**TODSP - Mitigated Construction Calculations**

## On-site Exhaust PM10 Emissions (Mitigated)

| Phase | tons/year |
|---|---|
| Phase-2c: Total | 0.041026696 |
| **Total (tons)** | **0.041026696** |
| **Total (lbs)** | **82.05339152** |
| **Total Construction Days** | **824** |
| **Emission Rate (lbs/day)** | **0.099579359** |
| **Emission Rate (g/s)** | **0.001045583** |

## Off-site Hauling Trips Exhaust PM10 Emissions

| Phase | Year | tons/year |
|---|---|---|
| Phase 2c: Demolition | 2028 | 0.000100919 |
| Phase 2c: Demolition | 2029 | 3.40052E-05 |
| **Total (tons)** | | 3.40052E-05 |
| **Total (lbs)** | | **0.06801** |
| **Total Construction Days** | | **824** |
| **Emission Rate (lbs/day)** | | **8.2537E-05** |
| **Emission Rate (g/s)** | | **8.66638E-07** |
| Hauling Trip Length (mile) | | **40** |
| Hauling Trip Number | | 6.97 |
| Total Hauling Trip Distance (mile) | | 278.8 |
| **Emission Rate (g/s/mile)** | | 3.10846E-09 |

## Off-siteVendor Trips Exhaust PM10 Emissions

| Phase | tons/year |
|---|---|
| Phase 2c: Building Construction | **0.002969107** |
| Phase 2c: Building Construction | **0.003244683** |
| Phase 2c: Building Construction | **0.002426845** |
| **Total (tons)** | **0.008640635** |
| **Total (lbs)** | **17.28127068** |
| **Total Construction Days** | **824** |
| **Emission Rate (lbs/day)** | **0.020972416** |
| **Emission Rate (g/s)** | **0.00022021** |
| **Vendor Trip Length (mile)** | **20.4** |
| **Vendor Trip Number** | **20.2** |
| **Total Vendor Trip Distance (mile)** | **412.08** |
| **Emission Rate (g/s/mile)** | **5.34387E-07** |

**Total Emission Rate (Hauling + Vendor)** 5.34387E-07

## Line Volumes Sources (AERMOD)

| | Length (meter) | Length (mile) |

                                          ***     MODEL SETUP OPTIONS SUMMARY
 ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for    24 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =    125000.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:     24 Source(s);       1 Source Group(s); and     910
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:     23 VOLUME source(s)
                 and:      1 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  21112
```

```
 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    23.50 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.7 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   TODSP Phase 2C.err

 **File for Summary of Results:   TODSP Phase 2C.sum

**TODSP - Mitigated Construction Calculations**

## On-site Exhaust PM10 Emissions (Mitigated)

| Phase | tons/year |
|---|---|
| Phase-3: Total | 0.018409638 |
| **Total (tons)** | **0.018409638** |
| **Total (lbs)** | **36.81927699** |
| **Total Construction Days** | **414** |
| **Emission Rate (lbs/day)** | **0.088935452** |
| **Emission Rate (g/s)** | **0.000933822** |

## Off-site Hauling Trips Exhaust PM10 Emissions

| Phase | Year | tons/year |
|---|---|---|
| Phase 3: Grading | 2040 | 0 |
| Phase 3: Grading | 2041 | 0 |
| **Total (tons)** | | **0.00000** |
| **Total (lbs)** | | **0** |
| **Total Construction Days** | | **414** |
| **Emission Rate (lbs/day)** | | **0** |
| **Emission Rate (g/s)** | | **0** |
| Hauling Trip Length (mile) | | 0 |
| Hauling Trip Number | | 0 |
| Total Hauling Trip Distance (mile) | | 0 |
| **Emission Rate (g/s/mile)** | | **#DIV/0!** |

## Off-siteVendor Trips Exhaust PM10 Emissions

| Phase | tons/year |
|---|---|
| Phase 3: Building Construction | **0.000173582** |
| Phase 3: Building Construction | **0.000296063** |
| **Total (tons)** | **0.000469644** |
| **Total (lbs)** | **0.939288754** |
| **Total Construction Days** | **414** |
| **Emission Rate (lbs/day)** | **0.002268813** |
| **Emission Rate (g/s)** | **2.38225E-05** |
| **Vendor Trip Length (mile)** | **20** |
| **Vendor Trip Number** | **1.8** |
| **Total Vendor Trip Distance (mile)** | **36** |
| **Emission Rate (g/s/mile)** | **6.61737E-07** |

