SECTION 1: EXECUTIVE SUMMARY

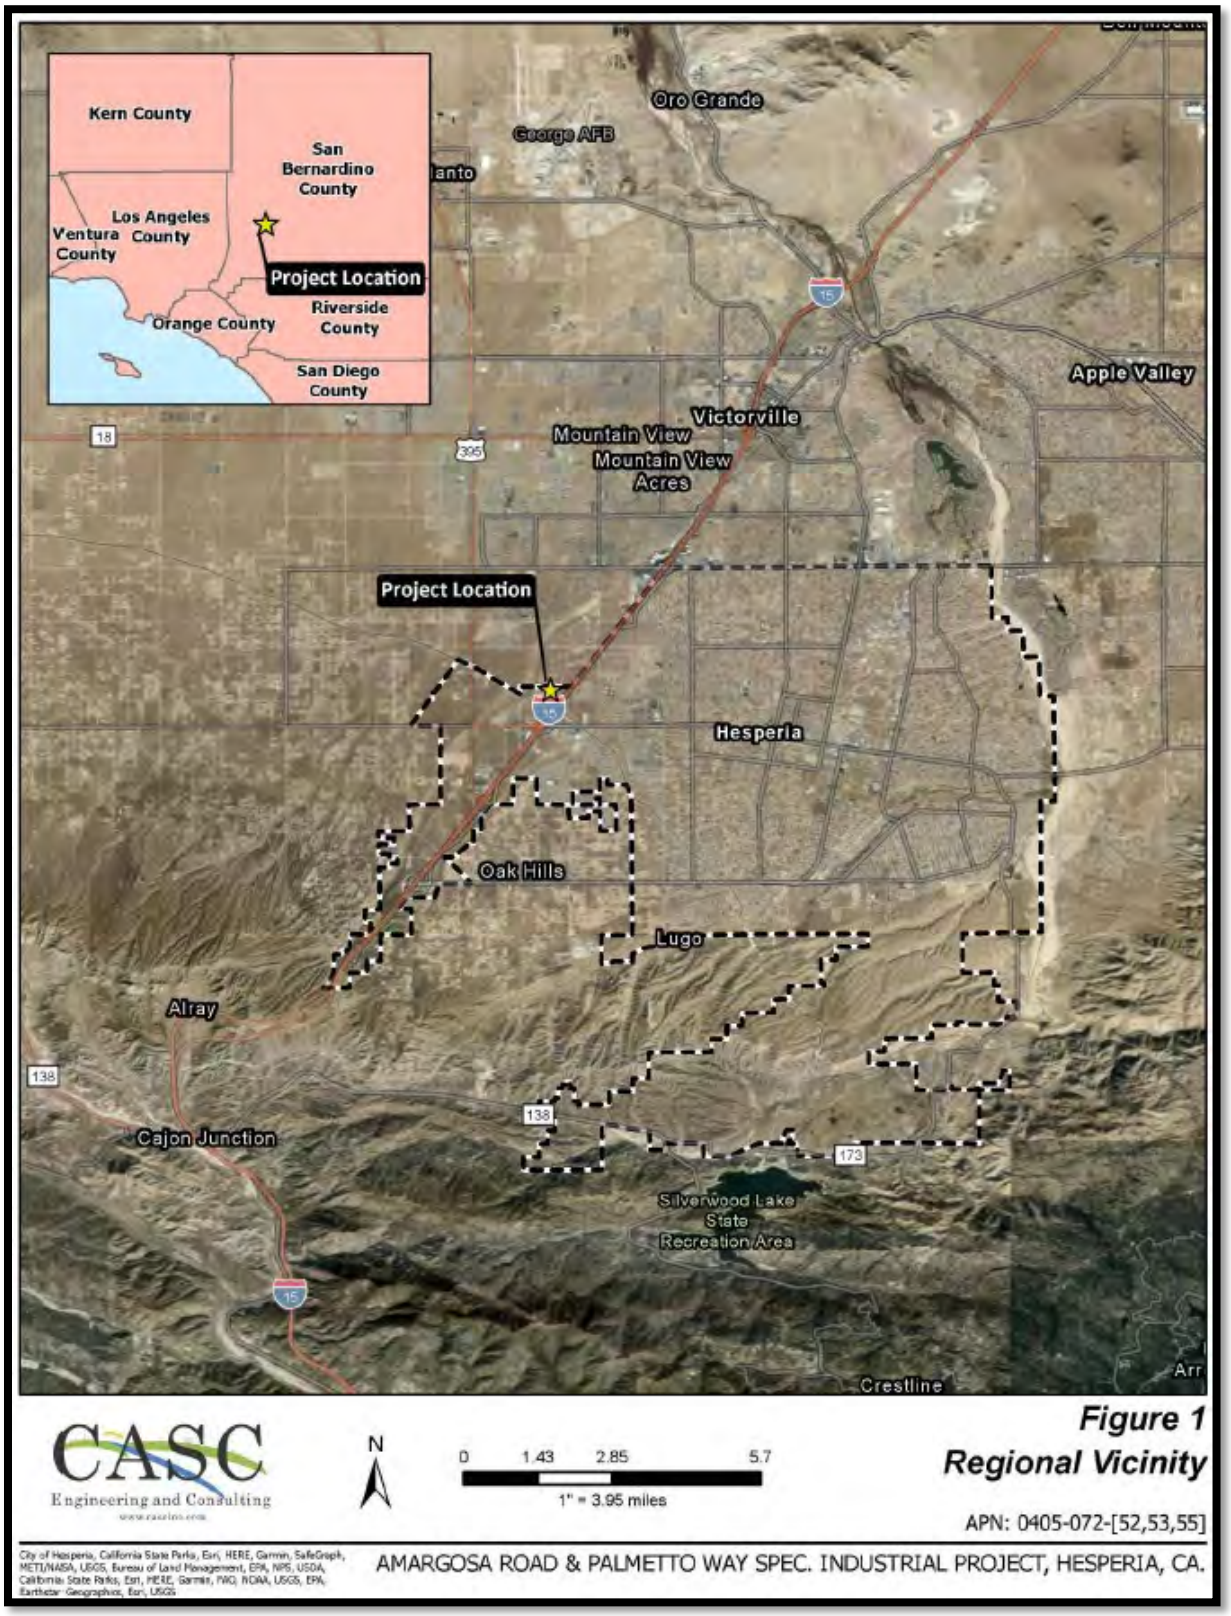
1.1 - Purpose

This Draft Environmental Impact Report (Draft EIR) is prepared in accordance with the California Environmental Quality Act (CEQA) to evaluate the potential environmental impacts associated with the implementation of the Amargosa Road and Palmetto Way Industrial Warehouse Building Project (State Clearinghouse Number (SCH) 2025090664). This document is prepared in conformance with CEQA (California Public Resources Code [PRC] § 21000, *et seq*.) and the CEQA Guidelines (California Code of Regulations [CCR] Title 14, § 15000, *et seq*.).

The purpose of this Draft EIR is to inform decision-makers, representatives of affected and responsible agencies, the public, and other interested parties of the potential environmental effects that may result from implementation of the proposed Project. This Draft EIR describes potential impacts relating to a wide variety of environmental issues and methods by which these impacts can be mitigated or avoided.

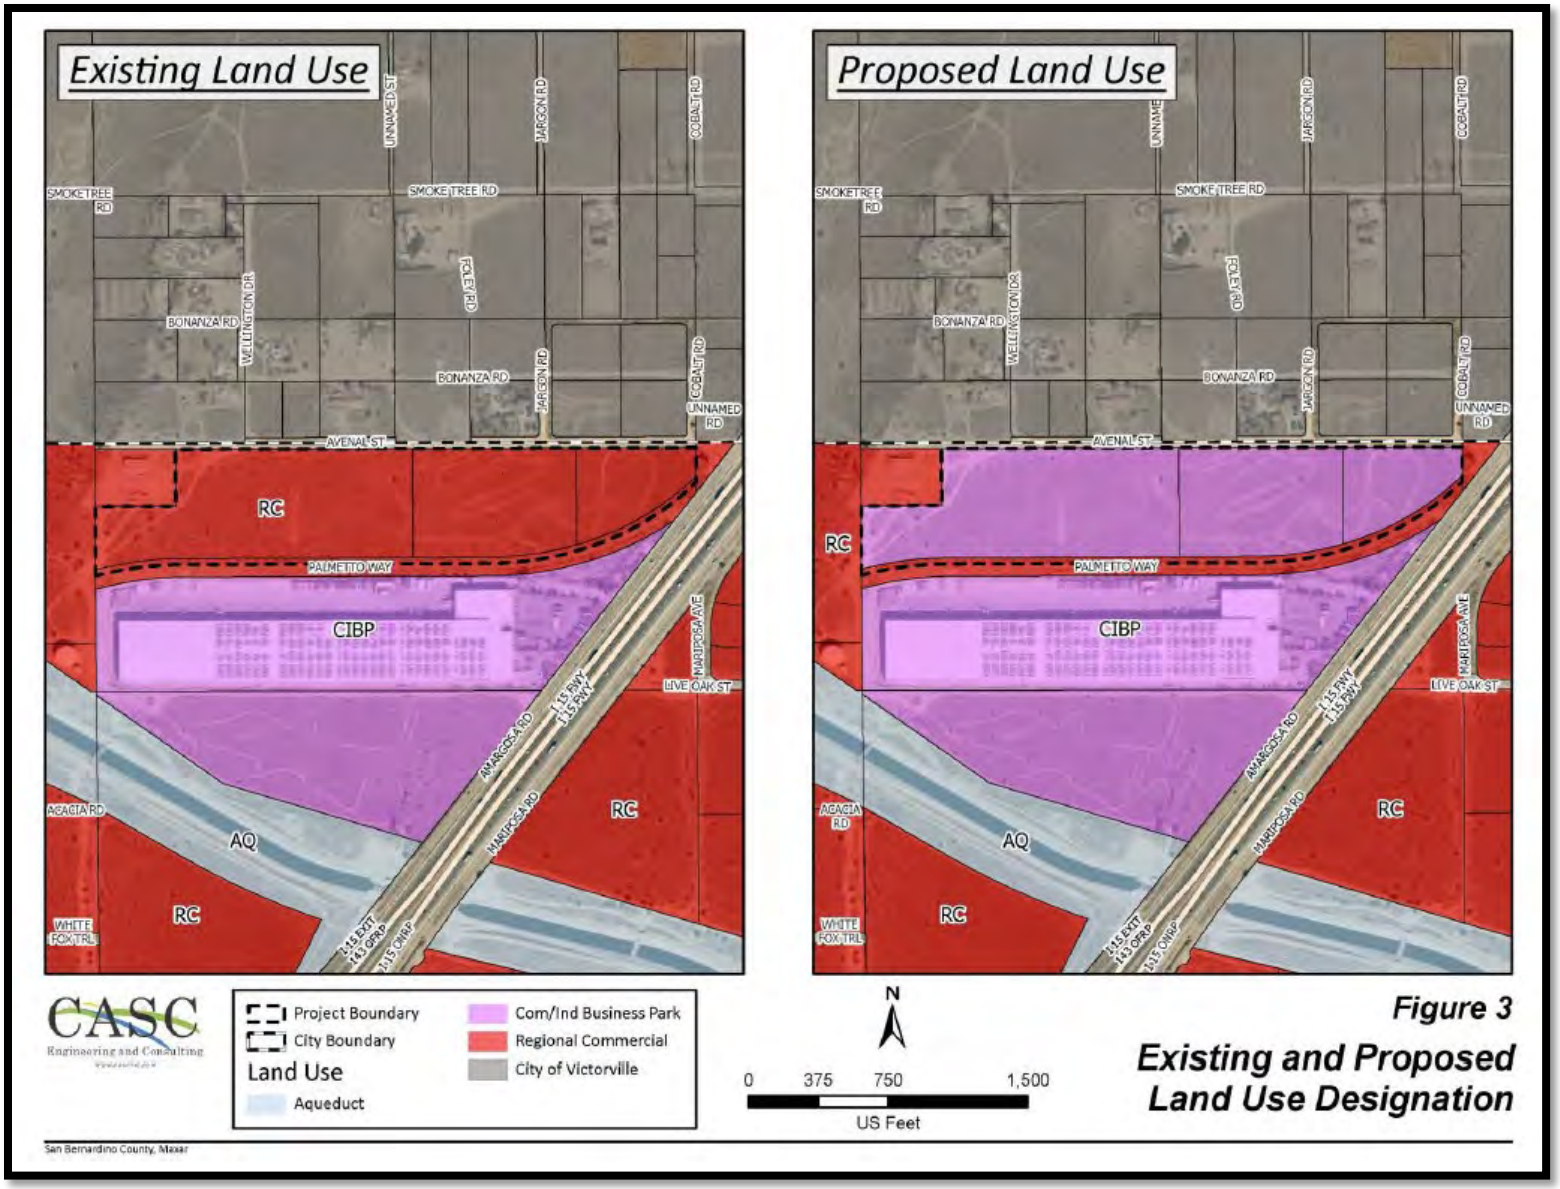
1.2 - Project Summary

1.2.1 - Project Location

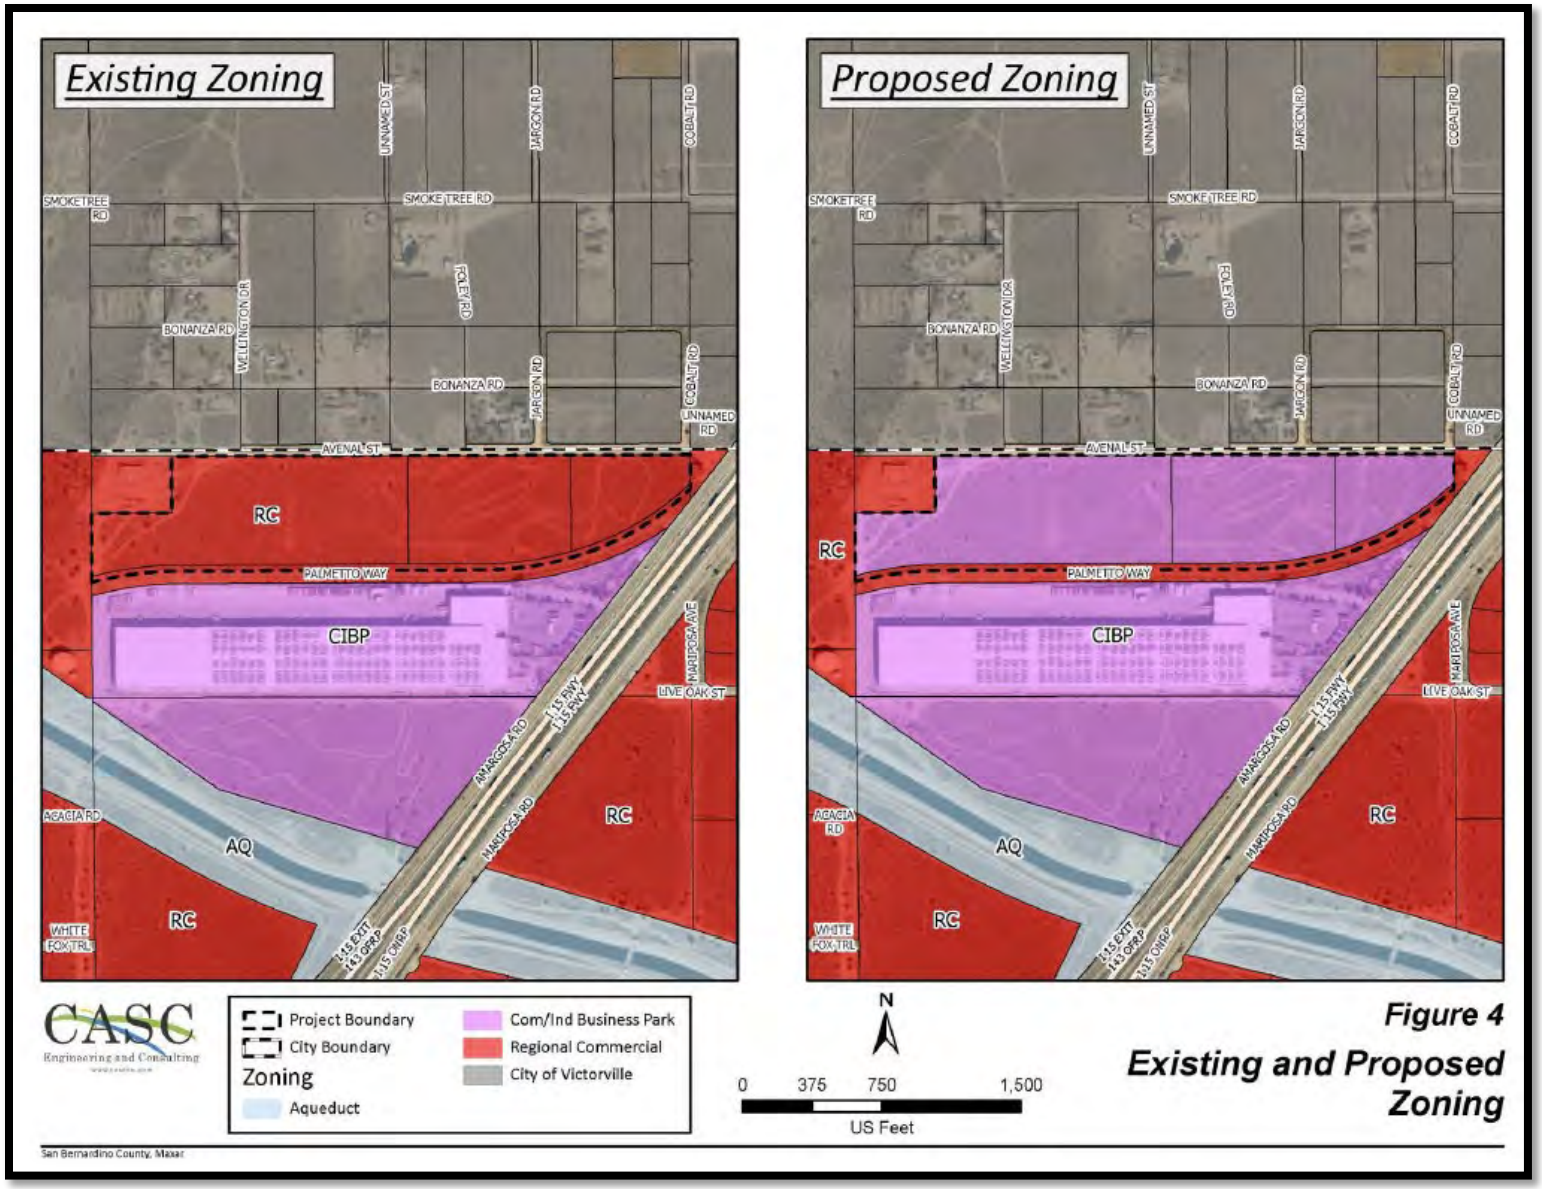


The Project site is recognized as Assessor's Parcel Numbers (APNs: 0405-072-52, 53, and 55) and is situated in the City of Hesperia ("City") within the southwestern portion of San Bernardino County within the High Desert region of Southern California. See *Figure 1 – Regional Vicinity*. The Project site is situated east of Interstate 15 (I-15) and is accessible via Amargosa Road and Avenal Street. The

Project site encompasses approximately 30.52 acres and consists of vacant land that is characterized by relatively level terrain and a mix of ruderal/disturbed vegetation and Joshua tree woodland. The site is bounded by Avenal Street to the north, Palmetto Way to the south, and Amargosa Road to the east. The Project site is located within Section 14, Township 4 North, Range 5 West, as depicted on the U.S. Geological Survey Baldy Mesa, California 7.5-minute topographic quadrangle map. See *Figure 2 - Aerial Imagery Map*.



The Project site has an existing General Plan Land Use designation of Main Street and Freeway Corridor Specific Plan – Regional Commercial (RC) and a proposed General Plan Land Use Designation of Commercial/ Industrial Business Park (CIBP). See *Figure 3 – Existing and Proposed Land Use Designation* and *Figure 4 – Existing and Proposed Zoning*.



Surrounding land use designations and existing conditions are as follows:

- **North**: The City of Victorville is located to the north. Existing uses include residential development and vacant land.
- **South:** Designated Commercial Industrial Business Park (CIBP). Existing uses consist of a Distribution Warehouse.
- **East:** Designated as Regional Commercial (RC). Existing uses consist of a two sided billboard, Amargosa Road and I-15 Freeway.
- **West:** Designated as Regional Commercial (RC). Existing uses consist of a utility building and vacant land.

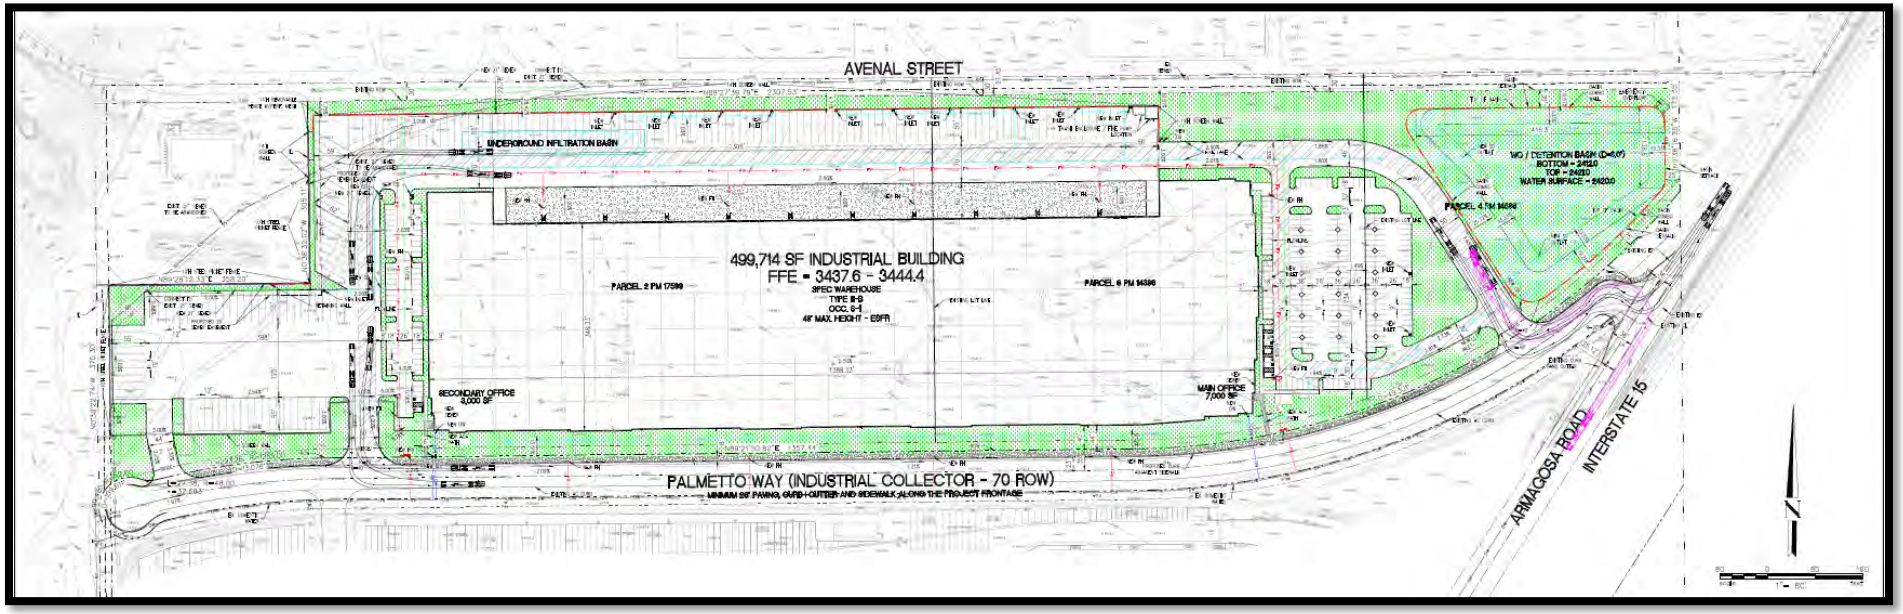
1.2.2 - Project Description

Rachamin 5, LLC., ("Applicant") proposes the development of an industrial warehouse and distribution facility totaling approximately 499,714 square feet on 30.52 acres within the City of Hesperia (City). The Project site consists of three parcels (Assessor's Parcel Numbers 0405-072-52, -53 and -55) and is generally located south of Avenal Street, North of Palmetto Way and west of Amargosa Road.



The Project would include approximately 489,714 square feet of industrial/warehouse space and 10,000 square feet of ancillary office space. Proposed site improvements include loading docks, tractor-trailer parking, passenger vehicle parking spaces, internal circulation, stormwater detention and infiltration facilities, sidewalks, and landscape totaling approximately 306,000 square feet. The Project would provide 72 loading dock positions, 171 tractor-trailer parking spaces, and 311 passenger vehicle parking spaces. See *Figure 5- Site Plan (July 2025).* Primary access to the site would be provided via three (3) driveways from Palmetto Way.

The Project site is currently vacant and characterized by relatively level terrain with ruderal/ disturbed vegetation and Joshua tree woodland. Development of the Project would required the extension of on-site and off-site utilities, including water, sewer, and electricity.

A specific tenant has not been identified; however, the facility is intended to support warehouse and distribution uses and is anticipated to employ approximately 500 to 600 employees. Operations are expected to occur 24 hours per day, seven days a week.

Implementation of the Project would require discretionary approvals from the City, including a Specific Plan Amendment to modify the Project site's Main Street and Freeway Corridor Specific Plan land use designation from Regional Commercial (RC) to Commercial/Industrial Business Park (CIBP), and a Conditional Use Permit to permit the construction and operation of a warehousing and distribution center of a size greater than 200,000 square feet. Additional ministerial permits, including grading and building permits, would be required.

Figure 5 – Site Plan (July 2025)

1.2.3 - Project Objectives

The following objectives have been identified in order to aid decision makers in their review of the proposed Project, and it's associated environmental impacts.

1. **Develop an Industrial Warehouse and Distribution Facility**
   Construct an industrial warehouse and distribution facility, including ancillary office space and supporting improvements, to accommodate logistics and good movement uses.

2. **Provide Industrial Uses in a Regionally Accessible Location**
   Locate industrial development within the City of Hesperia in proximity to major transportation corridors to support regional and interstate goods movement.

3. **Facilitate Efficient Use of a Vacant Site**
   Develop the approximately 30.52-acre Project site with a use that maximizes its utility while considering site constraints and surrounding land uses.

4. **Ensure Consistency with Local Planning Frameworks**
   Obtain necessary land use entitlements, including a Specific Plan Amendment and Zone Change to align the Project site's land use and zoning with the Commercial/Industrial Business Park designation, facilitating compatibility with surrounding land uses and the City's planning objectives.

5. **Provide Necessary Infrastructure and Site Improvements**
   Incorporate appropriate infrastructure and site design features, including circulation, parking, utilities, stormwater management, and landscaping, to support safe and functional operations.

6. **Support Economic Activity and Employment Opportunities**
   Contribute to the local and regional economy by providing opportunities for employment and supporting industrial and logistics- related business activity.

7. **Accommodate Modern Logistics Operations**
   Design the Project to accommodate contemporary warehouse and distribution operations, including appropriate building size, configuration, and site layout.

1.3 - Significant Unavoidable Adverse Impacts

Based on the environmental analysis conducted for the proposed Project, the following impacts were determined to be significant and unavoidable pursuant to California Environmental Quality Act (CEQA), even with implementation of all feasible mitigation measures:

Greenhouse Gas Emissions

The Project would generate greenhouse gas (GHG) emissions during construction and operation that exceed the applicable significance threshold of 3,000 metric tons of carbon dioxide equivalent ($MTCO_2e$) per year established by the South Coast Air Quality Management District. As such, the Project would result in a cumulatively considerable contribution to climate change. Mitigation measures would reduce GHG emissions; however, emissions would remain above the significance threshold. Therefore, this impact is considered significant and unavoidable.

Transportation (Vehicle Miles Traveled)

The Project would result in vehicle miles traveled (VMT) per capita that exceed the City of Hesperia's established threshold for significance. Feasible mitigation measures and VMT reduction strategies were evaluated; however, the Project would not achieve a reduction sufficient to meet the applicable threshold. Therefore, impacts related to VMT would remain significant and unavoidable.

1.4 - Summary of Project Alternatives

In accordance with California Environmental Quality Act (CEQA), the EIR evaluates a reasonable range of alternatives to the proposed Project that could feasibly attain most of the Project objectives while avoiding or substantially lessening significant environmental impacts.

No Project Alternative

Under the No Project Alternative, the Project site would remain in its existing vacant condition, and no development would occur. This alternative would avoid all environmental impacts associated with the proposed Project but would not meet the Project objectives related to industrial development, site utilization, or economic activity.

Alternative 1: Reduced Intensity Industrial Alternative

This alternative would reduce the building area to approximately 350,000 square feet (approximately 70 percent of the proposed Project), with a corresponding reduction in operational intensity, including truck trips and parking demand. This alternative would reduce impacts related to greenhouse gas emissions and vehicle miles traveled; however, impacts would not be reduced to less-than-significant levels. This alternative would meet most, but not all, of the Project objectives.

Alternative 2: Enhanced Transportation Demand Management (TDM) Alternative

This alternative would maintain the overall development program but incorporate enhanced transportation demand management strategies and sustainability features intended to reduce vehicle trips and associated emissions. While this alternative would incrementally reduce transportation and greenhouse gas impacts, it would not reduce impacts to a less-than-significant level and would generally meet the Project objectives.

Alternative 3: Reduced Building Footprint with Expanded Landscape Buffer Alternative

This alternative would reduce the building size to approximately 475,000 square feet and increase landscaped setbacks and buffers along key frontages. This alternative would result in modest reductions in operational impacts and improved visual character but would not substantially reduce significant impacts related to greenhouse gas emissions or vehicle miles traveled. This alternative would meet most of the Project objectives.

Environmentally Superior Alternative

The No Project Alternative would be the environmentally superior alternative because it would avoid all impacts associated with development of the site. Among the development alternatives, the Reduced Intensity Industrial Alternative would be environmentally superior, as it would result in the greatest reduction in operational impacts compared to the proposed Project.

1.5 - Areas of Controversy

Pursuant to California Environmental Quality Act (CEQA) Guidelines Section 15123(b), this section summarizes areas of controversy known to the lead agency, including issues raised by public agencies and the public, as well as key issues to be resolved by decision makers.

Prior to preparation of the Draft EIR, the City of Hesperia circulated a Notice of Preparation (NOP) on September 16, 2025. Comments received during the public review period (September 16, 2025, through October 16, 2025) are included in Appendix N. A summary of these comments and corresponding EIR responses is provided in Table 2-1.

Based on comments received during the NOP process and issues identified during preparation of the Draft EIR, the primary areas of controversy include:

- Potential impacts related to greenhouse gas (GHG) emissions and the Project's contribution to climate change;
- Transportation impacts associated with vehicle miles traveled (VMT), including the effectiveness of feasible mitigation measures;
- Air quality impacts associated with construction and operation of a large-scale warehouse and distribution facility, including emissions from diesel trucks;
- The scale and intensity of the proposed industrial development and its compatibility with surrounding land uses; and
- The adequacy and feasibility of mitigation measures to reduce environmental impacts.

Key issues to be resolved by the decision-making body include:

- Selection among the proposed Project and the alternatives analyzed in this EIR;
- Determination of whether feasible mitigation measures or alternatives can reduce identified impacts to less-than-significant levels; and
- Whether to approve the Project notwithstanding significant and unavoidable impacts, which would require adoption of a Statement of Overriding Considerations.

1.6 - Project Impacts

The City of Hesperia determined that an Environmental Impact Report (EIR) should be prepared pursuant to California Environmental Quality Act (CEQA). Environmental topics evaluated in this EIR include air quality, greenhouse gas emissions, and transportation.

Section 5.0, Environmental Analysis, provides a detailed evaluation of potential environmental impacts associated with implementation of the proposed Project and identifies mitigation measures, where feasible, to reduce impacts.

As discussed in Section 5.0, impacts related to air quality would be less than significant. Although concerns regarding air quality were raised during the Notice of Preparation (NOP) process, the Project's emissions would not exceed applicable thresholds of significance.

After implementation of all feasible mitigation measures, most impacts associated with the proposed Project would be reduced to a less-than-significant level. However, the following impacts would remain significant and unavoidable:

Greenhouse Gas Emissions

- The Project would generate greenhouse gas emissions that exceed applicable thresholds and would result in a cumulatively considerable contribution to climate change. Mitigation measures would reduce emissions; however, impacts would remain significant.

Transportation (Vehicle Miles Traveled)

- The Project would result in vehicle miles traveled (VMT) per capita exceeding the City's threshold of significance. Feasible mitigation measures would not reduce VMT impacts to a less-than-significant level.

1.7 - Summary of Project Impacts and Mitigation Measures

Table 1.7-1 below summarizes the impacts, mitigation measures, and resulting level of significance after mitigation for the relevant environmental issue areas evaluated for the proposed Project. The table is intended to provide an overview; narrative discussions for the issue areas are included in the corresponding section of this EIR and the previous Initial Study (Appendix N). Table 1.7-1 is included in the Focused EIR as required by CEQA Guidelines Section 15123(b)(1).

Table 1.7-1: Summary of Project Impacts and Mitigation Measures

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
Initial Study—Biological Resources			
Impact BIO-(a): The Project could have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.	The following mitigation measures supersede and replace the biological mitigation measures identified in the Initial Study. Strikeout text indicates language removed from the Initial Study; underlined text indicates revised or added language based on the 2025 Biological Resources Habitat Assessment. **BIO-1 Western Joshua Tree Permitting and Desert Native Plant Protection** Prior to any ground disturbance, a qualified biologist or botanist shall complete an updated Western Joshua tree inventory and prepare a Desert Native Plant Protection and Relocation Plan consistent with the California Desert Native Plant Act and Chapter 16.24 of the City of Hesperia Municipal Code. The Plan shall provide specifications for treatment, avoidance, or relocation of protected species such as Western Joshua tree, mesquite, smoke tree, and large creosote bush. Any removal, trimming, relocation, or other disturbance of Western Joshua trees or other protected desert plants shall comply with the Western Joshua Tree Conservation Act (WJTCA) and the City's Protected Plant Policy. The project proponent shall obtain an Incidental Take Permit (ITP) from CDFW prior to tree removal and shall implement all avoidance, minimization, and compensatory mitigation required by the ITP, such as	Less than significant impact.	Prior to ground disturbance Applicant and City of Hesperia

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
	relocation, on-site retention, or payment of mitigation fees. All permits, plans, and agency approvals shall be finalized prior to issuance of grading permits. **BIO-2 Focused Biological Surveys** Prior to any ground-disturbing activities, the applicant shall retain a qualified biologist to conduct focused surveys within the project disturbance area for special-status plants and wildlife species with potential to occur onsite, including rare plants, Western Joshua tree, burrowing owl, Crotch's bumble bee, desert tortoise, Mohave ground squirrel, and other species identified in the 2025 Biological Resources Habitat Assessment. Surveys shall be conducted in accordance with the most current CDFW and USFWS-approved protocols and during the appropriate seasonal windows. If any special-status species are detected, the applicant shall coordinate with the relevant agencies to determine appropriate avoidance, relocation, or mitigation measures. All required measures shall be implemented and verified prior to the start of construction. **BIO-3 Burrowing Owl Avoidance and Relocation** If Western burrowing owls are detected during the focused or pre-construction surveys, the applicant shall immediately notify CDFW and implement		

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
	avoidance or relocation measures consistent with the *CDFW Staff Report on Burrowing Owl Mitigation (2012)*. Occupied burrows shall not be disturbed during the nesting season (February 1 through August 31) unless a qualified biologist verifies that owls have not begun nesting or juveniles are capable of independent survival. Passive relocation using one-way doors and removal of inactive burrows shall only occur under the supervision of a qualified biologist and in coordination with CDFW. All exclusion and relocation efforts shall be documented and submitted to the City and CDFW prior to the start of construction. **BIO-4 Nesting Bird and Bat Protection** If construction or vegetation removal is scheduled during the avian breeding season (March 1 through August 31), a qualified biologist shall conduct pre-construction surveys for nesting birds and roosting bats no more than 72 hours prior to disturbance. If active nests or roosts are identified, species-appropriate no-disturbance buffers shall be established and maintained until a qualified biologist determines that young have fledged or the roost is no longer active.		

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
	All measures shall comply with the Migratory Bird Treaty Act and California Fish and Game Code Sections 3503, 3503.5, and 3513. **BIO-5 Mitigation Implementation and Verification** All biological surveys, coordination, and agency-required mitigation actions shall be completed prior to issuance of grading permits. Documentation of survey results and evidence of agency compliance (e.g., ITPs, relocation reports, CDFW correspondence) shall be submitted to the City for review and inclusion in the project record.		
Impact BIO-(b): The Project could have a substantial adverse effect on riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service.	Implement **BIO-(1)** and **BIO-(5).**	Less than significant impact.	Prior to ground disturbance. Applicant and City of Hesperia
Impact BIO-(e): The Project could conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.	Implement **BIO-(1)** and **BIO-(2).**	Less than significant impact.	Prior to ground disturbance. Applicant and City of Hesperia
Initial Study—Cultural and Tribal Cultural Resources			

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
Impact CUL-(b): The Project could cause a substantial adverse change in the significance of a archaeologist resource pursuant to Section 15064.5 of the CEQA Guidelines.	**CUL-(1)- Inadvertent Finds** In the event that cultural resources are discovered during Project activities, all work in the immediate vicinity of the find (within a 60-foot buffer) shall cease. A qualified archaeologist meeting the Secretary of the Interior's Professional Qualification Standards shall be retained to assess the significance of the find. Work may continue on other portions of the Project site outside the buffered area during this assessment. If the discovery is determined to be of Native American origin, the Yuhaaviatam of San Manuel Nation Cultural Resources Department (YSMN) shall be contacted, as outlined in TCR-1, and provided information following the archaeologist's initial assessment to allow for Tribal input on the significance and recommended treatment of the resource. **CUL-(2)- Monitoring Plan** If significant pre-contact cultural resources, as defined by CEQA (as amended, 2015), are discovered and avoidance cannot be ensured, the archaeologist shall develop a Monitoring and Treatment Plan, the drafts of which shall be provided to YSMN for review and comment, as detailed within TCR-1. The archaeologist shall monitor the remainder of the project and implement the Plan accordingly. **CUL-(3)- Human Remains Discovery**	Less than significant impact.	During ground disturbance. Applicant and City of Hesperia

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
	If human remains or funerary objects are encountered, all work shall stop in the area (within an 100-foot buffer of the find) and the County Coroner must be notified immediately in accordance with California Health and Safety Code Section 7050.5. No further disturbance shall occur until the Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. If the remains are determined to be prehistoric, the Coroner shall notify the Native American Heritage Commission (NAHC), which will identify and notify the Most Likely Descendant (MLD). With permission of the landowner or authorized representative, the MLD may inspect the site and shall complete the inspection within 48 hours of notification by the NAHC. The MLD may recommend scientific removal and nondestructive analysis of the remains and any associated items.		
Impact CUL-(c): The Project could disturb human remains, including those outside of formal cemeteries.	**Implement MMCUL-(1), MMCUL-(2), MMCUL-(3).**	Less than significant impact.	During ground disturbance. Applicant and City of Hesperia
Initial Study—Geology and Soils			

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
Impact GEO-(c): The Project could be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.	**MMGEO-(1)- Grading and Construction** The Project shall incorporate the recommendations provided in the Geotechnical Investigation prepared by Southern California Geotechnical, dated July 18, 2022 (Appendix F). The recommendations are presented in the following sections of the report: Site Grading Recommendations, Construction Considerations, Foundation Design and Construction, Floor Slab Design and Construction, Retaining Wall Design and Construction, and Pavement Design Parameters.	Less than significant impact.	Prior to start of construction Applicant and City of Hesperia
Impact GEO-(f): The Project could directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.	**MMGEO-(2)- Paleontological Monitoring** A paleontological monitor shall be present during ground disturbing activities below four (4) feet in depth within the Project. The monitor shall work under the direct supervision of a qualified paleontologist (B.S./B.A. in geology, or related discipline with an emphasis in paleontology and demonstrated competence in paleontological research, fieldwork, reporting, and curation). 1) The qualified paleontologist shall be on-site at the pre-construction meeting to discuss monitoring protocols. 2) The paleontological monitor shall be present full-time during ground disturbance below 4 feet in depth within the Project, including but not limited	Less than significant impact.	During ground disturbing activities below four (4) feet in depth within the Project. Applicant and City of Hesperia

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
	to grading, trenching, utilities, and off-site easements. If, after excavation begins, the qualified paleontologist determines that the sediments are not likely to produce fossil resources, monitoring efforts shall be reduced. 3) The monitor shall be empowered to temporarily halt or redirect grading efforts if paleontological resources are discovered. 4) In the event of a paleontological discovery the monitor shall flag the area and notify the construction crew immediately. No further disturbance in the flagged area shall occur until the qualified paleontologist has cleared the area. 5) In consultation with the qualified paleontologist, the monitor shall quickly assess the nature and significance of the find. If the specimen is not significant it shall be quickly mapped, documented, removed, and the area cleared. 6) If the discovery is significant the qualified paleontologist shall notify the CLIENT and CITY immediately. 7) In consultation with the CLIENT and CITY the qualified paleontologist shall develop a plan of mitigation which will likely include full-time monitoring, salvage excavation, scientific removal of the find, removal of sediment from around the specimen (in the laboratory), research to identify and categorize the find, curation of the find in a local qualified repository, and preparation of a report summarizing the find.		

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
Section 5.01—Greenhouse Gas Emissions			
Impact GHG-(a): The Project would generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.	**MM GHG-1** The Project shall implement the following measures in order to reduce operational mobile source air pollutant emissions to the extent feasible: • Only haul trucks meeting model year 2010 engine emission standards shall be used for the on-road transport of materials to and from the Project site. • Legible, durable, weather-proof signs shall be placed at truck access gates, loading docks, and truck parking areas that identify applicable California Air Resources Board (CARB) anti-idling regulations. At a minimum, each sign shall include: (1) instructions for truck drivers to shut off engines when not in use; (2) instructions for drivers of diesel trucks to restrict idling to no more than 5 minutes once the vehicle is stopped, the transmission is set to "neutral" or "park," and the 14848-04 GHG Report 48 Amargosa and Palmetto High-Cube Warehouse parking brake is engaged; and (3) telephone numbers of the building facilities manager and CARB to report violations. Prior to the issuance of an occupancy permit, the City of Hesperia shall conduct a site inspection to ensure that the signs are in place.	Significant and unavoidable impact.	None.

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
	• Prior to tenant occupancy, the Project Applicant or successor in interest shall provide documentation to the City demonstrating that occupants/tenants of the Project site have been provided documentation on funding opportunities, such as the Carl Moyer Program, that provide incentives for using cleaner-than-required engines and equipment. • The minimum number of automobile electric vehicle (EV) charging stations required by the California Code of Regulations Title 24 shall be provided. In addition, the buildings shall include electrical infrastructure sufficiently sized to accommodate the potential installation of additional auto and truck EV charging stations in the future. • Conduit shall be installed to tractor trailer parking areas in logical locations determined by the Project Applicant during construction document plan check, for the purpose of accommodating the future installation of EV truck charging stations at such time this technology becomes commercially available. **MM GHG-2** • The Project shall implement the following measures in order to reduce operational energy source air pollutant emissions to the extent feasible:		

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
	• The Project shall include rooftop solar panels to the extent feasible, with a capacity that matches the maximum allowed for distributed solar connections to the grid. • Install Energy Star-rated heating, cooling, lighting, and appliances. • Provide information on energy efficiency, energy-efficient lighting and lighting control systems, energy management, and existing energy incentive programs to future tenants of the Project. • Structures shall be equipped with outdoor electric outlets in the front and rear of the structures to facilitate use of electrical lawn and garden equipment. **MM GHG-3** • The Project shall include the following language within tenant lease agreements in order to reduce operational air pollutant emissions to the extent feasible: • Require tenants to use the cleanest technologies available and to provide the necessary infrastructure to support zero-emission vehicles, equipment, and appliances that would be operating on site. This requirement shall apply to equipment such as forklifts,		

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
	handheld landscaping equipment, yard trucks, office appliances, etc. • Require future tenants to exclusively use zero-emission light and medium-duty delivery trucks and vans, when economically feasible. • Tenants shall be in, and monitor, compliance with all current air quality regulations for on-road trucks including the CARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation, Periodic Smoke Inspection Program, and the Statewide Truck and Bus Regulation. **MM GHG-4** • Prior to the issuance of a building permit, Developer shall provide documentation to the City of Hesperia demonstrating that the Project will achieve Leadership in Energy and Environmental Design (LEED) certification to meet or exceed CALGreen Tier 2 standards in effect at the time of building permit application.		
Impact GHG-(b): The Project would conflict with any applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.	None.	Significant and unavoidable impact.	None.

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
Section 5.02—Transportation and Traffic			
Impact TRANS-(a): The Project would conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b).	**MMTRANS-(1)** Contribute fair share as determined by the City to construct a second southbound left turn lane at Key Pointe Drive (NS) at Main Street (EW).	Less than Significant impact.	Prior to issuance of occupancy permit Applicant and City of Hesperia
Impact TRANS-(b): The Project would conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b).	***MMTRANS-(2)*** Prior to issuance of an occupancy permit, the Project Applicant shall designate carpool and vanpool parking spaces in convenient locations near employee building entrances. The spaces shall be clearly marked and reserved for carpool and vanpool use. The designated spaces shall be shown on the final site plan and maintained for the life of the Project. ***MMTRANS-(3)*** Prior to issuance of an occupancy permit, the Project Applicant shall provide end-of-trip facilities to encourage employees to use bicycles and other alternative modes of transportation. Such facilities shall include bicycle parking, lockers, and similar amenities, as appropriate. The facilities shall be shown on the final site plan and maintained for the life of the Project. ***MMTRANS-(4)*** Prior to issuance of an occupancy permit, the Project Applicant shall develop and implement a commute trip reduction marketing program for Project employees. Informational materials promoting alternatives to single-	Significant and unavoidable impacts.	Prior to issuance of occupancy permit Applicant and City of Hesperia

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
	occupant vehicle travel, including carpooling, vanpooling, transit, bicycling, and walking, shall be displayed in prominent employee locations, such as employee break rooms, employee entrances, or other common areas. The informational materials shall be maintained for the life of the Project.		
Initial Study- Tribal and Cultural Resources			
Impact TCR-(a): The proposed Project could cause a substantial adverse change in listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k). **Impact TCR-(b):** The Project could have an adverse impact on a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	**MMTCR-(1): Tribal Notification and Monitoring Plan** The Yuhaaviatam of San Manuel Nation Cultural Resources Management Department (YSMN) shall be contacted, as detailed in CUL-1, of any pre-contact cultural resources discovered during project implementation, and be provided information regarding the nature of the find, so as to provide Tribal input with regards to significance and treatment. Should the find be deemed significant, as defined by CEQA (as amended, 2015), a Cultural Resources Monitoring and Treatment Plan shall be created by the archaeologist, in coordination with YSMN, and all subsequent finds shall be subject to this Plan. This Plan shall allow for a monitor to be present that represents YSMN for the remainder of the project, should YSMN elect to place a monitor on-site. **MMTCR-(2): Tribal Coordination and Documentation Sharing with YSMN** Any and all archaeological/cultural documents created as a part of the project (isolate records, site records, survey	Less than significant impact.	Prior to ground disturbance. If previously unidentified cultural materials are unearthed during construction Applicant and City of Hesperia

Impacts	Mitigation Measures	Level of Significance After Mitigation	Monitoring
	reports, testing reports, etc.) shall be supplied to the applicant and Lead Agency for dissemination to YSMN. The Lead Agency and/or applicant shall, in good faith, consult with YSMN throughout the life of the project.		

1.8 - Public Review of the Draft Focused EIR

Upon completion of the Draft Focused EIR, the City of Hesperia filed a Notice of Completion (NOC) with the State Office of Planning and Research to begin the public review period (Public Resources Code, Section 21161). Concurrent with the NOC, this Draft Focused EIR has been distributed to responsible and trustee agencies, other affected agencies, surrounding cities, and interested parties, as well as all parties requesting a copy of the Draft Focused EIR in accordance with Public Resources Code 21092(b)(3). During the public review period, the Draft Focused EIR, including the technical appendices, is available for review at the City of Hesperia Planning Department offices. The address is provided below:

City of Hesperia
9700 Seventh Avenue
Hesperia, CA 92345
Hours:
Monday–Thursday: 7:30 a.m. to 5:30 p.m.
Friday: 7:30 a.m. to 4:30 p.m.

Agencies, organizations, and interested parties have the opportunity to comment on the Draft Focused EIR during the 45-day public review period. Written comments on this Draft Focused EIR should be addressed to:

Edgar Gonzalez, Senior Planner
Planning Division
9700 Seventh Avenue
Hesperia, CA 92345
Phone: 760.947.1330
Email: egonzalez@hesperiaca.gov

Submittal of electronic comments in Microsoft Word or Adobe PDF format is encouraged. Upon completion of the public review period, written responses to all significant environmental issues raised will be prepared and made available for review by the commenting agencies at least 10 days prior to the public hearing before the County of Riverside on the proposed Project, at which the certification of the Final Focused EIR will be considered. Comments received and the responses to comments will be included as part of the record for consideration by decision-makers for the proposed Project.

1.8 - Public Review of the Draft Focused EIR

Upon completion of the Draft Focused EIR, the City of Hesperia filed a Notice of Completion (NOC) with the State Office of Planning and Research to begin the public review period (Public Resources Code, Section 21161). Concurrent with the NOC, this Draft Focused EIR has been distributed to responsible and trustee agencies, other affected agencies, surrounding cities, and interested parties, as well as all parties requesting a copy of the Draft Focused EIR in accordance with Public Resources Code 21092(b)(3). During the public review period, the Draft Focused EIR, including the technical appendices, is available for review at the City of Hesperia Planning Department offices. The address is provided below:

Submittal of electronic comments in Microsoft Word or Adobe PDF format is encouraged. Upon completion of the public review period, written responses to all significant environmental issues raised will be prepared and made available for review by the commenting agencies at least 10 days prior to the public hearing before the County of Riverside on the proposed Project, at which the certification of the Final Focused EIR will be considered. Comments received and the responses to comments will be included as part of the record for consideration by decision-makers for the proposed Project.

SECTION 2: INTRODUCTION AND PURPOSE

The California Environmental Quality Act (CEQA) requires that all State and local agencies consider the environmental consequences of projects over which they have discretionary authority. An Environmental Impact Report (EIR) is intended to provide decision-makers and the public with information concerning the environmental effects of a proposed Project, ways to reduce or avoid environmental damage, and to identify feasible alternatives to the Project. An EIR must also disclose significant environmental impacts that cannot be avoided; growth inducing impacts; effects not found to be significant; as well as significant cumulative impacts of all past, present, and reasonably anticipated future projects.

The purpose of this EIR is to review the existing conditions, analyze potential environmental impacts, identify General Plan goals and policies that serve as mitigation, and identify additional mitigation measures to reduce potentially significant effects of the proposed Project. A key assumption for both the Project and this EIR is that the goals, policies, and implementation measures identified in the General Plan will be implemented, in addition to the mitigation measures identified in Section 1, Table 1.7-1 of this EIR.

With this assumption, this EIR employs a conservative analytical approach that considers applicable General Plan goals and policies as part of the environmental baseline for evaluating and reducing potential impacts. This approach helps ensure that development-related impacts associated with the proposed Project are fully evaluated and addressed through enforceable mitigation measures and applicable policies.

2.1 - Authority

The City of Hesperia (City) is the Lead Agency under CEQA Guidelines Article 4, Section 15367 and is responsible for analyzing the environmental impacts of the Project. This EIR has been prepared in conformance with CEQA (California Public Resources Code [PRC] Section 21000 et seq.); CEQA Guidelines (California Code of Regulations [CCR], Title 14, Section 15000 et seq.); and the rules, regulations, and procedures for implementation of CEQA, as adopted by the County. The principal CEQA Guidelines sections governing content of this document are Articles 9 and 10 (Contents of Environmental Impact Reports and Considerations in Preparing EIR and Negative Declarations, respectively). Pursuant to CEQA Guidelines Section 15040 through Section 15043, the County has the legal authority to:

- Approve the proposed Project;
- Require feasible changes in any or all activities involved in the Project in order to substantially lessen or avoid significant effects on the environment;
- Disapprove the Project;
- Approve the Project even though the Project would cause a significant effect on the environment if the City makes a fully informed and publicly disclosed decision that: 1) there is no feasible way to lessen the effect or avoid the significant effect; and 2) expected benefits from the Project will outweigh significant environmental impacts of the Project.

2.2 - Approach

This Environmental Impact Report (EIR) has been prepared as a Draft EIR pursuant to the California Environmental Quality Act (CEQA) and the CEQA Guidelines (California Code of Regulations, Title 14,

Section 15000 et seq.). A Draft EIR is appropriate when only certain environmental topics require detailed analysis due to the potential for significant impacts, while other topics are determined to have no impact or less-than-significant impacts through an Initial Study.

An Initial Study was prepared for the proposed Project—a 499,714 square-foot industrial building and associated improvements in the City of Hesperia. The Initial Study identified the potential for significant environmental impacts in the following resource areas: Greenhouse Gas Emissions, Transportation and Air Quality. Based on these findings, these topics were carried forward for further analysis in this Draft EIR.

Detailed technical studies and regulatory consistency evaluations were prepared to support the environmental analysis. As documented in this Draft EIR, all environmental impacts—with the exception of Greenhouse Gas Emissions and Transportation—would be reduced to less-than-significant levels through the implementation of project-specific mitigation measures, compliance with existing regulations, and consistency with applicable General Plan policies. However, despite incorporation of feasible mitigation, the Project would result in a significant and unavoidable impact related to exceedance of the South Coast Air Quality Management District (SCAQMD) recommended threshold of 3,000 MTCO2e per year and Vehicle Miles Traveled (VMT), in accordance with CEQA Guidelines and SB 743.

This Draft EIR provides a thorough assessment of the Project's greenhouse gas emissions and transportation impacts, identifies feasible mitigation measures, and evaluates project alternatives intended to reduce or avoid those impacts. The EIR also provides a comprehensive environmental record to support informed decision-making by the City of Hesperia, as the Lead Agency, in its consideration of the proposed Project and associated entitlements.

2.3 - Compliance with CEQA

2.3.1 - Public Review of Draft EIR

This Draft EIR is subject to a 45-day review period by responsible and trustee agencies and interested parties. In accordance with the provisions of Sections 15085(a) and 15087(a)(1) of the CEQA Guidelines, the City of Hesperia, serving as the Lead Agency, has (1) published a Notice of Availability (NOA) to the public of a Draft EIR; and (2) prepared and transmitted a Notice of Completion (NOC) to the California State Clearinghouse. Proof of publication is available at the City of Hesperia Planning Department. Any public agency or members of the public desiring to comment on the Draft EIR must submit their comments in writing to the Lead Agency at the address on the NOC prior to the end of the public review period. The Lead Agency will evaluate and prepare responses to all written comments received from both citizens and public agencies during the public review period.

2.3.2 - Final EIR

The Final EIR will consist of the Draft EIR, any necessary revisions to the Draft EIR, comments received in the review process, a list of persons commenting, and responses to comments. After the Final EIR is completed, and at least 10 days prior to the certification hearing, a copy of the response to comments made by public agencies on the Draft EIR will be provided to the commenting agencies.

2.4 - Intended Uses of this EIR

In accordance with Section 15124(d) of the California Environmental Quality Act (CEQA) Guidelines, this Environmental Impact Report (EIR) is intended to evaluate the potential environmental impacts associated with the proposed Project and to inform decision-makers, responsible agencies, trustee agencies, and the public of the potential environmental consequences of Project implementation.

- Approval of a Specific Plan Amendment to modify the Main Street and Freeway Corridor Specific Plan land use designation from Regional Commercial (RC) to Commercial/Industrial Business Park (CIBP);
-
- Approval of a Conditional Use Permit (CUP) to allow construction and operation of a warehouse and distribution facility exceeding 200,000 square feet within the CIBP zone;
- Approval of Grading and Building Permits to authorize site preparation, construction, and associated infrastructure improvements;
- Certification of this EIR, confirming compliance with the California Environmental Quality Act (CEQA); and
- Adoption of Findings of Fact, a Mitigation Monitoring and Reporting Program (MMRP), and a Statement of Overriding Considerations for identified significant and unavoidable impacts related to Vehicle Miles Traveled (VMT) and Greenhouse Gas (GHG) emissions.

In addition, this EIR may be used by other responsible or trustee agencies that may have discretionary authority over aspects of the Project or related infrastructure improvements. These agencies may include, but are not limited to:

- California Department of Fish and Wildlife (CDFW) – for potential impacts to biological resources, including Joshua trees and other sensitive species or habitats that may require authorization under the California Endangered Species Act (CESA);
- State Water Resources Control Board (SWRCB) and/or Lahontan Regional Water Quality Control Board (RWQCB – Region 6) – for compliance with the National Pollutant Discharge Elimination System (NPDES) and stormwater quality regulations associated with the Municipal Separate Storm Sewer System (MS4) permit;
- Mojave Desert Air Quality Management District (MDAQMD) – for air quality permits, construction emissions review, and verification of compliance with applicable air quality management plans;
- Native American Heritage Commission (NAHC) – for consultation and coordination in accordance with Assembly Bill (AB) 52 and Public Resources Code Section 21080.3.1, as well as potential identification of culturally significant resources; and
- California Department of Transportation (Caltrans) – for review of potential transportation and access improvements along Amargosa Road and connections to the regional circulation network, including proximity to Interstate 15.

This EIR is intended to provide the environmental analysis necessary for these agencies to consider their respective permits, approvals, or actions, in accordance with CEQA.

2.5 - EIR Scoping Process

In compliance with the CEQA Guidelines, the City of Hesperia has provided opportunities for the public to participate in the environmental review process. During preparation of the EIR, efforts were made to

contact various Federal, State, regional and local government agencies and other interested parties to solicit comments on the proposed Project. This included the distribution of a Notice of Preparation (NOP) on September 16, 2025.

2.5.1 - Initial Study

An Initial Study was utilized in the preparation of this EIR by identifying the effects determined not to be significant, and focusing the analysis of this EIR on the effects determined to be significant, consistent with CEQA Guidelines Section 15063. The Initial Study screened out a number of topics with no impact or less than significant impact including aesthetics, agriculture and forestry resources, air quality, biological resources, cultural resources, energy, geology and soils, hazards and hazardous materials, hydrology and water quality, land use planning, mineral resources, noise, population and housing, public services recreation, tribal cultural resources, utilities and service systems, and wildfire. This EIR will focus on the following potentially significant impacts as identified in the Initial Study:

- Greenhouse Gas Emissions
- Transportation/Traffic
- Air Quality

2.5.2 - Notice of Preparation

Pursuant to the provision of Section 15082 of the CEQA Guidelines, the City of Hesperia circulated a NOP to public agencies, special districts and members of the public who had requested such notice for a 30-day period, beginning September 16, 2025, and ending October 16, 2025. The purpose of the NOP was to formally announce that the City is preparing a Draft EIR for the proposed Project, and that the Lead Agency was soliciting input regarding the scope and content of the environmental information to be included in the EIR. The Project's Initial Study was circulated with the NOP and is included as Appendix A of this EIR. The NOP and comments received on the NOP are included in Appendix A of this EIR.

2.5.3 - NOP and Scoping Results

The City of Hesperia received NOP comments from the following:

- Center for Community Action and Environmental Justice (CCAEJ)
- Mojave Desert Air Quality Management District (MDAQMD)
- California Department of Justice
- CARECA
- Mojave Water Agency
- Native American Heritage Commission

Comments received during the NOP period were reviewed to identify those addressing environmental concerns, which are summarized in Table 2.5.4-1 below. All comments related to environmental issues associated with the proposed Project are addressed within this EIR, including the Initial Study and the Technical Studies appended to it. The table identifies the Agency/Organization who submitted the comment, the date the comment was received, a summary of the comment as well as the location in this EIR where the comment is addressed. NOP comment letters are provided in Appendix A of this EIR.

Table 2.5.4-1 Summary of NOP Comments

Agency/ Organization/ Individual	Date	Comments	Location in this EIR Where Comment is Addressed
Center for Community Action and Environmental Justice (CCAEJ)	October 16,2025	• The review of the NOP raises concerns that the proposed Project may not meet AB 98 separation requirements from existing residences north of Avenal Street. Figure 5 (Site Plan, July 2025) suggests some drive aisles and trailer storage areas may be too close, so the City is encouraged to confirm that proper separation distances are accurately shown and maintained. • The Project should proactively plan for future use of zero-emission equipment, trucks, and refrigeration units by including conduit and infrastructure for charging equipment during the initial construction phase. • The City should ensure all street and roadway improvements follow Caltrans recommendations for safe and appropriate bike infrastructure and parking. Implementing these measures will promote biking and similar transportation modes, helping reduce vehicle miles traveled (VMT) by making active transportation safer and more viable.	The commenter raises concerns regarding compliance with Assembly Bill (AB) 98 separation requirements, the incorporation of infrastructure to support future zero-emission technologies, and bicycle and active transportation improvements. With respect to AB 98, the Project site plan and operational characteristics were evaluated for consistency with applicable State and local requirements. As discussed in Sections 5.01, Air Quality, 5.02, Greenhouse Gas Emissions, and 5.03, Transportation, the Project has been designed to comply with applicable development standards, including required setbacks and operational requirements. The site plan included in the EIR reflects the proposed development configuration evaluated for environmental impacts. Regarding zero-emission vehicle and equipment infrastructure, the commenter's recommendation has been noted. As discussed in Sections 5.01 and 5.02, the Project incorporates applicable regulatory requirements and design features intended to reduce air pollutant emissions and greenhouse gas emissions. Future advancements in zero-emission technologies and

Agency/ Organization/ Individual	Date	Comments	Location in this EIR Where Comment is Addressed
			associated infrastructure may be incorporated during final engineering and building permit review, as required by applicable regulations in effect at the time of development. With respect to bicycle infrastructure and active transportation, the Transportation analysis in Section 5.03 evaluates the Project's transportation impacts, including vehicle miles traveled (VMT), consistent with CEQA requirements. Any required roadway and frontage improvements will be reviewed by the City and implemented in accordance with applicable City standards and requirements. The City appreciates the commenter's recommendations regarding bicycle facilities and will consider them during final design and permitting, as appropriate. - The commenter's concerns have been considered and are addressed in Sections 5.01 (Air Quality), 5.02 (Greenhouse Gas Emissions), and 5.03 (Transportation) of the EIR. No additional significant environmental impacts have been identified as a result of the issues raised.
Mojave Desert Air Quality Management District (MDAQMD)	October 1, 2025	• The District concurs that the Project will not significantly impact ambient air quality. The owner/operator must	The Mojave Desert Air Quality Management District (MDAQMD) reviewed the Notice of Preparation and provided comments regarding compliance

Agency/ Organization/ Individual	Date	Comments	Location in this EIR Where Comment is Addressed
		obtain a Dust Control Plan (DCP) from MDAQMD, with current requirements and forms available at mdaqmd.ca.gov • Install Rule 403-compliant signage at all site entrances before construction starts. • Control dust using water trucks, chemical stabilization, or gravel on disturbed surfaces, especially exposed sand or fines. • Maintain perimeter wind fencing at least four feet high, unless superseded by local rules or biological mitigation. • Stabilize all roads, parking areas, and other surfaces to prevent visible dust and trackout, cleaning any trackout within 24 hours. • Obtain permits for any non-exempt equipment, such as internal c s i n en ines brake horsepower, under District Rule 219. • Comply with all applicable provisions listed in Rule 403- Fugitive Dust Control	with District permitting requirements and fugitive dust control measures during Project construction. The City acknowledges the District's concurrence that the Project would not result in a significant impact to ambient air quality. As discussed in Section 5.01, Air Quality, of the EIR, the Project's construction and operational air quality impacts were evaluated using applicable MDAQMD thresholds and methodologies. The analysis concluded that Project-related emissions would not exceed applicable significance thresholds. The commenter's recommendations regarding preparation of a Dust Control Plan, installation of Rule 403-compliant signage, implementation of dust suppression measures, stabilization of disturbed surfaces, perimeter wind fencing, prevention and cleanup of trackout, equipment permitting requirements, and compliance with Rule 403 Fugitive Dust Control requirements are acknowledged. These requirements constitute existing regulatory obligations and standard conditions administered and enforced by MDAQMD during Project construction and operation, as applicable. The Project applicant will be required

Agency/ Organization/ Individual	Date	Comments	Location in this EIR Where Comment is Addressed
			to comply with all applicable MDAQMD rules, regulations, permitting requirements, and dust control measures in effect at the time of construction, including obtaining any required permits for non-exempt equipment and implementing approved dust control measures. - The EIR's air quality analysis accounts for compliance with applicable federal, State, and local regulations, including MDAQMD requirements. Therefore, the comments do not identify a new significant impact or substantially increase the severity of any impact analyzed in the EIR. No revisions to the impact conclusions are required. The issues raised by the commenter are addressed in Section 5.01, Air Quality, of the EIR.
California Department of Justice	September 29, 2025	• Warehouses play a key economic role but can impact communities through diesel emissions that harm air quality and health, high noise levels from operations, increased traffic and road hazards, and other site-specific environmental effects. • The Attorney General's Bureau of Environmental Justice has published best practices and mitigation measures for warehouse projects to help lead	The EIR evaluates potential environmental impacts associated with air quality, greenhouse gas emissions, transportation, and noise, including impacts related to diesel particulate matter, truck traffic, and operational activities. These topics are addressed in the Air Quality, Transportation, Noise, and Cumulative Impacts sections of the EIR. The EIR also considers the proximity of sensitive receptors and evaluates potential exposure to operational emissions and

Agency/ Organization/ Individual	Date	Comments	Location in this EIR Where Comment is Addressed
		agencies address environmental impacts. A copy is attached and available online, and agencies are encouraged to use it when preparing the project's draft environmental impact report. • Priority should be given to avoiding or mitigating conflicts between warehouses and sensitive receptors. Even distant warehouses can contribute to regional air pollution or affect sensitive receptors if truck routes pass nearby, so emission-reduction measures should be considered.	traffic-related impacts. Where feasible and supported by substantial evidence, mitigation measures have been incorporated to reduce impacts associated with air emissions, truck activity, and operational noise. The City has also considered best practices and guidance materials, including those referenced by the California Department of Justice Bureau of Environmental Justice, in the development of the Project analysis and mitigation framework.
CARECA	October 16, 2025	• An EIR should give decisionmakers and the public detailed information on a project's environmental impacts, feasible mitigation measures, and reasonable alternatives, presented clearly enough for meaningful review and deliberation. A complete analysis of all impacts and mitigation is requested. • CARE CA requests that the City ensure the DEIR thoroughly analyzes air quality and public health impacts, revisiting the Initial Study's "less than significant" conclusion and aligning impact	The City acknowledges the comment regarding the scope and adequacy of the EIR, including the analysis of air quality, public health, greenhouse gas emissions, mitigation measures, and alternatives. Consistent with CEQA requirements, the EIR evaluates the Project's environmental impacts, identifies feasible mitigation measures, and considers a reasonable range of alternatives. Air quality and health-related impacts are addressed in Section 5.01 (Air Quality), greenhouse gas emissions are addressed in Section 5.02 (Greenhouse Gas Emissions), mitigation measures

Agency/ Organization/ Individual	Date	Comments	Location in this EIR Where Comment is Addressed
		estimates with current research on pollution and environmental stress. Additionally, the DEIR should use quantitative thresholds for greenhouse gas emissions that reflect the urgent threat of climate change. • CARE CA urges the City to use modern, effective, and enforceable mitigation measures, and to consider a Statement of Overriding Considerations only after all feasible measures are included in the Mitigation Monitoring and Reporting Program (MMRP).	are incorporated throughout Chapter 5.0 and summarized in the Mitigation Monitoring and Reporting Program, and alternatives are evaluated in Chapter 7.0 (Alternatives). The City has prepared the EIR in accordance with CEQA and considered all feasible mitigation measures identified through the environmental review process.
Mojave Water Agency	September 29,2025	• The Mojave Water Agency has reviewed the project and found no existing facilities or infrastructure in the area based on the submitted information. If any information is incomplete, MWA should be notified to provide additional details.	Utilities and service systems, including water infrastructure, were analyzed in the Initial Study/Mitigated Negative Declaration (ISMND) prepared for the Project and determined to be less than significant. Accordingly, utilities were not carried forward as a topic of detailed analysis in the Draft EIR. Relevant information is contained in the Initial Study/ISMND, which is incorporated by reference and included in Appendix N. The Mojave Water Agency's comments are consistent with the Initial Study findings. If additional information is required, it will be coordinated with the Agency as needed.

