1.0 INTRODUCTION

Langan CA, Inc. (Langan) was retained by California Resources Corporation (CRC; the Client), to conduct a soil investigation for the property located at 20101 Goldenwest Street in Huntington Beach, California (Site). CRC is proposing a zone change to allow residential, commercial and open space uses on the property. The investigation was conducted to assess soil conditions in certain areas of the Site unencumbered by active infrastructure.

1.1 Site Description

The Site is identified as Orange County Assessor Parcel Numbers (APNs) 023-181-53 and 023-181-54. It is located in the City of Huntington Beach and consists of approximately 92 acres (see **Figure 1**). The Site is bounded to the southwest by Pacific Coast Highway, the Pacific Ocean is present to the southwest. Goldenwest Street adjoins the Site to the southeast and portions of Palm Avenue adjoin the northeast end of the Site. Seapoint Street divides the two parcels, with APN 023-181-53 to the northwest and APN 023-181-54 to the southeast. The Bolsa Chica Wetlands, oil fields and residential properties are present to the northwest/north. Further residential properties are present to the east and southeast.

1.2 Site Background

Prior to conducting subsurface investigations at the Site, historical aerial photographs and reasonably ascertainable environmental records (e.g., standard environmental database records, local environmental regulatory agency files, building permits, etc.) were reviewed to identify areas of potential environmental concern. Additionally, Langan conducted a site visit to inspect the facility. Langan was escorted by CRC representatives who provided further information regarding the Site and facility operations.

Documented oil field operations began on the Site as early as 1920 with the drilling of the first recorded oil well. Site use prior to 1920 is unknown. Presently, the Site consists of active, plugged and abandoned, and idle wells, pipelines, storage tanks, oil and gas processing equipment and storage, and office and warehouse buildings. Idle wells are scattered throughout the Site. Active wells are located along the southwestern portion of the Site. Historical pits are located adjacent to the active wells. Two stormwater detention ponds are located in the southeast portion of the Site.

The facility is used to process extracted crude oil from subsurface petroleum reservoirs; produced water and gas are byproducts of the oil extraction and are also processed at the facility.

The gas is processed to remove hydrogen sulfide (H_2S) along with other impurities to meet SoCal Gas quality specifications. The gas is then predominately sold to the SoCal Gas grid to be used in homes and businesses. As a safety back up, the gas can be flared off through a permitted combustion device. Produced water is processed to remove residual oil and solids and is reinjected into the subsurface oil reservoirs.

Oil and gas are also transported to the Site via transmission pipelines from Platform Emmy, which is located off the coast of Huntington Beach on a State Lease, and from the Bolsa Chica production area, which is located north of the Site. The former Fort Apache facility, located at 1810 Pacific Coast Highway, also transferred produced fluids to the Site via underground pipelines before operations ceased in early 2024. Product from off-site areas is transferred to the Site for processing, storage, and off-site distribution along with the product produced onsite.

Numerous features were identified on historical aerials for the Site, including but not limited to, oil wells, oil well cellars, aboveground storage tanks (ASTs), pipelines, smokestacks, sumps, and buildings. Based on Langan's review of historical aerial photographs and records, the following areas of potential environmental concern were identified: Northwest Historical Tanks, Former Stretford Unit, Northern Historical Tank Farm, Pipe Laydown, Transformer Storage, Maintenance and Truck Wash Buildings, Former Underground Storage Tanks (USTs), Chemical Storage Area, Historical Bermed Area, Former Chemical Laboratory, Southern Historical Tank Farm, Historical Southern Sumps, and Historical Southern Battery areas. Additionally, an Electromagnetic Anomaly Area was identified during the prior investigation. These areas are depicted on a modern aerial photograph in **Figure 2**. Historical aerial photographs for the Site are included in the Langan *Initial Soil Investigation Report*, dated 31 December 2024. There are other areas of potential environmental concern noted from the historical aerial photographs; however, the areas included in **Figure 2** represent those areas accessible for investigation and not currently occupied by facility operations.

1.3 Prior Environmental Investigations

Langan previously conducted a soil investigation in November and December 2024. Geophysical surveys and soil sampling were completed in the Former Stretford Unit, Transformer Storage, Former Chemical Laboratory, and Northern Historical Tank Farm Areas. Geophysical surveys were also conducted in the Historical Southern Sumps and Truck Wash and Maintenance Buildings Area. These areas are depicted on **Figure 2**. Findings of the prior geophysical surveys informed the boring locations of this investigation in the Historical Southern Sumps and Truck Wash and Maintenance Building Areas. Otherwise, the areas investigated during the prior

investigation are separate from those described in this report. The findings of the prior investigation are described in Langan's *Initial Soil Investigation Report*, dated 24 December 2024.

1.4 Soil Investigation Purpose

This investigation is a continuance of the prior investigation. Both investigations were undertaken to understand subsurface conditions at specific areas on the Site. Areas investigated as part of this investigation included the Northwest Historical Tanks, Pipe Laydown, Maintenance and Truck Wash Buildings, Former Underground Storage Tank (UST), Electromagnetic Anomaly, Chemical Storage, Historical Bermed, Southern Historical Tank Farm, Southern Historical Sumps, and Southern Historical Tank Battery Areas (see **Figure 2**). Portions of the Southern Historical Tank Farm, Southern Historical Sumps, and Southern Historical Tank Battery are currently in use by facility operations and are not accessible. Investigation began with a geophysical survey in these areas (if not already surveyed during the prior investigation) to help identify subsurface anomalies that could be indicative of historical oil field operations in these areas. Soil samples for environmental analyses were then collected from these areas.

2.0 INVESTIGATION SUMMARY

2.1 Pre-Field Activities

2.1.1 Permitting

The Site is located in the Orange County Health Care Agency (OCHCA) well permitting jurisdiction; however, OCHCA does not require permits for soil borings that A) are less than 50 feet in depth, B) do not enter groundwater, C) do not penetrate significant confining material beds, and D) will be backfilled within 24 hours of completion. A permit with the OCHCA permit was not required.

2.1.2 Health and Safety Plan

Langan prepared a Site-specific health and safety plan (HASP) consistent with Occupational Safety and Health Administration (OSHA) hazardous waste operations and emergency response (HAZWOPER) requirements for the field investigation activities. The HASP also included safety requirements and guidance consistent with CRC policies for field operations. The HASP was maintained at the Site and implemented during the completion of the field activities.

2.3 Geophysical Survey

Under observation of Langan, Advantage Geophysics, Inc. (AGI) surveyed the areas indicated on **Figure 2**. Geophysical survey tools included a Geonics EM61-MK2 Time-Domain Electromagnetic Sensor, a GSSI SIR 3000 Ground Penetrating Radar, a Schonstedt GA-52 Magnetic Gradiometer, Fisher M-Scope TW-6 Pipe and Cable Locator, a Vivax vLoc3-Pro Line Tracer, and a Stonex S700a Global Navigation Satellite System Receiver. Site structures – facility buildings, process pipes, tanks, power substations, and pipes – were encountered in the surveyed areas. Other than access limitations associated with these structures, the selected areas were traversed with the geophysical tools.

Utilities identified during the survey were temporarily marked at the surface to help inform future soil sampling activities. Langan also called in an Underground Service Alert (USA) ticket, also known as DigAlert, prior to the advancement of any borings. USA Ticket Numbers A250130698,

A250130704, A250130708, and A250130720 were assigned to the Southern Historical Tank Farm/Southern Historical Sumps/Southern Historical Tank Battery Areas, Historical Bermed Area/Electromagnetic Anomaly/Chemical Storage Areas, Maintenance and Truck Wash Buildings/Pipe Laydown Areas, and Northwest Historical Tanks, respectively. Subsurface work did not commence until responses had been received from all required members.

The Maintenance and Truck Wash Buildings, Electromagnetic Anomaly, and Southern Historical Sumps Areas were surveyed during the prior investigation and were not included in the scope of this geophysical survey.

