1.0 INTRODUCTION

Langan CA, Inc. (Langan) was retained by California Resources Corporation (CRC; the Client), to conduct a soil investigation for the property located 2010 Goldenwest Street in Huntington Beach, California (Site). CRC is proposing a zone change to allow residential, commercial and open space uses on the property. The investigation was conducted to assess soil conditions in certain areas of the Site unencumbered by active infrastructure.

1.1 Site Description

The Site is identified as Orange County Assessor Parcel Numbers (APNs) 023-181-53 and 023-181-54. It is located in the City of Huntington Beach and consists of approximately 92 acres (see **Figure 1**). The Site is bounded to the southwest by Pacific Coast Highway, the Pacific Ocean is present to the southwest. Goldenwest Street adjoins the Site to the southeast and portions of Palm Avenue adjoin the northeast end of the Site. Seapoint Street divides the two parcels, with APN 023-181-53 to the northwest and APN 023-181-54 to the southeast. The Bolsa Chica Wetlands, oil fields and residential properties are present to the northwest/north. Further residential properties are present to the east and southeast.

1.2 Site Background

Prior to conducting subsurface investigations at the Site, historical aerial photographs and reasonably ascertainable environmental records (e.g., standard environmental database records, local environmental regulatory agency files, building permits, etc.) were reviewed to identify areas of potential environmental concern. Additionally, Langan conducted a site visit to inspect the facility. Langan was escorted by CRC representatives who provided further information regarding the Site and facility operations.

Documented oil field operations began on the Site as early as 1920 with the drilling of the first recorded oil well. Site use prior to 1920 is unknown. Presently, the Site consists of active, plugged and abandoned, and idle wells, pipelines, storage tanks, oil and gas processing equipment and storage, and office and warehouse buildings. Idle wells are scattered throughout the Site. Active wells are located along the southwestern portion of the Site. Historical pits are located adjacent to the active wells. Two stormwater detention ponds are located in the southeast portion of the Site.

The facility is used to process extracted crude oil from subsurface petroleum reservoirs; produced water and gas are byproducts of the oil extraction and are also processed at the facility.

The gas is processed to remove hydrogen sulfide (H_2S) along with other impurities to meet SoCal Gas quality specifications. The gas is then predominately sold to the SoCal Gas grid to be used in homes and businesses. As a safety back up, the gas can be flared off through a permitted combustion device. Produced water is processed to remove residual oil and solids and is reinjected into the subsurface oil reservoirs.

Oil and gas are also transported to the Site via transmission pipelines from Platform Emmy, which is located off the coast of Huntington Beach on a State Lease, and from the Bolsa Chica production area, which is located north of the Site. The former Fort Apache facility, located at 1810 Pacific Coast Highway, also transferred produced fluids to the Site via underground pipelines before operations ceased in early 2024. Product from off-site areas is transferred to the Site for processing, storage, and off-site distribution along with the product produced onsite.

Numerous features were identified on historical aerials for the Site, including, but not limited to, oil wells, oil well cellars, aboveground storage tanks (ASTs), pipelines, smokestacks, sumps, and buildings. Features of note are identified on **Figures 2** through **2E**. Based on Langan's review of these aerial photographs and historical records, the following areas of potential environmental concern were identified: Northwest Historical Tanks, Former Stretford Unit, Northern Historical Tank Farm, Pipe Laydown, Transformer Storage, Maintenance and Truck Wash Buildings, Former Underground Storage Tanks (USTs), Chemical Storage Area, Historical Bermed Area, Former Chemical Laboratory, Southern Historical Tank Farm, Historical Southern Sumps, and Historical Southern Battery areas. These areas are depicted on a modern aerial photograph in **Figure 3**. There are other areas of potential environmental concern noted from the historical aerial photographs; however, the areas included in **Figure 3** represent those areas accessible for investigation and not currently occupied by facility operations.

1.3 Shallow Soil Investigation Purpose

The purpose of this investigation described in this report was to help address potential environmental concerns associated with specific areas on the Site. Of the areas of potential environmental concern identified, the Northern Historical Tank Farm area, the Former Stretford Unit area, the Transformer Storage Area, and the Former Chemical Laboratory area were investigated (see **Figure 3**). Investigation began with a geophysical survey in these areas to help identify subsurface anomalies that could be indicative of historical oil field operations in these areas. Soil samples for environmental analyses were then collected from these areas. The geophysical survey was expanded to help identify anomalies in other areas of potential

environmental concern at the Site, including a Historical Southern Sump area and around the Central Site Buildings (i.e., Truck Wash and Maintenance Buildings (see **Figure 3**).

2.0 INVESTIGATION SUMMARY

2.1 Pre-Field Activities

2.1.1 Permitting

The Site is located in the Orange County Health Care Agency (OCHCA) well permitting jurisdiction; however, OCHCA does not require permits for soil borings that A) are less than 50 feet in depth, B) do not enter groundwater, C) do not penetrate significant confining material beds, and D) will be backfilled within 24 hours of completion. A permit with the OCHCA permit was not required.

2.1.2 Health and Safety Plan

Langan prepared a Site-specific health and safety plan (HASP) consistent with Occupational Safety and Health Administration (OSHA) hazardous waste operations and emergency response (HAZWOPER) requirements for the field investigation activities. The HASP also included safety requirements and guidance consistent with CRC policies for field operations. The HASP was maintained at the Site and implemented during the completion of the field activities.

2.2 Field Activities Summary

The following field scope of services was implemented between 20 November and 13 December 2024:

The investigation locations are shown on **Figure 3**. Details regarding the environmental scope are described in **Sections 2.3, 2.4 & 2.5**.

2.3 Geophysical Survey

Advantage Geophysics, Inc. (AGI) surveyed the areas indicated in **Section 2.2**. Geophysical survey tools included a Geonics EM61-MK2 Time-Domain Electromagnetic Sensor, a GSSI SIR 3000 Ground Penetrating Radar, a Schonstedt GA-52 Magnetic Gradiometer, Fisher M-Scope TW-6 Pipe and Cable Locator, a Vivax vLoc3-Pro Line Tracer, a Geometrics G858 Cesium Vapor Magnetometer (Former Stretford Unit and Northern Historical Tank Farm areas only), and a Stonex S700a Global Navigation Satellite System Receiver. Other than in the areas of portable water tanks in the Northern Historical Tank Farm Area and buildings in the Central Site Buildings Area, the areas were able to be fully traversed with the geophysical tools.

Utilities identified during the survey were temporarily marked at the surface to help inform future soil sampling activities. Langan also called in an Underground Service Alert (USA), also known as DigAlert, ticket for future subsurface activities. USA Ticket Numbers A243250358, A243250364, and A243250370 were assigned to the Northern Historical Tank Farm/Former Stretford Unit area, Transformer Storage area, and Former Chemical Laboratory area, respectively. Subsurface work did not commence until responses had been received from all required members.

2.4 Soil Sampling

2.4.1 Soil Sampling Locations

A total of 49 soil borings were advanced at the Site. The sample locations are described in the list below:

- Eight borings were advanced in the Former Stretford Unit Area. These borings, identified as SB1 through SB8, are depicted on **Figure 4**.
- Eight borings were advanced in the Transformer Storage Area. These borings, identified as SB9 through SB16, are depicted on **Figure 5**.
- Eight borings were advanced in the Former Chemical Laboratory Area. These borings, identified as SB17 through SB24, are depicted on **Figure 6**.

- Twenty-four (24) borings were advanced in the Northern Historical Tank Farm Area. These borings, identified as SB25 through SB49, are depicted on **Figure 7**.

2.4.2 Boring Advancement

Soft-digging methods were utilized during the first five feet of each soil boring (at a minimum) to help further clear the boring locations for underground utilities. For borings located in hard surface cover (i.e., concrete or asphalt) or for borings whose planned terminal depth was five feet below ground surface (bgs), soft digging was conducted using a hand auger. Prior to hand augering, concrete or asphalt was first saw-cut until first encountered soil. For borings located in soft surface cover (i.e., dirt), soft-digging was completed using an air knife unit. At each boring location, an approximate one-foot by one-foot "L" was air knifed to five feet deep around the planned boring location. The "L" trench was then inspected for any evidence of utility lines entering into the boring location.

Once soft digging was completed, the remainder of each boring was advanced using a Geoprobe® direct push technology (DPT) rig.

Soft-digging and DPT drilling was conducted by ABC Liovin Drilling, Inc. (ABC) (California Contractor C-57 License No. 422904). "L" trenches were dug for soil borings SB25, SB27, SB29, SB31, SB33, SB35, SB37, SB39, SB45, SB48 and SB49. The remaining borings were first advanced using a hand auger.