Agency/ Organization/ Individual	Date	Comments	Location in this EIR Where Comment is Addressed
Native American Heritage Commission	September 18,2025	• The NAHC recommends early consultation with California Native American tribes to protect tribal cultural resources and avoid inadvertent discoveries of human remains. Under AB 52 and SB 18, lead agencies must notify tribes, begin consultation promptly, address impacts and mitigation, and maintain confidentiality of tribal information. Consultation ends when agreements on mitigation are reached or deemed impossible. Agencies should also conduct archaeological records searches, surveys, and plan for monitoring and treatment of any discovered resources with input from certified archaeologists and culturally affiliated tribes.	Tribal cultural resources, including compliance with AB 52, were evaluated and addressed in the Initial Study prepared for the Project. The City completed the AB 52 tribal consultation process during the Initial Study phase, including notification to tribes and coordination as applicable. The Initial Study determined that impacts to tribal cultural resources would be less than significant with incorporation of standard conditions and applicable regulations. Therefore, tribal cultural resources were not carried forward for detailed analysis in the Draft EIR. Relevant information regarding AB 52 compliance and consultation is documented in the Initial Study/ISMND, which is incorporated by reference and included in Appendix N.

2.6 - Format of the EIR

Section 1.0, Executive Summary, provides a brief Project description and summary of the environmental impacts, mitigation measures, and alternatives.

Section 2.0, Introduction and Purpose, provides an overview of the proposed Project, as well as the scope, use, and approach of the EIR, including CEQA compliance information.

Section 3.0, Project Description, provides a detailed Project description. This section describes the environmental setting and defines the Project.

Section 4.0, Cumulative Impacts, describes the approach and methodology for cumulative impact analysis.

Section 5.0, Environmental Analysis, evaluates the impacts associated with the Project. This section contains a detailed environmental analysis of the existing conditions, Project impacts, recommended mitigation measures, cumulative impacts, and any unavoidable adverse impacts for three (3) environmental topic areas. The analyses are based in part upon technical reports that are appended to this EIR. Information also is drawn from sources of analytical materials that directly or indirectly relate to the Project and are cited in Section 10, References of this EIR.

Where the analysis demonstrates that a physical adverse environmental effect may or would occur, mitigation measures are recommended to reduce impacts to a less than significant level. If mitigation measures are not available or feasible to reduce an identified impact to below a level of significance, the environmental effect is identified as a significant and unavoidable adverse impact, for which a statement of overriding considerations would need to be adopted by the City of Hesperia pursuant to CEQA Guidelines Section 15093, prior to Project approval.

Section 6.0, Alternatives, describes a reasonable range of alternatives to the Project that could avoid or substantially lessen the significant impact of the Project and still feasibly attain the basic Project objectives.

Section 7.0, Other CEQA Considerations, discusses the long-term effects associated with the proposed Project, including the potential growth associated with the proposed action and energy conservation.

Section 8.0, Effects Found Not to Be Significant, provides an explanation of potential impacts that have been determined not to be significant.

Section 9.0, Significant Unavoidable Impacts, describes those impacts that remain significant following mitigation.

Section 10.0, References, identifies the organizations and individuals contacted during the preparation of the Project's EIR, report preparation personnel, and a list of reference materials.

The following Appendices contain the technical documentation for the EIR:

- Appendix A- Amargosa and Palmetto High-Cube Warehouse Air Quality Impact Analysis, City of Hesperia, Urban Crossroads, March 24,2026.

- Appendix B- Amargosa and Palmetto High-Cube Warehouse Mobile Source Health Risk Assessment, City of Hesperia, Urban Crossroads, March 24, 2026.

- Appendix H- Hesperia Spec. Industrial Buildings, City of Hesperia, California, Preliminary Hydrology Report, West Land Group, Inc. July 2022.
- Appendix I- Mojave River Watershed Conceptual Water Quality Management Plan, Hesperia Spec. Industrial, West Land Group, Inc. July, 13, 2022.
- Appendix J-Amargosa and Palmetto High-Cube Warehouse Noise Impact & Vibration Analysis, City of Hesperia, Urban Crossroads, March 24,2026.
- Appendix K- Amargosa and Palmetto High-Cube Warehouse Revised Traffic Impact Analysis, City of Hesperia, Ganddini Group, Inc. August 21,2025
- Appendix L- Amargosa and Palmetto High-Cube Warehouse Truck Trip Generation Comparision Analysis, Ganddini Group, Inc. September 6, 2023.
- Appendix M- Amargosa and Palmetto High-Cube Warehouse Project, Vehicle Miles Traveled Analysis, Ganddini Group, Inc. July 8, 2025.
- Appendix M.1 - Revised Vehicle Miles Traveled (VMT) Analysis
- Appendix N- Notice of Preparation (NOP), Initial Study and Comments

SECTION 3: PROJECT DESCRIPTION

This Draft Environmental Impact Report (DEIR) evaluates the potential environmental impacts associated with the implementation of the proposed Industrial Warehouse Building, which proposes to construct up to a 499,714 square-foot industrial building and associated improvements, including loading docks, tractor-trailer stalls, passenger vehicle parking spaces, stormwater facilities, sidewalks, and landscape area on approximately 30.52 acres within the City of Hesperia, California (Project). The Project includes approximately 10,000 square feet of office space, 489,714 square feet of industrial/warehouse space, and 306,000 square feet of landscape improvements. In total, the proposed Project includes 72 loading dock positions, 171 tractor-trailer stalls, and 311 passenger vehicle parking spaces. Project implementation involves a Specific Plan Amendment to modify the Project site's Main Street and Freeway Corridor Specific Plan land use designation from Regional Commercial (RC) to Commercial/Industrial Business Park (CIBP).Additionally, the Project requires a Conditional Use Permit to permit the construction and operation of a warehousing and distribution center of a size greater than 200,000 square feet in the Commercial/Industrial Business Park zone.

In accordance with the California Environmental Quality Act (CEQA) Guidelines Section 15124, the Project Description provides a clear, comprehensive, and detailed overview of the Project's purpose, location, design, and components. This section is intended to inform the public and responsible agencies of the nature and scope of the Project under review, forming the basis for the environmental analysis contained herein. This Project Description fulfills the CEQA requirements by describing the Project's physical characteristics, proposed land uses, and anticipated construction activities, thereby enabling a thorough assessment of potential environmental effects.

3.1 - Project Location and Setting

3.1.1 - Location

The City of Hesperia is located within the southwestern portion of San Bernardino County. Refer to section 1, *Figure 1- Regional Vicinity*. On a regional basis, the City is accessible via Interstate 15 (I-15), U.S. Federal Highway 395 (US-395), and State Route 18 (SR-18). Jurisdictions surrounding the City of Hesperia include the City of Adelanto to the northwest, Town of Apple Valley to the northeast, City of Victorville to the north, and unincorporated San Bernardino County to the south, east and west.

The Project site is comprised of three (3) parcels (APNs: 0405-072-52, 53, and 55) that total approximately 30.52 acres. The site is bounded by Avenal Street to the north, Palmetto Way to the south, and Amargosa Road to the east. Refer to Section 1, *Figure 2- Aerial Imagery Map*. Specifically, the Project site is in Section 14, Township 4 North, Range 5 West, as depicted on the U.S. Geological Survey Baldy Mesa, California 7.5-minute topographic quadrangle map.

3.1.2 - Existing Conditions

The Project site is currently vacant and undeveloped, characterized by level terrain and a mixture of ruderal/disturbed vegetation and Joshua tree woodland. Vegetation on the site is classified as the Larrea tridentata–Ambrosia dumosa Shrubland Alliance, with dominant species including creosote bush (Larrea tridentata), white bursage (Ambrosia dumosa), Mexican tea (Ephedra trifurca), and Joshua tree (Yucca brevifolia).

A biological survey conducted in November 2025 documented the presence of Joshua trees within the Project site and noted that earlier survey data from April 27, 2022 were outdated (see Appendix C). The 2025 survey provides the most current baseline biological information available at the time of preparation of this EIR.

Surrounding land uses primarily consist of vacant land, with scattered residential, industrial, and utility uses in the vicinity. The site is generally consistent with the developed and transitional land use pattern of the Amargosa Road corridor.

3.1.3 - General Plan Designations and Zoning

The Project site has an existing General Plan Land Use designation of Main Street and Freeway Corridor Specific Plan – Regional Commercial (RC) and a proposed General Plan Land Use Designation of Commercial/ Industrial Business Park (CIBP). Refer to Section 1, *Figure 3 – Existing and Proposed Land Use Designation* and *Figure 4 – Existing and Proposed Zoning*.

Surrounding land use designations and existing conditions are as follows:

- **North**: The City of Victorville is located to the north. Existing uses consist of residential uses and vacant land.
- **South:** General Plan Land Use Designation of Commercial Industrial Business Park (CIBP). Existing uses consist of a Distribution Warehouse.
- **East:** Designated as Regional Commercial (RC). Existing uses consist of a two sided billboard, Amargosa Road and I-15 Freeway.
- **West:** Designated as Regional Commercial (RC). Existing uses consist of a utility building and vacant land.

The Main Street and Freeway Corridor Specific Plan includes all freeway frontages within the city as well as the commercial and industrial areas parallel to the freeway corridor. In addition, it includes the commercial, industrial, and high-density residential properties adjacent to Main Street, as well as the area bounded by Lemon Street, Lime Street, Third Avenue, and I Avenue.

The Main Street/Freeway Corridor Specific Plan contains the majority of the commercially designated areas within the city, as well as the Civic Center complex (north of Main Street and west of Seventh Avenue), and a large portion of the Industrial area located between Santa Fe Avenue East and I Avenue. The goals, objectives, policies and development standards for this area are found in the adopted Main Street and Freeway Corridor Specific Plan.

Table 3.2 General Plan and Zoning Designations for the Surrounding Areas

	Existing Land Use	Land Use/ Zoning Designation (MSFC-SP)
North	Vacant/ Residential	City of Victorville
South	Distribution Warehouse	Commercial Industrial Business Park (CIBP)
East	Amargosa Road/ I-15 Freeway	Regional Commercial (RC)
West	Vacant/ Utility Building	Regional Commercial (RC)

3.2 - Project Overview

3.2.1 - Project Entitlements

Project entitlements such as a Specific Plan Amendment, Conditional Use Permit, and Municipal Separate Storm Sewer System (MS4) Permitare required to ensure a development complies with applicable planning, environmental, and infrastructure regulations. Together, these entitlements provide the legal and regulatory framework necessary for project approval and implementation. The proposed Project includes the following entitlements described below:

- Specific Plan Amendment
- Conditional Use Permit
- Municipal Separate Storm Sewer System (MS4) Permit

3.2.2 - Specific Plan Amendment

A Specific Plan Amendment is required to modify the Project site's Main Street and Freeway Corridor Specific Plan land use designation from Regional Commercial (RC) to Commercial/Industrial Business Park (CIBP).

3.2.3 - Conditional Use Permit

A Conditional Use Permit is required to permit the construction and operation of a warehousing and distribution center of a size greater than 200,000 square feet in the Commercial/Industrial Business Park zone. A Conditional Use Permit in the City of Hesperia allows for the review of proposed land uses that may otherwise pose compatibility concerns. The CUP process ensures such uses are consistent with the General Plan, the Development Code, and the character of surrounding properties, while mitigating potential impacts through discretionary conditions of approval (Hesperia Municipal Code, §16.12.105).

3.2.4 - MS4 Permit

An MS4 Permit ensures that the project's design and operations comply with regional stormwater quality requirements, minimizing potential impacts to receiving waters and public infrastructure.

Collectively, these entitlements allow the City to review and regulate the proposed project, ensuring environmental protection, orderly development, and consistency with applicable planning policies.

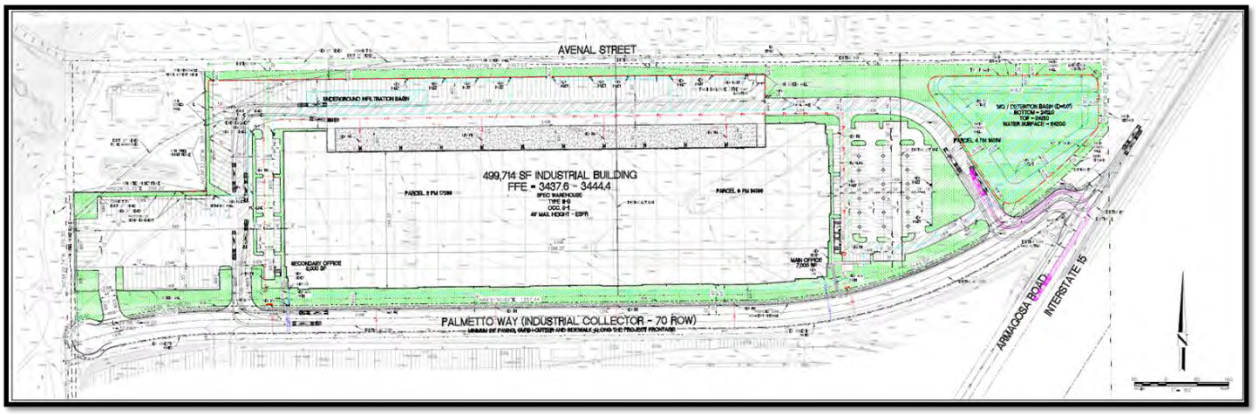
3.3 - Project Characteristics

3.3.1 – Project Trip Generation Comparison

Ganddini Group, Inc. prepared a Trip Generation Comparison Analysis for the proposed Project, dated September 6, 2023 (Appendix L). The purpose of the Trip Generation Comparison Analysis is to evaluate the difference in trips generated by the proposed Project under the Commercial/Industrial Business Park (CIBP) land use designation in comparison to an alternative use that is permitted under the existing Regional Commercial (RC) land use designation.

The Trip Generation Comparison Analysis forecasts the proposed Project trip generation based upon rates obtained from the Institute of Transportation Engineers (ITE) Trip Generation Manual (11th Edition, 2021). ITE land use code 155 (High-Cube Fulfillment Center Non-Sort) has been used to estimate the site-specific trip generation estimates for up to 499,700 square feet of high-cube fulfillment center (non-sort) use. Comparatively, the Trip Generation Comparison Analysis forecasts an alternative commercial retail land use trip generation based on regression equations from the ITE Trip Generation Manual (11th Edition, 2021). ITE land use code 820 (Shopping Center (>150k)) has been used to estimate the site-specific trip generation estimates for up to 499,850 square feet of commercial retail use. Which resulted in more trips than the warehousing alternative.

The proposed Project vehicle trips are converted to Passenger Car Equivalent (PCE) trips based on truck rates (as a percentage of a total vehicle trips) from the ITE Trip Generation Manual and truck axle mix data recommended by the South Coast Air Quality Management District (SCAQMD). For the alternative commercial retail land use, it should be noted that commercial retail land uses will often locate next to busy roadways to attract motorists already on the street. Therefore, Ganddini reduced the initial trip generation forecast by the applicable pass-by trip rate when calculating the net new trips that will be added to the surrounding street system. However, pass-by trip adjustments were not applied to the alternative commercial retail land use trip generation in accordance with pass-by rates noted in the ITE Trip Generation Manual (11th Edition, 2021) since Amargosa Road adjacent to the Project site is a low volume roadway and pass-by trips would be minimal.



The proposed Project is forecast to generate approximately 1,083 daily Passenger Car Equivalent (PCE) trips, including 90 PCE trips during the AM peak hour and 81 PCE trips during the PM peak hour. Truck trips would amount to 293 total daily trips, 26 am trips and 6 pm trips. The alternative commercial retail land use is forecast to generate a total of approximately 27,280 daily trips, including 1,007 PCE trips during the AM peak hour and 2,149 PCE trips during the PM peak hour without a pass-by trips reduction. Therefore, the proposed Project is forecast to generate approximately 25,505 fewer daily trips compared to a commercial retail land use of equivalent size, including 870 fewer trips during the AM peak hour and 2,035 fewer trips during the PM peak hour.

Based on the Trip Generation Comparison Analysis, the proposed Project consisting of a 499,714 square foot high-cube fulfillment center warehouse building is forecast to generate substantially fewer trips (up to 659% fewer daily trips) compared to an alternative land use composed of 499,850 square feet of commercial retail.

In addition to trip generation forecasts, Ganddini calculated directional distribution patterns for the Project generated trips and the alternative commercial retail land use generated trips. One hundred percent (100%) of the Project inbound, and outbound truck traffic will be distributed from and towards Main Street. Additionally, seventy-five percent (75%) of the Project inbound, and outbound car traffic will be distributed from and towards Main Street and only twenty-five percent (25%) of the Project inbound and outbound car traffic will be distributed from and towards Bear Valley Road. Comparatively, sixty percent (60%) of the alternative commercial retail land use traffic will be distributed towards Main Street and forty percent (40%) of the alternative commercial retail land use traffic will be distributed towards Bear Valley Road.

The Trip Generation Comparison Analysis also includes comparison of the intersection turning movement volumes for the proposed Project and the alternative commercial land use. The alternative commercial retail land use is expected to generate significantly more AM and PM peak hour intersection turning movement volumes compared to the proposed Project for all turning movements at each study area intersection where peak hour trips are expected to be added.

Exhibit 3-4
Preliminary Site Plan

Source: submitted project materials

3.3.2 – General Construction and Grading Assumptions

Construction for the Project is anticipated to begin in October 2026 and continue through September 2027. The construction schedule utilized in the analysis represents a "conservative" scenario, as emission factors for construction activities generally decrease over time due to increasingly stringent emission regulations. The duration of construction activities and associated equipment reflects a reasonable approximation of the expected construction fleet, consistent with CEQA Guidelines.

Construction assumptions are summarized in Table 3.3, including start and end dates and duration of construction activities. The Project is expected to generate construction-related earthwork; however, detailed grading quantities and export assumptions are addressed separately in the Project's technical studies. Table 3.4 presents the construction activity and equipment assumptions used in the analysis.

Table 3.3 Construction Schedule

Construction Activity	Start Date	End Date	Days
Phase 1 (2027 OY)			
Site Preparation	10/1/2026	10/19/2026	13
Grading	10/20/2026	12/17/2026	43
Building Construction	12/2/2026	8/19/2027	187
Paving	8/5/2027	9/20/2027	33
Architectural Coating	7/27/2027	9/20/2027	40

3.3.3 –On-Site and Off-Site Improvements

The Project includes improvements along Palmetto Way and Avenal Street, including frontage landscaping and pedestrian improvements. Project landscape conforms to City requirements for industrial uses (Main Street and Freeway Corridor Specific Plan Chapter 11: Industrial Design Standards and Guidelines, Section D). Frontage landscaping includes a variety of trees, shrubs, plants, and land covers within the Project frontage's landscape setback area, as well as within the landscape areas found around the proposed industrial/warehouse building to comprise 19.1% (255,000 SF) of the Project site.

3.3.4 - Site Access, Circulation, and Parking

Regional access to the Project site is provided via I-15 and Amargosa Road. The proposed Project includes three (3) driveways off Palmetto Way. Direct access to the paved tractor-trailer parking area is provided by a 45-foot truck-only driveway at the southwest corner of the site and a 50-foot driveway on the south side of the site for both autos and trucks. Direct access to the paved passenger vehicle parking area is provided by a 50-foot driveway at the southeast corner of the site for both autos and trucks. In total, the proposed Project includes 72 loading dock positions, 171 tractor-trailer stalls, and 311 passenger vehicle parking spaces.

3.3.5 - Utility Improvements

The proposed Project includes a combination of an at grade detention basin and underground infiltration basin to treat stormwater runoff for water quality purposes. Additionally, due to the vacant, undeveloped nature of the Project site, both dry and wet utilities, including domestic water, sanitary sewer, and electricity, need to be extended onto the Project site.

3.3.6 - Operations

A tenant for the Project has not been identified at this time; however, the facility is designed to accommodate approximately 500 to 600 employees. Hours of operation are anticipated to be 24 hours a day, 7 days a week.

3.3.7 - Specific Plan Amendment

The General Plan land use designation of the Project site is Main Street and Freeway Corridor Specific Plan – Regional Commercial (RC) and the zoning designation is Regional Commercial (RC). Implementation of the Project requires a Specific Plan Amendment to modify the Project site's Main Street and Freeway Corridor Specific Plan land use designation from Regional Commercial (RC) to Commercial/Industrial Business Park (CIBP). Refer to Section 1, *Figure 3- Existing and Proposed Land Use Designation*.

3.4 - Project Objectives

The following objectives have been identified in order to aid decision makers in their review of the proposed Project, and it's associated environmental impacts.

1. **Develop an Industrial Warehouse and Distribution Facility**

   Construct an industrial warehouse and distribution facility, including ancillary office space and supporting improvements, to accommodate logistics and good movement uses.

2. **Provide Industrial Uses in a Regionally Accessible Location**

   Locate industrial development within the City of Hesperia in proximity to major transportation corridors to support regional and interstate goods movement.

3. **Facilitate Efficient Use of a Vacant Site**

   Develop the approximately 30.52-acre Project site with a use that maximizes its utility while considering site constraints and surrounding land uses.

4. **Ensure Consistency with Local Planning Frameworks**

   Obtain necessary land use entitlements, including a Specific Plan Amendment and Zone Change to align the Project site's land use and zoning with the Commercial/Industrial Business Park designation, facilitating compatibility with surrounding land uses and the City's planning objectives.

5. **Provide Necessary Infrastructure and Site Improvements**

   Incorporate appropriate infrastructure and site design features, including circulation, parking, utilities, stormwater management, and landscaping, to support safe and functional operations.

6. **Support Economic Activity and Employment Opportunities**

   Contribute to the local and regional economy by providing opportunities for employment and supporting industrial and logistics- related business activity.

7. **Accommodate Modern Logistics Operations**

   Design the Project to accommodate contemporary warehouse and distribution operations, including appropriate building size, configuration, and site layout.

3.5 - Intended Uses of this Draft EIR

This Draft EIR is being prepared by the City to assess the potential environmental impacts that may arise in connection with actions related to implementation of the proposed Project. Pursuant to California Environmental Quality Act (CEQA) Guidelines Section 15367, the City is the lead agency for the proposed Project and has discretionary authority over the proposed Project and Project approvals. The Draft EIR is intended to discuss and disclose the potential Project impacts to the greatest extent

feasible at this time in order to avoid or minimize the need for future environmental documentation of the Project by using current plans, technical studies, and relevant information available. The Draft EIR will be used by the City of Hesperia, interested parties, the general public, and responsible agencies to evaluate the potential environmental impacts of the proposed Project.

SECTION 4: CUMULATIVE IMPACTS

4.1 - Introduction

CEQA Guidelines Section 15355 defines cumulative impacts as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts . . ." The following elements are necessary in an adequate discussion of cumulative impacts, as noted in Sections 15130(b) through 15130(e) of the CEQA Guidelines.

(b) The discussion of cumulative impacts shall reflect the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great detail as is provided for the effects attributable to the Project alone. The discussion should be guided by standards of practicality and reasonableness and should focus on the cumulative impact to which the identified other Project contribute rather than the attributes of other projects which do not contribute to the cumulative impact. The following elements are necessary to an adequate discussion of significant cumulative impacts:

(1) Either:

(A) A list of relevant past, present, and probable future projects, producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency, or

(B) A summary of projections contained in an adopted General Plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or area-wide conditions contributing to the cumulative impact.

(2) When utilizing a list, as suggested in paragraph (1) of subdivision (b), factors to consider when determining whether to include a related project should include the nature of each environmental resources being examined, the location of the project and its type. Location may be important, for example, when water quality impacts are at issue since projects outside the watershed would probably not contribute to a cumulative effect. Project type may be important, for example, when the impact is specialized, such as a particular air pollutant or mode of traffic.

(3) Lead agencies should define the geographic scope of the area affected by the cumulative effect and provide a reasonable explanation for the geographic limitation used.

(4) A summary of the expected environmental effects to be produced by those projects with specific reference to additional information stating where that information is available; and

(5) A specific analysis of the cumulative impacts of the relevant projects. An EIR shall examine reasonable, feasible options for mitigating or avoiding the Project's contribution to any significant cumulative effects.

(c) With some projects, the only feasible mitigation for cumulative impacts may involve the adoption of ordinances or regulations rather than the imposition of conditions on a project-by-project basis.

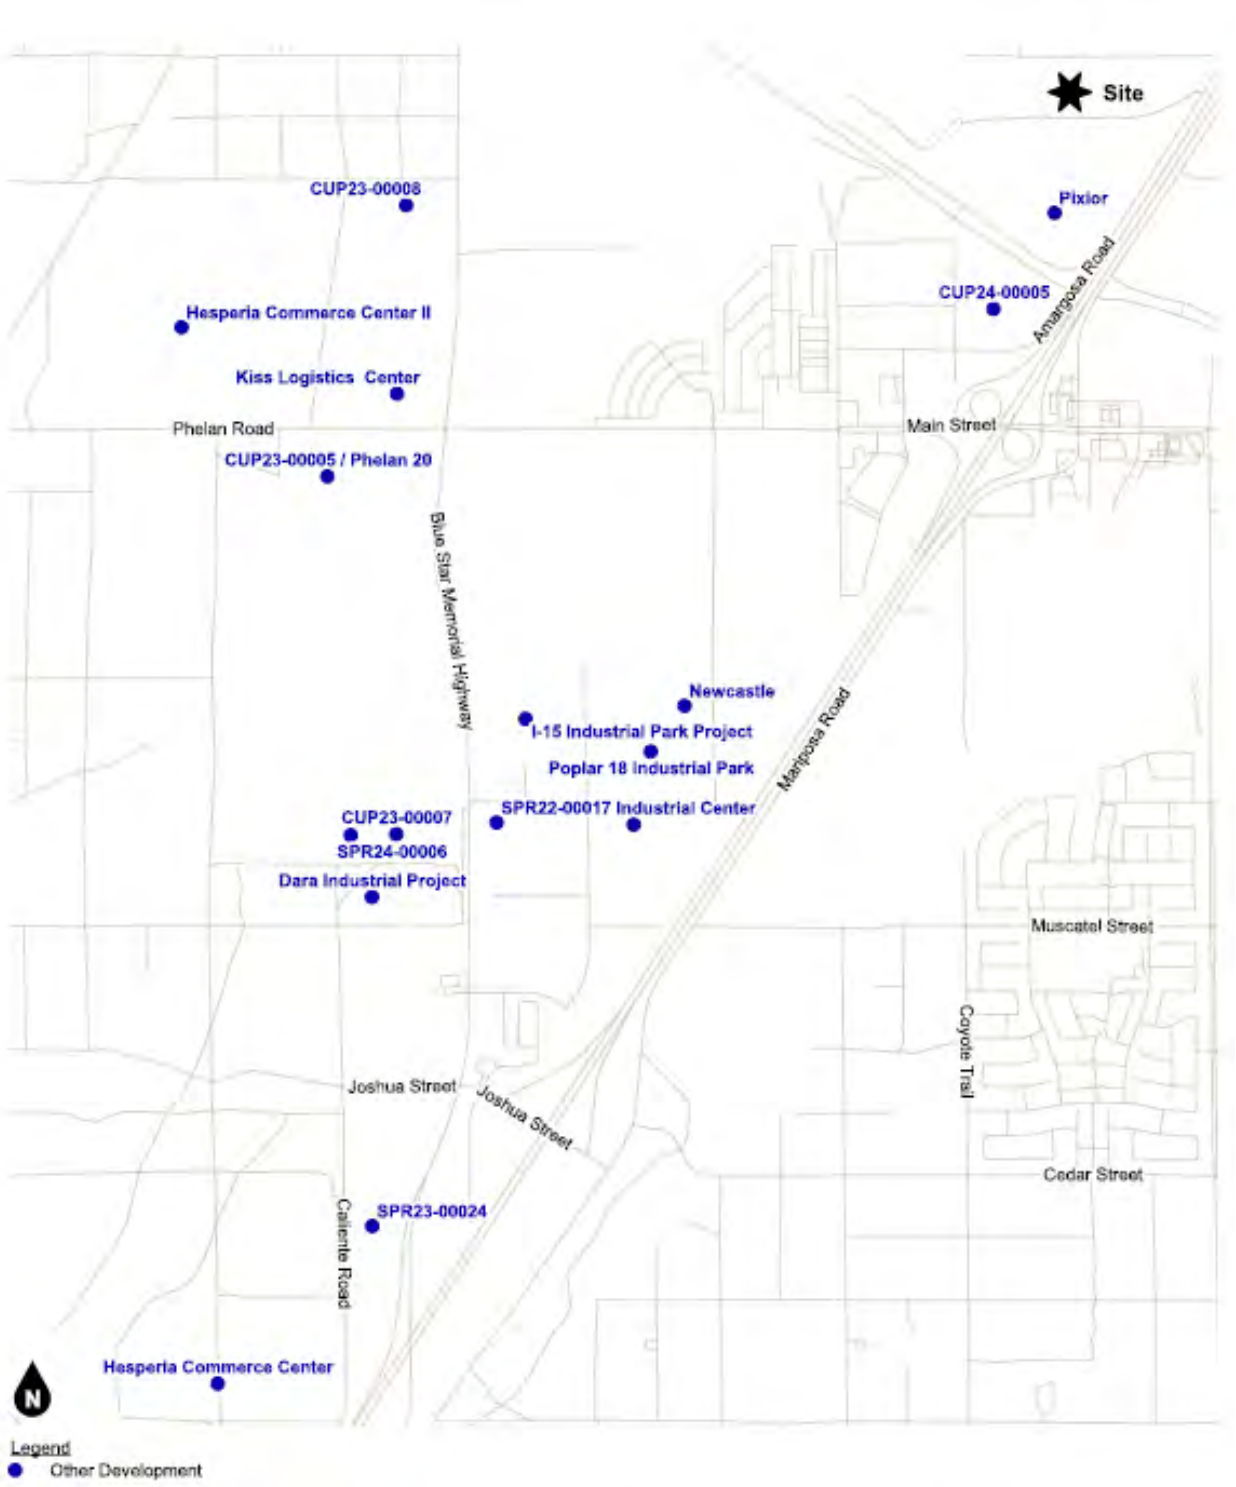
(d) Previously approved land use documents such as general plans, specific plans, and local coastal plans may be used in cumulative impact analysis. A pertinent discussion of cumulative impacts contained in one or more previously certified EIRs may be incorporated by reference pursuant to the provisions for tiering and program EIRs. No further cumulative impact analysis is required when a project is consistent with a general, specific, master or comparable programmatic plan where the lead agency determines that the regional or areawide cumulative impacts of the proposed Project have already been adequately addressed, as defined in Section 15152(f), in a certified EIR for that plan.

(e) If a cumulative impact was adequately addressed in a prior EIR for a community plan, zoning action, or general plan, and the project is consistent with that plan or action, then an EIR for such a project should not further analyze that cumulative impact, as provided by Section 15183(j).

4.2 - CUMULATIVE ANALYSIS IN THIS EIR

Cumulative impacts may be discussed in terms of proposed Project impacts, in combination with impacts anticipated for future development (including approved and planned development within the Project area and surrounding affected area), and impacts associated with growth within the region. The geographic area for each impact varies, depending on the nature of the impact, whether it is regional, such as air quality, or local, such as noise.

Quantification can be difficult for cumulative impacts, as it requires speculative estimates of impacts including, but not limited, to the following: the geographic diversity of impacts (impacts of future development may affect different areas); variations in time of impacts; and data for buildout projections may change following subsequent approvals. However, every attempt has been made herein to make sound qualitative judgments of the combined effects of, and relationship between, land uses and potential impacts.



The proposed Project's cumulative impacts were considered in conjunction with other proposed and approved projects within the surrounding area. Table 4.1-1 provides a list of the projects considered in the cumulative analysis, which were compiled based on the *Amargosa and Palmetto High-Cube Warehouse Revised Traffic Impact Analysis* prepared by Ganddini Group, Inc., dated August 21, 2025, Appendix K. Exhibit 4.1-1 shows the general location of these projects. Impact specific cumulative analysis is provided in each environmental resource topic section of this Draft EIR.

Table 4.1-1: Cumulative Projects

Project Name	Land Use[1]	Quantity[2]
CUP23-00008	Fulfillment Center Warehouse	469.979 TSF
Kiss Logistics Center (CUP22-00017)	Fulfillment Center Warehouse	655.468 TSF
Hesperia Commerce Center II (includes CUPR24-0001)	Fulfillment Center Warehouse	3,901.194 TSF
CUP23-00005/Phelan 20	Fulfillment Center Warehouse	419.700 TSF
Pixior (CUPR25-00001)	Fulfillment Center Warehouse	440.000 TSF
CUP24-00005	Commercial Retail	167.664 TSF
Newcastle (CUP22-00004)	Fulfillment Center Warehouse	400.000 TSF

Project Name	Land Use[1]	Quantity[2]
Poplar 18 Industrial Park CUP21-00010)	Fulfillment Center Warehouse	414.700 TSF
I-15 Industrial Park Project (CUP21-00004)	Fulfillment Center Warehouse	1,850.000 TSF
Industrial Center (CUP22-00016/CUP24-0003)	Warehouse	74.924 TSF
SPR22-00017	Fulfillment Center Warehouse	142.634 TSF
SPR24-00006	Fulfillment Center Warehouse	91.569 TSF
Dara Industrial Project (CUP22-00003)	Fulfillment Center Warehouse	750.000 TSF
CUP23-00007	Truck Parking	83 SP
SPR23-00024	Fulfillment Center Warehouse	150.000 TSF
Hesperia Commerce Center (SPR23-00024)	Fulfillment Center Warehouse	3,500.000 TSF
TSF = Thousand Square Feet; SP = spaces.		

Exhibit 4-1: Cumulative Development Location Map

SECTION 5: ENVIRONMENTAL IMPACT ANALYSIS

5.1 - Organization of Issue Areas

The next subsections of the EIR contain a detailed environmental analysis of the existing conditions, project impacts (including direct and indirect, short-term and long-term, and cumulative), recommended mitigation measures, and unavoidable adverse impacts. This EIR analyzes those environmental issue areas as stated in the Notice of Preparation and Comments (Appendix N) and Initial Study (Appendix N) where potentially significant impacts have the potential to occur.

The EIR will examine the following environmental factors outlined in the CEQA Guidelines.

5.01 Air Quality

5.02 Greenhouse Gas Emissions

5.03 Transportation/Traffic

Each environmental issue is addressed in a separate section of the EIR, and is organized into four sections, as follows:

- "Existing Setting" describes the physical conditions that exist at this time and that may influence or affect the issue under investigation.

- "Regulatory Framework"

- "Significance Threshold Criteria" provides the thresholds that are the basis of conclusions of significance, which are primarily the criteria in the CEQA Guidelines Appendix G, Environmental Checklist.

  Major sources used in crafting criteria include the CEQA Guidelines; local, state, federal, or other standards applicable to an impact category; and officially established significance thresholds. "…An ironclad definition of significant effect is not possible because the significance of any activity may vary with the setting." (CEQA Guidelines Section 15064[b]). Principally, "…a substantial, or potentially substantial adverse change in any of the physical conditions within an area affected by the project, including land, air, water, flora, fauna, ambient noise, and objects of historic and aesthetic significance" constitutes a significant impact (CEQA Guidelines Section 15382).

- "Impacts and Mitigation Measures" evaluates the project's environmental impacts in consideration of all phases, including planning, acquisition, development, and operation. This subsection also discusses the potential changes to the existing physical environmental conditions, which may occur if the proposed project is implemented. Evidence, based on factual and scientific data, is presented to show the cause-and-effect relationship between the proposed project and the potential changes in the environment. All of the potential direct and reasonably foreseeable indirect effects are considered. The exact magnitude, duration, extent, frequency, range, or other parameters are ascertained, to the extent possible, to determine their significance.

  The Project's environmental effects are categorized as either "effects found not to be significant" or "potentially significant impact". The "effects found not be significant" category provides a brief

discussion of the reasons that various possible significant effects of the Project were found not to be significant. The "potentially significant" category identifies and focuses on the significant environmental effects of the proposed project. Direct and indirect significant effects of the project on the environment are clearly identified and described, giving due consideration to both the short-term and long-term effects.

- "Mitigation Measures" are project-specific measures that would be required of the project to avoid a significant adverse impact; to minimize a significant adverse impact; to rectify a significant adverse impact by restoration; to reduce or eliminate a significant adverse impact over time by preservation and maintenance operations; or to compensate for the impact by replacing or providing substitute resources or environment.

- The "Level of Significance" presents the significance determination. This statement identifies which impacts would remain after the application of mitigation measures and whether the remaining impacts are or are not considered significant. When impacts, even with the inclusion of mitigation measures, cannot be mitigated to a level considered less than significant, they are identified as "unavoidable significant impacts."

- "Cumulative Impacts" describes potential environmental changes to the existing physical conditions that may occur as a result of the proposed project together with all other reasonably foreseeable, planned and approved future projects producing related or cumulative impacts, as set forth in Section 4.0. A cumulative impact analysis is provided only for those thresholds that result in a less than significant, potentially significant, or significant unavoidable impact. A cumulative impact analysis is not provided for Effects Found Not to be Significant, which result in no project-related impacts.

- "Significant Unavoidable Impacts" describes impacts that would be significant and cannot be feasibly mitigated to less than significant, so would therefore be unavoidable. To approve a project with unavoidable significant impacts, the lead agency must adopt a Statement of Overriding Considerations. In adopting such a statement, the lead agency is required to balance the benefits of a project against its unavoidable environmental impacts in determining whether to approve the project. If the benefits of a project are found to outweigh the unavoidable adverse environmental effects, the adverse effects may be considered "acceptable" (CEQA Guidelines Section 15093[a]).

5.2 - Level of Significance

Determining the severity of Project impacts is fundamental to achieving the objectives of the California Environmental Quality Act (CEQA). State CEQA Guidelines section 15091 requires that decision makers mitigate, as completely as is feasible, the significant impacts identified in the Final Focused EIR. If the Draft Focused EIR identifies any significant unmitigated impacts, State CEQA Guidelines section 15093 requires decision makers in approving a Project to adopt a statement of overriding considerations that explains why the benefits of the Project outweigh the adverse environmental consequences identified in the Draft Focused EIR.

The level of significance for each impact examined in this Draft Focused EIR was determined by considering the predicted magnitude of the impact against the applicable threshold. Thresholds were developed using criteria from the State CEQA Guidelines and checklist; State, federal, and local regulatory schemes;

local/regional plans and ordinances; accepted practice; consultation with recognized experts; and other professional opinions.

5.3 - Impact Analysis and Mitigation Measure Format

The format adopted in this Draft Program EIR to present the evaluation of impacts is described and illustrated below.

Summary Heading of Impact

Impact AES-1:	**An impact summary heading appears immediately preceding the impact description (Summary Heading of Impact in this example). The impact number identifies the section of the report (AES for Aesthetics, Light, and Glare in this example) and the sequential order of the impact (1 in this example) within that section. To the right of the impact number is the impact statement, which identifies the potential impact.**

Impact Analysis

A narrative analysis follows the impact statement.

Level of Significance Before Mitigation

This section identifies the level of significance of the impact before any mitigation is proposed.

Mitigation Measures

In some cases, following the impact discussion, reference is made to state and federal regulations and agency policies that would fully or partially mitigate the impact. In addition, policies and programs from applicable local land use plans that partially or fully mitigate the impact may be cited.

Project-specific mitigation measures, beyond those contained in other documents, are set off with a summary heading and described using the format presented below:

MM AES-1 Project-specific mitigation is identified that would reduce the impact to the lowest degree feasible. The mitigation number links the particular mitigation to the impact it is associated with (AES-1 in this example); mitigation measures are numbered sequentially.

Level of Significance After Mitigation

This section identifies the resulting level of significance of the impact following mitigation.

Abbreviations used in the mitigation measure numbering are:

Code	Environmental Issue
AQ	Air Quality
GHG	Greenhouse Gas Emissions
TRANS	Transportation and Traffic

5.01 - Air Quality

5.01.1 - Introduction

This section evaluates air quality associated with short- and long-term impacts resulting from the buildout of the proposed Project. Information in this section is based primarily on the information obtained from the Air Quality Impact Analysis prepared by Urban Crossroads, dated March 24, 2026 (Appendix A), as well as the Construction and Operational Health Risk Assessment, prepared by Urban Crossroads dated March 24, 2026 (Appendix B).

5.01.2 - Existing Setting

Mojave Desert Air Basin

Geography

The Project site is located in the portion of the City of Hesperia in San Bernardino County that is part of the Mojave Desert Air Basin (MDAB) and is under the jurisdiction of the Mojave Desert Air Quality Management District (MDAQMD). The air quality assessment for the Project evaluates emissions impacts associated with short-term construction and long-term operation of the Project. A number of air quality modeling tools are available to assess the air quality impacts of projects. In addition, certain air districts, such as the MDAQMD, have created guidelines and requirements to conduct air quality analyses. The MDAQMD's current guidelines, included in its *California Environmental Quality Act and Federal Conformity Guidelines* (August 2016), were adhered to in the assessment of air quality impacts for the Project.

Regional Climate

Air quality in the Project area is not only affected by various emissions sources (mobile, industry, etc.) but is also affected by atmospheric conditions such as wind speed, wind direction, temperature, and rainfall. The MDAB is an assemblage of mountain ranges interspersed with long broad valleys that often contain dry lakes. Many of the lower mountains within the vast terrain rise from 1,000 to 4,000 feet above the valley floor. Prevailing winds in the MDAB are out of the west and southwest. These prevailing winds are due to the proximity of the MDAB to coastal and central regions and the blocking nature of the Sierra Nevada Mountains to the north; air masses pushed onshore in Southern California by differential heating are channeled through the MDAB. The MDAB is separated from the Southern California coastal and Central California valley regions by mountains (highest elevation is approximately 10,000 feet), whose passes form the main channels for these air masses. The Mojave Desert is bordered on the southwest by the San Bernardino Mountains, separated from the San Gabriel Mountains by the Cajon Pass (4,200 feet). A lesser pass lies between the San Bernardino Mountains and the Little San Bernardino Mountains in the Morongo Valley. The Palo Verde Valley portion of the Mojave Desert lies in the low desert, at the eastern end of a series of valleys (notably the Coachella Valley), whose primary channel is the San Gorgonio Pass (2,300 feet) between the San Bernardino and San Jacinto Mountains.

During the summer, the MDAB is generally influenced by a Pacific subtropical high cell that sits off the coast, inhibiting cloud formation and encouraging daytime solar heating. The MDAB is rarely influenced by cold air masses moving south from Canada and Alaska, as these frontal systems are weak and diffuse by the time they reach the desert. Most desert moisture arrives from infrequent warm, moist, and unstable air masses from the south. The MDAB averages between three and seven inches of precipitation per year (from 16 to 30 days with at least 0.01 inch of precipitation). The MDAB is classified as a dry-hot

desert climate, with portions classified as dry-very hot desert, to indicate that at least three months have maximum average temperatures over 100.4° F.

Snow is common above 5,000 feet in elevation, resulting in moderate snowpack and limited spring runoff. Below 5,000 feet, any precipitation normally occurs as rainfall. Pacific storm fronts normally move into the area from the west, driven by prevailing winds from the west and southwest. During late summer, moist high-pressure systems from the Pacific collide with rising heated air from desert areas, resulting in brief, high-intensity thunderstorms that can cause high winds and localized flash flooding.

Photochemical Smog

The presence and intensity of sunlight are necessary prerequisites for the formation of photochemical smog. Under the influence of the ultraviolet radiation of sunlight, certain original or "primary" pollutants (mainly reactive hydrocarbons and oxides of nitrogen) react to form "secondary" pollutants (primarily oxidants). Since this process is time dependent, secondary pollutants can be formed many miles downwind from the emission sources. The direction and speed of the wind determines the horizontal dispersion and transport of the air pollutants. During the late autumn to early spring rainy season, the SCAB is subjected to wind flows associated with the traveling storms moving through the region from the northwest. This period also brings five to ten periods of strong, dry offshore winds, locally termed "Santa Anas" each year. During the dry season, which coincides with the months of maximum photochemical smog concentrations, the wind flow is bimodal, typified by a daytime onshore sea breeze and a nighttime offshore drainage wind. Because of the prevailing daytime winds and time-delayed nature of photochemical smog, oxidant concentrations are highest in the inland areas of Southern California.

Regional Air Quality

Air pollution contributes to a wide variety of adverse health effects. The Environmental Protection Agency (EPA) has established National Ambient Air Quality Standards (NAAQS) for seven of the most common air pollutants: CO, Pb, O_3, particulate matter (PM_{10} and $PM_{2.5}$), NO_2, and SO_2 which are known as criteria pollutants. The MDAQMD monitors levels of various criteria pollutants at 35 permanent monitoring stations and 2 single-pollutant source Pb air monitoring sites throughout the air district. On January 25, 2024, the California Air Resources Board (CARB) posted the proposed 2023 amendments to the state and national area designations. See Table 5.01-1 for attainment designations for the SCAB.

Table 5.01-1: Attainment Status of Criteria Pollutants in the SCAB

Criteria Pollutant	State Designation	Federal Designation
O_3 – 1-hour standard	Nonattainment	--
O_3 – 8-hour standard	Nonattainment	Nonattainment
PM_{10}	Nonattainment	Nonattainment
$PM_{2.5}$	Attainment	Unclassifiable/ Attainment
CO	Attainment	Unclassifiable/Attainment
NO_2	Attainment	Unclassifiable/Attainment
SO_2	Attainment	Unclassifiable/Attainment
Pb[1]	Attainment	Unclassifiable/Attainment

Regional Air Quality Improvements

MDAQMD rule development has resulted in improvement in air quality for the MDAB. Nearly all control programs developed through the early 2000s relied on (i) the development and application of cleaner technology; (ii) add-on emission controls, and (iii) uniform CEQA review throughout the MDAB. Industrial emission sources have been significantly reduced by this approach and vehicular emissions have been reduced by technologies implemented at the state level by CARB.

The single threshold of significance used to assess Project direct and cumulative impacts has in fact "worked" as evidenced by the track record of the air quality in the MDAB improving over the course of the past decades.

Emissions of O_3, NO_X, and VOCs have been decreasing in the MDAB since 1975 (Appendix A). These decreases result primarily from motor vehicle controls and reductions in evaporative emissions. Although vehicle miles traveled (VMT) in the MDAB continue to increase, NO_X and VOC levels are decreasing because of the mandated controls on motor vehicles and the replacement of older polluting vehicles with lower-emitting vehicles. NO_X emissions from electric utilities have also decreased due to use of cleaner fuels and renewable energy. O_3 contour maps show that the number of days exceeding the 8-hour NAAQS has generally decreased between 1975 and 2023. For 2023, there was an overall increase in exceedance days compared with the 1973 period. O_3 levels have increased in the past three years due to higher temperatures and stagnant weather conditions. Notwithstanding, O3 levels in the MDAB have generally decreased over the last 30 years.

The most recent PM_{10} statistics show a slight improvement. During the period for which data is available, the 24-hour national average concentration for PM_{10} decreased by approximately 18%, from 34.7 microgram per cubic meter (µg/m³) in 1988 to 28.4 µg/m³ in 2023. The 24-hour state annual average concentration for PM10 has decreased by approximately 59%, from 42.4 µg/m³ in 1989 to 17.3 µg/m³ in 2023. Overall, the national and state annual average concentrations have decreased by almost 34% and 29%, respectively. Over the last 50 years, NO_2 values have decreased significantly; the peak 1-hour national and state averages for 2023 are approximately 45% lower than what they were in 1970. NO_2 is formed from NO_X emissions, which also contribute to O_3. As a result, the majority of the future emission control measures would be implemented as part of the overall O_3 control strategy. Many of these control measures would target mobile sources, which account for more than three-quarters of California's NO_X emissions.

Local Air Quality

Relative to the Project site, the nearest long-term air quality monitoring site for O_3 and PM_{10} was obtained from the MDAQMD Hesperia-Olive Street monitoring station, located approximately 5.08 miles east of the Project site in Hesperia. As data for NO_2 and $PM_{2.5}$ were unavailable at this monitoring station, the next nearest monitoring station, MDAQMD Victorville-Park Avenue located 5.75 miles northeast, was utilized to report air quality data. It should be noted that data from the Victorville-Park Avenue monitoring station was utilized in lieu of the Hesperia-Olive Street monitoring station only in instances where data was not available. Additionally, it should be noted that data for CO was not available at MDAQMD Hesperia-Olive Street nor the nearest alternative monitoring stations.

The most recent three (3) years of data available is shown in Table 5.01-2 and identifies the number of days ambient air quality standards were exceeded for the study area, which is considered to be representative of the local air quality at the Project site. Data for O_3, NO_2, PM_{10}, and P $M_{2.5}$ was obtained

using the CARB iADAM: Air Quality and Data Statistics and the Air Quality and Meteorological Information System (AQMIS). Data for SO_2 has been omitted as attainment is regularly met and few monitoring stations measure SO_2 concentrations. It should be noted that the table is provided for informational purposes.

Table 5.01-2: Project Area Air Quality Monitoring Summary 2022-2024

Pollutant	Standard	Year		
		2022	2023	2024
O_3				
Maximum Federal 1-Hour Concentration (ppm)		0.108	0.110	1.121
Maximum Federal 8-Hour Concentration (ppm)		0.090	0.097	0.106
Number of Days Exceeding State 1-Hour Standard	> 0.09 ppm	11	11	14
Number of Days Exceeding State/Federal 8-Hour Standard	> 0.070 ppm	52	54	70
CO				
Maximum Federal 1-Hour Concentration	> 35 ppm	N/A	N/A	N/A
Maximum Federal 8-Hour Concentration	N/A	N/A	N/A	N/A

Pollutants Measured

Existing air quality is measured at established MDAQMD air quality monitoring stations. Monitored air quality is evaluated in the context of ambient air quality standards. These standards are the levels of air quality that are considered safe, with an adequate margin of safety, to protect public health and welfare.

NAAQS and California Ambient Air Quality Standards (CAAQS) currently in effect are shown in Table: 5.01-3 *Ambient Air Quality Standards.*

The determination of whether a region's air quality is healthful or unhealthful is determined by comparing contaminant levels in ambient air samples to the state and federal standards. At the time of the Air Quality Assessment, the most recent state and federal standards were updated by CARB on July 16, 2024, and are presented in Table 5.01-3. The air quality in a region is considered to be in attainment by the state if the measured ambient air pollutant levels for O_3, CO (except 8-hour Lake Tahoe), SO_2 (1 and 24 hour), NO_2, PM_{10}, and $PM_{2.5}$ are not to be exceeded. All others are not to be equaled or exceeded. It should be noted that the three-year period is presented for informational purposes and is not the basis for how the State assigns attainment status. Attainment status for a pollutant means that the Air District meets the standards set by the U.S. EPA or the California EPA (CalEPA). Conversely, nonattainment means that an area has monitored air quality that does not meet the NAAQS or CAAQS standards. In order to improve air quality in nonattainment areas, a State Implementation Plan (SIP) is drafted. The SIP outlines the measures that the state will take to improve air quality. Once nonattainment areas meet the standards and additional redesignation requirements, the U.S.EPA will designate the area as a maintenance area.

Table: 5.01-3 – Ambient Air Quality Standards

Ambient Air Quality Standards						
Pollutant	**Averaging Time**	**California Standards[1]**		**National Standards[2]**		
		Concentration[3]	**Method[4]**	**Primary[3,5]**	**Secondary[3,6]**	**Method[7]**
Ozone (O3)[8]	1 Hour	0.09 ppm (180 g/m^3)	Ultraviolet Photometry	-	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 g/m^3)		0.070 ppm (137 g/m^3)		
Respirable Particulate Matter (PM10)[9]	24 Hour	g/m^3	Gravimetric or Beta Attenuation	1 g/m^3)	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	g/m^3		-		
Fine Particulate Matter (PM2.5)[9]	24 Hour	-	-	g/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	1 g/m^3	Gravimetric or Beta Attenuation	9. g/m^3	1 g/m^3	
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m^3)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m^3)	-	Non-Dispersive Infrared Photometry (NDIR)

Criteria Pollutants

Air quality regulations were first promulgated with the Federal Clean Air Act (CAA) of 1970. Air quality is defined by ambient air concentrations of seven "criteria air pollutants," which are a group of common air pollutants identified by the U.S. EPA to be of concern with respect to the health and welfare of the general public. Federal and State governments regulate criteria air pollutants by using ambient standards based on criteria regarding the health and/or environmental effects of each pollutant. The seven "criteria" air pollutants defined by the U.S. EPA are: (1) carbon monoxide (CO); (2) sulfur dioxide (SO_2); (3) nitrogen dioxide (NO_2); (4) ozone (O_3); (5) particulate matter less than 10 microns (PM_{10}); (6), fine particulate matter less than 2.5 microns ($PM_{2.5}$); and (7) lead (Pb). Criteria pollutants are pollutants that are regulated through the development of human health based and/or environmentally based criteria for setting permissible levels. Criteria pollutants, their typical sources, and health effects are identified below in Table 5.01-4:

Table 5.01-4: Criteria Pollutants

Criteria Pollutant	Description	Sources	Health Effects
CO	CO is a colorless, odorless gas produced by the incomplete combustion of carbon containing fuels, such as gasoline or wood. CO concentrations tend to be the highest during the winter morning, when little to no wind and surface-based inversions trap the pollutant at ground levels. Because CO is emitted directly from internal combustion engines, unlike ozone (O_3), motor vehicles operating at slow speeds are the primary source of CO in the SCAB. The highest ambient CO concentrations are generally found near congested transportation corridors and intersections.	Any source that burns fuel such as automobiles, trucks, heavy construction equipment, farming equipment and residential heating.	Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects observed include earlier onset of chest pain with exercise, and electrocardiograph changes indicative of decreased oxygen (O_2) supply to the heart. Inhaled CO has no direct toxic effect on the lungs but exerts its effect on tissues by interfering with O_2 transport and competing with O_2 to combine with hemoglobin present in the blood to form carboxyhemoglobin (COHb). Hence, conditions with an increased demand for O_2 supply can be adversely affected by exposure to CO. Individuals most at risk include fetuses, patients with diseases involving heart and blood vessels, and patients with chronic hypoxemia (O_2 deficiency) as seen at high altitudes.
SO_2	SO_2 is a colorless, extremely irritating gas or liquid. It enters the atmosphere as a pollutant mainly as a result of burning high sulfur-content fuel oils and coal and from chemical processes occurring at chemical plants and refineries. When SO_2 oxidizes in the atmosphere, it forms SO_4. Collectively, these pollutants	Coal or oil burning power plants and industries, refineries, diesel engines	A few minutes of exposure to low levels of SO_2 can result in airway constriction in some asthmatics, all of whom are sensitive to its effects. In asthmatics, increase in resistance to air flow, as well as reduction in breathing capacity leading to severe breathing difficulties, are observed after acute exposure to SO_2. In contrast, healthy individuals do

Criteria Pollutant	Description	Sources	Health Effects
	are referred to as sulfur oxides (SO_X).		not exhibit similar acute responses even after exposure to higher concentrations of SO_2. Animal studies suggest that despite SO_2 being a respiratory irritant, it does not cause substantial lung injury at ambient concentrations. However, very high levels of exposure can cause lung edema (fluid accumulation), lung tissue damage, and sloughing off of cells lining the respiratory tract. Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient SO_2 levels. In these studies, efforts to separate the effects of SO_2 from those of fine particles have not been successful. It is not clear whether the two pollutants act synergistically, or one pollutant alone is the predominant factor.
NO_2	NO_2 is a key component of NO_X, which also includes nitric oxide (NO) and nitrous oxide (N_2O). NO_X compounds are primarily produced during combustion processes when nitrogen (N_2) reacts with oxygen (O_2). Both NO and NO_2 serve as precursors in the formation of O_3 and $PM_{2.5}$, making their monitoring crucial for air quality assessments. NO_2, being the more abundant form of NO_X in the atmosphere, has a relatively short lifespan of one to seven days, which enhances its significance as a major air pollutant. As a criteria air pollutant, NO2 poses various health risks, including respiratory issues and increased vulnerability to infections. It also absorbs blue	Any source that burns fuel such as automobiles, trucks, heavy construction equipment, farming equipment and residential heating.	Population-based studies suggest that an increase in acute respiratory illness, including infections and respiratory symptoms in children (not infants), is associated with long-term exposure to NO_2 at levels found in homes with gas stoves, which are higher than ambient levels found in Southern California. Increase in resistance to air flow and airway contraction is observed after short-term exposure to NO_2 in healthy subjects. Larger decreases in lung functions are observed in individuals with asthma or chronic obstructive pulmonary disease (e.g., chronic bronchitis, emphysema) than in healthy individuals, indicating a greater susceptibility of these sub-groups.

Criteria Pollutant	Description	Sources	Health Effects
	light, imparting a brownish-red hue to the atmosphere and contributing to reduced visibility and smog formation. Given that NO emissions largely convert to NO2, the examination of NOX emissions becomes essential when assessing potential air quality impacts. The concentrations of NO2 are closely related to traffic density, often resulting in higher exposure levels for commuters in heavy traffic compared to what regional monitoring stations may indicate.		In animals, exposure to levels of NO_2 is considerably higher than ambient concentrations result in increased susceptibility to infections, possibly due to the observed changes in cells involved in maintaining immune functions. The severity of lung tissue damage associated with high levels of O_3 exposure increases when animals are exposed to a combination of O_3 and NO_2.
O_3	O_3 is a highly reactive and unstable gas that is formed when VOCs and NO_X, both byproducts of internal combustion engine exhaust, undergo slow photochemical reactions in the presence of sunlight. O_3 concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperature conditions are favorable to the formation of this pollutant.	Formed when reactive organic gases (ROG) and NO_X react in the presence of sunlight. ROG sources include any source that burns fuels, (e.g., gasoline, natural gas, wood, oil) solvents, petroleum processing and storage and pesticides.	Individuals exercising outdoors, children, and people with preexisting lung disease, such as asthma and chronic pulmonary lung disease, are considered to be the most susceptible sub- groups for O_3 effects. Short-term exposure (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. Elevated O_3 levels are associated with increased school absences. In recent years, a correlation between elevated ambient O_3 levels and increases in daily hospital admission rates, as well as mortality, has also been reported. An increased risk for asthma has been found in children who participate in multiple outdoor sports and reside in communities with high O3 levels.

Criteria Pollutant	Description	Sources	Health Effects
			O_3 exposure under exercising conditions is known to increase the severity of the responses described above. Animal studies suggest that exposure to a combination of pollutants that includes O_3 may be more toxic than exposure to O_3 alone. Although lung volume and resistance changes observed after a single exposure diminish with repeated exposures, biochemical and cellular changes appear to persist, which can lead to subsequent lung structural changes.
Particulate Matter	PM_{10}: A major air pollutant consisting of tiny solid or liquid particles of soot, dust, smoke, fumes, and aerosols. Particulate matter pollution is a major cause of reduce visibility (haze) which is caused by the scattering of light and consequently the significant reduction air clarity. The size of the particles (10 microns or smaller, about 0.0004 inches or less) allows them to easily enter the lungs where they may be deposited, resulting in adverse health effects. Additionally, it should be noted that PM_{10} is considered a criteria air pollutant. $PM_{2.5}$: A similar air pollutant to PM_{10} consisting of tiny solid or liquid particles which are 2.5 microns or smaller (which is often referred to as fine particles). These particles are formed in the atmosphere from primary gaseous emissions that include SO_4 formed from SO_2 release from power plants and industrial facilities and nitrates that are formed from NOX release from power plants, automobiles,	Sources of PM_{10} include road dust, windblown dust and construction. Also formed from other pollutants (acid rain, NO_X, SO_X, organics). Incomplete combustion of any fuel. $PM_{2.5}$ comes from fuel combustion in motor vehicles, equipment, and industrial sources, residential and agricultural burning. Also formed from reaction of other pollutants (acid rain, NO_X, SO_X, organics).	A consistent correlation between elevated ambient fine particulate matter (PM_{10} and $PM_{2.5}$) levels and an increase in mortality rates, respiratory infections, number and severity of asthma attacks and the number of hospital admissions has been observed in different parts of the United States and various areas around the world. In recent years, some studies have reported an association between long-term exposure to air pollution dominated by fine particles and increased mortality, reduction in lifespan, and an increased mortality from lung cancer. Daily fluctuations in $PM_{2.5}$ concentration levels have also been related to hospital admissions for acute respiratory conditions in children, to school and kindergarten absences, to a decrease in respiratory lung volumes in normal children, and to increased medication use in children and adults with asthma. Recent studies show lung function growth in children is reduced with long term exposure to particulate matter.

Criteria Pollutant	Description	Sources	Health Effects
	and other types of combustion sources. The chemical composition of fine particles highly depends on location, time of year, and weather conditions. $PM_{2.5}$ is a criteria air pollutant.		The elderly, people with pre-existing respiratory or cardiovascular disease, and children appear to be more susceptible to the effects of high levels of PM_{10} and $PM_{2.5}$.
VOC	VOCs are hydrocarbon compounds (any compound containing various combinations of hydrogen and carbon atoms) that exist in the ambient air. VOCs contribute to the formation of smog through atmospheric photochemical reactions and/or may be toxic. Compounds of carbon (also known as organic compounds) have different levels of reactivity; that is, they do not react at the same speed or do not form O_3 to the same extent when exposed to photochemical processes. VOCs often have an odor, and some examples include gasoline, alcohol, and the solvents used in paints. Exceptions to the VOC designation include CO, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate. VOCs are a criteria pollutant since they are a precursor to O_3, which is a criteria pollutant. The terms VOC and ROG (see below) interchangeably.	Organic chemicals are widely used as ingredients in household products. Paints, varnishes, and wax all contain organic solvents, as do many cleaning, disinfecting, cosmetic, degreasing and hobby products. Fuels are made up of organic chemicals. All of these products can release organic compounds while you are using them, and, to some degree, when they are stored.	Breathing VOCs can irritate the eyes, nose, and throat, can cause difficulty breathing and nausea, and can damage the central nervous system as well as other organs. Some VOCs can cause cancer. Not all VOCs have all these health effects, though many have several.
ROG	Similar to VOC, ROGs are also precursors in forming O_3 and consist of compounds containing methane, ethane, propane, butane, and longer chain hydrocarbons, which are typically the result of some type of combustion/decomposition process. Smog is formed when ROG and NO_X react in the presence of sunlight. ROGs are a criteria pollutant since they	Sources similar to VOCs.	Health effects similar to VOCs.

Criteria Pollutant	Description	Sources	Health Effects
	are a precursor to O_3, which is a criteria pollutant. The terms ROG and VOC (see previous) interchangeably.		
Lead (Pb)	Pb is a heavy metal that is highly persistent in the environment and is considered a criteria pollutant. In the past, the primary source of Pb in the air was emissions from vehicles burning leaded gasoline. The major sources of Pb emissions are ore and metals processing, particularly Pb smelters, and piston-engine aircraft operating on leaded aviation gasoline. Other stationary sources include waste incinerators, utilities, and lead-acid battery manufacturers. It should be noted that the Project does not include operational activities such as metal processing or Pb acid battery manufacturing. As such, the Project is not anticipated to generate a quantifiable amount of Pb emissions.	Metal smelters, resource recovery, leaded gasoline, deterioration of Pb paint.	Fetuses, infants, and children are more sensitive than others to the adverse effects of Pb exposure. Exposure to low levels of Pb can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence quotient. In adults, increased Pb levels are associated with increased blood pressure. Pb poisoning can cause anemia, lethargy, seizures, and death; although it appears that there are no direct effects of Pb on the respiratory system. Pb can be stored in the bone from early age environmental exposure, and elevated blood Pb levels can occur due to breakdown of bone tissue during pregnancy, hyperthyroidism (increased secretion of hormones from the thyroid gland) and osteoporosis (breakdown of bony tissue). Fetuses and breast-fed babies can be exposed to higher levels of Pb because of previous environmental Pb exposure of their mothers.
Odor	Odor means the perception experienced by a person when one or more chemical substances in the air come into contact with the human olfactory nerves.	Odors can come from many sources including animals, human activities, industry, natures, and vehicles.	Offensive odors can potentially affect human health in several ways. First, odorant compounds can irritate the eye, nose, and throat, which can reduce respiratory volume. Second, studies have shown that the VOCs that cause odors can stimulate sensory nerves to cause neurochemical changes that might influence health, for instance, by compromising the immune system. Finally, unpleasant odors can trigger

Criteria Pollutant	Description	Sources	Health Effects
			memories or attitudes linked to unpleasant odors, causing cognitive and emotional effects such as stress.

Potential Impacts to Sensitive Receptors

The potential impact of Project-generated air pollutant emissions at sensitive receptors has also been considered. Sensitive receptors can include uses such as long-term health care facilities, rehabilitation centers, and retirement homes. Residences, schools, playgrounds, childcare centers, and athletic facilities can also be considered a sensitive receptors.

