1.0 INTRODUCTION

Langan CA, Inc. (Langan) was retained by California Resources Corporation (CRC; the Client), to conduct a soil and soil vapor investigation for the property located at 20101 Goldenwest Street in Huntington Beach, California (Site). CRC is proposing a zone change to allow residential, commercial and open space uses on the property. The investigation was conducted to assess soil and soil vapor conditions in areas of the Site unencumbered by active infrastructure.

1.1 Site Description

The Site is identified as Orange County Assessor Parcel Numbers (APNs) 023-181-53 and 023-181-54. It is located in the City of Huntington Beach and consists of approximately 92 acres (see **Figure 1**). The Site is bounded to the southwest by Pacific Coast Highway, the Pacific Ocean is present to the southwest. Goldenwest Street adjoins the Site to the southeast and portions of Palm Avenue adjoin the northeast end of the Site. Seapoint Street divides the two parcels, with APN 023-181-53 to the northwest and APN 023-181-54 to the southeast. The Bolsa Chica Wetlands, oil fields and residential properties are present to the northwest/north. Further residential properties are present to the east and southeast.

1.2 Site Background

Prior to conducting subsurface investigations at the Site, historical aerial photographs and reasonably ascertainable environmental records (e.g., standard environmental database records, local environmental regulatory agency files, building permits, etc.) were reviewed to identify areas of potential environmental concern. Additionally, Langan conducted a site visit to observe the property. Langan was escorted by CRC representatives who provided further information regarding the Site and facility operations.

Documented oil field operations began on the Site as early as 1920 with the drilling of the first recorded oil well. Site use prior to 1920 is unknown. Presently, the Site consists of active, plugged and abandoned, and idle wells, pipelines, storage tanks, oil and gas processing equipment and storage, and office and warehouse buildings. Idle wells are scattered throughout the Site. Active wells are located along the southwestern portion of the Site. Historical pits are located adjacent to the active wells. Two stormwater detention ponds are located in the southeast portion of the Site.

The facility is used to process extracted crude oil from subsurface petroleum reservoirs; produced water and gas are byproducts of the oil extraction and are also processed at the facility.

The gas is processed to remove hydrogen sulfide (H_2S) along with other impurities to meet SoCal Gas quality specifications. The gas is then predominately sold to the SoCal Gas grid to be used in homes and businesses. As a safety back up, the gas can be flared off through a permitted combustion device. Produced water is processed to remove residual oil and solids and is reinjected into the subsurface oil reservoirs.

Oil and gas are also transported to the Site via transmission pipelines from Platform Emmy, which is located off the coast of Huntington Beach on a State Lease, and from the Bolsa Chica production area, which is located north of the Site. The former Fort Apache facility, located at 1810 Pacific Coast Highway, also transferred produced fluids to the Site via underground pipelines before operations ceased in early 2024. Product from off-site areas is transferred to the Site for processing, storage, and off-site distribution along with the product produced onsite.

Numerous features were identified on historical aerials for the Site, including but not limited to, oil wells, oil well cellars, aboveground storage tanks (ASTs), pipelines, smokestacks, sumps, and buildings. Based on Langan's review of historical aerial photographs and records, the following areas of potential environmental concern were identified: Northwest Historical Tanks, Former Stretford Unit, Northern Historical Tank Farm, Pipe Laydown, Transformer Storage, Maintenance and Truck Wash Buildings, Former Underground Storage Tanks (USTs), Chemical Storage Area, Historical Bermed Area, Former Chemical Laboratory, Southern Historical Tank Farm, Historical Southern Sumps, and Historical Southern Battery areas. Additionally, an Electromagnetic Anomaly Area was identified during prior investigations. These areas are depicted on a modern aerial photograph in **Figure 2**. Historical aerial photographs for the Site are included in the Langan *Initial Soil Investigation Report*, dated 31 December 2024. There are other areas of potential environmental concern noted from the historical aerial photographs; however, the areas included in **Figure 2** represent those areas accessible for investigation and not currently occupied by facility operations.

1.3 Prior Environmental Investigations

Langan previously conducted a soil investigation in November and December 2024. Geophysical surveys and soil sampling were completed in the Former Stretford Unit, Transformer Storage, Former Chemical Laboratory, and Northern Historical Tank Farm Areas. Geophysical surveys were also conducted in the Historical Southern Sumps and Truck Wash and Maintenance Buildings Area. Findings of the geophysical surveys informed the boring locations of these areas. The findings of the prior investigation are described in Langan's *Initial Soil Investigation Report*, dated 31 December 2024.

The investigation was continued in January and February 2025. Geophysical surveys (where previously not completed or needed for utility clearance) and soil sampling were completed in the Northwest Historical Tanks, Pipe Laydown, Maintenance and Truck Wash Buildings, Former Underground Storage Tank (UST), Electromagnetic Anomaly, Chemical Storage, Historical Bermed, Southern Historical Tank Farm, Southern Historical Sumps, and Southern Historical Tank Battery Areas. Portions of the Southern Historical Tank Farm, Southern Historical Sumps, and Southern Historical Tank Battery are currently in use by facility operations and were not accessible. The findings of this investigation are described in Langan's *First Supplemental Soil Investigation Report*, dated 24 March 2025.

The investigated areas are depicted on **Figure 2**.

1.4 Soil and Soil Vapor Investigation Purpose

This investigation is a continuance of the prior investigations. Some soil samples collected during prior investigations contained concentrations of petroleum hydrocarbons or metal constituents that were not assessed laterally or vertically. Geophysical surveys also identified electromagnetic (EM) and ground penetrating radar (GPR) anomalies where soil borings were not previously advanced. This investigation was undertaken to further assess soil concentrations and to investigate the EM and GPR anomalies. Additionally, this investigation included several borings for soil vapor sampling to obtain data to support planning efforts at the Site.

Between the primary dates of the investigation (April 2025) and the date of this report (September 2025), updated screening levels were released by the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) and California Department of Toxic Substances Control (DTSC). The updated screening levels are more conservative for several constituents included in the analytical suite for the Site, particularly diesel range total petroleum hydrocarbons (TPH), naphthalene, and tert-butyl alcohol (TBA). Delineation borings were selected based on the screening levels available at the time; however, the analytical results are compared to the updated versions. As a result, there may be locations where soil borings could have been advanced to evaluate conditions below the updated screening levels, but were not, as the revised criteria were unavailable during the initial investigation scoping.

2.0 INVESTIGATION SUMMARY

2.1 Pre-Field Activities

2.1.1 Permitting

The Site is located in the Orange County Health Care Agency (OCHCA) well permitting jurisdiction; however, OCHCA does not require permits for soil borings that A) are less than 50 feet in depth, B) do not enter groundwater, C) do not penetrate significant confining material beds, and D) will be backfilled within 24 hours of completion. A permit with the OCHCA permit was not required.

2.1.2 Health and Safety Plan

Langan prepared a Site-specific health and safety plan (HASP) consistent with Occupational Safety and Health Administration (OSHA) hazardous waste operations and emergency response (HAZWOPER) requirements for the field investigation activities. The HASP also included safety requirements and guidance consistent with CRC policies for field operations. The HASP was maintained at the Site and implemented during the completion of the field activities.

2.2 Field Activities Summary

The field activities were implemented between 4 April and 17 June 2025. Field activities began with geophysical surveys to clear boring locations of utilities on 4, 8 and 9 April 2025. Soil borings were advanced on 7-11, 14 and 15 April 2025 and 17 June 2025. Soil vapor probes were installed on 16, 17 and 22 April 2025. Soil vapor samples were collected from the probes on 22 and 25 April 2025. Investigation derived waste was removed from the Site on 29 July 2025.

The investigation locations are shown on **Figure 2**. Details regarding the environmental scope are described in **Sections 2.3, 2.4 & 2.5**.

2.3 Geophysical Survey

Under observation of Langan, Advantage Geophysics, Inc. (AGI) surveyed the new boring locations indicated on **Figure 2**. Geophysical survey tools included a Geonics EM61-MK2 Time-Domain Electromagnetic Sensor, a GSSI SIR 3000 Ground Penetrating Radar, a Schonstedt GA-52 Magnetic Gradiometer, Fisher M-Scope TW-6 Pipe and Cable Locator, a Vivax vLoc3-Pro Line Tracer, and a Stonex S700a Global Navigation Satellite System Receiver.

Utilities identified during the survey were temporarily marked at the surface to help inform future soil sampling activities. Langan also called in an Underground Service Alert (USA) ticket, also known as DigAlert, prior to the advancement of any borings (USA Ticket Number B250911083). Subsurface work did not commence until responses had been received from the required members.

