EXECUTIVE SUMMARY

Langan CA, Inc. (Langan) completed a Phase I Environmental Site Assessment (ESA) of the California Resources Corporation (CRC) facility located at 20101 Goldenwest Street in the City of Huntington Beach, Orange County, California (the "subject property") under the written authorization of CRC(the "user").

The Phase I ESA was completed following the guidelines of ASTM International Standard Practice E1527-21 (ASTM E1527-21), the United States Environmental Protection Agency's (US EPA) All Appropriate Inquiries (AAI) Rule, and industry standard practice. The user requested this ESA as part of its environmental due diligence related to a potential redevelopment of the subject property.

Subject Property Layout

The subject property is approximately 92 acres and runs parallel to Pacific Coast Highway in the City of Huntington Beach. The subject property consists of active, plugged and abandoned, and idle wells, pipelines, storage tanks, oil and gas processing equipment and storage, and office and warehouse buildings. Plugged and abandoned wells, as well as active wells and idle wells are located throughout the subject property. Two stormwater detention ponds are located in the southeast portion of the subject property.

Subject Property Current Use

The facility is used to process extracted crude oil from subsurface petroleum reservoirs; produced water and gas are byproducts of the oil extraction and are also processed at the facility. The gas is processed to remove hydrogen sulfide (H_2S) along with other impurities to meet SoCal Gas quality specifications. The gas is then predominately sold to the SoCal Gas grid to be used in homes and businesses. As a safety back up, the gas can be flared off through a permitted combustion device. Produced water is processed to remove residual oil and solids and is reinjected into the subsurface oil reservoirs.

Oil and gas are also transported to the subject property via transmission pipelines from Platform Emmy, which is located off the coast of Huntington Beach on a State Lease, and from the Bolsa Chica (Bolsas) production area, which is located north of the subject property. The former Fort Apache facility, located at 1810 Pacific Coast Highway, also transferred produced fluids to the subject property via underground pipelines before operations ceased at Fort Apache in early 2024. Product from off-site areas is transferred to the subject property for processing, storage, and off-site distribution along with the product produced onsite.

Subject Property History

The earliest available records, 1890s topographic maps, indicate the property was undeveloped. According to California Geologic Energy Management Division (CalGEM) well records, the first oil well on the subject property was drilled in 1920. Since that time, the property has been used for oil and gas production. An affiliate of CRC acquired the subject property from Aera Energy in 2012.

Adjoining Properties and Surrounding Area

In the late 1920s, the properties to the east, west, northwest, and southeast adjoining properties and surrounding area were developed for oil and gas production. By the late 1940s, all adjoining properties were developed for oil and gas production. Residential development was first

observed to the east and southeast of the subject property by 1977. By 2002, the eastern and southeastern adjoining properties had been developed with residential dwellings, and the surrounding area appeared in its current general configuration.

Conclusions

Langan completed a Phase I ESA of the subject property using the scope guidelines and inherent limitations of ASTM E1527-21. Table ES-1 presents the conclusions of the Phase I ESA.

Table ES-1 Conclusions, Findings and Opinions

ASTM E1527-21 Scope Items
Recognized Environmental Conditions (RECs)
REC-1: Current and Historical Oil and Gas Production Infrastructure on the Subject Property: Records from CalGEM indicate the first oil well on the subject property was spudded in 1920. Historical aerial photographs from the 1920s through the 1990s note pits, tank farms, large-capacity aboveground storage tanks (ASTs), oil and gas wells, and other infrastructure associated with the production of oil and gas. Sumps were visible from the 1920s until the 1950s and, according to interviews, were reportedly filled with undocumented material. The sumps and pits were historically used for the storage of drilling muds, produced water, and oil and gas condensates, and are considered potential sources of subsurface impacts. Currently, some pits are used to collect stormwater, which is combined with produced water and reinjected into the subsurface reservoirs. ASTs have been on the subject property, prior to the implementation of federal secondary containment requirements. These ASTs were likely placed directly on soil without containment, increasing the potential for historical releases. According to CalGEM, the property currently contains 92 active, 142 idle, and 419 plugged and abandoned wells. Apparent petroleum residue was observed within the well cellars of active and idle wells. Additionally, previously plugged and abandoned wells are located on the subject property. Based on the historical use of pits and sumps, undocumented fill, the operation of ASTs without secondary containment, and the potential for releases from oil and gas wells, the potential for hazardous substance releases to the subsurface is considered a REC.
REC-2: Pipeline Chases: The subject property is bisected northwest–southeast by two pipeline chases. The northern chase (Chase 1) was first visible on the 1947 aerial photograph and, according to site observations and interviews, is suspected to be unlined. Apparent tar and petroleum impacts were observed in Chase 1. Pipelines within this chase transmit oil and gas from the State Lease and Bolsas Oil Fields into on-site ASTs. The southern chase (Chase 2) was first visible on the 1953 aerial photograph and is currently lined with concrete; however, large sections of the lining are cracked or missing. The installation date of the concrete lining is unknown. Pipelines within this chase transport oil and gas from Platform Emmy and on-site wells into on-site ASTs. According to interviews, the chases are also used for spill containment when necessary. Due to the historically unlined condition of Chase 1 and the current concrete condition of Chase 2, there is potential for petroleum to impact the underlying surface. Therefore, Chase 1 and Chase 2 are considered a REC.
REC-3: Documented Spills and Releases and Site Reconnaissance Observations: During the historical review, a pipeline laydown area was first identified in the 1947 aerial photograph, northwest of the Main Office and remains in use. According to interviews, used pipelines are staged here

ASTM E1527-21 Scope Items
for inspection prior to reuse or recycling, and may remain for several weeks to several months. During the site reconnaissance, oil was observed seeping from pipelines, and oily staining was noted throughout the laydown area soils. Additional oily staining was observed on soils and cracked concrete in multiple areas across the property. Northwest of the laydown area, a chemical storage area for Platform Emmy contained pallets and totes of drilling lubricant. Containers were leaking onto the soil, and an approximately 500-square-foot (sf) oily stain with associated odor was observed. The main chemical storage area, southeast of the Main Office, contained 55-gallon metal drums of motor oil, all stored on wooden pallets and within secondary containment. The drums appeared intact; however, water with floating oil was present within the containment. A tote was observed releasing diesel exhaust fluid. Additional totes of scale and corrosion inhibitors and amino propanol were intact without visible releases. A 450-gallon diesel tank located along the southeastern corner of the storage area was surrounded by pooling product and staining on deteriorated, cracked concrete. Another tank in the southern portion of the area was placed within plastic secondary containment; oily staining and fluid were observed on the surrounding concrete. The tank label was illegible, but a visible hazard label indicated the contents likely included diesel. Additionally, the subject property is identified in the ERNS and CHMIRS databases for hazardous substance releases, with 23 incidents reported between 1995 and 2023. Documentation of cleanup activities or confirmation sampling were not available in these databases or other resources researched as part of this ESA. The hazardous substances releases noted in the databases and observations made during the site reconnaissance have a potential to impact the underlying surface and are considered a REC.
REC-4: 2024 – 2025 Subsurface Investigation Findings: Between November 2024 and August 2025, Langan conducted subsurface investigations in accessible areas of concern identified through historical research at the subject property. While several investigated areas were absent of subsurface impact, several analytical results identified total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, and polycyclic aromatic hydrocarbons (PAHs) at concentrations exceeding selected environmental screening levels (ESLs) in multiple areas across the property. The investigation was limited to soil and soil vapor; however, given the detections above selected ESLs, these findings are considered a REC.
REC-5: Adjoining and Surrounding Current and Historical Oil and Gas Production: Oil derricks were first visible in the area surrounding the subject property on the 1928 aerial photograph. The southeast and east adjoining properties were used for oil and gas production until residential development occurred by 2002, while the north and northeast adjoining properties have remained in oil and gas production since 1928. Historical aerials also show tank farms, pits, and sumps on adjoining and surrounding properties until the 1970s. Oil and gas infrastructure was historically associated with hazardous substances use, and pits and sumps were commonly used for the collection and storage of drilling muds, produced water, oil and gas condensates, and other chemicals used in the drilling and production process. The north and northeastern adjoining property, Bolsas, is listed in the ERNS and CHMIRS databases for hazardous substance releases related to oil and gas production between 1994 and 2006. Based on prior groundwater investigations and the topography of the area, groundwater flow is expected to flow between west to southwest, creating a potential migration pathway toward the subject property.

ASTM E1527-21 Scope Items
Therefore, historical oil and gas production on the adjoining and surrounding properties, combined with documented hazardous substance releases at Bolsas, are considered a REC due to the potential for soil and groundwater migration impacts at the subject property.
Controlled Recognized Environmental Conditions (CRECs)
Langan did not identify CRECs for the subject property.
Historical Recognized Environmental Conditions (HRECs)
Langan did not identify HRECs for the subject property.
De Minimis Conditions
Langan did not identify de minimis conditions for the subject property.
Significant Data Gaps
Langan did not identify significant data gaps for the subject property.
Non-ASTM E1527-21 Scope Items
Business Environmental Risks (BERs)
BER-1 – Asbestos Containing Materials (ACM): According to interviews and observations made during the site reconnaissance, ACM is reportedly present within the buildings. Additionally, ACM is also often present in the gaskets, pipe flanges, and pipe wrapping in oil fields. Due to the ACM, additional mitigation measures may need to be implemented during redevelopment activities.
BER-2 – Methane: The subject property is located within the City of Huntington Beach Methane District. Methane is a naturally occurring flammable gas that is associated with natural decay and oil and gas production. Given the use of the subject property for oil and gas operations since the 1920s, methane mitigation measures will likely be required during redevelopment activities.
BER 3 - PFAS from Legacy AFFF in Firefighting Foam Tank. Although the current AFFF formulation stored in the firefighting foam tank does not appear to contain PFAS, legacy AFFF may have included PFAS compounds. During decommissioning, it may be necessary to assess for the presence of PFAS within the system and implement appropriate decontamination and disposal measures.

1. INTRODUCTION

Langan CA, Inc. (Langan) completed a Phase I Environmental Site Assessment (ESA) of the CRC facility located at 20101 Goldenwest Street in the City of Huntington Beach, Orange County, California (the "subject property") under the written authorization of CRC (the "user"). A Subject Property Location Map is provided in Appendix A (Figure 1).

The Phase I ESA was completed following the guidelines of ASTM International Standard Practice E1527-21 (ASTM E1527-21), the United States Environmental Protection Agency's (US EPA) All Appropriate Inquiries (AAI) Rule, and industry standard practice. The user requested this ESA as part of its environmental due diligence associated with a potential redevelopment of the subject property.

1.1 Purpose

The purpose of this Phase I ESA is to identify recognized environmental conditions (REC) associated with the subject property. This purpose also includes identifying controlled recognized environmental conditions (CREC), historical recognized environmental conditions (HREC), de minimis conditions, and significant data gaps. The definitions of REC, CREC, HREC, de minimis condition and other select ASTM terms used in this report are in Section 8.

1.2 Scope of Services

Langan's scope of services consisted of the completion of a Phase I ESA following the guidelines of ASTM E1527-21. Langan's scope of services as it pertains to the elements of a Phase I ESA as specified in ASTM E1527-21 is described below.

On 8 July 2024, the US EPA final rule designating two per- and polyfluoroalkyl substances (PFAS) – perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS) including their salts and structural isomers – as hazardous substances under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) became effective. Because of the complex and varied historical use of PFAS in various industries; limited prior disclosures of PFAS content on product specification sheets, Material Safety Data Sheets (MSDS), and Safety Data Sheets (SDS); the complex chemistry and chemical transformations associated with some PFAS; and the ever-growing and varied list of state regulations, it is not feasible to evaluate PFOA and PFOS without also considering other PFAS. As such, absent analytical data, Langan incorporated a review of PFAS as a general class into this Phase I ESA.

PFAS and other CERCLA hazardous substances and petroleum products have been detected in background environmental samples across the globe, including in areas removed from specific recognized sources. This Phase I ESA was not intended to evaluate background concentrations of CERCLA hazardous substances or petroleum products, regardless of whether the source is naturally occurring or anthropogenic. The objective of Langan's scope of services was to identify the presence, likely presence, and/or material threat of a release of CERCLA hazardous substances and petroleum products related to specific property uses that are generally recognized as known or potential sources of such substances and products.

1.2.1 Records Review and Local Government Interviews

Langan contracted a third-party provider to search environmental regulatory databases and provide historical records. The database search included select federal, state, local and tribal standard source environmental databases within the approximate search radii specified by ASTM E1527-21. A complete list of databases search is provided in the environmental database report included in Appendix C.

Langan submitted California Public Records Act (CPRA) requests to supplement environmental database listing information. The CPRA requests were submitted to the City of Huntington Beach, Orange County Fire Authority (OCFA), OC Health Care Agency (OCHCA), OC Sanitation District (OCSD), Santa Ana Regional Water Quality Control Board (SARWQCB), Department of Toxic Substance Control (DTSC), Air Quality Management District (AQMD), and California Geologic Energy Management Division (CalGEM). Agency CPRA-requested information, where received, is discussed in relevant sections of this report and included in Appendix F.

Langan supplemented the third-party-provided historical records with review of online historical record sources including Google Earth Pro and University of Santa Barbara Aerial Archive.

1.2.2 Site Reconnaissance and Owner/Operator/Occupant Interviews

Langan completed the site reconnaissance on 22 August 2025. Katherine Thomas, Senior Staff Scientist and Travis Knight, Project Engineer, of Langan were accompanied by the following CRC "key site managers".

- Terry Junkins, Operations Supervisor (2 years associated with subject property, 12 years associated with CRC operations)
- Joey Cordova, Gas Operations Manager (8 years associated with subject property)

Key site managers noted that they were not aware of naturally occurring radioactive material (NORM) present at the subject property.

Additionally, according to interviews, all of the historical buildings contain asbestos-containing materials (ACM) and is considered a BER.

Langan walked the periphery of the subject property, observed the subject property from adjoining public thoroughfares, and walked the accessible interiors of structures at the subject property. Langan observed the adjoining properties and the surrounding area from the periphery of the subject property and from public thoroughfares adjoining the subject property. The weather at the time of the site reconnaissance was approximately 85°F and sunny.

1.2.3 Evaluation, Report and Parts Used in Concert

Langan evaluated the information obtained from the records reviews, site reconnaissance and interviews described above, and from the user as described in Section 1.3 in concert with each other. Langan's findings, opinions, and conclusions are discussed throughout this report. Significant assumptions, or deletions, deviations or exceptions to ASTM E1527-21 are noted in Section 1.4.

1.2.4 Non-ASTM Scope Services

The scope of services for the Phase I ESA did not include non-scope ASTM considerations.

1.3 User Responsibilities

Langan requested that the user provide the results of tasks the user is responsible for completing to satisfy the requirements of AAI. The tasks include: searching for known environmental liens and activity and use limitations (AULs) filed or recorded against the subject property, and provision of information related to specialized knowledge or experience of the user or the degree of obviousness relative to conditions indicative of releases or threatened releases; actual knowledge of the user regarding environmental liens or AULs related to the subject property; specialized knowledge or experience of the user; reasons for significantly lower purchase prices, and commonly known or reasonably ascertainable information within the local community about the subject property. Langan also requested that the user state the reason the Phase I ESA was requested. A summary of the user's responses is provided in Appendix D and relevant information provided by the user is discussed in applicable sections of this report.

Unless specifically included in the scope of services, Langan did not complete a title search or a search for environmental liens or AULs, as that is the responsibility of the user. If the user requested that Langan complete such searches on the user's behalf, the information was supplied to Langan by a vendor, and to the vendor by government sources; therefore, neither Langan nor the vendor can verify the completeness or accuracy of the title search, or AUL searches.

1.4 Limiting Conditions/Deviations

Langan did not experience limiting conditions/deviations during this Phase I ESA.

Langan did not delete or deviate from the ASTM E1527-21 guidelines during this Phase I ESA.

1.5 Data Gaps

Data gaps, where applicable, are discussed throughout the report. Langan did not identify significant data gaps during this Phase I ESA.

2. SUBJECT PROPERTY DESCRIPTION AND CURRENT USE

The following sections describe the subject property location, ownership, physical setting, and current layout and operations.

2.1 Location, Legal Description, and Ownership

The approximately 92-acre subject property is located north of the intersection of Goldenwest Street and Pacific Coast Highway in the City of Huntington Beach. The subject property consists of two parcels that span across Seapoint Street. The subject property is described by the Orange County Assessor Parcel Numbers (APNs) 023-181-53 and 023-181-54. The subject property is owned by a wholly-owned subsidiary of CRC.

2.2 Physical Setting

The physical setting that includes the geologic, hydrogeologic, hydrologic, and topographic characteristics of the subject property and surrounding area is discussed below.

2.2.1 Topography

The 2022 United States Geological Survey (USGS) 7.5-minute quadrangle topographic map for Huntington Beach, CA, depicts the subject property at an elevation of approximately 35 feet above mean sea level (amsl) with a gentle slope downward toward the west-southwest. The regional topography slopes downward toward the west-southwest and the Pacific Ocean, which is located approximately 200 feet west-southwest of the subject property.

2.2.2 Geology

The USGS maps soil at the subject property as Quaternary alluvium and marine deposits from the Pleistocene to Holocene ages. According to the U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) Soil Survey Geographic (SSURGO) data for Huntington Beach, soils at the subject property are a combination of Marina loamy sand with zero to two or 9 to 30 percent slopes, Myford sandy loam with zero to two percent slopes, beaches soil and tidal flats soil.

2.2.3 Hydrogeology

Surface water bodies are not present within the boundary of the subject property. The nearest surface water body is the Pacific Ocean. According to a June 1990, Phase I Site Assessment Report, conducted by Groundwater Technology, Inc., groundwater is approximately 35 feet below ground surface (ft bgs) and flows to the general north. However, groundwater flow can be influenced by several factors such as wetlands, hydrogeologic, and anthropogenic variables. As reported in a subsequent 1995 groundwater monitoring report prepared by Groundwater Technology, Inc., groundwater was measured at approximately 34 ft bgs with groundwater flow to the west. Only minor level fluctuations (less than 0.04 feet) due to tidal influences were noted. Groundwater was again encountered during Langan geotechnical investigations between 35.5 and 36.3 ft bgs.

2.3 Subject Property Description

The subject property is located in the Huntington Beach Oil Field. The subject property consists of active, plugged and abandoned, and idle wells, pipelines, storage tanks, oil and gas production

equipment and storage, and office and warehouse buildings. Plugged and abandoned wells, as well as active wells and idle wells are located throughout the subject. Langan noted apparent petroleum releases within the well cellars. According to CalGEM at the time of Phase I ESA development, there are currently 92 active wells (waterflood and oil and gas) and 142 idle wells operated by CRC. CalGEM has records for 659 wells on the subject property that are characterized in the list below by the operator and well types. A list of current and historical wells with their corresponding APIs can be found in Appendix E.

Current and Historical Wells

Total number of wells	659

Historical pits are located adjacent to the active wells that are currently used as stormwater collection basins. Two detention ponds, located in the southeast end of the subject property, collect "clean" stormwater, or stormwater that has not been impacted by the oil and gas production or storage (i.e. stormwater collected northeast of Chase 1, see below.)

The subject property is northwest-southeast bisected by two pipeline chases: the northeastern chase, noted as Chase 1, and the southwestern chase, noted as Chase 2. Chase 1 was first visible on the 1947 aerial photograph. According to interviews, Chase 1 is suspected to be unlined, and apparent tar/petroleum impacts were observed throughout the length of the chase. Pipelines in Chase 1 transmit oil and gas from the State Lease and Bolsas oil fields into ASTs on the subject property.

Chase 2 is first noted on the 1953 aerial photograph. According to on-site interviews, the pipelines transmit oil and gas produced on-site to storage tanks and transmit product from Platform Emmy into ASTs on-site. Chase 2 is presently concrete lined, though observations made during the site reconnaissance noted large portions of concrete were either missing or contained deep cracks. Key site managers did not have knowledge of when the Chase was concrete lined and suspect that it was historically unlined.

Due to the potential for petroleum impacts to the underlying subsurface, Chase 1 and Chase 2 are considered a REC.

During the historical review, a pipeline laydown area was first identified in the 1947 aerial photograph northwest of the Main Office and was also observed during the site reconnaissance. According to interviews, used pipelines are staged in this area and inspected to determine whether they can be reused or must be recycled. Pipelines may remain in the laydown area for periods ranging from several weeks to several months. During the site reconnaissance, oil was visibly seeping out of some of the pipelines and oily staining was seen throughout the laydown area onto the underlying soil. Additionally, oily staining was visibly throughout the subject property both on soil and concrete near cracks. The visible on-site releases have a potential to impact the subsurface and are considered a REC.

A Subject Property Layout Map is provided in Figure 2 of Appendix A. Photographs of the subject property and a checklist documenting Langan's observations relative to the features, activities, uses and conditions outlined in Section 9.4 of ASTM E1527-21 are in Appendix D.

2.4 Current Subject Property Use

The facility is used to process extracted crude oil from subsurface petroleum reservoirs; produced water and gas are byproducts of the oil extraction and are also processed at the facility. The gas is processed to remove hydrogen sulfide (H_2S) along with other impurities to meet SoCal Gas quality specifications. The gas is then predominately sold to the SoCal Gas grid to be used in homes and businesses. As a safety back up, the gas can be flared off through a permitted combustion device. Produced water is processed to remove residual oil and solids and is reinjected into the subsurface oil reservoirs.

Oil and gas are also transported to the subject property via transmission pipelines from Platform Emmy, which is located off the coast of Huntington Beach on a State Lease, and from the Bolsa Chica (Bolsas) production area, which is located north of the subject property. The former Fort Apache facility, located at 1810 Pacific Coast Highway, also transferred produced fluids to the subject property via underground pipelines before operations at Fort Apache ceased in early

2024. Product from off-site areas is transferred to the subject property for processing, storage, and off-site distribution along with the product produced onsite

Oil and gas are also transported to the subject property via transmission pipelines from Platform Emmy, which is located off the coast of Huntington Beach on a State Lease, and from the Bolsa Chica production area, which is located north of the subject property. The former Fort Apache facility, located at 1810 Pacific Coast Highway, also transferred produced fluids to the subject property via underground pipelines before operations ceased at Fort Apache in early 2024. Product from off-site areas is transferred to the subject property for processing, storage, and off-site distribution along with the product produced onsite.

Subcontracted well maintenance and abandonment activities occur periodically at the subject property and were observed during the site reconnaissance. The following table summarizes subject property utility providers.

Table 2-1 Utility Providers

Utility	Providers
Electricity	Southern California Edison
Natural gas	Southern California Gas
Water	Municipal Water District Orange of County
Sewer	City of Huntington Beach

2.5 Hazardous Substances and Petroleum Products

Hazardous substance and petroleum product use at the subject property is primarily related to oil and gas production and storage and gas processing. Langan observed hazardous substances stored in dedicated areas throughout the subject property.

Below is an inventory of current chemicals and maximum daily usage at the subject property:

Chemical Inventory

Product Name	Identified Uses from SDS[1]	Tank Capacity (Gal[2])	Daily Usage (GPD[3])
SCW4056	Scale Inhibitor	300	2.10
PAO2000	Paraffin Dispersant	240	0.45
DMO8194HF	Demulsifier	125	0.94
SCW4056	Scale Inhibitor	300	2.34
SCW4056	Scale Inhibitor	200	2.83
DMO8424	Emulsion Breaker	240	9.46
CRW3658	Corrosion inhibitor	200	2.99
CRW3658	Corrosion inhibitor	125	1.06
WCW7918	Scale and Corrosion inhibitor	200	0.97
SCW4056	Scale Inhibitor	200	1.48
SCW4056	Scale Inhibitor	200	2.83

Product Name	Identified Uses from SDS[1]	Tank Capacity (Gal[2])	Daily Usage (GPD[3])

Note: [1]SDS: Safety Data Sheet – provided by CRC
[2]Gal: Gallons
[3]GPD: Gallons per day

2.5.1 Underground Storage Tanks (USTs)

Based on the EDR report and permits obtained from GeoTracker and the user, the following USTs have been associated with the subject property:

Tank #	Capacity (gallons)	Contents	Description	Installation Date	Removal Date
1	2,000	Stoddard solvent	Unlined, carbon-steel tank	Unknown	1989
2	5,000	Unleaded gasoline	Unlined, carbon-steel tank	Unknown	1988
3	7,500*	Leaded gasoline	Unlined, carbon-steel tank	1972	1988
4	10,000	Stoddard solvent / lubricating oil	Unlined, carbon-steel tank	1974	1989
5	10,000	Unleaded gasoline / leaded gasoline	Unlined, carbon-steel tank	1974	1989

Tank #	Capacity (gallons)	Contents	Description	Installation Date	Removal Date
6	500	Stoddard	Unknown	Unknown	1989
7	1,000	Diesel	Unlined, carbon-steel tank	1975	1988
8	10,000	Unleaded gasoline	Fiberglass steel	1989	2001

*The Remedial Action Completion Certification (RACC) issued following the removal of Tanks 1 through 5 notes a 7,000-gallon leaded gasoline UST. However, in all prior documentation for Tanks 1 through 5, reference is only made to a 7,500-gallon tank and there is no mention of a different 7,000-gallon UST. It is believed that the volume of the leaded gasoline tank is incorrectly recorded in the RACC and the 7,000-gallon and 7,500-gallon USTs are in reference to the same tank.

According to investigation reports and tank removal reports, the USTs were primarily located in a former fueling station near the Maintenance Building. Langan was unable to determine the original date of construction of the fueling station; however, due to subsequent records of removal, Langan does not deem this to be significant. The fueling station originally consisted of five tanks – Tanks 1 through 5, which were removed between 1988 and 1989. After the removal of the tanks, Tank 8 was installed and then subsequently removed in 2001.

According to a figure included with a 1989 OCHCA UST removal permit, a 500-gallon Stoddard solvent UST was historically located north of the Crude Oil Storage and Produced Water Filtration and Re-Injection area. Additionally, according to a SWRCB Hazardous Substance Storage Container Information for Orange County document, a 1,000-gallon diesel UST was formerly located at the subject property and removed in 1989. No further records or information were available to verify the existence of these USTs. Subsurface investigations and geophysical surveys conducted between 2024 and 2025 in suspected areas did not indicate the presence of any USTs beyond those discussed previously in the former fueling area near the Maintenance Building (see Section 3.3).

2.5.2 Aboveground Storage Tanks (ASTs)

Langan observed ASTs for crude oil production and storage and ASTs for natural gas storage and processing in the southern portion of the subject property. ASTs are mounted on concrete and within secondary containment and Langan did not observe stains or releases within the secondary containment. Langan also observed a diesel AST associated with the fire suppression system. The diesel AST is pad-mounted and within secondary containment and Langan did not observe releases within the secondary containment.

Tank Farm 1 occupies approximately 830 sf in the southern portion of the subject property. It currently contains ASTs used for crude oil storage and produced water filtration. Aerial photographs indicate that ASTs have been present in this area since the early 1990s. Historically, Tank Farm 1 covered a larger footprint of about 2,000 sf, with the number of ASTs ranging from roughly 12 in 1947 to about 50 in 1988. The 1990 aerial photograph shows demolition activities at the tank farm, with visible surface staining.

Tank Farm 2 was located in the northern portion of the subject property between the 1940s and 1990s. The number of ASTs in this area ranged from approximately 13 (1947 aerial photograph) to 22 (1990 aerial photograph). Drilling mud processing also took place here, both for onsite use and for use at Platform Emmy. During the site reconnaissance, plastic tanks within secondary containment and sealed five-gallon buckets containing residual materials from the mud processing operations were observed in this area.

Secondary containment for ASTs storing oil or hazardous substances in volumes greater than or equal to 1,320 gallons was not required by the U.S. Environmental Protection Agency (USEPA) until 1988. Langan conducted subsurface investigations within Tank Farm 1 and Tank Farm 2 and identified metals, TPH, VOCs, SVOCs, and PAHs in the areas. Due to the identified constituents and the operation of ASTs prior to the implementation of secondary containment requirements, the potential for negative impacts to the subsurface constitutes a REC.

A tank battery was identified on the subject property during the historical aerial review. In the 1928 aerial photograph (the earliest available), the tank battery is visible along the southeastern property line, extending to the northeastern adjacent property. It remained visible through the 1963 aerial photograph and appears to have been located within an unlined trench. Langan conducted subsurface investigations in 2024 and 2025 within accessible historical AST tank farm areas and detected metals, total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and polycyclic aromatic hydrocarbons (PAHs). A detailed summary of these findings is provided in Section 3.3. The presence of materials identified above selected screening levels during subsurface investigations constitutes a REC.

2.5.3 Drums, Totes, and Intermediate Bulk Containers

During the site reconnaissance, Langan observed the main chemical storage area southwest of the Main Office. The chemical storage area contained a concrete base with visible cracking and deterioration. 55-gallon poly drums containing glycols were noted in the area to be intact and on wooden pallets within secondary containment. 55-gallon metal drums containing motor oil were noted in the area to be intact and on wooden pallets within secondary containment; however, water with floating oil was noted within the secondary containment. A tote was observed in the north corner releasing diesel exhaust fluid. Storage containers and totes of scale and corrosion inhibitors and amino propanol were observed intact and without obvious signs of releases. A 450-gallon diesel fuel tank is located along the southeastern corner of the storage area with pooling product and staining on the deteriorated and cracked concrete. A tank was observed in the southern portion of the storage area within plastic secondary containment. Oily staining and fluid were observed on the concrete surrounding the secondary containment. The tank label was illegible, preventing identification of the contents; however, the hazard label remained visible and indicates the tank likely contains diesel.

Northwest of the Pipeline Laydown area, Langan observed a chemical storage area for Platform Emmy that contained pallets and totes of drilling lubricant. The containers were leaking lubricant onto the soil and an approximately 500-square foot (sf) oily stain and accompanying odor was noted.

The staining and releases within the chemical storage areas are an environmental concern and considered a REC due to the potential for impacts to the underlying subsurface.

2.5.4 Other Chemical Storage, Containers, or Equipment

Langan observed shelves and storage cabinets containing retail-size containers of maintenance-related products and janitorial products in the maintenance building. Compressed gas tanks were observed in the maintenance and welding buildings. The containers appeared to be in good condition with no visual sign of release and are not considered an environmental concern.

A firefighting foam, aqueous film-forming foam (AFFF), tank is located northwest of the Production Office, with subsurface piping extending southwest to the southern tank farm for fire suppression. The tank, manufactured in 1988, currently contains AFFF. A review of the current MSDS/SDS for the foam in the tank did not identify PFAS compounds; however, earlier foam formulations stored in the tank may have contained PFAS, particularly those prior to the phase-out efforts of fluorinated foams in the early 2000s.

Key site managers reported that they were not aware of any deployment of the AFFF system on the subject property. No evidence of fire-related incidents or use of the fire suppression system was identified in historical resources, standard environmental records, or during Langan's extensive review of the onsite library. Additionally, standard environmental records and databases do not contain information to suggest the presence of PFAS on the subject property or in its' subsurface.

Foam within the AFFF tank is deployed as a closed system, with valves and pipes to divert foam to specific areas within the southern tank farm if needed. Testing of the system deployment is not completed per information provided by key site managers. Samples of the AFFF tank contents are periodically conducted to verify efficacy of the foam. Key site managers were unaware of how often the foam in the tank is replaced but could confirm the foam had not been replaced within the last five years.

During site reconnaissance, the AFFF tank appeared to be in good condition with no visible signs of release. Any potential deployment would have occurred within the secondary containment of the southern tank farm. Based on the available information, the likelihood of a PFAS-related release from the AFFF tank to the subsurface is considered low, and the presence of the tank is not considered a recognized environmental condition.

2.6 Air Emissions

Air emission sources at the subject property include oil and gas wells, gas flares, and production equipment. Langan did not identify obvious impacts, such as visible emissions or odors, from air emission sources at the subject property. Permits from the South Coast Air Quality Management District (AQMD) are included in Appendix D.

Langan does not consider the air emissions an environmental concern for the subject property.

2.7 Waste Management

The following sections describe current hazardous and non-hazardous waste streams, and observations of fill areas or other solid waste throughout the subject property.

2.7.1 Hazardous Waste

The EDR database report indicates that CRC was a Resource Conservation and Recovery Act (RCRA) small quantity generator (SQG) of hazardous waste. Specific wastes are discussed in Section 3.2. According to key site managers, hazardous wastes are collected by Waste

Management (WM) and Ecology Control Industries (ECI). Upon review of the DTSC's Hazardous Waste Tracking System (HWTS), CRC generated approximately 361-tons of non-RCRA hazardous waste in 2025. The non-RCRA hazardous waste was described as other inorganic solid waste (0.25-tons) and contaminated soils from site cleanup (360.96-tons). The contaminated soils are from shallow soil excavations conducted by Langan described in Section 3.3. CRC did not generate RCRA hazardous waste in 2025.

2.7.2 Non-Hazardous Waste

According to key site managers, general refuse generated at the subject property is collected in roll-off containers that Langan observed on the exterior of the buildings. The wastes are then collected by Republic and Patriot.

2.7.3 Fill Areas or Solid Waste

Langan did not observe areas that were apparently filled or graded by non-natural causes (or filled with material of unknown origin) that suggest the presence of garbage, construction debris, demolition debris, or other solid waste disposal, or mounds or depressions suggesting solid waste disposal. However, interviews with key site managers noted that there are historical sumps, detention basins, pits, or other similar features that have reportedly been filled with material.

2.8 Wastewater

Sanitary water is discharged into seven septic tanks on the subject property near the following buildings: production office, the former chemical laboratory, two near the change room, the gas plant office, the former main office, and the training building.

During the site reconnaissance, a truck wash was observed along the eastern portion of the maintenance building. The truck wash has been on the subject property since at least the 1980s. Discharge from the truck wash goes into a catch basin adjacent to the building that connects to other stormwater drainage pipes at the subject property.

2.9 Stormwater

The subject property has an active National Pollutant Discharge Elimination System (NPDES) Waste Discharge Identification (WDID) 8301027973. Stormwater is monitored and sampled in accordance with the Stormwater Pollution Prevention Plan.

The process areas of the subject property have pits located adjacent to the well cellars, which are used to collect stormwater. Stormwater collected in the Chase 1, Chase 2, well cellars, and AST cellars are pumped into the pits. Stormwater is combined with produced water and then re-injected into the subsurface oil reservoirs. Water injection is conducted as part of the CalGEM and SARWQCB approved Underground Injection Control (UIC) Project for the subject property. Injection permits are issued for each well by CalGEM. According to historical imagery, the pits have been on the subject property since the 1950s and may have compromised concrete lining. The potential for the stormwater to have petroleum impacts and affect the underlying subsurface is considered a REC.

Stormwater runoff from the northeastern section, where there is no process equipment, is considered "non-impacted." The non-impacted stormwater is collected and pumped via an oil skimming tank to two connected detention ponds located near the entrance off Goldenwest

Street. The detention ponds total approximately 4.7 acres. When the detention ponds exceed their capacity, runoff flows to the municipal storm sewer system. According to interviews, stormwater is regularly tested to mitigate the risk of discharging pollutants.

3. SUBJECT PROPERTY HISTORY AND RECORDS REVIEW

The following sections provide summaries of the historical uses of the subject property, and available information regarding documented environmental conditions associated with the historical uses.

3.1 Historical Summary

Langan compiled the following summary of the subject property history based on a review of readily available and reasonably ascertainable sources and interviews. Historical resources are provided in Appendix E.

Table 3-1 Subject Property History

Time Period	Historical Discussion
1890s	The subject property is depicted as undeveloped on the 1896 topographic maps.
1920s – 1930s	According to historical oil well records, the first oil and gas well was spudded on the subject property in 1920. Historical aerial imagery from the 1920s note the presence of oil derricks and pipelines on the subject property, with a production facility located along the northeastern property line. Apparent dried sumps were present south of the facility, and a line of ASTs extended along the southeastern boundary to the northeast of the subject property. By the 1930s, the number of oil derricks on the subject property had increased, while the production facility previously noted was no longer visible. Additional apparent sumps were observed north of the line of ASTs, and smokestacks or gas flares were visible along the southeast and southwest property boundaries.
1940s – 1950s	In the 1940s, well cellars are visible along the southwestern property line. In the central portion of the subject property, an apparent trench bisects the northeast and southwest portions. There appears to be a pipeline laydown area in the central portion of the subject property. Tank farms are visible in the northern and southern portion and sumps are visible in sporadic locations throughout the subject property. Previous ASTs are still visible along the southeastern property line. By the 1950s, there are an increased number of well cellars along the southwest property line and smokestack/gas flares are visible along the well cellars and in the central portion of the subject property. There is also an increased number of ASTs in the previously noted tank farms. Structures are apparent near the pipeline laydown area. Other features previously noted are still visible on the subject property.
1960s – 1970s	In the 1960s, apparent pits or detention basins are visible adjacent to the well cellars along the southwestern property line. Additional structures are visible in the central portion of the subject property, near the previously noted pipeline laydown area. By the 1970s, the number of ASTs in the tank farms has further increased. Smokestacks/gas flares are apparent near the tank batteries and well cellars. There are an increased number of structures near the pipeline laydown area.
1980s – 1990s	In the 1980s, the line of ASTs previously noted along the southern property line is no longer visible. Warehouse-type structures are noted in the central portion of the subject property.

Time Period	Historical Discussion
	By 1994, the northern tank farm is no longer visible, and the number of ASTs in the southern tank farm has decreased. All other features previously noted are still visible on the subject property.
2000s – Present	By the 2000s, two pits are visible along the southeastern property line. Smokestacks/gas flares are no longer visible on the subject property. According to building permits issued in July 2024, a permit was submitted to demolish the former chemical laboratory and an office building (15,230 sf).

The subject property was first developed for oil and gas production in the 1920s. Due to the over 100 years of oil and gas related infrastructure, development, and production, the potential for petroleum related impacts to the subject property's subsurface is considered a REC.

Environmental concerns related to historical operations are discussed further in Section 3.3.

3.2 Regulatory Database Review

The subject property is identified on the Emergency Response Notification System (ERNS), Facility Index System (FINDS), Superfund Enterprise Management System Archive (SEMS-Archive), Resource Conservation and Recovery Act (RCRA) Small Quantity Generator (SQG), California Hazardous Material Incident Report System (CHMIRS), Integrated Compliance Information System (ICIS), Aerometric Information Retrieval System Facility Subsystem (US AIRS), Emission Inventory Data (EMI), Recovered Government Archive (RGA) Leaking Underground Storage Tank (LUST), Orange County LUST, California Environmental Reporting System (CERS) Hazardous Waste (Haz Waste), Hazardous Waste Tracking System (HWTS), Facility and Manifest Data (HAZNET), National Pollutant Discharge Elimination System (NPDES), California Integrated Water Quality System (CWIQS), CERS, Underground Storage Tank (UST), RGA Solid Waste Facilities List (LF), California (CA) Facility Inventory Database (FID) UST, Orange County Industrial Site, Toxic Substances Control Act (TSCA), Federal Insecticide, Fungicide, & Rodenticide Act / TSCA Tracking System (FTTS), Solid Waste Information System Active, Closed, and Inactive Landfills (SWF/LF), Cleanup Program Sites (CPS) Spills, Leaks, Investigations, and Cleanups (SLIC), Historical (HIST) UST, Hazardous Waste & Substances Sites List (CORTESE), UST Finder Release, RCRA Non-generators / No Longer Reporting (NonGen / NLR), Enforcement and Compliance History Information (ECHO), Underground Injection Control (UIC), and Per- and Polyfluorinated Substances (PFAS) ECHO databases. The environmental database report is attached as Appendix C.

The AST information is also discussed in Section 2.5.2.

Historical UST information is also discussed in Section 2.5.1.

RGA LUST, LUST, Orange County LUST, CORTESE, CA FID UST, UST FINDER RELEASE, RGA LF, UST:

According to permits, removal reports, and city permits, the following information was found for USTs on the subject property:

Tank #	Capacity (gallons)	Contents	Description	Installation Date	Removal Date
1	2,000	Stoddard solvent	Unlined, carbon-steel tank	Unknown	1989
2	5,000	Unleaded gasoline	Unlined, carbon-steel tank	Unknown	1988
3	7,500	Leaded gasoline	Unlined, carbon-steel tank	1972	1988
4	10,000	Stoddard solvent / lubricating oil	Unlined, carbon-steel tank	1974	1989
5	10,000	Unleaded gasoline / leaded gasoline	Unlined, carbon-steel tank	1974	1989
6	500	Stoddard	Unknown	Unknown	1989
7	1,000	Diesel	Unlined, carbon-steel tank	1975	1988
8	10,000	Unleaded gasoline	Fiberglass steel	1989	2001

*The RACC issued following the removal of Tanks 1 through 5 notes a 7,000-gallon leaded gasoline UST. However, in all prior documentation for Tanks 1 through 5, reference is only made to a 7,500-gallon tank and there is no mention of a different 7,000-gallon UST. It is believed that the volume of the leaded gasoline tank is incorrectly recorded in the RACC and the 7,000-gallon and 7,500-gallon USTs are in reference to the same tank.

According to GeoTracker and documentation obtained from the user, a RACC, dated 13 March 1997, was received by Cal Resources for the completion of the site investigation and remedial action for the underground storage tanks formerly located on the subject property. Historically, a fueling station was located in the central portion of the subject property near the maintenance building. The report notes five USTs (Tank Nos. 1-5 above) were removed between 1988 and 1989:

In response to confirmation sampling conducted after the removal of Tanks 1 – 5 between 1988 and 1989, total petroleum hydrocarbons (TPH) and benzene, toluene, ethylbenzene, and xylene (BTEX) were noted in the tank pit. Following the 1988 and 1989 removals, subsequent investigations were conducted and groundwater monitoring events were reported to the RGA LUST database in 1992, 1993, 1994, and 1995.

According to the 1997 RACC, following to removal of the USTs, soil was excavated to a depth of approximately 35 ft bgs. A total of 956 tons of impacted soil were removed and transported offsite. Concentrations of TPH in the gasoline range (gas), benzene, toluene, ethylbenzene, and xylene (BTEX), were characterized before and after the soil excavation. The table listed below presents the concentrations of constituents analyzed. A vapor extraction system was installed to remove TPH gas and BTEX from the soil and

groundwater. Between May 1993 to September 1995, approximately 22,300 pounds of TPH were removed. The RACC stated the remaining contamination left at the subject property presented no threat to drinking water, human health, or the environment.

The analyses found the following concentrations before and after soil excavation and the vapor extraction system:

1997 RACC Site Characterization

Constituent	Soil (ppm)		SFBRWQCB	Water (ppb)		SFBRWQCB
	Before	After	HHR/Protection of Groundwater ESL (mg/kg)	Before	After	HHR ESL (µg/L)
TPH gas	20,700	**3,700**	460	53,000	180	800
Benzene	22.5	**11**	0.025	3,800	ND*	1.0
Toluene	90.6	**240**	3.2	13,000	2.2	150
Xylene	399	**970**	2.1	29,000	3.8	190
Ethylbenzene	117	**180**	0.43	4,700	0.94	15

*Notes: No data (ND) – constituents were not detected above laboratory detection limits.

Residual soil concentrations following remedial actions exceed the current San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Human Health Risk (HHR) or protection of groundwater Environmental Screening Levels (ESLs). Investigations involving the residual soil contamination are discussed in Section 3.3.

As previously discussed in Section 2.5.1, a 1989 OCHCA UST removal permit noted a 500-gallon Stoddard solvent UST north of the Crude Oil Storage and Produced Water Filtration and Re-Injection area. Additionally, according to a SWRCB Hazardous Substance Storage Container Information for Orange County document, a 1,000-gallon diesel UST was formerly located at the subject property and removed in 1989. No further records or information were available to verify the existence of these UST. Subsurface investigations and geophysical surveys conducted between 2024 and 2025 in suspected areas did not indicate the presence of either of these two USTs (see Section 3.3).

ERNS: The subject property is listed in the ERNS database for hazardous substance releases. The known hazardous substance releases on the subject property were used in our determination of REC-3. The releases are detailed in the list below.

- **1987:** Shell Oil, July – approximately one barrel of produced water was released. The potential media affected, and cleanup reports were not available for review.

  Shell, September – a well blowout occurred which released approximately 15 gallons of crude oil. Additional information regarding the media affected and cleanup reports were not available for review.

Shell Western, October – a three-inch production line released approximately 25 gallons of produced water. The potential media effected was not listed in the database report. Langan was unable to locate cleanup reports for review.

Shell Oil, October – a flowline leaked releasing approximately one gallon of produced water onto the soil. Cleanup reports were not available for review.

- **1998:** AERA Energy, February – sheen was discovered during the transport of stormwater from one area on the subject property to another. An estimated two gallons of crude oil was in the stormwater. Additional information regarding the spill and potential media effected was not available for review. According to the database report, clean-up crews went on the subject property was vacuum trucks and booms to contain the spill. Langan was unable to locate cleanup reports for review.

  October – a two-inch gas line developed a leak, spilling approximately one quart of gasoline condensate into a drainage ditch which also affected the surface water. According to the database report, the release was secured, and the impacted soil was removed. Information pertaining to the release into water was not available for review.

  AERA Energy, November – a pin hole leak was discovered in an aboveground piping valve releasing approximately two barrels of crude oil and five barrels of produced water. According to the database report, the material was released into a dry drainage ditch and water was potentially affected. Langan was unable to locate cleanup reports for review.

  AERA Energy, November – approximately one-quart of gasoline condensate was release. The potential media affected was not listed in the database report. Langan was unable to locate cleanup reports for review.

- **2000:**

  AERA Energy, October – a two-inch oil well flowline released approximately one quart of crude oil. The potential media affected was described as "land." Cleanup reports were not available for review.

- **2020:** SoCal Holding, April – an equipment failure resulted in a release of approximately one-ounce of crude oil which resulted in a 10-foot by 10-foot sheen in a wet well. Cleanup reports were not available for review.

The releases discussed below were identified in the Bolsas, an area north and northeast and hydraulically upgradient of the subject property. These releases have the potential to impact underlying groundwater, which may migrate onto the subject property. The upgradient location and potential for groundwater migration is considered a REC. The Bolsas are not part of the 92-acre subject property.

- **1997**: AERA Energy, October – three-inch production line released approximately 90 gallons of produced water and 10 gallons of crude oil into the soil and dry waterbed. Langan was unable to locate cleanup reports for review.

  AERA Energy, December – residual oil from an earlier release washed onto the bank of a Bolsa Chica wet cell. According to the database report, approximately two gallons of crude oil stained an approximately 10-foot by 10-foot area on the shoreline and was excavated. Langan was unable to locate cleanup reports for review.

- **1998**: AERA Energy, January – a three-inch flowline released approximately one gallon of produced water and one pint of crude oil into the Bolsa Chica wetlands. According to the database report, a sheen was observed in the stormwater and sorbent pads were used to soak up oil and water. Cleanup reports were not available for review.

  AERA Energy, February – a dirt berm containment wall was breached due to bad weather releasing 1 gallon of crude oil into the Bolsa Chica wetlands. According to the database report, the berm was repaired by hand. Langan was unable to locate cleanup reports for review.

  AERA Energy, May – an oil well cellar overflowed releasing approximately one barrel of crude oil into the soil and five gallons of crude oil into the water. According to the database report, oil leaked through gopher holes into dry wetland areas. Langan was unable to locate cleanup reports for review.

- **1999:** AERA Energy, October – an underground pipeline released approximately five barrels of crude oil into soil. According to the database report, oil affected a habitat for a protected animal species. Langan was unable to locate cleanup reports for review.

- **2000**: AERA Energy, January – a leak in an underground crude oil gathering line released an unknown amount of produced water into a dry wetland area. According to the database report, an approximately 20-foot by 20-foot area was affected. Cleanup reports were not available for review.

  AERA Energy, June – a leak in a two-inch flow line was discovered releasing approximately one barrel of crude oil into the dry wetlands. Product was removed by hand, though no cleanup reports were provided.

  AERA Energy, July – a six-inch gathering line released approximately 10 barrels of produced water and five barrels of crude oil into the Bolsa Chica wetlands. According to the database report, product was recovered by vacuum truck and the spill was secured. Cleanup reports were not available for review.

  AERA Energy, July – an eight-inch gathering line released approximately 20 gallons of crude oil and 20 gallons of produced water into the Bolsa Chica dry waterway. According to the database report, the release was immediately stopped, and a shovel was used to clean up the affected soil. Langan was unable to locate cleanup reports for review.

  AERA Energy, September – three-inch flow line gaskets released approximately 10 gallons of crude oil and 80 gallons of produced water. The incident was described to have affected the water of the Bolsa Chica wetlands. Cleanup reports were not available.

  AERA Energy, September – a four-inch gathering line released approximately 20 gallons of produced water, two gallons of oil, and two gallons of crude oil into the Bolsa Chica wetlands. Langan was unable to locate cleanup reports for review.

- **2001:** AERA Energy, April – while removing an idle pipeline, approximately four ounces of crude oil were released into the Bolsa Chica wetlands. According to the database report, the spilled material was immediately cleaned up with sorbent pads. Cleanup reports were not available for review.

CHMIRS: The CHMIRS database reports information on hazardous materials (i.e., hazardous substance) incidents, including chemical releases, spills, and accidents that occur during the use, storage, or transportation of hazardous substances. The releases discussed below were documented on the subject property and may have potentially impacted underlying soil, soil vapor, or groundwater; therefore, the following documented releases are considered a REC:

- **1998**: AERA Energy, January – approximately one pint of crude oil was released due to skimmed overflow. Langan was unable to locate cleanup reports for review.
- **1999**: AERA Energy, February – according to the database report, approximately five barrels of crude oil was released from four-inch pipeline on separator while removing the solids screen. The release was reportedly contained on the facility. Langan was unable to locate cleanup reports for review.

  AERA Energy, June – a pressure valve malfunction resulting in 20 barrels of crude oil released. The potential media affected was not listed. Langan was unable to locate cleanup reports for review.

  AERA Energy, December – a pinhole leak in a four-inch gathering line resulted in a release of one gallon of crude oil. According to the database report, the release went into a dry area of a wet cell and was isolated and contained. Langan was unable to locate cleanup reports for review.
- **2001**: AERA Energy, July – five barrels of crude oil was released from a leak in a four-inch pipeline. According to the database report, the release did not occur on the wetlands area. Langan was unable to locate cleanup reports for review.
- **2002**: AERA Energy, July – 10 gallons of an unknown substance was released. According to the database report, the release occurred due to vandalism on the well. Information on the substance type or potential media affected was not available. Langan was unable to locate cleanup reports for review.
- **2003**: AERA Energy, November – a leak an oilfield production line resulted in the release of five barrels of crude oil. According to the database report, the release was contained on the subject property. Langan was unable to locate cleanup reports for review.
- **2008**: AERA Energy, April – a three-inch gathering line was corroded and released approximately two quarts of crude oil onto the ground. The potential media affected was not listed in the database report. Langan was unable to locate cleanup reports for review.
- **2017**: California Resources Production Company, April – an unlisted amount of petroleum, produced water, and crude oil was released from a pipeline. According to the database report, "The release origin is unknown, but it is contained to the pipe chase. The release has been stopped with no threats to life, property, or environment. The release did not enter a storm drain or waterway. The release will be mitigated by an undetermined contractor." Langan was unable to locate cleanup reports for review.
- **2020**: April – according to the database report, approximately one ounce of crude oil was released into an adjacent wet cell creating a 10-foot by 10-foot sheen. The release was contained in the wet cell. Langan was unable to locate cleanup reports for review.

- **2023**: SoCal Holding, May – a produced water line leak caused a release of five barrels of produced water and two gallons of crude oil onto the roadway. The spill was reportedly stopped and contained and cleaned up by the reporting party. Langan was unable to locate cleanup reports for review.

The releases discussed below were identified in the Bolsas, an area north and northeast and hydraulically upgradient of the subject property. These releases have the potential to impact underlying groundwater, which may migrate onto the subject property. The upgradient location and potential for groundwater migration is considered a REC.:

- **1994**: Shell Western E&P, April – mechanical failure of a booster pump resulted in the release of 10 gallons of crude oil and 20 gallons of produced water into the Bolsa Chica bird sanctuary. Langan was unable to locate cleanup reports for review.
- **1995**: September – a flowline leak released approximately 10 gallons of crude oil and 500 gallons of produced water into the Bolsa Chica wetlands. Langan was unable to locate cleanup reports for review.
- **1998**: March – according to the database report, a "form of acid has gotten into a ditch and has gotten into the Bolsa Chica Wetlands." The type and quantity of acid is unknown. Langan was unable to locate cleanup reports for review.
- **1999**: AERA Energy, February – during a stormwater transfer event, approximately two gallons of crude oil was released into the Bolsa Chica wetlands. Langan was unable to locate cleanup reports for review.
- **2000**: AERA Energy, September – a flange leak from a two-inch test line caused the release of two barrels of crude oil onto the subject property. According to the database report, the release did not occur on soil and was no threat to the Bolsa Chica wetlands. Langan was unable to locate cleanup reports for review.
- **2001**: AERA Energy, July – according to the database report, an operator error associated with a pipeline cleaning caused the release of approximately 20 gallons of crude oil into the Bolsa Chica wetlands. Langan was unable to locate cleanup reports for review.

  AERA Energy, November – five gallons of produced water was released into the Bolsa Chica wetlands waterway. According to the database report, a leak developed in a buried water injection pipeline, the pipeline was shut down and the leak was stopped. Langan was unable to locate cleanup reports for review.
- **2006**: AERA Energy, August – approximately two quarts of crude oil was released onto the soil of the wetlands. Langan was unable to locate cleanup reports for review.

TSCA: AERA Energy LLC is listed as a natural gas manufacturer from 1986 to 2002.

FTTS, HIST FTTS: The subject property was listed in the FTTS/HIST FTTS database for a violation in 1989 pertaining to Section 6 Polychlorinated Biphenyl (PCB). Langan was unable to locate additional information pertaining to these listings. Subsurface investigations were conducted by Langan in 2025 to evaluate potential areas of concern for PCBs, and the results indicated that no PCBs were detected.

RCRA-SQG, CERS HAZ WASTE, HWTS, CERS, HAZNET: Historical waste manifests are included in Appendix D. Historical waste manifests primarily include non-RCRA hazardous waste;

however, RCRA hazardous waste was also noted. Asbestos containing waste is noted on manifests from the 2010's. According to interviews conducted during the site reconnaissance, transite piping was removed from the subject property during this time. Additionally, PCBs were noted on the waste manifests in 1996, 2002, 2003, 2006, 2007, 2008, and 2010. A total of approximately 16-tons was generated between those years. Subsurface investigations were conducted by Langan in 2025 to evaluate potential areas of concern for PCBs, and the results indicated that no PCBs were detected.

Between 1998 and 2016, waste manifests noted: arsenic, barium, cadmium, chromium, lead, and mercury. The combined quantity of mercury, barium, cadmium, chromium, and arsenic generated during this period was less than one ton in total. During this same time period, lead waste totaled 44.3-tons, with the majority (42.7 tons) generated in 2006. Sandblasting was noted on the 2006 hazardous waste manifest, and it is likely the lead was from lead-based paint removal.

A search of the DTSC HWTS database for the EPA ID currently associated with the subject property (CAD981443807) identified numerous other hazardous waste disposals. Notable non-RCRA hazardous waste code descriptions included, but were not limited to, alkaline solutions, aqueous solutions, organic and inorganic solid, halogenated solvents, hydrocarbon solvents, waste and mixed oil, latex waste, sulfur sludge, laboratory waste chemicals, and liquids with either mercury, halogenated solvents, metals, or pH less than two. RCRA hazardous waste codes descriptions were predominately ignitable and corrosive, but also included several metals, benzene, methyl ethyl ketone, halogenated solvents, non-halogenated solvents, sodium cyanide, and phenol. These listings were noted from 1993 (earliest year included in the DTSC HWTS database) to the present. The current EPA ID number for the subject property has also been utilized for other hazardous waste disposals not associated with the subject property (e.g. Bolsas, Fort Apache). Previously listed waste code descriptions likely include waste not originating from the subject property.

The subject property is listed as a crude petroleum and natural gas extraction facility. The subject property has CERS violations pertaining to administrative matters such as, failure to annually certify that their business plan is complete.

Current hazardous waste generation information is discussed in Section 2.7.1.

SEMS-ARCHIVE: Aminoil Bolsa Chica is listed in the SEMS-ARCHIVE database under EPA ID: CAD042137307. Langan was unable to locate additional information pertaining to the EPA ID number. According to the database report, the subject property was listed in as a potential SEMS site in 1979. In 1988, the EPA determined the subject property does not qualify for the National Priorities List (NPL) and was archived. Superfund site information available from the EPA website describes the location as "Bolsa Chica Wetlands" with an address of "SE ¼ Sec 34 T5S R11W SBBM".Langan was unable to locate additional reports pertaining to the database listing. The Aminoil Bolsa Chica listing likely pertains to the Bolsas property located to the north and northeast of the subject property. Due to the lack of documentation indicating the listing is associated with the subject property, this listing is not an environmental concern.

UIC: According to CalGEM, there are 24 active UICs and 73 plugged and idle UICs.

NPDES, CIWQS: These database listings pertain to stormwater generation and management. Current stormwater information is discussed in Section 2.9.

FINDS, US AIRS, EMI, ICIS, TSCA: These listings pertain to air emissions from the subject property. Current air emissions at the subject property are discussed further in Section 2.6.

ECHO, PFAS ECHO: No violations or notices to comply were included in either database. The PFAS ECHO database is a listing of sites complied by the USEPA that may be using PFAS. The subject property is included in this database as an oil and gas facility and an airport.

3.3 Prior Report Review

Langan was provided with prior reports related to UST closures, discussed in Section 3.2. Langan conducted soil and soil vapor investigations for the site in 2024 and 2025. The reports are referenced in Section 7 and summarized below.

Soil Removal Report, California Resources Corporation, Huntington Beach Facility, 20101 Goldenwest Street, Huntington Beach, 8 August 2025, conducted by Langan CA, Inc.:

During soil investigations in the fourth quarter of 2024, shallow soil samples collected around the Former Stretford Unit contained concentrations exceeding selected screening levels. Shallow soil samples (between 0.5 and 1.5 ft bgs) five out of eight borings from this area contained concentrations of vanadium and cadmium exceeding SFBRWQCB or DTSC screening levels and California hazardous waste levels. Concentrations of gasoline and diesel range petroleum hydrocarbons, naphthalene, 1-methlynapthelene, and 2-methylnapthelene also exceeded SFBRWQCB and DTSC screening levels. To complete demolition of the Former Stretford Unit, the remaining concrete and visibly impacted underlying soil was removed.

During a separate soil investigation conducted in January 2025, Langan detected lead concentrations exceeding California hazardous waste thresholds in one boring in the southern historical tank farm (Soil Boring 143). In addition to lead, the shallow soil from this boring at two ft bgs also contained concentrations of diesel range petroleum hydrocarbons, naphthalene, and 1-methylnapthalene exceeding SFBRWQCB or DTSC screening levels. Removal of the soil around boring SB143 was also included to remove the isolated California hazardous lead.

Demolition and soil removal activities were completed in June and July 2025. Areas of approximately 3,660 square-feet (sf) and 130 sf were excavated in the Former Stretford Unit and soil boring SB143 areas, respectively. The depth of soil removal was determined by field screening to remove underlying soil that could constitute a hazardous waste. The depth of excavations were up to two ft bgs with the exception of a portion of the SB143 area where a subsurface concrete feature stopped excavation at eight inches bgs and a 25-sf area in the Former Stretford Unit Area where the excavation was extended to 4.5 ft bgs. Approximately 102 cubic yards (CY) of concrete and 172 CY of soil were removed from the Former Stretford Unit Area; approximately two CY of asphalt and six CY of soil were removed from the SB143 area. Confirmation sampling analytical results verified that soil constituting a hazardous waste was removed from these areas during the demolition activities. Confirmation samples were also collected for TPH, VOC, and SVOC analytes that were not the drivers of soil removal but were identified above selected screening

levels. Only concentrations of diesel range TPH and naphthalene were identified above selected screening levels in the final confirmation samples.

Second Supplemental Soil and Soil Vapor Investigation Report, Huntington Beach Facility, 20101 Goldenwest Street, Huntington Beach, 3 July 2025, conducted by Langan CA, Inc.:

Langan conducted a soil investigation for the subject property between April and June 2025 as a continuation of prior investigations conducted between November and December 2024 and January to February 2025. Areas investigated included: Northwest Historical Tanks, Pipe Laydown Area, Maintenance and Truck Wash Buildings, Former UST Area, Electromagnetic Anomaly, Chemical Storage Area, Historical Bermed Area, Former Chemical Laboratory, Southern Historical Tank Farm, Southern Historical Sumps, and Southern Historical Tank Battery. The geophysical survey did not identify any new subsurface lines or anomalies not encountered during prior investigations. Soil samples were tested for metals, TPH, VOCs, and SVOCs, and compared to the SFBRWQCB ESLs (July 2025), DTSC Human Health Risk Assessment (HHRA) Note Number 3 DTSC-modified Screening Levels (DTSC-SLs) (June 2020-Revised April 2025), USEPA Regional Screening Levels (RSLs) (November 2024), and DTSC HHRA Note Number 11 Southern California Ambient Arsenic Screening Level (December 2020).

The follow main conclusions from the investigation are below:

- In general, concentrations exceeding screening levels in soil are contained within the upper five feet of soil.
- Soil borings have been advanced in or adjacent to all EM and GPR anomalies identified at the subject property.
- Only two locations at the site have not been vertically delineated for constituents other than arsenic and TBA; three borings within the Former Bermed Area (SB102/SB102A, SB173, and SB174) and one boring within the Southern Historical Tank Area (SB119A/SB119B). While not delineated, the lowest concentrations in the three Former Bermed Area are lowest in the deepest samples collected, between 15 and 30 feet bgs. Decreasing soil concentrations with increasing depth, where sources originated at the ground surface, indicate limited vertical migration of impacts. SB119A/SB119B could not be delineated due to refusal as the result of an apparent abandoned liner encountered at 17 feet bgs.
- There are five borings not vertically delineated for arsenic; these borings where not advanced for the delineation of arsenic by design. There are 13 borings not vertically delineated for TBA; this is the result of an order in magnitude change in the SFB RWQCB protection of groundwater screening used to scope the investigation versus the updated level used to evaluate the analytical data.
- Groundwater was not encountered in the deepest borings advanced during this investigation (30 feet bgs) and prior environmental investigations (35 feet bgs).
- Three areas have been identified to contain metal concentrations exceeding California hazardous waste levels. These areas included the Former Stretford Unit (soil borings SB2, SB4, SB5, SB6 and SB8), soil borings SB78 and SB170 in the Truck Wash and Maintenance Buildings Area, and soil boring SB143 in the

Southern Historical Tank Farm. All three areas have been vertically and laterally delineated.

- Of the 203 environmental borings advanced to date at the subject property, there are 25 borings that have not been completely laterally delineated to below site-specific screening levels (excluding borings adjacent to site operations or boundaries). Relevant analyte concentrations in 13 of these borings were below the Sitewide 95 percent UCLs. As concentrations in the other 12 borings exceeded screening levels and the UCL, further delineation may be warranted once additional portions of the subject property become accessible. Nonetheless, site investigations have thoroughly covered accessible portions of the subject property where historical operations posing a potential environmental risk are known to have occurred. Given that oilfield operations have occurred since the 1920s, subsurface soil concentrations exceeding screening levels may be present in areas yet sampled.
- Subject property soil screening levels were selected based on the most conservative level available from a selection of potentially applicable guidance. As future use of the subject property becomes more evident, the screening levels may be adjusted to those more applicable to specific areas.
- Concentrations of VOCs in soil vapor probes were above screening levels in all locations with the exception of SV08 in the Former Bermed Area. Several of the VOCs included halogenated compounds that have either not been or only anomalously been detected in soil samples (chloroform, methylene chloride, PCE, and vinyl chloride). The other VOCs above screening levels, benzene and ethylbenzene, have been detected to a greater extent, but are still not commonly identified in soil samples and are less prevalent than several other VOCs at the site.
- Concentrations of methane in soil vapor probes were in the passive system mitigation requirement range in all probes with the exception of SV07 and SV10, located in the Truck Wash and Maintenance Buildings and Southern Historical Tank Farm Areas, respectively. These two soil vapor probes contained concentrations of methane in the active system mitigation requirement range.
- Concentrations of VOCs and methane nearest the onsite buildings do not suggest a health risk to site occupants is present.

The detections of metals, TPH, VOCs, SVOCs, and PAHs exceeding the selected screening levels during the subsurface investigations on the subject property are considered a REC.

First Supplemental Investigation Report, Huntington Beach Facility, 2101 Goldenwest Street, Huntington Beach, 24 March 2025, conducted by Langan CA, Inc.:

Langan conducted a soil investigation for the subject property between January and February 2025 as a continuation of prior soil investigation efforts. The areas investigated included: Northwest Historical Tanks, Pipe Laydown, Maintenance and Truck Wash Buildings, Former UST, Electromagnetic Anomaly, Chemical Storage, Historical Bermed, Southern Historical Tank Farm, Southern Historical Sumps, and Southern Historical Tank Battery Areas. The geophysical survey identified 15 candidate electromagnetic (EM)

anomalies, and numerous active utilities and unidentified lines in the surveyed areas. The investigation report noted that while findings of candidate EM anomalies is suggestive of the presence subsurface features, more direct methods are required to confirm findings.

Soil samples were tested for metals, TPH, VOCs, and SVOCs and compared to the SFBRWQCB ESLs, DTSC HHRA Note Number 3 DTSC-SLs, USEPA RSLs, Federal and State Hazardous Waste Characteristics of Toxicity Levels (§66261.24) and DTSC HHRA Note Number 11 Southern California Ambient Arsenic Screening Level.

The following main conclusions from the investigation are below:

- Fifteen electromagnetic anomalies were identified, three of which contained or were immediately adjacent to soil borings.
- In general, concentrations exceeding screening levels in soil are contained within the upper five feet of soil.
- There are exceptions where concentrations extend beyond five feet bgs, including 12 boring locations where screening level exceedances are not vertically defined. The majority of these borings exhibited decreasing concentrations with depth, indicating that the impacts are likely confined to shallow subsurface zones.
- Groundwater was not encountered in the deepest borings advanced during this investigation (35 feet bgs).
- Several of the investigated areas contain soil borings where screening level exceedances are not laterally defined.
- With the exception of TBA, soil borings in the former UST area delineated residual soil concentrations exceeding screening levels as the result of the former UST release.
- Two borings with soil concentrations exceeding California hazardous waste levels were identified.
- Further investigation can be conducted to investigate remaining electromagnetic anomalies, borings not vertically defined, borings not laterally defined, and borings with hazardous waste levels. Further investigation is prohibited by facility operations in some of these areas.

The detections of metals, TPH, VOCs, SVOCs, and PAHs exceeding the selected ESLs during the subsurface investigations on the subject property are considered a REC.

Initial Soil Investigation Report, California Resources Corporation, Huntington Beach Facility, 20101 Goldenwest Street, Huntington Beach, 31 December 2024, conducted by Langan CA, Inc.:

Langan conducted the soil investigation between November 2024 and December 2024 to address potential environmental concerns associated the subject property. Of the areas of potential environmental concern identified, the Northern Historical Tank Farm area, the Former Stretford Unit area, the Transformer Storage Area, and the Former Chemical Laboratory area were investigated. Geophysical surveys were also conducted Central Site Buildings and Historical Southern Sumps Area. Geophysical surveys did not identify any significant subsurface anomalies in the Former Stretford Unit Area and the Transformer Storage Area. Three subsurface anomalies, one of which resulted from a septic tank,

were identified at the Former Chemical Laboratory Area, and several subsurface anomalies suggestive of abandoned oil wells were identified at the Northern Historical Tank Farm. Several subsurface anomalies were identified in two remaining areas planned for future investigation: the Historical Southern Sumps and the Central Site Buildings.

Soil samples were tested for metals, TPH, PCBs, VOCs, and SVOCs and compared to the SFBRWQCB ESLs, DTSC HHRA Note Number 3 DTSC-SLs, USEPA RSLs, Federal and State Hazardous Waste Characteristics of Toxicity Levels (§66261.24) and DTSC HHRA Note Number 11 Southern California Ambient Arsenic Screening Level.

The follow conclusions were made at each identified area of concern:

- Former Stretford Unit Area: Vanadium exceeded screening levels in five borings. Soluble concentrations of vanadium or cadmium in the five borings exceeded California hazardous waste levels but were below Federal hazardous waste levels. Three borings also contained soil concentrations or method detection limits of TPH, VOCs, and SVOCs/PAHs exceeding screening levels. Metal concentrations exceeding screening levels were delineated to the upper 1.5 ft bgs of soil; TPH, VOC, and SVOC/PAH concentrations exceeding screening levels were delineated to the upper two ft bgs of soil. Borings with exceedances are laterally delineated to the northwest and northeast.
- Transformer Storage Area: None of the analyzed samples contained any concentrations of PCBs over detection limits. One boring contained soil concentrations of TPH, VOCs, and SVOCs/PAHs exceeding screening levels. The impact in this single boring was delineated to the upper 0.5 ft bgs of soil.
- Former Chemical Laboratory Area: Arsenic exceeded background levels in one boring, barium exceeded screening levels in two borings, TPH concentrations exceeded screening levels in five borings, VOC concentrations exceeded screening levels in two borings, and SVOC/PAH concentrations exceeded screening levels in two borings. Metal concentrations exceeding screening levels were delineated to the upper 0.5 ft bgs of soil; TPH and VOC concentrations/method detection limits exceeding screening levels were delineated to the upper two ft bgs of soil; SVOC/PAH concentrations exceeding screening levels were delineated to the upper five ft bgs of soil.
- Northern Historical Tank Farm Area: Arsenic exceeded ambient levels in one boring. TPH concentrations exceeded screening levels in eight borings. VOC and SVOC/PAH concentrations exceeded screening levels in 12 borings. Metal, TPH, and SVOC/PAH concentrations exceeding screening levels were delineated to the upper two ft bgs of soil. VOCs concentrations were also delineated to the upper 15 feet bgs. Borings with exceedances were laterally delineated with the exception of three borings to the northeast and one boring to the southwest.

The detections of metals, TPH, VOCs, SVOCs, and PAHs exceeding the selected ESLs during the subsurface investigations on the subject property are considered a REC.

4. ADJOINING PROPERTIES AND SURROUNDING AREA

The following sections describe current and historical uses of and database listings for adjoining properties and the surrounding area.

4.1 Current Use of Adjoining Properties and Surrounding Area

The current use of adjoining and surrounding properties is summarized in Table 4-1.

Table 4-1 Current Use of Adjoining Properties and Surrounding Area

Direction	Adjoining Properties	Surrounding Area
North	Helipad followed by the Bolsa Chica Wetlands and oil field.	Bolsa Chica Wetlands and oil field followed by residences.
East	Residential dwellings.	Residential dwellings.
South / Southwest	Pacific Coast Highway followed by Huntington Beach (Pacific Ocean)	Pacific Ocean
Southeast	Goldenwest Street followed by residential dwellings.	Residential dwellings.
West / Northwest	Well cellars and oil and gas infrastructure.	Bolsa Chica Tidal Inlet followed by Bolsa Chica Wetlands.

Langan did not observe obvious conditions likely to represent environmental concerns for the subject property from current uses of adjoining or surrounding properties.

4.2 Adjoining Properties and Surrounding Area History

Langan compiled the following summaries of the adjoining properties and surrounding area history based on a review of historical resources and interviews. Historical resources are provided in Appendix E.

Table 4-2 Historical Use of Adjoining Properties

Direction	Adjoining Properties
North	The northern adjoining property is depicted as wetlands on the 1896 topographic map. Between the 1928 and 1938 aerial photographs, the property was undeveloped or vacant. By the 1947 aerial photograph, ASTs and structures are visible. An oil field is visible north of the ASTs in 1963 that remain to present-day. By 1994, ASTs and structures are no longer visible and concrete foundations are noted north of the previous AST farm. By 2002, the property appears to be in its general configuration.
East	The eastern adjoining property is depicted as Las Bolsas and undeveloped land in the 1896 topographic map. Between the 1928 and 1977 aerial photography, the property is developed with oil derricks in the central and southern portions. ASTs are visible extending from the subject property along the southern portion of the property that remain from 1928 to 1953. The northern portion of the property is vacant land until 1947. Between 1953 to 1977, surface features indicative of oil and gas activity are visible in the northern portion of the property. By 1988, residential development is noted in the central portion of the property the remains to present-day. The northern and southern portions appear to still be used for oil and gas production between 1988 and 1994. By 2002, the northern and southern portions are developed for residential use that remain to present-day. Database listings associated with the eastern adjoining property are discussed in Section 4.3.

Direction	Adjoining Properties
Southeast	The southeastern adjoining property is depicted as undeveloped on topographic maps in 1896. By 1928, the property was developed with oil derricks which remained on the property until residential development was first noted in 1994. By 2002, the property was in its present-day configuration of residential dwellings. Database listings associated with the southeastern adjoining property are discussed in Section 4.3.
South / Southwest	The south and southwestern adjoining properties are depicted as undeveloped on 1896 topographic maps. By 1928, Pacific Coast Highway is visible along the subject property boundary followed by oil derricks and the beach. The oil derricks are visible until 1947. By 1953, the property appears to be in its general present-day configuration of sandy beach.
West / Northwest	The west and northwest adjoining properties are depicted as undeveloped on 1896 topographic maps. Between 1928 and 1947, a surface feature is visible indicative of an oil well. By 1953, well cellars, ASTs, and a pipeline corridor are visible. By 1977, ASTs are no longer visible on the property and the property appears to be in its general configuration of well cellars and a pipeline corridor.

The surrounding area was depicted as undeveloped in the topographic maps in 1896. Aerial photographs from the mid-1930s, note oil and gas infrastructure throughout the surrounding area until the late 1960s. By 1977, residential development is first visible to the east of the subject property. In the subsequent years, increased residential development is visible to the east and southeast of the subject property until 2005 when the area appears to be in its present-day general configuration.

Langan considers the historical oil and gas use of the adjoining properties and surrounding area a REC due to the potential for impacts to have migrated onto the subject property.

4.3 Regulatory Database Review

Langan reviewed the environmental database report to evaluate if adjoining or surrounding area properties identified in the database report could represent an environmental concern for the subject property (see Section 8.2). Langan did not consider additional review of the associated regulatory agency files necessary to evaluate potential RECs for the subject property unless discussed in Section 4.3.1 or 4.3.2 below.

4.3.1 Adjoining Properties

Database listings for adjoining properties are summarized as follows.

Ross Island Sand and Gravel Co – 19499 Seapoint Street (inferred cross gradient)

Ross Island Sand and Gravel Co is listed in the HWTS and HAZNET databases in 2006 under EPA ID: CAC002600878 for the generation of approximately 3.04 tons of non-RCRA hazardous waste. The waste is generally characterized as waste oil and mixed oil. Due to the type and amount of waste generated, this listing is not an environmental concern in connection with the subject property.

Kewit Pacific – 19499 Seapoint Street (inferred up-gradient)

Kewit Pacific is listed in the HWTS and HAZNET databases in 2005 under EPA ID: CAC002583494 for the generation of approximately 1.8 tons of non-RCRA hazardous waste. The waste is

generally characterized as unspecified oil-containing waste and other organic solids. Due to the type and amount of waste generated, this listing is not an environmental concern in connection with the subject property.

Fish & Wildlife – 19499 Seapoint Street (inferred up-gradient)

Fish & Wildlife is listed in the HWTS database between 2004 and 2005 under EPA ID: CAC002584677. There are no waste manifests listed in the database or records of environmental spills or releases associated with the database listings; therefore, the listing is not an environmental concern associated with the subject property.

Bolsa Chica Lowlands Restoration Project – 19499 Seapoint Avenue (north of the subject property, inferred up-gradient)

Bolsa Chica Lowlands Restoration Project is listed in the NPDES and CIWQS databases. According to the RWQCB Stormwater Multiple Application and Report Tracking System (SMARTS), a stormwater permit was submitted for construction in 2005 and was terminated in 2006. According to historical imagery, the area to the north of the subject property has been in its current configuration since the 1940s. This listing appears to be erroneous and is not considered an environmental concern in connection with the subject property.

BP Andreea Moyes – 6032 Panorama Drive (approximately 0.04-miles east of the subject property, inferred up-gradient)

BP Andreea Moyes is listed in the Historical Auto database as a gasoline service station between 2010 and 2014. Historical imagery for this area notes residential dwellings since the late 1980s. Due to the historical imagery, this listing appears to be erroneous and therefore not an environmental concern in connection with the subject property.

Aera Energy LLC, F V Group LLC Property – southeast corner of the Pacific Coast Highway and Goldenwest Street intersection (approximately 116-feet southeast of the subject property, inferred down-gradient)

Aera Energy and F V Group LLC Property are listed in the CPS-SLIC, Orange Co. Industrial Site, and CERS databases. The facilities were listed as having PCB contamination and underwent remediation activities between 1998 and 1999. According to a 1999 RWQCB Closure Report, impacted soil was removed from the site and characterized in accordance with the Orange County Health Care Agency (OCHCA) approved Remedial Action Plan. The facility received a No Further Action (NFA) letter from the RWQCB in 1999. According to historical imagery, the facility was developed with residential dwelling by 2002. Due to the down-gradient location, NFA, and redevelopment of the site, this facility does not appear to be an environmental concern in connection with the subject property.

4.3.2 Surrounding Area

Langan evaluated each of the database listings for surrounding area properties (see Section 8.2) and determined that the listings are not of environmental concern in connection with the subject property.

5. CONCLUSIONS, FINDINGS AND OPINIONS

Langan completed a Phase I ESA consistent with the scope and limitations of ASTM E1527-21 for the subject property at 20101 Goldenwest Street, Huntington Beach, California. Exceptions to, or deletions from, ASTM E1527-21 are described in Section 8 of this report.

This assessment has revealed the following RECs, CRECs, HRECs, de minimis conditions, and significant data gaps in connection with the subject property as presented in Table 5-1.

Table 5-1 Conclusions, Findings and Opinions

ASTM E1527-21 Scope Items
Recognized Environmental Conditions (RECs)
REC-1: Current and Historical Oil and Gas Production Infrastructure on the Subject Property: Records from CalGEM indicate the first oil well on the subject property was spudded in 1920. Historical aerial photographs from the 1920s through the 1990s note pits, tank farms, large-capacity aboveground storage tanks (ASTs), oil and gas wells, and other infrastructure associated with the production of oil and gas. Sumps were visible from the 1920s until the 1950s and, according to interviews, were reportedly filled with undocumented material. The sumps and pits were historically used for the storage of drilling muds, produced water, and oil and gas condensates, and are considered potential sources of subsurface impacts. Currently, some pits are used to collect stormwater, which is combined with produced water and reinjected into the subsurface reservoirs. ASTs have been on the subject property, prior to the implementation of federal secondary containment requirements. These ASTs were likely placed directly on soil without containment, increasing the potential for historical releases. According to CalGEM, the property currently contains 92 active, 142 idle, and 419 plugged and abandoned wells. Apparent petroleum residue was observed within the well cellars of active and idle wells. Additionally, previously plugged and abandoned wells are located on the subject property. Based on the historical use of pits and sumps, undocumented fill, the operation of ASTs without secondary containment, and the potential for releases from oil and gas wells, the potential for hazardous substance releases to the subsurface is considered a REC.
REC-2: Pipeline Chases: The subject property is bisected northwest–southeast by two pipeline chases. The northern chase (Chase 1) was first visible on the 1947 aerial photograph and, according to site observations and interviews, is suspected to be unlined. Apparent tar and petroleum impacts were observed in Chase 1. Pipelines within this chase transmit oil and gas from the State Lease and Bolsas Oil Fields into on-site ASTs. The southern chase (Chase 2) was first visible on the 1953 aerial photograph and is currently lined with concrete; however, large sections of the lining are cracked or missing. The installation date of the concrete lining is unknown. Pipelines within this chase transport oil and gas from Platform Emmy and on-site wells into on-site ASTs. According to interviews, the chases are also used for spill containment when necessary. Due to the historically unlined condition of Chase 1 and the current concrete condition of Chase 2Chase 2, there is potential for petroleum to impact the underlying surface. Therefore, Chase 1 and Chase 2 are considered a REC.
REC-3: Documented Spills and Releases and Site Reconnaissance Observations: During the historical review, a pipeline laydown area was first identified in the 1947 aerial photograph,

ASTM E1527-21 Scope Items
northwest of the Main Office and remains in use. According to interviews, used pipelines are staged here for inspection prior to reuse or recycling, and may remain for several weeks to several months. During the site reconnaissance, oil was observed seeping from pipelines, and oily staining was noted throughout the laydown area soils. Additional oily staining was observed on soils and cracked concrete in multiple areas across the property. Northwest of the laydown area, a chemical storage area for Platform Emmy contained pallets and totes of drilling lubricant. Containers were leaking onto the soil, and an approximately 500-square-foot (sf) oily stain with associated odor was observed. The main chemical storage area, southeast of the Main Office, contained 55-gallon metal drums of motor oil, all stored on wooden pallets and within secondary containment. The drums appeared intact; however, water with floating oil was present within the containment. A tote was observed releasing diesel exhaust fluid. Additional totes of scale and corrosion inhibitors and amino propanol were intact without visible releases. A 450-gallon diesel tank located along the southeastern corner of the storage area was surrounded by pooling product and staining on deteriorated, cracked concrete. Another tank in the southern portion of the area was placed within plastic secondary containment; oily staining and fluid were observed on the surrounding concrete. The tank label was illegible, but a visible hazard label indicated the contents likely included diesel. Additionally, the subject property is identified in the ERNS and CHMIRS databases for hazardous substance releases, with 23 incidents reported between 1995 and 2023. Documentation of cleanup activities or confirmation sampling were not available in these databases or other resources researched as part of this ESA. The hazardous substances releases noted in the databases and observations made during the site reconnaissance have a potential to impact the underlying surface and are considered a REC.
REC-4: 2024 – 2025 Subsurface Investigation Findings: Between November 2024 and August 2025, Langan conducted subsurface investigations in accessible areas of concern identified through historical research at the subject property. While several investigated areas were absent of subsurface impact, several analytical results identified total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, and polycyclic aromatic hydrocarbons (PAHs) at concentrations exceeding selected environmental screening levels (ESLs) in multiple areas across the property. The investigation was limited to soil and soil vapor; however, given the detections above selected ESLs, these findings are considered a REC.
REC-5: Adjoining and Surrounding Current and Historical Oil and Gas Production: Oil derricks were first visible in the area surrounding the subject property on the 1928 aerial photograph. The southeast and east adjoining properties were used for oil and gas production until residential development occurred by 2002, while the north and northeast adjoining properties have remained in oil and gas production since 1928. Historical aerials also show tank farms, pits, and sumps on adjoining and surrounding properties until the 1970s. Oil and gas infrastructure was historically associated with hazardous substances use, and pits and sumps were commonly used for the collection and storage of drilling muds, produced water, oil and gas condensates, and other chemicals used in the drilling and production process. The north and northeastern adjoining property, Bolsas, is listed in the ERNS and CHMIRS databases for hazardous substance releases related to oil and gas production between 1994 and 2006. Based on prior groundwater investigations and the topography of the area, groundwater flow is expected to flow

ASTM E1527-21 Scope Items
between west to southwest, creating a potential migration pathway toward the subject property. Therefore, historical oil and gas production on the adjoining and surrounding properties, combined with documented hazardous substance releases at Bolsas, are considered a REC due to the potential for soil and groundwater migration impacts at the subject property.
Controlled Recognized Environmental Conditions (CRECs)
Langan did not identify CRECs for the subject property.
Historical Recognized Environmental Conditions (HRECs)
Langan did not identify HRECs for the subject property.
De Minimis Conditions
Langan did not identify de minimis conditions for the subject property.
Significant Data Gaps
Langan did not identify significant data gaps for the subject property.
Non-ASTM E1527-21 Scope Items
Business Environmental Risks (BERs)
BER-1 – Asbestos Containing Materials (ACM): According to interviews and observations made during the site reconnaissance, ACM is reportedly present within the buildings. Additionally, ACM is also often present in the gaskets, pipe flanges, and pipe wrapping in oil fields. Due to the ACM, additional mitigation measures may need to be implemented during redevelopment activities.
BER-2 – Methane: The subject property is located within the City of Huntington Beach Methane District. Methane is a naturally occurring flammable gas that is associated with natural decay and oil and gas production. Given the use of the subject property for oil and gas operations since the 1920s, methane mitigation measures will likely be required during redevelopment activities.
BER 3 - PFAS from Legacy AFFF in Firefighting Foam Tank. Although the current AFFF formulation stored in the firefighting foam tank does not appear to contain PFAS, legacy AFFF may have included PFAS compounds. During decommissioning, it may be necessary to assess for the presence of PFAS within the system and implement appropriate decontamination and disposal measures.

6. ENVIRONMENTAL PROFESSIONAL STATEMENT

I declare that to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in Section 312.10 of 40 CFR Part 312 and I have the specific qualifications based on my education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Cory Lavoie
Principal/Vice President (Environmental Professional)

Resumes outlining the qualifications of the project team and the Environmental Professional are included in Appendix G.

8. LIMITATIONS AND DEFINITIONS

This Phase I ESA report was prepared for the user and is intended to be used in its entirety. Excerpts taken from this report are not necessarily representative of the assessment findings. The user is the sole intended beneficiary of the report. The user requested no special terms or conditions regarding this Phase I ESA.

Langan's scope of services, which is described in Section 1.2 and in the contract executed between Langan and the user, was limited to that agreed to with the user and no other services beyond those explicitly stated are implied. To the extent possible, the services performed and agreed upon for this Phase I ESA are consistent with the guidelines of ASTM E1527-21.

This report is not intended to be an exhaustive assessment of the subject property. The purpose of the Phase I ESA is to reduce uncertainty about unknown conditions at the subject property. No environmental site assessment can wholly eliminate uncertainty regarding the potential for RECs in connection with a subject property. Therefore, Langan cannot "verify", "insure", "certify", or "guarantee" that the subject property is free of environmental concerns.

No expressed or implied representation or warranty is included or intended in this report, except that our services were completed using the care and skill ordinarily followed by professionals providing similar services under similar circumstances in similar locations at the same point in time.

The conclusions provided in this report are based solely on information obtained through completing the standard activities required by ASTM E1527-21 and are intended exclusively for the purpose stated herein, at the specified subject property, as it existed at the point in time the assessment was completed. The conclusions provided in this report do not apply to conditions and features of which Langan was not made aware of through good faith efforts to complete the activities required by ASTM E1527-21 and did not have the opportunity to evaluate.

8.1 ASTM Definitions

The following definitions are provided in ASTM E1527-21 and presented below for reference. This section is not a comprehensive list of definitions provided in ASTM E1527-21 and is intended to summarize those pertinent to this Phase I ESA report.

Activity and use limitations (AULs): legal or physical restrictions or limitations on the use of, or access to, a site or facility: (1) to reduce or eliminate potential exposure to hazardous substances or petroleum products in the soil, soil vapor, groundwater, and/or surface water on the property, or (2) to prevent activities that could interfere with the effective-ness of a response action, in order to ensure maintenance of a condition of no significant risk to public health or the environment. These legal or physical restrictions, which may include institutional and/or engineering controls, are intended to prevent adverse impacts to individuals or populations that may be exposed to hazardous substances and petroleum products in the soil, soil vapor, groundwater, and/or surface water on a property.

Adjoining properties: any real property or properties the border of which is contiguous or partially contiguous with that of the subject property, or that would be contiguous or partially contiguous with that of the subject property but for a street, road, or other public thoroughfare separating them.

All Appropriate Inquiries: that inquiry constituting all appropriate inquiries into the previous ownership and uses of the subject property consistent with good commercial and customary practice as defined in CERCLA, 42 U.S.C.§ 9601(35)(B) and 40 C.F.R. Part 312, that will qualify a party to a commercial real estate transaction for one of the threshold criteria for satisfying the LLPs to CERCLA liability (42U.S.C. §§ 9601(35)(A) & (B), § 9607(b)(3), § 9607(q), and§ 9607(r)), assuming compliance with other elements of the defense.

Approximate minimum search distance: the area for which records must be obtained and reviewed pursuant to ASTM E1527-21 Section 8 subject to the limitations provided in that section. This may include areas outside the subject property and shall be measured from the nearest subject property boundary. This term is used in lieu of radius to include irregularly shaped properties.

Business environmental risk (BER): a risk which can have a material environmental or environmentally-driven impact on the business associated with the current or planned use of commercial real estate, not necessarily related to those environmental issues required to be investigated in this practice. Consideration of BER issues may involve addressing one or more non-scope considerations.

Controlled recognized environmental condition (CREC): recognized environmental condition affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to implementation of required controls (for example, activity and use limitations or other property use limitations).

Data gap: a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information. Data gaps may result from incompleteness in any of the activities required by this practice, including, but not limited to, site reconnaissance (for example, an inability to conduct the site visit), and interviews (for example, an inability to interview the key site manager, regulatory officials, etc.).

De minimis condition: a condition related to a release that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. A condition determined to be a de minimis condition is not a recognized environmental condition nor a controlled recognized environmental condition.

Engineering controls: physical modifications to a site or facility (for example, capping, slurry walls, or point of use water treatment) to reduce or eliminate the potential for exposure to hazardous substances or petroleum products in the soil or groundwater on a property. Engineering controls are a type of activity and use limitation (AUL).

Environment: environment shall have the same meaning as the definition of environment in CERCLA 42 U.S.C. § 9601(8).

Hazardous substance: a substance defined as a hazardous substance pursuant to CERCLA 42 U.S.C. § 9601(14), as interpreted by EPA regulations and the courts: "(A) any substance designated pursuant to section 1321(b)(2)(A) of Title 33, (B) any element, compound, mixture, solution, or substance designated pursuant to section 9602 of this title, (C) any hazardous waste having the characteristics identified under or listed pursuant to section 3001 of the Resource Conservation and Recovery Act of 1976 (RCRA), as amended, (42 U.S.C. § 6921) (but not including any waste the regulation of which under RCRA (42 U.S.C. § 6901 et seq.) has been

suspended by Act of Congress), (D) any toxic pollutant listed under section 1317(a) of Title 33, (E) any hazardous air pollutant listed under section 112 of the Clean Air Act (42 U.S.C. § 7412), and (F) any imminently Hazardous chemical substance or mixture with respect to which the Administrator (of EPA) has taken action pursuant to section 2606 of Title 15. The term does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically listed or designated as a hazardous substance under subparagraphs (A) through (F) of this paragraph, and the term does not include natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas).

Hazardous waste: any hazardous waste having the characteristics identified under or listed pursuant to section 3001 of RCRA, as amended, (42 U.S.C. § 6921) (but not including any waste the regulation of which under RCRA (42 U.S.C. §§ 6901-6992k) has been suspended by Act of Congress). RCRA is sometimes also identified as the Solid Waste Disposal Act. RCRA defines a hazardous waste, at 42 U.S.C. § 6903, as: "a solid waste, or combination of solid wastes, which because of its quantity, concentration, or physical, chemical, or infectious characteristics may: (A) cause, or significantly contribute to an increase in mortality or an increase in serious irreversible, or incapacitating reversible, illness, or (B) pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, or disposed of, or otherwise managed."

Historical recognized environmental condition (HREC): previous release of hazardous substances or petroleum products affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the subject property to any controls (for example, activity and use limitations or other property use limitations). A historical recognized environmental condition is not a recognized environmental condition.

Institutional controls (IC): a legal or administrative mechanism (for example, "deed restrictions," restrictive covenants, easements, or zoning) on the use of, or access to, a site or facility to (1) reduce or eliminate potential exposure to hazardous substances or petroleum products in the soil or groundwater on the property, or (2) to prevent activities that could interfere with the effectiveness of a response action, in order to ensure maintenance of a condition of no significant risk to public health or the environment. An institutional control is a type of activity and use limitation (AUL).

Key site manager: the person identified by the owner or operator of a subject property as having good knowledge of the uses and physical characteristics of the subject property.

Material threat: obvious threat which is likely to lead to a release and that, in the opinion of the environmental professional, would likely result in impact to public health or the environment.

Obvious: that which is plain or evident; a condition or fact that could not be ignored or overlooked by a reasonable observer.

Property use limitation: limitation or restriction on current or future use of a property in connection with a response to a release, in accordance with the applicable regulatory authority or authorities that allows hazardous sub-stances or petroleum products to remain in place at concentrations exceeding unrestricted use criteria.

Reasonably ascertainable: information that is (1) publicly available, (2) obtainable from its source within reasonable time and cost constraints, and (3) practically reviewable.

Recognized environmental conditions: (1) the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment. For the purposes of this definition, "likely" is that which is neither certain nor proved, but can be expected or believed by a reasonable observer based on the logic and/or experience of the environmental professional, and/or available evidence, as stated in the report to support the opinions given therein.

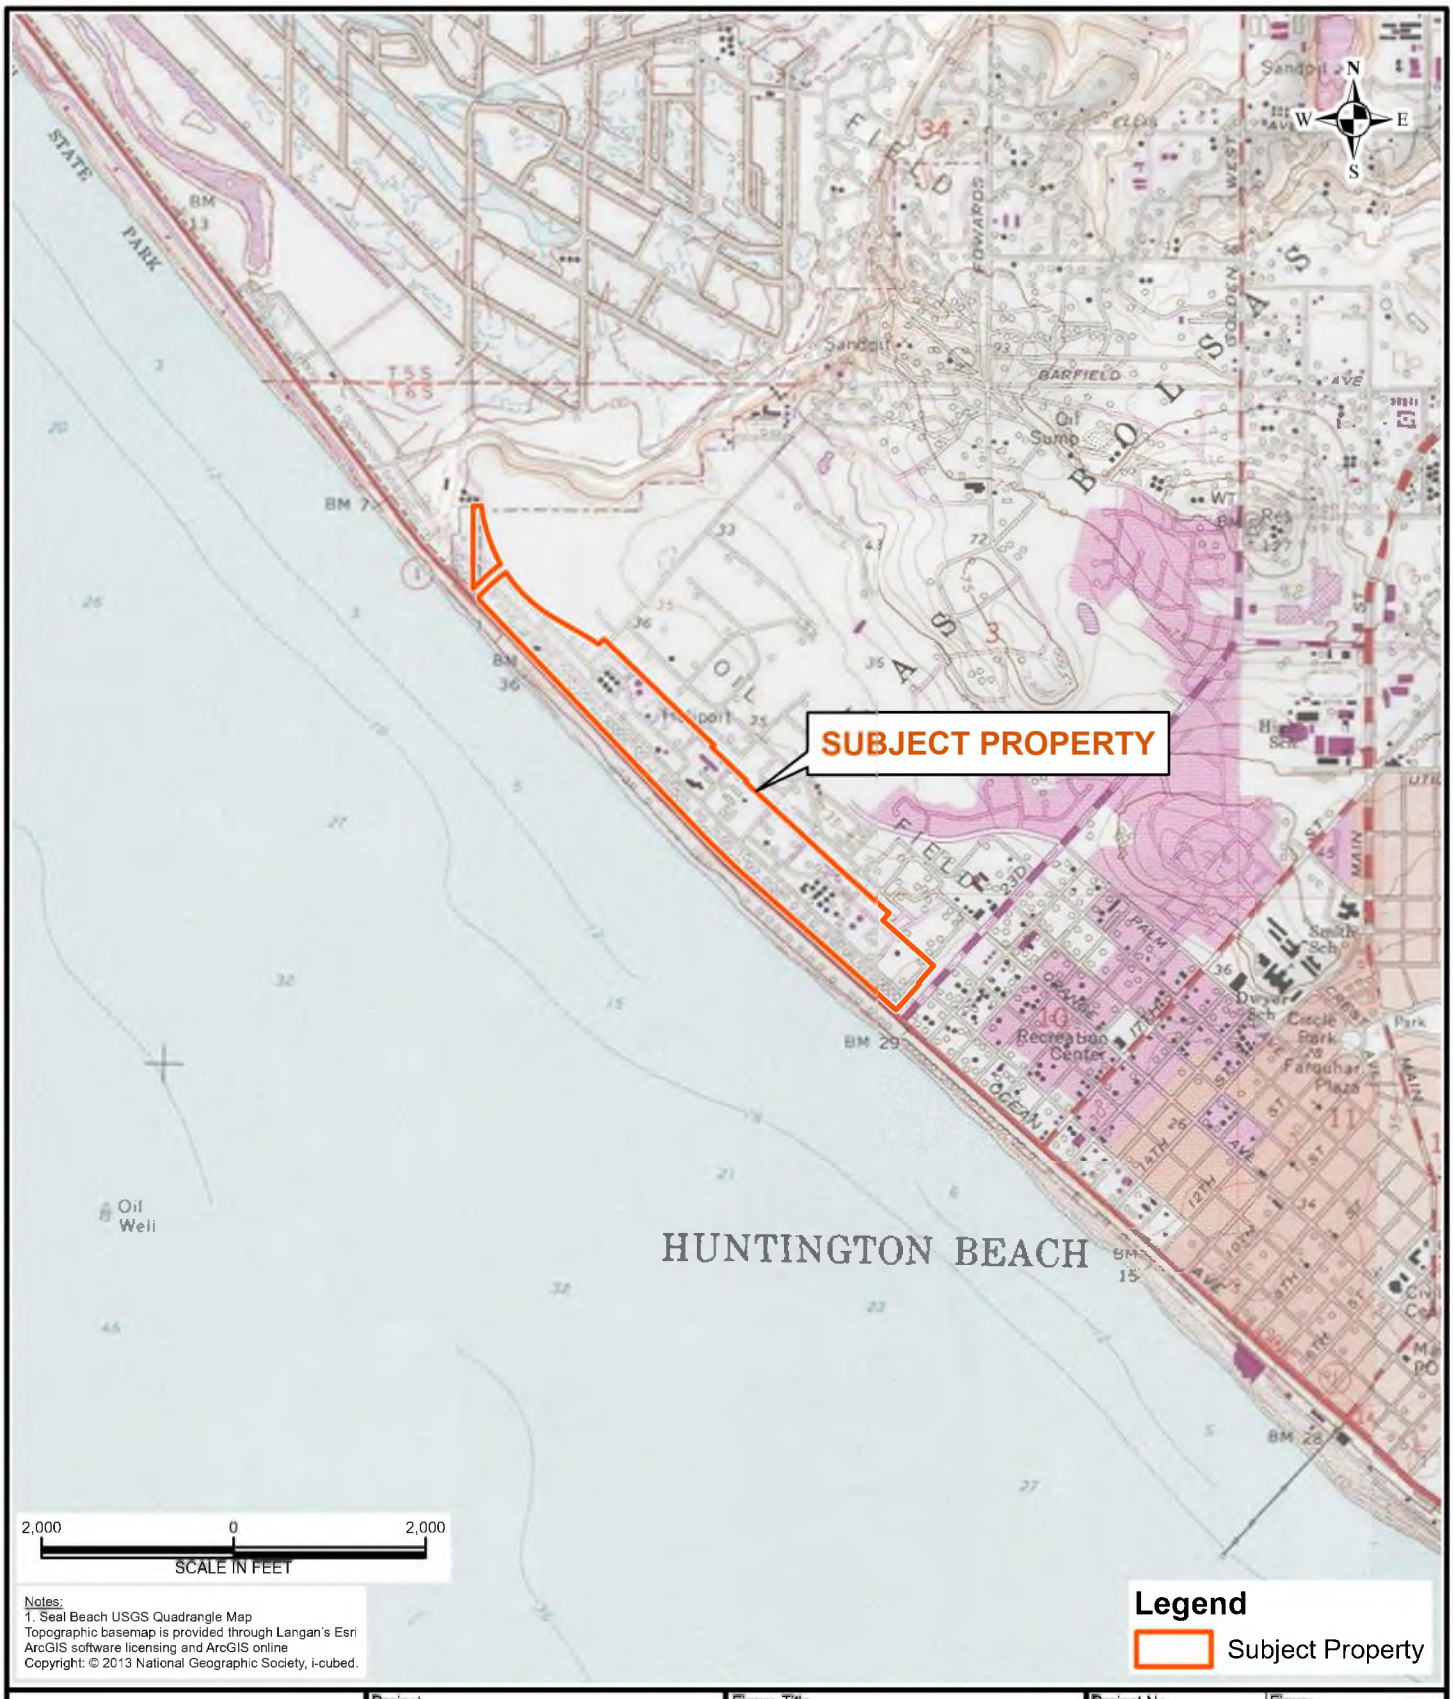
Release: a release of any hazardous substance or petroleum product shall have the same meaning as the definition of "release" in CERCLA 42 U.S.C. § 9601(22). There are a number of statutory exclusions from the definition of release that may impact the environmental professional's opinions and conclusions, such as the normal application of fertilizer.

Significant data gap: a data gap that affects the ability of the environmental professional to identify a recognized environmental condition.

Site reconnaissance: that part that is contained in Section 9 of ASTM E1527-21 and addresses what should be done in connection with the site visit. The site reconnaissance includes, but is not limited to, the site visit done in connection with such a Phase I Environmental Site Assessment.

Site visit: the visit of the subject property during which observations are made constituting the site reconnaissance section of this practice.

Subject property: the property that is the subject of the environmental site assessment described in this practice.



User: the party seeking to use ASTM E1527-21 to complete an environmental site assessment of the subject property.

8.2 Standard Environmental Record Sources

Langan reviewed an environmental database search report prepared by an environmental database search provider for the subject property and surrounding area. The database search report includes a listing of properties identified on select federal, state, local and tribal standard source environmental databases within the approximate minimum search radii outlined in ASTM E1527-21. This information was supplied to Langan by the environmental database search provider, and to the environmental database search provider by government sources; therefore, neither Langan nor the environmental database search provider can verify the completeness and accuracy of the database information. Appendix F contains a copy of the report, with specific source and property descriptions, and the dates of the last update for each database searched. Langan reviewed the database search report on a record-by-record basis to evaluate if certain properties identified in the database report are likely to represent an environmental concern for the subject property. The evaluation criteria included factors such as distance, groundwater gradient, nature of the listing, and regulatory status. Unless specifically discussed in the body of this report, the facilities listed on the database do not appear to represent an environmental concern to the subject property.

Dear Requestor:

On 7/7/25 the Department of Toxics Control (DTSC) received your email of 7/7/25 requesting records under the Public Records Act. DTSC Cypress Office has identified site records responsive to your request for 20101 Goldenwest Street, Huntington Beach, CA and is in the process of gathering the requested records. However, DTSC did not find records for any other addresses on your request.

Please contact us to schedule an appointment to review these records. DTSC will notify you if any of the records will be withheld from disclosure under the Act. We recommend you bring a copier or arrange for a bonded copying service to make copies of the records.

A large number of our records are available on EnviroStor, an online database that provides non-confidential, public access to DTSCs data management system. It tracks our cleanup, permitting, enforcement, and investigation efforts at hazardous waste facilities and sites with known or suspected contamination issues. EnviroStor is

available 24/7, 365 days a year. The data reflects the latest updates as they are entered in the system. Access it from your computer or smartphone, the local library-anywhere Internet access is available. Just go to www.envirostor.dtsc.ca.gov. You'll find a step-by-step tour of EnviroStor under the "How To Use EnviroStor" menu on the website.

If you have any questions or would like further information regarding your request, please contact me at (714) 484-5337 or via email at CypressFileRoom@dtsc.ca.gov.

Respectfully,

Julie Chandler

Hazardous Materials

Does your facility have on site (for any purpose) at any one time, hazardous materials at or above 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet for compressed gases (include liquids in ASTs and USTs); or is regulated under more restrictive inventory local reporting requirements (shown below if present); or the applicable Federal threshold quantity for an extremely hazardous substance specified in 40 CFR Part 355, Appendix A or B; or handle radiological materials in quantities for which an emergency plan is required pursuant to 10 CFR Parts 30, 40 or 70?	**Yes**

Underground Storage Tank(s) (UST)

Does your facility own or operate underground storage tanks?	**No**

Hazardous Waste

Is your facility a Hazardous Waste Generator?	**No**
Does your facility treat hazardous waste on-site?	**No**
Is your facility's treatment subject to financial assurance requirements (for Permit by Rule and Conditional Authorization)?	**No**
Does your facility consolidate hazardous waste generated at a remote site?	**No**
Does your facility need to report the closure/removal of a tank that was classified as hazardous waste and cleaned on-site?	**No**
Does your facility generate in any single calendar month 1,000 kilograms (kg) (2,200 pounds) or more of federal RCRA hazardous waste, or generate in any single calendar month greater than 1 kg (2.2 pounds) of RCRA acute hazardous waste; or generate more than 100 kg (220 pounds) of spill cleanup materials contaminated with RCRA acute hazardous waste.	**No**
Is your facility a Household Hazardous Waste (HHW) Collection site?	**No**

Excluded and/or Exempted Materials

Does your facility recycle more than 100 kg/month of excluded or exempted recyclable materials (per HSC 25143.2)?	**No**

Aboveground Petroleum Storage

Does your facility own or operate aboveground petroleum storage tanks or containers AND: * have a total aboveground petroleum storage capacity of 1,320 gallons or more, OR * have one or more petroleum tanks in an underground area?	**No**

Regulated Substances

Does your facility have Regulated Substances stored onsite in quantities greater than the threshold quantities established by the California Accidental Release prevention Program (CalARP)?	**No**

Additional Information

No additional comments provided.

THIS PLAN COVERS CHEMICAL SPILLS, FIRES, AND EARTHQUAKES INVOLVING (Check all that apply): A10.

☒ 1. HAZARDOUS MATERIALS; ☐ 2. HAZARDOUS WASTES

B. INTERNAL RESPONSE

INTERNAL FACILITY EMERGENCY RESPONSE WILL OCCUR BY (Check all that apply): B1.

☒ 1. CALLING PUBLIC EMERGENCY RESPONDERS (e.g., 9-1-1)
☒ 2. CALLING HAZARDOUS WASTE CONTRACTOR
☐ 3. ACTIVATING IN-HOUSE EMERGENCY RESPONSE TEAM

C. EMERGENCY COMMUNICATIONS, PHONE NUMBERS AND NOTIFICATIONS

In the event of an emergency involving hazardous materials and/or hazardous waste, all facilities must IMMEDIATELY:
1. Notify facility personnel and evacuate if necessary in accordance with the Emergency Action Plan (Title 8 California Code of Regulations §3220);
2. Notify local emergency responders by calling 9-1-1;
3. Notify the local Unified Program Agency (UPA) at the phone number below; and
4. Notify the State Warning Center at (800) 852-7550.

Facilities that generate, treat, store or dispose of hazardous waste have additional responsibilities to notify and coordinate with other response agencies. Whenever there is an imminent or actual emergency situation such as an explosion, fire, or release, the Emergency Coordinator must follow the appropriate requirements for the category of facility and type of release involved:
1. Title 22 California Code of Regulations §66265.56. Emergency Procedures for generators of 1,000 kilograms or more of hazardous waste in any calendar month.
2. Title 22 California Code of Regulations §66265.196. Response to Leaks or Spills and Disposition of Leaking or Unfit-for-Use Tank Systems.
3. Title 40 Code of Federal Regulations §302.6. Notification requirements for a release of a hazardous substance equal to or greater than the reportable quantity.
4. Title 22 California Code of Regulations §66262.34(d)(2) and Title 40 Code of Federal Regulations §262.34(d)(5)(ii) for generators of less than 1000 kilograms of hazardous waste in any calendar month.

Following notification and before facility operations are resumed in areas of the facility affected by the incident, the Emergency Coordinator shall notify the local UPA and the local fire department's hazardous materials program, if necessary, that the facility is in compliance with requirements to:
1. Provide for proper storage and disposal of recovered waste, contaminated soil or surface water, or any other material that results from an explosion, fire, or release at the facility; and
2. Ensure that no material that is incompatible with the released material is transferred, stored, or disposed of in areas of the facility affected by the incident until cleanup procedures are completed.

Note: If more than one alternate emergency coordinator is designated, attach a list in order of responsibility.

D. EMERGENCY CONTAINMENT AND CLEANUP PROCEDURES

Check the applicable boxes to indicate your facility's procedures for containing spills and preventing and mitigating releases, fires and/or explosions.

D1.