As per the MDAQMD's *Guidelines*, the following project types located within a specified distance to an existing or planned sensitive receptor land use must be evaluated to determine exposure of substantial pollutant concentrations to sensitive receptors:

- Any industrial project within 1,000 feet;
- A distribution center (40 or more trucks per day) within 1,000 feet;
- A major transportation project (50,000 or more vehicles per day) within 1,000 feet;
- A dry cleaner using perchloroethylene within 500 feet;
- A gasoline dispensing facility within 300 feet.

The Project includes development of a 499,714 square high-cube fulfillment center warehouse building. As such, the potential impact of Project-generated air pollutant emissions at sensitive receptors has also been considered. Receptors in the Project study area are described below. All distances are measured from the Project site boundary to the outdoor living areas (e.g., backyards) or at the building façade, whichever is closer to the Project site. Distance is measured in a straight line from the project boundary to each receptor location.

- R1: Location R1 represents the existing sensitive residence at 13030 Avenal Street, approximately 71 feet north of the Project site. Receptor R1 is placed at the private outdoor living areas (backyards) facing the Project site.
- R2: Location R2 represents the existing sensitive residence at 13164 Avenal Road, approximately 76 feet north of the Project site. Receptor R2 is placed at the private outdoor living areas (backyards) facing the Project site.
- R3: Location R3 represents the existing sensitive residence at 10445 Avenal Street, approximately 1,263 feet east of the Project site. Receptor R3 is placed at the private outdoor living areas (backyards) facing the Project site.
- R4: Location R4 represents the existing sensitive residence at 10122 Mt. Whitney Way, approximately 1,071 feet southeast of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receptor R4 is placed at the residential building façade.
- R5: Location R5 represents the existing sensitive residence at 10376 Wellington Road, approximately 227 feet north of the Project site Receptor R5 is placed at the private outdoor living areas (backyards) facing the Project site.
- R6: Location R6 represents MGA Entertainment, Inc. at 10200 Amargosa Road, approximately 201 feet south of the Project site.

The nearest sensitive receptor is a residence at 13030 Avenal Street, approximately 71 feet north of the Project site.

5.01.3 - Regulatory Framework

U.S. Environmental Protection Agency

The EPA is responsible for setting and enforcing the NAAQS for O_3, CO, NO_X, SO_2, PM_{10}, and Pb. The EPA has jurisdiction over emissions sources that are under the authority of the federal government including aircraft, locomotives, and emissions sources outside state waters (Outer Continental Shelf). The EPA also establishes emission standards for vehicles sold in states other than California. Automobiles sold in California must meet the stricter emission requirements of CARB. The Federal Clean Air Act (CAA) was first enacted in 1955 and has been amended numerous times in subsequent years (1963, 1965, 1967, 1970, 1977, and 1990). The CAA establishes the federal air quality standards, the NAAQS, and specifies future dates for achieving compliance. The CAA also mandates that states submit and implement SIPs for local areas not meeting these standards. These plans must include pollution control measures that demonstrate how the standards will be met.

The 1990 amendments to the CAA that identify specific emission reduction goals for areas not meeting the NAAQS require a demonstration of reasonable further progress toward attainment and incorporate additional sanctions for failure to attain or to meet interim milestones. The sections of the CAA most directly applicable to the development of the Project site include Title I (Non- Attainment Provisions) and Title II (Mobile Source Provisions). Title I provisions were established with the goal of attaining the NAAQS for the following criteria pollutants O_3, NO_2, SO_2, PM_{10}, CO, $PM_{2.5}$, and Pb. The NAAQS were amended in July 1997 to include an additional standard for O3 and to adopt a NAAQS for $PM_{2.5}$. As previously mentioned, Table 5.01-1 provides the NAAQS within the MDAB. Mobile source emissions are regulated in accordance with Title II provisions. These provisions require the use of cleaner burning gasoline and other cleaner burning fuels such as methanol and natural gas. Automobile manufacturers are also required to reduce tailpipe emissions of hydrocarbons and NO_X. NO_X is a collective term that includes all forms of NOX which are emitted as byproducts of the combustion process.

California Air Resources Board (CARB)

CARB, which became part of CalEPA in 1991, is responsible for ensuring implementation of the California Clean Air Act (AB 2595), responding to the federal CAA, and for regulating emissions from consumer products and motor vehicles. AB 2595 mandates achievement of the maximum degree of emissions reductions possible from vehicular and other mobile sources in order to attain the state ambient air quality standards by the earliest practical date. CARB established the CAAQS for all pollutants for which the federal government has NAAQS and, in addition, establishes standards for SO4, visibility, hydrogen sulfide (H_2S), and vinyl chloride (C_2H_3Cl). However, at this time, H_2S and C_2H_3Cl are not measured at any monitoring stations in the MDAB because they are not considered to be a regional air quality problem. Generally, the CAAQS are more stringent than the NAAQS. Local air quality management districts, such as the MDAQMD, regulate air emissions from stationary sources such as commercial and industrial facilities. All air pollution control districts have been formally designated as attainment or non-attainment for each CAAQS.

Serious non-attainment areas are required to prepare Air Quality Management Plans (AQMP) that include specified emission reduction strategies in an effort to meet clean air goals. These plans are required to include:

- Application of Best Available Retrofit Control Technology to existing sources;
- Developing control programs for area sources (e.g., architectural coatings and solvents) and indirect sources (e.g., motor vehicle use generated by residential and commercial development);
- A District permitting system designed to allow no net increase in emissions from any new or modified permitted sources of emissions;
- Implementing reasonably available transportation control measures and assuring a substantial reduction in growth rate of vehicle trips and miles traveled;
- Significant use of low emissions vehicles by fleet operators;
- Sufficient control strategies to achieve a 5% or more annual reduction in emissions or 15% or more in a period of three years for ROGs, NO_X, CO and PM_{10}. However, air basins may use alternative emission reduction strategy that achieves a reduction of less than 5% per year under certain circumstances.

CO "Hot Spot" Analysis

The MDAQMD has not established its own guidelines for CO hotspot analysis. Since the MDAQMD guidelines are based on SCAQMD methodology, it is appropriate to apply the SCAQMD criteria when analyzing CO hotspots within the MDAQMD. A CO hotspot is defined as a localized concentration of CO exceeding the state one-hour standard of 20 ppm or the eight-hour standard of 9 ppm. At the time the most recent CEQA Air Quality Handbook (1993) was published by SCAQMD, the air basin was designated as non-attainment, requiring projects to perform hotspot analyses to ensure they did not worsen the existing conditions. Over the last two decades, background CO concentrations have been significantly reduced due to regulatory controls on tailpipe emissions, which have culminated in the air basin achieving attainment status for CO.

The 2003 AQMP's findings underscore that CO hotspots are highly unlikely due to the reduced background concentrations and the effectiveness of California's air quality management strategies. The substantial reduction in CO levels from the vehicle fleet and the state's attainment status for CO further diminish the need for detailed microscale hotspot analyses, reinforcing that existing monitoring and regulatory frameworks adequately address potential air quality concerns.

In 2003, the SCAQMD as part of its AQMP development process, prepared modeling to determine the potential for CO hotspots at the four busiest intersections in the air basin. As summarized in the 2003 AQMP, even at one of the busiest intersections at that time, only 0.7 ppm of CO is attributable to vehicular traffic and the remaining 7.7 ppm were due to ambient background conditions. As shown in Table 2-5 in this report, the background 1-hour and 8-hour concentrations are well below the applicable AAQS. The 2003 AQMP's findings underscore that CO hotspots are highly unlikely due to the reduced background concentrations and the effectiveness of California's air quality management strategies. The substantial reduction in CO levels from the vehicle fleet and the state's attainment status for CO further diminish the need for detailed microscale hotspot analyses, reinforcing that existing monitoring and regulatory frameworks adequately address potential air quality concerns.

As such, Project-related traffic at any intersections within the Project area would not cause or contribute to a CO hotspot since the background concentrations are low and any contribution from Project traffic would be negligible.

Title 24 Energy Efficiency Standards and California Green Building Standards

California Code of Regulations (CCR) Title 24 Part 6: The California Energy Code was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption.

The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. CCR, Title 24, Part 11: California Green Building Standards Code (CALGreen) is a comprehensive and uniform regulatory code for all residential, commercial, and school buildings that went in effect on August 1, 2009, and is administered by the California Building Standards Commission.

CALGreen is updated on a regular basis, with the most recent approved update consisting of the 2025 California Green Building Code Standards that went into effect on January 1, 2026. The Project would be required to comply with the applicable standards in place at the time plan check submittals are made. The Project would be required to comply with the applicable standards in place at the time plan check submittals are made. These require, among other items:

Nonresidential Mandatory Measures

- Short-term bicycle parking. If the new project or an additional alteration is anticipated to generate visitors, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passers-by, for 20% of the peak daily visitors, with a minimum of one two-bike capacity rack (5.106.4.1.1).
- Long-term bicycle parking. Acceptable bicycle parking facility for Sections 5.106.4.1.2.1, 5.106.4.1.2.2 and 5.106.4.1.2.3 shall be conveniently located near the street and shall meet one of the following:

    1) Covered, lockable enclosures with permanently anchored racks for bicycles;
    2) Lockable bicycle rooms with permanently anchored racks; or
    3) Lockable, permanently anchored bicycle lockers.

Calculations for bicycle parking requirements shall be rounded up to the nearest whole number (5.106.4.1.2).

- Electric Vehicle (EV) charging stations. Construction to provide EV infrastructure and facilitate EV charging shall comply with Section 5.106.5.3.1 EV capable spaces, Section 5.106.5.3.2. EV charging stations and associated Table 5.106.5.3.1, or Section 5.106.5.3.6 EV charging stations – Power allocation method and associated Table 5.106.5.3.6, and shall be provided in accordance with regulations in the California Building Code and the California Electrical Code.

- Light pollution reduction. Outdoor lighting systems shall be designed and installed to comply with the following:

    1) The minimum requirements in the *California Energy Code* for Lighting Zones 0-4 as defined in Chapter 10, Section 10-114 of the *California Administrative Code*; and
    2) Backlight (B) ratings as defined in IES TM-15-11 (shown in Table A-1 in Chapter 8);

3) Uplight and Glare ratings as defined in *California Energy Code* (shown in Tables 130.2- A and 130.2-B in Chapter 8)
4) Allowable BUG ratings not exceeding those shown in Table 5.106.8, or
5) Comply with a local ordinance lawfully enacted pursuant to Section 101.7, whichever is more stringent (5.106.8).

- Construction waste management. Recycle and/or salvage for reuse a minimum of 65% of the nonhazardous construction and demolition waste in accordance with Section

- 5.408.1.1. 5.405.1.2, or 5.408.1.3; or meet a local construction and demolition waste management ordinance, whichever is more stringent (5.408.1)

- Excavated soil and land clearing debris. 100% of trees, stumps, rocks and associated vegetation and soils resulting primarily from land clearing shall be reused or recycled. For a phased project, such material may be stockpiled on site until the storage site is developed (5.408.3).

- Recycling by Occupants. Provide readily accessible areas that serve the entire building and are identified for the depositing, storage, and collection of non-hazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastics, organic waste, and metals or meet a lawfully enacted local recycling ordinance, if more restrictive (5.410.1).

- Water conserving plumbing fixtures and fittings. Plumbing fixtures (water closets and urinals) and fittings (faucets and showerheads) shall comply with the following:

  1) Water Closets. The effective flush volume of all water closets shall not exceed 1.28 gallons per flush (5.303.3.1).
  2) Urinals. The effective flush volume of wall-mounted urinals shall not exceed 0.125 gallons per flush (5.303.3.2.1). The effective flush volume of floor- mounted or other urinals shall not exceed 0.5 gallons per flush (5.303.3.2.2).
  3) Showerheads. Single showerheads shall have a minimum flow rate of not more than 1.8 gallons per minute and 80 psi (5.303.3.3.1). When a shower is served by more than one showerhead, the combined flow rate of all showerheads and/or other shower outlets controlled by a single valve shall not exceed 1.8 gallons per minute at 80 psi (5.303.3.3.2).
  4) Faucets and fountains. Nonresidential lavatory faucets shall have a maximum flow rate of not more than 0.5 gallons per minute at 60 psi (5.303.3.4.1). Kitchen faucets shall have a maximum flow rate of not more than 1.8 gallons per minute of 60 psi (5.303.3.4.2). Wash fountains shall have a maximum flow rate of not more than 1.8 gallons per minute/20 [rim space (inches) at 60 psi (5.303.3.4.3). Metering faucets shall not deliver more than 0.20 gallons per cycle (5.303.3.4.4). Metering faucets for wash fountains shall have a maximum flow rate not more than 0.20 gallons per cycle (5.303.3.4.5).

- Outdoor potable water use in landscaped areas. Nonresidential developments shall comply with a local water efficient landscape ordinance or the current California Department of Water Resources' Model Water Efficient Landscape Ordinance (MWELO), whichever is more stringent (5.304.1).

- Meters. For new buildings or additions in excess of 50,000 square feet, separate submeters shall be installed as follows (5.303.1.1):

1) For each individual leased, rented or other tenant space within the building projected to consume more than 100 gal/day (380 L/day), including, but not limited to, spaces used for laundry or cleaners, restaurant or food service, medical or dental office, laboratory, or beauty salon or barber shop.
2) Where separate submeters for individual buildings tenants are unfeasible, for water supplied to the following subsystems:
    a. Makeup water for cooling towers where flow through is greater than 500 gpm (30 L/s).
    b. Makeup water for evaporative coolers greater than 6 gpm (0.04 L/s).
    c. Steam and hot-water boilers with energy input more than 500,000 BTU/h (147 kW).

For excess consumption, a separate submeter or metering device shall be provided for any tenant within a new building or within an addition that is projected to consume more than 1,000 gal/day (5.303.1.2).

- Commissioning. For new buildings 10,000 square feet and over, building commissioning shall be included in the design and construction processes of the building project to verify that the building systems and components meet the owner's or owner representative's project requirements (5.410.2).

Air Quality Management Plan

Currently, the NAAQS and CAAQS are exceeded in most parts of the MDAB. The NAAQS, the Project region within the MDAB is in nonattainment for O_3 (8-hour) and PM10. For the CAAQS, the Project region within the MDAB is in nonattainment for O_3 (1-hour and 8-hour) and PM_{10}. In response, the MDAQMD has adopted a series of AQMPs to meet the state and federal ambient air quality standards. AQMPs are updated regularly in order to more effectively reduce emissions, accommodate growth, and to minimize any negative fiscal impacts of air pollution control on the economy.

5.01.4 - Thresholds of Significance

Appendix G to the State CEQA Guidelines is a sample Initial Study Checklist that includes questions for determining whether impacts related to air quality impacts are significant. These questions reflect the input of planning and environmental professionals at the Governor's Office of Planning and Research and the California Natural Resources Agency, based on input from stakeholder groups and experts in various other governmental agencies, nonprofits, and leading environmental consulting firms.

The criteria used to determine the significance of potential Project-related air quality impacts are taken from the *CEQA Guidelines* (14 CCR §§15000, et seq.). Based on these thresholds, a project would result in a significant impact related to air quality if it would:

- Conflict with or obstruct implementation of the applicable air quality plan.
- Result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is in non-attainment under an applicable federal or state ambient air quality standard.
- Expose sensitive receptors to substantial pollutant concentrations.
- Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

The MDAQMD has developed regional significance thresholds for regulated pollutants, shown below in Table 5.01-5. The MDAQMD's *CEQA and Federal Conformity Guidelines* indicate that any projects in the MDAB with daily regional emissions that exceed any of the indicated thresholds should be considered as having an individually and cumulatively significant air quality impact.

Table 5.01-5: Regional Emissions Significance Thresholds

Pollutant	Threshold
CO	548 lbs/day
NO_X	137 lbs/day
VOC	137 lbs/day
SO_X	137 lbs/day
PM_{10}	82 lbs/day
PM2.5	65 lbs/day

5.01.5 - Models Employed to Analyze Air Quality

CalEEMod

Land uses, such as the Project, affect air quality through construction-source and operational-source emissions. The California Air Pollution Control Officers Association (CAPCOA) in conjunction with other California air districts, including MDAQMD, released CalEEMod 2022 in May 2022. CalEEMod periodically releases updates; as such, the latest version available at the time of this report has been utilized in this analysis. The purpose of this model is to calculate construction-source and operational-source criteria pollutant (VOCs, NO_X, SO_X, CO, PM_{10}, and $PM_{2.5}$) and GHG emissions from direct and indirect sources; and quantify applicable air quality and GHG reductions achieved from mitigation measures. Accordingly, the latest version of CalEEMod has been used for this Project to determine construction and operational air quality emissions. Output from the model runs for both construction and operational activity are provided in Appendix A.

5.01.6 - Project Impacts and Mitigation Measures

Air quality was identified as a topic of concern during the Notice of Preparation (NOP) process and was therefore evaluated in detail in this EIR. Based on the Air Quality Impact Analysis (Appendix A), Project construction and operational emissions would not exceed applicable Mojave Desert Air Quality Management District (MDAQMD) thresholds. Accordingly, all air quality impacts are considered less than significant.

This section discusses potential impacts associated with the Project and provides mitigation measures where necessary.

Impact AQ-(a): Would the Project conflict with or obstruct implementation of the applicable air quality plan?

Impact Statement: Implementation of the proposed Project would not conflict with or obstruct implementation of the applicable air quality plan.

Impact Analysis:

AQMP Consistency Analysis

The Federal Particulate Matter Attainment Plan and Ozone Attainment Plan for the Mojave Desert set forth a comprehensive set of programs that will lead the MDAB into compliance with federal and state air quality standards. The control measures and related emission reduction estimates within the Federal Particulate Matter Attainment Plan and Ozone Attainment Plan are based upon emissions projections for a future development scenario derived from land use, population, and employment characteristics defined in consultation with local governments. Accordingly, conformance with these attainment plans for development projects is determined by demonstrating compliance with the indicators discussed below.

Consistency Criterion No. 1:

Local land use plans and/or population projections

The proposed Project is located within the City of Hesperia General Plan and has an existing land use designation for "General Commercial" (C2). The C2 land use designation is intended for goods and services of general nature, as well as professional offices that meet both short- and long-term needs of the City's population. The Project includes a General Plan Amendment and Zone Change to Commercial/Industrial Business Park (CIBP). As evaluated in this EIR, the proposed land use is consistent with the City's long-term planning framework and growth projections. The proposed development intensity, including a floor area ratio (FAR) of 0.376, is within the range of development anticipated for industrial and business park uses. The proposed Project site would have an FAR of 0.376, which is in conformance with the maximum allowable FAR of 1.0 under the C2 designation. The Project Applicant proposes land uses that are consistent with development anticipated under the site's existing General Plan designation. The Project would therefore conform to local land use plans.

Consistency Criterion No. 2:

All MDAQMD Rules and Regulations

The Project would be required to comply with all applicable MDAQMD Rules and Regulations, including, but not limited to Rules 401 (Visible Emissions), 402 (Nuisance), 403 (Fugitive Dust), and 1113 (Architectural Coatings). As previously stated in Section ES.2 of this AQIA, the Project would implement MDAQMD Rule 403 and MDAQMD Rule 1113.

Consistency Criterion No. 3:

Demonstrating that the project will not increase the frequency or severity of a violation in the federal or state ambient air quality standards

As substantiated herein, Project construction and operational-source emissions would not exceed applicable MDAQMD regional thresholds. As such, the Project would not have the potential to increase the frequency or severity of a violation in the federal or state ambient air quality for ongoing project operations.

AQMP Consistency Conclusion

The Project would not result in or cause NAAQS or CAAQS violations. The Project's proposed land use designation for the subject site is consistent with the land use designation discussed in the General Plan. Furthermore, the Project would not exceed the applicable regional thresholds and would therefore be considered to have a less than significant impact. The Project is therefore considered to be consistent with the AQMP.

Mitigation Measure

None.

Level of Significance Before Mitigation

Less than Significant impact.

Level of Significance After Mitigation

No Mitigation required.

Impact AQ-(b):	**Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?**

Impact Statement: Implementation of the proposed Project would not result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

Impact Analysis:

Construction Emissions

Construction of each site associated with the Project will result in emissions of VOCs, NO_X, SO_X, CO, PM_{10}, and $PM_{2.5}$. Construction related emissions are expected from the following construction activities:

- Site Preparation
- Grading
- Building Construction
- Paving
- Architectural Coating

Grading Activities

Dust is typically a major concern during grading activities. Because such emissions are not amenable to collection and discharge through a controlled source, they are called "fugitive emissions." Fugitive dust emissions rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). CalEEMod was utilized to calculate fugitive dust emissions resulting from this phase of activity. Based on consultation with the Project team, the Project site would require a net fill of approximately 59,302 cubic yards of soil import (Appendix A).

Off-Site Utility and Infrastructure Improvements

In addition, to support the Project development, there will be paving for off-site improvements associated with roadway construction and utility installation, as well as installation of fire hydrants and street lighting. It is expected that the off-site construction activities would not take place at one location for the entire duration of construction. Impacts associated with these activities are not expected to exceed the emissions identified for Project-related construction activities since the offsite construction areas would have physical constraints on the amount of daily activity that could occur. The physical constraints would limit the amount of construction equipment that could be used, and any off-site and utility infrastructure construction would not use equipment totals that would exceed the equipment totals on Table 5.01-6. As such, no impacts beyond what has already been identified in this report are expected to occur.

Construction Duration

For purposes of the Air Quality Report analysis, Project construction would begin October 2026 and would last through September 2027. The construction schedule utilized in the analysis, shown in Table 5.01-5, represents a "conservative" analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as time passes and the analysis year increases due to emission regulations becoming more stringent. The duration of construction activity and associated equipment represents a reasonable approximation of the expected construction fleet as required per *CEQA Guidelines*.

Table 5.01-6: Construction Duration

Construction Activity	Start Date	End Date	Days
Site Preparation	10/1/2026	10/19/2026	13
Grading	10/20/2026	12/17/2026	43
Building Construction	12/2/2026	8/19/2027	187
Paving	8/5/2027	9/20/2027	33
Architectural Coating	7/27/2027	9/20/2027	40

Source: Appendix A *Air Quality Analysis prepared by* Urban Crossroads.

Construction Equipment

Site-specific construction fleet may vary due to specific Project needs at the time of construction. The associated construction equipment was generally based on CalEEMod defaults. Consistent with industry standards and typical construction practices, each piece of equipment listed in Table 5.01-6 is assumed to operate up to a total of eight (8) hours per day, or more than two-thirds of the period during which construction activities are allowed.

Table 5.01-7: Construction Equipment Assumptions

Construction Activity	Equipment	Quantity	Hours
Site Preparation	Rubber Tired Dozers	3	8
	Crawler Tractors	4	8
Grading	Excavators	2	8
	Graders	1	8
	Rubber Tired Dozers	1	8

	Scrapers	2	8
	Crawler Tractors	2	8
Building Construction	Cranes	1	8
	Forklifts	3	8
	Generator Sets	1	8
	Tractors/Loaders/Backhoes	3	8
	Welders	1	8
Paving	Pavers	2	8
	Paving Equipment	2	8
	Rollers	2	8
Architectural Coating	Air Compressors	1	8

Source: Appendix A *Air Quality Analysis prepared by* Urban Crossroads.

On- Road Trips

Construction generates on-road vehicle emissions from vehicle usage for workers, vendors, and hauling trucks commuting to and from the site. The number of worker, vendor, and hauling trips per phase is presented below in Table 5.01-7. Worker, vendor, and hauling trips are based on CalEEMod defaults. It should be noted that, for vendor trips specifically, CalEEMod only assigns vendor trips to the Building Construction phase. Vendor trips would likely occur during all phases of construction, as shown in Table 5.01-7.

Table 5.01-8: Construction Trip Assumptions

Construction Activity	Worker Trips Per Day	Vendor Trips Per Day	Hauling Trips Per Day
Site Preparation	18	4	0
Grading	25	13	172
Building Construction	210	56	0
Paving	15	10	0
Architectural Coating	42	0	0

Source: Appendix A Air Quality Impact Analysis prepared by Urban Crossroads.

Operational Emissions

Operational activities associated with the Project will result in emissions of VOCs, NO_X, SO_X, CO, PM_{10}, and $PM_{2.5}$. Operational emissions are expected from the following primary sources:

- Mobile Source Emissions
- Area Source Emissions
- Energy Source Emissions
- Stationary Source Emissions; and

- On-site Cargo Handling Equipment Emissions.

Mobile Source Emissions

The Project related operational air quality emissions derive primarily from vehicle trips generated by the Project, including employee trips to and from the site and truck trips associated with the proposed uses. Trip characteristics available from the *Amargosa and Palmetto High-Cube Warehouse Traffic Impact Analysis (Appendix K)* were utilized in this analysis. Per Appendix K the proposed Project expected to generate approximately 905 total trips per day which include 790 passenger car trips per day and 115 truck trips per day.

Passenger Vehicles

To determine emissions from passenger car vehicles, the CalEEMod defaults were utilized for trip length and trip purpose for the proposed industrial land uses. This analysis assumes that passenger cars include Light-Duty-Auto vehicles (LDA), Light-Duty- Trucks (LDT13 & LDT24), Medium-Duty-Vehicles (MDV), and Motorcycles (MCY) vehicle types.

Trucks

To determine emissions from trucks for the proposed industrial uses, the analysis incorporated the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2) trucks, 14.2 miles 3-axle (MHDT) trucks and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages taken from the *Amargosa and Palmetto High-Cube Warehouse Traffic Impact Study (Appendix K)*. The trip length function for the proposed industrial building use has been calculated to 30.47 miles for the high-cube fulfillment center warehouse (non-sort) with an assumption of 100% primary trips. This trip length assumption is higher than the CalEEMod defaults for trucks. In order to be consistent with the *Amargosa and Palmetto High-Cube Warehouse Traffic Impact Study*, trucks are broken down by truck type. The truck fleet mix is estimated by apportioning the trip rates for each truck type based on information provided in the *Amargosa and Palmetto High-Cube Warehouse Traffic Impact Study.* Heavy trucks are broken down by truck type (or axle type) and are categorized as either Light-Heavy-Duty Trucks (LHDT15 & LHDT2 6)/2-axle, Medium-Heavy-Duty Trucks (MHD)/3-axle, and Heavy-Heavy-Duty Trucks (HHD)/4+-axle. To account for emissions generated by trucks, the fleet mix in Table 3-7 was utilized.

Fugitive Dust Related to Vehicular Travel

Vehicles traveling on paved roads would be a source of fugitive emissions due to the generation of road dust inclusive of brake and tire wear particulates. The emissions estimate for travel on paved roads was calculated using CalEEMod.

On-Road Mobile Source Emissions Modeling Methodology

EMFAC 2021 and Off-Model Adjustment Factors

On-road mobile source emissions for the Project were estimated using the CARB's EMFAC 2021 model. EMFAC 2021 is the most recent version of EMFAC approved by the U.S. EPA for use in State Implementation Plans (SIPs) and federal transportation conformity determinations, and it remains the standard analytical platform for regional air quality planning in California.

On November 21, 2025, the U.S. EPA approved the use of EMFAC 2021 off-model adjustment factors. These adjustment factors remove the estimated emission benefits that were attributed to California's

Advanced Clean Trucks, Zero-Emission Airport Shuttle, Heavy-Duty Vehicle and Engine Emission Warranty and Maintenance Provisions, and Heavy Duty Omnibus regulations from EMFAC 2021. Because the preemption waivers for these regulations no longer have effect, these regulations are no longer enforceable. These adjustment factors are multipliers provided by CARB which adjust VOC, NOX, PM10, and PM2.5 emission factors by year, region, and vehicle category to account for the removal of these regulations which are already accounted for in EMFAC 2021. Due to fleet turnover, the adjustment factors result in greater emission increases over the base EMFAC 2021 model outputs in later analysis years.

Although these adjustment factors were approved by EPA primarily for SIP and conformity analysis purposes, they have been incorporated into this analysis in order to provide a conservative estimation of emissions in an evolving regulatory environment.

Application of Adjustment Factors in This Analysis

Because CalEEMod utilizes EMFAC 2021 emission factors to calculate on-road vehicle emissions, adjustment factors were applied to the mobile source emissions outputs for each operational land use based on the vehicle fleet mix. Additionally, adjustment factors were applied to on-road construction emissions, such as those resulting from haul and vendor trucks.

This approach ensures that the emissions estimates are consistent with CARB-approved and EPA-approved planning methodologies, reflect regulatory programs applicable to heavy-duty vehicles that may not be fully captured in the base EMFAC 2021 model, and provide a technically robust basis for evaluating regional and localized air quality impacts.

Conservatism and Applicability Under CEQA

The use of EMFAC 2021 off-model adjustment factors is not required for CEQA purposes. CEQA does not mandate the use of EPA-approved models or SIP-specific adjustment techniques. Instead, CEQA requires a reasonable, good-faith effort to disclose a project's potential environmental impacts using methodologies supported by substantial evidence.

The decision to apply EMFAC 2021 off-model adjustment factors was made to be conservative and precautionary, even though such factors are primarily intended for federal SIP development and transportation conformity analyses. By incorporating these EPA-approved adjustment factors, the analysis avoids understating emissions that could result if certain regulatory impacts were omitted from the base model outputs.

Consistency with SCAQMD CEQA Practice

SCAQMD CEQA guidance recognizes the use of CARB's EMFAC model for estimating on-road mobile source emissions and does not prescribe a single mandatory modeling configuration for CEQA analyses. The application of EMFAC 2021 with CARB-developed, EPA-approved off-model adjustment factors falls within accepted professional practice and reflects a reasonable exercise of technical judgment.

Area Source Emissions

Architectural Coatings

Over a period of time the buildings that are part of this Project would require maintenance and would therefore produce emissions resulting from the evaporation of solvents contained in paints, varnishes, primers, and other surface coatings. The emissions associated with architectural coatings were calculated using CalEEMod.

Consumer Products

Consumer products include, but are not limited to, detergents, cleaning compounds, polishes, personal care products, and lawn and garden products. Many of these products contain organic compounds which, when released in the atmosphere, can react to form O_3 and other photochemically reactive pollutants. The emissions associated with the use of consumer products were calculated based on defaults provided within CalEEMod.

LANDSCAPE MAINTENANCE EQUIPMENT

Landscape maintenance equipment would generate emissions from fuel combustion and evaporation of unburned fuel. Equipment in this category would include lawnmowers, shedders/grinders, blowers, trimmers, chain saws, and hedge trimmers used to maintain the landscaping of the Project. It should be noted that on October 9, 2021, Governor Newsom signed AB 1346. The bill aims to ban the sale of new gasoline-powered equipment under 25 gross HP (known as small off-road engines [SOREs]) by January 1, 2024, which is now in effect. However, for purposes of analysis, the emissions associated with landscape maintenance equipment were calculated based on assumptions provided in CalEEMod, and do not incorporate the emissions reductions that would be realized from implementation of AB 1346.

Energy Source Emissions

COMBUSTION EMISSIONS ASSOCIATED WITH NATURAL GAS AND ELECTRICITY

Electricity and natural gas are used in almost every project. Criteria pollutant emissions are emitted through the generation of electricity. However, because electrical generating facilities for the Project area are located either outside the region (state) or offset through the use of pollution credits (RECLAIM) for generation within the MDAB, criteria pollutant emissions from offsite generation of electricity are excluded from the evaluation of significance. Natural gas and electricity usage associated with the Project was calculated by CalEEMod using default parameters.

Stationary Source Emissions

The proposed Project was conservatively assumed to include installation of one (1) 300-hp diesel-powered fire pump and one (1) 700-hp diesel-power emergency generator at the industrial building. The fire pump and emergency generator were estimated to operate for up to 1 hour per day, 1 day per week for up to 50 hours per year for maintenance and testing purposes. Emissions associated with the stationary diesel powered emergency fire pump and emergency generator were calculated using CalEEMod.

On-Site Cargo Handling Equipment Emissions

It is common for industrial buildings to require the operation of exterior cargo handling equipment in the building's truck court areas. For this Project, on-site modeled operational equipment includes up to two (2) 175 hp, natural gas-powered cargo handling equipment – port tractor operating 4 hours a day7 for 365 days of the year.

Operational Emissions Summary

CalEEMod utilizes summer and winter EMFAC2021 emission factors in order to derive vehicle emissions associated with Project operational activities, which vary by season. The estimated operational-source emissions without mitigation are summarized in Table 5.01-8. Detailed operation model outputs for the Project are presented in Appendix A. As shown on Table 5.01-8, the Project would not exceed the numerical thresholds of significance established by the MDAQMD for any emissions.

Table 5.01-9: Summary of Peak Operational Emissions

Source	Emissions (lbs/day)					
	ROG	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$
Summer						
Mobile	4.02	11.95	51.42	0.20	13.30	3.56

Source: Appendix A Air Quality Impact Analysis by Urban Crossroads.

The MDAQMD has not established its own guidelines for cumulative impacts. Since the MDAQMD guidelines are based on SCAQMD methodology, it is appropriate to apply the SCAQMD criteria when analyzing cumulative impacts within the MDAQMD. The SCAQMD has recognized that there is typically insufficient information to quantitatively evaluate the cumulative contributions of multiple projects because each project applicant has no control over nearby projects.

The SCAQMD published a report on how to address cumulative impacts from air pollution: *White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution.* In this report the SCAQMD clearly states:

> *"…the SCAQMD uses the same significance thresholds for project specific and cumulative impacts for all environmental topics analyzed in an Environmental Assessment or EIR. The only case where the significance thresholds for project specific and cumulative impacts differ is the Hazard Index (HI) significance threshold for TAC emissions. The project specific (project increment) significance threshold is HI > 1.0 while the cumulative (facility-wide) is HI > 3.0. It should be noted that the HI is only one of three TAC emission significance thresholds considered (when applicable) in a CEQA*

analysis. The other two are the maximum individual cancer risk (MICR) and the cancer burden, both of which use the same significance thresholds (MICR of 10 in 1 million and cancer burden of 0.5) for project specific and cumulative impacts. Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant."

Consistent with SCAQMD methodology as applied by MDAQMD, projects with emissions below applicable regional thresholds are not considered to make a cumulatively considerable contribution to regional air quality impacts. Conversely, projects that exceed project-specific thresholds are considered cumulatively considerable.

Construction-Source Emission Impacts

The Project-specific evaluation of emissions presented in the preceding analysis demonstrates that Project construction-source air pollutant emissions would not result in exceedances of MDAQMD thresholds. Therefore, Project construction-source emissions would be considered less than significant on a Project specific and cumulative basis.

Operational-Source Emission Impacts

The Project-specific evaluation of emissions presented in the preceding analysis demonstrates that Project operational-source air pollutant emissions would not result in exceedances of MDAQMD thresholds. Therefore, Project operational-source emissions would be considered less than significant on a Project-specific and cumulative basis.

Mitigation Measure

None.

Level of Significance Before Mitigation

Less than Significant impact.

Level of Significance After Mitigation

No Mitigation required.

Impact AQ-(c): Would the Project expose sensitive receptors to substantial pollution concentrations?

Impact Statement: Implementation of the proposed Project would not result in exposure to sensitive receptors to substantial pollution concentrations.

Impact Analysis:

The Project would have a potentially significant health risk impact if it results in a maximum incremental cancer ris r e issi n T xic Air n a inan s (TA s) 1 in ne illi n and r a chronic & acute ha ard index ha is 1. . n he case he r ec he TA c ncern is diesel particulate matter (DPM) that could be generated by Project construction activities, and on-site and off-site DPM that would result from on-going Project operations. For purposes of this evaluation, a Health Risk Assessment (HRA) has been prepared by Urban Crossroads, Inc. under a separate cover. The results of the *Amargosa and*

Palmetto High-Cube Warehouse Mobile Source Health Risk Assessment (Appendix B) indicate that the Project would not result in any potentially significant health risk impacts from exposure to DPM emissions. Therefore, impacts to sensitive receptors are expected to be less than significant.

Mitigation Measure

None.

Level of Significance Before Mitigation

Less than Significant impact.

Level of Significance After Mitigation

No Mitigation required.

Impact AQ-(d): Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Impact Statement: Implementation of the proposed Project would not result in an overall increase in odors within the city.

Impact Analysis:

The potential for the Project to generate objectionable odors has also been considered. Land uses generally associated with odor complaints include:

- Agricultural uses (livestock and farming)
- Wastewater treatment plants
- Food processing plants
- Chemical plants
- Composting operations
- Refineries
- Landfills
- Dairies
- Fiberglass molding facilities

The Project does not contain land uses typically associated with emitting objectionable odors. Potential odor sources associated with the Project may result from construction equipment exhaust and the application of asphalt and architectural coatings during construction activities and the temporary storage of typical solid waste (refuse) associated with the Project's (long-term operational) uses. Standard construction requirements would minimize odor impacts from construction. The construction odor emissions would be temporary, short-term, and intermittent in nature and would cease upon completion of the respective phase of construction and is thus considered less than significant. With respect to the operation of the gas station, gasoline dispensing activities may also generate odors associated with

gasoline fumes. The gas pumps and underground storage tanks would include requirements based on MDAQMD Rule 461 vapor recovery systems that would control VOC vapor releases during refueling and would minimize driver and employee exposure to gasoline odors and fumes. Thus, gasoline odors are not expected to adversely affect adjacent land uses. While restaurants may result in some odors from the cooking process, these odors are not typically considered objectionable. It is expected that Project-generated refuse would be stored in covered containers and removed at regular intervals in compliance with current solid waste regulations. The Project would also be required to comply with MDAQMD Rule 402 to prevent occurrences of public nuisances. Therefore, odors and other emissions (such as those leading to odors) associated with construction and operations activities of the Project would be less than significant and no mitigation is required.

Mitigation Measure

None.

Level of Significance Before Mitigation

Less than Significant impact.

Level of Significance After Mitigation

No Mitigation required.

5.01.7 - Cumulative Impacts

This cumulative impact analysis considers the proposed Project in combination with other past, present, and reasonably foreseeable future development within the Mojave Desert Air Basin (MDAB), which is the appropriate geographic context for evaluating regional air quality impacts due to the basin-wide nature of criteria pollutant formation and transport. The MDAB is currently designated as nonattainment for ozone (O_3) and particulate matter (PM_{10}) under both State and federal standards, and therefore cumulative impacts associated with these pollutants are considered potentially significant.

As described in this section, construction and operational emissions associated with the Project were quantified using CalEEMod (2022) consistent with Mojave Desert Air Quality Management District (MDAQMD) guidance. The analysis conservatively incorporates CARB EMFAC 2021 emission factors with EPA-approved off-model adjustment factors to ensure that emissions are not underestimated in light of evolving regulatory conditions.

The MDAQMD has established regional daily emission thresholds for criteria pollutants (e.g., 137 pounds per day for NO_x and VOC, 82 pounds per day for PM_{10}, and 65 pounds per day for $PM_{2.5}$), which are used to evaluate both project-specific and cumulative impacts. Consistent with SCAQMD methodology, which is applied by MDAQMD, projects that do not exceed these thresholds are not considered to make a cumulatively considerable contribution to regional air quality impacts because the thresholds are designed to represent the level at which an individual project's emissions would interfere with attainment of air quality standards.

Construction activities associated with the Project would generate temporary emissions of criteria pollutants from site preparation, grading, building construction, paving, and architectural coating activities. However, as demonstrated in the Project-level analysis, construction emissions would not exceed applicable MDAQMD daily thresholds. In addition, construction emissions would be short-term

and temporary, and would comply with applicable MDAQMD rules, including Rule 403 (Fugitive Dust Control). Therefore, construction-related emissions would not represent a cumulatively considerable contribution to regional air quality impacts.

Operational emissions associated with the Project would result primarily from mobile sources (i.e., vehicle trips), as well as area, energy, stationary, and on-site equipment sources. The Project is anticipated to generate approximately 905 daily vehicle trips, including passenger vehicles and truck traffic. As shown in Table 5.01-8, maximum daily operational emissions would be substantially below all applicable MDAQMD thresholds for all criteria pollutants in both summer and winter conditions. Because the Project's emissions do not exceed the established thresholds of significance, the Project would not result in a cumulatively considerable net increase in criteria pollutants for which the MDAB is in nonattainment.

With respect to localized impacts, including exposure of sensitive receptors to toxic air contaminants (TACs), the Project-specific Health Risk Assessment demonstrates that cancer risk and hazard index values would remain below applicable significance thresholds. Because cumulative health risk impacts are driven by facility-wide or regional exposure conditions and the Project's contribution is below applicable thresholds, the Project would not make a cumulatively considerable contribution to TAC-related health risks.

In addition, the Project would be required to comply with all applicable federal, State, and local regulations, including the Clean Air Act, CARB regulations, MDAQMD rules, and applicable Air Quality Management Plans (AQMPs), which are specifically designed to reduce emissions and achieve attainment of ambient air quality standards. Regional air quality planning efforts account for projected growth within the MDAB, and the Project is consistent with the land use assumptions and growth projections underlying these plans.

Although cumulative air quality impacts in the MDAB are significant due to existing nonattainment conditions, the Project's contribution would be below established significance thresholds, consistent with regional planning assumptions, and subject to applicable regulatory controls. Therefore, the Project would not make a cumulatively considerable contribution to significant cumulative air quality impacts. Cumulative impacts related to air quality would be less than significant, and no mitigation is required. This conclusion is consistent with CEQA Guidelines Section 15064(h)(1), which provides that a project's contribution to a cumulative impact is not cumulatively considerable if it remains below an applicable threshold of significance.

5.02 - Greenhouse Gas Emissions

5.02.1 - Introduction

This section describes the existing greenhouse gas (GHG) emissions setting and potential effects from Project implementation. A Greenhouse Gas Analysis was prepared by Urban Crossroads, dated March 24, 2026, for the Project and is included as Appendix G of this DEIR.

5.02.2 - Environmental Setting

Introduction to Global Climate Change

Global Climate Change (GCC) is a change in average meteorological conditions on the earth with respect to temperature, precipitation, and storms. The majority of scientists believe that the climate shift taking place since the Industrial Revolution is occurring at a quicker rate and magnitude than in the past. Scientific evidence suggests that GCC is the result of increased concentrations of GHGs in the earth's atmosphere, including carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), and fluorinated gases. The majority of scientists believe that this increased rate of climate change is the result of GHGs resulting from human activity and industrialization over the past 200 years.

An individual project like the proposed Project evaluated in the Greenhouse Gas Analysis conducted by Urban Crossroads, (Appendix G) cannot generate enough GHG emissions to affect a discernible change in global climate. However, the proposed Project may participate in the potential for GCC by its incremental contribution of GHGs combined with the cumulative increase of all other sources of GHGs, which when taken together constitute potential influences on GCC. Because these changes may have serious environmental consequences, the project's Greenhouse Gas Analysis will evaluate the potential for the proposed Project to have a significant effect upon the environment as a result of its potential contribution to the greenhouse effect.

Global Climate Change Defined

As previously mentioned, GCC refers to the change in average meteorological conditions on the earth with respect to temperature, wind patterns, precipitation, and storms. Global temperatures are regulated by naturally occurring atmospheric gases such as water vapor, CO_2, N2O, CH_4, hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF6). These particular gases are important due to their residence time (duration they stay) in the atmosphere, which ranges from 10 years to more than 100 years. These gases allow solar radiation into the earth's atmosphere, but prevent radioactive heat from escaping, thus warming the earth's atmosphere. GCC can occur naturally as it has in the past with the previous ice ages.

Gases that trap heat in the atmosphere are often referred to as GHGs. GHGs are released into the atmosphere by both natural and anthropogenic activity. Without the natural GHG effect, the earth's average temperature would be approximately 61 degrees Fahrenheit (°F) cooler than it is currently. The cumulative accumulation of these gases in the earth's atmosphere is considered to be the cause for the observed increase in the earth's temperature.

Greenhouse Gases

GHGs trap heat in the atmosphere, creating a GHG effect that results in global warming and climate change. Table 5.02-1, Greenhouse Gases, includes a description of greenhouse gases including their sources and health effects.

Table 5.02-1: Greenhouse Gases

GHGs	Description	Sources	Health Effects
Water	Water is the most abundant, important, and variable GHG in the atmosphere. Water vapor is not considered a pollutant; in the atmosphere it maintains a climate necessary for life. Changes in its concentration are primarily considered to be a result of climate feedbacks related to the warming of the atmosphere rather than a direct result of industrialization. Climate feedback is an indirect, or secondary, change, either positive or negative, that occurs within the climate system in response to a forcing mechanism. The feedback loop in which water is involved is critically important to projecting future climate change. As the temperature of the atmosphere rises, more water is evaporated from ground storage (rivers, oceans, reservoirs, soil). Because the air is warmer, the relative humidity can be higher (in essence, the air is able to 'hold' more water when it is warmer), leading to more water vapor in the atmosphere. As a GHG, the higher concentration of water vapor is then able to absorb more thermal indirect energy radiated from the Earth, thus further warming the atmosphere. The warmer atmosphere can then hold more water vapor and so on and so on. This is referred to as a "positive feedback loop." The extent to which this positive feedback loop would continue is unknown as there are also dynamics that hold the positive feedback loop in check. As an example, when water vapor increases in the atmosphere, more of it would eventually condense into clouds, which are more able to reflect incoming solar radiation (thus allowing less energy to reach the earth's surface and heat it up).	The main source of water vapor is evaporation from the oceans (approximately 85%). Other sources include evaporation from other water bodies, sublimation (change from solid to gas) from sea ice and snow, and transpiration from plant leaves.	There are no known direct health effects related to water vapor at this time. It should be noted however that when some pollutants react with water vapor, the reaction forms a transport mechanism for some of these pollutants to enter the human body through water vapor.
CO_2	CO_2 is an odorless and colorless GHG. Since the industrial revolution began in the mid- 1700s, the sort of human activity that increases GHG	CO_2 is emitted from natural and manmade sources. Natural sources include: the	Outdoor levels of CO_2 are not high enough to result in negative health

GHGs	Description	Sources	Health Effects
	emissions has increased dramatically in scale and distribution. Data from the past 50 years suggests a corollary increase in levels and concentrations. As an example, prior to the industrial revolution, CO_2 concentrations were fairly stable at 280 parts per million (ppm). Today, they are around 370 ppm, an increase of more than 30%. Left unchecked, the concentration of CO_2 in the atmosphere is projected to increase to a minimum of 540 ppm by 2100 as a direct result of anthropogenic sources.	decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic sources include: the burning of coal, oil, natural gas, and wood. CO_2 is naturally removed from the air by photosynthesis, dissolution into ocean water, transfer to soils and ice caps, and chemical weathering of carbonate rocks.	effects. According to the National Institute for Occupational Safety and Health (NIOSH) high concentrations of CO_2 can result in health effects such as: headaches, dizziness, restlessness, difficulty breathing, sweating, increased heart rate, increased cardiac output, increased blood pressure, coma, asphyxia, and/or convulsions. It should be noted that current concentrations of CO_2 in the earth's atmosphere are estimated to be approximately 370 ppm, the actual reference exposure level (level at which adverse health effects typically occur) is at exposure levels of 5,000 ppm averaged over 10 hours in a 40-hour workweek and short-term reference exposure levels of 30,000 ppm averaged over a 15 minute period.
CH_4	CH_4 is an extremely effective absorber of radiation, although its atmospheric concentration is less than CO_2 and its lifetime in the atmosphere is brief (10-12 years), compared to other GHGs.	CH_4 has both natural and anthropogenic sources. It is released as part of the biological processes in low oxygen environments, such as in swamplands or in rice production (at the roots of the plants). Over the last 50 years, human activities such as growing rice, raising cattle, using natural gas, and mining coal have added to the atmospheric concentration of CH_4. Other anthropocentric sources	CH_4 is extremely reactive with oxidizers, halogens, and other halogen-containing compounds. Exposure to elevated levels of CH_4 can cause asphyxiation, loss of consciousness, headache and dizziness, nausea and vomiting, weakness, loss of coordination, and an increased breathing rate.

GHGs	Description	Sources	Health Effects
		include fossil-fuel combustion and biomass burning.	
N_2O	N_2O, also known as laughing gas, is a colorless GHG. Concentrations of N_2O also began to rise at the beginning of the industrial revolution. In 1998, the global concentration was 314 parts per billion (ppb).	N_2O is produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. It is used as an aerosol spray propellant, i.e., in whipped cream bottles. It is also used in potato chip bags to keep chips fresh. It is used in rocket engines and in race cars. N_2O can be transported into the stratosphere, be deposited on the earth's surface, and be converted to other compounds by chemical reaction.	N_2O can cause dizziness, euphoria, and sometimes slight hallucinations. In small doses, it is considered harmless. However, in some cases, heavy and extended use can cause Olney's Lesions (brain damage).
Chlorofluorocarbons (CFCs)	CFCs are gases formed synthetically by replacing all hydrogen atoms in CH_4 or ethane (C_2H_6) with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble and chemically unreactive in the troposphere (the level of air at the earth's surface).	CFCs have no natural source but were first synthesized in 1928. They were used for refrigerants, aerosol propellants and cleaning solvents. Due to the discovery that they are able to destroy stratospheric ozone, a global effort to halt their production was undertaken and was extremely successful, so much so that levels of the major CFCs are now remaining steady or declining. However, their long atmospheric lifetimes mean that some of the CFCs would remain in the	In confined indoor locations, working with CFC-113 or other CFCs is thought to result in death by cardiac arrhythmia (heart frequency too high or too low) or asphyxiation.

GHGs	Description	Sources	Health Effects
		atmosphere for over 100 years.	
HFCs	HFCs are synthetic, man-made chemicals that are used as a substitute for CFCs. Out of all the GHGs, they are one of three groups with the highest global warming potential (GWP). The HFCs with the largest measured atmospheric abundances are (in order), Fluoroform (HFC-23), 1,1,1,2-tetrafluoroethane (HFC-134a), and 1,1-difluoroethane (HFC-152a). Prior to 1990, the only significant emissions were of HFC-23. HCF-134a emissions are increasing due to its use as a refrigerant.	HFCs are manmade for applications such as automobile air conditioners and refrigerants.	No health effects are known to result from exposure to HFCs.
PFCs	PFCs have stable molecular structures and do not break down through chemical processes in the lower atmosphere. High-energy ultraviolet rays, which occur about 60 kilometers above earth's surface, are able to destroy the compounds. Because of this, PFCs have exceptionally long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane (CF_4) and hexafluoroethane (C_2F_6). The EPA estimates that concentrations of CF_4 in the atmosphere are over 70 parts per trillion (ppt).	The two main sources of PFCs are primary aluminum production and semiconductor manufacture.	No health effects are known to result from exposure to PFCs.
SF_6	SF_6 is an inorganic, odorless, colorless, nontoxic, nonflammable gas. It also has the highest GWP of any gas evaluated (23,900). The EPA indicates that concentrations in the 1990s were about 4 ppt.	SF_6 is used for insulation in electric power transmission and distribution equipment, in the Magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.	In high concentrations in confined areas, the gas presents the hazard of suffocation because it displaces the oxygen needed for breathing.
Nitrogen Trifluoride (NF_3)	NF_3 is a colorless gas with a distinctly moldy odor. The World Resources Institute (WRI) indicates that NF3 has a 100-year GWP of 17,200.	NF_3 is used in Industrial processes and is produced in The manufacturing of semiconductors, Liquid Crystal Display (LCD) panels, types of solar panels, and chemical lasers.	Long-term or repeated exposure may affect the liver and kidneys and may cause fluorosis.

Source: Appendix G *Greenhouse Gas Analysis prepared by* Urban Crossroads.

For the purposes of this analysis, emissions of CO_2, CH_4, and N_2O were evaluated because these gases are the primary contributors to GCC from development projects. Although there are other substances such as fluorinated gases that also contribute to GCC, these fluorinated gases were not evaluated as their sources are not well-defined and do not contain accepted emissions factors or methodology to accurately calculate these gases.

GHGs have varying Global Warming Potential (GWP) values. GWP of GHG indicates the amount of warming a gas causes over a given period of time and represents the potential of a gas to trap heat in the atmosphere. CO_2 is utilized as the reference gas for GWP, and thus has a GWP of 1. The atmospheric lifetime and GWP of selected GHGs are summarized in Table 5.02-2 below.

Table 5.02-2: Global Warming Potential and Atmospheric Lifetime of Select GHGs

Gas	Atmospheric Lifetime (years)	GWP (100-year time horizon)	
		2nd Assessment Report	6th Assessment Report
CO_2	Multiple	1	1
CH_4	11.8	21	28
N_2O	109	310	273
HFC-23	228	11,700	14,600
HFC-134a	14	1,300	1,526
HFC-152a	1.6	140	164
SF_6	3,200	23,900	25,200

GHG EMISSIONS INVENTORY

Global

Worldwide anthropogenic GHG emissions are tracked by the IPCC for industrialized nations (referred to as Annex I) and developing nations (referred to as Non-Annex I). Human GHG emissions data for Annex I nations are available through 2021. Based on the latest available data, the sum of these emissions totaled approximately 28,272,940 gigagram (Gg) CO_2e^2 as summarized on Table 5.02-3.

Table 5.02-3: Top GHG Producing Countries and The European Union

Emitting Countries	GHG Emissions (Gg CO_2e)
China	12,300,200
United States	6,340,228
European Union (27-member countries)	3,468,394
India	2,839,425
Russian Federation	2,156,599
Japan	1,168,094
Total	**28,272,940**

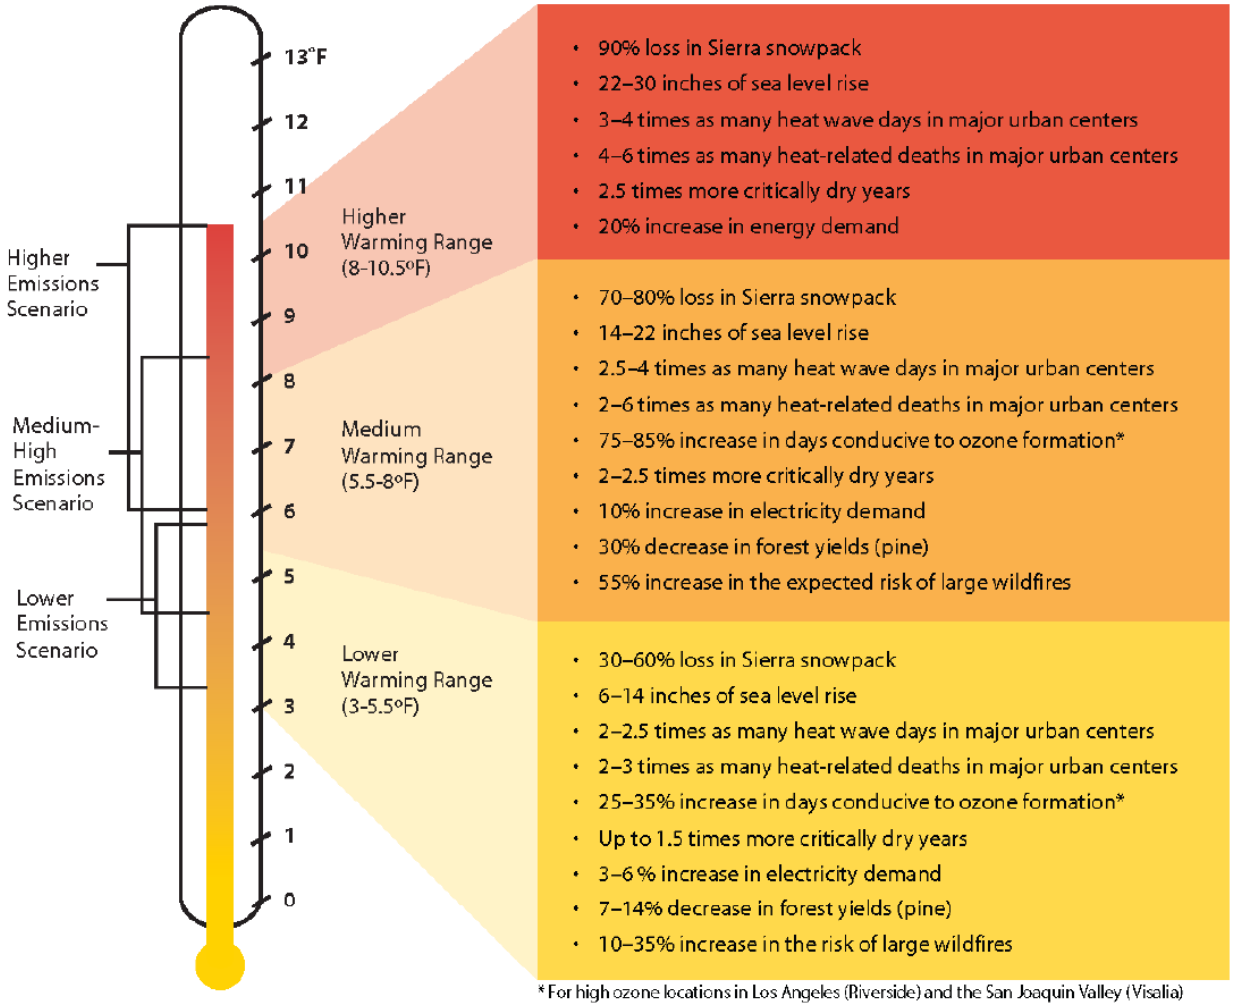
Source: Appendix G *Greenhouse Gas Analysis prepared by* Urban Crossroads.

United States

As noted in Table 5.02-3, the United States, as a single country, was the number two producer of GHG emissions in 2021.

State of California

California has significantly slowed the rate of growth of GHG emissions due to the implementation of energy efficiency programs as well as adoption of strict emission controls but is still a substantial contributor to the United States (U.S.) emissions inventory total. The California Air Resource Board (CARB) compiles GHG inventories for the State of California. Based upon the 2024 GHG inventory data (i.e., the latest year for which data are available) for the 2000-2022 GHG emissions period, California emitted an average 371.1 million metric tons of CO_2e per year ($MMTCO_2e/yr$) or 371,100 Gg CO_2e (5.85% of the total United States GHG emissions).



Effects of Climate Change in California

Public Health

Higher temperatures may increase the frequency, duration, and intensity of conditions conducive to air pollution formation. For example, days with weather conducive to ozone formation could increase from 25 to 35% under the lower warming range to 75 to 85% under the medium warming range. In addition, if global background ozone levels increase as predicted in some scenarios, it may become impossible to meet local air quality standards. Air quality could be further compromised by increases in wildfires, which emit fine particulate matter that can travel long distances, depending on wind conditions. According to The Our *Changing Climate: Assessing the Risks to California by the California Climate Change Center*, large wildfires could become up to 55% more frequent if GHG emissions are not significantly reduced.

In addition, under the higher warming range scenario, there could be up to 100 more days per year with temperatures above 90°F in Los Angeles and 95°F in Sacramento by 2100. This is a large increase over historical patterns and approximately twice the increase projected if temperatures remain within or below the lower warming range. Rising temperatures could increase the risk of death from dehydration, heat stroke/exhaustion, heart attack, stroke, and respiratory distress caused by extreme heat. Exhibit 5.02-1, Summary of Projected Global Warming Impact, presents the potential impacts of global warming.

Exhibit 5.02-1: Summary of Projected Global Warming Impact, 2070-2099 (As compared with 1961-1990)

Source: Barbara H. Allen-Diaz. "Climate change affects us all." *University of California, Agriculture and Natural Resources*, 2009, (Exhibit derived from Project Greenhouse Gas Analysis, Urban Crossroads, Appendix N)

Water Resources

A vast network of man-made reservoirs and aqueducts captures and transports water throughout the state from northern California rivers and the Colorado River. The current distribution system relies on Sierra Nevada snowpack to supply water during the dry spring and summer months. Rising temperatures, potentially compounded by decreases in precipitation, could severely reduce spring snowpack, increasing the risk of summer water shortages.

If temperatures continue to increase, more precipitation could fall as rain instead of snow, and the snow that does fall could melt earlier, reducing the Sierra Nevada spring snowpack by as much as 70 to 90%. Under the lower warming range scenario, snowpack losses could be only half as large as those possible if temperatures were to rise to the higher warming range. How much snowpack could be lost depends in part on future precipitation patterns, the projections for which remain uncertain. However, even under the wetter climate projections, the loss of snowpack could pose challenges to water managers and hamper hydropower generation. It could also adversely affect winter tourism. Under the lower warming range, the

ski season at lower elevations could be reduced by as much as a month. If temperatures reach the higher warming range and precipitation declines, there might be many years with insufficient snow for skiing and snowboarding.

The State's water supplies are also at risk from rising sea levels. An influx of saltwater could degrade California's estuaries, wetlands, and groundwater aquifers. Saltwater intrusion caused by rising sea levels is a major threat to the quality and reliability of water within the southern edge of the Sacramento/San Joaquin River Delta – a major fresh water supply.

Agriculture

Increased temperatures could cause widespread changes to the agriculture industry reducing the quantity and quality of agricultural products statewide. First, California farmers could possibly lose as much as 25% of the water supply needed. Although higher CO2 levels can stimulate plant production and increase plant water-use efficiency, California's farmers could face greater water demand for crops and a less reliable water supply as temperatures rise. Crop growth and development could change, as could the intensity and frequency of pest and disease outbreaks. Rising temperatures could aggravate ozone pollution, which makes plants more susceptible to disease and pests and interferes with plant growth.

Plant growth tends to be slow at low temperatures, increasing with rising temperatures up to a threshold. However, faster growth can result in less-than-optimal development for many crops, so rising temperatures could worsen the quantity and quality of yield for a number of California's agricultural products. Products likely to be most affected include wine grapes, fruits, and nuts.

In addition, continued GCC could shift the ranges of existing invasive plants and weeds and alter competition patterns with native plants. Range expansion could occur in many species while range contractions may be less likely in rapidly evolving species with significant populations already established. Should range contractions occur, new or different weed species could fill the emerging gaps. Continued GCC could alter the abundance and types of many pests, lengthen pests' breeding season, and increase pathogen growth rates.

Forests and Landscapes

GCC has the potential to intensify the current threat to forests and landscapes by increasing the risk of wildfire and altering the distribution and character of natural vegetation. If temperatures rise into the medium warming range, the risk of large wildfires in California could increase by as much as 55%, which is almost twice the increase expected if temperatures stay in the lower warming range. However, since wildfire risk is determined by a combination of factors, including precipitation, winds, temperature, and landscape and vegetation conditions, future risks would not be uniform throughout the state. In contrast, wildfires in northern California could increase by up to 90% due to decreased precipitation.

Moreover, continued GCC has the potential to alter natural ecosystems and biological diversity within the state. For example, alpine and subalpine ecosystems could decline by as much as 60 to 80% by the end of the century as a result of increasing temperatures. The productivity of the state's forests has the potential to decrease as a result of GCC.

Rising Sea Levels

Although not relevant to the Project area, rising sea levels, more intense coastal storms, and warmer water temperatures could increasingly threaten the State's coastal regions. Under the higher warming range scenario, sea level is anticipated to rise 22 to 35 inches by 2100. Elevations of this magnitude would inundate low-lying coastal areas with saltwater, accelerate coastal erosion, threaten vital levees and inland water systems, and disrupt wetlands and natural habitats. Under the lower warming range scenario, sea level could rise 12-14 inches.

5.02.3 - Regulatory Framework

International Regulations

Intergovernmental Panel on Climate Change (IPCC)

In 1988, the United Nations (U.N.) and the World Meteorological Organization established the Intergovernmental Panel on Climate Change (IPCC) to assess the scientific, technical, and socioeconomic information relevant to understanding the scientific basis of risk of human-induced climate change, its potential impacts, and options for adaptation and mitigation.

United Nation's Framework Convention on Climate Change (UNFCCC)

On March 21, 1994, the U.S. joined a number of countries around the world in signing the Convention. Under the UNFCCC, governments gather and share information on GHG emissions, national policies, and best practices; launch national strategies for addressing GHG emissions and adapting to expected impacts, including the provision of financial and technological support to developing countries; and cooperate in preparing for adaptation to the impacts of climate change.

International Climate Change Treaties

The Kyoto Protocol is an international agreement linked to the UNFCCC. The major feature of the Kyoto Protocol is that it sets binding targets for 37 industrialized countries and the European community for reducing GHG emissions at an average of 5% against 1990 levels over the five- year period 2008–2012. The Convention (as discussed above) encouraged industrialized countries to stabilize emissions; however, the Protocol commits them to do so. Developed countries have contributed more emissions over the last 150 years; therefore, the Protocol places a heavier burden on developed nations under the principle of "common but differentiated responsibilities."

In 2001, President George W. Bush indicated that he would not submit the treaty to the U.S. Senate for ratification, which effectively ended American involvement in the Kyoto Protocol. In December 2009, international leaders met in Copenhagen to address the future of international climate change commitments post-Kyoto. No binding agreement was reached in Copenhagen; however, the UN Climate Change Committee identified the long-term goal of limiting the maximum global average temperature increase to no more than 2 degrees Celsius (°C) above pre- industrial levels, subject to a review in 2015. The Committee held additional meetings in Durban, South Africa in November 2011; Doha, Qatar in November 2012; and Warsaw, Poland in November 2013. The meetings gradually gained consensus among participants on individual climate change issues.

On September 23, 2014, more than 100 Heads of State and Government and leaders from the private sector and civil society met at the Climate Summit in New York hosted by the U.N. At the Summit, heads of government, business and civil society announced actions in areas that would have the greatest impact

on reducing emissions, including climate finance, energy, transport, industry, agriculture, cities, forests, and building resilience.

Parties to the UNFCCC reached a landmark agreement on December 12, 2015, in Paris, charting a fundamentally new course in the two-decade-old global climate effort. Culminating a four-year negotiating round, the new treaty ends the strict differentiation between developed and developing countries that characterized earlier efforts, replacing it with a common framework that commits all countries to put forward their best efforts and to strengthen them in the years ahead. This includes, for the first time, requirements that all parties report regularly on their emissions and implementation efforts and undergo international review.

The agreement and a companion decision by parties were the key outcomes of the conference, known as the 21st session of the UNFCCC Conference of the Parties (COP) 21. Together, the Paris Agreement and the accompanying COP decision:

- Reaffirm the goal of limiting global temperature increase well below 2°C, while urging efforts to limit the increase to 1.5 degrees;
- Establish binding commitments by all parties to make "nationally determined contributions" (NDCs), and to pursue domestic measures aimed at achieving them;
- Commit all countries to report regularly on their emissions and "progress made in implementing and achieving" their NDCs, and to undergo international review;
- Commit all countries to submit new NDCs every five years, with the clear expectation that they would "represent a progression" beyond previous ones;
- Reaffirm the binding obligations of developed countries under the UNFCCC to support the efforts of developing countries, while for the first time encouraging voluntary contributions by developing countries too;
- Extend the current goal of mobilizing $100 billion a year in support by 2020 through 2025, with a new, higher goal to be set for the period after 2025;
- Extend a mechanism to address "loss and damage" resulting from climate change, which explicitly would not "involve or provide a basis for any liability or compensation;"
- Require parties engaging in international emissions trading to avoid "double counting;" and
- Call for a new mechanism, similar to the Clean Development Mechanism under the Kyoto Protocol, enabling emission reductions in one country to be counted toward another country's NDC (C2ES 2015a).

