Date: June 23, 2025

Re: Construction Health Risk Assessment, Marici Project LLC, City of Industry, CA
TRC Project No. 604109

Introduction

Planning Department staff has requested a health risk assessment (HRA) to evaluate potential health effects from construction activity that will occur from the Marici Project LLC (Project) located in the City of Industry, California. Air pollutant emissions from construction activity were estimated by TRC using the California Air Resources Board CalEEMod program as documented in Attachment H of the Project's CUP Application and found to be not significant based on South Coast Air Quality Management District CEQA significance thresholds. The health concern for construction emissions from the Project is diesel particulate exhaust (DPE) emissions that emanate from diesel construction equipment and construction site diesel powered vehicles.

This HRA addresses the potential health risk of the Project's construction DPE emissions using dispersion and chemical exposure modeling to evaluate the transport, then fate of the DPE estimated by CalEEMod and the resulting concentrations at residential and worker receptors. Health risk is then assessed using the modeled concentrations of DPE and the California Air Resources Board HARP 2 chemical exposure model. This transport is determined by the United States Environmental Protection Agency's (EPA)'s preferred atmospheric dispersion model, "AERMOD." AERMOD determines diesel particulate unity emission concentrations at nearest residences, worker occupation sites, and adjacent properties. These unity emission concentrations were determined using the entire construction site as a single polygon area source that emits at one pound (unity) per hour per square foot in AERMOD. The results were input into HARP2 to evaluate the product of AERMOD output and actual CalEEMod DPE emissions, then calculate cancer risk and non-cancer hazard levels to the surrounding public. Noncancer hazard indices include both "chronic" long term health effects as well as short term "acute" health effects. DPM emissions have only cancer and chronic toxicity, so no acute hazard effects are addressed here.

Dispersion Modeling

AERMOD's mapping projection was set up using Universal Transverse Mercator (UTM) coordinate system set up in World Geodetic System 1984 (WGS84) datum in northern hemispheric UTM Zone 11. The following provides the input settings used in this analysis for the many options AERMOD can perform.

Control Pathway

- Reg Default Option.
- Model Concentrations.
- Air toxics modeling for 1-hour max concentration and annual "Period," to provide unity emission concentrations.
- Urban Dispersion Coefficient.
- Elevated terrain.

Source Pathway- Polygon Area of the entire construction activity site.

Receptor Pathway

- Multi-tiered receptor grid with the following resolutions:
  - 50-meter spacing from the construction area perimeter out to 700 meters,
  - 100-meter spacing from the construction area perimeter out to 1200 meters,
  - 250-meter spacing from the construction area perimeter out to 5200 meters, and
  - 500-meter spacing from the construction area perimeter out to 12000 meters.
- Cartesian plant boundary receptors with 20-meter spacing for the entire perimeter.
- Elevated Terrain modeling scenario.
- Run AERMOD using the AERMAP Receptor Output File (*.ROU).

Meteorological data was obtained for the Pico Rivera surface weather monitoring station and includes upper air meteorological data from Fullerton airport. This data has been processed by the South Coast Air Quality Management District (SCAQMD) for years 2019 through 2024.

The construction site area was modeled for a 329,523 square foot polygon area and is provided in the figure below. The DPE emissions calculated by CalEEMod were input along with AERMOD unity concentrations into the HARP2 chemical exposure assessment model. HARP2 then calculates the actual field concentration from construction activity's DPE emissions, then performs the HRA calculations.

The risk assessment settings in HARP included the following:

- Risk Management Policy using the Office of Environmental Health Hazard Association (OEHHA) derived method intake rate percentile for residential cancer risk assessment,
- OEHHA derived method for worker intake rate percentile for worker cancer risk and all chronic hazard evaluations,
- CalEEMod average daily and annual emissions for both the 2026 and 2027 construction activity years were input for a one-year exposure duration, and
- Particulate deposition rate of 0.02 meters per second.