2.4 Soil Sampling

2.4.1 *Soil Sampling Locations*

A total of 57 soil borings (including step out locations due to refusal) were advanced at the Site. The sample locations are described in the list below:

- Seven borings and two step-out borings were advanced in the Northwest Historical Tanks Area. These borings, identified as SB57A, SB147 through SB151A, are depicted on **Figure 3**.
- Eight borings and two step-out borings were advanced in the Northern Historical Tank Farm. These borings, identified as SB152 through SB158, are depicted on **Figure 4**.
- Six borings were advanced in the Pipe Laydown Area. These borings, identified as SB161 through SB166, are depicted on **Figure 5**.
- Eight borings were advanced in the Maintenance and Truck Wash Buildings Area. These borings, identified as SB167 through SB171, are depicted on **Figure 5**.
- One boring was advanced near the Chemical Storage Area. This boring, SB172, is depicted on **Figure 5**.
- Six borings were advanced in the Historical Bermed Area. These borings, identified as SB102A and SB173 through SB177, are depicted on **Figure 6**.
- Five borings were advanced in the Former Chemical Laboratory Area. These borings, identified as SB178 through SB182, are depicted on **Figure 6**.
- Ten borings and one step-out boring were advanced in the accessible portion of the Southern Historical Tank Farm Area. These borings, identified as SB119B, and SB183 through SB191, are depicted on **Figure 7**.
- Three borings were advanced in the accessible portions of the Southern Historical Sumps Area. These borings, identified as SB131A, SB192 and 193, are depicted on **Figure 8**.
- Five borings were advanced in accessible portions of the Southern Historical Tank Battery Area. These borings, identified as SB134A, SB135A and SB194 through SB142, are depicted on **Figure 8**.

2.4.2 *Boring Advancement*

Soft-digging methods were utilized during the first five feet of each soil boring (at a minimum) to help further clear the boring locations for underground utilities. For borings located in hard surface cover (i.e., concrete or asphalt) soft digging was conducted using a hand auger. Prior to hand augering, concrete or asphalt was first saw-cut until first encountered soil. For borings located in soft surface cover (i.e., dirt), soft-digging was completed using an air knife unit. At each boring location, an approximate one-foot by one-foot "L" was air knifed to five feet deep around the planned boring location. The "L" trench was then inspected for any evidence of utility lines entering into the boring location.

Once soft digging was completed, the remainder of each boring was advanced using a Geoprobe® direct push technology (DPT) rig.

Soft-digging and DPT drilling was conducted by ABC Liovin Drilling, Inc. (ABC) (California Contractor C-57 License No. 422904) under the supervision of Langan. "L" trenches were dug for soil borings SB147, SB148, SB155-SB157, SB161, SB165 and SB194. The remaining borings were first advanced using a hand auger.

During air knifing of SB151, refusal was encountered due to gravel and/or concrete pieces beneath the surface. A step-out was attempted to the southeast, where a clay pipe (material assumed) was encountered at approximately two feet bgs. The pipe was intact. SB151A was ultimately advanced at another step-out boring 20 feet from the original location via hand auger.

During air knifing of SB158, refusal was encountered due to concrete pieces encountered beneath the surface. The boring was stepped out to the north, just outside the EM anomaly being investigated, where a clay pipe (pipe material assumed) was encountered one feet bgs. The pipe was intact. SB158A was ultimately advanced at another step-out boring approximately 15 feet northwest of the original location via hand auger.

Concrete was encountered beneath the asphalt surface at SB183, located in an EM anomaly. The concrete was cored through and boring SB183 was advanced in the original location.

During advancement of SB119B, a hard, plastic-like material was encountered at approximately 17 feet bgs. This boring, intended for vertical delineation of SB119A, was stepped out approximately 10 feet to the northwest (SB119C) where this same material was encountered at 17 feet bgs. This boring was located to investigate a former sump. It is possible the encountered plastic-like material is an abandoned liner for the former sump.

No other line contacts or adverse conditions were encountered during boring advancement.

2.4.3 *Field Screening and Sample Collection*

Retrieved soil samples were screened in the field for visual evidence of staining and using a RAE Systems MiniRAE3000 photoionization detector (PID) for volatile organic compounds (VOCs). Select borings to were also screened using a Thermo Scientific Niton™ XL2 Plus x-ray fluorescence (XRF) analyzer to help delineate concentrations of arsenic (SB167 through SB170) and lead (SB184 through SB187) exceeding hazardous waste thresholds. The soil type, texture, composition, color (as compared to a Munsell® Soil Chart) was logged in the field consistent with International American Society of Testing and Materials (ASTM) Standards D2487-17 and D488-17. Various soil types were observed in the borings (gravel, clay, sand, silt). In general, gravel was encountered just beneath the surface in several boring locations, underlaid by silts or sands in the shallow soil to two to five feet bgs. Clayey soils were noted beneath the shallow silts/sands. PID readings of screened soil were between non-measurable (0.0 PPM) to a maximum of 115.9 parts per million (ppm) in sample SB178-2.0. Copies of the field observations, boring logs and PID readings are included in **Appendix A**.

Samples for laboratory analysis were retrieved following field screening. The sampling depths for borings advanced to provide lateral delineation were identified previously based on prior investigation results. Borings advanced for vertical delineation were advanced to 30 feet bgs with samples collected at 20, 25, and 30 feet bgs. Analysis of these samples was conducted incrementally with deeper samples only analyzed if warranted by the results of the shallower sample. For borings advanced to investigate an EM or GPR anomaly, a sample for laboratory analysis was retrieved from each of the following intervals: 0-2 feet bgs (near-surface soil), 2-10 feet bgs (shallow soil), and the terminal depth of the boring (typically 15 feet bgs). The sampling depths were biased to target depth intervals with elevated PID readings and soil staining, if observed. The terminal boring depth was adjusted downward, as warranted, to be below indications of potential impacts observed during field screening.

Soil samples for laboratory analysis were collected either from the end of the hand-auger bucket or from acetate liners retrieved by the DTP rig. Samples were collected into laboratory supplied containers. Samples collected for analysis of VOCs were collected into United States Environmental Protection Agency (USEPA) Method 5035 sampling kits. Each sample was individually identified, labeled, and stored in a chilled cooler. The samples were then transported under standard chain-of-custody procedures to a certified laboratory.

Soil sampling equipment was decontaminated between sampling locations with a triple-rinse wash (washed and brushed once in a detergent solution, then twice with clean water). To help verify proper decontamination of sampling equipment, an equipment blank sample was collected at the end of each day by running deionized water over the cleaned hand auger or DPT drilling rod and collecting the rinsate into the appropriate sampling containers. To help identify potential contamination from ambient sources, a field blank sample was collected by pouring deionized water directly into laboratory supplied containers. A trip blank sample prepared by the laboratory was also submitted at the end of each day to help verify integrity of the samples during transit. Field quality assurance samples were also documented on the chain of custody.

No limitations were encountered during field screening and sample collection.

2.4.4 *Laboratory Analysis*

Collected samples were submitted to Eurofins CalScience (National Environmental Lab Accreditation Program No. 4175) for analysis. Samples were analyzed by one or more of the following methods:

- USEPA Methods 6010B/7471A for California Title 22 Metals
- USEPA Method 8015B (M) for Total Petroleum Hydrocarbons (TPH) by carbon chain number C4-C40
- USEPA Method 8260B for VOCs
- USEPA Method 8270C/8270C SIM for Semi-Volatile Organic Compounds (SVOCs) and polycyclic aromatic hydrocarbons (PAHs)

Samples collected for lateral or vertical delineation were analyzed by select methods appropriate to delineate the previously investigated area or boring. Samples collected from borings located in or next to EM or GPR anomalies were analyzed for all of the above methods.

If necessary, collected samples were further analyzed to determine soluble concentrations of select analytes. Total analyte concentrations that were greater than ten times the §66261.24 Hazardous Waste Characteristic of Toxicity Soluble Threshold Limit Concentrations (STLC) but less than the Total Threshold Limit Concentration (TTLC) were further analyzed following the Waste Extraction Test (WET) to determine their STLC component. Total analyte concentrations that were greater than twenty times the Toxicity Characteristic Leaching Procedure (TCLP) levels were further analyzed following USEPA Method 1311 TCLP.

Equipment and field blank samples were analyzed by the same analytical methods (adjusted for water) submitted for soil samples on that day. Trip blanks samples were analyzed for concentrations of VOCs. If VOCs were not included in the analytical lists for soil samples collected that day, a trip blank was not analyzed.

2.5 Soil Vapor Sampling

2.5.1 *Soil Vapor Sampling Locations*

A total of 12 borings for soil vapor probe installation (and nine borings where refusal was encountered during hand augering) were advanced at the Site. The soil vapor probes were installed throughout the Site in areas to provide data to support planning efforts for the Site. The soil vapor probe locations are depicted on **Figure 9**.

2.5.2 *Soil Vapor Probe Installation*

Soft-digging methods (i.e., hand augering) were utilized during the first five feet of each soil boring (at a minimum) to help further clear the boring locations for underground utilities. For borings located in hard surface cover, the concrete or asphalt was first saw-cut until first encountered soil. Once soft digging was completed, the remainder of each boring was advanced using a Geoprobe® direct push technology (DPT) rig. Soft-digging and DPT drilling was conducted by H&P Mobile Geochemistry, Inc. (H&P) (California Contractor C-57 License No. 920371) under the supervision of Langan.

Dual-nested soil vapor probes were installed in each boring at depths of five and 15 feet bgs. The probes were installed consistent with California Environmental Protection Agency (CalEPA) guidance[1]. One-eighth inch outer diameter Nylaflow tubing was inserted into each boring with probes set at five feet bgs and 15 feet bgs. Approximately 12 inches of sand were installed around each probe tip. To help protect the probe, a six-inch layer of dry granular bentonite was installed above and below (five-probe only) the sand. To form an airtight seal, the remainder of the annular fill consisted of hydrated bentonite to six inches below the next probe or the ground surface.