Following President Biden's day one executive order, the United States officially rejoined the landmark Paris Agreement on February 19, 2021, positioning the country to once again be part of the global climate solution. Meanwhile, city, state, business, and civic leaders across the country and around the world have been ramping up efforts to drive the clean energy advances needed to meet the goals of the agreement and put the brakes on dangerous climate change.

National Regulations

Prior to the last decade, there have been no concrete federal regulations of GHGs or major planning for climate change adaptation. The following are actions regarding the federal government, GHGs, and fuel efficiency.

GHG Endangerment

In Massachusetts v. Environmental Protection Agency 549 U.S. 497 (2007), decided on April 2, 2007, the United States Supreme Court (Supreme Court) found that four GHGs, including CO2, are air pollutants subject to regulation under Section 202(a)(1) of the Clean Air Act (CAA). The Supreme Court held that the EPA Administrator must determine whether emissions of GHGs from new motor vehicles cause or contribute to air pollution, which may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. On December 7, 2009, the EPA Administrator signed two distinct findings regarding GHGs under section 202(a) of the CAA:

- Endangerment Finding: The Administrator finds that the current and projected concentrations of the six key well-mixed GHGs— CO2, CH4, N2O, HFCs, PFCs, and SF6—in the atmosphere threaten the public health and welfare of current and future generations.
- Cause or Contribute Finding: The Administrator finds that the combined emissions of these well-mixed GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution, which threatens public health and welfare.

These findings do not impose requirements on industry or other entities. However, this was a prerequisite for implementing GHG emissions standards for vehicles, as discussed in "Clean Vehicles" below. After a lengthy legal challenge, the Supreme Court declined to review an Appeals Court ruling that upheld the EPA Administrator's findings.

Clean Vehicles

Congress first passed the Corporate Average Fuel Economy law in 1975 to increase the fuel economy of cars and light duty trucks. The law has become more stringent over time. On May 19, 2009, President Obama put in motion a new national policy to increase fuel economy for all new cars and trucks sold in the U.S. On April 1, 2010, the EPA, and the Department of Transportation's National Highway Traffic Safety Administration (NHTSA) announced a joint final rule establishing a national program that would reduce GHG emissions and improve fuel economy for new cars and trucks sold in the U.S.

The first phase of the national program applies to passenger cars, light-duty trucks, and medium- duty (MD) passenger vehicles, covering model years 2012 through 2016. They require these vehicles to meet an estimated combined average emissions level of 250 grams of CO2 per mile, equivalent to 35.5 miles per gallon (mpg) if the automobile industry were to meet this CO2 level solely through fuel economy improvements. Together, these standards would cut CO2 emissions by an estimated 960 million metric tons and 1.8 billion barrels of oil over the lifetime of the vehicles sold under the program (model years 2012–2016). The EPA and the NHTSA issued final rules on a second-phase joint rulemaking establishing national standards for light-duty vehicles for model years 2017 through 2025 in August 2012. The new standards for model years 2017 through 2025 apply to passenger cars, light-duty trucks, and MD passenger vehicles. The final standards are projected to result in an average industry fleetwide level of 163 grams/mile of CO2 in model year 2025, which is equivalent to 54.5 mpg if achieved exclusively through fuel economy improvements.

The EPA and the U.S. Department of Transportation issued final rules for the first national standards to reduce GHG emissions and improve fuel efficiency of HDT and buses on September 15, 2011, effective November 14, 2011. For combination tractors, the agencies are proposing engine and vehicle standards that begin in the 2014 model year and achieve up to a 20% reduction in CO2 emissions and fuel consumption by the 2018 model year. For HDT and vans, the agencies are proposing separate gasoline and

diesel truck standards, which phase in starting in the 2014 model year and achieve up to a 10% reduction for gasoline vehicles and a 15% reduction for diesel vehicles by the 2018 model year (12 and 17% respectively if accounting for air conditioning leakage). Lastly, for vocational vehicles, the engine and vehicle standards would achieve up to a 10% reduction in fuel consumption and CO2 emissions from the 2014 to 2018 model years.

On April 2, 2018, the EPA signed the Mid-term Evaluation Final Determination, which declared that the MY (Model Year) 2022-2025 GHG standards are not appropriate and should be revised (30). This Final Determination serves to initiate a notice to further consider appropriate standards for MY 2022- 2025 light-duty vehicles. On August 2, 2018, the NHTSA in conjunction with the EPA, released a notice of proposed rulemaking, the *Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks* (SAFE Vehicles Rule). The SAFE Vehicles Rule was proposed to amend existing Corporate Average Fuel Economy (CAFE) and tailpipe CO2 standards for passenger cars and light trucks and to establish new standards covering model years 2021 through 2026. As of March 31, 2020, the NHTSA and EPA finalized the SAFE Vehicle Rule which increased stringency of CAFE and CO2 emissions standards by 1.5% each year through model year 2026 (31). On December 21, 2021, after reviewing all the public comments submitted on NHTSA's April 2021 Notice of Proposed Rulemaking, NHTSA finalizes the CAFE Preemption rulemaking to withdraw its portions of the so-called SAFE I Rule. The final rule concludes that the SAFE I Rule overstepped the agency's legal authority and established overly broad prohibitions that did not account for a variety of important state and local interests. The final rule ensures that the SAFE I Rule will no longer form an improper barrier to states exploring creative solutions to address their local communities' environmental and public health challenges.

On March 31, 2022, NHTSA finalized CAFE standards for MY 2024-2026. The standards for passenger cars and light trucks for MYs 2024-2025 were increased at a rate of 8% per year and then increased at a rate of 10% per year for MY 2026 vehicles. NHTSA currently projects that the revised standards would require an industry fleet-wide average of roughly 49 mpg in MY 2026 and would reduce average fuel outlays over the lifetimes of affected vehicles that provide consumers hundreds of dollars in net savings. These standards are directly responsive to the agency's statutory mandate to improve energy conservation and reduce the nation's energy dependence on foreign sources.

Mandatory Reporting of GHGs

The Consolidated Appropriations Act of 2008, passed in December 2007, requires the establishment of mandatory GHG reporting requirements. On September 22, 2009, the EPA issued the Final Mandatory Reporting of GHGs Rule, which became effective January 1, 2010. The rule requires reporting of GHG emissions from large sources and suppliers in the U.S. and is intended to collect accurate and timely emissions data to inform future policy decisions. Under the rule, suppliers of fossil fuels or industrial GHGs, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons per year (MT/yr) or more of GHG emissions are required to submit annual reports to the EPA.

State

Legislative Actions to Reduce GHGs

The State of California legislature has enacted a series of bills that constitute the most aggressive program to reduce GHGs of any state in the nation. Some legislation such as the landmark AB 32 was specifically enacted to address GHG emissions. Other legislation such as Title 24 and Title 20 energy standards were originally adopted for other purposes such as energy and water conservation but also provide GHG reductions. This section describes the major provisions of the legislation at the State level. State regulations

play a critical role in shaping regional Air Quality Management Districts, such as the South Coast Air Quality Management District (SCAQMD), by providing the legal framework, authority, and policy direction for its air quality management programs.

California Assembly Bill No. 32 (AB 32)

The California State Legislature enacted AB 32, which required that GHGs emitted in California be reduced to 1990 levels by the year 2020 (this goal has been met[4]). GHGs as defined under AB 32 include CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6. Since AB 32 was enacted, a seventh chemical, NF_3, has also been added to the list of GHGs. CARB is the state agency charged with monitoring and regulating sources of GHGs. Pursuant to AB 32, CARB adopted regulations to achieve the maximum technologically feasible and cost-effective GHG emission reductions.

California Air Resources Board (CARB) Scoping Plan Update

In November 2017, CARB released the Final 2017 Scoping Plan Update (2017 Scoping Plan), which identifies the State's post-2020 reduction strategy. The 2017 Scoping Plan reflects the 2030 target of a 40% reduction below 1990 levels, set by Executive Order B-30-15 and codified by SB 32. Key programs that the proposed Second Update builds upon include the Cap-and-Trade Regulation, the LCFS, and much cleaner cars, trucks, and freight movement, utilizing cleaner, renewable energy, and strategies to reduce CH4 emissions from agricultural and other wastes. The 2017 Scoping Plan establishes a new emissions limit of 260 MMTCO2e for the year 2030, which corresponds to a 40% decrease in 1990 levels by 2030.

California's climate strategy would require contributions from all sectors of the economy, including the land base, and would include enhanced focus on zero and near-zero emission (ZE/NZE) vehicle technologies; continued investment in renewables, including solar roofs, wind, and other distributed generation; greater use of low carbon fuels; integrated land conservation and development strategies; coordinated efforts to reduce emissions of short-lived climate pollutants (CH4, black carbon, and fluorinated gases); and an increased focus on integrated land use planning to support livable, transit-connected communities and conservation of agricultural and other lands. Requirements for direct GHG reductions at refineries would further support air quality co-benefits in neighborhoods, including in disadvantaged communities historically located adjacent to these large stationary sources, as well as efforts with California's local air pollution control and air quality management districts (air districts) to tighten emission limits on a broad spectrum of industrial sources. Major elements of the 2017 Scoping Plan framework include:

- Implementing and/or increasing the standards of the Mobile Source Strategy, which include increasing zero-emission vehicles (ZEV) buses and trucks.
- LCFS, with an increased stringency (18% by 2030).
- Implementing SB 350, which expands the RPS to 50% RPS and doubles energy efficiency savings by 2030.
- California Sustainable Freight Action Plan, which improves freight system efficiency, utilizes near-zero emissions technology, and deployment of ZEV trucks.
- Implementing the proposed Short-Lived Climate Pollutant Strategy (SLPS), which focuses on reducing CH_4 and HCF emissions by 40% and anthropogenic black carbon emissions by 50% by year 2030.
- Continued implementation of SB 375.

- Post-2020 Cap-and-Trade Program that includes declining caps.
- 20% reduction in GHG emissions from refineries by 2030.
- Development of a Natural and Working Lands Action Plan to secure California's land base as a net carbon sink.

The *2017 Scoping Plan* acknowledges that:

> *"[a]chieving net zero increases in GHG emissions, resulting in no contribution to GHG impacts, may not be feasible or appropriate for every project, however, and the inability of a project to mitigate its GHG emissions to net zero does not imply the project results in a substantial contribution to the cumulatively significant environmental impact of climate change under CEQA."*

In addition to the statewide strategies listed above, the 2017 Scoping Plan also identifies local governments as essential partners in achieving the State's long-term GHG reduction goals and identifies local actions to reduce GHG emissions. As part of the recommended actions, CARB recommends that local governments achieve a community-wide goal to achieve emissions of no more than 6 metric tons of CO2e (MTCO2e) or less per capita by 2030 and 2 MTCO2e or less per capita by 2050. For CEQA projects, CARB states that lead agencies may develop evidence-based bright-line numeric thresholds—consistent with the 2017 Scoping Plan and the State's long-term GHG goals—and projects with emissions over that amount may be required to incorporate on- site design features and MMs that avoid or minimize project emissions to the degree feasible; or a performance-based metric using a CAP or other plan to reduce GHG emissions is appropriate.

According to research conducted by the Lawrence Berkeley National Laboratory (LBNL) and supported by CARB, California, under its existing and proposed GHG reduction policies, could achieve the 2030 goals under SB 32. The research utilized a new, validated model known as the California LBNL GHG Analysis of Policies Spreadsheet (CALGAPS), which simulates GHG and criteria pollutant emissions in California from 2010 to 2050 in accordance to existing and future GHG-reducing policies. The CALGAPS model showed that by 2030, emissions could range from 211 to 428 MTCO2e per year (MTCO2e/yr), indicating that "even if all modeled policies are not implemented, reductions could be sufficient to reduce emissions 40% below the 1990 level [of SB 32]." CALGAPS analyzed emissions through 2050 even though it did not generally account for policies that might be put in place after 2030. Although the research indicated that the emissions would not meet the State's 80% reduction goal by 2050, various combinations of policies could allow California's cumulative emissions to remain very low through 2050.

Cap-And-Trade Program

The 2017 Scoping Plan identifies a Cap-and-Trade Program as one of the key strategies for California to reduce GHG emissions. According to CARB, a cap-and-trade program would help put California on the path to meet its goal of achieving a 40% reduction in GHG emissions from 1990 levels by 2030. Under cap-and-trade, an overall limit on GHG emissions from capped sectors is established, and facilities subject to the cap would be able to trade permits to emit GHGs within the overall limit.

CARB adopted a California Cap-and-Trade Program pursuant to its authority under AB 32. The Cap-and-Trade Program is designed to reduce GHG emissions from regulated entities by more than 16% between 2013 and 2020, and by an additional 40% by 2030. The statewide cap for GHG emissions from the capped sectors (e.g., electricity generation, petroleum refining, and cement production) commenced in 2013 and would decline over time, achieving GHG emission reductions throughout the program's duration.

Covered entities that emit more than 25,000 MTCO2e/yr must comply with the Cap-and-Trade Program. Triggering of the 25,000 MTCO2e/yr "inclusion threshold" is measured against a subset of emissions reported and verified under the California Regulation for the Mandatory Reporting of GHG Emissions (Mandatory Reporting Rule or "MRR").

Under the Cap-and-Trade Program, CARB issues allowances equal to the total amount of allowable emissions over a given compliance period and distributes these to regulated entities. Covered entities are allocated free allowances in whole or part (if eligible), and may buy allowances at auction, purchase allowances from others, or purchase offset credits. Each covered entity with a compliance obligation is required to surrender "compliance instruments" for each MTCO2e of GHG they emit. There also are requirements to surrender compliance instruments covering 30% of the prior year's compliance obligation by November of each year.

The Cap-and-Trade Program provides a firm cap, which provides the highest certainty of achieving the 2030 target. An inherent feature of the Cap-and-Trade program is that it does not guarantee GHG emissions reductions in any discrete location or by any particular source. Rather, GHG emissions reductions are only guaranteed on an accumulative basis. As summarized by CARB in the First Update to the Climate Change Scoping Plan:

"The Cap-and-Trade Regulation gives companies the flexibility to trade allowances with others or take steps to cost-effectively reduce emissions at their own facilities. Companies that emit more have to turn in more allowances or other compliance instruments. Companies that can cut their GHG emissions have to turn in fewer allowances. But as the cap declines, aggregate emissions must be reduced. In other words, a covered entity theoretically could increase its GHG emissions every year and still comply with the Cap-and-Trade Program if there is a reduction in GHG emissions from other covered entities. Such a focus on aggregate GHG emissions is considered appropriate because climate change is a global phenomenon, and the effects of GHG emissions are considered cumulative."

The Cap-and-Trade Program covers approximately 80% of California's GHG emissions. The Cap-and-Trade Program covers the GHG emissions associated with electricity consumed in California, whether generated in-state or imported. Accordingly, GHG emissions associated with CEQA projects' electricity usage are covered by the Cap-and-Trade Program. The Cap-and-Trade Program also covers fuel suppliers (natural gas and propane fuel providers and transportation fuel providers) to address emissions from such fuels and from combustion of other fossil fuels not directly covered at large sources in the Program's first compliance period. The Cap-and-Trade Program covers the GHG emissions associated with the combustion of transportation fuels in California, whether refined in-state or imported.

The Sustainable Communities and Climate Protection Act Of 2008 (Sb 375)

On September 30, 2008, SB 375 was signed by the Governor. According to SB 375, the transportation sector, which emits over 40% of the total GHG emissions in California. SB 375 states, "Without improved land use and is the largest contributor of GHG emissions transportation policy, California would not be able to achieve the goals of AB 32." SB 375 does the following: it (1) requires metropolitan planning organizations (MPOs) to include sustainable community strategies in their regional transportation plans for reducing GHG emissions, (2) aligns planning for transportation and housing, and (3) creates specified incentives for the implementation of the strategies.

SB 375 requires Metropolitan Planning Organizations (MPOs) to prepare a Sustainable Communities Strategy (SCS) within the Regional Transportation Plan (RTP) that guides growth while taking into account

the transportation, housing, environmental, and economic needs of the region. SB 375 uses CEQA streamlining as an incentive to encourage residential projects, which help achieve AB 32 goals to reduce GHG emissions. Although SB 375 does not prevent CARB from adopting additional regulations, such actions are not anticipated in the foreseeable future.

Concerning CEQA, SB 375, as codified in Public Resources Code Section 21159.28, states that CEQA findings for certain projects are not required to reference, describe, or discuss (1) growth inducing impacts, or (2) any project-specific or cumulative impacts from cars and light-duty truck trips generated by the project on global warming or the regional transportation network, if the project:

1. Is in an area with an approved sustainable communities strategy or an alternative planning strategy that CARB accepts as achieving the GHG emission reduction targets.
2. Is consistent with that strategy (in designation, density, building intensity, and applicable policies).
3. Incorporates the MMs required by an applicable prior environmental document.

AB 1493 - Pavley Fuel Efficiency Standards

The second phase of the implementation for the Pavley bill was incorporated into Amendments to the Low-Emission Vehicle Program (LEV III) or the Advanced Clean Cars (ACC) program. The ACC program combines the control of smog-causing pollutants and GHG emissions into a single coordinated package of requirements for MY 2017 through 2025. The regulation will reduce GHGs from new cars by 34% from 2016 levels by 2025. The new rules will clean up gasoline and diesel powered cars, and deliver increasing numbers of zero-emission technologies, such as full battery electric cars, newly emerging plug-in hybrid EV and hydrogen fuel cell cars. The package will also ensure adequate fueling infrastructure is available for the increasing numbers of hydrogen fuel cell vehicles planned for deployment in California. On March 9, EPA reinstated California's authority under the Clean Air Act to implement its own GHG emission standards for cars and light trucks, which other states can also adopt and enforce. With this authority restored, EPA will continue partnering with states to advance the next generation of clean vehicle technologies.

Clean Energy and Pollution Reduction Act Of 2015 (Sb 350)

In October 2015, the legislature approved, and Governor Jerry Brown signed SB 350, which reaffirms California's commitment to reducing its GHG emissions and addressing climate change. Key provisions include an increase in the RPS, higher energy efficiency requirements for buildings, initial strategies towards a regional electricity grid, and improved infrastructure for EV charging stations. Provisions for a 50% reduction in the use of petroleum statewide were removed from the Bill because of opposition and concern that it would prevent the Bill's passage. Specifically, SB 350 requires the following to reduce statewide GHG emissions:

- Increase the amount of electricity procured from renewable energy sources from 33% to 50% by 2030, with interim targets of 40% by 2024, and 25% by 2027.
- Double the energy efficiency in existing buildings by 2030. This target would be achieved through the California Public Utilities Commission (CPUC), the California Energy Commission (CEC), and local publicly owned utilities.
- Reorganize the Independent System Operator (ISO) to develop more regional electrify transmission markets and to improve accessibility in these markets, which would facilitate the growth of renewable energy markets in the western United States.

Senate Bill No. 32 (SB 32)/AB 197

On September 8, 2016, Governor Brown signed SB 32 and its companion bill, AB 197. SB 32 requires the state to reduce statewide GHG emissions to 40% below 1990 levels by 2030, a reduction target that was first introduced in Executive Order B-30-15. The new legislation builds upon the AB 32 goal and provides an intermediate goal to achieving S-3-05, which sets a statewide GHG reduction target of 80% below 1990 levels by 2050. AB 197 creates a legislative committee to oversee regulators to ensure that CARB not only responds to the Governor, but also the Legislature.

SB 97 AND THE CEQA GUIDELINES UPDATE

Passed in August 2007, SB 97 added Section 21083.05 to the Public Resources Code. The code states "(a) On or before July 1, 2009, the Office of Planning and Research (OPR) shall prepare, develop, and transmit to the Resources Agency guidelines for the mitigation of GHG emissions or the effects of GHG emissions as required by this division, including, but not limited to, effects associated with transportation or energy consumption. (b) On or before January 1, 2010, the Resources Agency shall certify and adopt guidelines prepared and developed by the OPR pursuant to subdivision (a)."

In 2012, Public Resources Code Section 21083.05 was amended to state:

"The Office of Planning and Research and the Natural Resources Agency shall periodically update the guidelines for the mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions as required by this division, including, but not limited to, effects associated with transportation or energy consumption, to incorporate new information or criteria established by the State Air Resources Board pursuant to Division 25.5 (commencing with Section 38500) of the Health and Safety Code."

On December 28, 2018, the Natural Resources Agency announced the OAL approved the amendments to the *CEQA Guidelines* for implementing CEQA. The CEQA Amendments provide guidance to public agencies regarding the analysis and mitigation of the effects of GHG emissions in CEQA documents. The CEQA Amendments fit within the existing CEQA framework by amending existing *CEQA Guidelines* to reference climate change.

Section 15064.4 was added the *CEQA Guidelines* and states that in determining the significance of a project's GHG emissions, the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project's emissions to the effects of climate change. A project's incremental contribution may be cumulatively considerable even if it appears relatively insignificant compared to statewide, national, or global emissions. The agency's analysis should consider a timeframe that is appropriate for the project. The agency's analysis also must reasonably reflect evolving scientific knowledge and state regulatory schemes. Additionally, a lead agency may use a model or methodology to estimate GHG emissions resulting from a project. The lead agency has discretion to select the model or methodology it considers most appropriate to enable decision makers to intelligently take into account the project's incremental contribution to climate change. The lead agency must support its selection of a model or methodology with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use.

EXECUTIVE ORDERS RELATED TO GHG EMISSIONS

California's Executive Branch has taken several actions to reduce GHGs through the use of Executive Orders. Although not regulatory, they set the tone for the state and guide the actions of state agencies.

Executive Order S-3-05

California Governor Arnold Schwarzenegger announced on June 1, 2005, through Executive Order S-3-05, the following reduction targets for GHG emissions:

- By 2010, reduce GHG emissions to 2000 levels.
- By 2020, reduce GHG emissions to 1990 levels.
- By 2050, reduce GHG emissions to 80% below 1990 levels.

The 2050 reduction goal represents what some scientists believe is necessary to reach levels that would stabilize the climate. The 2020 goal was established to be a mid-term target. Because this is an executive order, the goals are not legally enforceable for local governments or the private sector, and do not apply to the Project.

Executive Order S-01-07 (LCFS)

Governor Schwarzenegger signed Executive Order S-01-07 on January 18, 2007. The order mandates that a statewide goal shall be established to reduce the carbon intensity of California's transportation fuels by at least 10% by 2020. CARB adopted the LCFS on April 23, 2009.

After a series of legal changes, in order to address the Court ruling, CARB was required to bring a new LCFS regulation to the Board for consideration in February 2015. The proposed LCFS regulation was required to contain revisions to the 2010 LCFS as well as new provisions designed to foster investments in the production of the low-carbon intensity fuels, offer additional flexibility to regulated parties, update critical technical information, simplify and streamline program operations, and enhance enforcement. On November 16, 2015, the Office of Administrative Law (OAL) approved the Final Rulemaking Package. The new LCFS regulation became effective on January 1, 2016.

In 2018, CARB approved amendments to the regulation, which included strengthening the carbon intensity benchmarks through 2030 in compliance with the SB 32 GHG emissions reduction target for 2030. The amendments included crediting opportunities to promote zero emission vehicle adoption, alternative jet fuel, carbon capture and sequestration, and advanced technologies to achieve deep decarbonization in the transportation sector. This is provided for informational purposes only and does not apply to this Project.

Executive Order S-13-08

Executive Order S-13-08 states that "climate change in California during the next century is expected to shift precipitation patterns, accelerate sea level rise and increase temperatures, thereby posing a serious threat to California's economy, to the health and welfare of its population and to its natural resources." Pursuant to the requirements in the Order, the 2009 California Climate Adaptation Strategy (CNRA 2009) was adopted, which is the "…first statewide, multi-sector, region-specific, and information-based climate change adaptation strategy in the United States." Objectives include analyzing risks of climate change in California, identifying, and exploring strategies to adapt to climate change, and specifying direction for future research. This is provided for informational purposes only and does not apply to this Project.

Executive Order B-30-15

On April 29, 2015, Governor Brown issued an executive order to establish a California GHG reduction target of 40% below 1990 levels by 2030. The Order sets a new interim statewide GHG emission reduction target to reduce GHG emissions to 40% below 1990 levels by 2030 in order to ensure California meets its target of reducing GHG emissions to 80% below 1990 levels by 2050 and directs CARB to update the *2017 Scoping Plan* to express the 2030 target in terms of $MMTCO_2e$. The Order also requires the state's climate adaptation plan to be updated every three years, and for the State to continue its climate change research program, among other provisions. As with Executive Order S-3-05, this Order is not legally enforceable as to local governments and the private sector and does not apply to this Project. Legislation that would update AB 32 to make post 2020 targets and requirements a mandate is in process in the State Legislature.

Executive Order B-55-18 And Sb 100

SB 100 and Executive Order B-55-18 were signed by Governor Brown on September 10, 2018. Previously, 25% of retail sales of electricity are required to be from renewable sources by December 31, 2016, 33% by December 31, 2020, 40% by December 31, 2024, 45% by December 31, 2027, and 50% by December 31, 2030. SB 100 raises California's RPS requirement to 50% renewable resources target by December 31, 2026, and to achieve a 60% target by December 31, 2030. SB 100 also requires that retail sellers and local publicly owned electric utilities procure a minimum quantity of electricity products from eligible renewable energy resources so that the total kilowatt hours (kWh) of those products sold to their retail end-use customers achieve 44% of retail sales by December 31, 2024, 52% by December 31, 2027, and 60% by December 31, 2030. In addition to targets under AB 32 and SB 32, Executive Order B-55- 18 establishes a carbon neutrality goal for the state of California by 2045; and sets a goal to maintain net negative emissions thereafter. The Executive Order directs the California Natural Resources Agency (CNRA), California EPA (CalEPA), the California Department of Food and Agriculture (CDFA), and CARB to include sequestration targets in the Natural and Working Lands Climate Change Implementation Plan consistent with the carbon neutrality goal which does not apply to local governments and the private sector and does not apply to this Project.

CALIFORNIA REGULATIONS AND BUILDING CODES

California has a long history of adopting regulations to improve energy efficiency in new and remodeled buildings. These regulations have kept California's energy consumption relatively flat even with rapid population growth.

Title 20 CCR Sections 1601 Et Seq. – Appliance Efficiency Regulations

The Appliance Efficiency Regulations regulate the sale of appliances in California. The Appliance Efficiency Regulations include standards for both federally regulated appliances and non- federally regulated appliances. 23 categories of appliances are included in the scope of these regulations. The standards within these regulations apply to appliances that are sold or offered for sale in California, except those sold wholesale in California for final retail sale outside the state and those designed and sold exclusively for use in recreational vehicles (RV) or other mobile equipment (CEC 2012).

Title 24 Energy Efficiency Standards and California Green Building Standards

The California Energy Code was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods.

Title 24 CCR Part 11 – California Green Building Standards Code

California Code of Regulations (CCR) Title 24 Part 6: The California Energy Code was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption.

The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. CCR, Title 24, Part 11: California Green Building Standards Code (CALGreen) is a comprehensive and uniform regulatory code for all residential, commercial, and school buildings that went in effect on August 1, 2009, and is administered by the California Building Standards Commission.

CALGreen is updated on a regular basis, with the most recent approved update consisting of the 2025 California Green Building Code Standards that went into effect on January 1, 2026. The Project would be required to comply with the applicable standards in place at the time plan check submittals are made. The Project would be required to comply with the applicable standards in place at the time plan check submittals are made. These require, among other items:

Nonresidential Mandatory Measures

- Short-term bicycle parking. If the new project or an additional alteration is anticipated to generate visitor traffic, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passers-by, for 5% of new visitor motorized vehicle parking spaces being added, with a minimum of one two-bike capacity rack (5.106.4.1.1).
- Long-term bicycle parking. Acceptable bicycle parking facility for Sections 5.106.4.1.2.1, 5.106.4.1.2.2 and 5.106.4.1.2.3 shall be conveniently located near the street and shall meet one of the following:

    1) Covered, lockable enclosures with permanently anchored racks for bicycles;

    2) Lockable bicycle rooms with permanently anchored racks; or

    3) Lockable, permanently anchored bicycle lockers.

Calculations for bicycle parking requirements shall be rounded up to the nearest whole

number (5.106.4.1.2).

- Electric Vehicle (EV) charging stations. Construction to provide EV infrastructure and facilitate EV charging shall comply with Section 5.106.5.3.1 EV capable spaces, Section 5.106.5.3.2. EV charging stations and associated Table 5.106.5.3.1, or Section 5.106.5.3.6 EV charging stations – Power allocation method and associated Table 5.106.5.3.6, and shall be provided in accordance with regulations in the California Building Code and the California Electrical Code.
- Light pollution reduction. Outdoor lighting systems shall be designed and installed to comply with the following:

    1) The minimum requirements in the *California Energy Code* for Lighting Zones 0-4 as defined in Chapter 10, Section 10-114 of the *California Administrative Code*; and

    2) Backlight (B) ratings as defined in IES TM-15-11 (shown in Table A-1 in Chapter 8);

3) Uplight and Glare ratings as defined in *California Energy Code* (shown in Tables 130.2-A and 130.2-B in Chapter 8)

4) Allowable BUG ratings not exceeding those shown in Table 5.106.8, or

5) Comply with a local ordinance lawfully enacted pursuant to Section 101.7, whichever is more stringent (5.106.8).

- Construction waste management. Recycle and/or salvage for reuse a minimum of 65% of the nonhazardous construction and demolition waste in accordance with Section
- 5.408.1.1. 5.405.1.2, or 5.408.1.3; or meet a local construction and demolition waste management ordinance, whichever is more stringent (5.408.1)
- Excavated soil and land clearing debris. 100% of trees, stumps, rocks and associated vegetation and soils resulting primarily from land clearing shall be reused or recycled. For a phased project, such material may be stockpiled on site until the storage site is developed (5.408.3).
- Recycling by Occupants. Provide readily accessible areas that serve the entire building and are identified for the depositing, storage, and collection of non-hazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastics, organic waste, and metals or meet a lawfully enacted local recycling ordinance, if more restrictive (5.410.1).
- Water conserving plumbing fixtures and fittings. Plumbing fixtures (water closets and urinals) and fittings (faucets and showerheads) shall comply with the following:

    1) Water Closets. The effective flush volume of all water closets shall not exceed 1.28 gallons per flush (5.303.3.1).

    2) Urinals. The effective flush volume of wall-mounted urinals shall not exceed 0.125 gallons per flush (5.303.3.2.1). The effective flush volume of floor- mounted or other urinals shall not exceed 0.5 gallons per flush (5.303.3.2.2).

    3) Showerheads. Single showerheads shall have a minimum flow rate of not more than 1.8 gallons per minute and 80 psi (5.303.3.3.1). When a shower is served by more than one showerhead, the combined flow rate of all showerheads and/or other shower outlets controlled by a single valve shall not exceed 1.8 gallons per minute at 80 psi (5.303.3.3.2).

    4) Faucets and fountains. Nonresidential lavatory faucets shall have a maximum flow rate of not more than 0.5 gallons per minute at 60 psi (5.303.3.4.1). Kitchen faucets shall have a maximum flow rate of not more than 1.8 gallons per minute of 60 psi (5.303.3.4.2). Wash fountains shall have a maximum flow rate of not more than 1.8 gallons per minute/20 [rim space (inches) at 60 psi (5.303.3.4.3). Metering faucets shall not deliver more than 0.20 gallons per cycle (5.303.3.4.4). Metering faucets for wash fountains shall have a maximum flow rate not more than 0.20 gallons per cycle (5.303.3.4.5).

- Outdoor potable water use in landscaped areas. Nonresidential developments shall comply with a local water efficient landscape ordinance or the current California Department of Water Resources' Model Water Efficient Landscape Ordinance (MWELO), whichever is more stringent (5.304.1).
- Meters. For new buildings or additions in excess of 50,000 square feet, separate submeters shall be installed as follows (5.303.1.1):

1) For each individual leased, rented or other tenant space within the building projected to consume more than 100 gal/day (380 L/day), including, but not limited to, spaces used for laundry or cleaners, restaurant or food service, medical or dental office, laboratory, or beauty salon or barber shop.
2) Where separate submeters for individual buildings tenants are unfeasible, for water supplied to the following subsystems:
    a. Makeup water for cooling towers where flow through is greater than 500 gpm (30 L/s).
    b. Makeup water for evaporative coolers greater than 6 gpm (0.04 L/s).
    c. Steam and hot-water boilers with energy input more than 500,000 BTU/h (147 kW).

For excess consumption, a separate submeter or metering device shall be provided for any tenant within a new building or within an addition that is projected to consume more than 1,000 gal/day (5.303.1.2).

- Commissioning. For new buildings 10,000 square feet and over, building commissioning shall be included in the design and construction processes of the building project to verify that the building systems and components meet the owner's or owner representative's project requirements (5.410.2).

REGIONAL REGULATIONS

The County is located within the SCAB, which is under the jurisdiction of the SCAQMD. SCAQMD operates within a regulatory structure set by the state, enforcing rules and implementing air quality improvement programs based on California's stringent environmental standards.

South Coast Air Quality Management District (SCAQMD)

SCAQMD is the agency responsible for air quality planning and regulation in the SCAB. The SCAQMD addresses the impacts to climate change of projects subject to SCAQMD permit as a lead agency, if they are the only agency having discretionary approval for the project, and acts as a responsible agency when a land use agency must also approve discretionary permits for the project. The SCAQMD acts as an expert commenting agency for impacts to air quality. This expertise carries over to GHG emissions, so the agency helps local land use agencies through the development of models and emission thresholds that can be used to address GHG emissions.

In 2008, SCAQMD formed a Working Group to identify GHG emissions thresholds for land use projects that could be used by local lead agencies in the SCAB. The Working Group developed several different options that are contained in the SCAQMD Draft Guidance Document – Interim CEQA GHG Significance Threshold, which could be applied by lead agencies. The working group has not provided additional guidance since release of the interim guidance in 2008. The SCAQMD Board has not approved the thresholds; however, the Guidance Document provides substantial evidence supporting the approaches to significance of GHG emissions that can be considered by the lead agency in adopting its own threshold. The proposed Project relies on SCAQMD's Tier 4 threshold as follows:

- Tier 4 has the following options:

- Option 1: Reduce Business-as-Usual (BAU) emissions by a certain percentage; this percentage is currently undefined.
- Option 2: Early implementation of applicable AB 32 Scoping Plan measures
- Option 3: 2020 target for service populations (SP), which includes residents and employees: 4.8 $MTCO_2e$ per SP per year for projects and 6.6 $MTCO_2e$ per SP per year for plans;
- Option 3, 2035 target: 3.0 $MTCO_2e$ per SP per year for projects and 4.1 $MTCO_2e$ per SP per year for plans

The SCAQMD's interim thresholds used the Executive Order S-3-05-year 2050 goal as the basis for the Tier 4 screening level. Achieving the Executive Order's objective would contribute to worldwide efforts to cap CO2 concentrations at 450 ppm, thus stabilizing global climate.

LOCAL REGULATIONS

City of Hesperia General Plan

The City of Hesperia adopted its General Plan in 2010, and the most recent General Plan Amendments were adopted in 2025.[1] The General Plan provides goals and policies to guide decision-makers and the community toward its vision to create a better Hesperia for everyone. A general plan is also a long-term document, projecting conditions and needs 20 to 25 years into the future to inform and direct shorter-term decisions such as annual budgeting, improvements to public facilities, partnerships to spur economic growth, and investments to enhance safety. The plan includes policies and programs within various elements and technical appendices that reduce GHG emissions in the City.

The current General Plan reduces GHG emissions through planning measures, such as limiting water consumption, sufficient bicycle and pedestrian routes, and reducing energy consumption. The City's applicable GHG goals and policies from the Health and Safety Element are listed below.

HUMAN HEALTH HAZARDS POLICIES

Goal SF-6:	***A resilient community able to adapt to climate change hazards.***
Policy SF-6.1	Promote water conservation measures in all public and private development.
Policy SF-6.2	Work with regional water providers to implement extensive water conservation measures and ensure sustainable water supplies, including for fire suppression needs.
Policy SF-6.3	Support local agencies to promote public awareness on resilience initiatives related to poor air quality, drought, extreme heat, severe weather, water conservation, and human health hazards.
Policy SF-6.4	Coordinate with the Victor Valley Transit Authority to increase shading and use of heat-mitigating materials on pedestrian walkways and at transit stops.

[1] City of Hesperia General Plan. Website: https://www.hesperiaca.gov/409/Hesperia-General-Plan Accessed October 4, 2025.

Policy SF-6.5 Develop and maintain an Extreme Heat Action Plan in accordance with State guidance.

Policy SF-6.6 Promote the use of drought-tolerant green infrastructure, including landscaped areas, as part of cooling strategies in public and private spaces.

Policy SF-6.7 Encourage local businesses to develop workplace heat safety protocols and provide training for employers and employees in heat-exposed occupations.

Policy SF- 6.8 Improve the resiliency of City-owned structures to severe weather events and support homeowners and business owners to improve the resilience of their buildings and properties through retrofits, weatherization, and other improvements.

Policy SF- 6.9 Coordinate with the City's utility service providers to upgrade, harden, and/or underground their facilities and infrastructure in Hesperia, to improve their survivability of a natural or human-caused hazard event.

Policy SF- 6.10 Participate in regional partnerships that support increased community resilience, such as the Inland Southern California Climate Collaborative.

Policy SF- 6.11 Coordinate with the San Bernardino County Department of Public Health and healthcare providers to support free or reduced-cost medical care for low-resourced households.

Policy SF- 6.12 Coordinate with local agencies, healthcare providers, and community-based organizations that provide resources to help residents respond to poor air quality events (e.g., transportation to resilience centers and supply free N95 masks).

Policy SF- 6.13 Work with local contractors and community-based organizations to help low-income households and community service providers obtain or upgrade indoor air filtration systems.

BICYLE AND PEDESTRIAN ROUTES POLICIES

Goal HC-2 **Ample parks, trails, community facilities, and services that meet community needs, are well maintained, distributed equitably, and provide opportunities for active living.**

Policy HC-2.1 Create an integrated system of bike, trail, and pedestrian routes that connect neighborhoods, corridors, recreation, and other major facilities.

Policy HC- 2.2 Collaborate with the Hesperia Recreation and Park District to assess development impact fees of five acres of parkland for every 1,000 new residents served by new residential developments.

Policy HC- 2.3 Work with the Hesperia Recreation and Park District to provide an appropriately designed public park within a 15-minute walk of all homes to ensure equitable access from all neighborhoods.

Policy HC- 2.4 Support partnerships that provide active and passive recreational activities that are affordable and accessible and sensitive to the needs of different ages and abilities.

Policy HC- 2.5 Work with local schools in the community to ensure that all public schools have safe and walkable routes to school that can encourage youth to be physically active.

Policy HC-2.6 Ensure that the function and design of parks, bicycle routes, and sidewalks meet the needs of residents of different age groups and abilities, and also serve northern and southern Hesperia.

ENERGY EFFICIENCY AND ENERGY CONSERVATION POLICIES

Goal CN-6 **Provide programs and incentives to encourage residents, businesses and developers to reduce consumption and efficiently use energy resources.**

Policy CN-6.1 Develop a green building program in the City to educate the development community and promote the conservation of natural resources.

Policy CN-6.2 Encourage the use of green building standards and Leadership in Energy and Environmental Design (LEED) or similar programs in both private and public projects.

Policy CN-6.3 Provide incentives like technical assistance and low-interest loans for projects that are energy efficient and contain energy conservation measures.

Policy CN-6.4 Educate the public about energy conservation techniques.

Policy CN-6.5 Coordinate with the local energy provider in developing policies and procedures to reduce energy consumption in existing and future developments.

Policy CN-6.6 Encourage residents and businesses to utilize the incentives provided by the local energy providers to retrofit their buildings and businesses for energy efficiency and conservation.

Policy CN-6.7 Continue the existing recycling program and utilization of the material recovery facility program while exploring additional methods of reducing waste.

GLOBAL CLIMATE CHANGE POLICIES

Goal CN-7 **Develop, promote and implement policies to reduce and limit Greenhouse Gas Emissions.**

Policy CN-7.1 Coordinate with the Regional Councils of Government in developing appropriate regional climate action policies.

Policy CN-7.2 In conjunction with regional councils of government, prepare and implement a city climate action plan.

Policy CN-7.3 Coordinate with neighboring cities and public jurisdictions in the preservation of air quality resources.

Policy CN-7.4	Promote the utilization of alternative energy resources such as wind and solar in new development.
Policy CN-7.5	Promote the utilization of environmentally sensitive construction materials to limit impacts on the ozone, global climate change and mineral resources.
Policy CN-7.6	Preserve land resources for the utilization of energy resources, including wind and solar energy resources.
Policy CN-7.7	Promote energy conservation through site layout, building design, natural light and efficient mechanical and electrical products in development.
Policy CN-7.8	Continue the existing recycling program and utilization of the material recovery facility program while exploring additional methods of reducing waste.
Policy CN-7.9	Promote sustainable principles in development that conserves such natural resources as air quality and energy resources.

City of Hesperia Climate Action Plan

On July 20, 2010, the City of Hesperia adopted the CAP, which provides a framework for reducing GHG emissions and managing resources to best prepare for a changing climate. The CAP recommends GHG emissions targets that are consistent with the reduction targets of the State of California and presents a number of strategies that will make it possible for the City to meet the recommended targets. Strategy CAP-1 specifies that "projects that are consistent with this CAP could result in less than significant impacts regarding climate change. This is because emissions from these projects are generally accounted for in this CAP and would be consistent with this CAP reduction target. To be consistent with this CAP, CEQA projects must implement the applicable CAP implementation strategies listed in Section 4.2."

Although Project consistency with the CAP is demonstrated in the following subsections for informational purposes, the CAP is not relied upon as the sole basis for determining the significance of GHG emissions. The CAP was adopted in 2010 and has not been updated to reflect subsequent changes in state law, including SB 32, updated CARB Scoping Plans, and more recent GHG reduction targets. As a result, while CAP consistency is informative, reliance on the CAP alone would not provide an adequate or current basis for determining GHG significance under CEQA.

5.02.4 - Thresholds of Significance

Appendix G to the State CEQA Guidelines is a sample Initial Study Checklist that includes questions for determining whether impacts related to GHG emissions and energy consumption are significant. These questions reflect the input of planning and environmental professionals at the Governor's Office of Planning and Research and the California Natural Resources Agency, based on input from stakeholder groups and experts in various other governmental agencies, nonprofits, and leading environmental consulting firms. They also reflect the requirements of laws other than CEQA, such as AB 32 and SB 32. As a result, many lead agencies derive their significance criteria from the questions posed in Appendix G. The County has chosen to do for this Project. Thus, the proposed Project would have significant effects if the Project would:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or

b) Conflict with any applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Section 15064.4(b) of the State CEQA Guidelines' 2018 amendments for GHG emissions states that a lead agency may take into account the following three considerations in assessing the significance of impacts from GHG emissions.

- **Consideration No. 1**: The extent to which the Project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting.
- **Consideration No. 2**: Whether the Project emissions exceed a threshold of significance that the lead agency determines applies to the Project.
- **Consideration No. 3**: The extent to which the Project complies with regulations or requirements adopted to implement a Statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such regulations or requirements must be adopted by the relevant public agency through a public review process and must include specific requirements that reduce or mitigate the Project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular Project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the Project. In determining the significance of impacts, the lead agency may consider a Project's consistency with the State's long-term climate goals or strategies, provided that substantial evidence supports the agency's analysis of how those goals or strategies address the Project's incremental contribution to climate change and its conclusion that the Project's incremental contribution is not cumulatively considerable.

5.02.5 - Methodology

MODELS EMPLOYED TO ANALYZE GHG EMISSIONS

California Emissions Estimator Model (CalEEmod)

The California Air Pollution Control Officers Association (CAPCOA) in conjunction with other California air districts, including MDAQMD, released CalEEMod 2022 in May 2022. CalEEMod periodically releases updates; as such, the latest version available at the time of the GHG report has been utilized in this analysis. The purpose of this model is to calculate construction-source and operational-source criteria pollutants and GHG emissions from direct and indirect sources; and quantify applicable air quality and GHG reductions achieved from mitigation measures. Accordingly, the latest version of CalEEMod has been used for this Project to determine GHG emissions. Output from the model runs for construction and operational activity for the Project are provided in Appendix G. CalEEMod includes GHG emissions from the following source categories: construction, area, energy, mobile, waste, water, refrigerants, stationary and on-site cargo equipment.

Construction Emissions

The Project involves construction activities associated with site preparation, grading, building construction, paving, and architectural coating. Construction activities associated with the Project would result in emissions of CO_2 and CH_4. The Air Quality Impact Analysis Report (Appendix A) contains detailed information regarding Project construction activities. As discussed in the Appendix A, Construction related emissions are expected from the following construction activities:

- Site Preparation
- Grading
- Building Construction
- Paving
- Architectural Coating

Construction Duration

The Project will be constructed in one phase. For purposes of analysis, Project construction is assumed to begin in October 2026 and continue through September 2027. The construction schedule utilized in the analysis, shown in Table 5.04-4, represents a "conservative" analysis scenario. That is, should construction occur any time after the assumed dates, construction emissions would be reduced when compared to the levels presented here. This is due to the decrease in emission factors for construction equipment over time, and increasing stringency in emissions regulations. The duration of construction activity and associated equipment represents a reasonable approximation of the expected construction fleet as required per the CEQA Guidelines.

Table 5.02-4: Construction Duration

Construction Activity	Start Date	End Date	Days
Site Preparation	10/1/2026	10/19/2026	13
Grading	10/20/2026	12/17/2026	43
Building Construction	12/2/2026	8/19/2027	187
Paving	8/5/2027	9/20/2027	33
Architectural Coating	7/27/2027	9/20/2027	40

Source: Appendix G *Greenhouse Gas Analysis prepared by* Urban Crossroads.

Construction Equipment

Consistent with industry standards and typical construction practices, each piece of equipment listed in Table 5.04-5 is assumed to operate up to a total of eight (8) hours per day, or more than two-thirds of the period during which construction activities are allowed pursuant to the County code.

Table 5.02-5: Construction Equipment Assumptions

Construction Activity	Equipment	Quantity	Hours
Site Preparation	Rubber Tired Dozers	3	8
	Crawler Tractors	4	8
Grading	Excavators	2	8
	Graders	1	8

	Rubber Tired Dozers	1	8
	Scrapers	2	8
	Crawler Tractors	2	8
Building Construction	Cranes	1	8
	Forklifts	3	8
	Generator Sets	1	8
	Tractors/Loaders/Backhoes	3	8
	Welders	1	8
Paving	Pavers	2	8
	Paving Equipment	2	8
	Rollers	2	8
Architectural Coating	Air Compressors	1	8

Source: Appendix G *Greenhouse Gas Analysis prepared by* Urban Crossroads.

Construction Emissions Summary

For construction phase emissions, GHGs are quantified and amortized over the life of the Project. To amortize the emissions over the life of the Project, the MDAQMD recommends calculating the total GHG emissions for the construction activities, dividing it by a 30-year Project life then adding that number to the annual operational phase GHG emissions. As such, construction emissions were amortized over a 30-year period and added to the annual operational phase GHG emissions. The amortized construction emissions from each phase are presented in Table 5.02-6.

Table 5.02-6: Amortized Annual Construction Emissions

Year	CO_2T	CH_4	N_2O	R	Total CO_2e
2026	472.48	0.01	0.04	0.28	485.36
2027	569.20	0.01	0.03	0.45	578.20
Total	**1,041.68**	**0.02**	**0.07**	**0.73**	**1,063.57**
Amortized	**34.72**	**0.00**	**0.00**	**0.02**	**35.45**

Source: Appendix G *Greenhouse Gas Analysis prepared by* Urban Crossroads.

Operational Emissions

Operational activities associated with the Project will result in emissions of VOCs, NO_X, CO, SO_X, PM_{10}, and $PM_{2.5}$. Operational emissions would be expected from the following primary sources:

- Area Source Emissions

- Energy Source Emissions
- Mobile Source Emissions
- On-Site Cargo Handling Equipment Emissions

AREA SOURCE EMISSIONS

ARCHITECTURAL COATING

Over a period of time the buildings that are part of this Project will require maintenance and will therefore produce emissions resulting from the evaporation of solvents contained in paints, varnishes, primers, and other surface coatings.

CONSUMER PRODUCTS

Consumer products include, but are not limited to detergents, cleaning compounds, polishes, personal care products, and lawn and garden products. Many of these products contain organic compounds which when released in the atmosphere can react to form ozone and other photochemically reactive pollutants.

LANDSCAPE MAINTENANCE EQUIPMENT

Landscape maintenance equipment would generate emissions from fuel combustion and evaporation of unburned fuel. Equipment in this category would include lawnmowers, shedders/grinders, blowers, trimmers, chain saws, and hedge trimmers used to maintain the landscaping of the Project. It should be noted that as October 9, 2021, Governor Gavin Newsom signed AB 1346. The bill aims to ban the sale of new gasoline-powered equipment under 25 gross horsepower (known as small off-road engines [SOREs]) by 2024.

ENERGY SOURCE EMISSIONS

COMBUSTION EMISSIONS ASSOCIATED WITH NATURAL GAS AND ELECTRICITY

Greenhouse gases (GHGs) are emitted from buildings primarily through the use of electricity and natural gas. Criteria pollutant emissions are emitted through the generation of electricity and consumption of natural gas. However, because electrical generating facilities for the Project area are located either outside the region (state) or offset through the use of pollution credits (RECLAIM) for generation within the MDAB, criteria pollutant emissions from offsite generation of electricity are generally excluded from the evaluation of significance and only natural gas use is considered.

MOBILE SOURCE EMISSIONS

The Project related operational air quality emissions derive primarily from vehicle trips generated by the Project, including employee trips to and from the site and truck trips associated with the proposed uses. Trip characteristics available from the Amargosa and Palmetto High-Cube Warehouse Trip Generation Comparison Analysis were utilized in the analysis.

ON-SITE CARGO HANDLING EQUIPMENT EMISSIONS

It is common for warehouse buildings to require the operation of exterior cargo handling equipment in the building's truck court areas. For this particular Project, on-site modeled operational equipment includes up to two (2) 200 horsepower (hp), compressed natural gas or gasoline-powered tractors/loaders/backhoes operating at 4 hours a day8 for 365 days of the year.

EMISSIONS SUMMARY

Impacts Without Mitigation

The estimated Project-related GHG emissions are summarized in Table 5.02-7. Detailed operation model outputs for the Project are presented in Appendix N. As shown on Table 5.02-7, the Project would result in 4,257.17 MTCO2e/yr.

Table 5.02-7: Project GHG Emissions

Source	Emissions (MT/yr)				
	CO_2T	CH_4	N_2O	R	Total CO_2E
Annual construction emissions (amortized 30 yrs)	34.72	0.00	0.00	0.02	35.45
Mobile Source	2,724.22	0.05	0.23	13.17	2,807.59
Area Source	7.30	0.00	0.00	0.00	7.32
Energy Source	885.55	0.08	0.01	0.00	889.18
Water Source	145.66	3.77	0.09	0.00	266.89
Waste Source	41.91	4.19	0.00	0.00	146.64
Stationary	19.04	0.00	0.00	0.00	19.10
On-Site Equipment Source	0.00	0.00	0.00	0.00	94.75
Total CO_2E (All Sources)	**4,257.17**				

Source: CalEEMod output, Appendix G.

As shown, construction and operation of the Project would generate a total of approximately 4,257.17 MTCO2e/yr., which would exceed the significance threshold of 3,000 MTCO2e/yr.; therefore, Project-related GHG emissions are considered potentially significant. The majority of the GHG emissions (59%) are associated with non-construction related mobile sources, as shown previously in Table 5.02-7. Emissions of motor vehicles are controlled by State and Federal standards, and the Project has no control over these emissions.

5.02.6 - Project Impacts and Mitigation Measures

Greenhouse gas (GHG) emissions were evaluated in detail in this EIR in accordance with CEQA Guidelines Section 15064.4. Based on the Greenhouse Gas Analysis (Appendix N), the Project would generate emissions that exceed the applicable Mojave Desert Air Quality Management District (MDAQMD) threshold. Therefore, GHG impacts are considered significant and unavoidable.

This section discusses potential impacts associated with the Project and provides mitigation measures where necessary.

Impact GHG-20(a): Would the Project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Impact Statement: Construction and operation activities under the proposed Project would generate greenhouse gas emissions either directly or indirectly, that will have a significant impact on the environment.

Impact Analysis

Urban Crossroads conducted a Greenhouse Gas Analysis for the proposed Project, dated March 24, 2026. The analysis provides the estimated GHG emissions that will result from Project construction and operation. Construction related GHG emissions are quantified and amortized over the life of the Project, which is identified as a 30-year period, in accordance with the MDAQMD which follows the South Coast Air Quality Management District (SCAQMD) recommendation. Project operational emissions would consist of mobile source emissions, area source emissions, energy source emissions, on-site cargo handling equipment emissions, solid waste management, refrigeration, stationary source and water supply, treatment, and distribution.

As shown in Table 5.-02.7, the Project would result in approximately 4,257.17 $MTCO_2e$/year, exceeding the 3,000 $MTCO_2e$ threshold. Therefore, the Project would result in a significant impact. The Project must incorporate the following mitigation measures **MM GHG-1** through **MM GHG-4** designed to reduce Project GHG emissions. Due to the programmatic and performance-based nature of the mitigation measures, precise quantification of emissions reductions is not feasible. However, these measures represent feasible strategies to reduce GHG emissions consistent with CEQA Guidelines.

Mitigation Measures

MM GHG-1 The Project shall implement the following measures in order to reduce operational mobile source air pollutant emissions to the extent feasible:

- Only haul trucks meeting model year 2010 engine emission standards shall be used for the on-road transport of materials to and from the Project site.
- Legible, durable, weather-proof signs shall be placed at truck access gates, loading docks, and truck parking areas that identify applicable California Air Resources Board (CARB) anti-idling regulations. At a minimum, each sign shall include: (1) instructions for truck drivers to shut off engines when not in use; (2) instructions for drivers of diesel trucks to restrict idling to no more than 5 minutes once the vehicle is stopped, the transmission is set to "neutral" or "park," and the 14848-04 GHG Report 48 Amargosa and Palmetto High-Cube Warehouse parking brake is engaged; and (3) telephone numbers of the building facilities manager and CARB to report violations. Prior to the issuance of an occupancy permit, the City of Hesperia shall conduct a site inspection to ensure that the signs are in place.
- Prior to tenant occupancy, the Project Applicant or successor in interest shall provide documentation to the City demonstrating that occupants/tenants of the Project site have been provided documentation on funding opportunities, such as the Carl Moyer Program, that provide incentives for using cleaner-than-required engines and equipment.

- The minimum number of automobile electric vehicle (EV) charging stations required by the California Code of Regulations Title 24 shall be provided. In addition, the buildings shall include electrical infrastructure sufficiently sized to accommodate the potential installation of additional auto and truck EV charging stations in the future.
- Conduit shall be installed to tractor trailer parking areas in logical locations determined by the Project Applicant during construction document plan check, for the purpose of accommodating the future installation of EV truck charging stations at such time this technology becomes commercially available.

MM GHG-2 The Project shall implement the following measures in order to reduce operational energy source air pollutant emissions to the extent feasible:

- The Project shall include rooftop solar panels to the extent feasible, with a capacity that matches the maximum allowed for distributed solar connections to the grid.
- Install Energy Star-rated heating, cooling, lighting, and appliances.
- Provide information on energy efficiency, energy-efficient lighting and lighting control systems, energy management, and existing energy incentive programs to future tenants of the Project.
- Structures shall be equipped with outdoor electric outlets in the front and rear of the structures to facilitate use of electrical lawn and garden equipment.

MM GHG-3 The Project shall include the following language within tenant lease agreements in order to reduce operational air pollutant emissions to the extent feasible:

- Require tenants to use the cleanest technologies available and to provide the necessary infrastructure to support zero-emission vehicles, equipment, and appliances that would be operating on site. This requirement shall apply to equipment such as forklifts, handheld landscaping equipment, yard trucks, office appliances, etc.
- Require future tenants to exclusively use zero-emission light and medium-duty delivery trucks and vans, when economically feasible.
- Tenants shall be in, and monitor, compliance with all current air quality regulations for on-road trucks including the CARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation, Periodic Smoke Inspection Program, and the Statewide Truck and Bus Regulation.

MM GHG-4 Prior to the issuance of a building permit, Developer shall provide documentation to the City of Hesperia demonstrating that the Project will achieve Leadership in Energy and Environmental Design (LEED) certification to meet or exceed CALGreen Tier 2 standards in effect at the time of building permit application.

Level of Significance Before Mitigation

Potentially significant impact.

Level of Significance After Mitigation

Significant and Unavoidable

Impact GHG-20(b): Would the Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Impact Statement: Implementation of the proposed Project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing greenhouse gas emissions; however, the Project would still result in a significant impact due to exceeding the applicable quantitative threshold.

As previously stated, pursuant to Section 15604.4 of the CEQA Guidelines, a lead agency may rely on qualitative analysis or performance-based standards to determine the significance of impacts from GHG emissions. As such, the Project's consistency with the 2022 Scoping Plan is discussed below. It should be noted that the Project's consistency with the 2022 Scoping Plan also satisfies consistency with AB 32 since the 2022 Scoping Plan is based on the overall targets established by AB 32 and SB 32. Consistency with the 2008 and 2017 Scoping Plan is not necessary since both of these plans have been superseded by the 2022 Scoping Plan. Furthermore, CARB recommends the use of a CAP to determine a project's impacts with respect to GHG and states that projects that are consistent with a CAP are presumed to be consistent with the 2022 Scoping Plan.

2022 CARB Scoping Plan Consistency

The Project would not impede the State's progress towards carbon neutrality by 2045 under the 2022 Scoping Plan. The Project would be required to comply with applicable current and future regulatory requirements promulgated through the 2022 Scoping Plan. Some of the current transportation sector policies the Project will comply with (through vehicle manufacturer compliance) include: Advanced Clean Cars II, Advanced Clean Trucks, Advanced Clean Fleets, Zero Emission Forklifts, the Off-Road Zero-Emission Targeted Manufacturer rule, Clean Off-Road Fleet Recognition Program, In-use Off-Road Diesel-Fueled Fleets Regulation, Off-Road Zero-Emission Targeted Manufacturer rule, Clean Off-Road Fleet Recognition Program, Amendments to the In-use Off-Road Diesel-Fueled Fleets Regulation, carbon pricing through the Cap-and-Trade Program, and the Low Carbon Fuel Standard. Lastly, the Project would be required to comply with applicable elements outlined in the City's CAP. As such, the Project would be consistent with the 2022 Scoping Plan.

City of Hesperia CAP Consistency

As previously stated, the City of Hesperia CAP presents a number of strategies that will make it possible for the City to meet the recommended GHG emissions targets that are consistent with the reduction targets of the State. Strategy CAP-1 specifies that "projects that are consistent with this CAP could result in less than significant impacts regarding climate change. This is because emissions from these projects are generally accounted for in this CAP and would be consistent with this CAP reduction target. To be consistent with this CAP, CEQA projects must implement the applicable CAP implementation strategies listed in Section 4.2."

The Project demonstrates consistency with several applicable CAP strategies, as shown on Table 5.02-8:

Table 5.02-8: CAP Checklist Strategies

CAP Strategies	Consistency Analysis
CAP-1: Reduce emissions from new development through the CEQA process.	Consistent. The Project includes several Project Design Features as illustrated in section ES.4 and mitigation measures (MM GHG-1 through MMGHG-4) to reduce emissions attributable to the proposed Project for construction and operations.
CAP-2: Encourage mixed use development in new development and redevelopment areas.	Not Applicable.
CAP-3: Increase transit use.	Consistent. As discussed in the VMT Assessment, transportation demand management (TDM) measures are recommended to reduce single-occupancy vehicle trips and support increased transit use; however, they are not anticipated to reduce VMT impacts to a less than significant level.
CAP-4: Promote compact development by protecting open space and encouraging infill and redevelopment of underutilized parcels in urbanized areas.	Consistent. Implementation of the Project would consist of development at a vacant and undeveloped site.
CAP-5: Provide pedestrian connections in new and existing development to improve pedestrian mobility and accessibility.	No conflict. The project includes off-site roadway improvements that support circulation to improve pedestrian mobility; however, sidewalks are not currently present along Amargosa Road and specific pedestrian improvements are not identified.
CAP-6: Increase bicycle use through a safe and well-connected system of bicycle paths and end of trip facilities.	Consistent. There is an existing Class I bike path along Main Street east of the I-15 Freeway near the Project site to promote bicycle use.
CAP-7: Use traffic calming measures to improve traffic flow, pedestrian orientation, and bicycle use.	Consistent. Public roadway improvements would be implemented as part of the Project to improve traffic flow and bicycle use.
CAP-8: Use parking facility designs and parking management to reduce vehicle trips.	No conflict. As discussed in the VMT Assessment, transportation demand management (TDM) measures are identified that would reduce the use of single occupant vehicles by employees; however, parking management strategies are not specifically identified.
CAP-9: Increase the use of energy conservation features and renewable sources of energy.	Consistent. The Project would be designed and constructed in accordance with the City's latest adopted energy efficiency standards, which are based on the California Title 24 energy efficiency standards. Title 24 standards include a broad set of energy conservation requirements that apply to the structural,

	mechanical, electrical, and plumbing systems in a building.
CAP-10: Reduce energy use from the transport and treatment of water.	Consistent. The Project would implement a Water Conservation Strategy to reduce water demands and associated energy use (see Project Design Feature section ES.4).
CAP-11: Improve the City's recycling and source reduction programs to make continued progress in minimizing waste.	Consistent. The Project will implement a 75% waste diversion program (see Project Design Feature section ES.4).
CAP-12: Participate in regional programs and initiatives that reduce greenhouse gas emissions.	Consistent. The Project would comply with all current applicable regulatory requirements that aim at reducing greenhouse gas emissions.

Source: Appendix G *Greenhouse Gas Analysis prepared by* Urban Crossroads.

Consistency with applicable plans, including the CARB Scoping Plan and the City of Hesperia Climate Action Plan, does not by itself ensure a less-than-significant impact under CEQA where a project exceeds an adopted numerical threshold of significance. Although the Project would be generally consistent with applicable plans and policies, it would exceed the 3,000 $MTCO_2e$/year threshold. Therefore, impacts would remain significant and unavoidable.

Level of Significance Before Mitigation

Potentially significant impact.

Level of Significance After Mitigation

Significant and Unavoidable

5.02.7 – Cumulative Impact

Greenhouse gas (GHG) emissions are, by their nature, cumulative because the environmental effects of climate change result from the incremental accumulation of emissions from sources worldwide rather than from any single project. This approach is consistent with CEQA Guidelines Section 15064(h), which recognizes that a project's incremental contribution to a cumulative impact is significant when it is cumulatively considerable. As described in this section, the proposed Project would generate GHG emissions during construction and operation, including emissions from mobile sources, energy use, water supply and treatment, solid waste, stationary sources, and on-site equipment. The Project's construction emissions were amortized over a 30-year period consistent with the methodology used in the analysis, and total annual Project emissions were calculated at approximately 4,257.17 metric tons of CO2e per year. This amount exceeds the 3,000 MTCO2e/year threshold applied in this section. Because climate change is a cumulatively significant impact and the Project's emissions exceed the applicable threshold, the Project would make a cumulatively considerable contribution to cumulative GHG emissions.

As discussed under Impacts GHG-20(a) and GHG-20(b), the Project would implement Mitigation Measures MM GHG-1 through MM GHG-4 to reduce GHG emissions to the extent feasible, including measures related to cleaner truck operations, electric vehicle infrastructure, rooftop solar, energy-efficient

equipment, tenant requirements, and LEED/CALGreen performance. The section also explains that the Project would be generally consistent with the 2022 CARB Scoping Plan and with applicable strategies in the City of Hesperia Climate Action Plan; however, the section expressly does not rely on the City's 2010 CAP as the sole basis for significance because it has not been updated to reflect later State law and more recent reduction targets. Most importantly, the chapter concludes that even with mitigation and despite plan consistency, Project emissions would remain above the 3,000 MTCO2e/year threshold and impacts would remain significant and unavoidable. For that reason, the Project's contribution to cumulative GHG impacts would also remain significant and unavoidable.

5.02.8 – Significant and Unavoidable Impacts

CEQA Guidelines Section 15126.2(b) requires that an Environmental Impact Report identify impacts that remain significant after the implementation of all feasible mitigation measures.

As discussed under Impacts GHG-20(a) and GHG-20(b), the proposed Project would generate approximately 4,257.17 metric tons of CO_2e per year, which exceeds the applicable MDAQMD threshold of 3,000 $MTCO_2e$ per year. The Project incorporates feasible mitigation measures (MM GHG-1 through MM GHG-4) to reduce greenhouse gas emissions, including measures related to cleaner vehicle technology, electric vehicle infrastructure, renewable energy, energy efficiency, and tenant operational requirements.

However, despite implementation of these measures, the Project's total GHG emissions would remain above the applicable threshold. No additional feasible mitigation measures or alternatives have been identified that would reduce emissions to a less-than-significant level without substantially compromising the Project's basic objectives, including development of an employment-generating industrial use consistent with planned land uses.

Therefore, the Project's contribution to greenhouse gas emissions would remain significant and unavoidable.

In accordance with CEQA Guidelines Section 15093, if the Project is approved, the lead agency must adopt a Statement of Overriding Considerations acknowledging that the Project's benefits outweigh its significant and unavoidable environmental impacts.

5.03 - Transportation and Traffic

5.03.1 - Introduction

This section evaluates the Project's potential impacts related to transportation, including vehicle miles traveled (VMT), consistent with Senate Bill (SB) 743 and the City of Hesperia's adopted transportation impact analysis guidelines. Descriptions and analysis in this section are based, in part, on the following documents prepared by Ganddini Group, Inc. (Ganddini): the Revised Traffic Impact Analysis dated August 21, 2025 (Appendix K), Truck Trip Generation Comparison Analysis dated September 6, 2023 (Appendix L), the Vehicle Miles Traveled (VMT) Analysis dated July 8, 2025 and revised on July 28, 2026 (Appendix M).

During the Notice of Preparation (NOP) comment period, the City did not receive comments from surrounding jurisdictions requesting additional information and coordination related to potential traffic impacts.

The EIR provides a VMT-based impact assessment in accordance with CEQA and evaluates potential effects to local circulation and intersection operations to support interagency coordination and regional transportation planning.

In the Project's Initial Study, several transportation considerations were evaluated and determined not to result in potentially significant impacts; therefore, they were screened out from further analysis in this EIR. Specifically, the Project would not substantially increase hazards due to a geometric design feature or incompatible uses or result in inadequate emergency access or access to nearby uses. In addition, the Project would not include the construction or expansion of a bike system or bike lanes.

