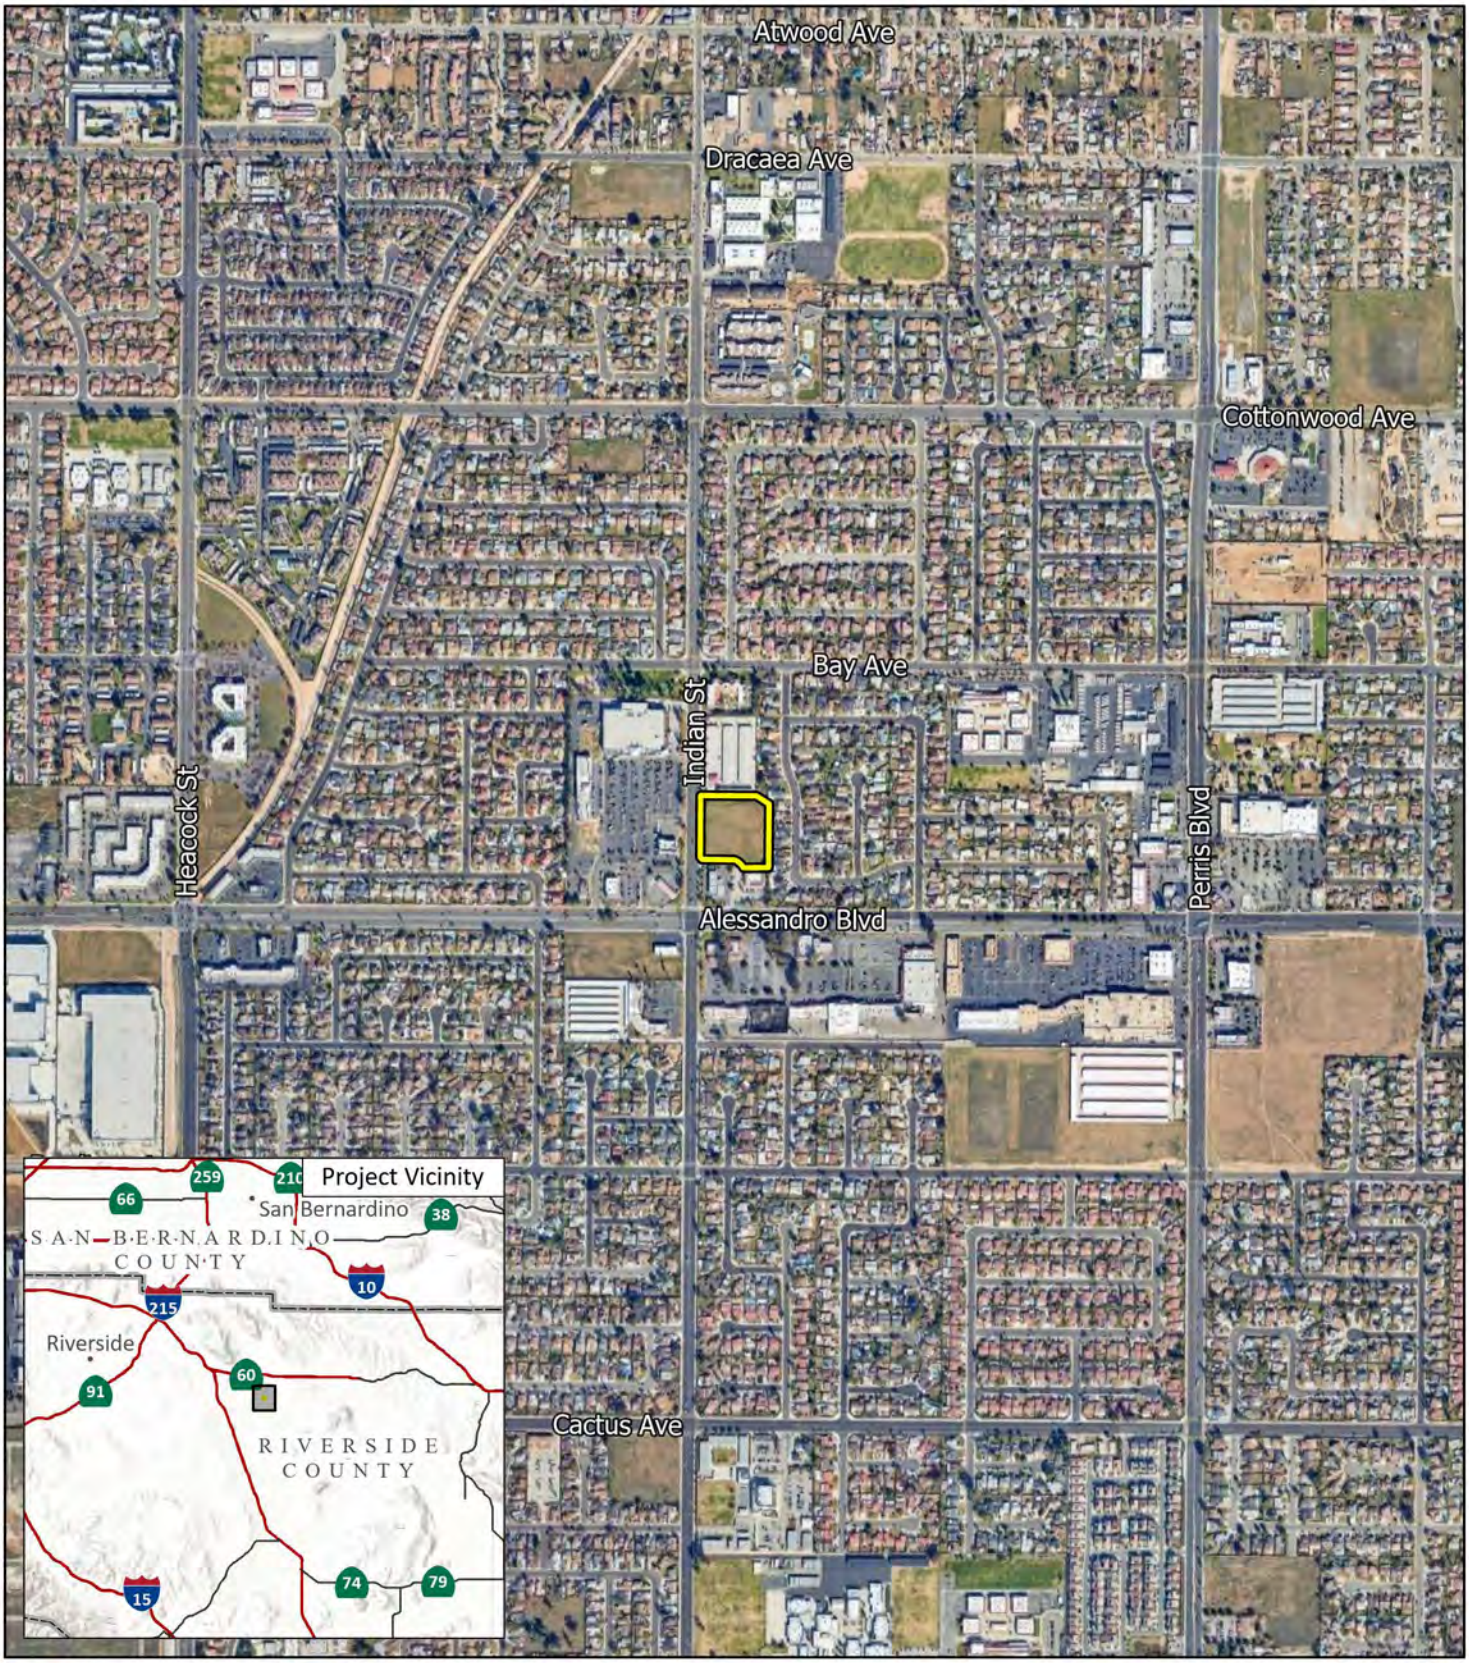
# INTRODUCTION

LSA has prepared a construction Health Risk Assessment (HRA) for the proposed Public Storage Moreno Valley Project (project) in Moreno Valley, California.