- [x] 1. MONITOR FOR LEAKS, RUPTURES, PRESSURE BUILD-UP, ETC.;
- [x] 2. PROVIDE STRUCTURAL PHYSICAL BARRIERS (e.g., Portable spill containment walls, built-in berms);
- [x] 3. PROVIDE ABSORBENT PHYSICAL BARRIERS (e.g., Pads, spill pigs, spill pillows);
- [ ] 4. COVER OR BLOCK FLOOR AND/OR STORM DRAINS;
- [ ] 5. LINED TRENCH DRAINS AND/OR SUMPS;
- [ ] 6. AUTOMATIC FIRE SUPPRESSION SYSTEM;
- [ ] 7. ELIMINATE SOURCES OF IGNITION FOR FLAMMABLE HAZARDS;
- [x] 8. STOP PROCESSES AND/OR OPERATIONS;
- [x] 9. AUTOMATIC / ELECTRONIC EQUIPMENT SHUT-OFF SYSTEM;
- [ ] 10. SHUT OFF WATER, GAS, ELECTRICAL UTILITIES;
- [x] 11. CALL 9-1-1 FOR PUBLIC EMERGENCY RESPONDER ASSISTANCE AND/OR MEDICAL AID;
- [x] 12. NOTIFY AND EVACUATE PERSONS IN ALL THREATENED AND/OR IMPACTED AREAS;
- [x] 13. ACCOUNT FOR EVACUATED PERSONS IMMEDIATELY AFTER EVACUATION;
- [ ] 14. PROVIDE PROTECTIVE EQUIPMENT FOR ON-SITE EMERGENCY RESPONSE TEAM;
- [x] 15. REMOVE CONTAINERS AND/OR ISOLATE AREAS;
- [x] 16. HIRE LICENSED HAZARDOUS WASTE CONTRACTOR;
- [x] 17. USE ABSORBENT MATERIAL FOR SPILL CONTAINMENT;
- [x] 18. VACUUM SUCTION USING APPROPRIATE VACUUM (e.g., Intrinsically safe) FOR SPILL CONTROL AND/OR CLEANUP;
- [ ] 19. DECONTAMINATE PERSONNEL AND EQUIPMENT WITHIN DESIGNATED AREA AND DISPOSE OF WASTEWATER AS HAZARDOUS WASTE;
- [x] 20. PROVIDE SAFE TEMPORARY STORAGE OF HAZARDOUS WASTE GENERATED DURING EMERGENCY ACTIONS;
- [ ] 21. OTHER (Specify): D2.

E. FACILITY EVACUATION

THE FOLLOWING ALARM SIGNAL(S) WILL BE USED TO BEGIN EVACUATION OF THE FACILITY (Check all that apply): E1.

E2.

- [ ] 1. BELLS;
- [ ] 2. HORNS/SIRENS;
- [x] 3. VERBAL (i.e., Shouting);
- [x] 4. OTHER (Specify): Telephone, Cell Phones, Car Horns

THE FOLLOWING LOCATION(S) WILL BE USED FOR AN EMERGENCY ASSEMBLY AREA(S) (e.g., Parking lot, street corner): E3.

Outside front gate.

Note: The Emergency Coordinator must account for all onsite employees and visitors after evacuation.

EVACUATION ROUTE S AND ALTERNATE EVACUATION ROUTES ARE DESCRIBED AS FOLLOWS: E4.

- [ ] 1. WRITTEN PROCEDURES DESCRIBING ROUTES, EXITS, AND ASSEMBLY AREAS;
- [ ] 2. EVACUATION MAP(S) DEPICTING ROUTES, EXITS, AND ASSEMBLY AREAS;
- [x] 3. OTHER (Specify): Meet at front gate. E5.

Note: Evacuation procedures and/or maps should be posted in visible facility locations and must be included in the Contingency Plan.

F. ARRANGEMENTS FOR EMERGENCY SERVICES

ADVANCE ARRANGEMENTS FOR LOCAL EMERGENCY SERVICES (Check one of the following): F1.

- [x] 1. HAVE BEEN DETERMINED NOT NECESSARY;
- [ ] 2. THE FOLLOWING ARRANGEMENTS HAVE BEEN MADE (Specify): F2.

Note: Advance arrangements with local fire and police departments, hospitals, state and local emergency response teams, and/or emergency services contractors should be made for your facility, if necessary. Large Quantity Generators must describe arrangements in the Contingency Plan.

G. EMERGENCY EQUIPMENT

Check the applicable boxes to list emergency response equipment available at the facility, identify the location(s) where the equipment is kept, and indicate the equipment's capability, if applicable.

TYPE	EQUIPMENT AVAILABLE G1.	LOCATION G2.	CAPABILITY G3.
EXAMPLE	☒ *CHEMICAL PROTECTIVE GLOVES*	*SPILL RESPONSE KIT*	*SINGLE USE, OIL RESISTANT ONLY*
Safety and First Aid	1. ☐ CHEMICAL PROTECTIVE SUITS, APRONS, AND/OR VESTS		
	2. ☒ CHEMICAL PROTECTIVE GLOVES	Vehicles	Nitrile
	3. ☐ CHEMICAL PROTECTIVE BOOTS		
	4. ☒ SAFETY GLASSES, GOGGLES, AND FACE SHIELDS	Vehicles, Employee PPE	
	5. ☒ HARD HATS	Vehicles, Employee PPE	
	6. ☐ AIR-PURIFYING RESPIRATORS		
	7. ☐ SELF-CONTAINED BREATHING APPARATUS (SCBA)		
	8. ☒ FIRST AID KITS	Vehicles	
	9. ☐ PLUMBED EYEWASH FOUNTAIN AND/OR SHOWER		
	10. ☐ PORTABLE EYEWASH KITS AND/OR STATION

H. EARTHQUAKE VULNERABILITY

Identify areas of the facility that are vulnerable to hazardous materials releases due to seismic motion. These areas require immediate isolation and inspection.

VULNERABLE AREAS (Check all that apply): H1.

- [x] 1. HAZARDOUS MATERIALS AND/OR WASTE STORAGE AREAS
- [ ] 2. PROCESS LINES AND PIPING
- [ ] 3. LABORATORY
- [ ] 4. WASTE TREATMENT AREA

LOCATIONS (e.g., Shop, outdoor shed, lab): H2.

Inside Electrical Equipment, Battery Cabinets

Identify mechanical systems vulnerable to releases / spills due to earthquake-related motion. These systems require immediate isolation and inspection.

VULNERABLE SYSTEMS AND/OR EQUIPMENT (Check all that apply): H3.

- [x] 1. SHELVES, CABINETS AND/OR RACKS
- [ ] 2. TANKS AND SHUT-OFF VALVES
- [ ] 3. PORTABLE GAS CYLINDERS
- [ ] 4. EMERGENCY SHUT-OFF AND/OR UTILITY VALVES
- [ ] 5. SPRINKLER SYSTEMS
- [ ] 6. STATIONARY PRESSURIZED CONTAINERS (e.g., Propane tank)

LOCATIONS: H4.

Battery Cabinets

I. EMPLOYEE TRAINING

Employee training is required for all employees and/or contractors handling hazardous materials and/or hazardous wastes during normal and/or emergency operations. Most facilities will need to submit a separate Training Plan. However, your CUPA may accept this section as the Training Plan for some small facilities.
Employee training plans may include the following content:

- Applicable laws and regulations;
- Emergency response plans and procedures;
- Safety Data Sheets;
- Hazard communication related to health and safety;
- Methods for safe handling of hazardous substances;
- Hazards of materials and processes (e.g., fire, explosion, asphyxiation);
- Hazard mitigation, prevention and abatement procedures;
- Coordination of emergency response actions;
- Notification procedures for local emergency responders, CUPA, Cal OES, and onsite personnel;
- Communication and alarm systems;
- Personal protective equipment;
- Use and maintenance of emergency response equipment and supplies (e.g. Fire extinguishers, respirators, spill control materials);
- Decontamination procedures;
- Evacuation procedures and evacuation staging locations;
- Identification of facility areas, equipment, and systems vulnerable to earthquakes and other natural disasters.
- OTHER (Specify):

Check the applicable boxes below to indicate how the employee training program is administered.

- [x] 1. FORMAL CLASSROOM
- [x] 2. VIDEOS
- [x] 3. SAFETY MEETINGS
- [x] 4. STUDY GUIDES / MANUALS I1.
- [x] 5. OTHER (Specify): Employees receive Hazardous Material and Hazardous Waste awareness (Training Handouts, Web Based Training, Policy/Procedure Manuals) depending on their position I2.
- [ ] 6. NOT APPLICABLE SINCE FACILITY HAS NO EMPLOYEES
- [ ] 7. CHECK IF A SEPARATE EMPLOYEE TRAINING PLAN IS USED AND UPLOADED TO CERS AS A PDF DOCUMENT I3.
- [x] 8. CHECK IF EMPLOYEE TRAINING IS COVERED BY THE ABOVE REFERENCED CONTENT AND OTHER DOCUMENTS ONSITE I4.

EMPLOYEE TRAINING FREQUENCY AND RECORDKEEPING TRAINING MUST BE:

- Provided initially for new employees as soon as possible following the date of hire. New employees should not work in an unsupervised position that involves hazardous materials handling and/or hazardous waste management without proper training;
- Provided within six months from the date of hire for new employees at a large quantity generator;
- Ongoing and provided at least annually;
- Amended prior to a change in process or work assignment;
- Given upon modification to the Emergency Response/Contingency Plan.

Large Quantity Generator Training: Large quantity generators (1,000 kg or more) must retain written plan and documentation of employee training which includes:

- A written description of the type and amount of both initial and ongoing training that will be given to persons filling each job position having responsibility for hazardous waste management and/or emergency response.
- The name, job title and job description for each position at the facility related to hazardous waste management.
- Current employee training records must be retained until closure of the facility and former employee training records must be retained for at least three years after termination of employment.

Small Quantity Generator Training: Small quantity generators (less than 1,000 kg) must include basic hazardous waste management and emergency response procedures but a written employee training plan and training records are not required. In order to show that the facility has met the small quantity generator employee training requirement, an employee training plan and training records may be made available.

Hazardous Materials Business Plan Training: Businesses must provide initial and annual employee training that includes the content referenced above. The training may be based on the job position and training records must be made available for a period of at least three years.

INTRODUCTION

This report presents the results of subsurface investigation conducted at the Shell Western E & P, Inc., at Huntington Beach. This work was performed following underground storage tank removals from the site, which confirmed the presence of contamination underneath the tanks.

SITE DESCRIPTION

Shell Western Exploration and Production Inc., is located at 20101 Golden West Street, Huntington Beach. The facility has been the site of concentrated oil production and oil field related services since the early 1930's. Figure 1 presents a plot plan showing the site of the removed tanks, the pump island as well as the borehole locations and the close-by buildings.

BACKGROUND

Recently three underground storage tanks were removed by Coast Contractors, Inc., from the Shell Western E and P Inc., facility in Huntington Beach. The following table presents a description of the tanks that have been removed and their contents:

Tank Number	Tank Capacity (Gallon)	Material Stored
1	2,000	Stoddard Solvent
2	5,000	Stoddard Solvent
3	7,500	Leaded Gasoline

Analyses of soil samples taken at about 2 feet below the bottom of the tanks at the time of tank removals show that contamination by fuel hydrocarbons exists at the northern part of the excavation site. Little or no contamination was detected at the southern part of the excavation. The fill pipes of the removed tanks were positioned at the northern part of the excavation. As the tanks were in good condition at the time of the removals, it is strongly suspected that the contamination at the site has been caused by overfilling of the tanks or leakage of the stored materials from loose fittings.

GROUNDWATER DEPTH

Data regarding groundwater depth for the area is rather limited. Search of the archives of the State Department of Water Resources revealed that data for groundwater was available for September 1966. We have also obtained water depth of 71 feet at the site for water source well 33A measured by the Shell Western E & P staff in August 1988. In a telephone conversation with the Orange County Water District we were informed that Well No. 05S/11W/26M8 about half a

mile away had a groundwater depth of 40 feet for November 1987. The Orange County Water District also informed us that the first aquifer in the Huntington Beach area is designated to be a municipal water source. The first aquifer is also connected to deeper aquifers in that region. No groundwater gradient can be presented at the present time.

RAINFALL DATA

Historical data obtained from a South Coast Air Quality Management District publication titled "A Climatological - Air Quality Profile, California South Coast Basin" shows that average data in Newport Beach the nearest station to the site is 11.88 inches. Historical data from other stations in Orange County show average annual rainfall in the range 12-14.5 inches.

RESULTS OF DRILLING, SOIL SAMPLING AND LABORATORY ANALYSES PROGRAM

On July 19 and 20, 1988, a drilling and soil sampling program was conducted at Shell Western E & P, Inc. located at 20101 Golden West Street in Huntington Beach to determine the vertical and lateral extent of the contamination at the site. Hollow stem augers were used to drill six boreholes around the excavation . Borings B-3, B-4 and B-5 were drilled to depths of 35 feet, borings B-1, B-2 and B-6 were drilled to depths of 30 feet. Borings B-1 and B-2 were drilled to determine if the contamination has migrated to the south and east of the excavation. Boreholes B-3 and B-4 were slant drilled at 20° angles to obtain soil samples from underneath tanks 1 and 2 at points where the highest concentrations of the contaminants were detected at the time of the tank removals. Borings B-5 and B-6 were drilled at locations dictated by the logistics of the site which include various pipes traversing the area and other underground storage tanks in the vicinity. All the borings were sampled at 5 foot intervals. At borehole B-3 several attempts were made to take a sample at 35 foot depth, but no sample was obtained. The soil samples were collected in stainless steel tubes inside a modified California sampler. The sample tube ends were covered with aluminum foil and sealed with plastic end caps and stored in an ice chest with blue ice to prevent volatilization. A Bacharach Instrument TLV meter was used to monitor duplicate soil samples for the presence of combustible vapors. The field monitoring results as well as visual and olfactory evidence indicated that some contamination was present at the site. The samples were submitted to a state-certified laboratory to be analyzed using the EPA Method 8015 for total petroleum hydrocarbons and by the EPA Method 8020 for BTX and E. A summary of the laboratory results for total fuel hydrocarbons are presented in Table 1, while Table 2 contains the BTX and E results.

TABLE 1

Detection Limit 5 ppb

The laboratory results show that contamination by petroleum hydrocarbons is present at the site. However, no BTX&E are present in the bottom samples. At borehole B-1 contamination has been detected at 5 foot depth. Considering the position of borehole B-1, this contamination is most likely not a result of leakage from the removed tanks. At boreholes B-2 and B-3 insignificant contamination is present to 10 and 20 foot depths respectively. The results of analyses for borehole B-2 shows that the contamination has not migrated to the eastern parts of the excavation. The results of analyses for borehole B-3 indicates that the contamination detected below tank 1 at the time of tank removals has not migrated to depths greater than 20 feet. At borehole B-4 minor contamination is detected to 15 foot depth, but at 35 foot depth a relatively low concentration of the contaminants are found. Such anomalies in the profile assessment are not usually expected, but it could be attributed to the migration of the contaminants by the channelling effect through the soil matrix. At boreholes B-5 and B-6 significant contamination is present to 15 and 20 foot depths respectively. Bottom samples from both boreholes show the presence of a small concentration of petroleum hydrocarbons. The results of the analyses for BTX&E for the bottom samples clearly show that no contamination by BTX&E are present. The presence of non-contaminated soil above the bottom samples indicates that the leakage or spillage from the removed tanks has not penetrated to such depths.

Enclosed are copies of the chain of custody papers regarding the drilling program as well as the formal laboratory reports for both the drilling program and the tank removals.

GENERAL GEOLOGY

The drilling program revealed that the soil formation at the site is mostly interbedded sandy silt, clayey silt or silty clay. Enclosed are the boring logs.

CONCLUSIONS

Based on the laboratory results of the subsurface investigation the vertical extent of the contamination by fuel hydrocarbons has been defined, but the lateral extent of the contamination has not been fully determined.

Figure 2 presents the plan view of the former tank site together with sections AA and BB. This figure also shows section AA with numerical presentation of the fuel hydrocarbon contamination as determined by the EPA method 8015. The maximum vertical depth at which significant fuel hydrocarbons were detected by the EPA Method 8015 is 20 feet. Figure 2 clearly shows that at the vertical depth of 25 feet all the boreholes are free from contamination. However, based on field observations the maximum depth of the contamination is 23 feet. The soil formation at the site is mostly interbedded sandy silt, clayey silt or silty clay. It appears that the clay layers have been instrumental in retarding the vertical penetration of the contaminants. The available data indicates that the contamination may have migrated laterally to the northern and northwestern parts of the excavation. However, various pipes and other underground tanks that exist in that locality may have also contributed to the contamination detected to the northern and northwestern parts of the excavation. Considering the data from boreholes B-1, B-2 and B-3, and those obtained at the time of tank removals, the lateral extent of the contamination at the eastern and southern parts of the excavation can be defined, but the lateral limits to the northern and western parts may not be determined. Figure 3 is a 3-dimensional presentation of the plume of contamination according to the available data. Further subsurface investigation is required to determine the plume size.

The LUFT Manual was consulted as a guideline to determine the concentration of the contaminants that can be left in place without threatening groundwater. Table 2-1 of the LUFT Manual which is a simplified procedure to evaluate the leaching potential of the contaminants from contaminated soils was employed. Table 3 shows the points scored for the site features. A total of 46 points is scored which allows a maximum concentration of 100 ppm TPH to be left in place. The maximum B/T/X/E concentrations that can accordingly be left in place are 0.3/0.3/1/1 ppm respectively. The general risk appraisal based on profile of soil contamination and depth to groundwater was subsequently considered. However, the site produced positive results for questions 7 and 8 of Table 2-3 of the LUFT Manual and the answers to questions 3 and 4 are not know at this time. Because of this, the results of the general risk appraisal will be less valid than if the site had produces negative answers. The general risk appraisal is also dependent upon the results of the BTX&E for the entire profile of the borings. Such data is not available at this moment. Therefore the general risk appraisal according to Tables 2-5 through 2-8 presents in the LUFT manual have not been used. As further subsurface investigations have been recommended for the site, the application of the general risk appraisal can be delayed, until the results of further subsurface investigation and laboratory analyses for total boreholes profiles for BTX&E is obtained.

REMEDIATION

A number of remediation methods that can be considered for the site are discussed as follows:

1. EXCAVATION

Excavation of the contaminated soil by a backhoe or crane and clam shell would ensure the removal of the contaminated soil. The nearby buildings may need to be shored up. The contaminated volume will be surrounded by soil which is clean, as a result the total volume of soil that needs to be removed will be larger than the actual plume of contamination. This is due to excavating and shoring up requirements. Field monitoring by a TLV sniffer should be employed to ascertain the lateral and vertical extent of the contamination at the time of excavation.

Several soil samples would be taken where the field monitoring indicates that the contamination has been totally removed. A report of this activity should be issued to the lead agency involved.

The clean soil excavated prior to the removal of the contaminated soil may be stock piled on site and can be used as backfill material.

After the agency approval for the clean-up is obtained, the excavation will have to be backfilled with clean soil from the pit as well as import soil.

Regarding the contaminated soil, two options would be available for completing the site remediation:

a) On-site surface aeration or treatment by biological degradation (landfarming). This work requires 12 to 18 months to be completed. However, due to the proposed regulations by South Coast Air Quality Management District (SCAQMD) the applicability of this type of remediation may be limited as time constraints would eventually be placed on the existing landfarms after the adoption of the regulations.

b) Transportation of the contaminated soil to a class 1 land fill by registered hazardous waste haulers.

As the volume of the contaminated plume has not been determined, the economic feasibility of conducting such work may not be evaluated.

2. In-situ treatment:

In-situ treatment refers to the abatement of the contamination in the soil matrix without disturbing the soil.

a) Biodegradation: Although a relatively simple method, its applicability is limited to very shallow depths in suitable soil formations.

b) Vapor extraction: This method is mostly applicable to sandy and silty formations. However, it may be an option to consider for this site even though the majority of the soils which exist at the site are interbedded sandy silt, clayey sit or silty clay. The treatment period may be very long due to the slow volatilization rates. It is difficult to monitor or control the treatment progress and completeness, but it has been used with varying degrees of success at a number of sites.

c) Air stripping: The applicability and limitations of this method are similar to those as in vapor extraction described above.

d) Chemical oxidation: This treatment method involves the injection of hydrogen peroxide into the contaminated soil. However, at this site due to the soil formation part of the upper strata soil needs to be excavated and treated at the surface to make the less contaminated soil at depths more than 20 feet more accessible to the treatment process. This treatment method is not approved by the State Department of Health Services. However, on a case by case basis some work plans employing this technique may be approved.

Several treatment options have been briefly described. It appears that options 1(a), 1(b) and 2(b) can be applicable to the site.

Option 1(a) is effective in the treatment of gasoline contaminated soil, but requires the shoring up of the building. Option 1(b) offers the fastest and surest remediation measure. But it is an extremely costly undertaking as it requires shoring up, excavation, transportation and disposal at a class 1 landfill.

Option 2(b) has the potential and suitability to be effective for pollution abatement at this site. It also offers economic feasibility as an acceptable method. But, this treatment technique would not remove the contamination completely. Therefore, prior to the installation of the vapor extraction system a criteria for leaving part of the contaminants in the soil should be established and approved by the lead agency.

It may be necessary to conduct limited vapor extraction at the site to monitor the progress of the process and assess its effectiveness for the site. If the results of the monitoring indicate that the process is achieving its intended goals then full scale vapor extraction will be a most suitable method to be considered for the mitigation at the site.

A combination of options 1(a) and 2(b) may also be an appropriate choice for mitigation at this site. Excavation at the epicenter of the contaminated soil and away form the buildings to a depth of about 23 feet may not require shoring up of the building. The excavated soil and the contaminated soil that would be left in place would then be treated by landfarming on site and by vapor extraction in-situ respectively.

It is recommended to investigate the economic and practical applicability of methods 1(a), 1(b) and 2(b) and a combination of methods 1(a) and 2(b) further.

DISCLAIMER

All properties are subject to some environmental risks. These risks cannot be eliminated completely. Many commercial and industrial properties that were developed prior to the enactment of modern environmental laws are particularly prone to risks associated with environmental hazards which include, but are not limited to materials or wastes which may be toxic, ignitable, corrosive or reactive. The identification and mitigation of the potential environmental hazards prior to the development or redevelopment of the property can lead to the reduction or elimination of the impact of the environmental hazards on the use of the property. In some cases, it is not possible to ascertain that hazardous materials/wastes are present on the property prior to development.

No warranty, expressed or implied, of any kind is made or intended in connection with this report, or by the fact that you are being furnished with the report, or by any other oral or written statement.

SUMMARY

The subsurface investigation program conducted for the Shell Western E and P Inc., located at Huntington Beach has not determined a contaminated plume completely. Further subsurface investigation at the site is required to determine the size of the contaminated plume caused by the leakage or spillage from the underground storage tanks in that locality. Installation of monitoring wells may be appropriate for the site. However, remediation methods have been briefly discussed and three methods suitable for this purpose have been brought into focus.

We look forward to your review and comments on this report. If you have any questions or require further information, please call us at (213) 596-2755.

I. INTRODUCTION

The following report describes the tank removal performed by Aman Environmental, Inc. (AEI) for the Shell Western Exploration and Production, Inc. (SWEPI) Huntington Beach Unit (the site) located at 20101 Goldenwest Street, Huntington Beach, California. Refer to Figure 1 - Site Location Map.

II. BACKGROUND

The site had two (2) 10,000-gallon underground storage tanks, one containing gasoline and one containing stoddard solvent, associated with the site maintenance yard. Refer to Figure 2 - Site Plan and Sample Locations. SWEPI, projecting no further use for the tanks, retained AEI to remove them.

III. TANK REMOVAL

AEI secured closure permits from the Orange County Health Care Agency, Environmental Health, Waste Management Section (OCHCA), and from the City of Huntington Beach Fire Department, Fire Prevention Division (HBFD). Refer to Appendix A - OCHCA and HBFD Permits.

The South Coast Air Quality Management District (SCAQMD) was notified by AEI and assigned reference number 89-1027 to the project in accordance with Rule 1166 excavation permit (AEI application number A/N 180871) notification requirement.

On April 4, 1989, the contents from both tanks were removed. The inside of each tank was washed, and the oxygen level was reduced by placing 150 pounds of dry ice into each tank. The tanks were observed to contain no visible contamination upon inspection by a Certified Industrial Hygienist. The tanks were removed and transported to American Metal Recycling, Inc. in Ontario, California. Refer to Appendix B - Tank Removal Certificates and Tank Disposal Form.

During tank excavation operations, a 1-foot diameter slotted steel liner was encountered and removed from the northeast corner of the stoddard solvent tank. The 4-foot long casing was welded to the base of a 4-inch diameter steel riser pipe, and total length of the vessel was approximately 8 feet. The slotted liner was packed with coarse gravel, and noticeable hydrocarbon odors were detected inside the vessel.

IV. SOIL SAMPLING AND LABORATORY ANALYSIS

Samples GT-EX-1 and GT-EX-2 were obtained at the base of each end of the gasoline tank, and samples ST-EX-1 and ST-EX-2 were obtained at the base of each end of the solvent tank, at a depth of approximately 12 feet (see Figure 2). Each soil sample was collected using a backhoe scoop, placed into 250-ml glass jars with Teflon caps, labeled, entered into AEI chain-of-custody protocol, then packed on ice prior to transport to the laboratory for analysis.

Because soil contamination was detected during excavation around the eastern end of the solvent tank, two additional soil samples were collected. One sample, ST-EX-1A, was taken approximately 2 feet beneath sample ST-EX-1, at a depth of about 14 feet, and one sample, SP-GS-1, was taken from the contaminated soil stockpiled to the south of the excavation (Figure 2).

The soil samples were submitted to Terra Tech Labs, Inc. (TTL) of Huntington Beach, California for analysis of total petroleum hydrocarbons (TPH) in accordance with modified EPA Method 8015 using gasoline and stoddard solvent as calibration standards, and for benzene, toluene, ethylbenzene, and total xylenes (BTEX) in accordance with EPA Method 8020. Analytical results for soil samples GT-EX-1, GT-EX-2, and ST-EX-2 indicated TPH concentrations below the detection limit of 1 milligram per kilogram, equivalent to parts per million (ppm), and BTEX concentrations below the detection limit of 0.01 ppm for benzene and toluene, and 0.05 ppm for ethylbenzene and total xylenes. Analytical results for samples ST-EX-1, ST-EX-1A, and SP-GS-1 indicated TPH concentrations ranging from 3,550 ppm in ST-EX-1 to 20,700 ppm in ST-EX-1A. Concentrations of benzene ranged from 6.17 ppm in SP-GS-1 to 90.6 ppm in ST-EX-1A. Concentrations of ethylbenzene ranged from 6.24 ppm in SP-GS-1 to 46.2 ppm in ST-EX-1A. Concentrations of total xylenes ranged from 52.2 ppm in SP-GS-1 to 339 ppm in ST-EX-1A. Refer to Table 1 - Summary of Analytical Results, and to Appendix C - Laboratory Analytical Reports and Chain-of-Custody Records.

V. EXCAVATION OF CONTAMINATED SOIL

On April 10, 1989, excavation of contaminated soil commenced around the east end of the former solvent tank location. Soil was stockpiled and covered with visqueen, pending analytical results from additional soil samples collected at various depths. Analytical results of soil samples ST-EX-7 and ST-EX-8, taken at approximate depths of 26 and 32 feet below the surface, respectively, still indicated elevated concentrations of TPH and BTEX (see Table 1). On April 13, excavation ceased due to safety

considerations based on proximity to surface structures and buildings. Approximately 640 cubic yards (956.36 tons) of contaminated soil had been excavated to an estimated depth of 35 feet below grade. Refer to Figure 3 - Site Plan and Boring Locations, and to Figure 4 - Cross Section A-A' - Boring and Sample Locations.

On April 13 and 14, the contaminated soil stockpiled on-site was removed and disposed under manifest to Casmalia Resources, a State permitted disposal facility in Casmalia, California, subject to all applicable government regulations. Refer to Appendix D - Hazardous Waste Manifests.

VI. DRILLING, ADDITIONAL SOIL SAMPLING AND ANALYSIS

Because additional excavation of contaminated soil could no longer be performed safely, it was decided to conduct a subsurface investigation to determine lateral and vertical extent of remaining contamination. The investigation included drilling 3 soil test borings, and analyzing the soils sampled for TPH (also known as total extractable petroleum hydrocarbons, TEPH) and for BTEX using a mobile analytical laboratory located on-site.

On June 27, 1989, AEI drilled, logged and sampled soils from borings PB-1, PB-2, and PB-3 located along the north and east sides of the excavation (see Figure 3). The borings were drilled using 3.25-inch inside diameter (ID) continuous-flight, follow-stem augers. Borings PB-1 and PB-3 were drilled to a total depth of 36 feet below surface and boring PB-2 was slant-drilled and projected beneath the excavation to a total depth of 40 feet (approximately 35 feet vertical depth). Groundwater was encountered at a depth of approximately 35 feet. Soil cuttings were logged continuously and monitored for volatile organic compounds (VOC) using a field organic vapor detector. Samples were collected at approximately 5-foot intervals (10-foot intervals in boring PB-2) from surface to total depth of each boring.

Soil samples were collected using a Modified California sampler containing two 2-inch O.D., 6-inch-long, brass retainers. Soil within the upper retainer was examined on-site for evidence of contamination and characterized using the Unified Soil Classification system (USCS). Soil within the lower retainer was immediately sealed, labeled, entered into AEI chain-of-custody protocol, and delivered to the mobile laboratory for analysis.

Sampling equipment was thoroughly washed between sample collections using an aqueous solution of phosphate detergent followed by tap water and distilled water rinses. Clean augers were used in each

boring. Borehole information including soil conditions, was documented on soil test boring logs included in Appendix E.

Soil samples were submitted to an on-site mobile laboratory provided by Enseco-CRL of Garden Grove, California, for TEPH analysis by modified EPA Method 8015 using stoddard solvent as a calibration standard, and for BTEX by EPA Method 8020. Analytical results for soils sampled from the borings indicated TEPH concentrations below the detection limit of 10 ppm, except for sample PB1-25' with 10 ppm, and for a grab sample of cuttings from boring PB2 at an approximate depth of 22 feet (labeled GS2-22') at 180 ppm. Analytical results for samples PB1-35', PB2-40', and PB3-35' indicated BTEX concentrations below the detection limit of 0.1 ppm. Results for sample PB1-25' indicated concentrations of benzene at 0.3 ppm, of toluene at 0.7 ppm, of ethylbenzene at 0.3 ppm, and of total xylenes of 0.9 ppm. Results for cuttings grab sample GS2-22' indicated concentrations of toluene at 0.2 ppm, of total xylenes at 6.6 ppm, and of benzene and ethylbenzene below detection (see Table 1).

VII. CONCLUSION

Based on the analytical results of soils sampled from borings PB1, PB2, and PB3, it appears that solvent contamination has not extended laterally to the east or north of the excavation. Also, based on no detectable concentrations of TPH or BTEX being encountered in samples taken at total depths of the borings, it appears that solvent contamination has not extended deeper than the excavation. Therefore, AEI concludes that the current excavation has adequately removed the extent of solvent contamination in the soil at the site.

Backfilling activities will commence immediately after clean closure has been indicated by the Orange County Health Care Agency. The former tank locations will be capped with impermeable building materials (i.e. asphalt, concrete) after the completion of backfill and sub-grade preparation.

VIII. CLOSURE

This report has been prepared under the direction of William B. Reese, California Registered Geologist, Number 4475. It is in accordance with accepted practices in the State of California.

GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

INTRODUCTION

Shell Western Exploration and Production, Inc. (SWEPI) retained Groundwater Technology, Inc. November 9, 1989, to install three groundwater wells around the perimeter of an existing excavation. Gasoline/stoddard solvent storage tanks had been removed from within the area defined by the excavated sidewalls. At a later date, two additional groundwater wells, and a soil vent well with a separate boring containing dual vapor pressure probes were installed. Groundwater Technology collected soil and groundwater samples, determined groundwater gradient, evaluated the laboratory data, conducted a soil vapor extraction test, and prepared a site assessment report.

Prior to the current work phase, soils were excavated directly beneath the pre-existing stoddard solvent and gasoline storage tanks and sampled. A previous consultant also clustered several soil borings near the east corner of the tank pit and collected soil samples to groundwater. Groundwater Technology was contracted by SWEPI to further define the existence of adsorbed-phase hydrocarbons within the soil column, determine groundwater gradient, and presence of dissolved-phase hydrocarbons in groundwater.

Two of the five groundwater wells were placed as close to the existing tank excavation as safety would allow. One other well was located near a pump island currently in operation. The pump island was perceived as a possible source of elevated hydrocarbon concentrations in the soil column. The fourth well was placed north of the tank excavation as a downgradient well after survey of the first three wells showed groundwater flow towards that

region. After the tank pit was backfilled by SWEPI in early 1990, a fifth well was positioned upgradient from the former tank pit, beneath the maintenance building's floor.

BACKGROUND

The site under investigation is located on the western edge of the Huntington Beach Mesa. The site contains an excavated tank pit and outlying buildings, located approximately 1/2 mile northeast of the intersection of Goldenwest Street and Pacific Coast Highway (See Figure 1). A previous consultant had removed separate stoddard solvent and gasoline underground storage tanks. During the tank removal phase, a petroleum/solvent odor was noted beneath the tanks. Subsequent laboratory tests indicated adsorbed-phase hydrocarbons in the soil. Additional borings/laboratory tests indicated adsorbed levels beyond the limits of the excavation sidewalls. The excavation was left open after this preliminary assessment was completed. Groundwater Technology was retained by SWEPI (Nov. 9, 1989) to further define the extent of hydrocarbon levels in the soil column, determine groundwater gradient, and conduct a soil vent test to determine the design criteria for hydrocarbon extraction using vapor extraction methods.

HYDROGEOLOGY

Sediments in the Huntington Beach Mesa have been above sea level since the late Pleistocene in response to uplifting imposed by the Newport-Inglewood Zone of Deformation. The south branch of the Newport-Inglewood Fault crosses near the site, approximately a half mile to the northeast. The Huntington Beach Mesa is approximately

2.5 miles wide and extends inland from the shoreline nearly 4 miles. Upper Pleistocene alluvial/terrace deposits underlie the site. Underlying the terrace deposits are the marine/continental gravel-sands of the Lakewood Formation, which extend to a depth of approximately 350 feet. The Lakewood Formation is composed of interbedded clay, silt, sand, and gravel (California Department of Water Resources, 1967). The soil types exposed by Groundwater Technology borings indicate sediment characteristics similar to those described in the Water Resources Report, from grade to 55 feet below grade. Marine shell fragments, in soils from 40 to 55 feet below grade, indicate the previous existence of a shore/nearshore marine depositional environment. The possibility exists that these sediments may be part of the Lakewood Formation. Alternating beds of sand/clay/silt from grade to 30 feet below grade, show a general decrease in fines (including clay beds).

Groundwater Technology's borings indicate that the dominant soil types below the capillary fringe (30 feet) are well sorted to poorly sorted sands (contained within the saturated zone). There is a lack of a dominant soil type from grade to approximately 30 feet in depth, due to the complex interbedded nature of the soil column.

Unconfined groundwater was encountered from approximately 32 to 33 feet below grade in the investigated area. A survey of wells installed by Groundwater Technology showed that the water-bearing zone has a predominantly north to northwest gradient of 0.06% across the tank excavation perimeter (see Surveying and Groundwater Gradient section of this report).

DRILLING INVESTIGATION

During the recently completed drilling phase of this investigation, five groundwater monitoring wells were installed to a depth of approximately 20 feet below first contact with groundwater. In addition, one boring, containing several probes for measuring soil vacuum during pilot testing, and a vadose zone well were installed near groundwater well GTW3 (Figure 2).

On November 10, 1989, well GTW1 was installed near the active pump island. On November 13, 1989, wells GTW2 and GTW3 were installed near the perimeter of the excavation with the intention of measuring the lateral extent of hydrocarbons away from the sidewalls.

GTV1, the soil probe monitoring boring, was installed December 7, 1989, and a soil vapor extraction pilot test was performed the same date. A vapor monitoring well, GTV2, was installed December 14, 1989. At this location, a continuous slotted well casing was installed within the soil column exhibiting elevated hydrocarbon odors and high photo-ionization detector (PID) readings. Groundwater monitoring well, GTW4, was installed the same day.

On May 23,1990, groundwater monitoring well GTW5 was installed within the confines of the maintenance building southeast of the old tank pit.

All five groundwater well borings were drilled to maximum depths of 50 to 55 feet while the vadose zone borings were extended down to 33 feet, to the static groundwater level

(Figure 3). The groundwater level depicted in cross-section A-A' was determined by: 1) Use of surveyed elevations for each well and 2) Gauged water level in each well several days after the water level had stabilized.

In the lithologic logs presented in Appendix A, sample labelling is as follows: a soil sample labeled GTW1-10 was obtained from the borehole of groundwater monitoring well #1, at a depth of 10 feet below grade. Generalized schematics for the four groundwater monitoring wells, one soil vent well, and one soil boring containing vapor probes are presented in Appendix B. Upon installation of each groundwater well casing, an inner locking cap was affixed to the casing and padlocked shut. A traffic box was installed around the top of each groundwater well, flush with the existing asphalt surface.

Soil samples were collected using a modified California Split Spoon Sampler with brass ring inserts, sealed with plastic caps, foil, and duct tape. Samples were identified and placed in a waterproof bag and then on ice for delivery to state-certified GTEL Environmental Laboratories (GTEL), Torrance, California. Between sampling runs, the equipment was washed with trisodium phosphate solution and rinsed successively with tap and distilled water. All laboratory results and the Chains-of-Custody for the soil sampling are presented in Appendix C.

Soils sampled during the drilling phase defined a near-surface soil horizon consisting of plastic clays, which increase in silt/sand percentage down to about 10 feet. At this depth, sands are the dominant lithology. Alternating clayey/sandy silt and silty sand beds were

encountered at depth in all borings. At location GTW3, from 20 to 25 feet, thin to medium bedded sands exhibited a distinct hydrocarbon odor. Soils encountered from 20 feet to groundwater (33 feet) in well boring GTW5 also displayed distinct hydrocarbon odors.

First water in the borings occurred at approximately 32 feet below grade. The water-bearing zone consists of well sorted to poorly sorted sands at depths ranging from 30 to 55 feet. Sands from 45 to 55 feet contain large quantities of marine shell fragments ("bioclastic" sands). Undisturbed soil samples were removed from each boring every 5 feet to the soil/water interface (GTV2 is an exception).

SOIL ANALYSES

Chemical Analyses

Thirty-two soil samples were sent to GTEL for either preservation or chemical analysis. Of these 32 samples, 13 were analyzed for TPH and BTEX following EPA methods 8015 and 8020. Table 1 lists analysis results for each sample. For a complete listing, please refer to Appendix C.

On November 10, 1989, six samples from GTW1 were analyzed for TPH and BTEX. The six samples were analyzed at a GTEL mobile laboratory at the site, during drilling operations. In the mobile laboratory, samples were analyzed for TPH as gasoline, and the samples indicated no stoddard solvent "peaks". A quality control laboratory check was run for stoddard solvent, confirming the reliability of the results.

One soil sample was obtained from each of the following borings and analyzed: GTW2, GTW3, GTW4, GTV1, and GTV2. Selection for analyses was based on higher (above background) field levels of volatile organic vapors. These soil samples were sent to GTEL and analyzed for TPH, stoddard solvent, and BTEX following EPA methods 8015/8020. Additional samples were obtained at 5-foot intervals from these borings and held at the laboratory for possible future analysis. On May 23,1990, two soil samples from boring GTW5 were analyzed for TPH (as gasoline) and BTEX following EPA methods 8015/8020.

Soils analyzed from boring locations GTW1, GTW2, and GTW4, showed non-detectable levels of TPH and BTEX for both gasoline and stoddard solvent. Soil borings at locations GTW3, GTV1, GTV2, and GTW5 had TPH (as gasoline) values of 140, 3,700, 5, and 70 ppm, respectively, at depths between 25 and 31 feet below grade. These values indicate existing elevated levels of adsorbed-phase hydrocarbons within the soil column directly adjacent to the east edge of the tank excavation. A soil sample collected December 7, 1989, during the installation of the soil vapor pressure test probes (GTV1), produced the highest level of TPH (3,700 ppm as gasoline). The sample location was within 10 feet of the tank excavation sidewall (Figure 3). A dashed line drawn on Figure 3 approximates the vertical extent of detectable vapor-phase hydrocarbons in the soil column.

TABLE 1

Summary of Laboratory Analyses of Undisturbed Soil Samples Obtained From The Shell Production Unit, Tank Pit Area Shell Western Exploration and Production, Inc. Huntington Beach, California

Sampled November 10 Through December 14, 1989 and May 23, 1990

GTV2-31	5	ND	0.34	0.19	0.38	1.8

ND = Not detected
All values are in parts per million (ppm).
TPH = Total Petroleum Hydrocarbons.
Minimum Detection Limits (ppm): TPH (gasoline) 1.0; TPH (stoddard solvent) 1.0; benzene 0.05; toluene 0.05; ethylbenzene 0.05; xylenes 0.05.
Exception: GTW5 TPH (gasoline) = 10

Physical Analyses

In addition to chemical analyses, a dry sieve analysis was performed on two individual undisturbed soil samples collected during the boring of the groundwater monitor well GTW3. Table 2 summarizes these test results.

TABLE 2

**Summary of Sieve Analyses on Soil Samples
Obtained From Borings
in The Tank Excavation Area, Shell Production Unit
Shell Western Exploration and Production, Inc.
Huntington Beach, California**

November 30, 1989

Sample No.	Mean Size (mm)	Grain Size Description Wentworth Scale
GTW3-25	.262	Medium Sand
GTW3-40	.293	Medium Sand

The zone containing the highest levels of hydrocarbons occurs from 25 feet to just above groundwater at 31 feet in GTV1. The average grain size is a medium grained sand, correlating closely with the field classification of textures reported in the boring logs (i.e., alternating medium beds of unsorted silty/clay sands with well sorted sands). The capillary fringe and saturated zone soil textures appear to be similar in average soil grain size but contain less fines (such as silt). Appendix D contains the complete laboratory reports.

GROUNDWATER ANALYSES

Three groundwater samples (GTW1, GTW2, and GTW3) were collected November 17, 1989, after the three wells were installed and allowed to reach static equilibrium over several days. On December 19, 1989, GTW4 was sampled by Groundwater Technology personnel. On June 5, 1990, GTW5 was sampled. The sampling procedure was as follows: After three well volumes had been removed by a vacuum truck, the wells were allowed to recharge to 95 percent of their static level, and pH and turbidity were allowed to stabilize. Two samples from each well were retrieved using a teflon bailer washed with trisodium phosphate, and rinsed with tap and distilled water. New string was attached to the sampling bailer prior to each sampling run, and water was placed in 40 ml vials, sealed with airtight caps, labeled, and placed on ice. The samples were then transported to state-certified GTEL Laboratories, Torrance, California, for analysis of TPH and BTEX, following EPA Methods 8015/8020.

Four of the five groundwater samples exhibited measurable concentrations of TPH using either a gasoline or stoddard solvent standard. GTW2 had the only detectable level of stoddard solvent (8 parts per billion (ppb)). GTW4 (downgradient of GTW3) had a value of 21 ppb as gasoline while well GTW5 (upgradient of the tank pit) had the highest concentrations of total petroleum hydrocarbons at 80,000 ppb as gasoline. Well GTW3 had a concentration of 3,300 ppb. Two additional samples, labelled GTW4 (collected November 17, 1989) and GTW5 (collected December 19, 1989), were run as field blanks. Table 3 summarizes the analysis results for TPH and BTEX in all five wells. Complete laboratory results and the Chains-of-Custody are presented in Appendix E.

GTW-5 (6/5/90)	80,000	--	3,800	13,000	4,700	29,000

ND = Not detected
All values are in parts per billion (ppb).
TPH = Total Petroleum Hydrocarbons.
Minimum Detection Limits (ppb): TPH (gasoline) 1.0; TPH (stoddard solvent) 1.0; benzene 0.5; toluene 0.5; ethylbenzene 0.5; xylenes 0.5.
Exception: GTW5 TPH (gasoline) = 100

The soil lithologic cross-section (Figure 3) has shown a limited lateral extent of impacted groundwater parallel to the south sidewall of the tank excavation. The level of dissolved-phase TPH in GTW5 is not presented in the cross-section, as the cross-section does not include that well.

Surveying and Groundwater Gradient

In addition to the groundwater sampling phase of the workplan, groundwater wells GTW1, GTW2, and GTW3, soil vent well GTV2, and soil vent probe GTV1, were surveyed November 17, 1989 by BBSI, a professional surveying company. After installation, wells GTW4 and GTW5 were surveyed on June 5, 1990, by Groundwater Technology personnel.

Groundwater Technology personnel gauged all existing water wells prior to well development, to determine the static groundwater depth from grade. Appendix F lists ground elevations, measured depths to groundwater, and static groundwater elevations relative to sea level. Using calculated groundwater elevations, two groundwater gradient maps were constructed showing water table elevations above sea level (Figures 4 and 5). The groundwater contours are evenly spaced in the vicinity of the tank pit (Figure 4). Gradient elevations measured November 17, indicate a shallow gradient in a northerly direction in the area of the tank excavation. Gradient data, using GTW4 and GTW5 water elevations, indicate a slight shift in the gradient from north to northwest near GTW5. The groundwater gradient is approximately 0.06% across the tank excavation perimeter.

Since the site is within .25 mile of the shoreline, the possible fluctuation of groundwater levels under tidal influence was investigated. Water level data compiled over a 12-hour period was used to determine if any fluctuations were present. On May 23, 1990, groundwater well levels were observed during the installation of well GTW5.

No noticeable changes occurred over the 12-hour period. A summary of the well level test is included in Appendix F.

VAPOR EXTRACTION TEST

On December 7, 1989, a vapor extraction pilot test was performed on GTW3 by Groundwater Technology during the current assessment phase. The vent test results were used to evaluate the effects of vapor extraction in the surrounding soils above the soil/water interface. Testing consisted of applying a vacuum with a 1.5 hp Rotron regenerative blower (up to 22 inches of water) to extraction well GTW3. Magnahelic (vacuum) gauges were attached to soil vapor probes installed approximately 7.5 feet from the extraction well. The vapor probe boring was designed as a dual probe monitoring well having monitor points 20 feet and 25 feet below grade (See Appendix B, well schematic). Vacuum readings were recorded from start-up of the blower until the vacuum stabilized in the observation well/vapor probes at a maximum value (recorded as inches of water). Once a maximum value was reached, the blower was turned off and readings were recorded over time until the vacuum returned to zero (rebound), or to a minimum value within the observation well/vapor probes. Vacuum gauge readings up to stabilization are listed in Table 4. Vapors extracted from the ground were channeled into a 55-gallon activated carbon canister to prevent emission of hydrocarbons into the atmosphere.

During the pilot test, a soil gas sample was collected in a tedlar bag from vapor extraction well GTW3. The sample was obtained from a sampling point in the line between the blower and the carbon canister. The sample was delivered to state-certified GTEL

Environmental Laboratory for analyses of benzene, toluene, ethylbenzene, xylenes, and total petroleum hydrocarbons using both gasoline and Stoddard Solvent standards, following EPA Methods 8020/8015, respectively. Table 5 summarizes the laboratory results. Complete laboratory reports are presented in Appendix G.

TABLE 4

Summary of Monitor Point Position and Vent Test Data Collected During the Vapor Extraction Pilot Test at the Shell Production Unit, Tank Excavation Area Shell Western Exploration and Production, Inc. 20101 Golden West Street Huntington Beach, California

Performed on December 7, 1989

Extraction Well	Monitoring Point	Monitor Point Vapor Probe Screen Intervals	Distance from Extraction Well
GTW-3	GTV-1	18'11" - 20' 23'11" - 25'	7'6"

GTW-3 extraction well screened from 23.5 ft to 53.5 ft (static water level in well at 32 ft).

Photoionization detector (PID) used to measure vapors in parts per million (ppm).

Magnahelic gauges used to measure pressure (Scale: 1 to 10 inches of water).

Twenty inches of water measured at blower during testing.

TABLE 5

Summary of EPA 8015/602 Analyses on Soil Vapor Samples Collected During Soil Vent Pilot Test in the Huntington Beach Unit, Tank Excavation Area Shell Western Exploration and Production, Inc. 20101 Golden West Street Huntington Beach, California

Collected on December 7, 1989

Sample #	TPH as Gasoline	TPH as Stoddard	Benzene	Toluene	Xylene	Ethyl-benzene
GTW-3	5,200	6,300	190	410	560	150

All concentrations measured in parts per million, by volume (ppmv).

The laboratory results indicate concentrations of both gasoline and stoddard solvent in vapor phase within the soil column. In oral communications with GTEL personnel, it was learned that overlap of gasoline and stoddard solvent type curves occurred on the gas chromatograph printouts. Since stoddard solvent and gasoline standard curves match closely, the C_4 - C_{12} peaks are additive in nature and are difficult to separate into specific concentrations by volume. Therefore, there appears to be almost equal amounts of gasoline and stoddard solvent concentrations (5200 ppmv to 6300 ppmv, respectively) in vapor phase.

Figure 6 shows that the radii of influence for vent well GTW3, and subsequently GTV2, are approximately 18 feet based on the maximum observed vacuum, during pilot testing, of 1.2 inches of water at the 20-foot probe. An 18-foot radius of extraction can be maintained by using a Rotron 505 XP regenerative blower at a flow rate of 60 cubic feet per minute. See Effective Radius of Soil Vent System, A Mathematical Model in Appendix G, which summarizes the derivation of the radius of influence from field-generated data. Based on that model, extraction of vapors will cover the areas represented in Figure 6. The radius of influence is expected to increase (using the same vacuum) when the tank excavation is backfilled. This will effectively curtail any possible soil vapor channeling caused by the unequal pressure differences inherent in having a large void present in the soil column in close proximity to the extraction well.

Soils above groundwater also show vertical influence from vacuum. The upper soil vapor probe (at 20 feet below grade, in GTV1) registered nearly 50% of the vacuum at the lower probe (25 feet), approximately 4 feet above the highest point of the extraction well screen.

This shows that there is vertical influence or pull when vacuum is induced within the impacted soil zone.

CONCLUSION

Soils in the vadose (unsaturated) zone underlying the site consist of unsorted sand and gravel fill to a depth of two to four feet. Below this, soils consist of organic clay and silty clay to 12 feet. Alternating beds of silty sand, sandy silt, and unsorted to moderately sorted sand extend from 12 feet to groundwater level just below 30 feet. The capillary and saturated zones consist of well to poorly sorted, medium to coarse sand.

Based on data collected from groundwater monitoring wells GTW2, GTW3 and GTW5, the groundwater gradient is 0.06% in a northwesterly direction within the central and southern portion of the former tank excavation area. Data derived from monitoring wells GTW1 and GTW4 suggest a more northerly flow direction near the north end of the former tank pit.

Based on the results of the drilling investigation and subsequent soil analyses, concentrations of hydrocarbons exist within the soil column near the eastern sidewall of the former tank excavation. Adsorbed-phase concentrations appear to dissipate laterally towards the GTW5 location. The zone of vapor/adsorbed-phase hydrocarbon concentrations extends from approximately 20 feet below ground surface down to the soil/groundwater interface at 33 feet below grade. The adsorbed-phase hydrocarbons within the soil column appear to consist mainly of TPH as gasoline and BTEX with low to non-detectable levels of stoddard solvent. Groundwater analyses for TPH as gasoline and stoddard solvent, and for BTEX

indicate similar results. While soil hydrocarbon levels appear to be concentrated near GTV1 and GTW3, hydrocarbon concentrations in groundwater increase towards GTW5. GTW5 has the highest dissolved-phase gasoline hydrocarbon levels, with an analyzed value of 80,000 ppb.

The reported results for vapor-phase hydrocarbons in the form of gasoline or stoddard solvent indicate concentrations of 5,200 ppmv TPH as gasoline and 6,300 ppmv stoddard solvent. The soil types comprising the last 20 feet above groundwater, in the hydrocarbon impacted zone near GTW3, are dominated by medium-grained silty sands and sandy silt. Groundwater well GTW3, when used as a vapor extraction well, will develop a radius of influence of 15 to 18 feet depending on the size of the blower inducing vacuum at the well. The radius of influence is expected to have increased (using the same vacuum) since the tank excavation has been backfilled. This will effectively curtail any possible soil vapor channeling caused by the unequal pressure differences inherent in having a large void present in the soil column in close proximity to the extraction well. The vent test data also indicates that there is lateral and vertical influence of vacuum, across soil horizons, to shallower levels.

BORING/WELL NUMBER: GTW1

APPENDIX 1

DESCRIPTION

SW/GW Sand: Light brown, moist, dense, faint to no hydrocarbon odor. Coarse grained, subangular, unsorted quartz sands with 10% ferromag. minerals. Grades into very coarse grained sand/pea gravel mixture. Light brown and very moist at 30'. No hydrocarbon odor. Unsorted, angular quartz/feldspathic sands with subangular granite pea gravel. Rust brown FeO_2 staining.

Very moist.
SP Sand: Brown, dense, faint hydrocarbon odor, not sharp, slightly sweet smell. Well sorted, fine grained, subangular quartz sand with <5% ferromag. minerals. Trace FeO_2 staining. No apparent grain orientation. Groundwater at 32.5 '.

SP Sand: Light grey, saturated, no hydrocarbon odor, dense, medium grained, well sorted, subangular, quartz sand with 15% ferromag. minerals.

CL Silty clay: Dark grey, stiff, very moist, no hydrocarbon odor. Plastic. Trace of very fine grained micaceous sand.

SP Sand: Light brown, saturated, no hydrocarbon odor, medium dense. Coarse grained, well sorted, subangular quartz sand with <10% ferromag. minerals. Non plastic. Unoriented sand grains.

SP/SW Bioclastic Sand: Grey-brown, saturated, dense, no hydrocarbon odor. Very coarse grained, well to poorly sorted, subangular quartz sands. Occassional traces of pea gravel (quartzites). Abundant bivalve shell fragments (>20%). Some fragments up to 2" in diameter.

SW Bioclastic sand: Same as above.

APPENDIX 1

DESCRIPTION

SW/ML Alternating thin to medium beds of laminated sandy SILT/SAND: Brown, moist, dense, coarse grained subangular, unsorted quartz sand with granitic pea gravel. Micaceous, brown, moist, stiff, laminated, silts with a moderate odor. FeO_2 stained sand grains.

SP Sand: Light grey-brown, very moist, dense, faint, hydrocarbon odor. Medium grained, well sorted, subangular sand with <5% ferromag. minerals. Less than 10% Biotite mica. FeO_2 staining in veins/channels. Cuttings saturated at 33'.

Cuttings logged only.

SP Sand: Light grey-brown, saturated, very dense, no hydrocarbon odor. Coarse grained, subangular, moderate to well sorted quartz sand with 5 to 10% ferromag. minerals (biotite magnetite). Sands weakly laminated, platy biotite/ferromag. mineral grains oriented perpendicular to vertical borehole.

Bioclastic Sand (marine).

SW/GW Bioclastic Sand/Gravel (marine): Light brown, saturated, very dense, no hydrocarbon odor. Very coarse grained, subrounded, unsorted quartz sand with <5% ferromag. minerals 5-20% pea gravel up to 1" diameter. Quartzites/Granite bioclastic grains = Bivalve shells/other shell fragments between 10-20%. Patches of gravel.

SW/GW Same as above.

End boring at 55'. Sampled to 51.5'. Groundwater at 33'. Set groundwater monitoring well to 54.5'. Soil cuttings deposited in labeled 55-gallon drums and stored on site.

CL Sandy Clay: Dark grey brown, moist, soft, faint hydrocarbon odor. Plastic.

CL Clay: Dark olive-grey, moist , stiff, very faint hydrocarbon odor. Mottled white grey/olive grey when calcareous veins present. Clays @ 90%, carbonate fracture filler @10%. Moderate reaction to HCL. Trace quartz sand. Plastic.

11:15 am
CL Clay: Olive grey, moist, hard, no hydrocarbon odor. Same as above.

ML Clayey Silt with a little sand: Light olive brown, moist, hard, no hydrocarbon odor. Silt @ 60-70%, clays @ 30%, sand <5%. Micaceous, subangular, quartz sand. Slightly plastic.

ML/SP Alternating thin beds of sandy SILT/SAND/Clayey SILT: Grey, moist, very stiff, sandy silt with no hydrocarbon odor (ML). Fine to medium grained, micaceous, subangular quartz sands (SP). Light brown, medium dense, moist, with a faint hydrocarbon odor. Clayey silts (ML) at 16' are micaceous, moist, olive brown with no hydrocarbon odors.
(ML) Sandy Silt: Silt @ 80%, sand @ 20%
(SP) Sand: Fine to medium grained <5% silt.
(ML) Clayey Silt: Silt @ 60%. clays @ 30%, sand <10%.

SW Sand with gravel and silt: Light orange-brown, moist, very dense, moderate hydrocarbon odor. Fine to medium grained sand @ 80%, silt @ 5%, gravel 10-15%. Subrounded to subangular, quartz sand with <15% ferromag minerals. Gravels are subrounded, granitic, 1/4" to 1/2" Dia.

Dear Mr. Girolamo,

Attached please find the analytical results for the samples received by GTEL on 11/10/89. The samples were received and analyzed as indicated on the chain of custody, which is attached.

GTEL maintains a formal quality assurance program to ensure the integrity of the analytical results. All quality assurance criteria were achieved during the analysis unless otherwise noted in the footnotes to the analytical report.

The specific analytical methods used and cited in this report are approved by state and federal regulatory agencies. GTEL is certified for the analysis reported herein by the Department of Health Services under certificate number 295.

If you have any questions regarding this analysis, or if we may service any additional analytical needs, please give us a call.

Sincerely,
GTEL Environmental Laboratories, Inc.

Mr. Bill Girolamo
Groundwater Technology, Inc.
20000/200 Mariner Ave.
Torrance, Ca. 90503

Dear Mr. Girolamo,

Attached please find the analytical results for the samples received by GTEL on 05/24/90. The samples were received and analyzed as indicated on chain of custody number 76-6214, which is attached.

GTEL maintains a formal quality assurance program to ensure the integrity of the analytical results. All quality assurance criteria were achieved during the analysis unless otherwise noted in the footnotes to the analytical report.

The specific analytical methods used and cited in this report are approved by state and federal regulatory agencies. GTEL is certified for the analysis reported herein by the California State Department of Health Services under certificate number E723.

If you have any questions regarding this analysis, or if we may service any additional analytical needs, please give us a call.

Sincerely,
GTEL Environmental Laboratories, Inc.

Rebecca Hsu-Chou
Laboratory Director

Dear Mr. Ford:

Re: Sieve Analysis
File No. 13374

Enclosed is the final report for the dry sieve analysis tests conducted on the Huntington Beach, Shell Western E & P, Inc. samples you sent to us. Laboratory procedures have been included for your reference.

We appreciate this opportunity to be of service and trust these data prove beneficial in the development of this project.

Sincerely,

Petroleum Testing Service, Inc.

PETROLEUM TESTING SERVICE, INC.
12051 RIVERA ROAD
SANTA FE SPRINGS, CA 90670-2289

File: 13374
Date: November 1989

Project: Shell Western E&P
Location: Huntington Beach
County: Orange
State: California

Client: Groundwater Technology, Inc.

DRY SIEVE ANALYSIS

1. Extract sample with toluene (24 hours).
2. Vacuum dry at 150°F.
3. Disaggregate to grain size using wooden mortar and pestle.
4. Split sample to ~10 - 15 grams, weigh to the nearest 0.01 gram.
5. Place split sample into sieve shaker and run for approximately 30 minutes. The retained sieve fractions from each screen are weighed to the nearest 0.01 gram and recorded. Report data.

Dear Mr. Girolamo.

Attached please find the analytical results for the samples received by GTEL on 06/06/90. The samples were received and analyzed as indicated on chain of custody number 76-6219, which is attached.

GTEL maintains a formal quality assurance program to ensure the integrity of the analytical results. All quality assurance criteria were achieved during the analysis unless otherwise noted in the footnotes to the analytical report.

The specific analytical methods used and cited in this report are approved by state and federal regulatory agencies. GTEL is certified for the analysis reported herein by the California State Department of Health Services under certificate number E723.

If you have any questions regarding this analysis, or if we may service any additional analytical needs, please give us a call.

Sincerely,
GTEL Environmental Laboratories, Inc.

APPENDIX G

EFFECTIVE RADIUS OF SOIL VENT SYSTEM

A mathematical model, based on Darcy's Radial Gas Flow Equation, is used to estimate the effective radius of the soil venting system. The model takes the following parameters into consideration: permeability of the soil matrix, viscosity of the air stream, effective vertical interval, flow rate, and available drawdown at the well head.

Assuming that the air stream flows radially toward the extraction well and the Ideal Gas Law applies, the pressure P at a distance r from the well can be determined by the following equation:

$$P^2 - P_W^2 = (0.74)\ (q)\ (u/kh)\ \ln\ (r/r_w)$$

where

P	=	pressure at a distance r from well (psia).
P_w	=	pressure at the well bore (psia).
q	=	air flow rate (cu. ft./day).
u	=	viscosity of air stream (centipoise)
k	=	permeability of the soil matrix (darcy).
h	=	effective vertical interval (ft).
r	=	radial distance from well (ft).
r_w	=	well radius (ft).

A soil vent test was performed in order to determine the above soil parameters (k and h). Results of the test indicate a (u/kh) ranging from 0.000074 to 0.000079 (centipoise/darcy-feet) with an average value of 0.000076.

If the radius of influence is defined as the distance between the well location at which the pressure is 14.69 psia (relative to atmospheric pressure of 14.70 psia), the radius of influence can be determined by substituting P with 14.69 psia into the above equation, along with the soil and vent system parameters, and solving for r.

A Rotron 505XP regenerative blower is proposed as the air moving device in the soil vent system. It is expected that the blower will vacuum 120 cfm at a vacuum of 22 inches of water at the two extraction wells. For flow = 60 cfm, vacuum = 22 inches, well radius = 2 inches, and u/kh = 0.000076 (from test data), the radius of influence is calculated to be 18 feet.

TABLE OF CONTENTS

INTRODUCTION 1

PREVIOUS WORK, PHASE I ASSESSMENT 1

RECENT WORK, PHASE II FURTHER ASSESSMENT 2

CONCLUSION 3

INTRODUCTION

This status report summarizes Phase II assessment activities performed from November 19, 1990 through February 28, 1991 at the gas pump area, Huntington Beach Production Unit, Huntington Beach Field, Huntington Beach, California (Figure 1). This document has been prepared at the request of Shell Western Exploration and Production, Inc. (SWEPI). Figure 2 is the site plan showing all sampling points used throughout Phase I and Phase II Assessment.

PREVIOUS WORK, PHASE I ASSESSMENT

SWEPI retained Groundwater Technology initially on November 9, 1989 to perform a site assessment at an existing excavation to define the extent of hydrocarbons in the soils and groundwater. The following activities were completed during Phase I.

- Three groundwater monitoring wells (GTW1 through GTW3) were installed around the perimeter of an existing excavation.

- A soil probe was installed, and a soil vapor extraction pilot test was performed. A soil gas sample was collected and analyzed for TPH and BTEX.

- A professional surveying was performed on all monitoring wells.

- Groundwater levels were measured and a groundwater gradient map was generated. Groundwater samples were collected and analyzed for TPH and BTEX.

- o A vapor monitoring well (GTV2) and an additional groundwater monitoring well (GTW4) were installed. GTW4 was sampled and analyzed for TPH and BTEX.

- o Groundwater monitoring well GTW5 was installed within an adjacent building. GTW5 was sampled and analyzed for TPH and BTEX.

- o GTW4 and GTW5 were surveyed by Groundwater Technology personnel.

RECENT WORK, PHASE II FURTHER ASSESSMENT

Shell Western Exploration and Production, Inc. retained Groundwater Technology Inc. on November 19, 1990, to further delineate the extent of hydrocarbons in the groundwater, and to determine the hydraulic characteristics of the aquifer underlying the site.

- o On December 17 and 18, 1990 a downgradient groundwater monitoring well (GTW7) and an upgradient groundwater monitoring well (GTW6) were installed. Selected soil samples were analyzed for TPH and BTEX following EPA Methods 8015 and 8020. The summary of soil chemical analysis is shown in Table 1.

- o On December 21, 1990, all on-site groundwater monitoring wells, GTW1 through GTW7 were sampled. Samples were analyzed for TPH and BTEX following EPA 8015 and 8020. The summary of groundwater chemical analysis is shown in Table 2. GTW6 and GTW7 were surveyed by Groundwater Technology personnel and plotted on the existing site map (See Figure 2).

- On January 8 and 9, 1991, a pre-pump test monitoring of the groundwater level was conducted. An aquifer pumping test was conducted on January 9, 1991.

- A revised groundwater gradient map (Figure 3), a groundwater TPH isocon map (Figure 4), a groundwater benzene isocon map (Figure 5) and a lithologic cross section (Figure 6) were prepared from acquired data.

CONCLUSION

Based on data collected from the two phases of work done at the site, Groundwater Technology concluded the following:

- Soils in the vadose (unsaturated) zone underlying the site consist of well graded sand and gravel fill to a depth of two to four feet. Below this, soils consist of organic clay and silty clay to 12 feet. Alternating beds of silty sand, sandy silt and well graded to moderately graded sand extend from 12 feet to groundwater level just below 30 feet. The capillary and saturated zones consist of well graded, medium to coarse sand.

- The vent test data indicates that the radius of influence is 15 to 18 feet depending on the size of the blower inducing vacuum at the well. The test also indicates that there is lateral and vertical influence of vacuum, across soil horizons, to shallower levels.

- Adsorbed- and dissolved-phase hydrocarbons have been identified directly upgradient from the former tank pit's southeast corner, and have been delineated downgradient and laterally.

- The highest dissolved-phase hydrocarbons in groundwater have been identified at well GTW-5 with concentrations of 53,000 parts per billion (ppb) TPH and 2,000 ppb benzene. GTW-1, GTW-2 and GTW-4 tested below detection limits for both TPH and BTEX.

- Under local hydrogeological conditions, a northwest to northerly groundwater gradient exists at the site at 0.04% to 0.07%, with groundwater at a depth of approximately 33 feet below grade.

- Groundwater level fluctuations due to tidal influence are minor in the area, with a maximum change in water level in well GTW5 of 0.04 feet recorded before the pumping test.

- Pump test data analysis revealed the following:

    1) The saturated zone is unconfined with the upper limit at the water table.
    2) Aquifer yields a minimum of five gallons per minute (gpm) with an average drawdown of two feet after one day of continuous pumping.
    3) The transmissivity of the saturated zone ranges from 7,800 to 9,100 gallons per day per foot.
    4) Hydraulic conductivity ranges from 47 to 53 feet per day. Under the natural groundwater gradient of 0.07%, the estimated groundwater seepage velocity ranges from 0.16 to 0.19 feet per day.
    5) The calculated storativity or specific yield of the saturated zone is 0.01.

TABLE 1

Summary of EPA Methods 8015/8020 (TPH/BTEX) Analysis Results on Soil Samples Collected from Borings During Well Installation in the Shell Production Unit Gas Pump Area

Sampled December 17, and 18, 1990

SAMPLE #	DATE SAMPLED	TPH	BENZENE	TOLUENE	ETHYL-BENZENE	XYLENES

INTRODUCTION

Shell Western Exploration and Production, Inc. (SWEPI) retained Groundwater Technology, Inc. on November 19, 1991, for the Phase II, Further site assessment, which includes the installation of additional groundwater monitoring wells in the Shell maintenance yard/gas pump area (Figures 1 and 2). One well was installed east of the former tank pit excavation, partially downgradient from the suspected release area. An additional well was installed within a maintenance and storage building upgradient from the former excavation. Groundwater Technology conducted soil and groundwater sampling, performed a pump test to determine aquifer characteristics, constructed a revised groundwater gradient map, evaluated the additional laboratory data, constructed cross-section and dissolved-phase hydrocarbon maps, redefined the vertical and lateral extent of hydrocarbons in the soils and groundwater, and prepared this summary report.

BACKGROUND

The site under investigation is located on the western edge of the Huntington Beach Mesa. The site contains a previous excavated tank pit and out lying buildings located approximately 1/2 mile northeast of the intersection of Goldenwest Street and Pacific Coast Highway. During the removal of the stoddard solvent and gasoline underground storage tanks by a previous consultant, a petroleum/solvent was noted beneath the tanks. Subsequent laboratory tests and additional borings/laboratory tests indicated adsorbed-phase hydrocarbons beyond the limits of the excavation side walls.

Groundwater Technology was retained by SWEPI (Nov. 9, 1989) for Phase I site assessment, to further define the extent of hydrocarbon levels in the soil, determine groundwater gradient and conduct a soil vent test to determine the design criteria for hydrocarbon extraction using vapor extraction methods. Five groundwater monitoring wells (GTI-1 through GTI-5), a soil vent well containing duel vapor pressure probes (GTV-1) and a soil

vent well (GTV-2) were installed. A vapor extraction pilot test was conducted to determine the design criteria for hydrocarbon extraction.

A site assessment report for Phase I was compiled by Groundwater Technology for this site:

> Groundwater Technology, Inc., June 22, 1990
> Phase I, "Site Assessment Report, Gasoline and Stoddard Solvent Tank Excavation, Huntington Beach Production Unit, Shell Western Exploration and Production, Inc., Huntington Beach California"
> Prepared for Shell Western Exploration and Production, Inc.

For a complete history of the site, please refer to Groundwater Technology's Phase I, site assessment report.

OBJECTIVES OF THE RECENT INVESTIGATION

Two more monitoring wells GTW 6 and GTW 7 were installed at this site in Phase II site assessment, to assess the lateral extent of dissolved hydrocarbons in groundwater, and to verify a previously assessed groundwater gradient during Phase I site assessment. Additionally, a pump test was conducted to determine aquifer characteristics beneath the site.

DRILLING AND WELL INSTALLATION

Groundwater Monitoring Well Outside Maintenance Building

A down-gradient groundwater monitoring well,(GTW-7) outside the maintenance building was installed on December 17, 1990 (Figure 2). The well was installed between the maintenance building and the abandoned steam cleaning unit to the northwest. The well extends from grade to 55 feet below grade. Groundwater was first encountered at 34 feet

below grade. Well GTW-7 is constructed of 30 feet of screened casing with 20 feet in groundwater. The well consists of 4-inch diameter Schedule 40 PVC casing with 0.02-inch width slots. Well GTW-7 was capped and covered, at the time of installation, with a traffic box. Further details on well construction have been provided in the form of a well schematic in Appendix A.

During the boring operation, soil samples were collected every five feet using a modified California Split-Spoon Sampler with brass ring inserts. Between sampling runs, the sampling tube was washed with TSP brand solution and rinsed successively with tap and distilled water. The samples were described and analyzed in the field for volatile organic compounds (VOC) using a photoionization detector (PID). The soil log of the boring is presented in Appendix B. One sample with the highest VOC level and one sample collected at the capillary fringe were collected for analysis of chemical adsorbed-phase hydrocarbon concentrations. Samples were sealed with plastic caps and duct tape, labeled, placed in a waterproof bag, and then on ice. The samples were delivered to GTEL Environmental Laboratories, (GTEL), Torrance, California following strict Chain-of-Custody procedures. Soil samples from the boring were analyzed for total petroleum hydrocarbons (TPH) as gasoline, and for benzene, toluene, ethylbenzene and xylenes (BTEX) following EPA Methods 8015/8020.

Groundwater Monitoring Well Inside Building

The upgradient groundwater monitoring well GTW-6 was installed inside the maintenance building on December 18, 1990 (Figure 2). The well was installed approximately 60 feet south (upgradient) from a previously installed well GTW-5 (June, 1990, Groundwater Technology assessment report). The well was constructed identically to well GTW-7, and soils were sampled and tested identically. Groundwater was first encountered at 32 feet below grade. Well construction details and lithology are presented in Appendix B.

During the installation of GTW-6, the working space occupied by the drilling rig and workers was essentially a confined space. The building interior was opened on one end by a large sliding door through which the drill rig gained entrance, and several corrugated tin side wall panels were removed, prior to the activities, for air intake. In addition to these precautionary measures to assure that adequate oxygen levels existed inside, several fans were used to push fresh outside air into the building during the drilling activities. Also, an exhaust line leading from the diesel engine of the drilling rig was extended outside the confines of the building for exhaust routing. As an added safety measure, a Lower Explosion Limit (LEL) meter was used by Groundwater Technology personnel to monitor air quality during the drilling activities. Tabled data on oxygen percentages and carbon monoxide levels have been added to Appendix B.

WELL DEVELOPMENT

On December 21, 1990, all of the groundwater monitoring wells, GTW-1 through GTW-7, were developed by over-pumping using a vacuum truck supplied by Shell Western Exploration and Production, Inc. After approximately three well volumes of water had been removed by a vacuum truck and the pH and EC had stabilized, the wells were allowed to recharge to 95 percent of their static level. Water sampling proceeded after the development of each well was finished.

Water Sampling Protocol

A sample from each well was retrieved using a teflon bailer washed with trisodium phosphate solution prior to sampling, and rinsed with tap and distilled water. New string was attached to the sampling bailer prior to each sampling run. Each sample was placed in two 40-ml vials with HCl preservative, filled to zero headspace, sealed with teflon septums and airtight caps, labeled, and placed on ice. The samples were then transported to state-certified GTEL Environmental Laboratories, Torrance, California, for analysis of TPH as gasoline, and BTEX following EPA Methods 8015/8020, respectively.

In addition to the aforementioned sampling dates and test methods, one 500 ml bottle of groundwater was collected during the beginning stages of the pump test (on January 9, 1991) from well GTW-5. The sample was sealed, labeled, and transported to state-certified GTEL Environmental Laboratories, Torrance, California, for analysis of total lead following EPA method 7421 and total dissolved solids (TDS) following Method 209B.

Surveying and Groundwater Gradient

In addition to developing the groundwater wells on December 21, 1990, the new groundwater monitoring wells were surveyed by Groundwater Technology personnel on the same day. Both of the new wells were plotted on a revised site map (Figure 2). Appendix C contains a list of well casing elevations, measured depths to groundwater, and calculated static groundwater elevations relative to sea level. Using calculated groundwater elevations, a revised groundwater gradient map was constructed (Figure 3). The new groundwater equal elevation contours show a flow direction from northwest to north in the vicinity of the former tank pit excavation. The gradient ranges from 0.04% to 0.07% in this northerly direction. The gradient constructed with the new wells confirm the previous interpretation of local groundwater gradient.

SOIL CHEMICAL ANALYSIS FOR TPH/BTEX

Four soil samples were sent to GTEL for chemical analysis of TPH (as gasoline) and BTEX following EPA Methods 8015/8020 with detection limits of 10 parts per million (ppm) and 0.05 ppm, respectively. Table 1 lists analysis results for each sample. For complete laboratory results, refer to Appendix D. As in the lithologic logs presented in Appendix A, the label GTW-6-15 refers to a soil sample collected from Groundwater Technology's boring of groundwater monitoring well #6, at a depth of 15 feet below grade.

Soil samples obtained during the drilling of groundwater monitoring wells GTW-6 and GTW-7 tested below detection limits for TPH/BTEX despite noticeable, faint, field hydrocarbon odors and elevated PID VOC levels.

GROUNDWATER ANALYTICAL RESULTS

Chemical Analysis for TPH/BTEX

Three out of the seven groundwater samples from the site tested below detection limits for TPH and BTEX (GTW-1, GTW-2, and GTW-4). The recently installed groundwater well, GTW-7, tested below detection limits for TPH but contained measurable amounts of benzene, ethyl benzene and xylenes. The remaining three wells, in closest proximity to the southeast edge of the former tank pit and directly upgradient, all contain measurable amounts of TPH (from 110 to 53,000 ppb) and BTEX (although GTW-6 contained no measurable benzene).

Table 2 summarizes the analytical results for TPH and BTEX in all seven wells. Complete laboratory results and the Chains-of-Custody are presented in Appendix E.

TPH and Benzene Concentration Maps

Based on the revised groundwater gradient and new groundwater chemical analysis, two dissolved constituent isocon maps were constructed (Figures 4 and 5). The highest sampled concentration of dissolved-phase hydrocarbons exist in groundwater at well GTW-5. The highest values on the TPH and benzene maps are located directly southeast of the edge of the former tank pit perimeter. Figure 4 indicates that the lateral and downgradient extent of dissolved hydrocarbons has been defined, and that the upgradient well, GTW-6, contains only minor dissolved concentrations.

Chemical Analysis for Total Dissolved Solids (TDS) and Total Lead

In addition to the TPH and BTEX analysis performed on the four previously described

samples, a sample from well GTW-5 was analyzed for total lead and TDS. The sample contained 77 parts per billion (ppb) Total Lead and 9,700 ppm TDS. Table 2 summarizes the laboratory results and Appendix E contains the complete laboratory results with the Chain-of-Custody.

LITHOLOGIC CROSS-SECTION AND VERTICAL EXTENT OF HYDROCARBONS

A generalized lithologic cross-section was constructed from the boring logs of wells GTW-6, GTW-5, GTW-3, and GTW-4 (Figure 6). GTW-5, GTW-3, and GTW-4, were installed earlier by Groundwater Technology (Phase I, "Site Assessment Report", June, 1990). The orientation of the cross-section is from south to north, parallel to the gradient direction, and cuts across the southeast edge of the former tank pit excavation. A "non-detect" line (for TPH and observable field hydrocarbon levels above background) has been drawn on the cross-section, extending from beneath the edge of the tank pit to the approximate depth of groundwater. This line construction was based on VOC levels above background levels, noticeable hydrocarbon vapors, and laboratory results.

The lithologic column, from grade to 20 feet into groundwater, has been separated into 3 distinct soil classification zones. In the upper zone, from grade to approximately 10 feet below grade, the soil type is an organic to silty clay. In the middle zone, from 10 to approximately 30 feet below grade, the soil types are a complex group of alternating silty sand, clayey sand, sandy to clayey silt, and poorly to well graded sand beds. The lower zone, from approximately 30 to 55 feet below grade, is essentially the upper aquifer at this site. This zone consists of fine to coarse grained, poor to well graded sands with several feet of silts and silty sands from approximately 30 to 37 feet below grade. The lower limits of this zone were not determined by the onsite drilling activities.

Under examination, the completed cross-section shows the soil lithologic types associated with the aquifer extending to a higher level in boring GTW-3 compared to other nearby borings.

SHALLOW AQUIFER PUMP TEST

Directly after the installation of groundwater monitoring wells GTW-6 and GTW-7, a one-day pump test was conducted from January 9 through January 10, 1991. Well GTW-5 was used as the pumping well, while monitoring wells GTW-3, GTW-4 and GTW-7 were used as observation wells to record changes in water levels during the test.

Pre-Test Monitoring of Tidal Influence

On January 8, 1991, before the initialization of the pump test, Groundwater Technology personnel performed overnight monitoring of the groundwater level in well GTW-5. The purpose of the test was to determine the effects of tidal influence or other background water level fluctuations before the pumping test. Appendix F contains the pre-pump test tidal survey data.

Installation of Equipment and Materials

During the period of January 8 through January 9, 1991, equipment used during the pumping test was installed in four groundwater monitoring wells. Three of the monitoring wells were used to measure and record groundwater levels during the pumping test.

Groundwater Technology personnel installed one pressure transducer in each of the three observation wells, GTW-3, GTW-4, and GTW-7. These transducers were attached separately, in-line, to an instrument capable of receiving seven signal channels simultaneously. The data-logger instrument was later attached to a computer for transferral of drawdown data.

One of the monitoring wells, GTW-5, was used as a pumping well. Prior to the initial pump test, a single line of 2" diameter PVC piping was placed on grade at the point of entry to well GTW-5, and extended to a 200 barrel holding tank supplied by Shell's production unit. This discharge line contained one check valve, one flow meter for measuring flow rates, two shut-off valves, and a sampling port to measure temperature and electrical conductivity. Water pumped from the well was discharged into a holding tank for temporary storage.

A specialized submersible pump was installed in groundwater well GTW-5. This "Sand-Handler" pump is capable of withstanding abrasion and clogging caused by fine silts and sands. As a check on the accuracy of the flow-meter, a five gallon bucket was used to monitor the flow rate throughout the test. See Appendix G for additional information.

Pump Test

On January 9, 1991, after the installation and testing of the equipment, Groundwater Technology personnel performed a pump test. Prior to pump start-up, static water levels at the pumping well (GTW-5) and the three selected observation wells (GTW-3, GTW-4 and GTW-7) were recorded at one second intervals for about three minutes. This was done by installing pressure transducers in each of the well and recording the groundwater levels before and during the pump test. After pump start-up, the initial flow rate, measured volumetrically, was about 8 gallons per minute (gpm). Static water levels were recorded, during the test, at varying time intervals during the 1,054 minutes of pumping. The pump test ended at 08:01:00 on January 10, 1991.

Adjustments in flow rate were performed using the in-line control valves to maintain a constant flow rate of 5.3 gpm. The maximum discharge rate was about 6 gpm during the early minutes of pumping and the minimum discharge rate was about 5 gpm. The electrical conductivity (EC) and temperature of the discharged water was measured during the pumping test.

Results

The maximum change in water level recorded prior to the pump test, in well GTW-5, was 0.04 feet over a 14 hour interval. Appendix F contains plotted water levels vs. time prior to the pump test.

Groundwater temperature was constant at 22 degrees centigrade throughout the test, whereas the EC showed a decline from 14,000 microhms per centimeter (micromhos/cm) during the first few minutes of pumping to 10,000 micromhos/cm after 1,000 minutes of pumping. Appendix G contains plotted EC data vs. time for well GTW-5 effluent.

The raw data recorded in the data-logger was transferred into the computer software, DATALOGR. Data was also inverted into a descending chronological order and files were transferred into GWAP software for interpretation. Data was compiled in tables and graphs. The following calculations were performed from the pump test data:

GTW-3 (first 100 minutes of pumping)

Transmissivity(T) = 7,776 gallons per day per foot (gpd/ft).

Hydraulic conductivity(K) = 353 gallons per day per square foot (gpd/sq ft).

Storativity (S)= 0.01

Aquifer condition = Unconfined aquifer with delayed gravity response.

GTW-3 (last 382 minutes of pumping)

T = 9,121 gpd/ft

K = 415 gpd/sq ft

S = 0.16

Aquifer condition = Anisotropic unconfined aquifer with delayed gravity response.

GTW-4 Due to the small magnitude of drawdown (0.08 feet) recorded during the pumping period, this particular well was not used for data interpretation.

GTW-7

T = 8,711 gpd/ft

K = 396 gpd/sq ft

S = 0.013

Aquifer condition = Anisotropic unconfined aquifer with elastic response.

Discussion of Pump Test Results

Fluctuations in groundwater level in well GTW-5 before the pump test showed that the area under investigation is effected by tidal influence. However, the maximum change in groundwater level, 0.04 feet, recorded over a 14 hour interval, was not considered large enough to be included as an adjustment in interpreting the pumping data.

The groundwater quality from well GTW-5 was that of moderately saline water with a total dissolved solid (TDS) concentration of 9,700 ppm and can be classified as non-potable water. Changes in EC and pH indicate that vertical leakage through the aquifer is possible.

The hydraulic properties of the shallow aquifer beneath the site was that of an unconfined aquifer. The recharge of this aquifer can be either vertical recharge (i.e. rain water percolating downwards) or horizontal recharge (i.e. gravitational flow of groundwater from leaking aquifers or salt water intrusion).

The hydraulic properties of the aquifer are as follows:

- Transmissivity ranges from 7,800 to 9,100 gpd/ft.
- Hydraulic conductivity ranges from 350 to 400 gpd/sq ft or 47 ft/day to 53 ft/day.

- Storativity of approximately 0.01.
- Under the natural groundwater gradient of 0.07%, the estimated groundwater seepage velocity ranges from 0.16 ft/day to 0.19 ft/day. For detailed calculations, see Appendix G.

These values are representative of a silty to fine grained sand existing under an unconfined water table condition. This standard interpretation is similar to lithology observed during drilling.

All water level data and interpretation curves are included in Appendix F.

CONCLUSIONS

Based on previous assessment, two additional groundwater monitoring wells were installed in proximity to the former tank pit excavation. In addition, an aquifer pump test was conducted in the uppermost aquifer beneath the site. Recent data analysis indicates the following:

(1) Adsorbed- and dissolved-phase hydrocarbons have been identified directly upgradient from the former tank pit's southeast corner, and have been delineated downgradient and laterally. The furthest upgradient soil and water analysis indicates no adsorbed hydrocarbons, and only minor dissolved hydrocarbons.

(2) Dissolved-phase hydrocarbons in groundwater have been identified with highest concentrations at well GTW-5. The furthest upgradient groundwater monitoring well, GTW-6, contains 300 ppb TPH and tested below detection limits for benzene. The down-gradient well, GTW-7, tested below detection limits for TP and contained minor BTEX concentrations all below state Department of Health and Safety action levels. The two wells closest to the former tank pit, GTW-3 and GTW-5, contained

110 and 53,000 ppb TPH, respectively. In addition, wells GTW-3 and GTW-5, contained 3.5 and 2,000 ppb benzene, respectively. GTW-1, GTW-2 and GTW-4 tested below detection limits for both TPH and BTEX.

(3) Analyzed concentrations of adsorbed-phase hydrocarbons in the soil samples collected from the two new well borings are below detection limits, indicating the lateral limits of hydrocarbons in soil.

(4) Under local hydrogeological conditions, a northwest to northerly groundwater gradient exists at the site at 0.04 to 0.07%, with groundwater at a depth of approximately 33 feet below grade.

(5) Groundwater level fluctuations due to tidal influence are minor in the area. The maximum change in groundwater level in well GTW-5 before the pumping test was 0.04 feet. The observed levels of drawdown, in observation wells during the pump test, were larger than the expected change due to tidal influence.

(6) Data analysis from the pump test reveals the following:

- The saturated zone is unconfined with the upper limit at the water table.
- The aquifer yields a minimum of five gallons per minute with an average drawdown of two feet after one day of continuous pumping.
- The transmissivity of the saturated zone ranges from 7,800 to 9,100 gallons per day per foot (gpd/ft) .
- The hydraulic conductivity ranges from 47 to 53 ft/day. Under the natural groundwater gradient of 0.07%, the estimated groundwater seepage velocity ranges from 0.16 ft/day to 0.19 ft/day.
- The calculated storativity or specific yield of the saturated zone is 0.01.

This report will serve as Phase II site assessment, an addition to the Phase I site assessment report prepared by Groundwater Technology, Inc for Shell Western Exploration and Production, Inc. in June, 1990. All the work described herein has been performed by Groundwater Technology, Inc., as a separate phase, in an ongoing project under contract with Shell Western Exploration and Production, Inc.

TABLE 1

Summary of EPA Methods 8015/8020 (TPH/BTEX) Analysis Results on Soil Samples Collected from Borings During Well Installation in the Shell Production Unit Gas Pump Area

Sampled December 17, and 18, 1990

SAMPLE #	DATE SAMPLED	TPH	BENZENE	TOLUENE	ETHYL-BENZENE	XYLENES
GTW-6-15	12/18/90	ND	ND	ND	ND	ND
GTW-6-30	12/18/90	ND	ND	ND	ND	ND
GTW-7-15	12/17/90	ND	ND	ND	ND	ND
GTW-7-30	12/17/90	ND	ND	ND	ND	ND

- All concentrations measured in parts per million (ppm)
- ND = Levels below detection limits
- TPH = Total petroleum hydrocarbons (analyzed as gasoline)
- BTEX = benzene, toluene, ethylbenzene, and total xylenes
- Detection limits: TPH 10.0 ppm; benzene 0.05; toluene 0.05; ethylbenzene 0.05; xylenes 0.05 ppm

Mr. Bill Girolamo
Groundwater Technology, Inc.
20000 Mariner Avenue, Suite 200
Torrance, CA 90503

Dear Mr. Girolamo,

Attached please find the analytical results for the samples received by GTEL on 12/19/90. The samples were received and analyzed as indicated on the chain of custody 76-11210, which is attached.

GTEL maintains a formal quality assurance program to ensure the integrity of the analytical results. All quality assurance criteria were achieved during the analysis unless otherwise noted in the footnotes to the analytical report.

The specific analytical methods used and cited in this report are approved by state and federal regulatory agencies. GTEL is certified for the analysis reported herein by the Department of Health Services under certificate number E723.

If you have any questions regarding this analysis, or if we may service any additional analytical needs, please give us a call.

Sincerely,
GTEL Environmental Laboratories, Inc.

Rebecca Hsu-Chou

Mr. Bill Girolamo
Groundwater Technology, Inc.
20000 Mariner Ave., Suite 200
Torrance, CA. 90503

Dear Mr. Girolamo,

Enclosed please find the analytical results report prepared by GTEL for samples received on 12/21/90, under chain of custody number 76-11219.

GTEL is certified by the California State Department of Health Services to perform analyses for drinking water, wastewater, and hazardous waste materials according to EPA protocols.

A formal quality control/quality assurance program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project was performed in strict adherence to our QA/QC program to ensure sample integrity and to meet quality control criteria.

If you have any question concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,
GTEL Environmental Laboratories, Inc.

Rebecca Hsu-Chou, Ph.D.
Laboratory Director

Mr. Bill Girolamo
Groundwater Technology, Inc.
20000 Mariner Avenue, Suite 200
Torrance, CA 90503

Dear Mr. Girolamo,

Attached please find the analytical results for the samples received by GTEL on 1/10/91. The samples were received and analyzed as indicated on the chain of custody 76-11241, which is attached.

GTEL maintains a formal quality assurance program to ensure the integrity of the analytical results. All quality assurance criteria were achieved during the analysis unless otherwise noted in the footnotes to the analytical report.

The specific analytical methods used and cited in this report are approved by state and federal regulatory agencies. GTEL is certified for the analysis reported herein by the Department of Health Services under certificate number E723.

If you have any questions regarding this analysis, or if we may service any additional analytical needs, please give us a call.

Sincerely,
GTEL Environmental Laboratories, Inc.

Rebecca Hsu-Chou, Ph.D.
Laboratory Director

INTRODUCTION

Hydraulic Properties of the Shallow Aquifer Beneath the Huntington Beach Production Area, Gas Pump Area

This report summarizes the pumping test procedure, including field activities and data interpretation for the shallow aquifer in the vicinity of the referenced site in Huntington Beach, California.

OBJECTIVES OF AQUIFER TESTING

The basic objectives of a pumping test are to determine the hydraulic characteristics of the saturated zone (aquifer test) and to evaluate the efficiency of the pumping well (well test).

The efficiency of a specific well can be determined from the yield and time-drawdown relationship. Specific capacity can be used for selecting the type of pump, and for estimating the cost of pumping. Such a test can be either a short or long term step-drawdown type. In either case, no observation wells or piezometers are required to be monitored in conjunction with the pumping well.

A long term pumping test can be used to evaluate the hydraulic parameters of the saturated zone. Such testing requires additional monitoring wells or piezometers to be used for the interpretation of the hydraulic parameters.

The long term pumping test performed for SWEPI was designed to evaluate the hydraulic properties of the uppermost saturated zone only. Most of the existing

monitoring wells were utilized for this test. The objectives of this test do not include the evaluation of the pumping well yield or specific capacity.

THE HYDRAULIC PROPERTIES OF AQUIFERS

The following are the most important properties that control the storage and flow of groundwater in the saturated zone.

Transmissivity (T)

The rate of flow under a hydraulic gradient equal to unity through a cross-section of unit width over the entire thickness of the aquifer. It is the product of the hydraulic conductivity (K), and the thickness of the saturated zone (b). It is designated by the symbol T or Kb and has the dimensions of length (cubed)/time/length or length (squared)/time and is, for example, expressed in square feet per day or gallons per day per foot.

Hydraulic Conductivity (K)

The rate of groundwater flow under a hydraulic gradient of unity through a cross-section of unit area. It has the dimensions of velocity: length/time, and area, length/time and is, for example, expressed in gallons per day per square foot (gpd/sq ft), meters/day, or feet/day.

Storativity or Storage Coefficient and Specific Yield (S):

The volume of water released or stored per unit surface area of the saturated zone per unit change in the component of head normal to that surface. Both are designated by the symbol S and are dimensionless.

Other hydraulic properties that may affect the yield from the semi-confined saturated zone are the hydraulic resistance, leakage factor, and drainage factor which is encountered in an unconfined saturated zone with delayed yield. Both properties have the dimensions of length and are, for example, expressed in meters or feet.

PRELIMINARY STUDIES

Before the performance of the test, the following basic information was collected, and field measurements were done one day prior to starting the test as a prerequisite for proper data acquisition and interpretation:

1) Well location, design and specifications, including total depth, diameter, location of well screens and blank casings intervals and specifications, filter pack type, well or boring diameter, and the distance between the wells to be used for monitoring were determined.

2) Static water levels or piezometric levels, gradients and directions of flow were measured with reference to a datum level over the whole area expected to be affected by the test.

3) Hourly fluctuation of groundwater levels were recorded. This was performed for one well, GTW-5, to reflect the fluctuation in the entire area being tested. The raw field data collected one day prior to the test are presented in Appendix C of the main body of this report. These data were plotted using Harvard Graphics software.

4) Site-specific hydrogeologic and geologic parameters were also reviewed in order to estimate hydraulic properties and to determine the proper discharge rate and duration of the pumping.

5) Site vicinity and regional interpretation was performed, including topography and surface drainage, the presence of hydraulic boundaries, and the artificial recharge or discharge of the saturated zone that may affect the aquifer being tested.

Prior to pumping, fluctuations of groundwater levels monitored in well GTW-5 and presented in the graph under "GT-5 PRE-PT" in Appendix C, are apparently due to tidal influence. The maximum water level observed was during the first two hours of monitoring at about 8:00 PM. After that, water levels decreases until the end of the monitoring period. However, the total decline in water level was only 0.04 feet.

Antecedent trends of water levels were not monitored in the remaining observation wells. Minor fluctuations in water levels are not considered in the interpretation of the pumping test data from these wells, and the observed drawdowns in observation wells were much larger than the expected background water level fluctuation.

FIELD ACTIVITIES AND PERFORMANCE OF THE PUMPING TEST

Field Activities

Prior to the performance of the test or the installation of the pump, the following measurements were taken in pumping well GTW-5 and the three observation well, GTW-3, GTW-4, and GTW-7:

- Measurements of the static water levels.

- Continuous monitoring of the proposed pumping well. This was done by installing a pressure transducer below the water level and monitoring the groundwater level for about 13 hours before the commencement of the test.

- All other external factors that might impact the test. These factors include precipitation, ground-surface loading conditions, recharge, discharge, and possible infiltration into the saturated zone.

All measurements of static water levels were performed prior to introduction of instruments into the pumping or monitoring wells. Considering the current state-of-the-art instrumentation available for water level measurements, it is cost effective and more efficient to use down-hole instruments for data acquisition than employing field personnel to do manual measurements. Therefore, pressure transducers and the data logger were used for data acquisition and a field computer was used for preliminary field data interpretation so that the test could be evaluated for validity before leaving the test site.

Discharge rate is another determining factor in the accuracy of the test and the validity of drawdown data. Discharge rate measurement and control were done both manually and by using an in-line flow meter.

Performance of the Pumping Test

On the morning of January 8th, 1991, a Groundwater Technology field technician, a geologist, and a hydrogeologist began field operations by measuring the static water levels, removing the in-hole stinger pipes used for sampling, installing the pressure transducers in the observation wells, and installing the pump in the pumping well, GTW-5.

The nearest observation well to the pumping well was GTW-3 located 22 feet northwest of GTW-5. The other two monitoring wells used for this test were GTW-4, 81.5 feet northwest of GTW-5, and GTW-7, 45.5 feet north of GTW-5.

Initial pumping, using a submersible pump, was discontinued after a few minutes of operation, due to the discharge of excessive quantities of sand and silt through the pump. The flow of sand through the pump damaged the teflon components of the pump and caused the termination of the test.

The small volume of water discharged during initial pumping contained a large amount of fine grained sand. Controlling sand and silt flow normally requires a recovery well that is specially designed to counteract such field conditions. The existing monitoring wells available for use in the aquifer test were all constructed with 4-inch diameter, Schedule 40, PVC casing and screens. The screen sections extended above the static water levels in all the wells and are slotted with 0.020 inch slot size. Since these wells were not designed to be recovery wells, it was decided to postpone the test until a proper pump that could handle the sand flow problem was available.

On January 9th, 1991, a "Sand-Handler" submersible pump was installed in GTW-5 and tested. The initial flow rate, measured volumetrically, was about 8 gallons per minutes (gpm). The discharge line through which groundwater was pumped included one check valve, one flow meter, two shut-off valves and one sampling port.

Before commencement of the test, static water levels were recorded once every second in the pumping well and the three selected observation wells for about three minutes starting at 14:24:01. The pump was turned on at 14:27:16 and continued to pump for 1054 minutes, until 08:01:00, on January 10, 1991.

Discharge Rate

The flow rate through the discharge line was monitored using a five gallon bucket and an in-line flow meter. the meter reading was recorded before the pump was turned on and then intermittently throughout the test. At the same intervals as the flow meter readings, the discharge of water into the five gallon bucket was timed. The flow rate was maintained at 57 seconds per bucket or 5.3 gpm. Early in the test, the flow rate required adjustment every 10 to 15 minutes. Adjustments were done using the in-line control valves. Maximum discharge rate was about 6 gpm during the early minutes of the test, adjusted to 5.3 gpm for the remaining period of the test. The minimum flow rate reported during the test was about 5 gpm after about two hours of pumping.

Ground Water Quality

The electrical conductivity of water (EC), measured in micromhos/cm previously monitored during well purging and sampling, was monitored throughout the test. Six water samples were collected for direct field measurement of both temperature and EC.

The reported water temperature was constant throughout the test at 22 degrees centigrade but the EC showed considerable decline from about 14,000 micromhos/cm during the early minutes of the test, to about 10,000 micromhos/cm after 1,000 minutes of pumping. The selected six EC measurements were graphed and are attached. These hydrochemical results indicate an increase in flow of less saline water, possibly through vertical leakage, into the well during water extraction.

COMPILATION, TRANSFER, AND ANALYSIS OF DATA

Preliminary analysis of field data reveal the accuracy, completeness and adequacy of the test. Data processing includes:

1) Transfer of the raw data from the data-logger into the computer software, DATALOGR, inverting the data to descending chronologic order, and transfer of files to GWAP software for interpretation.

2) Compilation of data in the form of tables and graphs.

3) Correction of drawdown data. This is generally done for one or more of the following:

   - Variable discharge rate, minor fluctuation in discharge rate, within or above 10% of the total rate. This fluctuation was minor and not corrected for in this test.

   - Barometric pressure changes or barometric efficiency. This is effective in confined aquifers and not applicable in this site.

   - Regional changes of the water levels not induced by pumping. No correction was necessary.

   - Effects of partial penetration of the pumping and monitoring wells. All the wells in this site are constructed throughout the upper saturated zone. Therefore, correction for partial penetration is not applicable for this test.

4) Determination of the hydraulic properties of the saturated zone.

PUMPING TEST RESULTS

Interpretation of the pumping test results was done using the computer software GWAP in which selected portions of the test were examined in light of all possible interpretations to identify and interpret the hydraulic properties of the saturated zone.

Observation Well GTW-3

This well is located 22 feet from the pumping well, GTW-5, and was monitored for the entire duration of the test. A significant drawdown in this well can be attributed to pumping from GTW-5. The tabulated time and drawdown data collected through channel 3 of the data logger are attached. The data was also plotted on a logarithmic scale, using GWAP software, for type curve fitting and interpretation. The maximum drawdown reported in this well was 0.2 feet. Therefore data from this observation well was used for pumping test interpretation. The first 482 minutes of the test were analyzed to calculate the hydraulic properties of the saturated zone. This set of data clearly indicates that delayed gravity response took place in the aquifer after about 100 minutes of pumping. For this reason, the early data, first 100 minutes, were interpreted using the unconfined condition that is affected by the elasticity of the aquifer. The best-fit curve was with a beta value of 0.20, where beta is a type curve. Details of this condition and data interpretation can be reviewed in S.P Neuman, (1975).

Transmissivity calculated using the above method is about 7,776 gpd/ft and the storativity or specific yield is about 1% . Hydraulic conductivity, calculated based on a saturated thickness of 22 feet, is 353 gpd/sq ft or 47 feet per day. These values are representative of a silty sand to fine sand lithology existing under unconfined, water table, condition.

The later drawdown data in this well can also be interpreted using the anisotropic unconfined aquifer condition with delayed gravity response. Details of this condition can also be found in S.P Neuman.(1975).

The best type curve fit for the late data was also with beta value of 0.20, and the calculated values of hydraulic properties were within the same order of magnitude as those from the early data. This interpretation resulted in the following:

T = 9121 gpd/ft
K = 415 gpd/sq ft or 55 ft/day
S = 0.16

Observation Well GTW-4

This well is located 81.5 feet from the pumping well,
GTW-5, and was monitored for the entire duration of the test. However, it did not show any significant drawdown that can be attributed to pumping. The tabulated time and drawdown data collected through channel 4 of the data logger are attached. The data was also plotted on a logarithmic scale, using GWAP software, to show it's general trend. The maximum drawdown reported in this well is less than one inch, 0.08 feet. Therefore this observation well is not used for pumping test interpretation.

Observation Well GTW-7

This well is located 45.5 feet from the pumping well,
GTW-5. A maximum of 0.12 feet of drawdown was recorded in this well after about 10 hours of pumping. The tabulated and drawdown data collected through channel 7 of the data logger are attached. The data was also plotted on a logarithmic scale, using GWAP software, for type curve fitting and interpretation. The first 10 minutes of pumping did

not show significant drawdown compared with observation well GTW-3. The entire drawdown and recovery data recorded in this well were plotted on one graph to show the general trend. Pumping test data recorded during the first three hours can be interpreted using an anisotropic unconfined aquifer condition with elastic response as is the case in observation well GTW-3. The best-fit curve was selected with a beta value of 0.10.

Transmissivity calculated using this method, 8711 gpd/ft, is slightly higher than the results from GTW-3: 7776 gpd/ft. However, the hydraulic conductivity is within the same order of magnitude, about 396 gpd/sq ft, and the storativity is 0.013.

The high transmissivity value calculated from observation well GTW-7 is probably affected by one or several of the following:

1) Vertical seepage from ponding water accumulated after the heavy rain during the morning and the afternoon of the day of pump test. All ponded water in the area drained into a storm drain located about 100 feet northwest of the pumping well. However, it is not known if this drain leaks is therefore a source for groundwater recharge. The only evidence available from this test that supports leakage from a shallow source is the decrease in EC values reported during the test. Late drawdown data showed recovery during the night and the second day of pumping and were not used for interpretation.

2) The steam cleaning area, located between wells GTW-4 and GTW-7 is another potential recharge source. No water was ponding during or after the heavy rain in this unpaved sandy area.

Velocity of Groundwater Flow

The general directions of the groundwater flowing across the site are shown in the Figure 3. The average linear velocity of groundwater flowing in the saturated zone under certain gradient can be estimated using the basic flow equation as follows:

$$V = (K/n) * I$$

Where: V = Average linear groundwater velocity in feet/day
K = Hydraulic Conductivity in feet/day
n = Effective Porosity of the saturated zone as a ratio
I = Groundwater gradient length/length

Using an average value for K = 50 ft/day calculated from the two observation wells, a gradient of 0.0007, and effective porosity of 20%, the calculated velocity is 0.175 ft/day or about 64 ft/year.

This value of groundwater velocity is relatively low and can be increased artificially by increasing the groundwater gradient within the cone of depression through pumping at the site.

Calculation of groundwater velocity in other parts of the property should consider the variations in hydraulic conductivity and gradients particularly in areas exhibiting lateral variations in the lithologic properties.

CONCLUSIONS

Based on the pumping test data interpretation from the two monitoring wells, GTW-3 and GTW-7, and on the lithologic characteristics of the saturated zone, the following conclusions can be reached:

conclusions can be reached:

- The saturated zone beneath the tested site is unconfined in which the upper limit is the water table.
- The saturated zone can yield a minimum of five gallons per minute with an average drawdown of two feet for continuous pumping exceeding one day.
- The average transmissivity of the saturated zone is 8,244 gpd/ft (1102 sq ft/day).
- The average hydraulic conductivity is 375 gpd/sq ft (50 ft/day).
- The calculated storativity or specific yield of the saturated zone is 0.012.

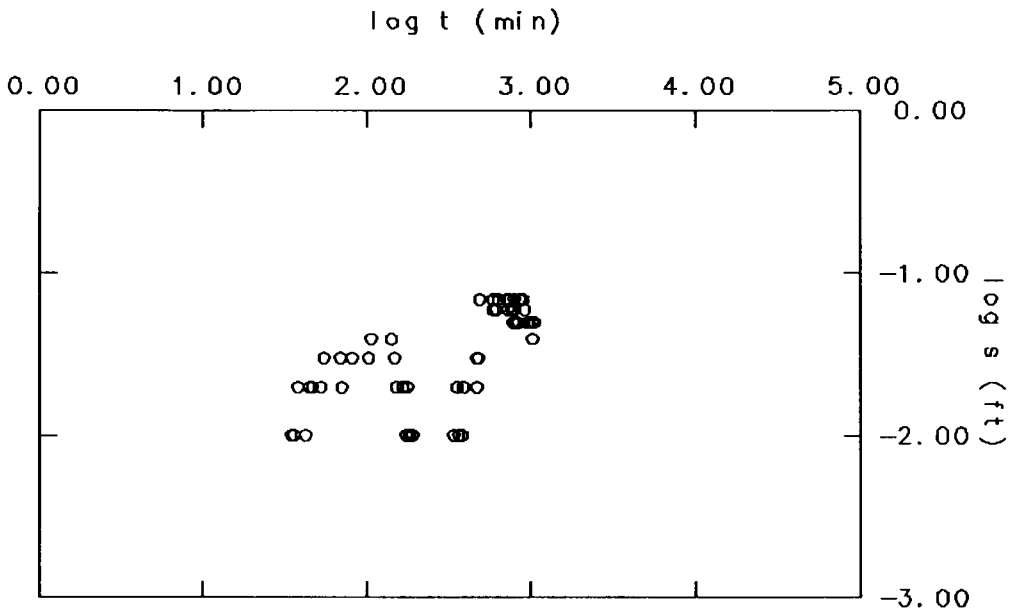
PUMP TEST DATA FOR WELL GTW-4

216-325-1801-02
1801-R10.BG/#1

GROUNDWATER TECHNOLOGY, INC.



Data for Pump Test

Well Name: SGP GTW4 Date of Test: 01-09-91
Aquifer Thickness (b): 22.000 ft
Pumped Well Discharge(Q) = 5.260 gpm
Radius of Pumping Well = 0.350 ft
Distance of Observation Well from Pumping Well = 81.500 ft

Entry No.	Time(t) (min)	Drawdown(s) (ft)	t / d^2 (min/sq ft)

SWEPI GP DRAWDOWN IN GTW-7

o - Data

WELL INFORMATION		
WELL IDENTIFICATION	:	GTW-7
DATE OF AQUIFER TEST	:	01-09-91
AQUIFER THICKNESS (b)	:	2.200E+0001 ft
DISCHARGE RATE (Q)	:	5.260E+0000 gpm
PUMPING WELL RADIUS (r)	:	3.500E-0001 ft
DISTANCE OF OBS. WELL FROM PUMPING WELL (d)	:	4.550E+0001 ft

SWEPI GP GTW-7 LATE DRAWDOWN

MATCH POINT			SOLUTION		
t	=	1.000E+0000	Transmissivity	=	8.711E+0003 gpd/ft
s	=	1.000E-0001	Hydraulic. Cond.	=	3.959E+0002 gpd/sq ft
1/Ua	=	3.090E-0002	Storativity	=	1.264E-0002
W(Ua, B)	=	1.445E+0000

Dear Mr. Peuron:

SUBJECT: CHARACTERIZATION REPORT
OCHCA CASE #88UT110
UNDERGROUND STORAGE TANK SITE
SHELL WESTERN E&P INC.
20101 GOLDENWEST STREET
HUNTINGTON BEACH, ORANGE COUNTY

As explained in Shell Western E&P Inc.'s (SWEPI) March 4, 1991 Quarterly Report, characterization of the subject former underground tank site is complete. The original tank removal was performed in April 1989. A subsequent closure request dated August 7, 1989 with accompanying site characterization was denied by your letter of September 1, 1989 with a request for further characterization. We believe that the requested additional investigation is now complete.

Enclosed is a final characterization report in two volumes (Phase I & Phase II) prepared by Groundwater Technology (SWEPI consultant). The information contained in the report is in addition to that in the original August 1989 report prepared by Aman Environmental (former SWEPI consultant). In order to tie the two reports together, a brief summary of the information in the three volumes is also enclosed.