5.03.2 - Environmental Setting

Project Study Area

The Project site is located in the City of Hesperia, with regional access provided via the I-15 Freeway and Amargosa Road. The site is currently vacant and bounded by Avenal Street to the north, Palmetto Way to the south, and Amargosa Road to the east. Land uses surrounding the Project site primarily consist of vacant land, along with some scattered residential, industrial, and utility uses. Surrounding land uses include single-family residential neighborhoods, vacant land, a church, and commercial uses.

The proposed Project includes three (3) driveways off Palmetto Way. Direct access to the paved tractor-trailer parking area is provided by a 45-foot truck only driveway at the southwest corner of the site and a 50-foot driveway on the south side of the site for both autos and trucks. Direct access to the paved passenger vehicle parking area is provided by a 50-foot driveway at the southeast corner of the site for both autos and trucks. In total, the proposed Project includes 72 loading dock positions, 171 tractor-trailer stalls, and 311 passenger vehicle parking spaces. As the site is currently undeveloped, it does not generate any existing vehicular traffic.

A Project-specific Traffic Impact Analysis (TIA) was prepared by Ganddini dated August 18, 2022. A revised TIA was completed by Ganddini Group on August 21, 2025 (Appendix K). The purpose of the TIA is to assess potential transportation impacts resulting from development of the proposed Project both in the context of the California Environmental Quality Act (CEQA) and City of Hesperia discretionary authority. In accordance with City of Hesperia Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT)

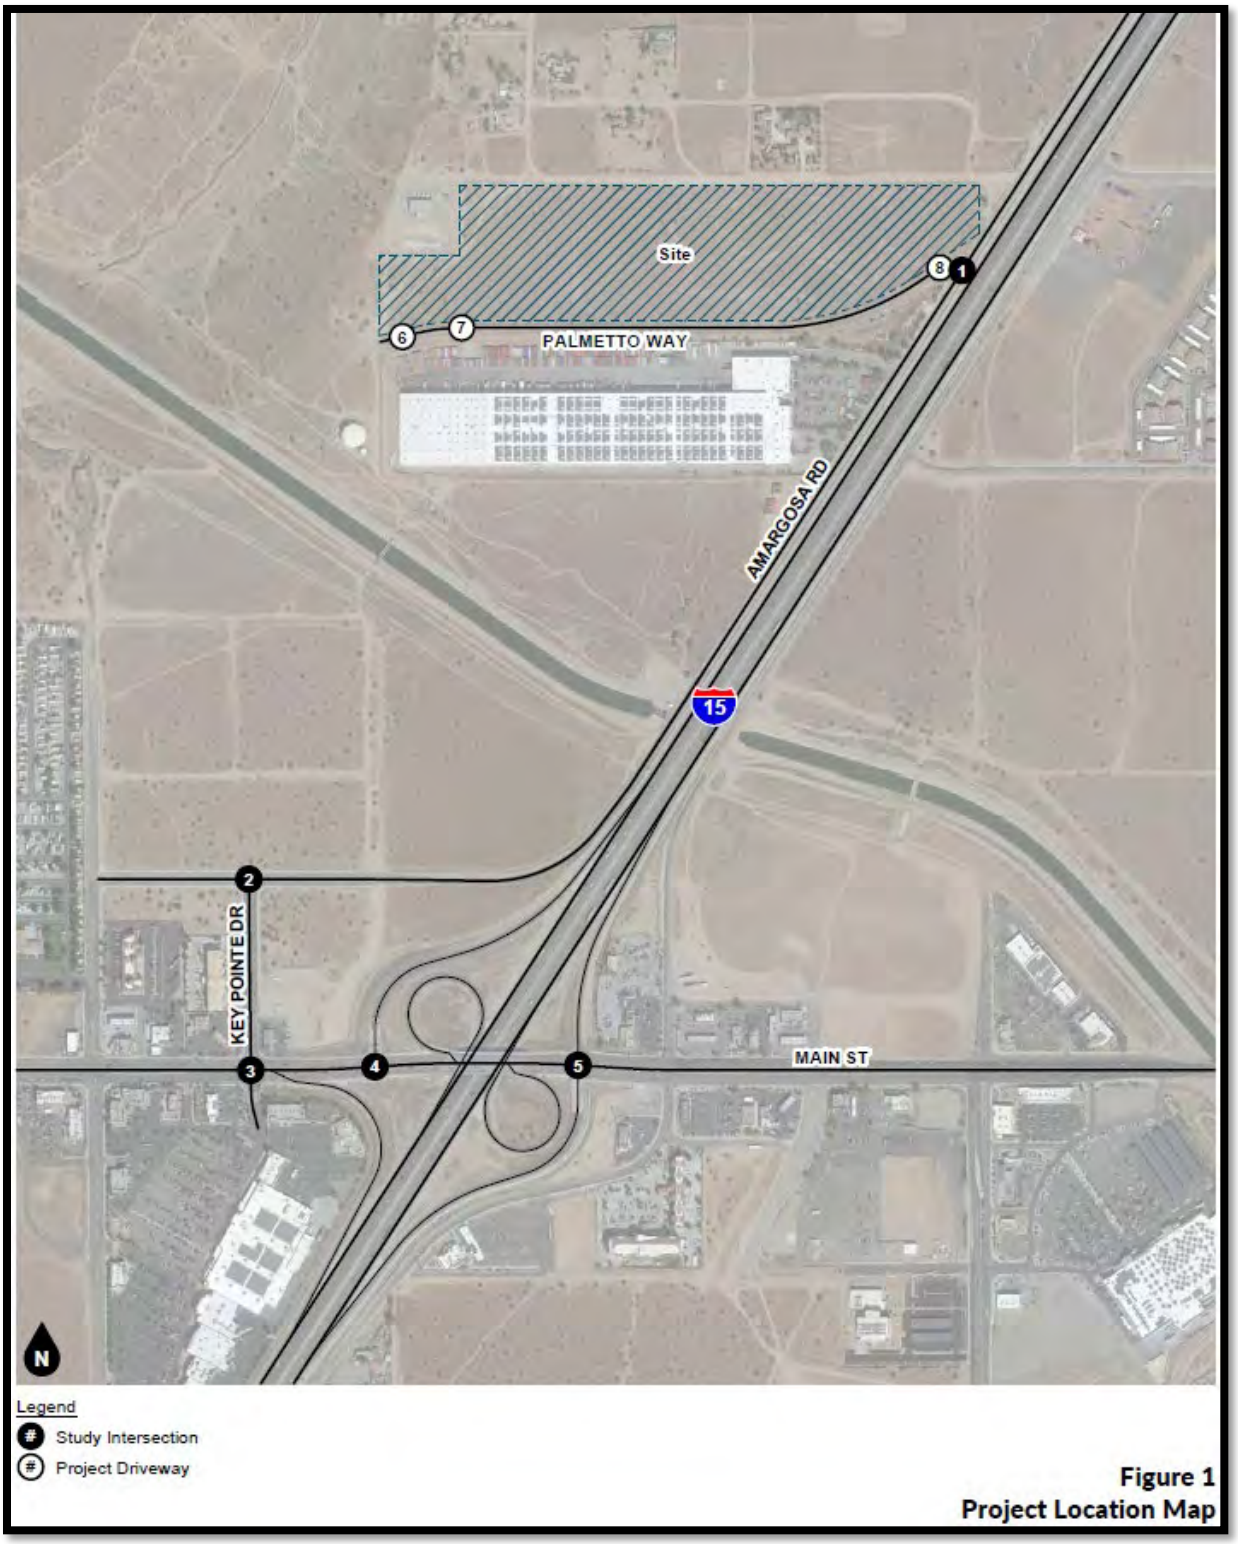
and Level of Service Assessment (LOS) (July 2020), existing and future conditions were analyzed for the proposed Project.

The TIA Scoping Agreement, which defines the study area, assumptions, and methodology, was reviewed and approved by the City and is included in Appendix B of the TIA (Appendix K). The proposed Project is anticipated to be developed in one phases.

Vehicular access will be provided through three (3) proposed driveways off Palmetto Way. Amargosa Road is classified as an Arterial roadway, while Palmetto Way is classified as Arterial 100' ROW in the City of Hesperia General Plan Circulation Element.

This section provides a summary of existing roadway conditions and travel patterns within the study area, which form the baseline for the impact analysis that follows.

Intersections Analyzed



The eight (8) study area intersections listed in Table 5.03-1 were selected for evaluation in the Traffic Impact Analysis (Appendix K) based on the study intersections identified in the approved scoping agreement (Appendix K). The study area consists of the following study intersections within the City of Hesperia and California Department of Transportation jurisdictions. The 8 study area intersections are shown in Figure 5.03-1: Study Area.

Table 5.03-1: Intersection Analysis Locations

Number	Intersection	Jurisdiction
1	Amargosa Road (NS) at Palmetto Way (EW)	City of Hesperia
2	Key Pointe Drive (NS) at Amargosa Road (EW)	City of Hesperia
3	Key Pointe Drive (NS) at Main Street (EW)	City of Hesperia
4	I-15 SB Offramp (NS) at Main Street (EW)	Caltrans
5	I-15 NB Ramps (NS) at Main Street (EW)	Caltrans
6	Project West Driveway (NS) at Palmetto Way (EW)	City of Hesperia
7	Project Central Driveway (NS) at Palmetto Way (EW)	City of Hesperia
8	Project East Driveway (NS) at Palmetto Way (EW)	City of Hesperia

Figure 5.03-1: Study Area

Source: Appendix K Ganddini: Revised Traffic Impact Analysis

5.03.3 – Traffic Analysis Scenarios

The following scenarios are analyzed during typical weekday AM and PM peak hour conditions:

- Existing
- Opening Year (2027) Without Project
- Opening Year (2027) With Project
- General Plan Buildout (2040) Without Project
- General Plan Buildout (2040) With Project

Existing Conditions

Existing Roadway System

Regional access to the project site is provided by the I-15 Freeway located adjacent to the project site to the east. Key roadways providing local circulation include Key Pointe Drive, Amargosa Road, Palmetto Way, and Main Street.

Transit Service

The study area is currently served by Victor Valley Transit Routes 20 and 114 along Amargosa Road adjacent to the project site.

Bicycle/ Pedestrian Facilities

There are currently no existing bike routes or sidewalks provided on Amargosa Road adjacent to the Project site. Main Street east of the I-15 Freeway is classified as a Class I Bike Path.

Truck Routes

The City of Hesperia General Plan does not identify Amargosa Road south of Bear Valley Road to the Project site as a truck route.

Existing Roadway Volumes

Existing peak hour traffic conditions are based upon morning peak period and evening peak period intersection turning movement counts obtained in May 2022 during typical weekday conditions. The weekday morning peak period was counted between 7:00 AM and 9:00 AM, and the weekday evening peak period was counted between 4:00 PM and 6:00 PM. The actual peak hour within the peak period is the four consecutive 15-minute periods with the highest total volume when all movements are added together. Thus, the weekday PM peak hour at one intersection may be 4:45 PM to 5:45 PM if those four consecutive 15-minute periods have the highest combined volume.

Since the initial traffic counts were conducted in 2022, these traffic counts were increased by an ambient growth rate of 2.0% per year over three years (1.061% total) to reflect existing 2025 conditions.

Existing Levels of Service (LOS)
The intersection Levels of Service for Existing conditions have been calculated and are shown below in Table 5.03-2.

Table 5.03-2: Existing Intersection LOS

#	Study Intersection	Traffic Control	AM Peak Hour		PM Peak Hour	
			Delay	LOS	Delay	LOS
1	Amargosa Road (NS) at Palmetto Way (EW)	CSS	0.0	A	0.0	A
2	Key Pointe Drive (NS) at Amargosa Road (EW)	CSS	8.8	A	9.7	A
3	Key Pointe Drive (NS) at Main Street (EW)	TS	15.1	B	24.2	C
4	I-15 SB Offramp (NS) at Main Street (EW)	TS	8.4	A	11.2	B
5	I-15 NB Ramps (NS) at Main Street (EW)	TS	4.3	A	12.9	B

1) CSS = Cross Street Stop; TS = Traffic Signal
2) Delay is shown in seconds/vehicle. For intersections with traffic signal or all way stop control, overall average intersection delay and LOS are shown. For intersections with cross street stop control, LOS is based on average delay of the worst individual approach.
3) LOS = Level of Service

Project Trip Generation

Trip generation represents the amount of traffic which is both attracted to and produced by a development. The Project trip generation is based upon trip generation rates obtained from the Institute of Transportation Engineers (ITE) *Trip Generation Manual* (11th Edition, 2021). Based on review of the ITE land use description, trip generation rates for ITE Land Use Code 155 - High-Cube Warehouse Fulfillment Center Warehouse (Non-Sort) were determined to adequately represent the proposed use and were selected for calculation of the Project trip generation forecast. The number of trips generated is determined by multiplying the trip generation rates and directional distributions by the land use quantity.

As shown in Table 5.03-3, the proposed Project is forecast to generate 905 daily trips, including 74 trips during the AM peak hour and 77 trips during the PM peak hour.

Table 5.03-3: Vehicle Trips Generated

Vehicle Type	AM Peak Hour			PM Peak Hour			Daily
	In	Out	Total	In	Out	Total	
Passenger Car	52	12	64	29	46	75	790
Trucks							
2-Axle Trucks	1	1	2	0	0	0	19
3-Axle Trucks	1	1	2	0	0	0	24
4+ Axle Trucks	3	3	6	1	1	2	72
Subtotal	5	5	10	1	1	2	115
Total Vehicle Trips Generated	**57**	**17**	**74**	**30**	**47**	**77**	**905**

Ambient Growth Rate

To account for ambient growth on roadways, existing 2022 volumes were increased by a growth rate of two percent (2%) per year over five years for Opening Year (2027) conditions; this equates to a total growth factor of approximately 1.104. The ambient growth rate was conservatively applied to all movements at the study intersections.

General Plan Buildout (2040) Projections

General Plan Buildout (2040) forecasts have been determined using a growth increment approach with the San Bernardino Transportation Analysis Model (SBTAM) Year 2016 and Year 2040 travel demand model plots. This difference defines the incremental growth in forecast volumes over the 24-year period between 2016 and 2040. The incremental growth in average daily traffic volume has been factored to reflect the forecast growth between the current year analysis traffic counts (2022) and year 2040. For this purpose, linear growth between the Year 2016 base condition and the forecast Year 2040 condition was assumed. Since the increment between the current year and Year 2040 is 18 years of the 24-year time frame, a factor of 0.75 (i.e., 18/24) was used.

To derive AM and PM peak hour intersection turning movement volumes, the roadway link growth forecasts were further refined using a spreadsheet program developed by the Federal Highway Administration and consistent with forecasting procedures outlined in the National Cooperative Highway Research Program Report 255. The spreadsheet program uses a linear programming algorithm to calculate future turning movements based on the relationship of existing intersection turning movements and forecast model growth. The forecast turning movements developed by the spreadsheet program were reviewed for reasonableness and adjusted as necessary to ensure no less than 10 percent traffic growth. The end results of the post-processing procedures are future traffic volumes suitable for analysis.

FUTURE OPERATIONAL ANALYSIS

Opening Year (2027) Without Project

To develop Opening Year (2027) Without Project volume forecasts, existing volumes were combined with ambient growth and trips generated by other developments.

The intersection LOS for Opening Year (2027) Without Project conditions are shown in Table 5.03-4. The study intersections are forecast to operate within acceptable LOS (D or better) during the peak hours for Opening Year (2027) Without Project conditions, except for the following study intersection which is projected to operate at an unacceptable Level of Service (E or F) during the PM peak hour:

- Key Pointe Drive (NS) at Main Street (EW) - #3 (PM Peak Hour – LOS F)

Table 5.03-4: Opening Year (2027) Without Project Intersection LOS

#	Study Intersection	Traffic Control	AM Peak Hour		PM Peak Hour	
			Delay	LOS	Delay	LOS
1	Amargosa Road (NS) at Palmetto Way (EW)	CSS	0.0	A	0.0	A

2	Key Pointe Drive (NS) at Amargosa Road (EW)	CSS	9.3	A	11.0	B
3	Key Pointe Drive (NS) at Main Street (EW)	TS	17.1	B	86.1	F
4	I-15 SB Offramp (NS) at Main Street (EW)	TS	10.4	B	15.6	B
5	I-15 NB Ramps (NS) at Main Street (EW)	TS	6.0	A	14.4	B

1) CSS = Cross Street Stop; TS = Traffic Signal
2) Delay is shown in seconds/vehicle. For intersections with traffic signal or all way stop control, overall average intersection delay and LOS are shown. For intersections with cross street stop control, LOS is based on average delay of the worst individual approach.
3) LOS = Level of Service

Opening Year (2027) With Project

The intersection LOS for Opening Year (2027) With Project conditions are shown in Table 5.10-5. The study intersections are projected to operate within acceptable LOS (D or better) during the peak hours for Opening Year (2027) With Project conditions, except for the following study intersection which is projected to operate at an unacceptable Level of Service (E or F) during the PM peak hour:

- Key Pointe Drive (NS) at Main Street (EW) - #3 (PM Peak Hour – LOS F)

The following improvements are recommended for Opening Year (2027) With Project conditions to maintain acceptable Level of Service:

- Key Pointe Drive (NS) at Main Street (EW) - #3
    - Construct a second southbound left turn lane.

The proposed Project is forecast to result in no substantial operational deficiencies at the study intersections for Opening Year (2027) With Project conditions with implementation of the recommended improvements.

Table 5.03-5: Opening Year (2027) With Project Intersection Levels of Service

#	Study Intersection	Traffic Control	AM Peak Hour		PM Peak Hour	
			Delay	LOS	Delay	LOS
1	Amargosa Road (NS) at Palmetto Way (EW)	CSS	12.1	B	16.3	C
2	Key Pointe Drive (NS) at Amargosa Road (EW)	CSS	9.5	A	11.2	B
3	Key Pointe Drive (NS) at Main Street (EW) – With Improvements	TS TS	17.5 14.6	B B	111.0 31.8	F C
4	I-15 SB Offramp (NS) at Main Street (EW)	TS	10.6	B	15.9	B

5	I-15 NB Ramps (NS) at Main Street (EW)	TS	6.3	A	14.5	B
6	Project West Driveway (NS) at Palmetto Way (EW)	CSS	**8.5**	A	**0.0**	A
7	Project Central Driveway (NS) at Palmetto Way (EW)	CSS	8.6	A	8.6	A
8	Project East Driveway (NS) at Palmetto Way (EW)	CSS	8.8	A	8.8	A

General Plan Buildout (2040) With Project

The intersection LOS for General Plan Buildout (2040) Without Project conditions are shown in Table 5.03-6. The study intersections are forecast to operate within acceptable LOS (D or better) during the peak hours for General Plan Buildout (2040) Without Project conditions, except for the following study intersection which is projected to operate at an unacceptable Level of Service (E or F) during the PM peak hour:

- Key Pointe Drive (NS) at Main Street (EW) - #3 (PM Peak Hour – LOS F)

Table 5.03-6: General Plan Buildout (2040) Without Project Intersection LOS

#	Study Intersection	Traffic Control	AM Peak Hour		PM Peak Hour	
			Delay	LOS	Delay	LOS
1	Amargosa Road (NS) at Palmetto Way (EW)	CSS	0.0	A	0.0	A
2	Key Pointe Drive (NS) at Amargosa Road (EW)	CSS	9.0	A	12.5	B
3	Key Pointe Drive (NS) at Main Street (EW)	TS	24.9	C	160.2	F
4	I-15 SB Offramp (NS) at Main Street (EW)	TS	8.8	A	12.2	B
5	I-15 NB Ramps (NS) at Main Street (EW)	TS	8.1	A	13.5	B

1) CSS = Cross Street Stop; TS = Traffic Signal
2) Delay is shown in seconds/vehicle. For intersections with traffic signal or all way stop control, overall average intersection delay and LOS are shown. For intersections with cross street stop control, LOS is based on average delay of the worst individual approach.
3) LOS = Level of Service

General Plan Buildout (2040) With Project

The intersection LOS for General Plan Buildout (2040) With Project conditions are shown in Table 5.03-7. The study intersections are projected to operate within acceptable Levels of Service (D or better) during the peak hours for General Plan Buildout (2040) With Project conditions, except for the following study intersection which is projected to operate at an unacceptable Level of Service (E or F) during the PM peak hour:

- Key Pointe Drive (NS) at Main Street (EW) - #3 (PM Peak Hour – LOS F)

The following improvements are recommended for General Plan Buildout (2040) With Project conditions to maintain acceptable Level of Service:

- Key Pointe Drive (NS) at Main Street (EW) - #3
    - Construct a second southbound left turn lane.

The proposed project is forecast to result in no substantial operational deficiencies at the study intersections for General Plan Buildout (2040) With Project conditions with implementation of the recommended improvements.

A conceptual striping exhibit for the improvement of a second southbound left turn lane at the intersection of Key Pointe Drive at Main Street (Int. #3).

The traffic signal would require modification from north-south permitted phasing to protected phasing.

Table 5.03-7: Opening Year (2027) With Project Intersection Levels of Service

#	Study Intersection	Traffic Control	AM Peak Hour		PM Peak Hour	
			Delay	LOS	Delay	LOS

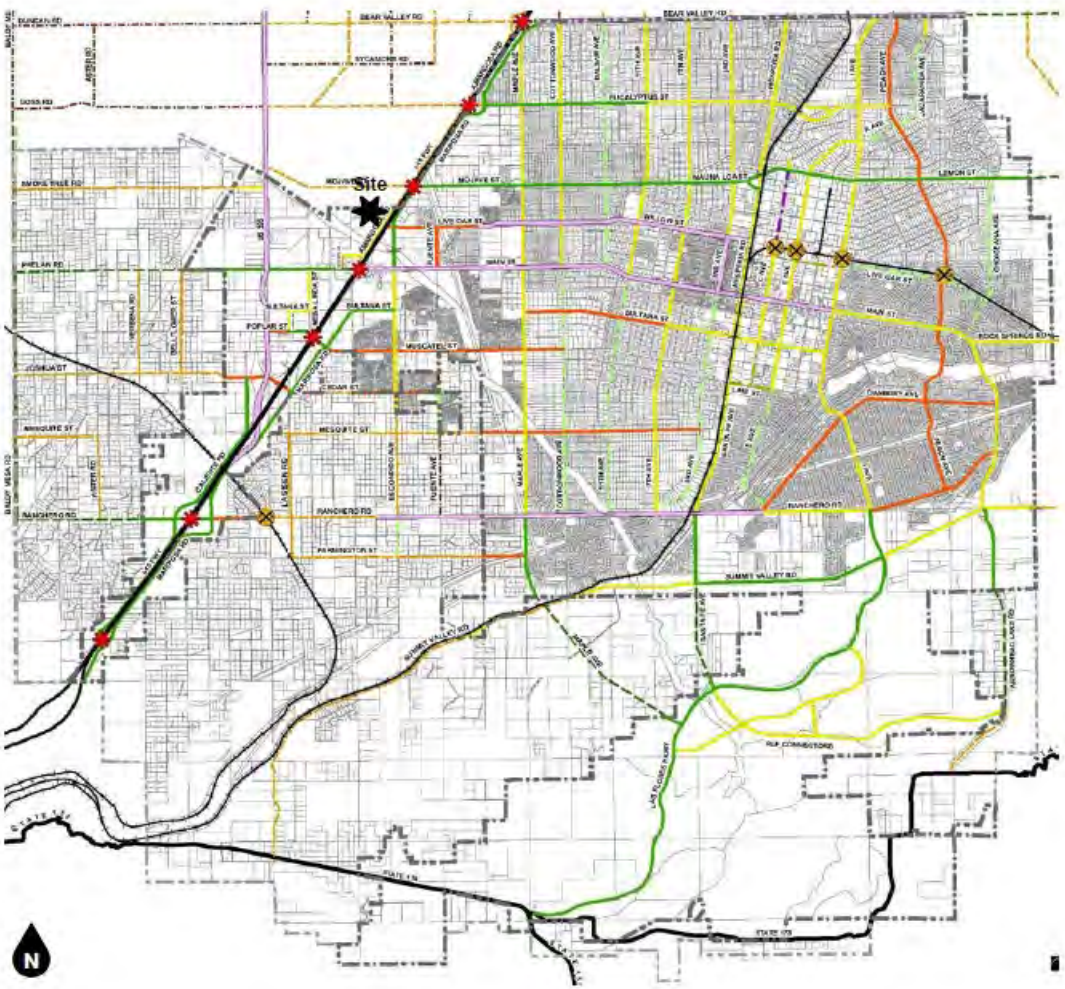
5.03.4 – Local and Regional Funding Mechanisms



Project Fair Share Contribution

The Project fair share contribution is based on the proportion of Project peak hour intersection turning movement volumes contributed to the improvement location relative to the total new peak hour intersection turning movement volumes. The intersection fair share cost calculations are typically based on the higher of the AM or PM peak hour traffic volumes. The fair share calculations are intended only for the discussion purposes of the Traffic Impact Analysis, and do not imply any legal responsibility or formula for contributions or mitigation.

5.03.5 – City of Hesperia General Plan Circulation Element

The City of Hesperia's Circulation Element (Circulation Element) details and outlines the City's plans to provide a transportation network system that allows the movement of people, goods, and services easily and safely throughout the city. A reliable and sound transportation strategy encourages economic growth and development and enhances the safety and quality of life of the community. The Circulation Element identifies the broader issues on which the City bases its circulation and transportation policies and outlines the City's goals and implementation policies to provide a safe and efficient transportation system strategy. It also includes non-motorized modes of transportation such as bicycle and equestrian paths and pedestrian routes as well as bus routes. Furthermore, Figure 5.03-2 shows the City's Circulation Element roadway classification map. This figure shows the nature and extent of arterial and collector highways that are needed to adequately serve the ultimate development depicted by the Land Use Element of the General Plan.

5.03.6 - Regulatory Framework

Federal

Federal rules and regulations govern many facets of the City's traffic and circulation system including transportation planning and programming; funding; design, construction, and operation of facilities; and others. The County complies with all applicable rules and regulations of the Federal Highway Administration (FHWA), Urban Mass Transit Administration (UMTA), Federal Railroad Administration, Federal Aviation Administration (FAA), and other federal agencies. In addition, the City coordinates with federal resource agencies where appropriate in the environmental clearance process for transportation facilities.

State

Assembly Bill 1358

Assembly Bill (AB) 1358, also known as the California Complete Streets Act of 2008, requires cities and counties to include "Complete Street" policies in their general plans. These policies address the safe accommodation of all users, including bicyclists, pedestrians, motorists, public transit vehicles and riders, children, the elderly, and the disabled. These policies can apply to new streets as well as the redesign of corridors.

Senate Bill 375

Senate Bill (SB) 375 provides guidance regarding curbing emissions from cars and light trucks. There are four major components to SB 375. First, SB 375 requires regional greenhouse gas emission targets. These targets must be updated every 8 years in conjunction with the revision schedule of the housing and transportation elements of local general plans. Second, Metropolitan Planning Organizations are required to create a Sustainable Communities Strategy that provides a plan for meeting regional targets. Third, SB 375 requires housing elements and transportation plans to be synchronized on 8-year schedules. Finally, Metropolitan Planning Organizations must use transportation and air emissions modeling techniques that are consistent with the guidelines prepared by the California Transportation Commission.

Senate Bill 743

SB 743, approved in 2013, endeavors to change the way transportation impacts will be determined according to the California Environmental Quality Act (CEQA). The Governor's Office of Planning and Research (OPR) has recommended the use of VMT as the replacement for automobile delay-based Level of Service (LOS). In December 2018, the Natural Resources Agency finalized updates to CEQA Guidelines to incorporate SB 743 (i.e., VMT).

Regional

Southern California Association of Governments Regional Transportation Plan

The Southern California Association of Governments (SCAG) adopted the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), also known as Connect SoCal, in 2021. Connect SoCal is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. Connect SoCal embodies a collective vision for the region's future and is developed with input from local governments, county transportation commissions,

tribal governments, non-profit organizations, businesses, and local stakeholders within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura.

Connect SoCal includes over 4,000 transportation projects—ranging from highway improvements, railroad grade separations, bicycle lanes, new transit hubs and replacement bridges–from county plans and seek to reduce traffic bottlenecks, improve the efficiency of the region's network, and expand mobility choices. In addition, Connect SoCal is supported by a combination of transportation and land use strategies that help the region achieve State greenhouse gas (GHG) emission reduction goals and federal Clean Air Act requirements, preserve open space areas, improve public health and roadway safety, support the vital goods movement industry, and utilize resources more efficiently.

Connect SoCal

SCAG has published the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), referred to as "Connect SoCal." Connect SoCal seeks to improve mobility, promote sustainability, facilitate economic development, and preserve the quality of life for the residents in the region. The long-range visioning plan balances future mobility and housing needs with goals for the environment, the regional economy, social equity and environmental justice, and public health. The goals included in Connect SoCal are pertinent to the proposed Project. These goals are meant to provide guidance for considering the proposed Project within the context of regional goals and policies. An analysis of the Project's consistency with the relevant goals of Connect SoCal is presented in Table 5.10-6. As indicated, the Project would not conflict with any Connect SoCal goals, and no impact would occur.

LOCAL REGULATIONS

City of Hesperia General Plan Circulation Element

The Circulation Element guides the development of a safe, efficient, and balanced transportation network that improves environmental quality, promotes healthy lifestyles, supports economic growth, and reduces congestion and access challenges as the City expands. The City's applicable Transportation and Traffic goals and policies from the Circulation Element are listed below.

ROADWAY NETWORK

Goal CI-1: A roadway network that provides for the safe and efficient mobility needs of residents, businesses, visitors, and emergency services.

Policy CI-1.1 Maintain a multi-year Capital Improvement Program to ensure the organized financing and construction of roadway and intersection improvements that meet existing and future demands of the community.

Policy CI-1.2 Periodically review and maintain street roadway classifications and standards to serve both local and regional traffic.

Policy CI-1.3 Support the development of regional transportation facilities that ensure the safe and efficient movement of people and goods between the city and outside areas, accommodating regional travel demands while minimizing adverse transportation impacts on Hesperia residents and businesses.

Policy CI-1.4 Strive to maintain a citywide level of service (LOS) standard of LOS D or better on all roadways and intersections; LOS E during peak hours shall be considered acceptable through freeway interchanges and major corridors (Bear Valley Road, Main Street/Phelan Road, Highway 395).

Policy CI-1.5 Coordinate with the County and other agencies on long-term plans, proposed development projects, and capital improvements while minimizing adverse traffic impacts on Hesperia residents and businesses.

Policy CI-1.6 Require new development to pay a fair share of needed transportation improvements based on a project's impacts to the City's motorized and non-motorized transportation networks.

Policy CI-1.7 Utilize intelligent transportation systems and research changing trends in mobility to more efficiently and safely move people and vehicles while managing motor vehicle speeds.

Policy CI-1.8 Encourage the installation, modernization, and improvement of grade separations at rail crossings to facilitate more convenient access for cars, trucks, and emergency vehicles.

Policy CI-1.9 Regularly update the pavement management plan and maintain roadways to ensure safety and functionality, as an investment strategy, and to improve the City's image and quality of life.

Policy CI-1.10 Coordinate with SBCTA, the County of San Bernardino, and Caltrans to improve the segment of Summit Valley Road between the City's boundary and Highway 138.

Policy CI-1.11 Support the implementation of Safe Systems Approach principles through the adoption and maintenance of a Local Roadway Safety Plan.

GOODS MOVEMENT

Goal CI-2: A circulation system that facilitates the movement of goods and services while minimizing impacts to sensitive land uses, such as homes, schools, and hospitals, and vulnerable roadway users, such as pedestrians and cyclists.

Policy CI-2.1 Maintain a network of truck routes that provides for the safe and efficient transport of goods while minimizing negative impacts on local circulation and sensitive receptors.

Policy CI-2.2 Require new truck-intensive land uses to design and incorporate space and facilities in order to reduce truck queueing, parking, and idling in the public rights-of-way.

Policy CI-2.3 Support improvements to roadways and rail facilities that increase the efficiency of goods movement; enhance the safety of rail operations, motor vehicles, and non-motorized modes of mobility; and minimize noise and vibration impacts on sensitive land uses.

Policy CI-2.4 Maintain Hesperia Airport as a general aviation facility, in conformance with the Comprehensive Airport Land Use Plan, and explore opportunities to activate the airport for community benefit.

NON-MOTORIZED TRANSPORTATION

Goal CI-3: A comprehensive bicycle and pedestrian network that promotes physical activity and non-automotive travel within Hesperia for people of all ages and abilities.

Policy CI-3.1 Design new on- and off-street facilities to accommodate pedestrians, cyclists, and equestrians based on a combination of the land use and roadway context to promote safety and efficiency for all users.

Policy CI-3.2 Establish and maintain an interconnected trail system that promotes safe and convenient travel to transit stops and between residential and commercial areas, schools, parks, recreation facilities, and other key destination points.

Policy CI-3.3 Leverage public rights-of-way, easements, and other public spaces to maintain and expand the non-motorized network.

Policy CI-3.4 Prioritize improvements along Main Street that facilitate a more pedestrian-friendly environment.

Policy CI-3.5 Promote new development and transportation demand management (TDM) strategies that will reduce household and employment vehicle miles traveled (VMT). Prioritize the implementation of TDM strategies over the expansion of roadway capacity.

PUBLIC TRANSIT

Goal CI-4: A transit network that provides for safe and convenient access to goods and services, job centers, and healthcare facilities.

Policy CI-4.1 Coordinate with Victor Valley Transit Authority (VVTA) to provide residents and workers with accessible and convenient service between residential neighborhoods, commercial centers, educational facilities, employment nodes, and medical facilities.

Policy CI-4.2 Coordinate with VVTA to install, improve, and maintain safe, clean, comfortable, well-lit, and rider-friendly transit stops that are well marked and visible to motorists.

Policy CI-4.3 Support the development of a regional commuter rail line that connects residents with employment centers and essential services in San Bernardino and Los Angeles counties and reduces traffic on Interstate 15

City of Hesperia's Main Street and Freeway Corridor Specific Plan

The Specific Plan was adopted in October 2008 and amended July 2021. The Specific Plan area consists of two corridors, Interstate-15 and Main Street, approximately 18 miles in length and with a total area of over 16 square miles. The Main Street corridor extends from I Avenue on the east to about a mile west of the interchange at the Interstate-15 Freeway. The Freeway corridor extends between the northern and southern City limits. The Specific Plan area is almost 80% vacant or underdeveloped. The Main Street corridor has vacant or underdeveloped land in 55% of its area while the Freeway corridor has development on only 15% of its area. The two corridors have been further subdivided into eight districts.

5.03.7 – Vehicle Miles Traveled (VMT)

California Senate Bill 743 (SB 743) directs the State Office of Planning and Research (OPR) to amend the California Environmental Quality Act (CEQA) Guidelines for evaluating transportation impacts to provide alternatives to Level of Service that "promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses." In December 2018, the California Natural Resources Agency certified and adopted the updated CEQA Guidelines package. The amended CEQA Guidelines, specifically Section 15064.3, recommend the use of Vehicle Miles Travelled (VMT) as the primary metric for the evaluation of transportation impacts associated with land use and transportation projects. In general terms, VMT quantifies the amount and distance of automobile travel attributable to a project or region. All agencies and projects State-wide are required to utilize the updated CEQA guidelines recommending use of VMT for evaluating transportation impacts as of July 1, 2020.

The updated CEQA Guidelines allow for lead agency discretion in establishing methodologies and thresholds provided there is substantial evidence to demonstrate that the established procedures promote the intended goals of the legislation. Where quantitative models or methods are unavailable, Section 15064.3 allows agencies to assess VMT qualitatively using factors such as availability of transit and proximity to other destinations. The Office of Planning and Research (OPR) *Technical Advisory on Evaluating Transportation Impacts in CEQA* (State of California, December 2018) ["OPR Technical Advisory"] provides technical considerations regarding methodologies and thresholds with a focus on office, residential, and retail developments as these projects tend to have the greatest influence on VMT. Based on guidance from the OPR Technical Advisory, the City of Hesperia adopted the Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service (LOS) (July 2020) ("TIA Guidelines"), which establishes the City approved methodologies and thresholds.

VMT is a measurement of the total amount of vehicular travel for a specific area. It is typically normalized on a per-household, per-resident, per-employee, or per-service-population (residents plus employees) basis such that it is a metric of travel efficiency (e.g., fewer vehicle trips per person or shorter distances traveled in an automobile per person means that travel is more efficient). Ultimately, VMT is a powerful performance indicator of a jurisdiction's land use plan and multimodal transportation network.

VMT Screening Assessment

The City's TIA Guidelines identify screening criteria for certain types of projects that typically reduce VMT and may be presumed to result in a less than significant VMT impact. To qualify for VMT screening, the project needs to only satisfy one of the following screening criteria:

- Transit Priority Area (TPA) Screening
- Low VMT Area Screening
- Project Type Screening

Based on initial review, the Project does not satisfy any of the screening criteria; therefore, further analysis for non-screened development is warranted in accordance with the City's TIA Guidelines.

VMT Assessment for Non- Screened Development

The Project-generated VMT and Project effect on VMT are calculated using San Bernardino Transportation Analysis Model (SBTAM) for the following scenarios:

- Baseline Conditions: This scenario reflects the existing SBTAM base year model.
- Baseline Plus Project: This scenario reflects the existing SBTAM base year model run with the addition of Project socio-economic data (SED) to the Project traffic analysis zone (TAZ).
- Cumulative No Project: This scenario reflects the existing SBTAM future year model (2050).
- Cumulative Plus Project: This scenario reflects a new SBTAM future year model run with the addition of Project SED to the TAZ.

VMT Modeling

In accordance with the City's TIA Guidelines, Ganddini calculated Project generated VMT using SBTAM+ (version 3.2). The SBTAM model is a trip-based travel demand model developed and maintained by the San Bernardino County Transit Authority (SBCTA). The model analyzes a complex system of inputs such as highway networks, socio-economic data (SED), driver behavior, and goods movement to forecast travel patterns as the region grows and changes. The SBTAM model covers the entire SCAG region, but the model data is more refined and focused within San Bernardino County as opposed to other areas of the region.

Project Land Use Conversion

To evaluate Project VMT within SBTAM, the Project land use was converted into socio-economic data (SED). Based on employment factors obtained from the Southern California Association of Governments Employment Density Study Summary Report, the proposed 499,714-square-foot high-cube warehouse was estimated to support 418 employees.

The Project site is located in TAZ 53908201. To isolate Project-generated VMT, the existing SED within the Project TAZ was moved to neighboring TAZ 53918203, which contains existing residential and employment-based land uses. The Project SED of 418 employees was then added to TAZ 53908201.

Project-generated VMT was calculated by isolating the Project in TAZ 53908201 and extracting the origin-destination matrix and assignment skims for the with-Project model run.

5.03.8 - Thresholds of Significance

Section XVII of Appendix G to the CEQA Guidelines addresses typical adverse effects to transportation and traffic and includes the following threshold questions to evaluate the proposed Project's impacts on transportation and traffic. Would the Project:

a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

b) Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

d) Result in inadequate emergency access?

Significance thresholds are set forth in City of Hesperia's Environmental Assessment Checklist, are derived from Section XVII of Appendix G to the CEQA Guidelines (listed above), and state that the proposed Project would have a significant impact to transportation and traffic if construction and/or operation of the proposed Project would:

Transportation

a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?

b) Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

d) Result in inadequate emergency access or access to nearby users?

Countywide Daily VMT Estimates

As previously mentioned, the threshold for Project-generated VMT is based on the San Bernardino County regional average baseline VMT per service population. The numeric threshold of 32.7 VMT per service population referred to in the City's TIA Guidelines was calculated based on an earlier version of the SBTAM model that was current at the time of preparation of the guidelines. Since the project VMT was calculated based on the latest SBTAM+ model (version 3.2), an updated numerical threshold was calculated using the latest SBTAM+ model to provide a comparison of the Project's impact relative to the Countywide average.

Project-Generated VMT Impact Assessment

The Project-generated VMT is estimated to equal 47.7 VMT per service population under baseline conditions and 48.5 VMT per service population under cumulative conditions. These values exceed the City-established threshold of 35.3 VMT per service population by 35.1 percent and 37.4 percent, respectively. Therefore, the Project-generated VMT would result in a significant impact without mitigation.

Table 5.03-9: Project-Generated VMT Impact Assessment

Scenario	Project-Generated VMT Impact Assessment			
	Project VMT per SP	Threshold	Above/Below Threshold (%)	Significant VMT Impact?
2019 (Baseline)	47.7	35.3	+35.1%	Yes
2050 (Cumulative)	48.5	38.3	+37.4%	Yes

1) VMT = Vehicle Miles Traveled; SP = Service Population (Population + Employment)
2) Per current SBTAM+ (v3.2)

Project-Generated VMT Mitigation

The revised VMT Analysis evaluates potential transportation-related measures identified in the California Air Pollution Control Officers Association (CAPCOA) Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity. The effectiveness of many of these measures is constrained by the nature of the proposed warehousing use, which limits the ability to provide a mix of on-site land uses, and the limited infrastructure for alternative transportation modes in the Project vicinity, which limits the effectiveness of commute trip reduction programs. In addition, although the San Bernardino County Transportation Authority is developing a pilot VMT mitigation bank, the program is not formally in effect and participation is therefore not currently feasible.

Nevertheless, the Project would implement Mitigation Measures TRANS-2 and TRANS-3 to encourage employee carpooling, vanpooling, bicycling, and other alternative transportation modes. These measures require designated carpool and vanpool parking spaces in convenient locations and end-of-trip facilities, such as bicycle parking, lockers, and similar amenities. Implementation of these measures is expected to reduce employee commute-related vehicle trips and VMT to some degree. However, the extent of the reduction cannot be reliably quantified because it would depend on future tenant operations, employee participation, and the availability of supporting transportation infrastructure. Therefore, although Mitigation Measures TRANS-2 and TRANS-3 would reduce Project-generated VMT, they would not reduce VMT below the applicable threshold, and the impact would remain significant and unavoidable.

5.03.9 - Project Impacts and Mitigation Measures

This section discusses potential impacts associated with the proposed Project and provides mitigation measures where necessary.

Transportation

Impact TRANS-(a): The proposed Project would conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.

Impact Statement: The implementation of the proposed Project would not conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.

Impact Analysis

A Traffic Impact Analysis (TIA) was prepared by Ganddini dated August 18, 2022. A revised TIA was completed by Ganddini on August 21, 2025. The purpose of the TIA is to assess potential transportation impacts resulting from development of the proposed Project both in the context of the California Environmental Quality Act (CEQA) and City of Hesperia discretionary authority. In accordance with City of Hesperia Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service Assessment (LOS) (July 2020), existing and future conditions were analyzed for the proposed Project. Based on the study intersections identified in the approved scoping agreement, the study area consists of the following study intersections within the City of Hesperia and California Department of Transportation jurisdictions:

1. Amargosa Road (NS) at Palmetto Way (EW)
2. Key Pointe Drive (NS) at Amargosa Road (EW)
3. Key Pointe Drive (NS) at Main Street (EW)
4. I-15 SB Offramp (NS) at Main Street (EW)
5. I-15 NB Ramps (NS) at Main Street (EW)
6. Project West Driveway (NS) at Palmetto Way (EW)
7. Project Central Driveway (NS) at Palmetto Way (EW)
8. Project East Driveway (NS) at Palmetto Way (EW)

The following scenarios were analyzed during typical weekday AM and PM peak hour conditions:

- Existing
- Opening Year (2027) Without Project
- Opening Year (2027) With Project
- General Plan Buildout (2040) Without Project
- General Plan Buildout (2040) With Project

All study intersections are forecast to operate within acceptable Levels of Service (D or better) during peak hour conditions for Existing, Opening Year (2027) Without Project, and Opening Year (2027) With Project scenarios. Additionally, all study intersections except for the Key Pointe Drive (NS) at Main Street (EW) intersection are forecast to operate within acceptable Levels of Service (D or better) during peak hour conditions for General Plan Buildout (2040) With Project and General Plan Buildout (2040) Without Project scenarios.

The Key Pointe Drive (NS) at Main Street (EW) intersection is projected to operate at an unacceptable Level of Service (E or F) during the PM peak hour for General Plan Buildout (2040) With Project and General Plan Buildout (2040) Without Project scenarios. Mitigation Measure **TRANS-1** requires that the Project's fair share is contributed, as determined by the City, to construct a second southbound left turn lane at Key Pointe Drive (NS) at Main Street (EW). **TRANS-1** will ensure that the proposed Project will result in no substantial operational deficiencies at the study intersections for General Plan Buildout (2040) With Project conditions, and impacts will be reduced to less than significant.

A Trip Generation Comparison Analysis was prepared by Ganddini dated November 28, 2022, and updated on February 28, 2025, and updated again on July 8, 2025. The Project proposes a Specific Plan Amendment to modify the Project site's Main Street and Freeway Corridor Specific Plan land use designation from Regional Commercial (RC) to Commercial/Industrial Business Park (CIBP). The purpose of the analysis is to evaluate the change in trip generation that can be expected between the proposed Project which is permitted under the CIBP land use designation, and an alternative land use consisting of commercial retail that is permitted under the existing RC land use designation. The proposed Project is forecast to generate approximately 1,083 daily Passenger Car Equivalent (PCE) trips, including 90 PCE trips during the AM peak hour and 81 PCE trips during the PM peak hour. The alternative land use consisting of commercial retail is forecast to generate a total of approximately 25,505 daily trips, including 944 AM peak hour trips and 2,112 PM peak hour trips. 870 fewer trips during the AM peak hour and 2,035 less trips during the PM peak hour.

For the alternative commercial retail land use, it should be noted that commercial retail land uses will often locate next to busy roadways to attract motorists already on the street. Therefore, Ganddini reduced the initial trip generation forecast by the applicable pass-by trip rate when calculating the net new trips that will be added to the surrounding street system. However, pass-by trip adjustments were not applied to the alternative commercial retail land use trip generation in accordance with pass-by rates noted in the ITE Trip Generation Manual (11th Edition, 2021) since Amargosa Road adjacent to the Project site is a low volume roadway and pass-by trips would be minimal.

The proposed Project is forecast to generate approximately 25,505 fewer daily trips compared to a commercial retail land use of equivalent size, including 870 fewer trips during the AM peak hour and 2,035 fewer trips during the PM peak hour. Based on the trip generation comparison analysis, the proposed Project consisting of a 499,714 square-foot industrial building is forecast to generate substantially fewer trips (up to 659% fewer daily trips) compared to an alternative land use composed of 499,850 square feet of commercial retail. Therefore, the Project would not conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities, impacts would be less than significant.

Policy Consistency Evaluation

- **General Plan Circulation Element**: The Project would impact local roadways and standards set back the City's General Plan Circulation Element. Traffic operations of roadway facilities are described using the term "Level of Service" (LOS), a qualitative measure of traffic flow based on factors such as speed, travel time, delay, and freedom to maneuver. LOS ranges from LOS A, representing completely free-flow conditions, to LOS F, representing stop-and-go conditions; LOS E reflects near-capacity, unstable operations with minimal vehicle spacing. While the Project would affect LOS, the Ganddini Traffic Impact Analysis identifies the roadway improvement recommendation [Key Pointe Drive (NS) at Main Street (EW)] necessary to maintain consistency

with the General Plan. A detailed consistency analysis (see Table 5.03-10) concludes that the Project would not conflict with City's General Plan policies.

- **San Bernardino County Congestion Management Program**
- **Connect SoCal (SCAG RTP/SCS):** A detailed consistency analysis (see Table 5.03-11) concludes that the Project would not conflict with Connect SoCal goals. Goals related to mobility, active transportation, emissions reduction, and land use compatibility are supported by the Project's proposed improvements, required conditions, and regional coordination.

Table 5.03-10: City of Hesperia General Plan Consistency Analysis

Policy Category	Policy No.	Policy Description	Consistency Determination
Roadway Network	CI-1.1	Maintain a multi-year Capital Improvement Program to ensure organized financing and construction of roadway and intersection improvements that meet existing and future demands of the community. .	**Consistent** – The Project would fund or construct roadway improvements and pay applicable development impact fees supporting the City's Capital Improvement Program and long-term circulation needs.
Roadway Network	CI-1.2	Periodically review and maintain street classifications and standards to serve both local and regional traffic.	**Consistent** – Project access and frontage improvements would be designed in accordance with applicable City roadway classification and design standards.
Roadway Network	CI-1.3	Support the development of regional transportation facilities that ensure the safe and efficient movement of people and goods between the city and outside areas, accommodating regional travel demands while minimizing adverse transportation impacts on Hesperia residents and businesses.	**Consistent** – The Project would provide circulation improvements consistent with the City's adopted transportation network and regional mobility objectives.
Roadway Network	CI-1.4	Strive to maintain a citywide level of service (LOS) standard of LOS D or better on all roadways and intersections: LOS E during peak hours shall be considered acceptable through freeway	**Consistent –** The Traffic Impact Analysis demonstrates that roadway and intersection operations would remain consistent with the City's LOS standards with implementation of required mitigation measures and

Policy Category	Policy No.	Policy Description	Consistency Determination
		interchanges and major corridors (Bear Valley Road, Main Street/Phelan Road, Highway 395).	transportation improvements.
Roadway Network	CI-1.5	Coordinate with the County and other agencies on long-term plans, proposed development projects, and capital improvements while minimizing adverse traffic impacts on Hesperia residents and businesses. .	**Consistent** – The Project would not conflict with coordinated regional transportation planning and would utilize approved access points on designated arterials.
Roadway Network	CI-1.6	Require new development to pay a fair share of needed transportation improvements based on a project's impacts to the City's motorized and non-motorized transportation networks.	**Consistent** – Consistent – The Project would contribute fair-share funding and/or construction of required transportation improvements consistent with City impact fee programs.
Roadway Network	CI-1.7	Utilize intelligent transportation systems and research changing trends in mobility to more efficiently and safely move people and vehicles while managing motor vehicle speeds.	**Consistent** – The Project would be required to implement applicable operational improvements and comply with City and agency requirements supporting traffic efficiency s.
Goods Movement	CI-2.1	Maintain a network of truck routes that provides for the safe and efficient transport of goods while minimizing negative impacts on local circulation and sensitive receptors.	**Consistent** – The Project provides direct access to designated arterial roadways and truck routes and would not direct truck traffic through residential neighborhoods..
Goods Movement	CI-2.2	Require new truck-intensive land uses to design and incorporate space and facilities in order to reduce truck queueing, parking, and idling in the public rights-of-way.	**Consistent** – The Project includes adequate on-site truck circulation, loading areas, and staging capacity to accommodate truck operations without adversely affecting public roadways.
Non-Vehicular Transportation	CI-3.1	Design new on-and off-street facilities to accommodate	**Consistent** – The Project includes pedestrian facilities

Policy Category	Policy No.	Policy Description	Consistency Determination
		pedestrians, cyclists, and equestrians based on a combination of the land use and roadway context to promote safety and efficiency for all users.	and frontage improvements consistent with City standards and would not preclude bicycle or other non-motorized transportation improvements.
Non-Vehicular Transportation	CI- 3.2	Establish and maintain an interconnected trail system that promotes safe and convenient travel to transit stops and between residential and commercial areas, schools, parks, recreation facilities, and other key destination points.	**Consistent** – The Project would not interfere with existing or planned active transportation facilities and would support future connectivity through frontage improvements and compliance with City circulation requirements.
Non-Vehicular Transportation	CI-3.5	Promote new development and transportation demand management (TDM) strategies that will reduce household and employment vehicle miles traveled (VMT). Prioritize the implementation of TDM strategies over the expansion of roadway capacity.	**Consistent** – The Project would not conflict with the City's VMT reduction objectives and may implement transportation demand management measures where feasible.
Transit Network	CI-4.1	Coordinate with Victor Valley Transit Authority (VVTA) to provide residents and workers with accessible and convenient service between residential neighborhoods, commercial centers, educational facilities, employment nodes, and medical facilities.	**Consistent** – The Project would not interfere with existing or planned transit services and would maintain access to the regional transit network serving employees and visitors.

Table 5.03-11: Consistency Analysis with Connect SoCal 2024 Congestion Management

Goal	Goal Description	Project Consistency Discussion
Develop Regional Objectives for Congestion Management	Ensure the project aligns with SCAG CMP (Congestion Management Process) objectives to maintain acceptable congestion levels in the region.	**Consistent-** Project considers regional congestion objectives.
Define CMP Network	Consider impact on SCAG-defined transportation network, including highways, arterials, transit, bicycle/pedestrian, and freight routes.	**Consistent-** Project integrates into the multimodal network.
Develop Multimodal Performance Measures	Evaluate and support mobility across all modes, not just vehicle traffic.	**Consistent-** Supports multimodal transportation and SCAG performance measures.
Collect Data / Monitor System Performance	Project should enable monitoring of its congestion impacts.	**Consistent-** Project uses recognized regional data and modeling tools.
Analyze Congestion Problems and Needs	Identify potential impacts on congestion and address them through design or mitigation.	**Consistent-** Congestion impacts analyzed and mitigated.
Reduce Congestion and Travel Delays	Minimize regional travel delays resulting from the Project.	**Consistent-** Congestion reduction measures incorporated.
Promote Multimodal Transportation Options	Encourage walking, biking, transit, and other alternatives to single-occupancy vehicles.	**Consistent-** Supports SCAG's multimodal mobility goal.
Link Transportation Planning with Land Use	Integrate land use decisions to reduce travel demand and support sustainable mobility.	**Consistent-** Land-use planning supports congestion management.
Support Public Health and Equity	Minimize adverse impacts on vulnerable populations and enhance accessibility.	Equity and health considerations addressed.

Goal	Goal Description	Project Consistency Discussion
Create a Sustainable, Resilient System Through 2050	Contribute to long-term sustainability and resiliency of regional transportation network.	Project supports long-term sustainable transportation goals.

The Project would not conflict with an applicable plan, or ordinance, or policy addressing the circulation system, including those related to transit, roadway, bicycle, and pedestrian facilities. Therefore, impacts would be less than significant. While one intersection (Key Pointe Drive and Main Street) is projected to operate at an unacceptable level of service under cumulative conditions, this condition also occurs under the no Project scenario. With implementation of Mitigation Measure TRANS-1, the Project would not result in a substantial adverse effect on the circulation system or conflict with applicable plans and policies.

Level of Significance before Mitigation

Less than significant impact.

Mitigation Measures

TRANS-1 Contribute fair share, as determined by the City, to construct a second southbound left turn lane at Key Pointe Drive (NS) at Main Street (EW).

Level of Significance after Mitigation

Less than Significant.

Impact TRANS-(b): Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

Impact Statement: The implementation of the proposed Project will conflict with CEQA Guidelines section 15064.3, subdivision (b).

Impact Analysis

CEQA Guidelines Section 15064.3, subdivision (b), addresses Vehicle Miles Traveled (VMT) and whether a land use project would generate VMT in excess of an applicable threshold of significance. Based on the revised VMT Analysis prepared by Ganddini Group, the Project is estimated to generate 47.7 VMT per service population under baseline conditions and 48.5 VMT per service population under cumulative conditions. These values exceed the City's established significance threshold of 35.3 VMT per service population. Therefore, the Project would result in a significant transportation impact without mitigation.

The Project's effect on VMT was also evaluated using link-level VMT per service population within the County boundary. Under baseline conditions, link-level VMT per service population would remain at 21.9 with and without the Project. Under cumulative conditions, link-level VMT per service population would remain at 25.2 with and without the Project. Therefore, the Project's effect on Countywide VMT would be less than significant without mitigation. This finding does not alter the separate conclusion that the Project's own generated VMT would exceed the City's threshold and result in a significant impact.

The VMT Analysis evaluated the VMT mitigation options identified in the City of Hesperia Transportation Impact Analysis (TIA) Guidelines, including modifications to the Project's built environment, implementation of Transportation Demand Management (TDM) measures, and participation in a VMT fee or mitigation banking program. As of May 2025, the San Bernardino County Transportation Authority (SBCTA) was developing a pilot VMT Mitigation Bank; however, the program is not formally in effect and is therefore unavailable as a feasible mitigation option. The VMT Analysis also evaluated the transportation-related measures identified in the CAPCOA Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity (2024). The effectiveness of these measures is constrained by the nature of the proposed warehouse use, which limits opportunities to provide a mix of on-site land uses, and the limited availability of transit, bicycle facilities, and other alternative transportation infrastructure in the Project vicinity.

Notwithstanding these constraints, several Project-level TDM measures are feasible and would encourage employees to utilize alternative modes of transportation. The VMT Analysis identifies these measures as a single mitigation measure consisting of three TDM components. For consistency with the organization of this EIR, these components are presented below as Mitigation Measures TRANS-2 through TRANS-4. These measures require the Project to provide designated carpool and vanpool parking spaces in convenient locations, install end-of-trip facilities including bicycle parking and lockers, and implement a commute trip reduction marketing program that promotes alternatives to single-occupant vehicle travel, including carpooling, vanpooling, transit, bicycling, and walking. While these measures could reduce employee commute-related VMT depending on future tenant operations and employee participation, implementation is expected to have only a marginal effect on VMT reduction, if any. No quantifiable VMT reduction is assumed. Therefore, the Project's VMT per service population would continue to exceed the City's significance threshold, and the transportation impact would remain significant and unavoidable.

Level of Significance Before Mitigation

Potentially significant impact.

Mitigation Measures

TRANS-2 Designated Carpool and Vanpool Parking

Prior to issuance of an occupancy permit, the Project Applicant shall designate carpool and vanpool parking spaces in convenient locations near employee building entrances. The spaces shall be clearly marked and reserved for carpool and vanpool use. The designated spaces shall be shown on the final site plan and maintained for the life of the Project.

TRANS-3 End-of-Trip Facilities

Prior to issuance of an occupancy permit, the Project Applicant shall provide end-of-trip facilities to encourage employees to use bicycles and other alternative modes of transportation. Such facilities shall include bicycle parking, lockers, and similar amenities, as appropriate. The facilities shall be shown on the final site plan and maintained for the life of the Project.

TRANS-4 Commute Trip Reduction Marketing Program

Prior to issuance of an occupancy permit, the Project Applicant shall develop and implement a commute trip reduction marketing program for Project employees. Informational materials promoting alternatives to single-occupant vehicle travel, including carpooling, vanpooling, transit, bicycling, and walking, shall

be displayed in prominent employee locations, such as employee break rooms, employee entrances, or other common areas. The informational materials shall be maintained for the life of the Project.

Level of Significance After Mitigation
Significant and unavoidable impact.

5.03.10 – Cumulative Impacts

This cumulative impact analysis considers the proposed Project in combination with other past, present, and reasonably foreseeable future development within the study area identified in the Traffic Impact Analysis, as well as growth anticipated under the City of Hesperia General Plan, the Main Street and Freeway Corridor Specific Plan, and the regional planning assumptions reflected in the San Bernardino Transportation Analysis Model (SBTAM). This geographic scope is appropriate because transportation conditions are influenced by traffic patterns on the local and regional roadway network, including the eight (8) study intersections evaluated in the Traffic Impact Analysis (Appendix K), and by broader travel behavior captured in the Vehicle Miles Traveled (VMT) analysis (Appendix M).

As described in this section, the Project would not conflict with an applicable program, plan, ordinance, or policy addressing the circulation system following implementation of Mitigation Measure TRANS-1, which requires the Project to contribute its fair share, as determined by the City, toward construction of a second southbound left-turn lane at Key Pointe Drive and Main Street. In addition, the section concludes that the Project would not substantially increase hazards due to a geometric design feature or incompatible uses, would not result in inadequate emergency access, and would not adversely affect bicycle or pedestrian facilities. Accordingly, with implementation of TRANS-1, the Project would not make a cumulatively considerable contribution to cumulative impacts related to local circulation, intersection operations, geometric design, or emergency access.

With respect to vehicle miles traveled, the analysis demonstrates that the Project would generate 47.7 VMT per service population under baseline conditions and 48.5 VMT per service population under cumulative conditions, exceeding the City's significance threshold of 35.3 VMT per service population. The effectiveness of many of the transportation-related measures evaluated in the revised CAPCOA feasibility assessment is constrained by the nature of the proposed warehousing use and the limited availability of alternative transportation infrastructure in the Project vicinity. The developing SBCTA pilot VMT mitigation bank is also not currently available.

Mitigation Measures TRANS-2 through TRANS-4 would require designated carpool and vanpool parking spaces and end-of-trip facilities to encourage employee use of shared and alternative transportation modes. Although these measures would reduce employee commute-related VMT to some degree, the reduction cannot be reliably quantified and would not reduce Project-generated VMT below the applicable threshold. Because VMT is the CEQA transportation metric established by CEQA Guidelines Section 15064.3, and because the Project's incremental contribution to regional VMT would remain above the applicable threshold, the Project's VMT impact would be cumulatively considerable. Therefore, the Project's cumulative transportation impact related to VMT would remain significant and unavoidable after mitigation.

5.03.11 – Significant and Unavoidable Transportation Impacts

Vehicle Miles Traveled (VMT)

The proposed Project would result in a significant and unavoidable impact related to Vehicle Miles Traveled (VMT). As discussed under Impact TRANS-(b), the Project would exceed the City of Hesperia's threshold of 35.3 VMT per service population under both baseline and cumulative conditions.

The VMT Analysis evaluated transportation-related measures identified in the CAPCOA Handbook. The effectiveness of many potential strategies is constrained by the proposed warehousing use and by regional factors outside the control of the Project Applicant, including limited transit service, bicycle infrastructure, surrounding land use patterns, and regional travel behavior. The developing SBCTA pilot VMT mitigation bank is also not formally in effect and is not currently available to the Project.

Mitigation Measures TRANS-2 through TRANS-4 would require the Project to provide designated carpool and vanpool parking spaces, end-of-trip facilities, including bicycle parking, lockers, and similar amenities and trip reduction marketing. These measures would encourage employees to use shared and alternative transportation modes and would reduce commute-related VMT to some degree. However, the amount of reduction cannot be reliably quantified because it would depend on future tenant operations and employee participation. Given the magnitude by which the Project would exceed the City's threshold under baseline and cumulative conditions, implementation of these measures would not reduce VMT below the applicable threshold. Therefore, the impact would remain significant and unavoidable after mitigation.

SECTION 6: ALTERNATIVES TO THE PROPOSED PROJECT

6.1 - Introduction

In accordance with CEQA Guidelines Section 15126.6, this Draft Environmental Impact Report (Draft EIR) contains a comparative impact assessment of alternatives to the proposed Project. The primary purpose of this chapter is to provide decision-makers and the public with a reasonable number of feasible Project alternatives that could attain most of the basic Project objectives, while avoiding or reducing one or more of the Project's significant adverse environmental effects. The alternatives analysis focuses on the Project's significant and unavoidable impacts related to greenhouse gas (GHG) emissions and vehicle miles traveled (VMT), consistent with CEQA Guidelines Section 15126.6(b). Important considerations for these alternatives analyses are noted below (as stated in State CEQA Guidelines § 15126.6):

- An EIR need not consider every conceivable alternative to a Project;
- An EIR should identify alternatives that were considered by the lead agency, but rejected as infeasible during the scoping process;
- Reasons for rejecting an alternative include:
    - Failure to meet most of the basic Project objectives;
    - Infeasibility; or
    - Inability to avoid significant environmental effects.

6.1.1 - Significant Unavoidable Impacts

The proposed Project would result in significant and unavoidable environmental impacts related to Vehicle Miles Traveled (VMT) and Greenhouse Gas (GHG) emissions, as identified in the transportation and greenhouse gas analyses prepared for this EIR. These impacts therefore require consideration in the alternatives analysis pursuant to CEQA Guidelines Section 15126.6(a). Despite implementation of feasible mitigation measures, neither impact can be reduced to a less-than-significant level.

Transportation (Vehicle Miles Traveled)

- Impact TRANS-37(b): The Project would generate an increase in vehicle miles traveled relative to existing (No Project) conditions and the exceeds the City of Hesperia's established VMT significance thresholds.
- The City's *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* (July 2020) require projects exceeding thresholds to implement feasible mitigation measures aimed at reducing VMT. However, the Project's VMT analysis determined that even with potential transportation demand management (TDM) strategies, reductions would not be sufficient to meet the City's thresholds.
- The only transportation mitigation measure identified for the Project—Mitigation Measure TRANS-1: Contribute fair share, as determined by the City, to construct a second southbound left-turn lane at Key Pointe Drive (NS) at Main Street (EW)—addresses intersection level of service (LOS) impacts only. This measure does not reduce VMT and therefore does not mitigate the Project's significant VMT impact.

- Because no feasible mitigation measures are available to reduce VMT below the City's threshold, and the primary contributing factors (regional travel behavior, roadway network characteristics, and land use distribution) are outside the City's control, the Project's VMT impact remains significant and unavoidable.

As such, VMT represents a project-level impact that cannot be feasibly mitigated through traditional transportation improvements and is primarily influenced by land use patterns and regional travel behavior.

Greenhouse Gas Emissions

- Based on the *Urban Crossroads Greenhouse Gas Analysis* (Appendix G), construction and operational emissions associated with the Project are estimated to total approximately 4,894.17 MT O e per year a r i ed ver a -year operational life consistent with regional air quality district guidance (MDAQMD and SCAQMD)
- This al exceeds he A M MT O e year hresh ld r ind s rial pr ec s. The r ec would implement feasible GHG reduction measures consistent with the City's adopted Climate Action Plan (CAP) Screening Tables, including:
    - Energy-efficient building design and compliance with CALGreen Standards;
    - Installation of EV-capable parking spaces;
    - Implementation of water-efficient landscaping and plumbing fixtures; and
    - Solid waste diversion consistent with City recycling goals.
- While these measures would incrementally reduce GHG emissions, the reductions are insufficient to achieve emissions below the applicable significance threshold. Therefore, the Project's impact related to GHG emissions would remain significant and unavoidable.

Accordingly, the Project would result in the following significant and unavoidable impacts:

1. **Vehicle Miles Traveled (VMT)**, and
2. **Greenhouse Gas (GHG) Emissions.**

These impacts result from factors that cannot feasibly be mitigated at the project level. Accordingly, the City must adopt **a Statement of Overriding Considerations pursuant** to CEQA Guidelines §15093 before approving the Project.

6.1.2 - Alternative Eliminated from Further Consideration

An EIR must briefly describe the rationale for selection and rejection of alternatives. The lead agency may make an initial determination as to which alternatives are potentially feasible and, therefore, merit in-depth consideration, and which are clearly infeasible. Alternatives that are remote or speculative, or the effects of which cannot be reasonably predicted, need not be considered (State CEQA Guidelines § 15126.6.

This section identifies the alternative considered by the lead agency, but rejected as infeasible, and provides a brief explanation of the reasons for its exclusion. As noted above, alternatives may be eliminated from detailed consideration in the EIR if they fail to meet most of the Project objectives, are infeasible, or do not avoid any significant environmental effects.

