conducted in one event at 28 existing monitoring wells.[1] Subsequent data will be incorporated into a Five Year Review report to evaluate the progress of constituents of concern natural degradation. All sampling and reporting will be conducted in accordance with the Final Record of Decision and Draft SAP.

The San Diego Water Board finds the Draft SAP acceptable and has no further comments.

The San Diego Water Board appreciates the Navy's time and efforts addressing contaminated sites within the Naval Base San Diego boundaries and looks forward to assisting with these efforts. In the subject line of any response, please include the reference code – **SL0607350511:JWhearty.**

Toluene	728	728	0.002	<0.0005	MTBE				<0.010

Comments : Tank pit #2 contained a small quantity of "ponded product". This was pumped out at time of tank removal. Tank #2 had numerous holes; the "ponded product" was probably rinse water from tank cleaning. A sampling trench was excavated through the filled pit seven months later; no product was observed and soil contamination at the depth of the "product" was 17 mg/kg TPH.

No remediation. Consultant estimates 160 cu yds of soil with TPH greater than 10 mg/kg remains on site; estimates 10 cu yds soil with TPH greater than 1000 mg/kg remains on site.

+ These soil values are from one soil sample taken at 8.5 feet (watertable) in a trench approximately 14 feet from the probable release location. Soil sample from 11 feet was ND for TPH and BTEX. Consultant reports a hydrocarbon odor at location, but nothing else that would confirm concentrations at such a high level.

VII. ADDITIONAL COMMENTS, DATA, ETC.

Site is located on filled tideland approximately 1000 feet from San Diego Bay. Groundwater gradient is presumed to be flat, based on observations at another site on Tidelands Av, (DEH case at 3040 Tidelands Av - H04735).

One monitoring well was installed between the soil contamination and the nearest receptor (San Diego Bay). The well is 12 feet from the edge of the soil contamination. This well showed non detect for BTEX in first sampling (October 1996). Benzene increased to 13 ppb in March 1997, then dropped to non detect in July 1997.

High levels of dissolved hydrocarbon are assumed to exist in the immediate area of the soil contamination, but the well between the contaminated soil and the nearest receptor (San Diego Bay) shows that dissolved BTEX/MTBE are not found 10 feet from the soil contamination.

A sewer line runs west of the contamination at a depth of 6 feet. Watertable is at 9-9.5 feet, so sewer trench should have no influence on migration of contaminated groundwater.

Monitoring well will be destroyed.

This document and the related CASE CLOSURE LETTER, shall be retained by the lead agency as part of the official site file.

RE: H01984-001 –A & E Industries, 1440 Tidelands Avenue, National City, CA– Administrative Case Closure/No Further Action
DATE: August 17, 2012
Caseworker: Ellen Beacon, EHS II

This case was opened on May 18, 1992, following a referral from the inspections unit where copper slag sand blasting medium and oil were found on the ground. The sand blast grit was a concern for copper and lead. Oil was noted in the degreasing/steam cleaning area and a small oil stain was noted in the compressor area.

The case was taken over by DTSC in 1995; therefore this case can be administratively closed.

Fact Sheet, March 2006

Naval Station San Diego Requests Renewal of Hazardous Waste Facility Permit for Building 3458

The Department of Toxic Substances Control (DTSC) invites you to comment on a proposed Hazardous Waste Permit renewal for the hazardous waste facility (Building 3458) at Naval Station San Diego (NAVSTA). Naval Station San Diego is located just south of downtown San Diego and adjacent to National City, California.

The proposed Draft Permit renewal would allow the facility to continue to operate the existing hazardous waste drum storage, consolidation and transfer activities at Building 3458 located on the naval station property. The Draft Permit and supporting documents define the permitted activities at the NAVSTA Hazardous Waste Facility under the federal Resource Conservation and Recovery Act (RCRA).

Our agency is part of the California Environmental Protection Agency (Cal-EPA) that regulates the generation, storage, treatment, and disposal of hazardous waste in California. This fact sheet contains information on:

Public Comment Period
March 7, 2006 to April 21, 2006

Announcing a 45-day public review and comment period on the Draft Hazardous Waste Permit renewal for Building 3458 at Naval Station San Diego. We will consider and respond to all public comments before making a final decision on this site. You are invited to review and comment on this document at the local information repositories listed on this fact sheet.

Please mail or email comments no later than April 21, 2006 to: Mike Eshaghian, DTSC Project Manager, 1011 N. Grandview Avenue, Glendale, CA 91201; or Email to: meshaghi@dtsc.ca.gov .

Public Hearing

DTSC will hold a public hearing to explain this draft permit and receive public comments.

Date: Thursday, April 6, 2006 Time: 7:00 p.m.
Location: National City Civic Center
City Council Chambers, 2nd Floor
1243 National City Blvd., National City, CA 91950

Facility Background

The Naval Station San Diego is located on the mainland side of San Diego Bay. The land was acquired by the United States Navy in 1921, and has been operated as the Naval Station since 1946. Building 3458, the Hazardous Waste Facility is a container storage facility.

The US Navy is the owner of the permitted hazardous waste facility at Naval Station San Diego. Shaw Infrastructure, Inc. is the operator of the facility.

The Facility, Building 3458, receives stores, consolidates, and transfers hazardous wastes and materials generated by Naval Station activities and other government organizations in the Southern California Region. Hazardous waste is collected from onsite and off-site generators and transported to the facility by trained and licensed personnel.

