INTRODUCTION

This Air Quality, Energy, and Greenhouse Gas (GHG) Impact Analysis has been prepared to evaluate the potential air quality, energy, and GHG emissions impacts associated with the Brar Farms Residential Development Project (project) in West Sacramento, California. This analysis was prepared using methods and assumptions recommended in the Yolo-Solano Air Quality Management District (YSAQMD) Handbook for *Assessing and Mitigating Air Quality Impacts*.[1] This analysis includes a description of the existing regulatory framework, an assessment of project construction and operation period emissions, and an assessment of GHG emissions and energy impacts resulting from the proposed project.

In addition, LSA has prepared a construction Health Risk Assessment (HRA) for the proposed project. An HRA is a process used to estimate the increased health risk levels for people living and/or working near a project that emits toxic air contaminants (TACs). The purpose of this HRA is to determine the increased cancer and noncancer health risks from project-related emissions of TACs in the exhaust of diesel-powered construction equipment on existing nearby sensitive receptors. This HRA has been prepared in accordance with policies and procedures of the State Office of Environmental Health Hazard Assessment (OEHHA), the California Air Resources Board (CARB), and the YSAQMD.

PROJECT LOCATION AND DESCRIPTION

The approximately 60-acre project site is located at the corner of Marshall Road and Otis Avenue, in the western portion of West Sacramento in Yolo County. The project site consists of five parcels (Assessor's Parcel Numbers: 045-260-008, -009, -010; 045-270-001, -002) and is undeveloped and relatively flat with a gentle slope toward the southwest. Local vehicular access to the project site is provided by way of Jefferson Boulevard, Marshall Road, and Southport Parkway. Regional vehicular access to the project site is provided by Interstate 5, and Interstate 80, which are located to the east and north of the project site, respectively.

The proposed project involves the subdivision of a 60-acre property to create 259 lots for future single-family homes, comprising approximately 34.78 acres of residential development and open space totaling 14.11 acres. The open space lots would include a 0.68-acre Central Park, a 0.14 acre parklet at the corner of Marshall Road and Otis Avenue, and 1.81 acres of landscaped lots distributed throughout the proposed development to provide greenspace and buffers. Additionally, the open space areas would include a 4.02-acre detention basin, which would also serve as a recreational field during dry seasons. The proposed project would also construct local streets to facilitate circulation throughout the proposed residential development, all of which will be public and meet applicable City Standards. Generally, the proposed streets would be 60 to 65 feet wide and would accommodate 5- to 8-foot-wide sidewalks, landscape strips between the curb and sidewalk and Class III bikeways within the proposed development, Class II bikeways along Marshall Road and Otis Avenue, and enhanced crosswalks with speed tables and bulb-outs. Future homes would

[1] Yolo-Solano Air Quality Management District (YSAQMD). 2007. *Handbook for Assessing and Mitigating Air Quality Impacts*. July 11. Website: https://www.ysaqmd.org/wp-content/uploads/Planning/CEQAHandbook2007.pdf (accessed July 2026).

include two-car garages and driveways for parking cars. On-street parking would be available for residents and guests.

The proposed project would be designed to comply with the water efficiency and energy conservation requirements included in the California Building Standards Code (California Code of Regulations [CCR], Title 24). The proposed residential units would also feature passive use solar heating and cooling, natural ventilation, energy-efficient windows (such as Low E Vinyl, Argon Glass Filled Low E, or Low E Wood Frame), solar roofs, green roofs, or cool roof systems, and energy-efficient home appliances. The proposed project would also be designed to be all-electric and will not include the use of natural gas. Based on the project's trip generation, the proposed project is estimated to generate 2,422 average daily trips.[2]

Construction activities for the project would include site preparation, grading, building construction, paving, and architectural coating. It is anticipated that during project construction, a total of 31,422 cubic yards would be cut through grading and excavation activities, and 88,068 cubic yards of fill would be required. It is assumed that a portion of the required fill would come from on-site excavation, with the remaining fill imported to achieve the proposed site elevations. All fill would remain on site, and no soil would be exported or hauled off. In addition, grading, site preparation, and building activities would involve the use of standard earthmoving equipment such as large excavators, cranes, and other related equipment.

The detailed project schedule is not yet known. However, construction of the proposed project is anticipated to begin in 2027 or 2028, commencing within 12 to 18 months of project approval. This assumption provides a more conservative basis for evaluating potential environmental impacts; however, construction may require a longer timeframe. For purposes of this analysis, it is assumed that construction of the proposed project would begin in early 2027 and would last for 18 months.

The proposed project would require a General Plan Amendment (GPA) to the City of West Sacramento's (City's) existing General Plan and an amendment to the Southport Framework Plan to change the designations from Rural Estates (RE) to Low-Density Residential (LR). It would also require a Zoning Map/Code amendment to rezone the site from Residential Rural Estates (RE) to Residential One Family (R-1-A). **Figure 1** shows the project location, and **Figure 2** shows the project's site plan.

EXISTING LAND USES IN THE PROJECT AREA

The project site is bounded to the north by Marshall Road and to the east by Otis Road. The project site is largely surrounded by single family residential uses to the north, west and south. A mix of residential and agricultural uses lie to the east and southeast of the project site. A retention pond, part of the Bridgeway Lakes Community Park within the Bridgeway Lakes residential development, borders the site to the northwest.

For the purposes of this analysis, sensitive receptors are areas of the population that have an increased sensitivity to air pollution or environmental contaminants. Sensitive receptor locations include residences, schools, daycare centers, hospitals, parks, and similar uses that are sensitive to air quality. Impacts on sensitive receptors are of particular concern because those receptors are the population most vulnerable to the effects of air pollution. The closest sensitive receptors to the project site include single-family residences located immediately south and west at approximately 25 feet as measured from the project boundary to the building façade. Other nearby sensitive receptors include the single-family residences located east and north of the project site at approximately 56 feet and 50 feet, respectively.

BACKGROUND

This section provides current background information on air pollutants and their health effects. It also provides current regulatory background information, including information from the CARB's Air Quality and Land Use Handbook[3] (CARB Handbook), a description of the general health risks of toxics, and the significance criteria for project evaluation.

AIR POLLUTANTS AND HEALTH EFFECTS

Both State and federal governments have established health-based ambient air quality standards (California Ambient Air Quality Standards [CAAQS] and National Ambient Air Quality Standards [NAAQS], respectively) for six criteria air pollutants:[4] carbon monoxide (CO), ozone (O_3), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), lead (Pb), and suspended particulate matter (PM) 2.5 micrometers in diameter or less and 10 micrometers in diameter or less ($PM_{2.5}$ and PM_{10}). In addition, the CAAQS have been established for sulfates, hydrogen sulfide (H_2S), vinyl chloride, and visibility-reducing particles. The CAAQS are generally equal to or more stringent than the NAAQS. These standards are designed to protect the health and welfare of the populace with a reasonable margin of safety. Long-term exposure to elevated levels of criteria pollutants may result in adverse health effects. However, emission thresholds established by an air district are used to manage total regional emissions within an air basin based on the air basin's attainment status for criteria pollutants. These emission thresholds were established for individual projects that would contribute to regional emissions and pollutant concentrations and could adversely affect or delay the projected attainment target year for certain criteria pollutants.

Because of the conservative nature of air district thresholds and the basin-wide context of regional air quality, there is no known direct correlation between a single project and localized air quality-related health effects. One individual project that generates emissions exceeding a threshold does not necessarily result in adverse health effects for residents in the project vicinity. This condition is especially true when the criteria pollutants exceeding thresholds are those with regional effects, such as ozone precursors like nitrogen oxides (NO_X) and volatile organic compounds (VOCs).

For the purposes of CEQA review, air quality analyses must consider impacts to sensitive receptors. Occupants of facilities such as schools, daycare centers, parks and playgrounds, hospitals, and nursing and convalescent homes are considered to be more sensitive than the general public to air pollutants because these population groups have increased susceptibility to respiratory disease. Persons engaged in strenuous outdoor work or exercise also have increased sensitivity to poor air quality. Residential areas are considered more sensitive to air quality conditions, compared to commercial and industrial areas, because people generally spend longer periods of time at their residences, with greater associated exposure to ambient air quality conditions. Recreational uses are

[3] California Air Resources Board (CARB). 2005. *Air Quality and Land Use Handbook: A Community Health Perspective.* April.

[4] Criteria pollutants are defined as those pollutants for which the federal and State governments have established ambient air quality standards, or criteria, for outdoor concentrations in order to protect public health.

also considered sensitive compared to commercial and industrial uses due to greater exposure to ambient air quality conditions associated with exercise.

Ozone

Rather than being directly emitted, most ground-level O_3 (smog) is formed by photochemical reactions between NO_X and VOCs. O_3 is a pungent, colorless gas. Elevated O_3 concentrations result in reduced lung function, particularly during vigorous physical activity. This health problem is particularly acute in sensitive receptors such as the sick, the elderly, and young children. O_3 levels typically peak during the summer and early fall months due to the greater prevalence of sunlight.[5]

Carbon Monoxide

CO is formed by the incomplete combustion of fossil fuels. It is a colorless, odorless gas that can cause dizziness, fatigue, and impairments to central nervous system functions. CO passes through the lungs into the bloodstream, where it interferes with the transfer of oxygen to body tissues.[6]

Particulate Matter

PM does not refer to a specific chemical compound and, rather, is the term used for a mixture of airborne solid particles and liquid. Particles are defined by their diameter for regulatory purposes. Coarse particles are those that are 10 microns or less in diameter (PM_{10}). Fine, suspended PM with an aerodynamic diameter of 2.5 microns or less ($PM_{2.5}$) is a component of PM_{10}. Nitrates, sulfates, dust, and combustion particulates are major components of PM_{10} and $PM_{2.5}$. These small particles can be directly emitted into the atmosphere as byproducts of fuel combustion; through abrasion, such as tire or brake lining wear; or through fugitive dust (wind or mechanical erosion of soil). They can also be formed in the atmosphere through chemical reactions. PM is small enough to be inhaled into deep parts of the lungs and result in adverse health effects. In addition, particulates may transport carcinogens and other toxic compounds that adhere to the particle surfaces and can enter the human body through the lungs.[7]

Nitrogen Dioxide

NO_2 is a reddish-brown gas that is a byproduct of fossil fuel combustion processes. Automobile exhaust and industrial operations are the main sources of anthropogenic NO_2. Aside from its contribution to ozone formation, NO_2 also contributes to other pollution problems, including a high concentration of $PM_{2.5}$, poor visibility, and acid deposition. NO_2 may be visible as a coloring component on high pollution days, especially in conjunction with high ozone levels. NO_2 decreases lung function and may reduce resistance to infection.[8]

---

5 USEPA. n.d. *Criteria Air Pollutants.* Website: https://www.epa.gov/criteria-air-pollutants (accessed July 2026).

6 Ibid.

7 Ibid.

8 Ibid.

Sulfur Dioxide

SO_2 is a colorless gas formed primarily from incomplete combustion of fuels containing sulfur that can cause irritation of the respiratory system. Industrial facilities, such as steel and paper mills, also produce SO_2 emissions. SO_2 irritates the respiratory tract, can injure lung tissue when combined with fine particulate matter, and reduces visibility and the level of sunlight.[9]

Lead

Lead has multiple adverse neurotoxic health effects, and children are at special risk. Some lead-containing chemicals cause cancer in animals. Lead levels in the air have decreased substantially since leaded gasoline was eliminated starting in 1973. Ambient lead concentrations are only monitored on an as-warranted, site-specific basis in California.[10]

Volatile Organic Compounds

VOCs (also known as reactive organic gases [ROGs] and reactive organic compounds [ROCs]) are formed from the combustion of fuels and the evaporation of organic solvents. VOCs generally accumulate in the atmosphere more readily during the winter, when sunlight is limited and photochemical reactions are slower. VOCs are not considered criteria pollutants and subsequently there are no ambient air quality standards for VOCs. However, VOCs are an immediate ozone precursor.[11]

Toxic Air Contaminants

In addition to the criteria pollutants discussed above, TACs are another group of pollutants of concern. TACs are injurious in small quantities and are regulated by the USEPA and the CARB. Some examples of TACs include benzene, butadiene, formaldehyde, and hydrogen sulfide.

TACs do not have ambient air quality standards but are regulated by the USEPA, the CARB, and the YSAQMD. In 1998, the CARB identified particulate matter from diesel-fueled engines as a TAC. The CARB has completed a risk management process that identified potential cancer risks for a range of activities using diesel-fueled engines.[12] High-volume freeways, stationary diesel engines, and facilities attracting heavy and constant diesel vehicle traffic (e.g., distribution centers and truck stops) were identified as posing the highest risk to adjacent receptors. Other facilities associated with increased risk include warehouse distribution centers, large retail or industrial facilities, high-volume transit centers, and schools with a high volume of bus traffic. Health risks from TACs are a function of both concentration and duration of exposure.

Unlike TACs emitted from industrial and other stationary sources noted above, most diesel particulate matter (DPM) is emitted from mobile sources—primarily "off-road" sources such as

11 Ibid.

12 CARB. 2000. Stationary Source Division and Mobile Source Control Division. *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles.* October.

construction and mining equipment, agricultural equipment, and truck-mounted refrigeration units, as well as "on-road" sources such as trucks and buses traveling on freeways and local roadways.

Although not specifically monitored, studies indicate that exposure to DPM may contribute significantly to a cancer risk (a risk of approximately 500 to 700 in 1,000,000) that is greater than all other measured TACs combined.[13] The technology for reducing DPM emissions from heavy-duty trucks is well established, and both State and federal agencies are moving aggressively to regulate engines and emission control systems to reduce and remediate diesel emissions.

Table A summarizes the sources and health effects of air pollutants discussed in this section. **Table B** presents a summary of CAAQS and NAAQS.

Table A: Sources and Health Effects of Air Pollutants

Pollutants	Sources	Primary Effects
Carbon Monoxide (CO)	• Incomplete combustion of fuels and other carbon-containing substances, such as motor exhaust • Natural events, such as decomposition of organic matter	• Reduced tolerance for exercise • Impairment of mental function • Impairment of fetal development • Death at high levels of exposure • Aggravation of some heart diseases (angina)
Nitrogen Dioxide (NO_2)	• Motor vehicle exhaust • High temperature stationary combustion • Atmospheric reactions	• Aggravation of respiratory illness • Reduced visibility • Reduced plant growth • Formation of acid rain
Ozone (O_3)	• Atmospheric reaction of organic gases with nitrogen oxides in sunlight	• Aggravation of respiratory and cardiovascular diseases • Irritation of eyes • Impairment of cardiopulmonary function • Plant leaf injury
Lead (Pb)	• Contaminated soil	• Impairment of blood functions and nerve construction • Behavioral and hearing problems in children
Suspended Particulate Matter ($PM_{2.5}$ and PM_{10})	• Stationary combustion of solid fuels • Construction activities • Industrial processes • Atmospheric chemical reactions	• Reduced lung function • Aggravation of the effects of gaseous pollutants • Aggravation of respiratory and cardiorespiratory diseases • Increased cough and chest discomfort • Soiling • Reduced visibility
Sulfur Dioxide (SO_2)	• Combustion of sulfur-containing fossil fuels • Smelting of sulfur-bearing metal ores Industrial processes	• Aggravation of respiratory diseases (asthma, emphysema) • Reduced lung function • Irritation of eyes • Reduced visibility • Plant injury • Deterioration of metals, textiles, leather, finishes, coatings, etc.

Table B: Federal and State Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[1]		Federal Standards[2]		
		Concentration[3]	Method[4]	Primary[3,5]	Secondary[3,6]	Method[7]
Ozone (O_3)[8]	1-Hour	0.09 ppm (180 µg/m³)	Ultraviolet Photometry	–	Same as Primary Standard	Ultraviolet Photometry
	8-Hour	0.07 ppm (137 µg/m³)		0.070 ppm (137 µg/m³)		
Respirable Particulate Matter (PM_{10})[9]	24-Hour	50 µg/m³	Gravimetric or Beta Attenuation	150 µg/m³	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m³		–		
Fine Particulate Matter ($PM_{2.5}$)[9]	24-Hour	-		35 µg/m³	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m³	Gravimetric or Beta Attenuation	9.0 µg/m³ [15]		
Carbon Monoxide (CO)	8-Hour	9.0 ppm (10 mg/m³)	Non-Dispersive Infrared Photometry (NDIR)	9 ppm (10 mg/m³)	–	Non-Dispersive Infrared Photometry (NDIR)
	1-Hour	20 ppm (23 mg/m³)		35 ppm (40 mg/m³)		
	8-Hour (Lake Tahoe)	6 ppm (7 mg/m³)		–	–	
Nitrogen Dioxide (NO_2)[10]	Annual Arithmetic Mean	0.03 ppm (57 µg/m³)	Gas Phase Chemi-luminescence	53 ppb (100 µg/m³)	Same as Primary Standard	Gas Phase Chemi-luminescence
	1-Hour	0.18 ppm (339 µg/m³)		100 ppb (188 µg/m³)	-	
Lead (Pb)[12,13]	30-Day Average	1.5 µg/m³	Atomic Absorption	–	–	High-Volume Sampler and Atomic Absorption
	Calendar Quarter	–		1.5 µg/m³ (for certain areas)[12]	Same as Primary Standard	
	Rolling 3-Month Average[9]	–		0.15 µg/m³		
Sulfur Dioxide (SO_2)[11]	24-Hour	0.04 ppm (105 µg/m³)	Ultraviolet Fluorescence	0.14 ppm (for certain areas)	–	Ultraviolet Fluorescence; Spectro-photometry (Pararosaniline Method)
	3-Hour	–		–	0.5 ppm (1,300 µg/m³)	
	1-Hour	0.25 ppm (655 µg/m³)		75 ppb (196 µg/m³)[11]	–	
	Annual Arithmetic Mean	–		0.030 ppm (for certain areas)[11]	–	
Visibility-Reducing Particles[12]	8-Hour	See footnote 14	Beta Attenuation and Transmittance through Filter Tape.	No Federal Standards		
Sulfates	24-Hour	25 µg/m³	Ion Chromatography			
Hydrogen Sulfide	1-Hour	0.03 ppm (42 µg/m³)	Ultraviolet Fluorescence			
Vinyl Chloride[10]	24-Hour	0.01 ppm (26 µg/m³)	Gas Chromatography			

Source: California Air Resources Board (2024) (Website:https://ww2.arb.ca.gov/sites/default/files/2024-08/AAQS%20Table_ADA_FINAL_07222024.pdf).