During the drilling of boring SB49, sandy soil was encountered beyond five feet bgs. Little to no soil recovery was possible beyond this depth. Refusal was then encountered at twelve feet bgs. Encountered refusal was indicative of a hard, flat surface. A step-out boring attempt was made five-feet from the original boring location, but identical low recovery and refusal was again encountered. A deeper sample could not be retrieved from this boring.

No other adverse conditions were encountered during boring advancement.

2.4.3 Field Screening and Sample Collection

Retrieved soil samples were screened in the field for visual evidence of staining and using a hand-held photoionization detector (PID) for volatile organic compounds (VOCs). The soil type, texture, composition, color (as compared to a Munsell® Soil Chart) was logged in the field consistent with International American Society of Testing and Materials (ASTM) Standards D2487-17 and D488-17. Various soil types were observed in the borings (gravel, clay, sand, silt). PID readings of screened soil were between non-measurable (0.0 PPM) to 2,420 parts per million (ppm) in

sample SB9-0.5, Copies of the field observations, boring logs and PID readings are included in **Appendix A**.

Following field screening, samples collected for laboratory analysis were generally retrieved from the sampling depths below. These sampling depths were adjusted in the field if evidence of impact was more prevalent in a different depth interval. Shallow sample depths were also adjusted in areas where thick (greater than six inches) concrete surface cover was encountered:

- Samples in the Former Stretford Unit and Transformer Storage Areas were generally retrieved from 0.5 feet and 2 feet bgs. If evidence of impact was observed, a deeper sample was also collected from 5 feet bgs.
- Samples in the Former Chemical Laboratory and Northern Historical Tank Farm Areas were retrieved from 2, 5, and 15 feet bgs.

Soil samples for laboratory analysis were collected either from the end of the hand-auger bucket or from acetate liners retrieved by the DTP rig. Samples were collected into laboratory supplied containers. With the exception of sample SB31-2.0, samples collected for analysis of VOCs were collected into United States Environmental Protection Agency (USEPA) Method 5035 Sampling Kits. VOC analysis was performed from a standard sample container (i.e., glass jar) for SB31-2.0 as insufficient soil volume was available in the collected USEPA Method 5035 Sampling Kit. Each sample was individually identified, labeled, and stored in a chilled cooler. The samples were then transported under standard chain-of-custody procedures to a certified laboratory.

Soil sampling equipment was decontaminated between sampling locations with a triple-rinse wash (washed and brushed once in a detergent solution, then twice with clean water). To help verify proper decontamination of sampling equipment, an equipment blank sample was collected at the end of each day by running deionized water over the cleaned hand auger or DPT drilling rod and collecting the rinsate into the appropriate sampling containers. A trip blank sample prepared by the laboratory was also submitted at the end of each day to help verify integrity of the samples during transit. Field quality assurance samples were also documented on the chain of custody.

Field screening of soil retrieved from boring SB48 suggested that, in addition to the 2-, 5- and 15-foot bgs samples collected, impacted soil may have been present at between 8 and 9.5 feet bgs. PID readings of the soil were 7.3 parts per million (ppm). An additional sample (SB48-9.5) was collected from this soil and submitted to the laboratory. However, between transfer of the samples from the field team to the sample courier, SB48-9.5 was misplaced and was not received by the lab. No analytical data is available for this extra sample. Analytical results for samples

collected from SB48, including the deepest sample collected at 15 feet, were below applicable screening levels (see **Section 3.2.4**).

As discussed previously regarding boring SB49, little to no soil recovery was possible beyond five feet bgs and refusal was encountered at 12 feet bgs. A soil sample deeper than five feet bgs could not be collected from this boring.

No other limitations were encountered during field screening and sample collection.

2.4.4 Laboratory Analysis

Collected samples were submitted to Eurofins CalScience (National Environmental Lab Accreditation Program No. 4175) for analysis. Analytical methods included the following:

- USEPA Methods 6010B/7471A for California Title 22 Metals
- USEPA Method 8015B (M) for Total Petroleum Hydrocarbons (TPH) by carbon chain number C4-C40
- USEPA Method 8260B for VOCs
- USEPA Method 8270C/8270C SIM for Semi-Volatile Organic Compounds (SVOCs) and polycyclic aromatic hydrocarbons (PAHs)
- USEPA Method 8082 for polychlorinated biphenyls (PCBs)

Samples collected from each area were analyzed for the following:

- Samples collected from the Former Stretford Unit Area were analyzed for concentrations of metals. Soil that was observed to have staining or measurable amounts of VOCs when screened with the PID was also analyzed for concentrations of TPH, VOCs, SVOCs and PAHs.
- Samples collected from the Transformer Storage Area were analyzed for concentrations of PCBs. Soil that was observed to have staining or measurable amounts of VOCs when screened with the PID was also analyzed from concentrations of TPH, VOCs, SVOCs and PAHs.
- Samples collected from the Former Chemical Laboratory and Northern Historical Tank Farm Areas were analyzed for concentrations of metals, TPH, VOCs, SVOCs, and PAHs.

If necessary, collected samples were further analyzed to determine soluble concentrations of select analytes. Total analyte concentrations that were greater than ten times the §66261.24 Hazardous Waste Characteristic of Toxicity Soluble Threshold Limit Concentrations (STLC) but

less than the Total Threshold Limit Concentration (TTLC) were further analyzed following the Waste Extraction Test (WET) to determine their STLC component. Total analyte concentrations that were greater than twenty times the Toxicity Characteristic Leaching Procedure (TCLP) levels were further analyzed following USEPA Method 1311 TCLP.

Field equipment blank samples were analyzed by the same analytical methods (adjusted for water) submitted for soil samples on that day. Trip blanks samples were analyzed for concentrations of VOCs.

2.5 Surface Completion and Investigation Derived Waste

"L" trenches at the Site were backfilled using native soil. Soil borings advanced via hand auger or DPT rig were backfilled with bentonite to the surface. Each boring was completed to match the existing surface cover (i.e., dirt, asphalt, concrete).

Soil cuttings were stored in steel Department of Transportation (DOT) approved drums onsite. Decontamination water was stored in a separate steel DOT-approved drum onsite. A total of four soil drums and one water drum were generated as part of the investigation. Each of the drums was labeled with the generator, generation date and contents identified. A composite soil sample was collected from the soil drums for waste profiling purposes. The water drum was also profiled from the composite soil sample. The drums were profiled as non-hazardous and are currently awaiting pickup and removal at a later date. A complete of the complete waste manifest will be provided once then drums have been transported offsite and disposed of.

3.0 INVESTIGATION FINDINGS

3.1 Geophysical Survey Findings

The geophysical survey identified 12 candidate electromagnetic (EM) anomalies, two larger candidate backfilled excavation anomalies, seven candidate vapor magnetometer (MAG) anomalies, and numerous active utilities and unidentified lines in the surveyed areas. Numerous high EM responses potentially indicative of buried metallic utilities and former structures were present throughout. Several smaller possible excavations and utility trenches were also detected. The geophysical survey report provided by Advantage is included as **Appendix B**. The report includes figures depicting the locations of the identified anomalies. The findings for each surveyed area are summarized in the following subsections. In many cases, while the findings may be suggestive of or provide evidence that a particular subsurface feature may be present,

due to the complex nature of the site subsurface, more direct methods (i.e., earth-moving investigations) would be required to confirm any of the findings.

3.1.1 Former Stretford Unit and Historical Tank Farms Areas

Three EM anomalies were noted in this area. GPR traverses over these areas were inclusive and more direct methods would be required to determine the exact nature of these anomalies. The EM anomalies were located in close proximity to soil borings SB26, SB41, and SB48, respectively.

A large potential exaction was noted in this area. While the GPR findings are indicative of a former structure in this area, the exact cause is unknown. Soil borings SB27 and SB29 are located on the northwest edge of the excavation anomaly.

Seven (MAG) anomalies were noted in this area. While significant interference as the result of buried metallic objects was encountered when surveying with the MAG, the MAG responses in these seven areas were strong enough to potentially be the result of abandoned oil wells. Further and more direct methods would be required to confirm if abandoned oil wells are present in these areas. The MAG anomalies were located after soil borings in this area were advanced. Soil borings SB32, SB38, and SB39 were coincidentally located near three respective MAG anomalies, whereas the other MAG anomalies were located outside the soil borings array.

Three current sumps were identified in this area, located on the northeast perimeter, southwest perimeter, and western corner of the surveyed area. Active and inactive underground lines, former foundations, and other debris are present throughout the area.

3.1.2 Transformer Storage and Central Site Buildings Areas

Five EM anomalies were noted in this area. One of the anomalies is long and narrow, indicative of a foundation or utility line located north of the eastern corner building in this area. One of the other anomalies located just south of the long and narrow anomaly, just northwest of the eastern corner building, is more suggestive of a UST. Three other anomalies also suggestive of a UST were identified in the southern corner of this area. GPR traverses over these anomalies were inclusive and more direct methods would be needed to confirm the cause of the EM anomalies.