**Total Emission Rate (Hauling + Vendor)** #DIV/0!

## Line Volumes Sources (AERMOD)

| | Length (meter) | Length (mile) |

- - - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for    24 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =    125000.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:     24 Source(s);       1 Source Group(s); and     910
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:     23 VOLUME source(s)
                 and:      1 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  21112

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
```

Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 23.50 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ;
Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.7 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: TODSP Phase 3 Mitigated.err

**File for Summary of Results: TODSP Phase 3 Mitigated.sum

Michael Baker INTERNATIONAL

We Make a Difference

# MEMORANDUM

**To:** Eddie Torres, Michael Baker International

**From:** Darshan Shivaiah, Michael Baker International

**Date:** January 20, 2026

**Subject:** Thousand Oaks Downtown Specific Plan Project – Freeway Health Risk Assessment Technical Memorandum

---

## PURPOSE

The purpose of this Health Risk Assessment (HRA) is to evaluate potential health risks impacts associated with toxic air contaminants (TAC), including diesel particulate matter (DPM) emissions from trucks traveling along Highway 101 on the Thousand Oaks Downtown Specific Plan Project (project) in the City of Thousand Oaks (City), California. The project proposes a mix of land uses, including residential, hotel, commercial, civic, and retail. Due to the project's proximity to Highway 101, the purpose of this analysis is to evaluate the health risk impacts likely to occur to the proposed project's sensitive receptors (residential and hotel) from on-road vehicles travelling on high-volume roadways, such as Highway 101.

This HRA was prepared in accordance with the requirements of the Ventura County Air Pollution Control District (VCAPCD) and guidance from the Office of Environmental Health Hazard Assessment (OEHHA) to determine if health risks impacts are likely to occur to the proposed project.

## PROJECT LOCATION

The project site is located in the City of Thousand Oaks in the eastern portion of the City, approximately 0.7 miles east of the Hwy-23 and US-101 interchange. Regional access to the site is taken from US-101 via the Hampshire Road and Rancho Road offramps. The site sits in a low-lying area of the City along Thousand Oaks Boulevard and is visible from nearby hillside trails to the north.

## ENVIRONMENTAL SETTING

The project is located within the South-Central Coast Air Basin (Basin), bounded by the Pacific Ocean to the west, the San Luis Obispo County boundary to the north and east, and the Ventura County boundary to the south and east. The Basin includes San Luis Obispo, Santa Barbara, Ventura Counties.

The extent and severity of the air pollution problem in the Basin is a function of the area's natural physical characteristics (weather and topography), as well as man-made influences (development patterns and lifestyle). Factors such as wind, sunlight, temperature, humidity, rainfall, and topography all affect the accumulation and/or dispersion of air pollutants throughout the Basin.

### Toxic Air Contaminants

Toxic air contaminants (TACs) are airborne substances capable of causing short-term (acute) and/or long-term (chronic) or carcinogenic (i.e., cancer causing) adverse human health effects (i.e., injury or illness). TACs include both organic and inorganic chemical substances. They may be emitted from a variety of common sources including gasoline stations, automobiles, dry cleaners, industrial operations, and painting operations. The current California list of TACs identifies approximately 200 compounds, including particulate emissions from diesel-fueled engines.

Hazardous air pollutants (HAP) is a term used in the Federal Clean Air Act (FCAA) and includes a variety of pollutants generated or emitted by industrial production activities. Identified as TACs under the California Clean Air Act (CCAA), ten pollutants have been singled out through ambient air quality data as being the most substantial health risks in California. Direct exposure to these pollutants has been shown to cause cancer, birth defects, brain and nervous system damage, and respiratory disorders.

TACs do not have ambient air quality standards because no safe levels of TACs can be determined. Instead, TAC impacts are evaluated by calculating the health risks associated with a given exposure. The requirements of the Air Toxic "Hot Spots" Information and Assessment Act (Assembly Bill [AB] 2588) apply to facilities that use, produce, or emit toxic chemicals. Facilities subject to the toxic emission inventory requirements of AB 2588 must prepare, submit, and periodically update their toxic emission inventory plans and reports.