Table notes are provided on the following page.

[1] California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1- and 24-hour), nitrogen dioxide, and particulate matter (PM_{10}, $PM_{2.5}$, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California Ambient Air Quality Standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[2] National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m^3 is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over 3 years, are equal to or less than the standard. Contact USEPA for further clarification and current national policies.

[3] Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[4] Any equivalent measurement method which can be shown to the satisfaction of the CARB to give equivalent results at or near the level of the air quality standard may be used.

[5] National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

[6] National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[7] Reference method as described by the USEPA. An “equivalent method” of measurement may be used but must have a “consistent relationship to the reference method” and must be approved by the USEPA.

[8] On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.

[9] On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 µg/m^3 to 12.0 µg/m^3. The existing national 24- hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m^3, as was the annual secondary standard of 15 µg/m^3. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m^3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

[10] To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

[11] On June 2, 2010, a new 1-hour SO_2 standard was established, and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.
Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.

[12] The CARB has identified lead and vinyl chloride as ‘toxic air contaminants’ with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[13] The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 µg/m^3 as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

[14] In 1989, the CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are “extinction of 0.23 per kilometer” and “extinction of 0.07 per kilometer” for the statewide and Lake Tahoe Air Basin standards, respectively.

[15] On February 7, 2024, the federal annual PM2.5 standard was revised from 12.0 µg/m3 to 9.0 µg/m3.

°C = degrees Celsius
µg/m^3 = micrograms per cubic meter
CARB = California Air Resources Board
mg/m^3 = milligrams per cubic meter
PM_{10} = particulate matter less than 10 microns in size
$PM_{2.5}$ = particulate matter less than 2.5 microns in size
ppb = parts per billion
ppm = parts per million
USEPA = United States Environmental Protection Agency

ENERGY

Electricity

Electricity is a manmade resource. The production of electricity requires the consumption or conversion of energy resources (including water, wind, oil, gas, coal, solar, geothermal, and nuclear resources) into energy. Electricity is used for a variety of purposes (e.g., lighting, heating, cooling, and refrigeration, and for operating appliances, computers, electronics, machinery, and public transportation systems).

According to the most recent data available, in 2024, California's electricity was generated primarily by natural gas (40.0 percent) and renewable sources (59.77 percent), including large hydroelectric and nuclear. Coal and other unspecified sources made up less than 1 percent. Total electric generation in California in 2024 was 216,181 gigawatt-hours (GWh), down from the 2023 total generation of 281,140 GWh.[14]

The project site is within the service territory of the Pacific Gas and Electric (PG&E) Company. According to the California Energy Commission (CEC), total electricity consumption in the PG&E service area in 2024 was 75,337 GWh (26,280 GWh for the residential sector).[15] Total electricity consumption in Yolo County in 2024 was 1,825 GWh (or 1,825,000,000 kilowatt-hours [kWh]).[16]

Natural Gas

Natural gas is a non-renewable fossil fuel. Fossil fuels are formed when layers of decomposing plant and animal matter are exposed to intense heat and pressure under the surface of the Earth over millions of years. Natural gas is a combustible mixture of hydrocarbon compounds (primarily methane) that is used as a fuel source. Natural gas is found in naturally occurring reservoirs in deep underground rock formations. Natural gas is used for a variety of uses (e.g., heating buildings, generating electricity, and powering appliances such as stoves, washing machines and dryers, gas fireplaces, and gas grills).

Natural gas consumed in California is used for electricity generation (45 percent), residential uses (21 percent), industrial uses (25 percent), and commercial uses (9 percent). California continues to depend on out-of-state imports for nearly 90 percent of its natural gas supply.[17]

PG&E is the natural gas service provider for West Sacramento. According to the CEC, total natural gas consumption in the PG&E service area in 2024 was 4,225 million therms (1,705 million therms for

14 California Energy Commission (CEC). 2025. *2024 Total System Electric Generation*. Website: https://www.energy.ca.gov/data-reports/energy-almanac/california-electricity-data/2024-total-system-electric-generation (accessed July 2026).

15 CEC. 2024 Electricity Consumption. Website: https://www.energy.ca.gov/data-reports/energy-almanac/california-electricity-data/california-energy-consumption-dashboards-0 (accessed July 2026).

16 Ibid.

17 CEC. 2025. Supply and Demand of Natural Gas in California. Website: https://www.energy.ca.gov/data-reports/energy-almanac/californias-natural-gas-market/supply-and-demand-natural-gas-california (accessed July 2026).

the residential sector).[18] Total natural gas consumption in Yolo County in 2024 was 59.6 million therms (59,550,000 therms).[19] However, as described in the Project Location and Description section, the proposed project would be designed to be all-electric and will not include the use of natural gas.

Petroleum Fuel

Petroleum is also a non-renewable fossil fuel. Petroleum is a thick, flammable, yellow-to-black mixture of gaseous, liquid, and solid hydrocarbons that occurs naturally beneath the earth's surface. Petroleum is primarily recovered by oil drilling. It is refined into a large number of consumer products, primarily fuel oil, gasoline, and diesel.

Gasoline is the most used transportation fuel in California, with 97 percent of all gasoline being consumed by light-duty cars, pickup trucks, and sport utility vehicles. According to the most recent data available, in 2023, total gasoline consumption in California was 648,296 thousand barrels or 3,490.8 trillion British Thermal Units (BTU).[20] Of the total gasoline consumption, roughly 86 percent (555,413 thousand barrels or 2,974.0 trillion BTU) was consumed for transportation.[21] Based on fuel consumption rates obtained from CARB's Emissions Factor Model, Version 2025 (EMFAC2025), approximately 80.4 million gallons of gasoline and approximately 35.7 million gallons of diesel will be consumed from vehicle trips in Yolo County in 2025.[22]

GREENHOUSE GASES

Global climate change is the observed increase in the average temperature of the Earth's atmosphere and oceans in recent decades. Global surface temperature was around 1.1°C above 1850–1900 levels in 2011–2020. The prevailing scientific consensus on climate change is that most of the warming observed over the last 50 years is attributable to human activities. The increased amounts of carbon dioxide (CO_2) and other GHGs are the primary causes of the human-induced component of warming. GHGs are released by the burning of fossil fuels, land clearing, agriculture, and other activities, and lead to an increase in the greenhouse effect.[23]

22 CARB. n.d. EMFAC Emissions Inventory. Website: https://arb.ca.gov/emfac/emissions-inventory/1ce2f46206362523da30b656d3fc5365ab81b8c9 (accessed July 2026).

23 The temperature on Earth is regulated by a system commonly known as the "greenhouse effect." Just as the glass in a greenhouse lets heat from sunlight in and reduces the heat escaping, greenhouse gases like carbon dioxide, methane, and nitrous oxide in the atmosphere keep the Earth at a relatively even temperature. Without the greenhouse effect, the Earth would be a frozen globe; thus, although an excess of greenhouse gas results in global warming, the naturally occurring greenhouse effect is necessary to keep the planet at a comfortable temperature.

GHGs are present in the atmosphere naturally, are released by natural and anthropogenic sources, or are formed from secondary reactions taking place in the atmosphere. The gases that are widely seen as the principal contributors to human-induced global climate change are:

- CO_2
- Methane (CH_4)
- Nitrous oxide (N_2O)
- Hydrofluorocarbons (HFCs)
- Perfluorocarbons (PFCs)
- Sulfur hexafluoride (SF_6)

These gases vary considerably in terms of Global Warming Potential (GWP), which is a concept developed to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The GWP is based on several factors, including the relative effectiveness of a gas to absorb infrared radiation and length of time that the gas remains in the atmosphere ("atmospheric lifetime"). The GWP of each gas is measured relative to CO_2, the most abundant GHG; the definition of GWP for a particular GHG is the ratio of heat trapped by one unit mass of the GHG to the ratio of heat trapped by one unit mass of CO_2 over a specified time period (usually 100 years). GHG emissions are typically measured in terms of pounds or tons of CO_2 equivalents (CO_2e). **Table C** shows the GWP for several prominent GHGs. For example, SF_6 is 23,500 times more potent at contributing to global warming than CO_2.

Table C: Atmospheric Lifetime and Global Warming Potential of Greenhouse Gases

Gas	Atmospheric Lifetime (Years)	Global Warming Potential (100-Year Time Horizon)
Carbon Dioxide	50-200	1
Methane	12	28
Nitrous Oxide	114	265
HFC-23	270	12,400
HFC-134a	14	1,300
HFC-152a	1.4	138
PFC: Tetrafluoromethane (CF_4)	50,000	6,630
PFC: Hexafluoromethane (C_2F_6)	10,000	11,100
Sulfur Hexafluoride (SF_6)	3,200	23,500

Source: *Intergovernmental Panel on Climate Change (IPCC) Fifth Assessment Report* (AR5) (IPCC 2014).
HFC = hydrofluorocarbons
PFC = perfluorocarbons

The following discussion summarizes the characteristics of the six most prominent GHGs and black carbon.

Carbon Dioxide

In the atmosphere, carbon generally exists in its oxidized form, as CO_2. Natural sources of CO_2 include the respiration (breathing) of humans, animals, and plants, volcanic out gassing, decomposition of organic matter, and evaporation from the oceans. Human-caused sources of CO_2 include the combustion of fossil fuels and biomass, waste incineration, mineral production, and deforestation. The atmospheric lifetime of CO_2 is variable because it is so readily exchanged in the atmosphere.[24]

Methane

CH_4 is produced when organic matter decomposes in environments lacking sufficient oxygen. Natural sources include wetlands, termites, and oceans. Decomposition occurring in landfills accounts for the majority of human-generated CH_4 emissions in California and in the United States as a whole. Agricultural processes such as intestinal fermentation, manure management, and rice cultivation are also significant sources of CH_4 in California.[25]

Nitrous Oxide

N_2O is produced naturally by a wide variety of biological sources, particularly microbial action in soils and water. Tropical soils and oceans account for the majority of natural source emissions. Among other sources, N_2O is a product of the reaction that occurs between nitrogen and oxygen during fuel combustion. Both mobile and stationary combustion sources emit N_2O, and the quantity emitted varies according to the type of fuel, technology, and pollution control device used, as well as maintenance and operating practices. Agricultural soil management and fossil fuel combustion are the primary sources of human-generated N_2O emissions in California.[26]

Hydrofluorocarbons, Perfluorocarbons, and Sulfur Hexafluoride

HFCs are man-made chemicals that were developed to be used as substitutes for ozone-depleting substances regulated under the Montreal Protocol.[27] PFCs and SF_6 are emitted from various industrial processes, including aluminum smelting, semiconductor manufacturing, electric power transmission and distribution, and magnesium casting.

Black Carbon

Black carbon is the most strongly light-absorbing component of PM formed by burning fossil fuels such as coal, diesel, and biomass. Black carbon is emitted directly into the atmosphere in the form of $PM_{2.5}$ and is the most effective form of PM, by mass, at absorbing solar energy. Black carbon contributes to climate change both directly, such as absorbing sunlight, and indirectly, such as

24 CARB. 2024. Assembly Bill 32 Greenhouse Gas Emissions Inventory for 2000-2022 – by Gas.

25 Ibid

26 Ibid

27 The Montreal Protocol is an international treaty that was approved on January 1, 1989, and was designated to protect the ozone layer by phasing out the production of several groups of halogenated hydrocarbons believed to be responsible for ozone depletion.

affecting cloud formation. However, because black carbon is short-lived in the atmosphere, it can be difficult to quantify its effect on global warming.

Most U.S. emissions of black carbon come from mobile sources (52 percent), particularly from diesel-fueled vehicles. The other major source of black carbon is open biomass burning, including wildfires, although residential heating and industry also contribute. The CARB estimates that the annual black carbon emissions in California will be reduced approximately 50 percent below 2013 levels by 2030.[28]

[28] CARB. 2017. *Short-Lived Climate Pollutant Reduction Strategy.* March. Website: https://ww2.arb.ca.gov/sites/default/files/2020-07/final_SLCP_strategy.pdf (accessed July 2026).

REGULATORY SETTING

AIR QUALITY REGULATIONS

The USEPA and the CARB regulate direct emissions from motor vehicles. The YSAQMD is the regional agency primarily responsible for regulating air pollution emissions from stationary sources (e.g., factories) and indirect sources (e.g., traffic associated with new development), as well as monitoring ambient pollutant concentrations.

Federal Regulations

Federal Clean Air Act

The 1970 Federal Clean Air Act (CAA) authorized the USEPA to establish national health-based air quality standards (NAAQS) and also set deadlines for their attainment. The Federal Clean Air Act Amendments of 1990 changed deadlines for attaining NAAQS as well as the remedial actions required of areas of the nation that exceed the standards. Under the CAA, State and local agencies in areas that exceed the NAAQS are required to develop State Implementation Plans to demonstrate how they will achieve the standards by specified dates.

State Regulations

California Clean Air Act

In 1988, the California Clean Air Act (CCAA) required that all air districts in the State endeavor to achieve and maintain CAAQS for CO, O_3, SO_2, and NO_2 by the earliest practical date. The CCAA provides districts with authority to regulate indirect sources and mandates that air districts focus particular attention on reducing emissions from transportation and area-wide emission sources. When an area is designated as nonattainment, the applicable air district is required to adopt a plan to achieve a 5 percent annual reduction, averaged over consecutive 3-year periods, in district-wide emissions of each nonattainment pollutant or its precursors. The attainment plan shows how a district would reduce emissions to achieve air quality standards.

California Air Resources Board

The CARB is the agency responsible for coordination and oversight of state and local air pollution control programs in California and for implementing the CCAA. The CARB's goals are to attain and maintain healthy air quality, protect the public from exposure to toxic air contaminants, and oversee compliance with air pollution rules and regulations. Other CARB duties include monitoring air quality in conjunction with air monitoring networks, establishing CAAQS, and setting emissions standards for new motor vehicles.

Assembly Bill 2588 Air Toxics "Hot Spots" Information and Assessment Act. Under Assembly Bill (AB) 2588 (1987), stationary sources of air pollutants are required to report the types and quantities of certain substances their facilities routinely released into the air. The goals of the Air Toxics "Hot Spots" Act are to collect emission data, identify facilities having localized impacts, determine health risks, notify nearby residents of significant risks, and implement risk reduction measures as necessary to ultimately protect public health.

The California Air Resources Board Handbook. The CARB has developed an Air Quality and Land Use Handbook[29] which is intended to serve as a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process. According to the CARB Handbook, air pollution studies have shown an association between adverse health effects and proximity to high traffic roadways. Other studies have shown that diesel exhaust and other cancer-causing chemicals emitted from cars and trucks are responsible for much of the overall cancer risk from airborne toxics in California. The CARB Handbook recommends that county and city planning agencies strongly consider proximity to these sources when finding new locations for "sensitive" land uses such as homes, medical facilities, daycare centers, schools, and playgrounds.

Land uses that can produce air pollution sources of concern include freeways, rail yards, ports, refineries, distribution centers, chrome plating facilities, dry cleaners, and large gasoline service stations. Key recommendations in the CARB Handbook include taking steps to avoid siting new, sensitive land uses:

- Within 500 feet of a freeway, urban roads with 100,000 vehicles/day or rural roads with 50,000 vehicles/day;
- Within 1,000 feet of a major service and maintenance rail yard;
- Immediately downwind of ports (in the most heavily impacted zones) and petroleum refineries;
- Within 300 feet of any dry cleaning operation (for operations with two or more machines, provide 500 feet); and
- Within 300 feet of a large gas station (defined as a facility with a throughput of 3.6 million gallons per year or greater).