Alternative Site Alternative: The Alternative Site Alternative was considered at a programmatic level only and is n analy ed in de ail d e lac speci ic availa le and c para le si es. An alternative location i hin an her ind s rially ned area esperia s ch as parcels n r h Main ree r i hin he Rail Spur Industrial Area, was considered. While relocating could theoretically reduce VMT by placing the facility closer to major transportation corridors or workforce concentrations, this option was determined to be infeasible for the following reasons:

- appr pria ely si ed (acre) vacan parcel i h necessary in ras r c re and ree ay access is currently available.
- Relocation would require new entitlements, infrastructure extensions, and potentially more extensive grading and biological disturbance.
- It would not necessarily achieve lower VMT or GHG emissions, as truck routing and regional trip lengths would remain comparable.
- No alternative site was identified that is both available to the Applicant and capable of accommodating the Project's operational needs.

Therefore, the Alternative Site was eliminated from further consideration due to infeasibility and uncertain environmental benefit.

6.1.3 - Alternatives to the Proposed Project

The hree al erna ives analy ed in de ail incl de he A-required No Project Alternative and three feasible build al erna ives s ari ed el

- **No Project Alternative:** Under this alternative, the Project site would remain in its existing vacant and disturbed condition. No warehouse construction, utility extension, or grading would occur, and he si e ld re ain i s c rren land se and nin desi na i ns Re i nal ommercial (RC).
- **Alternative 1: Reduced Intensity Industrial Alternative**: This alternative would reduce the overall building area to approximately 350,000 square feet (about 70 percent of the proposed Project). The number of loading docks, trailer stalls, and parking spaces would be proportionally reduced. Site circulation and access would remain similar to the proposed Project.
- **Alternative 2: Enhanced Transportation Demand Management (TDM) Alternative**: This alternative would retain the same 499,714-square-foot building footprint and program but incorporate enhanced on-site sustainability and mobility features designed to reduce GHG and VMT generation. Examples include:
    - Installation of electric vehicle (EV) charging stations for passenger and delivery vehicles;
    - Employee carpool, vanpool, or shuttle programs coordinated with regional transit hubs;
    - Bicycle and pedestrian connectivity improvements along Amargosa Road;
    - On-site amenities (break areas, food services) to reduce off-site trips; and
    - Preference for electric or low-emission delivery fleets.

- **Alternative 3**: **Reduced Building Footprint with Expanded Landscape Buffer Alternative**: Under this alternative, the building would be slightly reconfigured and reduced to approximately 475,000 square feet to allow for increased setbacks and landscaped buffers along Amargosa Road and Palmetto Way. Trailer parking would be reduced, and landscaping would increase from 19 percent to roughly 25 percent of the site area.

To support clarity and readability, the build alternatives are presented using a consolidated format that groups impact topics into broader categories. Each alternative includes a discussion of its purpose, design concept, environmental benefits, ability to meet Project objectives, and CEQA conclusions. All resource areas analy ed in he R are addressed h h n nder individ al s headin s as sed in he r ec Alternative. This format maintains consistency with CEQA while avoiding redundancy in the Alternatives Analysis.

The al erna ives are analy ed in he sec i ns el and c pared i h he pr p sed r ec . n several instances, both the Project and an alternative may result in the same CEQA significance conclusion (e.g., less than significant), but the relative degree of impact may differ. These distinctions form the basis for identifying greater or lesser impacts and ultimately the Environmentally Superior Alternative.

6.2 - Project Objectives

The following objectives have been identified in order to aid decision makers in their review of the proposed Project, and its associated environmental impacts.

1. **Develop an Industrial Warehouse and Distribution Facility**
   Construct an industrial warehouse and distribution facility, including ancillary office space and supporting improvements, to accommodate logistics and good movement uses.

2. **Provide Industrial Uses in a Regionally Accessible Location**
   Locate industrial development within the City of Hesperia in proximity to major transportation corridors to support regional and interstate goods movement.

3. **Facilitate Efficient Use of a Vacant Site**
   Develop the approximately 30.52-acre r ec si e i h a se ha axi i es i s ili y hile considering site constraints and surrounding land uses.

4. **Ensure Consistency with Local Planning Frameworks**
   Obtain necessary land use entitlements, including a Specific Plan Amendment and Zone Change ali n he r ec si e s land se and nin i h he ercial nd s rial siness ar designation, facilitating compatibility with surrounding land uses and the City's planning objectives.

5. **Provide Necessary Infrastructure and Site Improvements**
   Incorporate appropriate infrastructure and site design features, including circulation, parking, utilities, stormwater management, and landscaping, to support safe and functional operations.

6. **Support Economic Activity and Employment Opportunities**
   Contribute to the local and regional economy by providing opportunities for employment and supporting industrial and logistics- related business activity.

7. **Accommodate Modern Logistics Operations**
   Design the Project to accommodate contemporary warehouse and distribution operations, incl din appr pria e ildin si e c n i ra i n and si e lay .

6.3 - No Project Alternative

This alternative assumes that no development would occur on the 30.52-acre Project site. The site would remain in its existing, undeveloped condition with disturbed soils and sparse vegetation. No warehouse construction, grading, or infrastructure improvements would take place, and the existing Regional ercial (R) land se desi na i n and nin ld re ain in e ec .

6.3.1 - Impact Analysis

Under the No Project Alternative, no development would occur on the 30.52-acre Project site. As a result, the environmental conditions on the site would remain unchanged, and no Project-related construction or operational activities would take place.

Air Quality

Because no construction or operational activities would occur, the No Project Alternative would not generate emissions of criteria pollutants or toxic air contaminants associated with grading, building construction, or long-term warehouse operations. As such, the No Project Alternative would not result in any new air quality impacts. Compared to the proposed Project—which was determined to result in less-than-significant air quality impacts—the No Project Alternative would further reduce emissions by eliminating all Project-related sources. Therefore, the No Project Alternative would result in the greatest reduction in air quality emissions; however, because the Project's air quality impacts are already less than significant, this reduction does not represent a change in impact significant under CEQA.

Greenhouse Gas Emissions

The No Project Alternative would eliminate all construction and operational greenhouse gas (GHG) emissions associated with the proposed Project. This includes emissions from site preparation, building construction, vehicle trips, energy use, and ongoing warehouse operations. As a result, the No Project Alternative would avoid the significant and unavoidable GHG impacts identified for the proposed Project and would not contribute to cumulative climate change impacts. Compared to the proposed Project, this alternative would result in a substantial reduction in GHG emissions and would be environmentally superior with respect to this impact category.

Transportation (Vehicle Miles Traveled)

Under the No Project Alternative, no new vehicle trips would be generated, and there would be no increase in vehicle miles traveled (VMT) in the Project vicinity or region. Therefore, the No Project Alternative would avoid the significant and unavoidable transportation impacts identified for the proposed Project related to VMT per capita exceeding applicable thresholds. This alternative would not require

implementation of VMT reduction strategies or mitigation measures, as no impact would occur. Compared to the proposed Project, the No Project Alternative would result in a substantial reduction in transportation-related impacts and would be environmentally superior with respect to VMT.

In addition to the issue areas evaluated in this EIR, the No Project Alternative would avoid all other potential environmental effects associated with development, including grading, utility extensions, and changes to site conditions. Existing biological resources, including Joshua trees and ruderal vegetation, would remain undisturbed, and there would be no changes to hydrology, utilities, or local infrastructure.

Ability to Meet Project Objectives

The No Project Alternative would not meet any of the Project's fundamental objectives. Specifically, it would not provide for the development of an industrial warehouse and distribution facility, would not generate employment opportunities, would not facilitate infrastructure improvements, and would not support the City's economic development goals or efficient use of a vacant site.

Feasibility

The No Project Alternative is physically feasible, as it would maintain the site in its existing condition. However, it would be economically and functionally infeasible because it would not achieve the underlying purpose of the Project or the City's land use and economic development objectives for the site.

Conclusion

The No Project Alternative would avoid all environmental impacts associated with the proposed Project, including the significant and unavoidable impacts related to greenhouse gas emissions and transportation (VMT). However, it would not meet any of the Project objectives and would not provide the intended economic or land use benefits. As required by California Environmental Quality Act (CEQA), this alternative serves as a baseline for comparison with the proposed Project and other alternatives and is considered the environmentally superior alternative.

6.4 - Alternative 1: Reduced Intensity Industrial Alternative

This alternative would reduce the total building area from approximately 499,714 square feet to 350,000 square feet, maintaining the same general layout and land use but at a smaller scale. The facility would include proportionally fewer loading docks, truck stalls, and passenger vehicle parking spaces. Site access and circulation patterns would remain consistent with the proposed Project.

6.4.1 - Impact Analysis

The Reduced Intensity Industrial Alternative would decrease the total building area to approximately 350,000 square feet, resulting in a corresponding reduction in construction activity and operational intensity.

Air Quality

Construction and operational emissions of criteria pollutants and toxic air contaminants would be reduced compared to the proposed Project due to decreased grading, fewer construction activities, and lower operational throughput (i.e., fewer truck trips and employee commutes). However, because the proposed

Project's air quality impacts were determined to be less than significant, this alternative would not result in a substantial change in impact significance. Air quality impacts would remain less than significant.

Greenhouse Gas Emissions

This alternative would reduce total greenhouse gas (GHG) emissions relative to the proposed Project due to reduced building area, lower energy consumption, and fewer vehicle trips. However, the reduction in emissions would not be sufficient to reduce total GHG emissions below the applicable significance threshold. As a result, GHG impacts would remain significant and unavoidable, although reduced, but not to a less-than significant level compared to the proposed Project.

Transportation (Vehicle Miles Traveled)

The reduced scale of development would result in fewer employee and truck trips, leading to a reduction in total VMT. However, because the Project site is located within a regional logistics corridor with limited access to transit and housing, the decrease in VMT would not be sufficient to meet the City's threshold for VMT per capita. Therefore, transportation impacts related to VMT would remain significant and unavoidable, although reduced compared to the proposed Project.

Other environmental impacts, including biological resources, noise, and hydrology, would also be reduced proportionally with the smaller development footprint and would remain less than significant with implementation of mitigation measures and regulatory compliance.

Ability to Meet Project Objectives

This alternative would meet most of the Project's objectives, including developing a modern industrial use, providing new employment opportunities, and improving local infrastructure. However, it would provide fewer jobs and a lower economic return compared to the proposed Project.

Feasibility

This alternative is feasible from both a physical and regulatory standpoint, as it would require the same entitlements and infrastructure improvements as the proposed Project.

Conclusion

The Reduced Intensity Industrial Alternative would reduce GHG emissions and VMT relative to the proposed Project but would not eliminate significant and unavoidable impacts. It would provide moderate environmental benefits while still achieving most Project objectives.

6.5 - Alternative 2: Enhanced Transportation Demand Management (TDM) Alternative

This alternative would maintain the same overall building area of 499,714 square feet but would incorporate additional sustainability and mobility features intended to reduce GHG emissions and VMT. Key measures could include:

- Installation of electric vehicle (EV) charging stations for employees and truck fleets;

- Implementation of carpool, shuttle, or vanpool programs;
- Bicycle and pedestrian facilities connecting to Amargosa Road;
- On-site amenities such as food and rest areas to reduce off-site trips; and
- Preference for electric or low-emission delivery fleets.

6.5.1 - Impact Analysis

The Enhanced TDM Alternative would maintain the same development intensity as the proposed Project but incorporate transportation demand management and sustainability strategies.

Air Quality

Implementation of TDM strategies and cleaner vehicle technologies would reduce operational emissions associated with employee commuting and fleet operations. However, because the overall development intensity remains unchanged, construction emissions and a substantial portion of operational emissions would be similar to the proposed Project. Air quality impacts would remain less than significant, consistent with the proposed Project.

Greenhouse Gas Emissions

TDM measures and potential electrification strategies would reduce operational GHG emissions compared to the proposed Project by decreasing vehicle trips and improving energy efficiency. However, due to the scale of the facility and continued reliance on regional freight movement, total GHG emissions would still exceed applicable thresholds. Therefore, GHG impacts would remain significant and unavoidable, although reduced, but not to a less than-significant level.

Transportation (Vehicle Miles Traveled)

TDM strategies would reduce VMT per employee by encouraging carpooling, alternative transportation modes, and reduced trip generation. However, because a substantial portion of VMT is driven by goods movement and regional commute patterns beyond the control of the Project, the reduction would not be sufficient to meet the City's VMT threshold. Impacts would remain significant and unavoidable.

Other environmental impacts would be similar to the proposed Project, with minor incremental improvements due to reduced operational intensity in certain areas.

Ability to Meet Project Objectives

This alternative would fully meet the Project's objectives while incorporating enhanced sustainability and mobility benefits. It would support local employment, improve infrastructure, and promote consistency with City climate and transportation policies.

Feasibility

The alternative is feasible and could be implemented through standard conditions of approval or design re ire en s. ld n re ire chan es land se desi na i ns r nin .

Conclusion

The Enhanced TDM Alternative would reduce GHG emissions and VMT compared to the proposed Project but would not eliminate significant and unavoidable impacts. While it would fully meet Project objectives and improve sustainability performance, it would not provide the greatest overall reduction in environmental impacts among the development alternatives.

6.6 - Alternative 3: Reduced Building Footprint with Expanded Landscape Buffer Alternative

This alternative would reconfigure the site plan to reduce the total building area to approximately **475,000 square feet** and expand landscape setbacks along Amargosa Road and Palmetto Way. Trailer parking would be reduced, and landscape coverage would increase from approximately 19 percent to about 25 percent of the site area.

6.6.1 - Impact Analysis

This alternative would slightly reduce development intensity and increase landscaped areas.

Air Quality

A minor reduction in construction activity and operational intensity would result in slightly lower emissions compared to the proposed Project. However, because the reduction in building area is limited, overall emissions would be similar. Air quality impacts would remain less than significant.

Greenhouse Gas Emissions

GHG emissions would be marginally reduced due to slightly lower building area and reduced operational demand. However, the reduction would not be substantial enough to bring emissions below the applicable significance threshold. GHG impacts would remain significant and unavoidable.

Transportation (Vehicle Miles Traveled)

This alternative would result in minimal reductions in VMT, as the overall operational characteristics of the site would remain largely unchanged. Freight activity and employee commute patterns would be similar to the proposed Project. Therefore, VMT impacts would remain significant and unavoidable.

This alternative would provide localized environmental benefits including increased landscaping, reduced impervious surface area, and minor improvements to stormwater management and noise buffering.

Ability to Meet Project Objectives

This alternative would meet most of the Project objectives and could enhance community compatibility through improved aesthetics and landscaping. However, the slight reduction in building area may limit operational efficiency or tenant flexibility.

Feasibility

The alternative is feasible and could be implemented without substantial design or entitlement constraints.

Conclusion

The Reduced Building Footprint with Expanded Landscape Buffer Alternative would provide modest improvements in visual and site design-related impacts but would not substantially reduce GHG or VMT impacts. It would not be environmentally superior to other development alternatives.

6.7 - Environmentally Superior Alternative

CEQA Guidelines §15126.6(e)(2) require that an EIR identify the environmentally superior alternative a n h se analy ed. he r ec Al erna ive is de er ined e envir n en ally s peri r he R must also identify an environmentally superior alternative among the other feasible alternatives.

The environmentally superior alternative is the one that would avoid or substantially lessen one or more of the Project's significant environmental effects while still achieving most of the Project's basic objectives.

The No Project Alternative is the environmentally superior alternative because it would avoid all environmental impacts associated with development of the site.

Therefore, while the No Project Alternative is environmentally superior overall, the Reduced Intensity Industrial Alternative is identified as the environmentally superior development alternative because it would result in the greatest reduction in significant impacts related to greenhouse gas (GHG) emissions and vehicle miles traveled (VMT), while remaining feasible and meeting most of the Project objectives.

Table 6.6-1: Comparison of Alternatives to the Proposed Project

Alternative	Building Area / Features	General Description	Impact Reduction Focus	Consistency with CIBP / Project Land Use	Meets Project Objectives?	Avoids Significant and Unavoidable VMT Impact?	Reduces GHG Impact?
Proposed Project	499,714 sq. ft.; 72 loading docks, 171 tractor-trailer stalls, 311 parking spaces	Full buildout of industrial/warehouse facility with associated infrastructure, parking, and landscaping	Baseline for comparison	Yes	Fully	No	No
No Project Alternative	0	No development; site remains vacant and underutilized	All environmental impacts avoided	Yes (no change)	No	Yes	Yes

Alternative	Building Area / Features	General Description	Impact Reduction Focus	Consistency with CIBP / Project Land Use	Meets Project Objectives?	Avoids Significant and Unavoidable VMT Impact?	Reduces GHG Impact?
Alternative 1: Reduced Intensity Industrial	350,000 sq. ft.; proportionally fewer loading docks and parking spaces	Smaller-scale industrial/warehouse development, maintaining general layout	Construction emissions, GHG, grading, VMT moderately reduced	Yes	Mostly	No	Yes (but not below threshold)
Alternative 2: Enhanced TDM	499,714 sq. ft.; 72 loading docks, 171 tractor-trailer stalls, 311 parking spaces with EV charging, TDM programs, bicycle/pedestrian facilities	Same building size as Proposed Project with enhanced sustainability and mobility measures	GHG, VMT, operational emissions reduced, but remain significant and unavoidable	Yes	Fully	No (impacts reduced but still significant)	Yes (but not below threshold)
Alternative 3: Reduced Footprint with Expanded Landscape Buffer	475,000 sq. ft.; fewer trailer stalls; increased landscape coverage (~25% of site)	Reconfigured site with larger landscaped setbacks and modest building reduction	Visual quality, hydrology, noise, stormwater improvements	Yes	Mostly	No	Minimal

SECTION 7: OTHER CEQA CONSIDERATIONS

7.1 - Significant Unavoidable Impacts

CEQA Guidelines §15126.2(b) require that an Environmental Impact Report (EIR) identify and discuss significant environmental effects that cannot be avoided if a project is implemented, even with the incorporation of feasible mitigation measures. These are impacts that may be reduced in severity through mitigation but cannot be reduced to a less-than-significant level. Although the EIR evaluates alternatives that reduce project intensity or footprint, no alternative was identified that would fully avoid this impact without compromising the basic objectives of the Project, such as providing employment-generating industrial uses, supporting goods movement, and implementing planned land use designations. As a result, the impact remains significant and unavoidable.

This section describes those significant and unavoidable impacts associated with implementation of the proposed Project. It also provides a summary of the rationale for proceeding with the Project despite the adverse effect.

Air Quality

Air quality impacts associated with construction and operation of the Project were evaluated in this EIR and determined to be less than significant. Although concerns regarding air quality were raised during the Notice of Preparation (NOP) process, technical analysis demonstrates that emissions of criteria pollutants and toxic air contaminants would not exceed applicable thresholds established by the Mojave Desert Air Quality Management District (MDAQMD). Therefore, air quality is not identified as a significant and unavoidable impact.

Greenhouse Gas Emissions

The proposed Project would result in a significant and unavoidable impact related to greenhouse gas (GHG) emissions. Based on the Greenhouse Gas Analysis prepared for the Project (Appendix X), total construction and operational emissions are estimated at approximately 4,894.17 metric tons of carbon di xide e ivalen (MT O e) per year, amortized over a 30-year period consistent with guidance from the Mojave Desert Air Quality Management District (MDAQMD) and the South Coast Air Quality Management District (SCAQMD).

This level of emissions exceeds the SCAQMD-rec ended screenin hresh ld MT O e per year for industrial projects. Therefore, the Project would have a cumulatively considerable contribution to climate change and would result in a significant impact under CEQA.

The Project incorporates feasible GHG reduction measures consistent with applicable regulations and best practices including:

- Compliance with Title 24 Building Energy Efficiency Standards;
- Implementation of CALGreen requirements;
- Installation of EV-capable and EV-ready parking spaces;
- Energy-efficient building design and operational features; and
- Transportation Demand Management (TDM) strategies to reduce vehicle trips.

While these measures would reduce overall GHG emissions, they would not be sufficient to reduce emissions below the applicable significance threshold. The impact is primarily driven by the scale of the Project and regional travel behavior associated with goods movement, which cannot be fully mitigated at the project level.

As a result, even with implementation of all feasible mitigation measures, the Project's GHG impact would remain significant and unavoidable under CEQA.

Vehicle Miles Traveled (VMT)

The proposed Project would result in a significant and unavoidable impact related to Vehicle Miles Traveled (VMT). Based on the VMT analysis prepared in accordance with the City of Hesperia Transportation Impact Analysis Guidelines, the Project is expected to exceed the County's adopted VMT thresholds. Specifically, the Project's VMT per capita would surpass the County's significance thresholds across all metrics evaluated.

In accordance with CEQA and SB 743, projects that exceed VMT thresholds are required to implement feasible mitigation. The proposed Project includes Mitigation Measures project specific TDM measures identified in Section 5.0, which consist of a range of Transportation Demand Management (TDM) strategies, such as:

- Coordination with the regional and local transit providers
- Encouraging pedestrian and bicycle connectivity
- Supporting future transit infrastructure
- Promoting complete streets concepts
- Reducing vehicle trips through design and land use integration

While these measures are intended to reduce Project-generated VMT, their effectiveness cannot be guaranteed at the project level. The ultimate success of many TDM measures depends on external regional factors beyond the Project's control, such as fuel prices, transit availability, and regional transportation policy (e.g., a VMT-based fee or gas tax). Traditional transportation improvements, such as roadway widening or intersection improvements, do not reduce VMT and therefore do not mitigate impacts under CEQA Guidelines Section 15064.3.

As a result, even with mitigation, the Project's VMT impact is expected to remain above the County's threshold, and is therefore considered significant and unavoidable under CEQA.

Implications and Statement of Overriding Considerations

Although the VMT impact cannot be fully mitigated, the Project is proposed because it achieves key planning and policy objectives, including:

- Advancing local and regional development goals
- Supporting regional goods movement and logistics operations
- Providing employment opportunities within the City
- Facilitating development consistent with planned industrial land uses
- Contributing to the City's economic base and tax revenues

In accordance with CEQA Guidelines §15093, the lead agency must adopt a Statement of Overriding Considerations at the time of Project approval to document its decision to proceed in light of this unavoidable impact.

7.2 - Growth-Inducing Impacts

CEQA Guidelines §15126.2(d) require that an Environmental Impact Report (EIR) discuss the ways in which a proposed project could foster economic or population growth or the construction of additional housing, either directly or indirectly, in the surrounding environment. A project may also be growth-inducing if it removes obstacles to growth, such as by extending utilities or roads into previously undeveloped areas. Growth-inducing impacts are not necessarily adverse but must be disclosed where a project could facilitate or accelerate development.

Growth-inducing impacts are typically characterized as either direct or indirect:

- **Direct growth-inducing impacts** result from the immediate development of employment-generating or population-supporting land uses that contribute directly to economic or demographic growth
- **Indirect growth-inducing impacts** occur when a project extends infrastructure (e.g., roads, water, sewer, storm drainage, or power) or removes other constraints, thereby facilitating or accelerating future development in adjacent or nearby areas.

Project Evaluation

The proposed Project involves construction and operation of a 499,714-square-foot industrial warehouse facility, including approximately 10,000 square feet of office space, on a 30.52-acre site within the City of Hesperia. The Project would accommodate approximately 500 to 600 employees at full operation.

The Project represents a direct employment-generating use that would contribute to economic growth in the region by creating new industrial and logistics jobs, supporting local goods movement, and increasing the City's commercial tax base. While the Project site is currently designated Regional Commercial (RC) under the Main Street and Freeway Corridor Specific Plan, the proposed General Plan Amendment and Zone Change would redesignate the site to Commercial/Industrial Business Park (CIBP) to accommodate the planned warehouse use.

This change is consistent with the City's long-term planning vision for the Amargosa Road corridor, which encourages the transition of underutilized commercial parcels to employment-generating industrial uses that support regional logistics and distribution activities. Accordingly, the Project's contribution to growth would represent anticipated urban development consistent with evolving City land use policies and would not constitute unplanned or speculative growth under CEQA.

The Project does not include residential components and would therefore not directly induce population growth. Any increase in population would be indirect, resulting from potential in-migration of workers employed at the facility, which would be minor relative to the City's overall population and employment base and consistent with regional growth projections.

Infrastructure and Indirect Growth Potential

The Project includes necessary on-site and off-site infrastructure improvements to serve the proposed industrial use. These include:

- Extension of water, sewer, and stormwater facilities from existing service lines adjacent to the site;
- Frontage improvements along Palmetto Way, including curb, gutter, sidewalk, and landscape enhancements, and landscape improvements along Avenal Street frontage only; and
- Utility extensions (electricity, gas, and telecommunications) consistent with standard development requirements for industrial parcels within the City.

These improvements are limited in scope and designed solely to support the Project. They do not provide excess capacity that would enable or induce new development on surrounding properties beyond what is already allowed under the City's General Plan and Specific Plan. Furthermore, the Project area is already served by surrounding infrastructure networks, and the site is located within a fully urbanized and planned service area.

Because the Project's infrastructure extensions are proportionate to the needs of the development and occur within an area already designated for urban use, they would not remove a barrier to growth or facilitate development in previously undeveloped areas.

Economic Development and Employment Effects

The Project would generate short-term construction employment and long-term operational employment associated with warehouse and distribution activities. These new jobs would have a beneficial economic effect by increasing local employment opportunities and supporting Hesperia's industrial and logistics sector.

While the Project may attract ancillary services—such as vehicle maintenance, logistics support, or nearby food and retail uses—these potential secondary effects would occur within areas already zoned for such development. Consequently, the Project's contribution to economic growth would be incremental and consistent with planned City development patterns.

Conclusion

The proposed Project would generate direct employment consistent with the City of Hesperia General Plan and the Main Street and Freeway Corridor Specific Plan, both of which anticipate industrial and commercial growth in this corridor. Infrastructure extensions associated with the Project are localized, proportionate to its operational needs, and confined within an already urbanized service area.

Accordingly, while the Project would contribute to planned economic and employment growth, it would not induce unanticipated population growth or facilitate development in previously unserved areas. Therefore, the Project's growth-inducing impacts would be considered less than significant under CEQA. The Project would not extend infrastructure into previously developed or unplanned areas.

7.3 - Significant Irreversible Environmental Changes

CEQA Guidelines §15126.2(c) require that an Environmental Impact Report (EIR) identify significant irreversible environmental changes that would result from a proposed project. Such changes may:

- Involve a large commitment of nonrenewable resources;
- Result in permanent land use conversion or commit future generations to a specific use; or
- Lead to irreversible environmental damage as a result of hazards or accidents.

Irreversible and irretrievable Commitment of Resources

Construction and operation of the proposed industrial warehouse facility would involve the long-term commitment of nonrenewable resources. These include:

- **Construction materials** such as aggregate, sand, gravel, cement, asphalt, lumber, steel, copper, and plastics;
- **Energy resources** such as electricity and fossil fuels required for construction equipment, transportation of materials, and long-term facility operation;
- **Water resources** for dust suppression, concrete curing, landscape establishment, and ongoing maintenance; and
- **Manufactured materials** including glass, insulation, and piping products.

While operational emissions would contribute to regional air quality and greenhouse gas emissions, such impacts are addressed in Section 5.0 and are not considered irreversible environmental damage. These resource demands are typical of large-scale industrial development and do not involve the use of materials or energy in unusual or excessive quantities relative to similar projects. Once expended, these nonrenewable resources are irretrievably committed to the development and operation of the Project.

Permanent Land Use Changes

The Project would permanently convert approximately 30.52 acres of vacant land into developed industrial use, including a 499,714-square-foot warehouse with associated loading docks, parking areas, and landscaped buffers. This change constitutes an irreversible commitment to urban and industrial use, precluding future return of the site to open space or undeveloped condition.

While the Project would alter the physical character of the site, this conversion is consistent with the City of Hesperia's long-term land use vision for the Main Street and Freeway Corridor Specific Plan area, which encourages employment-generating development along the Amargosa Road corridor.

Visual and Environmental Setting Alterations

Development of the Project would result in permanent changes to the site's visual and environmental setting, including:

- Introduction of large-scale industrial buildings and paved areas in place of undeveloped desert land;
- Changes to traffic patterns, particularly due to increased truck activity and employee commute trips;

- Long-term energy consumption and air pollutant emissions, including greenhouse gases associated with ongoing operations; and
- Incremental noise increases from truck movements, mechanical equipment, and loading operations.

These effects represent lasting changes to the physical environment but would be mitigated where feasible through design measures, landscaping, and operational best practices.

Hazardous Materials and Accident Potential

The Project does not propose uses that are inherently hazardous or pose a substantial risk of catastrophic environmental accidents. Limited quantities of hazardous materials (such as fuels, lubricants, cleaning solvents, and maintenance chemicals) would be stored and used on-site in accordance with applicable federal, state, and local regulations, including those enforced by the San Bernardino County Fire Department, Certified Unified Program Agency (CUPA).

Compliance with existing laws and implementation of standard safety procedures would ensure that no irreversible environmental damage would result from accidental releases of such materials.

Conclusion

Implementation of the Project would result in irreversible environmental changes associated with the permanent conversion of vacant land to industrial use and the long-term commitment of nonrenewable resources. These effects are typical of large-scale industrial development and are consistent with the City's adopted land use plans and economic development policies.

While the Project would permanently alter the site's visual and physical character and commit resources to an urban use, it would not result in irreversible environmental damage due to hazards or accidents, nor would it require the use of materials or energy in unusually large quantities compared to similar developments.

7.4 - Energy

Regulatory Framework

CEQA Guidelines Appendix F requires consideration of potential energy impacts that may result from implementation of a project. Specifically, an EIR must evaluate:

- The potential for wasteful, inefficient, or unnecessary consumption of energy;
- The project's consistency with applicable state and local energy efficiency standards;
- The extent to which the project could affect local or regional energy supplies or the development of renewable energy resources; and
- Opportunities for energy conservation that could reduce environmental impacts.

The Project would be subject to multiple regulatory programs designed to ensure efficient energy use, including the California Building Energy Efficiency Standards (Title 24, Part 6), the California Green Building

Standards Code (CALGreen, Title 24, Part 11), and applicable California Air Resources Board (CARB) regulations that limit vehicle idling and promote clean fleet technologies. Energy impacts are evaluated in the context of CEQA Guidelines Appendix F and incorporated into the overall environmental analysis.

Energy Demand During Construction

Construction of the proposed industrial warehouse facility would result in a temporary increase in energy demand, primarily associated with:

- Diesel fuel consumption for heavy-duty construction equipment (e.g., graders, loaders, dozers, cranes);
- Gasoline and diesel use for construction worker commuting and material delivery vehicles; and
- Electricity use for temporary lighting, power tools, and water pumps.

Construction activities would occur over a limited duration and are typical for industrial development of comparable scale. The Project does not propose any unusual or energy-intensive construction methods.

In addition:

- Contractors must comply with CARB's off-road diesel vehicle regulations and idling restrictions, minimizing unnecessary fuel use;
- Equipment would be required to meet Tier 4 Final emission and efficiency standards where applicable;
- Best management practices (BMPs) would be implemented to reduce idle times and optimize equipment use; and
- The Project would connect to existing utility infrastructure and would not require new or expanded energy generation or transmission facilities.

Accordingly, construction-related energy use would be considered typical, temporary, and less than significant.

Energy Demand During Operation

At full operation, the Project would function as a warehouse and distribution facility with approximately 10,000 square feet of office space. Operational energy demand would include:

- **Electricity** for warehouse lighting, office HVAC, security systems, and electric vehicle (EV) charging stations;
- **Natural gas** for space and water heating; and
- **Transportation fuels** for employee commute trips and goods movement by diesel and alternative-fuel trucks.

The Project incorporates multiple energy conservation features, including:

- Compliance with Title 24 energy efficiency standards for lighting, insulation, HVAC, and equipment performance;
- Compliance with CALGreen requirements for high-efficiency lighting, low-flow fixtures, and energy-efficient mechanical systems;
- Installation of EV-capable and EV-ready parking spaces in accordance with the California Green Building Code; and
- Transportation Demand Management (TDM) measures and routing efficiency programs to reduce unnecessary vehicle miles traveled and associated fuel use.

Energy consumption is directly related to greenhouse gas emissions and is considered in the Project's GHG analysis. The Project's operation would not require new regional energy generation capacity beyond that already planned for in regional forecasts. Electricity and natural gas demand would be served by Southern California Edison (SCE) and the Southwest Gas Corporation, both of which have adequate supply and infrastructure to meet the Project's needs.

Energy Infrastructure and Supply

The Project site is located within a fully serviced and urbanized area of the City of Hesperia. Electrical and natural gas utilities exist adjacent to the site and would be extended as part of standard site development. No new or expanded off-site energy facilities or major transmission infrastructure would be required.

Energy consumption associated with the Project would represent a small fraction of regional demand and would be consistent with growth projections already evaluated in local and regional energy planning documents, including SCAG's Connect SoCal Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).

Conclusion

Implementation of the Project would result in the irretrievable commitment of energy resources during both construction and operation. However, energy consumption would:

- Occur within the range typical for similar industrial developments;
- Not involve inefficient, wasteful, or unnecessary energy use;
- Not result in significant adverse effects on local or regional energy supplies; and
- Be consistent with all applicable state and local energy efficiency regulations.

Therefore, energy impacts associated with the Project would be less than significant under CEQA.

SECTION 8: EFFECTS FOUND NOT TO BE SIGNIFICANT

As part of the environmental review process, an Initial Study was prepared and circulated with the Notice of Preparation (NOP) in accordance with CEQA Guidelines Section 15063. The Initial Study was prepared for the Project and is included in Appendix N of this EIR.

The Initial Study evaluated the full range of environmental issue areas in the CEQA Environmental Checklist and concluded that many topics would result in no impact or less-than-significant impacts due to the nature, scope, and location of the proposed Project, or by virtue of compliance with existing regulatory standards and adopted plans. These issues were therefore not carried forward for further analysis in the EIR.

In addition, certain environmental topics were carried forward for analysis in this EIR based on agency and public comments received during the NOP review period, even where the Initial Study indicated potentially less-than-significant impacts. Detailed technical analysis contained in this EIR confirms that some of these topics would result in less-than-significant impacts.

Air Quality
Air Quality was identified as an area of concern during the NOP scoping process and was therefore evaluated in detail in this EIR. As documented in Section 5.0 (Environmental Analysis) and supported by the Air Quality Impact Assessment prepared for the Project, construction and operational emissions of criteria pollutants and toxic air contaminants would not exceed the applicable thresholds established by the Mojave Desert Air Quality Management District (MDAQMD). In addition, the Project would comply with all applicable federal, state, and regional regulations related to air quality, including implementation of standard construction best management practices. Therefore, air quality impacts are considered less than significant, and no mitigation measures are required.

Where mitigation measures were identified to reduce potentially significant impacts to less-than-significant levels, they have been incorporated into the Mitigation Monitoring and Reporting Program (MMRP) provided as Table 1.7-1 in the Section 1, Executive Summary of this EIR.

A complete summary of:

- Environmental topics found to have no impact or less-than-significant impacts is included in the Initial Study Appendices B and B1; and
- All mitigation measures identified to reduce potential impacts to a less-than-significant level are detailed in the MMRP (Section 1, Executive Summary of this EIR).

Because these environmental issues were determined to be less than significant- either though the Initial Study or through detailed analysis provided in this EIR- they are not discussed further in this Section.

SECTION 9: SIGNIFICANT UNAVOIDABLE IMPACTS

The California Environmental Quality Act (CEQA) Guidelines Section 15126(b) requires an Environmental Impact Report (EIR) to describe any significant environmental impacts of a proposed project, including those that can be mitigated but not reduced to a less-than-significant level. Where significant impacts cannot be feasibly avoided or reduced without substantially altering the Project or its objectives, the EIR must identify those impacts and explain the reasons why the Project is being proposed notwithstanding those effects.

Section 5.0 of this EIR provides a comprehensive evaluation of the potential environmental impacts associated with implementation of the proposed Project and identifies applicable General Plan policies, standard regulatory requirements, and mitigation measures intended to avoid or minimize environmental effects. With incorporation of these measures, most potentially significant impacts would be reduced to a less-than-significant level.

However, as discussed in Section 5.0, certain impacts cannot be feasibly mitigated to a less-than-significant level without fundamentally altering the nature or objectives of the Project. These impacts are therefore considered significant and unavoidable.

The following significant and unavoidable impacts would result from implementation of the proposed Project:

Transportation (Vehicle Miles Traveled - VMT)

- The Project would conflict with CEQA Guidelines Section 15064.3, subdivision (b), as it would generate vehicle miles traveled (VMT) in excess of the City's adopted threshold of significance. Although transportation demand management (TDM) measures are recommended, no feasible mitigation measures have been identified that would reduce VMT impacts to a less-than-significant level.

Greenhouse Gas Emissions

- The Project would generate greenhouse gas (GHG) emissions that exceed the applicable threshold e ric ns O e per year. hile i i a i n eas res are inc rp ra ed red ce emissions, the Project would remain above the threshold, and impacts would be significant and unavoidable.

- The Project would conflict with applicable plans, policies, or regulations adopted for the purpose of reducing greenhouse gas emissions. Although the Project is generally consistent with statewide and local reduction strategies, it would still exceed the applicable numeric threshold, and impacts would remain significant and unavoidable.

Pursuant to CEQA Guidelines Section 15093, approval of the Project would require the decision-making body to adopt a Statement of Overriding Considerations, finding that specific economic, legal, social, technological, or other benefits of the Project outweigh these unavoidable adverse environmental effects.

EXECUTIVE SUMMARY

ES.1 SUMMARY OF FINDINGS

The results of this Amargosa and Palmetto High-Cube Warehouse Air Quality Impact Analysis (AQIA) are summarized below based on the significance criteria in Section 4 of this report consistent with Appendix G of the CEQA Guidelines (CEQA Guidelines) (1). Table ES-1 shows the findings of significance for each potential air quality impact under CEQA before and after any required mitigation measures (MM) described below.

TABLE ES-1: SUMMARY OF CEQA SIGNIFICANCE FINDINGS

Analysis	Report Section	Significance Findings	
		Unmitigated	Mitigated
Regional Construction Emissions	3.4	*Less Than Significant*	*n/a*
Regional Operational Emissions	3.5	*Less Than Significant*	*n/a*
CO "Hot Spot" Analysis	3.6	*Less Than Significant*	*n/a*
Air Quality Management Plan	3.7	*Less Than Significant*	*n/a*
Sensitive Receptors	3.8	*Less Than Significant*	*n/a*
Odors	3.9	*Less Than Significant*	*n/a*
Cumulative Impacts	3.10	*Less Than Significant*	*n/a*

ES.2 REGULATORY REQUIREMENTS

The Mojave Desert Air Quality Management District (MDAQMD) has implemented various rules and regulations to control air pollution sources within the Mojave Desert Air Basin (MDAB) and to support air quality standards for land use development projects. The following rules that are currently applicable during construction activity for this Project are described below:

MDAQMD Rule 403

The purpose of this rule is to reduce the amount of particulate matter less than 10 microns (PM_{10}) entrained in the ambient air from anthropogenic fugitive dust sources within the MDAQMD by requiring actions to prevent, reduce, or mitigate fugitive dust. The following measures shall be incorporated into Project plans and specifications as implementation of Rule 403 (2).

- Use periodic watering for short-term stabilization of Disturbed Surface Area to minimize visible fugitive dust emissions. For purposes of this Rule, use of a water truck to maintain moist disturbed surfaces and actively spread water during visible dusting episodes shall be considered sufficient to maintain compliance.
- Take actions sufficient to prevent project-related trackout onto paved surfaces.

MDAQMD Rule 1113

The purpose of this rule is to limit the quantity of volatile organic compounds (VOC) in architectural coatings. The following measure shall be incorporated into Project plans and specifications as implementation of MDAQMD Rule 1113 (3).

- Only "Low-VOC" paints consistent with MDAQMD Rule 1113 shall be used.

ES.3 Construction-Source Mitigation Measures

Project construction emissions would not exceed applicable MDAQMD regional thresholds of significance. Therefore, Project construction-source emissions would be considered less than significant on a project-specific and cumulative basis.

ES.4 Operational-Source Mitigation Measures

Project operational emissions would not exceed applicable MDAQMD regional thresholds of significance. Therefore, Project operational-source emissions would be considered less than significant on a project-specific and cumulative basis.

This page intentionally left blank

1 INTRODUCTION

This report presents the results of the AQIA prepared by Urban Crossroads, Inc., for the proposed Amargosa and Palmetto High-Cube Warehouse (Project). The purpose of this AQIA is to evaluate the potential impacts to air quality associated with construction and operation of the Project and recommend measures to mitigate impacts considered potentially significant in comparison to thresholds established by the MDAQMD.

1.1 SITE LOCATION

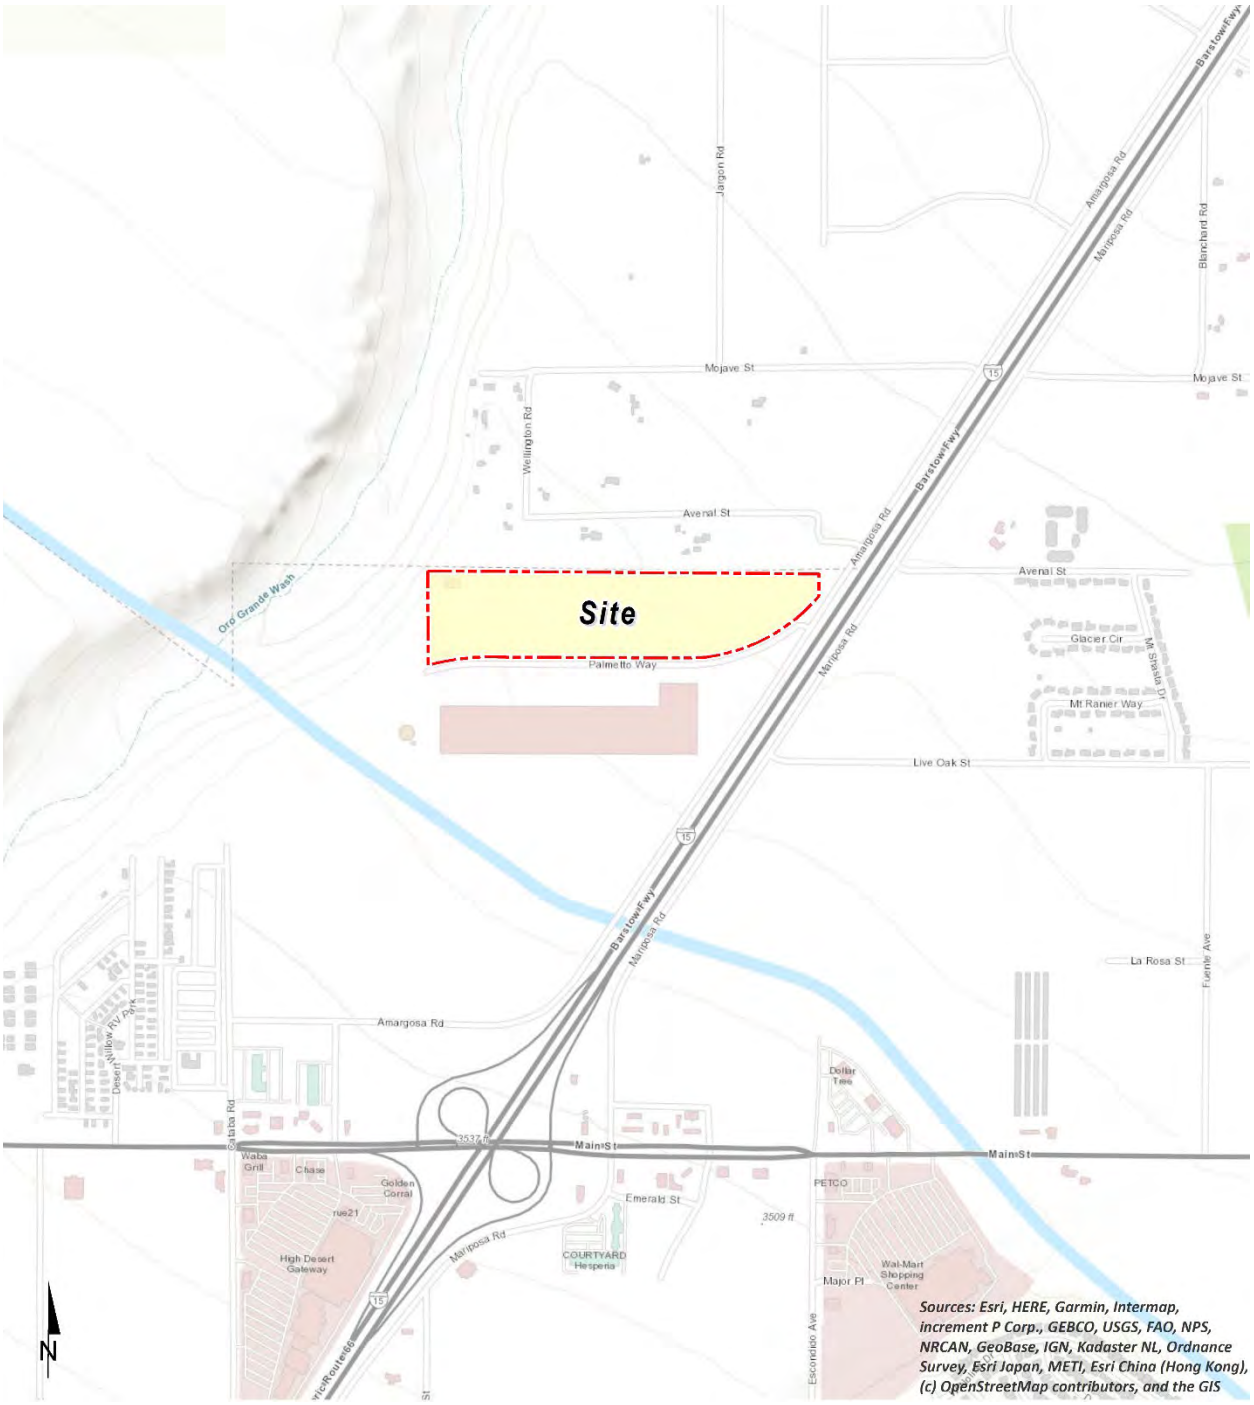
The proposed project is located on the northwest corner of Amargosa Road and Palmetto Way in the City of Hesperia, as shown on Exhibit 1-A.

1.2 PROJECT DESCRIPTION

The proposed Project is to consist of 499,714 square high-cube fulfillment center warehouse building as shown on Exhibit 1-2. The proposed project is anticipated to be constructed and fully operational by year 2027.

It is expected that the Project business operations would primarily be conducted within the enclosed building, except for traffic movement, parking, as well as loading and unloading of trucks at designated loading bays. This analysis includes a conservative assumption of on-site Project-related emission sources for potential future tenants, including architectural coatings, consumer products, landscape maintenance equipment, natural gas, electricity, mobile operations, stationary and on-site cargo handling equipment. This analysis is intended to describe air quality impacts associated with the expected typical operational activities at the Project site. To present a conservative approach, this report assumes the Project would operate 24-hours daily for seven days per week.

EXHIBIT 1-A: LOCATION MAP



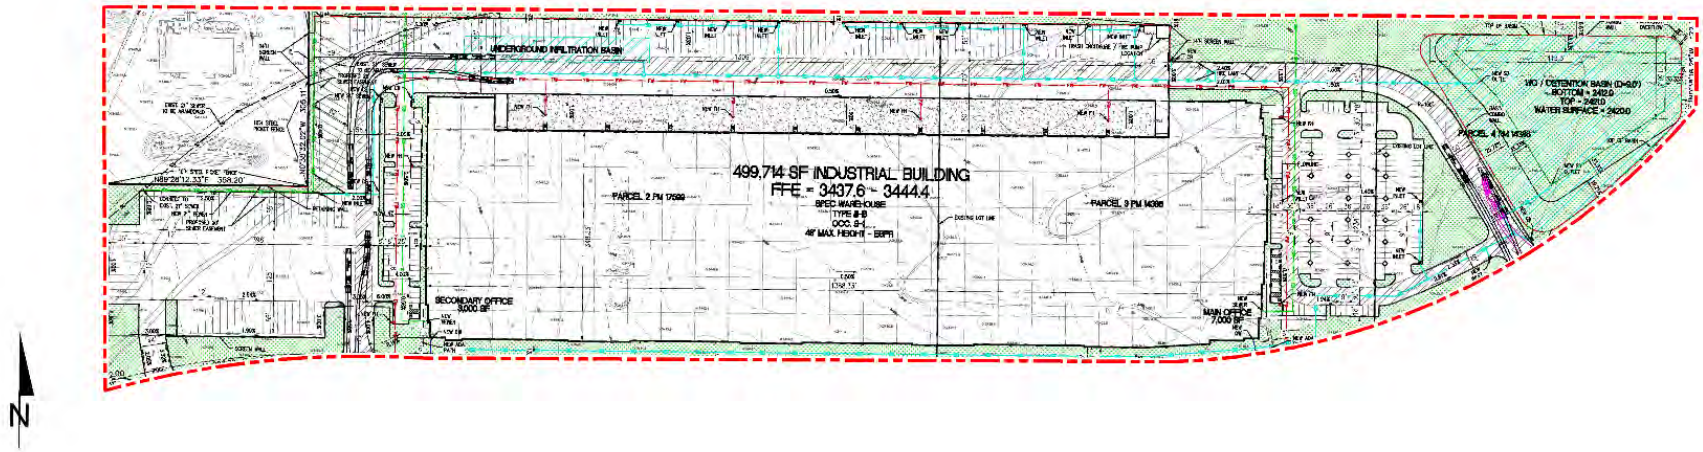


EXHIBIT 1-B: SITE PLAN

This page intentionally left blank

2 AIR QUALITY SETTING

This section provides an overview of the existing air quality conditions in the Project area and region.

2.1 MOJAVE DESERT AIR BASIN

The Project site is located in the portion of the City of Hesperia in San Bernardino County that is part of the MDAB and is under the jurisdiction of the MDAQMD. The air quality assessment for the Project evaluates emissions impacts associated with short-term construction and long-term operation of the Project. A number of air quality modeling tools are available to assess the air quality impacts of projects. In addition, certain air districts, such as the MDAQMD, have created guidelines and requirements to conduct air quality analyses. The MDAQMD's current guidelines, included in its *California Environmental Quality Act and Federal Conformity Guidelines* (August 2016), were adhered to in the assessment of air quality impacts for the Project.

2.2 REGIONAL CLIMATE

Air quality in the Project area is not only affected by various emissions sources (mobile, industry, etc.) but is also affected by atmospheric conditions such as wind speed, wind direction, temperature, and rainfall.

The MDAB is an assemblage of mountain ranges interspersed with long broad valleys that often contain dry lakes. Many of the lower mountains within the vast terrain rise from 1,000 to 4,000 feet above the valley floor. Prevailing winds in the MDAB are out of the west and southwest. These prevailing winds are due to the proximity of the MDAB to coastal and central regions and the blocking nature of the Sierra Nevada Mountains to the north; air masses pushed onshore in Southern California by differential heating are channeled through the MDAB. The MDAB is separated from the Southern California coastal and Central California valley regions by mountains (highest elevation is approximately 10,000 feet), whose passes form the main channels for these air masses. The Mojave Desert is bordered on the southwest by the San Bernardino Mountains, separated from the San Gabriel Mountains by the Cajon Pass (4,200 feet). A lesser pass lies between the San Bernardino Mountains and the Little San Bernardino Mountains in the Morongo Valley. The Palo Verde Valley portion of the Mojave Desert lies in the low desert, at the eastern end of a series of valleys (notably the Coachella Valley), whose primary channel is the San Gorgonio Pass (2,300 feet) between the San Bernardino and San Jacinto Mountains.

During the summer, the MDAB is generally influenced by a Pacific subtropical high cell that sits off the coast, inhibiting cloud formation and encouraging daytime solar heating. The MDAB is rarely influenced by cold air masses moving south from Canada and Alaska, as these frontal systems are weak and diffuse by the time they reach the desert. Most desert moisture arrives from infrequent warm, moist, and unstable air masses from the south. The MDAB averages between three and seven inches of precipitation per year (from 16 to 30 days with at least 0.01 inch of precipitation). The MDAB is classified as a dry-hot desert climate, with portions classified as dry-very hot desert, to indicate that at least three months have maximum average temperatures over 100.4° F.

Snow is common above 5,000 feet in elevation, resulting in moderate snowpack and limited spring runoff. Below 5,000 feet, any precipitation normally occurs as rainfall. Pacific storm fronts normally move into the area from the west, driven by prevailing winds from the west and southwest. During

late summer, moist high-pressure systems from the Pacific collide with rising heated air from desert areas, resulting in brief, high-intensity thunderstorms that can cause high winds and localized flash flooding.

2.3 AIR POLLUTANTS

2.3.1 Criteria Pollutants

Air quality regulations were first promulgated with the Federal Clean Air Act (CAA) of 1970. Air quality is defined by ambient air concentrations of seven "criteria air pollutants," which are a group of common air pollutants identified by the U.S. EPA to be of concern with respect to the health and welfare of the general public. Federal and State governments regulate criteria air pollutants by using ambient standards based on criteria regarding the health and/or environmental effects of each pollutant. The seven "criteria" air pollutants defined by the U.S. EPA are: (1) carbon monoxide (CO); (2) sulfur dioxide (SO_2); (3) nitrogen dioxide (NO_2); (4) ozone (O_3); (5) particulate matter less than 10 microns (PM_{10}); (6), fine particulate matter less than 2.5 microns ($PM_{2.5}$); and (7) lead (Pb). Criteria pollutants are pollutants that are regulated through the development of human health based and/or environmentally based criteria for setting permissible levels. Criteria pollutants, their typical sources, and health effects are identified below (4).

TABLE 2-1: CRITERIA POLLUTANTS (1 OF 7)

Criteria Pollutant	Description	Sources	Health Effects
CO	CO is a colorless, odorless gas produced by the incomplete combustion of carbon-containing fuels, such as gasoline or wood. CO concentrations tend to be the highest during the winter morning, when little to no wind and surface-based inversions trap the pollutant at ground levels. Because CO is emitted directly from internal combustion engines, unlike O_3, motor vehicles operating at slow speeds are the primary source of CO in the MDAB. The highest ambient CO concentrations are generally found near congested transportation corridors and intersections.	Any source that burns fuel such as automobiles, trucks, heavy construction equipment, farming equipment and residential heating.	Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects observed include earlier onset of chest pain with exercise, and electrocardiograph changes indicative of decreased oxygen (O_2) supply to the heart. Inhaled CO has no direct toxic effect on the lungs but exerts its effect on tissues by interfering with O_2 transport and competing with O_2 to combine with hemoglobin present in the blood to form carboxyhemoglobin (COHb). Hence, conditions with an increased demand for O_2 supply can be adversely affected by exposure to CO.

TABLE 2-1: CRITERIA POLLUTANTS (2 OF 7)

Criteria Pollutant	Description	Sources	Health Effects
CO (continued)			Individuals most at risk include fetuses, patients with diseases involving heart and blood vessels, and patients with chronic hypoxemia (O_2 deficiency) as seen at high altitudes.
SO_2	SO_2 is a colorless, extremely irritating gas or liquid. It enters the atmosphere as a pollutant mainly as a result of burning high sulfur-content fuel oils and coal and from chemical processes occurring at chemical plants and refineries. When SO_2 oxidizes in the atmosphere, it forms SO_4. Collectively, these pollutants are referred to as sulfur oxides (SO_X).	Coal or oil burning power plants and industries, refineries, diesel engines	A few minutes of exposure to low levels of SO_2 can result in airway constriction in some asthmatics, all of whom are sensitive to its effects. In asthmatics, increase in resistance to air flow, as well as reduction in breathing capacity leading to severe breathing difficulties, are observed after acute exposure to SO_2. In contrast, healthy individuals do not exhibit similar acute responses even after exposure to higher concentrations of SO_2. Animal studies suggest that despite SO_2 being a respiratory irritant, it does not cause substantial lung injury at ambient concentrations. However, very high levels of exposure can cause lung edema (fluid accumulation), lung tissue damage, and sloughing off of cells lining the respiratory tract. Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient SO_2 levels.

TABLE 2-1: CRITERIA POLLUTANTS (3 OF 7)

Criteria Pollutant	Description	Sources	Health Effects
SO_2 (continued)			In these studies, efforts to separate the effects of SO_2 from those of fine particles have not been successful. It is not clear whether the two pollutants act synergistically, or one pollutant alone is the predominant factor.
NO_2	NO_2 is a key component of NO_X, which also includes nitric oxide (NO) and nitrous oxide (N_2O). NO_X compounds are primarily produced during combustion processes when nitrogen (N_2) reacts with oxygen (O_2). Both NO and NO_2 serve as precursors in the formation of O_3 and $PM_{2.5}$, making their monitoring crucial for air quality assessments. NO_2, being the more abundant form of NO_X in the atmosphere, has a relatively short lifespan of one to seven days, which enhances its significance as a major air pollutant. As a criteria air pollutant, NO_2 poses various health risks, including respiratory issues and increased vulnerability to infections. It also absorbs blue light, imparting a brownish-red hue to the atmosphere and contributing to reduced visibility and smog formation. Given that NO emissions largely convert to NO_2, the examination of NO_X emissions becomes essential when assessing potential air quality impacts.	Any source that burns fuel such as automobiles, trucks, heavy construction equipment, farming equipment and residential heating.	Population-based studies suggest that an increase in acute respiratory illness, including infections and respiratory symptoms in children (not infants), is associated with long-term exposure to NO_2 at levels found in homes with gas stoves, which are higher than ambient levels found in Southern California. Increase in resistance to air flow and airway contraction is observed after short-term exposure to NO_2 in healthy subjects. Larger decreases in lung functions are observed in individuals with asthma or chronic obstructive pulmonary disease (e.g., chronic bronchitis, emphysema) than in healthy individuals, indicating a greater susceptibility of these sub-groups. In animals, exposure to levels of NO_2 considerably higher than ambient concentrations result in increased susceptibility to infections, possibly due to the observed changes in cells involved in maintaining immune functions.

TABLE 2-1: CRITERIA POLLUTANTS (4 OF 7)

Criteria Pollutant	Description	Sources	Health Effects
NO_2 (continued)	The concentrations of NO_2 are closely related to traffic density, often resulting in higher exposure levels for commuters in heavy traffic compared to what regional monitoring stations may indicate.		The severity of lung tissue damage associated with high levels of O_3 exposure increases when animals are exposed to a combination of O_3 and NO_2.
O_3	O_3 is a highly reactive and unstable gas that is formed when VOCs and NO_X, both byproducts of internal combustion engine exhaust, undergo slow photochemical reactions in the presence of sunlight. O_3 concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperature conditions are favorable to the formation of this pollutant.	Formed when ROGs and NO_X react in the presence of sunlight. ROG sources include any source that burns fuels, (e.g., gasoline, natural gas, wood, oil) solvents, petroleum processing and storage and pesticides.	Individuals exercising outdoors, children, and people with preexisting lung disease, such as asthma and chronic pulmonary lung disease, are considered to be the most susceptible sub-groups for O_3 effects. Short-term exposure (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. Elevated O_3 levels are associated with increased school absences. In recent years, a correlation between elevated ambient O_3 levels and increases in daily hospital admission rates, as well as mortality, has also been reported. An increased risk for asthma has been found in children who participate in multiple outdoor sports and reside in communities with high O_3 levels.

TABLE 2-1: CRITERIA POLLUTANTS (5 OF 7)

Criteria Pollutant	Description	Sources	Health Effects
O_3 (continued)			O_3 exposure under exercising conditions is known to increase the severity of the responses described above. Animal studies suggest that exposure to a combination of pollutants that includes O_3 may be more toxic than exposure to O_3 alone. Although lung volume and resistance changes observed after a single exposure diminish with repeated exposures, biochemical and cellular changes appear to persist, which can lead to subsequent lung structural changes.
Particulate Matter	PM_{10}: A major air pollutant consisting of tiny solid or liquid particles of soot, dust, smoke, fumes, and aerosols. Particulate matter pollution is a major cause of reduce visibility (haze) which is caused by the scattering of light and consequently the significant reduction air clarity. The size of the particles (10 microns or smaller, about 0.0004 inches or less) allows them to easily enter the lungs where they may be deposited, resulting in adverse health effects. Additionally, it should be noted that PM_{10} is considered a criteria air pollutant. $PM_{2.5}$: A similar air pollutant to PM_{10} consisting of tiny solid or liquid particles which are 2.5 microns or smaller (which is often referred to as fine particles).	Sources of PM_{10} include road dust, windblown dust and construction. Also formed from other pollutants (acid rain, NO_X, SO_X, organics). Incomplete combustion of any fuel. $PM_{2.5}$ comes from fuel combustion in motor vehicles, equipment, and industrial sources, residential and agricultural burning. Also formed from reaction of other pollutants (acid rain, NO_X, SO_X, organics).	A consistent correlation between elevated ambient fine particulate matter (PM_{10} and $PM_{2.5}$) levels and an increase in mortality rates, respiratory infections, number and severity of asthma attacks and the number of hospital admissions has been observed in different parts of the U.S. and various areas around the world. In recent years, some studies have reported an association between long-term exposure to air pollution dominated by fine particles and increased mortality, reduction in lifespan, and an increased mortality from lung cancer.

TABLE 2-1: CRITERIA POLLUTANTS (6 OF 7)

Criteria Pollutant	Description	Sources	Health Effects
Particulate Matter (continued)	These particles are formed in the atmosphere from primary gaseous emissions that include SO_4 formed from SO_2 release from power plants and industrial facilities and nitrates that are formed from NO_X release from power plants, automobiles, and other types of combustion sources. The chemical composition of fine particles highly depends on location, time of year, and weather conditions. $PM_{2.5}$ is a criteria air pollutant.		Daily fluctuations in $PM_{2.5}$ concentration levels have also been related to hospital admissions for acute respiratory conditions in children, to school and kindergarten absences, to a decrease in respiratory lung volumes in normal children, and to increased medication use in children and adults with asthma. Recent studies show lung function growth in children is reduced with long term exposure to particulate matter. The elderly, people with pre-existing respiratory or cardiovascular disease, and children appear to be more susceptible to the effects of high levels of PM_{10} and $PM_{2.5}$.
Pb	Pb is a heavy metal that is highly persistent in the environment and is considered a criteria pollutant. In the past, the primary source of Pb in the air was emissions from vehicles burning leaded gasoline. The major sources of Pb emissions are ore and metals processing, particularly Pb smelters, and piston-engine aircraft operating on leaded aviation gasoline. Other stationary sources include waste incinerators, utilities, and lead-acid battery manufacturers. It should be noted that the Project does not include operational activities such as metal processing or Pb acid battery manufacturing. As such, the Project is not anticipated to generate a quantifiable amount of Pb emissions.	Metal smelters, resource recovery, leaded gasoline, deterioration of Pb paint.	Fetuses, infants, and children are more sensitive than others to the adverse effects of Pb exposure. Exposure to low levels of Pb can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence quotient. In adults, increased Pb levels are associated with increased blood pressure.

TABLE 2-1: CRITERIA POLLUTANTS (7 OF 7)

Criteria Pollutant	Description	Sources	Health Effects
Pb (continued)			Pb poisoning can cause anemia, lethargy, seizures, and death; although it appears that there are no direct effects of Pb on the respiratory system. Pb can be stored in the bone from early age environmental exposure, and elevated blood Pb levels can occur due to breakdown of bone tissue during pregnancy, hyperthyroidism (increased secretion of hormones from the thyroid gland) and osteoporosis (breakdown of bony tissue). Fetuses and breast-fed babies can be exposed to higher levels of Pb because of previous environmental Pb exposure of their mothers.

2.3.2 Additional Pollutants

The MDAQMD's primary focus is to achieve the National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS) for criteria pollutants. However, it also has a broader mandate to control emissions of air contaminants and safeguard public health. As a result, MDAQMD regulates additional pollutants beyond criteria pollutants, including reactive organic gases (ROGs), VOCs, and odors. Additional pollutants, their typical sources, and health effects are identified below (4).

TABLE 2-2: ADDITIONAL POLLUTANTS (1 OF 3)

Pollutant	Description	Sources	Health Effects
VOC	VOCs are hydrocarbon compounds (any compound containing various combinations of hydrogen and carbon atoms) that exist in the ambient air.	Organic chemicals are widely used as ingredients in household products. Paints, varnishes, and wax all contain organic	Breathing VOCs can irritate the eyes, nose, and throat, can cause difficulty breathing and nausea, and can damage the central nervous system as well as other organs. Some VOCs can cause cancer.

TABLE 2-2: ADDITIONAL POLLUTANTS (2 OF 3)

Pollutant	Description	Sources	Health Effects
VOC (continued)	VOCs contribute to the formation of smog through atmospheric photochemical reactions and/or may be toxic. Compounds of carbon (also known as organic compounds) have different levels of reactivity; that is, they do not react at the same speed or do not form O_3 to the same extent when exposed to photochemical processes. VOCs often have an odor, and some examples include gasoline, alcohol, and the solvents used in paints. Exceptions to the VOC designation include CO, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate. VOCs are a criteria pollutant since they are a precursor to O_3, which is a criteria pollutant. The terms VOC and ROG (see below) interchangeably.	solvents, as do many cleaning, disinfecting, cosmetic, degreasing and hobby products. Fuels are made up of organic chemicals. All of these products can release organic compounds while you are using them, and, to some degree, when they are stored.	Not all VOCs have all these health effects, though many have several.
ROG	Similar to VOC, ROGs are also precursors in forming O_3 and consist of compounds containing methane, ethane, propane, butane, and longer chain hydrocarbons, which are typically the result of some type of combustion/decomposition process. Smog is formed when ROG and NO_X react in the presence of sunlight. ROGs are a criteria pollutant since they are a precursor to O_3, which is a criteria pollutant. The terms ROG and VOC (see previous) interchangeably.	Sources similar to VOCs.	Health effects similar to VOCs.

TABLE 2-2: ADDITIONAL POLLUTANTS (3 OF 3)

Pollutant	Description	Sources	Health Effects
Odor	Odor means the perception experienced by a person when one or more chemical substances in the air come into contact with the human olfactory nerves (5).	Odors can come from many sources including animals, human activities, industry, natures, and vehicles.	Offensive odors can potentially affect human health in several ways. First, odorant compounds can irritate the eye, nose, and throat, which can reduce respiratory volume. Second, studies have shown that the VOCs that cause odors can stimulate sensory nerves to cause neurochemical changes that might influence health, for instance, by compromising the immune system. Finally, unpleasant odors can trigger memories or attitudes linked to unpleasant odors, causing cognitive and emotional effects such as stress.

2.4 EXISTING AIR QUALITY

Existing air quality is measured at established MDAQMD air quality monitoring stations. Monitored air quality is evaluated in the context of ambient air quality standards. These standards are the levels of air quality that are considered safe, with an adequate margin of safety, to protect the public health and welfare. National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS) currently in effect are shown in Table 2-3 (6).