### Diesel Particulate Matter

Diesel particulate matter is emitted from both mobile and stationary sources. In California, on-road diesel-fueled engines contribute approximately 24 percent of the statewide total, with an additional 71 percent attributed to other mobile sources, such as construction and mining equipment, agricultural equipment, and transport refrigeration units. Stationary sources contribute approximately five percent of total DPM in the State. It should be noted that CARB has developed several plans and programs to reduce diesel emissions such as the Diesel Risk Reduction Plan, the Statewide Portable Equipment Registration Program (PERP), and the Diesel Off-Road Online Reporting System (DOORS). PERP and DOORS allow owners or operators of portable engines and certain other types of equipment to register their equipment in order to operate it in the State without having to obtain individual permits from local air districts.

Diesel exhaust and many individual substances contained in it (e.g., arsenic, benzene, formaldehyde, and nickel) have the potential to contribute to mutations in cells that can lead to cancer. Long-term exposure to diesel exhaust particles poses the highest cancer risk of any TAC evaluated by OEHHA. CARB estimates

that about 70 percent of the cancer risk that the average Californian faces from breathing toxic air pollutants stems from diesel exhaust particles.

In its comprehensive assessment of diesel exhaust, OEHHA analyzed more than 30 studies of people who worked around diesel equipment, including truck drivers, railroad workers, and equipment operators. The studies showed these workers were more likely to develop lung cancer than workers who were not exposed to diesel emissions. These studies provide strong evidence that long-term occupational exposure to diesel exhaust increases the risk of lung cancer. Using information from OEHHA's assessment, CARB estimates that diesel particle levels measured in California's air in 2000 could cause 540 "excess" cancers in a population of one million people over a 70-year lifetime. Other researchers and scientific organizations, including the National Institute for Occupational Safety and Health, have calculated cancer risks from diesel exhaust similar to those developed by OEHHA and CARB.

Exposure to diesel exhaust can also have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and can cause coughing, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks.

Diesel engines are a major source of fine particulate pollution. The elderly and people with emphysema, asthma, chronic heart and lung disease are especially sensitive to fine-particle pollution. Numerous studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems. Because children's lungs and respiratory systems are still developing, they are also more susceptible than healthy adults to fine particles. Exposure to fine particles is associated with increased frequency of childhood illnesses and can also reduce lung function in children. In California, diesel exhaust particles have been identified as a carcinogen.

## REGULATORY SETTING

### Federal

Federal Clean Air Act. The FCAA of 1970 and the FCAA Amendments of 1971 required the U.S. Environmental Protection Agency (EPA) to establish National Ambient Air Quality Standards (NAAQS), which required the EPA to adopt more stringent air quality standards or to include standards for other specific pollutants. The FCAA was amended in 1990 to address a large number of air pollutants that are known to cause or may reasonably be anticipated to cause adverse effects to human health or adverse environmental effects. A total of 188 specific pollutants and chemical groups were initially identified as HAPs, and the list has been modified over time. The FCAA Amendments included new regulatory programs to control acid deposition and regulate the issuance of stationary source operating permits.

Mobile Source Air Toxics Rule. In 2001, the EPA issued its first Mobile Source Air Toxics (MSAT) Rule, which identified 21 MSAT compounds as being HAPs that required regulation. A subset of six MSAT compounds were identified as having the greatest influence on health, including benzene, 1,3-butadiene, formaldehyde, acrolein, acetaldehyde, and DPM. In February 2007, the EPA issued a second MSAT Rule that generally supported the findings in the first rule and provided additional recommendations of compounds having the greatest impact on health. The rule also identified several engine emission

certification standards that must be implemented. Unlike criteria pollutants, MSATs do not have NAAQS, making evaluation of their impacts more subjective. In April 2014, the EPA issued a third MSAT Rule that established the Tier 3 standards, which are part of a comprehensive approach to reducing the impacts of motor vehicles on air quality and public health.