CBBY9109204 - 0001.0.0

We look forward to meeting with you to discuss the need for further action upon completion of your review of the enclosed reports. If you have any questions, please contact Sub Sen of our staff at (805) 326-5129.

Sincerely,

J. A. Ruhl
Manager Health, Safety & Environment
West Coast Production Division

SUMMARY OF CHARACTERIZATION STUDIES
OCHCA CASE #88UT110
UNDERGROUND STORAGE TANK SITE
HUNTINGTON BEACH, ORANGE COUNTY

HISTORY

Two 10,000 gallon underground tanks were removed in April 1989. Their former locations are shown in Figure 1. Samples below each end of the gasoline tank and one end of the Stoddard solvent tank (GT-EX-1, GT-EX-2, ST-EX-2) at 12 feet below grade were clean. However, sample ST-EX-1 (12 feet below grade) below the eastern end of the Stoddard solvent tank found elevated levels of hydrocarbons; ST-EX-1A at 14 feet below grade also found hydrocarbons. The hydrocarbon-containing soil was excavated down to 35 feet as shown in Figures 1 & 2. Further samples ST-EX-3, 4, 7 & 8 were taken during the excavation. The stockpiled soils were sampled (SP-GS-1) and removed. Three subsurface borings (PB-1, PB-2 & PB-3: Figures 1 & 2) down to groundwater at 35 feet vertical below grade showed no significant contamination remaining. Table 1 shows the analytical results from Aman Environmental's investigation. However, a request for closure was denied, and further investigation required.

In November 1989, SWEPI retained Groundwater Technology Inc. to further characterize the site. Phase I of the investigation included drilling and sampling soil and groundwater from 5 groundwater monitoring wells (GTW1 through GTW5) and a vapor extraction test through a soil probe and well GTV2. A Phase I report was completed in June 1990. However, due to the level of groundwater hydrocarbons found in well GTW-5, a Phase II investigation was initiated to define the limits of elevated groundwater TPH. Wells GTW-6 (upgradient) and GTW-7 (downgradient) completed this investigation, along with a pump-test on well GTW-5. A Phase II report was completed in March 1991. Figures 3 (plan) and 4 (cross-section) show the locations of all the wells, hydrocarbons and the isoTPH contours. Tables 2 and 3 show soil analytical results from Phase I and II. Tables 4 & 5 show the groundwater analytical results from Phase I & II.

CONCLUSIONS

It is deduced from the data above that:

1) A hydrocarbon plume originally extended from one end of the Stoddard solvent tank down to groundwater around Well GTW-5 as shown in Figure 4.

2) Most of the source hydrocarbon-bearing soil has been excavated. The highest remaining TPH level of 3700 ppm was found at 31 feet in well GTV-1 with next highest at 140 ppm.

3) The groundwater in well GTW-5 had 53,000 - 80,000 ppb of TPH. The upgradient well GTW-6 had low TPH levels, and the downgradient GTW-7 had non-detectable levels. Well GTW-5 also had 2,000 - 3,800 ppb of benzene, but other wells had less than 3.5 ppb. The hydrocarbon plume is now well defined and concentrated around well GTW-5, as shown in Figure 3.

4) Groundwater in the vicinity is brackish (TDS 9,700 ppm) and not used for any purpose. The site is within 0.25 mile of the shoreline.

1.0 INTRODUCTION

The following report summarizes field work and laboratory analyses performed during the third quarter (July 1 through September 30) of 1995, at CalResources LLC, (formerly Shell Western Exploration and Production, Inc., [SWEPI]), Huntington Beach Production Unit, 20101 Golden West Avenue, Huntington Beach, California (figure 1). The following tasks were performed during this reporting period:

- quarterly gauging and sampling of all on-site groundwater monitoring wells
- laboratory analysis of groundwater samples
- measurements of dissolved oxygen levels
- installation of a Stealth thermal oxidizer
- remedial system operation and maintenance

The soil vapor extraction system (Adwest Gravel Bed) began operation at the site May 4, 1993. The system was shut down December 2, 1993, and removed from the site for repairs. The Adwest unit was then used at the CalResources gas plant site. The system was reinstalled and began operation on June 2, 1994. The Adwest Gravel Bed was operated until January 18, 1995, when it was shut down for repairs and removed from the site.

A Stealth Thermal Oxidizer was installed to replace the gravel bed and began operation on July 10, 1995. The Thermal Oxidizer was previously used to remediate CalResources' former Huntington Beach Gas Plant facility currently undergoing demolition. The soil vapor extraction system operated during the third quarter of 1995.

2.0 GAUGING, SAMPLING, GRADIENT DETERMINATION, AND DISSOLVED OXYGEN LEVELS

On September 18, 1995, Groundwater Technology, Inc. personnel gauged monitoring wells associated with the gas pump area assessment (GTW-1 through GTW-7, figure 2). An iNTERFACE PROBE™ was used to measure depth to water. Liquid-phase hydrocarbons were not detected in any of the wells. Table 1 summarizes the well gauging data. A copy of the gauging data is included as appendix A.

Groundwater gradient beneath the site, calculated using the third quarter data (collected September 18), was 0.007 feet per foot (ft/ft) toward the west. The groundwater gradient is consistent with previous sampling events. Figure 3 shows groundwater equipotential lines and calculated gradient, including flow direction.

On September 18, 1995, Groundwater Technology personnel purged and sampled seven groundwater monitoring wells (GTW-1 through GTW-7) in the gas pump area. The wells were purged using an industrial vacuum truck and dedicated polyvinyl chloride (PVC) stingers. Approximately 37 to 45 gallons of groundwater was purged from each well before sampling. Purging was performed until PH, conductivity, and temperature parameters stabilized. Appendix A contains the well purging records. All purged groundwater was disposed on-site through the CalResources on-site water treatment system.

Samples were collected using disposable Teflon™ bailers. The samples were immediately placed on ice in a cooler and transported to state-certified BC Analytical Laboratories, Glendale, California, following proper chain-of-custody procedures. All samples were analyzed for total petroleum hydrocarbons as gasoline (TPH-g) following proper EPA Method 8015 (modified); and for benzene, toluene, ethylbenzene, and total xylenes (BTEX) following EPA Method 8020.

Dissolved oxygen levels were measured in each monitoring well to evaluate potential biological degradation of the dissolved hydrocarbon plume. After each well was purged, measurements were obtained using a model YSI-50B dissolved oxygen meter. The attached probe was calibrated in air to 20.9% oxygen prior to sampling. Field dissolved oxygen data is included in appendix A.

3.0 VAPOR TREATMENT SYSTEM OPERATION

During the reporting period, the Stealth system operated from July 10 through September 30, 1995, with approximately 8 days of downtime due to mechanical problems (August 12 to August 17, and September 11 to September 14). Weekly system checks and monitoring were performed during the operating period.

Tedlar bag samples were collected from the influent airstream on July 10 and September 14, 1995. Air samples were sent to Quanterra Environmental Services, City of Industry, California, following proper chain-of-custody procedures. The samples were analyzed for methane, total non-methane hydrocarbons (TNMHC) as hexane, carbon monoxide, and carbon dioxide following SCAQMD Method 25.1.

4.0 GROUNDWATER ANALYTICAL RESULTS

TPH-g was not detected at or above the reporting limit (100 micrograms per liter [μg/L]) in five of the wells sampled. Wells GTW-5 and GTW-6 contained TPH-g concentrations of 120 and 130 μg/L, respectively. Benzene was not detected at or above the reporting limit (0.3 μg/L) in six wells. Well GTW-5 contained benzene at a concentration of 0.35 μg/L.

Table 2 summarizes the EPA Method 8015 (modified) and EPA Method 8020 analytical results from groundwater samples collected September 19, 1995. A copy of the complete laboratory report is included as appendix B.

Laboratory analyses for TPH-g and benzene from December 1990 through September 1995 are provided in tables 3 and 4. Comparative data indicate limited lateral migration of dissolved-phase hydrocarbons from the suspected source area (i.e., around well GTW-5). TPH-g and benzene dissolved concentrations have decreased more than 99 percent since December 1990.

4.1 Dissolved Oxygen Measurement Results

Dissolved oxygen levels, measured September 18, 1995, ranged from 0.47 milligrams per liter (mg/L) to 0.95 mg/L in GTW-2 and GTW-6, respectively. The low dissolved oxygen concentrations could indicate limited biodegradation is occurring in the subsurface. The biological activity has been sufficient to control the migration of dissolved-phase hydrocarbons in a limited area around GTW-5. The hydrocarbon plume has remained confined to the same area since first quarter 1994 sampling when TPH-g was last detected in downgradient well GTW-3 (50 μg/L). Dissolved oxygen data is provided in table 5.

4.2 Vapor Stream Analytical Results

Table 6 summarizes vapor stream analytical results from the samples collected on July 10 and September 14, 1995. The influent sample collected July 10 contained 750 parts per million by volume (ppm[v]) TNMHC as hexane. The influent sample collected September 14 contained no TNMHC above the method detection limits (15 ppm). These values were reported in the laboratory as hexane, which is equivalent to TNMHC as gasoline. Completed laboratory results for vapor stream samples are included as appendix C.

5.0 HYDROCARBON REMOVAL

The quantity of hydrocarbons destroyed was determined using the extraction run time and the flow entering the thermal oxidizer treatment unit. The equation used in the analysis is shown below:

$$X = CQ\ (0.0000126)$$

where X = TPH removed in pounds per hour
C = Influent concentration in ppm(v)
Q = Flow rate in standard cubic ft per minute (scfm), and
0.0000126 is the unit conversion factor.

Influent concentrations were calculated using field data, and interpolated for days when the system was not monitored. Influent methane was not considered for calculation of hydrocarbon destruction. Calculations also assume 7.5% purge air, which reduces the total flow.

The combined flow rate, based on operating data recorded from the thermal oxidizer system, ranged from 189 to 370 scfm. The average TPH removal rate over the operating period was 1.69 pounds per hour. Total TPH mass removed during the period is estimated at 3,001 pounds.

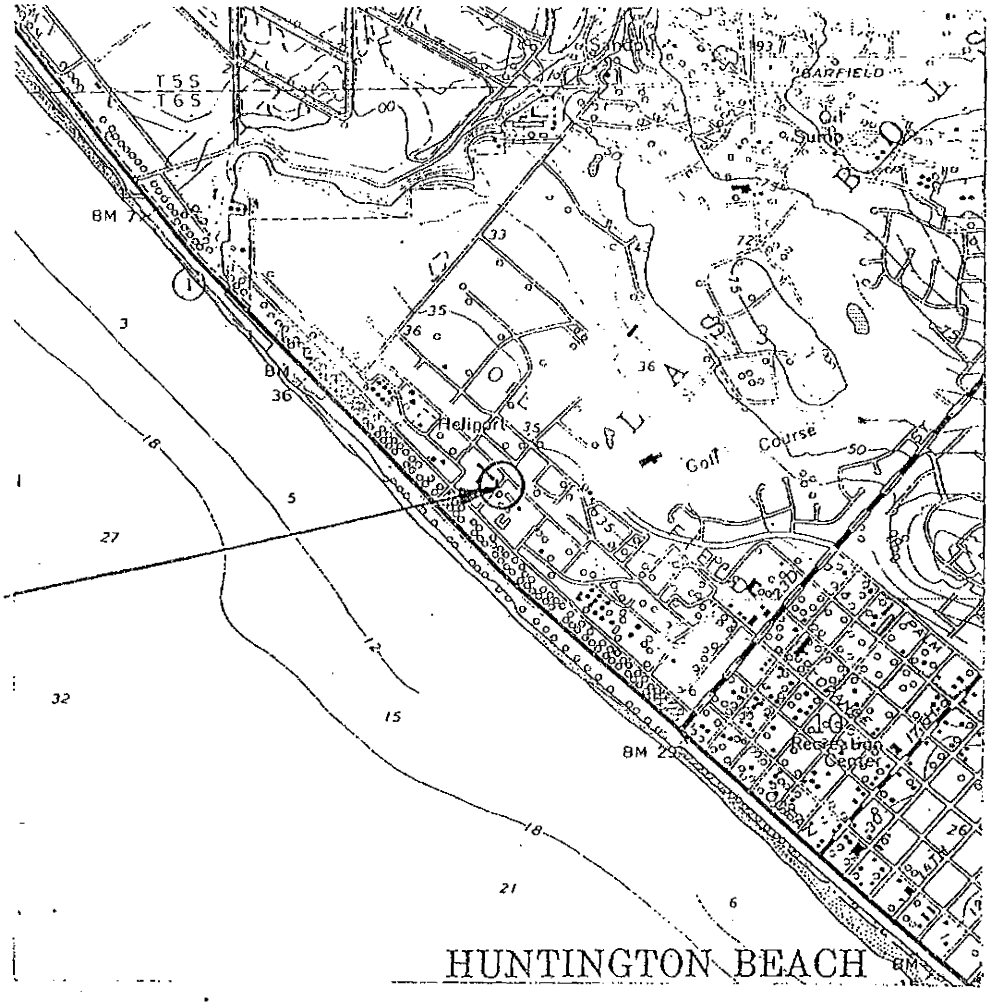
Figure 4 shows cumulative TPH mass removed during gravel bed operation from May 1993 to January 1994, and during thermal oxidizer operation from July to September 1995. Total TPH mass removed during remediation at the site is estimated at 22,328.

6.0 SUMMARY

The following summary is based on data collected during the third quarter of 1995 at the CalResources Huntington Beach Production Unit:

- Groundwater gradient, calculated using the third quarter 1995 gauging data, was about 0.007 ft/ft toward the west.
- TPH-g was not detected at or above the reporting limit (10 μg/L) in groundwater samples collected September, 1995, in five wells. Wells GTW-5 and GTW-6 contained TPH-g concentrations of 120 and 130 μg/L, respectively. Benzene was not detected at or above the reporting limit (0.3 μg/L) in six wells, and at a concentration of 0.35 μg/L in well GTW-5. Comparative historical data suggest limited lateral migration of dissolved-phase hydrocarbons from the source area (i.e., around well GTW-5). TPH-g and benzene dissolved concentrations have decreased more than 99 percent since December 1990.
- After purging, dissolved oxygen was recorded from each well on September 18, 1995. Dissolved oxygen ranged from 0.47 to 0.95 mg/L, in GTW-2 and GTW-6, respectively. Dissolved oxygen concentrations could indicate biological degradation of residual hydrocarbons (organic material) around GTW-5. The hydrocarbon plume has remained confined to the same area since first quarter 1994 sampling.
- A Stealth thermal oxidizer was installed at the site on July 10, 1995; the unit operated for 74 days during the quarter. Approximately 3,001 pounds of hydrocarbons were removed. Total TPH removed from all remediation activities is estimated at 22,328 pounds.

At this time, Groundwater Technology recommends that CalResources apply for site closure from the lead agency, Orange County Health Care Agency (OCHCA). This conclusion is based upon data from third quarter 1995 and previous historical data. The data indicate a decrease in dissolved hydrocarbon concentrations (see tables 3 and 4) and vapor influent concentrations (table 5). It appears that limited hydrocarbon mass remains at the site. Also, lack of dissolved hydrocarbon migration may indicate that the plume is in a state of equilibrium with biological degradation. The closure request is based on the following:



- low TPH-g and benzene concentrations in groundwater
- non-beneficial use of groundwater beneath the site
- limited migration of dissolved hydrocarbons from 1990 through 1995
- low influent soil vapor hydrocarbon concentrations are resulting in asymptotic recovery
- reduction of groundwater concentrations (53,000 μg/L TPH-g, to >200 μg/L and 2,000 μg/L to 0.35 μg/L for benzene in well GTW-5)

TABLE 1
Well Gauging Data
Third Quarter, September 18, 1995

(All values reported in feet)

CalResources, LLC
Gas Pump Area, Huntington Beach Production Unit
Huntington Beach, California

Well No.	SWE	DTW	DTP	PT	GWE
GTW-1	34.90	34.45	–	0	0.45
GTW-2	34.87	34.40	–	0	0.47
GTW-3	34.59	33.92	–	0	0.67
GTW-4	34.38	33.90	–	0	0.48
GTW-5	34.96	33.89	–	0	1.07
GTW-6	34.70	34.20	–	0	0.50
GTW-7	34.78	33.76	–	0	1.02

Notes: "SWE" indicates surveyed well elevation, relative to mean sea level (MSL). "DTW" indicates depth to water, measured from top of casing (feet). "DTP" indicates depth to product, measured from top of casing (feet). "PT" indicates product thickness. "GWE" indicates groundwater elevation relative to MSL. "– " indicates no liquid-phase hydrocarbons detected.

TABLE 2
Groundwater Analytical Results
September 19, 1995

(All values reported in micrograms per liter)

CalResources, LLC
Gas Pump Area, Huntington Beach Production Unit
Huntington Beach, California

Well No.	EPA Method 8015	EPA Method 8020			
	TPH (as Gasoline)	Benzene	Toluene	Ethyl-benzene	Total Xylenes
GTW-1	ND	ND	ND	ND	ND
GTW-2	ND	ND	ND	ND	ND
GTW-3	ND	ND	ND	ND	ND

Notes: "—" indicates not analyzed. "ND" indicates not detected.

Reporting Limits: benzene, 0.5 µg/L (except for 12/18/94 and 9/19/95, 0.3 µg/L).

TABLE 5
Summary of Dissolved Oxygen Levels
Groundwater Monitoring Wells
Huntington Beach Facility, Gas Pump Area
September 19, 1995

CalResources, LLC
Huntington Beach, California

Well No.	D.O. (mg/L)
GTW-1	0.62
GTW-2	0.47
GTW-3	0.60
GTW-4	0.64
GTW-5	0.70
GTW-6	0.95
GTW-7	0.75

Notes: Dissolved oxygen probe calibrated in air to 20.9% oxygen. "D.O." indicates dissolved oxygen, reported in milligrams per liter (mg/L). D.O. levels measured after a minimum purging of 3 well volumes.

TABLE 6
Summary of Vapor Stream Analytical Results
Huntington Beach Facility-Gas, Pump Area

(All values reported in parts per million by volume (ppm[v]))

CalResources LLC
Huntington Beach, California

Sample	Date	TNMHC as Hexane*	Methane	Carbon Dioxide	Carbon Monoxide
Influent	7/10/95	750	3,700	75,000	ND
Influent	9/14/95	ND	2.8	12,000	ND
Effluent	7/10/95	ND	ND	51,000	ND

Notes: "ND" indicates not detected. "NA" indicates not analyzed.
Reporting Limits:
Influent samples: Methane, 1,000 ppm(v); TNMHC, 5.0 and 15.0 ppm(v); carbon dioxide, 1,000 ppm(v); carbon monoxide, 10 ppm(v).
*TNMHC as hexane = total non-methane hydrocarbons. Analyzed using hexane. Represents total petroleum hydrocarbons as gasoline in vapor.

METHOD OF SHIPMENT:

SPECIAL INSTRUCTIONS:

The delivery of samples and the signature on this chain of custody form constitutes authorization to perform the analyses specified above under the **Enseco** Terms and Conditions, unless a contract or purchase order has been executed and is sited above.

SAMPLE DESPOSITION:

1. Storage time requested: _____ days (Samples will be stored for thirty (30) days without additional charge; thereafter storage charges will be billed at the published rates.)
2. Sample to be returned to client: ☐ Yes ☐ No (**Enseco** will dispose of unreturned samples for a charge of $15.00. Disposal will be by incineration wherever possible; otherwise, as appropriate, according to legal requirements.)

DISTRIBUTION: WHITE - With Report; CANARY - To **ENSECO**; PINK - To Courier; GOLDENROD - To Sample Control

RETURN RECEIPT REQUESTED

Mr. Carl Bernhardt
California Regional Water Quality Control Board
Santa Ana Region
3737 Main Street, Suite 500
Riverside, CA 92501-3339

Dear Mr. Bernhardt:

SUBJECT: SITE CLOSURE REQUEST, CalResources LLC
OCHCA CASE NO. 88UT110, 20101 GOLDEN WEST STREET
HUNTINGTON BEACH, ORANGE COUNTY

In talking with Mr. Peter Peuron of Orange County Health Care Agency about CalResources LLC's UST remediation site at Huntington Beach, I understood that the Regional Water Quality Control Board had some questions or reservations regarding site closure. In particular, I understand that the lack of post-remediation soil data is a concern. Mr. Peuron asked me to forward the recent closure and groundwater monitoring reports to you.

The site is on the sea-ward side of the Newport-Inglewood Fault, only a few hundred feet from the shoreline. The impacted perched acquifer has been shown to be non-potable. There is no free product. As the **attached** groundwater monitoring and closure **reports** show, undiluted vapor samples from the inlet of the vapor extraction system were down to 110 ppm non-methane hydrocarbons at shut-down, with little rebound. Since the extractable vapor concentrations are so low, further remediation efforts will not result in commensurate benefits. Carbon-dioxide levels were elevated. Along with the depressed dissolved oxygen levels, this indicated biodegradation was underway. The only well with detectable dissolved benzene was reported at 0.35 ppb at the last sampling event. The site has been remediated to the limits of technology. The dissolved plume has shrunk throughout the term of the remediation project both in mass and area. It would appear that this site should fit your definition of low-risk regardless of soil concentrations. We therefore request site closure without further action.

If you require further information or discussion regarding this site, please call me at (805) 326-5129.

Sincerely,

S. Sen
Staff Environmental Engineer

Dear Mr. Peuron:

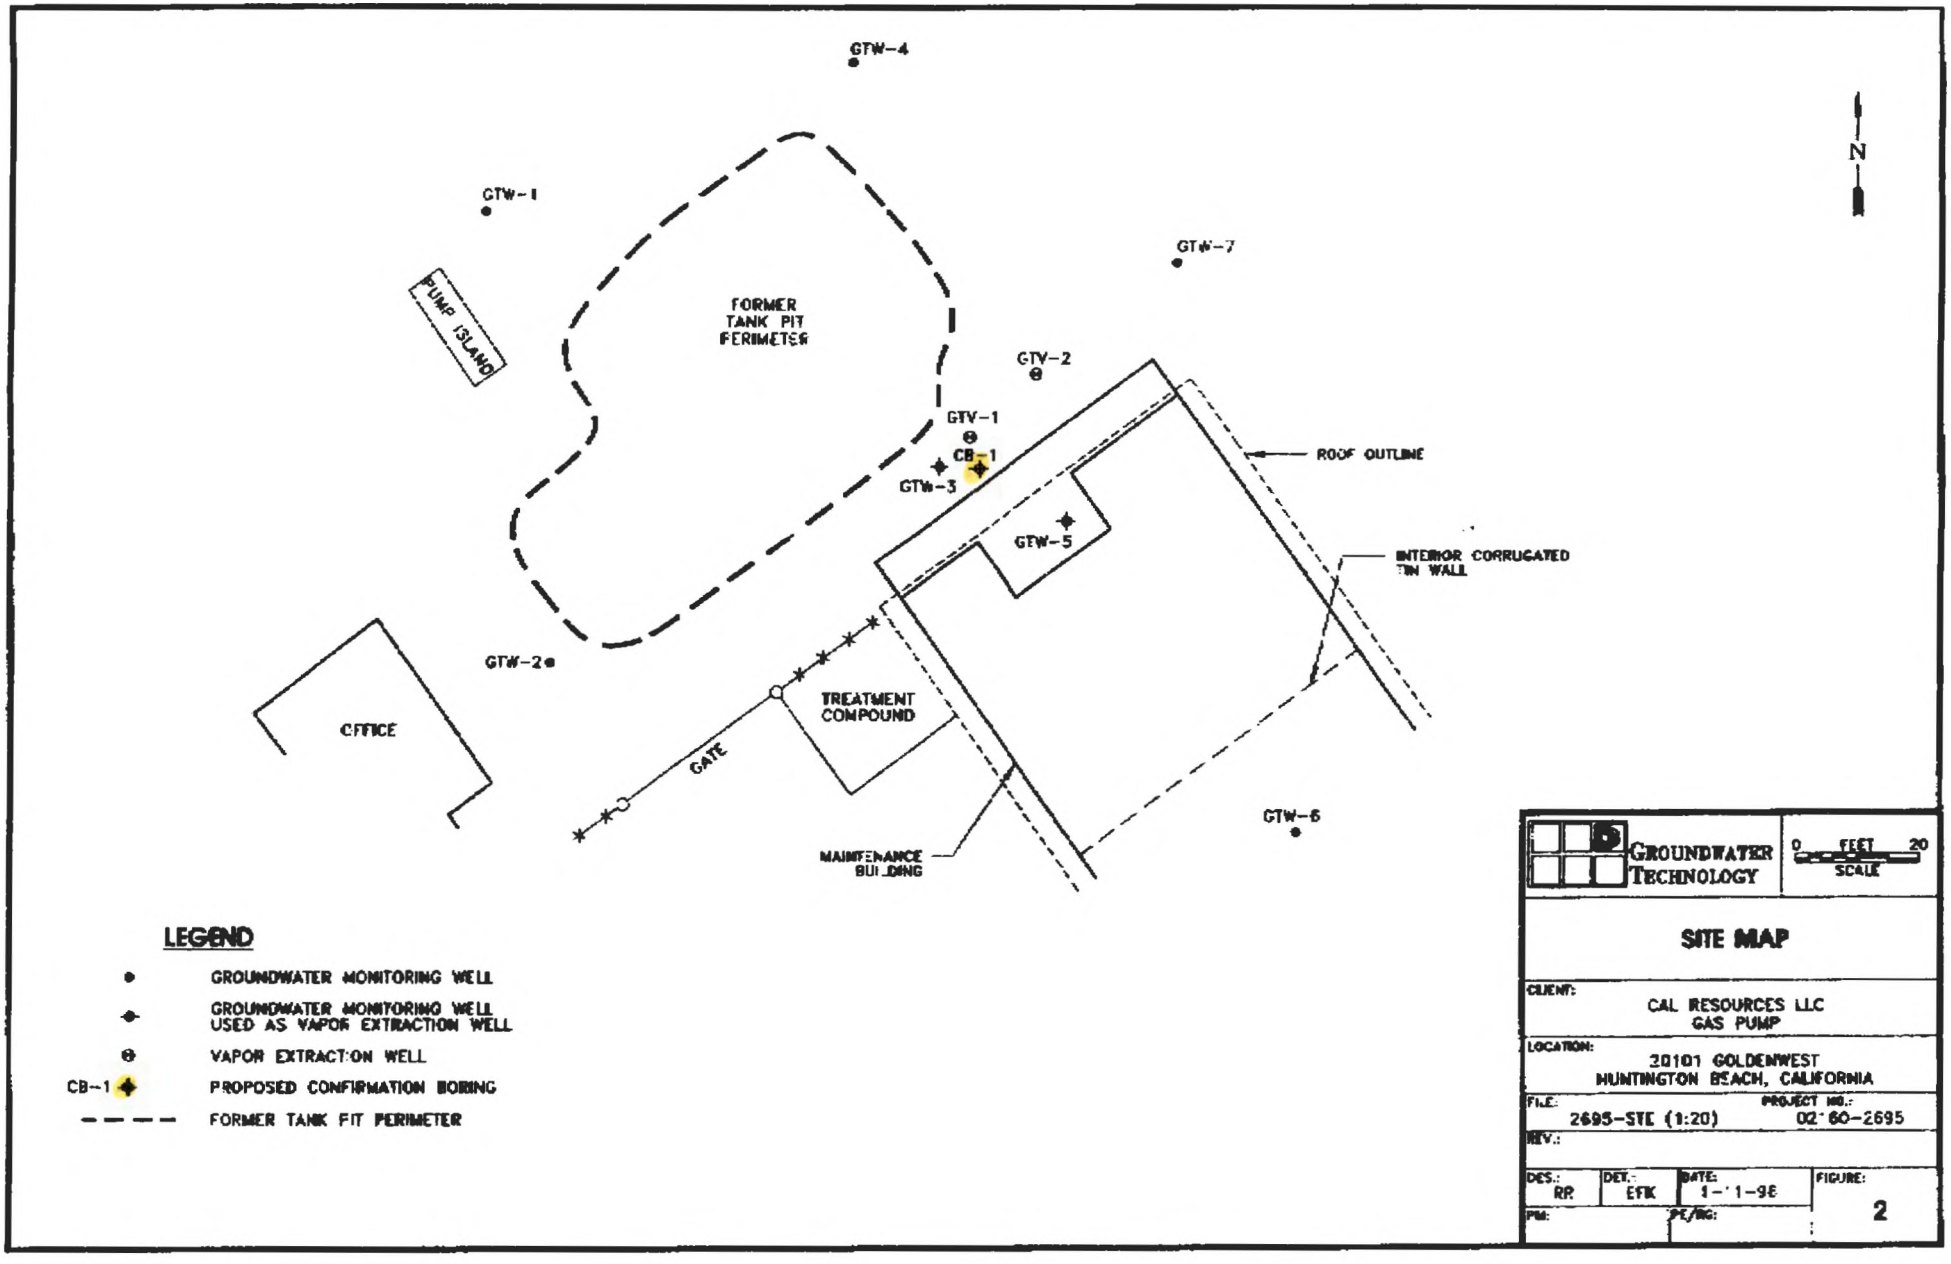
SUBJECT: PROPOSED CLOSURE VERIFICATION PLAN
OCHA CASE NO. 88UT110, 20101 GOLDEN WEST STREET
HUNTINGTON BEACH, ORANGE COUNTY, CALIFORNIA

Following our telephone conversation of January 10, 1996 in which we discussed the necessity of a verification boring prior to closure, I propose the location of a boring placed as shown in the attached site plan approximately 15 feet from groundwater monitoring/vapor extraction well No. GTW-5. This will place the boring as close as possible to the location of the highest historical dissolved phase hydrocarbons without penetrating the floor of our building and in direct line towards the UST excavation.

Soil samples will be taken by standard protocols previously described in our reports every 5 ft. down into the capillary fringe. Samples will be analyzed for BTXE and total petroleum hydrocarbons as gasoline (EPA 8015/8020) if they display elevated field OVA readings. A sample from the capillary fringe will be analyzed regardless of OVA readings.

Please call me at (805) 326-5129 to notify me if you agree with this plan.

Sincerely,



S. Sen
Staff Environmental Engineer
Health, Safety & Environment - Environmental

Subject: Groundwater Sampling For Closure
Wells GTW-2, GTW-3, GTW-5, and GTW-6
CalResources LLC
20101 Goldenwest Street
Huntington Beach, CA
OCHCA Case #88UT110

Dear Mr. Peuron:

This letter summarizes additional groundwater sampling for closure performed at the subject site (figures 1 and 2). Groundwater sampling was performed per the Orange County Health Care Agency (OCHCA) closure requirements stated in a letter dated October 29, 1996. This letter requested that wells GTW-2, GTW-3, GTW-5 and GTW-6 (figure 2) associated with the gas pump area be sampled prior to consideration for site closure.

Groundwater Well Gauging, Purging and Sampling

On November 20, 1996, Fluor Daniel GTI personnel gauged monitoring wells GTW-1 through GTW-7. An interface probe was used to measure depth to water. Liquid-phase hydrocarbons were not detected in any of the wells. A copy of the gauging data is attached. The groundwater gradient was not calculated.

On November 20 and December 3, 1996, Fluor Daniel GTI personnel purged and sampled wells GTW-2, GTW-3, GTW-5 and GTW-6 in the gas pump area. Wells GTW-2 and GTW-6 (purged and sampled on November 20) were purged using an industrial vacuum truck and dedicated polyvinyl chloride (PVC) stingers. About 45 gallons of water were purged from each well. Wells GTW-3 and GTW-5 (purged and sampled on December 3) were purged using a low flow down hole pump decontaminated between purging. About 40 gallons were purged from each well, placed in 55-gallon containers and left on-site for disposal. Purging was performed until pH, conductivity, and temperature parameters stabilized. Well purging records are attached. All purged groundwater was disposed on-site through the CalResources on-site water treatment system.

Groundwater Sampling and Analytical Results

Following well purging, samples were collected using disposable Teflon bailers. The samples were immediately placed on ice in a cooler and transported to state-certified BCA Analytical Laboratories, Anaheim, California, following proper chain-of-custody procedures. All samples were analyzed for total petroleum hydrocarbons as gasoline (TPH-g) following proper EPA Method 8015 (modified); and for benzene, toluene, ethylbenzene, total xylenes (BTEX), and methyl tert-butyl ether (MTBE) following EPA Method 8020. In addition, a duplicate sample for well GTW-3 and a trip blank sample were collected.

TPH-g was not detected at or above the method reporting limit (100 micrograms per liter [μg/L] for TPH-g and 0.3 μg/L for benzene) in wells GTW-2, GTW-3, and GTW-6. TPH-g was detected in GTW-5 with a concentration of 180 μg/L. Benzene was not detected at or above the method reporting limit (0.3 μg/L) in all the wells sampled. In addition, MTBE was not detected at or above the method reporting limit (30 μg/L) in all the wells sampled. The laboratory reports and chain-of-custody documents are attached. Table 1 summarizes the laboratory results.

Based on the analytical results for dissolved-phase TPH-g, benzene and MTBE concentrations (all results below detection limits except for TPH-g concentrations of 180 μg/L in sample GTW-5) Fluor Daniel GTI on behalf of CalResources LLC requests that the OCHCA close this site.

If you have any questions, please contact Bob Ruscitto at (310) 371-1394, extension 312.

Sincerely,
Fluor Daniel GTI

Date	Staff	Activities/Comments
10-29-96	P.P.	Spoke w/ Carl Bernhardt. Decided that they could better make the decision regarding closure if we sent over the closure rationale. Called Bob Resitio. Discussed situation. Noted MTBE issue. Called Carl Back - need MTBE analyzed for. Called Bob. Told him we need MTBE in 4 wells GTW 2, 3, 5 & 6. Drafted letter asking for another round of water sampling. Faxed letter
12-26-96	P.P.	Review of 12-24-96 "Groundwater Sampling for Closure" report. Benzene or MTBE found in wells GTW-2, GTW-3, GTW-5 & GTW-6. Trace T, E & X in GTW-5 w/ 180 PPB TPH. Detection limit for MTBE was 30 PPB. File review shows closure rationale is not yet

ACTIVITIES REPORT

Company Name: SWEPI (CAL RESOURCES)

Address: 20101 GOLDEN WEST STREET

City: HUNTINGTON BEACH State: CA Zip:

Contact Person(s): SUB SEA Phone: (805) 326-5129

Date	Staff	Activities/Comments
6-25-96	P.P.	Review for closure. Work on closure summary, submitted to Sub Sea
7-3-96	P.P.	Received note from K. Hodel. She asked if MTBE analysis was done (it wasn't - last sampling round was in September). Also, she asked why we are not requiring a confirmation boring. Low risk designation of the area (seaward of the Newport-Inglewood Fault) is basis for these issues. My interpretation is, if we only require free product removal at low risk ~~sites~~ sites, soil cleanup and dissolved phase MTBE would not be issues (note that other considerations, i.e. vapor risk & ecological issues are not at issue.
7-5-96	P.P.	Work on closure summary. Discussed site issues w/ C. Bernhardt. He needs a copy of the closure report called Sub Sea. Left message requesting he send Carl a copy.

8-29-95	P.P.	surprisingly steady and significant rate of reduction in benzene levels. Table 3 also shows this for TPH. Table 5 shows D.O levels from the wells. Highest D.O. was only 0.74 mg/L.
12-19-95	P.P.	Review of 10-31-95 Quarterly Report & cover letter. Cover letter request closure based on having reached the "practical limits of technology". The only benzene hit was 0.35 PPB detected in well GTW-5 for this last sampling round.
12-20-95	P.P.	Further review appears that groundwater is somewhat deep (as was last round). Checked previous reports which seem to indicate that current depth to groundwater is lower than usual (by a foot or two). May be a factor to consider. Appears that we need a bit confirmation sampling. Current boring should be O.K. (given low water results). Called Jim Lee. He will be back in January.

2-22-95	P.P.	Ne quarter 4,702 pounds ~~of~~ of gasoline was removed. Flow rate was 510 to 540 SCFM, Well GTW-5 had 62 PPB benzene. Other wells had N.D.
5-18-95	P.P.	Review of 4-14-95 Quarterly Report. Vapor recovery rate most recently was about 4 lbs per day. High flow rate - over 500 SCFM. Water contaminant level in the only well showing an impact is down to 62 PPB benzene (lowest level yet) and 3,100 PPB TPH. Appears that site is nearing the point where closure is possible. System was not running at time report was generated.
8-29-95	P.P.	Review of 7-28-95 monitoring & quarterly report + 8-8-95 cover letter. Only well GTW-5 was impacted, with 490 PPB TPH and 44 PPB benzene - trace T, E & E. Table 4 shows

11-7-91	P.P.	firstly using a containment approach (which will include some amount of well pump-out) since it appears that much water would only be drawn through contaminated zones if pump & treat were to be done. Review of R.A.P.: (10-15-91) R.A.P. proposes in-situ venting, but the A.Q.M.D. permit is for above ground treatment of spoils piles. Called John Hundley to ask about this. Z. Mc. spoke w/ J. Hundley. John said that the permit applies to both above-ground and in-situ vapor extraction. He pointed out that the permit applies to "vapor ~~wells~~ extraction wells" (See "1." under "Equipment Description" and therefore (he said) it applies generically to all vapor extraction wells (whether above ground or not). Drafted approval

8-14-91	P.P.	and continued monitoring of groundwater. Note that last sampling of groundwater was in May and sampling before that was at the end of December (So this report has latest sampling from May) Cover letter says a Remedial Action Plan will be prepared shortly (should receive at the end of September). Analysis of groundwater recovery says that "action levels" (State) can be reached if groundwater is pumped continuously for 200 days. On page 6 it says that there is about 20,500 cubic feet of water with 2000 PPB and this can be removed by pumping continuously for 21 days. Page 5 shows calculation method used.
9-26-91	P.P.	Awaiting remedial action workplan from SWEPI (September). Review of file for meeting. Report of 7-12-91 says no "free phase liquid" in any well. Note 2 complicating factors in calculation of amount of water that must be pumped (Pg 5 claims 153,000 gallons) (1) a certain fraction of the water is not drainable and will stay to mix with inflowing clean water (as described on pg. 5) (2) existence of NAPL would create a similar residual effect. They estimate

FROM: County of Orange Health Care Agency/Environmental Health Underground Storage Tank Cleanup Program

SUBJECT: Reimbursement For Costs Incurred In Administering The Underground Storage Tank Cleanup Program

The purpose of this letter is to inform responsible parties that the Orange County Health Care Agency has entered into an agreement with the State of California to oversee the cleanup of contaminated sites resulting from the unauthorized release of hazardous substances from underground storage tanks. The cleanup of these sites is necessary to protect the public and environment from unnecessary exposure to hazardous chemicals.

The cleanup program developed by Orange County is funded by State and Federal monies and is subject to the reimbursement requirements associated with the use of these funds. In order to comply with the reimbursement requirement, terials expended by County te specific amounts detail- ll be provided to the party for all direct he site.

ce of Reimbursement. sement requirements for ontained in the Notice uestions regarding the rground Storage Tank

Re: Underground Storage Tank (UST) Case

Cal Resources
20101 Goldenwest Street
Huntington Beach, CA
O.C.H.C.A. Case #88UT110

Dear Mr. Sen:

This letter confirms the completion of site investigation and remedial action for the underground storage tanks formerly located at the above-described location. Enclosed is the Case Closure Summary regarding the above-referenced site for your records.

Based upon the available information, including the current land use, and with the provision that the information provided to this Agency was accurate and representative of site conditions, no further action related to the underground storage tank release is required.

This notice is issued pursuant to a regulation contained in Title 23, California Code of Regulations, Division 3, Chapter 16, Section 2721(e).

Please telephone Peter Peuron at (714) 667-3719 if you have any questions regarding this matter.

Sincerely,

Karen L. Hodel

Case Closure Summary
Leaking Underground Fuel Storage Tank Program

Case#: **88UT110**
Date: **January 3, 1997**

III. Release and Site Characterization Information (Continued)

Maximum Documented Contaminant Concentrations - - Before and After Cleanup

Contaminant	Soil (ppm)		Water (ppm)		Contaminant	Soil (ppm)		Water (ppm)	
	Before	After	Before	After		Before	After	Before	After
TPH (gas)	**20,700**	**3,700**	**53**	**0.180**	MTBE			**NA**	**ND**
Benzene	**22.5**	**11**	**3.8**	**ND**					
Toluene	**90.6**	**240**	**13**	**0.0022**					
Xylene	**399**	**970**	**29**	**0.0038**					
Ethylbenzene	**177**	**180**	**4.7**	**0.00094**					

Comments (Depth of Remediation, etc.): **Soon after tanks were removed, extensive excavation of soil was performed. Soil was removed to a depth of about 35 feet below ground surface, where groundwater was encountered. A total of 956 tons of contaminated soil was disposed at Casmalia Resources. The "after" soil contamination levels shown above are concentrations left in place after soil excavation was performed. Due to the proximity of contaminated soil to the water table, a groundwater investigation was required and wells were installed. Significant groundwater contamination levels were found. Remaining soil and groundwater contamination was addressed using vapor extraction. The vapor extraction system operated from May of 1993 to September of 1995. During this time about 22,300 pounds of Total Petroleum Hydrocarbons were removed. Post-remedial monitoring demonstrated a steady decline in groundwater contaminant concentrations. All groundwater contaminant concentrations are below the MCLs. Also, the site is located seaward of the Newport-Inglewood Fault Zone. Therefore (since the site has been adequately characterized and no free product is present) the site can be classified as "low risk". Remaining contamination at this site presents no threat to drinking water, human health or the environment.**

IV. Closure

Does completed corrective action protect *existing* beneficial uses per the Regional Board Basin Plan? **yes**		
Does completed corrective action protect *potential* beneficial uses per the Regional Board Basin Plan? **yes**		
Does corrective action protect public health for current land use? **yes**		
Site management requirements: **none**		
Should corrective action be reviewed if land use changes? **no**		
Monitoring wells decommissioned: **no**	Number decommissioned:	Number Retained: **7**
List enforcement actions taken: **none**		
List enforcement actions rescinded: **NA**

Subject: Closure Requirements

Re: Cal Resources LLC
20101 Goldenwest Street
Huntington Beach, CA
OCHCA Case # 88UT110

Dear Mr. Sen:

The most recent groundwater data available for the subject site suggest that vapor extraction has succesfully mitigated the source of gasoline contamination in groundwater. The data tends to strongly support your request for closure. However, it is important to note that this data was obtained prior to concerns being raised on a statewide and nationwide basis about the presence of methyl tertiary butyl ether (MTBE) in gasoline contaminants. This Agency currently requires that all gasoline contaminant plumes be investigated for the presence of MTBE. Therefore, it is necessary to perform an additional round of groundwater sampling which includes analysis for this compound. Please observe the following requirements:

1. Wells GTW-2, GTW-3, GTW-5 and GTW-6 should be sampled and analyzed for MTBE, for aromatics (by EPA 8020) and for Total Petroleum Hydrocarbons (by the DTSC approved method for gasoline).

2. Please conduct water sampling within 30 days of receipt of this letter. Upon receipt of analytical results this Agency will again review the site for closure.

If you have any questions, please call me at (714) 667-3719.

Very truly yours,

Peter Peuron

Dear Mr. Peuron:

SUBJECT: QUARTERLY MONITORING REPORT & SITE CLOSURE REQUEST
OCHA CASE NO. 88UT110, 20101 GOLDEN WEST STREET
HUNTINGTON BEACH, ORANGE COUNTY, CA

Please find attached the 1995 Third Quarter Groundwater Monitoring Report for the former underground tank site at CalResources LLC's Huntington Beach oilfield facility (OCHA Case No. 88UT110) prepared by Groundwater Technology Inc.

Remedial actions have been carried out to the practical limits of technology. The dissolved hydrocarbon plume has been contained and is stabilized, apparently by ongoing biological degradation as indicated by depressed dissolved oxygen readings. All dissolved aromatics are below MCL's for drinking water; in addition, groundwater at the site is clearly marine intruded and not potential drinking water. The influent vapor stream from the vapor extraction system contains no detectable non-methane hydrocarbons. We therefore, request closure of this site and cessation of remedial actions.

If you have any questions regarding this site, please contact me at (805) 326-5129.

Sincerely,

S. Sen

Dear Mr. Peuron:

SUBJECT: QUARTERLY MONITORING REPORT
OCHA CASE NUMBER 88UT110
CalResources LLC
20101 GOLDENWEST STREET
HUNTINGTON BEACH, ORANGE COUNTY

Please find attached the 1995 Second Quarter Groundwater Monitoring report for the former underground tank site at CalResources LLC's Huntington Beach oilfield facility (OCHA Case Number 88UT110), prepared by Groundwater Technology Inc. Remedial operations commenced on December 2, 1991. Groundwater plume hydrocarbon concentrations have been reduced by 99%. Containment and source removal strategies for the groundwater appear to be working. While vapor extraction was suspended in this reporting quarter due to equipment problems, operations have now resumed.

If you have any questions, please contact me at (805) 326-5129.

Sincerely,

S. Sen

Dear Mr. Peuron:

SUBJECT: QUARTERLY MONITORING REPORT
OCHA CASE NUMBER 88UT110
CalResources LLC
20101 GOLDENWEST STREET
HUNTINGTON BEACH, ORANGE COUNTY

Please find attached the 1995 First Quarter Groundwater Monitoring report for the former underground tank site at CalResources LLC's Huntington Beach oilfield facility (OCHA Case Number 88UT110), prepared by Groundwater Technology Inc. Remedial operations commenced on December 2, 1991. Groundwater plume hydrocarbon concentrations have dropped substantially. Containment and source removal strategies for the groundwater appear to be working.

If you have any questions, please contact me at (805) 326-5129.

Sincerely,

S. Sen
Staff Environmental Engineer

Dear Mr. Peuron:

SUBJECT: QUARTERLY MONITORING REPORT
OCHA CASE NUMBER 88UT110
CalResources LLC
20101 GOLDENWEST STREET
HUNTINGTON BEACH, ORANGE COUNTY

Please find attached the 1994 Fourth Quarter Groundwater Monitoring report for the former underground tank site at CalResources LLC's Huntington Beach oilfield facility *(OCHA Case Number 88UT110), prepared by Groundwater Technology Inc.* Remedial operations commenced on December 2, 1991. Concurrent with soil vapor extraction, groundwater plume hydrocarbon concentrations continue to drop. Containment and source removal strategies for the groundwater appear to be working.

Please note that as of January 1, 1995, Shell Oil Company's California Exploration and Production assets have been transferred to a new entity named CalResources LLC. CalResources will be a separate company owned by Subsidiaries of Shell Exploration and Production Company. This should have no impact on our ongoing remediations at Huntington Beach.

If you have any questions, please contact Mr. Sub Sen of our staff at (805) 326-5129.

Sincerely,

S. Sen

Subject: **Quarterly Reporting Requirements for Unauthorized Release from an Underground Storage Tank**

Re: Shell Western E & P Inc.
20101 Golden West Street
Huntington Beach, CA
O.C.H.C.A. Case #88UT110

Dear Mr. Sen:

Please be advised that this Agency, which is authorized to enforce the State Underground Storage Tank Laws and Regulations, has not received a current progress report regarding the investigation and remedial activities completed to date at the subject location.

The California Code of Regulations, Title 23, Subchapter 16, Section 2652 requires the owner or operator to submit reports to the local agency every three (3) months until the cleanup is complete. A current review of our files indicated that an update report is required which covers the following information:

1. A description of the corrective and remedial actions, including investigations which were undertaken and will be conducted to determine the nature, and extent of soil, groundwater or surface water contamination due to the release;
2. The method(s) of cleanup implemented to date, proposed cleanup actions, and a time schedule for implementing the proposed actions; and
3. The method and location of disposal of the released hazardous substance and any contaminated soils or groundwater or surface water. Copies of any completed hazardous waste manifests for off-site transport of these media shall be attached to the report.

Please submit to this office a summary update report of the investigative and remedial activities indicated above that have occurred at the referenced location since these activities were last reported. Include also the results of these activities, where results are available. This report must be submitted within thirty (30) days of the receipt of this letter.

If you have any questions, please call me at (714) 667-3719.

Very truly yours,

Peter Peuron

Dear Mr. Peuron:

SUBJECT: QUARTERLY MONITORING REPORT
OCHA CASE NUMBER 88UT110
CalResources LLC
20101 GOLDENWEST STREET
HUNTINGTON BEACH, ORANGE COUNTY

In response to your letter of December 28, 1994, please find attached the 1994 Third Quarter Groundwater Monitoring report for the former underground tank site at Shell Western E&P Inc.s Huntington Beach oilfield facility (OCHA Case Number 88UT110), prepared by Groundwater Technology Inc. I apologize for the delay in transmittal of this report. Remedial operations commenced on December 2, 1991. Concurrent with soil vapor extraction, groundwater plume hydrocarbon concentrations continue to drop. Containment and source removal strategies for the groundwater appear to be working. *However, removal of soil vapor phase hydrocarbons has not occurred* at the anticipated pace; we believe soil vapor extraction will continue until the end of 1996.

LIST OF REMEDIATION PROJECTS
WITH ORANGE COUNTY HEALTH CARE AGENCY INVOLVEMENT

PROJECT DESCRIPTION	STATUS	LEAD AGENCY
UST leak in facility strip area. very small gasoline or Stoddard solvent plume.	Vapor extraction continues. Plume contained and concentrations dropping.	OCHCA
Mesa area condensate leak along gas line. Vapor extraction and thermal oxidizer, followed by carbon adsorption.	Vapor extraction complete. Some capillary fringe hydrocarbons & low ppm dissolved HC left - no benzene. Preparing closure/verification plan.	OCHCA
Bolsa wetland oil sump abanonment projects. 4 sets of sumps - 2 closed, one deferred till gas plant abandonment next year, and one (3-ROW pit) waiting on water sampling and soil recycling plan.	Preparing soil recycling plan. Will either incorporate into asphalt roads onsite or do the same thing as the Solid Waste Facility.	OCHCA
Solid Waste Facility in Bolsa wetlands - NPDES permitted, requires removal of 750000 cubic yards of wastes contain-degraded crude oil from tank bottoms.	Authorization to recycle wastes in roads received from RWQCB-Santa Ana. OCHCA consulted for health issues. Work plan being developed.	RWQCB-Santa Ana
Gas plant hillside seep light hydrocarbons in soil and water, pilot vapor extraction and groundwater extraction complete.	OCHCA transferred lead to RWQCB; work plan for plume containment & interim soil vapor extraction pending abandonment of gas plant submitted to RWQCB & OCHCA.	RWQCB
Fort Apache drillsite in a townlot near downtown Huntington Beach has crude oil in contact with groundwater. Very small (10 ft.) plume.	Working with Chevron to determine responsibility and with RWQCB to approve remedial action plan to auger out material.	RWQCB

Re: Request for a Change in the
Monitoring and Sampling Program
OCHCA Case #88UT110
Shell Western Exploration and Production, Inc.
Huntington Beach Facility, Gas Pump Area
Huntington Beach, California

Dear Mr. Peuron:

This is a request to change the groundwater monitoring and sampling program for the Shell Western Exploration and Production, Inc. (SWEPI) Gas Pump Area site (Figure 1), as outlined in Groundwater Technology, Inc.'s "Remedial Work Plan", dated October 15, 1991. According to this work plan, groundwater samples would be collected monthly from monitoring well GTW-5, and from all groundwater monitoring wells on a quarterly basis. Groundwater monitoring wells GTW-1 through GTW-7 have been sampled quarterly, and well GTW-5 (Figure 2) has been sampled monthly since November, 1991. Groundwater Technology requests that the Orange County Health Care Agency (OCHCA) allow a change in the sampling and monitoring program from monthly to quarterly.

Based on the sampling results, Groundwater Technology believes that the dissolved-phase hydrocarbons are localized in the vicinity of well GTW-5, located inside the former maintenance building. Dissolved-phase hydrocarbon concentrations have decreased in well GTW-5, (refer to the Groundwater Technology reports entitled "Quarterly Monitoring Report", dated January 28, May 6, July 17, and October 27, 1992). Groundwater Technology believes that quarterly groundwater gauging and sampling will be sufficient to monitor groundwater quality beneath the site. Continued operation of the soil vapor treatment system is expected to further decrease dissolved hydrocarbon concentrations by continued source removal. The change in sampling frequency should not affect remediation or groundwater quality.

Subject: "Remedial Workplan" (Dated October 15, 1991) For Huntington Beach Field (SWEPI), 20101 Golden West St., Huntington Beach, CA - O.C.H.C.A Case #88UT110

Dear Mr. Sen:

Please be advised that this office has reviewed the above referenced plan. We have found the plan to be adequate to initiate remediation at the subject site, provided the following considerations are addressed:

1. Continue to monitor groundwater on a quarterly basis. If groundwater contamination levels show unacceptable increases or indicate that contamination is spreading, remediation of groundwater will be required.

2. Notify me (Peter Peuron) 48 hours in advance of verification sampling of soil (after completion of venting) so that I may be on-site to witness this sampling.

3. It will be important to maintain accurate records that reflect system effectiveness as vapor extraction proceeds. Influent and effluent monitoring data should be supplied to this Agency on a regular basis. A justification for termination of vapor extraction will be based on a demonstration that further system operation would yield negligible benefits (as well as the results of verification sampling).

4. The proposed locations for verification sampling borings will not be acceptable since these locations (which are in immediate proximity to the venting wells) do not represent worst case sampling zones. Prior to arranging an appointment for verification sampling, it will be necessary to submit to this Agency a map showing alternative verification sampling locations that are

representative of soil zones that might be most heavily contaminated after soil venting. This map should include a delineation of soil contamination levels found prior to treatment. Consult with this Agency prior to submittal of this map.

If you have any questions, please contact me at (714) 667-3719.

Very truly yours,

Peter Peuron

PERMIT TO CONSTRUCT (VARIOUS LOCATIONS WITHIN THE SCAQMD) FOR AN IC ENGINE.

INTRODUCTION

This proposed remedial work plan for the gas pump area of the Shell Western Exploration & Production, Inc., Huntington Beach Production Unit (Figure 1) has been prepared by Groundwater Technology, Inc. per our discussion with the Orange County Health Care Agency (OCHCA) regarding clean-up of the site at a meeting September 26, 1991.

BACKGROUND

Previous remedial activities at the site have included removal of underground storage tanks containing gasoline and stoddard solvent. All related hydrocarbon-containing soils were excavated to groundwater (approximately 35 feet below grade) except for an area extending beneath an existing building located southeast of the former pit.

Assessment has shown that a limited amount of hydrocarbon-containing soils remains at approximately 25 to 32 feet below grade beneath and just northwest of the existing building. Dissolved-phase hydrocarbons exist in groundwater in the vicinity of the hydrocarbon-containing soils beneath the building, and samples obtained from nearby groundwater monitoring wells show that dissolved-phase hydrocarbons have not migrated substantially from the source area. Groundwater extraction from the monitoring wells during a recent pump test and during sampling has substantially lowered hydrocarbon concentrations in wells where hydrocarbons were previously detected. Figure 2 shows groundwater monitoring wells and vapor extraction well locations.

It is our understanding that installation of a groundwater treatment system may become necessary if the dissolved-phase hydrocarbons appear to be spreading. It is further understood that containment of the hydrocarbons must be achieved by the proposed remedial strategy.

PROPOSED WORK PLAN

Remediation will focus on source removal of the hydrocarbons, containment of the dissolved-phase, and groundwater monitoring to determine the effectiveness of the soil venting.

Remediation will consist of extracting the adsorbed-and vapor-phase hydrocarbons from the soils through two wells, vapor monitoring well GTV-2, and groundwater monitor well GTW-5. Remediation through soil venting will eliminate hydrocarbons within the soil and help volatilize and remove dissolved-phase hydrocarbons in the groundwater. The vapor extraction test conducted December 7, 1989, showed an approximate radius of influence of 18 feet. (Phase I, "Site Assessment Report, Gasoline and Stoddard Solvent Tank Excavation, Huntington Beach Production Unit, Shell Western Exploration and Production, Inc., Huntington Beach California", dated June 22, 1990). This radius of influence is expected to increase due to backfilling the tank excavation, and is expected to cover the entire zone of hydrocarbons remaining in the soil.

A soil vapor treatment system using an internal combustion (IC) engine will be operated for approximately two weeks to lower hydrocarbon concentrations to levels where carbon adsorption becomes feasible. The IC engine has a South Coast Air Quality Management District (SCAQMD) permit to construct, for various locations within the SCAQMD. Attached is the permit to construct for IC engine. The system will be operated according to the requirements listed in that permit. Daily system monitoring of the IC engine will be performed, with weekly influent and effluent sampling. The carbon absorption system will be permitted separately through SCAQMD for use at the site. The carbon system will be monitored daily for the first two weeks and on a weekly basis thereafter. The influent and effluent will be sampled weekly for the first two weeks, bi-weekly for two months and monthly thereafter.

Concurrent with soil vapor extraction, groundwater will be monitored to verify the containment and reduction of dissolved-phase hydrocarbons. Monitor well GTW-5 will be gauged, purged and sampled monthly. Quarterly gauging and sampling will be performed on all on-site monitoring wells (GTI-1 through GTW-7). A quarterly report summarizing all remedial and monitoring activities at the site will be submitted to OCHCA.

All actions taken to achieve source elimination will be performed under the direction and with the approval of the controlling agencies. These agencies are the OCHCA, SCAQMD, and the California Regional Water Quality Control Board (RWQCB). Groundwater Technology will notify OCHCA in advance of scheduled on-site work.

CURRENT SITE STATUS

Installation of the wells for vapor extraction has been completed. Installation of the vapor treatment system, including installation of the vapor extraction and treatment system will begin upon approval of this plan from OCHCA. The IC engine can be put at this site almost immediately, as it is already permitted and only requires simple notification of SCAQMD prior to use. Also, it can be attached directly to a well for vapor extraction (e.g., GTW-5) without installation of ancillary piping. While the IC engine is being used for initial vapor treatment, a Permit-to-Construct application for carbon adsorption will be prepared and submitted to the SCAQMD. Upon approval of the system by the SCAQMD, the Permit-to-Construct will become a Permit-to-Operate. Upon completion of permitting, approximately one month is expected to complete delivery, installation and start-up of the carbon adsorption treatment system. Soil treatment via carbon adsorption is expected to take 8 to 12 months.

MONITORING PROGRAM

Periodic sampling of the air stream will be performed. Air samples will be laboratory analyzed for total non methane petroleum hydrocarbons (TNMH), methane, and benzene, toluene, ethylbenzene, and xylenes (BTEX) following SCAQMD Method 25.2 and EPA Method 8020. All monitoring and maintenance performed on the system will be recorded in a log book available for review at any time by any of the controlling agencies. Monthly gauging and purging will be performed on well GTW-5. All seven groundwater monitoring wells (GTW-1 through GTW-7) will be gauged, purged and sampled on a quarterly basis. Groundwater samples will be laboratory analyzed for total petroleum hydrocarbons as gasoline (TPH), BTEX and Total Lead following EPA Methods 8015, 8020 and 7421, respectively. One sample from GTW-5 will also be analyzed for TPH as stoddard solvent following EPA Method 8015 during quarterly sampling. Quarterly reports will be submitted to OCHCA during operation of the vapor extraction and treatment system.

VERIFICATION FOR CLOSURE

During operation of the vapor extraction and treatment system, volatile organic compounds (VOC) in the airstream will be recorded and graphed until such time as the slope of a graphed curve, which depicts hydrocarbon concentrations versus time levels off, indicating soil venting is no longer necessary. Data will then be evaluated to determine if hydrocarbon concentrations in the soils have declined enough to seek closure. If not, further remedial strategy will be planned.

If data evaluation suggests that site closure is possible, verification borings will be planned to confirm that soil hydrocarbon concentrations are below agency action levels. Figure 3 is a site plan showing proposed verification boring locations. Soil samples will be taken at 5-foot depth intervals within the zone where hydrocarbons had initially been

detected. The soil samples will be analyzed for TPH, BTEX and total lead following EPA Methods 8015, 8020 and 7420, respectively. Based on the results of laboratory analysis, a request for closure will be submitted to the OCHCA.

In light of the amount and concentrations of hydrocarbons in the subsurface, Groundwater Technology believes that this remediation can be performed and closure obtained in a relatively short period of time. We request the assistance of OCHCA to expedite the permitting and installation of the treatment system. Our desire is to begin remediation as soon as possible.

PERMIT TO CONSTRUCT/OPERATE

9150 FLAIR DRIVE, EL MONTE, CALIFORNIA 91731

This initial permit must be renewed by 01/01 ANNUALLY unless the equipment is moved, or changes ownership. If the billing for annual renewal fee (Rule 301.f) is not received by the expiration date, contact the District.

Legal Owner Or Operator: ID 87140

GROUNDWATER TECHNOLOGY, INC.
20,000/200 MARINER AVENUE
TORRANCE, CA 90503-1670
ATTN: FRED CLARK

Equipment located at: VARIOUS LOCATIONS IN SCAQMD

Equipment Description:

SOIL VAPOR EXTRACTION AND TREATMENT SYSTEM CONSISTING OF:

1. VAPOR EXTRACTION WELLS

2. HORIZONTAL VAPOR COLLECTION WELLS, EMBEDDED IN CONTAMINATED SOIL PILES, EACH WITH A MAXIMUM OF 450 CUBIC YARDS, WITH TOTAL ABOVE GROUND SOIL TREATMENT NOT TO EXCEED 2,000 CUBIC YARDS.

3. VACUUM EXTRACTION, FLEXIBLE HOSE WITH AIR FILTER, INDUCED SUCTION BY ENGINE INTAKE.

4. INTERNAL COMBUSTION ENGINE, FORD, MODEL NO. LSG-875, SERIAL NO. 37, 8 CYLINDERS, 150 BHP. COMBINED WITH A CAR SOUND 3 WAY - 2 WAY CATALYST AND A COMPUTERIZED OXYGEN AIR TO FUEL SENSING AND CONTROL UNIT.

Conditions:

1. OPERATION OF THIS EQUIPMENT SHALL BE CONDUCTED IN COMPLIANCE WITH ALL DATA AND SPECIFICATIONS SUBMITTED WITH THE APPLICATION UNDER WHICH THIS PERMIT IS ISSUED UNLESS OTHERWISE NOTED BELOW.

2. THIS EQUIPMENT SHALL BE PROPERLY MAINTAINED AND KEPT IN GOOD OPERATING CONDITION AT ALL TIMES.

3. THE DIRECTOR OF ENFORCEMENT SHALL BE NOTIFIED IN WRITING OF THE FOLLOWING INFORMATION FIVE DAYS PRIOR TO PLACING THE EQUIPMENT IN THE DISTRICT.

ORIGINAL

CONTINUATION OF PERMIT TO CONSTRUCT/OPERATE

A. THE LOCATION WHERE THE EQUIPMENT WILL BE OPERATED.
B. THE ESTIMATED CALENDAR TIME THE EQUIPMENT WILL BE OPERATED AT THE LOCATION.
C. ALL OPERATING RECORDS REQUIRED UNDER CONDITIONS NO. 1, 2, 3, 4, 5, 6, 7, 9, 10, 11, 12, 13, 14, 15, 16, 17 AND 18 AT THE PREVIOUS LOCATION.

4. AN IDENTIFICATION TAG OR NAME PLATE SHALL BE DISPLAYED ON THE EQUIPMENT TO SHOW, MODEL NO., SERIAL NO. AND MANUFACTURER. THE TAG OR PLATES SHALL BE ISSUED BY THE MANUFACTURER AND SHALL BE ADHERED TO THE EQUIPMENT IN A PERMANENT AND CONSPICUOUS POSITION.

5. THIS EQUIPMENT SHALL NOT BE OPERATED WITHIN 1000 FEET OF THE OUTER BOUNDARY LINE OF ANY SCHOOL (KINDERGARTEN THROUGH HIGH SCHOOL).

6. THIS EQUIPMENT SHALL ONLY BE USED TO EXTRACT AND TREAT THE VAPORS FROM NON CHLORINATED HYDROCARBON VAPORS.

7. THE OXYGEN CONTENT BETWEEN THE EXHAUST OF THE I.C. ENGINE AND THE INLET OF THE CATALYST SHALL BE MAINTAINED AT 0.5 - 0.6% BY VOLUME WHENEVER THE ENGINE IS IN OPERATION.

8. THE OXYGEN CONTENT AT THE OUTLET OF THE CATALYST SHALL BE MAINTAINED AT 0.3 - 0.4% BY VOLUME WHENEVER THE ENGINE IS IN OPERATION.

9. THE OXYGEN SENSOR AND RECORDER SHALL BE CALIBRATED AND MAINTAINED TO MONITOR THE OXYGEN CONTENT UNDER CONDITIONS NO. 7 AND 8.

10. THE OXYGEN CONTENT STATED UNDER CONDITION NO. 7 SHALL BE MAINTAINED BY AN AUTOMATIC AIR TO FUEL RATIO REGULATING INSTRUMENTATION SYSTEM.

11. VAPORS SHALL NOT BE EXTRACTED FROM THE WELL UNLESS THEY ARE VENTED TO THE I.C. ENGINE AND CATALYST SYSTEM WHICH ARE IN FULL OPERATION AND HAS BEEN ISSUED A PERMIT BY THE EXECUTIVE OFFICER.

12. AN ORGANIC VAPOR ANALYZER (OVA) OR OTHER APPROVED MONITOR SHALL BE USED TO MEASURE THE TOTAL HYDROCARBON CONCENTRATION IN THE OUTLET FROM THE CATALYST OF THE I.C. ENGINE. MEASUREMENTS SHALL BE TAKEN ONCE EVERY OPERATING WEEK.

CONTINUATION OF PERMIT TO CONSTRUCT/OPERATE

13. AIR CONTAMINANT EMISSIONS AT THE EXIT OF THE I.C. ENGINE CATALYST SHALL NOT EXCEED THE FOLLOWING LIMITS BEFORE ANY DILUTION:

    A. NON-METHANE HYDROCARBON EMISSIONS 50 PPM BY VOLUME AS HEXANE.
    B. NOX, 80 PPM BY VOLUME.
    C. CO, 300 PPM BY VOLUME.

14. A TIMER SHALL BE INSTALLED TO INDICATE THE TOTAL OPERATING HOURS OF THE EQUIPMENT.

15. THE CATALYST SHALL BE REPLACED AFTER A BREAKTHROUGH CONDITION HAS BEEN DETERMINED BY THE MEASUREMENTS MADE UNDER CONDITION NO. 13 OR AFTER 4,000 HOURS OF OPERATION, WHICH EVER OCCURS FIRST.

16. THE AMOUNT OF BENZENE IN THE I.C. ENGINE CATALYST EXHAUST STREAM SHALL NOT EXCEED 0.3 PART PER MILLION, BY VOLUME (PPMV) AS DETERMINED BY METHOD 410A OF CALIFORNIA AIR RESOURCES BOARD.

17. A FLOW RECORDER SHALL BE INSTALLED AND MAINTAINED AT THE INLET OF THE I.C. ENGINE TO RECORD THE TOTAL FLOW RATE IN CUBIC FEET PER MINUTE (CFM).

18. THE FLOW RATE MEASURED UNDER CONDITION NO. 16 SHALL NOT EXCEED 250 CFM.

19. SAMPLING PORTS SHALL BE PROVIDED AT THE LOCATIONS LISTED BELOW:

    1. THE INLET COLLECTED VAPORS DIRECTED TO THE ENGINE.
    2. THE EXHAUST DIRECTLY FROM THE ENGINE.
    3. THE STACK EXHAUST FOLLOWING THE CATALYST.

20. SAMPLING PORTS SHALL BE PROVIDED AT THE LOCATIONS LISTED BELOW:

    1. THE INLET COLLECTED VAPORS DIRECTED TO THE I.C. ENGINE.
    2. THE STACK EXHAUST FOLLOWING THE CATALYST.

21. THE STOCKPILED CONTAMINATED SOIL SHALL BE COMPLETELY COVERED WITH, VISQUEEN PLASTIC SHEETING PROPERLY SECURED IN PLACE OR OTHER APPROVED COVER DURING TREATMENT. AN EQUIVALENT CONTROL METHOD MAY BE USED UPON PRIOR WRITTEN APPROVAL BY THE EXECUTIVE OFFICER.

22. THIS PERMIT ALLOWS FOR THE STOCKPILING OF CONTAMINATED SOIL FOR MORE THAN 40 DAYS.

CONTINUATION OF PERMIT TO CONSTRUCT/OPERATE

NOTICE

IN ACCORDANCE WITH RULE 206, THIS PERMIT TO OPERATE OR COPY MUST BE POSTED ON OR WITHIN 8 METERS OF THE EQUIPMENT.

THIS PERMIT DOES NOT AUTHORIZE THE EMISSION OF AIR CONTAMINANTS IN EXCESS OF THOSE ALLOWED BY DIVISION 26 OF THE HEALTH AND SAFETY CODE OF THE STATE OF CALIFORNIA OR THE RULES OF THE AIR QUALITY MANAGEMENT DISTRICT. THIS PERMIT CANNOT BE CONSIDERED AS PERMISSION TO VIOLATE EXISTING LAWS, ORDINANCES, REGULATIONS OR STATUTES OF OTHER GOVERNMENT AGENCIES.

Dear Mr. Peuron:

SUBJECT: QUARTERLY REPORT AND REMEDIAL WORK PLAN
OCHA CASE #88UT110
SHELL WESTERN E&P INC.
20101 GOLDENWEST STREET
HUNTINGTON BEACH, ORANGE COUNTY

Please find attached the 1991 Third Quarter groundwater monitoring report for the former underground tank site at Shell Western E&P Inc. (SWEPI) Huntington Beach facility (OCHA Case #88UT110), prepared by Groundwater Technology Inc. As follow up to our September 26, 1991 meeting at which we discussed SWEPI's proposed Remedial Work Plan (RWP), please also find attached a RWP report for your review and approval.

In general, SWEPI proposes to remove the remaining volatile hydrocarbons at the site to practically achievable levels through vapor extraction using first an IC engine, followed by a carbon adsorption system. SWEPI's strategy for the groundwater problem is source removal, containment and monitoring through periodic purging and sampling of key wells.

We thank you for your most efficient handling of our project. If you have any questions, please contact Sub Sen of our staff at (805) 326-5129.

Sincerely,

J. A. Ruhl
Manager Health, Safety & Environment
West Coast Production Division

PROPOSED REMEDIAL OPTION

Remediation through soil venting eliminate hydrocarbons within soil and help volatilize and remove dissolved phase hydrocarbons in the groundwater.

- IC engine to be operated for two weeks and change over to Carbon adsorption.
- Extraction from GTW-5 and GTV-2.
- Estimated duration for carbon adsorption treatment: 8 to 12 months not including time for permitting, shakedown, maintenance or potential down time.

MONITORING SCHEDULE:

IC engine operation:

- daily system monitoring.
- weekly influent and effluent sampling.

Carbon adsorption:

- - daily system monitoring for first two weeks.
  - weekly basis thereafter.
- - weekly system sampling for first two weeks (or proper operation is assured).
  - bi-weekly for two months.
  - monthly thereafter.
- - monthly system monitoring reporting (includes evaluation of system performance).

Note: Treatment system will be operated and monitored according to the satisfaction of SCAQMD.

To verify reduction of dissolved-phase hydrocarbons, groundwater will be monitored during the remediation of soils.

- monthly gauging, purging and sampling from GTW-5.
- quarterly gauging and sampling from all monitoring wells (GTI-1 through GTI-7).
- quarterly groundwater monitoring reporting.

Implementation schedule

- Installation of vapor wells completed.
- Two weeks remediation using an IC engine to begin upon final decision.
- Installation of treatment system will begin after a final decision on remediation type and acceptance of design plan.
- SCAQMD permit to construct for carbon adsorption, applied immediately after final decision.
- Start up and trouble shooting to begin upon approval by SCAQMD.

When VOC influent levels drop to where soil treatment is no longer necessary, venting operations will be discontinued and confirmation borings will be drilled.
Groundwater samples will be collected from all on-site wells.
Based on these results a closure report will be submitted to OCHA.

HUNTINGTON BEACH PRODUCTION UNIT

SHELL WESTERN EXPLORATION AND PRODUCTION, INC.

HUNTINGTON BEACH, CALIFORNIA

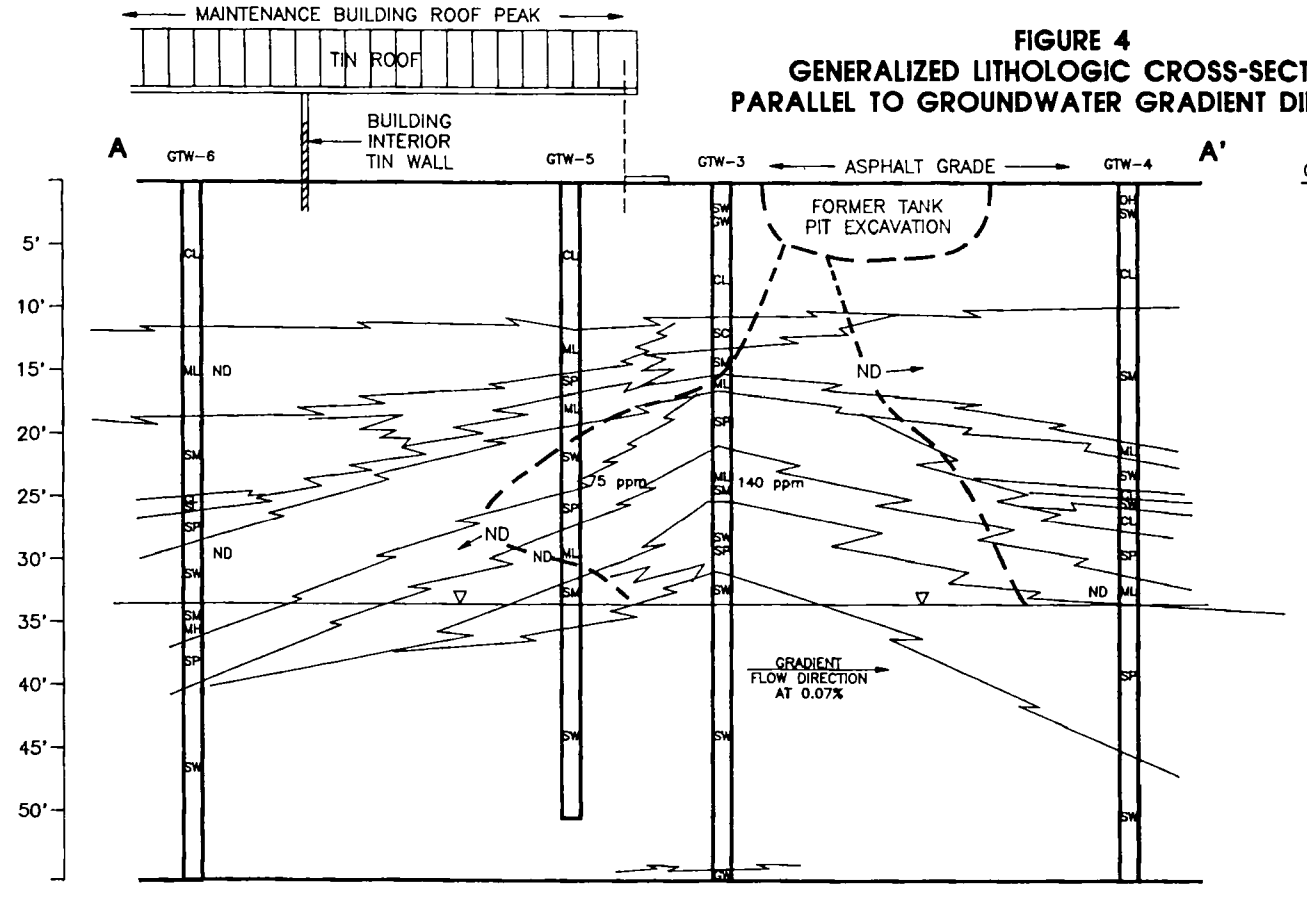
SEPTEMBER 26, 1991

LEAD AGENCY: ORANGE COUNTY HEALTH AGENCY (OCHA)

SUPPORTING AGENCIES: SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT (SCAQMD)
REGIONAL WATER QUALITY CONTROL BOARD (RWQCB)

- Estimated hydrocarbons in soil = 6,000 mg/cubic meter @ 1,000 pounds of hydrocarbons.
- Radius of influence = 18 feet
- Vapor stream concentrations = 5,200 ug/l as gasoline and 6,300 ug/l as stoddard solvent

Treatment Technologies compared for evaluation:



1) Carbon adsorption (two Westates VSC-1200 carbon canisters in series)

2) Catalytic oxidization (ORS Catalytic Scavenger)

3) Thermo Oxidization (Adwest regenerative thermal oxidizer (RETOX) and ORS Thermo Scavenger)

4) Internal Combustion Engine (VR systems)

SUBJECT: QUARTERLY REPORT
OCHCA CASE #88UT110
UNDERGROUND STORAGE TANK SITE
SHELL WESTERN E&P INC. (SWEPI)
20101 GOLDENWEST STREET
HUNTINGTON BEACH, ORANGE COUNTY

Please find attached the 1991 Second Quarter report for the subject site, prepared for SWEPI by its consultant Groundwater Technology Inc (GTI). We apologize for the delay, but we understand that GTI has kept you informed of our progress at this site through telephone conversations. At this point SWEPI is reviewing remedial options analyzed by GTI, and GTI will shortly assist SWEPI in preparing a Remedial Action Plan for your consideration. The anticipated date for the RAP to be ready is the end of September.

If you have any questions, please contact Sub Sen of our staff at (805) 326-5129.

Sincerely,

M J Klancher

Subject: Quarterly Reporting Requirements for Unauthorized Release from an Underground Storage Tank at Shell Western E & P Site, 20101 Goldenwest Street, Huntington Beach, CA - O.C.H.C.A. Case #88UT110

Dear Ms. Dormier:

Please be advised that this Agency, which is authorized to enforce the State Underground Storage Tank Laws and Regulations, has not received a current progress report regarding the investigation and remedial activities completed to date at the subject location.

The California Code of Regulations, Title 23, Subchapter 16, Section 2652 requires that the following information be reported to the local agency every three (3) months until the cleanup is complete:

1. The results of all investigations completed at that time to determine the extent of soil or groundwater or surface water contamination due to the release.

2. Method of cleanup implemented to date, proposed cleanup actions, and approximate cost of actions taken to date.

3. Method and location of disposal of the released hazardous substance and any other contaminated soils or groundwater or surface water (indicate whether a hazardous waste manifest(s) is utilized).

Please submit to this office a summary report of the investigation and remedial activities that have occurred at the subject location. This report must be submitted within thirty (30) days of the receipt of this letter.

If you have any questions, please call me at (714) 667-3719.

Very truly yours,

Peter Peuron

Dear Mr. Peuron:

SUBJECT: UNDERGROUND STORAGE TANK SITE UPDATE
20101 GOLDENWEST STREET
HUNTINGTON BEACH, CALIFORNIA

The following UST site update has been prepared for you as requested in your telephone conservation with our Ms. Sheila Dormier on September 24, 1990.

Site Update

On November 9, 1989, Shell Western E&P Inc. (SWEPI) retained Groundwater Technology Inc. to install three groundwater monitoring wells around the perimeter of the existing excavation. At a later date, two additional monitoring wells and a soil vent well (with a separate boring containing dual vapor pressure probes) were installed (see Figure 2). Groundwater Technology collected soil and groundwater samples, determined groundwater gradient (see Figure 5), evaluated the laboratory data, and conducted a soil vapor extraction test. Based on the soil vapor testing results, we have determined what a representative area of recovery will be for an extraction well (see Figure 6).

The results of the soil sampling (Table 1) indicate the zone containing the highest levels of hydrocarbons occurs from 25 feet to just above groundwater at 31 feet in GTV-1. The groundwater sample results (Table 3) indicate the highest concentrations of gasoline contamination were found in GTW-3 and GTW-5.

Current Plans

SWEPI is currently reviewing a proposal for the installation of a farther upgradient groundwater monitoring well (see Figure 7) in an effort to confirm the lateral extent of soil and groundwater contamination.

You will be contacted prior to commencing any additional investigation at this site.

CBBY9026804 - 0001.0.0

If you have any further questions regarding this subject please contact Sheila Dormier at (805) 326-5684.

Sincerely,

for

Subject: The Closure Report for Shell Western Exploration and Production, Inc., Huntington Beach Unit, 20101 Goldenwest Street, Huntington Beach, CA.

Dear Ms. Dormier:

Please be advised that this office has reviewed the above referenced report. We have found the report to be inadequate to fully charaterize this extent of soil and groundwater contamination at the subject site at the subject site.

The following considerations are to be addressed in a revised report which must be submitted to this office for approval prior to any further on-site activity:

1. Additional site verification sampling must be performed. Notify this Agency at least 48 hours prior to sampling so that an representative from this Agency can be on-site to direct sampling. Be sure to have necessary equipment (including an appropriately sized backhoe as needed, sampling sleeves, ice chest etc.)

2. The piping which is still in the ground on the north side of the excavation must be removed. Notify this office at least 48 hours in advance of this removal so that a representative from this Agency can witness the removal.

3. Additional investigation is necessary to determine the extent of contamination towards the north. Please indicate to this office additional work to be performed at the site to determine the full extent of contamination.

4. The proximity of significant total petroleum and aromatic hydrocarbon levels on the soil near groundwater (within a few feet according to the report dated June 24, 1989) indicate that groundwater may have been impacted by contaminants. Therefore, a groundwater investigation must be conducted. This investigation must include (1) determination of magnitude and direction of groundwater gradient, and (2) water sampling of wells to include at a minimum, 1 sample taken in the down-gradient direction from the suspected source of leakage.

If you have any questions, please contact me at (714) 834-8322.

Very truly yours,

Peter Peuron

Santa Ana, CA 92702

Dear Ms. Casner:

SUBJECT: CLOSURE REPORT OF UNDERGROUND STORAGE TANK REMOVAL
HUNTINGTON BEACH PRODUCTION UNIT
HUNTINGTON BEACH, CALIFORNIA

Shell Western E&P Inc. (SWEPI) is pleased to present you with a summary of the work performed for the removal of two underground storage tanks located at the Huntington Beach Production Unit.

The underground storage tanks were removed on April 4, 1989. The grab samples obtained indicated that soil contamination was present and excavation was performed to remove approximately 640 cubic yards of contaminated soil.

Further site characterization was performed by AMAN Environmental Inc. on June 27, 1989 using three borings to define the vertical and lateral extent of the contamination. Results of the borings indicate that contamination has not extended deeper than the excavation or laterally to the east or north of the excavation.

Your earliest consideration of this site closure is appreciated. If you have any questions regarding this matter please contact Ms. Sheila Dormier at (805) 326-5684.

Sincerely,

D. L. Oreolt

Dear Lisa:

Please find enclosed two sets of analytical data for Shell, Huntington Beach. The first set is for the site at 20th and Walnut, which we sampled on March 17, 1989. The results show non-detectable amounts of TPH and BTEX for all five samples and we would like to get approval to backfill the excavation.

The second set includes samples taken beneath the two 10,000 gallon tanks which were removed at 20101 Goldenwest on April 4, 1989.

Please feel free to contact me at (818) 967-4287 if you have any questions. Thank you.

Dear Ms. Casner:

SUBJECT: SAMPLE ANALYSIS UNDERGROUND STORAGE TANK REMOVALS
20101 GOLDENWEST STREET
HUNTINGTON BEACH OILFIELD

As a follow up to your telephone conservation with our Ms. Sheila Dormier on April 7, 1989, enclosed please find a copy of the grab sample lab analysis. The grab samples that were taken at depths of two and four feet beneath each end of the two underground storage tanks which were removed from the above location on April 4, 1989.

Mr. Mark Sutphin from the Orange County Environmental Health Department was present and directed sampling points.

As discussed Shell Western E&P Inc. (SWEPI) has contracted with AMAN Brothers Environmental to continue excavation at this site to further determine the vertical and lateral extent of contamination. As additional sample results are received they will be forwarded to you.

We will contact you 48 hours prior to site inspection.

If you have any questions regarding this matter please contact Sheila Dormier at (805) 326-5684.

Sincerely,

for D. L. Oreolt

Dear Ms. Casner:

SUBJECT: SAMPLE ANALYSIS UNDERGROUND STORAGE TANK REMOVALS
20101 GOLDENWEST STREET
HUNTINGTON BEACH OILFIELD

As a follow up to your telephone conservation with our Ms. Sheila Dormier on April 7, 1989, enclosed please find a copy of the grab sample lab analysis. The grab samples that were taken at depths of two and four feet beneath each end of the two underground storage tanks which were removed from the above location on April 4, 1989.

Mr. Mark Sutphin from the Orange County Environmental Health Department was present and directed sampling points.

As discussed Shell Western E&P Inc. (SWEPI) has contracted with AMAN Brothers Environmental to continue excavation at this site to further determine the vertical and lateral extent of contamination. As additional sample results are received they will be forwarded to you.

We will contact you 48 hours prior to site inspection.

If you have any questions regarding this matter please contact Sheila Dormier at (805) 326-5684.

Sincerely,

for D. L. Oreolt

Dear Mr. Sutphin:

SUBJECT: UNDERGROUND STORAGE TANK REMOVALS
ACCOUNT NUMBER 20
HUNTINGTON BEACH OILFIELD

In response to your telephone inquiry regarding our letter to you dated November 14, 1988. Shell Western E&P Inc. (SWEPI) has contracted with AMAN Bros. Inc. to remove the two 10,000 gallon underground storage tanks located at the Huntington Beach Oilfield.

Application to remove these tanks will be submitted this week. Taking into consideration permit time, we anticipate tank removals to begin no later than January 16, 1989. We will notify you in writing of the removal commencement date.

After the tanks are removed SWEPI will be operating a total of three (3) underground storage tanks at their 20101 Goldenwest St, location.

If you have any questions regarding this matter please contact Sheila Dormier at (805) 326-5684.

Sincerely,

D. L. Oreolt

Subject: Proposal for Subsurface Investigation at Shell Western E&P Inc. site at Huntington Beach

Dear Mr. Wilder;

We were pleased to meet with your representative recently to discuss a site assessment program for Shell Western E&P Inc. at Huntington Beach. We propose to prepare a work plan and subsurface investigation in conjuction with Jaykim Engineers, Inc. We envision that the work required by the County of Orange Health Care Agency can be performed in two phases:

PHASE I - SUBMITTAL OF A WORK PLAN

The following tasks would be performed under Phase I:

1. Review available groundwater reports and geologic maps. Identify local water wells and establish the groundwater depth at the site.

2. Conduct site recoonnaissance and review available drawings to locate the underground storage tanks and excavation pits. Construct a scaled site plot plan.

3. Develop a work plan to establish the number of soil borings, the proposed depth of the borings, and a soil sampling strategy for the subsurface investigation.

4. Submit the work plan to the Health Care Agency for approval.

We propose to provide Phase I service for a fee of $2,380.00.

PHASE II - CONDUCT SUBSURFACE INVESTIGATION

After approval of the Phase I work plan, a drilling and soil sampling program will be conducted to determine the extent of the contamination at the site. We propose to perform the following sit essessment work under Phase II:

1. Conduct 2 days of drilling and soil sampling at the site around the existing excavation. We envision that drilling six borings at the site will be adequate to determine the lateral and vertical extent of the contamination. the depth of the soil borings will be determined in the field based on monitoring of duplicate soil samples with a Bacharach Instrument TLV Sniffer combustible vapor detector. However, the boreholes are not envisioned to be drilled to depths greater than 40 feet in this work. If during drilling groundwater is encountered, the boring will then be drilled to 20 feet below the water level and a water well will be developed. The data generated from the soil sampling and laboratory analysis program will be employed to deterrmine the vertical and lateral extent of the contamination.

2. Undisturbed soil samples will be collected at 5 foot intervals to the bottom of the borings in stainless steel tubes, inside a Modified California Sampler.

3. As the contamination at the site has been caused by gasoline and Stoddard solvent, we propose to analyze the the samples by the EPA Method 8015. The contaminated soil samples and the bottom samples will be analyzed individually, while the non-contaminated soil samples will be composited and analyzed. + 8020

(No

4. Prepare a report of the investigation for Shell Western E. & P. Inc.to forward to the County fo Orange Health Care Agency.

We propose to perform the Phase II services on a time and material basis not to exceed $14,145.00, with subcontractors billed at cost plus fifteen percent. If the Health Care Agency requests work which has a significant effect on the above cost, we will provide you with a revised time and materials cost before any Phase II work is begun.

For a site free of contamination, the Phase II investigation and report should complete the work to the satisfaction of the Health Care Agency. If there is contamination at the site, recommendations for site mitigation and remedial action will be submitted to the Health Care Agency. The remediation work will be performed at additional cost to the proposed program.

COST SUMMARY

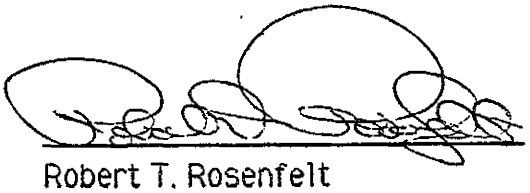
The following is a cost summary of the costs for the proposed subsurface investigations:

Phase I	$ 2,380.00
Phase II	$14,145.00
Total	$16,525.00

LIMITATIONS

Coast Contractors, Inc., will make a reasonable effort during the plan review and field reconnaissance to accurately locate tanks, piping, and utilities. However, due to the age of the sites and variability of construction procedures, we cannot be held responsible for any subsurface obstructions encountered during the drilling or installation operations. Therefore, all the proposed drilling and excavation locations must be approved by the client or his authorized agent prior to commencement of work. Furthermore, the client shall bear the expense of repairing any damaged facilities except as the result of negligence on the part of Coast Contractors, Inc., or their subcontractors.

SUMMARY



Thank you for the opportunity to submit this proposal for developing a work plan and conducting a subsurface investigation at the Shell Western E&P, Inc. Company facility in Huntington Beach. Coast Contractors, Inc., is avvvailable to begin this work upon notice to proceed. We look forward to working with you on this project.

Enclosed is a copy of a contract for you to sign and return to us.

If you have any questions or need additional information, please feel free to call us at (213)595-6300.

Sincerely,

Coast Contractors, Inc.

Robert T. Rosenfelt
President

AUTHORIZATION

This proposal constitutes a firm offer to conduct the scope of services described herein. this offer shall be valid for 30 days from the proposal date. One copy of this document is to be signed and returned to Coast Contractors, Inc., prior to commencement of the preparation of the work paln and subsurface investigation. Signature of this document constitutes authorization of the scope of services outlined herein for the specified fee.

Subject: Soil Contamination Located At 20101 Goldenwest Blvd., Huntington Beach

Dear Mr. Inman:

Based on inspections and field tests conducted on May 20, 1988, it has been determined that stoddard solvent/gasoline contaminated soil is present at the subject location.

This Agency, which is authorized to enforce both the State Hazardous Waste and Underground Tank Laws and Regulations, (Chapters 6.5 and 6.7 of the California Health and Safety Code and Titles 22 and 23 of the California Code of Regulations) directs Shell Western to develop and submit a site assessment workplan to this office within thirty (30) days of receipt of this letter. The plan must include the proposed methods to obtain the following information:

a. Identification of the nature, source and estimated volume of released contaminants.

b. Identification of the lateral and vertical extent of soil and groundwater contamination and the concentration of contaminants.

c. Proposed number and location of samples and borings.

d. Proposed laboratory analyses and methods.

e. Depth to groundwater and groundwater gradient.

f. Description of the soil profile.

g. Hydrogeological setting.

h. Present and potential future uses of groundwater and surface water that may be affected by the contaminated material, including the location and use of all wells within a 2,000 foot radius of the site.

Field investigation may begin only after the plan has been approved. This office must be notified 48 hours in advance of sampling. After completion of the investigation, a report outlining the findings from the site assessment investigation and the proposals for site mitigation and remedial action must be submitted to this office for approval. Remedial actions must include the following as applicable:

1. Free undissolved product must be removed from groundwater.

2. Proposed method of dissolved product removal must be approved by the appropriate Regional Water Quality Control Board and must be included in the reports submitted to this Agency.

3. Demonstrate to the satisfaction of this office that the contaminated soil, if left in place, would not present a potential public health or environmental hazard. This risk assessment evaluates the potential for movement of contaminants into adjoining soils or groundwater and the associated public health or environmental effects.

4. Reduce contamination to acceptable levels. A proposal describing the treatment process must be submitted to this office for approval prior to initiation of such process. In addition, permits must be obtained from all appropriate regulatory agencies.

5. Monitoring of contaminant fate and movement in soil and groundwater. Monitoring may include periodic sampling of soil and periodic sampling of properly placed wells with annual reevaluation of well locations. A report describing the proposed investigations must be submitted to this office for review.

6. Remove the contaminated soil. The contaminated soil should be removed to a nondetectable level or to natural background. If this cannot be achieve, options three (3), four (4), and five (5) must be employed.

Until cleanup is complete, update reports shall be submitted to this Agency every three (3) months or at a more frequent interval as specified.

If any material to be removed is hazardous waste, as defined in the California Health and Safety Code, Chapter 6.5 or as identified in the California Code of Regulations, Title 22, Division 4, Chapter 30, then the use of a registered hazardous waste hauler is required and a photocopy of every manifest signed by the receiving facility must be forwarded to this office for verification of proper disposal. Section 25298(c)(4) of the California Health and Safety Code states that no person shall close an underground storage tank unless the person demonstrates to the satisfaction of the local agency that no significant soil contamination has occurred. Violation of this requirement is subject to a civil penalty of Five Thousand Dollars ($5,000.00) per day.

Please be advised that all information received by Environmental Health is a matter of public record unless it has been clearly indicated on each page of the submittal that the information is confidential and is not to be released.

If you have any questions regarding this matter, please contact me at (714)834-8186.

Very truly yours,

Steve Harris

Wastewater Treatment

Wastewater treated through Knockout tanks, oil separators, and re-injected into the ground.

Chemical Storage

Various spill containment and secondary structures for chemical storage, no exposed sewer connections observed.

Waste Handling and Disposal

Re-inject water into ground, Stormwater to ocean as needed

Observation and Comments

California Resources Corp dba Oxy USA (FID#3636) visited to check business status, wastewater generating operations, and permit considerations. Facility identified through Wastehauler Station generator check, as they are frequent haulers to station and from an Oil Field.

Contact, Johnny Hardisty, stated the facility has been in Huntington since 1910, and the Sanitation District had to reimburse CRC for incorrect User fees several years ago. Yard does not have any sewer fees, only portable toilets and septic tanks. Company confirmed that 6 septics and some portable toilets are pumped every 2 weeks or so.

Site is a large oil field with over 100 active wells and 100 idle wells. Approximately 155 barrels per day of wastewater is re-injected into the ground, 4,500 bpd of oil is produced. Wet gas to scrubber and the H2S scavenger for running the gas powered turbines as three components of production is gas, oil, and water. Heat exchanger heats water from 150 - 170 deg. F for emulsification to occur which helps separate oil and water. Re-inject water has minimal oil (as this is product) and is <5ppm oil.

Company to remain permit exempt at this time, but informed contact to notify OCSD should operations change.

WASTEWATER ANALYSIS REPORT

[redacted]

REPORT DATE : 04/25/2024
MONITORING ID : 120099
MANIFEST NO : 16-06080
INSPECTOR : JC
SAMPLE TYPE : Waste Hauler

Your wastewater discharge was sampled and the results are as follows:

LAB NO: 1965677
Sample Type: GRAB
Sample Start Date: 02/09/2017 Time: 14:30
Sampling Point: 143
Sample End Date: 02/09/2017 Time: 14:30
Location: Truck

Actual Discharge : No Meter Reading

Mass Emmission Rate Flow Base : N/A
Effective :

Constituents	Compliance Sample	Sample Method	Discharge mg/L	Discharge Lbs/Day	Permit Limit mg/L	Permit Limit Lbs/Day	Over Limit mg/L	Over Limit Lbs/Day	Violation Percent Over	Violation Type
Cadmium	Y	GRAB	ND		1.0				0.00	
Chromium	Y	GRAB	ND		35.0				0.00	
Copper	Y	GRAB	3.21		25.0				0.00	
Lead	Y	GRAB	ND		10.0				0.00	
Nickel	Y	GRAB	ND		10.0				0.00	
Silver	Y	GRAB	ND						0.00	
Zinc	Y	GRAB	8.24		50.0				0.00

I, the below-signed Wastehauler, declare the following under penalty of perjury To the best of my knowledge I have accurately described the type, quantity, and source/generator of all waste that I now request to dispose of at OCSD's treatment plant. I was personally informed by the owner, owner's agent, or occupants of the property where this waste was received or have personal knowledge that this waste contains NO hazardous or industrial waste as defined in the OCSD's Wastewater Discharge Regulations The truck(s) used to transport this waste was free of all materials characterized by State and Federal law as hazardous waste or substance at the time of said use I am aware of the conditions and requirements of the Wastehauler Permit. Furthermore, I understand that failure to accurately describe the information above or failure to comply with the Wastehauler Permit and/or any applicable OCSD regulations may result in the immediate suspension of the Wastehauler Permit and/or other penalties as may be allowed by law

Subject: RE: Public Records Request - 20101 Goldenwest St, Huntington Beach

Good morning,

After careful review of our records, we show we have no files for the following site:
5615 Ocean Vista, Huntington Beach

However, responsive records for **20101 Goldenwest St, Huntington Beach** can be found on GeoTracker using this link.

We also show that we have Storm Water information for the following site:
20101 Goldenwest St, Huntington Beach
These records may be accessed online by:
• Clicking this link
https://smarts.waterboards.ca.gov/smarts/PublicDataAccess/PublicNoiSearch.xhtml
• Enter street number into "Facility/Site Street:" Field
• Enter the site city (e.g. "Irvine") into "Facility/Site City:" Field
• Click on relevant black underlined links to view attachments

Additional electronic Storm Water information can be accessed online by:
• Clicking this link
https://ciwqs.waterboards.ca.gov/ciwqs/readOnly/CiwqsReportServlet?reportName=facilityAtAGlance&inCommand=reset
• Enter street number only into "Enter a physical address:" field, and/or:
• Enter a keyword in the facility's name (e.g. "Heifer") into "Enter a facility name:" field, or leave blank
• Click on relevant blue underlined links under "Place ID" column to view the reports

Additionally, we show we have hardcopy files available for review for: **20101 Goldenwest St, Huntington Beach**. Our file review hours are Tuesday through Friday 9:00 AM - 4:00 PM. Please contact us through this inbox with your preferred date and time if you would like to schedule an appointment to review files. Your appointment is confirmed once you have received an email from this inbox stating the date and time of your appointment. If, within 2 weeks, we do not receive a response to schedule an appointment, this file review request will be considered closed.

Thank you,
File Review Desk

Subject: Public Records Request - 20101 Goldenwest St, Huntington Beach

Caution: External Email. Use caution when clicking links or opening attachments. When in doubt, contact DIT or use the Phish Alert Button.

Hello,

Langan Engineering is conducting a Phase I Environmental Site Assessment (ESA) of the property located at 20101 Goldenwest Street and 5615 Ocean Vista in Huntington Beach, California. In support of our Phase I ESA, Langan is requesting any information or copies of files regarding environmental conditions at the site, such as environmental reports, environmental permits, building permits, notices of violations, spill/discharge incidents, storage or disposal of hazardous substances, Underground Storage Tanks (USTs) or Aboveground Storage Tanks (ASTs), Leaking Underground Storage Tanks (LUSTs), asbestos abatement, and any other environmental reports that your department may have.

Thank you

Katherine Thomas
Staff Scientist

Hazardous Materials

Does your facility have on site (for any purpose) at any one time, hazardous materials at or above 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet for compressed gases (include liquids in ASTs and USTs); or is regulated under more restrictive inventory local reporting requirements (shown below if present); or the applicable Federal threshold quantity for an extremely hazardous substance specified in 40 CFR Part 355, Appendix A or B; or handle radiological materials in quantities for which an emergency plan is required pursuant to 10 CFR Parts 30, 40 or 70?	**Yes**

Underground Storage Tank(s) (UST)

Does your facility own or operate underground storage tanks?	**No**

Hazardous Waste

Is your facility a Hazardous Waste Generator?	**Yes**
Does your facility treat hazardous waste on-site?	**No**
Is your facility's treatment subject to financial assurance requirements (for Permit by Rule and Conditional Authorization)?	**No**
Does your facility consolidate hazardous waste generated at a remote site?	**No**
Does your facility need to report the closure/removal of a tank that was classified as hazardous waste and cleaned on-site?	**No**
Does your facility generate in any single calendar month 1,000 kilograms (kg) (2,200 pounds) or more of federal RCRA hazardous waste, or generate in any single calendar month greater than 1 kg (2.2 pounds) of RCRA acute hazardous waste; or generate more than 100 kg (220 pounds) of spill cleanup materials contaminated with RCRA acute hazardous waste.	**No**
Is your facility a Household Hazardous Waste (HHW) Collection site?	**No**

Excluded and/or Exempted Materials

Does your facility recycle more than 100 kg/month of excluded or exempted recyclable materials (per HSC 25143.2)?	**No**

Aboveground Petroleum Storage

Does your facility own or operate aboveground petroleum storage tanks or containers AND: * have a total aboveground petroleum storage capacity of 1,320 gallons or more, OR * have one or more petroleum tanks in an underground area?	**No**

Regulated Substances

Does your facility have Regulated Substances stored onsite in quantities greater than the threshold quantities established by the California Accidental Release prevention Program (CalARP)?	**No**

Additional Information

No additional comments provided.

Comments by submitter: 2025 Annual Submittal.
Submittal was ***Accepted***; Processed on 6/2/2025 by *Lisa Wales* for Orange County Environmental Health

Hazardous Materials

Does your facility have on site (for any purpose) at any one time, hazardous materials at or above 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet for compressed gases (include liquids in ASTs and USTs); or is regulated under more restrictive inventory local reporting requirements (shown below if present); or the applicable Federal threshold quantity for an extremely hazardous substance specified in 40 CFR Part 355, Appendix A or B; or handle radiological materials in quantities for which an emergency plan is required pursuant to 10 CFR Parts 30, 40 or 70?	**Yes**

Underground Storage Tank(s) (UST)

Does your facility own or operate underground storage tanks?	**No**

Hazardous Waste

Is your facility a Hazardous Waste Generator?	**No**
Does your facility treat hazardous waste on-site?	**No**
Is your facility's treatment subject to financial assurance requirements (for Permit by Rule and Conditional Authorization)?	**No**
Does your facility consolidate hazardous waste generated at a remote site?	**No**
Does your facility need to report the closure/removal of a tank that was classified as hazardous waste and cleaned on-site?	**No**
Does your facility generate in any single calendar month 1,000 kilograms (kg) (2,200 pounds) or more of federal RCRA hazardous waste, or generate in any single calendar month greater than 1 kg (2.2 pounds) of RCRA acute hazardous waste; or generate more than 100 kg (220 pounds) of spill cleanup materials contaminated with RCRA acute hazardous waste.	**No**
Is your facility a Household Hazardous Waste (HHW) Collection site?	**No**

Excluded and/or Exempted Materials

Does your facility recycle more than 100 kg/month of excluded or exempted recyclable materials (per HSC 25143.2)?	**No**

Aboveground Petroleum Storage

Does your facility own or operate aboveground petroleum storage tanks or containers AND: * have a total aboveground petroleum storage capacity of 1,320 gallons or more, OR * have one or more petroleum tanks in an underground area?	**No**

Regulated Substances

Does your facility have Regulated Substances stored onsite in quantities greater than the threshold quantities established by the California Accidental Release prevention Program (CalARP)?	**No**

Additional Information

No additional comments provided.

Hazardous Materials

Does your facility have on site (for any purpose) at any one time, hazardous materials at or above 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet for compressed gases (include liquids in ASTs and USTs); or is regulated under more restrictive inventory local reporting requirements (shown below if present); or the applicable Federal threshold quantity for an extremely hazardous substance specified in 40 CFR Part 355, Appendix A or B; or handle radiological materials in quantities for which an emergency plan is required pursuant to 10 CFR Parts 30, 40 or 70?	**Yes**

Underground Storage Tank(s) (UST)

Does your facility own or operate underground storage tanks?	**No**

Hazardous Waste

Is your facility a Hazardous Waste Generator?	**No**
Does your facility treat hazardous waste on-site?	**No**
Is your facility's treatment subject to financial assurance requirements (for Permit by Rule and Conditional Authorization)?	**No**
Does your facility consolidate hazardous waste generated at a remote site?	**No**
Does your facility need to report the closure/removal of a tank that was classified as hazardous waste and cleaned on-site?	**No**
Does your facility generate in any single calendar month 1,000 kilograms (kg) (2,200 pounds) or more of federal RCRA hazardous waste, or generate in any single calendar month greater than 1 kg (2.2 pounds) of RCRA acute hazardous waste; or generate more than 100 kg (220 pounds) of spill cleanup materials contaminated with RCRA acute hazardous waste.	**No**
Is your facility a Household Hazardous Waste (HHW) Collection site?	**No**

Excluded and/or Exempted Materials

Does your facility recycle more than 100 kg/month of excluded or exempted recyclable materials (per HSC 25143.2)?	**No**

Aboveground Petroleum Storage

Does your facility own or operate aboveground petroleum storage tanks or containers AND: * have a total aboveground petroleum storage capacity of 1,320 gallons or more, OR * have one or more petroleum tanks in an underground area?	**No**

Regulated Substances

Does your facility have Regulated Substances stored onsite in quantities greater than the threshold quantities established by the California Accidental Release prevention Program (CalARP)?	**No**

Additional Information

No additional comments provided.

Unified Program (UP) Form
CONSOLIDATED CONTINGENCY PLAN

SITE MAP

A site plan and storage map must be included with your Contingency Plan. For relatively small facilities, these documents may be combined into one drawing. Since these drawings are intended for use in emergency response situations, larger facilities *(generally those with complex and/or multiple buildings)* should provide an overall site plan and a separate storage map for each building/storage area. A blank Facility Site Map has been provided on the reverse side of this page. You may complete that page or attach any other drawing(s) which contain(s) the information required below.

1. Site Plan: This drawing shall contain, at a minimum, the following information:

a. Site Orientation (north, south, etc.);
b. Approximate scale *(e.g. "1 inch = 10 feet".)*;
c. Date the map was drawn;
d. Locations of all buildings and other structures;
e. Parking lots and internal roads;
f. Hazardous materials loading/unloading areas;
g. Outside hazardous materials storage or use areas;
h. Storm drain and sanitary sewer drain inlets;
i. Wells for monitoring of underground tank systems;
j. Primary and alternate evacuation routes, emergency exits, and primary and alternate staging areas;
k. Adjacent property use;
l. Locations and names of adjacent streets and alleys;
m. Access and egress points and roads.

2. Storage Map(s): The map(s) shall contain, at a minimum, the following information:

a. General purpose of each section/area within each building *(e.g. "Office Area", "Manufacturing Area", etc.)*;
b. Location of each hazardous material/waste storage, dispensing, use, or handling area *(e.g. individual underground tanks, aboveground tanks, storage rooms, paint booths, etc.)*. Each area shall be identified by a unique location code number, letter, or name *(e.g. "1", "2", "3"; "A", "B", "C", etc.)*;
c. Entrances to and exits from each building and hazardous material/waste room/area;
d. Location of each utility emergency shut-off point *(i.e. gas, water, electric.)*;
e. Location of each monitoring system control panel *(e.g. underground tank monitoring, toxic gas monitoring, etc.)*.

All occupancies within Huntington Beach must meet the requirements of the California Fire Code and the Huntington Beach Municipal Code. The Huntington Beach Fire Department conducted an inspection at the aforementioned address which revealed no violations.

Pursuant to the City Council approved fee schedule, a fee has been assessed for the fire inspection performed. An invoice for this inspection will be generated and mailed within three weeks of the inspection date. If you have any questions or concerns with this inspection, please contact the Fire Prevention Bureau at (714) 536-5411.

Benefits of Using Accela!

The City of Huntington Beach has transitioned to the Customer Portal as the new online system for permitting and inspection services. This system allows our customers to access their records and perform actions to streamline the inspection process. Below are some of the services available to our customers when they register as Accela user.

- *Inspection History and Reports*
- *Pay Fees*
- *Upload Self-Correct Affidavits*
- *Schedule Inspections (Construction Only)*

Please visit our Customer Portal (http://bit.ly/2Y3Pf4m) to get started. For assistance, visit the Help Center (https://www.huntingtonbeachca.gov/departments/community_development/apply_now/index.php).

