Appendix K

Tree Protection Measures

Tree Protection Measures

The following tree protection measures are provided as general guidelines for tree protection from construction impacts. The measures presented should be monitored by arborists and enforced by contractors and developers for maximum benefit to the trees.

Tree Protection Measures Prior to Construction

Prior to any construction activity (drainage, demolition, material removal or delivery), protected trees with crowns that fall within 30 feet of construction activity shall be protected by fencing and signage. All contractors shall be made aware of the tree protection measures. A project arborist shall be assigned to monitor tree health and construction activity near retained trees on site. The project arborist shall be an International Society of Arboriculture (ISA) Certified Arborist.

Fencing. A 6-foot high, chain link fence with tree protection signs shall be erected around all trees (or tree groups) with canopies that fall within 30 feet of construction activity. The protective fence should be installed at a distance from the trunk that is equal to the dripline radius plus 5 feet (protected tree zone). For any trees that would be encroached upon by construction activities, fencing shall be placed as far away from trunk of the tree as possible while still allowing the required construction activities to proceed. This fencing will delineate the tree protection zone and prevent unwanted activity in and around the trees in order to reduce soil compaction in the root zones of the trees and other damage from heavy equipment. Fences are to be mounted on two-inch diameter galvanized iron posts, driven into the ground to a depth of at least 2-feet at no more than 10-foot spacing. In areas where fencing is located on paving or concrete that will not be demolished, then the posts may be supported by an appropriate grade level concrete base. Tree protection signs should be attached to every fourth post. The contractor shall maintain the fence to keep it upright, taut, and aligned at all times. Fencing shall be removed only after all construction activities are complete.

Pre-Construction Meeting. A pre-construction meeting shall be held between all contractors and the arborist. The arborist will instruct the contractors on tree protection practices and answer any questions. All equipment operators and spotters, assistants, or those directing operators from the ground, shall provide written acknowledgement of their receiving tree protection training. This training shall include information on the location and marking of protected trees, the necessity of preventing damage, and the discussion of work practices that will accomplish such.

Protection and Maintenance During Construction

Once construction activities have begun, the following measures shall be adhered to:

Avoidance: Signs, ropes, cables, or any other items shall not be attached to any tree.

Equipment Operation and Storage. Operating heavy machinery around the root zones of trees will increase soil compaction, which decreases soil aeration and subsequently reduces water penetration in the soil. All heavy equipment and vehicles shall stay out of the fenced tree protection zone, unless where specifically approved in writing by the City Arborist and under the supervision of an ISA Certified Arborist

Storage and Disposal. Do not store or discard any supply or material, including paint, lumber, concrete overflow, etc. within the fenced tree protection zone. Remove all foreign debris within the fenced tree protection zone; it is important

to leave the duff, mulch, chips, and leaves around the retained trees for water retention and nutrients. Avoid draining or leakage of equipment fluids near retained trees. Fluids such as: gasoline, diesel, oils, hydraulics, brake and transmission fluids, paint, paint thinners, and glycol (anti-freeze) should be disposed of properly. Keep equipment parked outside of the fenced tree protection zone of retained trees to avoid the possibility of leakage of equipment fluids into the soil. The effect of toxic equipment fluids on the retained trees could lead to decline and death.

Moving Construction Materials. Moving Construction Materials: Care will be taken when moving equipment or supplies near the trees, especially overhead. Avoid damaging the tree(s) when transporting or moving construction materials and working around retained trees (even outside of the fenced tree protection zone). Above ground tree parts that could be damaged (e.g., low limbs, trunks) should be flagged with red ribbon. If contact with the tree crown is unavoidable, prune the conflicting branch(es) using ISA or ANSI A300 standards.

Grade Changes. Grade changes, including adding fill, are not permitted within the tree protection zone, without special written authorization and under supervision by a Certified Arborist. Lowering the grade within this area will necessitate cutting main support and feeder roots, jeopardizing the health and structural integrity of the tree(s). Adding soil, even temporarily, on top of the existing grade will compact the soil further, and decrease both water and air availability to the trees' roots.

Root Pruning. Except where specifically approved in writing, all trenching shall be outside of the fenced tree protection zone. Roots primarily extend in a horizontal direction, forming a support base to the tree similar to the base of a wineglass. Where trenching is necessary in areas that contain tree roots, prune the roots using a Dosko root pruner or equivalent. All cuts shall be clean and sharp, to minimize ripping, tearing, and fracturing the root system. The trench shall be made no deeper than necessary.

Trenching. Unless a Tree Permit has been issued for trenching activity within the fenced tree protection zone, all trenching shall be outside of the fenced tree protection zone. Roots primarily extend in a horizontal direction forming a support base to the tree similar to the base of a wineglass. Where trenching is necessary in areas that contain tree roots, prune the roots using a Dosko root pruner or equivalent. All cuts should be clean and sharp, to minimize ripping, tearing, and fracturing of the root system. The trench should be made no deeper than necessary.

Irrigation. Trees that have been substantially root pruned (30% or more of their root zone) will require irrigation for the first twelve months. The first irrigation should be within 48 hours of root pruning. They should be deep watered every two to four weeks during the summer and once a month during the winter (adjust accordingly with rainfall). One irrigation cycle should thoroughly soak the root zones of the trees to a depth of 3 feet. The soil should dry out between watering; avoid keeping a consistently wet soil. Designate one person to be responsible for irrigating (deep watering) the trees. Check soil moisture with a soil probe before irrigating. Irrigation is best accomplished by installing a temporary above ground micro-spray system that will distribute water slowly (to avoid runoff) and evenly throughout the fenced tree protection zone ***but never soaking the area located within 6- feet of the tree trunk***.

Pruning. Do not prune any of the trees until all construction is completed. This will help protect the tree canopies from damage. All pruning shall be completed under the direction of an ISA Certified Arborist and using ISA guidelines. Only dead wood shall be removed from tree canopies.

Washing. Periodic washing of the foliage is recommended during construction but no more than once every two weeks. Washing should include the upper and lower leaf surfaces and the tree bark. This should continue beyond the construction period at a less frequent rate with a high-powered hose only in the early morning hours. Washing will help control dirt/dust buildup that can lead to mite and insect infestations.

Inspection. An ISA Certified Arborist shall inspect the trees on at least a monthly basis for the duration of construction activity. A summary report documenting observations and management recommendations shall be submitted to the owner following each inspection. Photographs of representative trees are to be included in each report.

Maintenance After Construction

Once construction is complete the tree protection fencing may be removed and the following measures performed to sustain and enhance the vigor of the preserved trees.

Mulch. Provide a 4-inch mulch layer of mulch under the canopy of trees. Mulch shall be clean and organic and provide long-term soil conditioning, soil moisture retention, and soil temperature control.

Pruning. Pruning should only be done to maintain clearance and remove broken, dead or diseased branches. Pruning shall only take place following a recommendation by an ISA Certified Arborist and performed under the supervision of an ISA Certified Arborist. No more than 15% of the canopy shall be removed at any one time. All pruning shall conform to ISA or ANSI A300 standards.

Watering. Retained trees on site shall be watered as they were prior to the commencement of construction activity. Supplemental irrigation may be necessary for twelve months following substantial root pruning.

Watering Adjacent Plant Material. All plants near the trees shall be compatible with water requirements of said trees. Watering regime included in the site's landscape plan shall be developed with consideration for the water needs of retained trees.

Spraying. If the trees are maintained in a healthy state, regular spraying for insect or disease control should not be necessary. If a problem does develop, an ISA Certified Arborist should be consulted; the trees may require application of insecticides to prevent the intrusion of bark-boring beetles and other invading pests. All chemical spraying should be performed by a licensed applicator under the direction of a licensed pest control advisor.

Inspection. All trees within 30 feet of construction activity shall be monitored by an ISA Certified Arborist for the first two years after construction completion. An annual monitoring report shall be submitted to the City Arborist. Each report shall summarize the inspection efforts, document observations and management actions taken, include photographs of each tree, and compare postconstruction tree conditions with the original, pre-construction baseline condition. If any retained trees die within this inspection period, they shall be replaced at a ratio approved by the City.

SOLOMON HILLS – SOLSTRA COMMUNITIES CA, LLC
WET WEATHER STORAGE BASIN CONDITIONAL USE PERMIT
BIOLOGICAL RESOURCES ASSESSMENT

1.0 EXECUTIVE SUMMARY

Solstra Communities California, LLC (Solstra) proposes the Wet Weather Storage Basin improvements as an offsite Conditional Use Permit (CUP) on approximately 7.5 acres for a basin and 24 acres of spray fields on land owned by Solstra, located west of Highway 101 and just south of the town of Orcutt within the Orcutt Community Plan boundary. See Figure 1 and Figure 2.

The proposed CUP includes a basin footprint including a perimeter access road of approximately 7.5 acres with a depth of 20 feet, and 24 acres of spray fields (basin CUP site). An access road will be constructed from the entrance of Orcutt Hills Road off Highway 101. The basin will provide 39.5 acre-feet of recycled water storage during periods of wet weather when recycled water demand is low.

David Wolff Environmental (DWE) conducted the review of available background data and conducted biological and botanical resources field surveys on April 22, 2025 and July 15, 2025, during the peak expression and growth of the onsite flora. The survey focused on identifying plant communities, mapping habitat types, detecting special-status plants and wildlife if observed. The purpose of the field surveys and this biological resources assessment is to document existing conditions of the proposed basin CUP area, determine the suitability and presence/absence of rare, threatened, or endangered plants or wildlife (special-status species), wetlands/waters of the U.S./State, and to evaluate the potential for any direct or indirect significant impacts on biological resources, or adverse effects on any special-status species.

This basin CUP biological resources assessment establishes and describes existing conditions of the basin and spray fields sites that currently supports mostly non-native grassland habitat with small edges of coast live oak woodland and a narrow band of coastal scrub habitat. The basin and spray fields are amongst the greater expanse habitat mosaic of grasslands, scrublands, maritime chaparral, and oak woodlands.

The search and review of the California Natural Diversity Database revealed recorded occurrences of 13 special-status plants, 11 special-status wildlife species, and three natural communities of special concern in the region of the project area. No rare plants or natural communities of special concern were observed in the basin CUP site. The CUP area is within the 1.3-mile upland dispersal potential for the California tiger salamander, and low suitability/potential for the coast horned lizard, northern California legless lizard and American badger. No other rare, threatened or endangered species are expected to occur.

In accordance with the Santa Barbara County Thresholds of Significance, should they occur implementation of the proposed project would result in impacts from basin construction and operation on special-status wildlife species California tiger salamander, coast horned lizard, northern legless lizard, American badger, and nesting birds. No substantial habitat loss is associated with the basin project that would remain mostly as undeveloped grassland and seasonally ponded land. Mitigation measures are provided to avoid and minimize potentially significant impacts on wildlife resources to a less than significant level. No impacts on special-status plant species would result from the basin CUP as none occur within the basin CUP site. Based on the findings described in this basin CUP biological resources assessment establishing the existing conditions of biological resources within the basin CUP area, identification of biological resources impacts, and incorporation of the recommended mitigation measures, implementation of the proposed project would avoid and minimize impacts on biological resources to a less than significant level.

2.0 INTRODUCTION, PROJECT DESCRIPTION, AND PURPOSE

The Solstra Solomon Hills Project (Project) proposes to create Santa Barbara County's first new community that will result in a sustainable, resilient, and healthy environment for its residents. The Project establishes a holistic framework for Smart Growth with a redevelopment of private lands historically used for grazing and oil and gas production. The Project Specific Plan includes the design and implementation of a central village closely surrounded by several neighborhoods, office and commercial space, a TK-8 school, fire/sheriff station, parks, open space, and public trails to allow walking and biking as an easy alternative to vehicle transport.

The proposed Project Specific Plan allows for a balance of land uses primarily serving working families allowing 4,000 single and multifamily residential units, 650,000 square feet of commercial retail and office use and space, 25.5-acres of public and institutional uses and space, and 1,023 acres of recreational and open space uses. Critical infrastructure includes water supply and a water reclamation facility, interchange improvements along Highway 101, additional secondary access along Hwy 101 and Hwy 135 and several active and passive parks and public trails. Public benefits include developer sponsored affordable housing near commercial and transportation access points, utility and access improvements that minimize traffic impacts to neighboring properties, new public trail access into the Orcutt Hills, recreational improvements and public access to the Newlove Park Picnic Grounds, the preservation of open space ridgelines and valleys for habitat protection, and the abandonment and remediation of all oilfield features and operations within the Specific Plan. The Project is designed to be built in four (4) buildout phases over a fourteen-year period for the orderly delivery of the Project. Phased grading, access, utility, horizontal and public improvements are scheduled ahead of and to align with the same buildout phases.

Solstra Communities California, LLC (Solstra) proposes the Wet Weather Storage Basin improvements as an offsite Conditional Use Permit (basin CUP) on approximately 7.5 acre basin and 24 acres of spray fields on land owned by Solstra, located west of Highway 101 and just south of the town of Orcutt and within the Orcutt Community Plan boundary. (see Figure 3). The basin CUP area currently supports mostly non-native grassland habitat with small edges of oak woodland and coastal scrub habitats as described in Section 5 below.

The basin will provide 39.5 acre-feet of recycled water storage during periods of wet weather when recycled water demand is low. The proposed basin has a footprint, including a perimeter access road of approximately 7.5 acres and a maximum depth of 20 feet. As the water in the basin will be used for irrigation purposes, the basin will include a geosynthetic liner.

Construction of this basin is projected to commence when 80% of buildout wastewater flow is achieved (i.e. approximately 0.42 mgd); in the assumed 14-year buildout timeline, construction of the basin would start in year nine. The basin may be constructed over two or three phases to match the storage volume requirements over time. Assuming construction over three phases, each adding just over 13 ac-ft of capacity, a first phase would be completed by end of year nine, a second phase would be completed by end of year ten, and the third phase would be completed by end of year twelve.

Water will be delivered to the basin via an extension of the recycled water distribution system. Recycled water will be temporarily held in the basin until irrigation demand increases in the Solomon Hills development recycled water use areas and spray fields. A recycled water pump station will be installed immediately adjacent to the basin with a triplex pumping system capable of delivering 800 gallons per minute back to the recycled water distribution system serving the Solomon Hills development and Newlove Park. The wet well of the pump station will be hydraulically connected to the lined basin via a buried pipe and intake system and will have a depth of approximately 20 feet. The footprint of the pump station is approximately 1,000 square feet with access provided via the storage basin perimeter access road.

A 24-acre spray field will be designated west of and adjacent to this effluent storage basin. Water held in Effluent Storage Basin No.3 will be sent either to the adjacent spray field or returned to the recycled water distribution system for irrigation in other recycled water use areas. The spray field will consist of a piped sprinkler system split into separate irrigation blocks (for operational flexibility) with shallow buried mainline PVC pipes delivering water to above ground irrigation laterals feeding individual sprinkler heads. A shallow tailwater ditch will be installed at the toe of the spray field to collect incidental runoff due to irrigation and convey it to the spray field pump station. The pumping system is anticipated to consist of an 8-foot diameter by 20-foot deep wet well and duplex pumping system capable of delivering flows of up to 580 gpm to the spray field irrigation system. The wet well will be

located near the northwest end of the basin and have a direct connection to the basin through a buried pipe and intake system approximately 20-feet deep.

David Wolff Environmental (DWE) conducted the review of available background data and conducted biological resources field surveys on April 22, 2025 and July 15, 2025 during the peak expression and growth of the onsite flora. The Biological Resources Assessment (BRA) study area for identifying and mapping habitats, establishing existing conditions, and evaluating basin CUP impacts includes the proposed 7.5-acre constructed basin and 24 acres of irrigated spray fields. The survey focused on identifying plant communities, mapping habitat types, detecting special-status plants and wildlife if observed. The purpose of the field surveys and this biological resources assessment is to document existing conditions of the proposed basin CUP area, determine the suitability and presence/absence of rare, threatened, or endangered plants or wildlife (special-status species), and to evaluate the potential for any direct or indirect significant impacts on biological resources or waters of the U.S./State, or adverse effects on any special-status species.

3.0 EXISTING CONDITIONS

3.1 ENVIRONMENTAL SETTING

The Solstra Solomon Hills basin CUP offsite improvement includes approximately 7.5 acres of ground disturbance for construction of the lined basin, access road, and 24 acres of spray fields almost entirely within a non-native annual grassland habitat. The access road runs through a small patch of California sage brush dominated coastal scrub but mostly through annual grassland. The basin project is bordered by Highway 101 on the east and the Orcutt Hill habitat mosaic of grassland, coastal scrub, maritime chaparral and oak woodland habitats to the north, south and west. The region to the north and east around the basin CUP site and Orcutt Hill habitat mosaic are expanses of annual crops and vineyards, and urban development of the Orcutt community.

3.2 SOIL TYPES

The USDA Natural Resources Conservation Service has identified three soil series mapping units on the basin project site as shown in Figure 4 and described below.

- **Map Unit: BnB2—Betteravia loamy sand, dark variant, 0 to 5 percent slopes, eroded; BnD2—Betteravia loamy sand, dark variant, 5 to 15 percent slopes, eroded –** The dark variant is on alluvial fans derived from alluvium from diatomaceous shale and/or acid sandstone parent material. The surface layer is dark gray loamy sand about 26 inches thick with a sandy loam subsoil to 50 inches. This is a well-drained soil and does not meet hydric criteria.

- **Map Unit: DaF—Diablo silty clay, 30 to 45 percent slopes –** This soil is on hills derived from residuum weathered from calcareous mudstone or shale parent material. The surface is a dark gray silty clay about 26 inches with a calcareous silty clay substratum and mudstone. This is a well drained soil and does not meet hydric criteria.
- **Map Unit: EdD2—Elder sandy loam, 9 to 15percent slopes, eroded; EdD2—Elder sandy loam, 9 to 15 percent slopes, eroded –** This soil is on alluvial fans derived from alluvium from acid sandstone and shale parent material. The surface layer is dark gray sandy loam about 23 inches thick underlain with layers of brownish gray stratified sandy loam to 60 inches or more. This is a well-drained soil and does not meet hydric criteria.

3.3 REGULATORY SETTING (BIOLOGICAL RESOURCES)

The Federal Clean Water Act (CWA) – Waters of the U.S.

The Environmental Protection Agency (EPA) and U.S. Army Corps of Engineers (USACE) ("the agencies") promulgated a Final Rule (40 CFR 120) effective March 20, 2023, defining the scope of waters of the U.S. protected under the Clean Water Act (CWA) The basis of the final rule is the Supreme Court of the United States (SCOTUS) holding in Sackett v. EPA that the CWA's use of "waters" refers only to "geographical features that are described in ordinary parlance as streams, oceans, rivers, and lakes," and to adjacent wetlands that are "indistinguishable" from those bodies of water due to a continuous surface connection.

The SCOTUS decision definition of waters of the U.S. are summarized as follows:

- Traditional navigable waters, the territorial seas, and interstate waters;
- Impoundments of waters of the United States;
- Tributaries to territorial seas or interstate waters when they meet the relatively permanent standard of standing or continuously flowing waters to traditional navigable waters, or the significant nexus standard. The "significant nexus standard" refers to the test to identify waters that, either alone or in combination with similarly situated waters in the region, significantly affect the chemical, physical, or biological integrity of traditional navigable waters, the territorial seas, or interstate waters;
- Impoundments when the tributaries meet either the relatively permanent standard or the significant nexus standard as jurisdictional tributaries (above);
- Wetlands adjacent to above waters of the U.S. with a continuous surface connection to relatively permanent tributaries or impoundments; and
- Intrastate lakes and ponds, streams, or wetlands not identified above that meet either the relatively permanent standard or the significant nexus standard.

Section 404 of the CWA is administered by the USACE who has jurisdiction over permitting for the placement of fill or dredged material into waters of the U.S. including wetlands.