National Emissions Standards for Hazardous Air Pollutants Program. Under federal law, 187 substances are listed as HAPs. Major sources of specific HAPs are subject to the requirements of the National Emissions Standards for Hazardous Air Pollutants program. The EPA is establishing regulatory schemes for specific source categories and requires implementation of Maximum Achievable Control Technologies for major sources of HAPs in each source category. State law has established the framework for California's TAC identification and control program, which is generally more stringent than the federal program and is aimed at HAPs that are specific problems in California. The State has formally identified 244 substances as TACs and is adopting appropriate control measures for each TAC. Once adopted at the state level, each air district will be required to adopt a control measure that is equal or more stringent.

**State**

California Air Toxics "Hot Spots" Information and Assessment Act (AB 2588). Enacted in 1987, AB 2588 is a statewide program that requires facilities exceeding recommended OEHHA levels to reduce risks to acceptable levels. Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the air quality management district or air pollution control district. High priority facilities are required to perform an HRA and, if specific thresholds are exceeded, required to communicate the results to the public in the form of notices and public meetings. In September 1992, AB 2588 was amended by Senate Bill 1731, which required facilities that pose a significant health risk to the community to reduce their risk by developing a risk management plan.

Diesel exhaust is mainly composed of particulate matter (PM) and gases, which contain potential cancer-causing substances. Emissions from diesel engines currently include over 40 substances that are listed by EPA as HAPs and by CARB as TACs. On August 27, 1998, CARB identified PM in diesel exhaust as a TAC, based on data linking diesel particulate emissions to increased risks of lung cancer and respiratory disease.

Toxic Air Contaminant Identification and Control Act (AB 1807). CARB's statewide comprehensive air toxics program was established in 1983 with the Toxic Air Contaminant Identification and Control Act. AB 1807 created California's program to reduce exposure to air toxics and sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an airborne toxics control measure (ATCM) for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology to minimize emissions.

Diesel Reduction Plan. In September 2000, CARB adopted a comprehensive diesel risk reduction plan to reduce emissions from both new and existing diesel-fueled engines and vehicles. The goal of the plan is to reduce DPM emissions and its associated health risk by 75 percent in 2010 and by 85 percent by 2020. As part of this plan, CARB identified ATCM for mobile and stationary emissions sources. Each ATCM is codified in the California Code of Regulations (CCR), including the ATCM to limit diesel-fueled commercial motor vehicle idling, which puts limits on idling time for large diesel engines (13 CCR Chapter 10 Section 2485).

California Building Energy Efficiency Standards (Title 24). In 1978, the California Energy Commission established the State's energy efficiency standards for residential and non-residential buildings in response to a legislative mandate to create uniform building codes to reduce California's energy consumption. The Title 24 standards were last updated in 2022 and took effect on January 1, 2023. Under the 2022 standards, residential and non-residential buildings are required to have air filters with a designated efficiency equal to or greater than Minimum Efficiency Reporting Value (MERV) 13 when tested in accordance with the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) Standard 52.2. Per ASHRAE Standard 52.2, MERV 13 filters are able to filter out 50 percent of particles within 0.3 to 1.0 micrometers (µm), 85 percent of particles within 1.0 to 3.0 µm, and 90 percent of particles within 3.0 to 10 µm.

California Air Resource Board Air Quality and Land Use Handbook. The CARB primary goal in developing the Air Quality and Land Use Handbook is to provide information that will help keep California's children and other vulnerable populations out of harm's way with respect to nearby sources of air pollution. Reducing diesel particulate emissions is one of CARB's highest public health priorities and the focus of a comprehensive statewide control program that is reducing DPM emissions each year.

The CARB Handbook provides information on the siting of new sensitive land uses near specific emission sources (i.e., freeways, distribution centers, rail yards, ports, refineries, chrome plating facilities, dry cleaners, and gasoline dispensing facilities), and identifies recommended buffers for the avoidance of potential health-based consequences due to the proximity of sensitive land uses to such sources. Some examples of CARB's recommendations include avoiding siting sensitive receptors within:

- 500 feet of a freeway, urban road with 100,000 vehicles per day, or rural roads with 50,000 vehicles per day;[1]
- 1,000 feet of a transport distribution center; and
- 300 feet of any dry-cleaning operation using perchloroethylene or within 500 feet of a dry-cleaning operation with two or more machines.

Recommendations provided by CARB are voluntary and do not constitute a requirement or mandate for either land use agencies or local air districts.

**Regional**

Ventura County Air Pollution Control District. The CCAA authorizes the VCAPCD to regulate stationary sources of air pollution and implement air quality programs necessary to attain state and federal standards. Mobile source emissions including those from motor vehicles are regulated by the California Air Resources Board (CARB). VCAPCD's air toxics program is implemented through the AB 2588 Air Toxics "Hot Spots" program, which requires facilities to quantify TAC emissions, undergo prioritization, and conduct formal health risk assessments. VCAPCD publishes annual reports on facility risk levels and control measure progress.

VCAPCD does not conduct a regional toxics modeling program equivalent to the South Coast AQMD's MATES; therefore, cumulative TAC analyses in Ventura County typically rely on AB 2588 health risk

[1] According to CARB, California freeway studies show an approximately 70 percent drop off in particulate pollution levels at 500 feet, and lifetime cancer risk from exposure to diesel particulate matter is expected to be lowered proportionately at that distance.

assessment procedures and OEHHA methodologies. Diesel particulate matter (DPM) from mobile and stationary sources represents the dominant contributor to toxic air contaminant cancer risk in the county. Project-level TAC impacts are generally limited to DPM emissions, which are evaluated using standard health risk assessment methods.

## SIGNIFICANCE CRITERIA AND METHODOLOGY

### Health Risk Analysis Thresholds

In order to determine whether the on-site receptors would be significantly impacted by existing environmental health risks, it is essential to evaluate the types and levels of air toxics generated and their associated impacts on air quality. Given that the project is located adjacent to the Highway 101 to the west, this assessment considers the health risk contribution of TAC emissions from the adjacent Highway 101 and their effects on on-site receptors. VCAPCD recommends using specific air pollution thresholds to identify potential significant impacts. If the lead agency finds that the proposed project has the potential to exceed the following air pollution thresholds, the project's impact should be considered significant.

- Cancer Risk: Emit carcinogenic or toxic contaminants that exceed the maximum individual cancer risk of 10 in one million.

- Non-Cancer Risk: Emit toxic contaminants that exceed the maximum hazard quotient of 1.

Cancer risk is expressed in terms of expected incremental incidence per million population. The VCAPCD has established an incidence rate of 10 persons per million as the maximum acceptable incremental cancer risk due to DPM exposure. This threshold serves to determine whether or not a given project has a potentially significant development-specific and cumulative impact. The 10 in one million standard is a very health-protective significance threshold. A risk level of 10 in one million implies a likelihood that up to 10 persons out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of TACs over a specified duration of time. This risk would be an excess cancer that is in addition to any cancer risk borne by a person not exposed to these air toxics.

The VCAPCD has also established non-carcinogenic risk parameters for use in HRAs. Noncarcinogenic risks are quantified by calculating a “hazard index” (HI), expressed as the ratio between the ambient pollutant concentration and its toxicity or Reference Exposure Level (REL). An REL is a concentration at or below which health effects are not likely to occur. A hazard index less than one (1.0) means that adverse health effects are not expected. As such, non-carcinogenic exposures of less than 1.0 are considered less than significant.

### Methodology

The air dispersion modeling for the HRA was performed using the EPA AERMOD dispersion model, version 12.0.0. AERMOD is a steady-state, multiple-source, Gaussian dispersion model designed for use with emission sources situated in terrain where ground elevations can exceed the stack heights of the emission sources (not a factor in this case). AERMOD requires hourly meteorological data consisting of wind vector, wind speed, temperature, stability class, and mixing height. Surface and upper air meteorological data