An HRA is a process used to estimate the increased health risk levels for people living and/or working near a project that emits toxic air contaminants (TACs). An HRA combines results of studies on the health effects of various animal and human exposure to TACs with results of studies that estimate the exposure levels at different distances from the source of pollutants. The purpose of the HRA is to document the increased cancer and noncancer health risk levels from project-related emissions of TACs on existing nearby sensitive receptors, including residents and/or workers.



The City of Moreno Valley recommends the preparation of an HRA in accordance with policies and procedures of the California Office of Environmental Health Hazard Assessment (OEHHA) and the South Coast Air Quality Management District (SCAQMD). This HRA evaluates all of these criteria in compliance with applicable requirements.

## PROJECT LOCATION AND DESCRIPTION

The 3-acre project site (Assessor Parcel Number [APN] 482-190-022) is located along Indian Street, north of Alessandro Boulevard in the City of Moreno Valley (City). The project site is currently undeveloped and generally flat. Vehicular access to the project site is provided via an existing driveway along Indian Street that is shared with commercial uses to the south of the site. Local access to the project site is provided via Indian Street. The project location is shown on Figure 1, and the project conceptual site plan is shown on Figure 2.

The proposed project includes development of a 132,003-square-foot, three-story, self-storage building, including self-storage areas and a rental office. The on-site rental office would be located in the southeastern corner of the building. Vehicular access to the project site would be provided via Indian Street and the existing shared access driveway south of the proposed self-storage building. The access driveway would lead to two access gates: one on the east side of the proposed self-storage building that facilitates access to the northern portion of the project site, and the other (which is also on the east side of the proposed self-storage building) that facilitates access to the eastern portion of the project site. The proposed recreational vehicle (RV) parking lot would include 52 RV spaces. Additionally, 12 passenger vehicle parking spaces, including 1 Americans with Disabilities Act (ADA) compliant space, and 6 bicycle parking spaces would be provided adjacent to the east side of the proposed self-storage building. In accordance with Section 9.11.040 of the City's Municipal Code,[1] the proposed parking space supply would be adequate to accommodate the proposed project's parking demand.

Site Plan

According to the City's zoning map and General Plan, the project site is zoned as Neighborhood Commercial (NC) and has a land use designation of Commercial. Per the City's Municipal Code Permitted Uses Table 9.02.020-1 in Section 9.02.020,[2] self-storage facilities are not permitted uses in the NC zone, thus the project includes a zone change from NC to Community Commercial (CC) as well as a Conditional Use Permit (CUP) to allow development of the proposed project within the CC zone.

Once operational, the proposed project would generate approximately 216 average daily trips.[3] Operational office hours would be 9:00 a.m. to 6:00 p.m. 7 days a week. Customer access hours would be 6:00 a.m. to 9:00 p.m. The proposed project would include up to two employees per shift to operate the facility.[4]

Construction would occur for approximately 12 months, ending in the second quarter of 2027. Construction activities would include site preparation, grading, building construction, paving, and architectural coating activities. Site preparation, grading, and paving activities would involve the use of standard earthmoving equipment such as large excavators, cranes, and other related equipment. In addition, the proposed project would require approximately 4,210 cubic yards of soil export.[5]

## EXISTING LAND USES IN THE PROJECT AREA

For the purposes of this analysis, sensitive receptors are areas of the population that have an increased sensitivity to air pollution or environmental contaminants. Sensitive receptor locations include residences, schools, daycare centers, hospitals, parks, and similar uses that are sensitive to air quality. Impacts on sensitive receptors are of particular concern because those receptors are the population that is most vulnerable to the effects of air pollution. The areas adjacent to the project site include the following uses:

- **North:** Self-storage
- **East:** Single-family residences
- **South:** Commercial uses
- **West:** Commercial and retail uses

3 LSA Associates, Inc. 2024. Trip Generation and Vehicle Miles Traveled Analysis for the Public Storage Moreno Valley Project (LSA Project No. 20241908). October 16.

4 Assumes up to two shifts per day.

5 The California Emissions Estimator Model version 2022.1 (CalEEMod) model evaluated the project emissions assuming construction would begin in November 2025 and end in November 2026 and require approximately 5,000 cubic yards of soil export. The project schedule and grading plans have since been modified to assume construction would end in the second quarter of 2027 and approximately 4,210 cubic yards of soil export would be required. The 12-month construction duration remained the same. These modifications to the project have been reviewed by LSA and it was determined that the modified construction schedule and soil export quantities would not result in more severe impacts than what is described within.