CWA Section 401 requires that an applicant for a federal CWA Section 404 permit that allows activities resulting in a discharge of fill or dredged material into waters of the U.S., must obtain a state water quality certification that the discharge complies with other provisions of CWA. The Regional Water Quality Boards (RWQCB) administer the 401 water quality certification program in California. A Section 401 certification when a Corps Section 404 permit is issued is required to certify that the Section 404 Permit will comply with state water quality requirements.

Federal Endangered Species Act (FESA) administered by the United States Fish and Wildlife Service (USFWS) protects formally listed species from take (kill, harm, harass) and requires permits for activities that may adversely affect a listed species. Under FESA Section 7, federal agencies are required to consult with the USFWS regarding effects to federally listed species for projects permitted, approved, funded, or otherwise authorized by a federal agency (federal nexus).

The Federal Migratory Bird Treaty Act (MBTA) and the California Fish and Game Code Section 3503 and 3503.5 (see below) protect migratory birds and other birds from unlawful take any time, by any means or in any manner, including to pursue, hunt, take, capture, or kill migratory birds, and/or the destruction of birds, active nests, eggs, or parts thereof.

Bald and Golden Eagle Protection Act prohibits the "take" or possession, purchase, barter, transport, export or import, at anytime or in any manner any bald eagle or any golden eagle, alive or dead, or any part, nest, or egg thereof. While permits for impacts on bald or golden eagles are available, USFWS guidance suggests evaluation of construction activities within one mile of an active nest site. The USFWS suggests consultation to assess if an eagle permit is needed.

California Endangered Species Act (CESA) administered by the California Department of Fish and Wildlife (CDFW) protects species formally listed by the State from take (killing) and requires permits for activities that may result in take of a CESA listed species.

California Porter-Cologne Water Quality Control Act administered by the State Water Resources Control Board and Regional Water Quality Control Boards (Water Boards) is applied when projects involve impacts on waters of the State that are not regulated under the CWA 404/401 process. In these cases, the Water Boards would require Waste Discharge Requirement (WDR) permits for impacts on waters of the State. The Water Board issued policy, procedures, and wetland definition for the discharge of dredged or fill material into waters of the State (Procedures). In brief, the Procedures define wetlands as waters of the State to be consistent with the federal three parameter definition requiring the presence of hydrophytic (wetland) vegetation, hydric soils, and wetland hydrology.

California Fish and Game Code Section 1600 *et.seq.* requires an entity to notify CDFW prior to commencing any activity that may substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake, or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake.

California Fish and Game Code Section 1900 *et.seq.* – Native Plant Protection Act: The NPPA was enacted in 1977 and allows the Fish and Game Commission to designate plants as rare or endangered. The NPPA prohibits take of endangered or rare native plants, but includes some exceptions for agricultural and nursery operations; emergencies; and after properly notifying CDFW for vegetation removal from canals, roads, and other sites, changes in land use, and in certain other situations. No state designated rare species have been observed or are expected to occur within the project site.

California Fish and Game Code Sections 3503 & 3503.5 state that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto. 3503.5 specifies it is unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this code or any regulation adopted pursuant thereto. Section 3503 specifies it is unlawful to take or possess any migratory nongame bird as designated in the Migratory Bird Treaty Act or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Treaty Act.

Wetlands – Santa Barbara County Environmental Thresholds and Guidelines define wetlands for the purposes of determining potentially significant effects uses the following wetland definition that has been adopted by most resource protection agencies. This definition reads:

> "For purposes of this classification wetlands must have one or more of the following three attributes:
>
> a) At least periodically, the land supports predominantly hydrophytes, that is plants adapted to moist areas.
>
> b) The substrate is predominantly un-drained hydric soil, and
>
> c) The substrate is non-soil and is saturated with water or covered by shallow water at some time during the growing season of each year. (Cowardin 1979)"

Santa Barbara County Code Chapter 14, Appendix A, titled Grading Ordinance Guidelines for Native Oak Tree Removal, provides regulations regarding agricultural and non-agricultural deciduous and live oak tree removals. The purpose of Appendix A is to sustain and, where possible, enhance the native oak resources of Santa Barbara County. Specifically, the County Code seeks to ensure that there is no net loss of native oak trees and that, if possible and with the help of incentives, the number and extent of remaining valley oak

(*Quercus lobata*), blue oak (*Quercus douglasii*), and live oak (*Quecus agrifolia*) trees increases. As per the County Code, live oaks that are 8 inches diameter at standard height (DSH) or greater are protected trees.

State of California Public Resources Code (PRC) Section 21083.4 contains provisions for counties to mitigate impacts on oak woodlands that would be significant under the California Environmental Quality Act (CEQA). The PRC describes the means for counties to obtain feasible and proportional oak habitat mitigation.

4.0 METHODS

Prior to the field survey, DWE Principal Ecologist David Wolff conducted a review of available background information including aerial photography of the project area over time (Google Earth), the Natural Resources Conservation Service soil survey, and the evaluation of query results of an approximately ten-mile search radius of the California Natural Diversity Data Base (CNDDB). The CNDDB provided a list and mapped locations of special-status plant and wildlife species, and natural communities of special concern, that have been recorded in the region of the project site. The CNDDB records help to focus the field survey efforts and evaluation of potential project effects on specific species or habitats. It is noted that the CNDDB does not necessarily include all special-status species potentially occurring onsite or in the region, but rather only those that have been recorded in the CNDDB. In addition, the California Native Plant Society (CNPS) online rare plant inventory and CalFlora online database were queried for relevant potential rare, threatened or endangered plants.

DWE Principal Ecologist David Wolff reviewed the available background data described above prior to conducting field surveys of the basin and spray fields CUP site on April 22, 2025, and July 15, 2025, during the peak expression and growth of the onsite flora. Mr. Wolff, a highly skilled field ecologist with expertise in identifying botanical, wetland, and wildlife resources, has been conducting botanical and wildlife surveys, and delineating wetlands and limits of waters of the U.S./State for more than 40 years, the last 25 years on the Central Coast of California. The field survey included a floristic inventory and rare plant survey, wildlife observations, and determined no waters of the U.S./State are present within the basin project site.

Mr. Wolff conducted the survey by meandering transects through the entire and very uniform grassland habitat of the basin and spray fields affording complete and thorough coverage for the floristic inventory. Plant and wildlife species observed and general site characteristics were documented.

No protocol surveys were conducted or required to adequately document existing conditions and address special-status wildlife species occurrence. No ponds or perennial waters were observed within the basin project area so any California red-legged frog or western pond turtle surveys are not warranted. California tiger salamander breeding ponds are well

documented with the study area falling within the 1.3-mile upland dispersal distance with ORCU-3 nearby to the west. As such, CTS potential presence in underground refuges is assumed so the extensive two-year study protocol to prove absence is not warranted with compensatory habitat mitigation proposed as part of the overall Solomon Hills project.

DWE survey under overcast conditions leading to mostly sunny and partly cloudy weather conditions, sufficient wet season rainfall, and observable peak expression and growth of spring and summer season were conducive for the purpose of completing a floristic inventory and rare plant survey and assessing wildlife habitat to establish existing conditions. The DWE background data review and field survey were in accordance with the Santa Barbara County Environmental Thresholds and Guidelines Manual Including Appendix A, Biological Resources Technical Background Document. The overall purpose of the field survey was to document existing conditions in terms of habitat for plant and wildlife species, determination of the presence/absence of special-status plants, observations or habitat suitability for special-status wildlife species, and the potential to support wetland and/or riparian habitats other waters of the U.S./State. The basin CUP site habitat types were described by the aggregation of plants and wildlife based on the composition and structure of the dominant vegetation observed at the time the field reconnaissance was conducted and through review of multiple years of aerial photography. Plant community mapping and project impact analysis were conducted using GIS and recent high resolution aerial photography.

DWE Principal Ecologist David Wolff reviewed the available background information and available aerial photography, conducted the above field surveys, and is the primary author and principal in charge of report preparation. The survey data collected on plant and wildlife species and conclusions presented in this biological resources assessment are based on the methods and field reconnaissance conducted over the study area as described above.

5.0 RESULTS

5.1 HABITAT TYPES AND PLANT COMMUNITIES

Plant communities are generally described by the assemblages of plant species that occur together in the same area forming habitat types. The best fit based on observed site conditions for community alliance and alliance codes habitat classifications used in this report follow, *A Manual of California Vegetation, 2nd edition* (Sawyer et al. 2009) and California Department of Fish and Wildlife *California Natural Community List*. Plant names used in this report follow *The Jepson Manual, Vascular Plants of California, Second Edition Thoroughly Revised and Expanded* (Baldwin et al. 2012) with taxonomic updates using the Jepson e-flora project. The study area supports primarily one plant community, the fringe of two plant communities, and developed/disturbed existing road. The following discussion characterizes the plant community classifications using the dominant plant species observed during DWE field surveys with the extent of each plant community within the basin CUP

site are shown in Appendix A Figure 5. Table B-1 in Appendix B provides a complete list of plant species observed during DWE floristic inventory field survey. Figure 9 in Appendix A includes a set of onsite representative photographs from DWE field surveys.

WILD OATS AND BROME GRASSLANDS – NON-NATIVE ANNUAL GRASSLAND (CDFW 42.027.00)

WILD OATS GRASSLAND; *AVENA (BARBATA, FATUA)*
ANNUAL BROME GRASSLANDS; *BROMUS (DIANDRUS, HORDEACEUS)*
SEMI-NATURAL HERBACEOUS STANDS

The entire basin and spray field project area is non-native annual grassland dominated by ripgut brome (*Bromus diandrus*) and rattail sixweeks grass (*Festuca myuros*). Other common annual grasses and non-native herbaceous broadleaf plant species were observed included soft chess (*Bromus hordeaceus*), Italian ryegrass *(Festuca perennis),* oats (*Avena sp.*), foxtail barley (*Hordeum murinum* ssp. *leporinum*), smooth cat's ear (*Hypochaeris glabra*), filarees (*Erodium botrys*, *E. cicutarium*), and bur clover (*Medicago polymorpha*). Few native wildflowers were observed within the dense cover of ripgut brome and rattail sixweeks grass that included fiddleneck (*Amsinckia intermedia*), coastal tidy tips (*Layia platyglossa*), popcorn flower (*Plagiobothrys nothofulvus*), telegraph weed (*Heterotheca grandiflora*), and blue-eyed grass (*Sisyrinchium bellum*). Scattered purple needlegrass (*Stipa pulchra*) were observed in the non-native grassland that did not aggregate to a greater than 10 percent cover as a "native grassland" habitat. Thistles and mustards were also observed in the non-native grassland habitat.

CALIFORNIA SAGEBRUSH SCRUB

CALIFORNIA SAGEBRUSH; *ARTEMISIA CALIFORNICA* SHRUBLAND ALLIANCE (CDFW 32.010.01)

A narrow band of California sagebrush scrub occurs between the Highway 101 road shoulder and the eastern fence line along the southern part of the access road of the basin project area. The coastal sage scrub plant community within the study area is represented by California sagebrush (*Artemesia californica*) with few scattered coyote brush shrubs (*Baccharis pilularis*). The non-native annual grassland occurs under and all around the coastal scrub habitat zone.

COAST LIVE OAK WOODLAND

QUERCUS AGRIFOLIA WOODLAND ALLIANCE (CDFW 71.060.02)

The coast live oak woodland alliance is one of the most characteristic vegetation types on the central coast of California. There is the outer fringe of coast live oak woodland outside of the northwest corner of the basin grading area and the edge of the spray fields. The oak woodland is more like a small stand of widely spaced oaks amongst the non-native annual grassland understory (see Figure 3). Coast live oak woodland near the basin project area is characterized by an open cover of mature coast live oaks (*Quercus agrifolia*) with the typical

increase in occurrence of Italian thistle (*Carduus pycnocephalus*) in the grassland understory within the dripline along with some miner's lettuce (*Claytonia perfoliata*). Three single non-native unprotected cork oak trees (*Quercus suber*) occur along the proposed access road alignment.

DEVELOPED/DISTURBED

Although not defined by the Manual of California Vegetation, developed/disturbed area within the basin project area is the small reach of existing paved access road off the Highway 101 entrance to the Solomon Hills project.

5.2 WILDLIFE

The mosaic of non-native annual grassland and the fringe of coast live oak woodland habitats can provide habitat for an abundance of resident, migratory, and locally nomadic wildlife species typical in the region. The basin project abuts Highway 101that represents at least a significant barrier to wildlife movement through the site from the surrounding Orcutt Hill lands to the south and west. Common grassland species observe during the DWE field survey were California ground squirrel (*Spermophilus beecheyi*), pocket gopher (*Thomomys bottae*), and meadow mice (*Microtus californicus*). The mixture of grasslands, scrublands, and oak woodlands can support a variety of common wildlife species uses between habitat types including coyote (*Canis latrans*), bobcat (*Lynx rufus*), with sightings of mountain lions (*Puma concolor*) around Orcutt Hill. American badger (*Taxidea taxus;* no evidence observed), jack rabbit (*Lepus californicus*), meadowlark (*Sturnella neglecta*), sparrows, yellow-billed magpie (*Pica nuttalli*), western fence lizard (*Sceloporus occidentalis*), and gopher snake (*Pituophis catenifer*) are typical grassland species, along with foraging raptors such as red-tailed hawk (*Buteo jamaicensis*) and golden eagle (*Aquila chrysaetos*).

5.3 WATERS OF THE U.S., WETLANDS, AND WATERS OF THE STATE

No drainages or wetlands were observed within the basin project area. As such, no waters of the U.S./State or wetlands occur within the basin and spray field basin CUP area.

5.4 SPECIAL-STATUS SPECIES AND NATURAL COMMUNITIES OF SPECIAL CONCERN

Special-status species are those plants and animals listed, proposed for listing, or candidates for listing as threatened or endangered by the United States Fish and Wildlife Service (USFWS) or the National Marine Fisheries Service (NMFS) under the federal Endangered Species Act (FESA); those considered "species of concern" by the USFWS; those listed or proposed for listing as rare, threatened, or endangered by the CDFW under the California Endangered Species Act (CESA); animals designated as "Species of Special Concern" by the CDFW; and plants occurring as a rank 1B, 2, and 4 of the California Native Plant Society

(CNPS) *Inventory of Rare and Endangered Vascular Plants of California.* Natural Communities of Special Concern are habitat types considered rare and worthy of tracking in the CNDDB by the CNPS and CDFW because of their limited distribution or historic loss over time.

The search, review and evaluation of the CNDDB revealed 24 special-status species composed of 13 special-status plants, 11 special-status wildlife species, along with three natural communities of special concern with recorded occurrences in the region of the proposed project site. The following briefly describes or summarizes the special-status species issues and observations or potential for occurrence in the study area. Figures 6 and 7 in Appendix A provide CNDDB mapped locations of special-status plants and wildlife respectively, and Table B-2 in Appendix B provides a list of special-status species recorded in the CNDDB that includes scientific and common name, listing status, habitat requirements, potential for occurrence or whether or not species were observed during the DWE field survey, and special-status wildlife observations or potential for them to occur within the study area.

5.4.1 Special-Status Botanical Resources

The CNDDB revealed the recorded occurrences of 13 special-status plant species two of which are formally listed under the Federal and State Endangered Species Acts with the remainder being noted with a CNPS rank suggesting rarity. Three natural communities of special concern are recorded in the CNDDB in the region of the project site, Central Maritime Chaparral, Purple Needlegrass Grassland/Native Grassland, and Southern Vernal Pool. The nearby Orcutt Hill (Newlove Hill) to the west supports Central Maritime Chaparral associated with the fractured rock on the upper reaches of the hill but does not extend east to the basin project area. Purple needlegrass, while individuals were observed during the DWE field survey as an element in the non-native grassland, was not present in enough total relative cover (greater than 10% within ½-acre patch size visual resolution) to constitute a native grassland. No vernal pools occur on the basin project site.

The special-status plant species occurrences recorded in the CNDDB include perennial woody shrubs and herbaceous annuals that are commonly associated with a specific soil type, moisture regime (marsh/creek/wetlands), habitat type that dictates the range or microhabitat of the species and potential to occur on the project site. The following provides a suitability analysis for special-status plant species with CNDDB recorded occurrences in the region. No special-status woody shrubs, wetland associated plants, or sandy soil plants were observed in the basin CUP site during the DWE field surveys. The DWE field surveys were at the time of peak expression and growth of the onsite flora and species identification window for all CNDDB recorded special-status plants.

The perennial species such as manzanitas (La Purisima, Refugio, sand mesa; *Arctostaphylos* spp.*)*, Lompoc yerba santa (*Eriodictyon capitatum*), and mesa and Kellogg's horkelia (*Horkelia cuneata* var. *puberula; H. c.* var*. sericea*), would have been noticeable and identifiable any time of year and were not observed during the survey.

The special-status plant species recorded in the CNDDB known from mesic, moist, seep, wetland type habitats occurring in the region are La Graciosa thistle (*Cirsium scariosum v*ar. *loncholepis*) and San Bernardino aster (*Symphyotrichum defoliatum*) that were not observed. No mesic (wetland) habitats occur within the basin CUP site.

Sandy soil associated special-status plants with the low potential to occur in the study area include Hoover's bent grass (*Agrostis hooveri*), San Luis Obispo monardella (*Monardella undulata* ssp. *undulata*), dune larkspur (*Delphinium parryi* ssp. *blochmaniae*), and black flowered figwort (*Scrophularia atrata*). None of these species were observed during the DWE floristic inventory field surveys of the dense non-native grassland cover on the basin CUP site.

5.4.2 Special-Status Wildlife

The CNDDB search revealed the recorded occurrences of 11 special-status wildlife species within the region of the project site. While not recorded in the CNDDB, the Crotch's bumblebee (*Bombus crotchii*) is added to this analysis because of the recent listing by CDFW as a Candidate species for listing under CESA. Special-status wildlife species known from the region evaluated for this study are discussed below by groups based upon habitat preferences, specific habitat use requirements (i.e. terrestrial or aquatic), mobility, and migratory or dispersal patterns. Table B-2 in Appendix B provides listing status, habitat detail, and if observed or potential to occur on the project site for each of the species discussed below.

AQUATIC SPECIES

The CNDDB has recorded occurrences for the highly aquatic perennial stream or perennial pond associated western pond turtle (*Emys marmorata*) and California red-legged frog (CRLF; *Rana draytonii*). No perennial aquatic habitat occurs in the basin CUP site so these species would not occur. Given the lack of CRLF or western pond turtle perennial aquatic habitat within the basin CUP area, recorded occurrences over one mile away, and Highway 101 barrier to the east, CRLF or western pond turtle dispersal to or across the basin project site is highly improbably and would not be expected. Further, as noted above given the lack of perennial aquatic habitat within the study area, protocol surveys for either species are not warranted as there is no suitable aquatic habitat to survey.

The vernal pool fairy shrimp *(Branchinecta lynchi)* is listed as a threatened species by the USFWS that occurs in seasonal astatic (non-flowing) rain filled pools and are endemic to the grasslands of the Central Valley, Central Coast mountains, and the South Coast mountains.

There were no vernal pools or suitable seasonal wetland/pond habitat observed in the basin CUP site so this species would not occur.

The California tiger salamander (CTS; *Ambystoma californiense*) spends most of its lifecycle in upland underground refuges in small mammal burrows and can disperse upwards of 1.3 miles from their temporary (seasonal) breeding ponds in search of upland refuge. The basin CUP site is within the USFWS mapped West Los Alamos/Careaga metapopulation and is not within any CTS designated critical habitat. There are three USFWS identified known and potential breeding ponds within the maximum USFWS predicted 1.3-mile dispersal distance of the basin project site (see Figure 8). Most relevant to the study area is known CTS breeding ponds ORCU-3 and potential breeding pond ORCU-2 that are approximately 0.5 mile to the west and north of the basin project site respectively. ORCU-13 is approximately 1.0 mile to the west of the basin project site. There are densely vegetated oak and scrub hills with steep topography between the basin project area these known/potential CTS breeding ponds. ORCU-12 is well beyond the maximum 1.3 mile dispersal distance to the basin project site.