All requests for permits are processed in Fire Administration and must be paid prior to any permit issuance. **Make checks payable to the CITY OF HUNTINGTON BEACH. NO CASH PLEASE.** Fees will be charged according to the Huntington Beach Fire Department (HBFD) fee schedule. The HBFD, depending on the nature of the permit and the risk involved, may require additional plans, inspections and fees. Permits are valid for six months maximum from the date of issuance and are non-transferable. A new permit shall be required when there is a change in use, business operation or ownership. All permits are subject to six-month renewal and must have fees paid prior to the expiration date. Any decision by the City on this application may be appealed to the City Planning Commission and the City Council by the Applicant, or by any interested person pursuant to the appeal procedure contained in Huntington Beach Municipal Code section 15.12.180. Inspections must be scheduled at least 48-hours in advance and can be arranged by contacting Fire Administration at (714) 536-5411.

I am duly authorized on behalf of the operator to sign and file the application certifying that the information contained in the application is true and correct.

Applicant's Signature: Scott Walker **Date:** 6/25/14

Division Chief - Bill Reardon
City of Huntington Beach Fire Department
2000 Main St, 5th Floor
Huntington Beach, CA 92648

Subject: Oil Producer Well "State PRC 392" 729, API No. 259-21730, Huntington Beach Field

Chief Reardon:

This letter requests your approval for the "State PRC 392" 729, API No. 259-21730, oil producer well, to be drilled from the Huntington Beach onshore strip. At this time, the anticipated spud date for the well is October 31, 2014. We will be in contact with your staff if this timing changes.

The following text documents our compliance with the requirements of the California Fire Code, Section 5706.3, pertaining to well drilling and operating and to the requirements of the Huntington Beach Oil Code. Compliance with any sections of the Huntington Beach Municipal Code (HBMC) not herein mentioned shall also be adhered to.

Storage tanks and sources of ignition
The drilling rig package includes a portable diesel tank which will fuel a backup generator in the event that the rig loses primary power from the grid. This fuel tank, as well as open-flame devices and other sources of ignition (any flame, arc, spark or heated object or surface capable of igniting liquids, gases or vapors) necessary to the drilling of the well, will not be located within 25 ft of the well location. All electrical equipment used, installed or maintained within 50 feet of the drilling rig, or within 25 feet of any other oil operation will be installed and maintained in accordance with all applicable state and municipal regulations. No boiler, pass-through boiler, steam generator, direct-fired heater, gas or oil-burning device, or other open flame will be located closer than 25 feet to the wellhead or oil storage tank. Smoking will be limited to designated areas only, away from the drill site.

Streets and railways
The well will not be drilled within 75 ft of public streets or highways (see attached "State PRC 392" 729 Well Setback Map).

Buildings
The well will not be drilled within 100 ft of any current or future buildings (see attached "State PRC 392" 729 Well Setback Map).

Waste control
Rotary mud, drill cutting, oil or liquid hydrocarbons and all other oil field wastes derived or resulting from, or connected with the drilling or reworking of any well will be discharged into a portable steel tank. Waste materials will be removed from the operation site within 30 days from the completion of drilling, and shall be processed or disposed of according to all applicable city, county, state, and federal regulations.

Approved HBFD

JUL 01 2014

J. Glen

F-2014 08 3997

Oxy USA Inc.
Well "State PRC 392" 729, API No. 259-21730, Huntington Beach Field

Sumps
Sumps will not be used as part of the drilling operation.

Storage tanks
There are no oil storage tanks in the vicinity of the drill location.

Prevention of blowouts
In all cases, protection will be provided to prevent a blowout during oil operations as required by and in conformance with the requirements of the California Division of Oil, Gas & Geothermal Resources (CDOGGR), and the safety orders for drilling and production of the State Division of Industrial Safety. Oxy understands that violations of this section will constitute a misdemeanor punishable as set forth in the HBMC. Testing of the BOP will be witnessed and approved by the CDOGGR. See attached approved permit from the CDOGGR.

Soundproofing
An exhaust muffler, or mufflers or an exhaust muffler box constructed of noncombustible materials sufficient to suppress noise and prevent the escape of obnoxious gases, fumes or ignited carbon or soot will be used on the exhaust from any steam engine, internal combustion engine, stationary or mounted on wheels, used in connection with the drilling of any well or for use on any production equipment. The derrick and all drilling machinery used in connection with drilling of any well shall be enclosed with soundproofing material that is non-combustible, which will be maintained in a serviceable condition in accordance with section 15.20.100 of the Huntington Beach Oil Code. Oxy will adhere to the requirements within Chapter 8.40 of the HBMC, Noise Control.

Signs
The surface location of all wells will be confined within the OXY USA Inc. Huntington Beach property. The lease is enclosed by a fence and block wall and access to the location is through a guarded gate on Goldenwest Street. At the entrance of the property is a sign with the name of the operator (OXY USA Inc.) and telephone numbers to call in the event of an emergency. Similarly, each well (whether producing or not) has a sign with the well name, well number and name of the operator. No smoking signs of durable material will be posted and maintained in all locations approved or designated by the Fire Chief.

Use of Explosives
After the well has been drilled, the drilling rig will move off and a well service rig will move on and complete the well. Part of the completion process will involve perforating the steel casing in the wellbore to access the target formation zone. This will be accomplished by firing 38g charges at a density of 5 shots per foot over an interval of ~1,300 ft. The guns will be fired at ~5,700 ft below ground level and will not be detectable at surface. There will be no noise or vibration impact to the rig crews or neighboring homes. The perforating contractor is fully licensed to perform the work and has all the necessary permits for transporting explosives.

Derricks
The contracted drilling rig is a custom built, fully enclosed, 1500 hp automated drilling rig supplied by Ensign Drilling. The rig is fully electric and will run off the Southern California Edison power grid. The drilling derrick meets the standards and specifications of the American Petroleum Institute (API) as they

Approved HBFD
JUL 0 1 2014

presently exist or may be amended hereafter. Stamped engineering drawings of the drilling derrick have been previously provided to the Fire Department as part of this application package. All drilling, redrilling or reworking equipment will be removed from the operation site within 30 days following the completion of drilling, redrilling or reworking unless otherwise permitted by the Division of Oil and Gas.

Inspection
The well will be drilled within 150 ft of Pacific Coast Highway. After the operating equipment is securely in place and prior to commencement of drilling, Oxy will notify the Fire Department for the purpose of inspection. If an inspection is anticipated to be needed other than during normal working hours, Oxy will notify the Fire Department during a working day of the approximate time for the inspection and will not commence drilling until the Fire Department has made an inspection and given approval to commence. Oxy understands that the Fire Department will not approve the permit until all applicable provisions of the Huntington Beach Municipal Code (HBMC) have been met. Upon completion of drilling operations, Oxy will notify the Fire Department, and the Fire Department will make an inspection of the drill site to insure that provisions of the HBMC and any conditions of the drilling permit have been met.

Well Setbacks
The well will not be drilled within 25 ft of any property boundary line. The well will also not be drilled within 25 ft of any recovery heater, oil storage tank, or source of ignition. The well will not be drilled within 100 ft of any building. The well will not be drilled within 300 feet of any building used as a place of public assembly, institution or school. The well will not be drilled within 25 feet of any public street, road or highway or future street right-of-way. Setbacks will conform to appropriate provisions of the HBMC. See attached "State PRC 392" 729 Well Setback Map.

Wellhead Safety Equipment
On all wells there will be connected to the casing string a 2" steel valve with a rated working pressure equal to that of the wellhead, for the purpose of bleeding off casing pressure and for hookup to kill the well in case of an emergency. Oxy understands that violations of this section will constitute a misdemeanor punishable as set forth in the HBMC.

Cellars
Except during drilling and servicing operations, cellars will be kept covered, free from water, oil drilling fluids, rubbish, debris, and other substances. All multiwell cellars exceeding three feet in depth and 25 feet in length will have two separate means of exit or entrance. If the cellar exceeds 200 feet in length, a third means of entrance and exit will be provided. The depth of such cellars will be the vertical distance between the lowest point of the floor of such cellar and the adjacent ground level. Multiwell cellars will have a steel grate or covering with no unobstructed openings in excess of three inches.

Additional Safety Requirements
Belts guards shall be required over all drive belts used on oilfield equipment. Guarding shall be as required by Title 8 of the California Administrative Code, subchapter 14, Section 6622.

Fencing shall be provided/maintained in accordance with Section 15.20.160 of the Oil Code.

Fire hydrants shall be inspected, tested, and maintained in accordance with NFPA 25.
Fire lanes shall be maintained in accordance with City Specification 401.

Approved HBFD

JUL 01 2019

Oxy USA Inc.
Well "State PRC 392" 729, API No. 259-21730, Huntington Beach Field

The information contained herein applies to wells planned to be drilled at Oxy's Huntington Beach lease. However, the exact surface location coordinates, which will be updated on individual well application forms going forward, will change for each well to be drilled. If any of the above information changes, we will inform your staff in writing as soon as practical.

If you need any further information, or if you have any questions regarding the drilling operation, please contact me at (562) 624-3169.

Sincerely,

Scott Walker, P.E.

June 13, 2014

Mr. Scott Walker, Agent
Oxy USA Inc. (O2475)
111 W. Ocean Blvd., 8th FL
Long Beach, CA 90802

Your proposal to **Drill** well **"State Prc 392" 729**, A.P.I. No. **259-21730**, Section **4**, T. **06S**, R. **11W**, **SB** B. & M., **Huntington Beach** field, **Offshore** area, **Upper and Lower Main** pool, **Orange Offshore** County, dated **6/11/2014**, received **6/11/2014** has been examined in conjunction with records filed in this office. (Lat: **33.674664** Long: **-118.025019** Datum: **83**)

THE PROPOSAL IS APPROVED PROVIDED:

1. Blowout prevention equipment, as defined by this Division's publication No. M07, shall be installed and maintained in operating condition and meet the following minimum requirements:
   a. A **6" diverter system** on the **20"** casing.
   b. Class **IIIB3M,** with hydraulic controls, during **drilling** operations.
   c. Class **III3M,** with hydraulic controls, during **completion** operations.
   d. A **3M lubricator** for **wireline** operations.
2. Blowout prevention practice drills are conducted at least weekly and recorded on the tour sheet. A practice drill may be required at the time of the test/inspection.
3. Hole fluid of a quality and in sufficient quantity to control all subsurface conditions in order to prevent blowouts shall be used.
4. Sufficient material to control lost circulation of hole fluid shall be available for immediate use at the well site.
5. The **9-5/8"** casing is cemented with sufficient cement to fill behind the casing from the shoe to the surface.
6. The **7"** casing is cemented with sufficient cement to fill behind the casing to at least 500' above all oil, gas zones and/or anomalous pressure intervals and to at least 100' above the base of freshwater zone, if present.
7. A directional survey shall be made and filed with this division within 15 days of completion of drilling.
8. The producing interval of this well is not less than 75 feet from the outer boundary of the parcel of land into which the well is drilled, and is not less than 150 feet, as measured horizontally, from the producing interval of any other well in the same zone.
9. Once drilled the well location shall be surveyed and the survey shall be filed with this office. Latitude and longitude shall be in decimal degrees, to six decimal places, in NAD83.
10. Water shutoff effectiveness is demonstrated by use of either a **formation tester** above the intended zone of completion or by running both a **radial cement evaluation tool** from the casing shoe to **500'** above the upper

A copy of this permit and the proposal must be posted at the well site prior to commencing operations. Records for work done under this permit are due within 60 days after the work has been completed or the operations have been suspended. Issuance of this permit does not affect the Operator's responsibility to comply with other applicable state, federal, and local laws, regulations, and ordinances.

Approved Hold

OG111 (revised 6/2011)

JUL 01 2014

most hydrocarbon zone (UHZ) and **production test** within **60** days of the well being placed on production.

11. No program changes are made without prior Division approval.
12. **THIS DIVISION SHALL BE NOTIFIED TO:**
    a. Inspect the diverter system prior to commencing **drilling** operations.
    b. Witness a test of the installed blowout prevention equipment prior to drilling out the shoe of the **9-5/8"** casing.
    c. Inspect the installed blowout prevention equipment prior to commencing **completion** operations.
    d. Witness a test of the effectiveness of the **7"** shutoff above the **Upper Main** zone by either formation tester or production water shutoff test.

NOTE:

1. Prior to notifying the Division engineer to witness the test, the blind rams must be tested. Information on the blind rams test must be entered on the tour sheet along with the signature of the person in charge.
2. In order to coordinate field surveillance, please contact this office prior to commencing operations.
3. Hydrogen sulfide gas (H_2S) is known to be present in this area, adequate safety precautions shall be taken prior to and during well operations.
4. The base of the freshwater zone should be encountered at **1231'± md**.
5. Upon completion of the proposed work, a Well Summary (form OG100), History of Oil or Gas Well (form OG103) and copies of all logs, tests, and surveys shall be submitted to this office, noting the effective date of activation.
6. The Division routinely monitors monthly well production data and if anomalous water production is indicated, remedial action will be ordered.
7. **Any well stimulation conducted after January 1, 2014 will be subject to Senate Bill 4 (Chapter 313, 2013 Statute) requirements.**

15.12.010 Permit required. Permits shall be obtained from the City of Huntington Beach for the oil operations, activities, or structures in the City limits of Huntington Beach, as required by this title. (2491-7/81)

15.12.160 Grounds For Suspension Or Revocation. The Fire Chief may suspend or revoke any permit issued by the Fire Department under the provisions of this code upon finding any of the following: (3037-5/90)
(a) A permittee has failed, neglected or refused to perform, comply with or abide by any of the conditions of the permit; (3037-5/90)
(b) That permittee has failed or neglected or refused to comply with or abide by, or has in any way violated any of the provisions of this code, or of any other ordinance of the City, or any other law, rule, or regulation either directly or indirectly, by reason of or in connection with or incidental to his conduct of oil operations;
(c) If any of the permittee's operations or the continuance thereof upon the premises covered by the permit are a menace or hazard to public or private property, or to any interest of the City, or to the lives or safety of persons;
(d) Any of the permittee's operations or the continuance thereof upon the premises covered by the permit constitutes a public nuisance as described in this title;
(e) Permittee has made a willful misrepresentation of facts in any application for any such permit, or in any report or record required by this code to be filed or furnished by permittee.
(2491-7/81, 3037-5/90)
The Fire Chief will set forth his findings in writing and send notice of the same to the permittee. Said notice will contain a date upon which the suspension or revocation takes effect. (3037-5/90)

15.12.170 Effect Of Suspension Or Revocation Of Permit. No person shall carry on any operations performed under the terms of any permit during any period of permit suspension or revocation, or pending a judgment of the court of law upon any application for writ taken to review the decision or order of the City in suspending or revoking such permit; provided, however, that nothing therein contained shall be construed to prevent the performance of such operation as may be necessary in connection with a diligent and bona fide effort to cure and remedy the default or violation for which the suspension or revocation of the permit was ordered, or such operation as necessary for the safety of persons or as required by the Division of Oil and Gas. RE: ANNUAL WELL PERMIT REQUIRED

Dear CORBIN WEED:

The Huntington Beach Oil Code was established in 1981 to set reasonable and uniform limitations, safeguards and controls for present and future operations related to drilling for the production of oil, gas, and other hydrocarbon substances within the city of Huntington Beach. Section 15.12.030 requires that an annual well permit be renewed by July 1st of every year following the drilling of a new well or operation of an existing well.

Effective July 1, 2010, the Fire Department is requiring all well operators to apply for an annual well permit for locations where operations are being conducted. Pursuant to Section 15.12.030, a permit is required for every producing, non-producing, or idle oil and gas well, as well as injection wells.

The annual permit must be renewed each year, prior to July 1st until the well is properly abandoned. One physical permit will be issued per oil operation site. The permit fees are **$190 for initial well at the site and $75 for each additional well at the site**, as established by the Citywide User Fee Schedule. The fee incorporates the cost of performing annual well inspections, although additional charges may apply if re-inspections are required.

Included with this letter is a permit application for each oil operation site that you own, lease, or operate. Please complete the application and return it with payment to:

Huntington Beach Fire Department
2000 Main Street
Huntington Beach, CA 92648

Oil Operation Site Address: 20101 GOLDENWEST
Number of Oil or Gas Wells (not abandoned): 212
Total Annual Permit Fee: $16,015.00

If you have any questions, contact Jeff Lopez, Deputy Fire Marshal/Programs, at (714) 536-5565.

Sincerely,

William Reardon

William Reardon
Division Chief/Fire Marshal

RE: ANNUAL WELL PERMIT REQUIRED

Dear BRENT BOYCE:

The Huntington Beach Oil Code was established in 1981 to set reasonable and uniform limitations, safeguards and controls for present and future operations related to drilling for the production of oil, gas, and other hydrocarbon substances within the city of Huntington Beach. Section 15.12.030 requires that an annual well permit be renewed by July 1st of every year following the drilling of a new well or operation of an existing well.

Effective July 1, 2010, the Fire Department is requiring all well operators to apply for an annual well permit for locations where operations are being conducted. Pursuant to Section 15.12.030, a permit is required for every producing, non-producing, or idle oil and gas well, as well as injection wells.

The annual permit must be renewed each year, prior to July 1st until the well is properly abandoned. One physical permit will be issued per oil operation site. The permit fees are **$190 for initial well at the site and $75 for each additional well at the site**, as established by the Citywide User Fee Schedule. The fee incorporates the cost of performing annual well inspections, although additional charges may apply if re-inspections are required.

Included with this letter is a permit application for each oil operation site that you own, lease, or operate. Please complete the application and return it with payment to:

Huntington Beach Fire Department
2000 Main Street
Huntington Beach, CA 92648

Oil Operation Site Address: 20101 GOLDENWEST
Number of Oil or Gas Wells (not abandoned): 42
Total Annual Permit Fee: $3,265.00

If you have any questions, contact Jeff Lopez, Deputy Fire Marshal/Programs, at (714) 536-5565.

Sincerely,

William Reardon

Appendix Chapter 1, Section 105, of the Huntington Beach Fire Code (HBFC) requires that a permit be obtained from the fire code official to authorize any operations or conditions that are identified in Section 105.6 or 105.7. This permit shall constitute permission to maintain, store or handle materials; or to conduct processes which produce conditions hazardous to life or property; or to install equipment utilized in connection with such activities; or to install or modify any fire protection system or equipment or any other construction, equipment installation or modification in accordance with the provisions of the HBFC where a permit is required. Such permission shall not be construed as authority to violate, cancel or set aside any of the provisions of the HBFC or other applicable regulations or laws of the jurisdiction.

The fire code official is authorized to revoke a permit issued under the provision of the HBFC when it is found by inspection or otherwise that there has been a false statement or misrepresentation as to the material facts in the application or construction documents on which the permit or approval was based including, but not limited to, any one of the following:

1. Conditions and limitations set forth in the permit have been violated.
2. The permit is used for a condition or activity other than that listed in the permit.
3. The permitee failed, refused or neglected to comply with orders or notices duly served in accordance with the provisions of the HBFC within the time provided therein.
4. The permit was issued in error or in violation of an ordinance, regulation or the HBFC.

Issued permits shall be kept on the premises designated therein at all times and shall be readily available for inspection by the fire code official. Permits are not transferrable and any change in occupancy, operation, tenancy or ownership shall require that a new permit be issued. All permits are valid for one year, unless otherwise indicated, and must be renewed prior to expiration.

As per Article 4 of the Huntington Beach Fire Code and Resolution No. 96-51, an authorization form is issued to the owner of the business for an annual maintenance inspection for hazardous processes, assembly occupancies and special events. This authorization constitutes a receipt and permission to maintain, store, use or handle materials, occupy assembly areas, conduct processes which produce conditions hazardous to life or property, or to install equipment used in connection with such activities. Such permission shall not be construed as authority to violate, cancel or set aside any of the provisions of this code.

Fire Department authorizations shall not be transferable and any changes in use, occupancy, operation or ownership shall require a new permit application. All authorizations are valid for a period of one year, unless otherwise indicated, and must be renewed prior to expiration. This form shall serve as receipt of fees applied for the inspection, maintenance and processing of this authorization.

MONITORING SYSTEM CERTIFICATION

For Use By All Jurisdictions Within the State of California

Authority Cited: Chapter 6.7, Health and Safety Code; Chapter 16, Division 3, Title 23, California Code of Regulations

This form must be used to document testing and servicing of monitoring equipment. If more than one monitoring system control panel is installed at the facility, a separate certification or report must be prepared for each monitoring system control panel by the technician who performs the work. A copy of this form must be provided to the tank system owner/operator. The owner/operator must submit a copy of this form to the local agency regulating UST systems within 30 days of test date. Instructions are printed on the back of this page.

A. General Information

Facility Name: AERA ENERGY LLC Bldg. No.:

Site Address: 20101 Golded West City: Huntington Beach Zip: 92648

Facility Contact Person: Susan Perrell Contact Phone No.: (714) 969-3234

Make/Model of Monitoring System: Veeder Root ILS & Beaudreau 522 Date of Testing/Servicing: 10 / 30 /2007

B. Inventory of Equipment Tested/Certified

Check the appropriate boxes to indicate specific equipment inspected/serviced:

Tank ID: JET-A	**Tank ID:**
☐ In-Tank Gauging Probe. Model:	☐ In-Tank Gauging Probe. Model:
☒ Annular Space or Vault Sensor. Model: 794380-303	☐ Annular Space or Vault Sensor. Model:
☒ Piping Sump / Trench Sensor(s). Model: 794380-420	☐ Piping Sump / Trench Sensor(s). Model:
☒ Fill Sump Sensor(s). Model: 794380-420	☐ Fill Sump Sensor(s). Model:
☐ Mechanical Line Leak Detector. Model:	☐ Mechanical Line Leak Detector. Model:
☐ Electronic Line Leak Detector. Model:	☐ Electronic Line Leak Detector. Model:
☒ Tank Overfill / High-Level Sensor. Model: Mechanical Overfill	☐ Tank Overfill / High-Level Sensor. Model:
☐ Other (specify equipment type and model in Section E on Page 2).	☐ Other (specify equipment type and model in Section E on Page 2).
Tank ID: Waste Water	**Tank ID:**
☐ In-Tank Gauging Probe. Model:	☐ In-Tank Gauging Probe. Model:

Dispenser ID:	**Dispenser ID:**
☐ Dispenser Containment Sensor(s). Model:	☐ Dispenser Containment Sensor(s). Model:
☐ Shear Valve(s).	☐ Shear Valve(s).
☐ Dispenser Containment Float(s) and Chain(s).	☐ Dispenser Containment Float(s) and Chain(s).

*If the facility contains more tanks or dispensers, copy this form. Include information for every tank and dispenser at the facility.

C. Certification

- I certify that the equipment identified in this document was inspected/serviced in accordance with the manufacturers' guidelines. Attached to this Certification is information (e.g. manufacturers' checklists) necessary to verify that this information is correct and a Site Plot Plan showing the layout of monitoring equipment. For any equipment capable of generating such reports, I have also attached a copy of the report; *(check all that apply)*: ☐ System set-up ☐ Alarm history report

Technician Name (print): Robert Rodriguez Signature:

Certification No.: A29854 License. No.: 623516

Testing Company Name: R.Y.RODRIGUEZ, INC. Phone No.: (909) 937-9044

Site Address: 20101 Golded West Date of Testing/Servicing: 10 / 30 /2007

D. Results of Testing/Servicing

Software Version Installed: N/A

Complete the following checklist:

☒ Yes	❑ No*	Is the audible alarm operational?
☒ Yes	❑ No*	Is the visual alarm operational?
☒ Yes	❑ No*	Were all sensors visually inspected, functionally tested, and confirmed operational?
☒ Yes	❑ No*	Were all sensors installed at lowest point of secondary containment and positioned so that other equipment will not interfere with their proper operation?
❑ Yes	❑ No* ☒ N/A	If alarms are relayed to a remote monitoring station, is all communications equipment (e.g. modem) operational?
❑ Yes	❑ No* ☒ N/A	For pressurized piping systems, does the turbine automatically shut down if the piping secondary containment monitoring system detects a leak, fails to operate, or is electrically disconnected? If yes: which sensors initiate positive shut-down? *(Check all that apply)* ☒ Sump/Trench Sensors; ☒ Dispenser Containment Sensors. Did you confirm positive shut-down due to leaks and sensor failure/disconnection? ☒ Yes; ❑ No.
❑ Yes	❑ No* ☒ N/A	For tank systems that utilize the monitoring system as the primary tank overfill warning device (i.e. no mechanical overfill prevention valve is installed), is the overfill warning alarm visible and audible at the tank fill point(s) and operating properly? If so, at what percent of tank capacity does the alarm trigger? _____%
❑ Yes*	☒ No	Was any monitoring equipment replaced? If yes, identify specific sensors, probes, or other equipment replaced and list the manufacturer name and model for all replacement parts in Section E, below.
☒ Yes*	❑ No	Was liquid found inside any secondary containment systems designed as dry systems? *(Check all that apply)* ❑ Product; ☒ Water. If yes, describe causes in Section E, below.
☒ Yes	❑ No*	Was monitoring system set-up reviewed to ensure proper settings? Attach set up reports, if applicable
☒ Yes	❑ No*	Is all monitoring equipment operational per manufacturer's specifications?

*** In Section E below, describe how and when these deficiencies were or will be corrected.**

E. Comments:

F. In-Tank Gauging / SIR Equipment:

❑ Check this box if tank gauging is used only for inventory control.
☒ Check this box if no tank gauging or SIR equipment is installed.

This section must be completed if in-tank gauging equipment is used to perform leak detection monitoring.

Complete the following checklist:

❑ Yes	❑ No*	Has all input wiring been inspected for proper entry and termination, including testing for ground faults?
❑ Yes	❑ No*	Were all tank gauging probes visually inspected for damage and residue buildup?
❑ Yes	❑ No*	Was accuracy of system product level readings tested?
❑ Yes	❑ No*	Was accuracy of system water level readings tested?
❑ Yes	❑ No*	Were all probes reinstalled properly?
❑ Yes	❑ No*	Were all items on the equipment manufacturer's maintenance checklist completed?

*** In the Section H, below, describe how and when these deficiencies were or will be corrected.**

G. Line Leak Detectors (LLD):

☒ Check this box if LLDs are not installed.

Complete the following checklist:

❑ Yes	❑ No* ❑ N/A	For equipment start-up or annual equipment certification, was a leak simulated to verify LLD performance? *(Check all that apply)* Simulated leak rate: ❑ 3 g.p.h.; ❑ 0.1 g.p.h ; ❑ 0.2 g.p.h.
❑ Yes	❑ No*	Were all LLDs confirmed operational and accurate within regulatory requirements?
❑ Yes	❑ No*	Was the testing apparatus properly calibrated?
❑ Yes	❑ No* ❑ N/A	For mechanical LLDs, does the LLD restrict product flow if it detects a leak?
❑ Yes	❑ No* ❑ N/A	For electronic LLDs, does the turbine automatically shut off if the LLD detects a leak?
❑ Yes	❑ No* ❑ N/A	For electronic LLDs, does the turbine automatically shut off if any portion of the monitoring system is disabled or disconnected?
❑ Yes	❑ No* ❑ N/A	For electronic LLDs, does the turbine automatically shut off if any portion of the monitoring system malfunctions or fails a test?
❑ Yes	❑ No* ❑ N/A	For electronic LLDs, have all accessible wiring connections been visually inspected?
❑ Yes	❑ No*	Were all items on the equipment manufacturer's maintenance checklist completed?

*** In the Section H, below, describe how and when these deficiencies were or will be corrected.**

FIRE DEPARTMENT AUTHORIZATION

05-09-2007 (This Fire Department receipt must be posted on the premises)

AERA ENERGY LLC
AERA ENERGY LLC
20101 GOLDENWEST ST SUITE#
HUNTINGTON BEACH CA 92648

Issue Date: 1/1/2007
Expiration Date: 1/1/2008
(714) 969-3200

PERMITTEE: AERA ENERGY LLC
LOCATION: 20101 GOLDENWEST ST

FP Master File # 1277 Grid # 3912 Occupancy Type: H3

As per Article 4 of the Huntington Beach Fire Code and Resolution No. 96-51, an authorization form is issued to the owner of the business for an annual maintenance inspection for hazardous processes, assembly occupancies and special events. This authorization constitutes a receipt and permission to maintain, store, use or handle materials, occupy assembly areas, conduct processes which produce conditions hazardous to life or property, or to install equipment used in connection with such activities. Such permission shall not be construed as authority to violate, cancel or set aside any of the provisions of this code.

Fire Department authorizations shall not be transferable and any changes in use, occupancy, operation or ownership shall require a new permit application. All authorizations are valid for a period of one year, unless otherwise indicated, and must be renewed prior to expiration. This form shall serve as receipt of fees applied for the inspection, maintenance and processing of this authorization.

Permit No: 965063027

Permit Type	
C7	Compressed gases, to store, transport on site, dispense, use or handle amt in excess of table 105-A
H1	Hazardous materials, to store, transport on site, use hazardous material in excess of table 105-C
H3	Hot work operations/welding
F3	Flammable or combustible liquids, to use, store or handle this material
L1	Liquefied petroleum gases, to install or maintain any LP-gas container over 125 gallons

DURING WELDING OR OPEN FLAME OPERATIONS: MAINTAIN 10 FEET CLEARANCE FROM COMBUSTIBLES AND 20 FEET CLEARANCE FROM FLAMMABLE LIQUIDS.

Business Owner: AERA ENERGY LLC
Business Name: Phone: (714) 969-3349
Address: 20101 GOLDEN WEST City: HUNTINGTON BEACH State: CA Zip: 92648

All requests for fire permits are processed in Fire Administration. Fees are to be paid in the amount of **$125** to the City of Huntington Beach prior to any permit issuance. The Fire Department depending on the nature of the permit and the risk involved may require additional plans, inspections, and fees. Permits are renewed annually and are non-transferable. A new permit shall be required when there is a change in use, occupancy, business operation, or ownership. All permits that are subject to annual renewal must have fees paid prior to the anniversary date. Inspections must be scheduled 48 hours in advance and can be arranged by contacting Fire Administration at 714-536-5411.

Applicant Signature: Elpidio Vargas

As per Article 4 of the Huntington Beach Fire Code and Resolution No. 96-51, an authorization form is issued to the owner of the business for an annual maintenance inspection for hazardous processes, assembly oecupancies and special events. This authorization constitutes a receipt and permission to maintain, store, use or handle materials, occupy assembly areas, conduct processes which produce conditions hazardous to life or property, or to install equipment used in connection with such activities. Such permission shall not be construed as authority to violate, cancel or set aside any of the provisions of this code.

Fire Department authorizations shall not be transferable and any changes in use, occupancy, operation or ownership shall require a new permit application. All authorizations are valid for a period of one year, unless otherwise indicated, and must be renewed prior to expiration. This form shall serve as receipt of fees applied for the inspection, maintenance and processing of this authorization.

Permit No: 965063027

Permit Types

C7	Compressed gases, to store, transport on site, dispense, use or handle amt in excess of table 4108
F3	Flammable or combustible liquids, to use, store or handle this material
H1	Hazardous materials, to store, transport on site, use hazardous material in excess of table 105-C
H3	Hot work operations/welding
L1	Liquefied petroleum gases, to install or maintain any LP-gas container over 125 gallons

DURING WELDING OR OPEN FLAME OPERATIONS: MAINTAIN 10 FEET CLEARANCE FROM COMBUSTIBLES AND 20 FEET CLEARANCE FROM FLAMMABLE LIQUIDS.

[ ] Aircraft Refueling Vehicles. For certificates required for persons operating refueling units. See Section 24.204.

[ ] Automobile Wrecking Yard. To operate an automobile wrecking yard. See Article 34.

[ ] Bonfires or Rubbish Fires. To kindle or maintenance of bonfires or rubbish fires. See Section 11.101.

[ ] Bowling Pin or Alley Refinishing. To conduct a bowling alley resurfacing operation. See Article 26.

[ ] Burning in Public Place. To ignite or burn waste material on publicly controlled land. See Section 11.113.

[ ] Candles and Open Flames in Assembly Areas. To use open flame or candles in assembly areas or restaurants, dining or drinking establishments. See Sections 25.116 and 25.117 for open flame and candles.

[ ] Cellulose Nitrate Storage. To store or handle more than 25 pounds of cellulose nitrate plastic (pyroxylin). See Article 27.

[ ] Combustible Fiber Storage. To store or handle combustible fibers in quantities in excess of 100 cubic feet. See Article 28.

[ ] Compressed Gases, Flammable. To store, handle or use at normal temperature and pressures more than 2000 cubic feet or flammable compressed gas or 6000 cubic feet of nonflammable compressed gas. See Article 74.

[ ] * Cryogens. (See Article 75.)

A. Produce, store or sell cryogenic fluids.
B. Store or transport nonflammable, nontoxic cryogens in excess of 500 gallons.
C. Store or use more than 10 gallons of liquefied oxygen, flammable cryogenic fluids or cryogenic oxidizers.

[ ] Drycleaning Plants. To engage in the business of drycleaning. Such permits shall prescribe the class of system to be used. See Section 79.1302.

[ ] Dust-producing Operations. To operate a plant producing dusts as defined in Section 76.101.

[ ] Excavations Near Flammable or Combustible Liquid Pipelines. To excavate or do any work below grade within 10 feet of any pipeline used for the transportation of flammable or combustible liquids. See Section 79.1201.

[ ] * Explosives or Blasting Agents. For permits for explosives or blasting agents, see Section 77.104.

[ ] Fireworks. For permits for fireworks, see Article 78.

[ ] Flammable Liquids. To handle, store or use flammable liquids. See Section 79.103. See also permits for spraying or dipping.

[X] * Flammable or Combustible Liquid Tanks. To remove, abandon, place temporarily out of service or otherwise dispose of any flammable or combustible liquid tank. See Section 79.221.

[ ] Flammable or Combustible Liquid Pipelines Operation. To use or operate a pipeline used for the transportation of flammable or combustible liquid tank. See Section 79.1201.

[ ] Fruit Ripening. To ripen fruit by the process described in Section 46.101.

[ ] * Fumigation or Thermal Insecticidal Fogging. To operate a business of fumigation or thermal insecticidal fogging. See Article 47.

[ ] Garages. To use any structure as a place of business for repairing motor vehicles. See Article 29.

[ ] * Hazardous Chemicals. To store, transport or handle certain quantities of hazardous material or any amount of highly toxic materials, pyrophoric materials, cryogenic or poisonous gases. See Article 80.

[ ] High-piled Combustible Stock. To use any building or portion thereof exceeding 2500 square feet for the storage of high-piled combustible stock. See Article 81.

[ ] Junk yards. To operate a wrecking yard, junk or waste material handling plant. See Article 34.

[ ] Liquefied Petroleum Gases. Except for portable containers of less than 120 gallons water capacity to install or maintained any LP gas container or operate any tank vehicle which is used for the transportation of LP gas. See Article 30.

[ ] Lumber Yards. To store lumber in excess of 100,000 board feet. See Article 82.

[ ] Matches. To manufacture matches or to store matches exceeding an aggregate 60 matchman's gross. See Article 83.

[ ] Magnesium Working. To melt, cast, heat treat or grind more than 10 pounds of magnesium per working day. See Article 48.

[ ] * Nitrate Film. To store, handle, use or display nitrate film. See Article 33.

[ ] Open Flame Devices in Marinas. See Section 11.412.
To use open flame devices for maintenance or repair of boats, slips or wharfs.

[ ] Oil Wells. To drill, own operate or maintain an oil well. See Section 79.1001.

[ ] Organic Coatings. To manufacture more than one gallon of organic coatings in a working day. See Article 50.

[ ] Ovens, Industrial Baking or Drying. To operate an industrial baking or drying oven regulated by this code. See Article 62.

[ ] Places of Assembly. To operate a place of assembly as defined in Article 9.

[ ] * Radium. To store or handle at any installation. See Article 80.

[ ] Refrigeration Equipment. To operate a refrigeration unit or system containing more than 20 pounds of refrigerant other than air or water. See Article 63.

[ ] Spraying or Dipping. To operate a spraying or dipping enterprise utilizing flammable liquids included within the scope of Article 45. See Section 45.101.

[ ] Tank Vehicles. To operate a tank vehicle for the transportation of flammable or combustible liquids. See Article 79, Division XI.

[ ] Tents and Air-supported Structures. To erect or operate a tent or air-supported structure covering an area in excess of 200 square feet unless such structures are not used exclusively for camping. See Article 32.

[ ] Tire Recapping. To operate tire recapping or rebuilding plants. See Article 31.

[ ] Waste Material Handling Plant. To operate a waste material handling plant. See Article 34.

*Limits of Quantity Remove: (1) 7500 gal. leaded gas, (1) 5000 gal. Stoddard solvent and (1) 2000 gal. Stoddard solvent. Must comply with City Specification No. 418. Must schedule appointment at least 24 hours in advance. Tanks to go to AMR - Ontario (714)947-2888

In accordance with the permit requirements of the Huntington Beach Municipal Code, Chapter 17.56, I hereby make application to maintain, store or handle materials or conduct a use or a process, as described herein, and install equipment connected with such activity. I agree to comply with all of the requirements of this Municipal Code.

PERMIT

By authority of the Huntington Beach Municipal Code, Chapter 17.56, a permit is hereby granted to:

SID LOCKE
(Permitee Name)

AMINOIL USA
(Business Name) located at

20101 GOLDENWEST, H.B. 536-6521
(Business Address) (Phone) to maintain,

store or handle materials, or conduct a use or a process as described herein, and install equipment connected with such activity in which the conditions, surroundings and arrangement are such that the intent of the Municipal Code may be complied with. A life/fire safety inspection will be conducted _____ a year by the Fire Department.

DESCRIPTION OF PERMITTED USE:

(6) 1000 GALLON PROPANE TANKS TO BE USED FOR FUEL FOR DRILLING RIG.

This permit is issued and accepted on the condition that all requirements of the Huntington Beach Municipal Code, Chapter 17.56 be fulfilled.

This permit does not replace any license or any permit that is required by law or that is required by another agency. Any change in the occupancy use shall require a new permit. This permit is non-transferable.

Valid Period UNTIL REVOKED

Frank A. Kelly
(Fire Marshal)

Dated Issued: MARCH 26, 1980

Richard B. Turnbaum
(Other Permitter)

THIS PERMIT SHALL BE KEPT POSTED ON THE PREMISES AT ALL TIMES.

BAKERSFIELD CA 93389

Long Beach, California
July 9, 1993

Your proposal to **abandon** well **"State PRC 392" S-7**, A.P.I. No. **259-02919**, Section **3**, T. **6S**, R. **11W**, **S.B.** B. & M., **Huntington Beach** Field, **South Area, Offshore** area, **Lower Main** pool, **Orange** County, dated **6-24-93**, received **6-28-93** has been examined in conjunction with records filed in this office.

THE PROPOSAL IS APPROVED PROVIDED:

1. Blowout prevention equipment, equivalent to this Division's Class **II2M** requirements, or better, shall be installed and maintained in operating condition.
2. The proposed **operations do not** fulfill the requirements of this Division for the abandonment of the lower portion of the hole without further consideration.
3. This Division shall be consulted and a Supplementary Notice may be required before making any changes in the proposed program.
4. **THIS DIVISION SHALL BE NOTIFIED TO:**
   a. Witness the squeeze cementing of the **8 5/8"** casing through the **retainer** at **830'±**.
   b. Witness the squeeze cementing of the **8 5/8"** casing through the **perforations** at **750'±**.
   c. Witness the location and hardness of the cement plug at **surface.**
   d. Inspect and approve the cleanup of the well site.

NOTE:

1. A crew drill may be required at the time of the blowout prevention equipment inspection.
2. The proposed surface plug shall not contain rock or gravel.
3. The base of the freshwater sands is at **1100'±**.

February 8, 1993

Oil Field Inspector - Huntington Beach Fire Dept.
2000 Main
Huntington Beach, CA 92648

Dear Neighbor:

About February 15, 1993 work will begin to clean, dismantle and haul away several idle storage tanks and related equipment located on our oil lease near your property. This work is part of our continuing plan to upgrade the overall aesthetics, safety and environment of this lease. This overall plan has been discussed with the Huntington Beach City Council, Amigos de Bolsa Chica and other interested parties.

This particular dismantling project is expected to take about 20 weeks. Hours of work will be 7:00 a.m. to 6:00 p.m., Monday through Friday, as per city code. Although this work will require heavy equipment and trucks typical of any construction project, we hope the final result -- a more pristine, less "industrialized" Bolsa Chica -- will be worth whatever inconvenience you may have been caused.

If you have any questions, please direct them to Gary Cram here at our Huntington Beach Production Unit at 969-3272 or Ron Shenkman, our local community relations consultant at 847-3581. We thank you in advance for your patience.

Sincerely,

L B Buckley

ENVIRONMENTAL ASSESSMENT COMMITTEE AGENDA

Wednesday, September 4, 1991

2:00 P.M.

3rd Floor Center Conference Room

I. Environmental Assessment No. 91-25:

Applicant: Shell Western Exploration and Production, Inc.

Request: To dismantle the existing natural gas plant (Gas Plant #11) located northwest of the terminus of Seapoint Avenue within the proposed boundary of the Linear Park and to reconstruct a new gas plant within the boundaries of the existing Shell facility at PCH and Goldenwest Street. The new plant will consist of three buildings - control room. Sulferox enclosure and the compressor building. Buildings will range in height from 10-25 feet. The process will occur over a four year period.

Location: 20101 Goldenwest Street and Gas Plant #11 (northwest of terminus of Seapoint Avenue)

II. Environmental Assessment No. 91-36:

Applicant: City of Huntington Beach

Request: Deletion of Talbert Avenue between Goldenwest and Gothard Street as an arterial on the City's Circulation Plan of Arterial Streets and Highways to allow for subsequent development of a parking lot in conjunction with the Huntington Beach Central Library expansion project.

Location: Talbert Avenue between Goldenwest and Gothard Streets.

(0625d)

ENVIRONMENTAL CHECKLIST FORM

CITY OF HUNTINGTON BEACH

PLANNING DIVISION

ENVIRONMENTAL ASSESSMENT NO. 91-25

1. Name of Proponent: Shell Western Exploration and Production, Inc.
   Address: 5060 California Ave.
   Bakersfield, CA

2. Date Checklist Submitted for Review: September 4, 1991

3. Concurrent Entitlement(s): none

4. Project Location: 20101 Goldenwest Street and Gas Plant #11 (Northwest of Terminus of Seapoint Avenue).

5. Project Description: To dismantle the existing natural gas plant (Gas Plant #11) located northwest of the terminus of Seapoint Avenue within the proposed boundary of the Linear Park and to reconstruct a new gas plant within the boundaries of the existing Shell facility at PCH and Goldenwest Street. The new plant will consist of three buildings - Control room, Sulferox enclosure and the Compressor building. Buildings will range in height from 10-25 feet. The entire construction and removal process will occur over a four year period.

ENVIRONMENTAL IMPACTS

(Explanations of answers are included after each subsection.)

	Yes	Maybe	No
1. Earth. Will the proposal result in:			
a. Unstable earth conditions or changes in geologic substructures?	___	___	X
b. Disruptions, displacements, compaction or overcovering of the soil?	___	X	___

Discussion: Removal of the existing Gas plant facilities and construction of new facilities is anticipated to result in some distruptions, displacements, compaction and overcovering of soils. However, the existing plant site will be restored pursuant to Federal, State and local requirements. Construction of the new facilities is within the boundaries of the existing SWEPI facilities which is predominantly developed. No significant impact is anticipated.

	Yes	Maybe	No
c. Change in topography or ground surface relief features?	___	___	X
d. The destruction, covering or modification of any unique geologic or physical features?	___	___	X

Discussion (c, d): The new facility will be located within the boundaries of the existing SWEPI site which is primarily flat and does not contain any unique physical or geologic features. The new facility does not propose any substantial grading and is not anticipated to result in any significant topographical impacts. The existing Gas Plant (#11) site will be cleared and restored pursuant to State, Federal and local regulations. No significant impacts are anticipated.

e. Any increase in wind or water erosion of soils, either on or off the site?	___	___	X

Discussion: Grading and excavation activities associated with the proposed project may result in short-term wetting/covering of excavated soils and collection of runoff on site. No significant impacts are anticipated.

f. Changes in deposition or erosion of beach sands, or changes in siltation, deposition or erosion which may modify the channel of a river or stream or the bed of the ocean or any bay, inlet or lake?	___	___	X
g. Exposure of people or property to geologic hazards such as earthquakes, landslides, mudslides, ground failure, or similar hazards?	___	___	X

2. Air. Will the proposal result in:

a. Substantial air emissions or deterioration of ambient air quality?	___	X	___

Discussion: The proposed project is anticipated to result in a decrease in emissions due to removal of old equipment and installation of new, more efficient equipment. Based upon background information submitted by SWEPI, the emissions of PM, SO_2, NO_x, CO, CO_2, VOC, CH_4, NH_3 and H_2S are reduced between 53 and 99%. The reductions will result in an improvement of ambient air quality. The type of emissions will not change from those at Gas Plant #11 and are typical for oil/gas production facilities.

The emissions from Gas Plant #11 and the estimated emissions from the proposed facility are presented in Figure 2-1a, 2-1b, 2-1c and 2-1d. The percent emission reduction by component are presented in Figure 2-2. (See Attachment 4).

Furthermore, the proposed plant will employ BACT as defined by the SCAQMD for all emission sources, internal combustion engines currently used to drive the gas compressors will be replaced with electric motor-driven compressors, steam boilers will be removed from service, and vents and pressure relief valves will be routed to a ground flare to minimize the emission of gas during upset conditions. No significant adverse impacts are anticipated.

b. The creation of objectionable odors?	___	X	___

Discussion: The amount of odor is anticipated to be reduced because the new gas plant will employ BACT for fugitive emissions, will have significantly less fugitive emission sources, and will have increased H_2S removal efficiency. Furthermore, removal of the existing facilities will improve the environment around the wetlands and the proposed linear park areas and is anticipated to result in air quality benefits in the area.

c. Alteration of air movement, moisture, or temperature, or any change in climate, either locally or regionally?	___	___	X

3. Water. Will the proposal result in:

	Yes	Maybe	No
a. Changes in currents, or the course of direction of water movements, in either marine or fresh waters?	___	___	X

Discussion: Neither site is located in a floodplain, no streams flow across the property and no dredging of filling of water sources will be required to prepare the sites. No discharge of water will occur to any body of water off the site since all storm water and process waste water will be disposed on site.

b. Changes in absorption rates, drainage patterns, or the rate and amount of surface runoff?	___	___	X

Discussion: The proposed project will not result in changes in absorption rates, drainage patterns, or the rate and amount of surface runoff. No runoff will leave the site or be discharged into a public storm water drainage system. Rainwater falling within the existing SWEPI facility, where the new gas plant is to be located, is collected in several rainwater storm pits and pumped into two storm water surge tanks. The water is then pumped to a skim oil separator where trace amounts of oil are removed before the water is blended with the produced water in the field and re-injected into the oil reservoir. No significant impact is anticipated.

c. Alterations to the course or flow of flood waters?	___	___	X

Discussion: The site is classified in Zone X under the Flood Insurance Rate Map designations and is not located in a flood plain. No construction or demolition will occur in a flood plain.

d. Change in the amount of surface water in any water body?	___	___	X

Discussion: See 3a.

e. Discharge into surface waters, or in any alteration of surface water quality, including but not limited to temperature, dissolved oxygen or turbidity?	___	___	X

Discussion: See 3a.

f. Alteration of the direction or rate of flow of ground waters?	___	___	X
g. Change in the quantity of ground waters, either through direct additions or withdrawals, or through interception of an aquifer by cuts or excavations?	___	___	X
h. Substantial reduction in the amount of water otherwise available for public water supplies?	___	___	X

Discussion: The amount of water available to the public will not be affected by this project. The current water usage rate will not change upon completion of the proposed project.

i. Exposure of people or property to water related hazards such as flooding or tidal waves?	___	___	X

Discussion: See 3c.

4. Plant Life. Will the proposal result in:

a. Change in the diversity of species, or number of any species of plants (including trees, shrubs, grass, crops, and aquatic plants)?	___	___	X
b. Reduction of the numbers of any mature, unique, rare or endangered species of plants?	___	___	X

	Yes	Maybe	No
c. Introduction of new species of plants into an area, or in a barrier to the normal replenishment of existing species?	___	___	X
d. Reduction in acreage of an agricultural crop?	___	___	X

Discussion (a-d): Plant life is virtually non-existent on either site because both sites are currently occupied by oil facilities. Grasses and weeds that are present may be removed during the construction phase are not unique and are not anticipated to change the diversity or adversely impact plant species in the area.

5. Animal Life. Will the proposal result in:

	Yes	Maybe	No
a. Change in the diversity of species, or numbers of any species of animals (birds, land animals including reptiles, fish and shellfish, benthic organisms or insects)?	___	___	X
b. Reduction of the numbers of any unique, rare or endangered species of animals?	___	___	X
c. Introduction of new species of animals into an area, or result in a barrier to the migration or movement of animals?	___	___	X
d. Deterioration to existing fish or wildlife habitat?	___	___	X

Discussion (a-d): Both sites are currently occupied by oil facilities and do not appear to support any unique, rare or endangered species of animals. However, Gas Plant #11 is located adjacent to a wetland area. Five endangered bird species are known to use, of have been reported overflying the Bolsa Chica wetlands. These include the Brown Pelican, the Light-footed Clapper Rail, the Peregrine Falcon and the Belding Savannah Sparrow. None of these have been observed at the new facility site or the Gas Plant #11 site.

SWEPI has contacted the California Department of Fish and Game and the U.S. Fish and Wildlife to provide information on these birds. SEWPI has agreed to work with these agencies to protect the endangered species during construction demolition and operating activities. The project will not require the removal of any critical habitat. Removal of Gas Plant #11 and future linear park development is anticipated to allow for increased foraging and perching areas as well as provide a reduction is the amount of emissions, noise and traffic near the wetland area.

6. Noise. Will the proposal result in:

Discussion:

	Yes	Maybe	No
a. Increases in existing noise levels?	___	X	___
b. Exposure of people to severe noise levels?	___	X	___

Discussion (a-b): Short term: Typical construction related noise will be generated at the project sites during the removal and construction phases. Construction noise sources include diesel or gasoline-powered dozers, graders, loaders, backhoes, dump trucks, air compressors and welding machines. Noise levels at 50 feet from the diesel-powered equipment typically range from 80 to 90 dBA. Gasoline-powered equipment noise levels typically range from 75 to 80 dBA at 50 feet. Construction noise is intermittent in nature and only occurs during the construction phase of the project. The use of off-site modular construction (prefabrication) will be maximized to reduce time required for on site construction. No construction or demolition activities will be permitted on Sundays, Federal holidays or between the hours of 8 p.m. to 7 a.m. Monday through Saturday, per the Huntington Beach Municipal Code, Chapter 8.40.

Long Term: Noise levels generated by new equipment in the proposed gas plant will be less than noise levels generated by equipment currently operating in Gas Plant #11. The main noise sources in Gas Plant #11, the internal combustion engine-driven compressors, will be replaced with quieter electric motor-driven compressors and are expected to reduce noise levels by 5 dBA. Furthermore, the compressors at the new facility will be located further from residences than those currently used at the Gas Plant.

7. Light and Glare. Will the proposal produce new light or glare? ___ X ___

Discussion: Demolition of the existing gas plant will remove light and glare adjacent to the wetlands area and is anticipated to result in a benefit. The new lighting will not be a significant change from the existing lighting at the facility. Exterior lighting proposed for the new facility will be limited to safety lighting. Outdoor lighting will be used to allow plant operators to work safely and efficiently, approximately 5 foot-candles of light around the process areas and 0.1 foot-candles around the buildings for safety. The project proposes providing lighting which will be shielded to prevent excessive glare off-site. Furthermore, the new site is not located near any residences or other sensitive receptors. No significant adverse impacts are anticipated.

8. Land Use. Will the proposal result in a substantial alteration of the present or planned land use of an area? ___ ___ X

Discussion: The new gas plant consists of the same type of activities as is currently conducted at the SWEPI facility and does not constitute an alteration of the present or planned zoning of the area.

9. Natural Resources. Will the proposal result in:

a. Increase in the rate of use of any natural resources? ___ ___ X

b. Substantial depletion of any non-renewable natural resource? ___ ___ X

Discussion (a-b): The facility will burn less fuel because of the transformation of the compressor drivers from natural gas to electric and the removal of the boilers. More electricity from Southern California Edison will be used by the site to supply the compressor drivers. The amount of electricity required by the project will not be a substantial increase in the demand of the existing facility. No new sources of energy will be required. No significant adverse impacts are anticipated.

10. Risk of Upset. Will the proposal involve:

a. A risk of an explosion or the release of hazardous substances (including, but not limited to oil, pesticides, chemicals or radiation) in the event of an accident or upset conditions? ___ ___ X

b. Possible interference with an emergency response plan or an emergency evacuation plan? ___ ___ X

Discussion (a-b): This project involves the replacement of Gas Plant #11 with a new gas plant. Demolition/removal of the existing plant will be subject to Federal, State and local requirements for clean-up of the site. Development of the new pump station is anticipated to decrease the risk due to the reduction of hazardous waste generated, less fugitive emissions of natural gas, reduction of natural gasoline storage and propane storage, and the increase in distance from the new gas plant to residential areas. The risk associated with the proposed gas plant will also be reduced by utilizing an improved fire protection system. SWEPI has been working with the City of Huntignton Beach Fire Dept. in preparing a fire protection system. Gas Plant operations will be subject to Fire Department approval.

	Yes	Maybe	No
11. Population. Will the proposal alter the location, distribution, density, or growth rate of the human population of an area?	___	___	X
12. Housing. Will the proposal affect existing housing, or create a demand for additional housing?	___	___	X
13. Transportation/Circulation. Will the proposal result in:			
a. Generation of substantial additional vehicular movement?	___	___	X

Discussion: The proposed project will not change the amount of vehicle trips to and from the Huntington Beach Facility. Vehicle trips from Gas Plant #11 to the Strip will cease once the new gas plant is operational and will result in a net reduction in trips. The reduction in traffic is anticipated to be beneficial to the animals that live in the area west of the existing facility.

b. Effects on existing parking facilities, or demand for new off-site parking?	___	___	X

Discussion: All parking for the new facility will be accommodated on-site.

c. Substantial impact upon existing transportation systems?	___	___	X

Discussion: The project will not have an impact upon existing transportation systems since the amount of vehicle trips and the number of employees at the site will remain the same. There will be a decrease in traffic through the Bolsa Chica wetlands when Gas Plant #11 is removed.

d. Alterations to present patterns of circulation or movement of people and/or goods?	___	___	X
e. Alterations to waterborne, rail or air traffic?	___	___	X
f. Increase in traffic hazards to motor vehicles, bicyclists or pedestrians?	___	X	___

Discussion: Removal of the existing Gas Plant and construction of the new plant will increase truck and construction equipment traffic. However, with the implementation of the following mitigation measure, no significant impact is anticipated.

Mitigation:

1. Applicant shall submit demolition/construction vehicle routing plans to the City of Huntington Beach Traffic Division for approval prior to issuance of demolition and building permits.

14. Public Services. Will the proposal have an effect upon, or result in a need for new or altered governmental services in any of the following areas:			
a. Fire protection?	___	___	X

Discussion: There are adequate fire services available to both sites. Th proposed project will not require any additional fire manpower or facilities. Discussion of fire related impacts has been addressed under 10 a,b.

b. Police protection?	___	___	X

Discussion: There are adequate police services available to both sites. The proposed project will not require any additional police manpower or facilities.

	Yes	Maybe	No
c. Schools?	___	___	X

Discussion: No school facilities will be impacted by the proposed project. The nearest school is located between 1.0 - 1.4 miles from either site. No significant impacts are anticipated.

d. Parks or other recreational facilities?	___	X	___

Discussion: Removal of the existing facilities (Gas Plant #11) and clean-up of that site will make the site available for future linear park development. The environmental impacts associated with removal of the oil facilities and subsequent park development have been addressed by the EIR for the linear park. This project will allow for future park development and is not anticipated to result in any significant adverse impacts to park or recreational facilities.

f. Other governmental services?	___	___	X

Discussion (e-f): All proposed facilities will be removed, constructed an operated by SWEPI; no additional governmental facilities or services will be required to serve the site.

15. Energy. Will the proposal result in:

a. Use of substantial amounts of fuel or energy?	___	___	X
b. Substantial increase in demand upon existing source of energy, or require the development of sources of energy?	___	___	X

Discussion (a,b): See 9 (a,b):

16. Utilities. Will the proposal result in a need for new systems, or substantial alterations to the following utilities:

a. Power or natural gas?	___	___	X
b. Communication systems?	___	___	X
c. Water?	___	___	X
d. Sewer or septic tanks?	___	___	X
e. Storm water drainage?	___	___	X
f. Solid waste and disposal?	___	___	X

Discussion (a-f): This project will not increase the demand on private or city water, natural gas, or sewage treatment systems. There will be an increase in the amount of electricity purchased from SCE but the increase will not require new systems or substantial upgrades.

17. Human Health. Will the proposal result in:

a. Creation of any health hazard or potential health hazard (excluding mental health)?	___	___	X
b. Exposure of people to potential health hazards?	___	X	___

Discussion (a,b): See 10 (a,b).

18. Aesthetics. Will the proposal result in the obstruction of any scenic vista or view open to the public, or will the proposal result in the creation of an aesthetically offensive site open to public view? ___ X ___

Discussion: The proposed project will remove a gas facility from within the linear park boundary and relocate the operations with the existing SWEPI facility. Removal of the existing facilities may result in visual benefits to that area. The new facilities will be a maximum of 25 feet tall and due to the scale of structures and equipment already existing at the facility, are not anticipated to result in any significant adverse view impacts.

19. Recreation. Will the proposal result in an impact upon the quality or quantity of existing recreational opportunities? ___ ___ X

Discussion: The proposed project will not effect any existing recreational facilities.

20. Cultural Resources.

a. Will the proposal result in the alteration of or the destruction of a prehistoric or historic archaeological site? ___ X ___

b. Will the proposal result in adverse physical or aesthetic effects to a prehistoric or historic building, structure, or object? ___ X ___

c. Does the proposal have the potential to cause a physical change which would affect unique ethnic cultural values? ___ X ___

d. Will the proposal restrict existing religious or sacred uses within the potential impact area? ___ X ___

Discussion (a-d): The proposed project does not encroach into any known archeological sites; however, Gas Plant #11 is in the vicinity of several known archaeological sites. Excavation activities associated with removal of the Gas Plant may potentially encounter archaeologically or culturally significant materials. However, with implementation of the following mitigation measures, no significant impact is anticipated.

Mitigation:

1. An on-site qualified archaeologist should monitor all initial grading and excavation activities.

2. Should any cultural materials be encountered during the initial site servey or during grading and excavation activities, all activity shall cease and the archaeologist shall determine the appropriate course of action.

3. Should any human bone be encountered during any construction activities on the site, the archaeologist shall contact the coroner pursuant to Section 5097.98 and 5097.99 of the Public Resources Code relative to Native American Remains. Should the coroner determine the human remains to be Native American, the Native American Heritage Commission shall be contacted pursuant to State Law SB 297.

	Yes	Maybe	No

21. Mandatory Findings of Significance.

a. Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	___	___	X
b. Does the project have the potential to achieve short-term, to the disadvantage of long-term, environmental goals? (A short-term impact on the environment is one which occurs in a relatively brief, definitive period of time while long-term impacts will endure well into the future.)	___	___	X
c. Does the project have impacts which are individually limited, but cumulatively considerable? (A project may impact on two or more separate resources where the impact on each resource is relatively small, but where the effect of the total of those impacts on the environment is significant.)	___	___	X
d. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	___	___	X

DETERMINATION

On the basis of this initial evaluation:

I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared. ___

I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because the mitigation measures described on an attached sheet have been added to the project. A NEGATIVE DECLARATION WILL BE PREPARED. ___

I find the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required. ___

Huntington Beach, CA 92648

Dear Neighbor:

About February 15, 1993 work will begin to clean, dismantle and haul away several idle storage tanks and related equipment located on our oil lease near your property. This work is part of our continuing plan to upgrade the overall aesthetics, safety and environment of this lease. This overall plan has been discussed with the Huntington Beach City Council, Amigos de Bolsa Chica and other interested parties.

This particular dismantling project is expected to take about 20 weeks. Hours of work will be 7:00 a.m. to 6:00 p.m., Monday through Friday, as per city code. Although this work will require heavy equipment and trucks typical of any construction project, we hope the final result -- a more pristine, less "industrialized" Bolsa Chica -- will be worth whatever inconvenience you may have been caused.

If you have any questions, please direct them to Gary Cram here at our Huntington Beach Production Unit at 969-3272 or Ron Shenkman, our local community relations consultant at 847-3581. We thank you in advance for your patience.

Sincerely,

L B Buckley

Business Name: OKJ USA Inc. Huntington Beach Phone:

Address: 20101 Golden West City: State: Zip:

All requests for permits are processed in Fire Administration and must be paid prior to any permit issuance. **Payment by check made out to the CITY OF HUNTINGTON BEACH is accepted in the Fire Department. All other types of payments are accepted in the City Treasurer's Office.** Fees will be charged according to the Huntington Beach Fire Department fee schedule. The Fire Department, depending on the nature of the permit and the risk involved, may require additional plans, inspections, and fees. Permits are renewed annually and are non-transferable. A new permit shall be required when there is a change in use, occupancy, business operation, or ownership. All permits that are subject to annual renewal must have fees paid prior to the anniversary date. Inspections must be scheduled 48-hours in advance and can be arranged by contacting Fire Administration at (714) 536-5411.

Appendix Chapter 1, Section 105, of the Huntington Beach Fire Code (HBFC) requires that a permit be obtained from the fire code official to authorize any operations or conditions that are identified in Section 105.6 or 105.7. This permit shall constitute permission to maintain, store or handle materials; or to conduct processes which produce conditions hazardous to life or property; or to install equipment utilized in connection with such activities; or to install or modify any fire protection system or equipment or any other construction, equipment installation or modification in accordance with the provisions of the HBFC where a permit is required. Such permission shall not be construed as authority to violate, cancel or set aside any of the provisions of the HBFC or other applicable regulations or laws of the jurisdiction.

The fire code official is authorized to revoke a permit issued under the provision of the HBFC when it is found by inspection or otherwise that there has been a false statement or misrepresentation as to the material facts in the application or construction documents on which the permit or approval was based including, but not limited to, any one of the following:

1. Conditions and limitations set forth in the permit have been violated.
2. The permit is used for a condition or activity other than that listed in the permit.
3. The permitee failed, refused or neglected to comply with orders or notices duly served in accordance with the provisions of the HBFC within the time provided therein.
4. The permit was issued in error or in violation of an ordinance, regulation or the HBFC.

Issued permits shall be kept on the premises designated therein at all times and shall be readily available for inspection by the fire code official. Permits are not transferrable and any change in occupancy, operation, tenancy or ownership shall require that a new permit be issued. All permits are valid for one year, unless otherwise indicated, and must be renewed prior to expiration.

RE: Off-Shore Fire Life Safety Inspections for OXY USA, Inc. Oil Platform Emmy

Dear Mr. Kapelke:

The Huntington Beach Fire Department (HBFD) has reviewed the status of jurisdictional, authority, and responsibility to conduct off-shore fire / life safety inspections for OXY Platform Emmy.

After consulting with the State Lands Commission and the California State Fire Marshal's Office, it has been determined that the California State Lands Commission is the lead regulatory agency responsible for oil production in the State of California tidelands and submerged lands. Enclosed please find two letters verifying this responsibility.

As such, the State Lands Commission states they are the authority having jurisdiction and responsibility to conduct fire and safety inspections at this facility. Therefore, the HBFD will no longer conduct fire and life safety inspections for OXY Platform Emmy.

The HBFD has had a long and excellent working relationship with the offshore oil platform operators. We look forward to continuing this relationship and providing any assistance that we can. If you have any questions, please contact me directly at (714) 536-5564.

Sincerely,

William Reardon

Huntington Beach, California 92648

Dear Chief McIntosh:

Recently, at the request of your department, the Office of the State Fire Marshal facilitated a determination of responsibility and authority to conduct life safety inspections of oil drilling and production platforms located in State waters. The attached letter from the California State Lands Commission (SLC) delineated that the SLC has exclusive jurisdiction and provides local government with clarification on responsibility and authority to conduct life safety inspections of State water platforms.

This letter was sent to your agency for information purposes only. If you have any questions please contact Bob Gorham, Division Chief, Pipeline Safety Division at (562) 497-9102.

Sincerely,

TONYA L. HOOVER
State Fire Marshal

Subject: Offshore Platform Life Safety Inspections

Dear Mr. Reardon:

This letter is in response to your inquiry through Mr. Bob Gorham, Division Chief of the Office of the State Fire Marshall, Pipeline Safety Division, regarding Life Safety Inspections at the two oil drilling and production platforms, Emmy and Eva, located in State waters offshore Huntington Beach. The inquiry is: who is responsible for conducting life safety inspections at these platforms.

Public Resources Code Section 6301 provides that the State Lands Commission has exclusive jurisdiction over all ungranted tidelands and submerged lands owned by the State, and that the Commission shall exclusively administer and control all such lands. I believe this definitively answers the question of responsibility.

I have attached a short description of the programs carried out by our engineers here at the Mineral Resources Management Division in Long Beach, and our inspection staff at the Huntington Beach field office. Should you wish to discuss these programs further, please contact Mr. Pete Johnson, Chief of Operations and Compliance, at (562) 590-5201.

Sincerely,

Marina Voskanian

Marina Voskanian, P.E.
Acting Division Chief
Mineral Resources Management Division

Lakewood, CA 90712

MRMD SAFETY AND POLLUTION PREVENTION PROGRAMS

1. Platform Inspections

The MRMD Facility Inspection/Audit Program uses a two-pronged approach to assure Best Achievable Protection on marine facilities in its jurisdiction. First, the safety system must be designed correctly to prevent spills, and maintenance and training programs must be sufficient to preserve system integrity and provide qualified operation. This is discussed below in the "Facility Safety Audits" section. Second, the facility must be inspected regularly to verify that it is reliable and kept in a fully operable condition. Protection would be compromised by either design flaws or operational deficiencies.

The Platform Inspection Program provides the reliability part of the protection equation. Inspections are conducted at every offshore facility monthly, per MRMD regulations, and are conducted by MRMD inspectors from the Huntington Beach or Goleta field offices.

The core of each inspection is physical testing of the facilities production and processing alarms and shutdowns. This includes each well's surface and subsurface safety valves, the emergency shutdown system, high and low pressure and level alarms installed in vessels and tanks, toxic and combustible gas detectors, fire and smoke detection equipment, fire, abandon platform, and man overboard alarms, pipeline alarms, fire pumps, deluge and fire control system, and the emergency generator. In addition, the functioning of navigational aids is checked, spill response equipment is inventoried, maintenance and calibration records of pressure relief valves, cathodic protection rectifiers, firefighting equipment, and life saving equipment are reviewed. Additionally, pipeline right-of-way surveillance, spill drill, and boom deployment records are checked for compliance with required schedules. Each inspection requires two to three days complete, and includes testing of an average of 317 devices. Deficiencies are corrected immediately, or the affected equipment is shut down and isolated, which may require shut in of the entire facility.

The platform inspections provide assurance that the safety systems are kept in good operating condition, and that the equipment to respond to emergencies and spills is available and in good operating condition. The Inspectors also conduct daily surveillance of operations, pollution checks at facilities, beaches, and along pipelines, as well as royalty production verification duties.

2. Facility Safety Audits

The Safety and Spill Prevention Audit Program provides an analysis of the technical design of a facility's safety system and verification that the alarms and controls have been installed and operate as designed, and comply with MRMD regulations and industry standards from the American Petroleum Institute (API), American Society of Mechanical Engineers (ASME), American Society for Testing and Materials (ASTM),

National Association of Corrosion Engineers (NACE), and other professional organizations. The audits are conducted by a staff of six engineers in the Long Beach MRMD office with training in process safety management auditing, system safety design, process hazard analysis, preventing human error, root cause analysis, mechanical integrity analysis, management of change, and facility fire, electrical and instrumentation codes, as well as extensive experience in oilfield operations.

This analysis requires that the facility's "Piping and Instrumentation Drawings," a schematic representation of the layout and specifications of all wellheads, flowlines, process piping, vessels, alarms, and controls at the facility, be field verified for accuracy before the technical evaluation is conducted. The audit also reviews equipment maintenance and corrosion prevention and inspection programs and results to evaluate fitness for purpose of pressure vessels, tanks, and piping. The design, maintenance, and condition of the electrical power distribution circuits and fire detection and control systems and equipment are analyzed and inspected by a third-party contractor for compliance with the National Electrical Code (NEC), including NEC 70, the National Fire Code (NFC). Training and qualification programs are reviewed to assure competent training in, and oversight of, operation of the facility, and the Facility Operating Manual and Spill Prevention Plan are reviewed to evaluate adequacy of procedures for normal operation, upset conditions, and response to spill incidents.

Organizational safety culture, and the level of maturity of safety programs, is evaluated by a Safety Assessment of Management Systems (SAMS) procedure, which assesses these factors through a series of confidential interviews with a cross-section of company operators, engineers, management, and contractors. The SAMS evaluation is a tool that addresses human error factors, and which can be used by the operator to improve programs to reduce human error.

The safety audit provides a comprehensive evaluation of facility design, condition, procedures, and personnel qualifications, producing a matrix of action items that are prioritized by risk, and corrected during a follow-up phase. Safety audits are repeated every five years, as recommended by industry and government codes.

3. Pipeline Inspections

CSLC regulations require that all oil and gas pipelines in State waters be internally and externally inspected annually. The test equipment and procedures must have prior approval, and the results of the tests must be reviewed and approved by MRMD engineers, in order to continue operation of the pipeline.

For the internal inspection, an electronic "smart pig" inspection is required. This inspection is performed by pumping an electronic magnetic flux tool through the pipeline. The tool measures and records wall thickness along the entire length of the pipeline, which identifies any internal or external variations in thickness. Thin spots due to corrosion are identified, as well as any damage to the pipeline. Smart pig runs are analyzed by MRMD engineers using American Society of Mechanical Engineers

(ASME) criteria and compared with previous runs to evaluate corrosion trends and remaining service life. If a smart pig run is not mechanically feasible, a hydrostatic test to 1.5 times the maximum operating pressure of the pipeline is required. The test pressure is required to be held for eight hours in order to pass. This standard is more stringent than any other known state or federal regulations for oil pipelines. Hydrostatic tests are witnessed by an MRMD engineer, and evaluated using a material balance spreadsheet developed by MRMD and used by many operators to verify absence of leaks.

The external inspection of a submerged pipeline may be conducted by a diver or remote operating vehicle (ROV). The external inspection is used to detect damage, movement, free spans (unsupported section of pipeline), or foreign objects lying across the pipeline, that may cause failure due to physical movement or accelerated corrosion. Video tapes and diver reports of external pipeline inspections are reviewed by an MRMD engineer, and corrective actions coordinated with the pipeline operator if necessary.

4. Structural Assessments

Another MRMD oversight program is the Platform Structural Reassessment Program. Since the 1990s, all offshore platforms in State waters have been analyzed to API RP2A standards by the operators using finite element numerical modeling programs and a non-linear time-history analysis to determine whether they would withstand a 100-year return period storm event and a 1000 year return period earthquake. These analyses have been independently verified by MRMD staff engineers. As a result of the analyses, structural strengthening projects were undertaken at many of the platforms.

Since the analyses, the underwater jacket structure of each platform is inspected on a periodic basis as outlined in API RP 2A guidelines, and corrective measures implemented as required. Facility modification proposals that involve addition or relocation of major equipment on a platform, such that deck loads may be significantly increased or redistributed, require analysis and verification that existing structure or additions to the structure will withstand the new loading. In addition, all new drilling projects from offshore platforms require a rigorous structural analysis and, if necessary, a complete platform requalification to ensure that the structure will withstand the additional loads imposed by the project, and to require any strengthening or maintenance needed to bring the structure up to current codes. Verification of these analyses is performed by an MRMD staff civil engineer with expertise in structural analysis. Major construction projects are monitored on site, and post construction review of as-builts us conducted in order to ensure that construction has been performed according to approved plans.

Edmund G. Brown Jr., *Governor*

July 31, 2017

Mr. Robert Bordenave Jr., Agent
California Resources Corporation
11109 River Run Boulevard
Bakersfield, California 93311

Dear Mr. Bordenave:

INJECTION AND PRODUCTION WATER ANALYSIS REPORT, HUNTINGTON BEACH FIELD, UIC PROJECT NOS. 320-03-001, 320-06-013, 320-06-014, 320-09-001, AND 320-21-001

The Division of Oil, Gas & Geothermal Resources (Division) has reviewed the "DOGGR Water Sampling and Analyses of Injection & Formation Water for Huntington Beach," report (dated December 31, 2016) in accordance with the May 18, 2015 Notice to Operators (NTO), Water Sampling Protocols and Analyses of Injection and Formation Waters (amended June 8, 2015).

The following are items noted by the Division. Please review these items and make the appropriate changes and/or comments.

- **Item 1**
  Table 1 – Field Data Table:
  The flow rate for well 392-T13 was not located on the field form. State in the comments section how this rate was obtained.

- **Item 2**
  Tables:
  Practical Quantitation Limits (PQLs) are not required; however, current California Maximum Contaminant Levels (MCLs) are required (refer to item 3 of the "Reporting" section of the NTO).

  The most current California MCL list is available on the Water Boards website at http://www.waterboards.ca.gov/drinking_water/certlic/drinkingwater/MCLsandPHGs.shtml. Report only the California MCLs listed for the compounds tested. Not all chemical compounds have California MCLs.

- **Item 3**
  Radionuclides:
  Provide a radionuclide table with associated California MCLs (refer to item 2 above for the MCL reference document).

- **Item 4**
  Discuss the following in regards to the injection facility and injectate sample.

Briefly summarize the treatment process and verify that the injected zones sampled are processed and re-injected from this one facility.

If the sample was collected from an injection pipe, discuss the size and flow rate of the injection line and where the line is located in association to the treatment system (ex: 4-inch metal injection line with 100 psi flow was sampled from a one-inch sample port just before the fluid was re-injected back into the permitted injection zones).

If the sample was collected from a tank, discuss the size and location of the tank in association with the treatment process, the amount and type of fluids stored in the tank at the time of sampling, and the length of time the fluid was stored in the tank before sampling.

Discuss the amounts and types of additives or chemicals added to the fluids during treatment.

Discuss the amount and source of any added water, other than produced water.

- **Item 5**
  Total Dissolved Solids:

  Total Dissolved Solids (TDS) were not analyzed by gravimetric laboratory methods at the laboratory according to SM2540C. A field meter appears to have been used for TDS concentrations with a maximum range of 10 parts per thousand (ppt). The Division can not use the field data to determine TDS concentrations within each injection zone or within the injection fluids. These concentrations are vital to the Division's evaluation of each zone of injection. Due to the limited range and potential for inaccuracies of a field meter, the Division requires that these locations be re-sampled just for TDS and analyzed in the laboratory according to SM2540C.

  Schedule a date and time to collect these samples and call the Division, at least 24 hours in advance, to allow the Division an opportunity to witness the sampling.

- **Item 6**
  Stiff Diagram:

  Briefly discuss how the concentrations for bicarbonate (HCO_3) were calculated from the total alkalinity ($CaCO_3$) concentrations.

Provide the Division with the information requested above in a revised report format by October 1, 2017.

If you have any questions or need additional information, please contact me Greg.Berg@conservation.ca.gov or Rich Loverne Rich.Loverne@conservation.ca.gov at (714) 816-6847. Thank you for your submittal and efforts in complying with the Division's Notice to Operators.

Sincerely,

Gregory S. Berg

Subject: Failure to Conduct Adequate Mechanical Integrity Tests on Injection Wells in the Huntington Beach Oil Field.

Mr. Bordenave:

California Code of Regulations (CCR) section 1724.10 (j) states, in part, *"A mechanical integrity test (MIT) shall be performed on all injection wells…An MIT shall consist of a two-part demonstration as provided in subsections (j) (1) and (2). (1) …the annulus of each well must pass a pressure test at least once every five years… (2) …The second test of a two part MIT shall demonstrate that there is no fluid migration behind the casing, tubing, or packer. (3) The second part of the MIT must be performed within three months after injection has commenced. Thereafter…waterflood wells shall be tested at least once every two years…"*

According to our records, the below injection wells are not up-to-date with the required two part MITs, Radioactive Tracer Surveys (RA Surveys) and/or Standard Annular Pressure Tests (SAPTs):

Well	API #	NOV #	Last MIT Date	Violation Description
"North Bolsa" 44-1	059-02577	V117-0759	12/21/2011	Failure to conduct an SAPT
"South Bolsa" S-61-E	059-20556	V117-0760	9/17/2015	Failure to conduct an RA Survey
"South Bolsa" S-73-I	059-21378	V117-0761	8/24/2015	Failure to conduct an RA Survey
"State PRC 392" CJ-78	259-02870	V117-0762	6/7/1989	Failure to conduct an SAPT

"State PRC 392" UJ-3A	259-01923	V117-0763	No Record	Failure to conduct an SAPT
"State PRC 425" 502A	259-03066	V117-0764	3/17/2010	Failure to conduct an SAPT
"State PRC 425" CJ-287	259-20983	V117-0765	9/142014	Failure to conduct an RA Survey
"State PRC 425" CJ-287	259-20983	V117-0766	9/27/2012	Failure to conduct an SAPT
"State PRC 426" 4115	259-03239	V117-0767	7/23/2003	Failure to conduct an SAPT
"State PRC 426" 4132A	259-03256	V117-0768	4/21/2001	Failure to conduct an SAPT

The above wells shall be corrected within 30 days from the date of this letter, or the well shall be shut-in. If any of the above wells are not corrected within 30 days and shut-in, then California Resources Corporation shall submit a proposed schedule to this office on correcting the remaining wells. No well shall resume injection without the NOVs being corrected.

Failure to comply with the laws of California and this Division may result in enforcement action including, but not limited to, issuance of a civil penalty and/or order pursuant to Public Resources Code Sections 3106, 3224, 3235 and 3236.5.

If you have any questions, please contact Rich Loverne at (714) 816-6883 or rloverne@conservation.ca.gov .

Mr. Bordenave:

FAILURE TO PROVIDE REVISED INJECTION AND PRODUCTION WATER ANALYSIS REPORT FOR THE HUNTINGTON BEACH INJECTION PROJECTS.

California Code of Regulations (CCR) section 1724.7 states, in part, *"The data required to be filed with the district deputy include the following...(a)(3) Reservoir fluid data for each injection zone...(c)(7) Source and analysis of the injection liquid..."*

On July 31, 2017, the Division of Oil, Gas, and Geothermal Resources (Division) sent California Resources Production Corporation (CRC) a letter listing the changes to be made to CRC's original Water Analysis Report (see attached). The letter gave CRC until October 1, 2017 to submit the revised report. As of the date of this letter, the Division has not received the revised Water Analysis Report from CRC. CRC has 10 calendar days to submit the required revised Water Analysis Report as per the July 31, 2017 letter.

Failure to comply with the laws of California and this Division may result in enforcement action including, but not limited to, issuance of a civil penalty and/or order pursuant to Public Resources Code Sections 3106, 3224, 3235 and 3236.5.

If you have any questions, please contact Rich Loverne at (714) 816-6883 or rloverne@conservation.ca.gov .

Mr. Bordenave:

FAILURE TO CONDUCT MECHANICAL INTEGRITY TESTS ON INJECTION WELLS IN THE HUNTINGTON BEACH OIL FIELD.

California Resources Production Corporation (CRC) is out of compliance with mechanical integrity testing in the Huntington Beach oil field. According to our records, the injection wells listed in *Table 1* are not up-to-date with the required two-part mechanical integrity tests (MIT's), Radioactive Tracer Surveys (RA Surveys) and/or Standard Annular Pressure Tests (SAPT's).

California Code of Regulations (CCR) section 1724.10 (j) states, in part, *"A mechanical integrity test (MIT) shall be performed on all injection wells…An MIT shall consist of a two-part demonstration as provided in subsections (j) (1) and (2). (1) …the annulus of each well must pass a pressure test at least once every five years… (2) …The second test of a two part MIT shall demonstrate that there is no fluid migration behind the casing, tubing, or packer. (3) The second part of the MIT must be performed within three months after injection has commenced. Thereafter…waterflood wells shall be tested at least once every two years…"*

Table 1

The wells listed in *Table 1* are currently shut-in and not injecting. CRC shall submit a proposed schedule to this office on correcting the NOV's. CRC shall submit the proposed schedule within 10 days of the date of this letter. Injection in the individual wells listed in *Table 1* shall not resume until the well has passed the required MIT's.

Failure to comply with the laws of California may result in enforcement action including, but not limited to, issuance of a civil penalty and/or order pursuant to Public Resources Code Sections 3106, 3224, 3235 and 3236.5.

If you have any questions, please contact Rich Loverne at (714) 816-6883 or rloverne@conservation.ca.gov .

Sincerely,

Bakersfield, CA 93311-8957

Dear California Resources Production Corporation,

The Division has received your Notice of Intention to Deepen dated 11/28/2018 for State Prc 392 732, API. 0405921733, SU1136129 bond, Huntington Beach field, Sec. 04, T. 06S, R. 11W, SB B&M, Orange County.

Your Notice of Intention has been reviewed by our division in conjunction with records currently held by our office. Please review all categories below as statuses may have changed since submission.

DECISION: THE NOTICE OF INTENTION IS APPROVED PROVIDED THAT :

THE PROPOSAL IS APPROVED PROVIDED:

1. Blowout prevention equipment (BOPE), as defined by this Division's publication No. M07, shall be installed and maintained in operating condition and meet the following minimum requirements:
a. A 6" diverter system on the 20" conductor.
b. Class IIIB3M, with hydraulic controls, on the 9 5/8" casing. All casing annuli control valves must meet, or exceed, the same minimum pressure rating as the BOPE. The pipe safety valve must be suitable for all pipe in use, including casing.
c. A 3M lubricator for wireline operations.

2. BOPE requirements for critical wells must also comply with the following:
a. Any and all control lines common to the BOPE and installed within 25 feet of the well bore must be shielded properly and insulated so the temperature rating is equal to or greater than 450 degrees Fahrenheit.
b. Separate controls must be connected to each preventer in the BOPE stack. All control stations must be capable of providing complete opening and closure of each preventer in the BOPE stack.
c. A minimum of one control station must be located at least 25 feet from the well bore.
d. An emergency backup system must be installed that utilizes an independent, explosive-safe source of actuating energy. The source of energy and all controlling mechanisms associated with the backup system must be located at least 25 feet from the well bore, and in close proximity to the control station described above.

e. An access line of 2-inch minimum outside diameter must be installed below the preventer(s). In addition to the control valve installed at the wellhead, the access line must have a minimum of one

control valve located at least 10 feet outside the cellar. The valve outside of the cellar will be the primary control valve for well work operations. The part of the access line located between the well bore and the control valve outside of the well cellar must be shielded properly and insulated so the temperature rating is equal to or greater than 450 degrees Fahrenheit.

3. Blowout prevention practice drills are conducted at least weekly and recorded on the tour sheet. A practice drill may be required at the time of the test/inspection.

4. Well fluid of a quality and in sufficient quantity to control all subsurface conditions in order to prevent blowouts shall be used.

5. Sufficient material to control lost circulation of hole fluid shall be available for immediate use at the well site.

6. The 9 5/8" casing is cemented with sufficient cement to fill behind the casing from the shoe to the surface.

7. The 7" casing is cemented with sufficient cement to fill behind the casing from the shoe to surface.

8. The producing interval of this well is not less than 75 feet from the outer boundary of the parcel of land into which the well is drilled, and is not less than 150 feet, as measured horizontally, from the producing interval of any other well in the same zone.

9. A radial cement evaluation tool shall be run in the 7" casing from the shoe to 1,650' +/- to ensure zonal isolation outside the casing.

10. A directional survey shall be made and filed with this division within 15 days of completion of drilling.

11. The water shutoff effectiveness of the 7" casing shoe shall be demonstrated by a production test within 60 days of the well being placed on production.

12. Once drilled the well location shall be surveyed and the survey shall be filed with this office. Latitude and longitude shall be in decimal degrees, to six decimal places, in NAD 83.

13. No program changes are made without prior Division approval.

14. THIS DIVISION SHALL BE NOTIFIED TO:
a. Witness a test of the installed BOPE & 9 5/8" casing prior to drilling out the shoe of the 9 5/8" casing.
b. Witness a test of the installed BOPE & 7" casing prior to drilling out the shoe of the 7" casing.
c. Review the radial cement evaluation log within 15 days of completing or suspending drilling operations.

NOTES:
1. Hydrogen sulfide gas (H2S) is known to be present in this area, adequate safety precautions shall be taken prior to and during well operations.

2. Prior to notifying the Division engineer to witness the BOPE test, the blind rams must be tested. Information on the blind rams test must be entered on the tour sheet along with the signature of the person in charge.
3. The Division routinely monitors monthly well production data and if anomalous water production is indicated, remedial action will be ordered.
4. Upon completion of the proposed work, a Well Summary (form OG100), History of Oil or Gas Well (form OG103), and copies of all logs, tests, and surveys shall be submitted to this office.
5. All depths are based on the Drill Floor, which is 23' above Mat and 62.9' above sea level (10/19/2018).

6. This permit is for an oil or gas activity within the scope of the analysis set forth in the final environmental document(s) prepared and approved by the California Division of Oil, Gas, and Geothermal Resources (Division) as Lead Agency. The Division has considered the environmental document(s) and the analysis therein, made findings regarding the proposed oil or gas activity to any extent necessary, and issues this permit in the capacity as a Lead Agency with expertise in the activity(ies) authorized by this permit. The environmental document(s) and notice(s) filed with the State Clearinghouse can be found on the Division's website at http://www.conservation.ca.gov/dog/CEQA/Pages/CEQANotices.aspx/

The Division has also made a determination in relation to your Confidentiality Request.

DECISION: THE CONFIDENTIALITY REQUEST STATUS IS Not Applicable

If you have any supplemental questions, please contact your nearest DOGGR office or visit us at www.conservation.ca.gov/dog.

Sincerely,
Scott Walker

15.12.010 Permit required. Permits shall be obtained from the City of Huntington Beach for the oil operations, activities, or structures in the City limits of Huntington Beach, as required by this title. (2491-7/81)

15.12.160 Grounds For Suspension Or Revocation. The Fire Chief may suspend or revoke any permit issued by the Fire Department under the provisions of this code upon finding any of the following: (3037-5/90)
(a) A permittee has failed, neglected or refused to comply with or abide by any of the conditions of the permit; (3037-5/90)
(b) That permittee has failed or neglected or refused to comply with or abide by, or has in any way violated any of the provisions of this code, or of any other ordinance of the City, or any other law, rule, or regulation either directly or indirectly, by reason of or in connection with or incidental to his conduct of oil operations;
(c) If any of the permittee's operations or the continuance thereof upon the premises covered by the permit are a menace or hazard to public or private property, or to any interest of the City, or to the lives or safety of persons;
(d) Any of the permittee's operations or the continuance thereof upon the premises covered by the permit constitutes a public nuisance as described in this title;
(e) Permittee has made a willful misrepresentation of facts in any application for any such permit, or in any report or record required by this code to be filed or furnished by permittee.
(2491-7/81, 3037-5/90)
The Fire Chief will set forth his findings in writing and send notice of the same to the permittee. Said notice will contain a date upon which the suspension or revocation take effect. (3037-5/90)

15.12.170 Effect Of Suspension Or Revocation Of Permit. No person shall carry on any operations performed under the terms of any permit during any period of permit suspension or revocation, or pending a judgment of the court of law upon any application for writ taken to review the decision or order of the City in suspending or revoking such permit; provided, however, that nothing therein contained shall be construed to prevent the performance of such operation as may be necessary in connection with a diligent and bona fide effort to cure and remedy the default or violation for which the suspension or revocation of the permit was ordered, or such operation as necessary for the safety of persons or as required by the Division of Oil and Gas. AERA

Huntington Beach Sales Gas Conditioning Projects

Aera Energy LLC is installing two additional natural gas processing facilities at its Huntington Beach Unit beginning in the summer of 2004. Aera produces approximately 5,000 mcf per day of natural gas, which is processed on site in facilities consisting of towers, compressors, tanks and other equipment. These facilities separate water and natural gasoline from the natural gas prior to its delivery into the Southern California Gas Company system for transportation and subsequent delivery to customers.

The new facilities are designed to meet pipeline gas quality specifications. Compliance with these specifications reduces the possibility of pipeline corrosion.

The design and location of the additional facilities, which will be placed on the far side of existing facilities (closer to Pacific Coast Highway), have been planned to minimize visual or other impacts on nearby neighbors. Once the facilities are installed, neighbors should notice little difference from current operations.

During construction of the new facilities, neighbors may notice four narrow towers and a new pipe bridge as well as increased vehicle traffic in the vicinity of construction. To minimize any inconvenience to nearby residents, Aera is taking the following measures:

- Work will be scheduled during normal Huntington Beach construction hours of 7:00 a.m. to 7:00 p.m. five days a week.
- If required, Saturday work will be scheduled between 9:00 a.m. and 5:00 p.m.
- Dust control measures will be implemented.
- Most welding activities will take place in our welding shop to minimize noise.

All necessary construction and operating permits have been or will be secured from the City of Huntington Beach and the South Coast Air Quality Management District.

The updated gas processing facilities consist of a new dehydration unit, which replaces an existing water removal unit. Construction of the dehydration unit is expected to be completed by mid-September 2004.

An additional facility to reduce the carbon dioxide (CO_2) content of the natural gas will be installed by the end of March 2005.

Bill Hosband
Hazardous Materials Specialist
Huntington Beach Fire Department
2000 Main Street
Huntington Beach, CA 92648

SUBJECT: PRELIMINARY AGREEMENT ON HAZARDOUS MATERIALS SPILL RESPONSE FOR ORANGE COUNTY SANITATION DISTRICT FACILITIES

Dear Mr. Hosband;

As we discussed at our meeting of October 18, 2001 at our Huntington Beach facility, I would like to propose the following responses to hazardous materials spills at the Orange County Sanitation District (the district):

PRE-CONDITIONS:

1. All district personnel shall be trained in incident spill response, first responder operations (FRO) in accordance with 8 CCR 5192(q), hazard communication (8 CCR 5194) and personal protective equipment.
2. This procedure shall only apply to hazardous materials listed in our year 2000 hazardous materials business plan. This agreement shall be revised if hazardous materials change or quantities of hazardous materials increase by more than 10 percent.
3. This agreement shall not apply to contractor activities involving hazardous materials on district property. Contractors operating on district property shall be required to notify the district through our internal emergency procedures, and the Huntington Beach Fire Department shall be notified through the emergency 911 system. (EXCEPTION: Incidental Spills)

The district shall respond in the following manner to spills and releases of hazardous materials:

1. Incidental release as defined in 8 CCR 5192 (a)(3). District personnel shall be permitted to clean up incident releases of hazardous materials below a threshold of 5 gallons and a NFPA 704 rating below 3 in any category. A qualified person as defined in 8 CCR 5192 (a)(3) must determine if the spill or release constitutes an incidental release.

   This may include spills caused by maintenance and operations activities involving paint and paint related materials, lubricants and small quantities of automotive servicing fluids. Incidental spills may also be caused during the offloading of bulk chemicals when hoses are removed from either the storage tank inlet or the portable tank outlet.

2. A non incidental, uncontained release over a threshold of 5 gallons and a NFPA 704 rating 3 or above in any category. The district shall implement a FRO response and contact the Huntington Beach Fire Department (HBFD) via 911.

   This may include spills caused by maintenance, operations and contractor activities involving paint and paint related materials, lubricants and small quantities of automotive servicing fluids, above a threshold of 5 gallons and a NFPA 704 rating 3 or above in any category.

3. A contained spill of any material. District personnel may remove the material from containment for use in the wastewater treatment process or related operations. The district shall notify the HBFD Hazardous Materials Specialist via facsimile and telephone.

   This will involve spills of hazardous materials used in the wastewater treatment process such as ferric chloride, hydrogen peroxide, sodium hydroxide, etc that even if spilled into containment, can still be used to enhance the wastewater treatment process.

4. Threatened Release of hazardous materials. The district shall implement a FRO response and contact notify the HBFD Hazardous Materials Specialist via facsimile and telephone.

   This will include potential transportation accidents involving hazardous materials and damage to storage tanks or containment structures.

Please review this proposal within the applicable management ranks of the Huntington Beach Fire Department. Once we have agreed on the details, we can finalize the document with the appropriate district management signatures.

Please contact me at (714) 593-7155 if you have any additional questions.

Modified Hazardous Material/Substance Notification & Response Program

A Risk-Based Program

A. General Provisions:

The following general provisions must be met at all times by "*approved*" facilities under this plan:

1) Except as explicitly provided by this plan, all facilities are required to be in full compliance with applicable Federal, State and Local laws (codes) and regulations related to hazardous materials (including substances and wastes), fire and life safety.
2) Prior to a facility's approval under this plan, the facility shall submit to the Huntington Beach Fire Department its "Hazardous Materials/Substance Spill/Release Response and Mitigation Plan" for approval.
3) The components of this program and the facility's Hazardous Materials/Substance Spill/Release Response and Mitigation Plan shall be incorporated into the facility's Hazard Communications Program and training.
4) Prior to assignment (use under this program) all facility employees charged with the responsibility for response to and mitigation of spilled/released hazardous materials/substances (regardless of type/quantity) SHALL be appropriately trained and "certified" in accordance with current applicable Federal and State OSHA regulations. Records of such training and "certification" shall be available immediately upon request by any Fire Department representative.
5) Prior to assignment and thereafter at least quarterly, every facility shall conduct functional training covering the requirements of this program, the facility's spill/release and emergency response plan(s), response and mitigation operations/procedures, and approved clean-up/disposal procedures. All facility employees shall attend at least two (2) quarterly training sessions per year or shall be exempted from the facility's spill response/mitigation program. Records of such training, including attendance rosters, shall be maintained by the facility and made available immediately upon request by any Fire Department representative.
6) All facilities are required to conduct an annual Field Exercise. The exercise scenario, date and time SHALL be pre-approved by the Huntington Beach Fire Chief, or his designee. The Field Exercise SHALL be evaluated by the HBFD and appropriate corrective measures taken as directed by the Fire Department. All applicable facility employees shall attend at least one (1) annual Field Exercise every two (2) years or shall be exempted from the facility's spill response & mitigation program. Records of such exercise, including attendance rosters, shall be maintained by the facility and made available immediately upon request by any Fire Department representative.
7) All facilities shall have an approved plan, method(s) and on-site resources for the proper handling and disposal of clean-up related hazardous waste prior to final disposition.
8) Approved facilities under this program shall be subject to an annual review of there response program, including all related records, by the Huntington Beach Fire Department.
9) All spills/releases of hazardous materials/substances on "approved" facility property shall be subject to this plan. Notification and response operations of such spills/releases shall be conducted strictly in accordance with this program. Spill/releases of hazardous materials/substances off facility property shall be exempt from the provisions of this program (require applicable notification and response procedures – see current Federal, State and Local laws & regulations). Failure to adhere to the requirements of this program may result in disqualification at the sole discretion of the Huntington Beach Fire Chief, or his designee.

B. Definition of Routine Spill/Release Vs. Emergency

General provisions above must be met in all definitions below.

Routine Spill/Release = No HBFD Notification/Response Required

- Spilled/released material MUST be an identified/known substance.
- Situation MUST require no greater than ordinarily used personal protective equipment (PPE) for handling substance (skin, face & eye protection) and **DOES NOT** require the use of ANY respiratory protection.
- Situation MUST pose **NO** fire/explosion or toxic/unhealthful hazard to all facility employees or the public.
- Situation MUST pose **NO** airborne atmosphere that creates a fire and/or life safety hazard (flammable/explosive, O2 deficient/enriched, toxic/unhealthful).
- Situation MUST have appropriate functioning monitoring capability to ensure safe (non-hazardous) atmosphere present.
- Facility MUST ensure all required approved engineering controls are properly functioning and utilized.
- Situation MUST pose **NO** actual or potential risk to the environment (ground, water, air) or to any adjacent property and/or public right-a-way.
- Situation MUST have not resulted in injury(s) and/or fatality(s).
- Situation MUST require simple "in-house" mitigation measures (clean-up with rags and/or absorbent and proper disposal).
- Implemented appropriate mitigation measures pose NO risk to employees and/or the public.

Emergency Spill/Release = HBFD Notification ONLY/No HBFD Response Required

- ANY condition above is not met, AND:
- Spilled/released material MUST be an identified/known substance.
- Situation MUST pose **NO** fire/explosion and/or toxic/unhealthful hazard to non-response employees or the public.
- Airborne atmosphere poses **NO** fire or explosion hazard and/or only **MINIMAL** life safety hazard (O2 deficient/enriched, toxic/unhealthful) to facility response personnel ONLY (hazard must be adequately mitigated with use of PPE or engineering controls).
- Situation MUST have appropriate functioning monitoring capability to ensure a safe (non-hazardous) atmosphere is present.
- Adequate number of "qualified" response personnel and required resources are on site for immediate response and implementation of appropriate mitigation measures.
- **NO** off site response personnel and/or resources are required to adequately respond to the situation (pre-incident facility specific exceptions may be made with Fire Dept. approval).
- Facility MUST ensure all required approved engineering controls are properly functioning and utilized.
- Situation MUST pose **NO** actual or potential risk to the environment (ground, water, air) or to any adjacent property and/or public right-a-way.
- Situation MUST have not resulted in injury(s) and/or fatality(s).
- Situation MUST require "in-house" mitigation measures which facility response personnel have been previously trained and equipped.
- Implemented appropriate mitigation measures pose **NO** risk to non-response employees and/or the general public

Emergency Spill/Release = HBFD Notification & Response Required

- **ANY** of above conditions **CANNOT** be met.

May 24, 2001

William Morris, Manager of Operations
Los Angeles Basin, Coastal Asset
AERA Energy
20101 Goldenwest Street
Huntington Beach, CA 92648-2628

Dear Mr. Morris:

SUBJECT: AERA ENERGY – SPILL POLICY GUIDELINES

As a result of our discussions at the April 5, 2001 meeting, I am providing Release Reporting Guideline Modifications outlining the process recommended by the Fire Department in reporting spills. (See Attachment 1) When necessary, these guidelines will prove to be effective in alerting Fire Department personnel. Additionally, they provide the Huntington Beach Fire Department with sufficient notification and information to feel comfortable with in-house emergency response.

Submitting your existing forms by fax to the Huntington Beach Edwards Fire Station (714-375-8401) and Fire Administration (714-374-1551) as follow up reports is strongly encouraged, with timeliness as a key factor. Fax notification to the Fire Department would be placed on the AERA reporting forms in the following format:

1. **OIL & PRODUCED WATER RELEASE REPORT FORM**

   "b) IF OIL RELEASE OF ANY AMOUNT EITHER CONTACTS SURFACE WATER OR CROSSES THE HIGH WATER MARK IN A NATURAL DRAINAGE COURSE, NOTIFY:"

   - Edwards Fire Station Fax 714 375-8401
   - Fire Administration Fax 714 374-1551

   "c) IF RELEASE EXCEEDS ONE BARREL OF OIL TO LAND NOTIFY:"

   - Edwards Fire Station Fax 714 375-8401
   - Fire Administration Fax 714 374-1551

2. **OIL & PRODUCED WATER RELEASE REPORT FORM**

   "IF RELEASE OF OIL ENTERS WATERS NOTIFY:"

   - Edwards Fire Station Fax 714 375-8401
   - Fire Administration Fax 714 374-1551

3. HAZARDOUS MATERIALS RELEASE REPORT FORM

"b) IF AN 'RQ' IS REQUIRED, NOTIFY THE FOLLOWING IMMEDIATELY:"

- Edwards Fire Station Fax 714 375-8401
- Fire Administration Fax 714 374-1551

4. AIR RELEASE / DEVIATION / ENERGY /BREAKDOWN REPORT FORM

"b) IF A RELEASE IS INVOLVED, IMMEDIATELY NOTIFY:"

- Edwards Fire Station Fax 714 375-8401
- Fire Administration Fax 714 374-1551

I have included one of Boeing's Spill Response Forms for your review (Attachment 2).

Additionally, the Huntington Beach Fire Department recognizes that Orange County Fire Authority (OCFA) notification must be made if a spill or release affects County jurisdiction. The City is currently working with the Fire Authority to streamline your notification requirements and provide a procedure for the Fire Authority notification through the City of Huntington Beach.

In conclusion, I suggest that after you review our new recommendations (Attachment 1) we meet to evaluate these issues and mutually develop AERA's complete spill policy guidelines. Please contact my office at 714-536-5402 to schedule the meeting.

Sincerely,

Michael P. Dolder
Fire Chief

Aera Energy LLC – Huntington Beach Facility

Release Reporting Guideline Modifications
May 2001

- Aera will notify by fax HBFD (Edwards Station 714-375-8401) and Fire Administration (714-374-1551) ~~or in unincorporated areas, OCFA (714-538-3501)~~ immediately, when an unauthorized discharge becomes reportable under State, Federal, or local regulations ***and does not fall under the guidelines listed below for a 911 response***, and provide HBFD ~~(or OCFA)~~ copies of required written reports (if any).

- For releases reportable under State, Federal, or local regulations, ***and do not fall within the 911 guidelines***, Aera will make external notifications in accordance with its standard reporting forms for the Huntington Beach Facility. ***Other than 911 criteria, Aera will notify by fax Edwards Station at 714-375-8401 and Fire Administration at 714-374-1551.***

    1. Oil and Produced Water Release Report Form – Onshore
    2. Oil and Produced Water Release Report Form – Offshore
    3. Hazardous Materials Release Report Form
    4. Air Release / Deviation / Emergency / Breakdown Form

- ***Emergency Notification Guidelines (911). Aera will make emergency notification for releases that result in:***

    1. Serious or life-threatening injury.
    2. Potentially harmful exposure to a hazardous material.
    3. Threat to public health or safety.
    4. Explosive or serious fire hazard.
    5. Continuing and uncontrolled release of hazardous material.
    6. ***Release of flammable gas that presents an explosive or serious fire hazard.***
    7. ***Any unplanned release of a gas ~~(other than a puff)~~ that may present a significant ~~nuisance~~ odor and/or health hazard to the adjacent community.***
    8. ***Greater than fifty-five (55) gallons of hazardous*** MATERIALS

OES – INSURE FAX OES. If not.
Provide FAX Notification.

Huntington Beach Lease "Load Shed"
Shutdown Procedures
10/03/00 (Last Revised)

Purpose:

The purpose of the lease shutdown procedure is to ensure all production streams are shutdown within the facility and processes stabilized within 30 minutes.

Individuals involved:	Responsibilities:
Process Supervisor	Ensure that all elements of this procedure are understood and followed at the Huntington Beach production facility
Tank Farm Operator	Direct the workforce through this shutdown procedure. Ensure each step is completed before proceeding to next activity. Notify Process Supervisor or EHS Field Advisor if any unplanned events occur. (equipment problems, fluid or air releases, etc.)
Well Surveillance	Take direction provided by the Tank Farm Operator and complete activities as noted.
Documentation Lead	Mobilize to the Tank Farm facility and begin documenting the time that each activity is completed as well as who completed the activity.
Instrumentation & Electrical craft support	Take direction from Tank Farm Operator and complete activities as noted.
Gas Plant Operator	Take direction from Tank Farm Operator and complete activities as noted.

Procedure should also include:
- Notification – how
- Back-up for pers IAC/SL
- NEW personnel/The Fit.
- Practice/Simulate.
- Evaluation.
- Spill/Occurred –

may exist: NOTIFICATIONS
PROCEDURES/Reporting

The Following activities will begin once notification from Southern California Edison (SCE) is received by our Tank Farm Operator that a Load Shed event will occur in 30 minutes. This notification may be received by way of a "page" and/or by receiving a phone call from SCE.

Activities:	Who:
Tank Farm Operator to request Well Surveillance to lock open lease access gates at Goldenwest and Seapoint Well Surveillance to notify documentation Lead when activity is complete	Well Surv
Tank Farm Operator to shutdown wells from Control Room. Shutdown wells on computer showing MCC Bldgs.1 thru 4 Shutdown wells on computer showing Free Water Knock Outs Tank Farm Operator to notify Documentation Lead that activity is complete	Tank Farm Operator
Well Surveillance to perform "All Call" shutdown of Rod Wells at PC and notify Documentation Lead when activity is complete.	Well Surv
Well Surveillance to shutdown Gas Engine driven Rod Wells in Bolsa's and notify Documentation Lead when activity is complete.	Well Surv
Well Surveillance to take a surveillance drive to ensure remote equipment shutdown devices actually shut equipment down. (visual validation of shutdown) Well Surveillance to notify Documentation Lead when activity is complete.	Well Surv
Gas Plant Operator to shutdown the Dew Point Control Unit (DCU) per procedure. He is also to ensure Platform Emmy Gas Wells are shut-off at the Emmy Scrubber and at the DCU. Notify Documentation Lead when activity is complete.	Gas Plant Operator

Gas Plant Operator is to shut in the 425, 426, 392, 91, North and South Bolsa & Emmy casing gas. Notify Documentation Lead that activity is complete.	Gas Plant Operator
Tank Farm Operator to request Instrumentation Craftsmen to shutdown MCC building 1 thru 4 & B-Mat PLC. Instrumentation Craftsmen to notify Documentation Lead when activity is complete.	Instrument Craftsman
Tank Farm Operator to shutdown and secure Water Injection Plant #4	Tank Farm Operator
Gas Plant Operator is to shutdown and secure Stretford Unit Notify Documentation Lead when activity is complete.	Gas Plant Operator
Electrical Craftsmen to confirm with Tank Farm Operator that all production streams are shutdown and the processes are stabilized. At direction of the Tank Farm Operator the Electrical Craftsmen is to manually disconnect lease power supply. Notify Documentation Lead when activity is complete.	Electrical Craftsman
Tank Farm Operator to perform visual inspection throughout The Tank Farm area to ensure there are no releases.	Tank Farm Operator
Gas Plant Operator to start "back-up" Phone system generator , "back-up" generators to UPS at Tank Farm and "back – up" generator at DCU	Gas Plant Operator

FIRE DEPARTMENT

September 21, 2000

Mr. A. E. Mueller
Operating Vice President – Coastal Asset
AERA Energy LLC
20101 Golden West Street
Huntington Beach, CA 92648

Dear Mr. Mueller:

SUBJECT: AERA FACILITY - INTERRUPTION OF POWER SERVICE

On May 22, 2000, the California Independent System Operator ordered an interruption of power service to the AERA Facility. The power interruption lasted approximately two hours and was required due to an unusually high demand for electricity in the Southern California area.

The unexpected loss of power and the resulting sudden shutdown of the AERA Facility's equipment and systems resulted in temporary pressure surges in the Facility's fluid handling systems. The temporary pressure surges caused intermittent venting of hydrocarbon and hydrogen sulfide (H_2S) gases to the atmosphere. The upset condition resulted in odor complaint calls to the Huntington Beach Fire Department and claims of a potential harmful vapor release in the neighborhood.

The Fire Department was first notified of the event through several odor complaints received from the adjacent neighborhood. These complaints resulted in the discovery of the release by contacting AERA.

In an August 4, 2000 letter, AERA recommended interim corrective and mitigation measures; however, specific procedures suggested by the Fire Department still have not been resolved to our satisfaction. I would like to set up a meeting to discuss and finalize an acceptable action plan to address the following:

- AERA's methods, procedures, and assurances for immediate and accurate Fire Department notification of any unauthorized discharge. A specific performance standard for immediate notification would be five minutes or less. This immediate notification procedure should be in AERA's Release Reporting Policy, posted at the facility, and included in the training of new and existing employees.

- Provide a copy of AERA's written shutdown procedure for interruptible power events prior to our meeting.

- Methods and timing for AERA drills and simulated shutdown procedures, including Fire Department notifications and observation opportunities.

- Solutions for converting to uninterruptible power while a long-term, automatic operational and/or design adjustment can be incorporated into the Facility's fluid handling systems.

The Fire Department looks forward to continuing our positive working relationship with AERA in providing comments and recommendations to help facilitate a permanent resolution to site discharges.

If you have any questions, please call me at 714-536-5402.

Sincerely,

Michael P. Dolder
Fire Chief

SUBJECT: RELEASE OF MAY 22, 2000
AERA ENERGY LLC FACILITY
20101 GOLDENWEST STREET, HUNTINGTON BEACH

Dear Mr. Olson,

Thank you for meeting with us on July 25th. I believe that we now have a much better understanding of your concerns. As we stated in the meeting, Aera is committed to work with you, the California State Lands Commission, and other agencies as appropriate to expeditiously address concerns that may exist regarding operations at our Huntington Beach facility. The following information addresses the specific concerns discussed in the July 25th meeting.