2.4 Soil Sampling

2.4.1 *Soil Sampling Locations*

A total of 104 soil borings (including step out locations) were advanced at the Site. The sample locations are described in the list below:

- Eight borings and one step-out boring were advanced in the Northwest Historical Tanks Area. These borings, identified as SB50 through SB57, are depicted on **Figure 3**.
- 16 borings were advanced in the Pipe Laydown Area. These borings, identified as SB58 through SB73, are depicted on **Figure 5**.
- 12 borings and two step-out borings were advanced in the Maintenance and Truck Wash Buildings Area. These borings, identified as SB74 through SB85, are depicted on **Figure 5**.
- Eight borings and one step-out boring were advanced in the Former UST Area. These borings, identified as SB86 through SB93, are depicted on **Figure 5.**
- Four borings were advanced in the Electromagnetic Anomaly Area. These borings, identified as SB94 through SB97, are depicted on **Figure 5**.
- Three borings were near the Chemical Storage Area. These borings, identified as SB144 through SB146, are depicted on **Figure 5**.
- 12 borings and one step-out boring were advanced in the Historical Bermed Area. These borings, identified as SB98 through SB109, are depicted on **Figure 6**.
- 17 borings and one step-out boring were advanced in the accessible portion of the Southern Historical Tank Farm Area. These borings, identified as SB 110 through SB125 and SB143, are depicted on **Figure 7**.
- Eight borings were advanced in the accessible portions of the Southern Historical Sumps Area. These borings, identified as SB126 through SB133, are depicted on **Figure 8**.

- Nine borings and one step-out boring were advanced in accessible portions of the Southern Historical Tank Battery Area. These borings, identified as SB134 through SB142, are depicted on **Figure 8**.

2.4.2 *Boring Advancement*

Soft-digging methods were utilized during the first five feet of each soil boring (at a minimum) to help further clear the boring locations for underground utilities. For borings located in hard surface cover (i.e., concrete or asphalt) soft digging was conducted using a hand auger. Prior to hand augering, concrete or asphalt was first saw-cut until first encountered soil. For borings located in soft surface cover (i.e., dirt), soft-digging was completed using an air knife unit. At each boring location, an approximate one-foot by one-foot "L" was air knifed to five feet deep around the planned boring location. The "L" trench was then inspected for any evidence of utility lines entering into the boring location.

Once soft digging was completed, the remainder of each boring was advanced using a Geoprobe® direct push technology (DPT) rig.

Soft-digging and DPT drilling was conducted by ABC Liovin Drilling, Inc. (ABC) (California Contractor C-57 License No. 422904) under the supervision of Langan. "L" trenches were dug for soil borings SB56-SB60, SB62 -SB71, SB76, and SB134-SB137. The remaining borings were first advanced using a hand auger.

During hand augering of SB54, a pipe was encountered at two feet. The pipe was intact. The boring was stepped out approximately five feet and advanced at the new location, SB54A.

During hand augering of SB77, refusal was encountered as the result of hard soil conditions. The boring was stepped out approximately five feet and advanced at the new location, SB77A.

During hand augering of SB80, pooling water was encountered at approximately two and a half feet bgs. Hand augering was halted to observe the water. The water appeared to be from surface water trapped nearby that was migrating into the bore hole. The bore hole was advanced to four feet bgs where a clay layer was encountered. This boring was not advanced any further to avoid creating a downward pathway for the surface water.

During hand augering of SB81, a pipe was encountered just below two feet bgs. The boring was stepped out approximately five feet and advanced at the new location, SB81A.

During hand augering of SB88, concrete was encountered underneath the top asphalt surface cover. The boring was stepped out approximately five feet and advanced at the new location, SB88A.

During hand augering of SB98, an unknown hard surface was encountered at two feet bgs. Instead of forcibly pushing through the hard surface, the boring was stepped out approximately 35 feet southwest to a new location, SB98A. During the advancement of the SB98A, pieces of gray PVC pipe were observed in the soil core between 10 to 12 feet bgs. Water appeared to have been trapped in the PVC pipe. Langan conferred with CRC and based on the available information, determined the PVC pipe was an old, inactive line.

During hand augering of SB119, a concrete layer was encountered at two feet bgs. The boring was stepped out approximately 30 feet to the northeast and advanced at the new location, SB119A.

During air knifing of the L-Trench for SB137, a clay pipe (pipe material assumed) was encountered at approximately four feet bgs. The air knife punctured the clay pipe upon discovery. The pipe interior was moist and appeared to be a former drainage line. Langan conferred with CRC and based on the available information determined the clay pipe was an old, inactive line. Langan further air knifed around the clay pipe to determine its orientation and adjusted the location of SB137 prior to drilling accordingly.

No other line contacts or adverse conditions were encountered during boring advancement.

2.4.3 *Field Screening and Sample Collection*

Retrieved soil samples were screened in the field for visual evidence of staining and using a hand-held photoionization detector (PID) for volatile organic compounds (VOCs). The soil type, texture, composition, color (as compared to a Munsell® Soil Chart) was logged in the field consistent with International American Society of Testing and Materials (ASTM) Standards D2487-17 and D488-17. Various soil types were observed in the borings (gravel, clay, sand, silt). In general, borings contained sands in the shallow soil to two to five feet bgs. Clayey soils was noted beneath the shallow sands. PID readings of screened soil were between non-measurable (0.0 PPM) to a maximum of 1,056 parts per million (ppm) in sample SB87-21.0. Copies of the field observations, boring logs and PID readings are included in **Appendix A**.

Following field screening, a sample for laboratory analysis was retrieved from each of the following intervals: 0-2 feet bgs (near-surface soil), 2-10 feet bgs (shallow soil), and the terminal

depth of the boring (typically 15 feet bgs). In the former USTs area; however, a sample for laboratory analysis was retrieved from 0-2 feet bgs (near-surface soil), 2-10 feet bgs (shallow soil), 15 feet bgs, 15-25 feet bgs (interval of residual contaminated soil), and the terminal depth (35 feet bgs). The sampling depths were biased to target depth intervals with elevated PID readings and soil staining, if observed. The terminal boring depth was adjusted downward, as warranted, to be below indications of potential impacts observed by field screening.

Soil samples for laboratory analysis were collected either from the end of the hand-auger bucket or from acetate liners retrieved by the DTP rig. Samples were collected into laboratory supplied containers. Samples collected for analysis of VOCs were collected into United States Environmental Protection Agency (USEPA) Method 5035 Sampling Kits. Each sample was individually identified, labeled, and stored in a chilled cooler. The samples were then transported under standard chain-of-custody procedures to a certified laboratory.

Soil sampling equipment was decontaminated between sampling locations with a triple-rinse wash (washed and brushed once in a detergent solution, then twice clean with water). To help verify proper decontamination of sampling equipment, an equipment blank sample was collected at the end of each day by running deionized water over the cleaned hand auger or DPT drilling rod and collecting the rinsate into the appropriate sampling containers. To help identify potential contamination from ambient sources, a field blank sample was collected by pouring deionized water directly into laboratory supplied containers. A trip blank sample prepared by the laboratory was also submitted at the end of each day to help verify integrity of the samples during transit. Field quality assurance samples were also documented on the chain of custody.

During field quality assurance sampling on 20 and 21 January 2025, only enough deionized water volume was provided to the laboratory to analyze by USEPA Method 8270C or 8270C SIM, but not both (in addition to the other required analytical methods). The equipment and field blank samples were analyzed by 8270C SIM on 20 January 2025 and by 8270C on 21 January 2025. An adequate volume of deionized water was provided for both methods on subsequent days of sampling.

On 22-24 January 2025, laboratory supplied containers did not contain preservative needed for analysis of equipment and field blanks samples by USEPA Method 6010B/7470A. The required preservative was added to these samples upon delivery to the laboratory.

No other limitations were encountered during field screening and sample collection.

2.4.4 *Laboratory Analysis*

Collected samples were submitted to Eurofins CalScience (National Environmental Lab Accreditation Program No. 4175) for analysis. Each sample was analyzed by the following methods:

- USEPA Methods 6010B/7471A for California Title 22 Metals
- USEPA Method 8015B (M) for Total Petroleum Hydrocarbons (TPH) by carbon chain number C4-C40
- USEPA Method 8260B for VOCs
- USEPA Method 8270C/8270C SIM for Semi-Volatile Organic Compounds (SVOCs) and polycyclic aromatic hydrocarbons (PAHs)

If necessary, collected samples were further analyzed to determine soluble concentrations of select analytes. Total analyte concentrations that were greater than ten times the §66261.24 Hazardous Waste Characteristic of Toxicity Soluble Threshold Limit Concentrations (STLC) but less than the Total Threshold Limit Concentration (TTLC) were further analyzed following the Waste Extraction Test (WET) to determine their STLC component. Total analyte concentrations that were greater than twenty times the Toxicity Characteristic Leaching Procedure (TCLP) levels were further analyzed following USEPA Method 1311 TCLP.

Equipment and field blank samples were analyzed by the same analytical methods (adjusted for water) submitted for soil samples on that day. Trip blanks samples were analyzed for concentrations of VOCs.