The determination of whether a region's air quality is healthful or unhealthful is determined by comparing contaminant levels in ambient air samples to the state and federal standards. At the time of this AQIA, the most recent state and federal standards were updated by CARB on July 16, 2024, and are presented in Table 2-3. The air quality in a region is considered to be in attainment by the state if the measured ambient air pollutant levels for O_3, CO (except 8-hour Lake Tahoe), SO_2 (1 and 24 hour), NO_2, PM_{10}, and $PM_{2.5}$ are not to be exceeded. All others are not to be equaled or exceeded. It should be noted that the three-year period is presented for informational purposes and is not the basis for how the State assigns attainment status. Attainment status for a pollutant means that the Air District meets the standards set by the U.S. EPA or the California EPA (CalEPA). Conversely, nonattainment means that an area has monitored air quality that does not meet the NAAQS or CAAQS standards. In order to improve air quality in nonattainment areas, a State Implementation Plan (SIP) is drafted. The SIP outlines the measures that the state will take to improve air quality. Once nonattainment areas meet the standards and additional redesignation requirements, the U.S. EPA will designate the area as a maintenance area (7).

TABLE 2-3: AMBIENT AIR QUALITY STANDARDS (1 OF 2)

Ambient Air Quality Standards						
Pollutant	Averaging Time	California Standards [1]		National Standards [2]		
		Concentration [3]	Method [4]	Primary [3,5]	Secondary [3,6]	Method [7]
Ozone (O_3)[8]	1 Hour	0.09 ppm (180 µg/m^3)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m^3)		0.070 ppm (137 µg/m^3)		
Respirable Particulate Matter (PM10)[9]	24 Hour	50 µg/m^3	Gravimetric or Beta Attenuation	150 µg/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m^3		—		
Fine Particulate Matter (PM2.5)[9]	24 Hour	—	—	35 µg/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m^3	Gravimetric or Beta Attenuation	9.0 µg/m^3	15.0 µg/m^3	
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m^3)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m^3)	—	Non-Dispersive Infrared Photometry (NDIR)
	8 Hour	9.0 ppm (10 mg/m^3)		9 ppm (10 mg/m^3)	—	
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m^3)		—	—

California Air Resources Board (7/16/24)

TABLE 2-3: AMBIENT AIR QUALITY STANDARDS (2 OF 2)

1. California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM10, PM2.5, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

2. National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24 hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 $\mu g/m^3$ is equal to or less than one. For PM2.5, the 24 hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.

3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

4. Any equivalent measurement method which can be shown to the satisfaction of the ARB to give equivalent results at or near the level of the air quality standard may be used.

5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

6. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

7. Reference method as described by the U.S. EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the U.S. EPA.

8. On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.

9. On February 7, 2024, the national annual PM2.5 primary standard was lowered from 12.0 $\mu g/m^3$ to 9.0 $\mu g/m^3$. The existing national 24-hour PM2.5 standards (primary and secondary) were retained at 35 $\mu g/m^3$, as was the annual secondary standard of 15.0 $\mu g/m^3$. The existing 24-hour PM10 standards (primary and secondary) of 150 $\mu g/m^3$ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

10. To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

11. On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.
    Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.

12. The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

13. The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 $\mu g/m^3$ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

14. In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

For more information please call ARB-PIO at (916) 322-2990 **California Air Resources Board (7/16/24)**

2.5 REGIONAL AIR QUALITY

Air pollution contributes to a wide variety of adverse health effects. The EPA has established NAAQS for seven of the most common air pollutants: CO, Pb, O_3, PM_{10}, $PM_{2.5}$, NO_2, and SO_2 which are known as criteria pollutants. The MDAQMD monitors levels of various criteria pollutants at 35 permanent monitoring stations and 2 single-pollutant source Pb air monitoring sites throughout the air district (8). On January 25, 2024, CARB adopted the proposed 2023 amendments to the state and national area designations. See Table 2-4 for attainment designations for the MDAB (9). Appendix 2.1 provides geographic representation of the state and federal attainment status for applicable criteria pollutants within the MDAB.

TABLE 2-4: ATTAINMENT STATUS OF CRITERIA POLLUTANTS IN THE MDAB

Criteria Pollutant	State Designation	Federal Designation
O_3 - 1-hour standard	Nonattainment	--
O_3 - 8-hour standard	Nonattainment	Nonattainment
PM_{10}	Nonattainment	Nonattainment
$PM_{2.5}$	Attainment	Unclassifiable/Attainment
CO	Attainment	Unclassifiable/Attainment
NO_2	Attainment	Unclassifiable/Attainment
SO_2	Attainment	Unclassifiable/Attainment
PB[1]	Attainment	Unclassifiable/Attainment

Note: See Appendix 2.1 for a detailed map of State/National Area Designations within the MDAB and SDAB
"-" = The national 1-hour O_3 standard was revoked effective June 15, 2005.

2.6 LOCAL AIR QUALITY

Relative to the Project site, the nearest long-term air quality monitoring site for O_3 and PM_{10} was obtained from the MDAQMD Hesperia-Olive Street monitoring station, located approximately 5.08 miles east of the project site in Hesperia. As data for NO_2 and $PM_{2.5}$ were unavailable at this monitoring station, the next nearest monitoring station, MDAQMD Victorville-Park Avenue located 5.75 miles northeast, was utilized to report air quality data. It should be noted that data from the Victorville-Park Avenue monitoring station was utilized in lieu of the Hesperia-Olive Street monitoring station only in instances where data was not available. Additionally, it should be noted that data for CO was not available at MDAQMD Hesperia-Olive Street nor the nearest alternative monitoring stations.

The most recent three (3) years of data available is shown in Table 2-5 and identifies the number of days ambient air quality standards were exceeded for the study area, which is considered to be representative of the local air quality at the Project site. Data for O_3, NO_2, PM_{10}, and $PM_{2.5}$ was obtained using the CARB iADAM: Air Quality and Data Statistics and the Air Quality and Meteorological Information System (AQMIS) (10) (11). Data for SO_2 has been omitted as attainment is regularly met and few monitoring stations measure SO_2 concentrations. It should be noted that the table is provided for informational purposes.

TABLE 2-5: PROJECT AREA AIR QUALITY MONITORING SUMMARY 2022-2024

Pollutant	Standard	Year		
		2022	2023	2024
O_3				
Maximum Federal 1-Hour Concentration (ppm)		0.108	0.110	0.121
Maximum Federal 8-Hour Concentration (ppm)		0.090	0.097	0.106
Number of Days Exceeding State 1-Hour Standard	> 0.09 ppm	11	11	14
Number of Days Exceeding State/Federal 8-Hour Standard	> 0.070 ppm	52	54	70
CO				
Maximum Federal 1-Hour Concentration	> 35 ppm	N/A	N/A	N/A
Maximum Federal 8-Hour Concentration	> 20 ppm	N/A	N/A	N/A
NO_2				
Maximum Federal 1-Hour Concentration	> 0.100 ppm	0.054	0.060	0.057
Maximum State 1-Hour Concentration	> 0.180 ppm	0.053	0.060	0.057

N/A = data not available

2.7 REGULATORY BACKGROUND

2.7.1 Federal Regulations

The EPA is responsible for setting and enforcing the NAAQS for O_3, CO, NO_X, SO_2, PM_{10}, and Pb (12). The EPA has jurisdiction over emissions sources that are under the authority of the federal government including aircraft, locomotives, and emissions sources outside state waters (Outer Continental Shelf). The EPA also establishes emission standards for vehicles sold in states other than California. Automobiles sold in California must meet the stricter emission requirements of CARB. The Federal Clean Air Act (CAA) was first enacted in 1955 and has been amended numerous times in subsequent years (1963, 1965, 1967, 1970, 1977, and 1990). The CAA establishes the federal air

quality standards, the NAAQS, and specifies future dates for achieving compliance (13). The CAA also mandates that states submit and implement SIPs for local areas not meeting these standards. These plans must include pollution control measures that demonstrate how the standards will be met.

The 1990 amendments to the CAA that identify specific emission reduction goals for areas not meeting the NAAQS require a demonstration of reasonable further progress toward attainment and incorporate additional sanctions for failure to attain or to meet interim milestones. The sections of the CAA most directly applicable to the development of the Project site include Title I (Non-Attainment Provisions) and Title II (Mobile Source Provisions) (14) (15). Title I provisions were established with the goal of attaining the NAAQS for the following criteria pollutants O_3, NO_2, SO_2, PM_{10}, CO, $PM_{2.5}$, and Pb. The NAAQS were amended in July 1997 to include an additional standard for O_3 and to adopt a NAAQS for $PM_{2.5}$. Table 2-4 (previously presented) provides the NAAQS within the MDAB. Mobile source emissions are regulated in accordance with Title II provisions. These provisions require the use of cleaner burning gasoline and other cleaner burning fuels such as methanol and natural gas. Automobile manufacturers are also required to reduce tailpipe emissions of hydrocarbons and NO_X. NO_X is a collective term that includes all forms of NO_X which are emitted as byproducts of the combustion process.

2.7.2 California Regulations

CARB

CARB, which became part of CalEPA in 1991, is responsible for ensuring implementation of the California Clean Air Act (AB 2595), responding to the federal CAA, and for regulating emissions from consumer products and motor vehicles. AB 2595 mandates achievement of the maximum degree of emissions reductions possible from vehicular and other mobile sources in order to attain the state ambient air quality standards by the earliest practical date. CARB established the CAAQS for all pollutants for which the federal government has NAAQS and, in addition, establishes standards for SO_4, visibility, hydrogen sulfide (H_2S), and vinyl chloride (C_2H_3Cl). However, at this time, H_2S and C_2H_3Cl are not measured at any monitoring stations in the MDAB because they are not considered to be a regional air quality problem. Generally, the CAAQS are more stringent than the NAAQS (16) (12). Local air quality management districts, such as the MDAQMD, regulate air emissions from stationary sources such as commercial and industrial facilities. All air pollution control districts have been formally designated as attainment or non-attainment for each CAAQS.

Serious non-attainment areas are required to prepare Air Quality Management Plans (AQMP) that include specified emission reduction strategies in an effort to meet clean air goals. These plans are required to include:

- Application of Best Available Retrofit Control Technology to existing sources;
- Developing control programs for area sources (e.g., architectural coatings and solvents) and indirect sources (e.g. motor vehicle use generated by residential and commercial development);
- A District permitting system designed to allow no net increase in emissions from any new or modified permitted sources of emissions;
- Implementing reasonably available transportation control measures and assuring a substantial reduction in growth rate of vehicle trips and miles traveled;
- Significant use of low emissions vehicles by fleet operators;

- Sufficient control strategies to achieve a 5% or more annual reduction in emissions or 15% or more in a period of three years for ROGs, NO_X, CO and PM_{10}. However, air basins may use an alternative emission reduction strategy that achieves a reduction of less than 5% per year under certain circumstances.

Title 24 Energy Efficiency Standards and California Green Building Standards

California Code of Regulations (CCR) Title 24 Part 6: The California Energy Code was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption.

The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. CCR, Title 24, Part 11: California Green Building Standards Code (CALGreen) is a comprehensive and uniform regulatory code for all residential, commercial, and school buildings that went in effect on August 1, 2009, and is administered by the California Building Standards Commission.

CALGreen is updated on a regular basis, with the most recent approved update consisting of the 2025 California Green Building Code Standards that went into effect on January 1, 2026. The Project would be required to comply with the applicable standards in place at the time plan check submittals are made. The Project would be required to comply with the applicable standards in place at the time plan check submittals are made. These require, among other items (17):

Nonresidential Mandatory Measures

- Short-term bicycle parking. If the new project or an additional alteration is anticipated to generate visitors, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passers-by, for 20% of the peak daily visitors, with a minimum of one two-bike capacity rack (5.106.4.1.1).
- Long-term bicycle parking. Acceptable bicycle parking facility for Sections 5.106.4.1.2.1, 5.106.4.1.2.2 and 5.106.4.1.2.3 shall be conveniently located near the street and shall meet one of the following:
    1) Covered, lockable enclosures with permanently anchored racks for bicycles;
    2) Lockable bicycle rooms with permanently anchored racks; or
    3) Lockable, permanently anchored bicycle lockers.

  Calculations for bicycle parking requirements shall be rounded up to the nearest whole number (5.106.4.1.2).
- Electric Vehicle (EV) charging stations. Construction to provide EV infrastructure and facilitate EV charging shall comply with Section 5.106.5.3.1 EV capable spaces, Section 5.106.5.3.2. EV charging stations and associated Table 5.106.5.3.1, or Section 5.106.5.3.6 EV charging stations – Power allocation method and associated Table 5.106.5.3.6, and shall be provided in accordance with regulations in the California Building Code and the California Electrical Code.
- Light pollution reduction. Outdoor lighting systems shall be designed and installed to comply with the following:
    1) The minimum requirements in the *California Energy Code* for Lighting Zones 0-4 as defined in Chapter 10, Section 10-114 of the *California Administrative Code*; and
    2) Backlight (B) ratings as defined in IES TM-15-11 (shown in Table A-1 in Chapter 8);

3) Uplight and Glare ratings as defined in *California Energy Code* (shown in Tables 130.2-A and 130.2-B in Chapter 8)
4) Allowable BUG ratings not exceeding those shown in Table 5.106.8, or
5) Comply with a local ordinance lawfully enacted pursuant to Section 101.7, whichever is more stringent (5.106.8).

- Construction waste management. Recycle and/or salvage for reuse a minimum of 65% of the nonhazardous construction and demolition waste in accordance with Section
- 5.408.1.1. 5.405.1.2, or 5.408.1.3; or meet a local construction and demolition waste management ordinance, whichever is more stringent (5.408.1)
- Excavated soil and land clearing debris. 100% of trees, stumps, rocks and associated vegetation and soils resulting primarily from land clearing shall be reused or recycled. For a phased project, such material may be stockpiled on site until the storage site is developed (5.408.3).
- Recycling by Occupants. Provide readily accessible areas that serve the entire building and are identified for the depositing, storage, and collection of non-hazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastics, organic waste, and metals or meet a lawfully enacted local recycling ordinance, if more restrictive (5.410.1).
- Water conserving plumbing fixtures and fittings. Plumbing fixtures (water closets and urinals) and fittings (faucets and showerheads) shall comply with the following:

  1) Water Closets. The effective flush volume of all water closets shall not exceed 1.28 gallons per flush (5.303.3.1).
  2) Urinals. The effective flush volume of wall-mounted urinals shall not exceed 0.125 gallons per flush (5.303.3.2.1). The effective flush volume of floor- mounted or other urinals shall not exceed 0.5 gallons per flush (5.303.3.2.2).
  3) Showerheads. Single showerheads shall have a minimum flow rate of not more than 1.8 gallons per minute and 80 psi (5.303.3.3.1). When a shower is served by more than one showerhead, the combined flow rate of all showerheads and/or other shower outlets controlled by a single valve shall not exceed 1.8 gallons per minute at 80 psi (5.303.3.3.2).
  4) Faucets and fountains. Nonresidential lavatory faucets shall have a maximum flow rate of not more than 0.5 gallons per minute at 60 psi (5.303.3.4.1). Kitchen faucets shall have a maximum flow rate of not more than 1.8 gallons per minute of 60 psi (5.303.3.4.2). Wash fountains shall have a maximum flow rate of not more than 1.8 gallons per minute/20 [rim space (inches) at 60 psi (5.303.3.4.3). Metering faucets shall not deliver more than 0.20 gallons per cycle (5.303.3.4.4). Metering faucets for wash fountains shall have a maximum flow rate not more than 0.20 gallons per cycle (5.303.3.4.5).

- Outdoor potable water use in landscaped areas. Nonresidential developments shall comply with a local water efficient landscape ordinance or the current California Department of Water Resources' Model Water Efficient Landscape Ordinance (MWELO), whichever is more stringent (5.304.1).
- Meters. For new buildings or additions in excess of 50,000 square feet, separate submeters shall be installed as follows (5.303.1.1):

  1) For each individual leased, rented or other tenant space within the building projected to consume more than 100 gal/day (380 L/day), including, but not limited to, spaces

used for laundry or cleaners, restaurant or food service, medical or dental office, laboratory, or beauty salon or barber shop.

2) Where separate submeters for individual buildings tenants are unfeasible, for water supplied to the following subsystems:
    a. Makeup water for cooling towers where flow through is greater than 500 gpm (30 L/s).
    b. Makeup water for evaporative coolers greater than 6 gpm (0.04 L/s).
    c. Steam and hot-water boilers with energy input more than 500,000 BTU/h (147 kW).

For excess consumption, a separate submeter or metering device shall be provided for any tenant within a new building or within an addition that is projected to consume more than 1,000 gal/day (5.303.1.2).

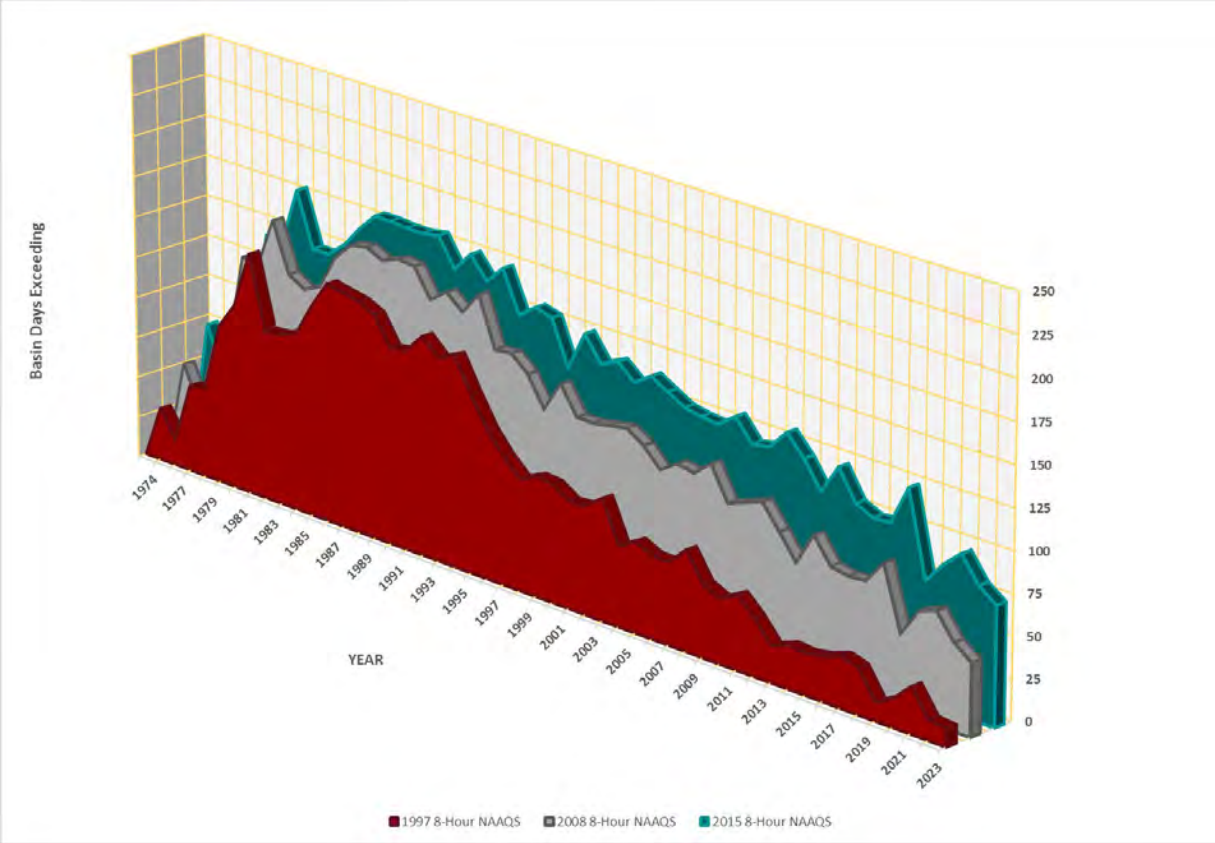
- Commissioning. For new buildings 10,000 square feet and over, building commissioning shall be included in the design and construction processes of the building project to verify that the building systems and components meet the owner's or owner representative's project requirements (5.410.2).

2.7.3 Regional Regulations

Air Quality Management Plan

Currently, the NAAQS and CAAQS are exceeded in most parts of the MDAB. The NAAQS, the Project region within the MDAB is in nonattainment for O_3 (8-hour) and PM_{10}. For the CAAQS, the Project region within the MDAB is in nonattainment for O_3 (1-hour and 8-hour) and PM_{10}. In response, the MDAQMD has adopted a series of AQMPs to meet the state and federal ambient air quality standards (18). AQMPs are updated regularly in order to more effectively reduce emissions, accommodate growth, and to minimize any negative fiscal impacts of air pollution control on the economy. A detailed discussion on the AQMP and Project consistency with the AQMP is provided in Section 3.7.

2.8 Regional Air Quality Improvements



The Project is within the jurisdiction of the MDAQMD and is located in the Mojave Desert Air Basin (MDAB). MDAQMD rule development has resulted in improvement in air quality for the MDAB. Nearly all control programs developed through the early 2000s relied on (i) the development and application of cleaner technology; (ii) add-on emission controls, and (iii) uniform CEQA review throughout the MDAB. Industrial emission sources have been significantly reduced by this approach and vehicular emissions have been reduced by technologies implemented at the state level by CARB.

The single threshold of significance used to assess Project direct and cumulative impacts has in fact "worked" as evidenced by the track record of the air quality in the MDAB improving over the course of the past decades.

Emissions of O_3, NO_X, and VOCs have been decreasing in the MDAB since 1975 (19). These decreases result primarily from motor vehicle controls and reductions in evaporative emissions. Although vehicle miles traveled (VMT) in the MDAB continue to increase, NO_X and VOC levels are decreasing because of the mandated controls on motor vehicles and the replacement of older polluting vehicles with lower-emitting vehicles. NO_X emissions from electric utilities have also decreased due to use of

cleaner fuels and renewable energy. O_3 contour maps show that the number of days exceeding the 8-hour NAAQS has generally decreased between 1975 and 2023. For 2023, there was an overall increase in exceedance days compared with the 1973 period. As shown in Table 2-6, O_3 levels have increased in the past three years due to higher temperatures and stagnant weather conditions. Notwithstanding, O_3 levels in the MDAB have generally decreased over the last 30 years (20).

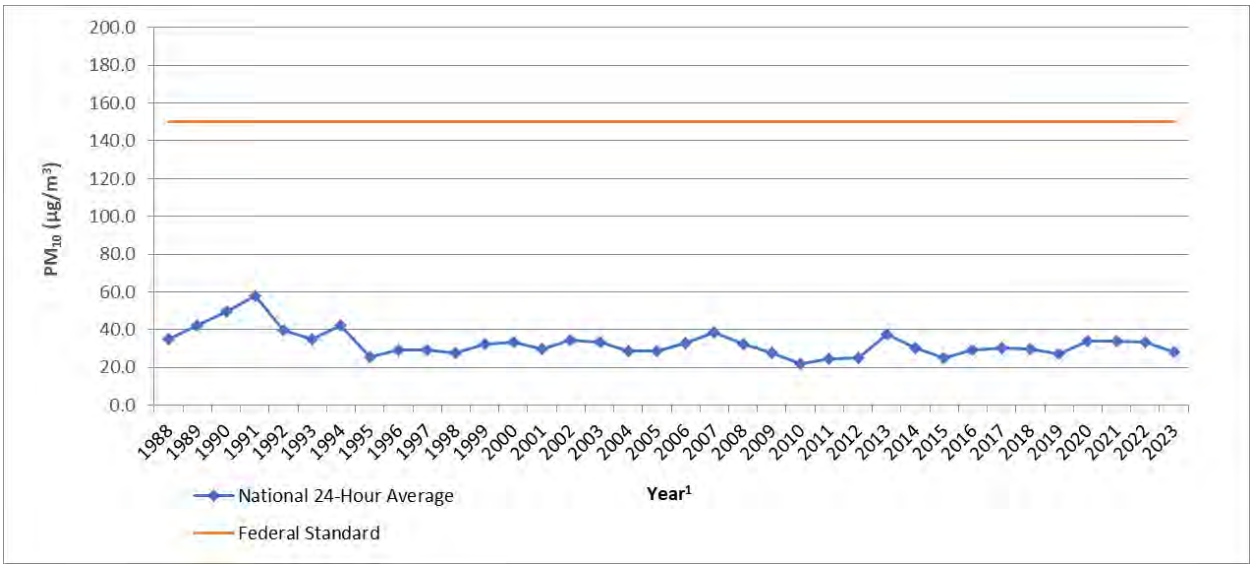


TABLE 2-6: MDAB O_3 TREND

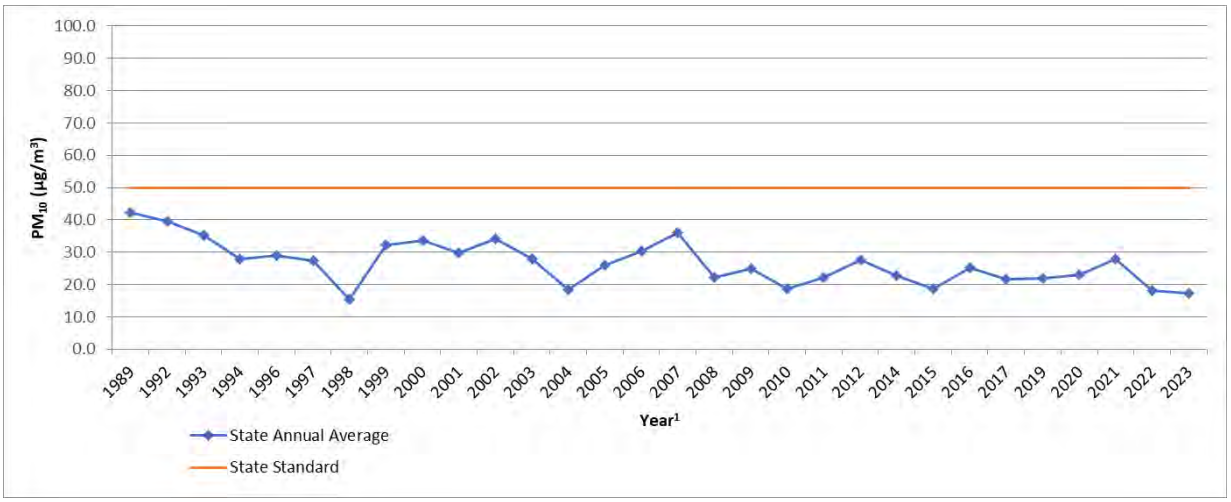
Source: 2024 CARB, iADAM: Top Four Summary: PM10 24-Hour Averages (1973-2023)
[1] Some years have been omitted from the table as insufficient data (or no) data has been reported. Years with reported value of "0" have also been omitted.



The most recent PM_{10} statistics show a slight improvement as illustrated in Tables 2-7 and 2-8. During the period for which data is available, the 24-hour national average concentration for PM_{10} decreased by approximately 18%, from 34.7 microgram per cubic meter (µg/m³) in 1988 to 28.4 µg/m³ in 2023 (20). The 24-hour state annual average concentration for PM_{10} has decreased by approximately 59%, from 42.4 µg/m³ in 1989 to 17.3 µg/m³ in 2023 (20).

TABLE 2-7: MDAB 24-HOUR AVERAGE CONCENTRATION PM_{10} TREND (BASED ON FEDERAL STANDARD)[1]

Source: 2024 CARB, iADAM: Top Four Summary: PM10 24-Hour Averages (1988-2023)
[1] Some years have been omitted from the table as insufficient data (or no) data has been reported. Years with reported value of "0" have also been omitted.

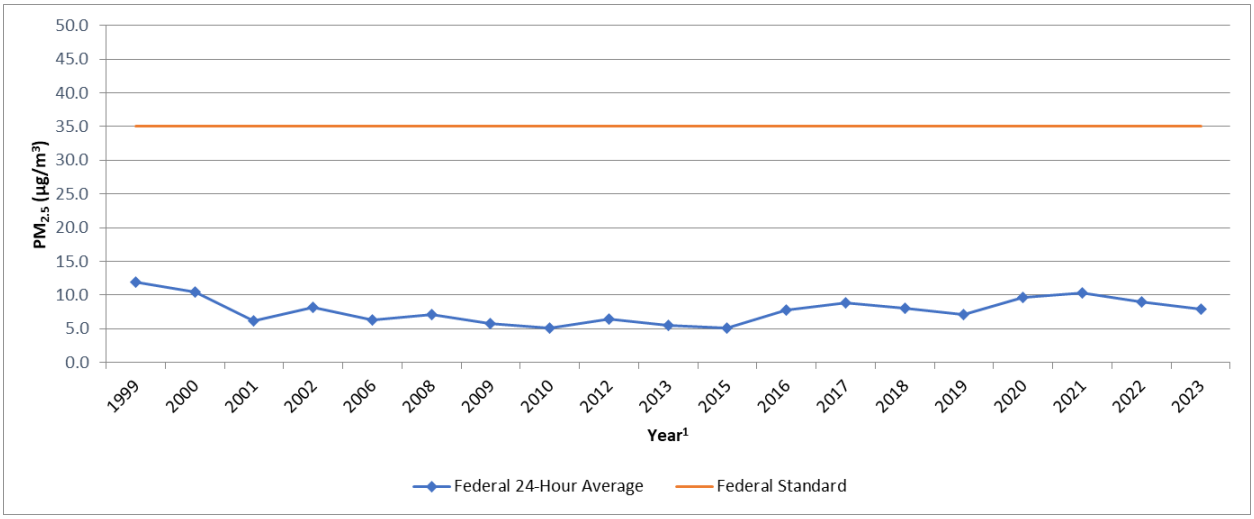


TABLE 2-8: MDAB ANNUAL AVERAGE CONCENTRATION PM_{10} TREND (BASED ON STATE STANDARD)[1]

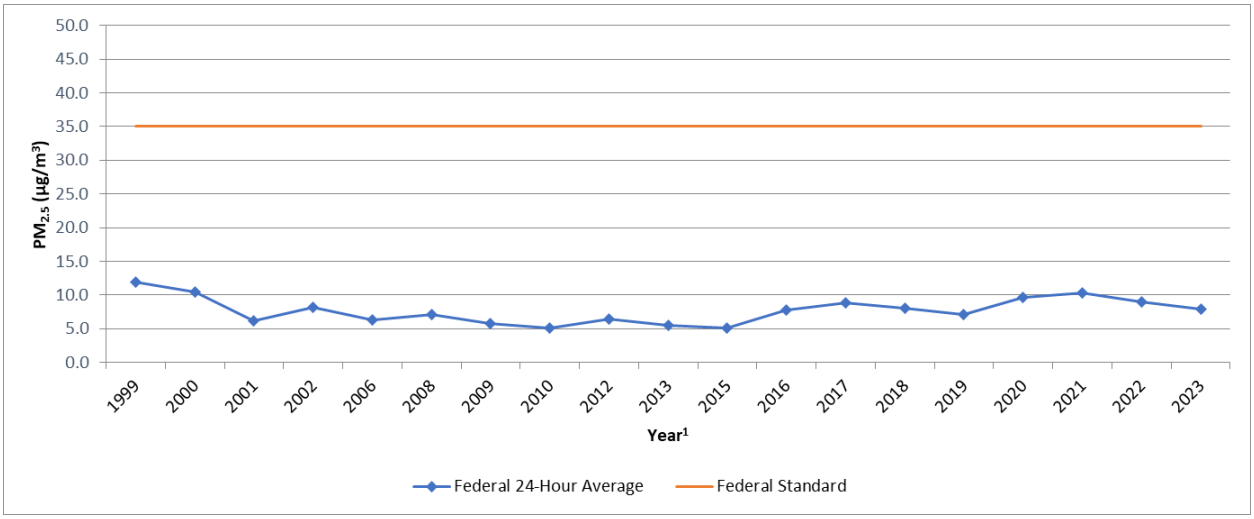
Source: 2024 CARB, iADAM: Top Four Summary: PM10 24-Hour Averages (1989-2023)
[1] Some years have been omitted from the table as insufficient data (or no) data has been reported. Years with reported value of "0" have also been omitted.



Tables 2-9 and 2-10 show the most recent average $PM_{2.5}$ concentrations in the MDAB from 1999 through 2023. Overall, the national and state annual average concentrations have decreased by almost 34% and 29%, respectively (20).

TABLE 2-9: MDAB 24-HOUR AVERAGE CONCENTRATION $PM_{2.5}$ TREND (BASED ON FEDERAL STANDARD)[1]

Source: 2024 CARB, iADAM: Top Four Summary: $PM_{2.5}$ 24-Hour Averages (1989-2023)
[1] Some years have been omitted from the table as insufficient data (or no) data has been reported. Years with reported value of "0" have also been omitted.

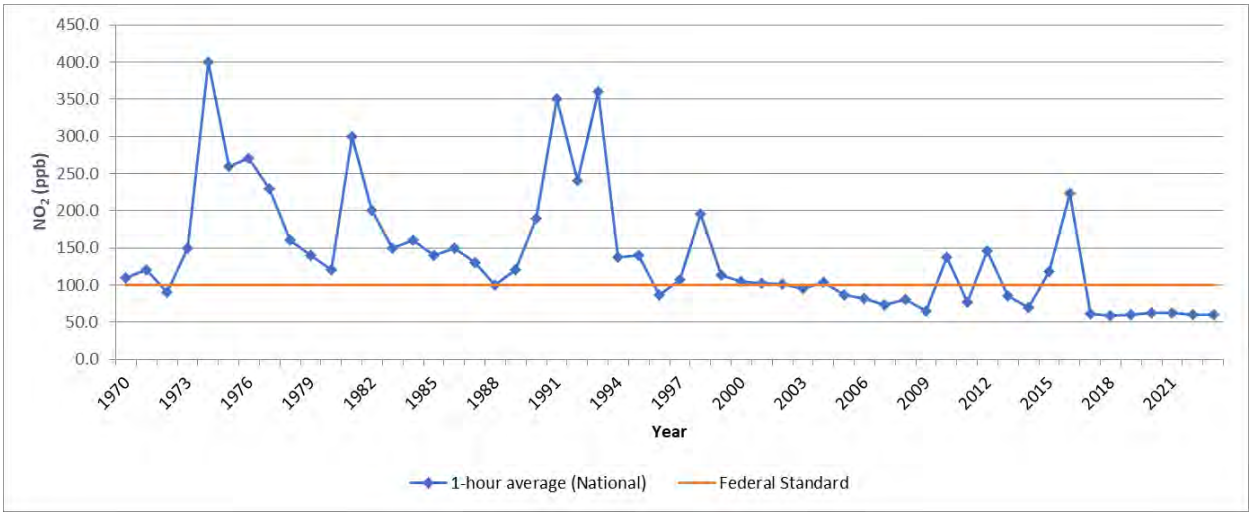


TABLE 2-10: MDAB ANNUAL AVERAGE CONCENTRATION $PM_{2.5}$ TREND (BASED ON STATE STANDARD)[1]

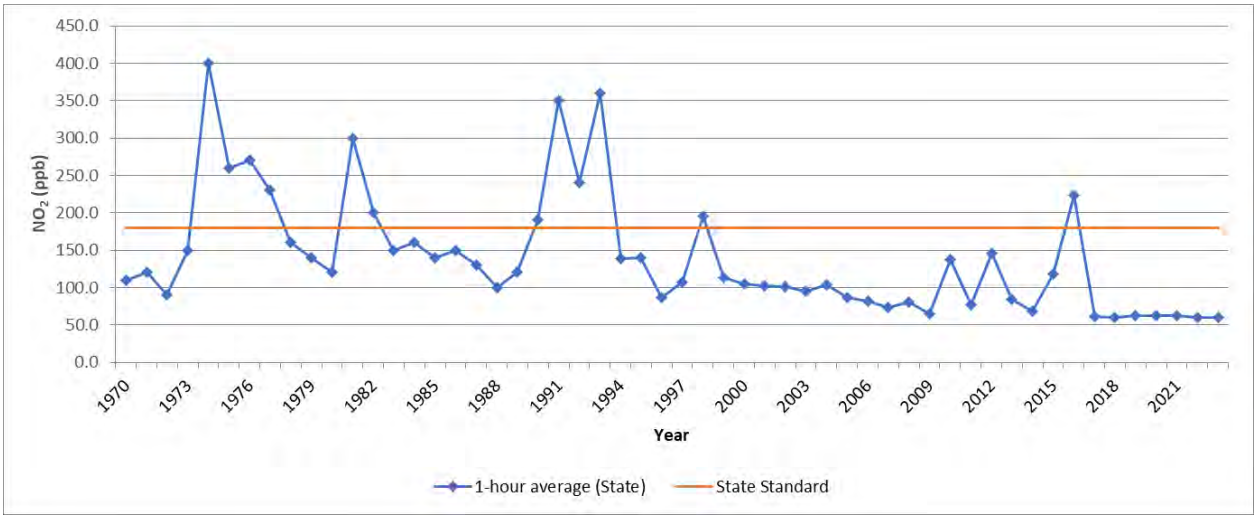
Source: 2024 CARB, iADAM: Top Four Summary: $PM_{2.5}$ 24-Hour Averages (1999-2023)
[1] Some years have been omitted from the table as insufficient data (or no) data has been reported. Years with reported value of "0" have also been omitted.



The most recent NO_2 data for the MDAB is shown in Tables 2-11 and 2-12 (20). Over the last 50 years, NO_2 values have decreased significantly; the peak 1-hour national and state averages for 2023 are approximately 45% lower than what they were in 1970. NO_2 is formed from NO_X emissions, which also contribute to O_3. As a result, the majority of the future emission control measures would be implemented as part of the overall O_3 control strategy. Many of these control measures would target mobile sources, which account for more than three-quarters of California's NO_X emissions.

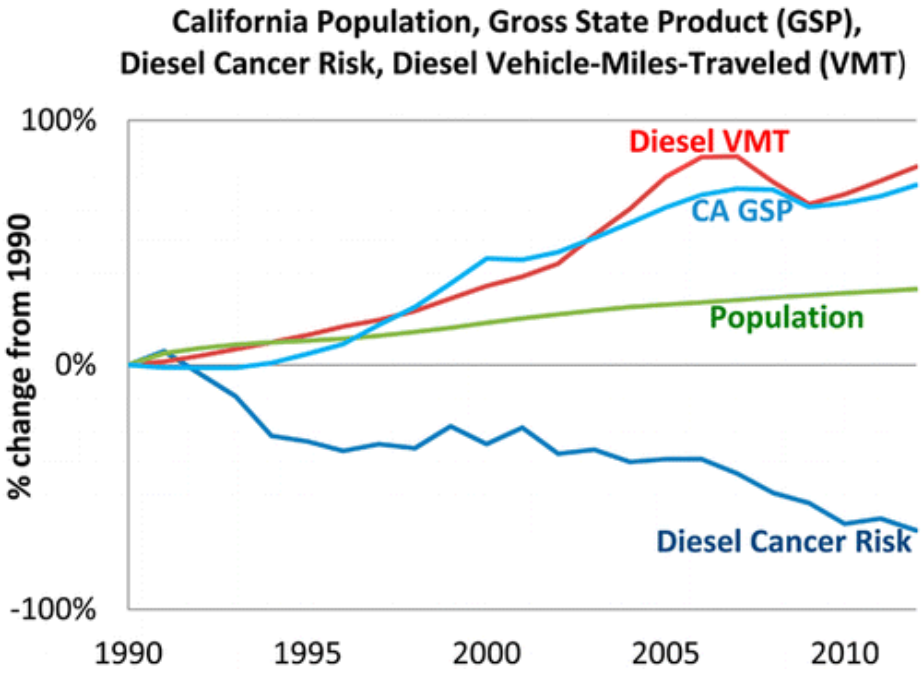
TABLE 2-12: MDAB 1-HOUR AVERAGE CONCENTRATION NO_2 TREND (BASED ON STATE STANDARD)

Source: 2024 CARB, iADAM: Top Four Summary: CO 1-Hour Averages (1970-2023)

2.8.1 Toxic Air Contaminants (TAC) Trends

In 1984, as a result of public concern for exposure to airborne carcinogens, CARB adopted regulations to reduce the amount of TAC emissions resulting from mobile and area sources, such as cars, trucks, stationary sources, and consumer products. According to the *Ambient and Emission Trends of Toxic Air Contaminants in California* journal article (21) which was prepared for CARB, results show that between 1990-2012, ambient concentration and emission trends for the seven TACs responsible for most of the known cancer risk associated with airborne exposure in California have declined significantly (between 1990 and 2012). The seven TACs studied include those that are derived from mobile sources: diesel particulate matter (DPM), benzene (C_6H_6), and 1,3-butadiene (C_4H_6); those that are derived from stationary sources: perchloroethylene (C_2Cl_4) and hexavalent chromium (Cr(VI)); and those derived from photochemical reactions of emitted VOCs: formaldehyde (CH_2O) and acetaldehyde (C_2H_4O)[1]. The decline in ambient concentration and emission trends of these TACs are a result of various regulations CARB has implemented to address cancer risk.



Mobile Source TACs

CARB introduced two programs aimed at reducing mobile emissions for light- and medium-duty vehicles through vehicle emissions controls and cleaner fuel. In California, light-duty vehicles sold after 1996 are equipped with California's second-generation On-Board Diagnostic (OBD-II) system. The OBD-II system monitors virtually every component that can affect the emission performance of the vehicle to ensure that the vehicle remains as clean as possible over its entire life and assists repair technicians in diagnosing and fixing problems with the computerized engine controls. If a problem is detected, the OBD-II system illuminates a warning lamp on the vehicle instrument panel to alert the driver. This warning lamp typically contains the phrase "Check Engine" or "Service Engine Soon." The system would also store important information about the detected malfunction so that a repair technician can accurately find and fix the problem. CARB has recently developed similar OBD requirements for heavy-duty vehicles over 14,000 pounds (lbs.). CARB's phase II Reformulated Gasoline Regulation (RFG-2), adopted in 1996, also led to a reduction of mobile source emissions. Through such regulations, benzene levels declined 88% from 1990-2012. Concentrations of 1,3-Butadiene also declined 85% from 1990-2012 as a result of the use of reformulated gasoline and motor vehicle regulations (21).

In 2000, CARB's Diesel Risk Reduction Plan (DRRP) recommended the replacement and retrofit of diesel-fueled engines and the use of ultra-low-sulfur (<15 ppm) diesel fuel. As a result of these measures, DPM concentrations have declined 68% since 2000, even though the state's population increased 31% and the amount of diesel vehicles miles traveled increased 81%, as shown in Exhibit 2-A. With the implementation of these diesel-related control regulations, CARB expects a DPM decline of 71% for 2000-2020.

[1] It should be noted that ambient DPM concentrations are not measured directly. Rather, a surrogate method using the coefficient of haze (COH) and elemental carbon (EC) is used to estimate DPM concentrations.

EXHIBIT 2-A: DPM AND DIESEL VEHICLE MILES TREND

Source: 2020 CARB

Diesel Regulations

CARB and the Ports of Los Angeles and Long Beach (POLA and POLB) have adopted several iterations of regulations for diesel trucks that are aimed at reducing DPM. More specifically, CARB Drayage Truck Regulation (22), CARB statewide On-road Truck and Bus Regulation (23), and the Ports of Los Angeles and Long Beach Clean Truck Program (CTP) require accelerated implementation of "clean trucks" into the statewide truck fleet (24). In other words, older more polluting trucks would be replaced with newer, cleaner trucks as a function of these regulatory requirements.

Moreover, the average statewide DPM emissions for Heavy-Duty Trucks (HDT), in terms of grams of DPM generated per mile traveled, would dramatically be reduced due to the aforementioned regulatory requirements. Diesel emissions identified in this analysis would therefore overstate future DPM emissions since not all the regulatory requirements are reflected in the modeling.

3 PROJECT AIR QUALITY IMPACT

3.1 INTRODUCTION

The Project has been evaluated to determine if it will violate an air quality standard or contribute to an existing or projected air quality violation. Additionally, the Project has been evaluated to determine if it will result in a cumulatively considerable net increase of a criteria pollutant for which the MDAB is non-attainment under an applicable federal or state ambient air quality standard. The significance of these potential impacts is described in the following section.

3.2 STANDARDS OF SIGNIFICANCE

The criteria used to determine the significance of potential Project-related air quality impacts are taken from the *CEQA Guidelines* (14 CCR §§15000, et seq.). Based on these thresholds, a project would result in a significant impact related to air quality if it would (1):

- Conflict with or obstruct implementation of the applicable air quality plan.
- Result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is in non-attainment under an applicable federal or state ambient air quality standard.
- Expose sensitive receptors to substantial pollutant concentrations.
- Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

The MDAQMD has developed regional significance thresholds for regulated pollutants, shown below in Table 3-1. The MDAQMD's *CEQA and Federal Conformity Guidelines* indicate that any projects in the MDAB with daily regional emissions that exceed any of the indicated thresholds should be considered as having an individually and cumulatively significant air quality impact (25).

TABLE 3-1: REGIONAL EMISSIONS SIGNIFICANCE THRESHOLDS

Pollutant	Threshold
CO	548 lbs./day
NO_X	137 lbs./day
VOC	137 lbs./day
SO_X	137 lbs./day
PM_{10}	82 lbs./day
$PM_{2.5}$	65 lbs./day

Lbs./day = Pounds Per Day

3.3 MODELS EMPLOYED TO ANALYZE AIR QUALITY

3.3.1 CalEEMod

Land uses, such as the Project, affect air quality through construction-source and operational-source emissions. The California Air Pollution Control Officers Association (CAPCOA) in conjunction with other California air districts, including MDAQMD, released CalEEMod 2022 in May 2022. CalEEMod

periodically releases updates; as such, the latest version available at the time of this report has been utilized in this analysis. The purpose of this model is to calculate construction-source and operational-source criteria pollutant (VOCs, NO_X, SO_X, CO, PM_{10}, and $PM_{2.5}$) and GHG emissions from direct and indirect sources; and quantify applicable air quality and GHG reductions achieved from mitigation measures (26). Accordingly, the latest version of CalEEMod has been used for this Project to determine construction and operational air quality emissions. Output from the model runs for both construction and operational activity are provided in Appendix 3.1.

3.4 CONSTRUCTION EMISSIONS

3.4.1 Construction Activities

Construction activities associated with the Project would result in emissions of VOCs, NO_X, SO_X, CO, PM_{10}, and $PM_{2.5}$. Construction-related emissions are expected from the following construction activities:

- Site Preparation
- Grading
- Building Construction
- Paving
- Architectural Coating

Grading Activities

Dust is typically a major concern during grading activities. Because such emissions are not amenable to collection and discharge through a controlled source, they are called "fugitive emissions." Fugitive dust emissions rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). CalEEMod was utilized to calculate fugitive dust emissions resulting from this phase of activity. Based on consultation with the project team, the Project site would require a net fill of approximately 59,302 cubic yards of soil import.

Off-Site Utility and Infrastructure Improvements

In addition, to support the Project development, there will be paving for off-site improvements associated with roadway construction and utility installation, as well as installation of fire hydrants and street lighting. It is expected that the off-site construction activities would not take place at one location for the entire duration of construction. Impacts associated with these activities are not expected to exceed the emissions identified for Project-related construction activities since the off-site construction areas would have physical constraints on the amount of daily activity that could occur. The physical constraints would limit the amount of construction equipment that could be used, and any off-site and utility infrastructure construction would not use equipment totals that would exceed the equipment totals on Table 3-3. As such, no impacts beyond what has already been identified in this report are expected to occur.

3.4.2 Construction Duration

For purposes of analysis, Project construction will begin October 2026 and would last through September 2027. The construction schedule utilized in the analysis, shown in Table 3-2, represents a

"conservative" analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as time passes and the analysis year increases due to emission regulations becoming more stringent.[2] The duration of construction activity and associated equipment represents a reasonable approximation of the expected construction fleet as required per *CEQA Guidelines* (27).

TABLE 3-2: CONSTRUCTION DURATION

Construction Activity	Start Date	End Date	Days
Site Preparation	10/1/2026	10/19/2026	13
Grading	10/20/2026	12/17/2026	43
Building Construction	12/2/2026	8/19/2027	187
Paving	8/5/2027	9/20/2027	33
Architectural Coating	7/27/2027	9/20/2027	40

3.4.3 Construction Equipment

Site-specific construction fleet may vary due to specific project needs at the time of construction. The associated construction equipment was generally based on CalEEMod defaults. Consistent with industry standards and typical construction practices, each piece of equipment listed in Table 3-3 is assumed to operate up to a total of eight (8) hours per day, or more than two-thirds of the period during which construction activities are allowed.

TABLE 3-3: CONSTRUCTION EQUIPMENT ASSUMPTIONS

Construction Activity	Equipment	Quantity	Hours
Site Preparation	Rubber Tired Dozers	3	8
	Crawler Tractors	4	8
Grading	Excavators	2	8
	Graders	1	8
	Rubber Tired Dozers	1	8
	Scrapers	2	8
	Crawler Tractors	2	8
Building Construction	Cranes	1	8
	Forklifts	3	8
	Generator Sets	1	8
	Tractors/Loaders/Backhoes	3	8
	Welders	1	8
Paving	Pavers	2	8
	Paving Equipment	2	8

[2] As shown in the CalEEMod User's Guide Version 2022, Appendix G "Table G-11. Statewide Average Annual Offroad Equipment Emission Factors" as the analysis year increases, emission factors for the same equipment pieces decrease due to the natural turnover of older equipment being replaced by newer less polluting equipment and new regulatory requirements.

Construction Activity	Equipment	Quantity	Hours
	Rollers	2	8
Architectural Coating	Air Compressors	1	8

[1] In order to account for fugitive dust emissions, Crawler Tractors were used in lieu of Tractors/Loaders/Backhoes.

3.4.4 On-Road Trips

Construction generates on-road vehicle emissions from vehicle usage for workers, vendors, and hauling trucks commuting to and from the site. The number of worker, vendor, and hauling trips per phase is presented below in Table 3-4. Worker, vendor, and hauling trips are based on CalEEMod defaults. It should be noted that, for vendor trips specifically, CalEEMod only assigns vendor trips to the Building Construction phase. Vendor trips would likely occur during all phases of construction, as shown in Table 3-4.

TABLE 3-4: CONSTRUCTION TRIP ASSUMPTIONS

Construction Activity	Worker Trips Per Day	Vendor Trips Per Day	Hauling Trips Per Day
Site Preparation	18	4	0
Grading	25	13	172
Building Construction	210	56	0
Paving	15	10	0
Architectural Coating	42	0	0

3.4.5 Construction Emissions Summary

CalEEMod calculates maximum daily emissions for summer and winter periods. As such, the estimated maximum daily construction emissions without mitigation for both summer and winter periods are summarized in Table 3-5. Detailed unmitigated construction model outputs are presented in Appendix 3.1. Under the assumed scenario, emissions resulting from the Project construction would not exceed criteria pollutant thresholds established by the MDAQMD. As such, construction impacts would be considered less-than-significant and no mitigation is required.

TABLE 3-5: CONSTRUCTION EMISSIONS SUMMARY

Year	Emissions (lbs/day)					
	ROG	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$
Summer						
2027	67.22	21.27	45.35	0.06	4.77	1.64
Winter						
2026	5.83	57.62	58.45	0.18	11.46	4.56
2027	2.02	12.88	24.82	0.04	3.61	1.14
Maximum Daily Emissions	67.22	57.62	58.45	0.18	11.46	4.56
MDAQMD Regional Thresholds	137	137	548	137	82	65
Threshold Exceeded?	NO	NO	NO	NO	NO	NO

Source: CalEEMod construction-source (unmitigated) emissions are presented in Appendix 3.1.

3.5 OPERATIONAL EMISSIONS

Operational activities associated with the Project would result in emissions of VOCs, NO_X, SO_X, CO, PM_{10}, and $PM_{2.5}$. Operational emissions are expected from the following primary sources:

- Mobile Source Emissions;
- Area Source Emissions;
- Energy Source Emissions;
- Stationary Source Emissions; and
- On-site Cargo Handling Equipment Emissions.

3.5.1 Mobile Source Emissions

The Project related operational air quality emissions derive primarily from vehicle trips generated by the Project, including employee trips to and from the site and truck trips associated with the proposed uses. Trip characteristics available from the *Amargosa and Palmetto High-Cube Warehouse Traffic Impact Analysis* were utilized in this analysis (28). Per the *Amargosa and Palmetto High-Cube Warehouse Traffic Impact Study* the proposed Project expected to generate approximately 905 total trips per day which include 790 passenger car trips per day and 115 truck trips per day.

Passenger Vehicles

To determine emissions from passenger car vehicles, the CalEEMod defaults were utilized for trip length and trip purpose for the proposed industrial land uses.

This analysis assumes that passenger cars include Light-Duty-Auto vehicles (LDA), Light-Duty-Trucks (LDT1[3] & LDT2[4]), Medium-Duty-Vehicles (MDV), and Motorcycles (MCY) vehicle types. To account for emissions generated by passenger cars, the fleet mix in Table 3-6 was utilized.

TABLE 3-6: PASSENGER CAR FLEET MIX

Land Use	% Vehicle Type				
	LDA	LDT1	LDT2	MDV	MCY
High-Cube Fulfillment Center (Non-Sort)	52.51%	4.52%	23.34%	16.84%	2.79%

Note: The Project-specific passenger car fleet mix used in this analysis is based on a proportional split utilizing the default CalEEMod percentages assigned to LDA, LDT1, LDT2, MDV, and MCY vehicle types.

Trucks

To determine emissions from trucks for the proposed industrial uses, the analysis incorporated the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2) trucks, 14.2 miles 3-axle (MHDT) trucks and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages taken from the *Amargosa and Palmetto High-Cube Warehouse Traffic Impact Study*. The trip length function for the proposed industrial building use has been calculated

[3] Vehicles under the LDT1 category have a gross vehicle weight rating (GVWR) of less than 6,000 lbs. and equivalent test weight (ETW) of less than or equal to 3,750 lbs.

[4] Vehicles under the LDT2 category have a GVWR of less than 6,000 lbs. and ETW between 3,751 lbs. and 5,750 lbs.

to 30.47 miles for the high-cube fulfillment center warehouse (non-sort) with an assumption of 100% primary trips. This trip length assumption is higher than the CalEEMod defaults for trucks.

In order to be consistent with the *Amargosa and Palmetto High-Cube Warehouse Traffic Impact Study*, trucks are broken down by truck type. The truck fleet mix is estimated by apportioning the trip rates for each truck type based on information provided in the *Amargosa and Palmetto High-Cube Warehouse Traffic Impact Study.* Heavy trucks are broken down by truck type (or axle type) and are categorized as either Light-Heavy-Duty Trucks (LHDT1[5] & LHDT2 [6])/2-axle, Medium-Heavy-Duty Trucks (MHD)/3-axle, and Heavy-Heavy-Duty Trucks (HHD)/4+-axle. To account for emissions generated by trucks, the fleet mix in Table 3-7 was utilized.

TABLE 3-7: TRUCK FLEET MIX

Land Use	% Vehicle Type			
	LHDT1	LHDT2	MHDT	HHDT
High-Cube Fulfillment Center (Non-Sort)	12.95%	3.57%	20.87%	62.61%

Note: Project-specific truck fleet mix is based on the number of trips generated by each truck type (LHDT1, LHDT2, MHDT, and HHDT) relative to the total number of truck trips.

Fugitive Dust Related to Vehicular Travel

Vehicles traveling on paved roads would be a source of fugitive emissions due to the generation of road dust inclusive of brake and tire wear particulates. The emissions estimate for travel on paved roads was calculated using CalEEMod.

On-Road Mobile Source Emissions Modeling Methodology

EMFAC 2021 and Off-Model Adjustment Factors

On-road mobile source emissions for the Project were estimated using the CARB's EMFAC 2021 model. EMFAC 2021 is the most recent version of EMFAC approved by the U.S. EPA for use in State Implementation Plans (SIPs) and federal transportation conformity determinations, and it remains the standard analytical platform for regional air quality planning in California.

On November 21, 2025, the U.S. EPA approved the use of EMFAC 2021 off-model adjustment factors. These adjustment factors remove the estimated emission benefits that were attributed to California's Advanced Clean Trucks, Zero-Emission Airport Shuttle, Heavy-Duty Vehicle and Engine Emission Warranty and Maintenance Provisions, and Heavy Duty Omnibus regulations from EMFAC 2021. Because the preemption waivers for these regulations no longer have effect, these regulations are no longer enforceable. These adjustment factors are multipliers provided by CARB which adjust VOC, NO_X, PM_{10}, and $PM_{2.5}$ emission factors by year, region, and vehicle category to account for the removal of these regulations which are already accounted for in EMFAC 2021. Due to fleet turnover, the adjustment factors result in greater emission increases over the base EMFAC 2021 model outputs in later analysis years.

[5] Vehicles under the LHDT1 category have a GVWR of 8,501 to 10,000 lbs.

[6] Vehicles under the LHDT2 category have a GVWR of 10,001 to 14,000 lbs.

Although these adjustment factors were approved by EPA primarily for SIP and conformity analysis purposes, they have been incorporated into this analysis in order to provide a conservative estimation of emissions in an evolving regulatory environment.

Application of Adjustment Factors in This Analysis

Because CalEEMod utilizes EMFAC 2021 emission factors to calculate on-road vehicle emissions, adjustment factors were applied to the mobile source emissions outputs for each operational land use based on the vehicle fleet mix. Additionally, adjustment factors were applied to on-road construction emissions, such as those resulting from haul and vendor trucks.

This approach ensures that the emissions estimates are consistent with CARB-approved and EPA-approved planning methodologies, reflect regulatory programs applicable to heavy-duty vehicles that may not be fully captured in the base EMFAC 2021 model, and provide a technically robust basis for evaluating regional and localized air quality impacts.

Conservatism and Applicability Under CEQA

The use of EMFAC 2021 off-model adjustment factors is not required for CEQA purposes. CEQA does not mandate the use of EPA-approved models or SIP-specific adjustment techniques. Instead, CEQA requires a reasonable, good-faith effort to disclose a project's potential environmental impacts using methodologies supported by substantial evidence.

The decision to apply EMFAC 2021 off-model adjustment factors was made to be conservative and precautionary, even though such factors are primarily intended for federal SIP development and transportation conformity analyses. By incorporating these EPA-approved adjustment factors, the analysis avoids understating emissions that could result if certain regulatory impacts were omitted from the base model outputs.

Consistency with SCAQMD CEQA Practice

SCAQMD CEQA guidance recognizes the use of CARB's EMFAC model for estimating on-road mobile source emissions and does not prescribe a single mandatory modeling configuration for CEQA analyses. The application of EMFAC 2021 with CARB-developed, EPA-approved off-model adjustment factors falls within accepted professional practice and reflects a reasonable exercise of technical judgment.

3.5.2 Area Source Emissions

Architectural Coatings

Over a period of time the buildings that are part of this Project would require maintenance and would therefore produce emissions resulting from the evaporation of solvents contained in paints, varnishes, primers, and other surface coatings. The emissions associated with architectural coatings were calculated using CalEEMod.

Consumer Products

Consumer products include, but are not limited to, detergents, cleaning compounds, polishes, personal care products, and lawn and garden products. Many of these products contain organic compounds which, when released in the atmosphere, can react to form O_3 and other

photochemically reactive pollutants. The emissions associated with the use of consumer products were calculated based on defaults provided within CalEEMod.

Landscape Maintenance Equipment

Landscape maintenance equipment would generate emissions from fuel combustion and evaporation of unburned fuel. Equipment in this category would include lawnmowers, shedders/grinders, blowers, trimmers, chain saws, and hedge trimmers used to maintain the landscaping of the Project. It should be noted that on October 9, 2021, Governor Newsom signed AB 1346. The bill aims to ban the sale of new gasoline-powered equipment under 25 gross HP (known as small off-road engines [SOREs]) by January 1, 2024, which is now in effect. However, for purposes of analysis, the emissions associated with landscape maintenance equipment were calculated based on assumptions provided in CalEEMod, and do not incorporate the emissions reductions that would be realized from implementation of AB 1346.

3.5.3 Energy Source Emissions

Combustion Emissions Associated with Electricity and Natural Gas

Electricity and natural gas are used in almost every project. Criteria pollutant emissions are emitted through the generation of electricity. However, because electrical generating facilities for the Project area are located either outside the region (state) or offset through the use of pollution credits (RECLAIM) for generation within the MDAB, criteria pollutant emissions from offsite generation of electricity are excluded from the evaluation of significance. Natural gas and electricity usage associated with the Project was calculated by CalEEMod using default parameters.

3.5.4 Stationary Source Emissions

The proposed Project was conservatively assumed to include installation of one (1) 300-hp diesel-powered fire pump and one (1) 700-hp diesel-power emergency generator at the industrial building. The fire pump and emergency generator were estimated to operate for up to 1 hour per day, 1 day per week for up to 50 hours per year for maintenance and testing purposes. Emissions associated with the stationary diesel-powered emergency fire pump and emergency generator were calculated using CalEEMod.

3.5.5 On-Site Cargo Handling Equipment Emissions

It is common for industrial buildings to require the operation of exterior cargo handling equipment in the building's truck court areas. For this Project, on-site modeled operational equipment includes up to two (2) 175 hp, natural gas-powered cargo handling equipment – port tractor operating 4 hours a day[7] for 365 days of the year.

3.5.6 Operational Emissions Summary

CalEEMod utilizes summer and winter EMFAC2021 emission factors in order to derive vehicle emissions associated with Project operational activities, which vary by season. The estimated

[7] Based on Table II-3, Port and Rail Cargo Handling Equipment Demographics by Type, from CARB's Technology Assessment: Mobile Cargo Handling Equipment document, a single piece of equipment could operate up to 2 hours per day (Total Average Annual Activity divided by Total Number Pieces of Equipment). As such, the analysis conservatively assumes that the tractor/loader/backhoe would operate up to 4 hours per day.

operational-source emissions without mitigation are summarized in Table 3-8. Detailed operation model outputs for the Project are presented in Appendix 3.1. As shown on Table 3-8, the Project would not exceed the numerical thresholds of significance established by the MDAQMD for any emissions.

TABLE 3-8: SUMMARY OF PEAK OPERATIONAL EMISSIONS

Source	Emissions (lbs./day)					
	ROG	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$

Source: CalEEMod construction-source (unmitigated) emissions are presented in Appendix 3.1.

3.6 CO "HOT SPOT" ANALYSIS

The MDAQMD has not established its own guidelines for CO hotspot analysis. Since the MDAQMD guidelines are based on SCAQMD methodology, it is appropriate to apply the SCAQMD criteria when analyzing CO hotspots within the MDAQMD. A CO hotspot is defined as a localized concentration of CO exceeding the state one-hour standard of 20 ppm or the eight-hour standard of 9 ppm. At the time the most recent CEQA Air Quality Handbook (1993) was published by SCAQMD, the air basin was designated as non-attainment, requiring projects to perform hotspot analyses to ensure they did not worsen the existing conditions. Over the last two decades, background CO concentrations have been significantly reduced due to regulatory controls on tailpipe emissions, which have culminated in the air basin achieving attainment status for CO.

The 2003 AQMP's findings underscore that CO hotspots are highly unlikely due to the reduced background concentrations and the effectiveness of California's air quality management strategies. The substantial reduction in CO levels from the vehicle fleet and the state's attainment status for CO further diminish the need for detailed microscale hotspot analyses, reinforcing that existing monitoring and regulatory frameworks adequately address potential air quality concerns.

In 2003, the SCAQMD as part of its AQMP development process, prepared modeling to determine the potential for CO hotspots at the four busiest intersections in the air basin. As summarized in the 2003 AQMP, even at one of the busiest intersections at that time, only 0.7 ppm of CO is attributable to vehicular traffic and the remaining 7.7 ppm were due to ambient background conditions. As shown in Table 2-5 in this report, the background 1-hour and 8-hour concentrations are well below the applicable AAQS. The 2003 AQMP's findings underscore that CO hotspots are highly unlikely due to the reduced background concentrations and the effectiveness of California's air quality management strategies. The substantial reduction in CO levels from the vehicle fleet and the state's attainment status for CO further diminish the need for detailed microscale hotspot analyses, reinforcing that existing monitoring and regulatory frameworks adequately address potential air quality concerns.

As such, Project-related traffic at any intersections within the Project area would not cause or contribute to a CO hotspot since the background concentrations are low and any contribution from Project traffic would be negligible.

3.7 AQMP

The Federal Particulate Matter Attainment Plan and Ozone Attainment Plan for the Mojave Desert set forth a comprehensive set of programs that will lead the MDAB into compliance with federal and state air quality standards. The control measures and related emission reduction estimates within the Federal Particulate Matter Attainment Plan and Ozone Attainment Plan are based upon emissions projections for a future development scenario derived from land use, population, and employment characteristics defined in consultation with local governments. Accordingly, conformance with these attainment plans for development projects is determined by demonstrating compliance with the indicators discussed below.

3.7.1 Consistency Criterion No. 1

Local land use plans and/or population projections

The proposed Project is located within the City of Hesperia General Plan and has an existing land use designation for "General Commercial" (C2). The C2 land use designation is intended for goods and services of general nature, as well as professional offices that meet both short- and long-term needs of the City's population (29). The Project uses are allowed under the site's existing C2 General Plan land use designation and does not propose or require a General Plan Amendment affecting the Project site or any off-site City of Hesperia properties. The proposed Project site would have an FAR of 0.376, which is in conformance with the maximum allowable FAR of 1.0 under the C2 designation. The Project Applicant proposes land uses that are consistent with development anticipated under the site's existing General Plan designation. The Project would therefore conform to local land use plans.

3.7.2 Consistency Criterion No. 2

All MDAQMD Rules and Regulations

The Project would be required to comply with all applicable MDAQMD Rules and Regulations, including, but not limited to Rules 401 (Visible Emissions), 402 (Nuisance), 403 (Fugitive Dust), and 1113 (Architectural Coatings). As previously stated in Section ES.2 of this AQIA, the Project would implement MDAQMD Rule 403 and MDAQMD Rule 1113.

3.7.3 Consistency Criterion No. 3

Demonstrating that the project will not increase the frequency or severity of a violation in the federal or state ambient air quality standards

As substantiated herein, Project construction and operational-source emissions would not exceed applicable MDAQMD regional thresholds. As such, the Project would not have the potential to increase the frequency or severity of a violation in the federal or state ambient air quality for on-going project operations.

AQMP Consistency Conclusion

The Project would not result in or cause NAAQS or CAAQS violations. The Project's proposed land use designation for the subject site is consistent with the land use designation discussed in the General Plan. Furthermore, the Project would not exceed the applicable regional thresholds and would therefore be considered to have a less than significant impact. The Project is therefore considered to be consistent with the AQMP.

3.8 Potential Impacts to Sensitive Receptors

The potential impact of Project-generated air pollutant emissions at sensitive receptors has also been considered. Sensitive receptors can include uses such as long-term health care facilities, rehabilitation centers, and retirement homes. Residences, schools, playgrounds, childcare centers, and athletic facilities can also be considered a sensitive receptors.