A GPR anomaly was identified just southwest of the eastern corner building. The anomaly is approximately 65 feet long, 13 feet wide, and 4 to 5 feet deep. Although the exact cause cannot be known, the disturbed soil in this area suggests something was removed.

Four septic tanks tied into the nearby buildings were identified during the survey. A current sump was identified in the eastern corner. A water well was identified on the southwest perimeter of the surveyed area. Numerous other utility lines are present.

3.1.3 Former Chemical Laboratory Area

Three EM anomalies were noted in this area. The first anomaly, located north of the east building corner, contained a cleanout cover connected to an apparent septic tank below. GPR traverses over this anomaly suggested a flat topped reinforced concrete structure was present. No aboveground indicators or suggestive GPR scans were noted in the area of the other two EM anomalies. More direct methods would be needed to determine the cause of these two anomalies. Soil borings SB18, SB19, and SB20 were located next to these anomalies, respectively.

3.1.4 Historical Southern Sumps Area

One EM anomaly was noted in this area. The anomaly is located northeast of the stormwater detention pond in the area, just beyond the point where asphalt surface cover transitions to dirt. While GPR traverses over the anomaly were inconclusive, the size and shape of the anomaly are suggestive of a UST. The presence of a subsurface pipe that terminates at the anomaly further supports this possibility. More direct methods would be needed to determine the exact cause of the EM anomaly.

A current sump was also identified in the northern corner of this area.

3.2 Soil Sampling Analytical Results

Laboratory analytical reports provided by Eurofins CalScience are included in **Appendix C.** The analytical results for collected soil samples are summarized by analyte group in the following tables:

- **Table 1** – Soil Analytical Results: Metals (Total Concentrations)
- **Table 2** – Soil Analytical Results: Metals (Soluble Concentrations)
- **Table 3** – Soil Analytical Results: Total Petroleum Hydrocarbons
- **Table 4** – Soil Analytical Results: Volatile Organic Compounds
- **Table 5** – Soil Analytical Results: Semi-Volatile Organic Compounds & Polycyclic Aromatic Hydrocarbons
- **Table 6** – Soil Analytical Results: Polychlorinated Biphenyls

Analyte concentrations identified above the method detection limits were compared to select screening levels. The method detection limit for VOC, SVOC, and PAH analytes that were identified in at least one sample were also compared to screening levels. Screening levels used for comparison were taken from the following sources, as appropriate and/or available.

- San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs), August 2025
- California Department of Toxic Substances Control (DTSC) Human Health Risk Assessment (HHRA) Note Number 3 DTSC-modified Screening Levels (DTSC-SLs), June 2020-Revised April 2025
- USEPA Regional Screening Levels (RSLs), November 2024
- DTSC HHRA Note Number 11 Southern California Ambient Arsenic Screening Level, December 2020
- Federal and State Hazardous Waste Characteristics of Toxicity Levels (§66261.24)

For the SFBRWQCB ESLs, DTSC-SLs, and USEPA RSLS, the most stringent screening level available for human health exposure (residential, commercial/industrial, or construction worker receptors), leaching to groundwater, and gross contamination from these sources was used for comparison. Concentrations exceeding the compared screening level are indicated in **bold** in the summary tables.

Screening levels from the Huntington Beach Fire Department (HBFD) City Specification No. 431-92 Soil Quality Standard, October 2022, were also evaluated when selecting comparison criteria for the analytical results. The HBFD Soil Quality Standard provides screening levels for TPHs (full carbon chain), benzene, toluene, ethylbenzene, xylenes, and PAHs. The SFBRWQCB, DTSC, and/or USEPA screening levels referenced above are more conservative than these values with the exception of oil range TPH and select PAHs. The SFBRWQCB and USEPA screening levels for oil range TPH and PAHs are derived from compound specific toxicity values and physical properties[1] evaluated based on scenario specific exposure parameters. The HBFD screening levels are generalized for the entire range of TPH mixtures and family of PAH compounds. The

[1] Toxicity values and physical properties for TPH mixtures utilized by the SFBRWQCB and USEPA are based on the carbon chain fraction and a representative surrogate compound for calculating screening levels. The DTSC does not provided screening levels for TPH mixtures.

compound specific SFBRWQCB and USEPA screening levels were utilized to provide a more chemically relevant comparison level for the analytical results.

In several instances, SVOCs/PAHs detected by USEPA Method 8270C were also detected by USEPA Method 8270C SIM. The gas chromatography used in the basic 8270C method scans a large range of masses for an array of compounds. The SIM (selected ion monitoring) method allows data collection at specific mass indexes for target compounds. In **Table 5**, the following procedure was followed to determine whether the 8270C or the 8270C SIM result was included:

1. If either result is qualified because it exceeded the calibration range ("E") or it could not be verified and was rejected ("R"), the other result not qualified with "E" or "R" was included.
2. If both method results were not detected, the 8270C SIM reporting and method detection limit was included.
3. If the 8270C method result was not detected and the 8270C SIM method did detect a concentration, the 8270C SIM result was included.
4. If both method results identified a concentration, the higher of the two results was included.
5. If both method results identified a concentration and the concentrations were the same, the 8270C SIM result was included.

Both the 8270C and 8270C SIM results are included in the laboratory analytical reports in **Appendix C**.

Several of the analytical results included in the summary tables were qualified by Eurofins CalScience. Qualifiers with a significant bearing on the veracity of the analytical result are denoted in the summary tables. Other analytical or quality issues of less significance or that did not result in a qualified concentration value are chronicled in the job narratives of the complete laboratory analytical reports included in **Appendix C**.

Further summaries of the analytical results are provided by area in the following subsections.

3.2.1 Former Stretford Unit Area

Metal analysis of soil samples collected from the Former Stretford Unit Area identified concentrations of arsenic, barium, beryllium, cadmium, total chromium, cobalt, copper, lead, mercury, molybdenum, nickel, vanadium, and zinc above the laboratory reporting or method detection limits (**Table 1**). Of these metals, only detections of cadmium in sample SB8-0.5 and

vanadium in samples SB2-0.5, SB4-0.5, SB5-0.5, SB6-1.5, and SB8-0.5 exceed the applicable screening level (DTSC-SL for residential soil, SFBRWQCB ESL for residential soil).

Concentrations of cadmium and vanadium in the aforementioned samples were high enough to warrant further analysis to determine if soluble concentrations may exceed Federal or State Hazardous Waste Characteristic of Toxicity Levels. STLCs for vanadium or cadmium (**Table 2**) exceeded State Hazardous Waste Characteristic of Toxicity Levels in samples SB2-0.5, SB4-0.5, SB5-0.5, SB6-1.5, and SB8-0.5. TCLP concentrations for these metals did not exceed Federal Hazardous Waste Characteristic of Toxicity Levels.

Although not detected in any of the samples, the method detection limit of thallium exceeded the applicable screening level (SFBRWQCB ESL for residential soil) in all the soil samples collected. There is no known evidence that the use of thallium was associated with Site operations.

Field screening of soil suggested that analysis of TPHs, VOCs, SVOCs, and PAHs was warranted for samples collected from borings SB2, SB6, and SB8. Gasoline, diesel, and oil range TPH was detected above method detection limits in all three borings (**Table 3)**. Gasoline range TPH exceeded the appliable screening level (SFBRWQCB ESL for odor nuisance) in SB6-2.0 only. Diesel range TPH exceeded the applicable screening level (SFBRWQCB ESL for residential soil) in SB2-0.5, SB6-1.5, and SB6-2.0.

VOC analysis of soil samples identified concentrations of 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, 2-butanone (methyl ethyl ketone [MEK]), acetone, benzene, carbon disulfide, ethylbenzene, isopropylbenzene, naphthalene, n-butylbenzene, n-propylbenzene, o-xylene, m,p-xylene, p-isopropyltoluene, sec-butylbenzene, tert-butyl alcohol (TBA), tetrachlorothene (PCE), toluene, and trichloroethene (TCE) above method detection limits (**Table 4**). Of these VOCs, detections of naphthalene in SB2-0.5 and SB6-2.0, and detections of TBA in SB2-0.5 and SB8-0.5 exceeded the applicable screening level (SFBRWQCB ESL for leaching to groundwater).

SVOC and PAH analysis of soil samples identified concentrations of 1-methylnapthalene, 2-methylnapthalene, acenaphthene, anthracene, benzo[g,h,i]perylene, benzon[k]fluoranthene, benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, chrysene, dibenzofuran, fluoranthene, fluorene, indenol[1,2,3-cd]pyrene, naphthalene, phenanthrene, and pyrene above method detection limits (**Table 5**). Of these analytes, only concentrations of 1-methylnapthalene, 2-methylnapthalene, and naphthalene in SB2-0.5, SB2-2.0, SB6-1.5, SB6-2.0, and SB8-0.5 exceeded the applicable screening levels (USEPA RSL for residential soil, SFBRWQCB ESL for leaching to groundwater).