I. May 22 Release Event

Composition of Released Gas: Attachments A-1 and A-2 are analytical results displaying the composition of two hydrocarbon gas streams in our facility that we believe are representative of the gas released to atmosphere during the subject event. Attachment A-1 is the analysis of a gas sample from free water knock-out (FWKO) vessel 111, one of the three FWKO vessels that released gas to the atmospheric relief system on May 22. Attachment A-2 is the analysis of a gas sample taken at a point where the gas streams from all seven of the facility's FWKO vessels are combined with gas from the facility's tank vapor recovery system. The analyses show that the compositions of these two streams are similar.

On May 24, gas from each of the three FWKO vessels that contributed to the release was sampled with the use of Sensidyne tubes to determine approximate H2S concentrations. The results were:

FWKO 111: 700 ppmv
FWKO 114: 250 ppmv
FWKO 115: 30 ppmv

RECEIVED
AUG 0 4 2000
FIRE DEPARTMENT

Volume of Gas Released: We have estimated the volume of gas that was released by conducting a material balance calculation on the systems involved. For each of the three FWKO vessels involved, we calculated the volumes of gas and liquid phases present in the vessels and the associated upstream gathering and well systems at the time power was lost (which closed the outlet valves on the FWKO vessels). Using these volumes and the average system pressures at the time power was lost, we then calculated the volume of gas that would need to be expelled to allow each system to equalize at the set pressure of the vessels' relief valves (60 psig). The results of this calculation were:

FWKO 111: 1300 scf
FWKO 114: 1300 scf
FWKO 115: 7600 scf

Total: 10,200 scf

Amount of H2S Released: Given the above release volumes and H2S concentrations, the amount of H2S released was calculated to be:

FWKO 111: 0.08 lbs
FWKO 114: 0.03 lbs
FWKO 115: 0.02 lbs.

Total: 0.13 lbs (the Federal Reportable Quantity for H2S is 100 lbs)

Dispersion Modeling: Using the estimated release volumes, the measured H2S data, and meteorological data for May 22 obtained from the National Weather Service, a vapor cloud dispersion modeling program (DNV Technica's PHAST Software) was utilized to assess the potential threat to public health and safety as a result of exposure to H2S. A summary of the modeling is included as Attachment B. Cases were run for releases from each vessel individually (Graphs 1, 2, and 3) and for a joint plume resulting from a simultaneous release from all three vessels (Graphs 4). Additionally, each of these cases were run for two different release volume scenarios; the August 3 report used the release volumes noted above and the July 26 report used higher volumes. The modeling results show that, in the joint plume scenarios (Graphs 4), the odor threshold for H2S (.0094 ppmv) would not have been exceeded beyond 55 feet downwind of the release point and the Emergency Response Planning Guideline (0.1 ppmv) would not have resulted more than ten feet downwind of the release point. The facility fence line is approximately 300 feet from the release point at its closest point and the nearest existing residence is approximately 1500 feet from the release point.

These dispersion modeling results point to a conclusion that there was not a threat to public health and safety related to the presence of H2S in the May 22 release. However, it does not allow any conclusion to be drawn regarding the potential for hydrocarbon odors to have migrated beyond the fence line. We will do additional dispersion modeling to investigate this possibility.

II. Interim Corrective Action / Mitigation Measures

Our interim corrective actions in response to the May 22 event are comprised of increased electrical system monitoring and changes to facility operating procedures, including:

1) increased monitoring of electrical grid system status,
2) ensuring redundancy in the systems providing us with advance warning of approaching service interruption requests, and
3) modifying and testing our procedures of shutting down the facility in a short time frame while minimizing the potential for releases. These procedures now also include shutting down wells driven by IC engines, and high water cut wells as necessary, during the Stage 1 alert (prior to receiving the 30 minute notification to shut down).

Attachment C provides a summary of the monitoring process we are currently using and the corresponding actions we take as dictated by the system status as determined by the monitoring. Since our meeting on the 25th, we have had occasion to implement these procedures on three separate occasions when service interruption requests have been initiated. This occurred on the afternoons of July 31st, August 1st, and August 2nd. In all three instances, we successfully shut down all facility systems and wells within the thirty minute notification window while preventing any detectable release of gas from our systems and equipment.

We are also evaluating additional facility modifications to further decrease the potential for releases of gas or any other potentially adverse impacts that could result from any loss of electrical service to our facility. We will advise you on the status of this effort in approximately one month.

III. Training and Drills

Release Reporting: Aera is committed to provide frequent training to ensure that all employees understand our release reporting procedures. Attachment D is a flow chart depicting those procedures. It has been our practice to provide this training on an informal basis during morning meetings and occasionally during monthly safety meetings, both attended by all on-duty employees. We will continue this practice and also create a call-up to ensure that no more than three months pass without refresher training. The failure that occurred in our internal reporting process during the May 22 event has been addressed directly with the individual involved and with all employees in morning meetings.

Our employees are trained to immediately (after taking appropriate safe action to stop or control the release) notify a supervisor or an Environmental, Health and Safety (EHS) Field Advisor when a release of any kind is discovered. The supervisor or EHS Field Advisor will then ensure that appropriate external and additional internal company notifications are made. The supervisory representative for the Huntington Beach facility

will typically be the Process Supervisor; Tony DeVito currently holds this position. The facility has two on-site EHS Field Advisors; Milan Steube and Sue Gonzales currently hold these positions. All three of these people, as well as several other on site exempt staff / supervisory personnel are trained in external release reporting procedures, have ready access to emergency response plans and guidance documents, and are available around the clock via pagers or home phone numbers. In addition, other Aera EHS personnel who are experts in release reporting and emergency response are readily available via telephone or pager at other Aera field locations in California or Aera's headquarters office in Bakersfield. Contact names and numbers for all of the above personnel are available on Emergency phone lists posted at key locations in the facility, in emergency response plan documents, and on Aera's Intranet and E-mail systems.

Our employees are also trained to bypass the internal reporting process and call "911" directly if they are confronted with a situation that poses an immediate significant threat to life, health, property, or the environment.

Regarding external reporting of release events, Aera will ensure that your agency receives timely and accurate notification of any unauthorized discharge from its facility in accordance with the Huntington Beach municipal code.

Shutdown Procedures:

As a result of the May 22 event, we have developed a written, step-by-step shutdown procedure for interruptible power events. It is based on a procedure previously used successfully for planned shutdowns, but required some modifications to specifically address the required 30 minute implementation period and the goal of preventing releases. Operating personnel participated in the development of this procedure and most of them now have first hand experience in implementing it. To further ensure we are prepared to effectively implement this procedure when needed in future years, we will conduct a simulated drill during the second quarter of each year (prior to peak electrical demand season).

For scheduled shutdown events, we will continue our historic practice of involving our operating personnel in developing event-specific written procedures which are then reviewed and discussed with employees as part of the planning for each event. Examples of this are a facility-wide maintenance shutdown that is normally scheduled at least once per year and other periodic planned shutdowns that usually affect only portions of the facility.

IV. Interruptible Power Contracts.

We are forwarding copies of our contracts with SCE to our legal department for review and determination of the feasibility of converting to a non-interruptible service contract for our facility.

CLOSING

We will continue to communicate with you as additional information becomes available. In the meantime, please feel free to contact me at (805) 648-8201 or any of the Aera staff members at the Huntington Beach facility any time you have specific questions or concerns.

Again, thank you for meeting with us on July 25th. I look forward to open communications with you and your agency as Aera continues to improve its facility and operations at its Huntington Beach facility.

Sincerely,

A. E. Mueller
Operating Vice President – Coastal Asset

CITY OF HUNTINGTON BEACH

INTER-DEPARTMENT COMMUNICATION

To: Tim Greaves, Deputy Fire Marshal

From: William T. Hosband, HazMat Program Manager WTH

Date: July 11, 2000

SUBJECT: "AERA ENGERGY" OIL SPILL OF JULY 5, 2000

The following is a summary of what I have learned from an investigative interview with Susan Gonzales, EHS Field Advisor for AERA Energy LLC (L.A. Basin Operations) at AERA's Huntington Beach site at 20101 Golden West St. conducted on July 11, 2000.

The crude oil spill was reported by a contractor of AERA while on his routine inspection rounds of wells on un-incorporated Bolsa Chica Wetlands operated by AERA Energy LLC. At approximately 7:50 a.m. on the morning of July 5, 2000, a pool of oil was observed near the location of an operating well at the north end of AERA property.

Immediate investigation by AERA surveillance personnel and an AERA Supervisor determined the source to be an eight inch underground production pipeline that is fed from several producing wells in the area. The wells providing production to this pipeline were shutdown and isolation valves were closed. Notification was made to other AERA Supervision and in turn notifications were made to the California Office of Emergency Services (OES) and the National Response Center (NRC). OES notified the California Fish & Game Warden and the U.S. Coast Guard who responded. Also responding were the State Lands Commission and Division of Oil & Gas. A unified command was established with Fish & Game, Coast Guard and AERA personnel.

Initial estimates of the production pipeline leak volume was an estimated 5 barrels of crude oil and 10 barrels of produced water, which spilled into a dry creek just opposite a wet cell and separated by a bridged road. The oil/water combination contaminated an area of approximately 45' X 60' which included some pickleweed which supports several endangered species of wildlife. Efforts to contain the spill and minimize the threat to flora and fauna were implemented by AERA's spill response contractor, Advance Cleanup Technology Inc., under the direction of the California State Department of Fish and Game and AERA Supervisors. Some of the activities included washing down of the pickleweed and evacuation of the oil/water mixture by as many as three vacuum trucks working under contract to AERA.

There were no injuries reported. This incident is under investigation. There were no activities occurring above ground in the area around the line break. The area was monitored for "lower explosive level (LEL), hydrogen sulfide (H2S) and Oxygen (O2) continuously to ensure safe clean-up operations. Levels were constant at 0% LEL, 0 ppm H2S and 20.9% O2. Biologists from Fish & Game requested that netting be placed over contaminated soils to keep wildlife away from harm until all contaminated soils were removed.

The question of Administering Agency Notification requirements has been discussed with AERA Energy personnel and a posed to the Orange County Fire Authority, because the spill occurred on unincorporated Orange County property rather than Huntington Beach City

property. It was agreed by all agencies polled, that notification to the Administering Agency could be either to Huntington Beach Fire or the Orange County Fire Authority and be in compliance with reporting regulations. The notification should, however, be immediate and follow AERA Energy Business and Emergency Plan guidelines.

Attached are pages of existing guidelines that contain information for emergency notification related to spills and releases. It is my recommendation that these guidelines spell out more specifically the agencies to be notified and include the 24-hour telephone numbers for each in the order of call preference. The Orange County Fire Authority representative recommends that **911** be used to notify the Administering Agency as required by AB2185/2187. The telephone number presently listed in the agency list (536-5411) is the general telephone number for Fire Administration but is answered after-hours by a Metro Net Dispatch telephone tree.

Continued open communications between AERA Energy and the Huntington Beach Fire Department will help resolve any notification or response issues that may arise and I encourage a commitment by both parties to maintain those communications at all costs. Thank you.

C: Duane Olson, Division Chief

AERA	PLATFORM EMMY & HUNTINGTON BEACH HUNTINGTON BEACH PRODUCTION UNIT BUSINESS EMERGENCY PLAN

OVERVIEW

The Huntington Beach production unit is manned 24 hours per day, 7 days per week. During this time all facilities are checked for leaks or operational failures. All personnel are equipped with a two-way radio to communicate immediately any potential or occurring problems that may arise.

Once field personnel discover a spill, they will immediately notify an Aera supervisor. The supervisor will obtain the Material Safety Data Sheet for the material in question. After assessing the amount of the spill and significance of endangerment to personnel, public and the environment, the supervisor will notify any Emergency Response Personnel and all other agencies required to be notified.

The supervisor or a delegate will meet the emergency response personnel at the property entrance and lead them to the incident site. Also, at this time the supervisor will provide them with any information required, such as possible hazards that may be present.

If it becomes necessary to evacuate personnel from a field location the field supervisor will contact personnel via radio. All contract personnel will be contacted in person and lead off lease or to a designated safe area.

If evacuation affects the general public or it appears that it may threaten any residential area, the Supervisor will request assistance from local fire and sheriff agencies.

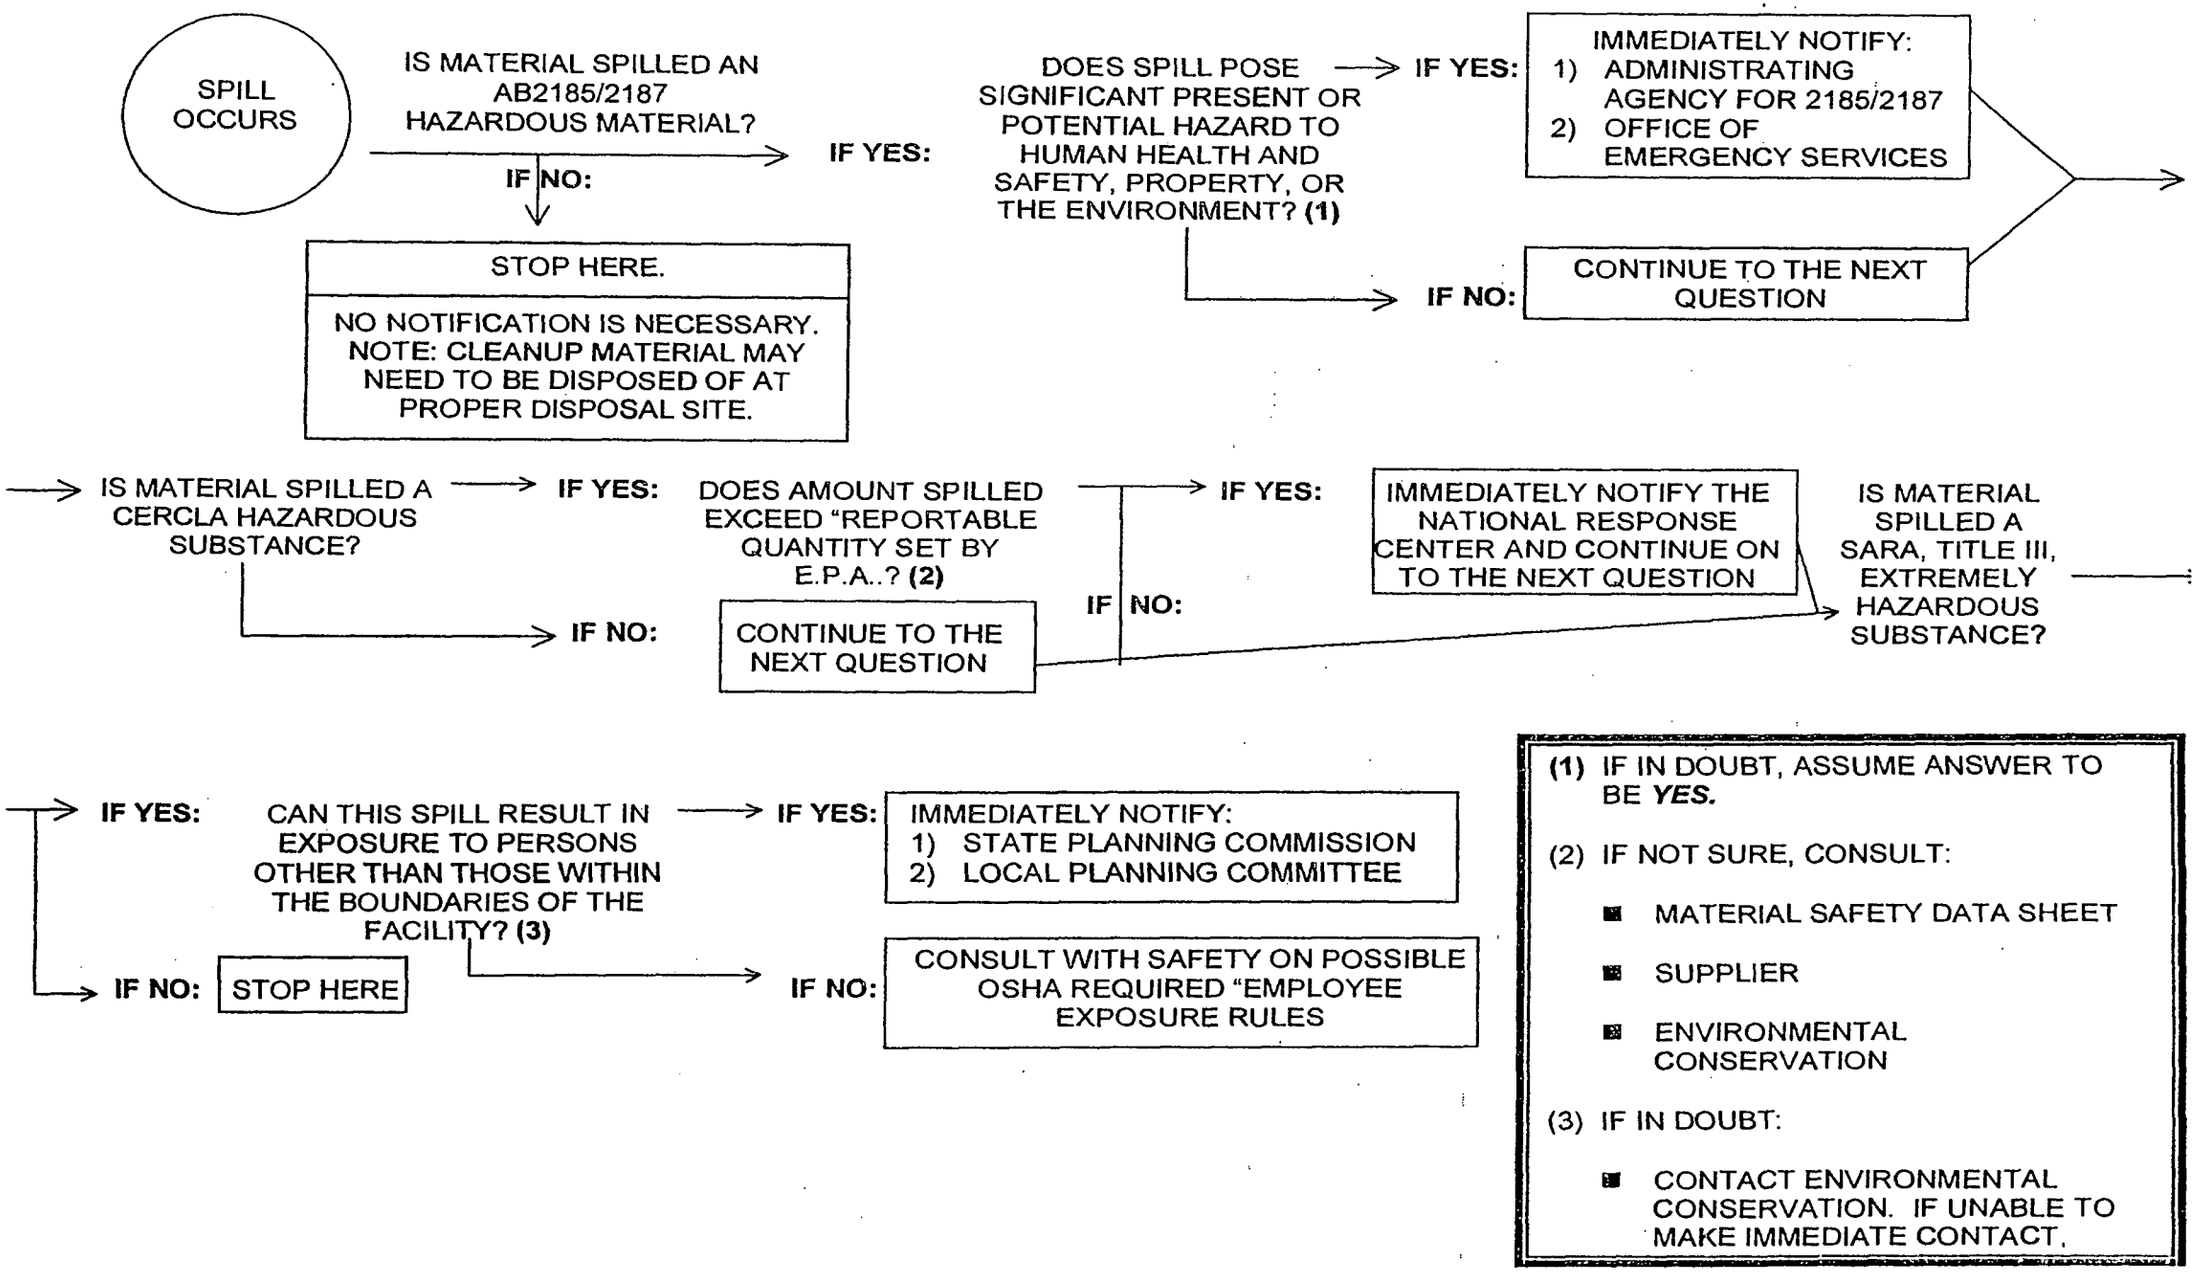
A personnel count will be made with corresponding duty roster for the day to ensure that all people are accounted for.

1.1 Notification

The person in charge of the facility or appointed delegate must report the release to the National Response Center *as soon* as they have knowledge of a release of a "reportable quantity" of a hazardous material. The fact that the facility is in the midst of an emergency response action cannot delay the notification. The Response Center will ask questions regarding response actions and record pertinent information. It will relay that information to a regional on-scene coordinator already designated by the EPA or to the U.S. Coast Guard. The coordinator will evaluate the circumstances and involve appropriate state and federal agencies.

1.2 Releases into the Environment

Any release that is not wholly contained within buildings or structures is reportable, even if it remains on the plant or installation grounds. Examples include evaporation of a reportable quantity into the air from a spill within a dike or to a concrete pad, or leaks of a reportable quantity from a tank, pipeline or process unit into the ground. "Environment" includes any navigable water, surface water, ground water, drinking water supply, land surface, subsurface strata or ambient air within or under the jurisdiction of the United States.



1.3 Reportable Quantity Amounts

EPA has identified the Reportable Quantity for over 600 chemicals in its April 4, 1985. This Reportable Quantity (RQ) refers to the amount of a material at which a spilled or released hazardous substance must be reported. The amount doesn't have to be spilled all at once; if the RQ is spilled in any 24 hour period it must be reported. All SWEPI locations should maintain their Hazardous Material list and update their Reportable Quantities inventories on a regular basis. These vary from 1 pound to over 10,000 pounds.

Aera Energy LLC
20101 Goldenwest Street
Huntington Beach, CA 92648

RE: MAY 22, 2000 HYDROCARBON VENTING AT FACILITY #104017

After reviewing the report regarding equipment breakdown prepared by Aera's Environmental Manager, Milan Steube, the Fire Department has determined that the incident was preventable while posing a potential threat to human health and significant liability to Aera Energy. Based on Aera's May 30, 2000 letter, the current status of "interruptible" electrical power consumer was the major cause. Additionally, this status may violate the agreements made under the conditional use permit granted for the site's operation.

Although mitigation measures were identified in the May 30, 2000 report, the Huntington Beach Fire Department finds these measurers insufficient to adequately safeguard the community from a potentially harmful chemical release. Aera's follow-up plan to prevent a recurrence is unacceptable. Area's current procedures for handling interruptible power at the Huntington Beach facility are not adequate and will require correctional measures.

We recommend a meeting between Aera and our Fire Department staff to discuss corrective actions to your proposed mitigation measures. Please contact Deputy Fire Marshal Tim Greaves or myself at 714 374-5379 to schedule a meeting.

Sincerely,

Duane S. Olson
Fire Marshal

Tim Greaves, Deputy Fire Marshal

7/6/00
Met & discussed the issue with Ron Sherman

Aera Energy LLC – Huntington Beach Facility
Gas Release Event of May 22, 2000

Pressure Release of Vessels.

Summary of Follow-Up Actions Taken or Being Taken

1. Improved State of Readiness for Future Power Interruptions

a. We are now monitoring Southern California Edison's web site to get earlier warning (i.e., several hours) of <u>possible</u> power interruptions. This will allow adjustments to be made to plant process equipment that will help minimize the likelihood of a gas release if a power interruption should occur.

b. We have arranged for our Plant Operator to automatically receive a page from Southern California Edison prior to a pending power interruption. This will occur thirty minutes prior to the actual interruption and will facilitate any additional adjustments that can be made to plant process equipment to minimize the likelihood of a gas release when the power is actually interrupted (may include voluntarily shutting down selected equipment <u>prior</u> to the actual loss of power).

Midnight.

Ammonia Safety Spill - 1995 CAL Resources 1997 - Aera

2. Operational / Design Adjustments.

a. Reviewed gas release reporting requirements with personnel.

b. Reviewed / updated facility shutdown procedures with personnel.

c. An engineering review of current facility design and operation is being conducted that may identify opportunities for additional improvements.

3. Equipment Inspection & Repair.

a. Replaced electrical breaker that did not operate properly (i.e., did not shut down certain equipment) during May 22 event.

b. During the two weeks following the May 22 event, a third party inspection service conducted a thorough inspection of the entire facility. Several vapor leaks were identified and repaired.

c. Another facility inspection by this third party will be conducted in July and on at least a quarterly basis in the future.

d. A thorough review of the operation of the facility's vapor recovery system is being scheduled. This is a "fine-tuning" effort to further minimize the likelihood of vapor leaks from facility tanks and pressure vessels.

Dear Sir or Madam,

SUBJECT: REPORT OF EQUIPMENT BREAKDOWN – MAY 22, 2000
AERA ENERGY LLC – HUNTINGTON BEACH FACILITY (#104017)
ELECTRICAL FAILURE

Pursuant to the requirements of SCAQMD Rule 430, this is Aera's written follow-up report for the subject breakdown.

At approximately 2:45 p.m. on May 22, 2000, the California Independent System Operator ordered an interruption of power service to various "interruptible" customers. The interruption, which lasted about two hours, was required due to unusually high demand for electricity in the Southern California area and resulted in a sudden unexpected shutdown of the subject facility. Power was restored at approximately 4:45 p.m. and the facility was gradually returned to normal operation over the next few hours.

The unexpected loss of power and the resulting sudden shut down of facility equipment and systems resulted in temporary pressure surges in the facility's fluid handling systems. These temporary pressure surges caused intermittent venting of hydrocarbon gas to atmosphere via the emergency relief vent system on three of the facility's seven free water knock-out vessels (specifically, Devices 6, 7, and 8). Although the emergency relief system on these vessels operated exactly as designed, this condition is a violation of Condition E-4 of the Facility Permit, which requires air pollution control equipment (i.e., the facility's gas processing and vapor recovery systems) to be "in full use".

Aera Energy LLC • 20101 Golden West Street • Huntington Beach, CA 92648 • (714) 969-3200 • Fax (714) 969-3364

An Aera operating employee observed the intermittent venting, but was not aware of the requirements to immediately report it. Milan Steube, Aera's Environmental Advisor, notified AQMD (1-800-CUT-SMOG; Evelyn) immediately upon learning of the relief event. Unfortunately, this did not occur until the following day (May 23). As Mr. Steube discussed with the District's Mr. Owen Amayo on May 25, reporting requirements have been reinforced with all facility employees as part of Aera's follow up to this event.

what occurred what was it. Method in Place

The intermittent venting occurred over a period of approximately one hour following the loss of power to the facility (i.e., from 2:45 p.m. to 3:45 p.m.). Since the flow rate and exact duration of each intermittent relief event could not be measured or recorded, estimation of the amount of hydrocarbon emissions is highly speculative, but estimated to have been approximately 500 pounds of VOC's.

In an attempt to prevent recurrence of this event, Aera's follow up plan is to conduct a thorough re-examination of:

(1) the manner in which the facility receives warning of a pending power interruption, and
(2) what operational and / or design adjustments might be made to avoid conditions that lead to atmospheric venting when power interruptions do occur (or are anticipated).

Please contact Milan Steube at (714) 969-3234 or at the letterhead address if you require any further information.

Sincerely,

for

W. A. Morris

REMARKS: ☐ FYI ☐ Urgent ☒ Per Your Request ☐ Reply ASAP ☐ Please Comment

Chief Olson:

Willie Morris asked me to provide you with information regarding the portions of Aera's facility area that are within City and County jurisdictions. Attached to this fax please find the following two items that depict the City / County boundary (shaded line) in the vicinity of our facility:

1) District Zoning Map "DM 4Z".
2) A portion of the USGS Seal Beach Quadrangle Map.

Although neither map shows the extension of Seapoint Drive to Pacific Coast Highway (we have drawn in the approximate location on the Zoning Map), it appears that ***all Aera wells and facilities south of Seapoint are within City jurisdiction and all Aera wells and facilities north of Seapoint are in County jurisdiction***.

Please feel free to call either Willie at 969-3533 or me at 969-3234 if you require any further information.

Regards,

ZONING

CITY OF HUNTINGTON BEACH
INTER-DEPARTMENT COMMUNICATION

To: Paul D'Alessandro, Deputy City Attorney

From: Michael P. Dolder, Fire Chief

Date: May 9, 2000

SUBJECT: CLIFFORD NOLAN INQUIRY – AERA ENERGY PIPE LINE OIL SPILL

This incident occurred from November 1 to November 16, 1999, when Aera Energy attempted to clean a 12" oil production pipeline that runs from oil production platform Eureka to platform Elly in federal waters approximately nine miles offshore. Elly is a processing platform and other platforms ship to it for oil, water, and gas separation prior to onshore delivery. Aera was cleaning the pipeline because there were several issues with platform Eureka that caused it to be shutdown in June 1999.

The leakage was described as a light sheen on the water that was absorbed with floating booms or was light enough to evaporate before any cleanup could happen. Some small tarballs were created and reported contained within cleaning operations. Amounts less than one gallon were picked up at the Huntington Beach Pier and less than five gallons at Crystal Cove in Laguna Beach. The Department of Fish and Game reported two cormorants and four western seagulls fouled with oil at platform Elly, but all birds flew away.

The cleaning operation and subsequent leaking lasted for approximately two weeks. The pipeline is currently filled with seawater and is considered clean and idle.

Specific and detailed reporting was remanded to the U.S. Department of the Interior, Minerals Management Service, 805-389-7775, reporting number NRC 503881. Additional reports were filed with the Office of Emergency Services at 800-852-7750, control number 99-4823.

If you have any further questions, please contact my office.

In Re: SWEPI Approval Status

Dear Howard:

This is to follow-up on our meeting with SWEPI on 2/7/94, which was held to discuss the firewater piping system and the status of Fire Department approvals:

1. **Firewater Piping:**

   a. Firewater drawings were marked up with needed corrections by Fire Department. Shell agreed with the corrections. Fire Department will give Shell a stamped copy subject to corrections, review of submittals and calculations for foam system, water spray systems, fire pump system. Approval to be also subject to onsite inspection and test, and subject to provision of adequately configured quadrameses so 2,500 GPM can be supplied by pumpers.

   b. Fire Department required a minimum main size of 8" (laterals to individual hydrant or monitor can be 6"). Shell requested variance on line to Stretford unit if adequate flow at approved velocities can be demonstrated. All other mains should be at least 8".

   c. Fire Department should require written request from Shell for the variance from the NFPA #24 depth of bury requirement, as it is a departure from a standard.

2. **Approval Status:**

   (This section reflects the status of submittals as of 2/7/94.)

   Note: Where "FPP" is shown, it refers to the Fire Protection Plan; revision 2, dated 6/11/91.

POST OFFICE BOX 291 • SOLVANG, CALIFORNIA 93464
PHONE: (805) 688-4625 • FAX: (805) 688-0275

A. Summary of plans which could be approved now:

Plan	Subject To
1. **Water System Piping Drawings (Sec. 5.1 of Fire Protection Plan - FPP)**	• Subject to notes made on drawings 2/7/94 • Vendor cut sheets regarding monitors, hydrants, valves, PIV • Review of detailed submittals for water spray, foam system and pump system • Subject to adequately configured quadrameses • Show hose reels on plan (per Sec. 5.1.3 of FPP) • Subject to letter from SWEPI requesting variance for depth of bury • Subject to on-site inspection and test
2. **Toxic & flammable dispersion modeling; done by Arthur D. Little & submitted by SWEPI (Sec. 4.2 of Fire Protection Plan)**	None.
3. **Access roads (Sec. 13 of FPP)**	Field inspection prior to startup
4. **Offsite monitoring and protection of public (Sec. 14 of FPP)**	Subject to review of Hazops which was requested 2/8/94
5. **Location & separation of equipment (Sec. 15 of FPP)**	Field inspect crash posts prior to startup

B. **Issues which can be deferred until on site inspections prior to startup:**

1. Hazmat list (FPP Sec. 4.3) "Onsite list, knox box, etc.";
2. Fire suppression system; FPP Sec. 6 "Fire extinguishers and carts";
3. Emergency Response Plan (FPP Sec. 21);
4. Safety, maintenance, quality assurance plans (FPP Sec. 22);
5. Worker safety and training plans (FPP Sec. 23);
6. Hazard identification methods; "Labeling" (FPP Sec. 25);
7. HMMP (FPP Sec. 26);
8. Site security plan (FPP Sec. 24) Review this onsite;
9. Field inspect SCBA's, first aid equipment, safety equipment (FPP Sec 8.1.1);
10. Require Fire Department permits for abandonments and removals onsite (FPP Sec. 27);

C. Status of pending submittals which are unapprovable at this point as far as I can ascertain. (This section is based upon the submittals which I have observed. I have not seen some of the submittals of 2/7/94 and have not seen the 2/10/94 submittals.)

Title	Required Deliverables	Comments
Sec. 4.1 Hazops (Hazards & Operability Study)	Hazops Study	Copies not received by HBFD or myself. I requested copies 2/8/94. This document needs review.
Sec. 5.2 Firewater Pump	Vendor data, drawings and curve	Not approvable, until review of cutsheets, submittals, and pump curve are done. Must review to NFPA 20 requirements.
Sec. 6.0 Fire Suppression System; i.e. foam & water spray systems & calculations	Drawing/ cutsheets	Prior to startup issue: Not approvable at this time. Field inspect extinguisher and cart locations (prior to startup). Need submittals on water spray systems and foam system now.
Sec. 7. Gas, Fire Detection & Shutdowns	Vendor cutsheets, specs	Not approvable, at this time (incomplete submittal). Need mfg. cut sheets and need to see spatial locations, listings and approvals, battery backup, etc.
Sec. 8. Fire Protection Systems	Covered in paragraphs 5.1, 5.2, 6.0 & 7.0	(See previous comments)
Sec. 9. Electrical area classification	Drawing	Not received, therefore not approvable at this time.
Sec. 10. Fireproofing	Drawing, spec, cutsheets	Not approvable until reviewed. Need to review for compliance with U.L 1709 rapid high rise curve, and SWEPI fire protection plan.
Sec. 11. Critical Cable Protection	Cable in cable tray or conduit. Drawings and specs	Not approvable. Drawings not received as far as I know. Need to see drawings.
Sec. 12. Drainage & Containment	Drawing and spill volume calculation	Not approvable. Drawings not received as far as I know. Need to review for compliance with fire code. Need field inspection. Ant 80 + 79
Sec. 16. Equipment, System, & Process Safety, Monitoring & Shutdowns	Hazops	Unapprovable at this time. Hazops not received. Needs review.
Sec. 17. Emergency Relief Systems (for vessels/tanks)	Calculations per Uniform Fire Code; statement of compliance with appropriate standards	Not approvable at this time. Need to review these submittals. Need to see calculations for fire exposure per fire code requirements. Need information on rupture disk reliability/safety.

D. Miscellaneous Issues:

1. Fire Department required crash posts around the propane tank. This will need field inspection.
2. Quadramese needs enough 2 1/2" inlets @ 250 GPM each to provide 2500 GPM if the fire pump fails. This was required in lieu of having two redundant fire pumps. 2500 GPM requires ten inlets. This could be accomplished by provided at least 5 inlets on each quadramese, providing that both locations have hydrants which are connected to ample city water supply (I'm not sure about hydrant availability for the quadramese near Palm; this needs verification).
3. Fire Department needs to inspect existing control room and lab building for fire and life safety relative to exposure to risks of this project. This was agreed to by SWEPI (FPP Sec. 18).
4. Those fire hydrants not having monitors, should be the same as those used by the City. All new fire systems to be painted red (hydrants to be yellow).
5. Designer of system needs to be reminded to provide 100 PSI nozzle pressure at monitors. The 7/21/93 Fluor Daniel memo acknowledges this requirement
6. Fire Department needs one drawing which will show entire facility, roads, all fire protection systems, detectors, etc.
7. Submittals for alarm systems and detector systems need to include drawings to scale showing detector locations and distances to targets, vendor cutsheets, listing/approval references, and State Fire Marshal listing for any fire detectors. Detectors must be compatible as a system of components. Battery/UPS power needs review also.

H. Summary:

Please have Ward Kinsman review this report for his concurrence. Let me know if you wish me to review any of the plans and/or other submittals. At this point, I do not have copies of the drawings or submittals.

I suggest you talk to Captain Bodenbender regarding the "Hazops" issue, to ascertain the details of any decisions he may have made, regarding the Hazops.

It may be a good utilization of time (and drawings) to get together and review the drawings listed herein to ascertain which can be approved now in order to assist SWEPI in their construction time frames. As you know, SWEPI has been very cooperative in this review effort.

Please call if you have any questions.

Thanks,

Jim Hunt

Jh/co

INTEROFFICE CORRESPONDENCE

To:	Jim Langer	Date:	February 4, 1994
Location:	754	Reference:	HB Gas Processing Project
From:	Bill Linkus		
Location:	5080 Calif. 300	Project #:	424601
Extension:	328-3094	Subject:	WATER ANALYSIS

Jim,

Our Mr. R. W. Hospodarec, chemical engineer, has evaluated the results of a chemical analysis of Huntington Beach city water supply that will be used for the proposed Fire Protection system at the Shell Western Huntington Beach lease.

Mr. Hospodarec's calculations and conclusions have been reviewed by the Bakersfield process engineering staff and found to be correct and appropriate.

No appreciable corrosion is expected in new carbon steel piping systems. In addition, Under ambient conditions the analysis of the water indicates minimal long term scaling. An excellent water source.

FLUOR DANIEL

CALCULATIONS and SKETCHES

DATE 3 FEB 94
CONT. NO.
BY RW HESPODARIC CHK'D
SHEET NO. 1

CHECK CORROSIVENESS/SCALING TENDENACY OF CITY WATER

BASIS OF CALCULATION

1. USE LANGELIER INDEX = pH - pHs
2. USE STABILITY INDEX(SI) = 2pHs - pH
3. CALCIUM CONC = 182 mg/l (AS $CaCO_3$)
4. ALKALINITY = 122 mg/l (AS $CaCO_3$)
5. pH = 8.06
6. TEMP = 70°F - 60°F
7. USE NALCO CHART(FIG 4.9) FROM NALCO BOOK "WATER: THE UNIVERSAL SOLVENT" TO DETERMINE pHs
8. USE PERMUTIT LANGELIER INDEX AND STABILITY INDEX (RYZNAR INDEX) PAGES 110 TO 112 FROM PERMUTIT BOOK "WATER AND WASTEWATER TREATMENT DATA BOOK".

CALCULATIONS

1) LANGELIER INDEX

A) USE NALCO BOOK, PAGE 60, FIG 4.9

pHs = 7.65

LANGELIER INDEX = pH - pHs = 8.06 - 7.65 = 0.41 AT 70°F
= 8.06 - 7.70 = 0.36 AT 60°F

WATER IS SCALING

B) USE PERMUTIT BOOK

pHs = 9.3 + A + B - (C + D)

A = TOTAL SOLIDS = 715 mg/l - 928 mg/l ; A = 0.18
B = TEMP AT 60°F ; B = 2.20
C = CA HARD = 182 mg/l AS $CaCO_3$ C = 1.86
D = ALKALINITY = 122 mg/l AS $CaCO_3$ D = 2.09

pHs = 9.3 + 0.18 + 2.20 - (1.86 + 2.09)
= 7.73

LANGELIER INDEX = pH - pHs
= 8.06 - 7.73 = 0.33 AT 60°F
GOOD CHECK

IM E-020 REV. 8/88
VTED IN U.S.A.

FLUOR DANIEL

CALCULATIONS and SKETCHES

DATE 3 FEB 94
CONT. NO.
BY RW HOSPODAREC CHK'D
SHEET NO. 2

CHECK CORROSIVENESS / SCALING TENDANCY OF CITY WATER

CALCULATION CONT'D

2) STABILITY OR RYZNAR INDEX. = $2pH_s - pH$

AT 60°F $pH_s = 7.73$

RYZNAR INDEX = $2 \times 7.73 - 8.06 = 7.4$

WATER IS SLIGHTLY CORROSIVE

CONCLUSION

1) CITY WATER IS PROBABLY QUITE NEUTRAL FROM THE STANDPOINT OF SCALING AND CORROSION. THE LANGELIER INDEX SHOWS WATER TO BE SLIGHTLY SCALING WHEREAS RYZNAR INDEX SHOWS WATER TO BE SLIGHTLY CORROSIVE.

2) NO APPRECIABLE CORROSION IS EXPECTED TO OCCUR IN THE PIPING IF SULFATE REDUCING BACTERIA (SRB) DO NOT GET ESTABLISHED WITHIN THE PIPING SYSTEM.

MESSAGE

Bill,

Attached is an analysis of the Shell water sample data, provided by Bob Hospoderic. His summary indicates relatively benign water supply characteristics.

Be advised: the sampling represents the future water source (City water supply) characteristics and it's potential effects on piping. It does not necessarily reflect the condition of existing piping which was previously fed by well-water sources.

FIRE DEPARTMENT

January 11, 1994

Mr. J. F. Langer, Senior Chemical Engineer
Shell Western E & P, Inc.
Coastal Assets California Division
SPT 754
5060 California Avenue
Bakersfield, CA 93309

RE: **SHELL SWEPI PROJECT - HUNTINGTON BEACH, DISTRICT 348**

Dear Mr. Langer:

The Fire Department has reviewed the proposed fire water protection system layout as required by Section 5.1.6 of the Fire Protection Plan for the Shell Oil Lease and submits the following additions and/or comments:

Part One - General Comments:

1. Locations of monitors and hydrants appear satisfactory. Two isolation valves need to be added in the Stretford area at the junction of the two mains (one valve on each main) prior to the hydrants.

2. Locations of some PIVs are not satisfactory. Certain PIVs are shown in the middle of the roadway; they should be on the opposite side of the road from the system which they supply. (See sheet by sheet comments beginning on page 3.)

3. Main sizes shall be shown for clarity. Minimum main size is to be 8" or larger as needed, with monitor and hydrant laterals 6" or larger.

4. The manufacturer and model number of the hydrants, monitors, hose reels, quadrameses, foam systems, fire pump, fire alarm panel, etc., must be submitted to the Fire Department. Such submittals are required per the Fire Protection Plan, Section 5.1. All such equipment shall be UL listed or FM approved for fire protection service when such listings or approvals exist for the type of equipment (per Section 5.0 of the Fire Protection Plan). Data regarding the fire pump and appurtenances, as well as installation drawings, are required.

5. All existing 4" Fire Department standpipes shall be replaced with approved fire hydrants with 4" outlets.

6. Design and calculations for water spray and foam systems shall be submitted for review per Section 5, 28, and 29 of the Fire Protection Plan.

7. The major issues with this submittal surround the proposed use of existing and new unlined steel fire mains. The Fire Protection Plan, Section 5.1.8 and 5.1.10, requires such mains to be internally lined and externally coated; NFPA 24 "Private Fire Service Mains" requires this per Section 7-2. The Fire Protection Plan, Section 28 cites this standard as applicable. The American Water Works Association also recommends against the use of unlined steel water mains.

The purpose of the lining requirement is to prevent corrosion and tuberculation within a fire main. Tuberculation results in a reduction of inside diameter with resultant loss in flow capacity. Corrosion can lead to failure of the pipe. Unlined steel is vulnerable to attack by certain types of water (hungry), which will eat away at the steel. Such destructive process can result in the plugging of orifices and failure of pipe.

The following conditions shall be provided in order for the Fire Department to approve the use of the existing **unlined** 12" steel pipe.

1. Age and condition of the pipe.

2. Actual fire flow test results which include static PSI, observed flowing PSI, and observed flow (GPM) at the furthest point. Calculation as to available flow at 20 PSI shall also be provided.

3. Hydrostatic test.

4. Photographs of exterior and interior cross section of the pipe to ascertain current condition.

5. A certified laboratory test of water which has flowed through the pipe. (Baseline sample from water source would also be needed.)

The following shall be required assuming that the test results and pipe conditions are acceptable to the Fire Department:

1. Install corrosion monitoring system.

2. Hydrostatically test the line every five years.

3. Install a "side stream" inspection piece aboveground so the Fire Department can unlock and remove a section of the pipe to inspect its condition annually.

4. Conduct an annual flow test in all areas of the plant to assure needed fire flow and PSI is available (2500 GPM at 100 PSI flowing PSI at the most remote location) during times of peak on-site domestic (non-emergency) flow. This flow test shall include a water sample.

5. "Pig" the line annually.

If, at any time, the results of these tests and/or inspections prove unsatisfactory, Shell Western will replace the pipe or line it in place. All new piping required for this fire protection project shall be installed per NFPA 24 standards; either lined and coated steel or plastic pipe listed/approved for fire protection use.

Part Two - Detailed Comments, Fire Protection Plan Addenda:

Section 5, Page 2 - Fire Protection Summary.

This summary shall be clarified as discussing fixed systems only, as it does not discuss the provision of monitors, hydrants, and hose reels.

Area #2 (oil plant), Page 3.

Foam density is listed as .16 GPM/square foot. However, Fluor Corp's conference notes dated July 21, 1993, page 2, states density of .10 GPM/square foot. Clarification is needed. We assume the density stated in this addendum applies. Also, conference notes lists quantity of foam to be 200 gallons. This is incorrect based upon the .16 density, duration, and Fire Protection Plan.

Area #3, Page 4.

Fire flow calculation says 1000 GPM for monitors. No monitors are shown on drawing #078-91-009D for area #3 (hydrants are shown).

Addenda Approval (Item 10, Page 5).

States that this document shall serve as the official Fire Protection Plan. This statement is incorrect as this is only an addendum to the official plan.

Detailed Comments - Water System Drawings Dated August 20, 1993:

1. Sheet 078-92-009-C (Fire Pump Area).

   a. Backflow device to be UL listed or FM approved and have OS & Y valves chained open.

   b. New mains shall comply with NFPA 24 (plastic or lined/coated steel, etc.).

c. Isolation valves shown immediately upstream and downstream of fire pump shall be OS & Y or have PIVs.

d. Fire Department connection to be UL listed or FM approved.

e. Fire alarm panels to be located at the plant's south and north entrances with graphics approved by the Fire Department.

f. Main sizes shall be indicated on the drawing.

g. Fire pump and system must demonstrate 2,500 GPM at 100 PSI at all portions of the system including the nozzle PSI at most remote monitor during peak periods of on-site domestic (non-emergency) water usage.

h. Pump data and listings shall be submitted to the Fire Department, as well as installation drawings.

i. Water mains in the area of the Fire Department connection shall be underground.

j. Pave the area around the quadramese and the approach to accommodate 50,000 pound fire apparatus.

2. Sheet 078-91-009-A (DCU/Ground Flare).

a. Show main size on drawing.

b. Move PIVs serving the water spray systems to the opposite side of the road and away from the road.

c. More detail will be needed on location, etc. of quadramese in relation to City main on Palm Avenue and Cherryhill Lane or other approved location providing access.

d. Design and calculations needed for water spray systems. Deluge valves shall be located in an area safely accessible in a fire situation; 50' from the protected equipment is preferred. Valves shown appear to be too close. – How many feet

3. Sheet 078-9-009-D (Stretford Unit).

a. Addendum refers to monitor; no monitors are shown. These shall be monitor/ hydrants.

b. Add isolation value on north side of main at tee to hydrant on south side.

c. Three hydrant monitors will be required for this unit in place of the hydrants shown. Add the third hydrant monitor on ocean side of unit at midpoint.

4. Sheet 078-91-009-B (Tank Farm #1).

   a. Move PIV which is near foam system out of road.

   b. Indicate main sizes on drawing.

   c. Detailed plans and calculations shall be submitted for foam system.

   d. Plans and specifications needed for hydrants, monitors, and hose reels.

   e. Replace existing 4" Fire Department standpipes with approved fire hydrants with 4" outlets.

   f. Move the fire hydrant next to the foam header north next to the roadway.

Part Three - General Notes:

1. All laterals to hydrants in this facility to have isolation valves and monitors shall have approved operating valves. Fire equipment near roads shall be protected by approved crash posts, per Section 5-1.9 of the Fire Protection Plan.

2. All roadways that make access to any fire protection facilities or equipment shall be an all weather surface to withstand 50,000 pound fire apparatus.

3. Applicant shall demonstrate compliance with the Uniform Fire Code for spill control, containment, and drainage for caustic storage tank T-5, and any other vessels or tanks with flammable, combustible, or hazardous liquids.

Please submit revised drawings for Fire Department approval. Additionally, please submit one master fire water system drawing which shows the entire project.

Thank you for your cooperation. If you have any questions, please call me at 714-536-5564.

Sincerely,

Thomas F. Poe
Fire Marshal

RE: SHELL SWEPI PROJECT

The Fire Department has reviewed the proposed fire water protection system layout as required by Section 5.1.6 of the Fire Protection Plan for the Shell Oil Lease and submits the following additions or comments:

PART ONE; GENERAL COMMENTS:

a. Locations of monitors and hydrants appear satisfactory. Two isolation valves need to be added in the Stretford area at the junction of the two mains (one valve on each main) prior to the hydrants.

b. Location of some P.I.V.'s are not satisfactory. Certain P.I.V.'s are shown in the middle of the roadway, they should be on the opposite side of the road from the system which they supply. See sheet by sheet comments beginning on page 3.

c. Main sizes are not shown. They should be shown for clarity. Minimum main size is to be 8 inch or larger as needed, with monitor and hydrant laterals 6 inch or larger.

d. The manufacturer and model number of the hydrants, monitors, hose reels, quadramese's, foam systems, fire pump, fire alarm panel, etc., must be submitted to the fire department. Such submittals are required per the Fire Protection Plan, Section 5.1. All such equipment shall be UL listed or FM approved for fire protection service, when such listings or approvals exist for the type of equipment (per Section 5.0 of the Fire Protection Plan). Data regarding the fire pump and appurtenances, as well as installation drawings are required.

e. All existing 4 inch fire department standpipes shall be replaced with approved fire hydrants with 4 inch outlets.

f. Design and calculations for water spray and foam systems shall be submitted for review per Sections 5, 28, and 29 of the Fire Protection Plan.

g. The major issues with this submittal surround the proposed use of existing and new unlined steel fire mains. The Fire Protection Plan, Section 5.1.8 and 5.1.10, requires such mains to be internally lined and externally coated. NFPA 24 "Private Fire Service Mains" requires this per Section 7-2. The Fire Protection Plan, Section 28 cites this standard as applicable. The American Water Works Association also recommends against the use of unlined steel water mains.

The purpose of the lining requirement is to prevent corrosion and tuberculation within a fire main. Tuberculation results in a reduction of inside diameter with resultant loss in flow capacity. Corrosion can lead to failure of the pipe. Unlined steel is vulnerable to attack by certain types of water ("hungry" water), which will eat away at the steel. Such destructive process can result in the plugging of orifices and failure of pipe.

In order for the Fire Department to approve the use of the existing unlined 12 inch steel pipe, the following conditions shall be provided:

1. Age and condition of the pipe.

2. Actual fire flow test results which include static PSI, observed flowing PSI and observed flow (GPM) at the furthest point. Calculation as to available flow at 20 PSI shall also be provided.

3. Hydrostatic test.

4. "Photo" of exterior and interior cross section of the pipe to ascertain current condition.

5. A certified laboratory test of water which has flowed through the pipe. (Baseline sample from water source would also be needed.)

Assuming that the test results and pipe conditions are acceptable to the Fire Department, then the following shall be required:

1. Install corrosion monitoring system.

2. Hydrostatically test the line every 5 years.

3. Install a "side stream" inspection piece aboveground so that the Fire Department can unlock and remove a section of the pipe to inspect it's condition annually.

4. Annual flow test to assure needed fireflow and PSI is available, in all areas of the plant (2500 GPM at 100 PSI flowing PSI at the most remote location) during times of peak on-site domestic (non-emergency) flow. This flow test should include a water sample.

5. "Pig" the line annually.

If at any time, the results of these tests and or inspections prove unsatisfactory, Shell Western will replace the pipe or line it in place.

All new piping required for this fire protection project, shall be installed per NFPA 24 Standards. Either lined and coated steel or plastic pipe listed/approved for fire protection use.

PART TWO; DETAILED COMMENTS; FIRE PROTECTION PLAN "ADDENDA".

Section 5; page 2 (Fire Protection Summary):

1. This summary should be clarified as discussing fixed systems only, as it does not discuss the provision of monitors, hydrants, and hose reels.

2. Area #2 (Oil Plant) Page 3:

Foam density is listed as .16 GPM/sq'. However Fluor Corp's conference notes dated 7/21/93, page 2, state density of .10 GPM/sq'. Clarification needed. We assume the density stated in this addendum applies. Also, conference notes lists quantity of foam to be 200 gallons. This is not correct based upon the .16 density, duration and the Fire Protection Plan.

3. Area #3 (page 4):

Fireflow calculation says 1000 GPM for monitors. No monitors are shown on Drawing #078-91-009D for area #3 (hydrants are shown).

4. Addenda Approval (Item 10, Page 5):

States that this document shall serve as the official Fire Protection Plan. This statement is not correct as this is only a addendum to the official plan.

DETAILED COMMENTS; WATER SYSTEM DRAWINGS DATED 8/20/93:

1. Sheet 078-92-009-C (Fire Pump Area):

a. Backflow device to be UL listed/FM approved and have OS&Y valves chained open.

b. New mains shall comply with NFPA 24 (plastic or lined/coated steel etc.).

c. Isolation valves shown immediately upstream and downstream of fire pump should be OS&Y or have P.I.V.'s.

d. Fire Department connection to be UL listed or FM approved.

e. Fire alarm panels to be located at plant South and North entrances with graphics approved by the Fire Department.

f. Main sizes shall be indicated on the drawing.

g. Fire pump and system must demonstrate 2,500 GPM at 100 PSI at all portions of the system including the nozzle PSI at most remote monitor during peak periods of on-site domestic (non-emergency) water usage.

h. Pump data and listings shall be submitted to the Fire Department, as well as installation drawings.

i. Water mains in the area of the Fire Department connection shall be underground.

j. Pave the area around the quadramese, and the approach thereto, to accommodate a 50,000 pound fire truck.

2. Sheet 078-91-009-A (DCU/Ground Flare):

a. Show main size on drawing.

b. Move P.I.V.'s serving the water spray systems, to opposite side of road, and away from the road.

c. More detail will be needed on location, etc. of quadramese in relation to city main on Palm and Cherry Hill or other approved location providing access.

d. Design and calculations needed for water spray systems. Deluge valves should be located in an area safely accessible in a fire situation, 50 feet from the protected equipment is preferred. Valves shown appear to be too close.

3. Sheet 078-9-009-D (Stretford Unit):

a. Addendum refers to monitors. No monitors are shown. These shall be monitor/hydrants.

b. Add isolation valve on north side of main at tee to hydrant on south side.

c. Three hydrant monitors will be required for this unit in place of the hydrants shown. Add the third hydrant monitor on ocean side of unit, at midpoint of unit.

4. Sheet 078-91-009-B (Tank Farm#1).

a. Move P.I.V. which is near foam system, out of road.

b. Indicate main sizes on drawing.

c. Detailed plans and calculations shall be submitted for foam system.

d. Plans and specifications needed for hydrants, monitors, and reels.

e. Replace existing 4 inch Fire Department standpipes with approved fire hydrants with 4 inch outlets.

f. Move the fire hydrant next to the foam header north, next to the roadway.

PART THREE; GENERAL NOTES::

All laterals to hydrants in this facility to have isolation valves. Monitors shall have approved operating valves. Fire equipment near roads shall be protected by approved crash posts, per Section 5-1.9 of the Fire Protection Plan.

All road ways that make access to any fire protection facilities or equipment shall be an all weather surface able to withstand 50,000 pound Fire Department apparatus.

Applicant shall demonstrate compliance with The Uniform Fire Code for spill control, containment and drainage for caustic storage tank T-5, and any other vessels or tanks with flammable, combustible or hazardous liquids

Please submit revised drawings for Fire Department approval. Also submit one master firewater system drawing showing entire project and firewater system.

Thank you for your cooperation, please call me if you have any questions at 714-536-5564

Sincerely,

THOMAS F. POE

IN RE: Fire Department Letter to SWEPI, dated 11/24/93

Here are my comments on the 11/24/93 letter per your request of 12/21/93.

My comments are keyed to sections in your letter:

Page one:

Part One; a:

Add after "area": "at the junction of the two mains (on valve on each main)."

Item c: Add after "inch (or larger as needed)". Add after "monitor": "and hydrant".

Page Two:

Item e: Change "connection" to "outlet."

Page Three:

Item 4 at top of page: After parenthesis add "during times of peak on-site domestic (non emergency) flow."

Item 5: In second sentence, insert "and coated" after lined. Cross out blue brute piping and insert "plastic pipe listed/approved for Fire protection use."

Page Four:

Item I-C (top of page): Insert "immediately" after "shown."

Item i-e: Change "are" to "with."

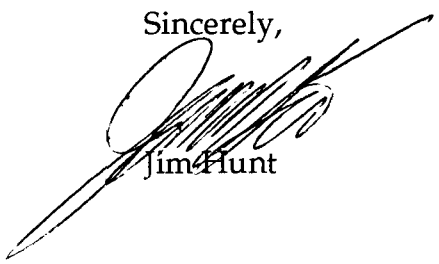
POST OFFICE BOX 291 • SOLVANG, CALIFORNIA 93464

Item 1-G: Add: "during peak periods of on-site domestic (non emergency) water usage."

Add item 1-J: "Pave the area around the quadramese, and the approach thereto, to accommodate a 50,000 pound fire truck."

Change number "3" to "2" and "4" to "3".

Item C at bottom of page: Add: Add the third hydrant monitor on ocean side of unit, at midpoint of unit.



Page 5: Change #5 to #4.

Item a: Insert "which is" after "P.I.V."

Part Three: General Notes: Insert prior to sign off: "Please submit revised drawings for Fire Department approval. Also submit one master firewater system drawing showing entire project and firewater system."

Call if you have any questions. Have a Merry Christmas.

Sincerely,

Jim Hunt

SPECIFICATION SP-575701-49-03

FIREWATER PUMP SKID

1.0 GENERAL

1.1 Scope

1.1.1 This specification prescribes the general requirements for one horizontal firewater pump, one jockey pump, drivers, controllers and appurtenances all skid mounted and specifically designed for fire protection service. This firewater pump skid (ME-100) shall be designed according to Drawing No. 078-92-007B and will be installed at the Shell Western E&P Inc Huntington Beach (CA) Field lease.

1.1.2 This specification supplements the Data Sheets on which the design conditions and special requirements are listed in detail. Whenever the data included on an individual Data Sheet conflicts with this general specification, the Data Sheet shall govern.

1.1.3 Compliance with this specification does not relieve SELLER of the responsibility of furnishing pumps and other equipment of proper design, mechanically and electrically suited to meet operating guarantees at the specified service conditions. Neither does it relieve SELLER of the responsibility of furnishing equipment assembled and prepared for shipment in a professional manner.

1.2 Work Included In SELLER'S Scope

1.2.1 The SELLER shall be responsible for design, fabrication and performance test of a firewater pump skid to satisfy the design conditions as specified on the Data Sheets.

1.2.2 The scope of supply shall include a firewater pump with a diesel engine driver, an electric motor driven jockey pump, controllers and other supporting accessories, as required.

1.3 Work Not Included In SELLER'S Scope

1.3.1 Support foundation for firewater pump skid.

1.3.2 Installation of firewater pump skid.

1.3.3 Tie-in of piping and utilities at skid limits.

1.3.4 Shelter over firewater pump skid.

1.4 Definitions

For the purposes of this specification, the following definitions apply:

BUYER: Shell Western E&P Inc. (SWEPI) or SWEPI's authorized representative.

SELLER: The vendor selected by BUYER to supply equipment, engineering, or services described in this specification and referenced documents.

CONTRACTOR: The corporation, partnership or individual contracted to provide on-site construction services, materials and/or fabrication in accordance with this specification and referenced documents.

MANUFACTURER: The original fabricator of the equipment or components described in this specification and referenced documents.

FABRICATOR: The corporation, partnership or individual contracted to perform services to produce a specific product normally remote from jobsite, as described in this specification and referenced documents.

2.0 CODES, STANDARDS AND REGULATIONS

2.1 BUYER's Data Sheets

Form E-212 Vendor's Drawing & Data Commitment

Form E-1183 Firewater Pump

Form E-559 Centrifugal Pump (Jockey Pump)

Form E-568 Electric Motors

2.2 Referenced Codes and Standards

The following referenced Codes and Standards shall, to the extent specified herein, form a part of this specification. Where a specific edition date is not indicated, it shall be taken that the most current edition (including addenda) in effect at the time of award shall apply.

In case of conflicts between the following Codes and Standards, and local codes at installation site, BUYER shall be consulted before disposition.

American National Standards Institute (ANSI)

3.0 GENERAL REQUIREMENTS

3.1 The firewater pump skid shall be SELLER's standard, reliable design to comply with this specification. Each major equipment component shall be of proven design with minimum of two years of successful operation in equal or more severe design conditions as outlined in the Data Sheet.

3.2 The complete package, including pumps, drivers, controllers and appurtenances, will be purchased under a unit contract stipulating compliance with NFPA 20, and shall be UL and/or FM approved or listed for the intended service.

3.3 The complete unit shall be field "acceptance tested" for proper performance in accordance with the provisions of NFPA 20.

3.4 SELLER shall supply all equipment completely fabricated, assembled, tested and dismantled only to the extent necessary for inspection and practical shipping.

3.5 SELLER shall be responsible for coordination of all subvendors and for overall guarantees relating to mechanical and electrical compatibility of all equipment.

3.6 Pumps, drivers, controllers and appurtenances shall be suitable for outdoor, unprotected installation and a marine coastal environment. The firewater pump skid will be located under a shelter provided by others.

3.7 Design and construction shall satisfy the requirements of UBC Chapter 23 Seismic Zone 4 for earthquake.

4.0 PUMPS

4.1 Materials of ASTM qualify, or equal, shall be used. Castings shall be sound, free from shrink or blow holes, scale, blisters and other defects. All casting burrs shall be filed or ground flush with the surface of the casting.

4.2 At 150% of the rated capacity, the firewater pump (P-100) shall develop at least 65% of its rated head and shall not exceed 120% of the rated head at zero capacity.

4.3 Pumps shall be horizontal, split case centrifugal designs and shall be UL listed and/or FM approved.

4.4 Firewater system pressure shall be maintained by a jockey pump (P-101) and controller mounted on the firewater pump skid, as described in Section 11.0 of this specification.

4.5 Equipment shaft extensions and/or couplings shall be designed to permit the use of a dial indicator in checking equipment alignment.

4.6 SELLER shall furnish all auxiliary piping located within the confines of the packaged unit. Piping shall be designed to provide flexibility and accessibility necessary for installation, proper operation, maintenance and cleaning.

4.7 Shaft centerlines of pumps shall be of sufficient height above the baseplate to permit the piping of all auxiliary connections.

4.8 All flanged connections shall be provided with the bolt holes straddling the horizontal and vertical centerlines.

5.0 BASEPLATE AND MOUNTING

5.1 The pump, driver, accessories and gear (if required) shall be mounted, pre-aligned but not doweled, and shipped on a common fabricated steel, drain rim type, skid.

5.2 The baseplate shall have a full metal deck with provisions for complete drainage through a 1 inch NPT drain connection at the pump end edge of the baseplate.

5.3 The baseplate shall include a minimum of two 6 inch grout holes, with raised lips to prevent liquid accumulation over the grout, and shall have sufficient vents for complete grout distribution. The holes shall be arranged to allow for grouting with all components in place. One grout hole shall be supplied per bulkhead section, as a minimum.

5.4 Lifting lugs or other arrangements shall be provided for handling the assembled units during transportation and field erection.

5.5 Baseplates will be epoxy grouted. Baseplate shall be sandblasted, In accordance with SSPC SP-6. All the grouting surfaces shall be precoated with a catalyzed epoxy primer.

5.6 Pump and driver support pads shall be machined flat and in the same plane within 0.002 inch per foot of distance between pads. Driver support pads shall be machined to have 3/16 inch (minimum) shim space available. Stainless steel shims shall be used with a maximum of 5 shims per shim pack.

5.7 Equipment support pads shall be welded to the skid.

5.8 Vertical leveling screws spaced for stability shall be provided on the outside perimeter of the baseplate. These shall be numerous enough to carry the weight of the baseplate, pump and driver, but in no case shall fewer than six (6) screws be provided.

5.9 Alignment positioning screws shall be provided for all drivers. Screw assemblies shall not be welded to the equipment support pads, unless machining of pads is performed after welding of screw assemblies.

5.10 Post Weld Heat Treatment shall be performed for all welding on baseplates. Welding is not permitted on baseplates after machining and leveling of mounting pads.

5.11 No component of the unit (or accessories) may overhang the baseplate except the motor conduit box.

6.0 COUPLINGS AND GUARDS

6.1 All-metal, flexible couplings shall be furnished and mounted by the pump SELLER.

6.2 Couplings shall be designed with a 1.5 service factor based on motor or engine nameplate horsepower.

6.3 The coupling shall be dynamically balanced when the coupling size-speed relationship is such that balancing is recommended by MANUFACTURER or is indicated in the pump Data Sheets.

6.4 Couplings shall be mounted on shafts with cylindrical fit and shall be keyed in place. Cylindrical fits shall conform to ANSI B4.1, Class FN-1.

6.5 The stubshaft shall be flange mounted on the engine flywheel to accommodate the drive half of the flexible coupling.

6.6 Removable, all-metal, nonsparking, OSHA type coupling guards shall be supplied and mounted. Guards shall be sufficiently heavy and rigid in design to avoid contact with coupling or shaft as a result of bodily contact.

7.0 ELECTRIC MOTORS

7.1 Electric motor shall be specifically listed for firewater pump service and meet the requirements of NFPA 20.

7.2 Motor shall be non-overloading over the full range of the pump performance curve.

7.3 Motor shall be suitable for coastal marine outdoor installation. Motor finish and external hardware shall be able to withstand marine environment.

7.4 The electric motor shall be supplied with space heaters.

8.0 DIESEL ENGINES

8.1 General Requirements

8.1.1 Diesel engines shall be in accordance with the latest DEMA specifications.

8.1.2 The engine shall be a 2 or 4 cycle water cooled diesel design capable of starting at the minimum ambient temperature specified. The engine may be turbocharged.

8.1.3 The engine start shall be by battery powered motor. The electric start may be automatic or manual and the engine stop shall be manual, by switch operation at the local engine control panel.

8.1.4 A tachometer (ST-9011) shall be supplied and mounted on the engine or the pump controller. Its range shall be 0 to 115 percent of rated speed.

8.1.5 Engine speeds shall not exceed 2100 rpm.

8.1.6 The engine shall deliver the rated torque at the rated speed for the site conditions specified, with no negative tolerances allowed.

8.2 Lube Oil System

8.2.1 The engine shall be equipped with a pressurized lubrication system supplying oil to all surfaces requiring lubrication. Circulation shall be by means of a positive displacement pump equipped with an adjustable pressure regulator. The lubrication system shall include a full flow oil filter and a series connected cooler of sufficient size to properly cool full oil flow. All components, including automatic lube oil temperature control, shall be installed, piped, and mounted on the firewater pump skid.

8.2.2 The engine shall be supplied with heaters in the lubricating oil to maintain the oil temperature between 85°F and 110°F with a minimum ambient air temperature of 35°F. The heaters and controls shall be completely wired and shall include a thermostat and contactor.

8.3 Cooling Water System

8.3.1 The engine shall be provided with a heat exchanger mounted on the engine or engine baseplate and cooled by water from the firewater pump discharge, in compliance with NFPA 20. Piping, valves, fittings, and related equipment are to be furnished by SELLER.

8.3.2 Flexible connections shall be provided from pump discharge to the cooling water manifold and from the outlet of the heat exchanger to the waste water piping.

8.3.3 There shall be a sight flow indicator (FG-9018) in the cooling water piping on the outlet of the heat exchanger.

8.4 Electrical System

8.4.1 The engine shall be equipped with a 24 volt DC starting motor and with an alternator and voltage regulator.

8.4.2 Batteries shall be 24 volt heavy duty, truck quality and shall be furnished in dual parallel sets complete with necessary cables and connectors of proper size and length. An AC-powered battery charger shall be furnished by SELLER. Battery sets to alternate on repeated starting attempts until diesel motor starts or 24 volt DC supply is exhausted.

8.4.3 Battery trays (or boxes) shall be provided with a plywood-lined, metal bottom and legs to provide cleaning of surface beneath trays (or boxes).

8.4.4 Boxes shall be constructed of 14 gage minimum sheet steel of ventilated design and with a steel lid. The interior of the box shall be painted with acid-resistant paint. The box shall be primered on the exterior and finished with paint suitable for coastal marine environment.

8.5 Fuel System

8.5.1 The diesel fuel supply tank (T-100) shall be fully furnished by the SELLER. The tank shall be sized to provide a minimum supply of 1.1 gallons of diesel fuel per engine maximum rated horsepower plus 5 percent for sump area and plus 5 percent for expansion area. The tank shall be furnished with legs for floor mounting and with a direct reading level gauge.

8.5.2 Fuel oil filters shall be provided by the engine SELLER.

8.6 Inlet and Exhaust System

8.6.1 The intake air filter shall be of the dry-element type.

8.6.2 A residential type exhaust silencer/spark arrestor with a flexible exhaust connection shall be furnished with the diesel engine. The exhaust silencer shall be properly sized for the engine and shall be complete with companion flanges. Installation of the exhaust silencer and connection to exhaust system will be by BUYER.

9.0 FIREWATER PUMP CONTROLLER (DIESEL ENGINE DRIVE)

9.1 The firewater pump controller shall be specifically listed for fire protection service and shall be built in accordance with NFPA 20 and listed by UL or approved by FM.

9.2 The controller shall be marked "Diesel Engine Fire Pump Controller" and shall show the name of the MANUFACTURER, the identifying designation, and the complete electrical rating.

9.3 Designated auxiliary contacts shall be provided and wired to a dedicated terminal strip. One normally closed and one normally open dry contact shall be furnished for each of the following indications and alarms:

- Engine running
- Engine fail to start
- Common trouble
- Main switch not in auto

9.4 The firewater pump controller shall be of the combined manual and automatic type in a NEMA 4X enclosure, suitable for outdoor installation and arranged for equipment baseplate mounting. Adequate bracing and suitable vibration isolators shall provided by the pump SELLER.

9.5 Control devices required for automatic operation shall be within a locked cabinet. A break glass panel shall be included to provide for unlocking/opening of the cabinet door in case of emergency. The cabinet shall also include, but not be limited to, the following components:

- Main (Hand off-auto) selector switch (HS-9012)
- Pressure switch (PSH/L-9009) for automatic starting of the diesel engine. The pressure switch shall have a calibrated dial adjustment for pressure setting.

- Visual alarms for:
  - Engine fail to start (XA-9011A)
  - High coolant temperature (TAH-9013)
  - Low lube oil pressure (PAL-9018)
  - Overspeed (Shutdown)(SAH-9011)
  - Battery failure (EAL-9011 A/B)
  - Battery charger failure (IAL-9011 A/B)
- Audible common trouble alarm (XA-9013A)
- Dry contacts listed in Section 9.3
- Provision for remote start/stop (1+S-9012C)
- Hour meter or tachometer totalizer (KQ-9011)
- RPM indication (SI-9011)

9.6 SELLER shall provide his standard means of performing control logic. The following shall also be provided if not SELLER's standard:

- A time delay function to allow the electric motor driven jockey pump to start first
- Provisions for automatically alternating dual storage batteries for diesel engine starting and control power
- Intermittent cranking of engine, with lockout, if engine fails to start within 90 seconds

9.7 The controller enclosure shall also include:

- Power on light
- A flow indicator (FI-9019)
- A discharge pressure recorder (PR-9019)
- Low battery voltage switches (ESL-9011 A/B)
- Low battery charger current (ISL-9011 A/B)
- Coolant temperature (TI-9013)

10.0 APPURTENANCES

10.1 SELLER shall furnish skid appurtenances, completely piped, which shall include the following, but not be limited to:

- Orifice meter and flow transmitter for the firewater pump (FE/FT-9019)
- Automatic air release valve for the firewater pump (XV-9016)
- Firewater and jockey pump discharge pressure indicator (PI-9014 and PI-9002, respectively)
- Eccentric tapered pump suction reducers, if required
- Concentric tapered pump discharge increasers, if required
- Jockey pump casing thermal relief valve (PSV-9002)

- Firewater pump suction pressure indicator (PI-9001)
- Firewater pump discharge relief valve (PSV-9014)
- Firewater pump discharge relief valve waste cone (enclosed type) (FG-9014)
- Exhaust silencer
- Jockey pump adjustable run timer

10.2 All pump fittings which are subjected to pump discharge pressure shall be properly ANSI rated.

11.0 JOCKEY PUMP

11.1 SELLER shall furnish a jockey pump as specified on the Data Sheet.

11.2 The jockey pump shall be a rear pull-out, horizontal, single stage, centrifugal type, close coupled to an TEFC motor.

11.3 The jockey pump and controller shall be mounted and completely piped on the firewater pump skid.

11.4 Jockey Pump Controller

11.4.1 The jockey pump unit controller shall be designed for use with firewater systems and shall be UL listed.

11.4.2 The jockey pump controller shall contain the following components, as a minimum:

- Jog-off-auto selector switch (HS-9001)
- High/Low pressure switch (PSH/L-9003)
- Pump running light (XI-9001)
- Power on light
- Control circuit transformer
- Circuit breaker
- Disconnect switch
- Motor starter

12.0 TESTING

12.1 Operational Test

Operational tests, standard for the MANUFACTURER and acceptable to the approving authority (UL and/or FM) shall be performed at the MANUFACTURER's facility. Certified test data to demonstrate that the pump, diesel engine driver and controller are in compliance with this specification and with the applicable codes

controller are in compliance with this specification and with the applicable codes and standards shall be made available to the BUYER upon request. BUYER reserves the right to witness any tests.

12.2 Testing Requirements

12.2.1 Firewater Pumps

Certified hydrostatic test to the pressure specified on the pump data sheet and according to NFPA and UL and/or FM requirements. Certified performance test shall be according to NFPA and UL and/or FM requirements.

12.2.2 Controllers

Certified MANUFACTURER's tests according to UL and/or FM requirements.

12.2.3 Motor Drivers

Certified routine (commercial) test according to NEMA MG-1.

12.2.4 Diesel Engine

Certified MANUFACTURER's performance tests according to UL and/or FM requirements.

12.2.5 Field Acceptance Test (Assembled Unit)

When installation is completed, an operating test shall be made in the presence of the BUYER, representative of the pump MANUFACTURER, and the authority having jurisdiction. Tests shall be per NFPA 20 requirements.

12.3 Test Reports

Certified test reports, test data and curves (where applicable) shall be furnished to the BUYER on all tests covered by the above Sections 12.2.5.

13.0 START-UP

Pump SELLER shall furnish a qualified engineer to supervise field start-up, acceptance testing and adjustment of all equipment.

14.0 IDENTIFICATION AND TAGGING

14.1 Nameplates

14.1.1 A stainless steel nameplate shall be permanently attached to the pump (not on the baseplate) and shall contain the following stamped information:

- Equipment item tag number
- MANUFACTURER's name (stamping optional)
- Serial number of pump
- Size and type of pump
- Rated capacity
- Differential pressure
- RPM
- Maximum allowable casing working pressure at maximum pumping temperature

14.1.2 A direction arrow shall be permanently attached to the pump showing the direction of rotation.

14.2 Marking

14.2.1 Each coupling half and spacer shall be electrically etched with the item number of the purchased pump for which it is intended.

14.2.2 Applicable UL and/or FM approval labels shall be affixed to the various components.

14.3 Tagging

14.3.1 Each item shall be identified with its Purchase Order (P.O.) Number and Item Number. Tags shall be stainless steel and shall be impression stamped with the following:

P.O. No. _____
Equipment Tag No. _____

14.3.2 Tags shall be attached to each components with stainless steel wire. This tagging is in addition to the equipment nameplate. Equipment shipped in fully enclosed containers shall also include the above information marked on the outside of the container.

14.3.3 Miscellaneous parts shall be tagged or marked with the Equipment Item Number for which they are intended.

14.3.4 Equipment containing insulating oils, antifreeze solutions or other fluids shall be prominently tagged at openings to indicate the nature of the contents and any shipping and storage precautions.

15.0 ASSEMBLY AND PREPARATION FOR SHIPMENT

Assembly and preparation for shipment shall be in accordance with SELLER's standards and as noted herein. SELLER shall be solely responsible for the adequacy of the preparation for shipment with respect to materials and application, and for providing equipment at the destination in ex-works condition when handled by commercial carriers.

15.1 Equipment Train Assembly

15.1.1 Pumps, drivers and all furnished appurtenances shall be shipped fully assembled on the baseplates, except as noted below. Coupling spacers with bolts and other items, such as minimum flow orifices which are not part of the pumping unit assembly, shall be separately boxed and securely attached to the baseplate.

15.1.2 Separate shipment of major components requires BUYER's prior authorization.

15.1.3 Metal filter elements and screens shall be cleaned and reinstalled prior to shipment. Nonmetallic filter elements shall be supplied installed in an unused condition.

15.2 Painting

15.2.1 Stainless steel surfaces, internal surfaces and finished surfaces, such as flange faces, shafts and couplings, shall not be painted.

15.2.2 External surfaces of pumps, drivers, baseplates, accessories and piping, except as noted in Paragraph 15.2.1, shall be painted prior to being shipped from the SELLER's shop. SELLER's standard surface preparation and finish is acceptable, unless otherwise specified on the Data Sheets.

15.3 Preservation

15.3.1 Bearings, bearing housings and oil systems shall be thoroughly cleaned and coated with a suitable rust preventative.

15.3.2 Surfaces contacted by the pumpage or working fluid, including stuffing boxes and flush piping, shall be thoroughly dried. Surfaces which are subject to atmospheric corrosion or rusting shall be coated with a suitable rust preventative.

15.3.3 External, non-painted surfaces (except austenitic stainless steel), including bolting and flange faces, shall be coated with a suitable rust preventative.

15.3.4 Exposed shafts and shaft couplings shall then be wrapped with waterproof, moldable, waxed cloth or barrier type VPI paper. The seams shall be sealed with adhesive tape.

15.3.5 Each engine and auxiliary system shall be drained of coolant and prepared for shipment. Warning tags indicating the engine is dry shall be attached.

15.3.6 Desiccant or vapor phase inhibitor shall be placed in spaces where condensation might occur. Closure covering shall be clearly marked to show amount and type of material in interior so that it may be recovered prior to placing in service.

15.4 Openings

15.4.1 All threaded openings shall be plugged with long shank pipe plugs. Plug material shall be equivalent to the material being plugged, except that carbon steel plugs shall be used with openings in cast iron.

15.4.2 Flanged openings shall be greased and provided with full flange diameter protective covers in accordance with A or B below:

A. Metal closures shall be 3/16 inch minimum thickness with full diameter rubber gaskets and at least four full diameter bolts.

B. Cover material shall be 1/4 inch (minimum) thick, low density "Poly-Foam" polyethylene plastic flange guard. Flanges 16 inches and larger shall use two 1/4 inch guards. Flange guards shall be held in place by metal bolts in every other bolt hole (minimum four plugs).

15.5 Packing

15.5.1 All equipment shall be packed, securely anchored (skid mounted, when required), and protected for domestic shipment by rail or truck. All

unmounted parts, except drivers, shall be suitably boxed and firmly attached to the main item for shipment.

15.5.2 One complete set of Installation, Operating, and Maintenance Instructions for pumps, drivers and controllers shall be packed and shipped with the equipment. These sets of instructions are in addition to the number of sets specified on Form E-212, "Vendor's Drawing & Data Commitment". which are to be sent directly to the BUYER.

16.0 DRAWINGS AND DATA REQUIREMENTS

All SELLER drawings, data submittals and other documentation shall be furnished according to Form E-212.

17.0 QUALITY ASSURANCE

The complete pumping assembly and all control equipment shall be guaranteed in writing for pressure, capacity, and power consumption as required by NFPA 20.

Huntington Beach, California 92648

In Re: Shell Swepi Project

Dear Tom:

I have reviewed the submittal drawing package dated 10/26/93. The scope of this package is limited to the proposed Firewater system layout for the facility. This submittal is required by the Fire Protection Plan, Section 5.1.6. I have the following comments:

Part 1; General Comments:

a. Locations of monitors and hydrants appear satisfactory. One isolation valve needs to be added in the Stretford area.

b. Location of some P.I.V.'s are not satisfactory. Certain P.I.V.'s are shown in middle of a road. They should be on the opposite side of the road from the system which they supply. See sheet by sheet comments beginning on Page 5.

c. Main sizes are not shown. They should be shown for clarity. Minimum main size is to be 8", with hydrant and monitor laterals 6" or larger.

d. The manufacturer and model number of the hydrants, monitors, hose reels, quadramese's, foam systems, fire pump, fire alarm panel, etc., will need to be submitted. Such submittals are required per the Fire Protection Plan, Section 5.1. All such equipment shall be UL listed or FM approved for Fire Protection service, when such listings or approvals exist for the type of equipment (per Section 5.0 of the Fire Protection Plan). Data regarding the fire pump and appurtenances, as well as installation drawings, will be needed.

POST OFFICE BOX 291 • SOLVANG, CALIFORNIA 93464
PHONE: (805) 688-4625 • FAX: (805) 688-0275

e. Design and calculations for water spray and foam systems shall be submitted for review per Sections 5, 28 and 29 of Fire Protection Plan.

f. The major issues with this submittal surround the proposed use of existing and new unlined steel fire mains. The Fire Protection Plan, Section 5.1.8 and 5.1.10, requires such mains to be internally lined and externally coated. NFPA 24 "Private Fire Service Mains" requires this per Section 7-2. Fire Protection Plan, Section 28 cites this standard as applicable. The American Water Works Association also recommends against the use of unlined steel water mains.

The purpose of the lining requirement is to prevent corrosion and tuberculation within a fire main. Tuberculation results in a reduction of inside diameter with a resultant loss in flow capacity.

Corrosion can lead to failure of the pipe. Unlined steel is vulnerable to attack by certain types of water ("hungry" water), which will eat away at the steel. I have personally observed this at a new oil and gas plant which has unlined steel fire mains, utilizing distilled water from an onsite water plant. Such destructive process can result in the plugging of orifices and failure of pipe.

The downside of lining steel pipe with cement mortar is that flaking and "holidays" can occur at joints if installation is not properly done. However, there are various alternative linings (i.e. epoxy) available, and there are techniques available to line pipe in place.

Shell apparently also wishes to utilize 5,600' of existing unlined 12" steel pipe. Shell says that use of this existing line will save $1mm.

In order for the Fire Department to grant a variance for the existing line (should you wish to), the following should be provided by Shell:

1. Age and condition of pipe.

2. Actual fire flow test results which include static PSI, observed flowing PSI and observed flow (GPM) at the furthest point. Calculation as to available flow at 20 PSI should also be provided.

3. Hydrostatic test.

4. "Photo" of exterior and interior cross section of the pipe to ascertain current condition.

5. A certified laboratory test of water which has flowed through the pipe. (Baseline sample from water source would also be needed.)

Assuming that the test results and pipe conditions were acceptable to the Fire Department, then Shell should be required to do the following:

1. Install corrosion monitoring system.

2. Hydrostatically test the line every 5 years.

3. Install a "side stream" inspection piece aboveground so that the Fire Department could unlock and remove a section of pipe annually to inspect it's condition.

4. Annual flow test to assure needed fireflow and PSI is available, in all areas of the plant (2500 GPM at 100 PSI flowing PSI at the most remote location). Such flow test should include a water sample.

5. Pig the line annually.

If at any time, the results of these tests and inspections prove unsatisfactory, Shell should agree to replace the pipe or line it in place

Regarding the use of new unlined steel pipe, there would need to be a major reason for the Fire Department to grant a variance from NFPA 24 for use of new unlined steel underground fire mains. Assuming proper installation and connections, lined steel is preferable to unlined steel from a fire protection standpoint. Approved plastic, underground fire service mains (Blue Brute, etc.), are widely used and should be considered for this facility.

Part 2: Detailed comments; Fire Protection Plan "Addenda":

Section 5; Page 2 (Fire Protection Summary):

1. This summary should be clarified as discussing fixed systems only, as it does not discuss the provision of monitors, hydrants and hose reels.

2. Area #2 (Oil Plant) Page 3:

   Foam density is listed as .16 GPM/sq'. However, Fluer Corp's conference notes dated 7/21/93, Page 2, state density of .10 GPM/sq'. Clarification needed. We assume the density stated in this addendum applies. Also, conference notes lists quantity of foam to be 200 gallons. This is not correct based upon the .16 density, duration and the Fire Protection Plan.

3. Area #3 (Page 4):

   Fireflow calculation says 1,000 GPM for monitors. No monitors are shown on Drawing #078-91-009-D for Area #3 (hydrants are shown).

4. Addenda Approval (Item 10, Page 5):

   States that this document shall serve as the official Fire Protection Plan. This statement is not correct as this is only an addendum to the official plan.

Detailed Comments; Water System Drawings Dated 8/20/93:

1. Sheet 078-92-009-C (Fire Pump Area):

   a. Backflow device to be UL listed/FM approved and have OS&Y valves chained open.
   b. New main shall comply with NFPA 24 (plastic or lined/coated steel, etc.).
   c. Isolation valves shown upstream and downstream of fire pump should be OS&Y or have P.I.V.'s.
   d. Fire Department connection to be UL listed or FM approved.
   e. Fire alarm panel to be listed or approved, and shall be a lighted annunciator with graphics to approval of Fire Department. Panel is also

required at second entrance.

f. Main sizes should be indicated on drawing.

g. Fire pump and system must demonstrate 2,500 GPM at 110 PSI at all portions of system including the nozzle PSI at most remote monitors.

h. Pump data and listing shall be submitted to Fire Department, as well as installation drawings.

2. Sheet 078-91-009-B (Tank Farm #1):

a. Move P.I.V., near foam system, out of road.

b. Indicate main sizes, on drawing.

c. Detailed plans and calculations shall be submitted for foam system.

d. Plans and specifications needed for hydrants, monitors and reels.

3. Sheet 078-91-009-A (DCU/Ground Flare):

a. Show main size, on drawing.

b. Move P.I.V.'s, serving the water spray systems, to opposite side of road, and away from the road.

c. More detail will be needed on location, etc., of quadramese in relation to city main on Palm and Cherry Hill.

d. Design and calculations needed for water spray systems. Deluge valves should be located in an area safely accessible in a fire situation, 50' from the protected equipment is preferred. Valves shown appear too close.

4. Sheet 078-9-009-D (Stretford Unit):

a. Addendum refers to monitors. No monitors shown. These should be monitor/hydrants.

b. Add isolation valve on north side of main at tee to hydrant on south side.

General Notes:

All laterals to hydrants in this facility to have isolation valves. Monitors shall have approved operating valves. Fire equipment near roads shall be protected by approved crash posts, per Section 5-1.9 of Fire Protection Plan.

Applicant will need to demonstrate compliance with Uniform Fire Code for spill control, containment and drainage for caustic storage tank T-5, and any other vessels or tanks with flammable, combustible or hazardous liquids.

We should visit the site this month to verify proposed locations of fire protection equipment. We will arrange the date and time via phone.

If you have any questions, please let me know.

Sincerely,

Jim Hunt

SPECIFICATION SP-575701-80-05

FIREPROOFING OF VESSELS AND EXCHANGERS

1.0 GENERAL

1.1 Scope

⚠1

1.1.1 This Specification prescribes the procedures for selection and application of field applied, external, fireproofing insulation and weatherproofing to specified propane containing vessels and exchangers (V-801, V-802, and E-604). The resulting insulation system shall be capable of maintaining mechanical integrity during two hours of fire exposure, including impingement of firewater spray.

1.1.2 Wherever a difference exists between this specification and the drawings, the drawings shall govern. However, no deviations shall be made from this Specification without written authorization from BUYER.

1.2 Definitions

BUYER: Shell Western E&P Inc. (SWEPI) or SWEPI's authorized representative.

CONTRACTOR: The corporation, partnership or individual contracted to provide on site construction services, materials and/or fabrication in accordance with this Specification and referenced documents.

MANUFACTURER: The original FABRICATOR of the equipment or material.

INSULATION CODE: Vessels and exchangers shall be fireproofed and insulated when indicated on the MFD's (Mechanical Flow Diagrams) and UFD's (Utility Flow Diagrams). Drawings will be coded as follows:

Insulation Code	Definition
IF	Insulate for fire protection

BLOCK: The term "block" (called "board" by some suppliers), as used in this Specification, refers to rigid insulation supplied in molded radius blocks.

1.3 Work Not Included

1.3.1 Low temperature thermal insulation ranging from minus 150°F to ambient shall be included in Specification SP-575701-80-03, Cold Insulation.

1.3.2 Intermediate and high temperature insulation from ambient to 1500°F shall be included in Specification SP-575701-80-04, Hot Insulation.

1.4 System Description - Design Requirements

1.4.1 Thickness of insulation for vessels and equipment shall be two (2) inches of Pabco Super Caltemp 1500 "Quad" block calcium silicate insulation, or BUYER approved equivalent. Alternative insulation shall yield an "Environment Factor" (F) no greater than 0.06 based on the following equation from API Recommended Practice 520, 5th edition, p. 61:

$$F = \frac{k(1660 - T_f)}{21,000\,t}$$

Where:

t = Insulation thickness (inches)
k = Insulation thermal conductivity evaluated at mean temperature of 904°F
T_f = Equipment contents temperature at relieving conditions (°F) = 148°F

1.4.2 Painting of vessels and exchangers will be by others and will be in accordance with Specification SP-575701-80-01.

1.4.3 It is intended that pressure tests will be completed by BUYER before insulation is installed. If insulation is applied before testing, all welds, threads, and bolted connections shall be left uninsulated and exposed until completion of testing. Exposed insulation shall be weatherproofed to prevent ingress of moisture prior to pressure testing.

1.4.4 Insulation supports required on vessels and exchangers will be supplied by BUYER. No welded attachments shall be made to vessels and exchangers without prior written authorization from BUYER.

1.4.5 Preformed fireproofing insulation shall be used on specified propane containing vessels and exchangers.

2.0 CODES, STANDARDS AND REGULATIONS

The publications listed below form part of this Specification. Each publication shall be the latest revision and addendum in effect at the time of Purchase Order issue. Except as modified by the requirements specified herein or the details of the drawings, work included in this Specification shall conform to the applicable provisions of these publications.

API (American Petroleum Institute)

API-RP550	Sizing, Selection, and Installation of Pressure-Relieving Devices in Refineries

ASTM (American Society for Testing and Materials)

ASTM C533	Specification for Calcium Silicate Block and Pipe Thermal Insulation
ASTM C1094	Specification for Removable Covers
ASTM E84	Water Vapor Transmission of Materials in Sheet Form
ASTM E96	Surface Burning Characteristics of Building Materials
ASTM E119	Fire Exposure Test

Underwriters Laboratories

UL 1709	Underwriters Laboratories Hydrocarbon Fire Exposure

Specifications

SP-575701-80-01	Painting of Equipment, Piping and Miscellaneous Steel

3.0 PRODUCTS

3.1 General - Materials

Acceptable Basic Materials - Vessels and Exchangers

3.1.1 All insulation materials and accessories shall conform to the regulations of the OSHA (Occupational Safety and Health Administration).

3.1.2 When the installation or use of fireproofing insulation materials, accessories, and systems may pose safety or health problems, CONTRACTOR shall provide BUYER with appropriate current information regarding known problems associated with the recommended use of the MANUFACTURER's products and shall also recommend protective measures to be employed in their safe utilization. CONTRACTOR shall establish appropriate safety and health practices and determine the applicability of regulatory requirements prior to use.

3.1.3 Insulation and accessory materials shall not contain asbestos in any form. This requirement shall be maintained without exception.

3.1.4 The basic fireproofing insulation materials for vessels and exchangers shall be formed in cylindrical sections, one piece or half sections, depending upon size and commercial availability.

3.1.5 Rigid block insulation shall be used on heads of vessels and exchangers.

3.2 Insulation Materials

3.2.1 Acceptable insulation system materials and suppliers shall be those listed herein. Materials equal or superior to those described may be used with prior written concurrence of BUYER. Engineering data and user references for the evaluation of alternative materials shall accompany proposals. BUYER shall be sole judge of suitability of alternative materials.

3.2.2 Materials for insulation systems shall be suitable for the metallurgy of the insulated equipment and other components of the insulation system which they contact.

3.2.3 **Recommended Materials**

A. Blocks

Calcium Silicate:

- Pabco Super Caltemp 1500 "Quad" Block
- Or BUYER approved equal

B. Insulating Cement

Mineral wool base filler for cracks, voids, and joints between blocks:

- Eagle Picher Super 66
- Manville 460
- Or BUYER approved equal

C. Weatherproof Coating

For vessel head within skirt

- Eagle Picher One Cote
- Keene Super Power House
- Manville 375

3.3 Jacketing Materials

3.3.1 Jacketing material shall be selected based on ability to withstand firewater impingement, code requirements, environmental considerations, maintenance requirements, and aesthetics.

3.3.2 **Stainless Steel Jacketing - Type 316**

A. For vessel and exchanger heads: Smooth, 0.019 inch, mill finished, cut and machine rolled section.

B. For vessel and exchanger shells: Smooth, 0.019 inch, mill finished, cut and machined rolled section.

3.3.3 All metal jacketing systems shall have a moisture barrier to prevent galvanic corrosion at the metal-to-insulation interface of the jacket and the piece of equipment. Moisture barriers shall be factory-applied to the underside of the metal jacket.

3.3.4 Jacketing shall be secured with stainless steel bands and screws so that insulation can easily be removed for inspection of corrosion.

3.4 Standard Accessory Material

3.4.1 Flashing/caulking compound shall be nonshrinking, permanently flexible, metallic gray, 94 percent nonvolatile, with a water vapor permeability of 0.008 as specified by ASTM E96, for service from minus 100 degrees F to 300°F.

3.4.2 Banding shall be fabricated from 3/4 inch by 0.020 inches thick, AISI Type 304 soft annealed stainless steel material.

3.4.3 Banding seals shall be heavy duty 18-8 Cr-Ni stainless steel, AISI Type 302 or 304, T-5005 hard temper, wing-type, 0.032 inches thick.

3.4.4 Screws shall be self-tapping, slotted, hex head, sheet metal, 304 stainless steel, number 8 by 1/2 inch long.

3.4.5 Wire shall be 0.0625 inches (16 gauge) diameter, 304 stainless steel, annealed temper, to secure block insulation prior to jacketing.

3.4.6 Floating ring shall be 1/4" stainless steel type 316 annealed rod.

3.5 Removable and Reusable Jacketed Covers

3.5.1 Equipment with irregular or complex surfaces such as manways or inspection openings that require regular inspection and maintenance shall be insulated with removable and reusable jacketed covers.

3.5.2 Removable covers shall be designed to provide the following qualities:

- Insulation integrity
- Accurate fit
- Ease in removing and replacing
- Adaptability to field conditions and interferences
- Neat appearance consistent with adjacent insulated systems

4.0 APPLICATION OF INSULATION

4.1 General

4.1.1 Block insulation on vessels and exchangers shall be applied with staggered joint arrangement. Top and bottom edges shall be securely tied over support rings with wire on 12 inch centers. Insulation shall then be secured in place with band loops spaced on 12 inch centers.

4.1.2 Heads shall have the insulation shaped so that all sections closely fit the contour of the head and are laced together with wire or are secured with bands on 12 inch centers at tangent line. Insulation for exposed heads shall be secured with banding attached to a 1/4 inch round stainless steel rod, as a floating ring on the top and a circumferential band at the tangent line of the vessel head as per Attachment 3.

4.1.3 Insulation and jacketing around structural support attachments on vessels and exchangers shall be closely fitted and sealed around such objects. Insulation voids in these areas shall be filled with insulating cement.

4.1.4 Care should be taken to avoid contact between dissimilar materials which might cause galvanic corrosion.

4.1.5 All cracks, voids, and joints in the block insulation surface shall be filled with insulating cement either troweled or palmed on after wires or bands are installed.

4.2 Jacketing

4.2.1 Weatherproof covering on straight fireproof insulated vessels and exchangers shall be stainless steel jacketing machine rolled to the OD of the insulation and fitted snugly over insulation. Joints shall be lapped a minimum of three inches (circumferentially and longitudinally) and arranged to shed water and secured with bands.

4.2.2 Each section of jacketing on vertical vessels shall be supported from the next lower section with "S" clips made from the banding material. Longitudinal joints on vertical jacketing shall be staggered.

4.2.3 Stainless steel jacketing on horizontal vessels and exchanger shells shall be fitted snugly to the insulation and both longitudinal and circumferential joints shall be lapped a minimum of three inches and arranged to shed water as per Attachment 1.

4.2.4 Vessels heads within skirts shall be insulated and covered with a weatherproof coating as per Attachment 2.

4.2.5 Exposed vessel heads shall be insulated and jacketed as specified in Section 3.3. Gored head sections shall be overlapped a minimum of two inches and fastened with stainless steel sheet metal screws on three inch centers. All seams shall be lapped to provide maximum weather protection as per Attachment 3.

4.3 Vessels and Exchangers Fireproofing Insulation

4.3.1 Vessels and exchangers shall be fireproof insulated where indicated by insulation code **IF** on the Mechanical Flow Diagrams.

4.3.2 Fireproofing insulation thickness shall be in accordance as specified in Section 1.4.

4.3.3 Nameplates shall not be insulated.

4.3.4 Manhole covers on vessels and exchangers shall be fireproof insulated with removable covers. Covers shall be furnished with jacketing as specified in Section 3.5..

4.3.5 On horizontal vessels and exchangers, jacketing shall be secured with bands spaced on 12 inch centers. Horizontal seams shall have stainless steel screws on six inch centers.

4.3.6 A total of four inspection openings shall be provided for each vessel and exchanger. Inspection opening shall consist of a three inch square removable piece of block insulation with a nine inch square stainless steel jacket as per Attachment 5. Location of openings will be specified at a later date prior to any insulation work.

4.4 Removable and Reusable Jacketed Covers

4.4.1 Covers shall be designed with a minimum number of pieces. Covers shall overlap adjacent insulation by two inches and must be designed to prevent air movement behind the insulating covers. Covers shall be secured to adjacent jacketed insulation with (minimum four) stainless steel screws.

4.4.2 Covers shall be designed from actual field measurements to ensure proper fit and design as per Attachment 4.

5.0 EXECUTION

5.1 General

5.1.1 Scope of work, general terms and conditions, and MANUFACTURER's recommended installation instructions for fireproofing insulation shall be considered as supplemental to the requirements of this specification.

5.1.2 All applications of insulation shall be in strict accordance with these specifications. CONTRACTOR shall submit for BUYER's approval any materials, insulation details, or intended practices of insulation application not covered in this Specification. Omission of details from these Specifications shall not relieve CONTRACTOR from the obligation

to supply a properly designed installation in accordance with current acceptable construction practices.

5.1.3 Where brand or trade names are mentioned herein, they are for the purpose of identifying general types of acceptable materials. Products offered as "equal " will be acceptable after information is submitted to and approved by BUYER. Written acceptance in Purchase Order shall constitute approval.

5.1.4 All materials shall be new, the best quality of the respective types, and suitable for the intended service.

5.1.5 Craftsmen regularly engaged in the insulation industry shall install the fireproofing insulation. The quality of workmanship shall be the best obtainable. Finished work shall be uniform and neat in appearance. All installation procedures shall follow good and acceptable insulation practices for the particular service.

5.2 Submittals

5.2.1 Product Data

Submit the MANUFACTURER's specifications and installation instructions, including data substantiating compliance with specified requirements, to BUYER for review.

5.2.2 Samples

Submit one sample of specified or equal fireproofing material indicating density, porosity, temperature rating, ASTM E 119 Fire Exposure Test data and finish texture for BUYER review.

5.2.3 Material Safety Data Sheet

Submit all applicable MSDS (Material Safety Data Sheet) forms to BUYER for review.

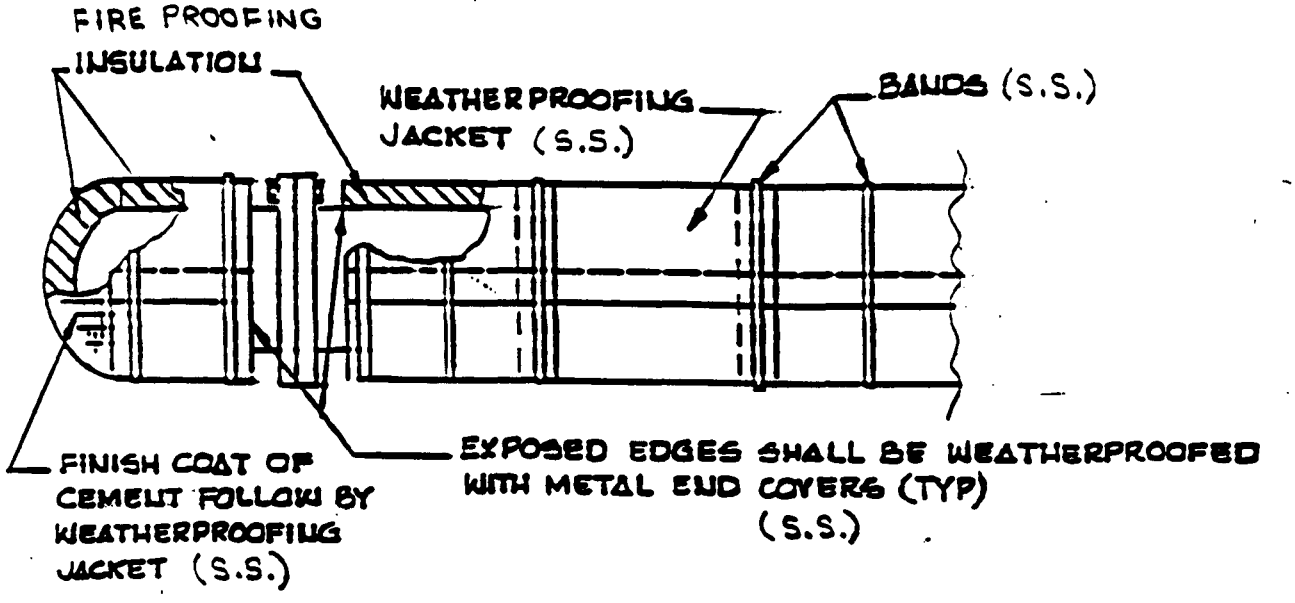
5.3 Quality Assurance

5.3.1 CONTRACTOR shall have no fewer than two years of experience installing fireproofing insulation.

5.3.2 CONTRACTOR shall provide BUYER with a signed and dated certification specifying what vessels and exchangers were provided with fireproofed

insulation. Thickness, UL design number, and UL rating shall also be on the certificate.

5.4 Product Delivery and Handling



Deliver, store, and handle materials in accordance with the MANUFACTURER's recommendations, and prevent intrusion of moisture and foreign material.

October 26, 1993

Mr. Thomas F. Poe
Fire Marshal/Division Chief
City of Huntington Beach Fire Department
2000 Main Street
Huntington Beach, CA 92648

Dear Chief Poe:

SUBJECT: FIRE PROTECTION PLAN ADDENDUM-HUNTINGTON BEACH

Considerable design effort has been underway since our last meeting, and the purpose of this letter is to give you an update as to the Fire Protection Status, and the overall project status. Both are proceeding according to plan, and schedule.

Attached are:

(1) Meeting Notes for our July 16,1993 meeting.
(2) A copy of the revised Fire Protection Plan addenda for your Approval. Please return one executed copy.
(3) Revised Piping Transpositions resulting from our meeting.

Fire Protection System:

The Fire Protection System is designed to supply 2500 gpm to all areas of the plant for firefighting use, supplied by a new diesel fire water pump. The design basis flow shall be provided with 100 psi available at the fire water monitors. We are currently working with Public Works to secure a 12" water service at the intersection of Goldenwest and Pacific Coast Highway. The secondary source requested will be supplied by our existing 8" connection at Cherry Hill. Fire Department connections will be provided at both locations to allow connection of a pumper truck.

We have complied with the requirements discussed at the meeting, but are seeking relief from the requirement in the Fire Protection Plan for internal cement lining of piping. The hydraulic calculations indicate that a minimum 12" main will be required to meet the water flows required by the HBFD. We intend to use an existing 12" that is not internally coated, but offer in mitigation to hydrostatically test this line on a biannual basis, and institute a corrosion monitoring/testing program for this system. Use of this existing line will result in a project savings of $1MM. We have committed in the past to hydrostatically, and non-destructively test any existing piping that is used in this project.

Within four weeks we will be sending to your and Mr Hunt's attention drawings/ specifications/design details for your review/comment/approval per the Fire Protection Plan.

Overall Project:

Engineering is essentially 80% complete, and major equipment is on order. We are securing the necessary authorities for construction from the South Coast Air Quality Management District, and plan to begin requesting building permits within the next 60 days. Construction is anticipated to begin in December 1993, and we will complete the project by December 1994. The demolition of the existing Gas Plant #11 will begin June of 1994.

The project will be conducted in phases:

(1) The construction and operation of the Ground Flare, which is a device similar to the one located in the parking lot at City Hall.
(2) Shutdown, secure, purge, and demolish the existing plant.
(3) A parallel effort for construction of the new facility.
(4) Site remediation and closure of the existing site.

An onsite qualified archeologist will monitor all initial grading activities associated with the removal of the existing Gas Plant #11, and a closure plan will be submitted to the Huntington Beach Fire Department, and the State Department of Oil & Gas for approval as per the conditions of our Negative Declaration.

If you have any questions or need any additional information, please contact me at (805) 326-5072.

Shell appreciates the City of Huntington Beach Fire Department's continued support and cooperation on this project with our common goal of Safety.

Best Regards,

James F. Langer, P.E.
Project Manager

SPECIFICATION SP-575701-49-07

FOAM/WATER FIRE EXTINGUISHING SYSTEMS

1.0 GENERAL

1.1 Scope

This specification, when accompanied by the BUYER's drawings and specifications, covers the requirements for the design, materials, fabrication, installation, inspection and testing of the Foam/Water Fire Extinguishing System.

1.2 Definitions

For the purposes of this specification, the following definitions apply:

BUYER: Shell Western E&P Inc. (SWEPI) or SWEPI's authorized representative.

SUPPLIER: The vendor selected by BUYER to engineer, supply and install equipment, in accordance this specification and referenced documents.

CONTRACTOR: The corporation, partnership or individual contracted to provide on-site construction services, materials and/or fabrication in accordance with this specification and referenced documents. CONTRACTOR shall be a licensed California contractor experienced in the installation of foam systems which meet the requirements of NFPA 11 and 13.

MANUFACTURER: The original fabricator of the equipment or components described in this specification and referenced documents.

FABRICATOR: The corporation, partnership or individual contracted to perform services to produce a specific product normally remote from jobsite, as described in this specification and referenced documents.

2.0 APPLICABLE CODES, STANDARDS AND REFERENCES

The equipment, materials, and/or design requirements covered by this specification shall be in accordance with the latest issue of the following referenced specifications, codes, and standards unless a specified edition/date is otherwise indicated.

2.1 Codes and Standards

2.1.1 Factory Mutual (FM)

Factory Mutual Data Sheets and Approval Guide

2.1.2 Underwriters Laboratories Inc. (UL)

SP-575701-90-02 Welding of Shop and/or Field Fabricated Piping

3.0 DESCRIPTION

The design, materials, fabrication, installation, and testing of the Foam/Water Fire Extinguishing Systems shall comply with the requirements of NFPA 11 and 13. All foam water extinguishing devices shall be suitably listed by UL or approved by FM.

3.1 Design Criteria

SUPPLIER shall design a manual Foam/Water Fire Extinguishing System per the requirements of NFPA 11, 13, and all applicable local, state and federal requirements. SUPPLIER shall be responsible to determine foam capacities & flow rates required per the needs of Tank Farm No. 1 and be responsible to obtain all necessary certifications..