Health Risk Assessment Results

Residential Cancer Risk & Burden

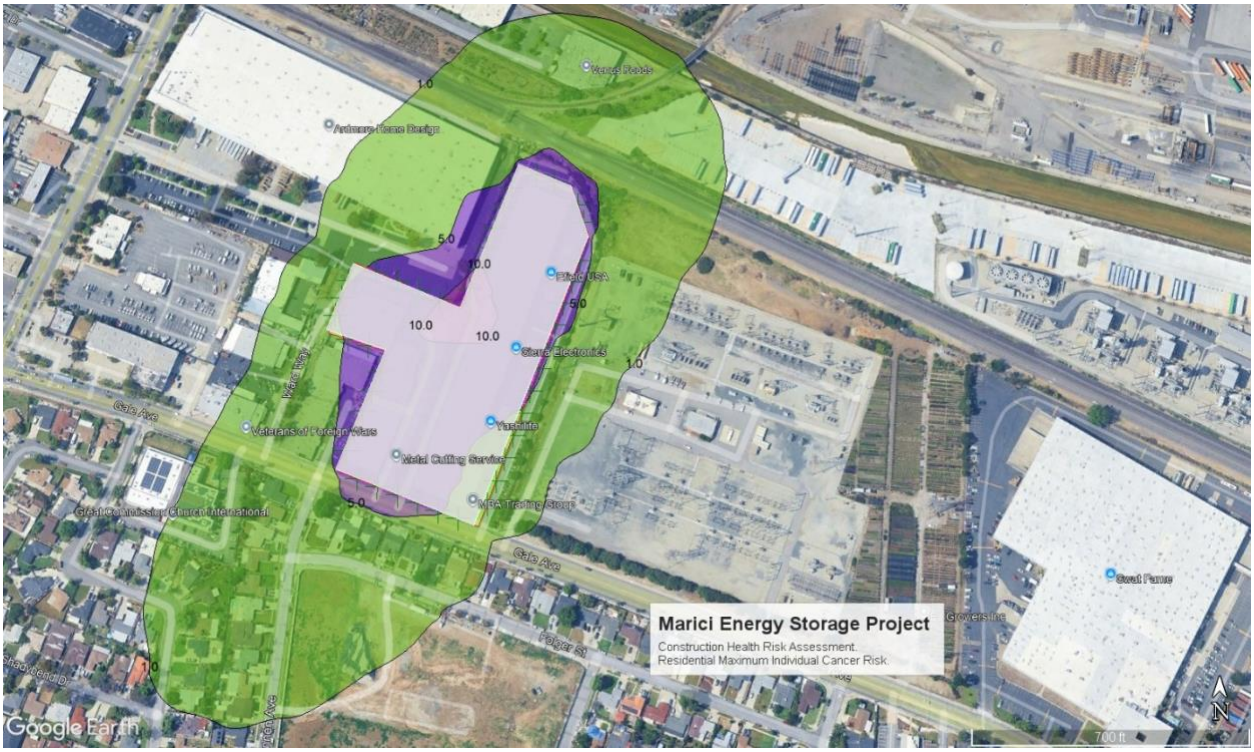
The maximum offsite cancer risk to residential receptors occurs at residences on the South side of Gale Avenue across from the construction site's southern side. The five in one million cancer risk contour intersects the northern residential property line. This means the residential structures exist within the one in one million to five in one million area shaded in green, which is below the SCAQMD significance threshold of ten in one million cancer risk[1]. Residential cancer risk results are presented in Figure 1 with contours showing cancer risk per million exposures.

The SCAQMD threshold for cancer burden is 0.5 excess cancer cases[2] for all residential population within the one in one million cancer risk impact zone. Cancer burden is determined by the product of population within the one in one million area and the cancer risk for those individuals. Therefore, it would take a population of 500,000 people existing at a one in one million cancer risk or 100,000 people existing at the five in one million cancer risk level to achieve a cancer burden of 0.5. In this case there are far less than fifty homes within the green one to five in one million impact zone and therefore several orders of magnitude less than a population of 100,000 people. Therefore, cancer burden for this impact zone is orders of magnitude less than 0.5 and there is no significant risk of reaching or exceeding the cancer burden threshold.

Worker Cancer Risk

Worker cancer risk results are shown in Figure 2 with contours labeled in risk per million exposures. The maximum worker cancer risk occurs just offsite at the building to the southwest where the purple shaded area barely overlaps this building's northeast corner. This maximum worker cancer risk value lies within the purple region and is just above the 0.1 in one million contour and far below the 0.15 in one million contour and is therefore far below the SCAQMD threshold of ten in one million[3].

Residential Chronic Hazard Index



The maximum residential offsite chronic hazard index results are presented in Figure 3. The figure shows the maximum occurs across Gale Avenue near the construction site's southern side. The 0.05 chronic hazard index contour intersects the northern residential property line. This means all the residential structures are below a chronic hazard index of 0.05 and are therefore far below the SCAQMD's significance chronic hazard index threshold one[4].

[3] south-coast-aqmd-air-quality-significance-thresholds.pdf
[4] south-coast-aqmd-air-quality-significance-thresholds.pdf

Worker Chronic Hazard Index

The maximum worker offsite chronic hazard index results are shown in Figure 4. The maximum occurs to the southwest of the site at the adjacent building's northeast side. This maximum worker chronic hazard index lies marginally within the purple shaded area. Therefore it's value is just barely above 0.008 and far below the 0.01 contour and therefore is far below the SCAQMD threshold of one[5].