Soil borings in the Former Stretford Unit Area that contained soil with analyte concentrations exceeding applicable screening levels are *italicized* in **Figure 4**. Concentrations exceeding screening levels were not observed in any samples beyond two feet bgs.

3.2.2 Transformer Storage Area

PCB analysis of soil samples collected from the Transformer Storage Area did not identify any concentrations of PCBs above method detection limits (**Table 6**).

Field screening of soil suggested that analysis of TPHs, VOCs, SVOCs, and PAHs was warranted for samples collected from borings SB9. Gasoline, diesel, and oil range TPH exceeded the appliable screening level (SFBRWQCB ESL for odor nuisance, SFBRWQCB ESL for residential soil, SFBRWQCB ESL for gross contamination) in SB9-0.5 only (**Table 3**).

VOC analysis of soil samples from boring SB9 identified concentrations of 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, MEK, acetone, ethylbenzene, isopropylbenzene, naphthalene, n-butylbenzene, n-propylbenzene, o-xylene, m,p-xylene, p-isopropyltoluene, sec-butylbenzene, TBA, and toluene above method detection limits (**Table 4**). Of these VOCs, only the concentration of naphthalene and TBA in SB9-0.5 exceeded the applicable screening level (SFBRWQCB ESL for leaching to groundwater).

SVOC and PAH analysis of soil samples from boring SB9 identified concentrations of 1-methylnapthalene, 2-methylnapthalene, acenaphthene, anthracene, benzo[g,h,i]perylene, benzo[a]anthracene, chrysene, fluorene, naphthalene, phenanthrene, and pyrene above method detection limits (**Table 5**). Of these analytes, only concentrations of 1-methylnapthalene, 2-methylnapthalene, and naphthalene in SB9-0.5 exceeded the applicable screening levels (USEPA RSL for residential soil, SFBRWQCB ESL for leaching to groundwater).

Soil borings in the Transformer Storage Area that contained soil with analyte concentrations exceeding applicable screening levels are *italicized* in **Figure 5**. Concentrations exceeding screening levels were not observed in any samples beyond 0.5 feet bgs.

3.2.3 Former Chemical Laboratory Area

Metal analysis of soil samples collected from the Former Chemical Laboratory Area identified concentrations of arsenic, barium, beryllium, cadmium, total chromium, cobalt, copper, lead, mercury, molybdenum, nickel, vanadium, and zinc above method detection limits (**Table 1**). Of these metals, only detections of arsenic in sample SB17-2.0, barium in samples SB18-2.0 and SB21-2.0, and mercury in samples SB19-2.0 and SB-20-2.0 exceeded applicable screening levels

(DTSC ambient arsenic level for Southern California, SFBRWQCB ESL for construction worker soil, DTSC-SL for residential soil).

Although not detected in any of the samples, the method detection limit of the thallium exceeded the applicable screening level (SFBRWQCB ESL for residential soil) in all the soil samples collected. There is no known evidence that the use of thallium was associated with Site operations.

Concentrations of barium in samples SB17-2.0, SB18-2.0, SB21-2.0, and SB22-2.0 and concentrations of mercury in samples SB19-2.0 and SB20-2.0 were high enough to warrant further analysis to determine if soluble concentrations may exceed Federal or State Hazardous Waste Characteristic of Toxicity Levels. None of the soluble concentrations of these metals in these samples exceeded either the Federal or State Hazardous Waste Characteristic of Toxicity Levels (**Table 2**).

Gasoline, diesel, and oil range TPH was detected above method detection limits in all Former Chemical Laboratory Area borings (**Table 3**). Of these detections, only diesel range TPH concentrations exceeded the screening level (SFBRWQCB ESL for residential soil) in samples SB-18-2.0, SB19-2.0, SB20-2.0, SB21-2.0, SB22-2.0, SB22-5.0, and SB23-2.0.

VOC analysis identified concentrations of 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, 1,3-dichlorobenzene, MEK, acetone, benzene, carbon disulfide, chlorobenzene, ethylbenzene, isopropylbenzene, n-butylbenzene, n-propylbenzene, o-xylene, m,p-xylene, p-isopropyltoluene, sec-butylbenzene, TBA, and toluene above method detection limits in several samples (**Table 4**). Of these VOCs, only the concentration of TBA in SB19-2.0, SB21-5.0 and SB23-5.0 exceeded the applicable screening level (SFBRWQCB ESL for leaching to groundwater).

SVOC and PAH analysis identified concentrations of 1-methylnapthalene, 2-methylnapthalene, acenaphthene, benzo[g,h,i]perylene, benzo[a]anthracene, benzo[a]pyrene, chrysene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene in several samples (**Table 5**). Of these SVOCs/PAHs, only concentrations of 1-methylnapthalene, 2-methylnapthalene, benzo[a]pyrene, and/or naphthalene in samples SB19-2.0, SB21-2.0, and SB21-5.0 exceeded screening levels (USEPA RSL for residential soil, SFBRWQCB ESL for leaching to groundwater, SFBRWQCB ESL for residential soil).

Soil borings in the Former Chemical Laboratory Area that contained soil with analyte concentrations exceeding applicable screening levels are *italicized* in **Figure 6**. Concentrations exceeding screening levels were not observed in any samples beyond five feet bgs.

3.2.4 Northern Historical Tank Farm

Metal analysis of soil samples collected from the Northern Historical Tank Farm Area identified concentrations of arsenic, barium, beryllium, cadmium, total chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, vanadium, and zinc above the laboratory method detection limits (**Table 1**). Of these metals, only a single detection of arsenic in sample SB33-1.5 exceeded the applicable screening level (DTSC ambient arsenic level for Southern California).

Although not detected in any of the samples, the method detection limit of thallium exceeded the applicable screening level (SFBRWQCB ESL for residential soil) in all the soil samples collected. There is no known evidence that the use of thallium was associated with Site operations.

Gasoline, diesel, and oil range TPH was detected above method detection limits in multiple samples collected from the Northern Historical Tank Farm (**Table 3**). Of these detections, only samples SB26-2.0, SB27-1.0, SB29-2.0, SB31-2.0, SB33-1.5, SB35-2.0, SB39-2.0, SB44-2.0, and SB44-5.0 contained concentrations that exceeded applicable screening levels (SFBRWQCB ESL for odor nuisance, SFBRWQCB ESL for residential soil, SFBRWQCB ESL for gross contamination).

VOC analysis identified concentrations of 1,1,2-trichloroethane, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, 4-methyl-2-pentanone (MIBK), MEK, acetone, benzene, bromodichloromethane, bromoform, carbon disulfide, chloroform[2], cis-1,2-dichloroethene, ethylbenzene, isopropylbenzene, naphthalene, n-butylbenzene, n-propylbenzene, o-xylene, m,p-xylene, total xylenes, p-isopropyltoluene, sec-butylbenzene, TBA, tetrachloroethene, toluene, trichloroethene and vinyl chloride (**Table 4**). Of these VOCs, only detections of benzene, chloroform, ethylbenzene, naphthalene, and TBA exceeded screening levels (SFBRWQCB ESL for leaching to groundwater).

SVOC and PAH analysis identified concentrations of 1-methylnapthalene, 2-methylnapthalene, acenaphthene, anthracene, chrysene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene. Of these SVOCs/PAHs, only concentrations of 1-methylnapthalene, 2-methylnapthalene,

[2] The single concentration of chloroform identified above method detection limits was found in sample SB31-2.0. The analytical result was qualified as chloroform was identified in the analysis batch blank and may not be the result of site contamination (*i.e.*, likely associated with laboratory contamination).

and naphthalene exceeded screening levels (USEPA RSL for Residential Soil, SFBRWQCB ESL for leaching to groundwater) in samples SB26-2.0, SB29-2.0, SB31-2.0, SB33-1.5, SB35-2.0, SB39-2.0, and SB44-2.0.

Soil borings in the Northern Historical Tank Farm that contained soil with analyte concentrations exceeding applicable screening levels are *italicized* in **Figure 7**. Concentrations exceeding screening levels were not observed in any samples beyond five feet bgs.

3.2.5 Field Quality Assurance Samples

Barium was detected above the method detection limit but below the laboratory reporting limit at 1.60 micrograms per liter (µg/L) in the equipment blank sample collected on 25 November 2024. Acetone was detected above the method detection limit but below the laboratory reporting limit in the equipment blank samples collected on 5 December 2024. No other analytes were detected above method detection limits in any of the equipment blank samples.

No VOCs were identified above method detection limits in any of the trip blank samples analyzed.

4.0 CONCLUSIONS

Langan completed this investigation to help address potential environmental concerns associated with specific areas at the Site. The investigation included a geophysical survey and soil sampling. Findings and conclusions for each area are outlined below.