The CARB Handbook specifically states that its recommendations are advisory and acknowledges land use agencies must balance other considerations, including housing and transportation needs, economic development priorities, and other quality of life issues.

The recommendations are generalized and do not consider site-specific meteorology, freeway truck percentages, or other factors that influence risk for a particular project site. The purpose of this guidance is to help land use agencies determine when to further examine project sites for actual health risk associated with the location of new sensitive land uses.

Regional Regulations

Yolo Solano-Air Quality Management District

The YSAQMD is the agency principally responsible for comprehensive air pollution control in its jurisdiction and is tasked with implementing programs and regulations required by both the federal CAA and the CCAA. The YSAQMD prepares air quality attainment plans to achieve and maintain

[29] CARB. 2005. *Air Quality and Land Use Handbook: A Community Health Perspective.* April.

compliance with the CAAQS and the NAAQS. YSAQMD's regulatory authority includes reducing emissions from stationary sources (both area and point sources), developing rules and regulations, establishing permitting requirements, inspecting emissions sources, and enforcing applicable measures through education, incentive programs, or penalties when necessary.

YSAQMD Handbook for Assessing and Mitigating Air Quality Impacts. The YSAQMD has prepared a Handbook for Assessing and Mitigating Air Quality Impacts (handbook)[30] as an advisory document to provide Lead Agencies, consultants, and project applicants with procedures for addressing air quality impacts in environmental documents. The handbook contains preliminary actions Lead Agencies can take to reduce air quality impacts; criteria and thresholds; project screening methods; and mitigation measures.

Rules and Regulations. The YSAQMD rules and regulations that may apply to the proposed project include, but are not limited to, the following[31]:

- **Rule 2.1—Control of Emissions.** The emission of material which may be the cause of air pollution shall be controlled by the contents of this regulation.
- **Rule 2.5 – Nuisance.** A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public or which endanger the comfort, repose, health, or safety of any such persons or the public or which cause to have a natural tendency to cause injury or damage to business or property.
- **Rule 2.11—Particulate Matter Concentration.** The purpose of this rule is to protect the ambient air quality by establishing a particulate matter emission standard. This rule applies to any source operation which emits, or may emit dust, fumes, or total suspended particulate matter.
- **Rule 2.14 – Architectural Coatings.** The purpose of this rule is to limit the quantity of volatile organic compounds in architectural coatings supplied, sold, offered for sale, applied, solicited for application, or manufactured for use within the Yolo-Solano Air Quality Management District.
- **Rule 2.40 – Wood Burning Appliances.** The purpose of this rule is to manage the emissions of particulate matter, carbon monoxide, and other air contaminants from wood burning appliances.

Local Regulations

City of West Sacramento 2035 General Plan

The City addresses air quality in the Safety Element of the 2035 General Plan. The Safety Element includes goals and policies that work to improve air quality in the City and protect residents from

30 YSAQMD. 2007. *Handbook for Assessing and Mitigating Air Quality Impacts.* July 11. Website: https://www.ysaqmd.org/wp-content/uploads/Planning/CEQAHandbook2007.pdf (accessed July 2026).

31 YSAQMD. n.d. Current Rules. Website: https://www.ysaqmd.org/rules-compliance/current-rules-rulemaking/current-rules/ (accessed July 2026).

potential effects of decreased air quality. Applicable air quality policies from the Safety Element are listed below.[32]

- **Policy S-5.1:** The City shall support and participate in local and regional air quality planning programs to ensure the earliest practicable attainment and subsequent maintenance of Federal and State ambient air quality standards.

- **Policy S-5.2:** The City shall promote and implement clean air programs administered by the Yolo-Solano Air Quality Management District to reduce air pollution emissions.

- **Policy S-5.3:** The City shall use the CEQA process to ensure development projects incorporate feasible mitigation measures to reduce construction and operational air quality emissions, and consult with the Yolo-Solano Air Quality Management District early in the development review process.

- **Policy S-5.4:** The City shall ensure maintenance of adequate separation between sensitive land uses and facilities or operations that may produce toxic or hazardous air pollutants or substantial odors consistent with California Air Resources Board recommendations.

- **Policy S-5.7:** The City shall require developers to reduce particulate emissions from construction (e.g. grading, excavation, and demolition) to the maximum extent feasible and consistent with Yolo-Solano Air Quality Management District guidance.

- **Policy S-5.9:** The City shall maximize the use of current air quality mitigation measures, including offsets, into the construction and design of new development to aid in the reduction of regional air pollution emissions.

ENERGY

Federal and State agencies regulate energy use and consumption through various means and programs. On the federal level, the United States Department of Transportation, the United States Department of Energy, and the USEPA are three federal agencies with substantial influence over energy policies and programs. Generally, federal agencies influence and regulate transportation energy consumption through establishment and enforcement of fuel economy standards for automobiles and light trucks, through funding of energy-related research and development projects, and through funding for transportation infrastructure improvements. On the State level, the California Public Utilities Commission (CPUC) and the CEC are two agencies with authority over different aspects of energy.

The CPUC regulates privately-owned electric, natural gas, telecommunications, water, railroad, rail transit, and passenger transportation companies and serves the public interest by protecting

[32] City of West Sacramento. 2016. *2035 General Plan, Safety Element*. Website: https://www.cityofwestsacramento.org/home/showpublisheddocument/2608/636400844109900000 (accessed July 2026).

consumers and ensuring the provision of safe, reliable utility service and infrastructure at reasonable rates, with a commitment to environmental enhancement and a healthy California economy.

The CEC is the State's primary energy policy and planning agency. The CEC forecasts future energy needs, promotes energy efficiency, supports energy research, develops renewable energy resources, and plans for/directs State response to energy emergencies. The applicable federal, State, regional, and local regulatory framework is discussed below.

Federal Regulations

Energy Policy Act of 2005

The Energy Policy Act of 2005 seeks to reduce reliance on non-renewable energy resources and provide incentives to reduce current demand on these resources. For example, under this Act, consumers and businesses can obtain federal tax credits for purchasing fuel-efficient appliances and products (including hybrid vehicles), building energy-efficient buildings, and improving the energy efficiency of commercial buildings. Additionally, tax credits are available for the installation of qualified fuel cells, stationary microturbine power plants, and solar power equipment.

Corporate Average Fuel Economy Standards

On March 31, 2022, the NHTSA finalized the Corporate Average Fuel Economy (CAFE) standards for Model Years 2024–2026 Passenger Cars and Light Trucks. In June 2024, NHTSA finalized CAFE standards for model years 2027 to 2031. The standards will bring the average light-duty vehicle fuel economy to approximately 50.4 miles per gallon by model year 2031. In addition, heavy-duty pickup truck and van fuel efficiency will increase to an average of approximately 35 miles per gallon by model year 2035. NHTSA projects that the foregoing standards will avoid the consumption of almost 70 billion gallons of gasoline through 2050, preventing more than 710 million metric tons of carbon dioxide emissions by 2050.[33]

Inflation Reduction Act

The Inflation Reduction Act (IRA) of 2022 was a multi-faceted, landmark federal law intended to reduce GHG emissions, help build a clean economy, reduce energy costs for Americans, and advance environmental justice. With funding from the IRA, the USEPA launched a network of clean energy financing and provided grant funding for climate pollution reduction programs, and implemented programs to put more clean vehicles on the transportation network.[34] In January 2025, Executive Order (EO) 14153, Unleashing American Energy, agencies were directed to stop issuing funds under the IRA, and EO 14082, Implementation of the Energy and Infrastructure Provisions of the IRA of 2022, was revoked.

33 National Highway Traffic Safety Administration (NHTSA). 2024. USDOT Finalizes New Fuel Economy Standards for Model Years 2027-2031. Website: https://www.nhtsa.gov/press-releases/new-fuel-economy-standards-model-years-2027-2031 (accessed July 2026).

34 USEPA. 2023. EPA Marks One Year of Progress Under President Biden's Inflation Reduction Act. Website: https://www.epa.gov/newsreleases/epa-marks-one-year-progress-under-president-bidens-inflation-reduction-act (accessed July 2026).

Executive Order 14156: Declaring a National Energy Emergency

In January 2025, an Executive Order (EO) was issued declaring a national energy emergency. The EO is intended to address the identified emergency and reduce energy prices by expediting energy and infrastructure projects and facilitating the production of domestic energy resources, which include, but are not limited to, crude oil, natural gas, petroleum products, coal, biofuels, hydropower, and minerals.

State Regulations

Assembly Bill 1575, Warren-Alquist Act

In 1975, largely in response to the oil crisis of the 1970s, the State Legislature adopted AB 1575 (also known as the Warren-Alquist Act), which created the CEC. The statutory mission of the CEC is to forecast future energy needs; license power plants of 50 megawatts or larger; develop energy technologies and renewable energy resources; plan for and direct State responses to energy emergencies; and, perhaps most importantly, promote energy efficiency through the adoption and enforcement of appliance and building energy efficiency standards. AB 1575 also amended Public Resources Code Section 21100(b)(3) and *State CEQA Guidelines* Section 15126.4 to require Environmental Impact Reports (EIRs) to include, where relevant, mitigation measures proposed to minimize the wasteful, inefficient, and unnecessary consumption of energy caused by a project. Thereafter, the State Resources Agency created Appendix F to the *State CEQA Guidelines*. Appendix F assists EIR preparers in determining whether a project will result in the inefficient, wasteful, and unnecessary consumption of energy. Appendix F of the *State CEQA Guidelines* also states that the goal of conserving energy implies the wise and efficient use of energy and the means of achieving this goal, including (1) decreasing overall per capita energy consumption; (2) decreasing reliance on fossil fuels such as coal, natural gas, and oil; and (3) increasing reliance on renewable energy sources.

Senate Bill 1389, Energy Planning and Forecasting

In 2002, the State Legislature passed Senate Bill (SB) 1389, which required the CEC to develop an integrated energy plan every 2 years for electricity, natural gas, and transportation fuels for the California Energy Policy Report. The plan calls for the State to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the least environmental and energy costs. To further this policy, the plan identifies a number of strategies, including assistance to public agencies and fleet operators in implementing incentive programs for zero emission vehicles (ZEVs) and their infrastructure needs, and encouragement of urban designs that reduce vehicle miles traveled (VMT) and accommodate pedestrian and bicycle access.

In compliance with the requirements of SB 1389, the CEC adopts an Integrated Energy Policy Report every 2 years and an update every other year. The most recently adopted report is the *2024 Integrated Energy Policy Report.*[35] The *Integrated Energy Policy Report* covers a broad range of topics, including decarbonizing buildings, integrating renewables, energy efficiency, energy equity,

[35] CEC. 2024. *2024 Integrated Energy Policy Report*. California Energy Commission. Docket Number: 24-IEPR-01.

integrating renewable energy, climate adaptation activities for the energy sector, natural gas assessment, transportation energy demand forecast, and the California Energy Demand Forecast.

Renewable Portfolio Standard

SB 1078 established the California Renewable Portfolio Standards program in 2002. SB 1078 initially required that 20 percent of electricity retail sales be served by renewable resources by 2017; however, this standard has become more stringent over time. In 2006, SB 107 accelerated the standard by requiring that the 20 percent mandate be met by 2010. In April 2011, SB 2 required that 33 percent of electricity retail sales be served by renewable resources by 2020. In 2015, SB 350 established tiered increases to the Renewable Portfolio Standards of 40 percent by 2024, 45 percent by 2027, and 50 percent by 2030. In 2018, SB 100 increased the requirement to 60 percent by 2030 and required that all the State's electricity come from carbon-free resources by 2045. SB 100 took effect on January 1, 2019.[36]

California Energy Code

Energy consumption by new buildings in California is regulated by the Building Energy Efficiency Standards, in Part 6 of Title 24 of the CCR, known as the Energy Code. The CEC first adopted the Building Energy Efficiency Standards for Residential and Non-residential Buildings in 1978 in response to a legislative mandate to reduce energy consumption in the State. The Energy Code is updated every 3 years, with the most recent update consisting of the 2022 Energy Code that became effective January 1, 2023, and mid-cycle supplements to the 2022 Code became effective on July 1, 2024. The efficiency standards apply to both new construction and rehabilitation of both residential and nonresidential buildings, and regulate energy consumed for heating, cooling, ventilation, water heating, and lighting. The building efficiency standards are enforced through the local building permit process. Local government agencies may adopt and enforce energy standards for new buildings, provided these standards meet or exceed those provided in the Energy Code.

California Green Building Standards Code (CALGreen Code)

In 2010, the California Building Standards Commission (CBSC) adopted Part 11 of the Title 24 Building Energy Efficiency Standards, referred to as the California Green Building Standards Code (CALGreen Code). The CALGreen Code took effect on January 1, 2011. The CALGreen Code is updated on a regular basis, with the most recent update consisting of the 2025 CALGreen Code standards that became effective January 1, 2026.[37] The CALGreen Code established mandatory measures for residential and nonresidential building construction and encouraged sustainable construction practices in the following five categories: (1) planning and design, (2) energy efficiency, (3) water efficiency and conservation, (4) material conservation and resource efficiency, and (5) indoor environmental quality. Although the CALGreen Code was adopted as part of the State's efforts to reduce GHG emissions, the CALGreen Code standards have co-benefits of reducing energy consumption from residential and nonresidential buildings subject to the standard.

California Energy Efficiency Strategic Plan

On September 18, 2008, the CPUC adopted California's first Long-Term Energy Efficiency Strategic Plan, presenting a roadmap for energy efficiency in California. The Strategic Plan was updated in 2011. The Plan articulates a long-term vision and goals for each economic sector and identifies specific near-term, mid-term, and long-term strategies to assist in achieving those goals. The Plan also reiterates the following four specific programmatic goals known as the "Big Bold Energy Efficiency Strategies" that were established by the CPUC in Decisions D.07-10-032 and D.07-12-051:[38]

- All new residential construction will be zero net energy (ZNE) by 2020.
- All new commercial construction will be ZNE by 2030.
- 50 percent of commercial buildings will be retrofitted to ZNE by 2030.
- 50 percent of new major renovations of State buildings will be ZNE by 2025.

Regional Regulations

There are no regional energy regulations that apply to the proposed project.

Local Regulations

City of West Sacramento 2035 General Plan

The City addresses energy in the Natural and Cultural Resources Element of the 2035 General Plan. The Natural and Cultural Resources Element includes policies that work to increase energy efficiency and conservation through the use of renewable energy sources in the City. Energy policies and action items from the Natural and Cultural Resources Element that may be applicable to the project are listed below.[39]

- **Policy NCR-7.1:** The City shall maintain and implement green building and energy efficiency standards for new development and redevelopment projects.

- **Policy NCR-7.2:** The City shall provide incentives for green building practices and strive to remove barriers that impede their uses.

- **Policy NCR-7.4:** The City shall require, to the extent feasible, site and building design that reduces exterior heat gain and heat island effects (e.g., tree planting, reflective paving materials, covered parking, cool roofs).

39 City of West Sacramento. 2016. *2035 General Plan, Natural and Cultural Resources Element. Website:* https://www.cityofwestsacramento.org/home/showpublisheddocument/2598/636400844095200000 (accessed July 2026).

- **Policy NCR-7.5:** The City shall require, to the extent feasible, building orientations and landscaping that use natural lighting to reduce energy demands.

- **Policy NCR-7.6:** The City shall require, to the extent feasible, new development to include renewable energy generation and co-generation facilities.

- **Policy NCR-7.7:** The City shall encourage the use of "EPA Energy Star" certified appliances (e.g., water heaters, swimming pool heaters, cooking equipment, refrigerators, furnaces and boiler units) for new private development and public facilities.

GREENHOUSE GAS REGULATORY SETTING

This section describes regulations related to GHGs at the federal, State, and local level.

Federal Regulations

The United States has historically had a voluntary approach to reducing GHG emissions. However, on April 2, 2007, the United States Supreme Court ruled that the USEPA has the authority to regulate CO_2 emissions under the CAA.

The USEPA commenced several actions in 2009 to implement a regulatory approach to global climate change, including the 2009 USEPA final rule for mandatory reporting of GHGs from large GHG emission sources in the United States. Additionally, the USEPA Administrator signed an endangerment finding action in 2009 under the CAA, finding that seven GHGs (CO_2, CH_4, N_2O, HFCs, nitrogen trifluoride [NF_3], PFCs, and SF_6) constitute a threat to public health and welfare, and that the combined emissions from motor vehicles cause and contribute to global climate change, leading to national GHG emission standards.

The Inflation Reduction Act of 2022 reaffirmed the USEPA's authority to regulate GHG emissions under the CAA. In January 2025, EO 14153, Unleashing American Energy, agencies were directed to stop issuing funds under the IRA. A bill has been introduced to repeal the IRA, but it has not been passed through the legislative process as of October 2025.

State Regulations

The CARB is the regulatory agency for implementing climate change regulations in the State. Since its formation, the CARB has worked with the public, the business sector, and local governments to find solutions to California's air pollution problems. Key efforts by the State are described below.