The USFWS suggests that even steep topography and dense vegetation do not restrict the potential for CTS to disperse 1.3 miles from breeding ponds. Only very costly and multiple year protocol surveys that require abundant rainfall for agency approved survey validity can refute this broad assumption of dispersal. ORCU-3, ORCU-12 and ORCU-13 are within the proposed CTS compensatory mitigation area for the Solomon Hills specific plan project. As such, potential for CTS occurrence in underground refuges within the basin CUP site is assumed so the extensive two-year study protocol to prove absence is not warranted. Compensatory habitat mitigation is proposed as part of the Solomon Hills specific plan inclusive of the offsite basin CUP (see Figure 8).

It is important to note that the primary basis for the USFWS 1.3-mile dispersal distance is statistical probability from studies in a central valley landscape with huge breeding ponds dispersing 1,000's of individuals seeking refuge opportunities in a flat grassland landscape for miles around the ponds. As noted above there is oak/shrub vegetation and varied steep topography between any noted CTS ponds and the basin CUP site.

The western spadefoot (toad) (*Spea hammondii*) requires temporary ponds and puddles for breeding and uplands within close proximity of breeding ponds for refuge in small mammal burrows similar to CTS, but spadefoot can also dig its own burrows in friable sandy/loam soils with a specialized structure (spade) on its hind legs. The USFWS issued a Proposed Rule on December 5, 2023 for establishing and proposed listing the northern and southern distinct population segments (DPS) of the western spadefoot as Threatened under the Federal Endangered Species Act (FR Vol.88, No. 232, pp. 84252-84278 (USFWS proposed rule). The USFWS proposed rule provided the following upland dispersal information based on studies in Orange County California: *The dispersal distance required between upland refugia and*

aquatic habitat ranges and may be up to approximately 600 m (1,968 ft) with a mean dispersal distance of 40m (131 ft) to 137 m (450 ft). Only one of 15 individuals tracked by radio telemetry in the Orange County study moved the maximum 600m distance with the rest moving from breeding ponds to uplands within the mean 40m to 137m distance. The study also suggested spadefoots strongly selected grassland rather than shrubs for burrow/refuge.

Western spadefoot has been observed in CTS ponds ORCU-12 and ORCU-13 that are well beyond the maximum predicted dispersal from breeding ponds. The USFWS has surveyed ORCU-3 in five years between 2017 and 2024 during "CTS roundups" (annual aquatic sampling of CTS ponds with landowner approvals) and has not detected western spadefoot in ORCU-3. No suitable seasonal pools occur within the basin project area itself and this species would not be expected to occur given the 0.5-mile distances beyond the documented dispersal study distances from the known breeding sites.

MONARCH BUTTERFLY

The monarch butterfly (*Danaus plexippus*) is now a federal candidate species for listing under the Endangered Species Act. The candidate status is from the USFWS determination that other species have a higher priority for staff resources to process listing requests. The monarch butterfly uses coastal eucalyptus/pine tree stands for fall and winter roosts typically from October through January. The CNDDB monarch butterfly roost site records are of small aggregations or only potential sites that support eucalyptus stands to the north in Orcutt and the City of Santa Maria. Most roost sites are near to the coast where winter low temperatures are not extreme. The inland basin project area location grassland and oak woodland fringe do not represent suitable roost habitat for the monarch butterfly.

CROTCH'S BUMBLEBEE

According to the available Xerces Society literature and 2018 petition to the California Fish and Game Commission to list the Crotch's bumble bee states they typically nest in undisturbed ground using existing burrows from other animals or downed debris as they do not excavate their own nests. There is not nest site tenacity with nest site locations changing each season. Areas subject to surface disturbance become unsuitable for this species. They are generalist forages on a wide variety of flowering plants and require a steady source of nectar and pollen from wildflowers during the flight season with an active colony period of April through August, but may be found from February through October. The Xerces petition showed the basin project area is outside of the predicted historic and current range that appeared to exclude from its range along the coast from Big Sur to southern Santa Barbara County. The CDFW in 2023 issued survey considerations for candidate bumble bee species that provided a new current predicted range map that includes almost the entirety of central California from Redding to the Mexico border including the basin CUP site. The nearest

CNDDB occurrence is over 20 miles away to the east near Figueroa Mountain from 1989. A recent court decision allowing the California Fish and Game Commission to consider the Crotch's bumble bee as a fish by California Fish and Game Code definition, determined its status as a Candidate for listing as endangered. As detailed above, the DWE field survey established the project site as non-native annual grassland dominated by non-native grasses with little wildflower resources and very limited small mammal burrows. No bumble bees were observed during the DWE April and July 2025 field surveys.

UPLAND REPTILES

The northern legless lizard *(Anniela pulchra)* is closely associated with sandy or very friable loamy soils under coastal scrub or woodland vegetation with soil moisture and vegetative cover being essential. The Blainville's (coast) horned lizard *(Phrynosoma blainvillii)* occurs in a wide variety of habitats with sandy soils, abundant ant colonies for food, open areas for sunning, and shrubs for cover needed. The dense grass cover, mostly loamy sand and silty clay soils, and lack of shrub cover on the basin project site provides only a low potential for either reptile species to occur.

BIRDS

The golden eagle (*Aquila chrysaetos*) is a wide-ranging raptor protected under the Bald and Golden Eagle Protection Act and as a Fully Protected species by CDFW. Large stick nests in trees and cliffs with long-term site tenacity are common. A nesting pair of golden eagles was observed by DWE near Solomon Mountain in 2023. The nest site was not active in 2025 (Althouse and Meade 2025). The basin project site is approximately 0.9 mile from Solomon Mountain with no visual sight lines to basin project site so would be unaffected by basin project construction should the nest be active at that time. However, the grassland habitat around the basin represents a small amount of suitable foraging habitat that would mostly remain for this wide-ranging species.

MAMMALS

The American badger *(Taxidea taxus)* is a grassland species needing abundant small mammal prey and are easily detected by their distinctive half-moon shaped burrows. The grassland in and around the basin project area provide suitable habitat for the American badger with CNDDB recorded occurrences in the vicinity. No distinct badger dens were observed during the DWE April and July 2025 surveys of the basin CUP site.

6.0 IMPACT ASSESSMENT AND RECOMMENDED MITIGATION MEASURES

6.1 SUFFICIENCY OF BIOLOGICAL DATA

The DWE field surveys on April 22, 2025, and July15, 2025 were at the peak expression and growth of the onsite dense non-native grassland plant community and constitutes a valid floristic inventory and rare plant survey for this assessment. The data collected as articulated in this report provide sufficient biological resources information sufficient to; 1) adequately establish existing conditions of the project site and landscape scale context based on the natural and developed land use mosaic in the vicinity; 2) determine if the site does supports any special-status plant or wildlife species or suitable habitat for such species; 3) determine if waters of the U.S./State, wetland or riparian habitats occur in the study area, and 4) adequately evaluate significance of proposed project impacts on biological resources, and 5) provide recommended mitigation measures to avoid, minimize, and otherwise reduce potential significant project impacts to a less than significant level to the extent feasible.

6.2 THRESHOLDS OF SIGNIFICANCE – SANTA BARBARA COUNTY

Santa Barbara County has an adopted Environmental Thresholds and Guidelines Manual that provides the direction on determining thresholds for significant impacts and those that are considered less than significant impacts, and for the analysis of impacts and development of feasible mitigation measures for the Proposed project.

According to the Santa Barbara County Environmental Thresholds and Guidelines Manual, Biological Resources Section (6.)(C.)(3.)(a.), significant impacts on biological resources are considered in the following circumstances:

(1) Substantially reduce or eliminate species diversity or abundance.
(2) Substantially reduce or eliminate quantity or quality of nesting areas.
(3) Substantially limit reproductive capacity through losses of individuals or habitat.
(4) Substantially fragment, eliminate, or otherwise disrupt foraging areas and/or access to food sources.
(5) Substantially limit or fragment range and movement (geographic distribution or animals and/or seed dispersal routes).
(6) Substantially interfere with natural processes, such as fire or flooding, upon which the habitat depends.

According to the Santa Barbara County Environmental Thresholds and Guidelines Manual, Biological Resources Section (6.)(C.)(3.)(b.), less than significant impacts on biological resources are considered in the following circumstances:

> ***Less Than Significant Impacts.*** *There are many areas in the County where there is little or no importance to a given habitat and it is presumed that disruption would not*

create a significant impact. Examples of areas where impacts to habitat are presumed to be insignificant include:

(1) Small acreages of non-native grassland if wildlife values are low.
(2) Individuals or stands of non-native trees if not used by important animal species such as raptors or monarch butterflies.
(3) Areas of historical disturbance such as intensive agriculture.
(4) Small pockets of habitats already significantly fragmented or isolated, and degraded or disturbed.
(5) Areas of primarily ruderal species resulting from pre-existing man-made disturbance.

According to the Santa Barbara County Environmental Thresholds and Guidelines Manual, Biological Resources Section (6.)(C.)(3.)(c.), Impact Assessment Factors, the following questions and factors are used in assessing the significance of Project impacts on biological resources.

(1) ***Size.*** *How much of the resource in question both on and off the Project site would be impacted?* (*Percentage of the whole area and square footage and/or acreage are both useful to know*) *How does the area or species that would be impacted relate to the remaining populations off the Project site?* (*Percentage of total area or species population, either quantitatively or qualitatively.*)

(2) ***Type of Impact.*** *Would it adversely indirectly affect wildlife* (*light, noise, barriers to movement, etc.*)*? Would it remove the resource or cause an animal to abandon the area or a critical activity* (*e.g., nesting*) *in that area? Would it fragment the area's resource?*

(3) ***Timing.*** *Would the impact occur at a critical time in the life cycle of an important plant or animal* (*e.g., breeding, nesting, or flowering periods*)*? Is the impact temporary or permanent? If it is temporary, how long would the resource take to recover? Would the impact be periodic, of short duration, but recur again and again?*

Additionally, Santa Barbara County Environmental Thresholds and Guidelines Manual, Biological Resources Section (6.)(D.) provides the following habitat-specific impact assessment guidelines pertinent to this proposed project analysis.

Section (6)(D.)(4.)(a. & b.) Oak Woodlands and Forests Habitat Impact Assessment Guidelines:

a. Description. *There are three primary types of oak woodlands in Santa Barbara County: Valley Oak, Coast Live Oak, and Blue Oak woodlands. The number, type, and density of oak trees, and the relationship between trees and understory are*

principal characteristics which define the various types of woodlands. Oak habitats support a diverse wildlife population, and offer abundant resources to wildlife including food sources, shade in summer, shelter in winter, perching, roosting, nesting, and food storage sites.

b. ***Impact Assessment Guidelines for Woodlands and Forest Habitat Areas.*** *Project-created impacts may be considered significant due to changes in habitat value and species composition such as the following:*
   (1) Habitat fragmentation.
   (2) Removal of understory.
   (3) Alteration to drainage patterns.
   (4) Disruption of the canopy.
   (5) Removal of a significant number of trees that would cause a break in the canopy or disruption in animal movement in and through the woodland.

Section (6)(E.)(1.)(a., b, & c.); (2) – General Mitigation Guidelines for Biological Impacts

1. Mitigation Hierarchy. The following general approaches to reducing biological impacts are presented in the order of their effectiveness.

a. Avoidance.

Avoid direct or indirect impacts to significant biological resources through project design.

Focus on maintaining large, contiguous habitat areas and animal movement corridors. A project design which clusters development on a relatively limited portion of the project site may reduce the habitat area disturbed by the project.

b. Onsite Mitigation.

Minimize or reduce impacts through on-site design and resource protection measures.

Measures may include vegetative spatial buffer between project and habitat areas; revegetation; habitat enhancement; erosion and water quality protection; on-site replacement/compensation; maintenance and management measures such as fencing, weed control, use of building envelopes, and dedication of areas through open space or conservation easements or grant deed of development rights; short-term measures to protect against construction impacts (e.g., fencing, timing of construction to avoid nesting season).

c. Off-Site Mitigation.

Compensate for on-site impacts through off-site measures.

When avoidance or on-site mitigation is infeasible or inadequate to reduce impacts, measures such as those listed under on-site mitigation can be considered in off-site locations, or may be accomplished through in-lieu fees. Off-site approaches may be appropriate at times if a

greater ecological value may be clearly gained than with on-site mitigation. (i.e., where on-site habitat is of low quality or highly fragmented).

2. **Habitat Replacement/Compensation Guidelines.** The mitigation approach of replacing habitat either on-site or off-site, to compensate for habitat loss, is generally not a preferred approach because it always results in some habitat loss (either short-term or long-term), and because prospects for successful habitat replacement are problematic.

Replacement mitigation should involve the same habitat type, location(s) within the same watershed and as close as possible to the site of impact, and should result in comparable and compensating size and habitat value.

Beneficial ecological restoration projects, where the purpose of the project is to enhance or restore biological or habitat resources, compensate replacement at a minimum ratio of 1:1. Refer to the County *Guidelines for the Implementation of the California Environmental Quality Act of 1970, As Amended*, revised January 8, 2008, for the definition and requirements for beneficial ecological restoration projects.

6.3 IMPACT ASSESSMENT

This section discusses potential significance of impacts on biological resources organized by CEQA Appendix G Checklist that would result from implementation of the basin CUP as described in Section 2.0 above and detailed below in Table 1.

Potential Adverse Effects on Candidate, Sensitive or Special-status Species

There is a low potential for the legless lizard, horned lizards, and Crotch's bumble bee within the project basin footprint and spay fields. Should they occur, there would be loss of habitat and likely mortality impacts on the northern legless lizard, Blainville's horned lizard, American badger, and Crotch's bumble bee. CTS could be using the small mammal burrows in the basin area as it is within the 1.3-mile maximum dispersal distance from two known and one potential CTS breeding pond. Impacts on CTS in upland refuge resulting in mortality could occur during construction. The seasonal ponding regime when operational could be viewed as beneficial to the CTS with another breeding pond opportunity, or an attractive nuisance if ponding once initiated is not of sufficient duration (90-120 days) for CTS breeding and successful metamorphosis. Basin and spray field construction could result in mortality and upland habitat loss considered "take" of the CTS that is protected under both the federal and state Endangered Species Acts. The operational aspect of the basin would create a seasonal aquatic habitat with a variable timing and duration of ponding depending on the seasonal rainfall pattern and generation/use of recycled water. While the basin will be lined, the ponding regime would likely attract aquatic insects and other invertebrates that are common to seasonal aquatic habitat. The temporary/seasonal (not permanent ponding regime could also possibly attract chorus frogs, western toads, and CTS should they occur nearby. No impact on species requiring permanent/perennial aquatic habitat would result as

none would occur because of dry season irrigation demand). No impact on the golden eagle would result from the basin project construction or operation as there is no loss of habitat and no visual sight line between the Solomon Mountain nest site and the basin CUP area.

- ***Impacts on candidate, sensitive, or special-status species are considered less than significant with mitigation measures BIO-1, BIO-2, and BIO-4 incorporated into the basin CUP.***

Adverse Effects on Riparian Habitat or Sensitive Natural Communities

No riparian habitat or sensitive natural communities occur within the basin CUP area.

- ***There would be no impact on riparian habitat or sensitive natural communities.***

Protected Wetlands

No protected wetlands or other waters of the U.S. State occur within the basin CUP area.

- ***There would be no impact on protected wetlands or other waters of the U.S./State.***

Interference with Movement of Native Fish or Wildlife, Wildlife Corridors, and Wildlife Nursery Sites

The construction of the basin would essentially be a temporary impact on 5.4 acres of non-native annual grassland habitat. There is the potential for impacts on locally common ground dwelling wildlife (ground squirrel, mice, gophers). When dry the basin may become vegetated with annual plant species, thus supporting the concept of a temporary impact as it won't be a loss of habitat from development. The basin construction would be temporary impacts on non-native grassland as the grassland cover would return to the basin area after construction. The access road would permanently impact a small amount of non-native grassland and through a narrow band of California sagebrush dominated coastal sage scrub habitat as shown below in Table 1. The spray fields would have a small amount temporary impacts from the buried irrigation lines but would otherwise remain as grassland habitat likely enhanced by the additional spray irrigation. The undeveloped basin CUP site and surrounding undeveloped lands support abundant habitat for a wide array of resident, nomadic, and migratory wildlife. Further, there is habitat for ground nesting birds in the onsite grassland and narrow fringe of coastal scrub habitat.

In accordance to the Santa Barbara County Environmental Thresholds and Guidelines Manual, Biological Resources Section (6.)(C.)(3.)(b.), less than significant impacts on biological resources are considered for small acreages of non-native grassland if wildlife values are low. This is the case for the temporary impacts from basin construction on non-native annual grassland habitat amongst the expanse of grassland, coastal scrub, and oak woodland around the basin CUP site. There would essentially be no loss of habitat as it would provide grassland and seasonal aquatic habitat values as described above. As such, the

basin construction and operation impacts on non-native grassland habitat would be considered ***a less than significant.***

Given the potential for ground nesting birds and other wildlife within the basin footprint, basin CUP project direct and indirect impacts on locally common, resident, nomadic, and migratory wildlife would be **considered less than significant with mitigation measures BIO-2 and BIO-4 to avoid, minimize, and compensate for impacts incorporated into the basin CUP.**

Conflicts with Local Policies or Ordinances, Such as Tree Preservation

Three single non-native unprotected cork oak trees (*Quercus suber*) occur along the proposed access road alignment where work may occur within the dripline of these unprotected trees. While the dripline of two coast live oak trees are within 25-feet of the grading limits for the basin, the grading is not within the critical root zone so is not considered an impact (see Figures 3 and 5). There are a few oak trees at the outer perimeter of the spray fields with the potential for the spray fields to saturate the soils near the coast live oak trees that could be detrimental resulting in the demise of these trees over time. This could be considered ***less than significant impact with mitigation incorporated into the basin CUP.*** **Otherwise, in accordance with** Santa Barbara County oak tree protection and impact assessment guidelines basin CUP impacts on oak trees would be:

(1) Habitat fragmentation. ***No impact.***
(2) Removal of understory. ***No impact.***
(3) Alteration to drainage patterns. ***No impact.***
(4) Disruption of the canopy. ***No impact.***
(5) *Removal of a significant number of trees that would cause a break in the canopy or disruption in animal movement in and through the woodland.* ***No impact.***

Conflicts with Local, Regional or State Conservation Plans

There are no local, regional or state conservation plans over the basin CUP area.

- ***There would be no impact on any local, reginal or state conservation plans.***

TABLE 1
PROPOSED BASIN PROJECT AREA PLANT COMMUNITY IMPACTS

HABITAT TYPE	BASIN CONSTRUCTION	ACCESS ROAD	IRRIGATED SPRAY FIELDS
NON-NATIVE ANNUAL GRASSLAND	5.4 AC	0.252	24.0

DEVELOPED / DISTURBED	0.0	0.111	0.0
TOTAL	**5.4**	**0.489**	**24.0**

6.4 RECOMMENDED MITIGATION MEASURES

The analysis of impacts on biological resources as described in Section 6.3 suggests that there would be less than significant impacts with mitigation incorporated into the basin CUP on oak trees, and common and special-status wildlife species from the construction of the basin in non-native annual grassland habitat. The following mitigation measures are recommended to avoid, minimize, and compensate for impacts to mitigate impacts on biological resources to a less than significant level.