The nearest sensitive receptors are the single-family residences along Pheasant Knoll Lane that are located to the east and within 50 feet of the project site (measured from the project site boundary to the center of the nearest residence).

Table A shows the summary of the distances to the nearby sensitive receptors based on the project activity.

## Table A: Summary of Analysis Distances by Impact Category

| Activity | Nearest Sensitive Receptor | Points of Analysis | Distance (feet) |
|---|---|---|---|
| Construction[1] | Single-family homes on Pheasant Knoll Lane | Perimeter of construction activities to the centroid of the nearest sensitive receptor. | 50 |
| Operations | Single-family homes on Pheasant Knoll Lane | Emissions sources on-site are generalized from the centroid of the project site to the centroid of the nearest sensitive receptor. | 210 |

DRAFT

# BACKGROUND

This section provides a discussion of regulatory guidance from the California Air Resources Board (CARB), the OEHHA, the California Air Pollution Control Officers Association (CAPCOA), and the SCAQMD.

## CALIFORNIA AIR RESOURCES BOARD HANDBOOK AND TECHNICAL ADVISORY

CARB has developed an *Air Quality and Land Use Handbook* (CARB Handbook)[6] and a supplement, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory,*[7] which are intended to serve as general reference guides for evaluating and reducing air pollution impacts associated with new projects that are part of the land use decision-making process. According to the CARB Handbook, recent air pollution studies have shown an association between both respiratory and other noncancer health effects and proximity to high-traffic roadways and other land uses associated with high volume truck traffic. Other studies have shown that diesel exhaust and other cancer-causing chemicals emitted from cars and trucks are responsible for much of the overall cancer risk from airborne toxics in California. The CARB Handbook recommends that planning agencies recognize that the configuration of warehouse and distribution centers can reduce population exposure and risk. For example, locating the main entry and exit points away from sensitive land uses helps to reduce cancer risks and other health impacts. However, the proposed project would not be considered a warehouse distribution center with high volume truck traffic. The CARB Handbook and supplemental guidance is referenced for informational purposes.

## OFFICE OF ENVIRONMENTAL HEALTH AND HAZARD ASSESSMENT GUIDELINES

The OEHHA developed the *Air Toxics Hot Spots Program Guidance Manual*[8] in conjunction with the CARB for use in implementing the Air Toxics Hot Spots Program (Health and Safety Code Section 44360). The manual describes health effect values, exposure pathway variates (e.g., breathing rates), and a tiered approach for performing HRAs based on current science and policy assessment. The intent of the guidance manual is to incorporate children's health concerns, update risk assessment practices, and provide consistent risk assessment procedures.

## CALIFORNIA AIR POLLUTION CONTROL OFFICERS ASSOCIATION

In 2009, the CAPCOA published guidance[9] on assessing the health risk impacts from and to proposed land use projects, focusing on the acute, chronic, and cancer impacts of sources affected by California Environmental Quality Act (CEQA). The document recommends procedures to identify when a project should undergo further risk evaluation, procedures for conducting an HRA, guidelines to engage the public, presentation guidelines for results from the HRA, and mitigation measures that may be appropriate for various land use projects.

## SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

The SCAQMD has risk assessment guidelines, *AB 2588 and Rule 1402 Supplemental Guidelines.*[10] These guidelines incorporate the OEHHA guidance and the options to be used when using the CARB's Hotspots Analysis and Reporting Program Version 2 (HARP) program for risk assessment calculations.[11]

# SETTING

## REGIONAL AIR QUALITY

The project site is in Moreno Valley, California, which is part of the South Coast Air Basin (Basin) and is under the jurisdiction of the SCAQMD.

### Climate/Meteorology

Air quality in the planning area is not only affected by various emission sources (e.g., mobile and industry), but also by atmospheric conditions (e.g., wind speed, wind direction, temperature, and rainfall). The nearest representative meteorological station that provides the American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) ready meteorological data is the Perris Meteorological Station. Figure 3, Project Area Wind Patterns, shows the windrose[12] from data measured at this station and the wind patterns for the project area. Figure 4 shows the graphical representation of the wind patterns as well as the receptors placed at the nearest sensitive receptor locations.