At the facility, the waste is identified, sorted, consolidated, and prepared for off-site treatment, recycling, and/or disposal. Wastes handled at the facility include conventional industrial wastes that have one or more of the following characteristics: ignitability, corrosivity, toxicity and/or reactivity (if mixed with water). These wastes include paints, solvents, acids/bases, oils/fuels, metals, detergents, light bulbs and ballasts, peroxides, photo-developer chemicals, metal plating liquids, pesticides, tank sludge, batteries, and soil. No bio-hazardous, explosive, or radioactive wastes are accepted at Building 3458.

Facility Features and Safety Measures

Building 3458 is 63 feet wide and 126 feet long. The inside containment area consists of 10 containment bays (nine hazardous waste storage bays and one consolidation bay), and one storage room for a limited amount of reactive waste.

The facility has several safety features built into the structure. Each storage bay is bordered on three sides by eight feet high concrete block walls. The fourth side of the bay is ramped for forklift access, while still providing for spill containment. The walls are designed to assist in spill containment and prevent mixing of incompatible chemicals from adjacent bays should a spill occur. As an additional safety measure each bay is provided with an isolated containment basin (blind sump) to allow for the collection of spilled material.

The enclosed reactive storage area is designed with six-inch thick concrete block walls on three sides and a roll-up door on the fourth side. All spills are contained within the surrounding curbing.

The concrete floor in all work and storage areas of the facility is covered with a chemical-resistant resinous coating. This coating is designed to prevent spilled chemicals from seeping into the concrete flooring. It also promotes efficient drainage to spill collection basins, enables thorough cleanup and decontamination, and protects the concrete floor from the decomposing effects of chemical compounds.

The permit will allow the Navy to continue storing up to 53,460 gallons of hazardous waste in 55-gallon drums (maximum 972 drums).

In the event of an emergency situation including: fire, explosion, release or threatened release of hazardous material, the Federal Fire Department on NAVSTA becomes the Emergency Coordinator. They will coordinate all emergency response efforts including ambulance dispatch and communication with Navy medical centers, National City and San Diego police and fire departments.

Truck Routes

A variety of truck types will be used to transport hazardous waste to and from the facility. The combined number of trucks transporting hazardous waste to the facility will be less than 230 per year. Trucks will travel between the hours of 7 a.m. and 6 p.m.

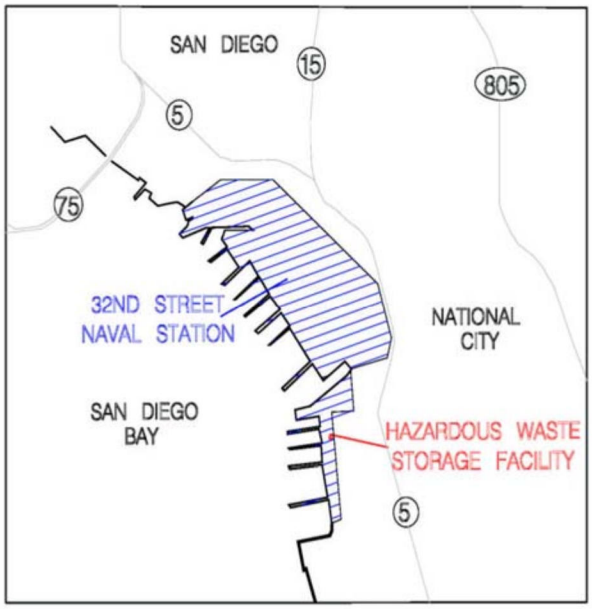
Trucks can enter and exit the site from a variety of routes to the Interstate 5 freeway, and prefer to select the most direct routes.

Possible East/West Roads

- South 32nd Street from National Avenue to the NAVSTA entrance on 32nd Street;
- South 28th Street from the I-5 entrance/exit to the NAVSTA entrance on 28th Street;
- Division Street from the I-5 entrance/exit to the NAVSTA entrance on Division Street;
- West 8th Street from the I-5 to the NAVSTA entrance on 8th Street;
- Civic Center Drive from Main Street to Tidelands Avenue;
- West 19th Street from Cleveland Avenue to the NAVSTA entrance on 19th Street.

Possible North/South Roads

- Harbor Drive from south 28th street to west 19th Street;
- Main Street from south 28th Street to east Division Street;
- National Avenue from south 28th Street to South 32nd Street;
- Tidelands Avenue from Civic Center Drive to West 19th Street;
- Cleveland Avenue from Harbor Drive to west 19th Street.



Corrective Action

On April 21, 1992, a Resource Conservation Recovery Act (RCRA) Facility Assessment (RFA) report was completed for this facility. The report identified potential or actual releases of hazardous waste elements from the Solid Waste Management Units. It also made a preliminary determination about the releases and the need for corrective action, and made recommendations from remedial measures.

The Corrective Action will be carried out under the Federal Facility Site Remediation Agreement, or Corrective Action Consent Agreement, and any subsequent agreements to be entered into and between DTSC and NAVSTA, or any orders to be issued by DTSC.

Permit History

The Hazardous Waste Facility Permit for Building 3458 was originally issued on August 16, 1993 and expired on August 16, 2003. Since NAVSTA submitted a permit renewal request in a timely manner, it's allowed to operate under the expired permit until DTSC makes a final decision on the permit renewal application.

The Building 3458 Hazardous Waste Facility is indicated by the arrow.

The Class 1 Permit Modification for the change of operator and other administrative changes was issued on November 3, 2005. During the last 10 years the facility has only had two minor administrative violations regarding the management of hazardous waste.

California Environmental Quality Act

As part of the permit process, DTSC has performed a review of the proposed draft permit renewal pursuant to the California Environmental Quality Act (CEQA). Based on this review, DTSC has determined that the proposed draft permit will not have any significant adverse effects on public health or the environment. DTSC proposes to issue a CEQA Exemption in connection with this project.