[1] California Environmental Protection Agency, *Advisory Active soil Gas Investigations*, July 2015

Refusal was encountered during hand augering at soil vapor probe locations SV01, SV03, SV07, SV09, and SV10 due to large concrete or gravel pieces encountered beneath the surface. These soil vapor probe locations had to be adjusted several times before they could be hand dug to five feet bgs.

No other adverse conditions were encountered during boring advancement.

2.5.3 *Field Screening and Sample Collection*

Soil from borings for soil vapor probe installation were screened in the field for visual evidence of staining and using a RAE Systems MiniRAE3000 PID for volatile VOCs. The soil type, texture, composition, color (as compared to a Munsell® Soil Chart) was logged in the field consistent with International American Society of Testing and Materials (ASTM) Standards D2487-17 and D488-17. Various soil types were observed in the borings (gravel, clay, sand, silt). Copies of the field observations, boring logs and PID readings are included in **Appendix A**.

Soil samples for laboratory analysis were retrieved from the soil vapor probe borings that contained visibly stained soil or soil with measurable VOC concentrations. This included borings SV01, SV02, SV05, SV06, SV07, and SV11. Soil samples for laboratory analysis were retrieved from the depth interval with the highest PID readings and soil staining and from the depth were PID readings and staining were no longer observed.

Soil samples for laboratory analysis were collected either from the end of the hand-auger bucket or from acetate liners retrieved by the DPT rig. Samples were collected into laboratory supplied containers. Samples collected for analysis of VOCs were collected into United States Environmental Protection Agency (USEPA) Method 5035 Sampling Kits. Each sample was individually identified, labeled, and stored in a chilled cooler. The samples were then transported under standard chain-of-custody procedures to a certified laboratory.

Soil sampling equipment was decontaminated between sampling locations following the same process that was utilized during the soil boring advancement, as described in **Section 2.4.3**.

Soil vapor samples were collected following CalEPA guidance. A minimum equilibration period of 48 hours was allowed before sample collection. A shut-in test was performed prior to purging or sampling to verify integrity of the soil vapor probe. A minimum of three probe volumes (tubing and dry annular space) were purged prior to sample collection. During purging, the flow rate was maintained between 200 and 500 milliliters per minute and the vacuum pressure was maintained below 100 inches of water. Once three well volumes were purged, the soil vapor sample was

collected into a 400-milliliter batch certified Summa® canister. During the sampling, a liquid leak check test was performed to determine if aboveground air infiltrated into the soil vapor sample. Soil vapor samples were individually identified, labeled, and then transported under standard chain-of-custody procedures to a certified laboratory.

No limitations were encountered during field screening and sample collection.

2.5.4 *Laboratory Analysis*

Collected soil samples were submitted to Eurofins CalScience (National Environmental Lab Accreditation Program No. 4175) for analysis. Samples were analyzed by the following methods:

- USEPA Methods 6010B/7471A for California Title 22 Metals
- USEPA Method 8015B (M) for Total Petroleum Hydrocarbons (TPH) by carbon chain number C4-C40
- USEPA Method 8260B for VOCs
- USEPA Method 8270C/8270C SIM for Semi-Volatile Organic Compounds (SVOCs) and polycyclic aromatic hydrocarbons (PAHs)

As was done for soil samples collected from the soil borings, samples were further analyzed for STLC and/or TCLP concentrations if necessary (see **Section 2.4.4**).

Collected soil vapor samples were submitted to H&P (National Environmental Lab Accreditation Program No. 4138) for analysis. Samples were analyzed by the following methods:

- USEPA Method TO-15 for VOCs
- USEPA Method 8015m for Methane

Equipment and field blank samples were analyzed by the same analytical methods (adjusted for water) submitted for soil samples on that day. Trip blanks samples were analyzed for concentrations of VOCs. If VOCs were not included in the analytical lists for soil samples collected that day, a trip blank was not analyzed. The replicate soil vapor samples were analyzed by the same analytical methods as the parent sample.

2.6 Surface Completion and Investigation Derived Waste

The airknifed "L" trenches at the Site were backfilled using native soil. Soil borings advanced via hand auger or DPT rig were backfilled with bentonite to the surface. Each soil boring was

completed to resemble the existing surface cover (i.e., dirt, asphalt, concrete). Soil vapor probes were covered with a temporary patch and left in place for potential future sampling.

Soil cuttings were stored in a Department of Transportation (DOT) approved, twenty cubic yard waste bin. Decontamination water was stored in one steel DOT-approved drum onsite. The soil bin and drums were labeled with the generator, generation date and contents identified. A composite soil sample was collected from the soil bin for waste profiling purposes (soil aliquots were collected from cardinal directions and composite for a representative profile sample). The water drums were also profiled from the composite soil sample. The investigation derived waste was profiled as non-hazardous. On 29 July 2025 the waste was picked up by Costera Waste & Environmental, Inc. (Contractors License No.1068264 A – HAZ) and transported offsite for disposal. Soil cuttings were transported to Waste Management Simi Valley; decontamination water was transported to World Oil Recycling, Compton, California. Copies of the waste manifests and weight ticket (soil only) are included in **Appendix B**.

3.0 INVESTIGATION FINDINGS

3.1 Geophysical Survey Findings

The geophysical survey completed during this investigation was conducted in previously surveyed areas to verify new boring locations were not in conflict with known utilities/lines and to ensure there were not utilities/lines not previously identified. The geophysical survey did not identify any new subsurface lines or anomalies not encountered during the prior investigations.

3.2 Soil Sampling Analytical Results

Laboratory analytical reports provided by Eurofins CalScience are included in **Appendix C.** The analytical results for collected soil samples are summarized by analyte group in the following tables:

- **Table 1** – Soil Analytical Results: Metals (Total Concentrations)
- **Table 2** – Soil Analytical Results: Metals (Soluble Concentrations)
- **Table 3** – Soil Analytical Results: Total Petroleum Hydrocarbons
- **Table 4** – Soil Analytical Results: Volatile Organic Compounds
- **Table 5** – Soil Analytical Results: Semi-Volatile Organic Compounds & Polycyclic Aromatic Hydrocarbons

Analyte concentrations and method detection limits were compared to select screening levels. Screening levels used for comparison were taken from the following sources, as appropriate and/or available.

- San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs), August 2025
- California Department of Toxic Substances Control (DTSC) Human Health Risk Assessment (HHRA) Note Number 3 DTSC-modified Screening Levels (DTSC-SLs), June 2020-Revised April 2025
- USEPA Regional Screening Levels (RSLs), November 2024
- DTSC HHRA Note Number 11 Southern California Ambient Arsenic Screening Level, December 2020
- Federal and State Hazardous Waste Characteristics of Toxicity Levels (§66261.24)

For the SFBRWQCB ESLs, DTSC-SLs, and USEPA RSLS, the most stringent screening level available for human health exposure (residential, commercial/industrial, or construction worker receptors), leaching to groundwater, and gross contamination from these sources was used for comparison. Concentrations exceeding the compared screening level are indicated in **bold** in the summary tables.

Screening levels from the Huntington Beach Fire Department (HBFD) City Specification No. 431-92 Soil Quality Standard, October 2022, were also evaluated when selecting comparison criteria for the analytical results. The HBFD Soil Quality Standard provides screening levels for TPHs (full carbon chain), benzene, toluene, ethylbenzene, xylenes, and PAHs. The SFBRWQCB, DTSC, and/or USEPA screening levels referenced above are more conservative than these values with the exception of oil range TPH and select PAHs. The SFBRWQCB and USEPA screening levels for oil range TPH and PAHs are derived from compound specific toxicity values and physical properties[2] evaluated based on scenario specific exposure parameters. The HBFD screening levels are generalized for the entire range of TPH mixtures and family of PAH compounds. The compound specific SFBRWQCB and USEPA screening levels were utilized to provide a more chemically relevant comparison level for the analytical results.

[2] Toxicity values and physical properties for TPH mixtures utilized by the SFBRWQCB and USEPA are based on the carbon chain fraction and a representative surrogate compound for calculating screening levels. The DTSC does not provided screening levels for TPH mixtures.

In several instances, SVOCs/PAHs detected by USEPA Method 8270C were also detected by USEPA Method 8270C SIM. The gas chromatography used in the basic 8270C method scans a large range of masses for an array of compounds. The SIM (selected ion monitoring) method allows data collection at specific mass indexes for target compounds. In **Table 5**, the following procedure was followed to determine whether the 8270C or the 8270C SIM result was included:

1. If either result is qualified because it exceeded the calibration range ("E") or it could not be verified and was rejected ("R"), the other result not qualified with "E" or "R" was included.
2. If both method results were not detected, the 8270C SIM reporting and method detection limit was included.
3. If the 8270C method result was not detected and the 8270C SIM method did detect a concentration, the 8270C SIM result was included.
4. If both method results identified a concentration, the higher of the two results was included.
5. If both method results identified a concentration and the concentrations were the same, the 8270C SIM result was included.

Both the 8270C and 8270C SIM results are included in the laboratory analytical reports in **Appendix C**.