Assembly Bill 32 (2006), California Global Warming Solutions Act

California's major initiative for reducing GHG emissions is AB 32, passed by the State legislature on August 31, 2006. This effort aims at reducing GHG emissions to 1990 levels by 2020. The CARB has established the level of GHG emissions in 1990 at 427 million metric tons (MMT) of CO_2e. The emissions target of 427 MMT requires the reduction of 169 MMT from the State's projected business-as-usual 2020 emissions of 596 MMT. AB 32 requires the CARB to prepare a Scoping Plan that outlines the main State strategies for meeting the 2020 deadline and to reduce GHGs that contribute to global climate change. The Scoping Plan was approved by the CARB on December 11,

2008, and contains the main strategies California will implement to achieve the reduction of approximately 169 MMT CO_2e, or approximately 30 percent, from the State's projected 2020 emissions level of 596 MMT CO_2e under a business-as-usual scenario (this is a reduction of 42 MMT CO_2e, or almost 10 percent from 2002–2004 average emissions). The Scoping Plan also includes CARB-recommended GHG reductions for each emissions sector of the State's GHG inventory. The Scoping Plan calls for the largest reductions in GHG emissions to be achieved by implementing the following measures and standards:

- Improved emissions standards for light-duty vehicles (estimated reductions of 31.7 MMT CO_2e);
- The Low-Carbon Fuel Standard (15.0 MMT CO_2e);
- Energy efficiency measures in buildings and appliances and the widespread development of combined heat and power systems (26.3 MMT CO_2e); and
- A renewable portfolio standard for electricity production (21.3 MMT CO_2e).

The CARB approved the First Update to the Climate Change Scoping Plan on May 22, 2014. The First Update identifies opportunities to leverage existing and new funds to further drive GHG emission reductions through strategic planning and targeted low carbon investments. The First Update defines CARB climate change priorities until 2020, and also sets the groundwork to reach long-term goals set forth in EOs S-3-05 and B-16-2012. The Update highlights California's progress toward meeting the "near-term" 2020 GHG emission reduction goals as defined in the initial Scoping Plan. It also evaluates how to align the State's "longer-term" GHG reduction strategies with other State policy priorities for water, waste, natural resources, clean energy, transportation, and land use. CARB released a second update to the Scoping Plan, the 2017 Scoping Plan,[40] to reflect the 2030 target set by EO B-30-15 and codified by SB 32.

The 2022 Scoping Plan[41] was approved in December 2022 and assesses progress toward achieving the SB 32 2030 target and lay out a path to achieve carbon neutrality no later than 2045. The 2022 Scoping Plan focuses on outcomes needed to achieve carbon neutrality by assessing paths for clean technology, energy deployment, natural and working lands, and others, and is designed to meet the State's long-term climate objectives and support a range of economic, environmental, energy security, environmental justice, and public health priorities.

The 2022 Scoping Plan focuses on building clean energy production and distribution infrastructure for a carbon-neutral future, including transitioning existing energy production and transmission infrastructure to produce zero-carbon electricity and hydrogen, and utilizing biogas resulting from wildfire management or landfill and dairy operations, among other substitutes. The 2022 Scoping Plan states that in almost all sectors, electrification will play an important role. The 2022 Scoping Plan evaluates clean energy and technology options and the transition away from fossil fuels, including adding four times the solar and wind capacity by 2045 and about 1,700 times the amount

40 CARB. 2017a. *California's 2017 Climate Change Scoping Plan*. November.

41 CARB. 2021. *2022 Scoping Plan Update*. May 10. Website: https://ww2.arb.ca.gov/sites/default/files/2023-04/2022-sp.pdf (accessed July 2026).

of current hydrogen supply. As discussed in the 2022 Scoping Plan, EO N-79-20 requires that all new passenger vehicles sold in California will be zero-emission by 2035, and all other fleets will have transitioned to zero-emission as fully possible by 2045, which will reduce the percentage of fossil fuel combustion vehicles.

Senate Bill 375 (2008)

Signed into law on October 1, 2008, SB 375 supplements GHG reductions from new vehicle technology and fuel standards with reductions from more efficient land use patterns and improved transportation in an effort to reduce VMT. Under the law, the CARB approved GHG reduction targets in February 2011 for California's 18 federally designated regional planning bodies, known as Metropolitan Planning Organizations (MPOs). The CARB may update the targets every 4 years and must update them every 8 years. MPOs, in turn, must demonstrate how their plans, policies, and transportation investments meet the targets set by the CARB through Sustainable Communities Strategies (SCSs). The SCSs are included with the Regional Transportation Plan, a report required by State law.

Executive Order B-30-15 (2015)

Governor Jerry Brown signed EO B-30-15 on April 29, 2015, which added the immediate target of:

- GHG emissions should be reduced to 40 percent below 1990 levels by 2030.

All State agencies with jurisdiction over sources of GHG emissions were directed to implement measures to achieve reductions of GHG emissions to meet the 2030 and 2050 targets. CARB was directed to update the AB 32 Scoping Plan to reflect the 2030 target, and therefore, is moving forward with the update process. The mid-term target is critical to help frame the suite of policy measures, regulations, planning efforts, and investments in clean technologies and infrastructure needed to continue reducing emissions.

Senate Bill 350 (2015) Clean Energy and Pollution Reduction Act

SB 350, signed by Governor Jerry Brown on October 7, 2015, updates and enhances AB 32 by introducing the following set of objectives in clean energy, clean air, and pollution reduction for 2030:

- Raise California's renewable portfolio standard from 33 percent to 50 percent; and
- Increasing energy efficiency in buildings by 50 percent by the year 2030.

The 50 percent renewable energy standard will be implemented by the CPUC for the private utilities and by the CEC for municipal utilities. Each utility must submit a procurement plan showing it will purchase clean energy to displace other non-renewable resources. The 50 percent increase in energy efficiency in buildings must be achieved through the use of existing energy efficiency retrofit funding and regulatory tools already available to state energy agencies under existing law. The addition made by this legislation requires State energy agencies to plan for and implement those programs in a manner that achieves the energy efficiency target.

Senate Bill 32, California Global Warming Solutions Act of 2016, and Assembly Bill 197

In summer 2016 the Legislature passed, and the Governor signed SB 32 and AB 197. SB 32 affirms the importance of addressing climate change by codifying into statute the GHG emissions reductions target of at least 40 percent below 1990 levels by 2030 contained in Governor Brown's April 2015 EO B-30-15. SB 32 builds on AB 32 and keeps California on the path toward achieving the State's 2050 objective of reducing emissions to 80 percent below 1990 levels, consistent with an Intergovernmental Panel on Climate Change (IPCC) analysis of the emissions trajectory that would stabilize atmospheric GHG concentrations at 450 parts per million CO_2e and reduce the likelihood of catastrophic impacts from climate change.

The companion bill to SB 32, AB 197, provides additional direction to CARB related to the adoption of strategies to reduce GHG emissions. Additional direction in AB 197 meant to provide easier public access to air emissions data that are collected by CARB was posted in December 2016.

Senate Bill 100

On September 10, 2018, Governor Brown signed SB 100, which raises California's Renewables Portfolio Standard (RPS) requirements to 60 percent by 2030, with interim targets, and 100 percent by 2045. The bill also establishes a State policy that eligible renewable energy resources and zero-carbon resources supply 100 percent of all retail sales of electricity to California end-use customers and 100 percent of electricity procured to serve all State agencies by December 31, 2045. Under the bill, the State cannot increase carbon emissions elsewhere in the western grid or allow resource shuffling to achieve the 100 percent carbon-free electricity target.

Executive Order B-55-18

EO B-55-18, signed September 10, 2018, sets a goal "to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter." EO B-55-18 directs CARB to work with relevant State agencies to ensure future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal. The goal of carbon neutrality by 2045 is in addition to other statewide goals, meaning not only should emissions be reduced to 80 percent below 1990 levels by 2050, but that, by no later than 2045, the remaining emissions be offset by equivalent net removals of CO_2e from the atmosphere, including through sequestration in forests, soils, and other natural landscapes.

Executive Order N-79-20

EO N-79-20, which was signed by the Governor on September 23, 2020, sets the following goals for the State: 100 percent of in-state sales of new passenger cars and trucks shall be zero-emission by 2035; 100 percent of medium- and heavy-duty vehicles in the State shall be zero-emission by 2045 for all operations where feasible and by 2035 for drayage trucks; and 100 percent of off-road vehicles and equipment in the State shall be zero-emission by 2035, where feasible.

Assembly Bill 1279

AB 1279 was signed in September of 2022, and codifies the State goals of achieving net carbon neutrality by 2045 and maintaining net negative GHG emissions thereafter. This bill also requires

California to reduce statewide GHG emissions by 85 percent compared to 1990 levels by 2045 and directs CARB to work with relevant state agencies to achieve these goals.

Regional Regulations

Yolo-Solano Air Quality Management District

The YSAQMD has not yet established a threshold of significance for GHGs. YSAQMD advises that lead agencies evaluate whether a project's incremental direct and indirect GHG emissions are cumulatively considerable. If the lead agency jurisdiction has adopted a Climate Action Plan or General Plan goals and policies with regard to GHGs, the environmental review should base its analysis on the provisions of those documents. If the lead agency jurisdiction has not adopted a Climate Action Plan or General Plan goals and policies, then the District recommends that lead agencies consider a project's total emissions in relation to the AB 32 and AB 32 Scoping Plan goals (and additional state goals as they are adopted) or the thresholds established by other jurisdictions.

Sacramento Area Council of Governments

As the designated MPO for the six-county 22-city Sacramento metropolitan region, the Sacramento Area Council of Governments (SACOG) prepares several plans to address regional growth, including the Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS). SACOG is mandated by federal and State law to research and draw up plans for transportation, growth management, hazardous waste management, and a regional growth forecast that is the foundation for these plans and regional air quality plans. SACOG prepares several plans to address regional growth, including the Regional Comprehensive Plan and Guide, Regional Housing Needs Assessment, the MTP/SCS, the Regional Transportation Improvement Program, and the annual State of the Region reports to measure progress toward achieving regional planning goals and policies. In 2022, the SACOG Board adopted the 2025 Blueprint growth projections for population, employment, and households in the region. On November 20, 2025, SACOG adopted the MTP/SCS to the final 2025 Blueprint Plan.[42]

Local Regulations

City of West Sacramento 2035 General Plan

The City addresses climate change and GHGs in the Safety Element of the 2035 General Plan. The Safety Element includes goals and policies that work to reduce GHG emissions and adapting to expected climate change impacts. Applicable GHG policies from the Safety Element are listed below.[43]

- **Policy S-4.1:** The City shall strive to reduce community greenhouse gas emissions to the following levels:

[42] Sacramento Area Council of Governments (SACOG). 2022. *2025 Blueprint.* Website: https://www.sacog.org/planning/2025-blueprint/2025-blueprint-plan (accessed June 2026).

[43] City of West Sacramento. 2016. *2035 General Plan, Safety Element*. Website: https://www.cityofwestsacramento.org/home/showpublisheddocument/2608/636400844109900000 (accessed July 2026).

- 30 percent below "business as usual" emissions in 2005 levels by 2020; and
- 30 percent below "business as usual" emissions levels by 2030.

- **Policy S-4.3:** The City shall, in collaboration with stakeholders from the community, implement policies and measures to reduce greenhouse gas emissions from community, business, and municipal activities consistent with the targets described in Policies HS-5.1 and 5.2.

- **Policy S-4.4:** The City shall monitor greenhouse gas emissions and maintain greenhouse gas emissions inventories for municipal operations, business sectors, and the community, using methods approved by or consistent with guidance from the California Air Resources Board.

- **Policy S-4.5:** The City shall support State and Federal actions to reduce greenhouse gas emissions.

- **Policy S-4.6:** The City shall support the development of technological improvements that reduce greenhouse gas emissions, and encourage residents and businesses to integrate into their operations and daily lives new greenhouse gas reducing technologies.

- **Policy S-4.7:** The City shall monitor the local and regional impacts of climate change, and use adaptive management techniques and the latest climate change science to implement, and/or revise, if necessary, strategies to respond to the expected impacts of climate change.

City of West Sacramento Draft Climate Action and Adaption Plan (CAAP)

The City's Draft CAAP was adopted by the City Council on June 4, 2025.[44] The Draft CAAP includes policies and strategies to reduce community and municipal GHG emissions. It builds upon the City's long-term planning vision for the future established in the City's 2035 General Plan. In addition, the CAAP describes development of the City's 2030 and 2045 reduction targets, detailing their consistency with state legislation and executive orders and establishes that meeting the reduction targets would avoid cumulatively considerable effects. As such, the CAAP was developed consistent with state guidelines that pertain to local plans "for the reduction or mitigation of GHG emissions" (pursuant to SB 97 and CEQA Guidelines Section 15183.5), allowing the City to use the CAAP rather than project-level analysis for GHG emissions impact assessment for future projects.

[44] City of West Sacramento. 2025. City of West Sacramento Climate Action and Adaptation Plan. June 4. Website: https://www.cityofwestsacramento.org/home/showpublisheddocument/20579/638860179110630000 (accessed July 2026).

SETTING

This section provides the current YSAQMD attainment status, climate and air quality, ambient air quality monitoring results, and GHG emissions inventory.

ATTAINMENT STATUS

The proposed project is located in West Sacramento and is within the Sacramento Valley Air Basin (SVAB). The YSAQMD is one of the air districts responsible for air quality regulation within the SVAB region and specifically has authority over air quality in Yolo and Solano counties. The SVAB is designated as being in non-attainment of the NAAQS for O_3 and $PM_{2.5}$ and in non-attainment of the CAAQS for O_3, PM_{10}, and $PM_{2.5}$s.

Table D provides a summary of the attainment status for the SVAB with respect to NAAQS and CAAQS.

Table D: Sacramento Valley Air Basin Air Quality Attainment Status

Pollutant	Federal	State
Ozone (1-hour)	Nonattainment	Nonattainment
Ozone (8-hour)	Nonattainment	Nonattainment
PM_{10}	Nonattainment	Unclassified
$PM_{2.5}$	Unclassified	Attainment
Carbon Monoxide	Attainment	Attainment
Nitrogen Dioxide	Attainment	Attainment
Lead	Attainment	Attainment
Sulfur Dioxide	Attainment	Attainment
Sulfates	No Federal Standard	Attainment
Hydrogen Sulfide	No Federal Standard	Unclassified

Source: California Air Resources Board and USEPA (2023).
PM_{10} = particulate matter less than 10 microns in size
$PM_{2.5}$ = particulate matter less than 2.5 microns in size

EXISTING CLIMATE AND AIR QUALITY

Air quality is a function of both local climate and local sources of air pollution. The amount of a given pollutant in the atmosphere is determined by the amount of the pollutant released and the atmosphere's ability to transport and dilute the pollutant. The major determinants of transport and dilution are wind, atmospheric stability, terrain, and for photochemical pollutants, sunshine.

A region's topographic features have a direct correlation with air pollution flow and therefore are used to determine the boundary of air basins. The project site is located within the SVAB. The SVAB is bounded on the north by the Cascade Range, on the south by the San Joaquin Valley Air Basin, on the east by the Sierra Nevada, and on the west by the Coast Ranges. The SVAB contains all of Tehama, Glenn, Butte, Colusa, Yolo, Sutter, Yuba, Sacramento, and Shasta Counties, as well as portions of Solano and Placer Counties.

The SVAB has a Mediterranean climate characterized by hot, dry summers and cool, rainy winters. During winter, the north Pacific storm track intermittently dominates Sacramento Valley weather, and fair weather alternates with periods of extensive clouds and precipitation. Periods of dense and persistent low-level fog, which is most prevalent between storms, are also characteristic of winter weather in the valley. The frequency and persistence of heavy fog in the valley diminish with the approach of spring. The average yearly temperature range for the Sacramento Valley is 20°F to 115°F, with summer high temperatures often exceeding 90°F and winter temperatures occasionally dropping below freezing.

In general, the prevailing winds are moderate in strength and vary from moist clean breezes from the south to dry land flows from the north. The mountains surrounding the SVAB create a barrier to airflow that can trap air pollutants under certain meteorological conditions. The highest frequency of air stagnation occurs in the autumn and early winter when large high-pressure cells collect over the Sacramento Valley. The lack of surface wind during these periods and the reduced vertical flow caused by less surface heating reduce the influx of outside air and allow air pollutants to become concentrated in a stable volume of air. The surface concentrations of pollutants are highest when these conditions are combined with temperature inversions (warm air over cool air), which trap pollutants near the ground.

The ozone season (May through October) in the Sacramento Valley is characterized by stagnant morning air or light winds, with the Delta breeze arriving in the afternoon from the southwest. Usually the evening breeze transports the airborne pollutants northward out of the Sacramento Valley. During about half of the days from July to September, however, a phenomenon called the Schultz Eddy prevents this from occurring. Instead of allowing the prevailing wind patterns to move north carrying the pollutants out, the Schultz Eddy causes the wind pattern to circle back to the south. Essentially, this phenomenon causes the air pollutants to be blown south toward the Sacramento Valley and Yolo County. This phenomenon has the effect of exacerbating the pollution levels in the area. The Schultz Eddy normally dissipates around noon when the Delta Breeze arrives.