4.1 Former Stretford Unit Area

The geophysical survey in the Former Stretford Unit Area did not identify any significant subsurface anomalies.

A total of eight borings were advanced in this area with 19 soil samples collected for laboratory analysis. Five of the eight borings had soil samples with analyte concentrations exceeding screening levels. Vanadium exceeded screening levels in each of these five borings. Soluble concentrations of vanadium or cadmium in these five borings also exceeded California hazardous waste levels but were below Federal hazardous waste levels. Three of the eight borings also contained soil concentrations or method detection limits of TPH, VOCs, and SVOCs/PAHs exceeding screening levels. Metal concentrations exceeding screening levels were delineated to the upper 1.5 feet bgs of soil; TPH, VOC, and SVOC/PAH concentrations exceeding screening levels were delineated to the upper two feet bgs of soil. Borings with exceedances are laterally delineated to the northwest and northeast. Borings with exceedances were present on the

southwest and southeast perimeter of the Former Stretford Unit Area soil borings array. A pipeline channel located immediately southwest of the Former Stretford Unit restricts access for advancing soil borings in that area.

4.2 Transformer Storage Area

The geophysical survey in the Transformer Storage Area did not identify any significant subsurface anomalies.

A total of eight borings were advanced in this area with 17 soil samples collected for laboratory analysis. None of the analyzed samples contained any concentrations of PCBs over detection limits. One boring contained soil concentrations of TPH, VOCs, and SVOCs/PAHs exceeding screening levels. Exceedances in this single boring were confined to the upper 0.5 feet bgs of soil. The single boring with exceedances was located on the northwest perimeter of the Transformer Storage Area soil borings array.

4.3 Former Chemical Laboratory

The geophysical survey of the Former Chemical Laboratory Area identified three subsurface anomalies, one of which was evident to be the result of a septic tank. Soil borings were located next to these anomalies.

A total of eight borings were advanced in this area with 24 soil samples collected for laboratory analysis. Seven of the eight borings had soil samples with analyte concentrations exceeding screening levels. Arsenic exceeded background levels in one boring; barium exceeded screening levels in two borings. TPH concentrations exceeded screening levels in five borings. VOC method concentrations exceeded screening levels in two of the borings. SVOC/PAH concentrations exceeded screening levels in two of the borings. Metal concentrations exceeding screening levels were delineated to the upper 0.5 feet bgs of soil; TPH and VOC concentrations/method detection limits exceeding screening levels were delineated to the upper two feet bgs of soil; SVOC/PAH concentrations exceeding screening levels were delineated to the upper five feet bgs of soil. Borings with exceedances were distributed throughout the Former Chemical Laboratory Area, with the exception of SB24, which is located along the southern perimeter of the soil boring array.

4.4 Northern Historical Tank Farm

The geophysical survey of the Northern Historical Tank Farm Area identified several subsurface anomalies. Soil borings were located next to EM anomalies and a potential excavation area.

Several anomalies suggestive of abandoned oil wells were identified; however, significant interference was encountered when identifying these anomalies and further investigation would be needed to confirm the presence of the wells. The potential oil well anomalies were identified after soil borings were advanced; however, several borings were coincidentally located next to these anomalies.

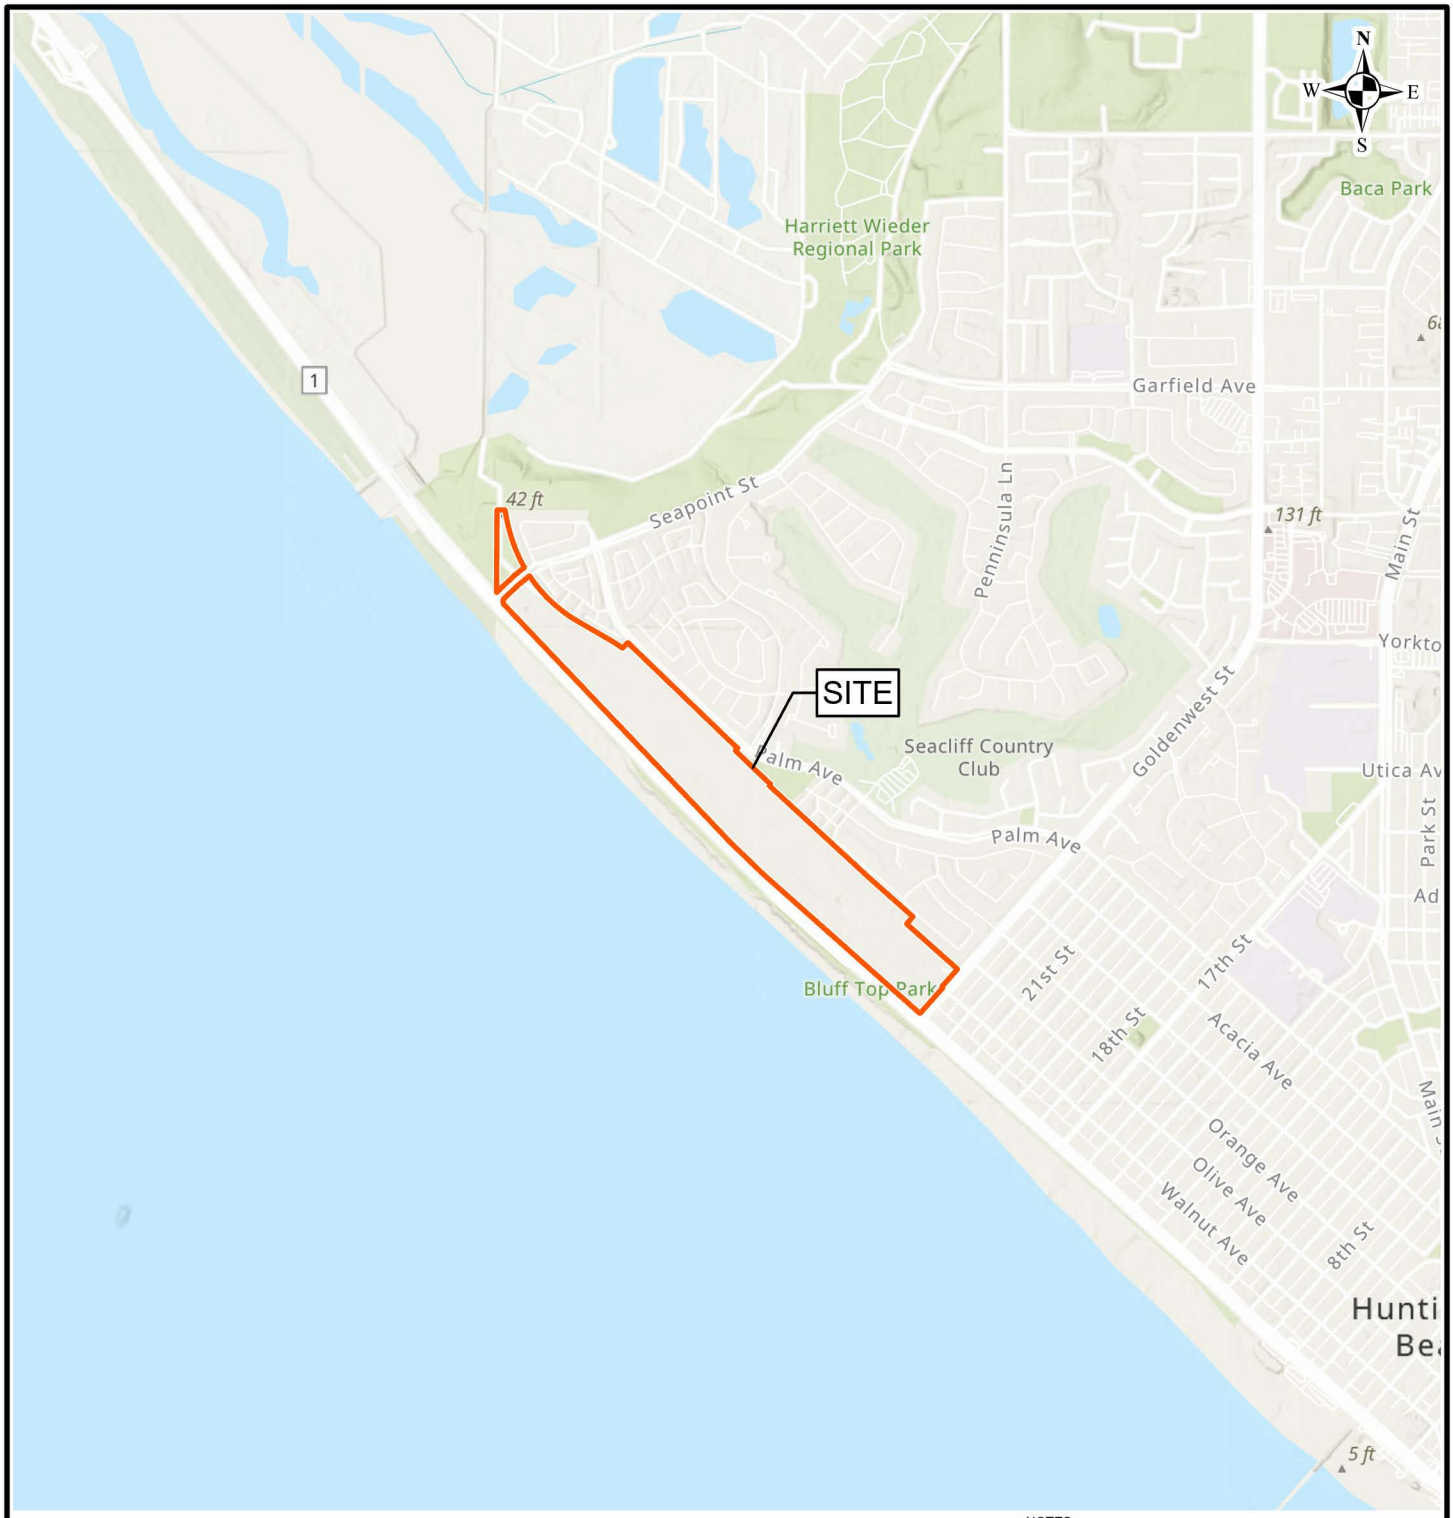
A total of 25 borings were advanced in this area with 74 soil samples collected for laboratory analysis. Nine of 25 borings had soil samples with analyte concentrations exceeding screening levels. Arsenic exceeded ambient levels in one boring. TPH concentrations exceeded screening levels in eight borings. VOC and SVOC/PAH concentrations exceeded screening levels in twelve borings. Metal, TPH, and SVOC/PAH concentrations exceeding screening levels were delineated to the upper two feet bgs of soil, with the exception of TPH at SB44-5.0. VOCs concentrations were delineated to the upper 15 feet bgs.. Borings with exceedances were laterally delineated with the exception of SB26, SB27, and SB39 to the northeast and SB44 to the southwest.