Several of the analytical results included in the summary tables were qualified by Eurofins CalScience. Qualifiers with a significant bearing on the veracity of the analytical result are denoted in the summary tables. Other analytical or quality issues of less significance or that did not result in a qualified concentration value are chronicled in the job narratives of the complete laboratory analytical reports included in **Appendix C**.

Further summaries of the analytical results are provided by area in the following subsections.

3.2.11 *Field Quality Assurance Samples*

Equipment blank samples were below laboratory detection limits for nearly all analyzed constituents; however, each equipment blank sample did contain concentrations of between one to six analytes. In most cases, the detected analytes were also detected in the associated field blank sample. This is suggestive of an ambient source present that is influencing the equipment blank analytical results. Exceptions to this include detections of diesel and oil range TPH, barium, total chromium, and molybdenum on 7 April 2025, and nickel on 17 April 2025. On 22 April 2025, diesel and oil range TPH was detected in the field blank sample that was not detected in the associated equipment blank sample. Overall, the equipment blank and field blank analytical results indicate that proper decontamination procedures were followed and cross-contamination or contamination from ambient sources would have no to negligible bearing on the analytical results.

Trip blank samples were below laboratory detection limits for all analyzed VOCs, indicating the integrity of the samples was not compromised during transit.

The complete field quality assurance samples analytical results are included in **Table 6**.

3.2.12 *Analytical Results Method Detection Limits*

Method detection limits (MDLs) for several analytes were shown to exceed comparison criteria up to two orders of magnitude above site-specific standards. In most instances, MDLs above comparison criteria are associated with analyses where the sample was non-detect for most if not all remaining analytes. Laboratory MDLs are statistically derived and instrument-specific, representing the lowest concentration achievable without signal-to-noise interference. Instrument variability can account for differences in MDLs between individual samples, as samples for a site can be placed in separate analytical batches and analyzed on different instruments to meet turnaround time needs of projects. MDLs are also subject to variability due to individual sample characteristics for solid matrices as data is quantitated from on-column results and calculated with respect to multiple factors, including final sample volume, dilution factors, and sample percent moisture. Individual sample characteristics for solid matrices can significantly differ within narrow spatial ranges and samples within the immediate vicinity of each other can yield notably different results due to varying sample homogeneity or perceived matrix interferences.

3.3 Soil Vapor Sampling Analytical Results

The laboratory analytical report provided by H&P is included in **Appendix C.** The analytical results for collected soil vapor samples are summarized by analyte group in the following tables:

- **Table 7** – Soil Vapor Analytical Results: Volatile Organic Compounds
- **Table 8** – Soil Vapor Analytical Results: Methane

VOC concentrations and method detection limits were compared to select screening levels. Screening levels used for comparison were taken from the following sources, as appropriate and/or available.

- San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs), August 2025
- California Department of Toxic Substances Control (DTSC) Human Health Risk Assessment (HHRA) Note Number 3 DTSC-modified Screening Levels (DTSC-SLs), June 202-Revised April 2025
- USEPA Regional Screening Levels (RSLs), November 2024

The most stringent screening level available for human health exposure from these sources was used for comparison. For the DTSC-SLs and USEPA RSLs, an attenuation factor of 0.03 was

applied to the air screening levels provided for comparison to soil vapor concentrations[3]. Concentrations exceeding the compared screening level are indicated in **bold** in the summary tables.

Soil vapor samples collected across the site contained concentrations of 1,1-dichloroethane, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, 4-ethyltoluene, acetone, benzene, carbon disulfide, chlorobenzene, chloroform, chloromethane, cis-1,2-dichloroethene, dichlorodifluoromethane, ethylbenzene, m,p-xylene, methyl ethyl ketone (2-butanone), methyl isobutyl ketone (MIBK), methylene chloride, o-xylene, tert-butyl alcohol, tetrachloroethene (PCE), toluene, trichloroethene (TCE), trichlorofluoromethane, and vinyl chloride. Of these VOCs, only concentrations of benzene, ethylbenzene, chloroform, methylene chloride, PCE, and vinyl chloride exceed screening levels. Only soil vapor probe SV08, located in this Historical Bermed Area, did not contain VOC concentrations exceeding screening levels.

Methane concentrations were evaluated based on Huntington Beach City Specification No. 429[4]. Based on the City specification, a passive methane mitigation system will need to be evaluated. Where methane concentrations exceed 12,000 parts per million by volume (ppmv), an active system will need to be evaluated. Methane concentrations in soil vapor probes SV07 and SV10 exceeded the active mitigation system threshold. Otherwise, methane concentrations were in the passive system range.

3.3.1 *Field Quality Assurance Samples*

The relative percent difference (RPD) between soil vapor replicate samples for analytes with concentrations detected above laboratory reporting limits were between zero and 68.29 percent. Variability in analytical results is inherent to analysis of volatile mediums such as soil vapor. With the exception of ethylbenzene, m,p-xylene and 4-ethyltolune, the RPD was less than 25 percent. When evaluating soil vapor data, the higher of the two values between the parent and replicate sample is considered.

---

[3] Attenuation factor of 0.03 applied as recommended in CalEPA *Supplemental Guidance: Screening and Evaluating Vapor Intrusion*, February 2023.

[4] The City Specification is referenced to help evaluate the methane results and does not indicate that the methane sampling was conducted to the City Specification requirements or should be used for final methane mitigation design.

3.3.2 *Analytical Results Method Detection Limits*

Method detection limits (MDLs) for several analytes were shown to exceed comparison criteria up to one order of magnitude above site-specific standards. In most instances, MDLs above comparison criteria are associated with analyses where the sample was non-detect for most if not all remaining analytes. Laboratory MDLs are statistically derived and instrument-specific, representing the lowest concentration achievable without signal-to-noise interference. Instrument variability can account for differences in MDLs between individual samples, as samples for a site can be placed in separate analytical batches and analyzed on different instruments to meet turnaround time needs of projects. MDLs are also subject to variability due to individual sample characteristics as data is quantitated from on-column results and calculated with respect to multiple factors, including final sample volume and dilution factors. Individual sample characteristics for air matrices can significantly differ within narrow spatial ranges and samples within the immediate vicinity of each other can yield notably different results due to variability inherent to air mediums and perceived matrix interferences.

4.0 PROUCL ANALYSIS

Several soil borings advanced as part of this investigation were not laterally delineated to below site screening levels in all directions. In some instances, this is due to the borings being located next to site operations/infrastructure or being located next to the site boundary. However, there were also borings where further step-out borings could be made in an attempt to delineate the concentrations further. These borings are identified in the table below:

Area	Borings	Analytes Exceeding Screening Levels
Northwest Historical Tanks	SB50, SB147, SB148, SB150	Diesel TPH
Northern Historical Tank Farm	SB46, SB152	Arsenic, diesel TPH, naphthalene, TBA
Pipe Laydown Area	SB58, SB59, SB165	Diesel TPH
Truck Wash and Maintenance Building Area	SB74, SB77, SB80, SB81A SV06, SV07	Gasoline/diesel/oil TPH, 1-methylnapthalene, 2-methylnapthalene, TBA
Former Bermed Area	SB175	Arsenic

Area	Borings	Analytes Exceeding Screening Levels
Former Chemical Laboratory	SB179, SB180, SB182	Arsenic, gasoline/diesel TPH, naphthalene, 1-methylnapthalene, 2-methlynapthalene

Southern Tank Battery Area	SB195, SB196	Arsenic, gasoline/diesel TPH, naphthalene, 1-methylnapthalene, 2-methylnapthalene, benzo[a]pyrene

A statistical analysis was performed to compare concentrations identified throughout the site to concentrations identified in the borings not laterally delineated and to site screening levels. Analytical soil data from this investigation and prior investigations (i.e., the entire data set for the site[5]) was entered into the USEPA ProUCL Software, Version 5.2, updated 14 June 2022 (ProUCL). ProUCL is an USEPA tool to conduct various statistical analysis on datasets, including 95 percent upper confidence limits (UCLs). The ProUCL software was ran for the analytes listed in the table above. Calculated 95 percent UCLs were then compared to concentrations that were not laterally delineated to determine if the concentration falls within the 95 percent range of the dataset or represents an outlier.

Inputs and outputs from the ProUCL software are included in **Appendix D**. A table comparing the concentrations not laterally delineated to the 95 percent UCL results is included as **Table 9**. From these borings, the following samples were found to contain concentrations that exceeded both the site screening level and the 95 percent UCL: SB148-5.0 (diesel TPH), SB150-2.0 (gasoline/diesel TPH), SB152-2.0 (arsenic, gasoline/diesel TPH, naphthalene, 1-methylnapthalene, 2-methylnapthalene), SB165-2.0 (diesel TPH), SB179-2.0 (arsenic, diesel TPH), SB180-2.0 (diesel TPH), SB182-2.0 (diesel TPH, naphthalene), SB183-2.0 (arsenic, diesel TPH, naphthalene), SB195-2.0 (gas/diesel TPH, naphthalene, 1-methlynapthalene, 2-

methylnapthalene), SB-196-2.0 (benzo[a]pyrene), and SV07-2.0 (gasoline/diesel/oil TPH, 1-methylnapthalene).

Of the analytes included in the statistical analysis, the sitewide 95 percent UCL for gasoline TPH, oil TPH, and benzo(a)pyrene were below the site screening levels. This suggests that any future delineation efforts should not be focused on these analytes. The UCLs for other analytes were within the same order of magnitude as the site screening levels.