SPECIAL-STATUS SPECIES AND NATIVE WILDLIFE

MM BIO-1: ENVIRONMENTAL AWARENESS TRAINING & ONSITE BIOLOGICAL MONITORING

- At the outset of each phase of basin construction, a Worker Environmental Awareness Program shall be developed and implemented for all construction personnel prior to commencing any ground disturbance activities. The program shall consist of an on-site or center presentation that will describe the locations and types of biological resources on and near the basin project area, an overview of the laws and regulations governing the protection of biological resources, the reasons for specific protection and avoidance measures that are applicable to the project, and the identity of designated points of contact should questions or issues arise, including the qualified biological monitor(s).
- A biological monitor shall be onsite during initial clearing, grubbing, excavation and grading for project construction for each phase to ensure any permit compliance and implementation of the avoidance and minimization measures required as part of project approvals.

MM BIO-2: UPLAND NON-LISTED SPECIAL-STATUS WILDLIFE AND CROTCH'S BUMBLE BEE AVOIDANCE AND MINIMIZATION MEASURES

- Prior to ground disturbing activities, a qualified biologist shall conduct a pre-construction survey within 30 days in advance of initial ground disturbance (clearing, mowing, grubbing, grading, etc.) to identify whether any special-status upland wildlife species (i.e. coast horned lizard, northern legless lizard, American badger, Crotch's bumble bee) are using any portion of the project disturbance footprint. Pre-construction surveys shall be repeated if construction site grading is idle for more than one year, and/or prior to subsequent phases of basin construction.
    - To the extent feasible, non-listed special-status upland wildlife encountered during pre-construction surveys and initial ground disturbance construction monitoring shall be captured and relocated to a suitable habitat within the open space areas by a qualified biologist.

- Natal American badger dens shall be avoided with a minimum 150-foot non-disturbance buffer zone until the young are self sufficient and no longer reliant on the den site. Once this determination is made by a qualified biologist, one way doors can be installed to allow badgers to relocate on their own and avoid and minimize any injury or mortality.
- Crotch's bumble bee nest surveys shall be conducted on the basin CUP site in accordance with current CDFW survey guidelines prior to any ground disturbing activities as this species moves nests each year. Any confirmed active Crotch's bumble bee nest(s) shall be avoided with a non-disturbance buffer zone determined by a qualified biologist. If nest avoidance is infeasible, the project proponent shall obtain take authorization from the CDFW prior to any basin CUP ground disturbance and implement any permit conditions to mitigate for project impacts on this species.

MM BIO-3: NESTING BIRDS IMPACT AVOIDANCE

- To avoid disturbance of nesting birds, including raptors (hawks, vulture, owls), protected by the Federal Migratory Bird Treaty Act (MBTA) and Sections 3503, 3503.5, and 3513 of the California Fish and Game Code (CFGC), the removal of vegetation and ground disturbance shall occur outside of the bird nesting season whenever feasible. If these activities must occur during the bird nesting season (February 1 through August 31), then a pre-construction nesting bird survey shall be performed by a County-qualified biologist. Pre-construction surveys for nesting birds shall occur within the area to be disturbed and shall extend outward from the basin project site by 500 feet to the extent feasible. The distance surveyed from the disturbance may be reduced if property boundaries render a 500-foot survey radius infeasible, or if existing disturbance levels within the 500-foot radius (such as from a major street or highway) are such that project-related activities would not disturb nesting birds in those outlying areas. If any occupied or active bird nests are found, a non-disturbance buffer zone shall be established and demarcated by the biologist with bright orange construction fencing, flagging, construction lathe, or other means to mark the boundary. The buffer shall be 300 feet for non-raptors and 500 feet for raptors, unless otherwise determined by the qualified biologist and approved by P&D. Buffer reductions shall be based on the known natural history traits of the bird species, nest location, nest height, line of site to the nest, existing pre-construction level of disturbance in the vicinity of the nest, and proposed construction activities. All construction personnel shall be notified as to the location of the non-disturbance buffer zone and to avoid entering the buffer zone during the nesting season. No ground disturbing activities or vegetation removal shall occur within this buffer until

the County-qualified biologist has confirmed that nesting is completed, the young have fledged and are no longer dependent on the nest, or the nest fails, and there is no evidence of a second nesting attempt; thereby determining the nest unoccupied or inactive.

- If construction must begin within the nesting season, then the pre-construction nesting bird survey shall be conducted no more than one week (7 days) prior to commencement of vegetation removal, grading, or other construction activities. Active nests shall be monitored by the biologist at a minimum of once per week until it has been determined that the nest is no longer being used by either the young or adults, and there is no evidence of a second nesting attempt. Bird survey results and buffer recommendations shall be submitted to County Planning and Development for review and approval prior to commencement of grading or construction activities. The qualified biologist shall prepare weekly monitoring reports, which shall document nest locations, nest status, actions taken to avoid impacts, and any necessary corrective actions taken. Active nest locations shall be marked on an aerial map and provided to the construction crew on a weekly basis after each survey is conducted. Active nests shall not be removed without written authorization from USFWS and CDFW.

Avoiding destruction of an active nest and avoiding nest failure during basin CUP construction would reduce impacts on nesting birds to a less than significant level.

MM BIO-4: CALIFORNIA TIGER SALAMANDER UPLAND DISPERSAL HABITAT IMPACT AVOIDANCE, MINIMIZATION, AND COMPENSATION MEASURES

Basin project grading impacts on the CTS could result in mortality to undetected CTS in underground refuges within 1.3 miles of known/potential breeding ponds. Pre-construction surveys and construction monitoring to salvage and relocate individuals discovered during construction would minimize direct mortality. However, the basin project would not result in the loss of habitat for these species. Operation of the basin (ponding during the wet season) could provide an additional breeding opportunity for the CTS, or be an attractive nuisance if the timing and duration of the ponding is not sufficient for CTS breeding and successful metamorphosis. There would be no impacts on breeding ponds and no destruction or adverse modification of CTS Designated Critical Habitat as none occurs in the basin project area. The following recommended mitigation measures assume that the USFWS and CDFW would require take authorization for direct construction impacts on CTS.

- Prior to commencement of any ground disturbing activities, the project proponent shall obtain incidental take authorization under the Federal Endangered Species Act (FESA) and California Endangered Species Act (CESA) for potential take of the California tiger salamander.

- A biological monitor approved/authorized under the FESA/CESA take authorization shall be present during initial ground disturbance and vegetation removal activities to attempt salvage and relocation efforts for the CTS that may be present. Relocation areas shall be identified within nearby areas not slated for any future development.
- When wet season ponding of the basin is initiated, a minimum of 24 inches of inundation ponding shall be maintained for a minimum of 120 days. Prior to any dry down of the pond from use between October 15 and April 30th, a qualified biologist with USFWS and CDFW approval/authorization shall survey the ponded area for CTS larvae/juveniles. If any are found, the minimum 24 inches of ponding shall remain until the qualified biologist determines CTS metamorphosis has been completed for the season.

PROTECTED OAK TREES

MM BIO-5: OAK TREE IMPACT AVOIDANCE MITIGATION MEASURE

- The proposed project has been designed to avoid the removal of oak trees or impacts within the critical root zone of protected trees. In order to avoid demise and mortality of oaks near the spray fields, no spray shall be directed where it could saturate soil within 25 feet of the drip line of oak trees. Incorporation of this mitigation measure into the basin CUP would reduce impacts to a less than significant level.

7.0 CONCLUSIONS

Based on the findings described above establishing the existing conditions of biological resources within the basin CUP area, and incorporation of the recommended mitigation measures into the basin CUP, implementation of the proposed project would result in less than significant impacts on biological resources,

TABLE B-2 SOLOMON HILLS CNDDB RECORDED OCCURRENCES				
Common Name Scientific Name(s)	**Listing Status Fed/CA/ CNPS**	**General Habitat Description**	**Period of Identification**	**Observed/ Potential Occurrence**
Plants				
Hoover's bent grass *Agrostis hooveri*	--/--/1B.2	Chaparral, cismontane woodland, valley and foothill grassland in Santa Barbara and San Luis Obispo counties. Dry, sandy Soil. 120-600m.	Flowering: April-August	Not observed
La Purisima manzanita *Arctostaphylos purissima*	--/--/1B.1	Chaparral. Sandstone outcrops, sandy soil. 120-300m.	Flowering: January-March	Not observed
Refugio manzanita *Arctostaphylos refugioensis*	--/--/1B.2	Chaparral. On sandstone. 275-820 m.	Flowering: December-March	Not observed
Sand mesa manzanita *Arctostaphylos rudis*	--/--/1B.1	Chaparral, coastal scrub. Sandy soils in Lompoc Nipomo area. 25-230m.	Flowering: November-February	Not observed
La Graciosa thistle *Cirsium scariosum* var. *loncholepis*	FE/ST/1B.1	Dune slack ponds, coastal strand, freshwater wetlands, marshes	Flowering: March-August	Not observed
Dune larkspur *Delphinium parryi* ssp. *blochmaniae*	--/--/1B.2	Coastal dunes (maritime chaparral). Rocky areas and dunes. 30-375m.	Flowering: April-May	Not observed
Lompoc Yerba Santa *Eriodictyon capitatum*	FE/SR/1B.2	Closed-cone coniferous forest, chaparral. Sandy soils on terraces. 40-455m.	Flowering: April-June	Not observed
Mesa horkelia *Horkelia cuneata* var. *puberula*	--/--/1B.1	Chaparral, cismontane woodland, and coastal scrub in sandy or gravelly soils. 70 to 810 meters.	Flowering: March - July	Not observed
Kellogg's horkelia *Horkelia cuneata* var. *sericea*	--/--/1B.1	Closed-cone coniferous forest, coastal scrub, chaparral, dunes, coastal sandhills. 10-200m.	Flowering: March - July	Not observed
Layia erubescens Blushing layia	--/--/1B.2	Coastal dunes, coastal scrub. 10-245m. Loose, fine sands of stabilized dunes and sandhills.	Flowering: March-June	Not observed
San Luis Obispo monardella *Monardella undulata* spp. *undulata*	--/--/1B.2	Coastal dunes, coastal scrub. Stabilized sand of the immediate coast. 10-100m.	Flowering: April-September	Not observed
Black-flowered figwort *Scrophularia atrata*	--/--/1B.2	Chaparral, coastal dunes, coastal scrub, riparian scrub. Sandy, diatomaceous shale, and soils derived from other parent material; 10-250m.	Flowering: April-July	Not observed
San Bernardino aster *Symphyotrichum defoliatum*	--/--/1B.2	Wetlands, freshwater marsh, coastal sage scrub, oak woodland	Flowering: July-November	Not observed
Natural Communities of Special Concern				
Central Maritime Chaparral	--/--/NCSC	Dense stands of *Arctostaphylos rudis* and *A. purissima*; scattered *Pinus muricata*, *Quercus agrifolia, Ceanothus cuneatus* and *Adenostoma fasciculatum*, *Eriodictyon capitatum*, *Ericameria ericoides*	Observable year round	None. Not observed

TABLE B-2 SOLOMON HILLS CNDDB RECORDED OCCURRENCES				
Common Name Scientific Name(s)	**Listing Status Fed/CA/ CNPS**	**General Habitat Description**	**Period of Identification**	**Observed/ Potential Occurrence**
Purple Needlegrass Grassland / Native Grassland	--/--/NCSC	Grassland with greater than 10% total relative cover of native bunch grass grassland species (grasses and forbs, e.g. wildflowers).	Observable year round	Not observed
Southern Vernal Pool	--/--/NCSC	Winter rainfall perches on impermeable layer forming pools in the depressions that support a unique fauna when ponded and flora as they dry down from evapotranspiration	September-March	None. Not observed
Invertebrates				
Crotch's bumble bee *Bombus crotchii*	--/SC/--	Wildflower rich undisturbed grasslands. Nests in ground typically using existing burrows of mammals or downed debris.	February-October	Very low potential in dense grass cover with minimal wildflower resources. No bumble bees observed.
Vernal pool fairy shrimp *Branchinecta lynchi*	FT/-- /--	Requires static (non-flowing) seasonal pools.	Wet Season	None. No vernal pools onsite.
Monarch butterfly *Danaus plexippus*	FP/SA/--	Winter roost sites extend along the coast from northern Mendocino to Baja California, Mexico. Roost located in wind-protected tree groves (Eucalyptus, Monterey pine, Cypress), with nectar and water sources nearby.	October-February	None. No suitable roost sites in project area.
Amphibians				
California tiger salamander *Ambystoma californiense*	FE/ST /--	Santa Barbara and San Luis Obispo counties DPS Federally listed as endangered. Need underground refuges, especially ground squirrel burrows and vernal pools or other seasonal water for breeding.	November-March	No ponds in project areas; Within 1.3-mile potential dispersal distance from known CTS ponds ORCU-3 and ORCU-13, and potential ORCU-2
California red-legged frog *Rana aurora draytonii*	FT/SSC/--	Lowlands and foothills in or near permanent sources of deep water with dense, shrubby or emergent vegetation. Requires 11-20 weeks of permanent water for larval development. Must have access to estivation habitat.	March-August	None. No streams or perennial ponds in/near project area
Western spadefoot *Spea hammondii* (Northern Distinct Population Segment)	FP/SSC/--	Largely terrestrial; enters seasonal ponds only to breed. Prefers open areas with sandy or gravelly soils, in a variety of habitats including mixed woodlands, grasslands, chaparral, sandy washes, lowlands, river floodplains, alluvial fans, foothills, and mountains.	Breeding: January to May, depending on development of seasonal ponds.	None. No ponds in project areas. 1 mile from nearest pond occurrence

TABLE B-2
SOLOMON HILLS CNDDB RECORDED OCCURRENCES

Common Name Scientific Name(s)	Listing Status Fed/CA/ CNPS	General Habitat Description	Period of Identification	Observed/ Potential Occurrence
Reptiles				
Coast horned lizard *Phrynosoma blainvillii*	--/SSC/--	Chaparral, sage scrub, oak woodlands, and grasslands; sometimes occurs along seldom used dirt roads where native ant species are prevalent	Observable year round.	Low potential in dense cover of grasses. Not observed
Northern California legless lizard *Anniella pulchra*	--/SSC/--	Shows a preference for areas of leaf litter and loose soil along washes, beach sand dunes, open scrub and woodland, and sandy benches along alluvial fans	Observable year round.	Low potential in dense cover of grasses
Western pond turtle *Emys marmorata*	FP/SSC/--	Requires perennial aquatic habitat and constructs nests along edge of streams and ponds.	Observable year round.	None. No streams or perennial ponds in/near project area
Birds				
Golden eagle *Aquila chrysaetos*	BGEPA/FP/--	Breeds on cliffs or in large trees or electrical towers, wide ranging foraging in open habitats.	Nesting: January - June. Year round resident.	Foraging habitat
Mammals				
American badger *Taxidea taxus*	--/SSC/--	Grasslands and other open habitats in friable soils.	Year-round	Potential. No evidence observed

Status Codes

Federal	State	California Native Plant Society Ranking
FE = Federally Endangered	**SE** = State Endangered	**1** = Plants of Highest Priority (2 sublists):
FT = Federally Threatened	**ST** = State Threatened	**1A** = Plants Presumed Extinct in California
FP= Federal Proposed Rule for Listing	**SR**= State Rare	**1B** = Plants Rare and Endangered in California and Elsewhere
CH = Federal Critical Habitat **BGEPA**= Bald and Golden Eagle Protection Act **MBTA** = Protected by Federal Migratory Bird Treaty Act	**CFP** = California Fully Protected **SSC** = State Species of Special Concern **SA** = Not formally listed but included in CDFG "Special Animal" list. This designation is used when the species does not have a higher listing status. **SC =** State Candidate Species for listing as Threatened/Endangered	**2 =** Plants Rare or Endangered in California, but More Common Elsewhere **3 =** Plants about which More Information is needed **4 =** Uncommon in California. Plants of Limited Distribution (A Watch List) **NCSC =** Natural Community of Special Concern

SOLOMON HILLS – SOLSTRA COMMUNITIES CA, LLC
NEWLOVE PARK CONDITIONAL USE PERMIT
BIOLOGICAL RESOURCES ASSESSMENT

1.0 EXECUTIVE SUMMARY

Solstra Communities California, LLC (Solstra) proposes the Newlove Park improvements as an offsite Conditional Use Permit (CUP) to the Solomon Hills Specific Plan project on approximately 31 acres of land owned by Solstra, located west of Highway 101 and just south of the town of Orcutt and within the Orcutt Community Plan boundary. Approximately 17 acres within the existing 31-acre Newlove Park will require site development improvements and features to create additional active spaces for sports and recreation that will also be accessible to the general public. The Newlove Park CUP area currently supports mostly non-native grassland habitat, coast live oak woodland, a fringe of coastal scrub, several stands of eucalyptus trees, softball field, horseshoe pits, bathrooms, BBQ facilities, picnic tables, and existing overflow parking areas. Newlove Park currently hosts multiple events a month ranging from 50-300 attendees.

David Wolff Environmental (DWE) conducted the review of available background data and conducted biological resources field surveys on April 22, 2025 and July 15, 2025, during the peak expression and growth of the onsite flora. The survey focused on identifying plant communities, mapping habitat types, and detecting special-status plants and wildlife if observed. The purpose of the field surveys and this biological resources assessment is to document existing conditions of the proposed Newlove Park CUP area, determine the suitability and presence/absence of rare, threatened, or endangered plants or wildlife (special-status species), wetlands/waters of the U.S./State, and to evaluate the potential for any direct or indirect significant impacts on biological resources, or adverse effects on any special-status species.

The entire Newlove Park improvement area is essentially low species diversity non-native annual grassland dominated by near pure stands of ripgut brome including the oak woodland understory along the existing access road. The site borders the fringe of coastal scrub habitat, has three stands of eucalyptus trees, and the edge of an oak woodland patch with grassland understory along the access road. No wetlands or other waters of the U.S./State occur on the project site.

The search and review of background data and the CNDDB revealed 26 special-status species and three natural communities of special concern known from the region of the proposed Newlove Park CUP area. No rare, threatened or endangered plant species or natural communities of special concern were observed in the project area during the DWE floristic inventory surveys. The Newlove Park CUP area is within the 1.3-mile maximum upland dispersal potential from seasonal breeding ponds (nearby ORCU-3) for the California tiger

salamander (CTS) that could occur in underground refuges in the area. Western spadefoot (toad) has not been observed in ORCU-3 over five years of CTS round up aquatic surveys. The Newlove Park CUP area has low suitability/potential for the coast horned lizard, northern California legless lizard, Townsend's big-eared bat, and American badger. The golden eagle nest on Solomon Mountain (observed active in 2023; inactive in 2025) would be unaffected by the Newlove Park project as there are no direct sight lines to the cliff face nest location. There is no perennial aquatic habitat on or near the Newlove Park CUP area so the California red-legged frog and southwestern pond turtle would not occur. The site falls within the current designated range of Crotch's bumble bee but lacks an abundant wildflower component and is not expected to occur. No other rare, threatened or endangered plants or wildlife species are expected to occur.

In accordance with the Santa Barbara County Thresholds of Significance, implementation of the proposed Newlove Park CUP would result in less than significant impacts with mitigation incorporated into the CUP for the California tiger salamander, coast horned lizard, northern legless lizard, American badger, Townsend's big-eared bat, Crotch's bumble bee, and nesting birds. The Newlove Park project would require the removal of 46 oak trees and encroachment into an additional 16 oak trees mostly for the primary access road improvements. Given the quantity of oak removal and encroachment, this could be considered a significant number of oak impacts and a less than significant impact with mitigation incorporated into the CUP for the loss of oak trees. However, the removals and encroachment are along the edge of an oak woodland patch, that does not result in habitat fragmentation or substantial disruption of the canopy. Mitigation measures are provided to avoid, minimize, and compensate for impacts on wildlife resources and oak trees to a less than significant level.

Based on the findings described in this Newlove Park CUP biological resources assessment establishing the existing conditions of biological resources within the Newlove Park CUP area, identification of impacts, and incorporation of the recommended mitigation measures, implementation of the proposed project would avoid and minimize impacts on biological resources to a less than significant level.