Source: South Coast Air Quality Management District (SCAQMD). n.d. Meteorological Data for AERMOD Applications. Website: www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/data-for-aermod (accessed March 2025).

**Figure 3: Project Area Wind Patterns**

[12] A windrose provides a succinct view of how wind speed and direction are typically distributed at a particular location. Presented in a circular format, the windrose shows the frequency of winds blowing from particular directions.

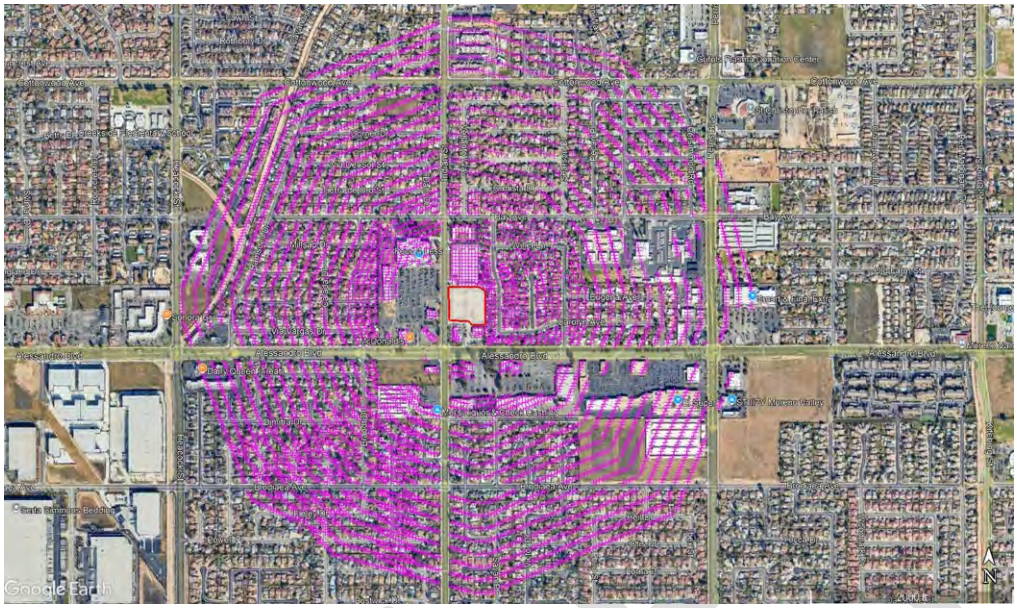

**Figure 4: Sensitive Receptor Grid**

## Toxic Air Contaminants

The public's exposure to TACs is a significant environmental health issue in the State of California. In 1983, the California Legislature enacted a program to identify the health effects of TACs and to reduce exposure to these contaminants to protect the public health. The Health and Safety Code defines a TAC as "an air pollutant which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health." A substance that is listed as a hazardous air pollutant pursuant to subsection (b) of Section 112 of the Federal Act (42 United States Code Section 7412) is a TAC. Under State law, the California Environmental Protection Agency (Cal/EPA), acting through CARB, is authorized to identify a substance as a TAC if it determines the substance is an air pollutant that may cause or contribute to an increase in mortality or an increase in serious illness, or which may pose a present or potential hazard to human health.

California regulates TACs primarily through Assembly Bill (AB) 1807 (Tanner Air Toxics Act), AB 2588 (Air Toxics "Hot Spot" Information and Assessment Act of 1987), and Senate Bill (SB) 25, the Children's Environmental Health Protection Act. The Tanner Air Toxics Act sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an "airborne toxics control measure" for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology to minimize emissions.

Air toxics from stationary sources are also regulated in California under AB 2588. Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the designated Air Quality Management District (AQMD) or Air Pollution Control District (APCD). High-priority facilities are required to perform an HRA and, if specific thresholds are exceeded, are required to communicate the results to the public in the form of notices and public meetings.

To date, CARB has designated nearly 200 compounds as TACs. Additionally, CARB has implemented control measures for a number of compounds that pose high risks and show potential for effective control. The majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from diesel-fueled engines (diesel particulate matter or DPM).