Notable amongst the other 95 percent UCLs that did exceed the site screening level is arsenic. The site screening level for arsenic is a regional background level determined by the DTSC. Delineation efforts for arsenic are best focused to results suggestive of potential release (i.e., an order of magnitude greater than the regional background or co-located with other analyte data over screening levels). The 95 percent UCL for arsenic is within the same order of magnitude as the regional background level and does not suggest a sitewide arsenic release occurred.

5.0 CONCLUSIONS

Langan completed this investigation to help address potential environmental conditions associated with specific areas at the Site. The investigation included soil and soil vapor sampling. The main conclusions from the investigation are listed below:

- In general, concentrations exceeding screening levels in soil are contained within the upper five feet of soil.
- Soil borings have been advanced in or adjacent to all EM and GPR anomalies identified at the Site.
- Only two locations at the site have not been vertically delineated for constituents other than arsenic and TBA; three borings within the Former Bermed Area (SB102/SB102A, SB173, and SB174) and one boring within the Southern Historical Tank Area (SB119A/SB119B). While not delineated, the lowest concentrations in the three Former Bermed Area are lowest in the deepest samples collected, between 15 and 30 feet bgs. Decreasing soil concentrations with increasing depth, where sources originated at the ground surface, indicate limited vertical migration of impacts. SB119A/SB119B could not be delineated due to refusal as the result of an apparent abandoned liner encountered at 17 feet bgs.
- There are five borings not vertically delineated for arsenic; these borings where not advanced for the delineation of arsenic by design. There are 13 borings not vertically delineated for TBA; this is the result of an order in magnitude change in the SFBRWQCB

protection of groundwater screening used to scope the investigation versus the updated level used to evaluate the analytical data.

- Groundwater was not encountered in the deepest borings advanced during this investigation (30 feet bgs) and prior environmental investigations (35 feet bgs).
- Three areas have been identified to contain metal concentrations exceeding California hazardous waste levels. These areas included the Former Stretford Unit (soil borings SB2, SB4, SB5, SB6 and SB8), soil borings SB78 and SB170 in the Truck Wash and Maintenance Buildings Area, and soil boring SB143 in the Southern Historical Tank Farm. All three areas have been vertically and laterally delineated.
- Of the 203 environmental borings advanced to date at the Site, there are 25 borings that have not been completely laterally delineated to below Site screening levels (excluding borings adjacent to site operations or boundaries). Relevant analyte concentrations in 13 of these borings were below the Sitewide 95 percent UCLs. As concentrations in the other 12 borings exceeded screening levels and the UCL, further delineation may be warranted once additional portions of the Site become accessible. Nonetheless, site investigations have thoroughly covered accessible portions of the Site where historical operations posing a potential environmental risk are known to have occurred. Given that oilfield operations have occurred since the 1920s, subsurface soil concentrations exceeding screening levels may be present in areas yet sampled.
- Site soil screening levels were selected based on the most conservative level available from a selection of potentially applicable guidance. As future use of the Site becomes more evident, the screening levels may be adjusted to those more applicable to specific areas.
- Concentrations of VOCs in soil vapor probes were above screening levels in all locations with the exception of SV08 in the Former Bermed Area. Several of the VOCs included halogenated compounds that have either not been or only anomalously been detected in soil samples (chloroform, methylene chloride, PCE, and vinyl chloride). The other VOCs above screening levels, benzene and ethylbenzene, have been detected to a greater extent, but are still not commonly identified in soil samples and are less prevalent than several other VOCs at the site.
- Concentrations of methane in soil vapor probes were in the passive system mitigation requirement range in all probes with the exception of SV07 and SV10, located in the Truck Wash and Maintenance Buildings and Southern Historical Tank Farm Areas, respectively. These two soil vapor probes contained concentrations of methane in the active system mitigation requirement range.

- Concentrations of VOCs and methane nearest the onsite buildings do not suggest a health risk to site occupants is present.

Specific findings and conclusions for each area are outlined below.

5.1 Northwest Historical Tanks

To date, 15 soil borings (plus three step-out borings) have been advanced in this area with 47 samples collected for laboratory analysis. No metal concentrations exceeded screening levels. TPH exceeded screening levels in nine borings that were delineated to the upper 20 feet. VOC concentrations exceeding screening levels were delineated to the upper five feet, with the exception of TBA in SB56 which was detected at 15 feet bgs. SVOC/PAH concentrations exceeded screening levels in four borings that were delineated to the upper 15 feet.

In total, 12 of the 15 borings contained analyte concentrations exceeding screening levels. Borings with exceedances were laterally delineated to the southeast. The active pipeline channel adjoins the area immediately to the southwest and prohibits further delineation in this direction. Soil boring SB50 and SB147 were not laterally delineated to the northwest, but concentrations were below the sitewide UCL (diesel TPH). Soil boringsSB147, SB148 and SB150 were not delineated to the northeast, with concentrations in SB148 and SB150 exceeding site screening levels and the sitewide 95 percent UCL (diesel TPH).

One dual-nested soil vapor probe was installed at five and 15 feet in this area. VOC concentrations exceeding screening levels were detected in both probes. Methane concentrations were in the passive system mitigation range in both probes.

5.2 Northern Historical Tank Farm

To date, 33 borings (plus two step-out borings) have been advanced in this area with 99 samples collected for laboratory analysis. Concentrations of metals exceed screening levels in three borings and were delineated to the upper ten feet. TPH exceeded screening levels in ten borings that were delineated to the upper five feet. VOC concentrations exceeded screening levels in eight borings that were delineated to the upper five feet. SVOC/PAH concentrations exceed screening levels in eight borings that were delineated to the upper five feet.

In total, 11 of the 33 borings contained analyte concentrations exceeding screening levels. Borings with exceedances were laterally delineated with the exception of SB46 to the northeast and SB152 to the northeast and northwest. Sample SB46-2.0 contained concentrations of TBA exceeding the site screening level but below the 95 percent UCL. Sample SB152-2.0 contained

concentrations exceeding the site screening level and sitewide 95 percent UCL (arsenic, diesel/oil TPH, naphthalene, 1-methylnapthalene, and 2-methylnapthalene).

Two dual-nested soil vapor probes were installed at five and 15 feet in this area. VOC concentrations exceeded screening levels in all four probes. Methane concentrations were in the passive system mitigation range in all four probes.

5.3 Pipe Laydown Area

To date, 22 borings have been advanced in this area with 61 samples collected for laboratory analysis. No metal concentrations exceeded screening levels. TPH concentrations exceeded screening levels in six borings that were delineated to the upper five feet. Concentrations of TBA in borings SB69A, SB73 and SV05 from the deepest sample collected (15, 15, and 10 feet, respectively) exceeded the screening level, Otherwise, VOC concentrations exceeding the screening levels were delineated to the upper five feet. SVOC/PAH concentrations exceeded screening levels in three borings that were delineated to the upper two feet.

In total, 15 of 22 borings contained analyte concentrations exceeding screening levels. Borings with exceedances were laterally delineated in all directions except to the southwest where the active pipeline channel immediately adjoins the area and to the northeast at borings SB58 and SB59 and to northwest at boring SB165. Samples SB58-5.0 and SB59-2.0 contained concentrations of diesel TPH that exceeded site screening levels but were below the sitewide 95 percent UCL. Sample SB165-2.0 contained concentrations of diesel TPH that exceeded site screening levels and the sitewide 95 percent UCL.

Two dual-nested soil vapor probes were installed at five and 15 feet in this area. VOC concentrations exceeded screening levels in three of the four probes. Methane concentrations were in the passive system mitigation range in all four probes.

5.4 Maintenance and Truck Wash Buildings

To date, 20 borings (plus two step-out borings) were advanced in this area with 50 samples collected for laboratory analysis. Metal concentrations exceeded screening levels in five borings that were delineated to the upper five feet, with the exception SV07-10. Sample SV07-10 contained arsenic exceeding the site screening level; however, the concentration was below the sitewide 95 percent UCL. TPH concentrations exceeded screening levels in five borings that were delineated to the upper ten feet. Other than concentrations of TBA in borings SB74, SB77a, and SB81A (detected to the maximum depth sampled of 15 feet), no VOC concentrations

exceeded screening levels. SVOC/PAH concentrations exceeded screening levels in three borings that were delineated to the upper five feet.

Concentrations of arsenic exceeding State hazardous waste thresholds were identified previously in boring SB78. These concentrations were laterally and vertically delineated by borings SB167 through SB170A.

In total, 11 of 20 borings contained analyte concentrations exceeding screening levels. Borings with exceedances were lateral delineated with the exception of borings SB74, SB77A, SB81A, SV06, and SV07. Samples with concentrations exceeding screening levels from borings SB74, SB77A, SB81A, and SV06 were all below the sitewide 95 percent UCL (diesel TPH, TBA). Sample SV07-2.0 contained analyte concentrations exceeding the screening level and sitewide 95 percent UCL.

Two dual-nested soil vapor probes were installed at five and 15 feet in this area. VOC concentrations exceeded screening levels in all four of the four probes. Methane concentrations were in the passive system mitigation range in two of the probes and active system mitigation range in four of the probes.