As per the MDAQMD's *Guidelines*, the following project types located within a specified distance to an existing or planned sensitive receptor land use must be evaluated to determine exposure of substantial pollutant concentrations to sensitive receptors (25):

- Any industrial project within 1,000 feet;
- A distribution center (40 or more trucks per day) within 1,000 feet;
- A major transportation project (50,000 or more vehicles per day) within 1,000 feet;
- A dry cleaner using perchloroethylene within 500 feet;
- A gasoline dispensing facility within 300 feet.

The Project includes development of a 499,714 square high-cube fulfillment center warehouse building. As such, the potential impact of Project-generated air pollutant emissions at sensitive receptors has also been considered. Receptors in the Project study area are described below and shown in Exhibit 3-A. All distances are measured from the Project site boundary to the outdoor living areas (e.g., backyards) or at the building façade, whichever is closer to the Project site. Distance is measured in a straight line from the project boundary to each receptor location.

R1: Location R1 represents the existing sensitive residence at 13030 Avenal Street, approximately 71 feet north of the Project site. Receptor R1 is placed at the private outdoor living areas (backyards) facing the Project site.

R2: Location R2 represents the existing sensitive residence at 13164 Avenal Road, approximately 76 feet north of the Project site. Receptor R2 is placed at the private outdoor living areas (backyards) facing the Project site.

R3: Location R3 represents the existing sensitive residence at 10445 Avenal Street, approximately 1,263 feet east of the Project site. Receptor R3 is placed at the private outdoor living areas (backyards) facing the Project site.

R4: Location R4 represents the existing sensitive residence at 10122 Mt. Whitney Way, approximately 1,071 feet southeast of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receptor R4 is placed at the residential building façade.

R5: Location R5 represents the existing sensitive residence at 10376 Wellington Road, approximately 227 feet north of the Project site Receptor R5 is placed at the private outdoor living areas (backyards) facing the Project site.

R6: Location R6 represents MGA Entertainment, Inc. at 10200 Amargosa Road, approximately 201 feet south of the Project site.

Based on Exhibit 3-A, the nearest sensitive receptor is a residence at 13030 Avenal Street, approximately 71 feet north of the Project site.

The Project would have a potentially significant health risk impact if it results in a maximum incremental cancer risk from emission of Toxic Air Contaminants (TACs) of ≥ 10 in one million and/or a chronic & acute hazard index that is ≥1.0. In the case of the Project, the TAC of concern is diesel particulate matter (DPM) that could be generated by Project construction activities, and on-site and off-site DPM that would result from on-going Project operations. For purposes of this evaluation, a Health Risk Assessment (HRA) has been prepared by Urban Crossroads, Inc. under a separate cover. The results of the *Amargosa and Palmetto High-Cube Warehouse Mobile Source Health Risk Assessment* (Urban Crossroads, Inc.) indicate that the Project would not result in any potentially significant health risk impacts from exposure to DPM emissions (30). Therefore, impacts to sensitive receptors are expected to be less than significant.

EXHIBIT 3-A: SENSITIVE RECEPTOR LOCATIONS

3.9 ODORS

The potential for the Project to generate objectionable odors has also been considered. Land uses generally associated with odor complaints include:

- Agricultural uses (livestock and farming)
- Wastewater treatment plants
- Food processing plants
- Chemical plants
- Composting operations
- Refineries
- Landfills
- Dairies
- Fiberglass molding facilities

The Project does not contain land uses typically associated with emitting objectionable odors. Potential odor sources associated with the Project may result from construction equipment exhaust and the application of asphalt and architectural coatings during construction activities and the temporary storage of typical solid waste (refuse) associated with the Project's (long-term operational) uses. Standard construction requirements would minimize odor impacts from construction. The construction odor emissions would be temporary, short-term, and intermittent in nature and would cease upon completion of the respective phase of construction and is thus considered less than significant. With respect to the operation of the gas station, gasoline dispensing activities may also generate odors associated with gasoline fumes. The gas pumps and underground storage tanks would include requirements based on MDAQMD Rule 461 vapor recovery systems that would control VOC vapor releases during refueling and would minimize driver and employee exposure to gasoline odors and fumes. Thus, gasoline odors are not expected to adversely affect adjacent land uses. While restaurants may result in some odors from the cooking process, these odors are not typically considered objectionable. It is expected that Project-generated refuse would be stored in covered containers and removed at regular intervals in compliance with current solid waste regulations. The Project would also be required to comply with MDAQMD Rule 402 to prevent occurrences of public nuisances. Therefore, odors and other emissions (such as those leading to odors) associated with construction and operations activities of the Project would be less than significant and no mitigation is required (31).

3.10 CUMULATIVE IMPACTS

The MDAQMD has not established its own guidelines for cumulative impacts. Since the MDAQMD guidelines are based on SCAQMD methodology, it is appropriate to apply the SCAQMD criteria when analyzing cumulative impacts within the MDAQMD. The SCAQMD has recognized that there is typically insufficient information to quantitatively evaluate the cumulative contributions of multiple projects because each project applicant has no control over nearby projects.

The SCAQMD published a report on how to address cumulative impacts from air pollution: *White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution* (32). In this report the SCAQMD clearly states (Page D-3):

"…the SCAQMD uses the same significance thresholds for project specific and cumulative impacts for all environmental topics analyzed in an Environmental Assessment or EIR. The only case where the significance thresholds for project specific and cumulative impacts differ is the Hazard Index (HI) significance threshold for TAC emissions. The project specific (project increment) significance threshold is HI > 1.0 while the cumulative (facility-wide) is HI > 3.0. It should be noted that the HI is only one of three TAC emission significance thresholds considered (when applicable) in a CEQA analysis. The other two are the maximum individual cancer risk (MICR) and the cancer burden, both of which use the same significance thresholds (MICR of 10 in 1 million and cancer burden of 0.5) for project specific and cumulative impacts.

Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant."

Consistent with the above SCAQMD guidance, individual projects that do not generate operational or construction emissions that exceed the MDAQMD's recommended daily thresholds for project-specific impacts would also not cause a cumulatively considerable increase in emissions for those pollutants for which the Basin is in nonattainment, and, therefore, would not be considered to have a significant, adverse air quality impact. Conversely, individual project-related construction and operational emissions that exceed MDAQMD thresholds for project-specific impacts would be considered cumulatively considerable.

Construction-Source Emission Impacts

The Project-specific evaluation of emissions presented in the preceding analysis demonstrates that Project construction-source air pollutant emissions would not result in exceedances of MDAQMD thresholds. Therefore, Project construction-source emissions would be considered less than significant on a Project-specific and cumulative basis.

Operational-Source Emission Impacts

The Project-specific evaluation of emissions presented in the preceding analysis demonstrates that Project operational-source air pollutant emissions would not result in exceedances of MDAQMD thresholds. Therefore, Project operational-source emissions would be considered less than significant on a Project-specific and cumulative basis.

APPENDIX 2.1:

STATE/FEDERAL ATTAINMENT STATUS OF CRITERIA POLLUTANTS

Appendix C - Maps and Tables of Area Designations for State and National Ambient Air Quality Standards

This attachment fulfills the requirement of Health and Safety Code section 40718 for CARB to publish maps that identify areas where one or more violations of any State ambient air quality standard (State standard) or national ambient air quality standard (national standard) have been measured. The national standards are those promulgated under section 109 of the federal Clean Air Act (42 U.S.C. 7409).

This attachment is divided into three parts. The first part comprises a table showing the levels, averaging times, and measurement methods for each of the State and national standards. This is followed by a section containing maps and tables showing the area designations for each pollutant for which there is a State standard in the California Code of Regulations, title 17, section 70200. The last section contains maps and tables showing the most current area designations for the national standards.

Table of Ambient Air Quality Standards

Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards [1]		National Standards [2]		
		Concentration [3]	Method [4]	Primary [3,5]	Secondary [3,6]	Method [7]
Ozone (O_3)[8]	1 Hour	0.09 ppm (180 µg/m^3)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m^3)		0.070 ppm (137 µg/m^3)		
Respirable Particulate Matter (PM10)[9]	24 Hour	50 µg/m^3	Gravimetric or Beta Attenuation	150 µg/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m^3		—		
Fine Particulate Matter (PM2.5)[9]	24 Hour	—	—	35 µg/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m^3	Gravimetric or Beta Attenuation	9.0 µg/m^3	15.0 µg/m^3	
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m^3)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m^3)	—	Non-Dispersive Infrared Photometry (NDIR)
	8 Hour	9.0 ppm (10 mg/m^3)		9 ppm (10 mg/m^3)	—	
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m^3)		—	—	
Nitrogen Dioxide (NO_2)[10]	1 Hour	0.18 ppm (339 µg/m^3)	Gas Phase Chemiluminescence	100 ppb (188 µg/m^3)	—	Gas Phase Chemiluminescence
	Annual Arithmetic Mean	0.030 ppm (57 µg/m^3)		53 ppb (100 µg/m^3)	Same as Primary Standard	
Sulfur Dioxide (SO_2)[11]	1 Hour	0.25 ppm (655 µg/m^3)	Ultraviolet Fluorescence	75 ppb (196 µg/m^3)	—	Ultraviolet Flourescence; Spectrophotometry (Pararosaniline Method)
	3 Hour	—		—	0.5 ppm (1300 µg/m^3)	
	24 Hour	0.04 ppm (105 µg/m^3)		0.14 ppm (for certain areas)[11]	—	
	Annual Arithmetic Mean	—		0.030 ppm (for certain areas)[11]	—	
Lead[12,13]	30 Day Average	1.5 µg/m^3	Atomic Absorption	—	—	High Volume Sampler and Atomic Absorption
	Calendar Quarter	—		1.5 µg/m^3 (for certain areas)[12]	Same as Primary Standard	
	Rolling 3-Month Average	—		0.15 µg/m^3		
Visibility Reducing Particles[14]	8 Hour	See footnote 14	Beta Attenuation and Transmittance through Filter Tape	**No National Standards**		
Sulfates	24 Hour	25 µg/m^3	Ion Chromatography			
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m^3)	Ultraviolet Fluorescence			
Vinyl Chloride[12]	24 Hour	0.01 ppm (26 µg/m^3)	Gas Chromatography			

See footnotes on next page ...

1. California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1- and 24-hour), nitrogen dioxide, and particulate matter (PM10, PM2.5, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

2. National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 $\mu g/m^3$ is equal to or less than one. For PM2.5, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.

3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

4. Any equivalent measurement method which can be shown to the satisfaction of the CARB to give equivalent results at or near the level of the air quality standard may be used.

5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

6. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

7. Reference method as described by the U.S. EPA. An “equivalent method” of measurement may be used but must have a “consistent relationship to the reference method” and must be approved by the U.S. EPA.

8. On October 1, 2015, the national 8hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.

9. On February 7, 2024, the national annual PM2.5 primary standard was lowered from 12.0 µg/m3 to 9.0 µg/m3. The existing national 24-hour PM2.5 standards (primary and secondary) were retained at 35 µg/m3, as was the annual secondary standard of 15.0 µg/m3. The existing 24-hour PM10 standards (primary and secondary) of 150 µg/m3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

10. To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

11. On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

    Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.

12. The CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

13. The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 $\mu g/m^3$)as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

14. In 1989, the CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

Area Designations for the State Ambient Air Quality Standards

The following maps and tables show the area designations for each pollutant with a State standard set forth in the California Code of Regulations, title 17, section 60200. Each area is identified as attainment, nonattainment, nonattainment transitional, or unclassified for each pollutant, as shown below:

Designation	Abbreviation
Attainment	A
Nonattainment	N
Nonattainment Transitional	NA-T
Unclassified	U

In general, CARB designates areas by air basin for pollutants with a regional impact and by county for pollutants with a more local impact. However, when there are areas within an air basin or county with distinctly different air quality deriving from sources and conditions not affecting the entire air basin or county, CARB may designate a smaller area. Generally, when boundaries of the designated area differ from the air basin or county boundaries, the description of the specific area is referenced at the bottom of the summary table.

Area Designations for the National Ambient Air Quality Standards

The following maps and tables show the area designations for each pollutant with a national ambient air quality standard. These maps reflect all current national standards. For example, the map for Fine Suspended Particulate Matter ($PM_{2.5}$) reflects both the annual and the 24-hour standard. Additional information about the federal area designations is available on the U.S. EPA website: *Nonattainment Areas for Criteria Pollutants (Green Book)*

Over the last several years, U.S. EPA has been reviewing the levels of the various national standards. The agency has already promulgated new standard levels for some pollutants and is considering revising the levels for others. Information about the status of these reviews is available on the U.S. EPA website: *Criteria Air Pollutants*

On February 7, 2024, the U.S. EPA established a new national annual primary $PM_{2.5}$ standard of 9.0 µg/m^3. Area designations for this revised standard will be finalized in February 2026. Until that time, the current designation map will reflect the most previous 2012 annual average standard of 12.0 µg/m^3 as well as the 24-hour standard of 35 µg/m^3, last revised in 2006.

Designation Categories

Suspended Particulate Matter (PM_{10}). The U.S. EPA uses three categories to designate areas with respect to PM_{10}:

- Attainment (A)
- Nonattainment (N)
- Unclassifiable (U)

Ozone, Fine Suspended Particulate Matter ($PM_{2.5}$), Carbon Monoxide (CO), Nitrogen Dioxide (NO_2), and Lead. The U.S. EPA uses two categories to designate areas with respect to these standards:

- Nonattainment (N)
- Unclassifiable/Attainment (U/A)

Sulfur Dioxide (SO_2). The U.S. EPA uses three categories to designate areas with respect to the 24-hour and annual average sulfur dioxide standards. These designation categories are:

- Nonattainment (N),
- Unclassifiable (U), and
- Unclassifiable/Attainment (U/A).

Designation Areas

From time to time, the boundaries of the California air basins have been changed to facilitate the planning process. CARB generally initiates these changes, and they are not always reflected in the U.S. EPA's area designations. For purposes of consistency,

the maps in this attachment reflect area designation boundaries and nomenclature as promulgated by the U.S. EPA. In some cases, these may not be the same as those adopted by CARB. For example, the national area designations reflect the former Southeast Desert Air Basin. In accordance with Health and Safety Code section 39606.1, CARB redefined this area in 1996 to be the Mojave Desert Air Basin and Salton Sea Air Basin. The definitions and boundaries for all areas designated for the national standards can be found in Title 40, Code of Federal Regulations (CFR), Chapter I, Subchapter C, Part 81.305. They are available on the web at: *Title 40 SECTION 81.305*.

* Definitions and references for all areas can be found in 40 CFR, Chapter I, Part 81.305.

NOTE: This map and Table reflect the 2015 8-hour ozone standard of 0.070 ppm.

[6] For this purpose, the Sacramento Metro Area comprises all of Sacramento and Yolo Counties, the Sacramento Valley Air Basin portion of Solano County, the southern portion of Sutter County, and the Sacramento Valley and Mountain Counties Air Basins portions of Placer and El Dorado counties.

[7] South Central Coast Air Basin Channel Islands:
Santa Barbara County includes Santa Cruz, San Miguel, Santa Rosa, and Santa Barbara Islands.
Ventura County includes Anacapa and San Nicolas Islands.
South Coast Air Basin:
Los Angeles County includes San Clemente and Santa Catalina Islands.

Imperial County (portion)[11]	N
Remainder of Air Basin	U/A

* Definitions and references for all areas can be found in 40 CFR, Chapter I, Part 81.305.

NOTE: This map reflects the 2006 24-hour $PM_{2.5}$ standard as well as the 1997 and 2012 $PM_{2.5}$ annual standards.

[8] For this purpose, Sacramento Metro Area comprises all of Sacramento and portions of El Dorado, Placer, Solano, and Yolo Counties. Air quality in this area meets the national $PM_{2.5}$ standards. A Determination of Attainment for the 2006 24-hour $PM_{2.5}$ standard was made by U.S. EPA in June 2017.

[9] Air quality in this area meets the national $PM_{2.5}$ standards. A Determination of Attainment for the 2006 24-hour $PM_{2.5}$ standard was made by U.S. EPA in June 2017.

[10] Those lands of the Santa Rosa Band of Cahulla Mission Indians in Riverside County are designated Unclassifiable/Attainment.

[11] That portion of Imperial County encompassing the urban and surrounding areas of Brawley, Calexico, El Centro, Heber, Holtville, Imperial, Seeley, and Westmorland. Air quality in this area meets the national $PM_{2.5}$ standards. A Determination of Attainment for the 2006 24-hour $PM_{2.5}$ standard was made by U.S. EPA in June 2017.

[12] South Central Coast Air Basin Channel Islands:
Santa Barbara County includes Santa Cruz, San Miguel, Santa Rosa, and Santa Barbara Islands.
Ventura County includes Anacapa and San Nicolas Islands.
Note that the San Clemente and Santa Catalina Islands are considered part of Los Angeles County, and therefore, are included as part of the South Coast Air Basin.

APPENDIX 3.1:

CALEEMOD EMISSIONS MODEL OUTPUTS

14848-Palmetto Industrial Detailed Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

2.2. Construction Emissions by Year

2.2.1. Total Construction Emissions by Year, Unmitigated

2.2.2. Onsite Construction Emissions by Year, Unmitigated

2.2.3. Offsite Construction Emissions by Year, Unmitigated

2.3. Operations Emissions Compared Against Thresholds

2.4. Operations Emissions by Sector, Unmitigated

3. Construction Emissions Details

3.1. Site Preparation (2026)

3.1.1. Onsite - Unmitigated

3.1.2. Offsite - Unmitigated

3.2. Grading (2026)

3.2.1. Onsite - Unmitigated

3.2.2. Offsite - Unmitigated

3.3. Building Construction (2026)

3.3.1. Onsite - Unmitigated

3.3.2. Offsite - Unmitigated

3.4. Building Construction (2027)

3.4.1. Onsite - Unmitigated

3.4.2. Offsite - Unmitigated

3.5. Paving (2027)

3.5.1. Onsite - Unmitigated

3.5.2. Offsite - Unmitigated

3.6. Architectural Coating (2027)

3.6.1. Onsite - Unmitigated

3.6.2. Offsite - Unmitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.3. Area Emissions by Source

4.3.1. Unmitigated

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

4.9. User Defined Emissions By Equipment Type

4.9.1. Unmitigated

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.10. Operational Area Sources

5.10.1. Hearths

5.10.2. Architectural Coatings

5.10.3. Landscape Equipment

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

5.16.2. Process Boilers

5.17. User Defined

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

8.1. Justifications

8.3. Land Use

8.4. Construction

8.4.1. Construction Phases

8.4.2. Off-Road Equipment

8.4.6. Trips and VMT

8.5. Operations

8.5.1. Mobile Sources

8.5.1.1. Vehicle Data

8.5.1.2. Fleet Mix

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	33.6400	annual days of extreme heat
Extreme Precipitation	4.95000	annual days with precipitation above 20 mm
Sea Level Rise	0.00000	meters of inundation depth
Wildfire	22.7300	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	4	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	4	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	1	1	1	2

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	91.0516
AQ-PM	32.2215
AQ-DPM	57.8843
Drinking Water	29.7490
Lead Risk Housing	13.7996
Pesticides	0.00000
Toxic Releases	24.9687
Traffic	83.1125
Effect Indicators	—
CleanUp Sites	73.3669
Groundwater	0.00000
Haz Waste Facilities/Generators	65.9166

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	52.0000

Healthy Places Index Score for Project Location (b)	42.0000
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

8.1. Justifications

Screen	Justification
Land Use	Taken from site plan
Construction: Construction Phases	Based on client indicated construction schedule
Construction: Off-Road Equipment	T/L/B replaced with Crawler Tractor to accurately calculate disturbance for Site Preparation and Grading phases Standard 8-hour work day
Construction: Trips and VMT	Vendor Trips adjusted based on CalEEMod defaults for Building Construction and number of days for Site Preparation, Grading, Building Construction, and Paving
Operations: Vehicle Data	Trip Characteristics based on information provided in the Traffic Analysis
Operations: Fleet Mix	Passenger Car Mix estimated based on CalEEMod default fleet mix and the ratio of the vehicle classes (LDA, LDT1, LDT2, MDV, MCY). Truck Fleet Mix based on 2, 3 and 4 axle

EXECUTIVE SUMMARY

This report evaluates the potential health risk impacts to sensitive receptors (which are residents) and adjacent workers associated with the development of the Project, more specifically, health risk impacts as a result of exposure to Toxic Air Contaminants (TACs) including diesel particulate matter (DPM) as a result of heavy-duty diesel trucks, equipment associated with on-site and off-site construction and operational activity. This section summarizes the significance criteria and Project health risks. The results of the health risk assessment (HRA) from Project-generated DPM are provided in Tables ES-1, ES-2, and ES-3.

ES.1 Project Mitigation Measures

The results of the HRA demonstrate that the Project would not result in a significant health risk impact during construction or operations. Therefore, no mitigation measures are required for HRA purposes.

ES.2 Construction Impacts

The land use with the greatest potential exposure to Project construction-source DPM emissions is Location R2 which is located approximately 76 feet north the Project site at an existing residence located at 13164 Avenal Road. R2 is placed in the private outdoor living area (backyard) facing the Project site. At the maximally exposed individual receptor (MEIR), the maximum incremental cancer risk attributable to Project construction-source DPM emissions is estimated at 1.71 in one million, which is less than the Mojave Desert Air Quality Management District's (MDAQMD) significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be <0.01, which would not exceed the applicable threshold of 1.0. As such, the Project will not cause a significant human health or cancer risk to adjacent land uses as a result of Project construction activity. All other receptors during construction activity would experience less risk than what is identified for this location.

ES.3 Operational Impacts

Residential Exposure Scenario

The residential land use with the greatest potential exposure to Project operational-source DPM emissions is Location R4 which is located approximately 1,071 feet southeast of the Project site at an existing residence located at 13500 Live Oak Street. Since there are no private outdoor living areas facing the Project site, R4 is placed at the building façade nearest the Project site. At the MEIR, the maximum incremental cancer risk attributable to Project operational-source DPM emissions is estimated at 0.65 in one million, which is less than the MDAQMD's significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be <0.01, which would not exceed the applicable significance threshold of 1.0. Because all other modeled residential receptors are exposed to lesser concentrations and are located at a greater distance from the Project site than the MEIR analyzed herein, and TACs generally dissipates with distance from the source, all other residential receptors in the vicinity of the Project site would be exposed to less emissions and therefore less risk than the MEIR identified herein. As such, the Project will not cause a significant human health or cancer risk to nearby residences.

Worker Exposure Scenario

The worker receptor land use with the greatest potential exposure to Project operational-source DPM emissions is Location R6, which represents the potential worker receptor approximately 201 feet south of the Project site. At the maximally exposed individual worker (MEIW), the maximum incremental cancer risk impact is 0.05 in one million which is less than the MDAQMD's threshold of 10 in one million. Maximum non-cancer risks at this same location were estimated to be <0.01, which would not exceed the applicable significance threshold of 1.0. Because all other modeled worker receptors are located at a greater distance than the MEIW analyzed herein, and DPM dissipates with distance from the source, all other worker receptors in the vicinity of the Project would be exposed to less emissions and therefore less risk than the MEIW identified herein. As such, the Project will not cause a significant human health or cancer risk to adjacent workers.

School Exposure Scenario

Proximity to sources of toxics is critical to determining the impact. In traffic-related studies, the additional non-cancer health risk attributable to proximity was seen within 1,000 feet and was strongest within 300 feet. California freeway studies show about a 70-percent drop-off in particulate pollution levels at 500 feet. Based on California Air Resources Board (CARB) emissions and modeling analyses, an 80-percent drop-off in pollutant concentrations is expected at approximately 1,000 feet from a distribution center (1).

The 1,000-foot evaluation distance is supported by research-based findings concerning Toxic Air Contaminant (TAC) emission dispersion rates from roadways and large sources showing that emissions diminish substantially between 500 and 1,000 feet from emission sources.

A one-quarter mile radius, or 1,320 feet, is commonly utilized for identifying sensitive receptors, such as schools, that may be impacted by a proposed project. This radius is more robust than, and therefore provides a more health protective scenario for evaluation than the 1,000-foot impact radius identified above.

There are no schools within ¼ mile of the Project site. The nearest school is Topaz Preparatory Academy, which is located approximately 5,580 feet southeast of the Project site. Because there is no reasonable potential that TAC emissions would cause significant health impacts at distances of more than ¼ mile from the air pollution source, there would be no significant impacts that would occur to any schools in the vicinity of the Project.

ES.4 Construction and Operational Impacts

The land use with the greatest potential increased cancer risk due to exposure to Project construction-source and operational-source DPM emissions is Location R2. At this location, the maximum incremental cancer risk attributable to Project construction and operational DPM source emissions is estimated at 1.98 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be <0.01, which would not exceed the applicable threshold of 1.0. As such, the Project will not cause a significant human health or cancer risk to adjacent land uses as a result of Project construction and operational activity. All other receptors during construction and operational activity would experience less risk than what is identified for this location.

1 INTRODUCTION

The purpose of this HRA is to evaluate Project-related impacts to nearby sensitive receptors (residents) and workers as a result of heavy-duty diesel trucks accessing the site.

The MDAQMD identifies that if a proposed Project is expected to generate/attract heavy-duty diesel trucks, which emit DPM, preparation of a mobile source HRA is recommended. This document serves to meet the MDAQMD's recommendation for preparation of an HRA. The mobile source HRA has been prepared in accordance with all relevant and appropriate procedures presented by the United States Environmental Protection Agency (U.S. EPA), California EPA and MDAQMD. Cancer risk is expressed in terms of expected incremental incidence per million population. The MDAQMD has established an incidence rate of ten (10) persons per million as the maximum acceptable incremental cancer risk due to DPM exposure from a project such as the proposed Project. This threshold serves to determine whether or not a given project has a potentially significant development-specific and cumulatively considerable impact.

The MDAQMD has also established non-carcinogenic risk parameters for use in HRAs. Non-carcinogenic risks are quantified by calculating a "hazard index," expressed as the ratio between the ambient pollutant concentration and its toxicity or Reference Exposure Level (REL). An REL is a concentration at or below which health effects are not likely to occur. A hazard index less of than one (1.0) means that adverse health effects are not expected. In this HRA, non-carcinogenic exposures of less than 1.0 are considered less-than-significant. Both the cancer risk and non-carcinogenic risk thresholds are applied to the nearest sensitive receptors below.

1.1 SITE LOCATION

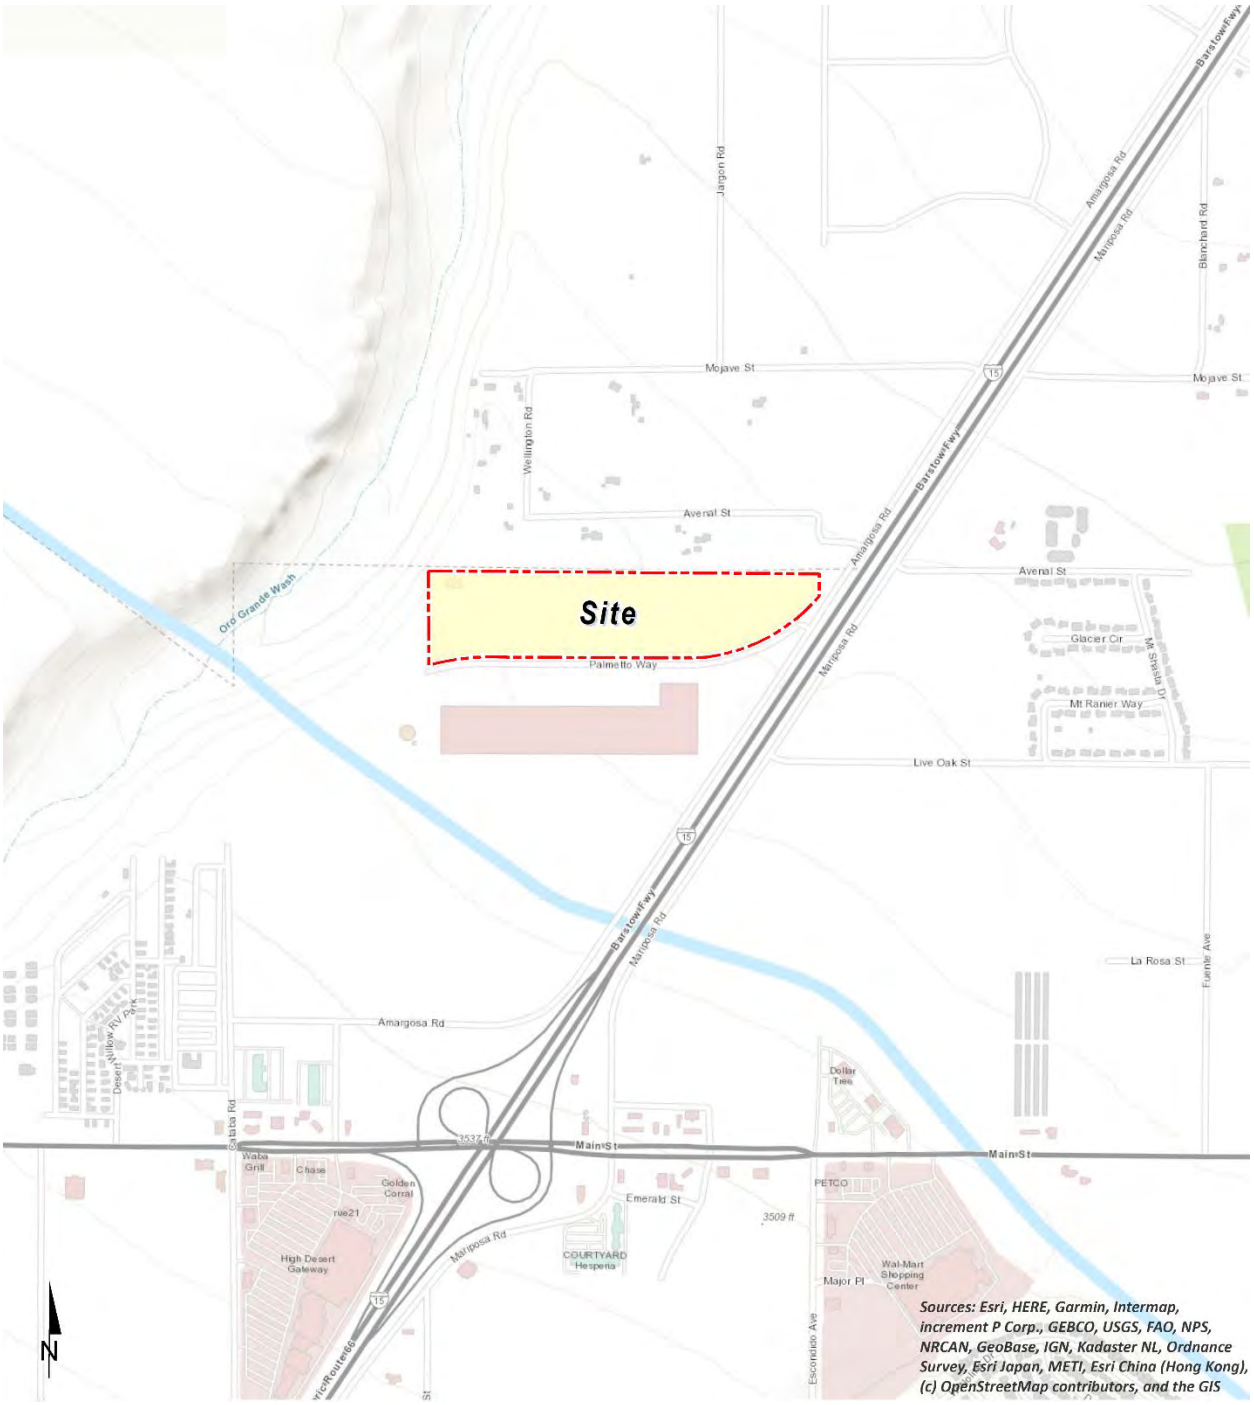
The proposed project is located on the northwest corner of Amargosa Road and Palmetto Way in the City of Hesperia, as shown on Exhibit 1-A.

1.2 PROJECT DESCRIPTION

The proposed Project is to consist of 499,714 square high-cube fulfillment center warehouse building as shown on Exhibit 1-2. The proposed project is anticipated to be constructed and fully operational by year 2027.

It is expected that the Project business operations would primarily be conducted within the enclosed building, except for traffic movement, parking, as well as loading and unloading of trucks at designated loading bays. This analysis includes a conservative assumption of on-site Project-related emission sources for potential future tenants, including architectural coatings, consumer products, landscape maintenance equipment, natural gas, electricity, mobile operations, stationary and on-site cargo handling equipment. This analysis is intended to describe health risk impacts associated with the expected typical operational activities at the Project site. To present a conservative approach, this report assumes the Project would operate 24-hours daily for seven days per week.

EXHIBIT 1-A: LOCATION MAP



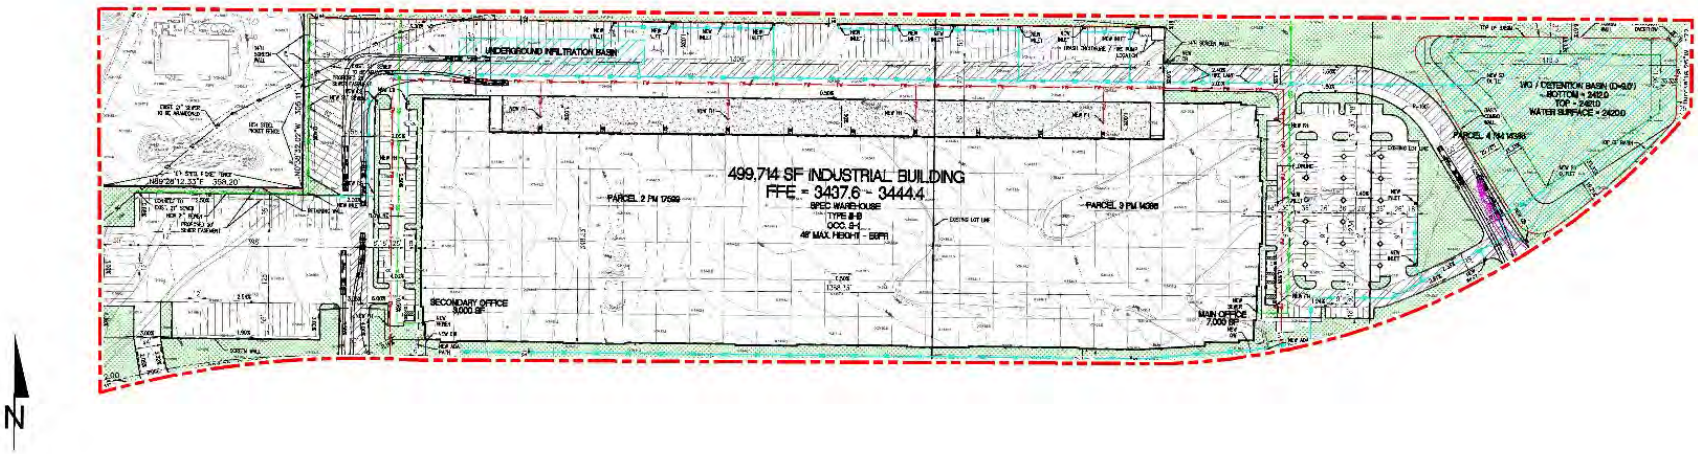


EXHIBIT 1-B: SITE PLAN

2 BACKGROUND

2.1 BACKGROUND ON RECOMMENDED METHODOLOGY

This HRA is based on applicable guidelines to produce conservative estimates of human health risk posed by exposure to DPM. Even though the Project is not within the jurisdiction of the SCAQMD, these recommendations are relevant for CEQA purposes since MDAQMD does not provide similar guidance. The conservative nature of this analysis is due primarily to the following factors:

- The CARB-adopted diesel exhaust Unit Risk Factor (URF) of 300 in one million per $\mu g/m^3$ is based upon the upper 95 percentile of estimated risk for each of the epidemiological studies utilized to develop the URF. Using the 95th percentile URF represents a very conservative (health-protective) risk posed by DPM because it represents breathing rates that are high for the human body.
- The emissions derived assume that every truck accessing the Project site will idle for 15 minutes under the unmitigated scenario, and this is an overestimation of actual idling times and thus conservative[1]. The CARB's anti-idling requirements impose a 5-minute maximum idling time and therefore the analysis conservatively overestimates DPM emissions from idling by a factor of 3.

2.2 CONSTRUCTION HEALTH RISK ASSESSMENT

2.2.1 Emissions Calculations

The emissions calculations for the construction HRA component are based on an assumed mix of construction equipment and hauling activity as presented in the *Amargosa and Palmetto High-Cube Warehouse Air Quality Impact Analysis* (AQIA) prepared by Urban Crossroads, Inc. (2).

Construction related DPM emissions are expected to occur primarily as a function of the operation of heavy-duty construction equipment.

In addition, to support the Project development, there may be paving for off-site improvements associated with roadway construction. It is expected that the off-site construction activities would not take place at one location for the entire duration of construction. Impacts associated with these activities are not expected to exceed the emissions identified for Project-related construction activities since the off-site construction areas would have physical constraints on the amount of daily activity that could occur. The utility improvement construction schedule and equipment are shown in Tables 2-1 and Table 2-2. Risk associated with utility improvements were analyzed and included as a part of the overall risk. As such, no impacts beyond what has already been identified in this report are expected to occur.

As discussed in the AQIA, the Project would result in approximately 354 total working-days of construction activity. The construction duration by phase is shown in Table 2-1. A detailed summary of construction equipment assumptions by phase is provided at Table 2-2. The CalEEMod emissions

[1] An idling time of 15 minutes per truck has been used per SCAQMD recommendations. Although the Project is required to comply with CARB's idling limit of 5 minutes, the SCAQMD recommends the on-site idling emissions should be estimated for 15 minutes of truck idling, which would take into account on-site idling that occurs while the trucks are waiting to pull up to the truck bays, idling at the bays, idling at check-in and check-out, etc.

outputs are presented in Appendix 2.1. The modeled emission sources for construction activity are illustrated on Exhibit 2-A.

EXHIBIT 2-A: MODELED CONSTRUCTION EMISSION SOURCES

2.3 OPERATIONAL HEALTH RISK ASSESSMENT

2.3.1 On-Site and Off-Site Truck Activity

Vehicle DPM emissions were calculated using emission factors for particulate matter less than 10µm in diameter (PM_{10}) generated with the 2021 version of the EMission FACtor model (EMFAC) developed by the CARB. EMFAC 2021 is a mathematical model that CARB developed to calculate emission rates from motor vehicles that operate on highways, freeways, and local roads in California and is commonly used by CARB to project changes in future emissions from on-road mobile sources (3). The most recent version of this model, EMFAC 2021, incorporates regional motor vehicle data, information and estimates regarding the distribution of vehicle miles traveled (VMT) by speed, and number of starts per day.

Several distinct emission processes are included in EMFAC 2021. Emission factors calculated using EMFAC 2021 are expressed in units of grams per vehicle miles traveled (g/VMT) or grams per idle-hour (g/idle-hr), depending on the emission process. The emission processes and corresponding emission factor units associated with diesel particulate exhaust for this Project are presented below.

For this Project, annual average PM_{10} emission factors were generated by running EMFAC 2021 in EMFAC Mode for vehicles in the San Bernardino County jurisdiction. The EMFAC Mode generates emission factors in terms of grams of pollutant emitted per vehicle activity and can calculate a matrix of emission factors at specific values of temperature, relative humidity, and vehicle speed. The model was run for speeds traveled in the vicinity of the Project. The vehicle travel speeds for each segment modeled are summarized below:

- Idling – on-site loading/unloading and truck trailer parking areas;
- 5 miles per hour – on-site vehicle movement including driving and maneuvering; and
- 25 miles per hour – off-site vehicle movement including driving and maneuvering.

It is expected that minimal idling would occur at nearby intersections during truck travel on study area roadways (e.g., at an intersection during a red light, or yielding to make a turn). Notwithstanding, the analysis conservatively utilizes a reduced off-site average speed of 25 miles per hour (below the posted speed limit) for travel on study area roadways. Use of a lower average speed for off-site travel results in a higher emission factor and therefore any negligible idling that would occur during truck travel along the study area is accounted for.

Calculated emission factors are shown at Table 2-3. As a conservative measure, a 2027 EMFAC 2021 run was conducted and a static 2027 emissions factor data set was used for the entire duration of analysis herein (e.g., 30 years). Use of 2027 emission factors would overstate potential impacts since this approach assumes that emission factors remain "static" and do not change over time due to fleet turnover or cleaner technology with lower emissions that would be incorporated into vehicles after 2027. Additionally, based on EMFAC 2021, Light-Heavy-Duty Trucks are comprised of 59.56 percent (%) diesel, Medium-Heavy-Duty Trucks are comprised of 75.13% diesel, and Heavy-Heavy-Duty Trucks are comprised of 99.71% diesel. Trucks fueled by diesel are accounted for by these percentages accordingly in the emissions factor generation. Appendix 2.1 includes additional details on the emissions estimates from EMFAC.

As discussed in the AQIA, the analysis incorporated the use of EMFAC 2021 off-model adjustment factors in accordance with CARB guidance. The adjustment factors modify the emission rates utilized in this analysis to reflect the incremental effects of specific adopted regulations and programs relevant to the South Coast Air Basin and are consistent with CARB- and EPA-approved planning methodologies to reflect regulatory programs applicable to heavy-duty vehicles that may not be fully captured in the base EMFAC 2021 model. As such, these adjustments conservatively result in an approximate 3.6% increase in DPM emissions compared to the base EMFAC 2021 model outputs.

The vehicle DPM exhaust emissions were calculated for running exhaust emissions. The running exhaust emissions were calculated by applying the running exhaust PM_{10} emission factor (g/VMT) from EMFAC over the total distance traveled. The following equation was used to estimate off-site emissions for each of the different vehicle classes comprising the mobile sources (4):

$$Emissions_{Speed\ A} = EF_{Run\ Exhaust} \times Distance \times \frac{Number\ of\ Trips\ per\ Day}{Seconds\ per\ Day}$$

Where:

$Emissions_{Speed\ A}$	=	Vehicle emissions at a given speed A (g/s)
$EF_{Run\ Exhaust}$	=	EMFAC running exhaust PM_{10} emission factor at speed A (g/vmt)
$Distance$	=	Total distance traveled per trip (miles)

Similar to off-site traffic, on-site vehicle running emissions were calculated by applying the running exhaust PM_{10} emission factor (g/VMT) from EMFAC and the total vehicle trip number over the length of the driving path using the same formula presented above for on-site emissions. In addition, on-site vehicle idling exhaust emissions were calculated by applying the idle exhaust PM_{10} emission factor (g/idle-hr) from EMFAC and the total truck trip over the total assumed idle time (15 minutes). The following equation was used to estimate the on-site vehicle idling emissions for each of the different vehicle classes :

$$Emissions_{Idle} = EF_{Idle} \times Number\ of\ Trips \times Idling\ Time \times \frac{60\ minutes\ per\ hour}{seconds\ per\ day}$$

Where:

$Emissions_{Idle}$	=	Vehicle emissions during Idling (g/s)
EF_{Idle}	=	EMFAC idle exhaust PM_{10} emission factor (g/s)
$Number\ of\ Trips$	=	Number of trips per day
$Idling\ Time$	=	Idling time (minutes per trip)

TABLE 2-3: 2027 WEIGHTED AVERAGE DPM EMISSIONS FACTORS

Speed	Weighted Average
0 (idling)	0.07876 (g/idle-hr)
5	0.01682 (g/mile)
25	0.00755 (g/mile)

Each roadway was modeled as a line source (made up of multiple adjacent volume sources). Due to the large number of volume sources modeled for this analysis, the corresponding coordinates of each volume source have not been included in this report but are included in Appendix 2.2. The DPM emission rate for each line volume source was calculated by multiplying the emission factor (based on the average travel speed along the roadway) by the number of trips and the distance traveled along each roadway segment, as illustrated in Table 2-4. In order to model idling emissions, line sources were modeled at the building loading docks and tractor trailer parking stalls. The modeled emission sources are illustrated on Exhibit 2-B for on-site sources and Exhibit 2-C for off-site sources. The modeling domain is limited to the Project's primary truck route and includes off-site sources in the study area for more than ¾ mile. This modeling domain is more inclusive and conservative than using only a ¼ mile modeling domain which is the distance supported by several reputable studies which conclude that the greatest potential risks occur within a ¼ mile of the primary source of emissions (1) In the case of the Project, the primary source of emissions is the on-site idling and on-site travel.

On-site truck idling was estimated to occur as trucks enter and travel through the Project site. Although the Project's diesel-fueled truck and equipment operators will be required by State law to comply with CARB's idling limit of 5 minutes, staff at SCAQMD recommends that the on-site idling emissions be calculated assuming 15 minutes of truck idling (5), which would take into account on-site idling which occurs while the trucks are waiting to pull up to the truck bays, idling at the bays, idling at check-in and check-out, etc. As such, this analysis calculates truck idling at 15 minutes, consistent with SCAQMD's recommendation. Even though the Project is not within the jurisdiction of the SCAQMD, these recommendations are relevant for CEQA purposes since MDAQMD does not provide similar guidance.

As summarized in the *Amargosa and Palmetto High-Cube Warehouse Traffic Impact Analysis*, the Project is expected to generate a total of approximately 905 actual vehicular trip-ends per day (452 vehicles inbound + 452 vehicles outbound) which includes 790 passenger vehicle trips (395 passenger vehicles inbound + 395 passenger vehicles outbound) and 115 two-way truck trips (57 trucks inbound per day + 57 trucks outbound) per day (6).

2.3.2 Stationary Sources

The proposed Project was conservatively assumed to include installation of a 300 HP diesel-powered fire pump and a 700 HP diesel-powered emergency generator at each building, as shown on Exhibit 2-B. The generators would be diesel fueled and potentially would result in exposure of sensitive receptors to DPM. The analysis assumed that the fire pumps and emergency generators could potentially operate for up to half hour per day, one day per week, for a total of 50 hours per year for maintenance and testing purposes. Consistent with SCAQMD guidance, the fire pumps and

emergency generators were modeled as a point source. Because detailed engine specifications are not known at this time, release parameters (including exhaust height, diameter, temperature, and flow rate) were obtained from the California Air Pollution Control Officers Association Facility Prioritization Guidelines (7).

2.4 EXPOSURE QUANTIFICATION

The analysis herein has been conducted in accordance with the guidelines in the Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis (8). The U.S. EPA's AERMOD model has been utilized. For purposes of this analysis, the Lakes AERMOD View (Version 12.0.0) was used to calculate annual average particulate concentrations associated with site operations. Lakes AERMOD View was utilized to incorporate the U.S. EPA's latest AERMOD Version 23132 (9).

The model offers additional flexibility by allowing the user to assign an initial release height and vertical dispersion parameters for mobile sources representative of a roadway. For this HRA, the roadways were modeled as adjacent volume sources. Roadways were modeled using the U.S. EPA's haul route methodology for modeling of on-site and off-site truck movement. More specifically, the Haul Road Volume Source Calculator in Lakes AERMOD View has been utilized to determine the release height parameters. Based on the US EPA methodology, the Project's modeled sources would result in a release height of 3.49 meters and an initial lateral dimension of 4.0 meters, and an initial vertical dimension of 3.25 meters.

Model parameters are presented in Table 2-5 (10). The model requires additional input parameters including emission data and local meteorology. Meteorological data from the Barstow-Daggett Airport monitoring station located in MDAQMD was used to represent local weather conditions and prevailing winds (11).

TABLE 2-5: AERMOD MODEL PARAMETERS

Dispersion Coefficient (Urban/Rural)	Rural
Terrain (Flat/Elevated)	Elevated (Regulatory Default)
Averaging Time	1 year (5-year Meteorological Data Set)
Receptor Height	0 meters (Regulatory Default)

Universal Transverse Mercator (UTM) coordinates for World Geodetic System (WGS) 84 were used to locate the Project site boundaries, each volume source location, and receptor locations in the Project vicinity. The AERMOD dispersion model summary output files for the Project are presented in Appendix 2.2. Modeled sensitive receptors were placed at residential and non-residential locations.

Receptors may be placed at applicable structure locations for residential and worker property and not necessarily the boundaries of the properties containing these uses because the human receptors (residents and workers) spend a majority of their time at the residence or in the workplace's building, and not on the property line. It should be noted that the primary purpose of receptor placement is focused on long-term exposure. For example, the HRA evaluates the potential health risks to residents, workers and school children over a period of 30, 25, or 9 years of exposure, respectively. Notwithstanding, as a conservative measure, receptors were placed at either the outdoor living area or the building façade, whichever is closer to the Project site.

Discrete receptors were placed in all directions nearest to the Project site and Project truck routes in order to account for the predominant wind directions in the Project vicinity.

For purposes of this HRA, receptors include both residential and non-residential (worker) land uses in the vicinity of the Project. These receptors are included in the HRA since residents, workers, and school children may be exposed at these locations over a long-term duration of 30, 25, and 9 years, respectively. This methodology is consistent with MDAQMD and OEHHA recommended guidance.

Any impacts to residents or workers located further away from the Project site than the modeled residential and workers in a given direction would have a lesser impact than what has already been disclosed in the HRA at the MEIR, MEISC and MEIW because concentrations dissipate with distance.

All receptors were set to existing elevation height so that only ground-level concentrations are analyzed. United States Geological Survey (USGS) Digital Elevation Model (DEM) terrain data based on a 7.5-minute topographic quadrangle map series using AERMAP was utilized in the HRA modeling to set elevations (12).

Discrete variants for daily breathing rates, exposure frequency, fraction of time at home, and exposure duration were obtained from relevant distribution profiles presented in the 2015 OEHHA Guidelines. Tables 2-6 through 2-9 summarize the Exposure Parameters for residents and workers based on 2015 OEHHA Guidelines. Appendix 2.3 includes the detailed risk calculation.

TABLE 2-6: EXPOSURE ASSUMPTIONS FOR INDIVIDUAL CANCER RISK (CONSTRUCTION ACTIVITY)

Age	Daily Breathing Rate (L/kg-day)	Age Specific Factor	Exposure Duration (years)	Fraction of Time at Home	Exposure Frequency (days/year)	Exposure Time (hours/day)
0 to 2	1,090	10	0.97	1.00	250	8

TABLE 2-7: EXPOSURE ASSUMPTIONS FOR INDIVIDUAL CANCER RISK (30 YEAR RESIDENTIAL)

Age	Daily Breathing Rate (L/kg-day)	Age Specific Factor	Exposure Duration (years)	Fraction of Time at Home	Exposure Frequency (days/year)	Exposure Time (hours/day)
-0.25 to 0	361	10	0.25	0.85	350	24
0 to 2	1,090	10	2	0.85	350	24
2 to 16	572	3	14	0.72	350	24
16 to 30	261	1	14	0.73	350	24

TABLE 2-8: EXPOSURE ASSUMPTIONS FOR INDIVIDUAL CANCER RISK (25 YEAR WORKER)

Age	Daily Breathing Rate (L/kg-day)	Age Specific Factor	Exposure Duration (years)	Exposure Frequency (days/year)	Exposure Time (hours/day)
16 to 41	230	1	25	250	12

TABLE 2-9: EXPOSURE ASSUMPTIONS FOR INDIVIDUAL CANCER RISK (9 YEAR SCHOOL CHILD)

Age	Daily Breathing Rate (L/kg-day)	Age Specific Factor	Exposure Duration (years)	Exposure Frequency (days/year) a	Exposure Time (hours/day)
4 to 13	572	3	9	180	12

[a] To represent the unique characteristics of the school-based population, the assessment employed the U.S. EPA's guidance to develop viable dose estimates based on reasonable maximum exposures (RME). RME's are defined as the "highest exposure that is reasonably expected to occur" for a given receptor population. As a result, lifetime risk values for the student population were adjusted to account for an exposure duration of 180 days per year for nine (9) years. The 9 year exposure duration is also consistent with OEHHA Recommendations and consistent with the exposure duration utilized in school-based risk assessments for various schools within the Los Angeles County Unified School District (LAUSD) that have been accepted by the SCAQMD.

2.5 CARCINOGENIC CHEMICAL RISK

Excess cancer risks are estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens over a specified exposure duration. The estimated risk is expressed as a unitless probability. The cancer risk attributed to a chemical is calculated by multiplying the chemical intake or dose at the human exchange boundaries (e.g., lungs) by the chemical-specific cancer potency factor (CPF). A risk level of 10 in one million implies a likelihood that up to 10 people out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of TACs over a specified duration of time.

Guidance from CARB and the California EPA, Office of Environmental Health Hazard Assessment (OEHHA) recommends a refinement to the standard point estimate approach when alternate human body weights and breathing rates are utilized to assess risk for susceptible subpopulations such as children. For the inhalation pathway, the procedure requires the incorporation of several discrete variates to effectively quantify dose. Once determined, contaminant dose is multiplied by the cancer potency factor (CPF) in units of inverse dose expressed in milligrams per kilogram per day $(mg/kg/day)^{-1}$ to derive the cancer risk estimate. Therefore, to assess exposures, the following dose algorithm was utilized.

$$DOSE_{AIR} = \left(C_{AIR} \times \frac{BR}{BW} \times A \times EF\right) \times (1 \times 10^{-6})$$

Where:

$DOSE_{AIR}$	=	chronic daily intake (mg/kg/day)
C_{AIR}	=	concentration of contaminant in air (µg/m^3)
$\frac{BR}{BW}$	=	daily breathing rate normalized to body weight (L/kg BW-day)
A	=	inhalation absorption factor
EF	=	exposure frequency (days/365 days)

BW	=	body weight (kg)
1×10^{-6}	=	conversion factors (µg to mg, L to m^3)

$$RISK_{AIR} = DOSE_{AIR} \times CPF \times ASF \times FAH \times \frac{ED}{AT}$$

Where:

$DOSE_{AIR}$	=	chronic daily intake (mg/kg/day)
CPF	=	cancer potency factor
ASF	=	age sensitivity factor
FAH	=	fraction of time at home
ED	=	number of years within particular age group
AT	=	averaging time

2.6 NON-CARCINOGENIC EXPOSURES

An evaluation of the potential noncarcinogenic effects of chronic exposures was also conducted. Adverse health effects are evaluated by comparing a compound's annual concentration with its toxicity factor or REL. The REL for diesel particulates was obtained from OEHHA for this analysis. The chronic REL for DPM was established by OEHHA as 5 µg/m^3 (13).

Non-cancer health effects are expressed as a hazard index (HI), which is calculated using the following equation:

$$HI_{DPM} = \frac{C_{DPM}}{REL_{DPM}}$$

Where:

HI_{DPM}	=	Hazard index (unitless)
C_{DPM}	=	Annual average DPM concentration (µg/m^3)
REL_{DPM}	=	REL for DPM (the DPM concentration at which no adverse health effects are anticipated).

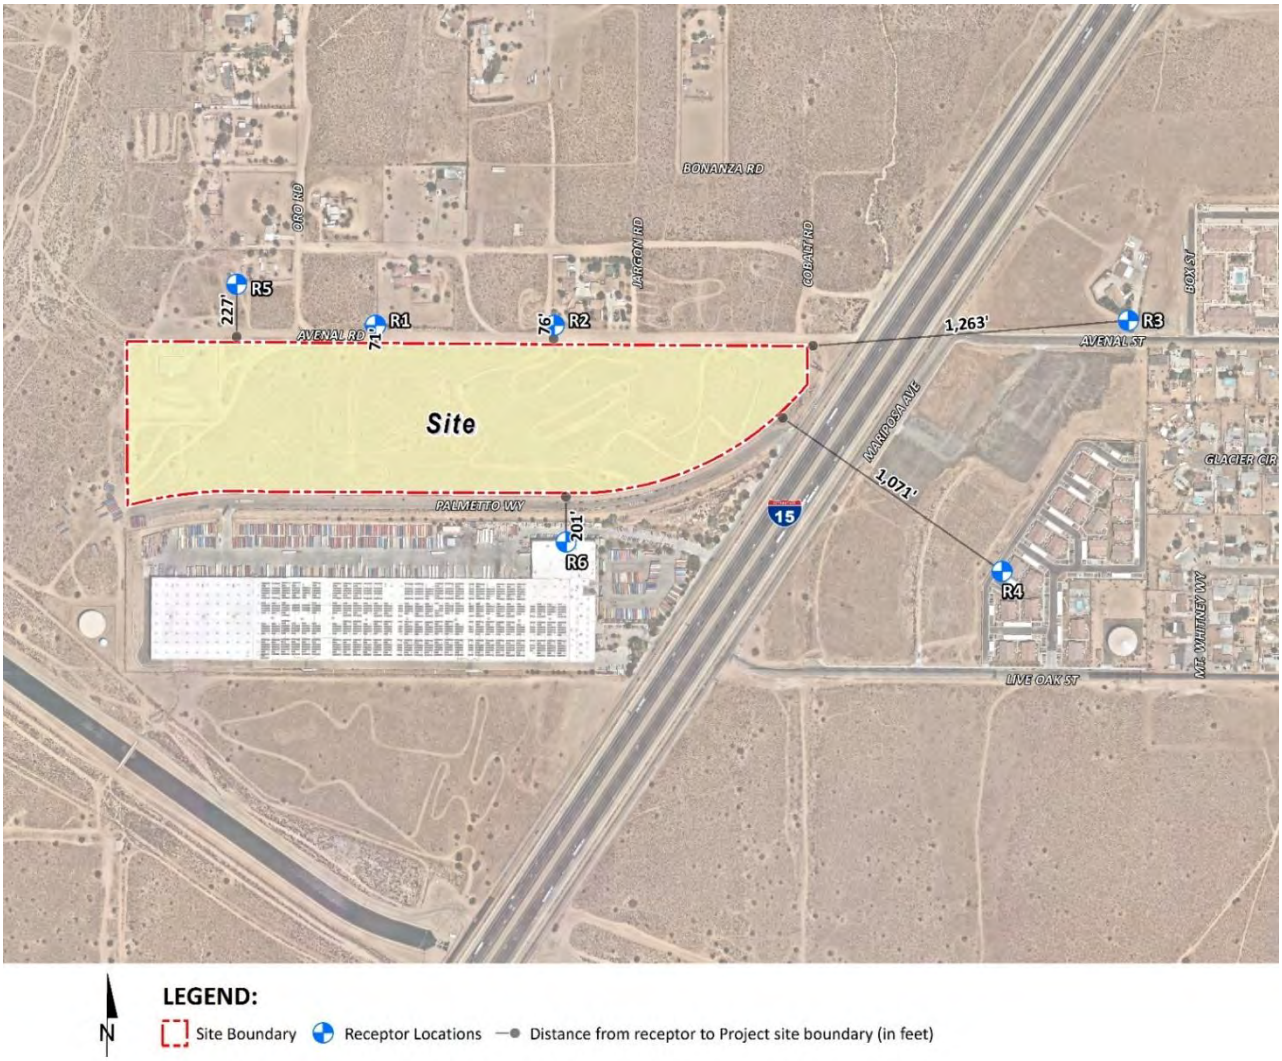
2.7 POTENTIAL PROJECT DPM CANCER AND NON-CANCER RISKS

2.7.1 Project-related Receptors

Receptors in the Project study area are described below and shown in Exhibit 2-D. It should be noted that for clarity purposes, the receptors presented in Exhibit 2-D do not represent all modeled receptors and instead presents the nearest receptors that would experience the highest pollutant concentrations. A total of 62 receptors were modeled in the analysis. Appendix 2.4 presents a figure detailing the locations of all receptors as modeled in AERMOD.

R1: Location R1 represents the existing sensitive residence at 13030 Avenal Street, approximately 71 feet north of the Project site. Receptor R1 is placed at the private outdoor living areas (backyards) facing the Project site.

R2: Location R2 represents the existing sensitive residence at 13164 Avenal Road, approximately 76 feet north of the Project site. Receptor R2 is placed at the private outdoor living areas (backyards) facing the Project site.



R3: Location R3 represents the existing sensitive residence at 10445 Avenal Street, approximately 1,263 feet east of the Project site. Receptor R3 is placed at the private outdoor living areas (backyards) facing the Project site.

R4: Location R4 represents the existing sensitive residence at 10122 Mt. Whitney Way, approximately 1,071 feet southeast of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receptor R4 is placed at the residential building façade.

R5: Location R5 represents the existing sensitive residence at 10376 Wellington Road, approximately 227 feet north of the Project site Receptor R5 is placed at the private outdoor living areas (backyards) facing the Project site.

R6: Location R6 represents MGA Entertainment, Inc. at 10200 Amargosa Road, approximately 201 feet south of the Project site.

EXHIBIT 2-D: RECEPTOR LOCATIONS

2.7.2 Construction Impacts

Residential Exposure Scenario

The land use with the greatest potential exposure to Project construction DPM source emissions is Location R2 which represents the existing residence located approximately 76 feet north the Project site at an existing residence located at 13164 Avenal Road. At the MEIR, the maximum incremental cancer risk attributable to Project construction-source DPM emissions is estimated at 1.71 in one million. As such, cancer risks at the MEIR associated with the Project are less than the MDAQMD significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be ≤0.01, which would not exceed the applicable threshold of 1.0. The MEIR would experience the highest concentrations of DPM during Project construction due to its location and meteorological conditions at the site. Because all other modeled receptors would experience lower concentrations of DPM during Project construction, all other receptors in the vicinity of the Project would be exposed to less emissions and therefore less risk than the MEIR identified herein. As such, the Project will not cause a significant human health or cancer risk to adjacent land uses as a result of Project construction activity. All other receptors during construction activity would experience less risk than what is identified for this location.

2.7.3 Operational Impacts

Residential Exposure Scenario

The land use with the greatest potential exposure to Project operational DPM source emissions is Location R4 which represents the existing residence at 10122 Mt. Whitney Way, approximately 1,071 feet southeast of the Project site. The maximum incremental cancer risk attributable to Project operational-source DPM at the nearest residential receptor is estimated at 0.65 in one million which would not exceed the MDAQMD's significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be ≤0.01 which would not exceed the applicable significance threshold of 1.0. All other modeled receptors would be exposed to lower concentrations of DPM and therefore less risk than the MEIR identified herein. As such, the Project will not cause a significant human health or cancer risk to nearby residences.

Worker Exposure Scenario

The land use with the greatest potential exposure to Project operational DPM is Location R6 which represents the worker receptor at 10200 Amargosa Road, approximately 201 feet south of the Project site. The maximum incremental cancer risk attributable to Project operational-source DPM at the nearest worker receptor is estimated at 0.05 in one million which would not exceed the MDAQMD's significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be ≤0.01 which would not exceed the applicable significance threshold of 1.0. MEIW identified herein. As such, the Project will not cause a significant human health or cancer risk to nearby workers.

School Exposure Scenario

The nearest school is Topaz Preparatory Academy, which is located approximately 5,580 feet southeast of the Project site. Because there is no reasonable potential that TAC emissions would

cause significant health impacts at distances of more than ¼ mile from the air pollution source, there would be no significant impacts that would occur to any schools in the vicinity of the Project.

2.7.4 Construction and Operational Impacts

The land use with the greatest potential exposure to Project construction and operational DPM is Location R2 which represents the existing residence located approximately 76 feet north the Project site at an existing residence located at 13164 Avenal Road. At the MEIR, the maximum incremental cancer risk attributable to Project construction-source and operational-source DPM is estimated at 1.98 in one million, less than the MDAQMD significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be ≤0.01, which would not exceed the applicable threshold of 1.0. As such, the Project will not cause a significant human health or cancer risk to adjacent land uses as a result of Project construction and operational activity. All other receptors during construction and operational activity would experience less risk than what is identified for this location.

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	33.6400	annual days of extreme heat
Extreme Precipitation	4.95000	annual days with precipitation above 20 mm
Sea Level Rise	0.00000	meters of inundation depth
Wildfire	22.7300	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	4	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	4	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	1	1	1	2

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	91.0516
AQ-PM	32.2215
AQ-DPM	57.8843
Drinking Water	29.7490
Lead Risk Housing	13.7996
Pesticides	0.00000
Toxic Releases	24.9687
Traffic	83.1125

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	52.0000

Healthy Places Index Score for Project Location (b)	42.0000
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

8.1. Justifications

Screen	Justification
Land Use	Taken from site plan
Construction: Construction Phases	Based on client indicated construction schedule
Construction: Off-Road Equipment	T/L/B replaced with Crawler Tractor to accurately calculate disturbance for Site Preparation and Grading phases Standard 8-hour work day
Construction: Trips and VMT	Vendor Trips adjusted based on CalEEMod defaults for Building Construction and number of days for Site Preparation, Grading, Building Construction, and Paving
Operations: Vehicle Data	Trip Characteristics based on information provided in the Traffic Analysis
Operations: Fleet Mix	Passenger Car Mix estimated based on CalEEMod default fleet mix and the ratio of the vehicle classes (LDA, LDT1, LDT2, MDV, MCY). Truck Fleet Mix based on 2, 3 and 4 axle

8.3. Land Use

Model Parameter	Units	Default Value	New Value
Lot Area	acre	4.33800	3.18000

[a] Vehicle miles traveled are for modeled truck route only.

[b] Emission rates determined using EMFAC 2021. Idle emission rates are expressed in grams per idle hour rather than grams per mile.

[c] This column includes the total truck travel and truck idle emissions. For idle emissions this column includes emissions based on the assumption that each truck idles for 15 minutes at loading docks and 5 minutes at parking spaces.

[d] It is assumed that each TRU operates for 2.1 hours while parked at building loading docks.

 - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
```

```
4613         * Stack-tip Downwash.
4614         * Model Accounts for ELEVated Terrain Effects.
4615         * Use Calms Processing Routine.
4616         * Use Missing Data Processing Routine.
4617         * No Exponential Decay.
4618         * Model Uses RURAL Dispersion Only.
4619         * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
4620         * CCVR_Sub - Meteorological data includes CCVR substitutions
4621         * TEMP_Sub - Meteorological data includes TEMP substitutions
4622         * Model Assumes No FLAGPOLE Receptor Heights.
4623         * The User Specified a Pollutant Type of: DPM
4624
4625    **Model Calculates PERIOD Averages Only
4626
4627    **This Run Includes:    313 Source(s);       1 Source Group(s); and      39 Receptor(s)
4628
4629                   with:      0 POINT(s), including
4630                              0 POINTCAP(s) and      0 POINTHOR(s)
4631                    and:    313 VOLUME source(s)
4632                    and:      0 AREA type source(s)
4633                    and:      0 LINE source(s)
4634                    and:      0 RLINE/RLINEXT source(s)
4635                    and:      0 OPENPIT source(s)
4636                    and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
4637                    and:      0 SWPOINT source(s)
4638
4639
4640    **Model Set To Continue RUNning After the Setup Testing.
4641
4642    **The AERMET Input Meteorological Data Version Date:  19191
4643
4644    **Output Options Selected:
4645             Model Outputs Tables of PERIOD Averages by Receptor
4646             Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
4647             Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)
4648
4649    **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
4650                                                                    m for Missing Hours
4651                                                                    b for Both Calm and
                                                                       Missing Hours
4652