2.5 Surface Completion and Investigation Derived Waste

The airknifed "L" trenches at the Site were backfilled using native soil. Soil borings advanced via hand auger or DPT rig were backfilled with bentonite to the surface. Each boring was completed to resemble the existing surface cover (i.e., dirt, asphalt, concrete).

Soil cuttings were stored in a Department of Transportation (DOT) approved, twenty cubic yard waste bin. Decontamination water was stored in two steel DOT-approved drum onsite. The soil bin and drums were labeled with the generator, generation date and contents identified. A composite soil sample was collected from the soil bin for waste profiling purposes. The water drums were also profiled from the composite soil sample. The drums were profiled as non-hazardous and will be transported for offsite disposal at a later date. A copy of the waste manifest will be available once the soil bin and drums have been transported offsite and disposed of.

3.0 INVESTIGATION FINDINGS

3.1 Geophysical Survey Findings

The geophysical survey identified 15 candidate electromagnetic (EM) anomalies, and numerous active utilities and unidentified lines in the surveyed areas. Numerous high EM responses, potentially indicative of buried metallic utilities and former structures, were present throughout the Site. Several buried reinforced pads and utility trenches were detected, however no larger candidate backfilled excavation anomalies were found. The geophysical survey report provided by AGI is included as **Appendix B**. The report includes figures depicting the locations of the identified anomalies. The findings for each surveyed area are summarized in the following subsections. While the findings may be suggestive of or provide evidence that a particular subsurface feature may be present, due to the complex nature of the Site subsurface, more direct methods (e.g. exploratory trenches, test borings, borings, etc.) are required to confirm the findings. Our sample locations were partly selected based on the location of anomalies and their locations relative the anomalies are shown in **Figure 3** through **Figure 8**.

3.1.1 Northwest Historical Tanks

Two EM anomalies, EM Anomaly N and O, were identified in the Northwest Historical Tanks area. The anomalies are located adjacent to reinforced concrete in the northern portion of the survey area and may be associated with the former structure. Further evaluation by direct methods (exploratory trenches, test pits, borings, etc.) are required to determine the nature of these anomalies. Soil boring, SB51, is approximately 15 feet southeast of EM Anomaly N and SB50 is approximately 30 feet southwest of EM Anomaly N.

Potential reinforced concrete obstructions and unidentified lines are noted throughout the survey area.

3.1.2 Pipe Laydown Area

Five EM anomalies (EM Anomaly D through EM Anomaly H) were noted in the Pipe Laydown Area. According to AGI, the anomalies are smaller and rounder than expected for USTs and may suggest buried debris or potentially abandoned wells. EM Anomaly L and EM Anomaly M are higher in amplitude and had a higher magnetic response when the gradiometer was traversed over the features. Based on the size and amplitude of these anomalies, further evaluation by direct methods (exploratory trenches, test pits, borings, etc.) should be considered.

EM Anomaly I, J, and K are nested together in the central portion of the survey area. Soil borings, SB62 and SB67, are located approximately 40 feet from the anomalies.

EM Anomaly L is located along the western boundary of the survey area and contains a terminated unidentified line. Soil boring, SB66, is located approximately 65 feet east-northeast of the anomaly.

EM Anomaly M is located along the southern boundary of the survey area. Soil boring, SB70, is located adjacent to the anomaly.

Electrical lines and unidentified lines are noted throughout the survey area and reinforced concrete is noted in the southern portion of the area.

3.1.3 Historical Bermed Area

Five EM anomalies (EM Anomaly D through EM Anomaly H) were noted in the Historical Bermed Area. GPR traverses over these areas were inclusive and more direct methods are required to determine the exact nature of these anomalies. Soil boring, SB144, is located approximately 25 feet west-northwest of EM Anomaly D.

EM Anomaly E is rectangular in shape and located in the southwestern portion of the survey area. There are no soil borings within a 100-foot radius of the anomaly.

Soil boring, SB98A, is within the footprint of EM Anomaly F, which is located within the northern portion of the survey area. Four unidentified lines are noted in the anomaly. One of the unidentified lines terminates within the anomaly. The unidentified lines located within EM Anomaly F are believed to be unrelated to the gray PVC pipe encountered in SB98A (see **Section 2.4.2**) based on the material, the depth at which it is was encountered (between 10 to 12 feet), and that SB98A was offset from the mapped unidentified line.

Soil boring, SB100, is located approximately 75-feet from EM Anomaly G. Additionally, an unidentified line terminates within the footprint of the anomaly.

Soil boring, SB106, is located approximately 60-feet southwest of EM Anomaly H.

Gas lines, electric lines, water lines, and unidentified lines were noted throughout the survey area.

3.1.4 Southern Historical Tank Farm

Two EM anomalies (EM Anomaly B and C) were noted in the Southern Historical Tank Farm area. GPR traverses over these areas were inclusive and more direct methods are required to determine the exact nature of these anomalies. Soil borings SB110, SB111, and SB114 are located approximately 40 feet to 60 feet southeast of EM Anomaly B. Soil boring, SB119A, is located approximately 85 feet north-northeast of EM Anomaly C.

Gas lines, electric lines, water lines, and unidentified lines were noted throughout the survey area. Areas of reinforced concrete were noted throughout the survey area.

3.1.5 Southern Historical Tank Battery

One EM anomaly, EM Anomaly A, was noted in the Historical Southern Tank Battery area. GPR traverses over these areas were inclusive and more direct methods are required to determine the exact nature of these anomalies. Soil boring, SB134, is located within the anomaly footprint. Soil boring, SB142/SB142A, is located approximately 35 feet northeast of the anomaly.

In addition to the EM anomaly, electrical lines, water lines, and unidentified lines were noted throughout the survey area. A potential trench was identified in between SB139 and SB140.

3.2 Soil Sampling Analytical Results

Laboratory analytical reports provided by Eurofins CalScience are included in **Appendix C.** The analytical results for collected soil samples are summarized by analyte group in the following tables:

- **Table 1** – Soil Analytical Results: Metals (Total Concentrations)
- **Table 2** – Soil Analytical Results: Metals (Soluble Concentrations)
- **Table 3** – Soil Analytical Results: Total Petroleum Hydrocarbons
- **Table 4** – Soil Analytical Results: Volatile Organic Compounds
- **Table 5** – Soil Analytical Results: Semi-Volatile Organic Compounds & Polycyclic Aromatic Hydrocarbons

Analyte concentrations and method detection limits were compared to select screening levels. Screening levels used for comparison were taken from the following sources, as appropriate and/or available.

- San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs), August 2025

- California Department of Toxic Substances Control (DTSC) Human Health Risk Assessment (HHRA) Note Number 3 DTSC-modified Screening Levels (DTSC-SLs), June 2020-Revised April 2025
- USEPA Regional Screening Levels (RSLs), November 2024
- DTSC HHRA Note Number 11 Southern California Ambient Arsenic Screening Level, December 2020
- Federal and State Hazardous Waste Characteristics of Toxicity Levels (§66261.24)

For the SFBRWQCB ESLs, DTSC-SLs, and USEPA RSLS, the most stringent screening level available for human health exposure (residential, commercial/industrial, or construction worker receptors), leaching to groundwater, and gross contamination from these sources was used for comparison. Concentrations exceeding the compared screening level are indicated in **bold** in the summary tables.

Screening levels from the Huntington Beach Fire Department (HBFD) City Specification No. 431-92 Soil Quality Standard, October 2022, were also evaluated when selecting comparison criteria for the analytical results. The HBFD Soil Quality Standard provides screening levels for TPHs (full carbon chain), benzene, toluene, ethylbenzene, xylenes, and PAHs. The SFBRWQCB, DTSC, and/or USEPA screening levels referenced above are more conservative than these values with the exception of oil range TPH and select PAHs. The SFBRWQCB and USEPA screening levels for oil range TPH and PAHs are derived from compound specific toxicity values and physical properties[1] evaluated based on scenario specific exposure parameters. The HBFD screening levels are generalized for the entire range of TPH mixtures and family of PAH compounds. The compound specific SFBRWQCB and USEPA screening levels were utilized to provide a more chemically relevant comparison level for the analytical results.

In several instances, SVOCs/PAHs detected by USEPA Method 8270C were also detected by USEPA Method 8270C SIM. The gas chromatography used in the basic 8270C method scans a large range of masses for an array of compounds. The SIM (selected ion monitoring) method allows data collection at specific mass indexes for target compounds. In **Table 5**, the following procedure was followed to determine whether the 8270C or the 8270C SIM result was included:

[1] Toxicity values and physical properties for TPH mixtures utilized by the SFBRWQCB and USEPA are based on the carbon chain fraction and a representative surrogate compound for calculating screening levels. The DTSC does not provided screening levels for TPH mixtures.