While it cannot be confirmed based on this investigation, encountered soil and drilling refusal suggest that SB49 may be located over a water detention basin that was abandoned in place with imported backfill. The geophysical survey in this area did not identify any significant anomalies in this area, although five to 12 feet bgs is beyond the general visibility depth of the utilized methods.

4.5 Historical Southern Sumps

The geophysical survey of the Historical Southern Sumps Area identified one anomaly that is potentially the result of a UST. This area is planned for future investigation, which will include the identified anomaly.

4.6 Central Site Buildings



The geophysical survey of the Central Site Buildings Area (i.e., Truck Wash and Maintenance Buildings) identified several subsurface anomalies. Some of the anomalies were suggestive of USTs and one was suggestive of a former excavation area. This area is planned for future investigation, which will include the identified anomalies.

Notes:

Soil results were compared Site-specific screening levels that are a compilation of [1] EPA RSL Residential Soil (November 2024), RWQCB [2] Soil Direct Exposure Construction Worker: Any Land Use ESL, [3] Soil Direct Exposure Residential ESL, [4] Leaching to Groundwater ESL, and [5] Soil Gross Contamination ESL (July 2025), [6] CA DTSC Residential Soil (April 2025), and [7] Average Background Arsenic Concentration from "Determination of a Southern California Regional Background Arsenic Concentration in Soil" published by the CA DTSC (2008)

RWQCB - Regional Water Quality Control Board

ESL - Environmental Screening Level

DTSC - Department of Toxic Substance Control

CAS - Chemical Abstract Service

NS - No standard

mg/kg - Milligrams per kilogram

NA - Not Analyzed

MDL - Method Detection Limit

<MDL - Not detected

Qualifiers:

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument. (Alpha)

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the MDL.

B - The analyte was found in the associated analysis batch blank.

Exceedance Summary:

10 - Result exceeds Site-Specific Soil Screening Levels

Notes:

Soil results were compared Site-specific screening levels that are a compilation of [1] EPA RSL Residential Soil (November 2024), RWQCB [2] Soil Direct Exposure Construction Worker: Any Land Use ESL, [3] Soil Direct Exposure Residential ESL, [4] Leaching to Groundwater ESL, and [5] Soil Gross Contamination ESL (July 2025), [6] CA DTSC Residential Soil (April 2025), and [7] Average Background Arsenic Concentration from "Determination of a Southern California Regional Background Arsenic Concentration in Soil" published by the CA DTSC (2008)

RWQCB - Regional Water Quality Control Board

ESL - Environmental Screening Level

DTSC - Department of Toxic Substance Control

CAS - Chemical Abstract Service

NS - No standard

mg/kg - Milligrams per kilogram

NA - Not Analyzed

MDL - Method Detection Limit

<MDL - Not detected

Qualifiers:

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument. (Alpha)

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the MDL.

B - The analyte was found in the associated analysis batch blank.

Exceedance Summary:

10 - Result exceeds Site-Specific Soil Screening Levels

Notes:

Soil results were compared Site-specific screening levels that are a compilation of [1] EPA RSL Residential Soil (November 2024), RWQCB [2] Soil Direct Exposure Construction Worker: Any Land Use ESL, [3] Soil Direct Exposure Residential ESL, [4] Leaching to Groundwater ESL, and [5] Soil Gross Contamination ESL (July 2025), [6] CA DTSC Residential Soil (April 2025), and [7] Average Background Arsenic Concentration from "Determination of a Southern California Regional Background Arsenic Concentration in Soil" published by the CA DTSC (2008)

RWQCB - Regional Water Quality Control Board

ESL - Environmental Screening Level

DTSC - Department of Toxic Substance Control

CAS - Chemical Abstract Service

NS - No standard

mg/kg - Milligrams per kilogram

NA - Not Analyzed

MDL - Method Detection Limit

<MDL - Not detected

Qualifiers:

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument. (Alpha)

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the MDL.

B - The analyte was found in the associated analysis batch blank.

Exceedance Summary:

10 - Result exceeds Site-Specific Soil Screening Levels

Notes:

Soil results were compared Site-specific screening levels that are a compilation of [1] EPA RSL Residential Soil (November 2024), RWQCB [2] Soil Direct Exposure Construction Worker: Any Land Use ESL, [3] Soil Direct Exposure Residential ESL, [4] Leaching to Groundwater ESL, and [5] Soil Gross Contamination ESL (July 2025), [6] CA DTSC Residential Soil (April 2025), and [7] Average Background Arsenic Concentration from "Determination of a Southern California Regional Background Arsenic Concentration in Soil" published by the CA DTSC (2008)

RWQCB - Regional Water Quality Control Board

ESL - Environmental Screening Level

DTSC - Department of Toxic Substance Control

CAS - Chemical Abstract Service

NS - No standard

mg/kg - Milligrams per kilogram

NA - Not Analyzed

MDL - Method Detection Limit

<MDL - Not detected

Qualifiers:

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument. (Alpha)

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the MDL.

B - The analyte was found in the associated analysis batch blank.

Exceedance Summary:

10 - Result exceeds Site-Specific Soil Screening Levels

Table 6
Soil Analytical Results:Polychlorinated Biphenyls
CRC Huntington Beach Property
Huntington Beach, CA

Notes:

Soil results were compared Site-specific screening levels that are a compilation of [1] EPA RSL Residential Soil (November 2024), RWQCB [2] Soil Direct Exposure Construction Worker: Any Land Use ESL, [3] Soil Direct Exposure Residential ESL, [4] Leaching to Groundwater ESL, and [5] Soil Gross Contamination ESL (July 2025), [6] CA DTSC Residential Soil (April 2025), and [7] Average Background Arsenic Concentration from "Determination of a Southern California Regional Background Arsenic Concentration in Soil" published by the CA DTSC (2008)

RWQCB - Regional Water Quality Control Board

ESL - Environmental Screening Level

DTSC - Department of Toxic Substance Control

CAS - Chemical Abstract Service

NS - No standard

mg/kg - Milligrams per kilogram

NA - Not Analyzed

MDL - Method Detection Limit

<MDL - Not detected

Qualifiers:

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument. (Alpha)

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the MDL.

B - The analyte was found in the associated analysis batch blank.

Exceedance Summary:

10 - Result exceeds Site-Specific Soil Screening Levels

Subject: **Geophysical Evaluation**
CRC Huntington Beach Facility, Huntington Beach, California
Project No. 2024120

Dear Mr. Knight:

Advantage Geophysics (Advantage) has performed a geophysical evaluation pertaining to the subject project in Huntington Beach, California. The purpose of our evaluation was to assess the presence of buried underground storage tanks (USTs), backfilled excavations associated with UST removal, and detectable utilities within selected portions of the project site. In addition, the presence of historic abandoned oil wells was evaluated within a portion of the project site. Specifically, our services included the performance of electromagnetic (EM) and magnetic (MAG) evaluations at preselected portions of the subject project. Our evaluation was conducted from November 20 through December 13, 2024. This report presents our methodology, equipment used, analysis, and findings.