provided by the VCAPCD for the Camarillo Airport Monitoring Station was selected as being the most representative meteorology based on proximity to the project site.[2]

***Roadway Parameters***

Truck traffic volume data for the modeled portion of the Highway 101 was developed using publicly available information from the California Department of Transportation (Caltrans) *Traffic Census Program*.[3] Emissions were calculated using truck traffic data for the Highway 101 links adjacent to the project site. Approximately one-mile of Highway 101 near the project site was modeled. A summary of truck traffic data used is provided in Table 1, *Truck Volume Data on the Highway 101 in the Vicinity of the Project Site*. As a conservative analysis, the highest truck traffic volume data from the most recent year 2023 was used in this analysis.

**Table 1**
**Truck Volume Data on the Highway 101 in the Vicinity of the Project Site**

| Post Mile | Description | Location | Truck Traffic Volume[1] |
|---|---|---|---|
| 0.701 | Thousand Oaks Junction Route 23 South | North of the Interchange | 6,521 |
| | | South of the Interchange | 6,675 |
| 3.107 | Thousand Oaks Junction Route 23 South | North of the Interchange | 6,678 |
| | | South of the Interchange | 6,408 |

***Source Modeling***

This HRA evaluates health risk impacts associated with TACs emitted by on-road trucks operating along the Highway 101 adjacent to the project site. DPM is expected to account for the majority of cancer risk from on-road vehicles travelling on high-volume roadways, such as the Highway 101.[4] Therefore, this report focuses on evaluating health impacts associated with DPM emissions.[5] Based on California regulatory guidelines, DPM was used as a surrogate to calculate cancer and chronic impacts of diesel-fueled vehicle exhaust.

The emission rate for exhaust particulate matter 10 micrometers and smaller ($PM_{10}$), or in this case, DPM, is based on the CARB's mobile source emission inventory model, Emissions Factor 2021 (EMFAC2021; version 1.0.2) computer model. It should be noted that, DPM is a major component of exhaust $PM_{10}$. Additionally, $PM_{10}$ includes $PM_{2.5}$ as a subset, meaning $PM_{2.5}$ particles are part of the broader $PM_{10}$

[4] California Air Resource Board, *Overview: Diesel Exhaust & Health*, https://ww2.arb.ca.gov/resources/overview-dieselexhaust- and-health, accessed October 27, 2025.

[5] Pursuant to Health and Safety Code section 39661, the Scientific Review Panel (SRP / Panel) has reviewed the report Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant by the staffs of the California Air Resources Board (ARB or Board) and the Office of Environmental Health Hazard Assessment (OEHHA) describing the public exposure to, and health effects of, diesel exhaust; Adopted at the Panel's April 22, 1998 Meeting.

category. The exhaust $PM_{10}$ emission rate from EMFAC2021 was multiplied by truck traffic volumes along Highway 101 to calculate DPM emissions. Plume height and plume width of the emissions from heavy-duty trucks were calculated using Haul Road Volume Source Calculator built in AERMOD using roadway width of Highway 101 segment and vehicle height of 4.57 meters (15 feet) in compliance with the VCAPCD guidance. In addition, Highway 101 was modeled as a line-volume source. Emission rates of project opening year 2030 were used. As previously discussed, the highest truck traffic volume data, 6,678, from the most recent year 2023 was used in this analysis and used to calculate emission rates. Refer to Appendix A, *Dispersion Modeling Data*, for all emission calculations and AERMOD modeling results.

***Sensitive Receptor Modeling***

Sensitive receptors are defined as facilities or land uses that include members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with illnesses. Examples of these sensitive receptors are residences, schools, hospitals, and daycare centers. As previously stated, the purpose of this HRA is to determine the best-suited location on the project to locate the mixed-use residential and hotel use. As such, sensitive receptors were modeled across the project site where future sensitive uses (residential and hotel) would be located. The potential cancer risk was calculated on a 70-year exposure scenario, with the age demographics starting at third trimester. The chronic and carcinogenic health risk calculations are based on the OEHHA Guidance Manual.[6]

For the purpose of this analysis, existing uses such as Civic Arts Plaza and Mary and Richard Carpenter Plaza Park are not modeled as a sensitive receptor.