5.5 Chemical Storage Area

The Chemical Storage area is an enclosed concrete storage area serving as secondary containment for hazardous waste. To date, four soil borings have been advanced outside the containment barrier with 12 samples collected for laboratory analysis. Metal concentrations exceeded screening levels in one boring that was delineated to the upper 15 feet. TPH concentrations exceeded screening levels in three borings that were delineated to the upper 15 feet bgs. VOC concentrations exceeded screening levels in two borings, one which included samples from the deepest depth collected, 15 feet. SVOC/PAH concentrations exceeded screening levels in two borings that were delineated to the upper 15 feet.

In total, three of the three borings contained analyte concentrations exceeding screening levels. Due to access restrictions these borings were advanced on the periphery of the identified area of concern. Lateral delineation of these borings outside the chemical waste storage area is not necessary.

5.6 Historical Bermed Area

To date, 18 borings (plus one step-out boring) were advanced in this area with 50 samples collected for laboratory analysis. Metal concentrations exceeded screening levels in four borings

that were delineated to the upper 15 feet. TPH concentrations exceeding screening levels in three borings as deep as 30 feet and were not delineated. VOC concentrations exceeded screening levels in one boring that was delineated to the upper 20 feet bgs. SVOC/PAH concentrations exceeded screening levels in three borings that were delineated to the upper 30 feet bgs.

In total, nine of 18 borings contained analyte concentrations exceeding screening levels. The borings were laterally delineated with the exception of SB175. Soil boring SB175 contained concentrations of arsenic exceeding site screening levels that were below the sitewide 95 percent UCL.

One dual-nested soil vapor probe was installed at five and 15 feet in this area. VOC concentrations were below screening levels in both probes. Methane concentrations were in the passive system mitigation range in both probes.

5.7 Former Chemical Laboratory

To date, 13 borings were advanced in this area with 33 samples collected for laboratory analysis. Metal concentrations exceeded screening levels in six borings that were delineated to the upper five feet. TPH concentrations exceeded screening levels 10 borings that were delineated to the upper 15 feet. VOC concentrations exceeded screening levels in six of the borings that were delineated to the upper five feet. SVOC/PAH concentrations exceeded screening levels in four borings that were delineated to the upper 15 feet of soil.

In total, 11 of 13 borings contained analyte concentrations exceeding screening levels. This area was delineated to the northwest and southeast. Soil borings SB179, SB180, and SB182 were not laterally delineated and contained concentrations exceeding the screening level and sitewide 95 percent UCL (arsenic, diesel TPH, naphthalene).

5.8 Southern Historical Tank Farm

To date, 27 borings (plus two step-out borings) were advanced in the accessible portion of this area with 73 samples collected for laboratory analysis. Metal concentrations exceeded screening levels in seven borings that were delineated to the upper fifteen feet, with the exception of SB119A/SB119B. TPH concentrations exceeded screening levels in 15 borings that were delineated to the upper 15 feet bgs, with the exception of SB119A/SB119B. VOC concentrations exceeded screening levels in five borings that were delineated to the upper 15 feet, with the

exception of SB119A/SB119B. SVOC/PAH concentrations exceeded screening levels in the six borings that were delineated to the upper 15 feet.

Soil boring SB119B was advanced to vertically delineate concentrations in SB119A; however, refusal was encountered at 17 feet as the result of an apparent abandoned liner that may have been associated with a former sump.

Concentrations of lead exceeding State hazardous waste thresholds were identified previously in boring SB143. These concentrations were laterally and vertically delineated by borings SB184 through SB187.

In total, 20 of the 27 borings contained analyte concentrations exceeding screening levels. The borings are delineated with the exception of SB110, SB183, SB184 and SV11. Soil concentrations exceeding screening levels in SB110, SB184 and SV11 were below the sitewide 95 percent UCL. In sample SB183-2.0, concentrations of arsenic, diesel TPH, and naphthalene exceeded site screening levels and the sitewide 95 percent UCL.

Three dual-nested soil vapor probes were installed at five and 15 feet in this area. VOC concentrations exceeded screening levels in five of the six probes. Methane concentrations were in the passive system mitigation range in five of the six probes and active system mitigation range in one of the probes.

5.9 Southern Historical Sumps

To date, 11 borings were advanced in the accessible portion of this area with 30 samples collected for laboratory analysis. Metal concentrations exceeded screening levels in three of the borings that were delineated to the upper 15 feet. TPH concentrations exceeded screening levels in six borings that were delineated to the upper 15 feet. VOC concentrations exceeded screening levels in two borings that were delineated to the upper 20 feet. However, the concentrations of TBA in borings SB128 and SB131A from the deepest depth collected (15 and 20 feet, respectively) did exceeded the screening level. SVOC/PAH concentrations exceeded screening levels in three borings that were delineated to the upper 15 feet.

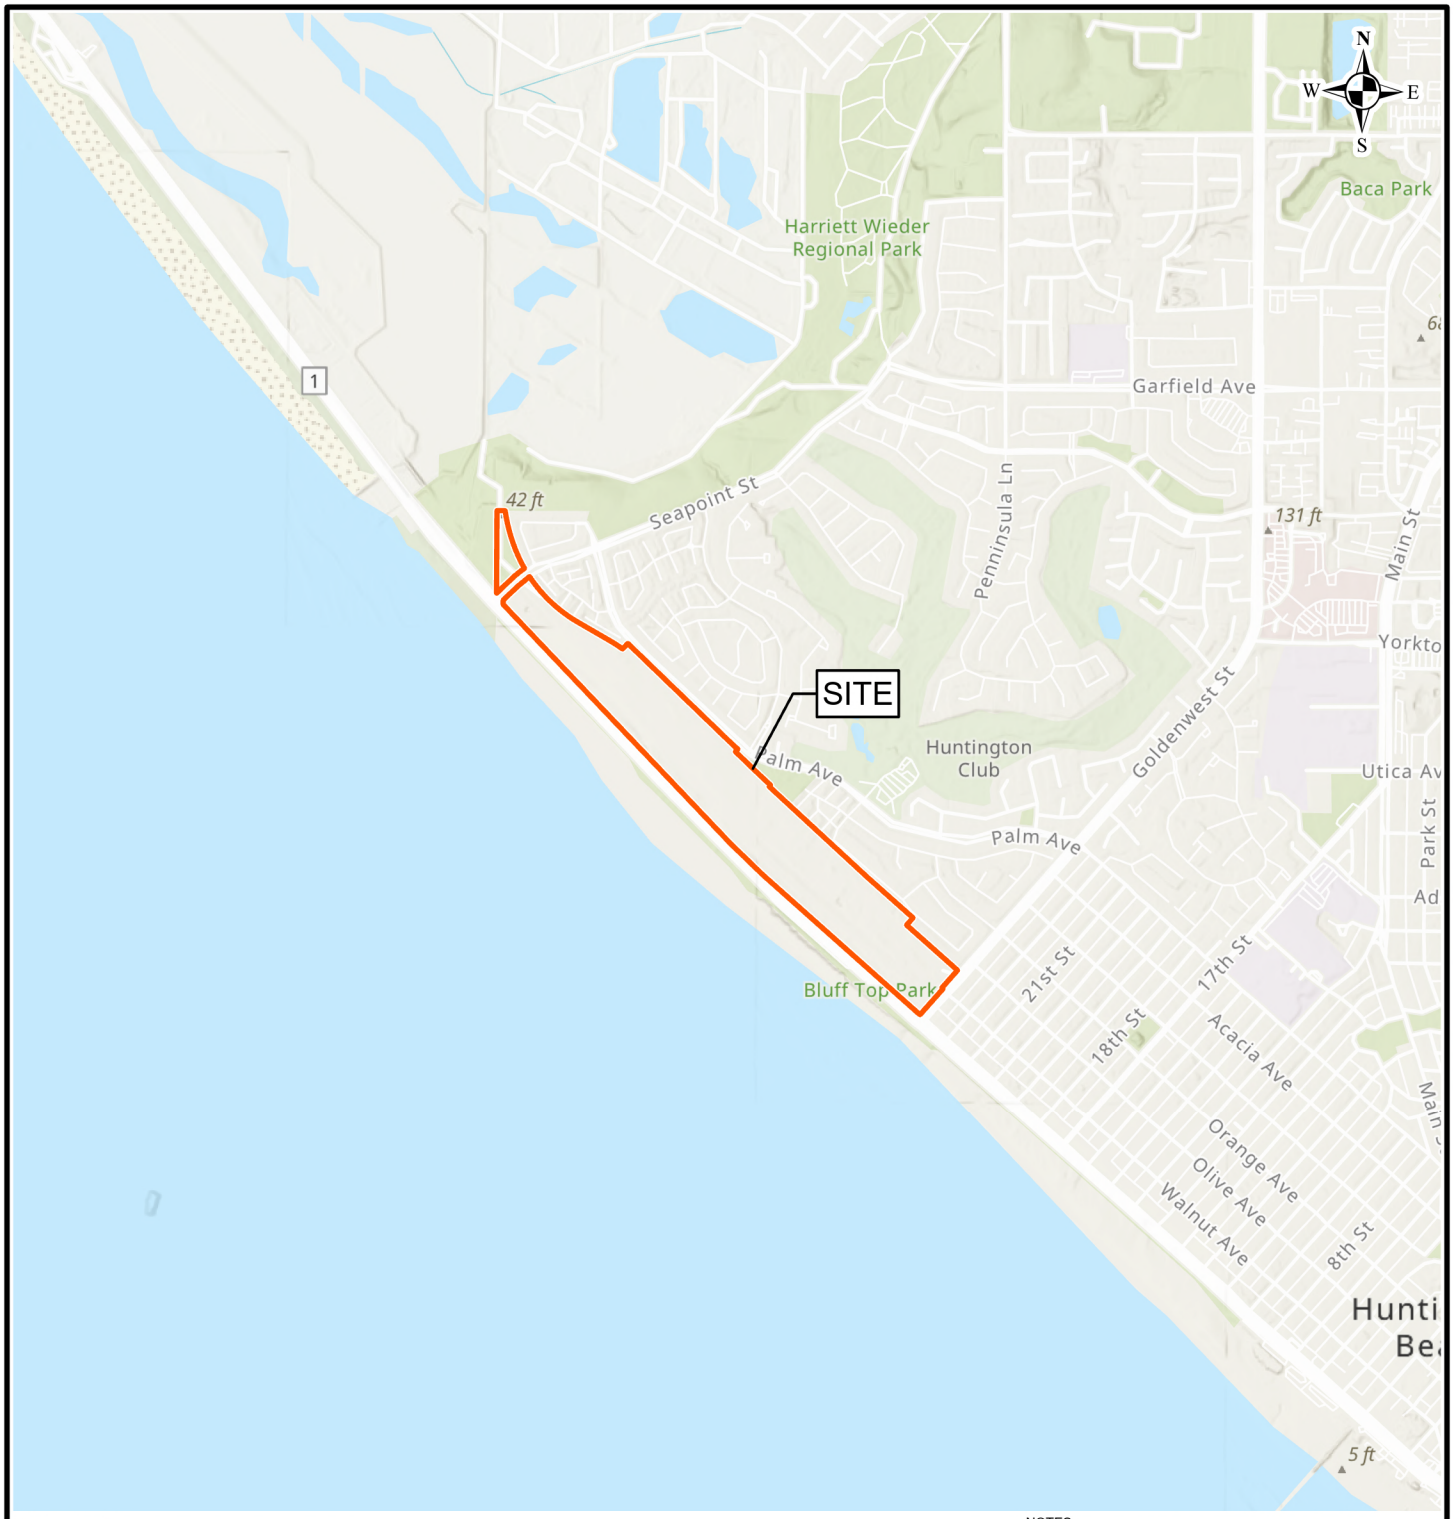
In total, ten of 11 borings contained analyte concentrations exceeding screening levels. The borings are not laterally delineated. Several of the borings with exceedances are adjoined by facility tanks/process piping, stormwater retention ponds, and Site property lines that prohibit further delineation in these directions. Otherwise, the borings have been delineated.