2.0 INTRODUCTION, PROJECT DESCRIPTION, AND PURPOSE

The Solstra Solomon Hills Specific Plan project proposes to create Santa Barbara County's first new community that will result in a sustainable, resilient, and healthy environment for its residents. The Solomon Hills project establishes a holistic framework for smart growth with a redevelopment of private lands historically used for grazing and oil and gas production. Its proposed Specific Plan includes the design and implementation of a central village closely surrounded by several neighborhoods, office and commercial space, a TK-8 school, fire/sheriff station, parks, open space, and public trails to allow walking and biking as an easy alternative to vehicle transport.

The proposed Specific Plan allows for a balance of land uses primarily serving working families allowing 4,000 single and multifamily residential units, 650,000 square feet of commercial retail and office use and space, 25.5-acres of public and institutional uses and space, and 1,023 acres of recreational and open space uses. Critical infrastructure includes water supply and a water reclamation facility, interchange improvements along Highway 101, additional secondary access along Hwy 101 and Hwy 135 and several active and passive parks and public trails. Public benefits include developer sponsored affordable housing near commercial and transportation access points, utility and access improvements that minimize traffic impacts to neighboring properties, new public trail access into the Orcutt Hills, recreational improvements and public access to the Newlove Park picnic grounds, the preservation of open space ridgelines and valleys for habitat protection and the abandonment and remediation of all oilfield features and operations in the Specific Plan area. The Specific Plan is designed to be built in four (4) buildout phases over a fourteen-year period for the orderly delivery of the project. Phased grading, access, utility, horizontal and public improvements are scheduled ahead of and to align with the same buildout phases.

Solstra proposes the Newlove Park improvements as an offsite Conditional Use Permit (CUP) on approximately 31 acres of land owned by Solstra, located west of Highway 101 and just south of the town of Orcutt and within the Orcutt Community Plan boundary. Approximately 17 acres within the existing 31-acre existing Newlove Park will require site development improvements and features to create additional active spaces for sports and recreation that will also be accessible for the general public. The Newlove Park CUP area currently supports mostly non-native grassland habitat, coast live oak woodland, a fringe of coastal scrub, several stands of eucalyptus trees, softball field, horseshoe pits, bathrooms, BBQ facilities, picnic tables, and existing overflow parking areas. Newlove Park currently hosts multiple events a month ranging from 50-300 attendees.

The improved Newlove Park will create an enhanced community park facility that will include public trails to connect the Solomon Hills trail system to the Orcutt Community trail system, trailhead, two youth soccer fields, four pickleball courts, one little league baseball/softball field, playground, recreational lawn area, activity nodes, overlook, new bathroom building and parking lot. Three stormwater detention basins with outlet culvert inverts at the bottom of the basins to rock field energy dissipaters will drain readily following rain events. The access road from the PCEC entrance road will be widened resulting in oak tree removals and an upslope retaining wall along the existing steep slope above the road. The secondary access road will only be repaved within the existing footprint with no expansion or impacts. Figures 3A and 3B in Appendix A provides overview layout of the Newlove Park CUP improvements. The Newlove Park CUP area improvements currently support mostly non-native annual grassland habitat, the edge of coast live oak woodland, a fringe of coastal scrub, and several stands of eucalyptus trees as described in Section 5 below.

The Biological Resources Assessment (BRA) CUP area for identifying and mapping habitats, establishing existing conditions, and evaluating Newlove Park CUP improvement impacts includes the entire 31-acre Newlove Park and primary and secondary access roads for the CUP improvements. David Wolff Environmental (DWE) conducted the review of available background data and conducted biological resources field surveys on April 22, 2025 and July 15, 2025, during the peak expression and growth of the onsite flora. The survey focused on identifying plant communities, mapping habitat types, detecting special-status plants and wildlife if observed. The purpose of the field surveys and this BRA is to document existing conditions of the proposed Newlove Park improvements CUP area, determine the suitability and presence/absence of rare, threatened, or endangered plants or wildlife (special-status species), and to evaluate the potential for any direct or indirect significant impacts on biological resources or waters of the U.S./State, or adverse effects on any special-status species.

3.0 EXISTING CONDITIONS

3.1 ENVIRONMENTAL SETTING

The Solomon Hills Newlove Park offsite improvements CUP includes approximately 17 acres of ground disturbance for varied new park elements almost entirely within a non-native annual grassland habitat. The access road widening and upslope retaining wall runs through the edge of coast live oak woodland with an annual grassland understory. The Newlove Park CUP area is bordered by a habitat mosaic of grassland, coastal scrub, maritime chaparral, and oak woodland habitats of Orcutt Hill. The region around the project site is the above habitat mosaic, expanses of annual crops and vineyards, existing PCEC oil field facilities, and urban development from the Orcutt community to the north.

3.2 SOIL TYPES

The USDA Natural Resources Conservation Service has identified two soil series with four mapping units on the Newlove Park project site as shown in Figure 4 and described below.

- **Map Unit: ArD — Arnold sand, 5 to 15 percent slopes and ArF – Arnold Sand, 15-45 percent slopes, severely eroded ArF3 –** This soil is on hills and ridges derived from residuum weathered from sandstone parent material. The surface layer is light brown to pale brown sand about 55 inches thick underlain by soft sandstone. This is a somewhat excessively drained soil and does not meet hydric criteria.
- **Map Unit: SfD – San Andreas-Tierra complex, 5 to 15 percent slopes, SfE—San Andreas-Tierra complex, 15 to 30 percent slopes; Map Unit: SfG—San Andreas-Tierra complex, 30 to 75 percent slopes –** The San Andreas component surface layer is grayish brown fine sandy loam about 15 inches thick with a grayish brown fine sandy loam subsoil. This complex is on hills derived of residuum weathered from soft

sandstone parent material. This is well drained soil and does not meet hydric criteria. The Tierra component makes up 25 percent of the map unit on dissected terraces derived from alluvium parent material with a surface layer of grayish brown loam about 12 inches thick with a brown clay and heavy clay loam subsoil. This is a moderately well drained soil and does not meet hydric criteria.

3.3 REGULATORY SETTING (BIOLOGICAL RESOURCES)

The Federal Clean Water Act (CWA) – Waters of the U.S.

The Environmental Protection Agency (EPA) and U.S. Army Corps of Engineers (USACE) ("the agencies") promulgated a Final Rule (40 CFR 120) effective March 20, 2023, defining the scope of waters of the U.S. protected under the Clean Water Act (CWA) The basis of the final rule is the Supreme Court of the United States (SCOTUS) holding in Sackett v. EPA that the CWA's use of "waters" refers only to "geographical features that are described in ordinary parlance as streams, oceans, rivers, and lakes," and to adjacent wetlands that are "indistinguishable" from those bodies of water due to a continuous surface connection.

The SCOTUS decision definition of waters of the U.S. are summarized as follows:

- Traditional navigable waters, the territorial seas, and interstate waters;
- Impoundments of waters of the United States;
- Tributaries to territorial seas or interstate waters when they meet the relatively permanent standard of standing or continuously flowing waters to traditional navigable waters, or the significant nexus standard. The "significant nexus standard" refers to the test to identify waters that, either alone or in combination with similarly situated waters in the region, significantly affect the chemical, physical, or biological integrity of traditional navigable waters, the territorial seas, or interstate waters;
- Impoundments when the tributaries meet either the relatively permanent standard or the significant nexus standard as jurisdictional tributaries (above);
- Wetlands adjacent to above waters of the U.S. with a continuous surface connection to relatively permanent tributaries or impoundments; and
- Intrastate lakes and ponds, streams, or wetlands not identified above that meet either the relatively permanent standard or the significant nexus standard.

Section 404 of the CWA is administered by the USACE who has jurisdiction over permitting for the placement of fill or dredged material into waters of the U.S. including wetlands.

CWA Section 401 requires that an applicant for a federal CWA Section 404 permit that allows activities resulting in a discharge of fill or dredged material into waters of the U.S., must obtain a state water quality certification that the discharge complies with other provisions of CWA. The Regional Water Quality Boards (RWQCB) administer the 401 water

quality certification program in California. A Section 401 certification when a Corps Section 404 permit is issued is required to certify that the Section 404 Permit will comply with state water quality requirements.

Federal Endangered Species Act (FESA) administered by the United States Fish and Wildlife Service (USFWS) protects formally listed species from take (kill, harm, harass) and requires permits for activities that may adversely affect a listed species. Under FESA Section 7, federal agencies are required to consult with the USFWS regarding effects to federally listed species for projects permitted, approved, funded, or otherwise authorized by a federal agency (federal nexus).

The Federal Migratory Bird Treaty Act (MBTA) and the California Fish and Game Code Section 3503 and 3503.5 (see below) protect migratory birds and other birds from unlawful take any time, by any means or in any manner, including to pursue, hunt, take, capture, or kill migratory birds, and/or the destruction of birds, active nests, eggs, or parts thereof.

Bald and Golden Eagle Protection Act prohibits the "take" or possession, purchase, barter, transport, export or import, at anytime or in any manner any bald eagle or any golden eagle, alive or dead, or any part, nest, or egg thereof. While permits for impacts on bald or golden eagles are available, USFWS guidance suggests evaluation of construction activities within one mile of an active nest site. The USFWS suggests consultation to assess if an eagle permit is needed.

California Endangered Species Act (CESA) administered by the California Department of Fish and Wildlife (CDFW) protects species formally listed by the State from take (killing) and requires permits for activities that may result in take of a CESA listed species.

California Porter-Cologne Water Quality Control Act administered by the State Water Resources Control Board and Regional Water Quality Control Boards (Water Boards) is applied when projects involve impacts on waters of the State that are not regulated under the CWA 404/401 process. In these cases, the Water Boards would require Waste Discharge Requirement (WDR) permits for impacts on waters of the State. The Water Board issued policy, procedures, and wetland definition for the discharge of dredged or fill material into waters of the State (Procedures). In brief, the Procedures define wetlands as waters of the State to be consistent with the federal three parameter definition requiring the presence of hydrophytic (wetland) vegetation, hydric soils, and wetland hydrology.

California Fish and Game Code Section 1600 *et.seq.* requires an entity to notify CDFW prior to commencing any activity that may substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake, or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake.

California Fish and Game Code Section 1900 *et.seq*. – Native Plant Protection Act: The NPPA was enacted in 1977 and allows the Fish and Game Commission to designate plants as rare or endangered. The NPPA prohibits take of endangered or rare native plants, but includes some exceptions for agricultural and nursery operations; emergencies; and after properly notifying CDFW for vegetation removal from canals, roads, and other sites, changes in land use, and in certain other situations. No state designated rare species have been observed or are expected to occur within the project site.

California Fish and Game Code Sections 3503 & 3503.5 state that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto. 3503.5 specifies it is unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this code or any regulation adopted pursuant thereto. Section 3503 specifies it is unlawful to take or possess any migratory nongame bird as designated in the Migratory Bird Treaty Act or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Treaty Act.

Wetlands – Santa Barbara County Environmental Thresholds and Guidelines define wetlands for the purposes of determining potentially significant effects uses the following wetland definition that has been adopted by most resource protection agencies. This definition reads:

> "For purposes of this classification wetlands must have one or more of the following three attributes:
>
> a) At least periodically, the land supports predominantly hydrophytes, that is plants adapted to moist areas.
>
> b) The substrate is predominantly un-drained hydric soil, and
>
> c) The substrate is non-soil and is saturated with water or covered by shallow water at some time during the growing season of each year. (Cowardin 1979)"

Santa Barbara County Code Chapter 14, Appendix A, titled Grading Ordinance Guidelines for Native Oak Tree Removal, provides regulations regarding agricultural and non-agricultural deciduous and live oak tree removals. The purpose of Appendix A is to sustain and, where possible, enhance the native oak resources of Santa Barbara County. Specifically, the County Code seeks to ensure that there is no net loss of native oak trees and that, if possible and with the help of incentives, the number and extent of remaining valley oak (*Quercus lobata*), blue oak (*Quercus douglasii*), and live oak (*Quecus agrifolia*) trees increases. As per the County Code, live oaks that are 8 inches diameter at standard height (DSH) or greater are protected trees.

State of California Public Resources Code (PRC) Section 21083.4 contains provisions for counties to mitigate impacts on oak woodlands that would be significant under the California Environmental Quality Act (CEQA). The PRC describes proportional oak habitat mitigation.

4.0 METHODS

Prior to the field survey, DWE Principal Ecologist David Wolff conducted a review of available background information including aerial photography of the project area over time (Google Earth), the Natural Resources Conservation Service soil survey, and the query and evaluation of results of an approximately ten-mile search radius of the California Natural Diversity Data Base (CNDDB). The CNDDB provided a list and mapped locations of special-status plant and wildlife species, and natural communities of special concern, that have been recorded in the region of the project site. The CNDDB records help to focus the field survey efforts and evaluation of potential project effects on specific species or habitats. It is noted that the CNDDB does not necessarily include all special-status species potentially occurring onsite or in the region, but rather only those that have been recorded in the CNDDB. In addition, the California Native Plant Society (CNPS) online rare plant inventory and CalFlora online database were queried for relevant potential rare, threatened or endangered plants.

DWE Principal Ecologist David Wolff reviewed the available background data described above prior to conducting field surveys on April 22, 2025 and July 15, 2025, during the peak expression and growth of the onsite flora. Mr. Wolff, a highly skilled field ecologist with expertise in identifying botanical, wetland, and wildlife resources, has been conducting botanical and wildlife surveys, and delineating wetlands and limits of waters of the U.S./State for more than 40 years, the last 25 years on the Central Coast of California. The field survey included a floristic inventory and rare plant survey, wildlife observations, and determined no waters of the U.S./State are present within the Newlove Park CUP area.

Mr. Wolff conducted the survey by meandering transects through the entire Newlove Park CUP area, ruderal/disturbed/developed areas, and very uniform grassland habitat and oak understory affording complete and thorough coverage for the floristic inventory. Plant and wildlife species observed and general site characteristics were documented.

No protocol surveys were conducted or warranted to adequately document existing conditions of the Newlove Park CUP area to address special-status wildlife species occurrence. No ponds or perennial waters were observed within the Newlove Park CUP area so any California red-legged frog or western pond turtle surveys would not be feasible or needed as there is no habitat present for either species. California tiger salamander breeding ponds are well documented in the region and vicinity of the Newlove Park CUP area falling within the 1.3-mile upland dispersal distance with nearby ORCU-3 to the east, and distant ORCU-13 and ORCU-12 to the southwest. As such, potential presence in underground refuges is assumed so that the extensive two-year study protocol to prove absence is not warranted with compensatory habitat mitigation incorporated into the overall Solomon Hills project.

DWE surveys under both sunny and overcast conditions leading to mostly sunny and partly cloudy weather conditions, sufficient wet season rainfall, and observable peak expression and growth of spring/summer season plant growth were conducive for the purpose of completing a floristic inventory and rare plant survey and assessing wildlife habitat to establish existing conditions. The DWE background data review and field survey were in accordance with the Santa Barbara County Environmental Thresholds and Guidelines Manual Including Appendix A Biological Resources Technical Background Document. The overall purpose of the field survey was to document existing conditions in terms of habitat for plant and wildlife species, determination of the presence/absence of special-status plants, observations or habitat suitability for special-status wildlife species, and the potential to support wetland and/or riparian habitats other waters of the U.S./State. The Newlove Park CUP area habitat types were described by the aggregation of plants and wildlife based on the composition and structure of the dominant vegetation observed at the time the field reconnaissance surveys were conducted and through review of multiple years of aerial photography. Plant community mapping and project impact analysis were conducted using GIS and recent high resolution aerial photography.

DWE Principal Ecologist David Wolff reviewed the available background information and available aerial photography, conducted the above field survey, and is the primary author and principal in charge of report preparation. The survey data collected on plant and wildlife species and conclusions presented in this biological resources assessment are based on the methods and field reconnaissance conducted over the study area as described above.

5.0 RESULTS

5.1 HABITAT TYPES AND PLANT COMMUNITIES

Plant communities are generally described by the assemblages of plant species that occur together in the same area forming habitat types. The best fit based on observed site conditions for community alliance and alliance codes habitat classifications used in this report follow, *A Manual of California Vegetation, 2nd edition* (Sawyer et al. 2009) and California Department of Fish and Wildlife *California Natural Community List*. Plant names used in this report follow *The Jepson Manual, Vascular Plants of California, Second Edition Thoroughly Revised and Expanded* (Baldwin et al. 2012) with taxonomic updates using the Jepson e-flora project. The study area supports primarily one plant community, the fringe of two plant communities, and developed/disturbed existing road. The following discussion characterizes the plant community classifications using the dominant plant species observed during DWE field surveys with the extent of each plant community within the Newlove Park project area shown in Appendix A Figure 5. Table B-1 in Appendix B provides a complete list of plant species observed during DWE floristic inventory field survey. Figure 10 in Appendix A includes a set of onsite representative photographs from DWE field surveys.

ANNUAL BROME GRASSLANDS – NON-NATIVE ANNUAL GRASSLAND (CDFW 42.026.11)

ANNUAL BROME GRASSLANDS; *BROMUS (DIANDRUS, HORDEACEUS)*
SEMI-NATURAL HERBACEOUS STANDS

The Newlove Park improvement CUP area is mostly non-native annual grassland (13 acres) dominated by near pure stands of ripgut brome (*Bromus diandrus*) including the oak woodland understory along the existing primary access road. While generally low in overall species diversity, other common annual grasses and non-native herbaceous broadleaf plant species were observed included soft chess (*Bromus hordeaceus*), rattail sixweeks grass, (*Festuca myuros*), Italian ryegrass (*Festuca perennis*), smooth cat's ear (*Hypochaeris glabra*), filarees (*Erodium botrys*, *E. cicutarium*), yellow-star thistle (*Centaurea solstitialis*), and bur clover (*Medicago polymorpha*). Few native wildflowers were observed within the dense cover of ripgut brome and rattail sixweeks grass that included fiddleneck (*Amsinckia intermedia*), sky lupine (*Lupinus nanus*), and telegraph weed (*Heterotheca grandiflora*). Ripgut brome and Italian thistle (*Carduus pycnocephalus*) dominate the grassland understory of the oak woodland along the access road.

COASTAL SAGE SCRUB

CALIFORNIA SAGEBRUSH; *ARTEMISIA CALIFORNICA* (CDFW 32.010.01)
COYOTE BRUSH SCRUB; *BACCHARIS PILULARIS* SHRUBLAND ALLIANCE (CDFW 32.060.00)

The Newlove Park CUP area includes a small sliver (0.01 acre) of a nearby patch of the coastal sage scrub plant community dominated by California sagebrush (*Artemesia californica*) and coyote brush shrubs (*Baccharis pilularis*), with scattered white horehound (*Marrubium vulgare*). The non-native annual grassland occurs under and all around the coastal scrub habitat zone.

COAST LIVE OAK WOODLAND

QUERCUS AGRIFOLIA WOODLAND ALLIANCE (CDFW 71.060.02)

The coast live oak woodland alliance is one of the most characteristic vegetation types on the central coast of California. The primary access road follows through the outer fringe of a coast live oak woodland patch (1.3 acre). Coast live oak woodland along the Newlove Park access road is characterized by a stand of mature coast live oaks (*Quercus agrifolia*) with the typical increase in occurrence of Italian thistle in the non-native annual grassland understory.

EUCALYPTUS GROVES

EUCALYPTUS GLOBULUS SEMI NATURAL WOODLAND STANDS (CDFW 79.100.02)

There are three stands of blue gum eucalyptus trees (*Eucalyptus globulus*) within the Newlove Park CUP area surrounded by the non-native annual grassland (1.0 acre). As is typical, the eucalyptus leaf, bark, and branch debris accumulates around the base of these tree stands precluding understory plant growth.