DRAFT

## THRESHOLDS OF SIGNIFICANCE

Both the State and federal governments have established health-based ambient air quality standards for seven air pollutants. For other air pollutants without defined significance standards, the definition of substantial pollutant concentrations varies. For TACs, "substantial" is taken to mean that the individual health risk exceeds a threshold considered to be a prudent risk management level.

The following limits for maximum individual cancer risk (MICR) and noncancer acute and chronic Hazard Index (HI) from project emissions of TACs are considered appropriate for use in determining the health risk for projects in the Basin:

- **MICR:** MICR is the estimated probability of a maximally exposed individual (MEI) contracting cancer as a result of exposure to TACs over a period of 30 years for adults and 9 years for children in residential locations and over a period of 25 years for workers. The MICR calculations include multipathway consideration, when applicable.

  The cumulative increase in MICR that is the sum of the calculated MICR values for all TACs would be considered significant if it would result in an increased MICR greater than 10 in 1 million ($1 \times 10^{-5}$) at any receptor location.

- **Chronic HI:** Chronic HI is the ratio of the estimated long-term level of exposure to a TAC for a potential MEI to its chronic reference exposure level. The chronic HI calculations include multipathway consideration, when applicable.

  The project would be considered significant if the cumulative increase in total chronic HI for any target organ system would exceed 1.0 at any receptor location.

- **Acute HI:** Acute HI is the ratio of the estimated maximum 1-hour concentration of a TAC for a potential MEI to its acute reference exposure level.

  The project would be considered significant if the cumulative increase in total acute HI for any target organ system would exceed 1.0 at any receptor location.

The SCAQMD *CEQA Air Quality Handbook*[13] states that emissions of TACs are considered significant if an HRA shows an increased risk of greater than 10 in 1 million. Based on guidance from SCAQMD in the document *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis,*[14] for the purposes of this analysis, the threshold of 10 in 1 million was used as the cancer risk threshold for the proposed project.

13 South Coast Air Quality Management District (SCAQMD). 1993. *CEQA Air Quality Handbook* (currently under revision).

14 South Coast Air Quality Management District (SCAQMD). 2003. *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*. August.

# METHODOLOGY

A construction HRA, which evaluates construction-period health risk to off-site receptors, was performed for the proposed project. To estimate the potential cancer risk associated with construction of the proposed project from equipment exhaust (including DPM), a dispersion model was used to translate an emission rate from the source location to a concentration at the receptor location of interest (i.e., a nearby residence and worksites). Dispersion modeling varies from a simpler, more conservative screening-level analysis to a more complex and refined detailed analysis. This refined assessment was conducted using the CARB exposure methodology with the air dispersion modeling performed using the United States Environmental Protection Agency's (USEPA) AERMOD air dispersion model. The model provides a detailed estimate of exhaust concentrations based on site and source geometry, source emissions strength, distance from the source to the receptor, and meteorological data.

The California Emissions Estimator Model version 2022.1. (CalEEMod) computer program was used to calculate emissions from on-site construction equipment and emissions from worker and vehicle trips to the site, which was included in AERMOD. This analysis assumes that construction would occur for approximately 12 months, ending in the second quarter of 2027. Construction activities would include site preparation, grading, building construction, paving, and architectural coating activities. Site preparation, grading, and paving activities would involve the use of standard earthmoving equipment such as large excavators, cranes, and other related equipment. In addition, the proposed project would require approximately 4,210 cubic yards of soil export.[15] This analysis also assumes the use of Tier 2 construction equipment as proposed by the project, and that the proposed project would comply with SCAQMD dust control regulations. All other construction details are not yet known; therefore, default assumptions (e.g., construction worker and truck trips and fleet activities) from CalEEMod were used.

DRAFT

[15] The CalEEMod model evaluated the project emissions assuming construction would begin in November 2025 and end in November 2026 and require approximately 5,000 cubic yards of soil export. The project schedule and grading plans have since been modified to assume construction end in the second quarter of 2027 and approximately 4,210 cubic yards of soil export would be required. The 12-month construction duration remained the same. These modifications to the project have been reviewed by LSA and it was determined that the modified construction schedule and soil export quantities would not result in more severe impacts than what is described within.