5.10 Southern Historical Tank Battery

To date, 14 borings (plus one step-out boring) were advanced in the accessible portion of the area with 37 samples collected for laboratory analysis. Metal concentrations exceeded screening levels in six borings that were vertically delineated to the upper 20 feet. TPH concentrations exceeded screening levels in six borings that were delineated to the upper 20 feet bgs. VOC concentrations exceeded screening levels in three borings that were delineated to the upper 20 feet bgs; however, the concentration of TBA in boring SB139 at 15 feet, the deepest sample collected, also exceeded the screening level. SVOC/PAH concentrations exceeded screening levels in six borings that were delineated to the upper 20 feet bgs.

Arsenic concentrations exceeded screening levels in six borings and were vertically delineated to the upper five feet with the exception of boring SB135. Soil boring SB135 contained arsenic exceeding screening levels in the deepest sample collected from 15 feet bgs. An additional boring can be advanced to help vertically delineate this boring.

In total, nine of the 14 borings contained analyte concentrations exceeding screening levels. The borings are laterally delineated to the southwest. Site property lines and stormwater retention ponds adjoining the area and prohibits further delineation to the northeast and northwest. The area is otherwise delineated with the exception of SB195 and SB196. Sample SB195-2.0 (diesel/oil TPH, naphthalene, 1-methylnapthalene, 2-methylnapthalene) and SB196-2.0 (benzo[a]pyrene) contained concentrations exceeding the screening level and sitewide 95 percent UCL.



One dual-nested soil vapor probe was installed at five and 15 feet in this area. VOC concentrations exceeded screening levels in one of the two probes. Methane concentrations were in the passive system mitigation range in both probes.

CRC Huntington Beach Property
Huntington Beach, CA

Notes:

Soil results were compared Site-specific screening levels that are a compilation of [1] EPA RSL Residential Soil (November 2024), RWQCB [2] Soil Direct Exposure Construction Worker: Any Land Use ESL, [3] Soil Direct Exposure Residential ESL, [4] Leaching to Groundwater ESL, and [5] Soil Gross Contamination ESL (July 2025), [6] CA DTSC Residential Soil (April 2025), and [7] Average Background Arsenic Concentration from "Determination of a Southern California Regional Background Arsenic Concentration in Soil" published by the CA DTSC (2008)

RWQCB - Regional Water Quality Control Board

ESL - Environmental Screening Level

DTSC - Department of Toxic Substance Control

CAS - Chemical Abstract Service

NS - No standard

mg/kg - Milligrams per kilogram

NA - Not Analyzed

RL - Reporting Limit

<RL - Not detected

Qualifiers:

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the MDL.

B - The analyte was found in the associated analysis batch blank.

H - The sample was prepped or analyzed beyond the specified holding time.

Exceedance Summary:

10 - Result exceeds Site-Specific Soil Screening Levels

Notes:

Soil results were compared Site-specific screening levels that are a compilation of [1] EPA RSL Residential Soil (November 2024), RWQCB [2] Soil Direct Exposure Construction Worker: Any Land Use ESL, [3] Soil Direct Exposure Residential ESL, [4] Leaching to Groundwater ESL, and [5] Soil Gross Contamination ESL (July 2025), [6] CA DTSC Residential Soil (April 2025), and [7] Average Background Arsenic Concentration from "Determination of a Southern California Regional Background Arsenic Concentration in Soil" published by the CA DTSC (2008)

RWQCB - Regional Water Quality Control Board

ESL - Environmental Screening Level

DTSC - Department of Toxic Substance Control

CAS - Chemical Abstract Service

NS - No standard

mg/kg - Milligrams per kilogram

NA - Not Analyzed

RL - Reporting Limit

<RL - Not detected

Qualifiers:

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the MDL.

B - The analyte was found in the associated analysis batch blank.

H - The sample was prepped or analyzed beyond the specified holding time.

Exceedance Summary:

10 - Result exceeds Site-Specific Soil Screening Levels

Notes:

Soil results were compared Site-specific screening levels that are a compilation of [1] EPA RSL Residential Soil (November 2024), RWQCB [2] Soil Direct Exposure Construction Worker: Any Land Use ESL, [3] Soil Direct Exposure Residential ESL, [4] Leaching to Groundwater ESL, and [5] Soil Gross Contamination ESL (July 2025), [6] CA DTSC Residential Soil (April 2025), and [7] Average Background Arsenic Concentration from "Determination of a Southern California Regional Background Arsenic Concentration in Soil" published by the CA DTSC (2008)

RWQCB - Regional Water Quality Control Board

ESL - Environmental Screening Level

DTSC - Department of Toxic Substance Control

CAS - Chemical Abstract Service

NS - No standard

mg/kg - Milligrams per kilogram

NA - Not Analyzed

RL - Reporting Limit

<RL - Not detected

Qualifiers:

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the MDL.

B - The analyte was found in the associated analysis batch blank.

H - The sample was prepped or analyzed beyond the specified holding time.

Exceedance Summary:

10 - Result exceeds Site-Specific Soil Screening Levels

Notes:

Soil results were compared Site-specific screening levels that are a compilation of [1] EPA RSL Residential Soil (November 2024), RWQCB [2] Soil Direct Exposure Construction Worker: Any Land Use ESL, [3] Soil Direct Exposure Residential ESL, [4] Leaching to Groundwater ESL, and [5] Soil Gross Contamination ESL (July 2025), [6] CA DTSC Residential Soil (April 2025), and [7] Average Background Arsenic Concentration from "Determination of a Southern California Regional Background Arsenic Concentration in Soil" published by the CA DTSC (2008)

RWQCB - Regional Water Quality Control Board

ESL - Environmental Screening Level

DTSC - Department of Toxic Substance Control

CAS - Chemical Abstract Service

NS - No standard

mg/kg - Milligrams per kilogram

NA - Not Analyzed

RL - Reporting Limit

<RL - Not detected

Qualifiers:

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.

U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the MDL.

B - The analyte was found in the associated analysis batch blank.

H - The sample was prepped or analyzed beyond the specified holding time.