1. If either result is qualified because it exceeded the calibration range ("E") or it could not be verified and was rejected ("R"), the other result not qualified with "E" or "R" was included.
2. If both method results were not detected, the 8270C SIM reporting and method detection limit was included.
3. If the 8270C method result was not detected and the 8270C SIM method did detect a concentration, the 8270C SIM result was included.
4. If both method results identified a concentration, the higher of the two results was included.
5. If both method results identified a concentration and the concentrations were the same, the 8270C SIM result was included.

Both the 8270C and 8270C SIM results are included in the laboratory analytical reports in **Appendix C**.

Several of the analytical results included in the summary tables were qualified by Eurofins CalScience. Qualifiers with a significant bearing on the veracity of the analytical result are denoted in the summary tables. Other analytical or quality issues of less significance or that did not result in a qualified concentration value are chronicled in the job narratives of the complete laboratory analytical reports included in **Appendix C**.

Further summaries of the analytical results are provided by area in the following subsections.

Although not detected in any of the samples, the method detection limit of thallium exceeded the applicable screening level (SFBRWQCB ESL for residential soil) in all the soil samples collected. There is no known evidence that the use of thallium was associated with Site operations.

Gasoline, diesel, and oil range TPH were detected above method detection limits in multiple samples collected from the Southern Historical Tank Battery (**Table 3**). Of these detections, only samples SB134-2.0, SB134-5.0, SB134-15.0, SB135-6.0, SB136-3.0, SB137-2.0, SB137-4.0, SB139-2.0, SB140-2.0, SB140-4.0, SB142-13.0 and SB142-15.0 contained concentrations that exceeded applicable screening levels (SFBRWQCB ESL for residential soil, SFBRWQCB ESL for gross contamination).

VOC analysis identified concentrations of 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, MEK, acetone, benzene, carbon disulfide, ethylbenzene, isopropyl benzene, naphthalene, n-butylbenzene, n-propyl benzene, o-xylene, m,p-xylene, p-isopropyl toluene, sec-butylbenzene, tert-butylbenzene, TBA, toluene, and TCE (**Table 4**). Of these VOCs, detections of benzene, ethylbenzene, naphthalene, o-xylene,m,p-xylene, and TBA in SB134-5.0, SB136-5.0, SB139-15.0, SB140-4.0, SB142-13.0 and SB142-15.0 exceeded screening levels (SFBRWQCB ESL for leaching to groundwater).

SVOC and PAH analysis identified concentrations of 1-methylnapthalene, 2-methylnapthalene, acenaphthene, anthracene, benzo[g,h,i]perylene, benzo[k]fluoranthene, benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, chrysene, dibenz(a,h)anthracene, di-n-butyl phthalate, fluoranthene, fluorene, Indenol[1,2,3-cd]pyrene, naphthalene, phenanthrene, and pyrene. Of

these SVOCs/PAHs, only concentrations of 1-methylnapthalene, 2-methylnapthalene, benzo[a]pyrene, dibenz(a,h)anthracene, naphthalene and phenanthrene exceeded screening levels (USEPA RSL for Residential Soil, SFBRWQCB ESL for leaching to groundwater, DTSC-SL for residential soil) in SB134-5.0, SB135-2.0, SB136-3.0, SB137-4.0, SB140-2.0, SB140-4.0, SB142-13.0 and SB142-15.0.

Soil borings in the Southern Historical Tank Battery that contained soil with analyte concentrations exceeding applicable screening levels are depicted in red in **Figure 8**. Concentrations exceeding screening levels were not observed in any samples beyond six feet bgs with the exception of four borings, SB134, SB135, SB139 and SB142. Soil borings SB134,SB135, and SB139 contained concentrations exceeding screening levels in the deepest sample collected at 15 feet bgs. Boring SB142 also contained concentrations exceeding screening levels at 15 feet bgs; however, step-out boring SB142A immediately adjacent to SB142 contained no concentrations exceeding screening levels at 20 feet bgs.

3.2.11 *Field Quality Assurance Samples*

Equipment blank samples were below laboratory detection limits for nearly all analyzed constituents. However, concentrations of between one to four analytes were identified in most of the equipment blank samples collected. In most cases, the detected analytes were also detected in the associated field blank sample, or were within five percent of the method detection limit and may also have been present in the field blank sample. This is suggestive of an ambient source present that is influencing the equipment blank analytical results. Exceptions to this include detections of diesel range TPH on 24 January 2025, mercury on 28 January 2025, and oil range TPH on 30 January 2025. In some instances, analytes were detected in the field blank samples that were not detected in the associated equipment blank sample. Overall, the equipment blank and field blank analytical results indicate that proper decontamination procedures were followed and cross-contamination or contamination from ambient sources would have no to negligible bearing on the analytical results.

Trip blank samples were below laboratory detection limits for all analyzed VOCs with the exception of the sample analyzed on 7 February 2025, which contained 1,2,4-trimethylbenzene. The result was an estimated value and was qualified as 1,2,4-trimethylbenzene was also found in the associated analysis batch blank. Overall, the trip blank analytical results indicate that the integrity of the samples was not compromised during transit.

The complete field quality assurance samples analytical results are included in **Table 6**.

3.2.12 *Analytical Results Method Detection Limits*

Method detection limits (MDLs) for several analytes were shown to exceed comparison criteria up to two orders of magnitude above site-specific standards. In most instances, MDLs above comparison criteria are associated with analyses where the sample was non-detect for most if not all remaining analytes. Laboratory MDLs are statistically derived and instrument-specific, representing the lowest concentration achievable without signal-to-noise interference. Instrument variability can account for differences in MDLs between individual samples, as samples for a site can be placed in separate analytical batches and analyzed on different instruments to meet turnaround time needs of projects. MDLs are also subject to variability due to individual sample characteristics for solid matrices as data is quantitated from on-column results and calculated with respect to multiple factors, including final sample volume, dilution factors, and sample percent moisture. Individual sample characteristics for solid matrices can significantly differ within narrow spatial ranges and samples within the immediate vicinity of each other can yield notably different results due to varying sample homogeneity or perceived matrix interferences.

4.0 CONCLUSIONS

Langan completed this investigation to help address potential environmental conditions associated with specific areas at the Site. The investigation included a geophysical survey and soil sampling. The main conclusions from the investigation are listed below:

- Fifteen electromagnetic anomalies were identified, three of which contained or were immediately adjacent to soil borings.
- In general, concentrations exceeding screening levels in soil are contained within the upper five feet of soil.
- There are exceptions where concentrations extend beyond five feet bgs, including 12 boring locations where screening level exceedances are not vertically defined. The majority of these borings exhibited decreasing concentrations with depth, indicating that the impacts are likely confined to shallow subsurface zones.
- Groundwater was not encountered in the deepest borings advanced during this investigation (35 feet bgs).
- Several of the investigated areas contain soil borings where screening level exceedances are not laterally defined.
- With the exception of TBA, soil borings in the former UST area delineated residual soil concentrations exceeding screening levels as the result of the former UST release.

- Two borings with soil concentrations exceeding California hazardous waste levels were identified.
- Further investigation can be conducted to investigate remaining electromagnetic anomalies, borings not vertically defined, borings not laterally defined, and borings with hazardous waste levels. Further investigation is prohibited by facility operations in some of these areas.

Specific findings and conclusions for each area are outlined below.

4.1 Northwest Historical Tanks

The geophysical survey identified two electromagnetic subsurface anomalies. The anomalies may have been associated with the former structure in this area. Soil borings were located in the area of the former structures and were within 30 feet of the anomalies.

A total of eight soil borings (plus one step-out boring) were advanced in the area with 29 samples collected for laboratory analysis. No metal concentrations exceeded screening levels. TPH concentrations exceeded screening levels in seven borings which included one location that was not vertically delineated (SB57). VOC concentrations exceeded screening levels in three borings and were delineated to 15 feet. SVOC/PAH concentrations exceeded screening levels in three borings and were vertically delineated to the upper 12 feet.

In total, seven of the eight borings contained analyte concentrations exceeding screening levels. Borings with exceedances were laterally delineated to the northwest. The active pipeline channel adjoins the area immediately to the southwest and prohibits further delineation in this direction. Further soil borings to the northeast, southeast, and northwest extending outside the Northwest Historical Tank area can be advanced to help provide lateral delineation.