AIR QUALITY MONITORING RESULTS

Air quality monitoring stations are located throughout the State and are maintained by the local air pollution control district and overseen by CARB. The YSAQMD, together with the CARB, maintains ambient air quality monitoring stations in the SVAB. The air quality monitoring stations closest to the project area are UC Davis Campbell Road in Yolo County, 100 Bercut Drive and 1309 T Street in Sacramento, and Del Paso 2701 Avalon Drive in Sacramento County, California.

Pollutant monitoring results for 2022 to 2024 at the nearby ambient air quality monitoring stations, shown in **Table E**, indicate that air quality in the area has generally been good. As indicated in the monitoring results, the State PM_{10} standard was exceeded six times in 2022, two times in 2023, and at no time in 2024. In addition, the federal PM_{10} standard was not exceeded during the 3-year period. The federal $PM_{2.5}$ standard had one exceedance in 2023 and 2024 only. The State 1-hour ozone standard was also not exceeded in the 3-year period. The State 8-hour ozone standard had only one exceedance in 2022. Similarly, the federal 8-hour ozone standard was exceeded one time in 2022 only. The CO, NO_2, and SO_2 standards were not exceeded in this area during the 3-year period.

Table E: Ambient Air Quality at Nearby Monitoring Stations

Pollutant	Standard	2022	2023	2024
Carbon Monoxide (CO)[1]				
Maximum 1-hour concentration (ppm)		2.0	1.9	1.5
Number of days exceeded:	State: > 20 ppm	ND	ND	ND
	Federal: > 35 ppm	0	0	0
Maximum 8-hour concentration (ppm)		1.6	1.3	1.1
Number of days exceeded:	State: > 9 ppm	0	0	0
	Federal: > 9 ppm	0	0	0
Ozone (O_3)[2]				
Maximum 1-hour concentration (ppm)		0.078	0.080	0.077
Number of days exceeded:	State: > 0.09 ppm	0	0	0
Maximum 8-hour concentration (ppm)		0.071	0.068	0.069
Number of days exceeded:	State: > 0.07 ppm	1	0	0
	Federal: > 0.07 ppm	1	0	0
Coarse Particulates (PM_{10})[3]				
Maximum 24-hour concentration (µg/m^3)		61.3	61.9	49.7
Number of days exceeded:	State: > 50 µg/m^3	6	2	0
	Federal: > 150 µg/m^3	0	0	0
Annual arithmetic average concentration (µg/m^3)		21.0	ND	17.4
Exceeded for the year:	State: > 20 µg/m^3	Yes	ND	No
	Federal: > 50 µg/m^3	No	ND	No
Fine Particulates ($PM_{2.5}$)[3]				
Maximum 24-hour concentration (µg/m^3)		33.1	35.6	35.6
Number of days exceeded:	Federal: > 35 µg/m^3	0	1	1
Annual arithmetic average concentration (µg/m^3)		8.6	7.2	6.9
Exceeded for the year:	State: > 12 µg/m^3	No	No	No
	Federal > 9 µg/m^{3a}	No	No	No
Nitrogen Dioxide (NO_2)[2]				
Maximum 1-hour concentration (ppm)		0.027	0.022	0.025
Number of days exceeded:	State: > 0.250 ppm	0	0	0
Annual arithmetic average concentration (ppm)		ND	0.003	0.003
Exceeded for the year:	Federal: > 0.053 ppm	ND	No	No
Sulfur Dioxide (SO_2)[4]				
Maximum 1-hour concentration (ppm)		0.0028	0.0023	0.0024
Number of days exceeded:	State: > 0.25 ppm	0	0	0
Maximum 24-hour concentration (ppm)		0.0006	0.0011	0.0008
Number of days exceeded:	State: > 0.04 ppm	0	0	0
	Federal: > 0.14 ppm	0	0	0
Annual arithmetic average concentration (ppm)		0.00012	0.00012	0.0006
Exceeded for the year:	Federal: > 0.030 ppm	No	No	No

Sources: CARB (2025) and USEPA (2025).
Note: On February 7, 2024, the federal annual PM2.5 standard was revised from 12.0 µg/m3 to 9.0 µg/m3. Since the data presented in Table E are through 2024, it uses the 9.0 µg/m^3 standard.
[1] Data were taken from the 100 Bercut Drive Monitoring Station.
[2] Data were taken from the UC Davis Campbell Road Monitoring Station.
[3] Data were taken from the 1309 T Street Monitoring Station.
[4] Data were taken from the Del Paso 2701 Avalon Drive Monitoring Station
µg/m^3 = micrograms per cubic meter
CARB = California Air Resources Board
ND = No data. There were insufficient (or no) data to determine the value.
ppm = parts per million
USEPA = United States Environmental Protection Agency

GREENHOUSE GAS EMISSIONS INVENTORY

An emissions inventory that identifies and quantifies the primary human-generated sources and sinks of GHGs is a well-recognized and useful tool for addressing climate change. This section summarizes the latest information on global, United States, and California GHG emission inventories.

Global Emissions

Worldwide emissions of GHGs in 2020 totaled 22.9 billion metric tons (MT) of CO_2e. Global estimates are based on country inventories developed as part of the programs of the United Nations Framework Convention on Climate Change.[45]

United States Emissions

In 2022, the year for which the most recent data are available, the United States emitted about 6,343.2 MMT CO_2e. Overall, net emissions increased by 1.3 percent from 2021 to 2022 and decreased by 16.7 percent from 2005 levels. The increase in total GHG emissions was driven by an increase in CO_2 emissions from fossil fuel combustion.

In 2022, CO_2 emissions from fossil fuel combustion increased by 1 percent relative to the previous year. This increase in fossil fuel consumption emissions was due primarily to economic activity rebounding after the height of the COVID-19 pandemic. Of the five major sectors (e.g., residential and commercial, agricultural, industry, transportation, and electricity generation), transportation accounted for the highest amount of GHG emissions in 2022 (approximately 28 percent), with electricity generation second at 25 percent and emissions from industry third at 23 percent.[46]

State of California Emissions

The State emitted approximately 371.1 MMT CO_2e emissions in 2022, which was 9.3 MMT CO_2e lower than 2021 levels.[47] CARB estimates that transportation was the source of approximately 37.7 percent of the State's GHG emissions in 2022. The next largest sources included industrial sources at approximately 19.6 percent and electricity generation at 16.1 percent. The remaining sources of GHG emissions were commercial and residential activities at 10.6 percent, agriculture at 8.0 percent, high GWP at 5.7 percent, and waste at 2.2 percent.[48]

METHODOLOGY

The methodology used to estimate air quality, energy, and GHG impacts is described below.

CONSTRUCTION EMISSIONS

Construction activities can generate a substantial amount of air pollution. Construction activities are considered temporary; however, short-term impacts can contribute to exceedances of air quality standards. Construction activities include site preparation, earthmoving, and general construction. The emissions generated from these common construction activities include fugitive dust from soil disturbance, fuel combustion from mobile heavy-duty diesel- and gasoline-powered equipment, portable auxiliary equipment, and worker commute trips.

The California Emissions Estimator Model (CalEEMod) Version 2022.1 computer program was used to calculate emissions from on-site construction equipment and emissions from worker and vehicle trips to the site. CalEEMod is a statewide land use emissions web model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutants associated with both construction and operation of a variety of land use projects. The model quantifies direct emissions from construction and operations (including vehicle use), as well as indirect emissions, such as greenhouse gas (GHG) emissions from energy use, solid waste disposal, vegetation planting and/or removal, and water use for land use developments and linear projects. Default data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) have been provided by the various California air districts to account for local requirements and conditions.

For the proposed project, the exact construction schedule is not yet known. However, construction of the proposed project is anticipated to begin in 2027 or 2028, commencing within 12 to 18 months of project approval. For purposes of this analysis, it is assumed that construction of the proposed project would begin in early 2027 and would last for 18 months, which was included in CalEEMod. This represents a conservative approach as it would produce a maximum amount of emissions for a shorter time frame, in comparison to a longer time frame (e.g., 3- to 5-years) which would see the same amount of emissions for the same level of activity spread over a longer period. Additionally, should construction commence at a later date, emissions would be similar or less than those evaluated herein due to technological advancements and increasingly stringent regulations. In addition, the proposed project would require a net total of 88,068 cubic yards of soil fill, which was included in CalEEMod. This analysis assumes the use of Tier 2 construction equipment. Other detailed construction information is currently unavailable; therefore, this analysis uses CalEEMod default assumptions. CalEEMod output sheets are included in Appendix A.

CONSTRUCTION HEALTH RISK ASSESSMENT

As described above, CalEEMod was used to calculate emissions from on-site construction equipment and emissions from worker and vehicle trips to the site. Based on the CalEEMod results, a construction HRA, which evaluates construction-period health risk to off-site receptors, was performed for the proposed project. To estimate the potential cancer risk associated with construction of the proposed project from equipment exhaust, a dispersion model was used to

translate an emission rate from the source location to a concentration at the receptor location of interest (i.e., a nearby residence and worksites). Dispersion modeling varies from a simpler, more conservative screening-level analysis to a more complex and refined detailed analysis. This refined assessment was conducted using air dispersion modeling performed using the USEPA dispersion model AERMOD. The model provides a detailed estimate of exhaust concentrations based on site and source geometry, source emissions strength, distance from the source to the receptor, and meteorological data. AERMOD input parameters are included in Appendix B.

For the purposes of this HRA, short-term emissions are of concern for analyzing acute health impacts, and long-term emissions are of concern for analyzing chronic and carcinogenic health impacts. A multi-pathway assessment has been conducted. This technique was chosen as recommended in the OEHHA *Air Toxic Hot Spots Program Risk Assessment Guidelines* and guidance from YSAQMD.

The HRA has been conducted using two models: (1) the USEPA's AERMOD air dispersion model to determine how the TACs would move through the atmosphere after release from sources both on site and on surrounding roadways; and (2) CARB's HARP2 model to translate the pollutant concentrations from AERMOD into individual health risks at any given sensitive receptor location surrounding the project site.

The OEHHA has determined that long-term exposure to diesel exhaust particulates poses the highest cancer risk of any TAC it has evaluated.[49] Exposure to diesel exhaust can also have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, DPM made people with allergies more susceptible to the materials to which they were allergic, such as dust and pollen. Exposure to DPM also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. For risk assessment procedures, the OEHHA specifies that the surrogate for whole diesel exhaust is DPM. The HRA analyses used PM_{10} emissions to represent DPM emissions, consistent with OEHHA guidance.

The conservative nature of this analysis is due primarily to the following three factors:

- The CARB-adopted diesel exhaust unit risk factor (URF) of 300 in 1 million per $\mu g/m^3$ is based on the upper 95^{th} percentile of estimated risk for each of the epidemiological studies used to develop the URF. Therefore, the risk factor is already representative of the conservative risk posed by DPM.

- The risk estimates assume sensitive receptors would be subject to DPM 24 hours per day, 350 days per year. As a conservative measure, YSAQMD does not recognize indoor adjustments for residents. However, typical people spend the majority of their time indoors versus remaining outdoors 24 hours per day, 350 days per year.

[49] OEHHA. 2001. *Health Effect of Diesel Exhaust.* Website: https://oehha.ca.gov/air/health-effects-diesel-exhaust (accessed July 2026)

- The exposure to DPM is assumed to be constant for the given period analyzed (i.e., 18 months). However, emissions from DPM are expected to substantially decrease in the future with the implementation of standard regulatory requirements and technological advancement to reduce DPM.

OPERATIONAL EMISSIONS

The air quality analysis includes estimating emissions associated with long-term operation of the proposed project. Consistent with the YSAQMD guidance for estimating emissions associated with land use development projects, the CalEEMod computer program was used to calculate the long-term operational emissions associated with the project.

As discussed in the Project Location and Description section, the proposed project would construct single-family units supported by integrated open space and associated site improvements. Therefore, the proposed project analysis was conducted using land use codes *Single Family Housing, City Park,* and *Other Asphalt Surfaces*. The *City Park* land use is used to represent the proposed open space area, and the *Other Asphalt Surfaces* land use represents paved area. Trip generation rates used in CalEEMod for the project were based on the project's trip generation, which identifies that the proposed project would generate approximately 2,422 daily trips.[50] The proposed project would be all-electric, and no natural gas use is anticipated for operations, which was assumed in CalEEMod. Where project-specific data were not available, default assumptions (e.g., fireplaces, energy usage, water usage, and solid waste generation) from CalEEMod were used to estimate project emissions. CalEEMod output sheets are included in Appendix A.

ENERGY USE

Fuel consumption (diesel fuel and gasoline) from vehicle trips during operation was estimated for the opening year (2028) of the proposed project based on trip estimates from the CalEEMod model and fuel efficiencies from the CARB EMFAC2025 model. Estimates of fuel consumption (diesel fuel and gasoline) from construction trucks and construction worker vehicles were based on trip estimates from the CalEEMod model and fuel efficiencies from the CARB EMFAC2025 model.

The analysis focuses on the three sources of energy that are relevant to the proposed project: electricity, the equipment fuel necessary for project construction, and vehicle fuel necessary for project operations. For the purposes of this analysis, the amount of electricity, construction fuel, and fuel use from operations are quantified and compared to that consumed in Yolo County. The electricity use of the proposed project was analyzed as a whole on an annual basis. Electricity was estimated using default energy intensities by land use type in CalEEMod.

50 LLG. 2025. *Transportation Study for 3425 Marshall Road Residential.* April 2.

GREENHOUSE GAS ANALYSIS

GHG emissions associated with the project would occur over the short term from construction activities, consisting primarily of emissions from equipment exhaust. There would also be long-term GHG emissions associated with project-related vehicular trips. Lead agencies should calculate or estimate emissions from vehicular traffic, energy consumption, water conveyance and treatment, waste generation, construction activities, and any other significant source of emissions within the project area. CalEEMod was used to quantify GHG emissions generated by the project.

THRESHOLDS OF SIGNIFICANCE

AIR QUALITY

The *State CEQA Guidelines* indicate that a project would normally have a significant adverse air quality impact if project-generated pollutant emissions would do any of the following:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project is nonattainment under applicable federal or State ambient air quality standards;
- Expose sensitive receptors to substantial pollutant concentrations; or
- Result in other emissions (such as those leading to odors) affecting a substantial number of people.

Regional Emissions Thresholds

In developing thresholds of significance for air pollutants, the YSAQMD considered the emission levels for which a project's individual emissions would be cumulatively considerable. If a project exceeds the identified significance thresholds, its emissions would be cumulatively considerable, resulting in significant adverse air quality impacts to the region's existing air quality conditions. To meet these standards, the YSAQMD has established project-level thresholds for criteria pollutant emissions generated during both construction and operation of projects as shown in **Table F**, below.

Table F: YSAQMD Thresholds of Significance for Criteria Pollutants

Pollutant	Thresholds of Significance
ROG	10 tons per year
NO_x	10 tons per year
PM_{10}	80 pounds per day
CO	Violation of a State ambient air quality standard for CO

Source: YSAQMD, 2007. *Handbook for Assessing and Mitigating Air Quality Impacts.* July 11. Website: https://www.ysaqmd.org/wp-content/uploads/Planning/CEQAHandbook2007.pdf (accessed July 2026).
CO = carbon monoxide
NO_x = nitrogen oxide
PM_{10} = particulate matter less than 10 microns in size
ROG = reactive organic gases
YSAQMD = Yolo-Solano Air Quality Management District

Local Microscale Concentration Standards

The significance of localized project impacts under CEQA depends on whether ambient CO levels in the vicinity of the project are above or below State and federal CO standards. Because ambient CO levels are below the standards throughout the SVAB, a project would be considered to have a

significant CO impact if project emissions result in an exceedance of one or more of the 1-hour or 8-hour standards. The following are applicable local emission concentration standards for CO:

- California State 1-hour CO standard of 20 parts per million (ppm).
- California State 8-hour CO standard of 9 ppm.

Health Risk Thresholds

Both the State and federal governments have established health-based AAQS for seven air pollutants. For other air pollutants without defined significance standards, the definition of substantial pollutant concentrations varies. For TACs, "substantial" is taken to mean that the individual health risk exceeds a threshold considered to be a prudent risk management level.

The following limits for maximum individual cancer risk (MICR) and noncancer acute and chronic Hazard Index (HI) from project emissions of TACs are considered appropriate for use in determining the health risk for projects in the SVAB:

- **MICR:** MICR is the estimated probability of a maximum exposed individual (MEI) contracting cancer as a result of exposure to TACs over a period of 30 years for adults and 9 years for children in residential locations, for the duration of the construction period (i.e., 18 months). The project would be considered significant if an HRA shows an increased risk of greater than 10 in 1 million.

- **Chronic HI:** Chronic HI is the ratio of the estimated long-term level of exposure to a TAC for a potential MEI to its chronic reference exposure level. The chronic HI calculations include multi-pathway consideration when applicable. The project would be considered significant if the cumulative increase in total chronic HI for any target organ system would exceed 1.0 at any receptor location.