Exceedance Summary:

10 - Result exceeds Site-Specific Soil Screening Levels

Notes:

Soil results were compared Site-specific screening levels that are a compilation of [1] EPA RSL Residential Soil (November 2024), RWQCB [2] Soil Direct Exposure Construction Worker: Any Land Use ESL, [3] Soil Direct Exposure Residential ESL, [4] Leaching to Groundwater ESL, [5] Soil Gross Contamination ESL, and [6] Soil Odor Nuisance ESL (January 2019), [7] CA DTSC Residential Soil (May 2022), and [8] Average Background Arsenic Concentration from "Determination of a Southern California Regional Background Arsenic Concentration in Soil" published by the CA DTSC (2008) Concentration (TTLC) (1998)

RWQCB - Regional Water Quality Control Board
ESL - Environmental Screening Level
DTSC - Department of Toxic Substance Control
CAS - Chemical Abstract Service
NS - No standard
mg/kg - Milligrams per kilogram
NA - Not Analyzed
RL - Reporting Limit
<RL - Not detected
Tert Butyl-Alcohol

Qualifiers:

J - The analyte was detected above the method detection limit (MDL), but below the RL; therefore, the result is an estimated concentration.
U - The analyte was analyzed for, but was not detected at a level greater than or equal to the RL; the value shown in the table is the MDL.
B - The analyte was found in the associated analysis batch blank.
H - The sample was prepped or analyzed beyond the specified holding time.

Exceedance Summary:

10 - Result exceeds Site-Specific Soil Screening Levels
10 - Result exceeds Sitewide 95 Percent UCL

Job Narrative
570-225607-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 4/7/2025 5:40 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.6°C and 3.8°C.

GC/MS VOA
Method 8260B: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for analytical batch 570-557281 recovered outside control limits for the following analytes: 1,2,3-Trichloropropane, 1,3-Dichlorobenzene, 4-Chlorotoluene, 1,2-Dibromoethane and N-Propylbenzene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with analytical batch 570-557281.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-555292. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-555480. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8260B: The following sample was diluted due to the nature of the sample matrix (Sulfur): SB119B-2.0 (570-225607-13). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270C_SIM_PAH: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 570-555375. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8270C_SIM_PAH: The following samples were diluted due to the nature of the sample matrix: SB188-2.0 (570-225607-10) and SB189-2.0 (570-225607-16). Elevated reporting limits (RLs) are provided.

Method 8270C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 570-555732. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8270C: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 570-555732 and analytical batch 570-559032 recovered outside control limits for the following analyte(s): Benzidine and Pyridine. Benzidine and Pyridine have been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

Method 8270C: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 570-555732 and analytical batch 570-559032 recovered outside control limits for the following analytes: Pyridine.

Method 8270C: The continuing calibration verification (CCV) associated with batch 570-556557 recovered above the upper control limit for 2-Nitrophenol and Di-n-octyl phthalate. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are:SB134A-20.0 (570-225607-1), (CCVIS 570-556557/2) and (570-225132-G-49-D).

Method 8270C: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for preparation batch 570-555340 and analytical batch 570-556557 recovered outside control limits for the following analytes: Bis(2-ethylhexyl) phthalate, Butyl benzyl phthalate and Di-n-octyl phthalate. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8270C: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 570-555340 and analytical batch 570-556205 recovered outside control limits for the following analytes: 2,4-Dinitrophenol, 4,6-Dinitro-2-methylphenol, Bis(2-ethylhexyl) phthalate, Di-n-octyl phthalate, Hexachlorocyclopentadiene and Pentachlorophenol.

Job Narrative
570-225607-2

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 4/7/2025 5:40 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.6°C and 3.8°C.

Metals
Method 6010B - STLC Citrate: The method blank for preparation batch 570-563764 and 570-565550 and analytical batch 570-565607 contained < Barium> above the method detection limit. This target analyte concentration was less than half the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Subject: RE: Eurofins Calscience report and EDD files from 570-225607-1 Soil Sampling / 700152701

Vik, thank you for the report.

Can you run STLC for barium on samples SB119-2.0, SB119-5.0, and SB119-15.0?

Can you please also run STLC for lead on sample SB189-2.0?

We do not need analysis of any of the samples on hold.

Thank you

Travis Knight

Job Narrative
570-225769-3

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 4/8/2025 6:00 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.6°C and 4.0°C.

Diesel Range Organics
Method 8015B_DRO: The following sample was prepared outside of preparation holding time due to <EXPLANATION_REQUIRED> : SB102A-30.0 (570-225769-16).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method MOISTURE_2540G: The following sample(s) was analyzed outside of analytical holding time because the date requested changed. SB102A-30.0 (570-225769-16).

Method MOISTURE_2540G: The sample duplicate (DUP) precision for analytical batch 570-567382 was outside control limits. Sample non-homogeneity is suspected.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
570-225769-4

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 4/8/2025 6:00 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.6°C and 4.0°C.

GC/MS VOA
Method 8260B: The following sample was requested outside of holding time: SB102A-24.0 (570-225769-15) and SB102A-30.0 (570-225769-16).

Method 8260B: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for preparation batch 570-573416 and analytical batch 570-573303 recovered outside control limits for the following analytes: 1,2-Dibromo-3-Chloropropane and 1,2-Dichloroethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260B: The following analyte(s) recovered outside control limits for the LCS associated with preparation batch 570-573416 and analytical batch 570-573303: Chloromethane. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

Method 8260B: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for preparation batch 570-573416 and analytical batch 570-573303 recovered outside control limits for the following analytes: 1,2-Dichloroethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270C_SIM_PAH: The following sample(s) was prepared outside of preparation holding time due to Client Request.

Method 8270C: The following sample(s) was prepared outside of preparation holding time due to Client Request.

Method 8270C: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for the following sample associated with preparation batch 570-571455 and analytical batch 570-572140 were outside control limits: (570-225769-F-15-C MS) and (570-225769-F-15-D MSD). The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method 8270C: The following samples were diluted due to the nature of the sample matrix: SB102A-24.0 (570-225769-15), (570-225769-F-15-C MS) and (570-225769-F-15-D MSD). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Thank you for the report Vik.

Can you analyze samples SB102A-25 and SB102A-30 for VOCs, SVOCs, and PAHs? I understand these will be outside hold time.

Job Narrative
570-225769-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 4/8/2025 6:00 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.6°C and 4.0°C.

GC/MS VOA
Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-556089. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8260B: Internal standard response for 1,4-Dichlorobenzene-d4 was outside of acceptance limits for the following sample: SB174-10.0 (570-225769-18). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8260B: The following sample was diluted due to the abundance of non-target hydrocarbons: SB173-15.0 (570-225769-21). Elevated reporting limits (RLs) are provided.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-556631. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270C_SIM_PAH: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 570-555973. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8270C_SIM_PAH: The following sample required a dilution due to the nature of the sample matrix: SB195-2.0 (570-225769-4). Because of this dilution, the surrogate spike concentration in the sample was reduced to a level where the recovery calculation does not provide useful information.

Method 8270C_SIM_PAH: The following samples were diluted due to the nature of the sample matrix: SB195-2.0 (570-225769-4), SB192-2.0 (570-225769-8) and SB196-2.0 (570-225769-9). Elevated reporting limits (RLs) are provided.

Method 8270C_SIM_PAH: The following sample was diluted due to the nature of the sample matrix: SB191-2.0 (570-225769-12). Elevated reporting limits (RLs) are provided.

Method 8270C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 570-555732. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8270C: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 570-555732 and analytical batch 570-559032 recovered outside control limits for the following analyte(s): Benzidine and Pyridine. Benzidine and Pyridine have been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

Method 8270C: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 570-555732 and analytical batch 570-559032 recovered outside control limits for the following analytes: Pyridine.

Method 8270C: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 570-556317 and analytical batch 570-557569 recovered outside control limits for multiple compounds.

Method 8270C: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-556317 and analytical batch 570-557569 were outside control limits. Sample matrix interference is suspected.

Method 8270C: Surrogate recovery for the following sample was outside control limits: SB195-2.0 (570-225769-4). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8270C: The following samples were diluted due to the nature of the sample matrix: SB195-2.0 (570-225769-4), SB193-2.0 (570-225769-6), SB193-5.0 (570-225769-7), SB192-2.0 (570-225769-8), SB196-2.0 (570-225769-9), SB190-2.0 (570-225769-11) and SB191-2.0 (570-225769-12). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Method 8015B_GRO: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-560177. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 7471A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-556835 and analytical batch 570-556831 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method MOISTURE_2540G: The sample duplicate (DUP) precision for analytical batch 570-556217 was outside control limits. Sample non-homogeneity is suspected.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Vik,

Follow up on this, I'm not seeing PAHs requested on the field blank sample. Can we check if we submitted a jar for this and if it can be added?

Job Narrative
570-225769-2

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 4/8/2025 6:00 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.6°C and 4.0°C.

Diesel Range Organics
Method 8015B_DRO: The following sample was prepared outside of preparation holding time because analysis was requested past sample holding time: SB102A-24.0 (570-225769-15).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 6010B - STLC Citrate: The method blank for preparation batch 570-564703 and 570-566110 and analytical batch 570-566160 contained < Barium> above the method detection limit. This target analyte concentration was less than half the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method MOISTURE_2540G: The following sample was analyzed outside of analytical holding time because analysis was requested past sample holding time: SB102A-24.0 (570-225769-15).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
570-225953-2

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 4/9/2025 5:05 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.8°C and 3.6°C.

Metals
Method 6010B - STLC Citrate: The method blank for preparation batch 570-564703 and 570-566110 and analytical batch 570-566160 contained < Barium> above the method detection limit. This target analyte concentration was less than half the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
570-225953-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 4/9/2025 5:05 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.8°C and 3.6°C.