3.2 System Design

The Foam/Water Fire Extinguishing System shall be designed by the SUPPLIER for the protection of Tank Farm No. 1. SUPPLIER shall provide a self-contained, skid-mounted Foam/Water Fire Extinguishing System (see drawing 078-92-007C). In addition, SUPPLIER shall provide all piping, supports, and foam chambers to comprise a total foam system. The Foam/Water Fire Extinguishing System shall be of the Diaphragm Balance Pressure Proportioning type design and shall include all necessary equipment, approved design drawings, configuration, installation and testing. As a minimum, the scope shall include the following:

3.2.1 Foam

The foam concentrate provided by BUYER shall be a synthetic type and shall meet the requirements of NFPA 11. The foam shall form a 3 percent solution by volume when mixed with water. The foam solution shall be produced by continuous introduction of the foam concentrate at the correct ratio to the water flow. The foam concentrate shall be introduced into the waterflow by pressure injection through the use of a pressure proportioning tank and a proportioning ratio controller.

3.2.2 Diaphragm (Bladder) Proportioning Tank, V-200

The foam bladder tank shall be sized on the basis of extinguishing a fire in a 40 foot diameter tank. The design shall meet the requirements of NFPA 11. The foam bladder tank shall be skid mounted and will be permanently located, as shown on Firewater Transposition Dwg. No. 078-91-009B). The foam liquid storage tank shall be of welded construction in accordance with the requirements of Section 2 of this specification. The foam bladder tank shall provide for filling, draining, cleaning, and inspection of interior surfaces.

3.2.3 Proportioning Controller (Venturi-Type)

SUPPLIER shall provide a proportioning controller to mix the foam concentrate and water to produce a 3 percent solution at various flow rates.

3.2.4 Strainers for Foam Concentrates

Strainer shall be installed in foam concentrate line upstream of metering orifices or ratio controllers so as to be accessible for cleaning during system operation.

3.2.5 Foam/Water System Piping

All piping, fittings and valves for the Foam/Water Fire Extinguishing System shall be in accordance with the requirements of Section 2 of this specification. Hydraulic calculation shall be made in accordance with the requirements of NFPA 11. The SUPPLIER shall provide all design drawings, calculations, piping layouts, pipe supports, hangers, and critical pipe dimensions for BUYER approval.

3.2.6 Foam Chamber

Foam chambers shall provide the means of introducing foam to the tanks located in Tank Farm No. 1. SUPPLIER shall select and size the appropriate foam chamber per the requirements of NFPA 11.

4.0 SYSTEM OPERATIONS

The balance pressure proportioning design shall be configured to operate as follows:

4.1 The foam system will be activated manually by connection to the fire department truck and opening valves systematically.

4.2 Water supply then simultaneously feeds the ratio controller and pressurizes the foam concentrate through a bladder in the tank.

4.3 Water flowing through the ratio controller venturi creates a differential pressure common to both the downstream water and foam concentrate. This pressure differential between V-200 and the proportioning controller inlet, induces foam concentrate from V-200 through a foam concentrate orifice and mixes with the water to produce foam solution at various flow rates.

4.4 During operation the water outside V-200's bladder gradually displaces the foam concentrate inside, causing the bladder to collapse until the supply is exhausted.

4.5 At such time that the foam supply is exhausted, the system shall be shut down, the tank drained, and the bladder refilled with foam concentrate.

5.0 TECHNICAL REQUIREMENTS

5.1 Welding

All welding shall be in accordance with the requirements of Specification SP-575701-20-02 and SP-575701-90-02.

5.2 Structural

All equipment, supports, and skids shall conform to the requirements of Specification SP-575701-00-01 and SP-575701-20-01.

5.3 Supports

5.3.1 All pipe supports shall be designed, furnished, and installed by CONTRACTOR. All piping shall be supplied with adequate sway bracing to prevent movement during operations.

5.3.2 Exterior supporting steel members shall be galvanized.

5.3.3 Hangers for support of piping and equipment shall be galvanized and shall be types approved for fire protection services. Supports shall not interfere with access to operating areas.

5.4 Tooling

SUPPLIER shall furnish any special tooling needed for maintenance and servicing of the system. The tooling shall be new and shall not have been used for manufacturing or assembly of the unit.

6.0 QUALITY CONTROL

6.1 Materials/Equipment Supplied

SUPPLIER shall furnish all fire protection material and equipment from BUYER's suggested manufacturers lists. All materials and equipment furnished in accordance with this specification shall be standard equipment, new, designed for the use intended, and conform to the types and sizes defined in NFPA. Materials and equipment furnished shall be UL listed and/or FM approved for the particular application proposed.

6.2 Inspection

6.2.1 SUPPLIER shall furnish the BUYER copies of the SUPPLIER's Quality Control Plan.

6.2.2 The following information shall be available to the inspector upon request:

A. Evidence, such as material certifications, purchase specifications and bills of materials, to establish that various parts and components are of specified material.

B. Copies of SUPPLIER's unpriced purchase orders to all subsuppliers.

7.0 SUBMITTALS

7.1 SUPPLIER shall submit a list of materials being used to BUYER for review prior to shipment. The list shall include a description of all materials and material listings.

7.2 SUPPLIER shall submit plan drawings and hydraulic calculations to BUYER for review prior to installation. Drawings and calculations shall be in accordance with NFPA 11.

7.3 SUPPLIER/CONTRACTOR shall provide BUYER with a set of Operation and Maintenance Manuals prior to testing the system. Each set of manuals shall contain the following information:

7.3.1 A complete set of instructions regarding operation, maintenance, and testing of equipment involved.

7.3.2 A complete bill of materials of all replaceable parts, their part numbers, current cost, and name and address of nearest supplier.

7.3.3 Supporting documentation including calculations, drawings, certification.

7.3.4 A copy of all guarantees and warranties issued.

7.4 Before final acceptance by BUYER, SUPPLIER/CONTRACTOR shall provide the BUYER with As-Built drawings and test certificates in accordance with NFPA 11.

8.0 SUGGESTED MANUFACTURERS

Chubb National Foam
3M Co.
Ansul Fire Protection
Rockwood Systems
Feecon
Grimway

9.0 SURFACE CONDITIONS

9.1 SUPPLIER/CONTRACTOR shall examine the areas and conditions under which work of this section will be performed. CONTRACTOR shall not proceed until unsatisfactory conditions are corrected.

9.2 It shall be the responsibility of CONTRACTOR to coordinate with BUYER, the schedule and sequencing of installation, prior to installation. Specifically, the CONTRACTOR shall schedule and coordinate the following:

a) Excavation of underground piping
b) Penetrations in tanks located in Tank Farm No. 1
c) Inspection by Huntington Beach Fire Marshall to coincide with inspection of other systems

10.0 DOCUMENTATION

10.1 SUPPLIER shall supply shop drawings with schematics to facilitate BUYER evaluation of the effectiveness of each system.

10.2 Drawings and Data submitted shall include information and calculations on the amount of foam, container storage pressure, the location and flow rate of each nozzle, the nozzle discharge pressure, size and equivalent length of pipe, fittings and the location.

10.3 Plans and calculations shall be submitted for BUYER review.

11.0 INSPECTION

11.1 BUYER shall be allowed access to SUPPLIER/CONTRACTOR's facilities to inspect the equipment prior to shipment. SUPPLIER/CONTRACTOR shall coordinate with BUYER to schedule or waiver the inspection prior to the packaging of the equipment being shipped.

11.2 BUYER shall be permitted to inspect SUPPLIER/CONTRACTOR supplied equipment at the jobsite prior to installation.

11.3 During and after installation the system shall be subject to inspection for proper workmanship, appearance, and compliance with this specification.

12.0 SHIPPING, HANDLING AND STORAGE

12.1 Equipment shall be prepared for shipment after all shop tests have been completed.

12.2 Openings shall be covered and lifting points clearly marked.

12.3 SUPPLIER/CONTRACTOR shall be responsible for, and shall make all arrangements for, delivery, unloading and handling of all equipment, materials and tools, and for the storage of same in areas as designated by BUYER.

12.4 SUPPLIER/CONTRACTOR shall provide protection for the equipment during transit and storage.

13.0 INSTALLATION

13.1 CONTRACTOR and all of his employees, subcontractors, etc., must at all times keep away from all parts of the site except the areas in which work is being done under this specification or the areas assigned for storage of materials. BUYER will assign a foreman to the project, and his direction shall be closely followed. At no time shall any work commence or continue without the presence and direction of BUYER's foreman.

13.2 CONTRACTOR shall install the piping and equipment in accordance with the working drawings as accepted by BUYER.

13.3 Any deviations from the accepted drawings shall require prior acceptance by BUYER.

13.4 CONTRACTOR shall install the equipment so that it will not interfere with piping, electrical conduit and structural members. If any such interferences exist or occur, CONTRACTOR shall make the necessary adjustment to permit satisfactory installation of the equipment without additional cost upon approval of BUYER's construction manager.

13.5 CONTRACTOR shall give adequate prior notice to BUYER of any requirements for BUYER-supplied services for installation and testing of the system.

13.6 All excess oil, dirt, pipe joining compound, rust, and mill scale shall be removed from piping and equipment. All dirt, debris, and excess cutting oil shall be removed from the interior of all piping and equipment before it is erected.

13.7 Open ends of all installed piping and equipment shall be covered at the end of each working day to prevent foreign material from entering.

14.0 IDENTIFICATION

14.1 CONTRACTOR shall furnish a master chart for each system and shall show the identification numbers and locations of all critical system components, valves, and instruments.

14.2 Drain and test valves shall have brass tags not less than 2-1/2 inches in diameter, inscribed with 3/4 inch numbers. The tags shall be attached to the valves with non-ferrous chains.

15.0 TESTING

15.1 CONTRACTOR shall perform inspections and tests in accordance with this specification and applicable codes and standards. The tests shall include all testing required by NFPA 11, as a minimum. A test plan shall be submitted to the BUYER for approval prior to the start of testing.

15.2 CONTRACTOR shall flush the water supply connections in accordance with NFPA 11 and 13. Prior to testing, the foam/water system shall be flushed to allow thorough cleaning. The flushing operation shall be documented and certified.

15.3 Piping shall be hydrostatically tested in accordance with the requirements of NFPA 11 and 13. After testing and acceptance, the system shall be thoroughly drained.

15.4 All tests performed by CONTRACTOR shall be conducted in the presence of BUYER's authorized representative, and representatives of all authorities having jurisdiction. Concerned parties shall be notified not less than 1 week in advance of the tests in order to acknowledge attendance at the tests. CONTRACTOR shall execute the Inspection Agreement of the National Automatic Sprinkler and Fire Control Association, Inc., and subsequent reports of inspection required by the Agreement.

16.0 CLEANUP

16.1 Before acceptance of the installation, CONTRACTOR shall remove the following:

16.1.1 Rubbish and debris resulting from the work.

16.1.2 CONTRACTOR-furnished equipment, tools, and temporary services and utilities.

16.2 Equipment or areas damaged by CONTRACTOR shall be repaired, replaced, or restored to its original condition at no additional cost to BUYER.

Mr. J. F. Langer, Senior Chemical Engineer
Shell Western E&P, Inc.
Coastal Assets California Division
SPT 754
5060 California Avenue
Bakersfield, California 93309

RE: CHARGES FOR HUNT RESEARCH CORPORATION

Dear Mr. Langer:

Enclosed is the Invoice from Hunt Research Corporation for services rendered for the City of Huntington Beach Fire Department to plan check, review and recommend corrections in fire protection details for the new Shell Gas Plant and existing facilities on the Shell Oil Lease located on Pacific Coast Highway and Golden West Street in Huntington Beach, California.

Pursuant to section 2.302 of the Uniform Fire Code and the Fire Department's understanding, costs were to be billed to Shell Western for the use of Hunt Research Corporation services for technical assistance to the Fire Department.

Thank you for your cooperation to assure that a quality system will be installed specific to the needs of the City of Huntington Beach. Please call me if you have any questions regarding the above at 714-536-5564.

Sincerely,

Thomas F. Poe

FLUOR DANIEL

INTEROFFICE CORRESPONDENCE

To:	Bill Linkus	Date:	July 21, 1993
Location:	Bakersfield	Reference:	SHELL "SWEPI"
From:	Dave Rich		
Location:	Irvine	Client:	SHELL
Extension:	5166	Subject:	Meeting with Fire Marshall

cc: G. Monteath
I. Gosla

Following is a summary of the subject meeting.

Attending:

(SWEPI)	Allan Budvitis	Operations Foreman
(Client)	Jim Langer	
(HBFD)	Ward Kinsman	Fire Protection Analyst
(HBFD)	Thomas Poe	Fire Marshall/Division Chief
(FD)	Dave Rich	
(HBFD)	Jim Hunt	Consultant
(HBFD)	Mark Bodenbender	Captain
(FD)	Buddy Leech	Process Engineer
(HBFD)	Lee Caldwell	

The meeting was scheduled to conduct a detailed review of the plant fire water system. Following is a summary of the important points of the meeting:

1. A detailed review of hydrant and monitor locations was conducted. I will convey these comments to FD Bakersfield for revision, via a marked-up set of plans.

2. The client agreed to provide a AFFF foam bladder tank with proportioner, to serve the proposed Oil Plant foam systems (Area #2). The system will remain manual, for use by HBFD. Client and HBFD will be discussing arrangements for the provision of a foam "cache".

3. Chief Poe will initiate flow tests of City water lines to confirm water supply characteristics. Current estimate is 3,000 to 4,000 gpm @ 20 psi. Client will pay fees. Tests to be conducted at Goldenwest entrance, and at Cherry Hill & Palm intersection.

4. The new connection to the city main at Cherry Hill & Palm will be made to the 8" leg extending from the 12" main line, so that domestic service is not interrupted.

5. On-site fire mains must be 8" minimum.

6. The fire pump system will consist of a diesel driven pump with associated controller, jockey pump and fuel tank equipment. Client will relocate a used 2,000 gpm unit to this site. Client will provide pressure rating of this pump to me for verification that capacity is sufficient for the system.

   A single diesel fire pump is acceptable to HBFD and the consultant, provided:

   a) that all performance requirements are verified by tests, and

   b) that provisions are made for fire trucks to act as the secondary pump source (fire dept. connection to pump bypass line).

7. If the proposed 2,000 gpm (used) pump proves to be insufficient to meet design basis requirements, the Client will provide a new 2,500 gpm diesel pump.

8. The design basis for the plant fire water system will be revised to 2,500 gpm, as requested by the HBFD consultant. The system shall provide 100 psi to the monitor nozzles, at that flow. FD process engineering will revise flow diagrams and calculations to reflect this requirement.

9. HBFD has requested that 10" piping not be used; however, teleconference with Ward Kinsman 7/20/93: 10" will be acceptable to HBFD.

Miscellaneous Comments

- Plant roads to be "all weather".
- Isolation valves on mains every 1,200'. (Shown on marked up plans 7/20)
- AFFF supply shall be based on NFPA II requirement: 0.10 gpn density; 55 minute duration; 3% solution; 39'0" diameter tank. Total foam requirement: 197 gallons (200 gallons).
- Combination hydrant monitor to be a single piece unit.
- Conference Notes to be sent to HBFD for concurrence.

June 21, 1993

Huntington Beach Fire Department
2000 Main Street
Huntington Beach, California 92648

Gentlemen:

SUBJECT: HUNTINGTON BEACH LEASE FIRE PROTECTION SYSTEM

The enclosed Addenda to the Fire Protection Plan represents the proposed fire and safety features which will be provided for the Water Plant, Oil Dehydration, Stretford Unit, and new Gas Processing Facility.

This safety plan is the result of an analysis of the potential risks from processes and equipment, balanced with appropriate automatic and manual safety features, to insure that reasonable safety levels are achieved.

Upon acceptance by the City of Huntington Beach Fire Department, this plan will form the basis of the safety system provided for the operation of the facility.

If you have any questions, please contact Mr. Jim Langer at (805) 326-5072.

Very truly yours,

J. C. Elliott
Technical Manager - L.A. Basin
California Division

REVISION 1

SPECIFICATION SP-575701-49-02

FIRE PROTECTION SYSTEM

ADDENDA

1.0 INTRODUCTION

This addenda provides data and information to supplement the "Approved, Fire Protection System, Master Plan". The addenda includes the following sections:

2.0 General Facility Description
3.0 Firewater Supply Source Description
4.0 Risk Areas Design Basis
5.0 Firewater Demand Summary
6.0 Firewater Demand Calculations
7.0 Firewater System Piping Transposition
8.0 Fire Department Notes
9.0 Attachments
10.0 Addenda Approval

2.0 GENERAL FACILITY DESCRIPTION

The systems, equipment and areas requiring fire protection coverage have decreased in their order of magnitude. The areas requiring fire protection are as follows:

AREA 1 - GAS PROCESSING

Area 1 has decreased both in number of equipment and in the quantities of gas being processed. The new design incorporates only one (1) reciprocating gas compressor compared to three (3) gas compressors. In addition, the total gas processed has decreased by 1/3. Originally, two (2) trains of equipment, each processed 3.0 MMSCFD, whereas now one (1) equipment train processes 4.0 MMSCFD.

AREA 2 - OIL PLANT

The equipment included within this area remains unchanged. Detailed risk evaluation resulted in the requirement to cover fewer equipment.

AREA 3 - STRETFORD UNIT

An existing sulfur removal system retrofitted to allow processing of the 4.0 MMSCFD of sweet and sour gas. This unit replaces the Sulferox Unit, which shall be considered for future installation

AREA 4 - FREE WATER KNOCKOUT VESSELS

The equipment included in this area remains unchanged. Detailed risk evaluation resulted in the requirement to cover fewer equipment.

AREA 5 - GROUND FLARE AREA

Area to include emergency vent stack

AREA 6 - WATER PLANT

The equipment included in this area remains unchanged. Detailed risk evaluation resulted in the requirement to cover fewer equipment.

AREA 7 - CONTROL ROOM

No changes.

3.0 FIREWATER SUPPLY SOURCE DESCRIPTION

The site firewater source is assumed to be the municipal water system. The municipal source will be pressurized by a new on-site fire pump system. Seven areas of risks were determined, each one of them protected by a reasonable supply of water.

4.0 RISK AREAS DESIGN BASIS

The revised design basis includes seven (7) risk areas and the following assumptions:

a) Where primary hazards exist, fixed systems are provided.

b) Each area includes a firewater allowance for two fixed or mobile monitor streams (500 gpm each), for the protection of the general area.

c) Each area includes a firewater allowance of 500 gpm for manual hoses.

d) The integrity of hazard containers is maintained (i.e. a ruptured container is not considered).

e) The firewater supply is capable of providing 100 psi at each monitor inlet, based on maximum demand.

5.0 FIREWATER DEMAND SUMMARY

AREA #1 **GAS PROCESSING**
Water demand: 1945 gpm

AREA #2 **OIL PLANT**
Water demand: 1720 gpm

AREA #3 **STRETFORD UNIT**
Water demand: 1500 gpm

AREA #4 **FREE WATER KNOCKOUTS**
Water demand: 1500 gpm,

AREA #5 **GROUND FLARE**
Water demand: 1500 gpm

AREA #6 **WATER PLANT**
Water demand: 1500 gpm

AREA #7 **CONTROL ROOM**
Water demand: 1500 gpm

6.0 FIREWATER DEMAND CALCULATIONS

AREA #1 **GAS PROCESSING**

Equipment included:

- K-601 - Reciprocating compressor skid - 4 MMSCFD
- ME-800 - Propane refrigeration skid - 200 gallons propane storage
- Compressor scrubbers V-601, V-602, V-606
- ME-700 - Glycol Regeneration Skid
- Dewpoint Control Unit Skid (DCU), includes E-604 Propane heat exchanger
- Sulfatreat vessels - V-604, V-605
- V-4, Drain Drum
- P-702 Glycol make-up pump
- T-703 Glycol Storage

Water demand:

Fixed water spray system provided for ME-800, K-601, E-604. Density = 0.50 gpm/sq ft

Largest Hazard (K-601): 445 gpm
Area Protection (Monitors): 1000 gpm

Manual Hose:	500 gpm
Total:	1945 gpm

No fixed protection is provided for remaining equipment.

AREA #2 **OIL PLANT**

Equipment included:

- LACT Unit
- Crude Oil Tanks T-101, T-102, T-103, T-104
- Oil Tanks Diked Area
- Vapor Recovery System
- Filter Surge Tank T-316
- Heater Treaters V-102, V101
- Skim Tanks T-317, T-318

Water demand:

Fixed foam systems are provided for:
Tanks T-101, 102,103,104, 316, 317 and 318,
Density = 0.16 gpm/sq ft

Largest Hazard (T-317):	220 gpm
Area Protection (Monitors):	1000 gpm
Manual Hose:	500 gpm
Total:	1720 gpm

No fixed protection is provided for remaining equipment.

AREA #3 **STRETFORD UNIT**

Equipment included:

- V-1 Inlet Scrubber
- V-2, V-3, V-5, Contact Towers
- V-4, Discharge Scrubber
- T-1 Sulfur Slurry Holding Tank
- T-2 Flotation Cell
- T-3 Oxidizer
- T-4 Pump Surge Tank

Water demand:

No fixed protection systems are provided.

Area Protection (monitors):	1000 gpm
Manual Hose:	500 gpm
Total:	1500 gpm

Dry chemical extinguishers are provided. The only hazard at this unit includes natural gas. There are no liquid hydrocarbons storage at this unit. The safety features for the Stretford Unit include emergency plant shutdown.

AREA #4 **FREE WATER KNOCKOUT VESSELS**

Equipment included:

- FWKO's # 107, 108, 109, 110, 111, 114, 115
- V-104, V-110, V-111

Water demand:

No fixed protection systems are provided.

Area Protection (monitors):	1000 gpm
Manual Hose:	500 gpm
Total:	1500 gpm,

AREA #5 **GROUND FLARE**

Equipment included:

- Pilot Gas
- Purge Gas
- Gas Relief System

Water demand:

No fixed protection systems are provided.

Area Protection (monitors):	1000 gpm
Manual Hose:	500 gpm
Total:	1500 gpm

AREA #6 **WATER PLANT**

Equipment Included:

- Flotation Cells T-334, T-335, T-336, T-337, T-338
- Sludge Tanks T-330, T-331

Water demand:

No fixed protection systems are provided.

Area Protection (monitors):	1000 gpm
Manual Hose:	500 gpm
Total:	1500 gpm

AREA #7 **CONTROL ROOM**

Water demand:

No fixed protection systems are provided.

Area Protection (monitors):	1000 gpm
Manual Hose:	500 gpm
Total:	1500 gpm

Dry Chemical extinguishers are provided.

7.0 FIREWATER PIPING TRANSPOSITION

To satisfy the requirements as defined in sections 4,5 and 6, the Piping Transposition Drawing was developed. Reference attached drawing.

FIRE PROTECTION SYSTEM

ADDENDA

1.0 INTRODUCTION

This addenda provides data and information to supplement the "Approved, Fire Protection System, Master Plan". The addenda includes the following sections:

2.0 General Facility Description
3.0 Firewater Supply Source Description
4.0 Risk Areas Design Basis
5.0 Firewater Demand Summary
6.0 Firewater Demand Calculations
7.0 Firewater System Piping Transposition
8.0 Fire Department Notes
9.0 Attachments
10.0 Addenda Approval

2.0 GENERAL FACILITY DESCRIPTION

The systems, equipment and areas requiring fire protection coverage have decreased in their order of magnitude. The areas requiring fire protection are as follows:

AREA 1 - GAS PROCESSING

Area 1 has decreased both in number of equipment and in the quantities of gas being processed. The new design incorporates only one (1) reciprocating gas compressor compared to three (3) gas compressors. In addition, the total gas processed has decreased by 1/3. Originally, two (2) trains of equipment, each processed 3.0 MMSCFD, whereas now one (1) equipment train processes 4.0 MMSCFD.

AREA 2 - OIL PLANT

The equipment included within this area remains unchanged. Detailed risk evaluation resulted in the requirement to cover fewer equipment.

AREA 3 - STRETFORD UNIT

An existing sulfur removal system retrofitted to allow processing of the 4.0 MMSCFD of sweet and sour gas. This unit replaces the Sulferox Unit, which shall be considered for future installation

AREA 4 - FREE WATER KNOCKOUT VESSELS

The equipment included in this area remains unchanged. Detailed risk evaluation resulted in the requirement to cover fewer equipment.

AREA 5 - GROUND FLARE AREA

Area to include emergency vent stack

AREA 6 - WATER PLANT

The equipment included in this area remains unchanged. Detailed risk evaluation resulted in the requirement to cover fewer equipment.

AREA 7 - CONTROL ROOM

No changes.

3.0 FIREWATER SUPPLY SOURCE DESCRIPTION

The site firewater source is to be the municipal water system. The municipal source will be pressurized by a new on-site fire pump system. Seven areas of risks were determined, each one of them protected by a reasonable supply of water.

4.0 RISK AREAS DESIGN BASIS

The revised design basis will provide 2500 gpm to all areas of the plant for firefighting use, supplied by a single diesel fire pump.

The design basis flow shall be provided with 100 psi available at the fire water monitors, hydrants, and miscellaneous end devices.

The Huntington Beach Fire Department will act as the backup pumping system, in the event that the primary diesel pump fails. City water pressure from two hydrants located adjacent to the pumphouse will be boosted by pumper truck(s), supplying a 6-way fire department connection to the fire pump bypass line.

5.0 FIRE PROTECTION SUMMARY

AREA #1 GAS PROCESSING

Equipment included:

- K-601 - Reciprocating compressor skid - 4 MMSCFD
- ME-800 - Propane refrigeration skid - 200 gallons propane storage
- Compressor scrubbers V-601, V-602, V-606

- ME-700 - Glycol Regeneration Skid
- Dewpoint Control Unit Skid (DCU), includes E-604 Propane heat exchanger
- Sulfatreat vessels - V-604, V-605
- V-4, Drain Drum
- P-702 Glycol make-up pump
- T-703 Glycol Storage

Fire Protection:

Fixed water spray system provided for ME-800, K-601, E-604. Density = 0.50 gpm/sq ft

No fixed protection is provided for remaining equipment.

AREA #2 **OIL PLANT**

Equipment included:

- LACT Unit
- Crude Oil Tanks T-101, T-102, T-103, T-104
- Oil Tanks Diked Area
- Vapor Recovery System
- Filter Surge Tank T-316
- Heater Treaters V-102, V101
- Skim Tanks T-317, T-318

Fire Protection:

Fixed foam systems are provided for:
Tanks T-101, 102,103,104, 316, 317 and 318, and tank diked area.
Density = 0.16 gpm/sq ft

No fixed protection is provided for remaining equipment.

AREA #3 **STRETFORD UNIT**

Equipment included:

- V-1 Inlet Scrubber
- V-2, V-3, V-5, Contact Towers
- V-4, Discharge Scrubber
- T-1 Sulfur Slurry Holding Tank
- T-2 Flotation Cell
- T-3 Oxidizer
- T-4 Pump Surge Tank

Fire Protection:

No fixed protection systems are provided.

Area Protection (monitors):	1000 gpm
Manual Hose:	500 gpm
Total:	1500 gpm

Dry chemical extinguishers are provided. The only hazard at this unit includes natural gas. There are no liquid hydrocarbons storage at this unit. The safety features for the Stretford Unit include emergency plant shutdown.

AREA #4 **FREE WATER KNOCKOUT VESSELS**

Equipment included:

- FWKO's # 107, 108, 109, 110, 111, 114, 115
- V-104, V-110, V-111

Fire Protection:

No fixed protection systems are provided.

AREA #5 **GROUND FLARE**

Equipment included:

- Pilot Gas
- Purge Gas
- Gas Relief System

Fire Protection:

No fixed protection systems are provided.

AREA #6 **WATER PLANT**

Equipment included:

- Flotation Cells T-334, T-335, T-336, T-337, T-338
- Sludge Tanks T-330, T-331

Fire Protection:

No fixed protection systems are provided.

AREA #7 **CONTROL ROOM**

Fire Protection:

No fixed protection systems are provided.

Dry Chemical extinguishers are provided.

6.0 FIREWATER PIPING TRANSPOSITION

To satisfy the requirements as defined in sections 4,5 and 6, the Piping Transposition Drawing was developed. Reference attached drawing.

7.0 ATTACHMENTS

- Firewater Piping Transpositions

Huntington Beach Fire Department

March 10, 1993

J. C. Elliott, Technical Manager
Shell Western E&P Inc.
P.O. Box 11164
Bakersfield, Ca. 93389-1164

SUBJECT: GAS PLANT RELOCATION

Dear Mr. Elliot:

The fire department has reviewed your request to extend time to relocate your current gas plant from an area designated as part of the future Bolsa Chica Park site to a new gas plant facility located on the Shell Oil Lease.

The fire department will approve the extension of time as requested beyond the agreed upon date of December 1994 providing Shell has met the following conditions:

1. A Hazard Utilization Study approved be the fire department must be completed to show how the current plant risks will impact the existing and growing residential development.

2. A Fire Protection Plan approved by the fire department must be completed to show hazards of the current plant. The plan must show how measures will be proposed for mitigating risks, such as fire, explosion or toxic releases. Emergency management procedures must be incorporated into the plan to show evacuation areas and provisions for evacuating people.

It was a pleasure meeting with you and the other the Shell representatives in February and the subsequent follow-up telephone call I had with you on March 1st informing you of this action. If you have any further questions from myself or the fire department, please call at 714-536-5564.

Sincerely,

Thomas F. Poe
Fire Marshal

SPECIFICATION SP-575701-49-05

FIRE PROTECTION DELUGE SYSTEMS

1.0 GENERAL

1.1 Scope

1.1.1 This specification shall include furnishing the complete engineering and design as well as furnishing the material, installation, testing and equipment required for the complete and operational automatic deluge spray system including detection and alarm systems.

⚠1 1.1.2 The Deluge Spray System is to be installed at the Shell Western E&P Inc. (SWEPI) Gas Processing Plant at Huntington Beach, California, for a gas compressor and a propane compressor located inside the compressor building, and a propane surge drum and air cooling heat exchanger.

1.2 Definitions

For the purposes of this specification, the following definitions apply:

BUYER: Shell Western Exploration and Production, Inc. (SWEPI) or SWEPI's authorized representative.

SELLER: The vendor selected by BUYER to supply equipment, engineering, or services described in this specification and referenced documents.

CONTRACTOR: The corporation, partnership or individual contracted to provide on-site construction services, materials and/or fabrication in accordance with this specification and referenced documents.

MANUFACTURER: The original fabricator of the equipment or components described in this specification and referenced documents.

FABRICATOR: The corporation, partnership or individual contracted to perform services to produce a specific product normally remote from jobsite, as described in this specification and referenced documents.

2.0 APPLICABLE CODES, STANDARDS, AND REFERENCES

Design engineering and installation shall be in accordance with the latest edition of the following Codes, Standards, and Documents referenced in the specification.

National Fire Protection Association (NFPA)

NFPA 13	Installation of Sprinkler Systems
NFPA 15	Water Spray Fixed Systems for Fire Protection
NFPA 70	National Electric Code
NFPA 72A	Local Protective Signaling Systems
NFPA 72D	Proprietary Protective Signaling Systems
NFPA 72E	Automatic Fire Detectors

BUYER's Specifications and Standard Forms

SP-575701-50-08	Firewater Piping Systems
SP-575701-70-16	Control Panels
SP-575701-50-81	Coating and Wrapping of Steel Pipe
Form E-212	Vendor Drawings and Data Commitment

3.0 DESCRIPTION

3.1 One deluge valve riser shall be provided for the area specified in Section 1.1.2. The deluge system shall be hydraulic release type and shall meet the requirements of NFPA 15. The associated detection equipment shall meet the requirements of NFPA 72E.

3.2 The CONTRACTOR shall provide one local alarm system which shall include, but not be limited to, local alarm bell, and manual pull station. The fire alarm system shall meet the requirements of NFPA 70, 72A, and 72D.

3.3 BUYER will provide firewater to the CONTRACTOR from one 10-inch 150# flanged stub-up. CONTRACTOR shall make the proper connections as required for system operation.

3.4 Power (120 VAC single phase) will be provided by BUYER. CONTRACTOR shall make the necessary connections and shall provide circuit breakers as required for system operation.

3.5 CONTRACTOR shall provide all wiring and conduit and shall make the necessary connections for a complete and operational deluge system with alarm and detection. Wiring and conduit to the local and central control rooms shall not be a part of the Work included under this specification.

3.6 CONTRACTOR shall provide spare contacts to transmit all trouble alarm signals and fire alarm signals to the fire alarm panel located in the control rooms.

4.0 DESIGN CRITERIA

⚠1 4.1 Water for each deluge system will be available from the yard firewater supply loop at a pressure of 100 psig. CONTRACTOR is to verify adequate water supply prior to installation.

4.2 Compressors shall be directly sprayed at a rate of 0.5 gpm per square foot of "envelope" surface area which includes the compressor case, gear box, motor, lube oil console, etc. Water spray piping shall be designed and installed so as not to interfere with dismantling operation of the compressor and/or associated equipment.

⚠1 4.3 Water density for propane surge drum and air cooling heat exchanger will be 0.25 gpm per square foot.

4.4 Minimum end head pressure at hydraulically most remote nozzle shall be 25 psi.

5.0 OPERATING SEQUENCE

5.1 Activation of fixed-temperature heat detectors located in the deluged area will cause the local control panel to activate a local alarm bell, shut down the compressors and air fin cooler, open the deluge valve, and transmit a fire alarm signal to the fire alarm panel located in the Central Control Room.

5.2 Activation of a manual pull station will cause the same sequence of events as the activation of the detection system.

5.3 Any system malfunction or trouble will cause an audible and visual indication at the local control panel. The panel will then transmit a trouble alarm signal to the fire alarm panel located in the Central Control Room.

6.0 QUALITY ASSURANCE

6.1 All equipment and system components shall be Underwriters' Laboratories, Inc. (UL) listed and/or Factory Mutual Systems (FM) approved.

6.2 CONTRACTOR shall be a licensed California contractor experienced in the installation of deluge spray systems which meet the requirements of NFPA 15.

7.0 SUBMITTALS

7.1 CONTRACTOR shall submit a list of materials being used to BUYER or BUYER's authorized representative for approval prior to shipment. The list shall include a description of all materials and material listings.

7.2 CONTRACTOR shall submit plan drawings and hydraulic calculations to BUYER or BUYER's authorized representative for approval prior to installation. Drawings and calculations shall be in accordance with NFPA 15.

7.3 CONTRACTOR shall provide BUYER or BUYER's authorized representative with a set of Operation and Maintenance Manuals prior to testing the system. Each set of manuals shall contain the following information:

7.3.1 A complete set of instructions regarding operation, maintenance, and testing of equipment involved.

7.3.2 A complete bill of materials of all replaceable parts, their part numbers, current cost, and name and address of nearest supplier.

7.3.3 Supporting documentation including calculations,

7.3.4 A copy of all guarantees and warranties issued.

7.4 Before final acceptance by BUYER, CONTRACTOR shall provide the BUYER or BUYER's authorized representative with As-Built drawings and test certificates in accordance with NFPA 15.

8.0 TECHNICAL REQUIREMENTS

8.1 Deluge Riser

Each deluge riser shall include, but not be limited to, a strainer, OS&Y gate valve with tamper switch, deluge valve, and the trim required for a complete and operational automatic/manual deluge spray system.

8.2 Piping

8.2.1 Piping, fittings and valves shall be as specified in BUYER's Specification SP-575701-50-08

8.2.2 Deluge system piping and fittings downstream of the system water control valve shall be galvanized. Pipe and fittings on the supply side of the system water control valve shall not be galvanized. All aboveground piping shall be painted red.

8.2.3 Deluge system piping crossing an aisleway or access area shall be underground and shall be protected against corrosion as required. Coating and wrapping of steel pipe and fitting shall be per Specification SP-575701-50-81

8.2.4 Deluge system piping shall slope at not less than 1/2 inch in 10 feet. Low point drains shall be provided for trapped water and valved as required by NFPA. All test, drain, and flush connection to the local sump.

8.2.5 Cathodic protection of underground steel pipe shall be provided. The contractor shall provide an insulating flange set between all underground and aboveground piping.

8.3 Valves

8.3.1 The deluge valves shall be FM approved clapper-and-latch or diaphragm type with ball check valve trim, main and auxiliary drains, ball drip valve, drip funnel and support, pressure gages to indicate the pressure below the clapper (or diaphragm), break-glass control stations for local manual actuation, air and priming water connections, and electric alarm switch to signal water flow in the system at the local panel. Devices and connections for the following shall be provided:

A. Automatic fixed temperature thermal actuation

B. Additional electrical contacts for supervision

C. Trouble alarms

8.3.2 The deluge valves shall be mounted in an accessible location outside the respective protection zone. The deluge valve release shall be supervised for system integrity.

8.4 Strainer

8.4.1 An approved strainer with blow-off valve shall be provided in the feed main riser. The strainer shall be accessible for cleaning during a fire emergency.

8.4.2 Spray nozzles with orifices less than 1/8 inch shall be provided with individual strainers.

8.5 Supports

8.5.1 All supports shall be furnished, designed, and installed by CONTRACTOR. All piping shall be supplied with adequate sway bracing to prevent movement during operations.

8.5.2 Exterior supporting steel members shall be galvanized.

8.5.3 Hangers for support of piping and equipment shall be galvanized and shall be types approved for fire protection services. Supports shall not interfere with access to operating areas.

8.6 Fire Protection

8.6.1 The fire detection system shall include detectors and alarm devices with accessories required for supervised control, annunciation, and actuation of the deluge system. Detectors shall be in NEMA 4X fixtures, suitable for marine environment.

8.6.2 Each detector shall be a fixed temperature thermal, spot type, detecting unit designed for outdoor application. Detector contacts shall be designed to close when the fixed temperature exceeds 165°F. The detectors shall be self-restoring so that the contacts open when the temperature at the detector location drops below the activation temperature. All detectors shall be Fenwal Detect-A-Fire (Series 270 or 271), as manufactured by Fenwal, Inc., Ashland, Massachusetts, or approved equal. CONTRACTOR shall supply two spare detectors of each type furnished. The maximum spacing between the detectors shall be 8 feet around the periphery of the compressor and refrigeration skids.

8.6.3 Any failure of the detection system shall initiate local audible and remote audible and visual alarms but shall not cause the deluge valve to open.

8.6.4 All detectors and associated wiring shall be arranged such that continuity of the detector circuits is continuously monitored by "end of line" devices and problem automatically annunciated at the local control pane.

8.7 Local Control Panel

8.7.1 CONTRACTOR shall provide a local control panel for the deluge system, designed in accordance with applicable sections of NFPA 72A and 72D.

8.7.2 The local control panel shall be provided with an overcurrent protection device to protect the alarm initiating circuits from excessive amperage.

8.7.3 The panel shall be complete with zone indicating unit modules, solid-state control modules for input signals, output signals, and power supply.

8.7.4 The control panel shall provide for supervision of the deluge valve release circuit, and system water control gate valve, and shall initiate the audible and visual trouble alarm for abnormal conditions.

8.7.5 Upon receipt of a thermal or remote manual release signal, the deluge valve shall release and initiate an alarm at the local control panel signifying that the system is actuated.

8.8 Local Fire Alarm Bell

The local fire alarm bell directly actuated by the local control panel shall be 24 VDC rated and approximately 10 inches in diameter. The bell shall have a sound pressure level of 115 dBA at a distance of 10 feet. The bell shall be the vibrating type and shall be provided with a NEMA 4X fixture, suitable for marine environment.

8.9 Tools

8.9.1 CONTRACTOR shall furnish all tools, ladders, and temporary supports required for performance of the Work required by this specification.

8.9.2 CONTRACTOR shall furnish one set of any special tools required for the operation or maintenance of CONTRACTOR furnished equipment. CONTRACTOR shall provide a detailed list of all special tools furnished.

9.0 SURFACE CONDITIONS

9.1 CONTRACTOR shall examine the areas and conditions under which Work of this section will be performed. CONTRACTOR shall not proceed until unsatisfactory conditions are corrected.

9.2 It shall be the responsibility of CONTRACTOR to coordinate with BUYER or BUYER's authorized representative for the schedule and sequencing of installation prior to installation.

10.0 INSPECTION

10.1 BUYER shall be allowed access to CONTRACTOR's facilities from which the equipment shall be shipped. CONTRACTOR shall coordinate with BUYER or BUYER's authorized representative to schedule or waiver the inspection prior to the packaging of the equipment being shipped.

10.2 BUYER shall be permitted to inspect CONTRACTOR supplied equipment at the jobsite prior to installation.

10.3 During and after installation the system shall be subject to inspection for proper workmanship, appearance, and compliance with this specification.

11.0 SHIPPING, HANDLING AND STORAGE

11.1 Equipment shall be prepared for shipment after all shop tests have been completed.

11.2 Openings shall be covered and lifting points clearly marked.

11.3 CONTRACTOR shall be responsible for, and shall make all arrangements for, delivery, unloading and handling of all equipment, materials and tools, and for the storage of same in areas as designated by BUYER or BUYER's authorized representative.

11.4 CONTRACTOR shall provide protection for the equipment during transit and storage.

12.0 INSTALLATION

12.1 CONTRACTOR and all of his employees, subcontractors, etc., must at all times keep away from all parts of the site except the areas in which work is being done under this specification or the areas assigned for storage of materials. BUYER will assign a foreman to the project, and his direction shall be closely followed. At no

time shall any work commence or continue without the presence and direction of BUYER's foreman.

12.2 CONTRACTOR shall install the piping and equipment in accordance with the working drawings as accepted by BUYER.

12.3 Any deviations from the accepted drawings shall require prior acceptance by BUYER or BUYER's authorized representative.

12.4 CONTRACTOR shall install the equipment so that it will not interfere with piping, electrical conduit and structural members. If any such interferences exist or occur, CONTRACTOR shall make the necessary adjustment to permit satisfactory installation of the equipment without additional cost.

12.5 CONTRACTOR shall give adequate prior notice to BUYER of any requirements for BUYER-supplied services for installation and testing of the system.

12.6 All excess oil, dirt, pipe joining compound, rust, and mill scale shall be removed from piping and equipment. All dirt, debris, and excess cutting oil shall be removed from the interior of all piping and equipment before it is erected.

12.7 Open ends of all installed piping and equipment shall be covered at the end of each working day to prevent foreign material from entering.

13.0 IDENTIFICATION

13.1 CONTRACTOR shall furnish a master chart for each system and shall show the identification numbers and locations of all critical system components, valves, and instruments.

13.2 Control valves shall have engraved, two-color (white and black), laminated plastic labels with minimum 1/2 inch lettering. Labels shall be attached with bronze chains or drive screws.

13.3 Drain and test valves shall have brass tags not less than 2-1/2 inches in diameter, inscribed with 3/4 inch numbers. The tags shall be attached to the valves with non-ferrous chains.

14.0 TESTING

14.1 CONTRACTOR shall perform inspections and tests in accordance with this specification and applicable codes and standards.

14.2 CONTRACTOR shall flush the water supply connections in accordance with NFPA 13. Prior to testing, the deluge system shall be flushed to allow thorough cleaning. The flushing operation shall be documented and certified.

14.3 Piping shall be hydrostatically tested in accordance with the requirements of NFPA 13. After testing and acceptance, the system shall be thoroughly drained.

14.4 All operating parts, including automatic detection equipment, shall be fully tested to ensure their proper operation. Sensitivity of each detector shall be adjusted. CONTRACTOR shall perform a pattern test to ensure that complete coverage is obtained.

14.5 All tests performed by CONTRACTOR shall be conducted in the presence of BUYER's authorized representative, and representatives of all authorities having jurisdiction. Concerned parties shall be notified not less than 1 week in advance of the tests in order to acknowledge attendance at the tests. CONTRACTOR shall execute the Inspection Agreement of the National Automatic Sprinkler and Fire Control Association, Inc., and subsequent reports of inspection required by the Agreement.

15.0 CLEANUP

15.1 Before acceptance of the installation and when directed by BUYER or BUYER's authorized representative, CONTRACTOR shall remove the following:

15.1.1 Rubbish and debris resulting from the work.

15.1.2 CONTRACTOR-furnished equipment, tools, and temporary services and utilities.

15.1.3 Dirt, stains, and spatters resulting from the Work.

15.2 Equipment or areas damaged by CONTRACTOR shall be repaired, replaced, or restored to its original condition at no additional cost to BUYER.

SUPPLIER'S DRAWING AND DATA COMMITMENT

FLUOR DANIEL

DATE: December 15, 1993 REV.:

INQUIRY NO. 7-0022-00RQ SUPPLEMENT_____ DATE_____ PO NO._____ SUPPLEMENT_____ DATE_____

EQUIPMENT TAG NUMBERS FIRE PROTECTON SENSORS AND DETECTORS SERVICE _____

SUPPLIER DETECTION SYSTEMS INC., 10611 Calle Lee, Unit 121, Los Alamitos, CA, 90720 phone 1-714-995-7185
ATTN FRANK DAGERMAN _

INSTRUCTIONS:

1. All drawings/data submitted must be marked with PURCHASE ORDER NUMBER and EQUIPMENT TAG NUMBER(S).
2. Identical items may be represented on common drawing with all EQUIPMENT TAG NUMBERS clearly shown.
3. All drawings/data submitted must be of good quality that will allow production of legible copies and microfilming.
4. The PURCHASER will specify in Column I the QUANTITY and TYPE CODE. These codes are described as follows:

   A = Certified Reproducible Transparencies submitted to Purchaser for Authorization to proceed.
   B = Certified Reproducible Transparencies submitted to Purchaser for information ONLY.
   P = Number of copies of Data required for Information Only.

5. The SUPPLIER enters in Column IV the PROMISED SUBMITTAL time (in weeks) after award of Purchase Order. The Purchaser will assign priorities in Column III to drawings/data (HIGHEST PRIORITY = LOWEST number). SUPPLIER will return this form to Fluor Daniel with his QUOTATION. The SUPPLIER'S signature is required.
6. The DUE DATE (Column V) will be entered by the Purchaser at the time the PO is issued. The DUE DATE will be based upon the promised submittal time furnished by the SUPPLIER (Column IV). Upon receipt of the PO, the SUPPLIER must provide the Purchaser the drawings and data as specified.

DRAWINGS/DATA REQUIRED BY PURCHASER

CERTIFIED BY:_____ COMPANY:_____ DATE:_____

NOTES

1) Vendor data shall be identified by the model/ type, and applicable instrument tag numbers.

2) All identical instruments can be represented by one (1) common certified reproducible providing all instrument tag numbers are clearly stated on the certified reproducible.

3) Drawings shall show overall and clearance dimensions, size, rating, and location of piping connections. When applicable, drawings should also show specified orientation and materials of components.

4) Drawings shall show conduit connection size and location, terminal location and identifiction, electrical classification, voltage and power consumption required.

5) Include sub-suppliers equipment.

5. Table 1-2 "Hazardous Materials" (page 1-18):

    1. Ethylene Glycol is also combustible in it's pure form. Table only states "moderately toxic".

    2. Need MSDS for decanol, ammonium bisulfite, ammonium thiosuflate, and pluronic.

6. Table 1-3 Equipment Removal:

    Equipment abandonment and removal will require a plan and Fire Department permits.

7. Page 1-32: Paragraph 35:

    States that a rotten egg smell from H2S may emulate from the plant. This should not occur if the system is designed correctly and I doubt the SCAQMD people will allow this.

8. Page 1-32; Paragraph 36:

    Discusses rainwater drainage and states that it is collected in pits and is pumped into storm water surge tanks, etc. This needs evaluation for compliance with Article 79 and 80 UFC. (Section 12 FPP should cover you on this one.)

9. Page 1-35; Section 47

    Need MSDS or other information on the waste stream. 34,700 pounds of waste are generated per year.

10. Page 2-14; Sec 2.10 Risk of Upset:

    Concurrence with this section should be subject to Fire Department review of the toxic and flammable footprints.

11. Page 2-19 Paragraph Q:

    "Will the proposal result in exposure of people to potential health hazards?"

    Concurrence with this section should be subject to Fire Department review of the toxic and flammable footprints. The risk of exposure to workers on-site will obviously differ from the risk of off-site exposure. OSHA regulations must be complied with on site, including the hazardous waste risks. It may be found that provisions should be required to facilitate education and notification of the

persons living and using surrounding properties. Older, less energy efficient, structures in proximity to the site may need to be "tightened up" to better facilitate sheltering-in-place (made more air tight to reduce infiltration), depending upon the "footprint".

Appendix B: Properties of Hazardous Materials:

MSDS needed for materials on this table where information is listed as unavailable.

Appendix C: Fire Protection Plan:

This is subject to Fire Department approval. My latest comment letter is dated 8/3/91.

Appendix D: Closure Plan:

Subject to Fire Department approval and Fire Code permits.

Thank You,

Jim Hunt

In Re: Review of Revised Flour
Daniel Fire Protection Plan

Dear Mark:

I have reviewed the revised Fire Protection Plan (FPP) for the Shell SWEPI Gas Plant. I received this plan on 7/17/91.

My comments are as follows. They have asterisks as per the FPP:

Section 2.4; Page 2 (Project Description): (no asterisk)

I still feel that this plan should state the "design" H2S concentration in PPM, the amount of gas processed per day, the amount of NGL, sulfur, Ethylene Glycol, etc. The process flow diagrams do not clearly provide this information. For project permitting purposes this information should be clearly stated and include flash points, ignition temperatures and unique hazards. MSDS sheets may not be available for the site specific raw products. They can put this information in the Appendix. Also see Section 4.3 (Ref: your 5/6/91 letter).

Section 4.2 (Modeling): *

Fire Department should see the toxic and flammable footprints prior to issuing any approvals. These should be based upon the "design" throughput and concentrations.

Section 5.1.1, 5.1.2 & 5.1.3; Firewater System: **

These paragraphs should also state that PSI shall be to approval of Fire Department. They state that flow will be, but obviously PSI must also. As an example, many designers do not realize that firefighters want 100 PSI flowing pressure at monitor and hose reel nozzles (Ref: your 5/6/91 letter).

Section 5.1.5: **

Fire water system: Add the words "fire pumps".

Section 5.1.7: **

Minimum main size is stated to be 6". Does this meet the Huntington Beach Fire Department standards? (Ref: your 5/6/91 letter).

Section 5.1.8; Fire Mains: **

Mark note: Existing firewater mains should be test flowed at needed fire flow rates and should be hydrostatically tested. If these pipes are old unlined (and perhaps uncoated) steel they are probably tuberculated and corroded. In addition, they may contribute debris to the water and clog fire systems.

Section 5.1.11; Duration of Fireflow: **

Add: Water should be "clean" so as to not clog or damage fire protection systems (Ref: your 5/6/91 letter).

Section 5.2.1; Fire Pumps: **

Add "and PSI" after the words "minimum flow".

Section 5.2.2: **

Should state that flowing nozzle pressures should be 100 PSI (Ref: your 5/6/91 letter).

Be advised that it appears they are not proposing a pump house. Obviously, salt air exposure will be a problem unless salt air resistant equipment enclosures and protection are provided. I prefer an enclosed pump room.

Section 7.6; Gas/Fire Detection & Shutdowns: **

Paragraph 7.6 "cross checked" should be "cross zoned".

Audible and visible alarms should also be located in the plant. Text says control room (Ref: your 5/6/91 letter).

Section 14; Offsite Monitoring & Protection of Public: * (This relates to the issue raised for Section 4.)

Down

Section 15; Location & Separation of Equipment (site layout): **

I plan to review this plot plan at this point in time. I have requested a full size drawing from Flour. I will provide you a report on the results of my review.

Section 19; Emergency Power: (no asterisk) AUTOMATIC.

OK. Note: Battery backup for the fire detection panels and annunciation should be to approval of the Fire Department. 24 HR. MIN.

Section 20; Portable Fire, Safety & Monitoring Equipment: **

OK Portable gas detectors and EMS equipment should be included on this list (Ref: your 5/6/91 letter). EXPLAIN STANDARD F.A.

Section 27; Site & Equipment Abandonment Plan: **

OK Add: Shall comply with Huntington Beach Fire Department specifications 427 and 431 (Ref: your 5/6/91 letter).

Section 28; Applicable Codes & Standards: (Page 14) (no asterisk)

CHECK Add UBC (Ref: your 5/6/91 letter).
Add NFPA 655 (Ref: your 5/6/91 letter). SUCTION

Section 30; Five Year Upgrade Program for Tank Farm #1: *

They should add second asterisk per your 5/6/91 letter.

Appendix "A": (foam) (no asterisk)

More information on the foam will be needed:

- Has it been tested for quality and deterioration?
- Is it AFFF?
- Is the mutual aid foam AFFF?
- Is this a signed mutual aid agreement?
- What is the response time and who can order it?
- How is it transported and by whom?

I suggest you review my comments and decide which ones you feel should be sent to SWEPI for inclusion in the plan, and which ones you feel will not pose a problem in gaining compliance without being specifically stated in the plan. My experience has been that the biggest compliance and approval issues will involve the firewater system, the alarm system and equipment spacing. I will also be reviewing the "Negative Declaration" you sent me.

There are two ways to go:

1. Send these comments and ask them to be included for clarity to avoid future misunderstandings.

2. Accept plan as is except for Sections 2.4, 4.2, 5.1.8, 14, 20, 27 and 30, and rely on the two asterisk notations to provide Fire Department with ample approval/disapproval authority.

   The SWEPI asterisk legend is as follows:

   Sections 5, 7, 15, 20 and 27 have 2 asterisks (approval needed by Fire Department).

   Sections 4, 14 and 30 have one asterisk (Fire Department review only).

   Section 2, 19, 28 and Appendix "A" have no asterisk (apparently intimating no approval or review by Fire Department).

   I prefer option #1, however the City's philosophy, style and posture towards this project may prefer option #2.

Sincerely,

Jim Hunt

AERA

FIRE DEPARTMENT

August 4, 2000

2000 AUG -4 P 2:38

Duane S. Olson, Fire Marshall
City of Huntington Beach Fire Department - Fire Protection Division
Fire Administrative Office
2000 Main Street
Huntington Beach, CA 92648

SUBJECT: RELEASE OF MAY 22, 2000
AERA ENERGY LLC FACILITY
20101 GOLDENWEST STREET, HUNTINGTON BEACH

Dear Mr. Olson,

Thank you for meeting with us on July 25th. I believe that we now have a much better understanding of your concerns. As we stated in the meeting, Aera is committed to work with you, the California State Lands Commission, and other agencies as appropriate to expeditiously address concerns that may exist regarding operations at our Huntington Beach facility. The following information addresses the specific concerns discussed in the July 25th meeting.

I. May 22 Release Event

Composition of Released Gas: Attachments A-1 and A-2 are analytical results displaying the composition of two hydrocarbon gas streams in our facility that we believe are representative of the gas released to atmosphere during the subject event. Attachment A-1 is the analysis of a gas sample from free water knock-out (FWKO) vessel 111, one of the three FWKO vessels that released gas to the atmospheric relief system on May 22. Attachment A-2 is the analysis of a gas sample taken at a point where the gas streams from all seven of the facility's FWKO vessels are combined with gas from the facility's tank vapor recovery system. The analyses show that the compositions of these two streams are similar.

On May 24, gas from each of the three FWKO vessels that contributed to the release was sampled with the use of Sensidyne tubes to determine approximate H2S concentrations. The results were:

FWKO 111: 700 ppmv
FWKO 114: 250 ppmv
FWKO 115: 30 ppmv

Volume of Gas Released: We have estimated the volume of gas that was released by conducting a material balance calculation on the systems involved. For each of the three FWKO vessels involved, we calculated the volumes of gas and liquid phases present in the vessels and the associated upstream gathering and well systems at the time power was lost (which closed the outlet valves on the FWKO vessels). Using these volumes and the average system pressures at the time power was lost, we then calculated the volume of gas that would need to be expelled to allow each system to equalize at the set pressure of the vessels' relief valves (60 psig). The results of this calculation were:

FWKO 111: 1300 scf
FWKO 114: 1300 scf
FWKO 115: 7600 scf

Total: 10,200 scf

Amount of H2S Released: Given the above release volumes and H2S concentrations, the amount of H2S released was calculated to be:

FWKO 111: 0.08 lbs
FWKO 114: 0.03 lbs
FWKO 115: 0.02 lbs.

Total: 0.13 lbs (the Federal Reportable Quantity for H2S is 100 lbs)

Dispersion Modeling: Using the estimated release volumes, the measured H2S data, and meteorological data for May 22 obtained from the National Weather Service, a vapor cloud dispersion modeling program (DNV Technica's PHAST Software) was utilized to assess the potential threat to public health and safety as a result of exposure to H2S. A summary of the modeling is included as Attachment B. Cases were run for releases from each vessel individually (Graphs 1, 2, and 3) and for a joint plume resulting from a simultaneous release from all three vessels (Graphs 4). Additionally, each of these cases were run for two different release volume scenarios; the August 3 report used the release volumes noted above and the July 26 report used higher volumes. The modeling results show that, in the joint plume scenarios (Graphs 4), the odor threshold for H2S (.0094 ppmv) would not have been exceeded beyond 55 feet downwind of the release point and the Emergency Response Planning Guideline (0.1 ppmv) would not have resulted more than ten feet downwind of the release point. The facility fence line is approximately 300 feet from the release point at its closest point and the nearest existing residence is approximately 1500 feet from the release point.

These dispersion modeling results point to a conclusion that there was not a threat to public health and safety related to the presence of H2S in the May 22 release. However, it does not allow any conclusion to be drawn regarding the potential for hydrocarbon odors to have migrated beyond the fence line. We will do additional dispersion modeling to investigate this possibility.

II. Interim Corrective Action / Mitigation Measures

Our interim corrective actions in response to the May 22 event are comprised of increased electrical system monitoring and changes to facility operating procedures, including:

1) increased monitoring of electrical grid system status,
2) ensuring redundancy in the systems providing us with advance warning of approaching service interruption requests, and
3) modifying and testing our procedures of shutting down the facility in a short time frame while minimizing the potential for releases. These procedures now also include shutting down wells driven by IC engines, and high water cut wells as necessary, during the Stage 1 alert (prior to receiving the 30 minute notification to shut down).

Attachment C provides a summary of the monitoring process we are currently using and the corresponding actions we take as dictated by the system status as determined by the monitoring. Since our meeting on the 25th, we have had occasion to implement these procedures on three separate occasions when service interruption requests have been initiated. This occurred on the afternoons of July 31st, August 1st, and August 2nd. In all three instances, we successfully shut down all facility systems and wells within the thirty minute notification window while preventing any detectable release of gas from our systems and equipment.

We are also evaluating additional facility modifications to further decrease the potential for releases of gas or any other potentially adverse impacts that could result from any loss of electrical service to our facility. We will advise you on the status of this effort in approximately one month.

III. Training and Drills

Release Reporting: Aera is committed to provide frequent training to ensure that all employees understand our release reporting procedures. Attachment D is a flow chart depicting those procedures. It has been our practice to provide this training on an informal basis during morning meetings and occasionally during monthly safety meetings, both attended by all on-duty employees. We will continue this practice and also create a call-up to ensure that no more than three months pass without refresher training. The failure that occurred in our internal reporting process during the May 22 event has been addressed directly with the individual involved and with all employees in morning meetings.

Our employees are trained to immediately (after taking appropriate safe action to stop or control the release) notify a supervisor or an Environmental, Health and Safety (EHS) Field Advisor when a release of any kind is discovered. The supervisor or EHS Field Advisor will then ensure that appropriate external and additional internal company notifications are made. The supervisory representative for the Huntington Beach facility

will typically be the Process Supervisor; Tony DeVito currently holds this position. The facility has two on-site EHS Field Advisors; Milan Steube and Sue Gonzales currently hold these positions. All three of these people, as well as several other on site exempt staff / supervisory personnel are trained in external release reporting procedures, have ready access to emergency response plans and guidance documents, and are available around the clock via pagers or home phone numbers. In addition, other Aera EHS personnel who are experts in release reporting and emergency response are readily available via telephone or pager at other Aera field locations in California or Aera's headquarters office in Bakersfield. Contact names and numbers for all of the above personnel are available on Emergency phone lists posted at key locations in the facility, in emergency response plan documents, and on Aera's Intranet and E-mail systems.

Our employees are also trained to bypass the internal reporting process and call "911" directly if they are confronted with a situation that poses an immediate significant threat to life, health, property, or the environment.

Regarding external reporting of release events, Aera will ensure that your agency receives timely and accurate notification of any unauthorized discharge from its facility in accordance with the Huntington Beach municipal code.

Shutdown Procedures:

As a result of the May 22 event, we have developed a written, step-by-step shutdown procedure for interruptible power events. It is based on a procedure previously used successfully for planned shutdowns, but required some modifications to specifically address the required 30 minute implementation period and the goal of preventing releases. Operating personnel participated in the development of this procedure and most of them now have first hand experience in implementing it. To further ensure we are prepared to effectively implement this procedure when needed in future years, we will conduct a simulated drill during the second quarter of each year (prior to peak electrical demand season).

For scheduled shutdown events, we will continue our historic practice of involving our operating personnel in developing event-specific written procedures which are then reviewed and discussed with employees as part of the planning for each event. Examples of this are a facility-wide maintenance shutdown that is normally scheduled at least once per year and other periodic planned shutdowns that usually affect only portions of the facility.

IV. Interruptible Power Contracts.

We are forwarding copies of our contracts with SCE to our legal department for review and determination of the feasibility of converting to a non-interruptible service contract for our facility.

CLOSING

We will continue to communicate with you as additional information becomes available. In the meantime, please feel free to contact me at (805) 648-8201 or any of the Aera staff members at the Huntington Beach facility any time you have specific questions or concerns.

Again, thank you for meeting with us on July 25th. I look forward to open communications with you and your agency as Aera continues to improve its facility and operations at its Huntington Beach facility.

Sincerely,

A. E. Mueller
Operating Vice President – Coastal Asset

AERA

May 30, 2000

Assistant Deputy Executive Officer
Stationary Source Compliance / Major Source
South Coast Air Quality Management District
21865 East Copley Drive
Diamond Bar, CA 91765-4182

Dear Sir or Madam,

SUBJECT: REPORT OF EQUIPMENT BREAKDOWN – MAY 22, 2000
AERA ENERGY LLC – HUNTINGTON BEACH FACILITY (#104017)
ELECTRICAL FAILURE

Pursuant to the requirements of SCAQMD Rule 430, this is Aera's written follow-up report for the subject breakdown.

At approximately 2:45 p.m. on May 22, 2000, the California Independent System Operator ordered an interruption of power service to various "interruptible" customers. The interruption, which lasted about two hours, was required due to unusually high demand for electricity in the Southern California area and resulted in a sudden unexpected shutdown of the subject facility. Power was restored at approximately 4:45 p.m. and the facility was gradually returned to normal operation over the next few hours.

The unexpected loss of power and the resulting sudden shut down of facility equipment and systems resulted in temporary pressure surges in the facility's fluid handling systems. These temporary pressure surges caused intermittent venting of hydrocarbon gas to atmosphere via the emergency relief vent system on three of the facility's seven free water knock-out vessels (specifically, Devices 6, 7, and 8). Although the emergency relief system on these vessels operated exactly as designed, this condition is a violation of Condition E-4 of the Facility Permit, which requires air pollution control equipment (i.e., the facility's gas processing and vapor recovery systems) to be "in full use".

An Aera operating employee observed the intermittent venting, but was not aware of the requirements to immediately report it. Milan Steube, Aera's Environmental Advisor, notified AQMD (1-800-CUT-SMOG; Evelyn) immediately upon learning of the relief event. Unfortunately, this did not occur until the following day (May 23). As Mr. Steube discussed with the District's Mr. Owen Amayo on May 25, reporting requirements have been reinforced with all facility employees as part of Aera's follow up to this event.

The intermittent venting occurred over a period of approximately one hour following the loss of power to the facility (i.e., from 2:45 p.m. to 3:45 p.m.). Since the flow rate and exact duration of each intermittent relief event could not be measured or recorded, estimation of the amount of hydrocarbon emissions is highly speculative, but estimated to have been approximately 500 pounds of VOC's.

In an attempt to prevent recurrence of this event, Aera's follow up plan is to conduct a thorough re-examination of:

(1) the manner in which the facility receives warning of a pending power interruption, and
(2) what operational and / or design adjustments might be made to avoid conditions that lead to atmospheric venting when power interruptions do occur (or are anticipated).

Please contact Milan Steube at (714) 969-3234 or at the letterhead address if you require any further information.

Sincerely,

for

W. A. Morris
Manager of Operations - L.A. Basin

Aera Energy LLC – Huntington Beach Facility
Gas Release Event of May 22, 2000

Summary of Follow-Up Actions Taken or Being Taken

1. **Improved State of Readiness for Future Power Interruptions**

   a. We are now monitoring Southern California Edison's web site to get earlier warning (i.e., several hours) of possible power interruptions. This will allow adjustments to be made to plant process equipment that will help minimize the likelihood of a gas release if a power interruption should occur.
   b. We have arranged for our Plant Operator to automatically receive a page from Southern California Edison prior to a pending power interruption. This will occur thirty minutes prior to the actual interruption and will facilitate any additional adjustments that can be made to plant process equipment to minimize the likelihood of a gas release when the power is actually interrupted (may include voluntarily shutting down selected equipment prior to the actual loss of power).

2. **Operational / Design Adjustments.**

   a. Reviewed gas release reporting requirements with personnel.
   b. Reviewed / updated facility shutdown procedures with personnel.
   c. An engineering review of current facility design and operation is being conducted that may identify opportunities for additional improvements.

3. **Equipment Inspection & Repair.**

   a. Replaced electrical breaker that did not operate properly (i.e., did not shut down certain equipment) during May 22 event.
   b. During the two weeks following the May 22 event, a third party inspection service conducted a thorough inspection of the entire facility. Several vapor leaks were identified and repaired.
   c. Another facility inspection by this third party will be conducted in July and on at least a quarterly basis in the future.
   d. A thorough review of the operation of the facility's vapor recovery system is being scheduled. This is a "fine-tuning" effort to further minimize the likelihood of vapor leaks from facility tanks and pressure vessels.

CITY OF HUNTINGTON BEACH

2000 MAIN STREET CALIFORNIA 92648

FIRE DEPARTMENT

June 29, 2000

Aera Energy LLC
20101 Goldenwest Street
Huntington Beach, CA 92648

RE: MAY 22, 2000 HYDROCARBON VENTING AT FACILITY #104017

After reviewing the report regarding equipment breakdown prepared by Aera's Environmental Manager, Milan Steube, the Fire Department has determined that the incident was preventable while posing a potential threat to human health and significant liability to Aera Energy. Based on Aera's May 30, 2000 letter, the current status of "interruptible" electrical power consumer was the major cause. Additionally, this status may violate the agreements made under the conditional use permit granted for the site's operation.

Although mitigation measures were identified in the May 30, 2000 report, the Huntington Beach Fire Department finds these measurers insufficient to adequately safeguard the community from a potentially harmful chemical release. Aera's follow-up plan to prevent a recurrence is unacceptable. Area's current procedures for handling interruptible power at the Huntington Beach facility are not adequate and will require correctional measures.

We recommend a meeting between Aera and our Fire Department staff to discuss corrective actions to your proposed mitigation measures. Please contact Deputy Fire Marshal Tim Greaves or myself at 714 374-5379 to schedule a meeting.

Sincerely,

Duane S. Olson
Fire Marshal

CITY OF HUNTINGTON BEACH

INTER-DEPARTMENT COMMUNICATION

To: Tim Greaves, Deputy Fire Marshal

From: William T. Hosband, HazMat Program Manager WTH

Date: July 11, 2000

SUBJECT: "AERA ENGERGY" OIL SPILL OF JULY 5, 2000

The following is a summary of what I have learned from an investigative interview with Susan Gonzales, EHS Field Advisor for AERA Energy LLC (L.A. Basin Operations) at AERA's Huntington Beach site at 20101 Golden West St. conducted on July 11, 2000.

The crude oil spill was reported by a contractor of AERA while on his routine inspection rounds of wells on un-incorporated Bolsa Chica Wetlands operated by AERA Energy LLC. At approximately 7:50 a.m. on the morning of July 5, 2000, a pool of oil was observed near the location of an operating well at the north end of AERA property.

Immediate investigation by AERA surveillance personnel and an AERA Supervisor determined the source to be an eight inch underground production pipeline that is fed from several producing wells in the area. The wells providing production to this pipeline were shutdown and isolation valves were closed. Notification was made to other AERA Supervision and in turn notifications were made to the California Office of Emergency Services (OES) and the National Response Center (NRC). OES notified the California Fish & Game Warden and the U.S. Coast Guard who responded. Also responding were the State Lands Commission and Division of Oil & Gas. A unified command was established with Fish & Game, Coast Guard and AERA personnel.

Initial estimates of the production pipeline leak volume was an estimated 5 barrels of crude oil and 10 barrels of produced water, which spilled into a dry creek just opposite a wet cell and separated by a bridged road. The oil/water combination contaminated an area of approximately 45' X 60' which included some pickleweed which supports several endangered species of wildlife. Efforts to contain the spill and minimize the threat to flora and fauna were implemented by AERA's spill response contractor, Advance Cleanup Technology Inc., under the direction of the California State Department of Fish and Game and AERA Supervisors. Some of the activities included washing down of the pickleweed and evacuation of the oil/water mixture by as many as three vacuum trucks working under contract to AERA.

There were no injuries reported. This incident is under investigation. There were no activities occurring above ground in the area around the line break. The area was monitored for "lower explosive level (LEL), hydrogen sulfide (H2S) and Oxygen (O2) continuously to ensure safe clean-up operations. Levels were constant at 0% LEL, 0 ppm H2S and 20.9% O2. Biologists from Fish & Game requested that netting be placed over contaminated soils to keep wildlife away from harm until all contaminated soils were removed.

The question of Administering Agency Notification requirements has been discussed with AERA Energy personnel and a posed to the Orange County Fire Authority, because the spill occurred on unincorporated Orange County property rather than Huntington Beach City

property. It was agreed by all agencies polled, that notification to the Administering Agency could be either to Huntington Beach Fire or the Orange County Fire Authority and be in compliance with reporting regulations. The notification should, however, be immediate and follow AERA Energy Business and Emergency Plan guidelines.

Attached are pages of existing guidelines that contain information for emergency notification related to spills and releases. It is my recommendation that these guidelines spell out more specifically the agencies to be notified and include the 24-hour telephone numbers for each in the order of call preference. The Orange County Fire Authority representative recommends that **911** be used to notify the Administering Agency as required by AB2185/2187. The telephone number presently listed in the agency list (536-5411) is the general telephone number for Fire Administration but is answered after-hours by a Metro Net Dispatch telephone tree.

Continued open communications between AERA Energy and the Huntington Beach Fire Department will help resolve any notification or response issues that may arise and I encourage a commitment by both parties to maintain those communications at all costs. Thank you.

C: Duane Olson, Division Chief

OVERVIEW

The Huntington Beach production unit is manned 24 hours per day, 7 days per week. During this time all facilities are checked for leaks or operational failures. All personnel are equipped with a two-way radio to communicate immediately any potential or occurring problems that may arise.

Once field personnel discover a spill, they will immediately notify an Aera supervisor. The supervisor will obtain the Material Safety Data Sheet for the material in question. After assessing the amount of the spill and significance of endangerment to personnel, public and the environment, the supervisor will notify any Emergency Response Personnel and all other agencies required to be notified.

The supervisor or a delegate will meet the emergency response personnel at the property entrance and lead them to the incident site. Also, at this time the supervisor will provide them with any information required, such as possible hazards that may be present.

If it becomes necessary to evacuate personnel from a field location the field supervisor will contact personnel via radio. All contract personnel will be contacted in person and lead off lease or to a designated safe area.

If evacuation affects the general public or it appears that it may threaten any residential area, the Supervisor will request assistance from local fire and sheriff agencies.

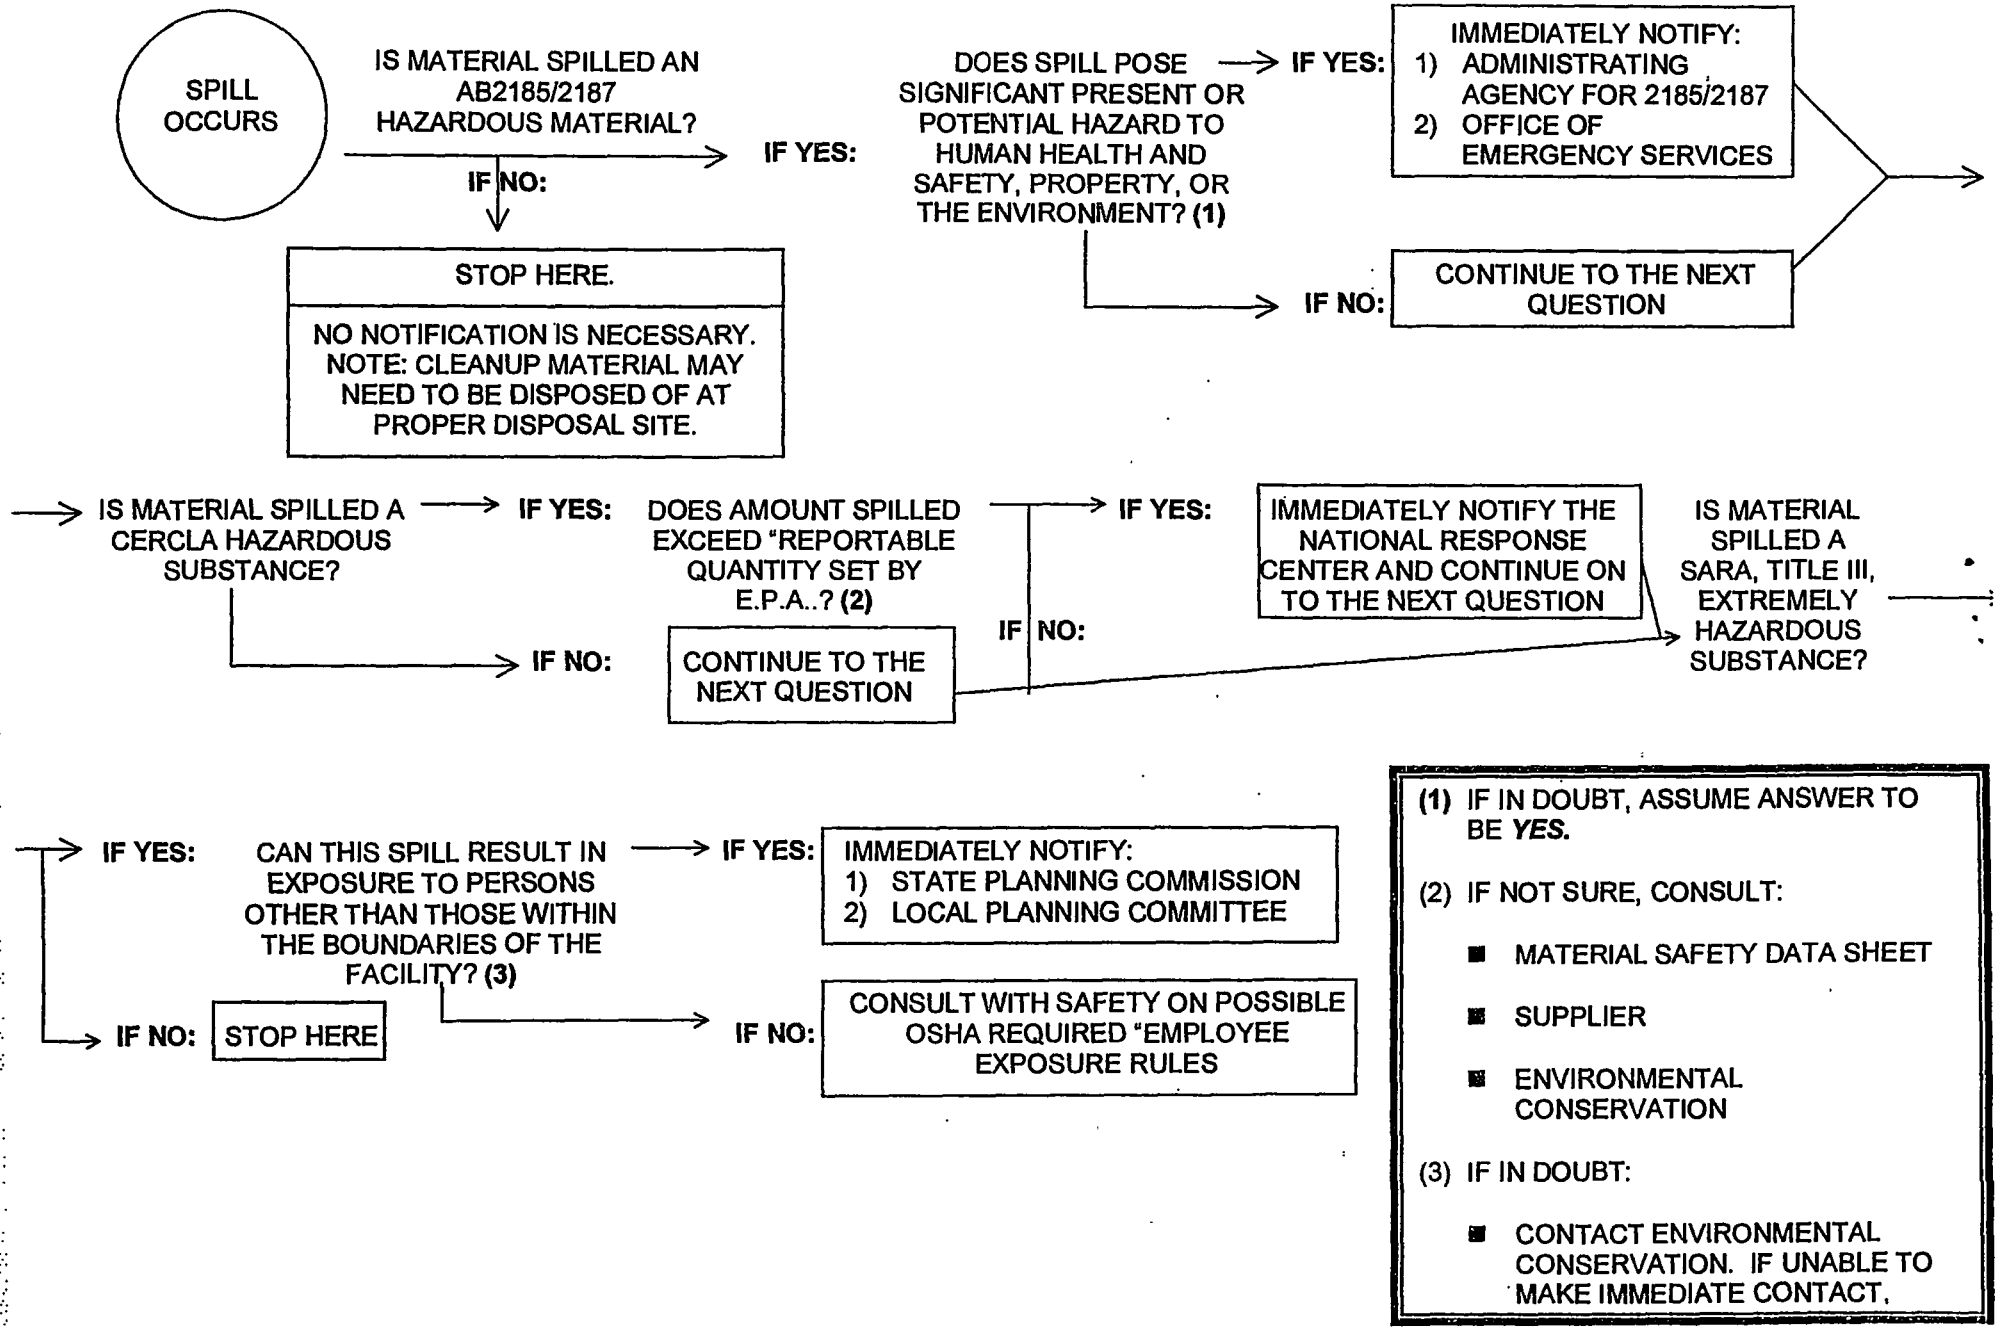
A personnel count will be made with corresponding duty roster for the day to ensure that all people are accounted for.

1.1 Notification

The person in charge of the facility or appointed delegate must report the release to the National Response Center *as soon* as they have knowledge of a release of a "reportable quantity" of a hazardous material. The fact that the facility is in the midst of an emergency response action cannot delay the notification. The Response Center will ask questions regarding response actions and record pertinent information. It will relay that information to a regional on-scene coordinator already designated by the EPA or to the U.S. Coast Guard. The coordinator will evaluate the circumstances and involve appropriate state and federal agencies.

1.2 Releases into the Environment

Any release that is not wholly contained within buildings or structures is reportable, even if it remains on the plant or installation grounds. Examples include evaporation of a reportable quantity into the air from a spill within a dike or to a concrete pad, or leaks of a reportable quantity from a tank, pipeline or process unit into the ground. "Environment" includes any navigable water, surface water, ground water, drinking water supply, land surface, subsurface strata or ambient air within or under the jurisdiction of the United States.



1.3 Reportable Quantity Amounts

EPA has identified the Reportable Quantity for over 600 chemicals in its April 4, 1985. This Reportable Quantity (RQ) refers to the amount of a material at which a spilled or released hazardous substance must be reported. The amount doesn't have to be spilled all at once; if the RQ is spilled in any 24 hour period it must be reported. All SWEPI locations should maintain their Hazardous Material list and update their Reportable Quantities inventories on a regular basis. These vary from 1 pound to over 10,000 pounds.

DECISION TREE FOR EMERGENCY NOTIFICATION OF CHEMICAL SPILLS

(1) IF IN DOUBT, ASSUME ANSWER TO BE ***YES.***

(2) IF NOT SURE, CONSULT:

- MATERIAL SAFETY DATA SHEET
- SUPPLIER
- ENVIRONMENTAL CONSERVATION

(3) IF IN DOUBT:

- CONTACT ENVIRONMENTAL CONSERVATION. IF UNABLE TO MAKE IMMEDIATE CONTACT,

Meeting Objectives

- Improve Aera's understanding of agencies' concerns
- Improve agencies' understanding of Aera's operations and systems
- Agree on next steps needed to work toward resolution of all parties' concerns

Agenda

- Review Agency Concerns
- Review of May 22 Event
- Aera's Response to May 22 Event
- Discussion
- Define and Agree on Next Steps

Review Agency Concerns
Huntington Beach Fire Department

- Incident was preventable while posing a potential threat to human health and significant liability to Aera.
- Interruptible power service may violate agreements made under the conditional use permit for the site.
- Aera's measures to mitigate future events are insufficient to safeguard the community from a "potential harmful chemical release".
- Current procedures for handling interruptible power are not adequate and require correctional measures.

- ADD — HB FIRE HAD TO INQUIRE TO HAVE KNOWLEDGE OF THE ISSUE.

Review Agency Concerns
California State Lands Commission

- Date, time, duration, volume and source(s) of release
- Release composition
- Chronology leading up to, and response to the release
- Agencies notified
- Investigation results
- Shut-down systems:
  - SCE interruption did not kill entire lease; some wells continued to produce
  - Other similar situations where entire lease did not shut down
  - How is ESD system distributed among Emmy, Onshore Strip, and Bolsas?
  - Will a power interruption kill all of the above?
  - Status of "All Call" system for rod wells?
  - ESD for Bolsas?

Review of May 22 Event

- Unanticipated SCE load shed
- Three of seven FWKO vessels released hydrocarbon gas (containing some H2S) to atmosphere via pressure relief system
- HBFD received an odor complaint from Seacliff Country Club

Aera's Response to May 22 Event

- Root Cause Failure Analysis
  - Unanticipated nature of event
  - Facility design
- Improved State of Readiness for Potential Future Load Shed Events
  - Began routinely monitoring SCE's web site as an "early warning" system
  - Arranged for 30 minute warning of key personnel via pager system
  - Reviewed and updated shut down systems and procedures
  - Reviewed and reinforced reporting requirements with personnel
- Equipment Inspection and Repair
  - Conducted thorough third-party inspection and repairs of vapor handling system
  - Confirmed proper operation of "All Call" system for all rod wells
- Operational and Design Adjustments
  - Continuing to fine tune controls on vapor handling system
  - Evaluating potential facility / process modifications to minimize the potential for gas releases during unexpected shut-downs. **Aera is committed to find a long term solution that addresses the concerns of all parties.**

Discussion

- What concerns remain?
- What other actions does Aera need to consider?
- Is there anything we can learn from other facility operators?

SURFACE LEASE

DESCRIPTION

Parcel 1:

A portion of Sections 3, 4 and 10, Township 6 South, Range 11 West, San Bernardino Base and Meridian, in the City of Huntington Beach, County of Orange, State of California described as follows:

Beginning at the intersection of the north corner of Pacific Coast Highway and 23rd Street; thence North 40° 36' 00" East, 672.85 feet along the Northwest line of 23rd Street to a point of tangent curve, concave to the West, having a radius of 30.00 feet; thence Northeast and Northwest along said curve 47.10 feet to a point of tangency; thence North 49° 24' 00" West, 1320.57 feet; thence North 48° 18' 20" West, 1522.215 feet; thence North 47° 04' 50" West, 1758.56 feet to a point of tangent curve, concave to the Southwest, having a radius of 1540.00 feet; thence Northwesterly along said curve 373.69 feet to a point of tangency; thence North 60° 59' 01" West, 385.045 feet to a point of tangent curve, concave to the Northeast, having a radius

of 1510.00 feet; thence Northwesterly along said curve, 658.29 feet, through a central angle of 24° 58' 42" to a point of reverse curve, concave to the South, having a radius of 30.00 feet; a radial line through said point of reverse curve, bears North 53° 59' 41" East; thence Northwesterly and Southeasterly along said curve 47.74 feet to a point of compound curve, concave to the Southeast, having a radius of 1050.00 feet, a radial line through said point of compound curve, bears North 37° 10' 53" West; thence Southwesterly along said curve 136.26 feet to a point of tangency; thence South 45° 23' 00" West, 240.34 feet to a point of intersection with Northeasterly line of said Pacific Coast Highway, said point of intersection is South 44° 37' 00" East, 72.00 feet from the intersection of the westerly city limit line of said Huntington Beach and the northeast line of said Pacific Coast Highway; thence South 44° 37' 00" East 3463.83 feet along the said Northeasterly line of said Pacific Coast Highway to a point of tangent curve, concave to the Northeast, having a radius of 5597.60 feet, thence Southeasterly along said curve 465.69 feet to a point of tangency; thence South 49° 23' 00" East, 2190.92 feet along the Northeasterly line of said Pacific Coast Highway to the point of beginning.

W.B.J.

Parcel 2:

That portion of land in the Northeast 1/4 of Section 4, Township 6 South, Range 11 West, in the City of Huntington Beach, County of Orange, State of California, described as follows:

Beginning at the Northwest corner of the Southwest 1/4 of the said Northeast 1/4 of said section, further described as the Northwest corner of said City of Huntington Beach, as shown on Record of Survey 59-2 as filed August 15, 1962 in the County Recorders office of said county in book 59, page 2, Record of Surveys; thence South 0° 47' 16" East, 861.07 feet to a point; thence North 45° 23' 00". East, 213.46 feet to a point of tangent curve, concave to the Southeast, having a radius of 1150.00 feet; thence along said curve 160.58 feet, to a point of reverse curve, concave to the West, having a radius of 30.00 feet, a radial through said point of reverse curve, bears South 36° 36' 58.5" East; thence Northeasterly and Northwesterly along said curve 46.30 feet to a point of reverse curve, concave to the Northeast, having a radius of 1510.00 feet, a radial line through said point of reverse curve bears South 59° 57' 49" West; thence along said curve 454.465 feet to a point of tangency; thence North 12° 47' 31" West 150.861 feet to a point of intersection with the Northerly line of the Southerly 1/2 of the Northeast 1/4 of said section; thence South 89° 20' 10" ~~West~~ East 94.96 feet to the point of beginning.

Attn: Mr. Brian Briggs

Gentlemen:

Pursuant to my conversation with Mr. Brian Briggs on August 20, 1987, the City of Huntington Beach requires that plans and certified specifications for the mast and subbase for Rig 16 be filed with the Fire Department as a condition to permit our Montgomery Drilling Co. Rig 16 to operate within the City.

Attached is a copy of the name plate which is attached to the mast as required under API specifications. The subbases were designed and fabricated to support the weight of the mast, plus hook load of 760,000 lbs. with 240,000 lbs. of setback weight. Also attached is plan drawing DA-M110-B prepared by Derrick Service International Inc., an authorized API manufacturer, of a drilling rig for design of Rig 16.

The letter certifies that Montgomery Drilling Co. Rig 16 now being operated in the Huntington Beach Field by us has not been altered from its original approved API design criteria and, as of this date, said rig complies with all API and other known specifications governing the operation of Rig 16.

I hereby declare that I, the undersigned, as Drilling Superintendent for Montgomery Drilling Co., have been duly authorized to make this statement on behalf of this corporation and that the same is true to my knowledge. I certify under penalty of perjury that the foregoing is true and correct.

Montgomery Drilling Co.

SPECIFICATION SP-575701-49-02

FIRE PROTECTION PLAN

1.0 INTRODUCTION/SCOPE

This Plan is provided as supplemental information to the Environmental Assessment for this project. It is intended to document the facility design philosophy, safety systems, fire protection systems, alarms systems, fire detection systems, applicable codes, and approval process once detailed engineering has been completed. This document shall serve as the Fire Protection Plan for this project.

2.0 PROJECT DESCRIPTION

This gas processing project is approximately $10MM of new equipment which will replace existing facilities and which will be consolidated adjacent to SWEPI's recently modernized Tank Farm #1 Oil Dehydration Facility. The primary driving forces are: environmental compliance, emissions reduction, improved safety, reduction in operating expenses, and consistency with the overall City of Huntington Beach, Linear Park Development Project. The project includes three major items:

2.1 Installation of a **Dew Point Control Unit** (DCU), which is a functional equivalent of Shell Western E&P Gas Plant #11. The purpose of this unit is to compress natural gas produced with the associated oil production at this location and to chill the stream to below the ~~hydrocarbon dew point to meet sales gas hydrocarbon and~~ water dew point specifications.

The DCU will have no natural gasoline storage, and all products will be sold via existing pipeline as they are currently being handled and transported.

2.2 The project also includes installation of a **SulFerox Unit** which is a desulfurization unit to replace the existing Stretford Unit. This is a proprietary Shell Oil Company/DOW process which converts hydrogen sulfide to elemental sulfur in a single contacting step. The contacting fluid is non-hazardous and non-flammable.

2.3 An **Emergency Ground Flare**, which will provide a sanitary disposition for natural gas during emergency upset conditions, is also a part of this project. The Ground Flare is of a safe, smokeless, low noise, hidden flame, and environmentally friendly design.

2.4 All product streams, properties, flowrates and temperatures are listed in the Process Flow Diagrams which are attached.

3.0 DESIGN BASIS

3.1 The design for all fire protection, detection and alarm systems shall comply with this specification. All referenced codes, standards, publications and specifications referenced herein shall be a part of this specification.

3.2 The basis of design for the fire protection system at the facility shall be that of a single risk area concept. The facilities shall be divided into separate areas of possible fire involvement, and each area shall be considered as a single risk. The area of the plant requiring the greatest degree of protection shall be classified as the largest single risk area, and the total capacity of the firewater system shall be based on meeting this requirement. The single risk concept assumes only one fire is occurring at any one time.

4.0 RISK ASSESSMENT

△2 ~~4.1~~ HAZOPS (Hazard and Operability Study)*

A Hazard and Operability Study (HAZOP) will be conducted on this project. The study will include a team of engineers, specialists, operators, independent third party consultant, and outside registered professional engineers who will go through the detailed design line by line, item by item, to validate the inherent safety system built into the design of each component.

The Fire Department and its consultant are invited to participate in the HAZOP process.

Additionally, a series of API 14C Safe Charts will be developed for each major system, API 14-C is the recommended practice for analysis, design, installation and testing of basic surface safety systems on offshore production platforms.

The results of these HAZOP and API 14C Safe Charts will be submitted to the Fire Department for their review.

4.2 Toxic and Flammable Dispersion Modeling*

The results of these dispersion modeling which will be done by a third party consultant will be submitted to the Fire Department for their review. All criteria and modeling assumptions will be submitted with the model results.

△2 4.3 Hazardous Materials/MSDS List*

Material Safety Data Sheets are kept physically on the lease. On site are located a full volume of MSDS Sheets for review as per OSHA requirements. MSDS sheets will be added and updated as required by OSHA and in conjunction with this project.

5.0 FIRE PROTECTION CONCEPTS

The facility depends on early hazard detection and the ability of plant personnel to contain a flammable liquid fire and/or a high pressure flammable gas fire with fixed and portable fire fighting equipment.

All detailed plans for the Fire Protection System, equipment types and locations will be submitted to the Fire Department for approval. This shall occur during the request for the project building permits.

△2 All fire protection equipment shall be listed where equipment having such listings are available. The Fire Department will allow the applicant to propose reasonable alternatives and solutions which assure equal safety to life and property when strict compliance with listings or approvals are not reasonably attainable.

5.1 Firewater System**

△2 5.1.1 Fixed firewater monitors shall be located adjacent to the process areas, pipeways, equipment, and elevated structures. Fixed monitors shall be 40 feet to 50 feet from equipment to be protected. Approximate spacing between monitors should be 150 feet. Each monitor should be capable of producing at least the minimum flow requirements to meet Fire Department standards.

△2 5.1.2 Firewater hydrants with pumper connections shall be installed around the perimeter of the facility. Hydrant spacing in the system shall allow easy access for fire truck operation while maintaining minimum exposure to personnel. The firewater supply source shall have the capability of delivering a minimum four hour supply to the fire pump suction inlet. Hydrants should have a minimum flow as required by Fire Department standards. Hydrant spacing should be approximately 250-300 feet apart on roads and approximately 40-50 feet from equipment to be protected.

△2 5.1.3 Hose reels and hose carts shall be installed along pipe racks, and process area. Fixed wet hose reels shall contain 100 feet of 1-1/2 inch hard line booster fire hose with an adjustable fog nozzle having a capacity of 125 gpm.

△2 5.1.4 The firewater supply system shall consist of firewater mains, laterals, and isolation block valves to provide the required firewater flows to each "fire loading" area, even though one section of the system is shut in for maintenance or repairs. Post indicator valves shall be used for sprinkler or deluge systems.

5.1.5 The firewater system includes piping, fittings, valves, hydrants, water monitors, hose reels, hose hydrants, and stub-up connections for firewater spray systems.

5.1.6 A firewater transposition drawing showing the total fire protection system piping shall be prepared for approval by authorities having jurisdiction.

5.1.7 The minimum pipe size for firewater mains and hydrant branch lines shall be six (6) inches.

5.1.8 All new underground carbon steel pipe shall be outside coated and wrapped. Field joints shall be coated and wrapped after assembly and hydro-test. All buried piping shall be cement-lined for internal corrosion protection. All new above ground piping shall be exterior painted and internal lined. Any existing firewater piping shall be externally protected.

5.1.9 Hydrants, monitors, valve pits (boxes, etc., shall be located a minimum of three feet from the edge of the road shoulder. Where a shoulder is not provided, this distance shall be five feet from the edge of the road. Four (4) guard posts shall be provided for distances less than 10 feet from the edge of the road and where maintenance vehicles may be operating. Hydrants or approved hose manifolds shall be used for truck and hose connections.

5.1.10 General information for laying piping systems, installation of and requirements for thrust blocks, valve pits (boxes), and appliances such as hydrants and water monitors shall be in accordance with NFPA 24.

5.1.11 The duration of the required firewater flow shall be 4 hours, as per the NFPA Code.

5.2 Firewater Pumps**

△2 5.2.1 The fire protection engineer shall verify that the new or existing firewater pumps are capable of delivering firewater flow rates to the largest user, and meet the designed water flow requirements at each fire protection system. The flow rate shall meet the minimum flow requirements as determined by Fire Department standards.

⚠2 5.2.2 The fire pumps shall delivery the required flow rates to all areas of the facility at a pressure of approximately 100 psi at the base of the fire fighting appliance and a minimum of 60-70 psi at the inlet side of all water spray system operation valves. Firewater pumps shall be designed to meet NFPA 20 and provide for redundant pump with required capacity as per NFPA 20. Appropriate tie-ins to water supply will be determined. Pumps shall be remotely located in an approved covered shelter.

An evaluation of the need for firewater pumps and tanks will be performed in conjunction with the Fire Department to determine if adequate flow and duration can be supplied with only a looped system.

6.0 FIRE SUPPRESSION SYSTEM**

6.1 Portable hand held fire extinguishers shall be installed in all areas of the facilities. The extinguishing agent shall be compatible with the class of fire to be encountered.

⚠2 6.2 Foam systems may not be required in the scope of this project. See Appendix A for quantity of foam already stored on site.

6.3 A water spray deluge system shall be provided for areas as required.

⚠2 6.4 Hose reels and hose carts shall be provided throughout the plant for easy access and emergency use.

7.0 GAS/FIRE DETECTION AND SHUTDOWNS**

7.1 The area UV/IR flame detectors and vapor/gas alarm systems shall be monitored at the Local Control Room and/or the Central Control Room and shall shut down plant upon alarm.

7.2 Combustible vapor/gas sensors shall be installed in critical outdoor areas. The gas sensors shall monitor the level of hydrocarbon/ air mixture and/or hydrogen sulfide.

7.3 Manual ESD stations shall be provided in the areas of egress.

7.4 A detail of the alarm and shutdown system wiring hardware and design will be submitted for approval at submittal of building permits.

7.5 ESD valves are located on the plant inlet and outlet limits and, upon actuation, all plant gas feeds will be blocked in and diverted to the flare.

7.6 All detectors causing ESD shutdowns will be crossed checked to minimize false shutdowns. Audible and visible alarms will be provided in each control room. Any detection of hydrocarbon or flame detection will initiate an alarm requiring operator initiation of ESD. The cause of the ESD will be alarmed and listed in the control rooms on a first out basis. Annunciation of an ESD will be alarmed on the fire control panels at the plant entrances.

△2 7.7 A fire control alarm panel will be located at each plant entrance (2 entrances) to inform the Fire Department of cause and area of alarm.

8.0 FIRE PROTECTION SYSTEMS**

8.1 SulFerox Unit Area

△2 8.1.1 The SulFerox units contain hydrogen sulfide and hydrocarbons. Self-contained breathing apparatus and safety showers and eyewash stations shall be provided for this area.

8.1.2 Structural steel supporting vessels shall be fireproofed according to UL 1709. The fireproofing shall be capable of meeting a 2 hour UL 1709 fire rating.

8.1.3 Fixed water monitors shall be installed in the area to protect all equipment.

8.1.4 Hydrants for manual firefighting and fire truck pumper application shall be located in the area.

8.1.5 Hose reels and portable dry chemical extinguishers shall be strategically located in the area.

8.1.6 The sulfur product consists of a 40 percent water, wet sulfur cake which is non-hazardous and will be stored in approved DOT containers.

8.2 Dew Point Control Unit, Knockout Drums, Stabilizer Skid, Pipeways, Glycol Unit and Pumps

8.2.1 This area shall be protected by fixed water monitors to cover equipment, vessels and pipeways.

8.2.2 Combustible vapor/gas sensors and UV/IR flame detectors shall be installed. Vapor/gas readout from 0 to 100 percent of LEL shall be monitored at the alarm panels located in the Local Control Room and Central Control Room. The vapor/gas sensors shall provide visual and audible alarm at 25 percent and 40 percent of LEL.

8.2.3 Hydrants for manual firefighting and fire truck pumper application shall be located in the area. Required hose shall be on fire hose carts and/or fire trucks.

8.2.4 Hose reels and portable dry chemical fire extinguishers shall be strategically located in the area.

8.3 Gas Compressors and Lube Oil skids in the Compressor Building

8.3.1 Gas compressors, refrigeration compressors, and lube oil console shall be protected by an automatic water spray deluge system discharging at a rate of 0.5 gpm/sq. ft. Fixed temperature pilot heads (165°F) shall be installed in the protected area for actuation of the deluge system. A manually actuated release station shall be provided with the system riser.

8.3.2 The area UV/IR flame detectors and vapor/gas alarm systems shall be monitored at the Local Control Room and/or the Central Control Room and shall shut down plant upon alarm.

△2 8.4 Local Control Room

The Local Control Room interior shall be maintained under positive air pressure to prevent combustible vapor/gas from contaminating the area. The local control room is located upwind and away from the process area and will only be partially attended. The remote control room (1000 feet away) will be attended 24 hours per day. H_2S detections will be added to the building HVAC. Smoke detection will be provided. Adequate building protection will be provided for plant personnel and equipment.

8.5 Substation and Transformers

Substation buildings shall be located in electrical non-classified, non-hazardous area.

9.0 ELECTRICAL AREA CLASSIFICATION**

9.1 Electrical equipment installed in classified hazardous areas shall be approved for use in the specific atmosphere as outlined in the NFPA 70, National Electric Code, API RP500A, and Uniform Fire Code.

9.2 The Area Classification drawings for the Gas Processing Project will be submitted for review.

△2 10.0 FIRE PROOFING OF VESSELS AND STRUCTURAL STEEL**

10.1 Fireproofing of structural steel pipeways and vessel skirts shall be provided in areas where equipment handling liquid hydrocarbons are located. Steel structures supporting elevated equipment shall be fireproofed regardless of location.

10.2 Fireproofing material shall be protected against mechanical damage, thermal shock, and environmental conditions and shall have resistance to hydrocarbons and sulfuric acid fumes.

The types of fireproofing to be used shall have a fire resistance rating of two (2) hours in accordance with UL 1709 Rapid Rise Curve.

11.0 CRITICAL CABLE PROTECTION*

Control systems cabling for ESD will be protected by locating them underground.

12.0 DRAINAGE AND CONTAINMENT**

12.1 Drainage of firewater from the plant area shall be by swales, trenches, catch basins, or sheet flow to a remote impounding area. Path of drainage shall be designed to allow vapors to dissipate in the atmosphere. Vapor clouds resulting from liquid spills which are slow to vaporize may be dispersed with water spray application. Drainage and containment shall comply with Uniform Fire Code, Articles 79 and 80.

12.2 Open drainage systems to the oily water system shall be provided to prevent combustible vapor/gas spills from entering the storm water drainage system. Firewater or flammable liquids shall not be allowed to accumulate under pipeways, vessels, pumps, or equipment handling hydrocarbons.

13.0 ACCESS ROADS**

A plot plan showing all access and surrounding roads is attached. A plot plan with monitor and hydrant locations will be supplied at a later date. Knox locks and Knox map boxes shall be provided at each entrance. Appropriate pre-plan information will be provided at each location.

14.0 OFF-SITE MONITORING AND PROTECTION OF THE PUBLIC*

14.1 The site is currently protected at the perimeter wall by a hydrogen sulfide gas detection system.

△2 14.2 Refer to the HAZOP results to insure elimination of all risks.

15.0 LOCATION AND SEPARATION OF EQUIPMENT (SITE LAYOUT)**

15.1 A plot plan is attached for your review. the Fire Department may review the plot plan and make recommendations as to equipment spacing and plant layout, as per the applicable codes.

15.2 The plant layout shall maximize equipment separation to reduce the propagation of fire to adjacent areas.

16.0 EQUIPMENT, SYSTEM AND PROCESS SAFETY, MONITORING AND SHUTDOWNS*

Copies of the API 14C Safe Charts will be provided for your review. The HAZOPS documentation will be completed and reviewed with the appropriate fire department personnel.

△2 17.0 EMERGENCY RELIEF SYSTEMS**

17.1 Emergency relief systems will be provided and will have a rupture disk below the relief valve. The rupture disk will be equipped with an electronic tattle tale to alert the control room as to the location of the device relieving in the facility.

17.2 Pressure relief/venting systems shall be provided for equipment subject to internal pressure buildup from an external source of heat, as defined in API 14C System Evaluation.

18.0 CONTROL ROOM PROTECTION

The Central Control Room is an existing structure. The Local Control Room is addressed in Section 8.4. The Central Control Room will have full capabilities to operate the plant from a remote location. The Central Control Room will have the same safety monitoring and shutdown capabilities as the Local Control Room.

△2 19.0 EMERGENCY POWER

Currently, there is no provision for total plant emergency power. The facility will be designed for fail-safe shutdown in the event of a power loss. The oil field is currently electrified, and, if a loss of power should occur, the field is shutdown so that incoming oil, gas, and water production is shutdown. A UPS system is provided for power back-up of all

electronic computer control systems which will initiate and complete a safe ESD. Battery power back up will be provided for fire detection panels and annunciation.

20.0 PORTABLE FIRE, SAFETY AND MONITORING EQUIPMENT**

20.1 Self-contained breathing apparatus (SCBA) shall be provided in strategic areas.

20.2 Safety showers shall be installed in the areas where eye or skin irritating material is stored or handled.

21.0 EMERGENCY RESPONSE PLAN*

An Emergency Response Plan exists for the SWEPI Huntington Beach facility. Appropriate modifications to the Plan will be made to incorporate the modified facility.

△2 22.0 ONGOING INSPECTION, SAFETY, MAINTENANCE AND QUALITY ASSURANCE PLAN*

A copy of the safety, training and quality assurance manuals can be made available for review. These manuals cover all of the above 22.0 subject areas.

23.0 WORKER SAFETY AND TRAINING PROGRAM*

The current worker Safety and Training Programs can be reviewed with the local Safety/Training Coordinator located at the Huntington Beach lease.

24.0 SITE SECURITY PLAN*

The Huntington Beach site is under 24 hour guard and security. All access is limited at the entrance gates. The new plant facility is within the secured site and will have 24 hour operator attention.

25.0 HAZARD IDENTIFICATION METHODS (LABELING, ETC.)*

All stored materials will be properly labeled as per the NFPA, and Uniform Fire Code placard requirements.

26.0 HAZARDOUS MATERIALS MANAGEMENT PLAN*

The Shell Hazardous Materials Business Plan has been submitted to the Fire Department for their records. Included in the Plan are response and inventory procedures as required by SARA Title III. The Plan will be modified to accommodate the new facility.

27.0 SITE AND EQUIPMENT ABANDONMENT PLAN**

A proposal from Fluor Environmental for the abandonment of the existing plant site is attached. SWEPI is the lessee and will return the land to the lessor in accordance with its lease obligations and any Local, State or Federal regulations which may apply. The proposal outlines the appropriate testing, agency notification, remediation and closure approvals.

28.0 APPLICABLE CODES AND STANDARDS

National Fire Protection Agency (NFPA)

NFPA 10	Portable Hand Extinguishers
NFPA 11	Foam Extinguishing Systems
NFPA 13	Sprinkler System Installation
NFPA 14	Standpipe and Hose Systems

29.0 PLAN SUBMITTAL AND APPROVAL PROCESS

29.1 Items highlighted by a single asterisk (*) are information/specifications which will be provided for review, but not approval, of the City of Huntington Beach Fire Department and it's independent consultant. Items highlighted by a double asterisk (**) are items/components/safety systems which will be installed where appropriate and are listed on specifications, and drawings which will need to be approved by the City of Huntington Beach Fire Department prior to issuing building permits.

29.2 SWEPI agrees to comply with safety requirements as listed in the appropriate codes and standards section. High safety standards are important to SWEPI; however, should a disagreement arise between the independent consultant and SWEPI on a particular safety issue, SWEPI reserves the right for the City of Huntington Beach Fire Department to consider design systems provided which are in SWEPI's/Fluor Daniel's opinion "as safe as" those required by the recommendations of the independent consultant.

30.0 FIVE YEAR UPGRADE PROGRAM FOR TANK FARM #1 (MODERNIZED OIL DEHYDRATION FACILITIES)*

SWEPI agrees to submit a plan for an upgrade to the fire protection systems at the Modernized Tank Farm to be completed prior to 1996. The project description and schedule will be submitted the City of Huntington Beach Fire Department by the end of second quarter 1992. The plan for the fire protection system upgrade will be in accordance with this specification and codes within this document. A separate Fire Protection Plan will be submitted for the Tank Farm and will be similar to this Gas Plant Fire Protection Plan.

** Documentation/information which will be provided to the City of Huntington Beach Fire Department and it's independent consultant for review.*

*** Items/components/safety systems which will be installed where appropriate and listed on specifications, and drawings which will need to be approved by the City of Huntington Beach Fire Department prior to issuing building permits.*

When approved by the Huntington Beach Fire Department, this document shall serve as the official Fire Protection Plan for the SWEPI Gas Processing Project facility at Golden West Blvd. and Pacific Coast Highway.