DEVELOPED/DISTURBED

Although not defined by the Manual of California Vegetation, developed/disturbed area within the Newlove Park project area (1.7 acres) includes the existing access road and grassy areas used intermittently for parking that included abundant invasive buckhorn plantain (*Plantago coronopus*).

5.2 WILDLIFE

The Newlove Park project area of predominantly non-native annual grassland abutting the fringe of the expanse of coast live oak woodland and coastal scrub habitats on Orcutt Hill can provide habitat for resident, migratory, and locally nomadic wildlife species typical in the region. Common grassland species expected include California ground squirrel (*Spermophilus beecheyi*), pocket gopher (*Thomomys bottae*), and meadow mice (*Microtus californicus*). The mixture of grasslands and nearby scrublands, and oak woodlands can support a variety of wildlife species uses between habitat types including coyote (*Canis latrans*), bobcat (*Lynx rufus*), with sightings of mountain lions (*Puma concolor*) around Orcutt Hill. American badger (*Taxidea taxus;* no evidence observed), jack rabbit (*Lepus californicus*), meadowlark (*Sturnella neglecta*), sparrows, yellow-billed magpie (*Pica nuttalli*), western fence lizard (*Sceloporus occidentalis*), and gopher snake (*Pituophis catenifer*) are typical grassland species, along with foraging raptors such as red-tailed hawk (*Buteo jamaicensis*) and golden eagle (*Aquila chrysaetos*). No raptor activity was observed in the eucalyptus trees during DWE field surveys of the Newlove Park CUP area.

5.3 WATERS OF THE U.S., WETLANDS, AND WATERS OF THE STATE

No drainages or wetlands were observed within the Newlove Park project area. As such, no waters of the U.S./State or wetlands occur within the Newlove Park project area.

5.4 SPECIAL-STATUS SPECIES AND NATURAL COMMUNITIES OF SPECIAL CONCERN

Special-status species are those plants and animals listed, proposed for listing, or candidates for listing as threatened or endangered by the United States Fish and Wildlife Service (USFWS) or the National Marine Fisheries Service (NMFS) under the federal Endangered Species Act (FESA); those considered "species of concern" by the USFWS; those listed or proposed for listing as rare, threatened, or endangered by the CDFW under the California Endangered Species Act (CESA); animals designated as "Species of Special Concern" by the CDFW; and plants occurring as a rank 1B, 2, and 4 of the California Native Plant Society (CNPS) *Inventory of Rare and Endangered Vascular Plants of California.* Natural Communities of Special Concern are habitat types considered rare and worthy of tracking in the CNDDB by the CNPS and CDFW because of their limited distribution or historic loss over time.

The search and review of the CNDDB revealed 24 special-status species and one natural community of special concern with recorded occurrences within an approximately ten-mile radius of the proposed project site (see Figures 6 & 7). While not included in the CNDDB, based on DWE knowledge of other potential special-status species in the region two natural communities of special concern and two wildlife species were added to this evaluation (see(*) on Table B-2). The following briefly describes or summarizes the special-status species issues and observations or potential for occurrence in the study area. Figures 6 and 7 in Appendix A provide CNDDB mapped locations of special-status plants and wildlife respectively, and Table B-2 in Appendix B provides a list of special-status species recorded in the CNDDB that includes scientific and common name, listing status, habitat requirements, potential for occurrence or whether or not species were observed during the DWE field surveys, and special-status wildlife observations or potential for them to occur within the study area.

5.4.1 Special-Status Botanical Resources

The CNDDB revealed the recorded occurrences of 14 special-status plant species, two of which are formally listed under the Federal and State Endangered Species Acts with the remainder being noted as a CNPS rank suggesting rarity. Three natural communities of special concern are known from the region of the project site, Central Maritime Chaparral, Purple Needlegrass Grassland/Native Grassland, and Southern Vernal Pool. The nearby Orcutt Hill (Newlove Hill) to the west supports Central Maritime Chaparral associated with the fractured rock on the upper reaches of the hill but does not extend east to the Newlove Park project area. No purple needlegrass individuals or patches were observed during the DWE field surveys. No vernal pools occur within the Newlove Park project site with ORCU-3 is outside of and greater than 300 feet to the east of the CUP area.

The special-status plant species occurrences recorded in the CNDDB include perennial woody shrubs and herbaceous annuals that are commonly associated with a specific soil type (dune sands), moisture regime (marsh/creek/wetlands), or habitat type that dictates the range or microhabitat of the species and potential to occur on the project site. The following provides a suitability analysis for special-status plant species with CNDDB recorded occurrences in the region. No special-status woody shrubs, wetland associated plants, or sandy soil plants were observed in the Newlove Park project area during the DWE field surveys. The DWE field surveys were conducted at the time of peak expression and growth of the onsite flora species identification window for all CNDDB recorded special-status plants and documenting all plant species present within the Newlove Park CUP area.

The perennial species such as manzanitas (La Purisima, Refugio, sand mesa; *Arctostaphylos* spp.*)*, Lompoc yerba santa (*Eriodictyon capitatum*), and mesa and Kellogg's horkelia (*Horkelia cuneata* var. *puberula; H. c.* var*. sericea*), would have been noticeable and identifiable any time of year and were not observed during the DWE field surveys.

The special-status plant species recorded in the CNDDB known from mesic, moist, seep, wetland type habitats occurring in the region are La Graciosa thistle (*Cirsium scariosum v*ar. *loncholepis*) and San Bernardino aster (*Symphyotrichum defoliatum*) that were not observed. No mesic (wetland) habitats occur within the Newlove Park CUP area

Sandy soil associated special-status plants with the low potential to occur in the study area include Hoover's bent grass (*Agrostis hooveri*), San Luis Obispo monardella (*Monardella undulata* ssp. *undulata*), curly leaved monardella (*Monardella undulata* spp. *arguelloensis*), dune larkspur (*Delphinium parryi* ssp. *blochmaniae*), and black flowered figwort (*Scrophularia atrata*; shaley soils too.) None of these species were observed during the DWE floristic inventory field surveys of the dense ripgut brome dominated non-native grassland cover on the Newlove Park CUP area.

No special-status plant species were observed during DWE floristic inventory and rare plant surveys of the Newlove Park CUP area.

5.4.2 Special-Status Wildlife

The CNDDB search revealed the recorded occurrences of 10 special-status wildlife species within the region of the project site. While not recorded in the CNDDB query, the golden eagle with a nearby nest location near Solomon Mountain is added, and the Crotch's bumblebee (*Bombus crotchii*) is added to this analysis because of the recent listing by CDFW as a Candidate species for listing under CESA. Special-status wildlife species known from the region evaluated for this study are discussed below by groups based upon habitat preferences, specific habitat use requirements (i.e. terrestrial or aquatic), mobility, and migratory or dispersal patterns. Table B-2 in Appendix B provides listing status, habitat detail, and if observed or potential to occur on the project site for each of the species discussed below.

AQUATIC SPECIES

The CNDDB has recorded occurrences for the highly aquatic perennial stream or perennial pond associated western pond turtle (*Emys marmorata*) and California red-legged frog (CRLF; *Rana draytonii*). No perennial aquatic habitat occurs in the Newlove Park CUP area so these species would not occur. Given the lack of CRLF or western pond turtle perennial aquatic habitat within the Newlove Park project area, and recorded occurrences over one mile away, CRLF or western pond turtle dispersal to or across the dry upland Newlove Park project site is highly improbably and would not be expected. Further, as noted above given the lack of perennial aquatic habitat within the study area, protocol surveys for either species are not warranted as there is no suitable aquatic habitat to survey.

The vernal pool fairy shrimp *(Branchinecta lynchi)* is listed as a threatened species by the USFWS that occur and are restricted to the boundaries ofseasonal astatic (non-flowing) rain filled pools and are endemic to the grasslands of the Central Valley, Central Coast mountains,

and the South Coast mountains. There were no vernal pools or suitable seasonal wetland/pond habitat observed in the Newlove Park CUP area so this species would not occur. Fairy shrimp presence in ORCU-3 is unknown.

The California tiger salamander (CTS; *Ambystoma californiense*) spends most of its lifecycle in upland underground refuges in small mammal burrows and can disperse upwards of 1.3 miles from their temporary (seasonal) breeding ponds in search of upland refuge. The entire 31-acres Newlove Park is within the USFWS mapped West Los Alamos/Careaga metapopulation and is not within any CTS designated critical habitat. Most relevant to the Newlove Park project site is known CTS breeding ponds ORCU-3 about 300 feet to the east and potential breeding pond ORCU-2 approximately 0.24 mile to the north. CTS known breeding ponds within 1.3 miles of the project site to the southwest are ORCU-13 (0.42 mile) and ORCU-12 (1.2 miles) away (see Figure 8). There are densely vegetated oak and scrub hills with steep topography between the Newlove Park CUP area and the two known CTS breeding ponds. Steep vegetated topography and gully erosion separate the Newlove Park CUP area and potential CTS pond ORCU-2.

The USFWS suggests that even steep topography and dense vegetation do not restrict the potential for CTS to disperse 1.3 miles from breeding ponds. Only very costly and multiple year protocol surveys that require abundant rainfall for agency approved survey validity can refute this broad assumption of dispersal. ORCU-3, ORCU-12 and ORCU-13 are within the proposed CTS compensatory mitigation area for the Solomon Hills specific plan project. As such, CTS potential presence in upland refuges in the Newlove Park CUP area is assumed so the extensive two-year study protocol to prove absence is not warranted since compensatory habitat mitigation is proposed with the Newlove Park project (see Figure 8).

It is important to note that the primary basis for the USFWS 1.3-mile dispersal distance is statistical probability from studies in a central valley landscape with huge breeding ponds dispersing 1,000's of individuals seeking refuge opportunities in a flat grassland landscape for miles around the ponds. Except for the nearby ORCU-3, as noted above there is oak/shrub vegetation and varied steep topography between the ponds and the Newlove Park CUP.

The western spadefoot (toad) (*Spea hammondii*) requires temporary ponds and puddles for breeding and uplands within close proximity of breeding ponds for refuge in small mammal burrows similar to CTS, but spadefoot can also dig its own burrows in friable sandy/loam soils with a specialized structure (spade) on its hind legs. The USFWS issued a Proposed Rule on December 5, 2023 for establishing and proposed listing the northern and southern distinct population segments (DPS) of the western spadefoot as Threatened under the Federal Endangered Species Act (FR Vol.88, No. 232, pp. 84252-84278 (USFWS proposed rule). The USFWS proposed rule provided the following upland dispersal information based on studies in Orange County California: *The dispersal distance required between upland refugia and aquatic habitat ranges and may be up to approximately 600 m (1,968 ft) with a mean*

dispersal distance of 40m (131 ft) to 137 m (450 ft). Only one of 15 individuals tracked by radio telemetry in the Orange County study moved the maximum 600m distance with the rest moving from breeding ponds to uplands within the mean 40m to 137m distance. The study also suggested spadefoots strongly selected grassland rather than shrubs for burrow/refuge.

Western spadefoot has been observed in CTS ponds ORCU-12 and ORCU-13 that are well beyond the maximum predicted western spadefoot dispersal from breeding ponds. The USFWS has surveyed ORCU-3 in five years between 2017 and 2024 during "CTS roundups" (annual aquatic sampling of CTS ponds with landowner approvals) and has not detected western spadefoot in ORCU-3. No suitable seasonal pools occur within the Newlove Park project area itself and this species would not be expected to occur given the 2,300-foot and greater distances (beyond the documented dispersal study distances) from the known breeding sites.

MONARCH BUTTERFLY

The monarch butterfly (*Danaus plexippus*) is now a federal candidate species for listing under the Endangered Species Act. The candidate status is from the USFWS determination that other species have a higher priority for staff resources to process listing requests. The monarch butterfly uses coastal eucalyptus/pine tree stands for fall and winter roosts typically from October through January. The CNDDB monarch butterfly roost site records are of small inland aggregations or only potential sites that support eucalyptus stands to the north in Orcutt and the City of Santa Maria without documented monarch butterfly roosting. Most roost sites are near to the coast where winter low temperatures are not extreme. The inland Newlove Park project area location has three small stands of eucalyptus trees that do not have any recorded monarch butterfly roost activity. Given the existing high public use of the park, it would be likely that a monarch butterfly roost would have been recorded. The three small and separate stands of eucalyptus out in the open do not represent suitable monarch butterfly fall/winter roost habitat.

CROTCH'S BUMBLEBEE

According to the available Xerces Society literature and 2018 petition to the California Fish and Game Commission to list the Crotch's bumble bee states they typically nest in undisturbed ground using existing burrows from other animals or downed debris as they do not excavate their own nests. The Crotch's bumble be does not have nest site tenacity with nest site locations changing each season. Areas subject to surface disturbance become unsuitable for this species. They are generalists that forage on a wide variety of flowering plants and require a steady source of nectar and pollen from wildflowers during the flight season with an active colony period of April through August, but may be found from February through October. The Xerces petition showed the Newlove Park project area is

outside of the predicted historic and current range that appeared to exclude from its range the coast from Big Sur to southern Santa Barbara County. A recent court decision allowing the California Fish and Game Commission to consider the Crotch's bumble bee as a fish by California Fish and Game Code definition, allowed for the determination of its status as a Candidate for listing as endangered. The CDFW in 2023 issued survey considerations for candidate bumble bee species that provided a new current predicted range map that includes almost the entirety of central California from Redding to the Mexico border including the Newlove Park CUP area. The nearest CNDDB occurrence is over 20 miles away to the east near Figueroa Mountain from 1989 with bumble bee watch occurrences in the Carrizo Plain. As detailed above, the DWE field survey established the project site as non-native annual grassland dominated by a dense cover of ripgut brome with little wildflower resources and very limited small mammal burrows. No bumble bees were observed during the DWE field survey.

UPLAND REPTILES

The northern legless lizard *(Anniela pulchra)* is closely associated with sandy or very friable loamy soils under coastal scrub or woodland vegetation with soil moisture and vegetative cover being essential. The Blainville's (coast) horned lizard *(Phrynosoma blainvillii)* occurs in a wide variety of habitats with sandy soils, abundant ant colonies for food, open areas for sunning, and shrubs for cover needed. While soils may be suitable for both species, the dense grass cover and lack of shrub cover on the Newlove Park project site provides only a low potential for either reptile species to occur.

BIRDS

The golden eagle (*Aquila chrysaetos*) is a wide-ranging raptor protected under the Bald and Golden Eagle Protection Act and as a Fully Protected species by CDFW. Large stick nests in trees and cliffs with long-term site tenacity are common. A nesting pair of golden eagles was observed by DWE near Solomon Mountain in 2023. The nest site was not active in 2025 (Althouse and Meade 2025). The Newlove Park project site is approximately 0.6 mile from Solomon Mountain with no visual sight lines to the project site from the cliff face nest site so would be unaffected by project construction and future park use should the nest be active in the future.

MAMMALS

The CNDDB has recorded occurrences of one bat species the Townsend's big eared bat (*Corynorhinus townsendii)* within the five-mile search radius. This is a colonial cave/cavernous rooster, feeds in forest/woodland habitats or along habitat edges. Occurrence is highly unlikely given the lack of natural and/or human made structural requirements (caves, crevices, bridges, structures) in the project area. Given the existing high public use of the park, it would be likely that a colonial bat roost would have been recorded.

The American badger *(Taxidea taxus)* is a grassland species needing abundant small mammal prey and are easily detected by their distinctive half-moon shaped burrows. The grassland in and around the Newlove Park project area provides suitable habitat for the American badger with CNDDB recorded occurrences in the vicinity. No distinct badger dens were observed during the DWE survey.

6.0 IMPACT ASSESSMENT AND RECOMMENDED MITIGATION MEASURES

6.1 SUFFICIENCY OF BIOLOGICAL DATA

The DWE field surveys on April 22 and July 15, 2025 was at the peak expression and growth of the onsite dense non-native grassland plant community and constitutes a valid floristic inventory and rare plant survey for this assessment. The data collected as articulated in this report provide sufficient biological resources information sufficient to; 1) adequately establish existing conditions of the project site and landscape scale context based on the natural and developed land use mosaic in the vicinity; 2) determine if the site does supports any special-status plant or wildlife species or suitable habitat for such species; 3) determine if waters of the U.S./State, wetland or riparian habitats occur in the study area, and 4) adequately evaluate significance of proposed project impacts on biological resources, and 5) provide recommended mitigation measures to avoid, minimize, and otherwise reduce Newlove Park CUP improvement impacts to a less than significant level.

6.2 THRESHOLDS OF SIGNIFICANCE – SANTA BARBARA COUNTY

Santa Barbara County has an adopted Environmental Thresholds and Guidelines Manual that provides the direction on determining thresholds for significant impacts and those that are considered less than significant impacts, and for the analysis of impacts and development of feasible mitigation measures for the Proposed project.

According to the Santa Barbara County Environmental Thresholds and Guidelines Manual, Biological Resources Section (6.)(C.)(3.)(a.), significant impacts on biological resources are considered in the following circumstances:

(1) Substantially reduce or eliminate species diversity or abundance.
(2) Substantially reduce or eliminate quantity or quality of nesting areas.
(3) Substantially limit reproductive capacity through losses of individuals or habitat.
(4) Substantially fragment, eliminate, or otherwise disrupt foraging areas and/or access to food sources.
(5) Substantially limit or fragment range and movement (geographic distribution or animals and/or seed dispersal routes).
(6) Substantially interfere with natural processes, such as fire or flooding, upon which the habitat depends.

According to the Santa Barbara County Environmental Thresholds and Guidelines Manual, Biological Resources Section (6.)(C.)(3.)(b.), less than significant impacts on biological resources are considered in the following circumstances:

> ***Less Than Significant Impacts.*** *There are many areas in the County where there is little or no importance to a given habitat and it is presumed that disruption would not create a significant impact. Examples of areas where impacts to habitat are presumed to be insignificant include:*
>
> *(1) Small acreages of non-native grassland if wildlife values are low.*
> *(2) Individuals or stands of non-native trees if not used by important animal species such as raptors or monarch butterflies.*
> *(3) Areas of historical disturbance such as intensive agriculture.*
> *(4) Small pockets of habitats already significantly fragmented or isolated, and degraded or disturbed.*
> *(5) Areas of primarily ruderal species resulting from pre-existing man-made disturbance.*

According to the Santa Barbara County Environmental Thresholds and Guidelines Manual, Biological Resources Section (6.)(C.)(3.)(c.), Impact Assessment Factors, the following questions and factors are used in assessing the significance of Project impacts on biological resources.

(1) ***Size.*** *How much of the resource in question both on and off the Project site would be impacted?* (*Percentage of the whole area and square footage and/or acreage are both useful to know*) *How does the area or species that would be impacted relate to the remaining populations off the Project site?* (*Percentage of total area or species population, either quantitatively or qualitatively.*)

(2) ***Type of Impact.*** *Would it adversely indirectly affect wildlife* (*light, noise, barriers to movement, etc.*)*? Would it remove the resource or cause an animal to abandon the area or a critical activity* (*e.g., nesting*) *in that area? Would it fragment the area's resource?*

(3) ***Timing.*** *Would the impact occur at a critical time in the life cycle of an important plant or animal* (*e.g., breeding, nesting, or flowering periods*)*? Is the impact temporary or permanent? If it is temporary, how long would the resource take to recover? Would the impact be periodic, of short duration, but recur again and again?*

Additionally, Santa Barbara County Environmental Thresholds and Guidelines Manual, Biological Resources Section (6.)(D.) provides the following habitat-specific impact assessment guidelines pertinent to this proposed project analysis.