4.2 Pipe Laydown Area

The geophysical survey identified five electromagnetic subsurface anomalies. The anomalies are more indicative of buried debris or abandoned wells than USTs. The anomalies were located after soil sampling and only one anomaly had a boring located adjacent to it. Other anomalies had a boring located 40 to 65 feet away. Additional soil borings can be advanced to further investigate these anomalies.

A total of 16 borings were advanced in the area with 45 samples collected for laboratory analysis. No metal concentrations exceeded screening levels. TPH concentrations exceeded screening levels in nine borings and were delineated to the upper five feet. VOC concentrations exceeded

the screening level in nine borings and were delineated to 15 feet. SVOC/PAH concentrations exceeded screening levels in three borings and were delineated to the upper two feet.

In total, 15 of the 16 borings contained analyte concentrations exceeding screening levels. Borings with exceedances were laterally delineated to the southeast. The active pipeline channel adjoins the area immediately to the southwest and prohibits further delineation in this direction. Further soil borings can be advanced to the northwest and northeast to help provide lateral delineation.

4.3 Maintenance and Truck Wash Buildings

A geophysical survey previously completed in this area identified two electromagnetic anomalies. Soil borings were located next to these anomalies.

A total of 12 borings (plus two step-out borings) were advanced in the area with 36 samples collected for laboratory analysis. Arsenic concentrations exceeded screening levels in two borings and mercury concentrations exceeded screening levels in one boring. One of the samples, SB78-2.0, contained soluble concentrations of arsenic exceeding State hazardous waste levels. Metal concentrations exceeding screening levels were delineated to the upper two feet.

TPH concentrations exceeded screening levels in four of the borings and were delineated to the upper nine feet bgs. VOC concentrations exceeded the screening level in six borings and were delineated to 15 feet. SVOC/PAH concentrations exceeded screening levels in one boring and were delineated to the upper two feet bgs.

In total, eight of the 12 borings contained analyte concentrations exceeding screening levels. Borings with exceedances were laterally delineated to the southeast only. The northeast borings in this area are approximately 55 feet from the Site boundary; however, borings can still be advanced in this direction to help provide lateral delineation.

4.4 Former UST Area

A geophysical survey previously completed in this area identified a subsurface anomaly suggestive of soil excavation. An electromagnetic anomaly was located just northeast of the potential excavation anomaly. Soil borings were placed in the excavation anomaly, adjacent to the electromagnetic anomaly, and in locations believed to have former had USTs based on historical documents for the site.

A total of eight borings (plus one step-out boring) were advanced in the area with 41 samples collected for laboratory analysis. No metal concentrations exceeded screening levels. TPH concentrations exceeded screening levels in four borings and were delineated to the upper two feet bgs or were delineated between 15 and 35 feet. VOC, SVOC, and PAH concentrations exceeded screening levels in six borings and were delineated between 15 and 35 feet.

In total, six of the eight borings contained analyte concentrations exceeding screening levels. Borings with exceedances in the upper two feet bgs can be further laterally delineated. Additional soil borings can be advanced northeast of this area and beyond the Maintenance and Truck Wash Buildings Area to help provide lateral delineation. Borings with exceedances in soil between 15 and 35 feet bgs were laterally delineated.

The eight borings in this area thoroughly encompassed a suspected UST area identified from historical documents and geophysical investigations. With the exception of TBA, concentrations exceeding screening levels were identified at 21 feet bgs with clean samples above and below this depth. Soil concentrations exceeding screening levels as the result of the former UST release have been fully delineated. The data are below human health screening levels and do not indicate that a threat to human health is present as a result of the former USTs. The data exceed protection of groundwater from leaching screening levels. Current site conditions do not suggest leaching would occur (i.e., surface cover in the former UST area consists of asphalt) and, with the exception of TBA, screening levels exceedances have been vertically delineated to below groundwater protection screening levels. TBA was detected in sample SB91-35.0 just above the groundwater table at concentrations above the protection of groundwater screening level. The data set in the Former UST area do not suggest a significant release of TBA occurred (i.e., TBA concentrations are only slightly higher than method detection limits where identified). It is possible the detection of TBA at 35 feet is the result of "smearing" of TBA-impacted groundwater onto soil during seasonal fluctuations of the groundwater table. However, given the known use of TBA as a fuel additive and the absence of any historical data for TBA from when UST remedial actions were conducted, it is possible the concentration of TBA is the result of the former UST release.

4.5 Electromagnetic Anomaly Area

A geophysical survey previously completed in this area identified three large electromagnetic anomalies. Borings were soft dug in the top five feet in this investigation to further investigate if a subsurface tank may be present. No subsurface structures were encountered in the electromagnetic anomalies.

A total of four borings were advanced in the area with 13 samples collected for laboratory analysis. Arsenic and nickel exceeded screening levels in one boring at 10 feet bgs; the sample was delineated with samples below screening levels at five and 15 feet bgs. TPH concentrations exceed screening levels in four borings and were delineated to the upper five feet bgs. VOC concentrations exceeded screening levels in one boring at 15 feet. SVOC/PAH concentrations exceeded screening levels in one boring and were delineated to the upper 10 feet bgs.

All of the four borings contained analyte concentrations screening levels. These borings encompassed the area of the identified electromagnetic anomalies. Lateral delineation of the borings exceeding screening levels in this area is not necessary.

4.6 Chemical Storage Area

The chemical waste storage area is an enclosed concrete storage area serving as secondary containment for hazardous waste. Soil borings were advanced immediately outside the storage as to not compromise the concrete containment. The geophysical survey was conducted just in the vicinity of the soil borings.

Three borings were advanced immediately outside the concrete berm of the chemical waste storage area. Nine samples were collected for laboratory analysis. Arsenic concentrations exceeded screening levels in one boring at five feet bgs; the sample was delineated with samples below screening levels at two and 15 feet bgs. TPH concentrations exceeded screening levels in two borings and were delineated to the upper five feet bgs. VOC concentrations exceeded screening levels in three borings and were detected as deep as 15 feet. SVOC/PAH borings exceeded screening levels in one boring and were vertically delineated to the upper five feet bgs.

In total, three of the three borings contained analyte concentrations levels.Dueto access restrictions, these borings were advanced on the periphery of the identified area of concern. Lateral delineation of these borings outside the chemical waste storage area is not necessary.

4.7 Historical Bermed Area

The geophysical survey identified five electromagnetic anomalies. The anomalies were identified after soil borings were advanced. One of the anomalies coincidentally contained a soil boring; the nearest borings to any of the remaining four anomalies were 25 to over 100 feet away. One of the remaining four anomalies is located within the gas processing area at the Site, which may preclude drilling activities to investigate further. Otherwise, additional soil borings can be advanced to further investigate these anomalies.

Twelve borings (plus one step-out boring) were advanced in the area with 36 samples collected for laboratory analysis. Arsenic concentrations exceed screening levels in two borings and were delineated to the upper five feet bgs. TPH concentrations exceeded screening levels in two borings and was not vertically delineated (SB102). VOC concentrations exceeded screening levels in two borings and were vertically delineated. SVOC/PAH concentrations exceeded screening levels in one boring that was not vertically delineated (SB102). An additional boring can be advanced to help vertically delineate this boring.

In total, six of the 12 borings contained analyte concentrations exceeding screening levels. The borings are laterally delineated to the northwest and southwest. Further borings can be advanced to the northeast and southeast to help provide lateral delineation.

4.8 Southern Historical Tank Farm

The geophysical survey identified two electromagnetic anomalies. These anomalies were identified after the soil borings were advanced. Soil borings were located 40 to 85 feet from the anomalies. Additional soil borings can be advanced to further investigate these anomalies.

Seventeen borings (plus one step-out boring) were advanced in the accessible portion of the area with 51 samples collected for laboratory analysis. Antimony, arsenic and lead exceeded screening levels in four borings. Metal concentrations exceeding screening levels were delineated to the upper two feet with the exception of boring SB119A. Soil boring SB119A contained concentrations or arsenic exceeding screening levels in the deepest sample collected at 15 feet bgs. An additional boring can be advanced to help vertically delineate this boring. One of the samples, SB143-2.0, contained soluble concentrations of lead exceeding State hazardous waste levels. Reinforced concrete identified during the geophysical survey is immediately adjacent to the southwest of boring SB143. Further borings can be advanced beyond this concrete and next to boring SB143 to help provide lateral delineation.