- **Acute HI:** Acute HI is the ratio of the estimated maximum 1-hour concentration of a TAC for a potential MEI to its acute reference exposure level. The project would be considered significant if the cumulative increase in total acute HI for any target organ system would exceed 1.0 at any receptor location.

ENERGY

The thresholds for energy impacts used in this analysis are consistent with Appendix G of the *State CEQA Guidelines*. The proposed project may be deemed to have a significant impact with respect to energy resources if it would:

- Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.

- Conflict with or obstruct a State or local plan for renewable energy or energy efficiency.

GREENHOUSE GAS THRESHOLDS

The *State CEQA Guidelines* indicate that a project would normally have a significant adverse GHG emission impact if the project would:

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or

- Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.

Section 15064.4 of the *State CEQA Guidelines* states that "A lead agency should make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project." In performing that analysis, the lead agency has discretion to determine whether to use a model or methodology to quantify GHG emissions or to rely on a qualitative analysis or performance-based standards. In making a determination as to the significance of potential impacts, the lead agency then considers the extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting, whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project, and the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

The YSAQMD does not have an adopted threshold of significance for GHG-related emissions. Therefore, consistent with the *State CEQA Guidelines*, Section 15183.5, if a project is consistent with an adopted qualified Greenhouse Gas Reduction Strategy that meets the standards, it can be presumed that the project would not have significant GHG emission impacts. The City of West Sacramento CAAP meets the requirements of *State CEQA Guidelines*, Section 15183.5; therefore, the proposed project will be evaluated for consistency with the City's CAAP. The City's CAAP describes development of the City's 2030 and 2045 reduction targets, detailing their consistency with State legislation and executive orders and establishes that meeting the reduction targets would avoid cumulatively considerable effects. The CAAP includes a range of GHG reduction measures, implementation of which would enable the City to meet its 2035 GHG emissions reduction target. Projects that are consistent with the goals and reduction measures of the City's CAAP would not generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.

IMPACTS ANALYSIS

This section identifies the air quality and GHG emissions impacts associated with implementation of the proposed project.

AIR QUALITY IMPACTS

Air pollutant emissions associated with the project would occur over the short term from construction activities and over the long term from operational activities associated with the proposed project.

Consistency with Applicable Air Quality Plans

In compliance with the *State CEQA Guidelines*, the analysis below evaluates whether implementation of the proposed project would conflict with or otherwise obstruct implementation of regional air quality plans. An air quality plan describes air pollution control strategies to be implemented by a city, county, or region classified as a nonattainment area. The applicable air quality plan is the 2017 Sacramento Regional 2008 8-Hour Ozone and Further Reasonable Progress Plan (2017 Ozone Plan). Consistency with the 2017 Ozone Plan can be determined if the proposed project supports the goals of the plan, includes applicable control measures from the plan, and would not disrupt or hinder implementation of any control measures from the plan. For air quality planning purposes, the 2017 Ozone Plan contains emissions inventories based on existing and foreseeable future land uses within the planning area. If a new project is consistent with the planned land use designation that was considered in the forecasts used to develop an air quality management plan, the project would be considered consistent with the buildout assumptions and, as a result, would not conflict with nor obstruct implementation of the applicable air quality management plan. Generally, the local general plan is used in preparation of regional air quality management plans. In that case, a project's conformance with a local general plan land use designation demonstrates that the project would not conflict with or obstruct implementation of the air quality management plan.

As discussed in the Project Location and Description Section, the proposed project would require a General Plan Amendment to the City's existing General Plan and an amendment to the Southport Framework Plan to change the designations from Rural Estates (RE) to Low-Density Residential (LR). It would also require a Zoning Map/Code amendment to rezone the site from RE to Residential One Family (R-1-A). The proposed project involves the construction of 259 new residential lots and associated improvements on the project site. The City's 2021-2029 Housing Element Update reports 2.8 residents per household in West Sacramento;[51] therefore, the development of 259 residential estates could house approximately 725 residents. The City Housing Element estimates that the city will grow to 87,999 residents by 2040, an increase of 65 percent from the 2016 baseline. Correspondingly, the number of households is also projected to increase by 84 percent in the City and 34.3 percent in the County overall. Thus, the additional 725 new residents necessitated by the

[51] City of West Sacramento. 2021. *2021-2029 Housing Element Update, Table A-6.* Website: https://www.cityofwestsacramento.org/home/showpublisheddocument/12221/637619619413930000 (accessed July 2026).

proposed project would represent approximately 0.8 percent of the projected 2040 population.[52] This level of growth is also well within the City's projections in the SACOG 2020-2050 Metropolitan Transportation Plan/Sustainable Communities Strategy (2025 Blueprint Plan), which identifies the City's housing is projected to increase by 15,880 units from 2020 to 2050.[53] As such, the additional 259 new units would represent approximately 1.6 percent of the anticipated housing growth from 2020 to 2050 in the SACOG 2025 Blueprint Plan.[54] Therefore, the proposed project would be consistent with the 2025 Blueprint Plan and the population growth assumptions for the region, and the land use assumptions in the 2017 Ozone Plan.

Additionally, as discussed in further detail below, construction of the proposed project would not result in the generation of criteria air pollutants that would exceed YSAQMD thresholds of significance. Thresholds of significance are intended to help identify whether a project is consistent with the applicable air quality management plan. The YSAQMD requires implementation of Rule 2.11 for PM control during construction. These control measures are intended to reduce the amount of PM_{10} emissions during the construction period. Implementation of the fugitive dust control measures outlined in Regulatory Measure AIR-1 would ensure that the proposed project complies with Rule 2.11, further reducing the short-term construction-period air quality impacts.

As discussed in the following sections, emissions associated with both construction and operational phases of the proposed project would not exceed YSAQMD-established significance thresholds. As a result, with implementation of Regulatory Measure AIR-1, the proposed project would not conflict with or obstruct implementation of applicable air quality plans.

Criteria Pollutant Analysis

The SVAB is designated as being in non-attainment of the NAAQS for O_3 and $PM_{2.5}$ and in non-attainment of the CAAQS for O_3, PM_{10}, and $PM_{2.5}$. The YSAQMD non-attainment status is attributed to the region's development history. Past, present, and future development projects contribute to the region's adverse air quality impacts on a cumulative basis. By its very nature, air pollution is largely a cumulative impact. No single project is sufficient in size to, by itself, result in non-attainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulatively significant adverse air quality impacts. If a project's contribution to the cumulative impact is considerable, then the project's impact on air quality would be considered significant.

In developing thresholds of significance for air pollutants, the YSAQMD considered the emission levels for which a project's individual emissions would be cumulatively considerable. If a project exceeds the identified significance thresholds, its emissions would be cumulatively considerable,

---

52 (725 persons from the proposed project/ 87,999 2040 projected population) x 100 = 0.8 percent of total 2040 population

53 SACOG. 2025. *2025 Blueprint (MTP/SCS), Appendix C: 2025 Blueprint Land Use Forecast.* Website: https://www.sacog.org/home/showpublisheddocument/3297/638975101112800000 (accessed July 2026).

54 (259 units from the proposed project/ 15,880 total projected housing growth) × 100 = 1.6 percent of total projected housing growth

resulting in significant adverse air quality impacts to the region's existing air quality conditions. The following analysis assesses the potential construction- and operation-related air quality impacts.

Construction Emissions

During construction, short-term degradation of air quality may occur due to the release of criteria pollutant emissions generated by grading, paving, building, and other activities that involve heavy equipment use. Emissions from construction equipment also include TACs such as diesel exhaust particulate matter.

Construction activities associated with the proposed project would include site preparation, grading, paving, and building activities. Construction-related effects on air quality from the proposed project would be greatest during the site preparation phase due to the disturbance of soils. If not properly controlled, these activities would temporarily generate particulate emissions. Sources of fugitive dust would include disturbed soils at the construction site. Unless properly controlled, vehicles leaving the site may deposit dirt and mud on local streets, which could be an additional source of airborne dust after it dries. PM_{10} emissions would vary from day to day, depending on the nature and magnitude of construction activity and local weather conditions. PM_{10} emissions would depend on soil moisture, silt content of soil, wind speed, and the amount of operating equipment. Larger dust particles would settle near the source, while fine particles would be dispersed over greater distances from the construction site.

Water or other soil stabilizers can be used to control dust, resulting in emission reductions of 50 percent or more. The YSAQMD has implemented Rule 2.11 measures for reducing particulate matter emissions. With the implementation of Rule 2.11, fugitive dust emissions from construction activities would not result in adverse air quality impacts.

In addition to dust-related PM_{10} emissions, heavy trucks and construction equipment powered by gasoline and diesel engines would generate CO, SO_2, NO_x, ROG, and $PM_{2.5}$ and PM_{10} in exhaust emissions. If construction activities were to increase traffic congestion in the area, CO and other emissions from traffic would increase slightly while those vehicles idle in traffic. These emissions would be temporary in nature and limited to the immediate area surrounding the construction site.

Construction emissions were estimated for the project using CalEEMod and are summarized in **Table G**. Appendix A provides CalEEMod output sheets.

As shown in Table G, maximum daily emissions from project construction would be 9.0 pounds per day for PM_{10}, which is below the significance threshold of 80 pounds per day for PM_{10}. Additionally, as shown in Table G, the annual emissions from project construction would be 0.2 tons per year for ROG and 4.4 tons per year for NO_X, which are below the threshold of 10 tons per year for ROG and NO_X. In addition to the construction period thresholds of significance, the YSAQMD has recommended measures for dust control during construction. Implementation of Regulatory Measure AIR-1 would ensure that the proposed project complies with Rule 2.11.

Table G: Short-Term Regional Construction Emissions

Construction Year	Pollutant Emissions					
	ROG	NO_x	CO	SO_X	PM_{10}	$PM_{2.5}$
Maximum Daily Emissions (pounds per day)						
2027	1.7	62.9	41.0	0.1	9.3	5.0
2028	40.3	22.0	21.7	<0.1	2.1	1.1
YSAQMD Threshold	N/A	N/A	N/A	N/A	80	N/A
Above Threshold?	**N/A**	**N/A**	**N/A**	**N/A**	**No**	**N/A**
Annual Emissions (tons per year)						
2027	0.2	4.4	3.3	<0.1	0.6	0.3
2028	2.1	1.2	1.1	<0.1	0.1	0.1
YSAQMD Threshold	10.0	10.0	N/A	N/A	N/A	N/A
Significant?	**No**	**No**	**N/A**	**N/A**	**N/A**	**N/A**

Source: Compiled by LSA (July 2026).
CO = carbon monoxide
N/A = not applicable
NO_x = nitrogen oxides
$PM_{2.5}$ = particulate matter less than 2.5 microns in size
PM_{10} = particulate matter less than 10 microns in size
ROG = reactive organic gas
SO_x = sulfur oxides
YSAQMD = Yolo Solano Air Quality Management District

Regulatory Measure AIR-1 The City or construction contractor shall implement the following measures at the project site:

- Water all active construction sites at least twice daily. Frequency shall be based on the type of operation, soil, and wind exposure.
- Haul trucks shall maintain at least 2 feet of freeboard;
- Cover all trucks hauling dirt, sand, or loose materials;
- Apply non-toxic binders (e.g., latex acrylic copolymer) to exposed areas after cut and fill operations and hydroseed area;
- Apply chemical soil stabilizers on inactive construction areas (disturbed lands within construction projects that are unused for at least four consecutive days);
- Plant tree windbreaks on the windward perimeter of construction projects if adjacent to open land;
- Plant vegetative ground cover in disturbed areas as soon as possible;
- Cover inactive storage piles;
- Sweep streets if visible soil material is carried out from the construction site;

- Treat accesses to a distance of 100 feet from the paved road with a 6 to 12 inch layer of wood chips or mulch; and
- Treat accesses to a distance of 100 feet from the paved road with a 6- to 12-inch layer of wood chips or mulch or 6-inch layer of gravel.

Construction emissions associated with the proposed project would be less than significant with implementation of Regulatory Measure AIR-1. Therefore, construction of the proposed project would not result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard.

Operational Air Quality Impacts

Long-term air pollutant emission impacts associated with the proposed project are those related to mobile sources (e.g., vehicle trips) and area sources (e.g., architectural coatings and the use of landscape maintenance equipment). The proposed project would be designed and operated as an all-electric development. Therefore, no on-site combustion of natural gas or other fuel sources would occur, and no operational criteria pollutant emissions associated with energy use would be generated.

Mobile source emissions include ROG and NO_X emissions that contribute to the formation of ozone. Additionally, PM_{10} emissions result from running exhaust, tire and brake wear, and the entrainment of dust into the atmosphere from vehicles traveling on paved roadways.

Typically, area source emissions consist of direct sources of air emissions located at the project site, including architectural coatings and the use of landscape maintenance equipment. Area source emissions associated with the project would include emissions from the use of landscaping equipment and the use of consumer products.

Long-term operational emissions associated with the proposed project were calculated using CalEEMod. **Table H** provides the proposed project's estimated operational emissions. Appendix A provides CalEEMod output sheets.

The results shown in **Table H** indicate the proposed project would not exceed the significance criteria for daily ROG NO_X, and PM_{10} emissions. Therefore, operation of the proposed project would not result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or State AAQS.

Table H: Project Operational Emissions

Emission Type	Pollutant Emissions					
	ROG	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Daily Emissions (pounds per day)

Long-Term Microscale (CO Hot Spot) Analysis

Vehicular trips associated with the proposed project would contribute to congestion at intersections and along roadway segments in the vicinity of the proposed project site. Localized air quality impacts would occur when emissions from vehicular traffic increase as a result of the proposed project. The primary mobile-source pollutant of local concern is CO, a direct function of vehicle idling time and, thus, of traffic flow conditions. CO transport is extremely limited; under normal meteorological conditions, it disperses rapidly with distance from the source. However, under certain extreme meteorological conditions, CO concentrations near a congested roadway or intersection may reach unhealthful levels, affecting local sensitive receptors (e.g., residents, schoolchildren, the elderly, and hospital patients).

Typically, high CO concentrations are associated with roadways or intersections operating at unacceptable levels of service or with extremely high traffic volumes. In areas with high ambient background CO concentrations, modeling is recommended to determine a project's effect on local CO levels.

An assessment of project-related impacts on localized ambient air quality requires that future ambient air quality levels be projected. Ambient CO levels monitored at the 100 Bercut Drive air quality monitoring station, the closest station to the project site monitoring CO, showed a highest recorded 1-hour concentration of 2.0 ppm (the State standard is 20 ppm) and a highest 8-hour concentration of 1.6 ppm (the State standard is 9 ppm) during the past 3 years (Table E). The highest CO concentrations would normally occur during peak traffic hours; hence, CO impacts calculated under peak traffic conditions represent a worst-case analysis.

As part of its CEQA Air Quality Guidelines[55], the YSAQMD provides a screening methodology based on peak hourly traffic volumes to evaluate potential impacts of CO emissions from mobile sources. If either of the following criteria is true of any intersection affected by the project traffic, then the project can be said to have the potential to create a violation of the CO standard:

- A traffic study for the project indicates that the peak-hour Level of Service (LOS) on one or more streets or at one or more intersections in the project vicinity will be reduced to an unacceptable LOS (typically LOS E or F); or

- A traffic study indicates that the project will substantially worsen an already existing peak-hour LOS F on one or more streets or at one or more intersections in the project vicinity. "Substantially worsen" includes situations where delay would increase by 10 seconds or more when project-generated traffic is included.

The proposed project would result in 178 AM peak hour trips and 244 PM peak hour trips. As described in the *Transportation Study*,[56] implementation of the proposed project would not substantially change the LOS at the study intersections. As noted in the Transportation Study, the Rivermont Street-Allen Drive/Marshall Road intersection is projected to operate at LOS F (AM peak hour conditions) under existing plus project conditions. However, the City plans to install an all-way stop control at the intersection to improve operational efficiency and traffic circulation. This would improve LOS to level B. All other study intersections would continue to operate at a LOS C or better, which does not conflict with the City's policy regarding the level of service performance of the circulation system. Accordingly, the proposed project would not be expected to result in substantial traffic congestion or vehicle queuing beyond existing conditions, and would not create conditions that would be conducive to the formation of a localized CO hotspot. Therefore, the proposed project would not result in a significant impact related to CO hotspots.

Health Risk on Nearby Sensitive Receptors

Sensitive receptors are defined as residential uses, schools, daycare centers, nursing homes, and medical centers. Individuals particularly vulnerable to diesel particulate matter are children, whose lung tissue is still developing, and the elderly, who may have serious health problems that can be aggravated by exposure to diesel particulate matter. The project site is surrounded primarily by agricultural and residential uses. The closest sensitive receptors to the project site include single-family residences located immediately south and west at approximately 25 feet as measured from the project boundary to the building façade. Other nearby sensitive receptors include the single-family residences located east and north of the project site at approximately 56 feet and 50 feet, respectively. The closest worker receptor is located east of the project site along Otis Avenue at approximately 57 feet. The nearest school is located north of the project site at approximately 1,728 feet from the project northern boundary to the school's property line.