Section (6)(D.)(4.)(a. & b.) Oak Woodlands and Forests Habitat Impact Assessment Guidelines:

a. ***Description.*** *There are three primary types of oak woodlands in Santa Barbara County: Valley Oak, Coast Live Oak, and Blue Oak woodlands. The number, type, and density of oak trees, and the relationship between trees and understory are principal characteristics which define the various types of woodlands. Oak habitats support a diverse wildlife population, and offer abundant resources to wildlife including food sources, shade in summer, shelter in winter, perching, roosting, nesting, and food storage sites.*

b. ***Impact Assessment Guidelines for Woodlands and Forest Habitat Areas.*** *Project-created impacts may be considered significant due to changes in habitat value and species composition such as the following:*
   (1) Habitat fragmentation.
   (2) Removal of understory.
   (3) Alteration to drainage patterns.
   (4) Disruption of the canopy.
   (5) Removal of a significant number of trees that would cause a break in the canopy or disruption in animal movement in and through the woodland.

Section (6)(E.)(1.)(a., b, & c.); (2) – General Mitigation Guidelines for Biological Impacts

1. Mitigation Hierarchy. The following general approaches to reducing biological impacts are presented in the order of their effectiveness.

a. Avoidance.

Avoid direct or indirect impacts to significant biological resources through project design.

Focus on maintaining large, contiguous habitat areas and animal movement corridors. A project design which clusters development on a relatively limited portion of the project site may reduce the habitat area disturbed by the project.

b. Onsite Mitigation.

Minimize or reduce impacts through on-site design and resource protection measures.

Measures may include vegetative spatial buffer between project and habitat areas; revegetation; habitat enhancement; erosion and water quality protection; on-site replacement/compensation; maintenance and management measures such as fencing, weed control, use of building envelopes, and dedication of areas through open space or conservation easements or grant deed of development rights; short-term measures to protect against construction impacts (e.g., fencing, timing of construction to avoid nesting season).

c. Off-Site Mitigation.

Compensate for on-site impacts through off-site measures.

When avoidance or on-site mitigation is infeasible or inadequate to reduce impacts, measures such as those listed under on-site mitigation can be considered in off-site locations, or may be accomplished through in-lieu fees. Off-site approaches may be appropriate at times if a greater ecological value may be clearly gained than with on-site mitigation. (i.e., where on-site habitat is of low quality or highly fragmented).

2. **Habitat Replacement/Compensation Guidelines.** The mitigation approach of replacing habitat either on-site or off-site, to compensate for habitat loss, is generally not a preferred approach because it always results in some habitat loss (either short-term or long-term), and because prospects for successful habitat replacement are problematic.

Replacement mitigation should involve the same habitat type, location(s) within the same watershed and as close as possible to the site of impact, and should result in comparable and compensating size and habitat value.

Beneficial ecological restoration projects, where the purpose of the project is to enhance or restore biological or habitat resources, compensate replacement at a minimum ratio of 1:1. Refer to the County *Guidelines for the Implementation of the California Environmental Quality Act of 1970, As Amended*, revised January 8, 2008, for the definition and requirements for beneficial ecological restoration projects.

6.3 IMPACT ASSESSMENT

This section discusses potential significance of impacts on biological resources organized by CEQA Appendix G Checklist that would result from implementation of the Newlove Park improvements CUP as described in Section 2.0 above.

Potential Adverse Effects on Candidate, Sensitive or Special-status Species

No special-status plant species were observed during DWE floristic inventory and rare plant surveys so there would be no impact on special-status plants.

There is a low potential for the legless lizard, horned lizards, American badger, and Crotch's bumble bee within the Newlove Park improvements CUP area. Should they occur, there would be loss of habitat and likely mortality impacts on the northern legless lizard, Blainville's horned lizard, American badger, and Crotch's bumble bee.

CTS could be using the small mammal burrows for upland refuge in the grassland and habitats around and in close proximity to ORCU-3, and within the 1.3-mile maximum dispersal distance from two known (ORCU-12, ORCU-13) and one potential (ORCU-3) CTS breeding ponds. Newlove Park CUP improvement construction could result in mortality and upland habitat loss considered "take" of the CTS that is protected under both the federal and state Endangered Species Acts. The primary access road would be widened with an upslope four foot retaining wall along the existing steep slope down to the Newlove Park area that

represents a barrier to CTS movement. The secondary access road would only be paved within the existing footprint with no widening or curbs with no impact on CTS. The improved and developed park uses could represent at least a partial barrier or impediment to CTS dispersal to and from ORCU-3. However, there will remain barrier free and partial barrier dispersal corridors through the entire Newlove Park CUP area as shown on Figure 9 in Appendix A. CTS interactions from ORCU-2, ORCU-13, and ORCU-12 are highly improbably given the distance and intervening vegetation and varied steep and gullied topography.

No impact on species requiring permanent/perennial aquatic habitat would result from the Newlove Park improvements CUP as there is no habitat onsite for these species. No impact on the golden eagle would result from the Newlove Park project construction or use as it represents a small area of potential foraging habitat loss compared to the greater surrounding habitat mosaic and there are no visual sight lines between the Solomon Mountain cliff face nest site and the Newlove Park CUP area.

- ***Impacts on candidate, sensitive, or special-status species are considered less than significant with mitigation measures BIO-1, BIO-2, and BIO-4 incorporated into the Newlove Park CUP.***

Adverse Effects on Riparian Habitat or Sensitive Natural Communities

No riparian habitat or sensitive natural communities occur within the Newlove Park CUP area.

- ***There would be no impact on riparian habitat or sensitive natural communities.***

Protected Wetlands

No protected wetlands or other waters of the U.S. State occur within the Newlove Park CUP area.

- ***There would be no impact on protected wetlands or other waters of the U.S./State.***

Interference with Movement of Native Fish or Wildlife, Wildlife Corridors, and Wildlife Nursery Sites

The construction of the Newlove Park improvements CUP would impact on 13 acres of non-native annual grassland habitat and a small sliver of coastal scrub habitat. The eucalyptus stands are to remain. There is the potential for impacts on locally common ground dwelling wildlife (ground squirrel, mice, gophers). The undeveloped Newlove Park improvement project site and surrounding undeveloped lands of Orcutt Hill support abundant habitat for a wide array of resident, nomadic, and migratory wildlife. Further, there is habitat for nesting birds in the onsite grassland, oak trees, eucalyptus trees, and adjacent coastal scrub habitat. The eucalyptus trees would remain providing roosting and nesting habitat for birds.

In accordance to the Santa Barbara County Environmental Thresholds and Guidelines Manual, Biological Resources Section (6.)(C.)(3.)(b.), less than significant impacts on biological resources are considered for small acreages of non-native grassland if wildlife values are low. This is the case for the non-native annual grassland habitat amongst the expanse of grassland, coastal scrub, and oak woodland around the Newlove Park CUP site. As such, the Newlove Park improvements CUP construction and operation impacts on non-native grassland habitat would be considered ***a less than significant.***

Given the potential for ground nesting birds and other wildlife within the Newlove Park CUP area, project direct and indirect impacts on locally common, resident, nomadic, and migratory wildlife would be considered ***less than significant*** with mitigation measures BIO-1, BIO-2, BIO-3, and BIO-4 to avoid, minimize, and compensate for impacts incorporated into the Newlove Park CUP.

Conflicts with Local Policies or Ordinances, Such as Tree Preservation

Oak Trees/Woodland – The removal of 46 oak trees and encroachment into an additional 16 oak trees mostly for the access road improvements would result from the Newlove Park improvements CUP. However, the removals and encroachment are along the edge of an oak woodland patch, that does not result in habitat fragmentation or substantial disruption of the canopy. Further, no drainage patterns would be altered and would not disrupt animal movement opportunities that would remain across the road between the remaining habitat areas.

Impacts on oak trees are considered a ***less than significant impact with mitigation measure BIO-5 incorporated into the Newlove Park CUP.*** Otherwise, in accordance with Santa Barbara County oak tree protection and impact assessment guidelines Newlove Park improvements CUP impacts on oak trees would be:

(1) *Habitat fragmentation.* ***No impact.***
(2) *Removal of understory.* ***No impact.***
(3) *Alteration to drainage patterns.* ***No impact.***
(4) *Disruption of the canopy.* ***No impact.***
(5) *Removal of a significant number of trees that would cause a break in the canopy or disruption in animal movement in and through the woodland.* ***Less than significant impact.***

Conflicts with Local, Regional or State Conservation Plans

There are no local, regional or state conservation plans over the Newlove Park CUP area.

- ***There would be no impact on any local, reginal or state conservation plans.***

6.4 RECOMMENDED MITIGATION MEASURES

The analysis of impacts on biological resources as described in Section 6.3 suggests that there would be impacts on oak trees, common and special-status wildlife species, nesting birds, and CTS upland habitat impacts from the construction and use of the Newlove Park improvements. The following mitigation measures are recommended to avoid, minimize, and compensate for impacts on biological resources to a less than significant level.

SPECIAL-STATUS SPECIES AND NATIVE WILDLIFE

MM BIO-1: ENVIRONMENTAL AWARENESS TRAINING & ONSITE BIOLOGICAL MONITORING

- At the outset of Newlove Park improvements construction, a Worker Environmental Awareness Program shall be developed and implemented for all construction personnel prior to commencing any ground disturbance activities. The program shall consist of an on-site or center presentation that will describe the locations and types of biological resources on and near the project area, an overview of the laws and regulations governing the protection of biological resources, the reasons for specific protection and avoidance measures that are applicable to the project, and the identity of designated points of contact should questions or issues arise, including the qualified biological monitor(s).
- A biological monitor shall be onsite during initial clearing, grubbing, excavation and grading for project construction to ensure any permit compliance and implementation of the avoidance and minimization measures required as part of project approvals.

MM BIO-2: UPLAND NON-LISTED SPECIAL-STATUS WILDLIFE AND CROTCH'S BUMBLE BEE AVOIDANCE AND MINIMIZATION MEASURES

- Prior to ground disturbing activities, a qualified biologist shall conduct a pre-construction survey within 30 days in advance of initial ground disturbance (clearing, mowing, grubbing, grading, etc.) to identify whether any special-status upland wildlife species (i.e. coast horned lizard, northern legless lizard, American badger, Townsend's big eared bat, Crotch's bumble bee) are using any portion of the project disturbance footprint. Pre-construction surveys shall be repeated if construction site grading or oak/vegetation removal is idle for more than one year, and/or prior to subsequent phases of construction.
    - To the extent feasible, non-listed special-status upland wildlife encountered during pre-construction surveys and initial ground disturbance construction monitoring shall be captured and relocated to a suitable habitat within the open space areas by a qualified biologist.

- Natal American badger dens shall be avoided with a minimum 150-foot non-disturbance buffer zone until the young are self-sufficient and no longer reliant on the den site. Once this determination is made by a qualified biologist, one-way doors can be installed to allow badgers to relocate on their own and avoid and minimize any injury or mortality.
- Crotch's bumble bee nest surveys shall be conducted on the Newlove Park CUP site prior to any ground disturbing activities as this species moves nests each year in accordance with the current CDFW survey guidelines. Any confirmed active Crotch's bumble bee nest shall be avoided with a non-disturbance buffer zone determined by a qualified biologist. If nest avoidance is infeasible, the project proponent shall obtain take authorization from the CDFW prior to any project ground disturbance and implement any permit conditions to mitigate for project impacts on this species.
- Should a bat roost be found, then an assessment of the type of use shall be made (natal roost, daily, nomadic/transitory roost, etc.) and appropriate avoidance and minimization measures implemented to reduce potential impacts. Natal bat roosts shall be avoided with a minimum 100-foot buffer zone until it is determined young are leaving the roost site or the site becomes unoccupied. During other times, exclusionary measures shall be applied with no bat occupation verified prior to removal roost site "structure" (tree, crevice, etc.).

Implementation of the above mitigation measures would reduce impacts to a less than significant level.

MM BIO-3: NESTING BIRDS IMPACT AVOIDANCE

- To avoid disturbance of nesting birds, including raptors (hawks, vulture, owls), protected by the Federal Migratory Bird Treaty Act (MBTA) and Sections 3503, 3503.5, and 3513 of the California Fish and Game Code (CFGC), the removal of vegetation and ground disturbance shall occur outside of the bird nesting season whenever feasible. If these activities must occur during the bird nesting season (February 1 through August 31), then a pre-construction nesting bird survey shall be performed by a County-qualified biologist. Pre-construction surveys for nesting birds shall occur within the area to be disturbed and shall extend outward from the Newlove Park CUP area by 500 feet to the extent feasible. The distance surveyed from the disturbance may be reduced if property boundaries render a 500-foot survey radius infeasible, or if existing disturbance levels within the 500-foot radius (such as from a major street or highway) are such that project-related activities would not disturb nesting birds in those outlying areas. If any occupied or active bird nests are found, a non-disturbance buffer zone shall be established and demarcated by the

biologist with bright orange construction fencing, flagging, construction lathe, or other means to mark the boundary. The buffer shall be 300 feet for non-raptors and 500 feet for raptors, unless otherwise determined by the qualified biologist and approved by P&D. Buffer reductions shall be based on the known natural history traits of the bird species, nest location, nest height, line of site to the nest, existing pre-construction level of disturbance in the vicinity of the nest, and proposed construction activities. All construction personnel shall be notified as to the location of the non-disturbance buffer zone and to avoid entering the buffer zone during the nesting season. No ground disturbing activities or vegetation removal shall occur within this buffer until the County-qualified biologist has confirmed that nesting is completed, the young have fledged and are no longer dependent on the nest, or the nest fails, and there is no evidence of a second nesting attempt; thereby determining the nest unoccupied or inactive.

- If construction must begin within the nesting season, then the pre-construction nesting bird survey shall be conducted no more than one week (7 days) prior to commencement of vegetation removal, grading, or other construction activities. Active nests shall be monitored by the biologist at a minimum of once per week until it has been determined that the nest is no longer being used by either the young or adults, and there is no evidence of a second nesting attempt. Bird survey results and buffer recommendations shall be submitted to County Planning and Development for review and approval prior to commencement of grading or construction activities. The qualified biologist shall prepare weekly monitoring reports, which shall document nest locations, nest status, actions taken to avoid impacts, and any necessary corrective actions taken. Active nest locations shall be marked on an aerial map and provided to the construction crew on a weekly basis after each survey is conducted. Active nests shall not be removed without written authorization from USFWS and CDFW.

Avoiding destruction of an active nest and avoiding nest failure during construction would reduce potentially significant impacts on nesting birds to a less than significant level.

MM BIO-4: CALIFORNIA TIGER SALAMANDER UPLAND DISPERSAL HABITAT IMPACT AVOIDANCE, MINIMIZATION, AND COMPENSATION MEASURES

Newlove Park improvements CUP grading impacts on the CTS could result in mortality to undetected CTS in underground refuges within 1.3 miles of known/potential breeding ponds. Pre-construction surveys and construction monitoring to salvage and relocate individuals discovered during construction would minimize direct mortality. However, the Newlove Park CUP would result in the loss of 13 acres of potential upland refuge in the non-native annual grassland habitat, The stormwater detention basins would drain readily (within several days) of rain events and would not represent an attractive nuisance for dispersing

CTS. There would remain barrier free and partial barrier dispersal opportunities for CTS as shown in Figure 9. There would be no impacts on breeding ponds and no destruction or adverse modification of CTS Designated Critical Habitat as none occurs in the Newlove Park CUP area. The following recommended mitigation measures assume that the USFWS and CDFW would require take authorization for direct construction impacts on CTS. Overall compensation for the loss of CTS habitat would be as a part of the Solomon Hills Specific Plan project CTS conservation efforts.

- Prior to commencement of any ground disturbing activities, the project proponent shall obtain incidental take authorization under the Federal Endangered Species Act (FESA) and California Endangered Species Act (CESA) for potential take of the California tiger salamander.
- A biological monitor approved/authorized under the FESA/CESA take authorization shall be present during initial ground disturbance and vegetation removal activities to attempt salvage and relocation efforts for the CTS that may be present. Relocation areas shall be identified within nearby areas not slated for any future development.

Implementation of the above mitigation measures to avoid and minimize mortality to CTS, and overall CTS compensatory mitigation would reduce impacts to a less than significant level.

PROTECTED OAK TREES

MM BIO-5: OAK TREE IMPACT AVOIDANCE MITIGATION MEASURE

The removal of 46 oak trees and encroachment under an additional 16 would require compensatory mitigation to reduce impacts to a less than significant level. The Solomon Hills project includes the *Oak Tree Management and Replacement Plan* (Dudek OTMRP; Dudek 2024(a)) that provides for an approach to mitigation for the loss of oak trees. The Newlove Park CUP oak tree impacts would be mitigated under the Solomon Hill project OTMRP that includes the following.

In order to mitigate for the loss of oak trees and oak woodland in accordance with County and State requirements, as part of the project the Dudek OTMRP provides for the following oak tree mitigation goals, objectives and compensation program as summarized from the Dudek OTMRP.

OTMRP GOALS

- Preserving large tracts of oak woodland both on and off site.
- Restoring and enhancing impaired, preserved woodlands by creating conditions that will allow for the restoration of the natural regeneration capabilities of the woodlands.

- Creating woodlands on suitable lands to enhance biodiversity by replacing invasive grasses with native vegetation and by creating "live-in habitat" for raptors and other species.
- Enhancing existing on-site woodlands and creating wildlife movement corridors through tree planting.
- Implementing an adaptive management program, including long-term monitoring.
- Increased success rates and establishment criteria above and beyond that required by the County.

OTMRP OBJECTIVES

1. Substantial avoidance and preservation of oak trees outside of the proposed grading footprint, where feasible, and within large, expansive open space easements.
2. Mitigation consistent with or exceeding the County Code regulations. The mitigation program exceeds the County Code in that it has been tailored to the site and is designed to restore and enhance woodland function and sustainability beyond what is prescribed in the ordinance through the following efforts:
    a. Enhancement/restoration of natural regeneration within protected oak woodlands both to increase overall tree populations and to establish succession populations (i.e., encourage conditions where woodlands would be characterized by a natural diversity of trees ranging from seedlings to saplings to varying ages of mature trees).
    b. Creation of new oak woodlands on selected cut/fill slopes to replace lost woodland and enhance connectivity for wildlife movement, and creation in areas within or adjacent to development as part of site-sensitive landscaping.
3. Creation of site-sensitive landscaping within and adjacent to the grading footprint by planting a variety of sizes of oak trees at County Code standard ratios:
    a. Acorns, seedlings, and 1-gallon trees (or equivalent and where appropriate) in preserved on-site woodlands.
    c. Five-gallon trees on favorable development slopes and within the community.
    d. A variety of larger box specimens, distributed from 24-inch box trees up to 60-inch box trees, within the community right-of-way and in common areas, parks, entry points, and along selected medians.
4. Collection of acorns from the local site for planting and growing in an on-site nursery to provide genetically consistent plant material.
5. Use of adaptive management in conjunction with an adaptive management program proposed for oak woodlands:

a. Supporting an enhancement/restoration strategy such that currently impaired oak woodlands will gradually achieve the ability to regenerate once cattle and exotic plants are removed/controlled and wildfire events are suitably controlled.

6. Provisions for long-term monitoring.

Implementation of the above mitigation measures would reduce potentially significant impacts to a less than significant level.

7.0 CONCLUSIONS

Based on the findings described above establishing the existing conditions of biological resources within the Newlove Park improvements project area, identification of impacts, and incorporation of the recommended mitigation measures, implementation of the proposed project would avoid, minimize, and mitigate impacts on biological resources to a less than significant level.