APPROVED BY:

Attached is the revised draft of our proposal for the Closure Plan and Investigation for Gas Plant No. 11. This draft includes your request for adding the pipeline adjacent to the Bolsa Chica Wetlands to the scope of work. The scope of work has also been modified to reflect a phased approach. The first phase will provide valuable information on potential surface and subsurface contamination areas, finalize regulatory requirements for closure of a non-RCRA facility, and provide a Closure Plan for submittal to the appropriate agency. The second phase will provide detailed information on potential surface and subsurface contamination, final Closure Report, and recommendations for remediation.

The cost estimate is being reviewed by management and will be presented at the meeting next week.

clsrinvst

PROPOSAL FOR CLOSURE PLAN & INVESTIGATION GAS PLANT NO. 11

SHELL WESTERN E & P, INC.
HUNTINGTON BEACH PRODUCTION UNIT

Fluor Daniel, Inc. is pleased to submit this proposal to prepare a Closure Plan and perform a field investigation for the Shell Western E & P, Inc. (SWEPI) Huntington Beach Production Unit, Gas Plant No. 11. This proposal presents our project approach, scope of work, deliverables, schedule for completing the project, and budget estimate.

BACKGROUND

It is Fluor Daniel's understanding that the Gas Plant No. 11 will be decommissioned and dismantled by 1994, prior to the site being restored to a natural condition and turned over to the property owners for subsequent transfer to the City of Huntington Beach for use as park land. As a result of meetings with Mr. Jim Langer and Mr. Sub Sen, Fluor Daniel was requested to develop a proposal to prepare a closure plan, conduct a site closure investigation, and submit documentation that the site meets regulatory requirements for closure and property transfer.

PROJECT APPROACH

The objective of the Closure Plan and Site Closure Investigation is to meet applicable regulatory requirements for the complete dismantling and property transfer of Gas Plant No. 11. Fluor Daniel proposes to conduct the activities in multi-phased approach. The project approach includes:

- Conducting an initial scoping investigation prior to decommissioning Gas Plant No. 11.
- Reviewing available information pertaining to the storage, treatment, or disposal of waste on site; existing soil and ground water data; site history and previous site use.
- Contacting appropriate regulatory agencies to determine specifically what documentation must be provided to individual agencies.
- Conducting a site visit, file review, and interviews with SWEPI staff.
- Conducting a limited field investigation to determine the extent of possible subsurface impact by past operation of the Gas Plant No. 11.
- Conducting a limited field investigation along the pipeline chase adjacent to the Bolsa Chica Wetlands area.
- Preparing a final Closure Report summarizing the investigation and observations. An additional and separate Recommendations Report will be submitted to SWEPI.

The field investigation will be conducted to identify and define potential surface and subsurface contamination. The field investigation activities will include soil borings, shallow ground water monitoring wells, field analysis of collected samples for organic compounds, and collection of specific soil and ground water samples for laboratory analysis. Services rendered during this entire project will be conducted in a discrete manner and kept confidential.

SCOPE OF WORK

Fluor Daniel recommends the following specific scope of work for the Gas Plant No. 11 Closure Plan and Investigation. The activities have been divided into two phases.

Phase I Activities

1. SITE RECONNAISSANCE - Fluor Daniel staff will meet with key SWEPI staff to develop an understanding of past operations at Gas Plant No. 11. This will include interviewing staff who may have worked at Gas Plant No. 11 during its early history. Along with the interviews, Fluor Daniel staff will review facility files and site drawings to identify potential release points.

   In addition, Fluor Daniel staff will conduct a detailed field inspection to locate potential sampling locations. Fluor Daniel staff will follow-up this field inspection with a meeting with SWEPI to discuss actual boring numbers, locations, and depths. All borings and ground water monitoring well locations will be approved by SWEPI prior to submitting the Closure Plan to the appropriate regulatory agency.

2. CLOSURE PLAN - Fluor Daniel will prepare a Closure Plan for submittal to the appropriate agency. The Closure Plan will meet the county requirements for closure of a non-RCRA facility. The Closure Plan will:

   - Provide a description of the site and a discussion of the facility history.
   - Describe the proposed field investigation to demonstrate a clean closure.
   - Include the number, location, depth, and sampling frequency of the soil borings and ground water monitoring wells.
   - Provide a Health & Safety Plan to be applied during all field activities.
   - Describe the analytical methods to be performed on samples.
   - Include an outline of the Closure Report that will be submitted to the reviewing agency.

3. PRELIMINARY FIELD INVESTIGATION - Fluor Daniel staff will conduct a preliminary field investigation at Gas Plant No. 11 prior to decommissioning and dismantling activities.

   - The field investigation team will drill six shallow soil borings using a hand auger.
   - The depth of the borings will be determined by the local soil conditions. An attempt will be made to reach ten feet in depth to collect soil samples.
   - Soil borings will be logged geologically and soil samples will be collected for analysis off-site at an analytical laboratory.

4. LABORATORY ANALYSIS - Preliminary Field Investigation: Selected soil samples will be taken to a California Department of Health Services (CDOHS) Certified laboratory for further chemical analysis. Soil samples will be analyzed by U.S. EPA Method 8240 (volatile organic compounds (VOC)), Method 418.1 (total petroleum hydrocarbons (TPH)), and Method 6010 (metals).

5. PRELIMINARY FIELD INVESTIGATION REPORT - Fluor Daniel will prepare a report containing field observations and analytical results from the preliminary limited field investigation. The goal of this report is to provide SWEPI a very general idea of subsurface conditions. The report will be prepared and submitted to SWEPI for review following field activities and analytical results.

6. MONTHLY STATUS REPORTS - Fluor Daniel will attend a project status meeting a minimum of once each calendar month to report to SWEPI on the status of activities. A written status report will be provided at the same time. In addition, Fluor Daniel will also attend meetings at critical decision points. SWEPI will be advised by telephone of important developments. Conference Notes will be developed by Fluor Daniel to document formal meetings and important telephone conversations with agencies and SWEPI.

Phase II Activities

1. FIELD SAMPLING TASK - Following facility dismantling and agency approval of the Closure Plan, Fluor Daniel staff will conduct a limited subsurface investigation at the Gas Plant No. 11.

   - The field investigation team will drill a minimum of 15 borings to a maximum of 24 borings to an approximate depth of fifteen feet or to ground water. (the depth is dependent upon site conditions such as depth to ground water, visual contamination, and mobile laboratory results)

   - Soil borings will be logged geologically and soil samples retrieved for analysis on-site at a mobile laboratory and/or analysis off-site at an analytical laboratory.

   - The drilling contractor and the mobile laboratory typically operate at a day rate. Fluor Daniel staff will drill as many soil borings as possible during each day to check for the presence of visually impacted soils or soils which contain volatile organic compounds. Seven days of field activities have been scheduled.

   - A minimum of three and up to a maximum of five 2-inch shallow ground water monitoring wells will be installed. The wells will be designed to acquire ground water samples for laboratory analysis. The monitoring well design will comply with design recommendations developed by the U.S. EPA and California Department of Health Services, Toxic Substance Control Program. Monitoring wells will be developed to meet the water sample clarity requirements for the analytical laboratory.

   - Ground water samples will be collected using procedures discussed in the U.S. EPA's RCRA Ground-Water Monitoring Technical Enforcement Guidance Document, September 1986.

2. FIELD SAMPLING TASK - During Task 1 Fluor Daniel staff will also conduct a limited subsurface investigation along the pipeline chase that carries gas from off-shore platforms to Gas Plant No. 11.

   - A maximum of 8 soil borings will be hand augured along side the chase as soil conditions allow.

   - The depth of the borings will be determined by the local soil conditions. An attempt will be made to reach five feet in depth to collect soil samples.

   - Soil borings will be logged geologically and soil samples will be collected for analysis off-site at an analytical laboratory.

3. LABORATORY ANALYSIS - A CDOHS Certified mobile laboratory will be utilized on-site to conduct limited chemical analyses. This will provide the most cost effective use of field investigation resources by defining the areas impacted while field staff are on-site and the field investigation is in progress. In addition, selected soil and ground water samples will be collected and taken to a CDOHS Certified laboratory for further chemical analysis.

   - Fluor Daniel staff will collect a maximum of 61 soil and five ground water samples, to be analyzed by the mobile laboratory. The samples will be analyzed by U.S. EPA Method 8020/602 (purgeable aromatic compounds (BTEX)) and Method 418.1 (TPH).

   - A maximum of five soil samples and three ground water samples will be collected for further laboratory analysis. Specific samples, identified in the field, will be properly stored and taken to a CDOHS Certified laboratory, following proper chain of custody, for chemical analysis by U.S. EPA Method 8240/624 (volatile organic compounds), Modified Method 8015 (hydrocarbon chain fingerprint), Method 6010/200.7 (metals including vanadium) and Method 7196/218.4 (hexavalent chromium). In addition, three selected soil samples will be analyzed by a Priority Pollutant Scan (chlorinated pesticides, PCB's, VOC's, BNA, cyanide, phenols, and general metals) and five samples will be collected and analyzed for asbestos.

4. LABORATORY ANALYSIS - Pipeline chase associated with Task 2: On-site and off-site sample analysis will be conducted similarly to samples collected and analyzed at Gas Plant No. 11. Metals analysis will not be conducted unless pre-investigation review indicate a need. No Priority Pollutant or asbestos analyses will be conducted on these samples.

5. DRAFT CLOSURE REPORT - Fluor Daniel will prepare a draft Closure Report containing observations and conclusions relating to the apparent environmental conditions at the site. The report will provide an introduction, site history, description of field activities, summary of analytical results, and conclusions. Recommendations will not be included in this report. The report will be prepared and submitted to SWEPI staff for review and comments.

6. FINAL CLOSURE REPORT - Fluor Daniel will prepare a final Closure Report. The final report will be prepared utilizing the draft report and comments received from SWEPI. This final Closure Report will be submitted to the appropriate agency for review.

7. RECOMMENDATIONS REPORT - Fluor Daniel will prepare a report summarizing the field investigation results and suggesting possible recommendations for future investigatory work and remediation if judged to be necessary. The report will be submitted to SWEPI. Order-of-magnitude cost estimates will be provided for any recommended work.

8. MONTHLY STATUS REPORTS - Fluor Daniel will attend a project status meeting a minimum of once each calendar month to report to SWEPI on the status of activities. A written status report will be provided at the same time. In addition, Fluor Daniel will also attend meetings at critical decision points. SWEPI will be advised by telephone of important developments. Conference Notes will be developed by Fluor Daniel to document formal meetings and important telephone conversations with agencies and SWEPI.

DELIVERABLES

Fluor Daniel will provide the following deliverables within the approved schedule:

- A Preliminary Investigation Report (3 copies) will be provided to SWEPI following receipt of analytical results for samples collected during the preliminary field investigation activity.
- A Closure Plan (6 copies) will be provided to SWEPI for submittal to the appropriate agencies.
- A draft Closure Report (1 copy) will be provided to SWEPI for review and comments.
- A final Closure Report (6 copies) will be provided to SWEPI for submittal to the appropriate agencies.
- A Recommendations Report (3 copies) will be provided for SWEPI for review and discussion.
- Fluor Daniel will provide a written status report each calendar month.
- Conference Notes will be transmitted to SWEPI within ten working days following the meeting for concurrence by SWEPI.

ASSUMPTIONS

The development of this proposal is based upon the following assumptions:

- Current regulatory compliance cannot be ascertained without contacting appropriate regulatory agencies, reviewing existing permits, and performing extensive regulatory review.
- The scope of work proposed herein, is based upon Fluor Daniel's experience with closure of non-RCRA facilities in Orange County and the lack of specific rules regulating non-RCRA closures. Changes in county or state policy concerning non-RCRA closure may require changes in the scope of this project.

The field investigations may identify unanticipated contamination, and therefore additional borings, ground water monitoring wells, and samples may be recommended.

- Key SWEPI staff at the facility will grant access to and provide pertinent information to Fluor Daniel.

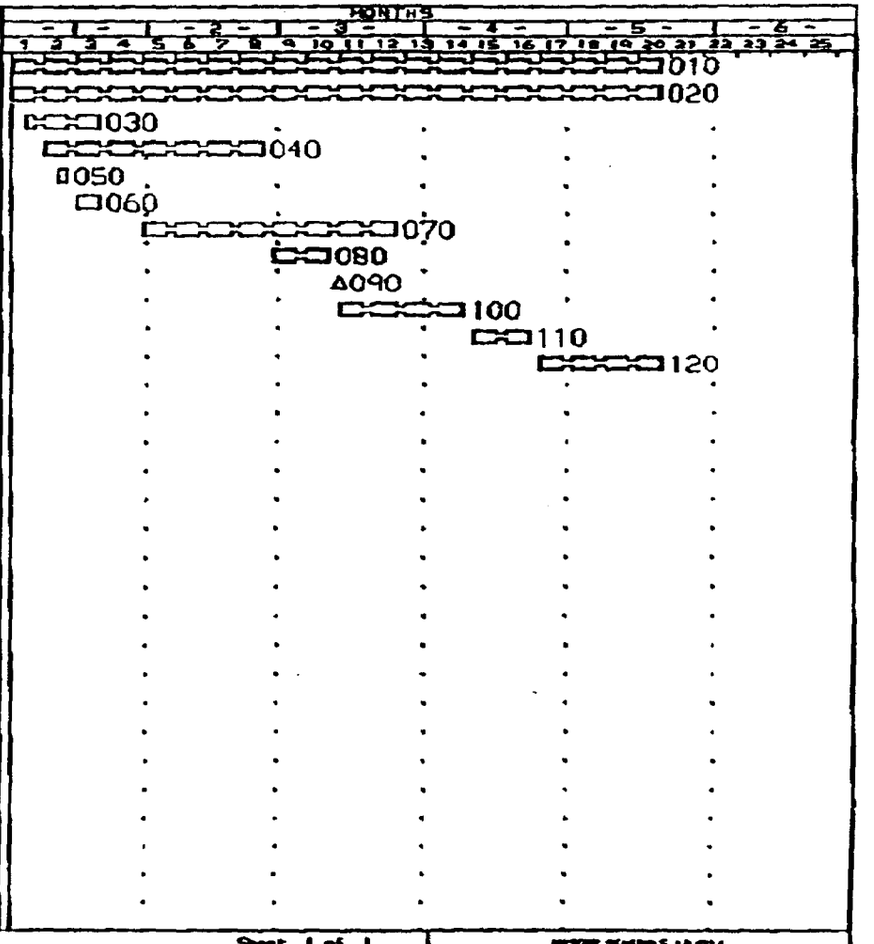
- Turnaround for standard laboratory analysis results will be six weeks.

- Project schedule is dependent upon completion of Gas Plant No. 11 removal prior to field investigation project activities, excluding the preliminary field investigation (Phase I,Task 3).

- Sampling activities will be conducted in Level D personal protective equipment unless field conditions and Health & Safety Plan implementation establishes higher personal protection. Changes in the level of personal protection may impact the proposed schedule.

- Fluor Daniel staff will provide personal protective equipment.

- The Recomendations Report may have future investigation and remediation cost estimates which will be based upon the limited scope of this project.



SCHEDULE

A proposed schedule, Figures 1 and 2, are provided for your review and comment. This schedule is provided in weeks of activities instead of actual dates due to the variability of the project at this time. A revised detailed schedule will be provided once various project start dates are established.

PROJECT ORGANIZATION

Fluor Daniel proposes the following project organization and responsibilities. Their resumes are provided at the end of this proposal.

- PROJECT MANAGER - Dan Johnnie will act as Project Manager and direct liaison between Fluor Daniel and SWEPI.
- TASK MANAGER - Chuck Stultz, Registered Environmental Assessor (REA), will act as Task Manager during the proposed phases of the project. Chuck will work directly with SWEPI to direct field work and project development.
- HEALTH & SAFETY MANAGER - David Jackson, Certified Industrial Hygienist (CIH), will act as the Health & Safety Manager and will be in charge of design and implementation of the Health & Safety Plan.
- TECHNICAL STAFF - Gustavo Valdivia and Tom Casabonne will provide technical assistance during office and field investigation activities.

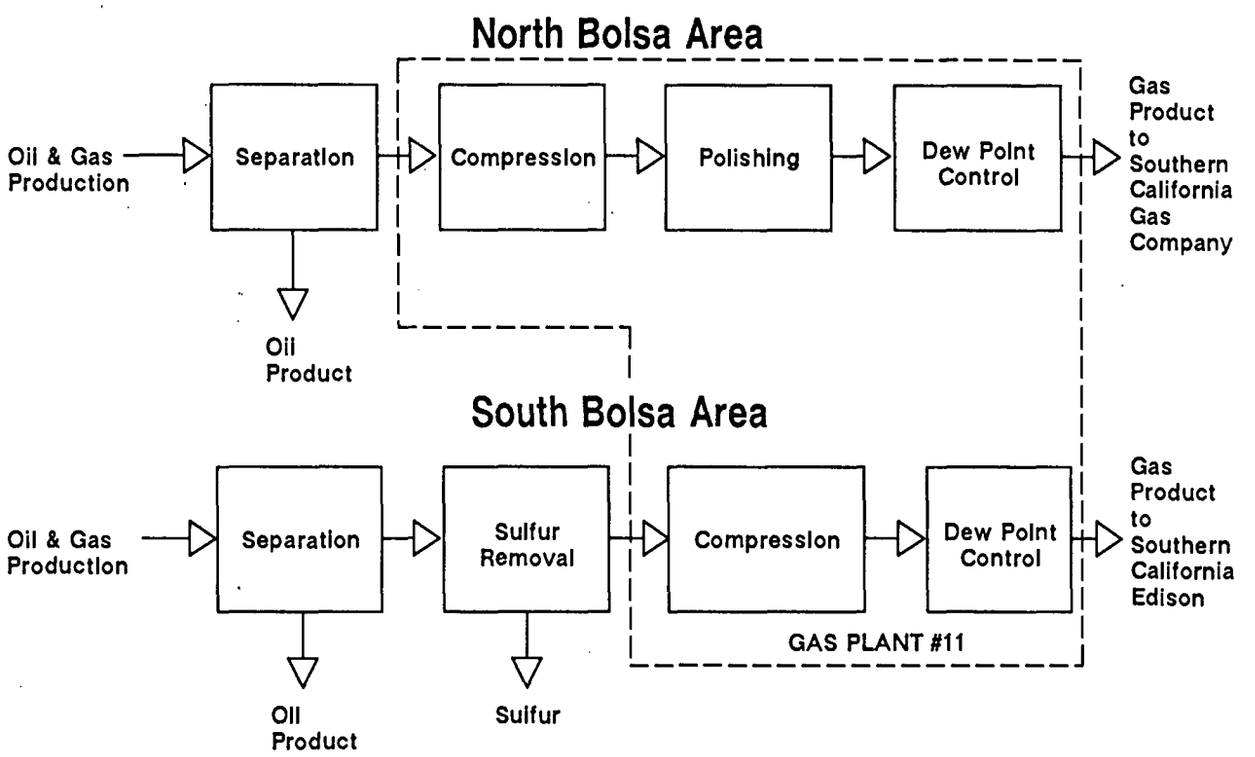
EXECUTIVE SUMMARY

EXECUTIVE SUMMARY

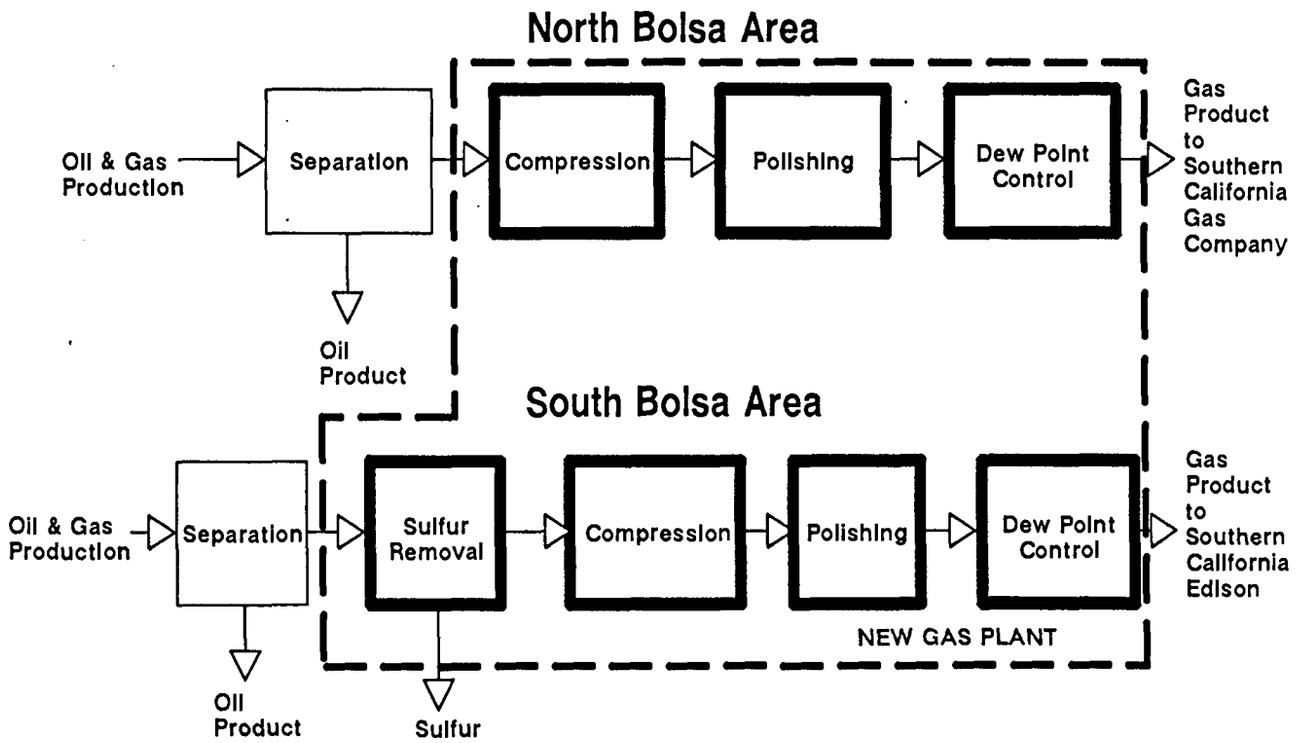
PROJECT DESCRIPTION

Shell Western Exploration and Production, Inc. (SWEPI) is proposing to dismantle the existing natural gas processing plant, Gas Plant #11, at the Huntington Beach Production Unit and construct a smaller replacement gas plant. The expected cost of the project is approximately $10 million.



The proposed gas plant will be located at the existing SWEPI Huntington Beach Facility Strip near Goldenwest Avenue and Pacific Coast Highway. Gas Plant #11 is located north of the Strip within the bounds of the proposed linear park project.

The proposed gas plant will have a capacity of 6 million standard cubic feet per day (MMSCFD), reduced from the Gas Plant #11 original rating of 42 MMSCFD. Natural gas will continue to be processed from the North Bolsa Area (NBA) and the South Bolsa Area (SBA). Gas from the NBA is processed and sold to Southern California Gas Company. Gas from the SBA, which is higher in sulfur compounds and carbon dioxide, is processed and sold to Southern California Edison.



The proposed gas plant will utilize several processes which are functionally equivalent to those in Gas Plant #11. The inlet compression will include two working and one spare gas compressor trains. Each compressor will be a two-stage electric drive reciprocating machine. Hydrogen sulfide is removed from the SBA gas stream with the SulFerox® system. The SulFerox® system will use an iron chelate to remove the H_2S from the stream. The NBA and SBA gas streams will be treated separately with two Sulfa Treat® systems to further reduce the H_2S to meet pipeline specifications. The gas streams will then be processed through separate dew point control units to meet the dewpoint requirement of 45 °F. The dew point control units will inject ethylene glycol to remove water and use propane coolers to cool the gases and condense heavier components. An emergency ground flare will be included in the project to control excursion emissions. Simplified process flow sketches of Gas Plant #11 and the proposed gas plant are presented in Figure I.

FIGURE I
Simplified Flow Sketches

EXISTING FACILITY

PROPOSED FACILITY

BENEFITS

Control equipment incorporated into the design of the proposed gas plant will enable the total emissions to be reduced by approximately 7,800 tons per year as shown in Figure II. Specific emission reductions of 53% to 99% will be realized with this project, with no increase in emissions of any single component. The reductions are shown in Figure III and will be accomplished by the replacement of internal combustion engine compressor drivers with electric motors, improved H_2S removal systems, and the use of an emergency ground flare for destruction of gas excursions. The seven fold reduction in plant capacity also reduces fugitive emissions since fewer and smaller components will be required.

Noise level impacts will be controlled by several methods. The existing internal combustion engines used to drive compressors and air cooler fans will be replaced with quieter electric motors. Fewer control valves, which are a potential noise source, will be required because of the reduction in capacity. The overall noise level will be reduced by 5 dBA. The perceived loudness will be reduced by 25 percent.

The removal of Gas Plant #11 is consistent with the plans for the linear park and will decrease the amount of noise, traffic and emissions near the Bolsa Chica wetlands. SWEPI intends to dismantle Gas Plant #11 once the proposed gas plant is fully operational and will restore the existing site consistent with SWEPI's Lease Agreements and all applicable federal, state and local regulations. The proposed gas plant will be located on the Strip and will not change the land use of the area.

The proposed gas plant will be inherently safer, due to the elimination of 50,000 gallons of natural gasoline storage, the reduction of propane storage from 30,000 gallons to 300 gallons, the reduction in the amount of hazardous waste generated, and inclusion of state-of-the-art computer command and control for facility operations. An upgraded fire protection system will also be provided for the proposed gas plant, and a comprehensive Fire Protection Plan has been submitted to the City of Huntington Beach Fire Department.

The checklist in Table I indicates how the proposed project will affect the twenty areas of concern identified in the California Environmental Quality Act (CEQA) regulations. The proposed project will have a beneficial impact on the surrounding community and environment.

1.0 CITY OF HUNTINGTON BEACH PLANNING DIVISION ENVIRONMENTAL ASSESSMENT FORM

1.0 *CITY OF HUNTINGTON BEACH PLANNING DIVISION ENVIRONMENTAL ASSESSMENT FORM*

1.1 *GENERAL INFORMATION*

1. *Name of Property Owner* Shell Western E&P, Inc.
   Address 5060 California Avenue
   City Bakersfield *State* CA *Zip* 93389
   Telephone (805) 326-5000

2. *Name of Authorized Agent* N/A
   Address _____
   City _____ *State* _____ *Zip* _____
   Telephone _____

3. *List any other related permits or approvals required from Agencies other than City of Huntington Beach, i.e. Caltrans, Coastal Commission:*

Type of permit	Agency	If approved, give date
Permits to Construct	South Coast Air Quality Management District	
Permits to Operate	South Coast Air Quality Management District	

The existing facility required a conditional use permit under Ordinance 9680.2 because the site is classified as combined zone M2-O-CZ (industrial-oil with drilling-coastal zone). The facility is currently operating under Use Permit No. 50-71 which was issued by the Board of Zoning Adjustments on 11/18/70 to Signal Oil and Gas Company. The permit has been amended twice; in 12/28/70 and 1/19/71. This permit allows the "drilling and operating for the discovery or production of oil, gas, hydrocarbons and/or kindred substances in their natural state, including the installation and use of equipment, structures, tools an other facilities incidental, necessary, and accessory to the drilling, production, repressuring and processing of substances produced by such wells for shipment to pipeline." No additional use permits should be required since the proposed project is consistent with these permit conditions.

The facility has been exempted from the coastal development permit requirements by the Coastal Commission Resolution of Exemption No. E-2-15-73-71 given to Signal Oil and Gas Company. This exemption includes any activities related to the "repair, maintenance, replacement, installation, and expansion of gathering, metering, testing, cleaning, and shipping facilities necessary to the production and sale of oil and gas". The proposed project is consistent with this exemption because it involves the cleaning of the gas prior to sale and is replacing an existing gas processing facility.

4. *Is the proposal part of a larger project or series of projects? If so, describe the proposal's relationship to the project or series of projects:*

This project is not part of a larger project or series of projects.

1.2 LOCATION OF PROJECT:

5. *Address*:

20101 Goldenwest Street
Huntington Beach, CA 92648

6. *The project site is located on the north, ~~south, east, west~~ (circle one) side of* Pacific Coast Highway *between* Warner Avenue *and* Goldenwest *Street*. A vicinity map is provided in Figure 1-1. An aerial photograph of the Strip and areas immediately surrounding the Strip is provided in Figure 1-2a. This photograph was taken in February 1991. The overlays show the outline of the existing gas plant (Gas Plant #11), the location of the proposed project site and the outline of the proposed linear park.

A perspective photograph showing the Strip from the southeast is provided in Figure 1-2b. This photograph was taken in October 1990. The overlays indicate the location of Gas Plant #11 and the proposed project site.

Figure 1-2c shows a similar perspective photograph as Figure 1-2b, with abandoned items deleted and a computer-generated images of the proposed gas plant superimposed. The overlay shows the location of the proposed compressor building, dew point control building and SulFerox® building. The computer-generated image of the proposed compressor and dew point control units is shown in further detail in Figure 1-2d. The computer-generated image of the proposed SulFerox® unit is shown in further detail in Figures 1-2e.

1.3 PROJECT DESCRIPTION:

7. Site Size: _____ *gross acres/square feet.*

_____ *net acres/square feet.*

The entire Huntington Beach Facility site is approximately 3,960,000 gross square feet (~91 acres) in size including the Strip and Gas Plant #11 sites. The proposed project site will occupy approximately 53,750 net square feet (~1.2 acres), which is about 1.5% of the facility site. The facility site size will be reduced by approximately 112,500 square feet (2.6 acres) when Gas Plant #11 is demolished and the land returned to the lessors. This land has been designated for future development of the linear park. A plot plan of the proposed project is provided in Figure 1-3.

8. What is the surrounding land use to the north, south, east and west?

The proposed project site is zoned M2-O1-CZ (industrial-oil with drilling-coastal zone). The land to the north of the proposed project site is primarily residential, zoned R3-17-O-CZ (medium-high density residential-oil-coastal zone), R4-29-O-CZ (high density residential-oil-coastal zone), and R4-O-CZ (high density residential-oil-coastal zone). The land to the south of the proposed project site is beach front, zoned S1-O-CZ-FP3 (shoreline-oil-coastal zone-floodplain). The land to the east of the proposed project site is zoned Downtown Specific Plan District 1a (commercial serving visitors), Downtown Specific Plan District 2 (high density residential) and Townlot Specific Plan Area One - section A (medium density residential). The Bolsa Chica State Park is located west of the proposed project site. Zoning maps for the area surrounding the Strip are presented in Appendix A. (Text continued on page 1-11)

The SWEPI Huntington Beach facility has always strived to be a good neighbor to the surrounding areas. SWEPI donates much time and financial resources to the Amigos de Bolsa Chica for the conservation of the Bolsa Chica wetlands, and other community groups including the Boy Scouts, Huntington Beach Library, Huntington Beach Pier Restoration, Huntington Beach Youth Shelter, Boys & Girls Club and the Huntington Beach Chamber of Commerce. A complete listing is provided in Table 1-1. Shell Oil & SWEPI plan to donate between $35,000 and $40,000 to Huntington Beach community groups this year.

*1.4 **FOR RESIDENTIAL PROJECTS**: (IF PROJECT IS COMMERCIAL, INDUSTRIAL, OR INSTITUTIONAL SKIP TO ITEM 15 .)*

9-14. N/A

*1.5 **FOR COMMERCIAL, INDUSTRIAL OR INSTITUTIONAL PROJECTS**: (IF PROJECT IS RESIDENTIAL SKIP TO ITEM 28 .)*

15. Describe the types of uses and/or activities proposed:

The proposed project will replace Gas Plant #11 located near the Bolsa Chica wetlands with a new gas plant located within the existing SWEPI oil production facilities along the Pacific Coast Highway. Gas Plant #11 currently processes approximately 6 million standard cubic feet per day (MMSCFD) of natural gas, but is rated to process 42 MMSCFD. The proposed gas plant is rated and will process 6 MMSCFD, which represents a 36 MMSCFD reduction in the rated capacity of the gas plant operations. The reduction in capacity corresponds to less equipment and a smaller gas plant. The proposed gas plant will cost approximately $10 million compared with a cost of $70 million to completely replace the larger Gas Plant #11.

The gas feed can be classified into two major streams; the North Bolsa Area (NBA) gas (from reservoirs north of the Newport-Inglewood Fault) and the South Bolsa Area (SBA) gas (from reservoirs south of the fault). The SBA gas also includes gas from the SWEPI offshore Emmy platform, the existing casing vapor collection systems and the existing tank vapor recovery unit. The NBA and the SBA gas streams are approximately 3 MMSCFD each. The NBA gas meets pipeline specifications for carbon dioxide (CO_2) and is relatively free from sulfur compounds. The NBA gas is treated and sold to Southern California Gas Company (SoCal) which markets the gas. The SBA gas does not meet pipeline specifications because of high CO_2 concentrations. It also has higher concentrations of sulfur compounds, approximately 8000 ppm of hydrogen sulfide (H_2S). The SBA gas is treated and sent to Southern California Edison (SCE) for use in the Huntington Beach power plant.

The NBA gas and the SBA gas are currently compressed and treated in a dew point control unit to remove condensables. The H_2S from the SBA gas is removed with a Stretford Unit, which uses vanadium as a catalyst. The small amount of H_2S remaining in the NBA gas is removed with an iron sponge. Approximately 50,000 gallons (143 tons) of produced natural gasoline and 30,000 gallons (64 tons) of propane are stored at Gas Plant #11.

The proposed gas plant will consist of gas compression, dehydration and dewpoint control. The H_2S from the SBA gas will be removed with a SulFerox® unit, using an iron compound (non-hazardous material) to remove the H_2S. Both gases are sent through a Sulfa Treat® unit to reduce the H_2S content to meet required specifications. Auxiliary facilities include propane refrigeration, glycol regeneration and an emergency ground flare. Produced gasoline will not be stored at the new gas plant. Approximately 300 gallons (0.64 tons) of propane will be stored at the new gas plant. This represents a 99% reduction in the amount of propane stored.

Gas Compression

Three identical natural gas compressors will be utilized; a one hundred percent train for each gas stream and a one hundred percent common spare. Each compressor will be a two-stage electric drive reciprocating machine with interstage cooling and condensate separators. The spare machine will be connected to the support equipment of either

normal operating compressor as required. Hydrocarbon condensate from each compression train is collected and sent to the on-site oil/water treating facility.

Desulfurization

Desulfurization of the SBA gas will be provided by a SulFerox® unit located at the intermediate stage of the gas compression train. The gas stream is contacted with an iron chelate - water solution to remove the H_2S. The hydrocarbons in the spent solution will be evaporated and recycled through the existing tank vapor recovery system. The existing Stretford Unit will be retained as a spare.

Sulfa Treat®

The NBA and SBA gas streams will be treated separately with two Sulfa Treat® systems operating in series to reduce the H_2S content further to meet the required pipeline specifications. The Sulfa Treat® system uses an iron compound to selectively remove H_2S from the gas. The process is non-regenerative and the spent material will be disposed of as non-hazardous waste. There will be three Sulfa Treat® trains, one for each inlet gas stream and one spare train.

Dewpoint Control

The gas streams will be processed through separate dew point control units after the second stage of compression and the Sulfa Treat® train, to meet the required pipeline dewpoint specification of 45°F. The gas is treated with ethylene glycol to remove the remaining water and cooled in the propane chillers to condense the heavier components. The clean NBA gas is sent to SoCal and the clean SBA gas is sent to SCE. The ethylene glycol is regenerated and the hydrocarbon liquid is stabilized to generate natural gasoline which is mixed with the crude oil. The off-gas from the stabilizer is mixed with the SBA gas prior to distribution.

Ground Flare

An emergency ground flare will be utilized to destroy any vent gas that is not recycled. The flare will also be designed to burn the total amount of produced gas, up to 6 MMSCFD, that may be vented in an emergency. The flare will be smokeless and have a hidden flame.

16. *Size of each proposed building: (in gross square feet):*

Three new buildings will be constructed as part of the proposed project. The size of these buildings is:

Building	Area (Square Feet)
Control Room	300
SulFerox® Enclosure	400
Compressor Building	4500

17. *Number of buildings proposed:*

Three new buildings will be constructed; the control room, the SulFerox® enclosure and the compressor building.

18. *Maximum building height and number of stories:*

The building heights and number of stories are:

Building	Height (feet)	Number of Stories
Control Room	10-12	1
SulFerox® Enclosure	10-15	1
Compressor Building	25	1

19. *Amount and type of off-street parking proposed:*

Off-street parking will not be required for the proposed project. The parking requirements will be met by existing parking lots within the site boundaries.

20. *Projected number of employees _____ total, _____ shift:*

The SWEPI Huntington Beach facility currently employs 77 people with an additional 10 to 15 support personnel from the SWEPI Bakersfield office. Approximately 90 contract laborers not directly employed by SWEPI also work at the site. The operations at the proposed facility will not increase or decrease the current number of employees. The number of workers on site could increase by approximately 65 persons during the construction phase.

Most of the personnel work dayshift (8 hrs/day). The gas plant has 1 person per shift, three shifts per day. The tank farm and field personnel operate on 2-12 hour shifts, with 4 persons per shift.

21. *Maximum occupancy of building(s):*

The control room, the SulFerox® enclosure and the compressor building will not normally be occupied. An operator will be entering these buildings periodically during each shift.

22. *What will be the days and hours of operation:*

The proposed plant will operate on the same schedule as Gas Plant #11; twenty-four hours per day, seven days per week.

23. *Describe the proposed scheduling or phasing of the project:*

The overall schedule for the project will be approximately four years. Preliminary engineering will take approximately six months. Environmental documentation and permitting for the project are expected to take twenty months. Detailed engineering and procurement start after the permitting has been completed and will be take approximately 9 months. The construction will take approximately seven months after detailed engineering is completed. The new gas plant is expected to start up in 1994. Gas Plant #11 will be demolished after the new plant is operational.

24. *For restaurants, how many seats will there be:* N/A

If outdoor seating is proposed, amount of outdoor square footage _____.

25. *What percentage of the project site will be covered by:*
Paving 0 %; *Building* ~10 %; *Landscaping* 0 %.

26. *What is the distance of the project from the nearest school, hospital, convalescent hospital, park or recreation facility:*

The distance of the Gas Plant #11 site and the proposed project site to the nearest school, hospital, convalescent hospital and park or recreation facility is given below.

	Existing Gas Plant #11 Site	Proposed Project Site
Smith Elementary School/ Dwyer Elementary School	1.4 miles	1.0 miles
Pacifica Hospital	1.7 miles	2.0 miles
Huntington Beach Convalescent Hospital	1.7 miles	2.0 miles
Bolsa Chica State Beach	0.6 miles	0.1 mile
Bolsa Chica Wetlands	adjacent	1 mile

27. *Does the project involve the handling, manufacture, storage, transport or disposal of any toxic, flammable or hazardous substance? If so, please describe and indicate what safety measures have been incorporated into the project:*

The proposed gas plant will handle basically the same materials as Gas Plant #11. These materials are listed in Table 1-2. Further detail on these materials is provided in Appendix B.

Table 1-2

Hazardous Materials

Material	Use or Source	Comments
Natural Gas	Produced at site	Flammable
Natural Gasoline	Produced at site	Flammable
Propane	Refrigeration	Flammable
Hydrogen Sulfide	Trace amounts in product natural gas and NBA gas, approximately 8000 ppm in SBA gas	Toxic/Flammable
Benzene	Trace amounts in product natural gas, NBA gas and SBA gas	Carcinogen/Flammable
Ethylene Glycol	Removal of water from natural gas	Moderately Toxic
Spent Lube Oils	Removed from compressor pumps and other pieces of equipment	Potential heavy metal contamination
Ammonium Hydroxide	pH buffer - SulFerox® unit	Corrosive
Decanol	Surfactant	Flammable
Ammonium Bisulfite	Inhibitor	Corrosive
Ammonium Thiosulfate	Additive	Reactive
Pluronic	Surfactant	Moderately Toxic/Reactive

SWEPI has developed internal guidelines for the management of hazardous materials that will continued to be followed at the new gas plant. The area operation foreman is responsible to ensure that all chemical containers being used and received for use are labeled appropriately. The containers are checked to ensure they are in good condition and approved for use for the specified chemical. The foreman reviews incoming Material Safety Data Sheets (MSDS's) on new chemicals and forwards the information to any affected employees and to the unit clerk for input into a computerized system.

Any hazardous waste is collected on-site in approved containers which are labeled and dated. The material is stored for less than 90 days and transported to a RCRA approved treatment/disposal facility by a qualified transporter. An approved manifest is attached with all shipments. The new facility will generate less hazardous waste because of the different sulfur removal system.

The operations foreman is also responsible for employee training. Employees are trained on the proper handling of hazardous materials and also on the reading of the MSDS's. Annual retraining is conducted for all affected personnel. Additional training is required before personnel begin non-routine work involving hazardous materials.

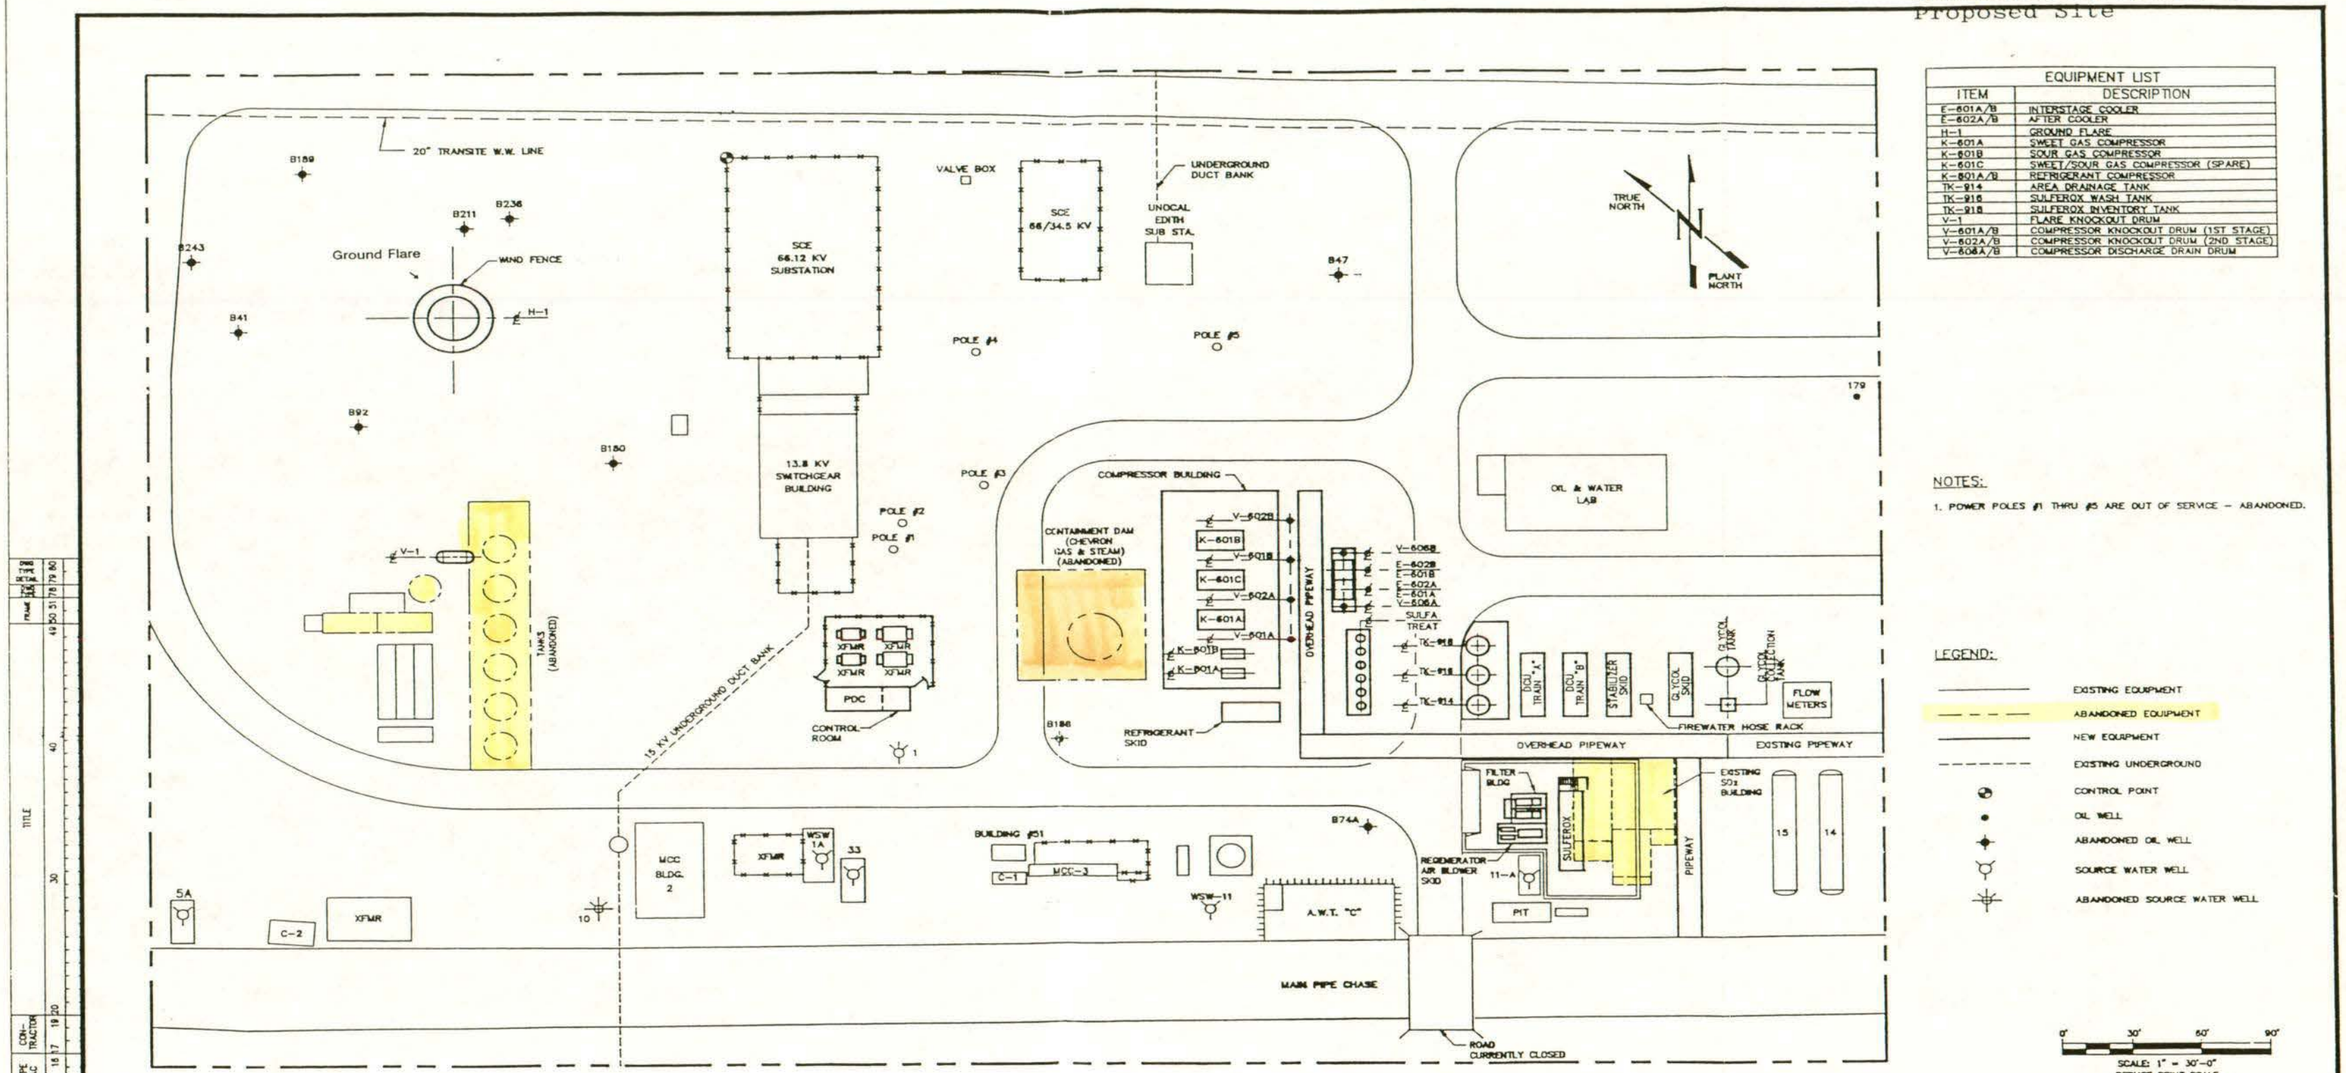
Care has been taken in the design of the new facility to minimize risk. Potential emissions are controlled by installing Best Available Control Technology (BACT) on emission sources. Pressure relief valves and vent systems will be routed to the ground flare to prevent the direct release of natural gas and H_2S to the environment.

Natural gasoline storage is 50,000 gallons (143 tons) at the Gas Plant #11 site and will be eliminated in the proposed gas plant design. The amount of propane storage will be reduced from 30,000 gallons (64 tons) at the Gas Plant #11 site to 300 gallons (0.64 tons) at the proposed gas plant site.

A firewater system, fire protection system including ultraviolet [UV] and infrared [IR] detection, and combustible gas and H_2S detection systems will be installed at the new gas processing plant. Hydrogen sulfide detectors are already in place around the perimeter wall to allow plant operators to constantly monitor the area. A proposed Fire Protection Plan has been submitted to the City of Huntington Beach Fire Department.

SWEPI will continue to work closely with the City of Huntington Beach to adopt a final Plan that is suitable to meet the needs of the area. Details of the proposed Plan are given in Appendix C.

Safety showers, eyewash stations and self-contained breathing apparatus will be provided near the SulFerox® unit area for the safety of employees and emergency response personnel. Routine inspections will be performed to ensure personnel are qualified for the job and that equipment is maintained in top condition. The Emergency Response Plan and Business Plans for the existing Strip facility will be updated to account for the new gas plant.



1.6 ENVIRONMENTAL IMPACTS:

28. If improvements are to be demolished by the project, please outline them on the site plan and describe them briefly:

The empty cinder block building and seven abandoned tanks on the proposed project site will be demolished during construction activities. The plot plan of the proposed gas plant site with the abandoned tanks and building is provided in Figure 1-4.

Gas Plant #11 will be demolished after the new gas plant is operational. A listing of the main items to be removed from this area is provided in Table 1-3. A plot plan of Gas Plant #11 is provided in Figure 1-5. A Closure Plan for Gas Plant #11 will be developed and submitted to the appropriate agencies for approval. The Closure Plan will provide a description of the site and a discussion of the facilities history; the proposed field investigation to demonstrate a clean closure; description of the number, location, depth and sampling frequency of the soil borings and ground water monitoring wells; the analytical methods to be performed on samples; and an outline of the Closure Report that will be submitted to the appropriate agencies. A proposal for the closure of the Gas Plant #11 site is provided in Appendix D.

Glycol Settling Tank, 4'-0" Dia. x 15'-0" L.

Glycol Regenerator, Rheem Superior, Model No. 60-300, 1'-6" Dia. x 20'-0" L., With Two ¾-H.P. Pumps.

Glycol Regenerator, McFarland, Model No. MAC-24.

Table 1-3 (Continued)
Equipment to be Removed

Cooler, Smitheco, Air-Cooled Type, With A Propane Refrigerant Condenser Section, A Propane Column Reflux Condenser Section And Natural Gasoline Product Cooler Section, With Two 15-H.P. Air Blowers.

Two Propane Dehydrators, Each 1'-6" Dia. x 20'-0" H.

Propane Make-Up Pump, Centrifugal, Mechanical Seal, With 2 H.P. Motor.

Glycol Settling Tank, 3'-0" Dia. x 10'-0" L.

Glycol Regenerator, With A Heat Exchanger, Three Stage Each 1'-9" Dia. x 6'-9" L.

Three Propane Refrigerant Scrubbers, Two (V-7 & V-8) 2'-0" Dia. x 10'-6" H. Each And One (V-10) 2'-0" Dia. x 7'-6" H.

Propane Refrigerant Surge Tank, 5' Dia. x 15' H., 2280 Gallons Capacity.

Two Steam Boilers, Each 350 H.P. Gas-Fired Only (One Stand-By).

Low Temperature Separator (Lts), With 2'-0" Dia. x 8'-0" L. Inlet Scrubber, Gas/Gas Exchanger 1'-6" Dia. x 27'-0" L., Gas Chiller 2'-3" Dia. x 23'-3" L., Glycol Separator 2'-6" Dia. x 8'-0" L., And Two Stabilizer Feed Pumps, Each 1 ½ H.P. (One Stand-By).

Wet Gas Scrubber, 3'-6" Dia. x 13'-4" H.

First Stage Separator, 2'-6" Dia. x 10'-3" H.

Two Coolers, First Stage/Second Stage, Air-X-Changer Model No. 84AH With A 7 ½-H.P. Air Blower Each.

Ammonia Tank, 8'-0" Dia. x 44'-4" L.

Slug Catcher, 9'-0" Dia. x 66'-0" L.

VSH Scrubber, 6' Dia. x 12' H.

VW Scrubber, 2'-6" Dia. x 10' H.

Propane Oil Separator, 1'-3" Dia. x 5'-0" H.

Fuel Scrubber For Electric Generators, 1'-6" Dia. x 6'-0" H.

Two Glycol Charcoal Filters, Each 1' Dia. x 4' H.

Glycol Storage Tank, 9' Dia. x 15' H.

Glycol Make-Up Tank, 6' Dia. x 7'-6" H.

Table 1-3 (Continued)
Equipment to be Removed

High Pressure Residue Scrubber, 4' Dia. x 10' H.

Natural Gasoline Make Water Glycol Separator, 3' Dia. x 4' H.

Two Natural Gasoline Shipping Pumps, Each 20 H.P.

Natural Gasoline Shipping Pump, 5 H.P.

Two Waste Oil Tanks, 7'-6" Dia. x 31'-8" L. Each.

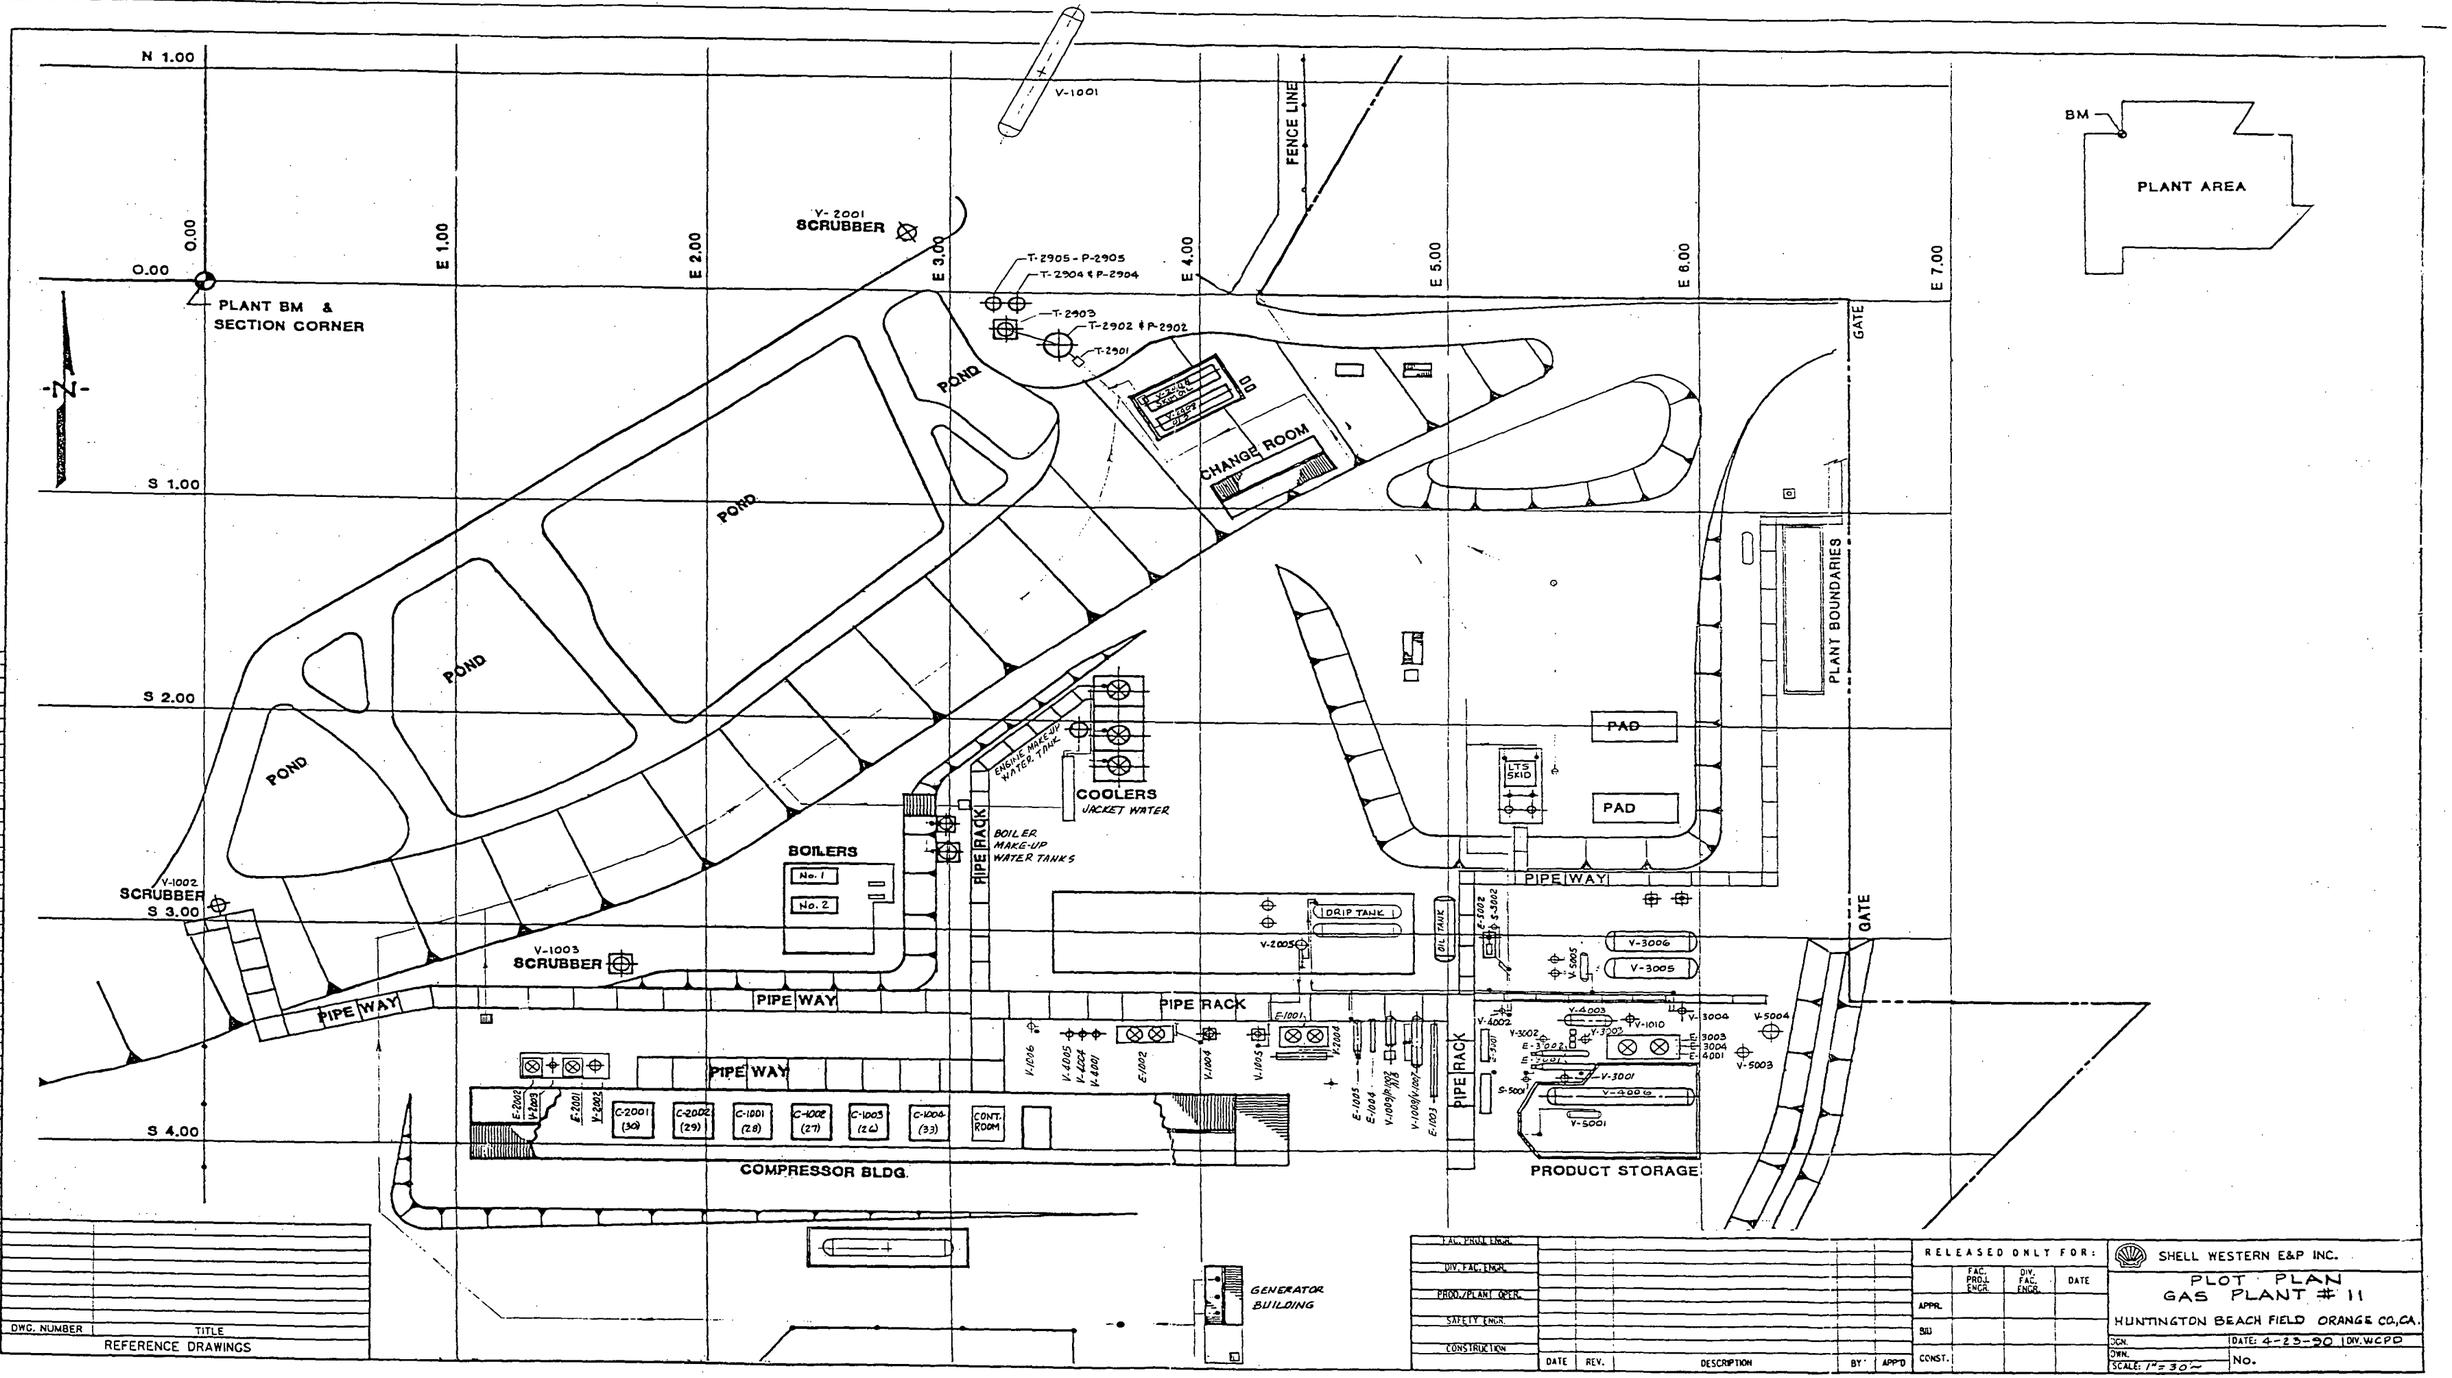
Waste Water Separator, 7' Dia. x 16' H.

Two Concrete Waste Water Receivers, 6' Dia. x 6' Deep Each.

Fiberglass Skim Tank, 12' Dia. x 7' H.

Propane Rundown Pressure Tank, 30,000 Gallons, 9'-6" Dia. x 50'-0" L.

Two Natural Gasoline Rundown Tanks, Each 18,000 Gallons, 9'-0" Dia. x 41'-8" L.



Two H2S Sulfa Check Vessels (Stand-By), 5'-0" Dia. x 9'-6" H.

Existing Improvements - removed prior to gas plant construction

- Seven tanks - out of service
- One cinder block building - empty

Compressor Drivers

Four (4) 600 H.P. Natural gas-fired, lean burn internal combustion engines, driving first and second stages of compressors 28, 29, 30 & 33.

PLOT PLAN
GAS PLANT # 11
HUNTINGTON BEACH FIELD ORANGE CO., CA.

DGN. | DATE: 4-23-90 | DIV. WCPD
DWN. | No.
SCALE: 1" = 30'

Figure 1-5

29. *Will the project potentially affect an historic structure or object in any way? If so, please describe:*

The demolition activities are associated only with oil/gas production equipment. The project will not involve the demolition of or affect any historic structures.

30. *List any potential noise sources which could affect the site (i.e., roadways, freeways, industrial projects) and give approximate distances:*

The project site is zoned for industrial use. Potential noise sources include Pacific Coast Highway and Goldenwest Street which are adjacent to the Strip.

31. *Describe any noise that will be produced by the project during construction and after project is completed:*

Noise levels generated by new equipment in the proposed gas plant will be less that noise levels generated by equipment currently operating in Gas Plant #11. The main noise sources in Gas Plant #11, the internal combustion engine-driven compressors, will be replaced with quieter electric motor-driven compressors. The expected reductions in noise levels for these units are presented below:

Unit	Noise Levels, dBA		
	Existing	Proposed	Change
Compressors & Drivers @ 3 ft.	90 to 93	85 to 88	-5
Compressors & Drivers @ 100 ft.	65 to 70	60 to 65	-5

The following changes in design between the new and existing gas plants will also provide a reduction in noise level impacts:

- The new compressors will be located further from residences than the existing compressors.

- Fewer fans (air-cooled heat exchangers) will be installed in the new plant than are currently used in Gas Plant #11.

- No internal combustion engines will be used as fan drivers in the new plant. One set of fans in Gas Plant #11 is engine driven.

- Fewer control valves, a potential noise source, will be installed in the new plant than are currently used in Gas Plant #11.

- No hydrocarbon streams will be vented directly to atmosphere in the new plant.

Typical construction related noise will be generated at the project site during the construction phase. Construction noise sources include diesel or gasoline-powered dozers, graders, loaders, backhoes, dump trucks, air compressors and welding machines. Noise levels at 50 feet from the diesel-powered equipment typically range from 80 to 90 dBA. Gasoline-powered equipment noise levels typically range from 75 to 80 dBA at 50 feet. Construction noise is intermittent in nature and only occurs during the construction phase of the project. The use of offsite modular construction (prefabrication) will be maximized to reduce time required for onsite construction. No construction activities will occur on Sunday, a federal holiday or between the hours of 8pm to 7am Monday through Saturday, per the Huntington Beach Municipal Code, Chapter 8.40.

32. *Will the project incorporate outdoor lighting? If so, indicate location and source on the site plan.*

Exterior lighting will be provided for the proposed gas plant for safety, as with most of the existing buildings at the site. The lighting will be shielded to prevent excessive glare offsite. Enough outdoor lighting will be used to allow plant operators to work safely and effectively, approximately 5 foot-candles of light around the process areas and 0.1 foot candles around the buildings for safety. Lights will be located to provide optimum visibility. Exact locations of the lights will be determined during detailed design. The new lighting will not be a significant change from the existing lighting at the facility.

33. *Estimate the average number of daily vehicle trips (ADT) generated by the project site currently; after development:*

Approximately 500 vehicle trips occur currently to and from the Strip daily. The proposed project will not increase or decrease this number. Approximately 5 vehicle trips occur to Gas Plant #11. These trips will cease after the demolition of Gas Plant #11.

34. *List type and quantity of any air pollutants that the project will emit:*

The emissions from Gas Plant #11 and the estimated emissions from the proposed gas plant are presented in Figure 1-6a, 1-6b, 1-6c and 1-6d. The type of emissions will not change from those at Gas Plant #11 and are typical for oil/gas production facilities.

The replacement of Gas Plant #11 with the proposed gas plant will result in a net decrease in emissions of sulfur dioxide (SO_2), nitrogen oxides (NO_x), carbon monoxide (CO), carbon dioxide (CO_2), volatile organic compounds (VOC), methane (CH_4), particulate matter (PM), ammonia (NH_3) and hydrogen sulfide (H_2S). The percent emission reduction by component is presented in Figure 1-7.

The decrease in air pollutant emissions are a result of the following changes in design between the proposed gas plant and Gas Plant #11:

- The existing Stretford unit will be replaced with a SulFerox® unit which is more efficient in removing H_2S from the SBA gas stream. The Stretford® unit will be retained for backup capability.

- The new gas plant will have fewer sources of fugitive VOC, CH_4 and H_2S emissions. The number of fugitive emission sources are presented below:

Number of Fugitive Emission Sources, Gas Plant #11	Number of Fugitive Emission Sources, Proposed Gas Plant	Reduction
2190	670	1520

Figure 1-6a
Emission Rates - Total

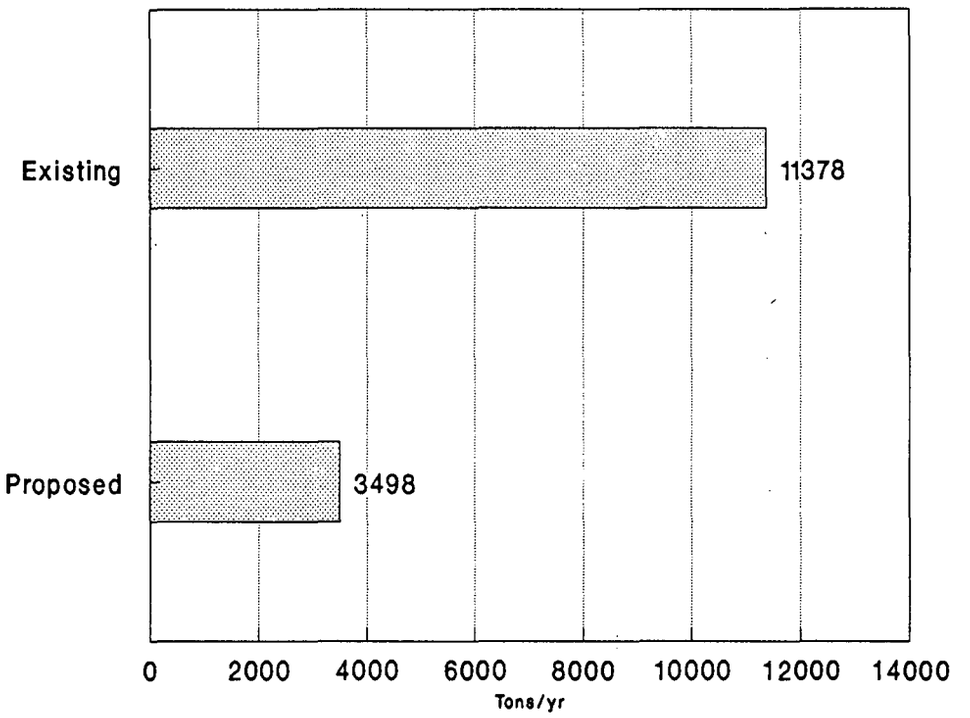

Figure 1-6b
Emission Rates - Existing and Proposed

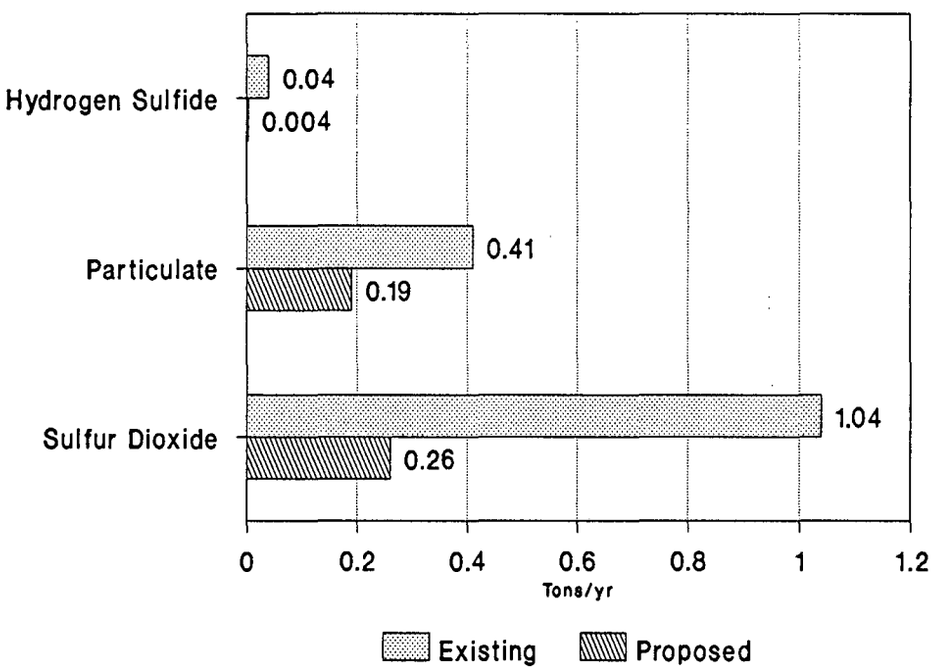

Figure 1-6c
Emission Rates - Existing and Proposed

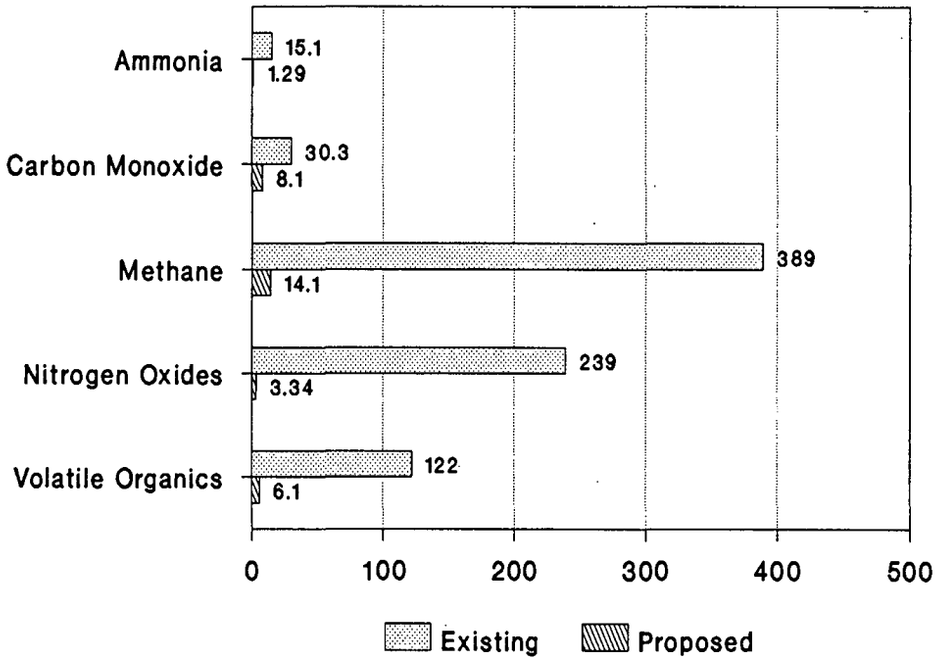

Figure 1-6d
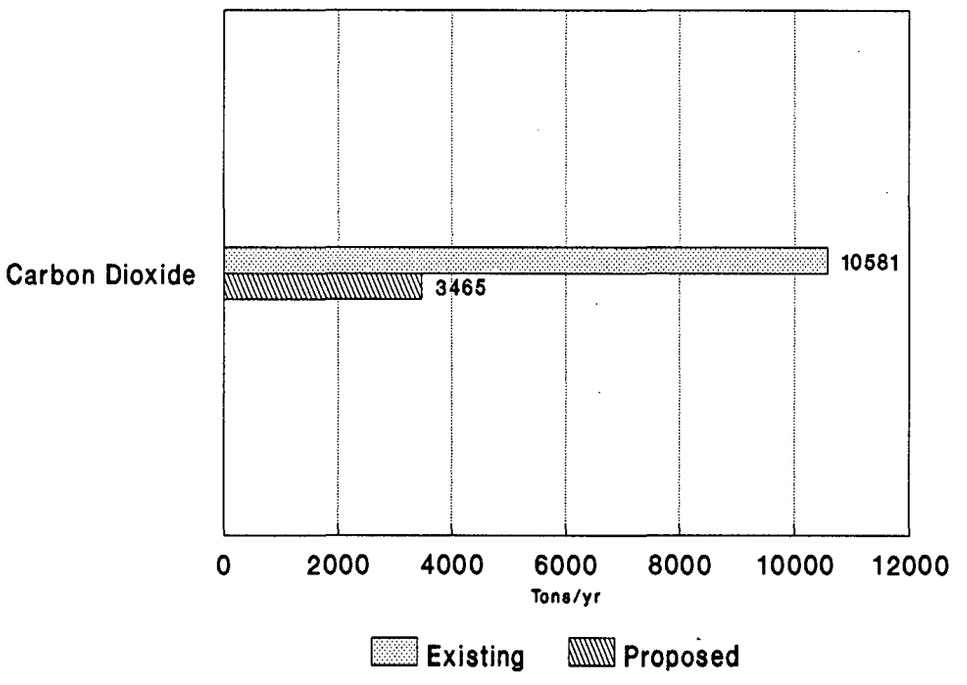
Emission Rates - Existing and Proposed



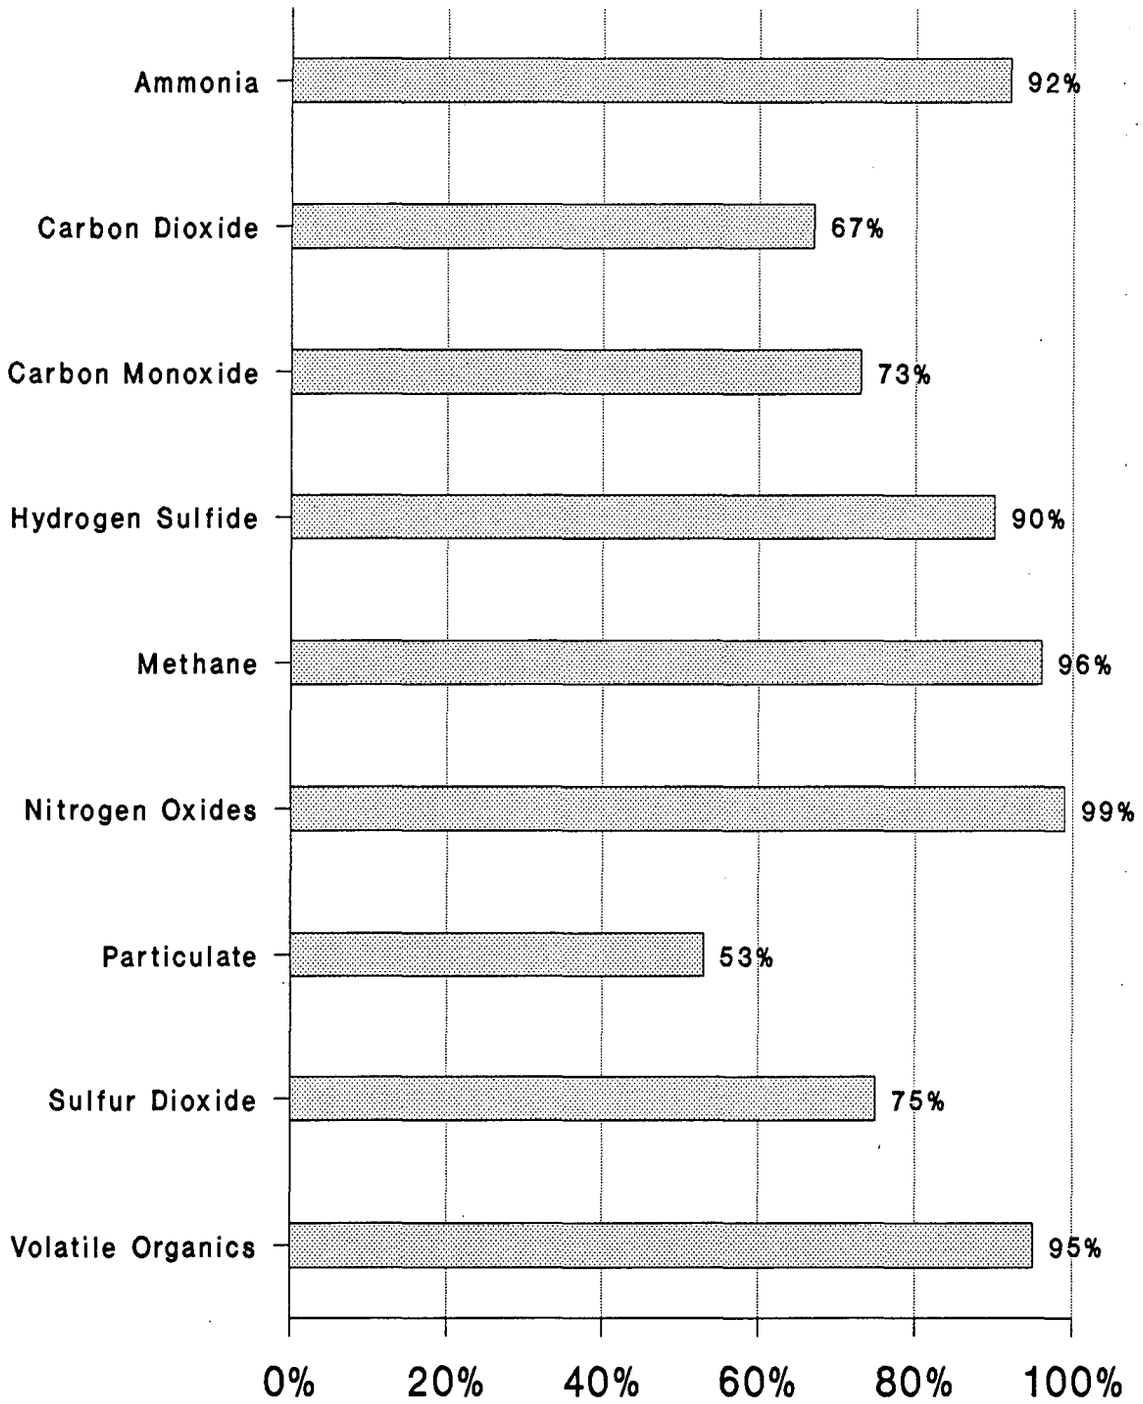


Figure 1-7
Percent Emission Reduction by Component

- No internal combustion engines or boilers will be installed in the new gas plant. These units are the main source of NO_x, SO_2, CO, CO_2 and PM emissions from the existing plant.

- No SCR systems or ammonia storage tanks will be required in the new gas plant since the internal combustion engines will be replaced. These items in Gas Plant #11 were decommissioned in 1990 and are eligible for emission offsets.

35. *Describe the type and source of any odors that may emanate from the project or site:*

No new odors will be created by installation of the proposed gas plant. Certain odors associated with oil/gas production facilities such as the 'rotten egg' smell from H_2S could emanate from the proposed gas plant. The amount of odor will diminish because the proposed gas plant will have significantly fewer fugitive emissions sources and will have increased H_2S removal efficiency. This project will improve the environment around the wetlands and in the proposed linear park area.

36. *If the drainage from the project will not be discharged into an existing public storm water drainage system, please describe how it will be accommodated:*

No rainwater will leave the site or be discharged into a public storm water drainage system. Rainwater falling within the developed facility Strip is collected in several rainwater storm pits and pumped into two storm water surge tanks. The water is then pumped to a skim oil separator where trace amounts of oil are removed before the water is blended with the produced water in the field and re-injected into the oil reservoir. This is the current practice for the facility and the proposed project will not impact the amount of water to be disposed.

37. *Has the project site been previously graded?*

Yes. The existing site has been utilized for industrial purposes for many years. Virtually all of the site has been graded at one time or another because of these activities.

38. *What percentage of the site will be graded as part of this project?*

Approximately 100% of the new project site will be regraded during construction. The site of Gas Plant #11 will be cleared and restored per SWEPI's Lease Agreements and federal, state, and local regulations.

39. *Volume of cutting:* ___Ø___ cubic yards; maximum cut slope ratio will be ___N/A___; maximum cut slope height will be ___N/A___ feet.

The site is virtually flat and no cutting will be necessary. The cut slope ratio and slope height are not applicable to this project.

40. *Volume of fill:* ___0___ *cubic yards: maximum fill slope ratio will be* ___N/A___; *maximum fill slope height will be* ___N/A___ *feet.*

The site is virtually flat and no filling will be necessary. The fill slope ratio and fill slope height are not applicable to this project.

41. *Does the cut and fill volume balance?*

No cut or fill material will be transported to or from the Strip during construction.

42. *Identify species of plants and animals that are found on the site, and describe any areas of vegetation to be removed (to be shown on accompanying site plan).*

The site for the proposed gas plant has been previously graded and is virtually clear of plant or animal life. Many plants and animals can be found in the Bolsa Chica wetlands west of the facility. Five endangered bird species are known to use, or have been reported overflying, the Bolsa Chica wetlands. None of these have been reported on the proposed project site or the Gas Plant #11 site. The California Least Tern is on both the Federal and State endangered species list. This bird species forages and nests in the wetlands. The Brown Pelican, Light-footed Clapper Rail and the Peregrine Falcon are also on both the Federal and State endangered species list. These birds primarily use the wetlands for foraging and rest stops. The Belding Savannah Sparrow is on the State

endangered species list. This bird species nests in the pickleweed salt marshes of the wetlands.

There are no endangered species of plants located in the wetlands. The pickleweed has been placed on the State protected list because of its use by the Belding Savannah Sparrow for nesting. No pickleweed will be removed due to this project.

The California Department of Fish and Game and the U.S. Fish and Wildlife Department have been contacted to provide information on the endangered species. Copies of this correspondence are provided in Appendix E. SWEPI will work closely with these agencies to ensure the protection of the endangered species during construction, demolition, and operation activities. The project will not require the removal of any critical habitat. The linear park created at the site of Gas Plant #11 will provide for increased foraging and perching areas as well as provide a "buffer zone" between the wetlands and the industrial site. The removal of Gas Plant #11 will also reduce the amount of emissions, noise and traffic near the wetland area.

43. *What is the distance to the nearest, beach, channel waterway, wetland, degraded wetland, or inland water area? Describe how the project may affect any body of water:*

The site is adjacent to Bolsa Chica State Park along the Pacific Coast and the Bolsa Chica wetlands and is also near Huntington Beach City and State Parks. The proposed project will benefit the surrounding bodies of water since no aqueous discharges occur from the gas plant or the Strip, and air emissions are reduced.

44. *What is the Flood Insurance Rate Map designation on the site. If the site is in a floodplain, describe the method of floodproofing, and impacts of such floodproofing on adjacent property. (A hydrology study may be required)*

The site is not located in a flood plain. The Flood Insurance Rate Map designation for the site is Zone X.

45. *Will the project require installation or replacement of water lines? Approximately how many gallons of water per day will the project use?*

The proposed project will not require installation or replacement of water lines. The water usage will not change due to the construction of the proposed gas plant.

46. *Will the project require installation or replacement of sewer lines? Approximately how many gallons of sewage per day will be discharged into the sewer system?*

The proposed project will not require installation of sewer lines. The site currently uses septic tanks and is not hooked up to a sewer line.

47. *Describe the type and amount (pounds per day) of solid waste generated by the project:*

A description of the solid, non-hazardous waste streams generated by the proposed gas plant is provided in Table 1-4. The amount of municipal waste generated will be approximately the same as for Gas Plant #11. The iron pyrite waste stream replaces the iron sponge waste stream from Gas Plant #11. The iron chelate from the proposed Sulferox® system will be classified as a solid waste, unlike the vanadium waste stream from the existing H_2S removal system which is classified as hazardous waste.

All solid wastes will be handled in a manner to prevent the attraction of insects or the creation of nuisances. Containers will be nonabsorbent, watertight, insect-resistant, durable, easily cleaned, designed for safe handling and large enough to prevent overflow. Containers of a cubic yard or more will be identified with the name and phone number of the servicing agent. Refuse, except for inert materials, will not be allowed to remain on the site for more than seven days. A bill of lading will be used when hauling non-hazardous waste off site. Copies of the bill of lading will be maintained by the SWEPI Health, Safety and Environmental Manager for 30 years.

48. *Will any residential occupants be displaced by the project?*

The proposed gas plant will occupy space on an existing SWEPI lease used for oil/gas production and will not displace any residential occupants.

Table 1-4

Solid Waste Generated

Waste Stream	Description	Amount Generated (lb/day)
Municipal Waste	Paper, boxes, cardboard, etc.	10-15
Waste from Chelate Solution	Waste iron chelate from the SulFerox® Unit - may be sold if market allows	600
Iron Pyrite[1]	Waste stream from Sulfa Treat® Operations	95

(1) The iron pyrite waste is not generated on a daily basis. The estimate assumed that the Sulfa Treat® Vessel would be changed out four times per year generating 34,700 lbs/yr. This number was then divided by 365 days per year.

1.7 MITIGATION AND CONSERVATION MEASURES:

49. What measures have been incorporated into the project, beyond what is required by existing codes and standards to:

(a) Minimize erosion and siltation during construction of the project? After completion?

Little erosion or siltation is expected because the site area is relatively flat. Dirt piles will be wetted or covered with plastic to prevent wind erosion during construction operations. Any water will be collected by the storm water system and will not leave the site. Wind and water erosion are expected to be minimal during construction and after the project completion.

(b) Minimize dust during construction of the property?

Trucks will wet the construction area to minimize dust during construction.

(c) Minimize noise during construction of the property? After completion?

Construction noise will be mitigated by fitting heavy equipment with mufflers or other sound suppression devices, as approved by the manufacturer. Equipment will be maintained to prevent noise generation from worn or broken parts.

The use of offsite modular construction (prefabrication in manufacturers' shops) will be maximized to reduce the amount of time and equipment required for onsite construction.

No noise producing construction activities will occur on a federal holiday, Sunday, or between the hours of 8pm and 7am Monday through Saturday, per the Huntington Beach Municipal Code, Chapter 8.40.

Noise control measures will be incorporated in the new plant design. Replacing gas engine-driven compressors and air coolers with electric motor-driven units will reduce noise emitted from the gas plant. Control valve and piping noise will be

reduced by installation of low-noise valves and/or acoustic insulation. Reducing the number of control valves in the new plant decreases the number of potential noise sources associated with the plant. An emergency ground flare will be used for controlling intermittent gas reliefs. The ground flare is quieter than a standard, smokeless elevated flare, and eliminates noise associated with direct atmospheric venting.

(d) *Minimize air pollution emissions?*

The proposed project will meet or exceed all requirements for emission reductions. Components in the proposed gas plant will utilize Best Available Control Technology (BACT) as defined by the South Coast Air Quality Management District (SCAQMD) to minimize emissions. The internal combustion engines currently used to drive the gas compressors will be replaced with electric motor-driven compressors, ahead of SCAQMD schedule for implementation of this requirement. Two steam boilers will be removed from service. A higher efficiency SulFerox® system will be utilized to reduce H_2S emissions. The existing Stretford Unit will be available for backup H_2S removal capability. Vents and pressure relief valves will be routed to a ground flare to minimize the emission of gas during upset conditions. The number of fugitive emissions sources will be reduced.

(e) *Protect, enhance or conserve energy, non-renewable resources, water, vegetation, wildlife, aesthetic quality, views, etc.?*

The new gas plant will have electric motor-drivers installed for the compressors to conserve fuel at the plant (a non-renewable resource). Gas Plant #11 currently uses internal combustion engines to drive the compressors. Two steam boilers will be removed from Gas Plant #11 which will also reduce the natural gas consumption. Natural gas consumption at the Strip will be reduced even with the use of natural gas for the ground flare pilot.

The demolition of Gas Plant #11 will improve the aesthetic value of the area by removing items that block the view of the wetland area. This land will eventually be used for the linear park which will create a partial buffer zone between the

main industrial strip and the wetland area. This buffer zone along with reduced emissions, noise and traffic will benefit the wetland ecosystem.

The proposed gas plant will reduce the amount of hazardous waste generated at the site by utilizing the SulFerox® technology to remove the H_2S from the stream. This will reduce the risk to local communities associated with the transportation, treatment and disposal of hazardous waste. It will also ultimately help to protect the wildlife, vegetation, water and non-renewable resources that can be damaged or destroyed by hazardous waste.

2.0 CEQA ENVIRONMENTAL ASSESSMENT

2.0 CEQA ENVIRONMENTAL ASSESSMENT

2.1 EARTH

Q. *Will the proposal result in unstable earth conditions or in changes in geologic substructures?*

No, the proposed project will not result in unstable earth conditions or changes in geologic substructures. The proposed gas plant will be built on a previously developed site. The site is less than 1 mile from the Newport-Ingelwood fault; however, the earth conditions of the site itself are relatively stable. This is supported by the fact that structures have existed on this site for more than forty years and no major problems have been encountered due to site stability. All buildings will be designed to meet seismic Zone 4 standards per Section 2312 of the Uniform Building Code.

Q. *Will the proposal result in disruptions, displacements, compaction or overcovering of the soil?*

No disruptions, displacements, compaction or overcovering of soil will occur due to the proposed project. The proposed site has been previously used for oil/gas production facilities and virtually all of the area has been graded at one time or another. The site will be regraded before the proposed gas plant is built.

Q. *Will the proposal result in change in topography or ground surface relief features?*

No, the proposed project will not result in a change in topography or ground surface relief features. The area that the proposed gas plant will be located on is relatively flat and will remain flat after regrading. Gas Plant #11 will be cleared and restored per SWEPI's Lease Agreements and federal, state and local regulations.

Q. *Will the proposal result in the destruction, covering or modification or any unique geological or physical features?*

No, the proposed project will not result in the destruction, covering or modification of any unique geological or physical features. The proposed gas plant will be built on previously developed land.

Q. *Will the proposal result in any increase in wind or water erosion of soils, either on or off the site?*

No increase in wind or water erosion of soils will occur. Wind erosion may decrease because of increased ground cover due to the improvements. Dirt piles will be wetted or covered with plastic to prevent wind erosion during construction operations. Water erosion will not occur because all storm water is collected and disposed on site.

Q. *Will the proposal result in changes in deposition or erosion of beach sands, or changes in siltation, deposition or erosion which may modify the channel of a river or stream or the bed of the ocean or any bay, inlet or lake?*

No water will be allowed to runoff the site to cause siltation, deposition or erosion. Storm water will be collected and disposed of on the site.

Q. *Will the proposal result in exposure of people or property to geologic hazards such as earthquakes, landslides, mudslides, ground failure, or similar hazards?*

The proposed project will not result in any additional exposure to earthquakes compared to the exposure due to the existing facility. Landslides and mudslides are not expected to be a problem because the facility is relatively flat. The earth is relatively stable at the site and ground failure is not expected to be a problem. This project will not expose people or property to any additional geological hazards compared to the hazards at the existing site or the residential and business areas around the facility.

2.2 AIR

Q. Will the proposal result in substantial air emissions or deterioration or ambient air quality?

No, the proposed project will result in a significant decrease in emissions because old equipment will be replaced with new, more efficient equipment. The reductions will result in an improvement of ambient air quality. The type of emissions will not change from those at Gas Plant #11 and are typical for oil/gas production facilities.

The emissions from Gas Plant #11 and the estimated emissions from the proposed facility are presented in Figure 2-1a, 2-1b, 2-1c and 2-1d. The emissions of PM, SO_2, NO_x, CO, CO_2, VOC, CH_4, NH_3 and H_2S are reduced between 53 and 99%. The percent emission reduction by component are presented in Figure 2-2.

The proposed plant will employ BACT as defined by the SCAQMD for all emission sources. The SulFerox® unit which will replace the Stretford unit will be more efficient in removing H_2S from the SBA gas stream. The Stretford unit will remain as a 100% spare. The internal combustion engines currently used to drive the gas compressors will be replaced with electric motor-driven compressors, ahead of SCAQMD schedule for implementation of this requirement. Two steam boilers will be removed from service. Ammonia storage tanks and selective catalytic reduction systems for NO_x control will not be required for the new gas plant since the internal combustion engines will be replaced. These items in Gas Plant #11 were decommissioned in 1990 and are still eligible for emission offsets. Vents and pressure relief valves will be routed to a ground flare to minimize the emission of gas during upset conditions. The number of fugitive emission sources will be reduced as shown below.

Number of Fugitive Emission Sources, Gas Plant #11	Number of Fugitive Emission Sources, Proposed Gas Plant	Reduction
2190	670	1520

Figure 2-1a
Emission Rates - Total

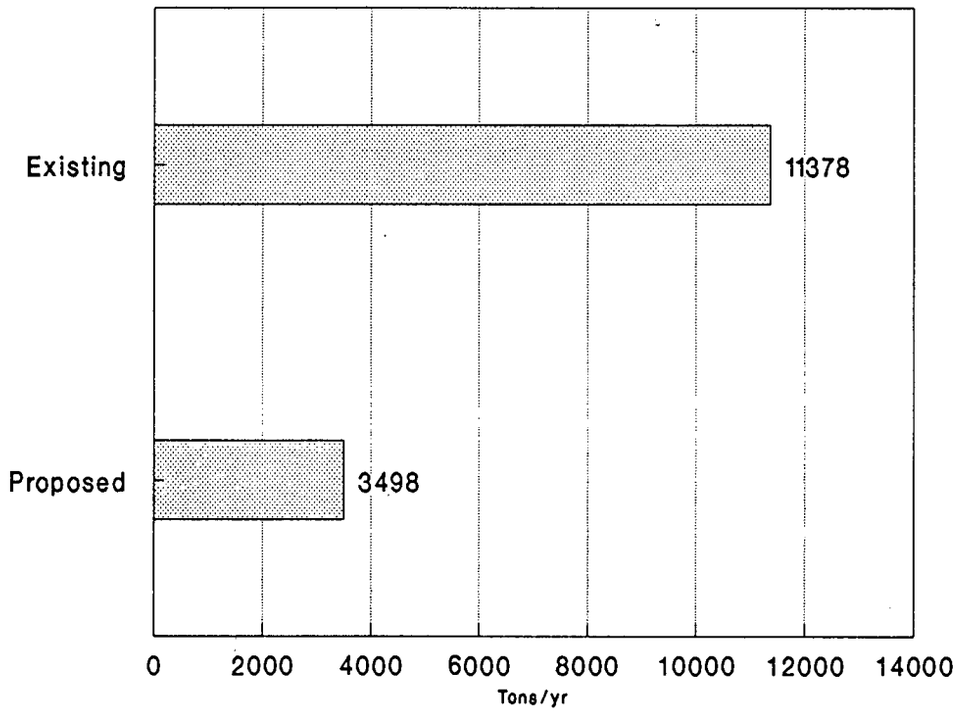

Figure 2-1b
Emission Rates - Existing and Proposed

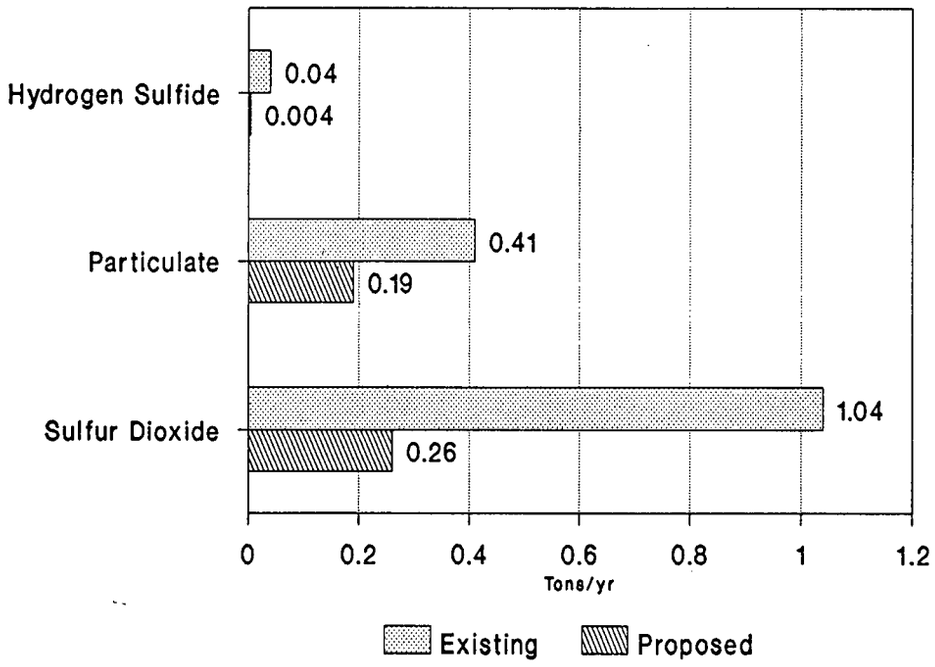

Figure 2-1c
Emission Rates - Existing and Proposed

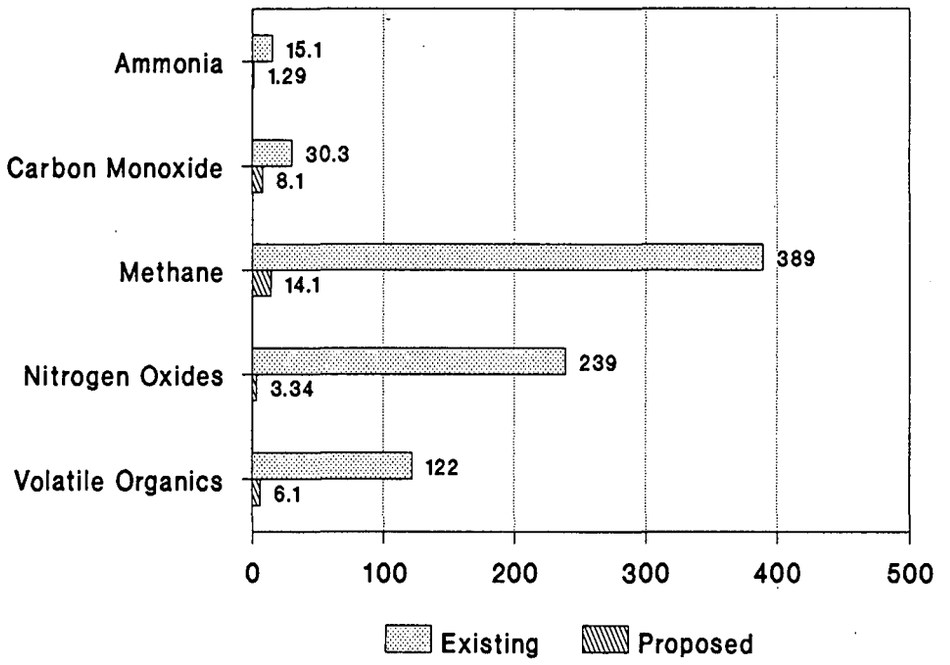

Figure 2-1d
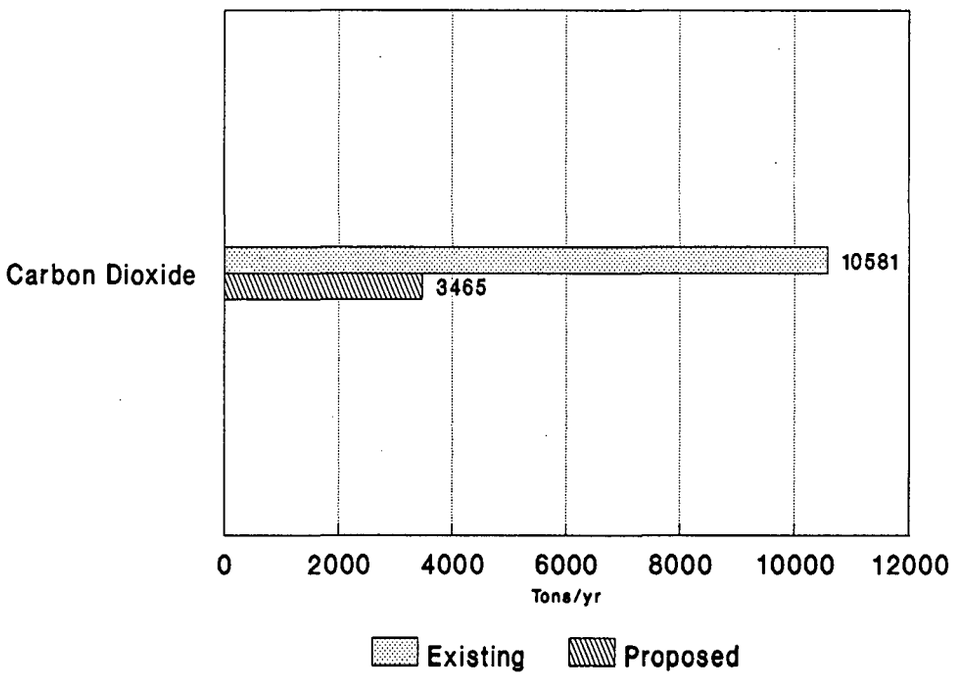
Emission Rates - Existing and Proposed



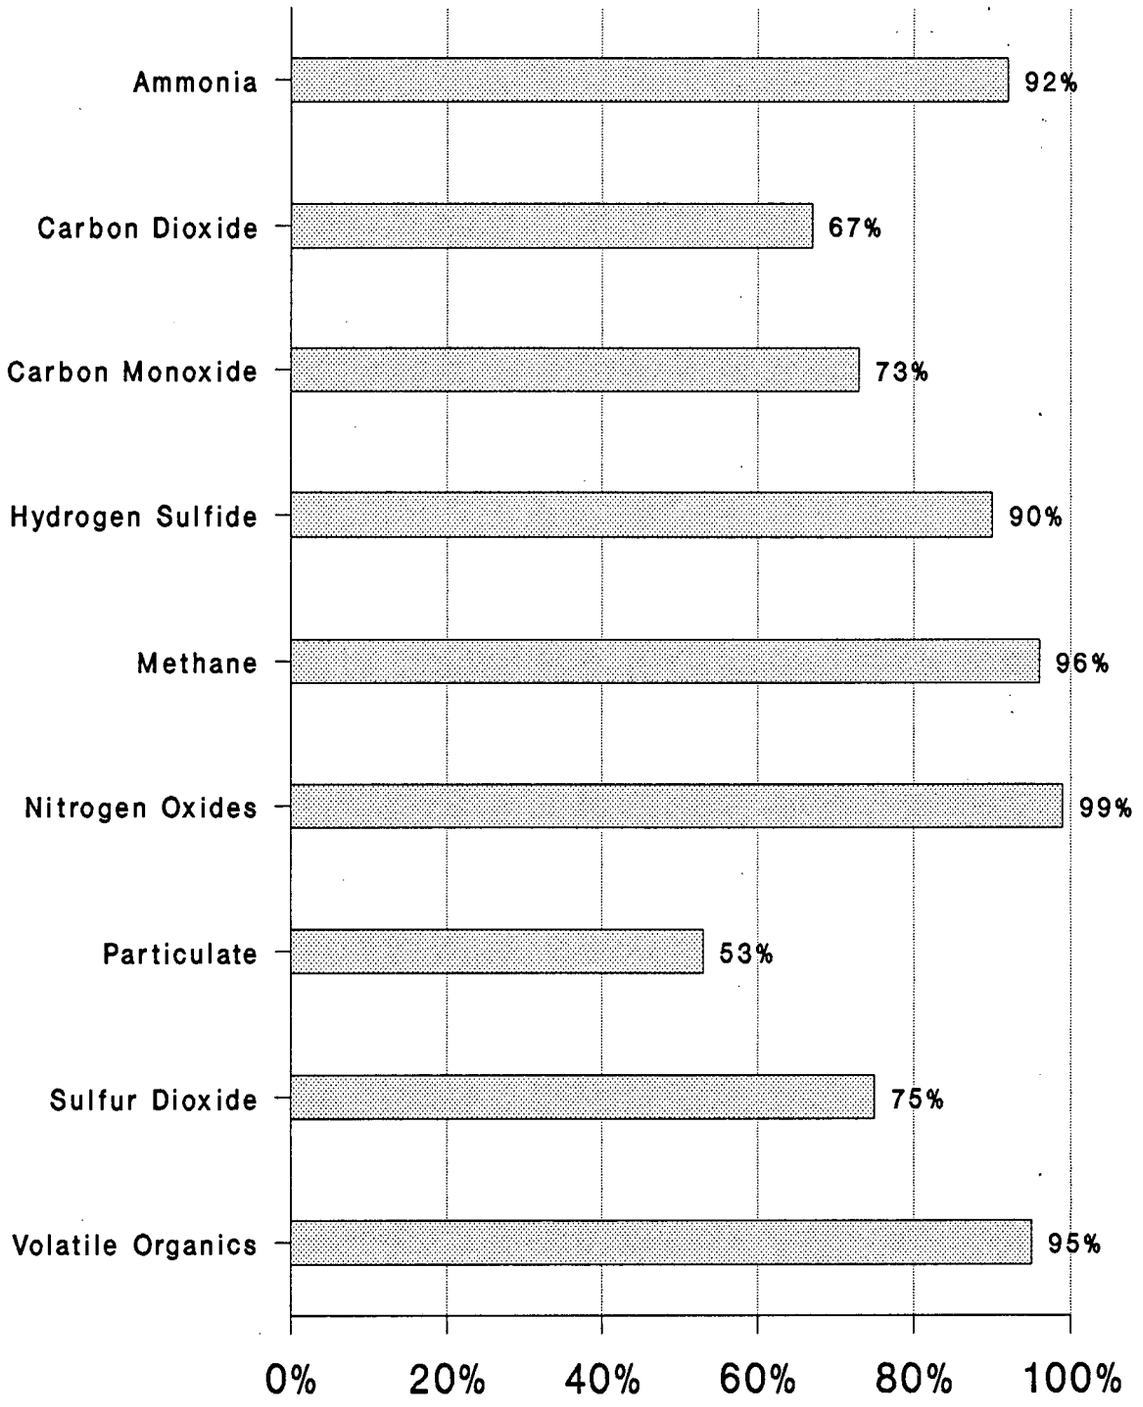


Figure 2-2
Percent Emission Reduction by Component

Q. *Will the proposal result in the creation of objectional odors?*

How about the project site

No, the amount of odor will diminish because the proposed gas plant will employ BACT for fugitive emissions, will have significantly less fugitive emission sources, and will have increased H_2S removal efficiency. This project will improve the environment around the wetlands and in the proposed linear park area.