TPH concentrations exceeded screening levels in 15 of the borings and were delineated to the upper five feet with the exception of boring SB119A. VOC concentrations exceeded screening levels in five borings and were delineated to the upper five feet bgs with the exception of boring SB119A. Soil boring SB119A contained concentrations of TPHs and VOCs exceeding screening levels in the deepest sample collected at 15 feet bgs. SVOC/PAH concentrations exceeded screening levels in six borings and were delineated to the upper five feet bgs.

In total, 15 of the 17 borings contained analyte concentrations levels. The borings are not laterally delineated. Facility tanks and process pipes adjoin the area to southwest and prohibit further

delineation in this direction in several areas. Otherwise, further borings can be advanced to help provide lateral delineation.

4.9 Southern Historical Sumps

A geophysical survey previously completed identified an electromagnetic anomaly in the area. The electromagnetic anomaly was indicative of a possible UST. A boring was advanced in the anomaly area. No tank was identified during soft digging of the upper five feet bgs.

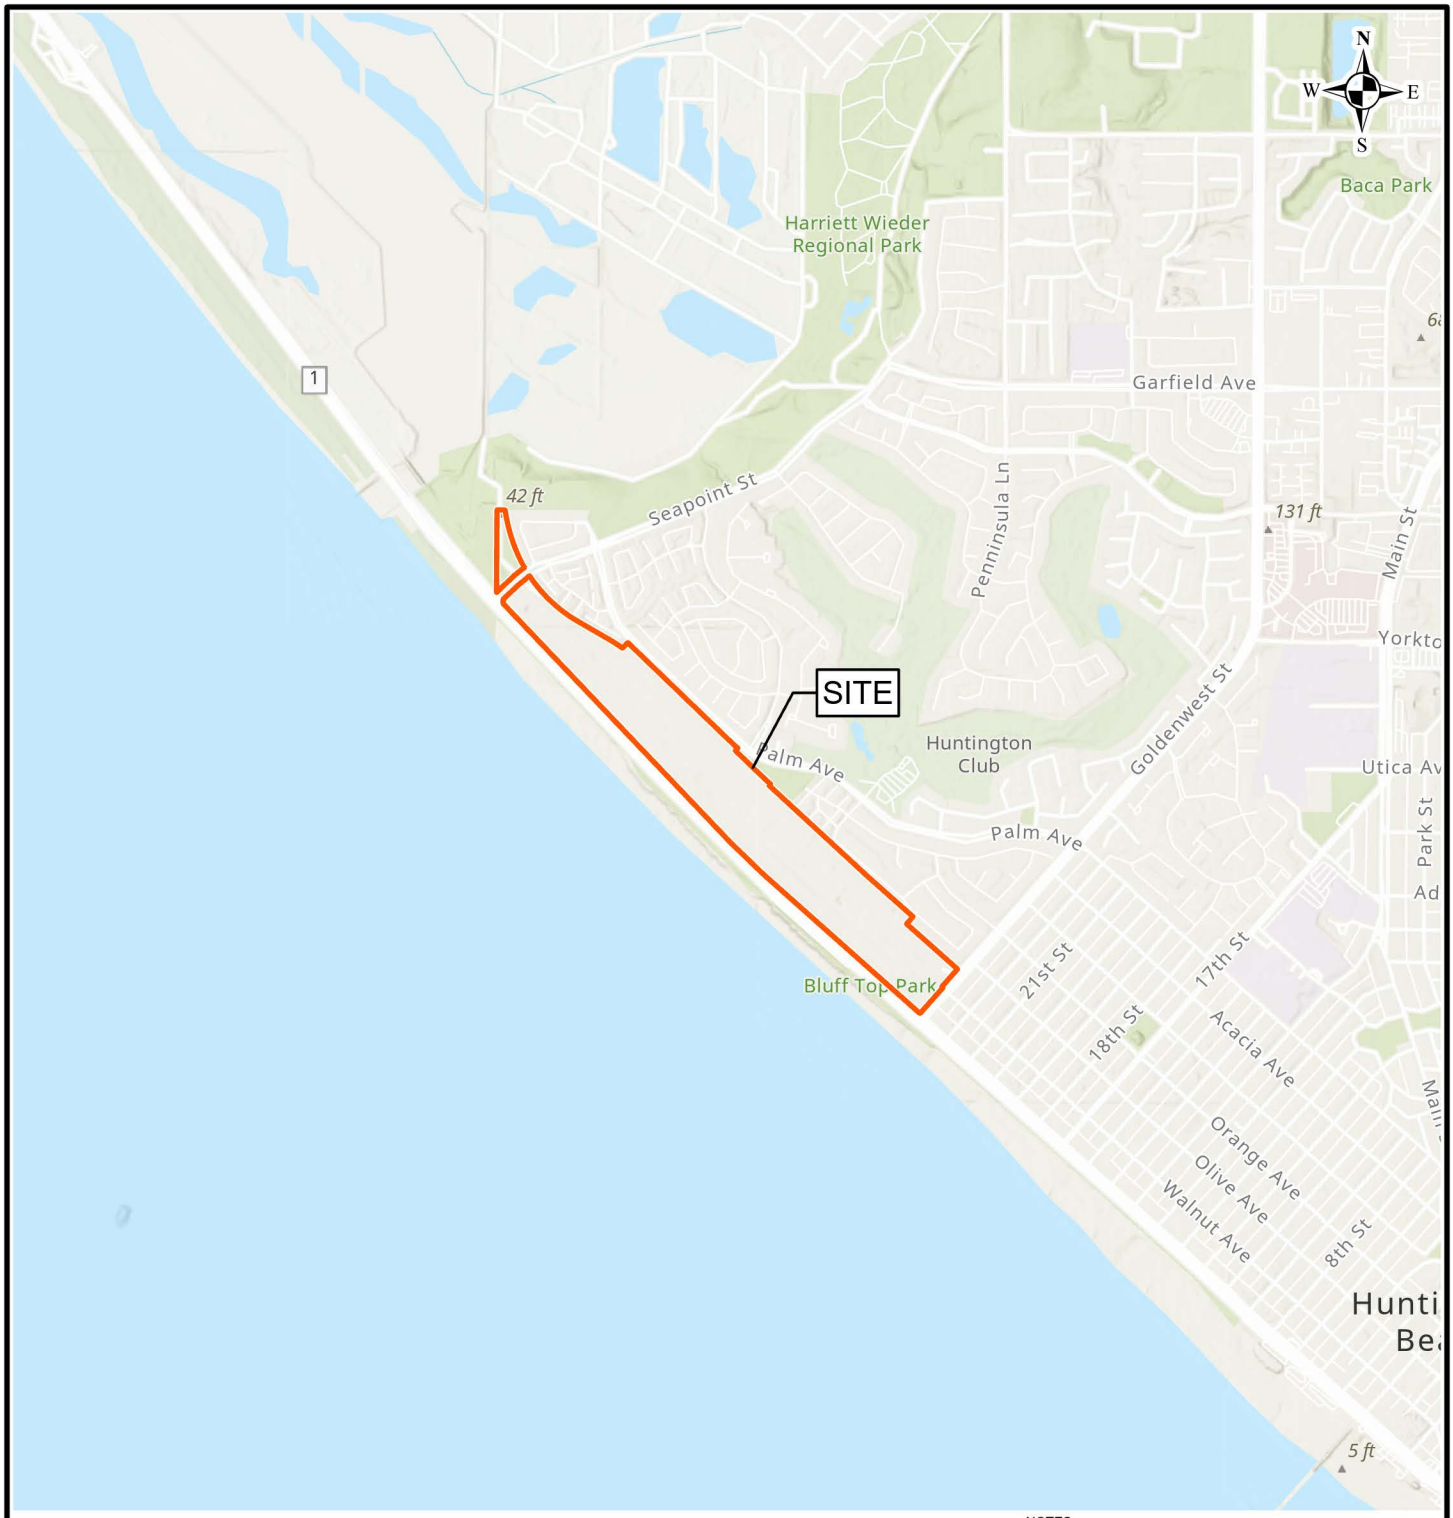
Eight borings were advanced in the accessible portion of the area with 24 samples collected for laboratory analysis. Arsenic and lead concentrations exceeded screening levels in three of the borings and were delineated to the upper five feet. TPH concentrations exceeded screening levels in seven of the borings and were delineated to the upper five feet. VOC concentrations exceeded screening levels in six of the borings; four were delineated to the upper five feet bgs while two borings (SB128 and SB131) contained exceedances in the deepest sample collected at 15 feet bgs. An additional boring can be advanced to help vertically delineate these borings. SVOC/PAH concentrations exceeded screening levels in three of the borings and were delineated to the upper five feet bgs.