COMMON NAME	*SCIENTIFIC NAME*
Fiddleneck	*Amsinckia menziesii*
Scarlet pimpernel	*Anagallis arvensis*
California sagebrush	*Artemisia californica*
Oats	*Avena sp.*
Coyote brush	*Baccharis pilularis*
Ripgut brome	*Bromus diandrus*
Soft chess brome	*Bromus hordeaceus*
Italian thistle	*Carduus pycnocephalus*
Yellow-star thistle	*Centaurea solstitialis*
Miner's lettuce	*Claytonia perfoliata*
Croton	*Croton californicus*
Redstem filaree	*Erodium cicutarium*
Eucalyptus	*Eucalyptus globulus*
Rattail sixweeks grass	*Festuca myuros*
Italian rye grass	*Festuca perennis*
Telegraph weed	*Heterotheca grandiflora*
Foxtail barley	*Hordeum murinum*
Smooth cat's ear	*Hypochaeris glabra*
White horehound	*Marrubium vulgare*
Bur clover	*Medicago polymorpha*
Cut leaf plantain	*Plantago coronopus*
Coast live oak	*Quercus agrifolia*
Poison oak	*Toxicodendron diversilobum*

TABLE B-2 SOLOMON HILLS CNDDB RECORDED OCCURRENCES & SPECIAL-STATIS SPECIES				
Common Name Scientific Name(s)	**Listing Status Fed/CA/ CNPS**	**General Habitat Description**	**Period of Identification**	**Observed/ Potential Occurrence**
Plants				
Hoover's bent grass *Agrostis hooveri*	--/--/1B.2	Chaparral, cismontane woodland, valley and foothill grassland in Santa Barbara and San Luis Obispo counties. Dry, sandy Soil. 120-600m.	Flowering: April-August	Not observed
La Purisima manzanita *Arctostaphylos purissima*	--/--/1B.1	Chaparral. Sandstone outcrops, sandy soil. 120-300m.	Flowering: January-March	Not observed
Refugio manzanita *Arctostaphylos refugioensis*	--/--/1B.2	Chaparral. On sandstone. 275-820 m.	Flowering: December-March	Not observed
Sand mesa manzanita *Arctostaphylos rudis*	--/--/1B.1	Chaparral, coastal scrub. Sandy soils in Lompoc Nipomo area. 25-230m.	Flowering: November-February	Not observed
La Graciosa thistle *Cirsium scariosum* var. *loncholepis*	FE/ST/1B.1	Dune slack ponds, coastal strand, freshwater wetlands, marshes	Flowering: March-August	Not observed
Dune larkspur *Delphinium parryi* ssp. *blochmaniae*	--/--/1B.2	Coastal dunes (maritime chaparral). Rocky areas and dunes. 30-375m.	Flowering: April-May	Not observed
Lompoc Yerba Santa *Eriodictyon capitatum*	FE/SR/1B.2	Closed-cone coniferous forest, chaparral. Sandy soils on terraces. 40-455m.	Flowering: April-June	Not observed
Mesa horkelia *Horkelia cuneata* var. *puberula*	--/--/1B.1	Chaparral, cismontane woodland, and coastal scrub in sandy or gravelly soils. 70 to 810 meters.	Flowering: March - July	Not observed
Kellogg's horkelia *Horkelia cuneata* var. *sericea*	--/--/1B.1	Closed-cone coniferous forest, coastal scrub, chaparral, dunes, coastal sandhills. 10-200m.	Flowering: March - July	Not observed
Layia erubescens Blushing layia	--/--/1B.2	Coastal dunes, coastal scrub. 10-245m. Loose, fine sands of stabilized dunes and sandhills.	Flowering: March-June	Not observed
Curly leaved monardella *Monardella undulata* spp. *arguelloensis*	--/--/1B.1	Coastal bluff, coastal dunes (stabilized), coastal scrub. 50-150m.	Flowering: May-September	Not observed
San Luis Obispo monardella *Monardella undulata* spp. *undulata*	--/--/1B.2	Coastal dunes, coastal scrub. Stabilized sand of the immediate coast. 10-200m.	Flowering: May-September	Not observed
Black-flowered figwort *Scrophularia atrata*	--/--/1B.2	Chaparral, coastal dunes, coastal scrub, riparian scrub. Sandy, diatomaceous shale, and soils derived from other parent material; 10-250m.	Flowering: April-July	Not observed
San Bernardino aster *Symphyotrichum defoliatum*	--/--/1B.2	Wetlands, freshwater marsh, coastal sage scrub, oak woodland	Flowering: July-November	Not observed

TABLE B-2 SOLOMON HILLS CNDDB RECORDED OCCURRENCES & SPECIAL-STATIS SPECIES				
Common Name Scientific Name(s)	**Listing Status Fed/CA/ CNPS**	**General Habitat Description**	**Period of Identification**	**Observed/ Potential Occurrence**
Natural Communities of Special Concern				
* Central Maritime Chaparral	--/--/NCSC	Dense stands of *Arctostaphylos rudis* and *A. purissima*; scattered *Pinus muricata*, *Quercus agrifolia, Ceanothus cuneatus* and *Adenostoma fasciculatum*, *Eriodictyon capitatum*, *Ericameria ericoides*	Observable year round	Not observed
* Purple Needlegrass Grassland / Native Grassland	--/--/NCSC	Grassland with greater than 10% total relative cover of native bunch grass grassland species (grasses and forbs, e.g. wildflowers).	Observable year round	Not observed
Southern Vernal Pool	--/--/NCSC	Winter rainfall perches on impermeable layer forming pools in the depressions that support a unique fauna when ponded and flora as they dry down from evapotranspiration	September-March	Not observed
Invertebrates				
* Crotch's bumble bee *Bombus crotchii*	--/SC/--	Wildflower rich undisturbed grasslands. Nests in ground typically use existing burrows of mammals or downed debris.	February-October	Very low potential in dense grass cover with minimal wildflower resources. No bumble bees observed.
Vernal pool fairy shrimp *Branchinecta lynchi*	FT/-- /--	Requires static (non-flowing) seasonal pools.	Wet Season	None. No vernal pools onsite.
Monarch butterfly *Danaus plexippus*	FP/SA/--	Winter roost sites extend along the coast from northern Mendocino to Baja California, Mexico. Roost located in wind-protected tree groves (Eucalyptus, Monterey pine, Cypress), with nectar and water sources nearby.	October-February	None. No suitable roost sites in project area.
Amphibians				
California tiger salamander *Ambystoma californiense*	FE/ST /--	Santa Barbara and San Luis Obispo counties DPS Federally listed as endangered. Need underground refuges, especially ground squirrel burrows and vernal pools or other seasonal water for breeding.	November-March	No ponds in project areas; Within 1.3-mile potential dispersal distance from known CTS ponds ORCU-3 and ORCU-13, and potential ORCU-2

TABLE B-2
SOLOMON HILLS CNDDB RECORDED OCCURRENCES & SPECIAL-STATIS SPECIES

Common Name Scientific Name(s)	Listing Status Fed/CA/ CNPS	General Habitat Description	Period of Identification	Observed/ Potential Occurrence
California red-legged frog *Rana aurora draytonii*	FT/SSC/--	Lowlands and foothills in or near permanent sources of deep water with dense, shrubby or emergent vegetation. Requires 11-20 weeks of permanent water for larval development. Must have access to estivation habitat.	March-August	None. No streams or perennial ponds in/near project area
Western spadefoot *Spea hammondii* (Northern Distinct Population Segment)	FP/SSC/--	Largely terrestrial; enters seasonal ponds only to breed. Prefers open areas with sandy or gravelly soils, in a variety of habitats including mixed woodlands, grasslands, chaparral, sandy washes, lowlands, river floodplains, alluvial fans, foothills, and mountains.	Breeding: January to May, depending on development of seasonal ponds.	None. No ponds in project areas. 1 mile from nearest pond occurrence
Reptiles				
Coast horned lizard *Phrynosoma blainvillii*	--/SSC/--	Chaparral, sage scrub, oak woodlands, and grasslands; sometimes occurs along seldom used dirt roads where native ant species are prevalent	Observable year round.	Low potential in dense cover of grasses. Not observed
Northern California legless lizard *Anniella pulchra*	--/SSC/--	Shows a preference for areas of leaf litter and loose soil along washes, beach sand dunes, open scrub and woodland, and sandy benches along alluvial fans	Observable year round.	Low potential in dense cover of grasses
Western pond turtle *Emys marmorata*	FP/SSC/--	Requires perennial aquatic habitat and constructs nests along edge of streams and ponds.	Observable year round.	None. No streams or perennial ponds in/near project area
Birds				
* Golden eagle *Aquila chrysaetos*	BGEPA/FP/--	Breeds on cliffs or in large trees or electrical towers, wide ranging foraging in open habitats.	Nesting: January - June. Year round resident.	Foraging habitat
Mammals				
Townsend's big-eared bat *Corynorhinus townsendii*	--/SSC/--	Colonial cave/cavernous rooster, feeds in forest/woodland habitats or along habitat edges within 15 km of roost site	Year-round	Unlikely. Potential for foraging adults only
American badger *Taxidea taxus*	--/SSC/--	Grasslands and other open habitats in friable soils.	Year-round	Potential. No evidence observed

*From background data not included in the CNDDB query results

TABLE B-2

MEMORANDUM

To:	Peter Kiesecker
From:	Michael Huff
Date:	January 9, 2026
Subject:	Oak Tree Impact Evaluation for the Solomon Hills Off-Site Water Line
cc:	Doug Nickles
Att.	1. Tree Information Matrix 2. Tree Location Map

Dudek evaluated the alignment of the proposed water supply pipeline for the Solomon Hills project to determine the potential for tree impacts resulting from pipeline construction activities. Water delivery would be via a 10.2-mile pipeline (proposed 16" diameter) from the existing state water project turnout located southwest of the Tanglewood development on Black Road. The pipeline would run through existing public utility easements to the proposed supply tank on the Solomon Hills project site.

A Dudek arborist assessed and mapped protected trees along the pipeline alignment on November 13, 2025. The field assessment included trees that may require removal or where tree root and/or canopy encroachment impacts may be realized during pipeline construction. The tree inventory was consistent with the methodology outlined in Section 4.1 of the Oak Tree Management and Replacement Plan for the Solomon Hills project (July 2025). A total of 82 coast live oak (Quercus agrifolia) trees were included in this inventory and assessment. Tree attribute data for all mapped and assessed trees is presented in Attachment 1. Tree locations are presented in Attachment 2.

Tree impacts were determined by evaluating tree locations in relation to the pipeline alignment and two well locations. Pipeline mapping data (Wallace Group (July 3, 2025)) included a line representing the pipeline alignment. This line was buffered out to a 2-foot wide polygon in GIS to account for trenching. Work area polygons for the two well locations (Wallace Group (November 7, 2025)) were assumed to be the extent of ground disturbance. Consistent with the Oak Tree Management and Replacement Plan for the Solomon Hills project (July 2025), it is anticipated that tree removal would be required when trunks are located inside of or within 2 feet of the proposed disturbance area. Encroachment is anticipated when soil and roots are disturbed within the tree protected zone (tree trunk to crown dripline). The following summarizes anticipated tree impacts associated with water pipeline/well construction:

- 10 protected oak trees will require removal (all on Solstra Owned Property).
- 70 protected oak trees will be subject to encroachment impacts.

The additional protected tree removals associated with pipeline construction (10) would be added to the 14,206 protected trees identified for removal in the project's Oak Tree Management and Replacement Plan. This results in

total of 14,216 protected trees to be removed for the proposed project. Based on this, and the average replacement ratio based on oak plantings only (4.6:1), the 10 protected oak trees requiring removal would add 46 oak plantings to the replacement total. This results in a total of 65,296 replacement oak plantings (in addition to landscape, nurtured, and preserved trees).

Trees subject to encroachment impacts would be protected according to the measures outlined in Appendix K of the Oak Tree Management and Replacement Plan, which includes provisions for monitoring and replacement should retained tree mortality occur. All final project-related tree impacts will be precisely documented and mitigation proportionally required.

memorandum

date	September 19, 2025
to	Peter Kiesecker
cc	Tamara Klug and Anushna Patel, ESA
from	Robin Hutchinson, ESA
subject	Solomon Hills Project September 2025 Floristic Survey Results

Introduction

This memorandum presents the findings of the late summer focused floristic survey conducted by Environmental Science Associates (ESA) on September 4th and 5th, 2025 at the proposed Solomon Hills (Project). The proposed Project is located south of the community of Orcutt and north of the community of Los Alamos in northern Santa Barbara County, west of U.S. 101, and east of SR 135 (Assessor's Parcel Numbers 101-020-041, 101-020-043, 101-020-085, 101-020-086, and 101-020-087). The Project Site is approximately four miles northeast of the gate at Vandenberg Space Force Base, which is located off of U.S. Highway 1 and east of SR 135. This memorandum is intended as an addendum to ESA's *Solomon Hills Biological Technical Report* (BTR) (ESA 2025), which provides detailed information about rare plant species, special-status wildlife species and habitats, vegetation communities and native grasslands, and background investigation conducted by ESA for Solstra Communities California LLC's (Solstra) proposed 1,903-acre Solomon Hills Project. Please refer to the BTR for more information on project plans, components, and proposed mitigation measures.

The late summer floristic surveys are the third set of floristic surveys conducted by ESA at Solomon Hills in 2025. The first surveys were conducted from March 3 to May 8 and were focused on identifying plant species that bloom in early spring, vegetation mapping, and general biological surveys. The second set of surveys were performed from June 2 to June 26, 2025 and were focused on identifying plant species that bloom in late spring to early summer, refining the vegetation mapping done during the previous surveys, and additional general biological surveys. Please see the BTR for further information on previous surveys conducted. The late summer floristic surveys that are the focus of this memorandum covered the Biological Study Area of the main project site, and specifically targeted habitats that have potential to support rare plant species identifiable in late summer.

Methods

Database Records Search and Literature Review

Prior to the surveys conducted for the BTR, ESA reviewed publicly available and subscription-based biological resources data for records of special-status botanical and wildlife species, and hydrological features documented within a five-mile radius of the Project Site. Data sources used in this analysis include:

- California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CNDDB) (CDFW 2018a)
- California Native Plant Society's (CNPS) Rare Plant Inventory (CNPS 2025)
- U.S. Fish and Wildlife Service's (USFWS) National Wetlands Inventory online mapping tool (NWI) (USFWS 2025a)
- Solomon Hills Biological Technical Report (ESA 2025)
- USFWS's Information for Planning and Consultation (IPaC) (USFWS 2025b)

Prior to late-season surveys, ESA biologists reviewed the literature to identify special-status plant species with potential to occur within the Biological Study Area. Special-status plants are defined as those listed by the USFWS, CDFW, and those with California Rare Plant Rank (CRPR) of 1 or 2[1]. Three special-status plant species were identified with blooming periods in late summer that may not have been identifiable during previous floristic surveys conducted by ESA.

- La Graciosa thistle (*Cirsium scariosum var. loncholepis*) is federally listed as endangered, state listed as threatened, and CRPR 1B.1.[2] It is a perennial herb that blooms from April to September. This species is found in coastal dune wetlands and marshes in the Santa Maria River valley and its tributaries.
- California saw-grass (*Cladium californicum*) is a CRPR 2B.2.[3] It is a perennial herb that blooms from June to September. This species is found in marshes, swamps, meadows and seeps, often in alkaline soils.
- San Bernardino aster (*Symphyotrichum defoliatum*) is CRPR 1B.2. It is a perennial herb that blooms from July to November. This species is found near streams, springs, freshwater marshes and wetlands.

[1] Plants with a CRPR of 4 are considered of "limited distribution or infrequent throughout a broader area in California" (CNPS 2025). We reviewed CRPR 4 species that were found on the Project Site to determine if there were other cumulative effects on the species that are sufficiently substantial to affect the overall rarity of the species. We determined that none of the CRPR 4 species have such cumulative effects that are known at this time. In addition, they do not meet the County's environmental threshold of rare or endangered. Therefore, these species are not considerable under CEQA.

[2] CRPR 1B plants are defined by CNPS as "Plants rare, threatened, or endangered in California and elsewhere, with the majority also being endemic to California. Many of the plants that are ranked 1B have declined significantly over the last century" (CNPS 2025)

[3] CRPR 2B plants are defined by CNPS as "Rare or endangered in California — Plants rare, threatened, or endangered in California but common elsewhere. Except for being common beyond the boundaries of California, 2B plants would have been ranked 1B" (CNPS 2025).

Field Survey

La Graciosa thistle, California sawgrass, and San Bernardino aster all require mesic habitats such as streambanks, wetlands, and marshes. Based on the constrained habitat requirements for the target special-status plants, and due to the thorough coverage of the Solomon Hills Project conducted in earlier surveys, we determined that the late summer surveys should be focused on areas that support wetlands and other mesic habitats within the Biological Study Area. Surveys conducted previously by ESA identified several wetland habitats within the Biological Study Area, most notably soft and western rush marshes, and salt grass – alkali heath habitats. Please refer to *Solomon Hills Biological Technical Report: Appendix A: Figure 8a* for wetland locations mapped within the Biological Study Area of the Project.

Floristic surveys of the wetland areas were scheduled to coincide with the period of time that the species that were found during the literature review are identifiable. Surveys were conducted according to protocols provided by CDFW (2018b), consisting of parallel meandering transects over targeted areas. Plant species were identified using the Jepson Flora Project online key (Jepson 2025) and our professional knowledge.

Results

None of the target special-status plant species were observed during the late summer floristic surveys. La Graciosa Thistle, California sawgrass, and San Bernardino aster would have been identifiable during early September. Please see Attachment A: Representative Photographs for photos of the survey areas, and Attachment B: Plant List for all botanical species observed during the late summer floristic surveys.

Conclusion

No target special-status plant species were observed, and no additional special-status plant species were observed that had not been previously documented during prior surveys conducted by ESA in 2025. Please refer to the *Solomon Hills Biological Technical Report* for more information related to the Project.

Attachment B
Botanical Species Observed

TABLE B-1
BOTANICAL SPECIES LIST

Scientific Name	Common Name
Adenostoma fasciculatum	chamise
Ambrosia psilostachya	Western ragweed
Artemisia californica	California sagebrush
Atriplex semibaccata	Australian saltbush*
Avena barbata	slender wild oat*
Avena fatua	wild oat*
Baccharis pilularis	coyote brush
Bromus diandrus	ripgut grass*
Bromus hordeaceus	soft chess*
Bromus madritensis ssp. rubens	foxtail chess*
Cirsium vulgare	bullthistle*
Corethrogyne filaginifolia	common sandaster
Cynodon dactylon	Bermuda grass*
Cyperus eragrostis	tall cyperus
Diplacus aurantiacus	sticky monkeyflower
Distichlis spicata	salt grass
Eleocharis macrostachya	pale spike-rush
Elymus condensatus	giant wild rye
Elymus triticoides	creeping wildrye
Encelia californica	coastal brittlebush
Erigeron bonariensis	flax-leaved horseweed
Erodium botrys	Longbeak stork's bill*
Erodium cicutarium	redstem filaree*
Festuca myuros	rattail fescue*
Festuca perennis	Italian ryegrass*
Heterotheca grandiflora	telegraph weed
Hirschfeldia incana	Shortpod mustard*
Hordeum murinum	glaucus foxtail barley*
Juncus acutus var. *leopoldii*	wire grass
Juncus mexicanus	Mexican rush
Juncus patens	blue rush
Juncus phaeocephalus	iris-leaved rush
Lamarckia aurea	goldentop
Lotus corniculatus	bird's foot trefoil
Marrubium vulgare	horehound*
Medicago polymorpha	burr clover
Melilotus albus	White sweetclover*

Scientific Name	Common Name
Nicotiana glauca	tree tobacco*
Phalaris aquatica	canary grass*
Poa annua	annual bluegrass*
Polypogon monspeliensis	annual beardgrass*
Pseudognaphalium luteoalbum	Jersey cudweed
Pseudognaphalium ramosissimum	pink cudweed
Quercus agrifolia	coast live oak
Rumex crispus	curly dock*
Salsola tragus	prickly Russian thistle*
Salvia mellifera	black sage
Spergularia rubra	red sandspurry
Symphyotrichum subulatum var. *squamatum*	Eastern annual saltmarsh aster*
Salix lasiolepis	arroyo willow

Note:
* species nonnative to California