Q. *Will the proposal result in alteration of air movement, moisture, or temperature, or any change in climate, either locally or regionally?*

No. The proposed project will reduce carbon dioxide and methane emissions as shown in Figures 2-1c, 2-1d and 2-2. The amount of fugitive VOC emissions sources will be reduced, lowering the amount of methane emitted to the atmosphere. Less carbon dioxide and water vapor will be emitted because the amount of fuel consumed will be reduced. No significant sources of water vapor or heat (such as cooling towers or large boilers) will be associated with this project. The topography of the site will not change so as to alter air movement.

2.3 WATER

Q. *Will the proposal result in changes in currents, or the course of direction of water movements, in either marine or fresh waters?*

No. The site is not located in a floodplain, no streams flow across the property and no dredging or filling of water courses will be required to prepare the site. No discharge of water will occur to any body of water off the site since all stormwater and process waste water will be disposed on site.

Q. *Will the proposal result in changes in absorption rates, drainage patterns, or the rate and amount of surface runoff?*

No, the proposed project will not result in changes in absorption rates, drainage patterns, or the rate and amount of surface runoff. No rainwater will leave the site or be discharged into a public storm water drainage system. Rainwater falling within the

developed facility Strip is collected in several rainwater storm pits and pumped into two storm water surge tanks. The water is then pumped to a skim oil separator where trace amounts of oil are removed before the water is blended with the produced water in the field and re-injected into the oil reservoir. This is current practice for the facility and the proposed plant will not impact the amount of water to be disposed.

Q. *Will the proposal result in alterations to the course or flow of flood waters?*

No. The site is classified in Zone X under the Flood Insurance Rate Map designations and is not located in a flood plain. No construction or demolition will occur in a flood plain.

Q. *Will the proposal result in change in the amount of surface water in any water body?*

No. Fresh water is received from on-site wells and city sources, not from nearby surface waters. The amount of water used at the site will not change from current usage due to the proposed project. Waste water will be collected and disposed of on-site; no water will be discharged into any surface water body.

Q. *Will the proposal result in discharge into surface waters, or in any alteration of surface water quality, including but not limited to temperature, dissolved oxygen or turbidity?*

No water will be discharged into any surface water body and no alteration in surface water quality will occur.

Q. *Will the proposal result in alteration of the directional or rate of flow of ground waters?*

The directional or rate of flow of ground water will not be affected by the proposed project. There will not be any additional demand on the rate of flow of water received from the wells on-site and no change in disposal rate of stormwater and waste water.

Q. *Will the proposal result in change in the quantity of ground waters, either through direct additions or withdrawals, or through interception of an aquifer by cuts or excavations?*

The quantity of ground water will not be affected by the proposed project. There will not be any additional demand on the amount of water received from the wells on-site and no change in amount of stormwater disposed. Surface grading will be required for site preparation and will not intercept an aquifer.

Q. *Will the proposal result in substantial reduction in the amount of water otherwise available for public water supplies?*

The amount of water available to the public will not be affected by this project. The Strip's current water usage rate will not change upon completion of the proposed project.

Q. *Will the proposal result in exposure of people or property to water related hazards such as flooding or tidal waves?*

The proposed gas plant will be located at the current site and does not increase the risk of exposure to any water related hazards.

2.4 PLANT LIFE

Q. *Will the proposal result in change in the diversity of species, or number of any species of plants (including trees, shrubs, grass, crops, and aquatic plants)?*

No. Plant life is virtually non-existent on the portion of the site where the proposed gas plant will be built because the site has been previously developed. The grasses and weeds that may be removed during the construction phase will not change the diversity or number of plant species in the area.

Q. *Will the proposal result in the reduction of the numbers of any unique, rare or endangered species of plants?*

No. One species of plants, the pickleweed, that exists in the Bolsa Chica wetlands has been placed on the State protected list because of its use by the Belding Savannah Sparrow for nesting. The pickleweed has not been reported to exist on the proposed site and will not be disturbed by the proposed project.

Q. *Will the proposal result in introduction of new species of plants into an area, or in a barrier to the normal replenishment of existing species?*

Landscaping is not part of the proposed project, and no new plants will be added to the site. The proposed project will not result in a barrier to the normal replenishment of existing species.

Q. *Will the proposal result in reduction in acreage of any agricultural crop?*

No reduction in acreage of agricultural crops will occur due to the project. The project site is zoned M2-O1-CZ (industrial-oil with drilling-coastal zone) and is currently used for the production of oil and gas.

2.5 ANIMAL LIFE

Q. *Will the proposal result in change in the diversity of species, or numbers of any species of animals (birds, land animals including reptiles, fish and shellfish, benthic organisms or insects)?*

No. Animal life is virtually non-existent on the portion of the site where the proposed gas plant will be built because the site has been previously developed. The animals that are in the area will be able to coexist with the new facilities as with the existing facilities.

Q. *Will the proposal result in reduction of the numbers of any unique, rare or endangered species of animals?*

The proposed project will not result in the reduction of the numbers of any unique, rare or endangered species of animals. Five endangered bird species are known to use, or have been reported overflying, the Bolsa Chica wetlands. None of these have been reported on the proposed project site or the Gas Plant #11 site. The California Least Tern is on both the Federal and State endangered species list. This bird species forages and nests in the wetlands. The Brown Pelican, Light-footed Clapper Rail and the Peregrine Falcon are also on both the Federal and State endangered species list. These birds primarily use the wetlands for foraging and rest stops. The Belding Savannah Sparrow is on the State endangered species list. This bird species nests in the pickleweed salt marshes of the wetlands.

The California Department of Fish and Game and the U.S. Fish and Wildlife have been contacted to provide information on these birds. Copies of this correspondence is provided in Appendix E. SWEPI will work closely with these agencies to protect the endangered species during construction demolition and operating activities. The project will not require the removal of any critical habitat. The linear park created at the site of Gas Plant #11 will provide for increased foraging and perching areas as well as provide a "buffer zone" between the wetlands and the industrial site. The removal of Gas Plant #11 will also reduce the amount of emissions, noise and traffic near the wetland area.

Q. *Will the proposal result in introduction of new species of animals into an area, or result in a barrier to the migration or movement of animals?*

No new species of animals will be introduced to the area. The proposed project will not change the site significantly to be considered as an additional barrier to the animals.

Q. *Will the proposal result in deterioration to existing fish or wildlife habitat?*

No, the improvements to the facility will result in a benefit to existing habitats, because of decreases in noise, emissions and traffic near the wetland area.

2.6 NOISE

Q. Will the proposal result in increases in existing noise levels?

No. Noise levels generated by new equipment in the proposed gas plant will be less that noise levels generated by equipment currently operating in Gas Plant #11. The main noise sources in Gas Plant #11, the internal combustion engine-driven compressors, will be replaced with quieter electric motor-driven compressors. The expected reductions in noise levels for these units are presented below:

Unit	Noise Levels, dBA		
	Existing	Proposed	Change
Compressors & Drivers @ 3 ft.	90 to 93	85 to 88	-5
Compressors & Drivers @ 100 ft.	65 to 70	60 to 65	-5

The following changes in design between the new and existing gas plants will also provide a reduction in noise level impacts:

- The new compressors will be located further from residences than the existing compressors.
- Fewer fans (air-cooled heat exchangers) will be installed in the new plant than are currently used in Gas Plant #11.
- No internal combustion engines will be used as fan drivers in the new plant. One set of fans in Gas Plant #11 is engine driven.
- Fewer control valves, a potential noise source, will be installed in the new plant than are currently used in Gas Plant #11.
- No hydrocarbon streams will be vented directly to atmosphere in the new plant.

Typical construction related noise will be generated at the project site during the construction phase. Construction noise sources include diesel or gasoline-powered dozers, graders, loaders, backhoes, dump trucks, air compressors and welding machines. Noise levels at 50 feet from the diesel-powered equipment typically range from 80 to 90 dBA. Gasoline-powered equipment noise levels typically range from 75 to 80 dBA at 50 feet. Construction noise is intermittent in nature and only occurs during the construction phase of the project. The use of offsite modular construction (prefabrication) will be maximized to reduce time required for onsite construction. No construction activities will occur on Sunday, a federal holiday or between the hours of 8pm to 7am Monday through Saturday, per the Huntington Beach Municipal Code, Chapter 8.40.

Q. *Will the proposal result in exposure of people to severe noise levels?*

The proposed project will not result in exposure of people to severe noise levels.

2.7 LIGHT AND GLARE

Q. *Will the proposal produce new light or glare?*

The new lighting will not be a significant change from the existing lighting at the facility. Exterior lighting will be provided for the proposed gas plant for safety, as with most of the existing buildings at the site. The lighting will be shielded to prevent excessive glare offsite. Enough outdoor lighting will be used to allow plant operators to work safely and efficiently, approximately 5 foot-candles of light around the process areas and 0.1 foot-candles around the buildings for safety. Lights will be located to provide optimum visibility. Exact locations of the lights will be determined during detailed design.

2.8 LAND USE

Q. *Will the proposal result in a substantial alteration of the present or planned land use of an area?*

The proposed gas plant consists of the same type of activities as the Strip and does not constitute an alteration of the present or planned zoning of the area. The site is currently

zoned M2-O1-CZ (industrial-oil with drilling-coastal zone). The oil and gas production activities at the site have a conditional use permit and a coastal commission exemption, and are in agreement with the zoning requirements. Zoning maps for the area surrounding the site are presented in Appendix A.

2.9 NATURAL RESOURCES

Need Info 2.10

Q. Will the proposal result in increase in the rate of use of any natural resources?

No. The proposed gas plant is rated to process 6 MMSCFD of gas, which is 36 MMSCFD less than the rated value of Gas Plant #11.

The small amount of natural gas that is consumed by the gas plant will be reduced by the proposed project. The compressor drivers and steam boilers currently utilize natural gas. The proposed gas plant will eliminate the boilers and replace the gas drivers with electric drivers. The only item at the proposed gas plant that will burn natural gas is the pilot of the emergency flare.

2.10 RISK OF UPSET

PUT IN A.D.L REPORT SUMMARY

Q. Will the proposal involve a risk of an explosion or the release of hazardous substances (including, but not limited to oil, pesticides, chemicals or radiation) in the event of an accident or upset conditions?

This project involves the replacement of Gas Plant #11 with a new gas plant. The risk will actually decrease because of the reduction of hazardous waste generated, less fugitive emissions of natural gas, reduction of natural gasoline storage and propane storage, and the increase in distance from the gas plant to residential areas. Information on the potential hazardous substances that the proposed gas plant may use is in Appendix B.

The risk associated with the proposed gas plant will also be reduced by utilizing an improved fire protection system. Details of the proposed Fire Protection Plan that SWEPI

has submitted to the City of Huntington Beach Fire Department are provided in Appendix C.

Q. *Will the proposal involve possible interference with an emergency response plan or an emergency evacuation plan?*

No. The improvements associated with the proposed project will increase the effectiveness of the Emergency Response Plan.

2.11 POPULATION

Q. *Will the proposal alter the location, distribution, density, or growth rate of the human population of an area?*

The location, distribution, density, or growth rate of the population in the area will not be affected by the proposed project. The proposed project will utilize the staff of the existing facility for operations and will not increase or decrease the current number of employees.

2.12 HOUSING

Q. *Will the proposal affect existing housing, or create a demand for additional housing?*

The amount of housing in the area will not be affected by the proposed project. Staff of the existing facility will be utilized for operations of the new gas plant, and the current number of employees will not change.

2.13 TRANSPORTATION/CIRCULATION

Q. *Will the proposal result in generation of substantial additional vehicular movement?*

The proposed project will not change the amount of vehicle trips to and from the Huntington Beach Facility. Vehicle trips from Gas Plant #11 to the Strip will cease after the new gas plant is operational. This reduced traffic will be beneficial to the animals that live in the area west of the facility.

Q. *Will the proposal result in effects on existing parking facilities, or demand for new parking?*

The parking requirements of the proposed facility will be met by existing parking lots and additional parking will not be required.

Q. *Will the proposal result in substantial impact upon existing transportation systems?*

The project will not have an impact upon existing transportation systems since the amount of vehicle trips and the number of employees at the site will remain the same. There will be a decrease in traffic through the Bolsa Chica wetlands when Gas Plant #11 is removed.

Q. *Will the proposal result in alterations to present patterns of circulation or movement of people and/or goods?*

The overall amount of vehicle traffic will remain the same and the project is not expected to have a significant impact upon circulation or movement of people and goods. Some of the delivery vehicles and pick-up trucks that enter and leave the facility may originate from different destinations due to the change in chemicals that will be required by the new gas plant. Less amounts of hazardous materials will be transported, because of the change in contacting fluids in the H_2S removal system.

Q. *Will the proposal result in alterations to waterborne, rail or air traffic?*

No. The site is currently accessed by ground transportation and helicopter. The project will not incorporate access routes by sea ports, rail lines or airports and will not alter the current helipad schedule.

Q. *Will the proposal result in increase in traffic hazards to motor vehicles, bicyclists or pedestrians?*

Increases in traffic hazards will not be caused by the proposed project. The only change in traffic patterns will occur within the site boundaries. The number of vehicle trips to the

site will remain the same and traffic patterns outside the site will not be affected by the project.

2.14 PUBLIC SERVICES

Q. *Will the proposal have an effect upon, or result in a need for new or altered governmental services in any of the following areas: fire protection, police protection, schools, parks or other recreation facilities, maintenance of public facilities including roads, other governmental services?*

Fire Protection

The proposed project will reduce the demands on the fire department because of the upgrades to the fire protection system at the facility. A proposed Fire Protection Plan has been submitted to the City of Huntington Beach Fire Department. SWEPI will continue to work closely with the City of Huntington Beach to adopt a final Plan that is suitable to meet the needs of the area. Details of a proposed Plan are given in Appendix C.

Police Protection

The project will not require any increase in the services of the Huntington Beach Police Department.

Schools

The project will not require a change in the services of the school district because the plant will not increase the amount of employees.

Parks and Recreation Facilities

There will not be a change in the required services of the existing park and recreation facilities because the plant will not increase the amount of employees.

Approximately 2.6 acres of land will be made available for future development of the linear park with the demolition of Gas Plant #11.

Maintenance

The project will not require a change in the services of city maintenance services because the proposed gas plant will be located at the existing SWEPI facility.

2.15 ENERGY

Q. Will the proposal result in use of substantial amounts of fuel or energy?

The facility will burn less fuel because of the transformation of the compressor drivers from natural gas to electric and the removal of the boilers. More electricity from Southern California Edison will be used by the site to supply the compressor drivers.

Q. Will the proposal result in substantial increase in demand upon existing sources or energy, or require the development of new sources of energy?

The amount of electricity required by the project will not be a substantial increase in the demand of the existing facility. No new sources of energy will be required.

2.16 UTILITIES

Q. Will the proposal result in a need for new systems, or substantial alterations to the following utilities:

This project will not increase the demand on private or city water, natural gas, or sewage treatment systems. There will be a increase in the amount of electricity purchased from SCE but the increase will not require new systems or substantial upgrades.

2.17 HUMAN HEALTH

Q. Will the proposal result in creation of any health hazard or potential health hazard (excluding mental health)?

No. The proposed project will actually improve the safety of the facility and will reduce the potential health hazards. Better controls achieved by application of BACT for fugitive

volatile organics will reduce the risk of toxic emissions. Improved fire safety devices and measures will reduce the risk of explosions, fire and other emergencies to the surrounding areas.

Q. *Will the proposal result in exposure of people to potential health hazards?*

No. The exposure of people to potential health hazards will be reduced by the construction of the proposed gas plant because of the improved emission controls and the fire safety measures that will be implemented. The proposed gas plant will still have the potential to emit certain toxic chemicals such as benzene and H_2S because these chemicals are naturally found in crude oil and gas. These emissions will be reduced by several methods, including:

- Capturing the VOC emissions from pressure relief valves and tanks and destroying them in the ground flare versus venting the gas to the atmosphere
- Sizing the ground flare to destroy all gas processed versus venting the gas to the atmosphere in case of an upset
- Incorporating a safer, more efficient means of removing the H_2S from the SBA gas stream which does not use a catalyst classified as a hazardous material.

The proposed Fire Protection Plan is presented in Appendix C. Some of the measures that will protect the health and safety of the surrounding community include:

- Use of H_2S monitors around the perimeter of the facility.
- Installation of a firewater system and a gas/fire detection system.
- Modifications as needed of the Emergency Response Plan, Inspection/Maintenance Plan, Worker Safety Plan and Site Security Plan.

2.18 AESTHETICS

Q. *Will the proposal result in the obstruction of any scenic vista or view open to the public, or will the proposal result in the creation of an aesthetically offensive site open to public view?*

No. The removal of Gas Plant #11 from the border of the wetlands will significantly increase the aesthetic beauty of the wetland area. The proposed gas plant will be located in an area of the strip that already has similar equipment located nearby, consolidating the industrial operations to one area and opening scenic vistas next to the facility.

The ground flare incorporated into the gas plant design will have an approximate height of 40 feet. The flare will have no visible flame and will be smokeless.

2.19 RECREATION

Q. *Will the proposal result in an impact upon the quality or quantity of existing recreational opportunities?*

The removal of Gas Plant #11 from the border of the wetlands will increase the quality and quantity of recreational facilities by making available the land for the development of the linear park along the border of the wetlands.

The removal of Gas Plant #11 will also benefit existing recreational facilities, such as the Bolsa Chica State Park. The emission reduction will decrease odors in the area. The reduction of noise and traffic near the wetland border will benefit the animals of the wetland and increase the recreational value of the surrounding area.

2.20 CULTURAL RESOURCES

Q. *Will the proposal result in the alteration of or the destruction of a prehistoric or historic archaeological site?*

No. The soils around the site are relatively young (5,000-10,000 years old) and are not considered to have a significant amount of fossils according to the Bolsa Chica Development Plan (1985). The closest site of vertebrate fossil remains is located near Wintersburg Street in Huntington Beach.

The proposed project will not affect any archaeological sites that exist in the area around the Bolsa Chica wetlands.

Q. *Will the proposal result in adverse physical or aesthetic affects to a prehistoric or historic building, structure, or object?*

The project will not involve the demolition of or affect any historic buildings, structures or objects. The demolition activities are associated only with oil/gas production equipment.

Q. *Does the proposal have the potential to cause a physical change which would affect unique ethnic cultural values?*

The site area has been used for the production of oil and gas for over 50 years. The proposed project is only a minor modification of the existing production facilities. No affects to ethnic cultural values has been known to be caused by the production facilities, and the proposed project is not expected to change this.

Q. *Will the proposal restrict existing religious or sacred uses within the potential impact area?*

The project is not expected to have an impact of existing religious or sacred uses of the area surrounding the facility.

2.21 IMPACTS

Table 2-1 provides a summary of the potential affect the project will have on the CEQA areas of concern. The proposed project will benefit the surrounding community.

Table 2-1

CEQA Summary

CEQA Item	Will Positively Affect	Will Not Affect	Could Negatively Affect

Transportation/ Circulation		✓	
Public Services		✓	
Energy		✓	
Utilities		✓	
Human Health	✓		
Aesthetics	✓		
Recreation	✓		
Cultural Resources		✓	

Construction noise will be mitigated by fitting heavy equipment with mufflers or other sound suppression devices, as approved by the manufacturer. Equipment will be maintained to prevent noise generation from worn or broken parts.

The use of offsite modular construction (prefabrication in manufacturers' shops) will be maximized to reduce the amount of time and equipment required for onsite construction.

No noise producing construction activities will occur on a federal holiday, Sunday, or between the hours of 8pm and 7am Monday through Saturday, per the Huntington Beach Municipal Code, Chapter 8.40.

Noise control measures will be incorporated in the new plant design. Replacing gas engine-driven compressors and air coolers with electric motor-driven units will reduce noise emitted from the gas plant. Control valve and piping noise will be reduced by installation of low-noise valves and/or acoustic insulation. Reducing the number of control valves in the new plant decreases the number of potential noise sources associated with the plant. An emergency ground flare will be used for controlling intermittent gas reliefs. The ground flare is quieter than a standard, smokeless elevated flare, and eliminates noise associates with direct atmospheric venting.

The proposed project will meet or exceed all requirements for emission reductions. All components in the proposed gas plant will utilize the Best Available Control Technology (BACT) as defined by South Coast Air Quality Management District (SCAQMD) to minimize emissions. The internal combustion engines currently used to drive the gas compressors will be replaced with electric motor-driven compressors, ahead of SCAQMD schedule for implementing of this requirement. Two steam boilers will be removed from service. A higher efficiency SulFerox® system will be utilized to reduce H_2S emissions. The existing Stretford Unit will be available for backup H_2S removal capability. Vents and pressure relief valves will be routed to a ground flare to minimize the emission of gas during minor upset or major emergency conditions. The number of fugitive emissions sources will be reduced.

The project will benefit the ecosystem of the wetland area by providing land for development into the planned linear park and by reducing the amounts of emissions,

noise and traffic. The linear park will act as a buffer zone between the wetlands and the main facility, as well as providing increased foraging, perching and resting areas.

All practical steps will be taken to ensure that the construction and demolition will not affect any endangered species. The California Department of Fish and Game and the U.S. Fish and Wildlife Department have been contacted to provide information on the endangered species. SWEPI will work closely with these agencies to ensure the protection of the endangered species during construction, demolition, and operation activities.

The installation of electric motor-drivers for the compressors will reduce fuel consumption at the facility. Gas Plant #11 currently uses gas-fired internal combustion engines to drive the compressors. Two steam boilers will be removed which will also reduce the natural gas consumption. The overall natural gas consumption will be reduced at the facility even with the use of natural gas for the ground flare pilot.

The proposed facility will reduce the amount of hazardous waste generated at the site by utilizing the SulFerox® technology to remove the H_2S from the stream. This will reduce the risk to local communities associated with the transportation, treatment and disposal of hazardous waste. It will also ultimately help to protect the wildlife, vegetation, water and non-renewable resources that can be damaged or destroyed by hazardous waste.

RE: SWEPI PRELIMINARY FIRE PROTECTION PLAN GAS PROCESSING PROJECT

Dear Jim:

The Fluor Daniel Preliminary Fire Protection Plan has been reviewed by the Huntington Beach Fire Department along with Jim Hunt, Hunt Research Corporation. Attached are comments keyed to the report by page number.

I would like to commend you and your staff in preparing such a thorough document. It appears that you have addressed all prior issues of concern. I hope these comments will assist in your final draft as well as the projects successful acceptance for a negative declaration.

If you have any questions regarding this matter, please contact me at the Fire Prevention Division, 714-536-5411 or Jim Hunt, 805-688-4625.

Sincerely,

Mark Bodenbender

SPECIFICATION SP-575701-49-02

FIRE PROTECTION PLAN

1.0 INTRODUCTION/SCOPE

This Plan is provided as supplemental information to the Environmental Assessment for this project. It is intended to document the facility design philosophy, safety systems, fire protection systems, alarms systems, fire detection systems, applicable codes, and approval process once detailed engineering has been completed. This document shall serve as the Fire Protection Plan for this project.

2.0 PROJECT DESCRIPTION

This gas processing project is approximately $10MM of new equipment which will replace existing facilities and which will be consolidated adjacent to SWEPI's recently modernized Tank Farm #1 Oil Dehydration Facility. The primary driving forces are: environmental compliance, emissions reduction, improved safety, reduction in operating expenses, and consistency with the overall City of Huntington Beach, Linear Park Development Project. The project includes three major items:

2.1 Installation of a **Dew Point Control Unit** (DCU), which is a functional equivalent of Shell Western E&P Gas Plant #11. The purpose of this unit is to compress natural gas produced with the associated oil production at this location and to chill the stream to below the hydrocarbon dew point to meet sales gas hydrocarbon and water dew point specifications.

The DCU will have no natural gasoline storage, and all products will be sold via existing pipeline as they are currently being handled and transported.

2.2 The project also includes installation of a **SulFerox Unit** which is a desulfurization unit to replace the existing Stretford Unit. This is a proprietary Shell Oil Company/DOW process which converts hydrogen sulfide to elemental sulfur in a single contacting step. The contacting fluid is non-hazardous and non-flammable.

2.3 An **Emergency Ground Flare**, which will provide a sanitary disposition for natural gas during emergency upset conditions, is also a part of this project. The Ground Flare is of a safe, smokeless, low noise, hidden flame, and environmentally friendly design.

2.4 All product streams, properties, flowrates and temperatures are listed in the Process Flow Diagrams which are attached.

3.0 DESIGN BASIS

3.1 The design for all fire protection, detection and alarm systems shall comply with this specification. All referenced codes, standards, publications and specifications referenced herein shall be a part of this specification.

3.2 The basis of design for the fire protection system at the facility shall be that of a single risk area concept. The facilities shall be divided into separate areas of possible fire involvement, and each area shall be considered as a single risk. The area of the plant requiring the greatest degree of protection shall be classified as the largest single risk area, and the total capacity of the firewater system shall be based on meeting this requirement. The single risk concept assumes only one fire is occurring at any one time.

4.0 RISK ASSESSMENT

⚠2 4.1 HAZOPS (Hazard and Operability Study)*

A Hazard and Operability Study (HAZOP) will be conducted on this project. The study will include a team of engineers, specialists, operators, independent third party consultant, and outside registered professional engineers who will go through the detailed design line by line, item by item, to validate the inherent safety system built into the design of each component.

The Fire Department and its consultant are invited to participate in the HAZOP process.

Additionally, a series of API 14C Safe Charts will be developed for each major system, API 14-C is the recommended practice for analysis, design, installation and testing of basic surface safety systems on offshore production platforms.

The results of these HAZOP and API 14C Safe Charts will be submitted to the Fire Department for their review.

4.2 Toxic and Flammable Dispersion Modeling*

The results of these dispersion modeling which will be done by a third party consultant will be submitted to the Fire Department for their review. All criteria and modeling assumptions will be submitted with the model results.

△2 4.3 Hazardous Materials/MSDS List*

Material Safety Data Sheets are kept physically on the lease. On site are located a full volume of MSDS Sheets for review as per OSHA requirements. MSDS sheets will be added and updated as required by OSHA and in conjunction with this project.

5.0 FIRE PROTECTION CONCEPTS

The facility depends on early hazard detection and the ability of plant personnel to contain a flammable liquid fire and/or a high pressure flammable gas fire with fixed and portable fire fighting equipment.

All detailed plans for the Fire Protection System, equipment types and locations will be submitted to the Fire Department for approval. This shall occur during the request for the project building permits.

△2 All fire protection equipment shall be listed where equipment having such listings are available. The Fire Department will allow the applicant to propose reasonable alternatives and solutions which assure equal safety to life and property when strict compliance with listings or approvals are not reasonably attainable.

5.1 Firewater System**

2 5.1.1 Fixed firewater monitors shall be located adjacent to the process areas, pipeways, equipment, and elevated structures. Fixed monitors shall be 40 feet to 50 feet from equipment to be protected. Approximate spacing between monitors should be 150 feet. Each monitor should be capable of producing at least the minimum flow requirements to meet Fire Department standards.

2 5.1.2 Firewater hydrants with pumper connections shall be installed around the perimeter of the facility. Hydrant spacing in the system shall allow easy access for fire truck operation while maintaining minimum exposure to personnel. The firewater supply source shall have the capability of delivering a minimum four hour supply to the fire pump suction inlet. Hydrants should have a minimum flow as required by Fire Department standards. Hydrant spacing should be approximately 250-300 feet apart on roads and approximately 40-50 feet from equipment to be protected.

2 5.1.3 Hose reels and hose carts shall be installed along pipe racks, and process area. Fixed wet hose reels shall contain 100 feet of 1-1/2 inch hard line booster fire hose with an adjustable fog nozzle having a capacity of 125 gpm.

2 5.1.4 The firewater supply system shall consist of firewater mains, laterals, and isolation block valves to provide the required firewater flows to each "fire loading" area, even though one section of the system is shut in for maintenance or repairs. Post indicator valves shall be used for sprinkler or deluge systems.

5.1.5 The firewater system includes piping, fittings, valves, hydrants, water monitors, hose reels, hose hydrants, and stub-up connections for firewater spray systems.

5.1.6 A firewater transposition drawing showing the total fire protection system piping shall be prepared for approval by authorities having jurisdiction.

5.1.7 The minimum pipe size for firewater mains and hydrant branch lines shall be six (6) inches.

5.1.8 All new underground carbon steel pipe shall be outside coated and wrapped. Field joints shall be coated and wrapped after assembly and hydro-test. All buried piping shall be cement-lined for internal corrosion protection. All new above ground piping shall be exterior painted and internal lined. Any existing firewater piping shall be externally protected.

5.1.9 Hydrants, monitors, valve pits (boxes, etc., shall be located a minimum of three feet from the edge of the road shoulder. Where a shoulder is not provided, this distance shall be five feet from the edge of the road. Four (4) guard posts shall be provided for distances less than 10 feet from the edge of the road and where maintenance vehicles may be operating. Hydrants or approved hose manifolds shall be used for truck and hose connections.

5.1.10 General information for laying piping systems, installation of and requirements for thrust blocks, valve pits (boxes), and appliances such as hydrants and water monitors shall be in accordance with NFPA 24.

5.1.11 The duration of the required firewater flow shall be 4 hours, as per the NFPA Code.

5.2 Firewater Pumps**

△2 5.2.1 The fire protection engineer shall verify that the new or existing firewater pumps are capable of delivering firewater flow rates to the largest user, and meet the designed water flow requirements at each fire protection system. The flow rate shall meet the minimum flow requirements as determined by Fire Department standards.

⚠2 5.2.2 The fire pumps shall delivery the required flow rates to all areas of the facility at a pressure of approximately 100 psi at the base of the fire fighting appliance and a minimum of 60-70 psi at the inlet side of all water spray system operation valves. Firewater pumps shall be designed to meet NFPA 20 and provide for redundant pump with required capacity as per NFPA 20. Appropriate tie-ins to water supply will be determined. Pumps shall be remotely located in an approved covered shelter.

An evaluation of the need for firewater pumps and tanks will be performed in conjunction with the Fire Department to determine if adequate flow and duration can be supplied with only a looped system.

6.0 FIRE SUPPRESSION SYSTEM**

6.1 Portable hand held fire extinguishers shall be installed in all areas of the facilities. The extinguishing agent shall be compatible with the class of fire to be encountered.

⚠2 6.2 Foam systems may not be required in the scope of this project. See Appendix A for quantity of foam already stored on site.

6.3 A water spray deluge system shall be provided for areas as required.

⚠2 6.4 Hose reels and hose carts shall be provided throughout the plant for easy access and emergency use.

7.0 GAS/FIRE DETECTION AND SHUTDOWNS**

7.1 The area UV/IR flame detectors and vapor/gas alarm systems shall be monitored at the Local Control Room and/or the Central Control Room and shall shut down plant upon alarm.

7.2 Combustible vapor/gas sensors shall be installed in critical outdoor areas. The gas sensors shall monitor the level of hydrocarbon/ air mixture and/or hydrogen sulfide.

7.3 Manual ESD stations shall be provided in the areas of egress.

7.4 A detail of the alarm and shutdown system wiring hardware and design will be submitted for approval at submittal of building permits.

7.5 ESD valves are located on the plant inlet and outlet limits and, upon actuation, all plant gas feeds will be blocked in and diverted to the flare.

7.6 All detectors causing ESD shutdowns will be crossed checked to minimize false shutdowns. Audible and visible alarms will be provided in each control room. Any detection of hydrocarbon or flame detection will initiate an alarm requiring operator initiation of ESD. The cause of the ESD will be alarmed and listed in the control rooms on a first out basis. Annunciation of an ESD will be alarmed on the fire control panels at the plant entrances.

⚠2 7.7 A fire control alarm panel will be located at each plant entrance (2 entrances) to inform the Fire Department of cause and area of alarm.

8.0 FIRE PROTECTION SYSTEMS**

8.1 SulFerox Unit Area

⚠2 8.1.1 The SulFerox units contain hydrogen sulfide and hydrocarbons. Self-contained breathing apparatus and safety showers and eyewash stations shall be provided for this area.

8.1.2 Structural steel supporting vessels shall be fireproofed according to UL 1709. The fireproofing shall be capable of meeting a 2 hour UL 1709 fire rating.

8.1.3 Fixed water monitors shall be installed in the area to protect all equipment.

8.1.4 Hydrants for manual firefighting and fire truck pumper application shall be located in the area.

8.1.5 Hose reels and portable dry chemical extinguishers shall be strategically located in the area.

8.1.6 The sulfur product consists of a 40 percent water, wet sulfur cake which is non-hazardous and will be stored in approved DOT containers.

8.2 Dew Point Control Unit, Knockout Drums, Stabilizer Skid, Pipeways, Glycol Unit and Pumps

8.2.1 This area shall be protected by fixed water monitors to cover equipment, vessels and pipeways.

8.2.2 Combustible vapor/gas sensors and UV/IR flame detectors shall be installed. Vapor/gas readout from 0 to 100 percent of LEL shall be monitored at the alarm panels located in the Local Control Room and Central Control Room. The vapor/gas sensors shall provide visual and audible alarm at 25 percent and 40 percent of LEL.

8.2.3 Hydrants for manual firefighting and fire truck pumper application shall be located in the area. Required hose shall be on fire hose carts and/or fire trucks.

8.2.4 Hose reels and portable dry chemical fire extinguishers shall be strategically located in the area.

8.3 Gas Compressors and Lube Oil skids in the Compressor Building

8.3.1 Gas compressors, refrigeration compressors, and lube oil console shall be protected by an automatic water spray deluge system discharging at a rate of 0.5 gpm/sq. ft. Fixed temperature pilot heads (165°F) shall be installed in the protected area for actuation of the deluge system. A manually actuated release station shall be provided with the system riser.

8.3.2 The area UV/IR flame detectors and vapor/gas alarm systems shall be monitored at the Local Control Room and/or the Central Control Room and shall shut down plant upon alarm.

△2 8.4 Local Control Room

The Local Control Room interior shall be maintained under positive air pressure to prevent combustible vapor/gas from contaminating the area. The local control room is located upwind and away from the process area and will only be partially attended. The remote control room (1000 feet away) will be attended 24 hours per day. H_2S detections will be added to the building HVAC. Smoke detection will be provided. Adequate building protection will be provided for plant personnel and equipment.

8.5 Substation and Transformers

Substation buildings shall be located in electrical non-classified, non-hazardous area.

9.0 ELECTRICAL AREA CLASSIFICATION**

9.1 Electrical equipment installed in classified hazardous areas shall be approved for use in the specific atmosphere as outlined in the NFPA 70, National Electric Code, API RP500A, and Uniform Fire Code.

9.2 The Area Classification drawings for the Gas Processing Project will be submitted for review.

△2 10.0 FIRE PROOFING OF VESSELS AND STRUCTURAL STEEL**

10.1 Fireproofing of structural steel pipeways and vessel skirts shall be provided in areas where equipment handling liquid hydrocarbons are located. Steel structures supporting elevated equipment shall be fireproofed regardless of location.

10.2 Fireproofing material shall be protected against mechanical damage, thermal shock, and environmental conditions and shall have resistance to hydrocarbons and sulfuric acid fumes.

The types of fireproofing to be used shall have a fire resistance rating of two (2) hours in accordance with UL 1709 Rapid Rise Curve.

11.0 CRITICAL CABLE PROTECTION*

Control systems cabling for ESD will be protected by locating them underground.

12.0 DRAINAGE AND CONTAINMENT**

12.1 Drainage of firewater from the plant area shall be by swales, trenches, catch basins, or sheet flow to a remote impounding area. Path of drainage shall be designed to allow vapors to dissipate in the atmosphere. Vapor clouds resulting from liquid spills which are slow to vaporize may be dispersed with water spray application. Drainage and containment shall comply with Uniform Fire Code, Articles 79 and 80.

12.2 Open drainage systems to the oily water system shall be provided to prevent combustible vapor/gas spills from entering the storm water drainage system. Firewater or flammable liquids shall not be allowed to accumulate under pipeways, vessels, pumps, or equipment handling hydrocarbons.

13.0 ACCESS ROADS**

A plot plan showing all access and surrounding roads is attached. A plot plan with monitor and hydrant locations will be supplied at a later date. Knox locks and Knox map boxes shall be provided at each entrance. Appropriate pre-plan information will be provided at each location.

14.0 OFF-SITE MONITORING AND PROTECTION OF THE PUBLIC*

14.1 The site is currently protected at the perimeter wall by a hydrogen sulfide gas detection system.

△2 14.2 Refer to the HAZOP results to insure elimination of all risks.

15.0 LOCATION AND SEPARATION OF EQUIPMENT (SITE LAYOUT)**

15.1 A plot plan is attached for your review. the Fire Department may review the plot plan and make recommendations as to equipment spacing and plant layout, as per the applicable codes.

15.2 The plant layout shall maximize equipment separation to reduce the propagation of fire to adjacent areas.

16.0 EQUIPMENT, SYSTEM AND PROCESS SAFETY, MONITORING AND SHUTDOWNS*

Copies of the API 14C Safe Charts will be provided for your review. The HAZOPS documentation will be completed and reviewed with the appropriate fire department personnel.

△2 17.0 EMERGENCY RELIEF SYSTEMS**

17.1 Emergency relief systems will be provided and will have a rupture disk below the relief valve. The rupture disk will be equipped with an electronic tattle tale to alert the control room as to the location of the device relieving in the facility.

17.2 Pressure relief/venting systems shall be provided for equipment subject to internal pressure buildup from an external source of heat, as defined in API 14C System Evaluation.

18.0 CONTROL ROOM PROTECTION

The Central Control Room is an existing structure. The Local Control Room is addressed in Section 8.4. The Central Control Room will have full capabilities to operate the plant from a remote location. The Central Control Room will have the same safety monitoring and shutdown capabilities as the Local Control Room.

△2 19.0 EMERGENCY POWER

Currently, there is no provision for total plant emergency power. The facility will be designed for fail-safe shutdown in the event of a power loss. The oil field is currently electrified, and, if a loss of power should occur, the field is shutdown so that incoming oil, gas, and water production is shutdown. A UPS system is provided for power back-up of all

electronic computer control systems which will initiate and complete a safe ESD. Battery power back up will be provided for fire detection panels and annunciation.

20.0 PORTABLE FIRE, SAFETY AND MONITORING EQUIPMENT**

20.1 Self-contained breathing apparatus (SCBA) shall be provided in strategic areas.

20.2 Safety showers shall be installed in the areas where eye or skin irritating material is stored or handled.

21.0 EMERGENCY RESPONSE PLAN*

An Emergency Response Plan exists for the SWEPI Huntington Beach facility. Appropriate modifications to the Plan will be made to incorporate the modified facility.

⚠2 22.0 ONGOING INSPECTION, SAFETY, MAINTENANCE AND QUALITY ASSURANCE PLAN*

A copy of the safety, training and quality assurance manuals can be made available for review. These manuals cover all of the above 22.0 subject areas.

23.0 WORKER SAFETY AND TRAINING PROGRAM*

The current worker Safety and Training Programs can be reviewed with the local Safety/Training Coordinator located at the Huntington Beach lease.

24.0 SITE SECURITY PLAN*

The Huntington Beach site is under 24 hour guard and security. All access is limited at the entrance gates. The new plant facility is within the secured site and will have 24 hour operator attention.

25.0 HAZARD IDENTIFICATION METHODS (LABELING, ETC.)*

All stored materials will be properly labeled as per the NFPA, and Uniform Fire Code placard requirements.

26.0 HAZARDOUS MATERIALS MANAGEMENT PLAN*

The Shell Hazardous Materials Business Plan has been submitted to the Fire Department for their records. Included in the Plan are response and inventory procedures as required by SARA Title III. The Plan will be modified to accommodate the new facility.

27.0 SITE AND EQUIPMENT ABANDONMENT PLAN**

A proposal from Fluor Environmental for the abandonment of the existing plant site is attached. SWEPI is the lessee and will return the land to the lessor in accordance with its lease obligations and any Local, State or Federal regulations which may apply. The proposal outlines the appropriate testing, agency notification, remediation and closure approvals.

29.0 PLAN SUBMITTAL AND APPROVAL PROCESS

29.1 Items highlighted by a single asterisk (*) are information/specifications which will be provided for review, but not approval, of the City of Huntington Beach Fire Department and it's independent consultant. Items highlighted by a double asterisk (**) are items/components/safety systems which will be installed where appropriate and are listed on specifications, and drawings which will need to be approved by the City of Huntington Beach Fire Department prior to issuing building permits.

29.2 SWEPI agrees to comply with safety requirements as listed in the appropriate codes and standards section. High safety standards are important to SWEPI; however, should a disagreement arise between the independent consultant and SWEPI on a particular safety issue, SWEPI reserves the right for the City of Huntington Beach Fire Department to consider design systems provided which are in SWEPI's/Fluor Daniel's opinion "as safe as" those required by the recommendations of the independent consultant.

30.0 FIVE YEAR UPGRADE PROGRAM FOR TANK FARM #1 (MODERNIZED OIL DEHYDRATION FACILITIES)*

SWEPI agrees to submit a plan for an upgrade to the fire protection systems at the Modernized Tank Farm to be completed prior to 1996. The project description and schedule will be submitted the City of Huntington Beach Fire Department by the end of second quarter 1992. The plan for the fire protection system upgrade will be in accordance with this specification and codes within this document. A separate Fire Protection Plan will be submitted for the Tank Farm and will be similar to this Gas Plant Fire Protection Plan.

** Documentation/information which will be provided to the City of Huntington Beach Fire Department and it's independent consultant for review.*

*** Items/components/safety systems which will be installed where appropriate and listed on specifications, and drawings which will need to be approved by the City of Huntington Beach Fire Department prior to issuing building permits.*

When approved by the Huntington Beach Fire Department, this document shall serve as the official Fire Protection Plan for the SWEPI Gas Processing Project facility at Golden West Blvd. and Pacific Coast Highway.

Subject: Partial Closure: TPH- and PCB-Impacted Soil

Re: Aera Energy (formerly CalResources)
Huntington Beach Gas Plant # 11
Seapoint Avenue (at Garfield)
Huntington Beach, CA 92648
OCHCA Case # 90IC33

Dear Mr. Klancher:

This letter confirms the completion of remedial action for the subject soil at the above-referenced site. With the provision that the information provided to this Agency was accurate and representative of existing conditions, it is the position of this office that no further action is required at this time. It is understood that ongoing remedial activities will continue to address contamination within the deeper soil and the shallow groundwater zone.

This confirmation of completion is limited in scope. It is limited to site conditions made known to this Agency under the above-referenced case number. It is based on an evaluation of the health threat presented by the inhalation, ingestion, or dermal absorption of the residual contaminants. In addition, this evaluation considered the present and proposed use of the property. Changes in the present or proposed land use may require further site characterization and/or site mitigation activity.

The presence of TPH, TRPH and PCBs and the potential for residual contamination to cause further groundwater contamination at this site was discussed with Ray Akhtarshad of the Santa Ana Regional Water Quality Control Board. Regional Board staff concurred that no further action is required at this time.

Please be advised that this letter does not relieve you of any liability under the California Health and Safety Code or Water Code for past, present or future operations at the site. Nor does it relieve you of the responsibility to clean up existing, additional or previously unidentified conditions at the site which cause or threaten to cause pollution or nuisance or otherwise pose a threat to water quality or public health. It is

the property owner's responsibility to notify this Agency of any changes in future contamination findings or site usage.

If you have any questions regarding this matter, please contact Luis Lodrigueza at (714) 667-3717.

Sincerely,

Karen L. Hodel

APPENDIX C

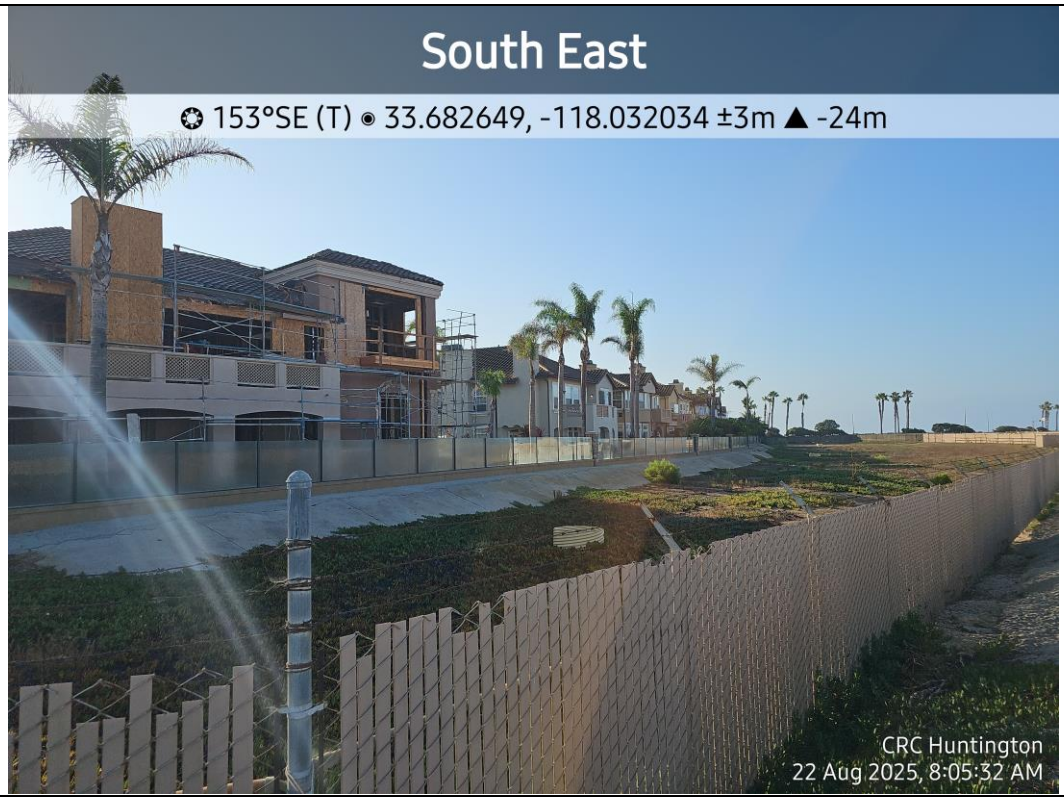
SITE RECONNAISSANCE CHECKLIST AND PHOTOGRAPHS

LANGAN

Site Reconnaissance Photographs

Client Name:	Subject Property Location:	Project No.
California Resources Corporation	20101 Goldenwest St, Huntington Beach, CA	700152701

Date	Photo No.
22 Aug 2025	1



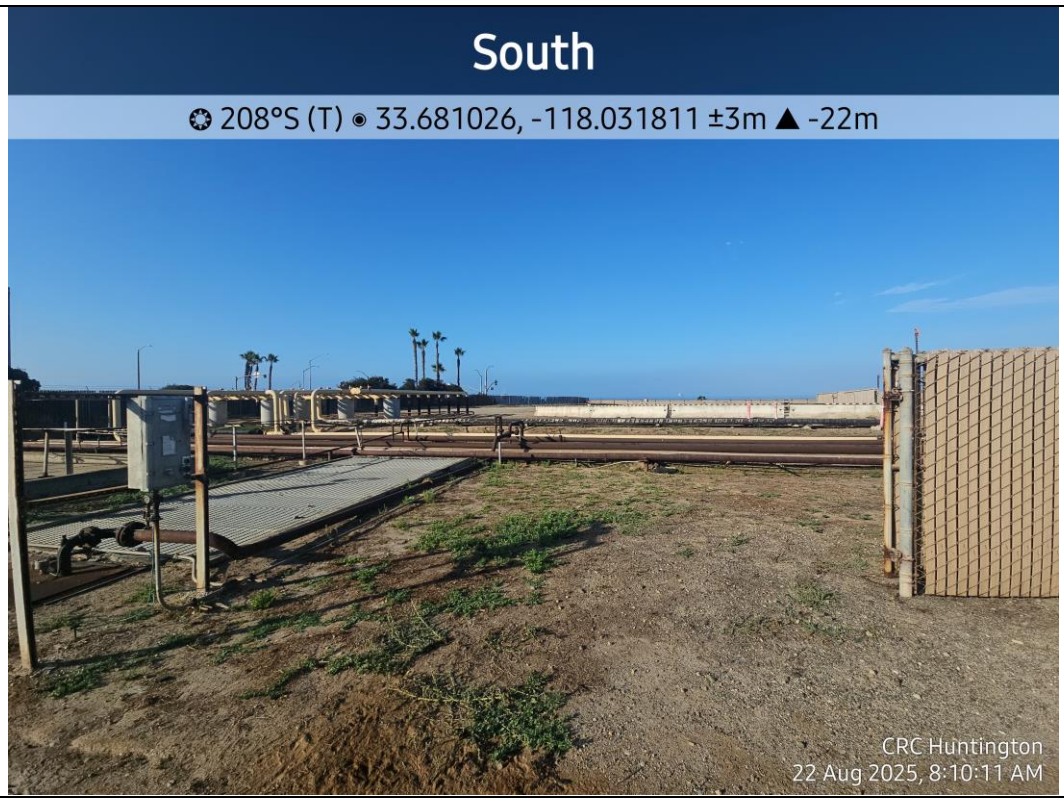
Direction Photo Taken:

Southeast

Description:

Southern view from the northern property line. Western property line (chain-link fence) visible. Yellow stormwater drain visible in the center of the property.

East adjoining properties (residential) visible in the background of the photograph.



Date	Photo No.
22 Aug 2025	2

Direction Photo Taken:

South

Description:

Flow lines from the State Lease, north of Seapoint Street.

Client Name:	Subject Property Location:	Project No.
California Resources Corporation	20101 Goldenwest St, Huntington Beach, CA	700152701

Date	Photo No.
22 Aug 2025	3

Direction Photo Taken:

Northwest

Description:

Chase 1 – Flow lines entering the subject property south of Seapoint Street.

Date	Photo No.
22 Aug 2025	4

Direction Photo Taken:

Southeast

Description:

Oily staining surrounding the electrical component of the demolished Former Stretford Unit.

Client Name:	Subject Property Location:	Project No.
California Resources Corporation	20101 Goldenwest St, Huntington Beach, CA	700152701

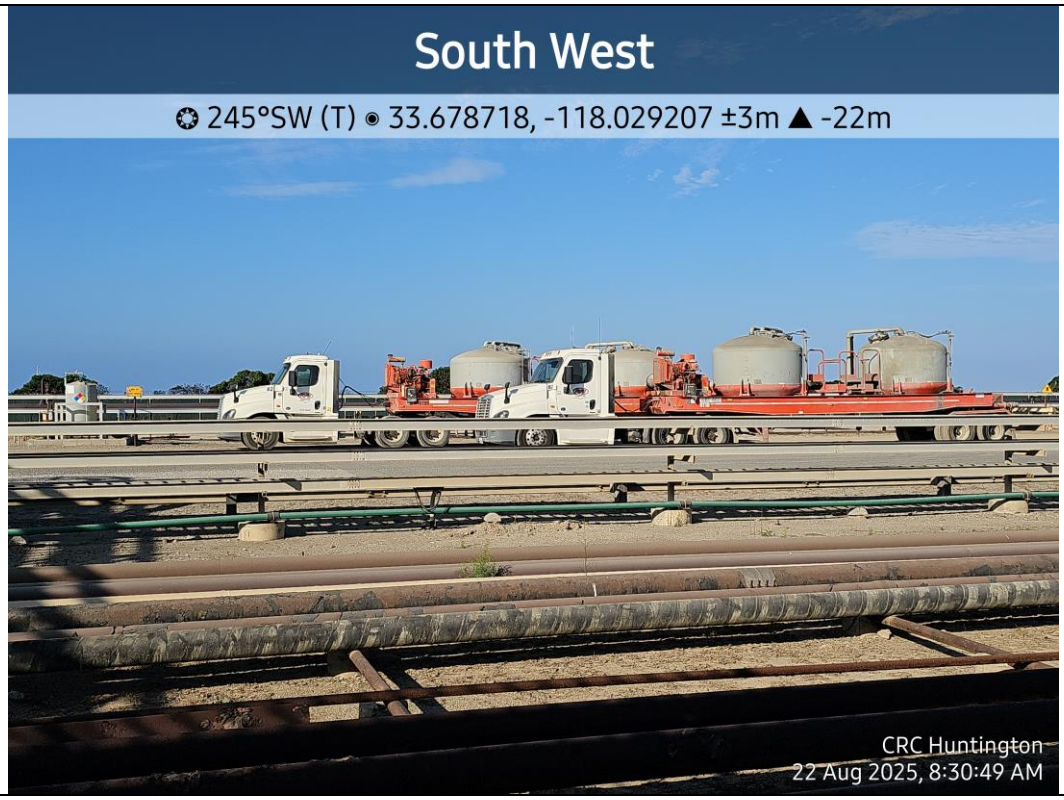
Date	Photo No.
22 Aug 2025	5

Direction Photo Taken:

South

Description:

Pit 1 – currently used as stormwater collection for "dirty" water to be used for reinjection.



Date	Photo No.
22 Aug 2025	6

Direction Photo Taken:

Southwest

Description:

Concrete trucks used for well abandonment.

LANGAN

Site Reconnaissance Photographs

Client Name:	Subject Property Location:	Project No.
California Resources Corporation	20101 Goldenwest St, Huntington Beach, CA	700152701

Date	Photo No.
22 Aug 2025	7

Direction Photo Taken:

West

Description:

Northwest Historical Tanks area of investigation.

Date	Photo No.
22 Aug 2025	8

Direction Photo Taken:

Description:

Historical steam generator foundations located in the southernmost stormwater detention pond.

APPENDIX D

USER PROVIDED INFORMATION

Clear Form

ASTM E1527-21 User Questionnaire

Please complete the below form and return to Langan.

Providing the following information (if available) to the environmental professional (Langan) is one of the requirements to qualify for one of the Landowner Liability Protections (LLP) offered under CERCLA. Missing or incomplete information for questions 1 through 6 could result in a determination that "all appropriate inquiry" is not complete. Additional information should be provided for "Yes" answers where relevant.

General Information

User/Client Names: California Resorces Corporation

Reason for the Phase I ESA: Environmental due diligence

Type of property: Oil and Gas lease

Type of property transaction (e.g. sale, purchase, exchange): Redevelopment

Subject property address (provide documentation of subject property boundary):

20101 Goldenwest Street Huntington Beach, California

Site Contact and Contact Information: Hugo.DeLaLlave@crc.com

Relying Party(ies):

Required Information

(1.) Environmental liens that are filed or recorded against the subject property (40 CFR 312.25).

Did a search of recorded land title records (or judicial records where appropriate) identify any environmental liens filed or recorded against the subject property under federal, tribal, state or local law?

Yes ○ No ◉

(2.) Activity and use limitations that are in place on the subject property or that have been filed or recorded against the subject property (40 CFR 312.26(a)(1)(v) and (vi)).

Did a search of recorded land title records (or judicial records where appropriate) identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the subject property and/or have been filed or recorded against the subject property under federal, tribal, state or local law?

Yes ◉ No ○

(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).

Do you have any specialized knowledge or experience related to the subject property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the subject property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

Yes ◉ No ○

(4.) Relationship of the purchase price to the fair market value of the subject property if it were not contaminated (40 CFR 312.29).

Does the purchase price being paid for this subject property reasonably reflect the fair market value of the subject property?

Yes ○ No ○

NA Property not selling

If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the subject property?

Yes ○ No ○

(5.) Commonly known or reasonably ascertainable information about the subject property (40 CFR 312.30).

	Yes	No
Are you aware of commonly known or reasonably ascertainable information about the subject property that would help the environmental professional to identify conditions indicative of releases or threatened releases?	◉	○
For example,	Yes	No
(a.) Do you know the past uses of the subject property?	◉	○
(b.) Do you know of specific chemicals that are present or once were present at the subject property?	◉	○
(c.) Do you know of spills or other chemical releases that have taken place at the subject property?	◉	○
(d.) Do you know of any environmental cleanups that have taken place at the subject property?	◉	○

(6.) The degree of obviousness of the presence or likely presence of contamination at the subject property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).

	Yes	No
Based on your knowledge and experience related to the subject property, are there any obvious indicators that point to the presence or likely presence of releases at the subject property?	◉	○
Do you have knowledge or experience with the subject property that may be pertinent to the environmental professional (for example, copies of any available prior environmental site assessment reports, documents, correspondence, etc., concerning the property and its environmental condition)?	◉	○

(7.) Proceedings Involving the Subject Property Questions (Section 10.9 of ASTM E1527-21 and Section 10.10 of ASTM E2247-16)

Do you know of:	Yes	No
(a.) Any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the subject property?	○	◉
(b.) Any pending, threatened, or past administrative proceedings relevant to hazardous substances or petroleum products in, on, at, or from the subject property?	◉	○
(c) Any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products?	○	◉

Signature

It is understood that the information presented in this form is an integral part of the Phase I ESA process and that Langan will evaluate and rely on this information in the development of the final Phase I ESA report.

Relationship to Client/User: _____

Date: 10/14/25

SAFETY DATA SHEET

Section 1. Identification

Product name : CRW3658A CORROSION INHIBITOR

Product code : CRW3658A

Relevant identified uses of the substance or mixture and uses advised against

Identified uses : Corrosion inhibitor.

Print date : 8/10/2021

Validation date : 8/10/2021

Version : 1

Supplier's details : Baker Petrolite LLC
12645 W. Airport Blvd.
Sugar Land, TX 77478
For Product Information/SDSs Call: 800-231-3606
(8:00 a.m. - 5:00 p.m. CST, Monday - Friday) 281-276-5400

Emergency telephone number (with hours of operation) : CHEMTREC: 800-424-9300 (U.S. 24 hour)
Baker Petrolite: 800-231-3606
(001)281-276-5400
CHEMTREC Int'l 01-703-527-3887 (International 24 hour)

Section 2. Hazards identification

OSHA/HCS status : This material is considered hazardous by the OSHA Hazard Communication Standard (29 CFR 1910.1200).

Classification of the substance or mixture : SKIN CORROSION - Category 1
SERIOUS EYE DAMAGE - Category 1
AQUATIC HAZARD (ACUTE) - Category 3
AQUATIC HAZARD (LONG-TERM) - Category 1

GHS label elements

Hazard pictograms :

Signal word : Danger

Hazard statements : Causes severe skin burns and eye damage.
Harmful to aquatic life.
Very toxic to aquatic life with long lasting effects.

Precautionary statements

Prevention : Wear protective gloves, protective clothing and eye or face protection. Avoid release to the environment. Wash thoroughly after handling.

Section 2. Hazards identification

Response : Collect spillage. IF INHALED: Remove person to fresh air and keep comfortable for breathing. Immediately call a POISON CENTER or doctor. IF SWALLOWED: Immediately call a POISON CENTER or doctor. Rinse mouth. Do NOT induce vomiting. IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water. Immediately call a POISON CENTER or doctor. Wash contaminated clothing before reuse. IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER or doctor.

Storage : Store locked up.

Disposal : Dispose of contents and container in accordance with all local, regional, national and international regulations.

Hazards not otherwise classified : None known.

Hazard statements (Code) : H314, H402, H410

Precautionary statements (Code) : P280, P273, P264, P391, P304 + P340, P310, P301 + P310, P330, P331, P303 + P361 + P353, P310, P363, P305 + P351 + P338, P310, P405, P501

Section 3. Composition/information on ingredients

Substance/mixture : Mixture

Ingredient name	%	CAS number
Quaternary ammonium compound	10 - 20	Trade secret.
Phosphate ester salt	5 - 10	Trade secret.
Ethanol	1 - 5	64-17-5
Alkyl amine	0.1 - 1	Trade secret.

Section 4. First aid measures

Description of necessary first aid measures

Eye contact : Get medical attention immediately. Call a poison center or physician. Immediately flush the eye(s) continuously with lukewarm, gently flowing water for at least 20-60 minutes while holding the eyelid(s) open. Check for and remove any contact lenses. Chemical burns must be treated promptly by a physician.

Inhalation : Call a poison center or physician. Remove victim to fresh air and keep at rest in a position comfortable for breathing. If not breathing, if breathing is irregular or if respiratory arrest occurs, provide artificial respiration or oxygen by trained personnel. If unconscious, place in recovery position and get medical attention immediately. Maintain an open airway. In case of inhalation of decomposition products in a fire, symptoms may be delayed. The exposed person may need to be kept under medical surveillance for 48 hours.

Skin contact : Get medical attention immediately. Call a poison center or physician. Wash affected area with soap and mild detergent for at least 20 - 60 minutes. Flush contaminated skin with plenty of water. Remove contaminated clothing and shoes. Wash contaminated clothing thoroughly with water before removing it, or wear gloves. Chemical burns must be treated promptly by a physician. Wash clothing before reuse. Clean shoes thoroughly before reuse.

Ingestion : Call a poison center or physician. Wash out mouth with water. If material has been swallowed and the exposed person is conscious, give small quantities of water to drink. Do not induce vomiting unless directed to do so by medical personnel. If vomiting occurs, the head should be kept low so that vomit does not enter the lungs. Chemical burns must be treated promptly by a physician. Never give anything by mouth to an unconscious person. If unconscious, place in recovery position and get medical attention immediately. Maintain an open airway.

Section 4. First aid measures

Most important symptoms/effects, acute and delayed

Potential acute health effects

Eye contact : Causes serious eye damage.

Inhalation : No known significant effects or critical hazards.

Skin contact : Causes severe burns.

Ingestion : No known significant effects or critical hazards.

Over-exposure signs/symptoms

Eye contact : Adverse symptoms may include the following:,pain,watering,redness

Inhalation : No specific data.

Skin contact : pain or irritation,redness,blistering may occur

Ingestion : Adverse symptoms may include the following:,stomach pains

Indication of immediate medical attention and special treatment needed, if necessary

Notes to physician : In case of inhalation of decomposition products in a fire, symptoms may be delayed. The exposed person may need to be kept under medical surveillance for 48 hours.

Specific treatments : No specific treatment.

Protection of first-aiders : No action shall be taken involving any personal risk or without suitable training. If it is suspected that fumes are still present, the rescuer should wear an appropriate mask or self-contained breathing apparatus. It may be dangerous to the person providing aid to give mouth-to-mouth resuscitation. Wash contaminated clothing thoroughly with water before removing it, or wear gloves.

See toxicological information (Section 11)

Section 5. Fire-fighting measures

Extinguishing media

Suitable extinguishing media : Use an extinguishing agent suitable for the surrounding fire.

Unsuitable extinguishing media : None known.

Specific hazards arising from the chemical : In a fire or if heated, a pressure increase will occur and the container may burst. This material is very toxic to aquatic life with long lasting effects. Fire water contaminated with this material must be contained and prevented from being discharged to any waterway, sewer or drain.

Hazardous thermal decomposition products : carbon dioxide,carbon monoxide,nitrogen oxides,phosphorus oxides,halogenated compounds

Special protective actions for fire-fighters : Promptly isolate the scene by removing all persons from the vicinity of the incident if there is a fire. No action shall be taken involving any personal risk or without suitable training.

Special protective equipment for fire-fighters : Fire-fighters should wear appropriate protective equipment and self-contained breathing apparatus (SCBA) with a full face-piece operated in positive pressure mode.

Section 6. Accidental release measures

Personal precautions, protective equipment and emergency procedures

For non-emergency personnel : No action shall be taken involving any personal risk or without suitable training. Evacuate surrounding areas. Keep unnecessary and unprotected personnel from entering. Do not touch or walk through spilled material. Do not breathe vapor or mist. Provide adequate ventilation. Wear appropriate respirator when ventilation is inadequate. Put on appropriate personal protective equipment.

For emergency responders : If specialized clothing is required to deal with the spillage, take note of any information in Section 8 on suitable and unsuitable materials. See also the information in "For non-emergency personnel".

Environmental precautions : Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers. Inform the relevant authorities if the product has caused environmental pollution (sewers, waterways, soil or air). Water polluting material. May be harmful to the environment if released in large quantities. Collect spillage.

Methods and materials for containment and cleaning up

Small spill : Stop leak if without risk. Move containers from spill area. Dilute with water and mop up if water-soluble. Alternatively, or if water-insoluble, absorb with an inert dry material and place in an appropriate waste disposal container. Dispose of via a licensed waste disposal contractor.

Large spill : Stop leak if without risk. Move containers from spill area. Approach release from upwind. Prevent entry into sewers, water courses, basements or confined areas. Wash spillages into an effluent treatment plant or proceed as follows. Contain and collect spillage with non-combustible, absorbent material e.g. sand, earth, vermiculite or diatomaceous earth and place in container for disposal according to local regulations (see Section 13). Dispose of via a licensed waste disposal contractor. Contaminated absorbent material may pose the same hazard as the spilled product. Note: see Section 1 for emergency contact information and Section 13 for waste disposal.

Section 7. Handling and storage

Precautions for safe handling

Protective measures : Put on appropriate personal protective equipment (see Section 8). Do not get in eyes or on skin or clothing. Do not breathe vapor or mist. Do not ingest. Avoid release to the environment. If during normal use the material presents a respiratory hazard, use only with adequate ventilation or wear appropriate respirator. Keep in the original container or an approved alternative made from a compatible material, kept tightly closed when not in use. Empty containers retain product residue and can be hazardous. Do not reuse container.

Advice on general occupational hygiene : Eating, drinking and smoking should be prohibited in areas where this material is handled, stored and processed. Workers should wash hands and face before eating, drinking and smoking. Remove contaminated clothing and protective equipment before entering eating areas. See also Section 8 for additional information on hygiene measures.

Conditions for safe storage, including any incompatibilities : Store in accordance with local regulations. Store in original container protected from direct sunlight in a dry, cool and well-ventilated area, away from incompatible materials (see Section 10) and food and drink. Store locked up. Keep container tightly closed and sealed until ready for use. Containers that have been opened must be carefully resealed and kept upright to prevent leakage. Do not store in unlabeled containers. Use appropriate containment to avoid environmental contamination. See Section 10 for incompatible materials before handling or use.

Section 8. Exposure controls/personal protection

Control parameters

Occupational exposure limits

Ingredient name	Exposure limits
Quaternary ammonium compound	None.
Phosphate ester salt	None.
Ethanol	**ACGIH TLV (United States, 3/2020).** STEL: 1000 ppm, 0 times per shift, 15 minutes. **NIOSH REL (United States, 10/2016).** TWA: 1900 mg/m³, 0 times per shift, 10 hours. TWA: 1000 ppm, 0 times per shift, 10 hours. **OSHA PEL (United States, 5/2018).** TWA: 1900 mg/m³, 0 times per shift, 8 hours. TWA: 1000 ppm, 0 times per shift, 8 hours. **OSHA PEL 1989 (United States, 3/1989).** TWA: 1900 mg/m³, 0 times per shift, 8 hours. TWA: 1000 ppm, 0 times per shift, 8 hours.
Alkyl amine	None.

Consult local authorities for acceptable exposure limits.

If OSHA permissible exposure levels are shown above they are the OSHA 1989 levels or are from subsequent OSHA regulatory actions. Although the 1989 levels have been vacated the 11th Circuit Court of Appeals, Baker Hughes recommends that these lower exposure levels be observed as reasonable worker protection.

Appropriate engineering controls : If user operations generate dust, fumes, gas, vapor or mist, use process enclosures, local exhaust ventilation or other engineering controls to keep worker exposure to airborne contaminants below any recommended or statutory limits.

Individual protection measures

Hygiene measures : Wash hands, forearms and face thoroughly after handling chemical products, before eating, smoking and using the lavatory and at the end of the working period. Appropriate techniques should be used to remove potentially contaminated clothing. Wash contaminated clothing before reusing. Ensure that eyewash stations and safety showers are close to the workstation location.

Eye/face protection : Wear chemical safety goggles. When transferring material wear face-shield in addition to chemical safety goggles. If inhalation hazards exist, a full-face respirator may be required instead.

Hand protection : Chemical-resistant gloves.

Skin protection : Wear long sleeves and chemical resistant apron to prevent repeated or prolonged skin contact.

Respiratory protection : If a risk assessment indicates it is necessary, use a properly fitted, air purifying or supplied air respirator complying with an approved standard. Respirator selection must be based on known or anticipated exposure levels, the hazards of the product and the safe working limits of the selected respirator.

Section 9. Physical and chemical properties

Appearance

Physical state : Liquid. [Clear.]

Color : Colorless.

Odor : Alcohol

Odor threshold : Not available.

pH : 5.5 to 7.5

Melting/freezing point : Not available.

Section 9. Physical and chemical properties

Boiling point	:	Not available.
Initial Boiling Point	:	Not available.
Flash point	:	Closed cup: >93.34°C (>200°F) [TCC]
Burning time	:	Not applicable.
Burning rate	:	Not applicable.
Evaporation rate	:	Not available.
Flammability (solid, gas)	:	Slightly flammable in the presence of the following materials or conditions: open flames, sparks and static discharge and heat.
Lower and upper explosive (flammable) limits	:	Not available.
Vapor pressure	:	Not available.
Vapor density	:	Not available.
Relative density	:	1
Density	:	8.32 (lbs/gal)
Solubility in water	:	Soluble
Partition coefficient: n-octanol/water	:	Not available.
Auto-ignition temperature	:	Not available.
Decomposition temperature	:	Not available.
Viscosity	:	Not available.
VOC	:	Not available.
Pour Point	:	-1.67°C (29°F)

Section 10. Stability and reactivity

Reactivity	:	No specific test data related to reactivity available for this product or its ingredients.
Chemical stability	:	The product is stable.
Possibility of hazardous reactions	:	Under normal conditions of storage and use, hazardous reactions will not occur.
Conditions to avoid	:	No specific data.
Incompatible materials	:	Reactive or incompatible with the following materials: oxidizing materials, metals, acids and alkalis.
Hazardous decomposition products	:	Under normal conditions of storage and use, hazardous decomposition products should not be produced.

Section 11. Toxicological information

Information on toxicological effects

Acute toxicity

Section 11. Toxicological information

Product/ingredient name	Result	Species	Dose	Exposure
Quaternary ammonium compound	LD50 Oral	Rat	426 mg/kg	-
Ethanol	LC50 Inhalation Vapor	Rat	20000 ppm	10 hours
	LC50 Inhalation Vapor	Rat	124700 mg/m³	4 hours
	LD50 Oral	Rat	7 g/kg	-
Alkyl amine	LD50 Oral	Rat	1000 to 1250 mg/kg	-

Irritation/Corrosion

No available toxicity data.

Sensitization

No available toxicity data.

Mutagenicity

No available toxicity data.

Carcinogenicity

Classification

Product/ingredient name	OSHA	IARC	NTP
Ethanol	-	1	-

Reproductive toxicity

No available toxicity data.

Teratogenicity

No available toxicity data.

Specific target organ toxicity (single exposure)

Not applicable.

Specific target organ toxicity (repeated exposure)

Not applicable.

Aspiration hazard

Not available.

Information on the likely routes of exposure : Routes of entry anticipated: Dermal, Inhalation.

Potential acute health effects

Eye contact : Causes serious eye damage.

Inhalation : No known significant effects or critical hazards.

Skin contact : Causes severe burns.

Ingestion : No known significant effects or critical hazards.

Symptoms related to the physical, chemical and toxicological characteristics

Eye contact : Adverse symptoms may include the following:,pain,watering,redness

Inhalation : No specific data.

Skin contact : pain or irritation,redness,blistering may occur

Ingestion : Adverse symptoms may include the following:,stomach pains

Section 11. Toxicological information

Delayed and immediate effects and also chronic effects from short and long term exposure

Short term exposure

Potential immediate effects : Not available.

Potential delayed effects : Not available.

Long term exposure

Potential immediate effects : Not available.

Potential delayed effects : Not available.

Potential chronic health effects

General : No known significant effects or critical hazards.

Carcinogenicity : No known significant effects or critical hazards.

Mutagenicity : No known significant effects or critical hazards.

Reproductive toxicity : No known significant effects or critical hazards.

Numerical measures of toxicity

Acute toxicity estimates

Product/ingredient name	Oral (mg/kg)	Dermal (mg/kg)	Inhalation (gases) (ppm)	Inhalation (vapors) (mg/l)	Inhalation (dusts and mists) (mg/l)
CRW3658A CORROSION INHIBITOR	3485.7	Not available.	Not available.	Not available.	Not available.
Quaternary ammonium compound	426	Not available.	Not available.	Not available.	Not available.
Ethanol	7000	Not available.	Not available.	124.7	Not available.
Alkyl amine	500	Not available.	Not available.	Not available.	Not available.

Section 12. Ecological information

Toxicity

Product/ingredient name	Result	Species	Exposure
Quaternary ammonium compound	Acute EC50 37 ppb Fresh water	Daphnia - Daphnia magna	48 hours
	Acute LC50 64 ppb Fresh water	Fish - Oncorhynchus mykiss	96 hours
	Chronic NOEC 4.15 ppb Marine water	Daphnia - Daphnia magna	21 days
	Chronic NOEC 32.2 ppb	Fish - Pimephales promelas	34 days
Ethanol	Acute EC50 17.921 mg/l Marine water	Algae - Ulva pertusa	96 hours
	Acute EC50 2000 µg/l Fresh water	Daphnia - Daphnia magna	48 hours
	Acute LC50 25500 µg/l Marine water	Crustaceans - Artemia franciscana - Larvae	48 hours
	Acute LC50 42000 µg/l Fresh water	Fish - Oncorhynchus mykiss	4 days
	Chronic NOEC 4.995 mg/l Marine water	Algae - Ulva pertusa	96 hours
	Chronic NOEC 0.375 ul/L Fresh water	Fish - Gambusia holbrooki - Larvae	12 weeks

Persistence and degradability

Section 12. Ecological information

Not available.

Other adverse effects : No known significant effects or critical hazards.

Section 13. Disposal considerations

Disposal methods : Dispose of surplus and non-recyclable products via a licensed waste disposal contractor. Waste packaging should be recycled. Incineration or landfill should only be considered when recycling is not feasible. This material and its container must be disposed of in a safe way. Care should be taken when handling emptied containers that have not been cleaned or rinsed out. Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers.

Section 14. Transport information

	DOT Classification	TDG Classification	IMDG	IATA
UN number	UN1760	UN1760	UN1760	UN1760
UN proper shipping name	CORROSIVE LIQUID, N.O.S. (Contains: Quaternary ammonium compound)	CORROSIVE LIQUID, N.O.S. (Contains: Quaternary ammonium compound)	CORROSIVE LIQUID, N.O.S. (Contains: Quaternary ammonium compound)	CORROSIVE LIQUID, N.O.S. (Contains: Quaternary ammonium compound)
Transport hazard class(es)	8 	8 	8 	8 
Packing group	III	III	III	III
Environmental hazards	Yes.	Yes.	Yes.	Yes. The environmentally hazardous substance mark is not required.

Additional information

DOT Classification : This product is not regulated as a marine pollutant when transported on inland waterways in sizes of ≤5 L or ≤5 kg or by road, rail, or inland air in non-bulk sizes, provided the packagings meet the general provisions of §§ 173.24 and 173.24a.

TDG Classification : Product classified as per the following sections of the Transportation of Dangerous Goods Regulations: 2.40-2.42 (Class 8), 2.7 (Marine pollutant mark).
The marine pollutant mark is not required when transported by road or rail.

IMDG : The marine pollutant mark is not required when transported in sizes of ≤5 L or ≤5 kg.
Emergency schedules F-A S-B

IATA : The environmentally hazardous substance mark may appear if required by other transportation regulations.

Special precautions for user : **Transport within user's premises:** always transport in closed containers that are upright and secure. Ensure that persons transporting the product know what to do in the event of an accident or spillage.

Transport in bulk according to IMO instruments : Not available.

Section 14. Transport information

DOT Reportable Quantity Not applicable.

Marine pollutant Quaternary ammonium compound

North-America NAERG : 154

Section 15. Regulatory information

U.S. Federal regulations : **TSCA 12(b) one-time export**: No products were found.

TSCA 12(b) annual export notification: No products were found.

United States inventory (TSCA 8b): All components are active or exempted.

Clean Water Act (CWA) 307: No products were found.

Clean Water Act (CWA) 311: No products were found.

United States - Clean Air Act Section 112(b) Hazardous Air Pollutants (HAPs) :

List name	Status	Ingredient name	Name on list	Conc.
None of the components are listed.				

SARA 302/304 : No products were found.

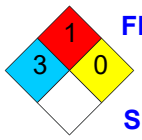
SARA 311/312

Classification : SKIN CORROSION - Category 1
SERIOUS EYE DAMAGE - Category 1

SARA 313

Supplier notification : No products were found.

California Prop. 65



This product does not require a Safe Harbor warning under California Prop. 65.

Canada

Canada (CEPA DSL): : At least one component is not listed in DSL but all such components are listed in NDSL.

Section 16. Other information

National Fire Protection Association (U.S.A.)

History

Date of printing : 8/10/2021

Key to abbreviations : ATE = Acute Toxicity Estimate
BCF = Bioconcentration Factor
GHS = Globally Harmonized System of Classification and Labelling of Chemicals
IATA = International Air Transport Association
IBC = Intermediate Bulk Container
IMDG = International Maritime Dangerous Goods
LogPow = logarithm of the octanol/water partition coefficient
MARPOL = International Convention for the Prevention of Pollution From Ships, 1973 as modified by the Protocol of 1978. ("Marpol" = marine pollution)
N/A = Not available
SGG = Segregation Group
UN = United Nations

Section 16. Other information

Indicates information that has changed from previously issued version.

Notice to reader

NOTE: The information on this SDS is based on data which is considered to be accurate. Baker Hughes, however, makes no guarantees or warranty, either expressed or implied of the accuracy or completeness of this information.

The conditions or methods of handling, storage, use and disposal of the product are beyond our control and may be beyond our knowledge. For this and other reasons, we do not assume responsibility and expressly disclaim liability for loss, damage or expense arising out of or in any way connected with the handling, storage, use or disposal of this product.

This SDS was prepared and is to be used for this product. If the product is used as a component in another product, this SDS information may not be applicable.

SAFETY DATA SHEET

Section 1. Identification

Product name : TRETOLITE™ DMO7040 DEMULSIFIER
™ a trademark of Baker Hughes Incorporated.

Product code : DMO7040

Relevant identified uses of the substance or mixture and uses advised against

Identified uses : Demulsifier.

Print date : 5/1/2020

Validation date : 5/1/2020

Version : 2

Supplier's details : Baker Petrolite LLC
12645 W. Airport Blvd.
Sugar Land, TX 77478
For Product Information/SDSs Call: 800-231-3606
(8:00 a.m. - 5:00 p.m. CST, Monday - Friday) 281-276-5400

Emergency telephone number (with hours of operation) : CHEMTREC: 800-424-9300 (U.S. 24 hour)
Baker Petrolite: 800-231-3606
(001)281-276-5400
CHEMTREC Int'l 01-703-527-3887 (International 24 hour)

Section 2. Hazards identification

OSHA/HCS status : This material is considered hazardous by the OSHA Hazard Communication Standard (29 CFR 1910.1200).

Classification of the substance or mixture : FLAMMABLE LIQUIDS - Category 3
SKIN IRRITATION - Category 2
EYE IRRITATION - Category 2A
CARCINOGENICITY - Category 2
SPECIFIC TARGET ORGAN TOXICITY (SINGLE EXPOSURE) (Respiratory tract irritation) - Category 3
SPECIFIC TARGET ORGAN TOXICITY (SINGLE EXPOSURE) (Narcotic effects) - Category 3
AQUATIC HAZARD (ACUTE) - Category 3
AQUATIC HAZARD (LONG-TERM) - Category 2

GHS label elements

Hazard pictograms :

Signal word : Warning

Section 2. Hazards identification

Hazard statements : Flammable liquid and vapor.
Causes serious eye irritation.
Causes skin irritation.
Suspected of causing cancer.
May cause respiratory irritation.
May cause drowsiness or dizziness.
Toxic to aquatic life with long lasting effects.

Precautionary statements

Prevention : Obtain special instructions before use. Do not handle until all safety precautions have been read and understood. Wear protective gloves: > 8 hours (breakthrough time): Nitrile or Neoprene gloves. 4H gloves.. Wear eye or face protection. Wear protective clothing. Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking. Use explosion-proof electrical, ventilating, lighting and all material-handling equipment. Use only non-sparking tools. Take precautionary measures against static discharge. Keep container tightly closed. Use only outdoors or in a well-ventilated area. Avoid release to the environment. Avoid breathing vapor. Wash hands thoroughly after handling.

Response : Collect spillage. IF exposed or concerned: Get medical attention. IF INHALED: Remove person to fresh air and keep comfortable for breathing. Call a POISON CENTER or physician if you feel unwell. IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water or shower. IF ON SKIN: Wash with plenty of soap and water. Take off contaminated clothing and wash it before reuse. If skin irritation occurs: Get medical attention. IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. If eye irritation persists: Get medical attention.

Storage : Store locked up. Store in a well-ventilated place. Keep cool.

Disposal : Dispose of contents and container in accordance with all local, regional, national and international regulations.

Supplemental label elements : Avoid contact with skin and clothing. Wash thoroughly after handling.

Hazards not otherwise classified : Prolonged or repeated contact may dry skin and cause irritation.

Section 3. Composition/information on ingredients

Substance/mixture : Mixture

Ingredient name	%	CAS number
Light aromatic naphtha	20 - 30	64742-95-6
1,2,4-Trimethylbenzene	10 - 20	95-63-6
Heavy aromatic naphtha	5 - 10	64742-94-5
1,3,5-Trimethylbenzene	5 - 10	108-67-8
Xylene	1 - 5	1330-20-7
1,2,3-Trimethylbenzene	1 - 5	526-73-8
Naphthalene	0.1 - 1	91-20-3
Cumene	0.1 - 1	98-82-8
Ethylbenzene	0.1 - 1	100-41-4

Section 4. First aid measures

Description of necessary first aid measures

Eye contact : Immediately flush eyes with plenty of water, occasionally lifting the upper and lower eyelids. Continue to rinse for at least 10 minutes. Check for and remove any contact lenses. Get medical attention.

Inhalation : Remove victim to fresh air and keep at rest in a position comfortable for breathing. If not breathing, if breathing is irregular or if respiratory arrest occurs, provide artificial respiration or oxygen by trained personnel. If unconscious, place in recovery position and get medical attention immediately. Maintain an open airway.

Skin contact : Wash skin thoroughly with soap and water or use recognized skin cleanser. Remove contaminated clothing and shoes. Continue to rinse for at least 10 minutes. Get medical attention. Wash clothing before reuse. Clean shoes thoroughly before reuse.

Ingestion : Wash out mouth with water. If material has been swallowed and the exposed person is conscious, give small quantities of water to drink. Do not induce vomiting unless directed to do so by medical personnel. If vomiting occurs, the head should be kept low so that vomit does not enter the lungs. Never give anything by mouth to an unconscious person. If unconscious, place in recovery position and get medical attention immediately. Maintain an open airway.

Most important symptoms/effects, acute and delayed

Potential acute health effects

Eye contact : Causes serious eye irritation.

Inhalation : Can cause central nervous system (CNS) depression. May cause drowsiness or dizziness. May cause respiratory irritation.

Skin contact : Causes skin irritation. Defatting to the skin.

Ingestion : Can cause central nervous system (CNS) depression.

Over-exposure signs/symptoms

Eye contact : pain or irritation,watering,redness

Inhalation : respiratory tract irritation,coughing,nausea or vomiting,headache,drowsiness/fatigue, dizziness/vertigo,unconsciousness

Skin contact : irritation,redness,dryness,cracking

Ingestion : No specific data.

Indication of immediate medical attention and special treatment needed, if necessary

Notes to physician : Treat symptomatically. Contact poison treatment specialist immediately if large quantities have been ingested or inhaled.

Specific treatments : No specific treatment.

Protection of first-aiders : No action shall be taken involving any personal risk or without suitable training. If it is suspected that fumes are still present, the rescuer should wear an appropriate mask or self-contained breathing apparatus. It may be dangerous to the person providing aid to give mouth-to-mouth resuscitation.

See toxicological information (Section 11)

Additional information

If product is ingested and vomiting occurs naturally, have person lean forward to reduce the risk of aspiration into the lungs.

Section 5. Fire-fighting measures

Extinguishing media

Suitable extinguishing media : Use dry chemical, CO_2, alcohol-resistant foam or water spray (fog).

Unsuitable extinguishing media : Do not use water jet.

Specific hazards arising from the chemical : Flammable liquid and vapor. Runoff to sewer may create fire or explosion hazard. In a fire or if heated, a pressure increase will occur and the container may burst, with the risk of a subsequent explosion. The vapor/gas is heavier than air and will spread along the ground. Vapors may accumulate in low or confined areas or travel a considerable distance to a source of ignition and flash back. This material is toxic to aquatic life with long lasting effects. Fire water contaminated with this material must be contained and prevented from being discharged to any waterway, sewer or drain.

Hazardous thermal decomposition products : carbon dioxide,carbon monoxide

Special protective actions for fire-fighters : Promptly isolate the scene by removing all persons from the vicinity of the incident if there is a fire. No action shall be taken involving any personal risk or without suitable training. Move containers from fire area if this can be done without risk. Use water spray to keep fire-exposed containers cool.

Special protective equipment for fire-fighters : Fire-fighters should wear appropriate protective equipment and self-contained breathing apparatus (SCBA) with a full face-piece operated in positive pressure mode.

Section 6. Accidental release measures

Personal precautions, protective equipment and emergency procedures

For non-emergency personnel : No action shall be taken involving any personal risk or without suitable training. Evacuate surrounding areas. Keep unnecessary and unprotected personnel from entering. Do not touch or walk through spilled material. Shut off all ignition sources. No flares, smoking or flames in hazard area. Avoid breathing vapor or mist. Provide adequate ventilation. Wear appropriate respirator when ventilation is inadequate. Put on appropriate personal protective equipment.

For emergency responders : If specialized clothing is required to deal with the spillage, take note of any information in Section 8 on suitable and unsuitable materials. See also the information in "For non-emergency personnel".

Environmental precautions : Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers. Inform the relevant authorities if the product has caused environmental pollution (sewers, waterways, soil or air). Water polluting material. May be harmful to the environment if released in large quantities. Collect spillage.

Methods and materials for containment and cleaning up

Small spill : Stop leak if without risk. Move containers from spill area. Use spark-proof tools and explosion-proof equipment. Dilute with water and mop up if water-soluble. Alternatively, or if water-insoluble, absorb with an inert dry material and place in an appropriate waste disposal container. Dispose of via a licensed waste disposal contractor.

Large spill : Stop leak if without risk. Move containers from spill area. Use spark-proof tools and explosion-proof equipment. Approach release from upwind. Prevent entry into sewers, water courses, basements or confined areas. Wash spillages into an effluent treatment plant or proceed as follows. Contain and collect spillage with non-combustible, absorbent material e.g. sand, earth, vermiculite or diatomaceous earth and place in container for disposal according to local regulations (see Section 13). Dispose of via a licensed waste disposal contractor. Contaminated absorbent material may pose the same hazard as the spilled product. Note: see Section 1 for emergency contact information and Section 13 for waste disposal.

Section 6. Accidental release measures

If RQ (Reportable Quantity) is exceeded, report to National Spill Response Office at 1-800-424-8802.

Section 7. Handling and storage

Precautions for safe handling

Protective measures : Put on appropriate personal protective equipment (see Section 8). Avoid exposure - obtain special instructions before use. Do not handle until all safety precautions have been read and understood. Do not get in eyes or on skin or clothing. Do not ingest. Avoid breathing vapor or mist. Avoid release to the environment. Use only with adequate ventilation. Wear appropriate respirator when ventilation is inadequate. Do not enter storage areas and confined spaces unless adequately ventilated. Keep in the original container or an approved alternative made from a compatible material, kept tightly closed when not in use. Store and use away from heat, sparks, open flame or any other ignition source. Use explosion-proof electrical (ventilating, lighting and material handling) equipment. Use only non-sparking tools. Take precautionary measures against electrostatic discharges. Empty containers retain product residue and can be hazardous. Do not reuse container.

Advice on general occupational hygiene : Eating, drinking and smoking should be prohibited in areas where this material is handled, stored and processed. Workers should wash hands and face before eating, drinking and smoking. Remove contaminated clothing and protective equipment before entering eating areas. See also Section 8 for additional information on hygiene measures.

Conditions for safe storage, including any incompatibilities : Store in accordance with local regulations. Store in a segregated and approved area. Store in original container protected from direct sunlight in a dry, cool and well-ventilated area, away from incompatible materials (see Section 10) and food and drink. Store locked up. Eliminate all ignition sources. Separate from oxidizing materials. Keep container tightly closed and sealed until ready for use. Containers that have been opened must be carefully resealed and kept upright to prevent leakage. Do not store in unlabeled containers. Use appropriate containment to avoid environmental contamination. See Section 10 for incompatible materials before handling or use.

Section 8. Exposure controls/personal protection

Control parameters

Occupational exposure limits

Ingredient name	Exposure limits
Light aromatic naphtha 1,2,4-Trimethylbenzene	None. **ACGIH TLV (United States, 3/2019).** TWA: 123 mg/m³, 0 times per shift, 8 hours. TWA: 25 ppm, 0 times per shift, 8 hours. **NIOSH REL (United States, 10/2016).** TWA: 125 mg/m³, 0 times per shift, 10 hours. TWA: 25 ppm, 0 times per shift, 10 hours. **OSHA PEL 1989 (United States, 3/1989).** TWA: 125 mg/m³, 0 times per shift, 8 hours. TWA: 25 ppm, 0 times per shift, 8 hours.
Heavy aromatic naphtha 1,3,5-Trimethylbenzene	None. **ACGIH TLV (United States, 3/2019).** TWA: 123 mg/m³, 0 times per shift, 8 hours. TWA: 25 ppm, 0 times per shift, 8 hours. **NIOSH REL (United States, 10/2016).** TWA: 125 mg/m³, 0 times per shift, 10 hours. TWA: 25 ppm, 0 times per shift, 10 hours. **OSHA PEL 1989 (United States, 3/1989).** TWA: 125 mg/m³, 0 times per shift, 8 hours. TWA: 25 ppm, 0 times per shift, 8 hours.

Section 8. Exposure controls/personal protection

Xylene	**ACGIH TLV (United States, 3/2019).** STEL: 651 mg/m³, 0 times per shift, 15 minutes. STEL: 150 ppm, 0 times per shift, 15 minutes. TWA: 434 mg/m³, 0 times per shift, 8 hours. TWA: 100 ppm, 0 times per shift, 8 hours. **OSHA PEL (United States, 5/2018).** TWA: 435 mg/m³, 0 times per shift, 8 hours. TWA: 100 ppm, 0 times per shift, 8 hours. **OSHA PEL 1989 (United States, 3/1989).** STEL: 655 mg/m³, 0 times per shift, 15 minutes. STEL: 150 ppm, 0 times per shift, 15 minutes. TWA: 435 mg/m³, 0 times per shift, 8 hours. TWA: 100 ppm, 0 times per shift, 8 hours.
1,2,3-Trimethylbenzene	**ACGIH TLV (United States, 3/2019).** TWA: 123 mg/m³, 0 times per shift, 8 hours. TWA: 25 ppm, 0 times per shift, 8 hours. **NIOSH REL (United States, 10/2016).** TWA: 125 mg/m³, 0 times per shift, 10 hours. TWA: 25 ppm, 0 times per shift, 10 hours. **OSHA PEL 1989 (United States, 3/1989).** TWA: 125 mg/m³, 0 times per shift, 8 hours. TWA: 25 ppm, 0 times per shift, 8 hours.
Naphthalene	**ACGIH TLV (United States, 3/2019). Absorbed through skin.** TWA: 52 mg/m³, 0 times per shift, 8 hours. TWA: 10 ppm, 0 times per shift, 8 hours. **NIOSH REL (United States, 10/2016).** STEL: 75 mg/m³, 0 times per shift, 15 minutes. STEL: 15 ppm, 0 times per shift, 15 minutes. TWA: 50 mg/m³, 0 times per shift, 10 hours. TWA: 10 ppm, 0 times per shift, 10 hours. **OSHA PEL (United States, 5/2018).** TWA: 50 mg/m³, 0 times per shift, 8 hours. TWA: 10 ppm, 0 times per shift, 8 hours. **OSHA PEL 1989 (United States, 3/1989).** STEL: 75 mg/m³, 0 times per shift, 15 minutes. STEL: 15 ppm, 0 times per shift, 15 minutes. TWA: 50 mg/m³, 0 times per shift, 8 hours. TWA: 10 ppm, 0 times per shift, 8 hours.
Cumene	**ACGIH TLV (United States, 3/2019).** TWA: 50 ppm, 0 times per shift, 8 hours. **NIOSH REL (United States, 10/2016). Absorbed through skin.** TWA: 245 mg/m³, 0 times per shift, 10 hours. TWA: 50 ppm, 0 times per shift, 10 hours. **OSHA PEL (United States, 5/2018). Absorbed through skin.** TWA: 245 mg/m³, 0 times per shift, 8 hours. TWA: 50 ppm, 0 times per shift, 8 hours. **OSHA PEL 1989 (United States, 3/1989). Absorbed through skin.** TWA: 245 mg/m³, 0 times per shift, 8 hours. TWA: 50 ppm, 0 times per shift, 8 hours.
Ethylbenzene	**ACGIH TLV (United States, 3/2019).** TWA: 20 ppm, 0 times per shift, 8 hours. **NIOSH REL (United States, 10/2016).** STEL: 545 mg/m³, 0 times per shift, 15 minutes.

Section 8. Exposure controls/personal protection

	STEL: 125 ppm, 0 times per shift, 15 minutes. TWA: 435 mg/m³, 0 times per shift, 10 hours. TWA: 100 ppm, 0 times per shift, 10 hours. **OSHA PEL (United States, 5/2018).** TWA: 435 mg/m³, 0 times per shift, 8 hours. TWA: 100 ppm, 0 times per shift, 8 hours. **OSHA PEL 1989 (United States, 3/1989).** STEL: 545 mg/m³, 0 times per shift, 15 minutes. STEL: 125 ppm, 0 times per shift, 15 minutes. TWA: 435 mg/m³, 0 times per shift, 8 hours. TWA: 100 ppm, 0 times per shift, 8 hours.

Consult local authorities for acceptable exposure limits.

If OSHA permissible exposure levels are shown above they are the OSHA 1989 levels or are from subsequent OSHA regulatory actions. Although the 1989 levels have been vacated the 11th Circuit Court of Appeals, Baker Hughes recommends that these lower exposure levels be observed as reasonable worker protection.

Appropriate engineering controls : Use only with adequate ventilation. Use process enclosures, local exhaust ventilation or other engineering controls to keep worker exposure to airborne contaminants below any recommended or statutory limits. The engineering controls also need to keep gas, vapor or dust concentrations below any lower explosive limits. Use explosion-proof ventilation equipment.

Individual protection measures

Hygiene measures : Wash hands, forearms and face thoroughly after handling chemical products, before eating, smoking and using the lavatory and at the end of the working period. Appropriate techniques should be used to remove potentially contaminated clothing. Wash contaminated clothing before reusing. Ensure that eyewash stations and safety showers are close to the workstation location.

Eye/face protection : Wear chemical safety goggles. When transferring material wear face-shield in addition to chemical safety goggles.

Hand protection : Chemical-resistant gloves: Nitrile or Neoprene gloves. 4H gloves.

Skin protection : Wear long sleeves to prevent repeated or prolonged skin contact.

Respiratory protection : If a risk assessment indicates it is necessary, use a properly fitted, air purifying or supplied air respirator complying with an approved standard. Respirator selection must be based on known or anticipated exposure levels, the hazards of the product and the safe working limits of the selected respirator.

Section 9. Physical and chemical properties

Appearance

Physical state : Liquid.

Color : Amber.

Odor : Aromatic hydrocarbon.

Odor threshold : Not available.

pH : 5 to 6

: in IPA/water

Melting/freezing point : Not available.

Boiling point : Not available.

Initial Boiling Point : Not available.

Flash point : Closed cup: 45°C (113°F) [PMCC]

Burning time : Not applicable.

Burning rate : Not applicable.

Section 9. Physical and chemical properties

Evaporation rate : Not available.

Flammability (solid, gas) : Flammable in the presence of the following materials or conditions: open flames, sparks and static discharge and heat.

Lower and upper explosive (flammable) limits : Not available.

Vapor pressure : Not available.

Vapor density : >1 [Air = 1]

Relative density : 0.93 (15.6°C)

Density : 7.75 (lbs/gal)

Solubility in water : Dispersible

Partition coefficient: n-octanol/water : Not available.

Auto-ignition temperature : Not available.

Decomposition temperature : Not available.

Viscosity : Not available.

VOC : Not available.

Pour Point : Not available.

Section 10. Stability and reactivity

Reactivity : No specific test data related to reactivity available for this product or its ingredients.

Chemical stability : The product is stable.

Possibility of hazardous reactions : Under normal conditions of storage and use, hazardous reactions will not occur.

Conditions to avoid : Avoid all possible sources of ignition (spark or flame). Do not pressurize, cut, weld, braze, solder, drill, grind or expose containers to heat or sources of ignition. Do not allow vapor to accumulate in low or confined areas.

Incompatible materials : Reactive or incompatible with the following materials: oxidizing materials and acids.

Hazardous decomposition products : Under normal conditions of storage and use, hazardous decomposition products should not be produced.

Section 11. Toxicological information

Information on toxicological effects

Acute toxicity

Product/ingredient name	Result	Species	Dose	Exposure
Light aromatic naphtha	LD50 Oral	Rat	2900 mg/kg	-
1,2,4-Trimethylbenzene	LC50 Inhalation Vapor	Rat	18000 mg/m³	4 hours
	LD50 Oral	Rat	5 g/kg	-
Heavy aromatic naphtha	LC50 Inhalation Vapor	Rat	>11.4 mg/l	6 hours
	LD50 Oral	Rat	3200 mg/kg	-
	LD50 Oral	Rat	>2000 mg/kg	-
1,3,5-Trimethylbenzene	LC50 Inhalation Vapor	Rat	24000 mg/m³	4 hours

Ethylbenzene	Category 2	Not determined	hearing organs

Aspiration hazard

Section 11. Toxicological information

Name	Result
Light aromatic naphtha	ASPIRATION HAZARD - Category 1
Heavy aromatic naphtha	ASPIRATION HAZARD - Category 1
Xylene	ASPIRATION HAZARD - Category 1
1,2,3-Trimethylbenzene	ASPIRATION HAZARD - Category 1
Cumene	ASPIRATION HAZARD - Category 1

Information on the likely routes of exposure : Routes of entry anticipated: Dermal, Inhalation.

Potential acute health effects

Eye contact : Causes serious eye irritation.

Inhalation : Can cause central nervous system (CNS) depression. May cause drowsiness or dizziness. May cause respiratory irritation.

Skin contact : Causes skin irritation. Defatting to the skin.

Ingestion : Can cause central nervous system (CNS) depression.

Symptoms related to the physical, chemical and toxicological characteristics

Eye contact : pain or irritation,watering,redness

Inhalation : respiratory tract irritation,coughing,nausea or vomiting,headache,drowsiness/fatigue, dizziness/vertigo,unconsciousness

Skin contact : irritation,redness,dryness,cracking

Ingestion : No specific data.

Delayed and immediate effects and also chronic effects from short and long term exposure

Short term exposure

Potential immediate effects : Not available.

Potential delayed effects : Not available.

Long term exposure

Potential immediate effects : Not available.

Potential delayed effects : Not available.

Potential chronic health effects

General : Prolonged or repeated contact can defat the skin and lead to irritation, cracking and/or dermatitis.

Carcinogenicity : Suspected of causing cancer. Risk of cancer depends on duration and level of exposure.

Mutagenicity : No known significant effects or critical hazards.

Teratogenicity : No known significant effects or critical hazards.

Developmental effects : No known significant effects or critical hazards.

Fertility effects : No known significant effects or critical hazards.

Numerical measures of toxicity

Acute toxicity estimates

Section 11. Toxicological information

Product/ingredient name	Oral (mg/kg)	Dermal (mg/kg)	Inhalation (gases) (ppm)	Inhalation (vapors) (mg/l)	Inhalation (dusts and mists) (mg/l)
TRETOLITE™ DMO7040 DEMULSIFIER	Not available.	23081.2	104914.5	94.5	Not available.
Light aromatic naphtha	2900	Not available.	Not available.	Not available.	Not available.
1,2,4-Trimethylbenzene	5000	Not available.	Not available.	18	Not available.
Heavy aromatic naphtha	3200	Not available.	Not available.	Not available.	Not available.
1,3,5-Trimethylbenzene	5000	Not available.	Not available.	24	Not available.
Xylene	4300	1100	5000	Not available.	Not available.
Naphthalene	500	Not available.	Not available.	Not available.	Not available.
Cumene	2900	10600	Not available.	39	Not available.
Ethylbenzene	3500	15400	Not available.	11	Not available.

Section 12. Ecological information

Toxicity

Product/ingredient name	Result	Species	Exposure
1,2,4-Trimethylbenzene	Acute LC50 4910 µg/l Marine water	Crustaceans - Elasmopus pectenicrus	48 hours
	Acute LC50 22.4 mg/l Fresh water	Fish - Tilapia zillii	96 hours
1,3,5-Trimethylbenzene	Acute LC50 12520 to 15050 µg/l Fresh water	Fish - Carassius auratus	96 hours
	Chronic NOEC 400 µg/l Fresh water	Daphnia - Daphnia magna	21 days
Xylene	Acute LC50 8500 µg/l Marine water	Crustaceans - Palaemonetes pugio	48 hours
	Acute LC50 13400 µg/l Fresh water	Fish - Pimephales promelas	96 hours
Naphthalene	EC50 2.96 mg/l Fresh water	Algae - Pseudokirchneriella subcapitata	96 hours
	EC50 2.16 mg/l Fresh water	Daphnia	48 hours
	LC50 1.6 mg/l Fresh water	Fish - Oncorhynchus mykiss	96 hours
Cumene	Acute EC50 2600 µg/l Fresh water	Algae - Pseudokirchneriella subcapitata	72 hours
	Acute LC50 7400 to 11290 µg/l Fresh water	Crustaceans - Artemia sp.	48 hours
	Acute LC50 30500 µg/l Fresh water	Daphnia - Daphnia magna	48 hours
	Acute LC50 2700 µg/l Fresh water	Fish - Oncorhynchus mykiss	96 hours
Ethylbenzene	Acute EC50 4600 µg/l Fresh water	Algae - Pseudokirchneriella subcapitata	72 hours
	Acute EC50 2930 to 4400 µg/l Fresh water	Daphnia - Daphnia magna	48 hours
	Acute LC50 5200 µg/l Marine water	Crustaceans - Americamysis bahia	48 hours
	Acute LC50 4200 µg/l Fresh water	Fish - Oncorhynchus mykiss	96 hours
	Chronic NOEC 1000 µg/l Fresh water	Algae - Pseudokirchneriella subcapitata	96 hours

Section 12. Ecological information

Persistence and degradability

Not available.

Other adverse effects : No known significant effects or critical hazards.

Section 13. Disposal considerations

Disposal methods : Dispose of surplus and non-recyclable products via a licensed waste disposal contractor. Waste packaging should be recycled. Incineration or landfill should only be considered when recycling is not feasible. This material and its container must be disposed of in a safe way. Care should be taken when handling emptied containers that have not been cleaned or rinsed out. Vapor from product residues may create a highly flammable or explosive atmosphere inside the container. Do not cut, weld or grind used containers unless they have been cleaned thoroughly internally. Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers.

Section 14. Transport information

	DOT Classification	TDG Classification	IMDG	IATA
UN number	UN1993	UN1993	UN1993	UN1993
UN proper shipping name	FLAMMABLE LIQUID, N.O.S. (Contains: Light aromatic naphtha, Xylene)	FLAMMABLE LIQUID, N.O.S. (Contains: Light aromatic naphtha, Xylene)	FLAMMABLE LIQUID, N.O.S. (Contains: Light aromatic naphtha, Xylene)	FLAMMABLE LIQUID, N.O.S. (Contains: Light aromatic naphtha, 1,2,4-Trimethylbenzene)
Transport hazard class(es)	3 	3 	3 	3 
Packing group	III	III	III	III
Environmental hazards	Yes.	Yes.	Yes.	Yes. The environmentally hazardous substance mark is not required.

Additional information

DOT Classification : This product may be re-classified as "Combustible Liquid," unless transported by vessel or aircraft. Non-bulk packages (less than or equal to 119 gal) of combustible liquids, that are marine pollutants, are not regulated as hazardous materials in package sizes less than the product reportable quantity, unless transported by vessel.
This product is not regulated as a marine pollutant when transported on inland waterways in sizes of ≤5 L or ≤5 kg or by road, rail, or inland air in non-bulk sizes, provided the packagings meet the general provisions of §§ 173.24 and 173.24a.
Reportable quantity 2098.3 lbs / 952.62 kg [270.6 gal / 1024.3 L]. Package sizes shipped in quantities less than the product reportable quantity are not subject to the RQ (reportable quantity) transportation requirements.

TDG Classification : Product classified as per the following sections of the Transportation of Dangerous Goods Regulations: 2.18-2.19 (Class 3), 2.7 (Marine pollutant mark).
The marine pollutant mark is not required when transported by road or rail.

IMDG : The marine pollutant mark is not required when transported in sizes of ≤5 L or ≤5 kg.
Emergency schedules F-E S-E

Section 14. Transport information

IATA : The environmentally hazardous substance mark may appear if required by other transportation regulations.

Special precautions for user : **Transport within user's premises:** always transport in closed containers that are upright and secure. Ensure that persons transporting the product know what to do in the event of an accident or spillage.

Transport in bulk according to Annex II of MARPOL and the IBC Code : Not available.

DOT Reportable Quantity
Xylene, 271 gal of this product.
Naphthalene, 1356 gal of this product.

Marine pollutant
Light aromatic naphtha
1,2,4-Trimethylbenzene

North-America NAERG : 128

Section 15. Regulatory information

U.S. Federal regulations :