Construction Health Risk

The proposed project would construct single-family units supported by integrated open space and associated site improvements. The OEHHA *Air Toxic Hot Spots Program Risk Assessment Guidelines*[57] has determined that long-term exposure to diesel exhaust particulates poses the highest cancer risk of any TAC it has evaluated. In addition, CARB has also identified DPM emitted by off-road and diesel-fueled engines as a TAC.[58] As such, the TAC of concern would be DPM associated with the use of diesel engines during project construction and operation. For risk assessment procedures, the OEHHA specifies that the surrogate for whole diesel exhaust is DPM. HRA analyses typically use PM_{10} emissions to represent DPM emissions, consistent with OEHHA guidance.

A construction HRA, which evaluates construction-period health risk to off-site receptors, was performed for the proposed project. **Table I**, below, identifies the results of the analysis assuming the use of Tier 2 construction equipment as proposed by the project. Model snapshots of the sources are shown in Appendix B.

Table I: Health Risks from Project Construction to Off-Site Receptors

Location	Carcinogenic Inhalation Health Risk in 1 Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index
Residential Receptor Risk	11.13	0.011	0.000
Worker Receptor Risk	0.11	0.006	0.000
School Receptor Risk	0.22	<0.001	0.000
YSAQMD Significance Threshold	**10.0 in one million**	**1.0**	**1.0**
Significant?	**Yes**	**No**	**No**

Source: LSA (July 2026).
YSAQMD = Yolo-Solano Air Quality Management District

As shown in **Table I**, the maximum cancer risk for the residential MEI would be 11.13 in one million, which would exceed the YSAQMD cancer risk threshold of 10 in one million. The worker receptor risk would be lower at 0.11 in one million and the school receptor risk would be 0.22 in one million, which would not exceed the YSAQMD cancer risk thresholds. The total chronic hazard index would be 0.011 for the residential MEI, 0.006 for the worker MEI, and less than 0.001 for the school MEI, which are all below the threshold of 1.0. In addition, the total acute hazard index would be nominal (0.000), which would also not exceed the threshold of 1.0. Therefore, implementation of Mitigation Measure AIR-1 would be required to reduce construction cancer risk.

Mitigation Measure AIR-1 All off-road diesel-powered construction equipment of 25 horsepower or more used during construction of the proposed project shall be equipped with Tier 3 engines or higher, as certified by the California Air Resources Board. The equipment shall be

57 OEHHA. 2015. *Air Toxic Hot Spots Program – Risk Assessment Guidelines*. February. Website: https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf (accessed July 2026).

58 CARB. 2025. Overview: Diesel Exhaust and Health. Website: https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health (accessed July 2026).

properly maintained and tuned in accordance with manufacturer specifications. Prior to issuance of building permits, the project Applicant shall submit construction plans to the City of West Sacramento denoting the projected equipment Tier rating that will be used during the construction period.

As shown in **Table J**, with the implementation of Mitigation Measure AIR-1 the maximum cancer risk for the residential MEI would be 9.07 in 1 million, which would not exceed the YSAQMD cancer risk threshold of 10 in 1 million. Therefore, with implementation of Mitigation Measure AIR-1, construction of the proposed project would not exceed YSAQMD thresholds and would not expose nearby sensitive receptors to a significant health risk.

Table J: Mitigated Health Risks from Project Construction to Off-Site Receptors

Location	Carcinogenic Inhalation Health Risk in 1 Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index
Residential Receptor Risk	9.07	0.009	0.000
Worker Receptor Risk	0.09	0.005	0.000
School Receptor Risk	0.18	<0.001	0.000
YSAQMD Significance Threshold	**10.0 in one million**	**1.0**	**1.0**
Significant?	**No**	**No**	**No**

Source: Compiled by LSA (July 2026).
YSAQMD = Yolo-Solano Air Quality Management District

Operational Health Risk

The proposed project would include the construction of a 259-unit single-family residential development. As identified in Table H, project operational emissions of criteria pollutants would be below YSAQMD significance thresholds; thus, they are not likely to have a significant impact on sensitive receptors. Compliance with YSAQMD rules would further limit doses and exposures, reducing potential health risk related to vehicle and equipment emissions to a level that is not significant. Once the proposed project is constructed, the proposed project would not be a source of substantial emissions. Therefore, implementation of the proposed project would not result in new sources of TACs. Therefore, the project would not expose sensitive receptors to substantial levels of TACs.

Odors

The occurrence and severity of potential odor impacts depends on numerous factors. The nature, frequency, and intensity of the source, the wind speeds and direction, and the sensitivity of the receiving location each contribute to the intensity of the impact. While offensive odors rarely cause any physical harm, they can be unpleasant and cause distress among the public and generate citizen complaints.

During construction, diesel exhaust from construction equipment would generate some odors. However, construction-related odors would be temporary and would not persist upon construction

completion. Once operational, the proposed project would not include any sources of odor emissions; therefore, operation of the proposed project would not generate any odor impacts. The proposed project would not result in other emissions (such as those leading to odors) adversely affecting a substantial number of people. Therefore, this impact would be less than significant.

Naturally Occurring Asbestos

The project is in Yolo County, which is among the counties found to have serpentine and ultramafic rock in their soils.[59] However, according to the California Geological Survey, no such rock has been identified in the project vicinity. When demolition is proposed during construction, the demolition of existing buildings may expose asbestos used in building materials. However, the proposed project would not involve any demolition or renovation as no current development exists on the project site. Therefore, the potential risk for naturally occurring asbestos during project construction is small and would not be significant.

ENERGY IMPACTS

The following describes the potential impacts regarding energy resources that could result from implementation of the proposed project.

Energy Consumption

The proposed project would increase the demand for energy through day-to-day operations and fuel consumption associated with project construction. This section discusses energy use resulting from implementation of the proposed project and evaluates whether the proposed project would result in the wasteful, inefficient, or unnecessary consumption of energy resources or conflict with any applicable plans for renewable energy and energy efficiency.

Construction Energy Use

Construction of the proposed project is anticipated to be completed in approximately 18 months. As described above, this represents a conservative approach as it would produce a maximum amount of daily emissions for a shorter time frame, in comparison to a longer time frame (e.g., 3- to 5-years) which would see the same amount of emissions for the same level of activity spread over a longer period. The threshold for construction emissions is based on a peak daily emission rate, so evaluating the shortest possible timeframe results in the maximum anticipated emissions. The proposed project would require energy for activities such as the manufacture and transportation of building materials, grading activities, and building construction. The construction-related equipment would not be powered by natural gas, and no natural gas demand is anticipated during construction.

Transportation energy represents the largest energy use during construction and would occur from the transport and use of construction equipment, delivery vehicles and haul trucks, and construction worker vehicles that would use petroleum fuels (e.g., diesel fuel and/or gasoline). Therefore, the analysis of energy use during construction focuses on fuel consumption. Construction trucks and vendor trucks hauling materials to and from the project site would be anticipated to use diesel fuel,

[59] California Department of Conservation (DOC). n.d. California Geological Survey. Asbestos. Website: https://www.conservation.ca.gov/cgs/minerals/mineral-hazards (accessed July 2026).

whereas construction workers traveling to and from the project site would be anticipated to use gasoline-powered vehicles. Fuel consumption from transportation uses depends on the type and number of trips, VMT, the fuel efficiency of the vehicles, and the travel mode.

Estimates of fuel consumption (diesel fuel and gasoline) from construction equipment, construction trucks, and construction worker vehicles were based on default construction equipment assumptions and trip estimates from CalEEMod and fuel efficiencies from EMFAC2025. Fuel consumption estimates are presented in **Table K**. CalEEMod output sheets are included in Appendix A, and detailed energy calculations are included in Appendix C.

Table K: Energy Consumption Estimates During Construction

Energy Type	Total Energy Consumption	Percentage Increase Countywide in 2027
Total Fuel Consumption		
Diesel Fuel (total gallons)	140,590.0	-
Gasoline (total gallons)	32,508.7	-
Annual Fuel Consumption		
Diesel Fuel (total gallons)	93,726.7	0.3
Gasoline (total gallons)	21,672.5	<0.1

Source: Compiled by LSA (July 2026).

As indicated in Table K, the proposed project would consume a total of approximately 140,590.0 gallons of diesel fuel and approximately 32,508.7 gallons of gasoline during the construction period. Construction of the proposed project is anticipated to occur for 18 months. Therefore, when averaged over the 18-month construction period (1.5 years), the proposed project is estimated to consume approximately 93,726.7 gallons of diesel fuel and approximately 21,672.5 gallons of gasoline per year. Based on fuel consumption obtained from EMFAC2025, approximately 74.7 million gallons of gasoline and approximately 34.7 million gallons of diesel will be consumed from vehicle trips in Yolo County in 2027. Therefore, the proposed project would increase the annual construction-generated fuel use in Yolo County by approximately 0.3 percent for diesel fuel usage and by approximately less than 0.1 percent for gasoline fuel usage. As such, project construction would have a negligible effect on local and regional energy supplies. Furthermore, impacts related to energy use during construction would be temporary and relatively small in comparison to Yolo County's overall use of the State's available energy resources. No unusual project characteristics would necessitate the use of construction equipment that would be less energy efficient than at comparable construction sites in the region or the State. In addition, construction activities are not anticipated to result in an inefficient use of energy because gasoline and diesel fuel would be supplied by construction contractors who generally are incentivized for efficient fuel use to minimize their costs on the project. The proposed project would not cause or result in the need for additional energy facilities or an additional or expanded delivery system. For these reasons, fuel consumption during construction of the proposed project would not be inefficient, wasteful, or unnecessary.

Operational Energy Use

Operational energy use is typically associated with natural gas use, electricity consumption, and fuel used for vehicle trips associated with a project. The proposed project would be all-electric, and no natural gas use is anticipated for operations. Energy consumption was estimated for the proposed project using default energy intensities by land use type in CalEEMod.

The proposed project would also result in energy usage associated with gasoline and diesel fuel consumed by project-related vehicle and truck trips. Fuel use associated with vehicle and truck trips generated by the proposed project were calculated based on the project's trip generation,[60] which identifies that the proposed project would generate approximately 2,422 daily trips. The amount of operational fuel use was estimated using CARB's EMFAC2025 model, which provided projections for typical daily fuel usage in Yolo County.

Electricity and fuel usage estimates associated with operation of the proposed project are shown in **Table L**.

Table L: Energy Consumption Estimates During Operation

Energy Type	Annual Energy Consumption
Electricity Consumption (kWh/year)	4,416,340.0
Gasoline (gallons/year)	469,540.7
Diesel Fuel (gallons/year)	65,028.3

Source: Compiled by LSA (July 2026).
kWh = kilowatt-hours

As shown in Table L, the estimated potential increase in electricity demand associated with the operation of the proposed project is 4,416,340 kWh per year. Total electricity consumption in Yolo County in 2024 was 1,825 GWh (or 1,825,000,000 kWh). Therefore, operation of the proposed project would increase the annual electricity consumption in Yolo County by approximately 0.2 percent.

Electrical demand associated with project operations would not be considered inefficient, wasteful, or unnecessary in comparison to other similar developments in the region. Furthermore, the proposed project would not conflict with or obstruct a State or local plan for renewable energy or energy efficiency. The proposed project would also be required to adhere to all federal, State, and local requirements for energy efficiency, including the Title 24 standards. Title 24 building energy efficiency standards establish minimum efficiency standards related to various building features. The proposed residential units would feature passive use solar heating and cooling, natural ventilation, energy-efficient windows, solar roofs, green roofs, or cool roof systems, and energy-efficient home appliances, which would further reduce energy usage. The proposed project would also be designed to be all-electric and will not include the use of natural gas.

60 LLG. 2025. *Transportation Study for 3425 Marshall Road Residential*. April 2.

As shown in Table L, the increase in fuel use associated with the vehicle trips generated by the proposed project is estimated at 469,540.7 gallons of gasoline and 65,028.3 gallons of diesel fuel per year. This analysis conservatively assumes that all vehicle trips generated as a result of project operation would be new to Yolo County. Based on fuel consumption obtained from EMFAC2025, approximately 77.8 million gallons of gasoline and approximately 34.4 million gallons of diesel will be consumed from vehicle trips in Yolo County in 2028. Therefore, vehicle and truck trips associated with the proposed project would increase the annual fuel use in Yolo County by 0.6 percent for gasoline fuel usage and by approximately 0.2 percent for diesel fuel usage. In addition, the proposed project would also be designed to support alternative modes of transportation by including open space and pedestrian infrastructure which would improve street connectivity. Therefore, the proposed project would promote overall mobility within the project site. Therefore, fuel consumption associated with vehicle trips generated by the proposed project operations would not be considered inefficient, wasteful, or unnecessary in comparison to other similar developments in the region.

Conflicts with Renewable Energy or Energy Efficiency Plans

In 2002, the Legislature passed SB 1389, which required the CEC to develop an integrated energy plan every 2 years for electricity, natural gas, and transportation fuels for the Integrated Energy Policy Report. The plan calls for the State to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the least environmental and energy costs. To further this policy, the plan identifies a number of strategies, including assistance to public agencies and fleet operators in implementing incentive programs for ZEVs and their infrastructure needs, and encouragement of urban designs that reduce VMT and accommodate pedestrian and bicycle access.

The CEC's *2024 Integrated Energy Policy Report Update* provides the results of the CEC's assessments of a variety of energy issues facing California. As indicated above, energy usage during construction of the proposed project would be temporary in nature and relatively small in comparison to the overall use in Yolo County. In addition, energy usage associated with operation of the proposed project would be relatively small in comparison to the overall use in Yolo County, and the State's available energy resources. Therefore, energy impacts at the regional level would be negligible. Because California's energy conservation planning actions are conducted at a regional level, and because the proposed project's total impact on regional energy supplies would be minor, the proposed project would not conflict with or obstruct California's energy conservation plans as described in the CEC's Integrated Energy Policy Report. Additionally, as demonstrated above, the proposed project would not result in the inefficient, wasteful, and unnecessary consumption of energy. Potential impacts related to conflict with or obstruction of a State or local plan for renewable energy or energy efficiency would be less than significant, and no mitigation is required.

GREENHOUSE GAS IMPACTS

This section describes the potential GHG impacts associated with implementation of the proposed project.

Generation of Greenhouse Gas Emissions

This section describes the proposed project's construction- and operational-related GHG emissions and contribution to global climate change.

Short-Term Greenhouse Gas Emissions

Construction activities associated with the construction of residential and nonresidential development capacity would cause short-term GHG emissions. Construction activities associated with the proposed project would produce combustion emissions from various sources. During construction, GHGs would be emitted through the operation of construction equipment and from worker and builder supply vendor vehicles, each of which typically use fossil-based fuels to operate. The combustion of fossil-based fuels creates GHGs such as CO_2, CH_4, and N_2O. Furthermore, CH_4 is emitted during the fueling of heavy equipment. Exhaust emissions from on-site construction activities would vary daily as construction activity levels change.

The YSAQMD has not adopted a threshold of significance for construction-related GHG emissions. Similarly, the Bay Area Air Quality Management District (BAQMD), located immediately to the west of the YSAQMD, has not developed a quantitative threshold of significance for construction GHG Emissions because such emissions are temporary and variable.[61] The Sacramento Metropolitan Air Quality District (SMAQD), located to the east of the YSAQMD has adopted a construction emissions threshold of 1,100 metric tons of CO_2e per year.[62]

Consistent with YSAQMD guidance, the significance determination for this impact statement is based on project consistency with a qualified GHG reduction plan, as discussed below. However, lead agencies are encouraged to quantify and disclose GHG emissions that would occur during construction. Using CalEEMod, it is estimated that construction of the proposed project would generate approximately 1,136.0 metric tons of CO_2e over the construction period of 18 months. Furthermore, construction-related emissions would be temporary and would not persist upon completion of construction. Again, there is no threshold of significance for construction-related GHG emissions in areas subject to YSAQMD jurisdiction; however, for point of comparison, project construction emissions would not exceed the neighboring SMAQD construction emissions threshold of 1,100 metric tons of CO_2e per year.

Long-Term Greenhouse Gas Emissions

Long-term GHG emissions are typically generated from mobile sources (e.g., vehicle and truck trips), area sources (e.g., maintenance activities and landscaping), indirect emissions from sources associated with energy consumption, waste sources (land filling and waste disposal), and water sources (water supply and conveyance, treatment, and distribution). Mobile-source GHG emissions

61 BAAQMD. 2022 CEQA Guidelines: Chapter 6 Project-Level Climate Impacts. Website: https://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/ceqa-guidelines-2022/ceqa-guidelines-chapter-6-project-climate-impacts_final-pdf.pdf?rev=ce3ba3fe9d39448f9c15bbabd8c36c7f&sc_lang=en. (accessed July 2026).