***Air Dispersion Modeling***

A model run was conducted to obtain the peak 1-hour and annual average $PM_{10}$ concentration in micrograms per cubic meter [$\mu g/m^3$] at the sensitive receptors. Note that the concentration estimate developed using this methodology is considered conservative and is not a specific prediction of the actual concentrations that would occur at any one point over the course of the any period. Actual one-hour and annual average concentrations are dependent on many variables, particularly the number and type of vehicles traveling at specific speed and distances during time periods of adverse meteorology. Refer to Appendix A for modeling assumptions and results.

***Risk and Hazard Assessment***

The Hotspots Analysis and Reporting Program Version 2 (HARP2) Air Dispersion Modeling and Risk Tool (ADMRT) was employed to calculate the health risks related to the DPM emissions from the trucks travelling on Highway 101. HARP2 was created for the purpose of assisting and supporting the local California Air Pollution Control and Air Quality Management Districts with implementing the requirements of AB 2588. Although designed to meet the programmatic requirements of AB 2588, HARP2 modules have also been used for preparing risk assessments for other air related programs (e.g., air toxic control measure development, facility permitting applications, and ambient monitoring evaluations).

[6] Office of Environmental Health Hazard Assessment, *The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*, February 2015.

The risk analysis algorithms and default values used in HARP2 are based on the OEHHA guidelines set forth in the revised *Technical Support Document for Exposure Assessment and Stochastic Analysis*.[7] All equations, default parameter values, and variable distributions encoded into HARP2 are from the OEHHA Guidance Manual. More specifically, the ADMRT module in HARP2 allows users to:

- Calculate potential health impacts using a ground level concentration;
- Evaluate one or multiple pollutants for one or multiple receptor points;
- Calculate cancer and non-cancer (e.g., acute, 8-hour, and chronic) health impacts using the new risk assessment guidelines in the OEHHA Guidance Manual;
- Use point estimates to calculate inhalation and multi-pathway risks; and
- Perform stochastic health risk analyses.

Cancer Risk. Based on the OEHHA methodology, the inhalation cancer risk from annual average DPM concentrations is calculated by multiplying the daily inhalation or oral dose by a cancer potency factor, an age sensitivity factor (ASF), the frequency of time spent at home (for residents only), and the exposure duration divided by averaging time, to yield the excess cancer risk. These factors are discussed in more detail below.

Exposure through inhalation (Dose-air) is a function of breathing rate, exposure frequency, and concentration of a substance in the air. For residential exposure, breathing rates are established for specific age groups; therefore, Dose-air is calculated for the following age group: third trimester to 70 years, consistent with the OEHHA guidelines. To estimate cancer risk, the dose was estimated by applying the following formula to each ground level concentration:

$$\text{Dose-air} = (C_{air} * \{BR/BW\} * A * EF * 10^{-6})$$

Where:

| | | |
|---|---|---|
| Dose-air | = | dose through inhalation (microgram per kilogram per day; mg/kg/day) |
| $C_{air}$ | = | air concentration ($\mu g/m^3$) from air dispersion model |
| {BR/BW} | = | 95$^{th}$ percentile daily breathing rate normalized to body weight (liters per kilogram [L/kg] body weight [BW]-day) (361 L\kg BW-day for third trimester, 1,090 L/kg BW-day for 0<2 years, 861 L/kg BW-day for 2<9 years, 745 L/kg BW-day for 2<16 years, 335 L/kg BW-day for 16<30 years, and 290 L/kg BW-day 16<70 years) |
| A | = | Inhalation absorption factor (unitless [1]) |
| EF | = | exposure frequency (unitless), days/365 days (0.96 [approximately 350 days per year]) |
| $10^{-6}$ | = | conversion factor (micrograms to milligrams, liters to cubic meters) |

OEHHA developed ASFs to take into account the increased sensitivity to carcinogens during early-in-life exposure. Fraction of time at home (FAH) during the day is used to adjust exposure duration and cancer risk from a specific emission source, based on the assumption that exposure to the emissions is not occurring away from home.

[7] Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Program Risk Assessment Guidelines Technical Support Document for Exposure Assessment and Stochastic Analysis*, https://oehha.ca.gov/media/downloads/crnr/110711exposuretsd.pdf, accessed October 27, 2025.

To estimate the cancer risk, the Dose-air is multiplied by the cancer potency factor, ASF, exposure duration divided by averaging time, and frequency of time spent at home (for residents only):

$$Risk_{inh\text{-}res} = (Dose_{air} * CPF * ASF * ED/AT * FAH)$$

Where:

| | | |
|---|---|---|
| $Risk_{inh\text{-}res}$ | = | residential inhalation cancer risk (potential chances per million) |
| Dose-air | = | daily dose through inhalation (mg/kg/day) |