In summary, all of the eight borings contained analyte concentrations levels. The borings are not laterally delineated. Several of the borings with exceedances are adjoined by facility tanks/process piping, stormwater retention ponds, and Site property lines that prohibit further delineation in these directions. Further borings can be advanced to the northwest or southeast (beyond the Southern Historical Tank Battery Area) to help provide lateral delineation.

4.10 Southern Historical Tank Battery

The geophysical survey identified one electromagnetic anomaly in the area. One of the soil borings was located in the anomaly. No subsurface structures were encountered during the soft digging of this boring.

Nine borings (plus one step-out boring) were advanced in the accessible portion of the area with 28 samples collected for laboratory analysis. Arsenic concentrations exceeded screening levels in six borings and were vertically delineated to the upper five feet with the exception of boring SB135. Soil boring SB135 contained arsenic exceeding screening levels in the deepest sample collected from 15 feet bgs. An additional boring can be advanced to help vertically delineate this boring.



TPH concentrations exceeded screening levels in seven borings and were delineated to the upper six feet bgs with the exception of borings SB134 and SB142. Soil boring SB134 contained TPH exceeding screening levels in the deepest sample collected at 15 feet bgs. An additional boring can be advanced to help vertically delineate SB134. Soil boring SB142 was delineated to the upper 15 feet bgs. VOC concentrations exceeded screening levels in five borings and were delineated to the upper five feet bgs with the exception of boring SB142, which was delineated to the upper 15 feet bgs, and SB139 which exceed screening levels at the deepest depth investigated, 15 feet bgs. SVOC/PAH concentrations exceeded screening levels in six borings and was delineated to the upper five feet bgs with the exception of boring SB142, which was delineated to the upper 15 feet bgs.

In total, seven of the nine borings contained analyte concentrations exceeding screening levels. The borings are laterally delineated to the southwest. Site property lines and stormwater retention ponds adjoining the area and prohibits further delineation to the northeast and northwest. However, further borings can be advanced to the northwest beyond the retention ponds (and the Historical Southern Sumps Area) and to the southeast to help provide lateral delineation.

Soil results were compared Site-specific screening levels that are a compilation of [1] EPA RSL Residential Soil (November 2024), RWQCB [2] Soil Direct Exposure Construction Worker: Any Land Use ESL, [3] Soil Direct Exposure Residential ESL, [4] Leaching to Groundwater ESL, and [5] Soil Gross Contamination ESL (July 2025), [6] CA DTSC Residential Soil (April 2025), and [7] Average Background Arsenic Concentration from "Determination of a Southern California Regional Background Arsenic Concentration in Soil" published by the CA DTSC (2008)

RWQCB - Regional Water Quality Control Board

ESL - Environmental Screening Level

DTSC - Department of Toxic Substance Control

CAS - Chemical Abstract Service

NS - No standard

mg/kg - Milligrams per kilogram

NA - Not Analyzed

MDL - Method Detection Limit

<MDL - Not detected

Qualifiers:

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument. (Alpha)

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the MDL.

B - The analyte was found in the associated analysis batch blank.

Exceedance Summary:

10 - Result exceeds Site-Specific Soil Screening Levels

Notes:

Soil results were compared Site-specific screening levels that are a compilation of [1] EPA RSL Residential Soil (November 2024), RWQCB [2] Soil Direct Exposure Construction Worker: Any Land Use ESL, [3] Soil Direct Exposure Residential ESL, [4] Leaching to Groundwater ESL, and [5] Soil Gross Contamination ESL (July 2025), [6] CA DTSC Residential Soil (April 2025), and [7] Average Background Arsenic Concentration from "Determination of a Southern California Regional Background Arsenic Concentration in Soil" published by the CA DTSC (2008)

RWQCB - Regional Water Quality Control Board

ESL - Environmental Screening Level

DTSC - Department of Toxic Substance Control

CAS - Chemical Abstract Service

NS - No standard

mg/kg - Milligrams per kilogram

NA - Not Analyzed

MDL - Method Detection Limit

<MDL - Not detected

Qualifiers:

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument. (Alpha)

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the MDL.

B - The analyte was found in the associated analysis batch blank.

Exceedance Summary:

10 - Result exceeds Site-Specific Soil Screening Levels

Notes:

Soil results were compared Site-specific screening levels that are a compilation of [1] EPA RSL Residential Soil (November 2024), RWQCB [2] Soil Direct Exposure Construction Worker: Any Land Use ESL, [3] Soil Direct Exposure Residential ESL, [4] Leaching to Groundwater ESL, and [5] Soil Gross Contamination ESL (July 2025), [6] CA DTSC Residential Soil (April 2025), and [7] Average Background Arsenic Concentration from "Determination of a Southern California Regional Background Arsenic Concentration in Soil" published by the CA DTSC (2008)

RWQCB - Regional Water Quality Control Board

ESL - Environmental Screening Level

DTSC - Department of Toxic Substance Control

CAS - Chemical Abstract Service

NS - No standard

mg/kg - Milligrams per kilogram

NA - Not Analyzed

MDL - Method Detection Limit

<MDL - Not detected

Qualifiers:

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument. (Alpha)

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the MDL.

B - The analyte was found in the associated analysis batch blank.

Exceedance Summary:

10 - Result exceeds Site-Specific Soil Screening Levels

Notes:

Soil results were compared Site-specific screening levels that are a compilation of [1] EPA RSL Residential Soil (November 2024), RWQCB [2] Soil Direct Exposure Construction Worker: Any Land Use ESL, [3] Soil Direct Exposure Residential ESL, [4] Leaching to Groundwater ESL, and [5] Soil Gross Contamination ESL (July 2025), [6] CA DTSC Residential Soil (April 2025), and [7] Average Background Arsenic Concentration from "Determination of a Southern California Regional Background Arsenic Concentration in Soil" published by the CA DTSC (2008)

RWQCB - Regional Water Quality Control Board

ESL - Environmental Screening Level

DTSC - Department of Toxic Substance Control

CAS - Chemical Abstract Service

NS - No standard

mg/kg - Milligrams per kilogram

NA - Not Analyzed

MDL - Method Detection Limit

<MDL - Not detected

Qualifiers:

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument. (Alpha)

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the MDL.

B - The analyte was found in the associated analysis batch blank.

Exceedance Summary:

10 - Result exceeds Site-Specific Soil Screening Levels

Subject: **Geophysical Evaluation**
CRC Huntington Beach Facility, Huntington Beach, California
Project No. 2025005.rev1

Dear Mr. Knight:

Advantage Geophysics (Advantage) has conducted an additional geophysical evaluation for the subject project located in Huntington Beach, California. The purpose of this evaluation was to assess additional areas for the potential presence of underground storage tanks (USTs), backfilled excavations associated with UST removal, and detectable utilities within designated portions of the project site.

A previous evaluation was conducted from November 20 through December 13, 2024, with findings presented in a report dated December 31, 2024. The most recent evaluation took place from January 13 through January 24, 2025. This document summarizes the methodology, equipment used, analysis, and findings from our most recent study.

SCOPE OF SERVICES

Our scope of services for the project included:

- Performance of a geophysical evaluation to assess additional areas for the potential presence of underground storage tanks (USTs), backfilled excavations associated with UST removal, and detectable utilities.
- Site reconnaissance including field mapping of surface structures at and near the study area.
- Compilation and analysis of the data collected.
- Preparation of this report presenting our findings, conclusions, and recommendations.

SITE AND PROJECT DESCRIPTION

The project site is located at 20101 Goldenwest Street in Huntington Beach, California (Figure 1a). Specifically, the site is located along Pacific Coast Highway 1 between Goldenwest Street and Seapoint Street. The subject project is currently an operating oil field with active electric lines, wastewater lines, water lines, gas lines, sumps, storm drains, etc. Figure 1b depicts the approximate study areas and general site conditions. The study areas have been labeled as Historic Southern Tank Battery, Southern Historic Tank Farm, Historic Bermed Area, Pipe Laydown Area, and Northwest Historic Tanks.

Based on our discussions with you and review of historical aerial images and maps provided by your office, it is our understanding that the site has been used as an oil field for many years. It is also our understanding that several USTs and septic tanks may be in areas of interest; however, there are only known locations in the Southern Historic Tank Farm area. Additionally, our understanding is that

abandoned oil wells, active/abandoned utilities, and remnant building foundations may exist within the study areas.