62 Sacramento Metropolitan Air Quality District (SMAQD). 2020. SMAQD Thresholds of Significance. <https://www.airquality.org/LandUseTransportation/Documents/CH2ThresholdsTable4-2020.pdf> (accessed July 2026)

would include project-generated vehicle trips to and from the project. Area-source emissions would be associated with activities such as landscaping and maintenance on the project site. Energy source emissions would be generated at off-site utility providers as a result of increased electricity demand generated by the project. Waste source emissions generated by the proposed project include energy generated by land filling and other methods of disposal related to transporting and managing project generated waste. In addition, water source emissions associated with the proposed project are generated by water supply and conveyance, water treatment, water distribution, and wastewater treatment.

Following guidance from the YSAQMD, GHG emissions for operation of the project were calculated using CalEEMod. Based on the analysis results, summarized in **Table M**, the proposed project would result in emissions of approximately 4,739.0 metric tons of CO_2e per year. These estimated emissions are provided for informational purposes, and the significance of the proposed project is further analyzed below. CalEEMod output sheets are provided in Appendix A.

Table M: Project Greenhouse Gas Emissions

Emission Type	Operational Emissions (Metric Tons per Year)			
	CO_2	CH_4	N_2O	CO_2e
Mobile Sources	4,181.0	0.2	0.2	4,254.0
Area Sources	3.2	<0.1	<0.1	3.2
Energy Sources	408.6	0.1	<0.1	412.7
Water Sources	5.5	0.3	<0.1	15.0
Waste Sources	15.2	1.5	0.0	53.3
Total Annual Operational Emissions				**4,739.0**

Source: Compiled by LSA (July 2026).
CH_4 = methane
CO_2 = carbon dioxide
CO_2e = carbon dioxide equivalent
N_2O = nitrous oxide

As discussed, the YSAQMD has not established a numeric threshold for GHG emissions. The significance of GHG emissions may be evaluated based on locally adopted quantitative thresholds or consistency with a regional GHG reduction plan (e.g., a Climate Action Plan). Therefore, consistent with the *State CEQA Guidelines*, Section 15183.5, if a project is consistent with an adopted qualified Greenhouse Gas Reduction Strategy, it can be presumed that the project would not have significant GHG emission impacts. The City's CAAP meets the requirements of *State CEQA Guidelines*, Section 15183.5; therefore, the proposed project is evaluated for consistency with the City's CAAP.[63] **Table N** below presents the proposed project's consistency with the CAAP.

As shown in **Table N**, the proposed project is consistent with applicable goals and CAAP actions of the City of West Sacramento CAAP. Many of the CAAP goals and actions are the responsibility of the City and are not applicable to individual projects (i.e., land use planning decisions, funding, regional transit, etc.); however, the proposed project would be in track for meeting the CAAP goals related to transportation, carbon neutrality, and solid waste. The proposed project would include open space

[63] City of West Sacramento. 2025. City of West Sacramento Climate Action and Adaptation Plan. June 4. Website: https://www.cityofwestsacramento.org/home/showpublisheddocument/20579/638860179110630000 (accessed July 2026).

lots consisting of a 0.68-acre Central Park and a 0.14-acre parklet. This would encourage future residents and surrounding residential communities to use the open space for recreation and other daily activities within walking or biking distance of their homes. By providing accessible and attractive green spaces, the project reduces the need for residents to drive to distant parks or recreational facilities. Therefore, the integration of these parks into the neighborhood design promotes active transportation by encouraging walking and biking within the project site.

Table N: Proposed Project Consistency with the City's CAAP

CAAP Actions	Consistency
Goal 2: Reimagine how we move people and goods	
Prioritize transit-oriented development and center/corridor community growth through land use planning	**Consistent.** As noted above, Yolo Transportation District's Yolobus Route 37 runs down Marshall Road along the northern edge of the project site, and a bus stop is located approximately 0.25 mile east of the project site. Implementation of the proposed project within close proximity of the existing bus stop would promote the use of public transit in the area and support transit-oriented development and land use planning.
Goal 3: Design a future with zero carbon power sources	
Enhance utility coordination and advocate for the City's utility provider to provide access to carbon-free electricity and additional building efficiency/retrofit rebates and funding	**Consistent.** PG&E would provide electricity for the project. In 2022, approximately 40 percent of PG&E's delivered electricity came from renewable sources, including solar, wind, geothermal, small hydroelectric and various forms of bioenergy.[64] PG&E reached California's 2020 renewable energy goal in 2017 and is positioned to meet the State's 60 percent by 2030 renewable energy mandate set forth in Senate Bill (SB) 100. In addition, PG&E plans to continue to provide reliable service to its customers and upgrade its distribution systems as necessary to meet future demand.
Incentivize local solar photovoltaic systems and enhanced energy storage, and promote participation in community solar programs	**Consistent**. The proposed residential units would feature passive use of solar heating and cooling, solar roofs, green roofs, or cool roof systems, and energy-efficient home appliances. In addition, future residents may elect to join a community solar program.
Goal 4: Plan for all-electric buildings city-wide	
Develop and adopt a building electrification program and incentives for existing buildings	**Not applicable**. No existing buildings are included as part of the project.
Establish energy performance standards and GHG emissions limits for existing commercial buildings	**Not applicable.** No existing buildings are included as part of the project. In addition, the proposed project is a single-family housing development and would not include commercial buildings.
Mandate all-electric new construction in a phased approach to eliminate on-site fossil fuel use	**Consistent.** The proposed project would be designed to be all-electric and will not include the use of natural gas.
Goal 5: Create a waste-free city	
Expand commercial and multifamily organic waste programs	**Not applicable.** The project is a single-family housing development and would not include multifamily units or commercial uses. However, the proposed project would be consistent with the CALGreen Code for residential and organic waste disposal. In addition, the proposed project would include green bins and trash enclosures for operational waste activities.
Expand the food recovery network to collect edible food from businesses	**Not applicable.** The project is a single-family housing development and would not include commercial uses.
Reduce unnecessary material consumption	**Consistent.** The proposed project would be consistent with County Solid Waste and State waste reduction requirements for the construction of the proposed project. In addition, the proposed project would include green bins and trash enclosures for operational waste activities.

Source: Compiled by LSA (July 2026).
Note: Not applicable refers to measures that are not relevant to new development and measures not within the project applicant's control.
PG&E = Pacific Gas & Electric

In addition, the project would include two new sidewalks where none currently exist, one along Marshall Road and another along Otis Avenue. The sidewalk along Marshall Road would provide direct, walkable access to a neighboring park located along Marshall Road, further encouraging non-vehicular travel for recreational purposes. Furthermore, Yolo Transportation District's Yolobus Route 37 runs down Marshall Road along the northern edge of the project site. A bus stop is located approximately 0.25 mile east of the project site on Marshall Road between Otis Avenue and Seymour Avenue. The close proximity of the bus stop to the project site would encourage and promote the use of active transit in the area. As described in the Project Location and Description Section, the proposed residential units would also feature passive use of solar heating and cooling, natural ventilation, energy-efficient windows (such as Low E Vinyl, Argon Glass Filled Low E, or Low E Wood Frame), solar roofs, green roofs, or cool roof systems, and energy-efficient home appliances. The proposed project would also be designed to be all-electric and will not include the use of natural gas. Therefore, the project is not expected to obstruct the attainment of the State's long-term GHG reduction goal for 2045. The proposed project would be consistent with the City's CAAP and would not generate GHG emissions that may have a significant effect on the environment.

Consistency with Greenhouse Gas Emissions Reduction Plans

An evaluation of the proposed project's consistency with the 2022 Scoping Plan and the SACOG's 2025 Blueprint Plan is provided below.

2022 Scoping Plan

The following discussion evaluates the proposed project according to the goals of the 2022 Scoping Plan, EO B-30-15, AB 1279, SB 32, and AB 197.

The 2022 Scoping Plan focuses on outcomes needed to achieve carbon neutrality by assessing paths for clean technology, energy deployment, natural and working lands, and others, and is designed to meet the State's long-term climate objectives and support a range of economic, environmental, energy security, environmental justice, and public health priorities.

The City's CAAP establishes GHG reduction goals consistent with State legislation.[65] The City's CAAP outlines a plan for how the City can prepare for climate change impacts while reducing GHG emissions to meet its 2030 and 2045 targets. The GHG goals and actions identified in the City's CAAP would enable the City to reduce its community GHG emissions by 392,070 metric tons of CO_2e by 2030 and reach carbon neutrality by 2045. Furthermore, the strategies adopted in the City's CAAP have the ability, when fully implemented, to reduce GHG emissions below the City's 2030 GHG reduction target and make substantial progress toward a 2045 carbon neutrality target, consistent with State goals and legislature such as AB 1279. Therefore, the strategies, actions, and steps in this CAAP will create the basis for long-term carbon neutrality when implemented, including electrified

65 City of West Sacramento. 2025. City of West Sacramento Climate Action and Adaptation Plan. June 4. Website: https://www.cityofwestsacramento.org/home/showpublisheddocument/20579/638860179110630000 (accessed July 2026).

buildings and vehicles coupled with decarbonized electricity, improved active transportation, decreased waste generation, and increased carbon sequestration.

As discussed in the preceding section and in Table N, the proposed project would be consistent with the goals outlined in the CAAP. While many of the implementing actions will be the responsibility of the City, the project would still be in track with meeting all the applicable actions and will contribute to the City's GHG reduction goals for 2030 and 2045. Therefore, because the City's CAAP is designed to meet the State's established GHG reduction goals, including the 2022 Scoping Plan goals, then an agency reviewing the project under CEQA can conclude that the project would be consistent with the State's 2022 Scoping Plan. As such, the proposed project would be contributing its "fair share" of emissions reductions to support long-term State goals of GHG emission reductions and carbon neutrality and would therefore be found to be consistent with regional and State goals and applicable plans for GHG emissions reductions.

SACOG's 2025 Blueprint Plan

The 2025 Blueprint Plan,[66] approved in November 2025, is the relevant MTP/SCS that lays out a transportation investment and land use strategy to support a prosperous region, with access to jobs and economic opportunity, transportation options, and affordable housing that works for all residents. The plan also lays out a path for improving air quality, preserving open space and natural resources, and helping California achieve its goal to reduce greenhouse gas emissions that contribute to climate change. The vision, goals, and policies in the 2025 Blueprint Plan are intended to serve as the foundation for both short- and long-term planning and guide implementation activities. The 2025 Blueprint Plan contains policies for projects to help more efficiently distribute population, housing, and employment growth, as well as forecast development that is generally consistent with regional-level general plan data. The 2025 Blueprint Plan does not require that local General Plans, Specific Plans, or zoning be consistent with the 2025 Blueprint Plan, but provides incentives for consistency for governments and developers.

The proposed project would not involve more than 500 dwelling units and, therefore, is not regionally significant per *State CEQA Guidelines* Section 15206(b)(2)(A). As such, it would not conflict with the 2025 Blueprint Plan targets since those targets were established and are applicable on a regional level. The City's 2021-2029 Housing Element Update reports 2.8 residents per household in West Sacramento;[67] therefore, the development of 259 residential units could house approximately 725 residents. The City Housing Element estimates that the city will grow to 87,999 residents by 2040. Thus, the additional 725 new residents introduced by the proposed project would represent

[66] SACOG. 2025. *2025 Blueprint; 2020-2050 Metropolitan Transportation Plan and Sustainable Communities Strategy*. November. Website: https://www.sacog.org/home/showpublisheddocument/3313/639020116166800000 (accessed July 2026).

[67] City of West Sacramento. 2021. *2021-2029 Housing Element Update, Table A-6.* Website: https://www.cityofwestsacramento.org/home/showpublisheddocument/12221/637619619413930000 (accessed July 2026).

approximately 0.8 percent of the projected 2040 population, and is not considered a significant contribution to planned population growth.[68]

Furthermore, on March 19, 2020, the SACOG Board of Directors adopted the Cycle 6 (2021-29) Regional Housing Needs Plan which provides the number of total housing units that each jurisdiction in the SACOG region must zone for during the 8-year period. According to the adopted Regional Housing Needs Assessment (RHNA) methodology, West Sacramento's housing need allocation for the planning period between 2021 and 2029 is 9,471 units (2,287 very low-income units, 1,378 low-income units, 1,722 moderate-income units, and 4,084 above moderate-income units).[69] The total RHNA for the City of West Sacramento is less than the projected housing growth included in the 2025 Blueprint Plan, which projects an increase of 15,880 housing units from 2020 to 2050.[70] As such, the additional 259 new units proposed under the project would represent approximately 1.6 percent of the anticipated housing growth from 2020 to 2050 in the SACOG 2025 Blueprint Plan, and would help to meet the City's identified housing needs.[71] Therefore, the proposed project would be consistent with the regional growth assumptions established in the 2025 Blueprint. Furthermore, as noted in the 2025 Blueprint Plan, regional VMT can be reduced through integrated land use and transportation planning. For example, high-density, mixed-use, and infill development results in shorter trip lengths for residents. The project site is an infill parcel surrounded by development to the north, west, and south, and is identified as an Established Communities area in the 2025 Blueprint Plan. Development of the proposed project within an Established Communities area is consistent with the integrated land use planning decisions encouraged by the 2025 Blueprint Plan.

Therefore, the project would not conflict with the regional growth projections used to develop the CARB's 2022 Scoping Plan and the SACOG's 2025 Blueprint Plan. As such, the proposed project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, including the CARB Scoping Plan and the SACOG's 2025 Blueprint Plan.

---

68 (725 persons from the proposed project/ 87,999 2040 projected population) x 100 = 0.8 percent of total 2040 population

71 (259 units from the proposed project/ 15,880 total projected housing growth) × 100 = 1.6 percent of total projected housing growth

CONCLUSION

Based on the analysis presented above, with implementation of Regulatory Measure AIR-1, construction and operational activities associated with the proposed project would not result in the generation of criteria air pollutants that would exceed YSAQMD thresholds of significance. The proposed project would also not conflict with or obstruct implementation of YSAQMD air quality plans. Furthermore, with implementation of Mitigation Measure AIR-1, construction of the proposed project is not expected to produce significant emissions that would affect nearby sensitive receptors. The project would not result in other emissions (such as those leading to odors) affecting a substantial number of people. The proposed project would not result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation and would not conflict with or obstruct a State or local plan for renewable energy or energy efficiency. As mentioned above, the proposed project would be consistent with the goals established in the City's CAAP and would not generate GHG emissions that may have a significant effect on the environment. Additionally, the project would not conflict with the State's GHG emissions reductions objectives embodied in EO B-30-15, AB 1279, SB 32, or AB 197. Therefore, the proposed project's incremental contribution to cumulative GHG emissions would not be cumulatively considerable.

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Control Strategies Applied	PM10 Reduction	PM2.5 Reduction
Water unpaved roads twice daily	55%	55%
Limit vehicle speeds on unpaved roads to 25 mph	44%	44%
Sweep paved roads once per month	9%	9%

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	1,022,726	340,909	0.00000	0.00000	28,775.7

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (Cubic Yards)	Material Exported (Cubic Yards)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Site Preparation	0.00000	0.00000	60.0000	0.00000	0.00000
Grading	88,068.0	0.00000	60.0000	0.00000	0.00000
Paving	0.00000	0.00000	0.00000	0.00000	13.8640

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Phase Name	Land Use	Area Paved (acres)	% Asphalt
Paving	Single Family Housing	2.85399	0%
Paving	City Park	0.00000	0%
Paving	Other Asphalt Surfaces	11.0100	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2027	0.00000	203.983	0.03300	0.00400
2028	0.00000	203.983	0.03300	0.00400

5.9. Operational Mobile Sources

5.9.1. Unmitigated

Land Use Type	Trips/Weekday	Trips/Saturday	Trips/Sunday	Trips/Year	VMT/Weekday	VMT/Saturday	VMT/Sunday	VMT/Year
Single Family Housing	2,421.65	2,421.65	2,421.65	883,902	31,209.3	31,209.3	31,209.3	11,391,403
City Park	0.00000	0.00000	0.00000	0.00000	0.00000	0.00000	0.00000	0.00000
Other Asphalt Surfaces	0.00000	0.00000	0.00000	0.00000	0.00000	0.00000	0.00000	0.00000

8. User Changes to Default Data

8.1. Justifications

Screen	Justification
Land Use	Project would construct 259 single-family residential lots with approximately 14.11 acres of HOA and public open space and 11.01 acres of paved area on a 59.9 acre property
Construction: Construction Phases	No demolition is anticipated as part of the proposed project. Construction of the proposed project is anticipated to begin in 2027 or 2028 and would commence within 12 to 18 months of project approval. This analysis assumes construction to begin in 2027 and last 18 months
Construction: Off-Road Equipment	Default tier 2 equipment
Construction: Dust From Material Movement	Project would require 88,068 cubic yards of net import soil. Assumed material imported to be phased.
Construction: On-Road Fugitive Dust	Project is located in an urban area. Assume all vehicles would travel on paved roads

Screen	Justification
Operations: Vehicle Data	Project would generate 2,422 ADT. Trip rates based on this trip generation Trip rate = 2,422 / 259 = 9.35
Operations: Road Dust	Project is located in an urban setting. Assume vehicles would travel on paved roads
Operations: Energy Use	Project would be all-electric

8.3. Land Use

Model Parameter	Units	Default Value	New Value