| CPF | = | inhalation cancer potency factor ($mg/kg\text{-}day^{-1}$) |
| ASF | = | age sensitivity factor for a specified age group (unitless) |
| ED | = | exposure duration (in years) for a specified age group (0.25 years for third trimester, 2 years for 0<2, 7 years for 2<9, 14 years for 2<16, 14 years for 16<30, and 54 years for 16-70) |
| AT | = | averaging time of lifetime cancer risk (years) |
| FAH | = | fraction of time spent at home (unitless) |

It should be noted that, sensitive receptors were modeled as residents with age demographics starting at third trimester in HARP2, as it is the most conservatively way to adjust the daily and annual exposure duration. Residential cancer risks were evaluated using OEHHA default residential exposure parameters, including 24-hour exposure duration and age weighted breathing rates applied internally within HARP. No occupational or reduced exposure assumptions were applied to residential receptors.

Chronic Non-Cancer Hazard. Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. The following equation was used to determine the non-cancer risk:

$$\text{Hazard Quotient} = C_i/REL_i$$

Where:

| | | |
|---|---|---|
| $C_i$ | = | Concentration in the air of substance i (annual average concentration in $\mu g/m^3$) |
| $REL_i$ | = | Chronic non-cancer Reference Exposure Level for substance i ($\mu g/m^3$) |

**IMPACT ANALYSIS**

**Carcinogenic Risk**

The highest overall annual concentration of diesel exhaust from Highway 101 to the proposed project's on-site sensitive receptors would be 0.05585 $\mu g/m^3$. DPM concentrations are the highest near Highway 101 and generally decrease as the distance from the Highway increases. The calculations conservatively assume cleaner technology with lower emissions are not implemented in future years and cancer risk calculations are based on 70-year worker exposure scenario. This is mainly due to the dispersion of DPM as it moves away from the source, combined with atmospheric conditions.

Furthermore, the project would be required to comply with the most recent Title 24 requirements, which require installation of MERV 13 air filters or higher. MERV 13 air filters would reduce $PM_{10}$ concentrations by 95 percent, which would drastically lower the maximum cancer risk from DPM. It should be also noted that the hotel part of the project is not anticipated that sensitive receptors would be present on-site for the 70-year resident exposure scenario. However, this analysis conservatively analyze exposure scenario of 70-years for the hotel component.

As shown in Table 2, *Project Maximum Individual Cancer Risk,* the highest calculated carcinogenic risk would be approximately 9.43 in one million at the on-site sensitive receptors. As shown in Table 2, carcinogenic exposures from the trucks traveling on Highway 101 are calculated to be within acceptable limits and would not exceed VCAPCD threshold.

**Table 2**
**Project Maximum Individual Cancer Risk**

| Exposure Scenario | Maximum Cancer Risk (Risk per Million)[1] | Significance Threshold (Risk per Million) | Exceeds Significance Threshold? |
|---|---|---|---|
| Maximum at the On-site Sensitive Receptorsl[2] | 9.43 | 10 | No |

Notes:
1. Refer to Appendix A, *Dispersion Modeling Data*.
2. The maximum cancer risk would be experienced at UTM NAD83 Zone 11S coordinate location 329561.03, 3783115.51. The MICR risk is for sensitive receptors located within the project site.

**Non-Carcinogenic Hazard**

The significance thresholds for TAC exposure also require an evaluation of non-cancer risk stated in terms of a hazard index. Non-cancer chronic impacts are calculated by dividing the annual average concentration by REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. The potential for acute non-cancer hazards is evaluated by comparing the maximum short-term exposure level to an acute REL. RELs are designed to protect sensitive individuals within the population. The calculation of acute non-cancer impacts is similar to the procedure for chronic non-cancer impacts. Currently, OEHHA has not set an acute REL for DPM. To be conservative, the acute REL for Acrolein is used instead given that Acrolein is a major component of diesel exhaust and is considered the worst-case acute REL for diesel exhaust emissions.

A chronic hazard index of 1.0 is considered individually significant. The highest maximum chronic and acute hazard index associated with the emissions from the trucks traveling on Highway 101 at the on-site sensitive receptors would be 0.035 and 0.022, respectively; refer to Appendix A. Therefore, non-carcinogenic hazards are calculated to be within acceptable limits.

**Conclusion**

As described, the carcinogenic and non-carcinogenic hazards resulting from the DPM emissions from trucks traveling on Highway 101 adjacent to the proposed project are calculated to be within acceptable limits.