SCOPE OF SERVICES

Our scope of services for the project included:

- Performance of geophysical evaluations to assess the presence of buried underground storage tanks (USTs), backfilled excavations associated with UST removal, detectable utilities, and the presence of historic abandoned oil wells within selected portions of the project site.
- Site reconnaissance including field mapping of surface structures at and near the study area.
- Compilation and analysis of the data collected.
- Preparation of this report presenting our findings, conclusions, and recommendations.

SITE AND PROJECT DESCRIPTION

The project site is located at 20101 Goldenwest Street in Huntington Beach, California (Figure 1a). Specifically, the site is located along Pacific Coast Highway 1 in between Goldenwest Street and Seapoint Street. The subject project is currently an operating oil field with active electric lines, wastewater lines, water lines, gas lines, sumps, storm drains, etc. Figure 1b depicts the approximate study areas and general site conditions. The study areas have been labeled as Historical Tank Farm and Former Stretford Unit, Central Site Buildings and Transformer Storage Area, Former Chem Lab, and Historical Southern Sumps.

Based on our discussions with you and review of historical aerial images and maps provided by your office, it is our understanding that the site has been used as an oil field for many years. It is also our understanding that several USTs and septic tanks may be in the areas of interest; however, there are only known locations in the Central Site Buildings area. Additionally, is our understanding that abandoned oil wells, active/abandoned utilities, and remnant building foundations may exist within the study areas.

GEOPHYSICAL INSTRUMENTATION AND APPLICATIONS

Our evaluation included the use of a Geonics model EM61-MK2 time-domain instrument, Geometrics G858 cesium vapor magnetometer, GSSI SIR 3000 Ground Penetrating Radar (GPR) units using a 400 MHz transducer, Schonstedt GA-52 magnetic gradiometer, Fisher M-Scope TW-6 pipe and cable locator, Vivax vLoc3-Pro line tracer and Stonex S700a Global Navigation Satellite System (GNSS) receiver.

The EM61 instrument is a high-resolution, electromagnetic (EM) time-domain device for detecting buried conductive objects. It consists of a powerful transmitter that generates a pulsed primary magnetic field when its coils are energized, which induces eddy currents in nearby conductive objects. The decay of the eddy currents, following the input pulse, is measured by the coils, which in turn serve as receiver coils. The decay rate is measured for two coils, mounted concentrically, one above the other. By making the measurements at a relatively long-time-interval (measured in milliseconds) after the termination of the primary pulse, the response is nearly independent of the electrical conductivity of the ground. Thus, the instrument is a very sensitive metal detector. Due to its unique coil arrangement, the response curve is a single well-defined positive peak directly over a buried conductive object. This facilitates quick and accurate location of targets. Conductive objects to a depth of approximately 11 feet generally can be detected.

The 858 magnetometer is a cesium vapor magnetometer, which measures the strength of the earth's magnetic field and the superposed magnetic field of ferromagnetic materials in its vicinity. The precision of the instrument is approximately $1/10^{th}$ gamma. The earth's magnetic field strength at the project site's latitude was roughly 45,937 gammas during our study (https://www.ngdc.noaa.gov/geomag). Solar geomagnetic activity for the magnetometer survey was predominantly quiet, according to the National Oceanic and Atmospheric Administration (NOAA) (ftp://ftp.swpc.noaa.gov/pub/warehouse). In addition, pre and post-survey measurements were collected at a test station to assess diurnal variations. Variations of less than 20 gammas were observed. Due to these relatively small magnetic field variances, no diurnal corrections were made to the recorded magnetometer data. The earth's magnetic field is inclined in the direction of the north magnetic pole. Because of this inclination, a buried ferromagnetic object generally is expressed as a paired anomaly with a positive (above background) slightly to the south and a negative slightly in the direction of magnetic north, whereas a long vertical ferromagnetic object (i.e., well) would generally be expressed as a positive (monopole). The anomaly caused by a buried oil well can be as much as several thousand gammas higher than the background and in some cases, create an anomaly as big as 50 feet in diameter. It should be noted that surface and subsurface metal objects (i.e., metal fencing, bollards, vehicles, utility lines, vaults, and risers, etc.) can influence the location and size of the magnetic response. In addition, the depth of burial, diameter and type of well casing, and inclination of the casing, can substantially change the amplitude and areal extent of the magnetic response. Typically, the well head is found within several feet of the peak positive magnetic value.

The GPR instrument beams energy into the ground from its transducer/antenna, in the form of electromagnetic waves. A portion of this energy is reflected to the antenna at boundaries in the subsurface across which there is an electrical contrast. The recorder continuously makes a record of the reflected energy as the antenna is moved across the ground surface. The greater the electrical contrast, the higher the amplitude of the returned energy. The EM wave travels at a velocity unique to the material properties of the ground being studied, and when these velocities are known, or closely estimated from ground conductivity values and other information, two-way travel times can be converted to depth. Penetration into the ground and resolution of the GPR images produced are a function of ground electrical conductivity and dielectric constant. Images tend to be graphic, even at considerable depth, in sandy soils, but penetration and resolution may be limited in more conductive clayey moist ground. The magnetic gradiometer has two fluxgate magnetic fixed sensors that are passed close to and over the ground. When not in close proximity to a magnetic object, that is, only in the earth's field, the instrument emits an

audible signal at a low frequency. When the instrument passes over buried iron or steel objects (so that the field is significantly different at the two sensors) the frequency of the emitted sound increases. Frequency is a function of the gradient between the two sensors.

The M-Scope TW-6 device energizes the ground by producing an alternating primary magnetic field with alternating current (AC) in the transmitting coil. If conducting materials (including soils) are within the area of influence of the primary field, AC eddy currents are induced to flow in the conductors. A receiving coil senses the secondary magnetic field produced by these eddy currents and outputs an audio response. The strength of the secondary field is a function of the conductivity of the object, its size, and its depth and position relative to the instrument's two coils. Conductive objects to a depth of approximately 10 feet are sensed. Also, the device is somewhat focused, that is, it is more sensitive to conductors below (and above) the instrument than to conductors off to the side.

Where risers are present, the Vivax vLoc3-Pro utility locator transmitter can be connected to the object, and a current is impressed on the conductor pipe or cable. The receiver unit is tuned to this same frequency, and it is used to trace the pipe's surface projection away from the riser. The transmitter and receiver can also be used in a non-connect (induction) mode, whereby the transmitter is positioned on the ground and an electromagnetic signal is emitted. In the presence of buried metal pipes and wires, a discrete signal will be induced on the conductor which can be sensed by the receiver. In addition, the instrument may be used in the passive mode, whereby radio and 60 Hz electromagnetic signals produced by communication and live electric lines are detected.

EVALUATION METHODOLOGY AND ANALYSIS

The collection of EM61 and MAG data was performed in conjunction with a Stonex S700a GNSS receiver unit for spatial control. The limits of our study area were generally selected by you (see Figures 1b and 2a through 2e). Traverses with the EM61 were conducted across accessible portions of the study area along generally northwest-southeast transects spaced approximately 5 feet apart. Traverses with the MAG were conducted across accessible portions of a portion of the site along generally northwest-southeast transects spaced approximately 10 feet apart. GPR traverses were conducted along roughly north-south and east-west transects spaced approximately 3 to 5 feet apart. GPR and EM61 traverses were also conducted along random profiles across and near detected features. Traverses with the M-Scope and gradiometer were conducted along transects spaced approximately 10 feet apart. The line tracer was used in passive, direct connect, and inductive modes to delineate the presence of underground utilities in the study area. The recorded EM61 and MAG data were downloaded to a portable computer in the field for preliminary analysis. Significant anomalies, as well as detectable underground utilities, were marked on the ground with surface paint, photographed, mapped, and reported to you upon completion of our time on site. Figures 3a through 3d display the general site conditions within the study areas during our evaluation.

RESULTS AND RECOMMENDATIONS

The results of our geophysical evaluation identified 12 candidate EM anomalies, two candidate backfilled excavation anomalies, seven candidate MAG anomalies, as well as numerous active utilities and unidentified lines within the evaluated areas (Figures 2a-2e and 4a-4e). The 12 candidate EM anomalies appear more representative of possible USTs and were labeled as Anomaly A through Anomaly L in Figures 2a through 2e and Figures 4a through 4e. Additional, numerous high EM responses were noted and seem to be representative of buried metallic utilities (represented as lines where linear in the data) and former structures (i.e. building elements, buried metallic debris, capped off abandoned utilities, etc.). Although several possible excavations and utility trenches were detected with GPR, two larger candidate backfilled excavation anomalies were found and labeled Excavations A and B. These features are noted

on Figures 2a and 2d and Figures 4a and 4d. The MAG study indicated seven candidate anomalies labeled as MAG Anomaly A through MAG Anomaly G. Although the response for these features appears to be affected by pipes, surface metal, former structures and metal debris, the responses in these areas are strong enough to represent abandoned wells. These features are noted in Figure 2e and Figure 4e. The following discusses the findings of each of the study areas.