GEOPHYSICAL INSTRUMENTATION AND APPLICATIONS

Our evaluation included the use of a Geonics model EM61-MK2 time-domain instrument, GSSI SIR 3000 Ground Penetrating Radar (GPR) units using a 400 MHz transducer, Schonstedt GA-52 magnetic gradiometer, Fisher M-Scope TW-6 pipe and cable locator, Vivax vLoc3-Pro line tracer and Stonex S700a Global Navigation Satellite System (GNSS) receiver.

The EM61 instrument is a high-resolution, electromagnetic (EM) time-domain device for detecting buried conductive objects. It consists of a powerful transmitter that generates a pulsed primary magnetic field when its coils are energized, which induces eddy currents in nearby conductive objects. The decay of the eddy currents, following the input pulse, is measured by the coils, which in turn serve as receiver coils. The decay rate is measured for two coils, mounted concentrically, one above the other. By making the measurements at a relatively long-time-interval (measured in milliseconds) after the termination of the primary pulse, the response is nearly independent of the electrical conductivity of the ground. Thus, the instrument is a very sensitive metal detector. Due to its unique coil arrangement, the response curve is a single well-defined positive peak directly over a buried conductive object. This facilitates quick and accurate location of targets. Conductive objects to a depth of approximately 11 feet generally can be detected.

The GPR instrument beams energy into the ground from its transducer/antenna, in the form of electromagnetic waves. A portion of this energy is reflected to the antenna at boundaries in the subsurface across which there is an electrical contrast. The recorder continuously makes a record of the reflected energy as the antenna is moved across the ground surface. The greater the electrical contrast, the higher the amplitude of the returned energy. The EM wave travels at a velocity unique to the material properties of the ground being studied, and when these velocities are known, or closely estimated from ground conductivity values and other information, two-way travel times can be converted to depth. Penetration into the ground and resolution of the GPR images produced are a function of ground electrical conductivity and dielectric constant. Images tend to be graphic, even at considerable depth, in sandy soils, but penetration and resolution may be limited in more conductive clayey moist ground. The magnetic gradiometer has two fluxgate magnetic fixed sensors that are passed close to and over the ground. When not in close proximity to a magnetic object, that is, only in the earth's field, the instrument emits an audible signal at a low frequency. When the instrument passes over buried iron or steel objects (so that the field is significantly different at the two sensors) the frequency of the emitted sound increases. Frequency is a function of the gradient between the two sensors.

The M-Scope TW-6 device energizes the ground by producing an alternating primary magnetic field with alternating current (AC) in the transmitting coil. If conducting materials (including soils) are within the area of influence of the primary field, AC eddy currents are induced to flow in the conductors. A receiving coil senses the secondary magnetic field produced by these eddy currents and outputs an audio response. The strength of the secondary field is a function of the conductivity of the object, its size, and its depth and position relative to the instrument's two coils. Conductive objects to a depth of approximately 10 feet are sensed. Also, the device is somewhat focused, that is, it is more sensitive to conductors below (and above) the instrument than to conductors off to the side.

Where risers are present, the Vivax vLoc3-Pro utility locator transmitter can be connected to the object, and a current is impressed on the conductor pipe or cable. The receiver unit is tuned to this same

frequency, and it is used to trace the pipe's surface projection away from the riser. The transmitter and receiver can also be used in a non-connect (induction) mode, whereby the transmitter is positioned on the ground and an electromagnetic signal is emitted. In the presence of buried metal pipes and wires, a discrete signal will be induced on the conductor which can be sensed by the receiver. In addition, the instrument may be used in the passive mode, whereby radio and 60 Hz electromagnetic signals produced by communication and live electric lines are detected.

EVALUATION METHODOLOGY AND ANALYSIS

The collection of EM61 data was performed in conjunction with a Stonex S700a GNSS receiver unit for spatial control. The limits of our study area were generally selected by you (see Figures 1b and 2a through 2e). Traverses with the EM61 were conducted across accessible portions of the study area along generally northwest-southeast or northeast-southwest transects spaced approximately 5 feet apart. GPR traverses were conducted along roughly northwest-southeast and northeast-southwest transects spaced approximately 3 to 5 feet apart. GPR and EM61 traverses were also conducted along random profiles across and near detected features. Traverses with the M-Scope and gradiometer were conducted in accessible portions of the study area along transects spaced approximately 10 feet apart. The line tracer was used in passive, direct connect, and inductive modes to delineate the presence of underground utilities in the study area. The recorded EM61 data were downloaded to a portable computer in the field for preliminary analysis. Significant anomalies, as well as detectable underground utilities, were marked on the ground with surface paint, photographed, mapped, and reported to you upon completion of our time on site. Figures 3a through 3e illustrate the general site conditions observed during our evaluation, including site obstructions and existing structures.

RESULTS AND RECOMMENDATIONS

The results of our geophysical evaluation identified 15 candidate EM anomalies, as well as numerous active utilities and unidentified lines within the evaluated areas (Figures 2a-2e and 4a-4e). The 15 candidate EM anomalies appear more representative of possible USTs and were labeled as Anomaly A through Anomaly O in Figures 2a through 2e and Figures 4a through 4e. Additionally, numerous high EM responses were noted and seem to be representative of buried metallic utilities (represented as lines where linear in the data) and former structures (i.e. building elements, buried metallic debris, capped off abandoned utilities, etc.). Although several buried reinforced pads and utility trenches were detected with GPR, no larger candidate backfilled excavation anomalies were found. These features are delineated in Figure 2a through 2e and Figure 4a through 4e. The following discusses the findings of each of the study areas.

The **Historic Southern Tank Battery** area yielded candidate EM Anomaly A (Figure 2a and Figure 4a). Additionally, it is clear from the EM data and the line tracing efforts that underground lines and other debris exist in the subsurface throughout the study area. Anomaly A appears as a grouping of high amplitude EM responses with a somewhat irregular shape. GPR traverses over candidate EM Anomaly A were inconclusive as to their cause or nature, but the size and shape suggest that these features are good candidates for evaluation by more direct methods (e.g., exploratory trenches, test pits, borings, etc.).

The **Southern Historic Tank Farm** area (Figure 2b and Figure 4b) yielded EM Anomalies B and C. GPR traverses over candidate EM Anomalies B and C were inconclusive as to their cause or nature, but the size and shape suggest that these features are good candidates for further evaluation by more direct methods (e.g., exploratory trenches, test pits, borings, etc.).

The **Historic Bermed Area** (Figure 2c and Figure 4c) yielded EM Anomalies D through H. GPR traverses over EM Anomalies D through H were inconclusive as to the cause or nature of this feature. The size and shape of Features E through H and the fact that pipes terminate near these features indicate that these are good candidates for further evaluation by more direct methods (e.g., exploratory trenches, test pits, borings, etc.).

The **Pipe Laydown Area** (Figure 2d and Figure 4d) yielded EM Anomalies I through M. These EM Anomalies appear smaller and rounder than expected for USTs and may suggest burred debris or possibly abandoned wells. Specifically, EM Anomalies L and M are much higher in amplitude and had a higher magnetic response when the gradiometer was traversed over these features. GPR traverses conducted over these features were inconclusive as to their cause or nature. Based on size and amplitude, each of these EM anomalies should be considered for further evaluation by direct methods (e.g., exploratory trenches, test pits, borings, etc.).

The **Northwest Historic Tanks Area** (Figure 2e and Figure 4e) yielded anomalies N and O. These EM Anomalies appear in line with the concrete slab, however, branch off and may be associated with the former structure. The size and shape of Features N and O and the fact that a concrete slab is near these features indicate that these are good candidates for further evaluation by more direct methods (e.g., exploratory trenches, test pits, borings, etc.).

As indicated, to further evaluate the anomalous features described above, we recommend that more direct methods be used. Such methods may include the excavation of exploratory trenches, test pits, and/or borings.

Our study utilized industry-standard equipment (i.e., GPR, electromagnetic, and magnetic instruments) and was conducted in general accordance with current practice. It should be noted that the presence of existing structures and surface objects (i.e., water tanks, stored materials, metal debris, and parked vehicles) may have potentially limited the study. Where obstructions were present, subsurface data could not be collected. Moreover, EM/magnetic responses produced by metal surface objects, reinforced concrete, and underground lines can potentially obscure subsurface features. Radar penetration at the site was approximately 3 to 5 feet below the ground surface; therefore, objects below this depth would not have been detected with GPR.

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Job Narrative
570-215002-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 1/22/2025 5:15 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 0.6°C and 0.9°C.