The **Historical Tank Farm and Former Stretford Unit** area yielded candidate EM Anomalies A through C, Excavation A, and MAG Anomalies A through G (Figures 2a and 2e and Figures 4a and 4e). Additionally, it is clear from the EM and MAG data and the line tracing efforts that underground lines, former foundations, and other debris exist in the subsurface throughout the study area. GPR traverses over area indicated one fairly large possible excavation feature (Excavation A). The cause or nature of this feature is not known; however, appears as an area of disturbed soil and may be associated with the removal of a structure from this location. GPR traverses over candidate EM Anomalies A, B, and C were inconclusive as to their cause or nature, but the size and shape suggest that these features are good candidates for more direct methods. Additionally, candidate MAG Anomalies A through G should be located in the field for further evaluation by more direct methods.

The **Former Chem Lab** area (Figure 2b and Figure 4b) yielded EM Anomaly D through EM Anomaly F. EM Anomaly D was found to have a cleanout cover with a port at the surface which appears to be connected to a septic tank below the surface. GPR traverses over this feature appear to indicate a flat topped reinforced concrete structure. GPR traverses over EM Anomaly E and Anomaly F were inconclusive as to the cause or nature of these features and should be considered for further evaluation by more direct methods.

The **Historical Southern Sumps** area (Figure 2c and Figure 4c) yielded EM Anomaly G. GPR traverses over EM Anomaly G were inconclusive as to the cause or nature of this feature. The size and shape of this feature and the fact that a pipe terminates near this feature make this a viable candidate for a possible UST and, therefore, it should be considered for further evaluation by more direct methods.

The **Central Site Buildings and Transformer Storage Area** (Figure 3d and Figure 4d) yielded EM Anomalies H through L and Excavation B. While EM Anomaly H is long and linear in nature and likely associated with a foundation or utility line, EM Anomalies I, J, K and L are more suggestive of USTs. GPR over these features were inconclusive as to the cause or nature of these features but all based on size and amplitude, each of these EM anomalies should be considered for further evaluation by direct methods. Anomaly I is the most notable in the area as it is within the reported location of a former UST. The size and shape of EM Anomaly I suggests that a possible UST may still exist within this area. The cause or reason for the possible Excavation B is not known and appeared as an area of disturbed soil which suggests something has been removed from this area. This possible excavation feature appeared to be more than 4 or 5 feet deep with an aerial extent of approximately 65 feet long and 13 feet wide.

To further evaluate the features described above, we recommend that more direct methods be used. Such methods may include the excavation of exploratory trenches, test pits, and/or borings.

Our study utilized industry-standard equipment (i.e., GPR, electromagnetic, and magnetic instruments) and was conducted in general accordance with current practice. It should be noted that the presence of existing structures and surface objects (i.e., water tanks, stored materials, metal debris, and parked vehicles) may have potentially limited the study. Where obstructions were present, subsurface data could not be collected. Moreover, EM/magnetic responses produced by metal surface objects, reinforced concrete, and underground lines can potentially obscure subsurface features. Radar penetration at the site was approximately 3 to 5 feet below the ground surface; therefore, objects below this depth would not have been detected with GPR.

Job Narrative
570-208722-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/26/2024 1:05 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.7°C and 2.2°C.

GC/MS VOA
Method 8260B: The following analyte(s) recovered outside control limits for the LCSD associated with analytical batch 570-510087: 1,3,5-Trimethylbenzene, 1,2-Dichloroethane, Isopropylbenzene and o-Xylene. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-507936.

Method 8260B: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for analytical batch 570-507936 recovered outside control limits for the following analytes: Acetone. Laboratory control sample / laboratory control sample duplicate (LCS/LCSD) percent recovery is in control for affected analytes.

Method 8260B: Internal standard responses were outside of acceptance limits for the following sample: SB-2-0.5 (570-208722-3). The sample(s) shows evidence of matrix interference.

Method 8260B: The following samples were diluted due to the abundance of non-target hydrocarbons: SB-6-1.5 (570-208722-7) and SB-6-2.0 (570-208722-8). Elevated reporting limits (RLs) are provided.

Method 8260B: The following sample was diluted due to the nature of the sample matrix (sulfur) : SB-8-2.0 (570-208722-16). Elevated reporting limits (RLs) are provided.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-508126.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8260B: The following sample was diluted due to the abundance of non-target hydrocarbons: SB-2-2.0 (570-208722-4). Elevated reporting limits (RLs) are provided.

Method 8270C: The method blank for preparation batch 570-508281 and analytical batch 570-509232 contained Dibenz(a,h)anthracene above the method detection limit. This target analyte concentration was less than the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.

Method 8270C: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 570-508281 and analytical batch 570-509232 recovered outside control limits for the following analytes: Benzoic acid.

Method 8270C: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-508281 and analytical batch 570-509232 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

Method 8270C: The following sample was diluted due to the nature of the sample matrix: SB-2-0.5 (570-208722-3). Elevated reporting limits (RLs) are provided.

Method 8270C: The following sample was diluted due to the nature of the sample matrix: SB-6-1.5 (570-208722-7). Elevated reporting limits (RLs) are provided.

Method 8270C: The following sample was diluted due to the nature of the sample matrix: SB-8-0.5 (570-208722-15). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
570-208722-2

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/26/2024 1:05 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.7°C and 2.2°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
570-208722-3

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/26/2024 1:05 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.7°C and 2.2°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Subject: RE: [External] Eurofins Calscience EDD and report files from 570-208722-1 700152701

Vik,

Sorry, caught one more sample that we need additional analysis on. We need the STLC and TCLP for cadmium on sample SB-8-0.5. Can you run these tests as well?

Does Eurofins have a client portal for viewing and screening data? If something like that exists, it'll help us figure out which extra analysis we need sooner.

Thanks,
Travis Knight

Job Narrative
570-208723-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/26/2024 1:05 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.3°C.

Receipt Exceptions
Insufficient sample volume was provided for the following sample: EB-2-1126 (570-208723-12). Received 1x1L unpreserved amber bottlr for 8270 and 8270 Sim PAH.

The following sample was submitted for metals analysis; however, it was not listed on the Chain-of-Custody (COC): EB-2-1126 (570-208723-12) Received 1x250mL plastic bottle with HNO3.

GC/MS VOA
Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-508630. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-508126.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270C_SIM_PAH: The following sample was diluted due to the nature of the sample matrix: SB-9-0.5 (570-208723-9). Elevated reporting limits (RLs) are provided.

Method 8270C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 570-508150. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8270C: The continuing calibration verification (CCV) associated with batch 570-509710 recovered above the upper control limit for 2,4,6-Trichlorophenol, 2,4-Dichlorophenol and Hexachloro-1,3-butadiene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: EB-2-1126 (570-208723-12) and (CCVIS 570-509710/2).

Job Narrative
570-209335-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 12/3/2024 5:15 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.8°C and 2.7°C.

Receipt Exceptions
The Field Sampler was not listed on the Chain of Custody.

GC/MS VOA
Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-510130.

Method 8260B: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for analytical batch 570-510130 recovered outside control limits for the following analytes: Di-isopropyl ether and Vinyl acetate. Laboratory control sample / laboratory control sample duplicate (LCS/LCSD) percent recovery is in control for affected analytes.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-510307. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-510544. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8260B: The following sample was diluted due to the abundance of non-target analytes: SB20-2.0 (570-209335-19). Elevated reporting limits (RLs) are provided.

Method 8260B: The following volatiles sample was diluted due to foaming at the time of purging during the original sample analysis: SB23-2.0 (570-209335-7). Elevated reporting limits (RLs) are provided.

Method 8260B: The following sample was diluted due to the abundance of non-target hydrocarbons: SB21-2.0 (570-209335-4). Elevated reporting limits (RLs) are provided.

Job Narrative
570-209335-2

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 12/3/2024 5:15 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.8°C and 2.7°C.

Metals
Method 6010B - TCLP: Insufficient sample was provided to perform the leaching procedure with the required 100g for the following sample: SB18-2.0 (570-209335-16). The volume of leaching fluid was adjusted proportionally to maintain a 20:1 ratio of leaching fluid to weight of sample. Reporting limits (RLs) are not affected.

Method 6010B - TCLP: The matrix spike / matrix spike duplicate (MS/MSD) recoveries and precision for preparation batch 570-512737 and 570-513483 and analytical batch 570-513753 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample / laboratory sample control duplicate (LCS/LCSD) precision was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.