# HEALTH RISK IMPACTS

The following section describes the potential impacts on sensitive and worker receptors from construction and operation of the proposed project. As identified above, the closest sensitive receptor includes the single-family residences along Pheasant Knoll Lane, which are located within 50 feet to the east of the project site from the project site boundary to the center of the nearest residence. The nearest worker receptor to the project site is the Autozone Auto Parts Center, located immediately south of the project site, within 10 feet. The nearest school receptor to the project site is located approximately 1,000 feet east of the project site, along Bay Avenue. The HRA analysis and results are presented below, and data outputs are provided in Appendix A.

A construction HRA, which evaluates construction-period health risk to off-site receptors, was performed for the proposed project. Table B, below, identifies the results of the analysis at the MEI, which is the park receptor. Model snap shots of the sources are attached.

## Table B: Health Risks from Project Construction to Off-Site Receptors

| Location | Carcinogenic Inhalation Health Risk in 1 Million | Chronic Inhalation Hazard Index | Acute Inhalation Hazard Index |
|---|---|---|---|
| Residential Receptor Risk | 13.18 | 0.014 | 0.000 |
| Worker Receptor Risk | 0.79 | 0.048 | 0.000 |
| School Receptor | 0.01 | <0.001 | 0.00 |
| **SCAQMD Significance Threshold** | **10 in 1 million** | **1.0** | **1.0** |
| **Significant?** | **Yes** | **No** | **No** |

Source: Compiled by LSA (December 2024).
SCAQMD = South Coast Air Quality Management District

As shown in Table B, the maximum cancer risk for the residential MEI would be 13.18 in 1 million, which would exceed the SCAQMD cancer risk threshold of 10 in 1 million. The worker MEI would be at 0.79 in 1 million and the school MEI would be lower at 0.01 in 1 million, which would not exceed the SCAQMD cancer risk threshold of 10 in 1 million. The total chronic hazard index would be 0.014 for the residential MEI, 0.048 for the worker MEI, and less than 0.001 for the school MEI, all of which are below the threshold of 1.0. In addition, the total acute hazard index would be nominal (0.000), which would also not exceed the threshold of 1.0. Therefore, implementation of Mitigation Measure AIR-1, which would require the use of cleaner construction equipment, would be necessary to reduce substantial pollutant concentrations during project construction.

**Mitigation Measure AIR-1** During construction of the proposed project, the project contractor shall ensure all off-road diesel-powered construction equipment of 50 horsepower or more that are used for project construction meet, at a minimum, the California Air Resources Board Tier 2 emissions standards equipped with Level 3 Diesel Particulate Filters or the equivalent.

Table C identifies the results of the analysis with implementation of Mitigation Measure AIR-1.

## Table C: Health Risks from Project Construction to Off-Site Receptors with Mitigation

| Location | Carcinogenic Inhalation Health Risk in 1 Million | Chronic Inhalation Hazard Index | Acute Inhalation Hazard Index |
|---|---|---|---|
| Residential Receptor Risk | 2.15 | 0.002 | 0.000 |
| Worker Receptor Risk | 0.13 | 0.008 | 0.000 |
| School Receptor | 0.0 | <0.001 | 0.00 |
| **SCAQMD Significance Threshold** | **10 in 1 million** | **1.0** | **1.0** |
| **Significant?** | **No** | **No** | **No** |

Source: Compiled by LSA (December 2024).
SCAQMD = South Coast Air Quality Management District

As shown in Table C, with implementation of Mitigation Measure AIR-1, the cancer risk at the residential MEI would be 2.15 in 1 million, which would not exceed the SCAQMD cancer risk of 10 in 1 million. Therefore, with implementation of Mitigation Measure AIR-1, construction of the proposed project would not exceed SCAQMD thresholds and would not expose nearby sensitive receptors to substantial pollutant concentrations. Impacts would be below thresholds and therefore less than significant.

Once the proposed project is constructed, the proposed project would not be a source of substantial emissions. Therefore, implementation of the proposed project would not result in new sources of TACs. Therefore, with implementation of Mitigation Measure AIR-1, the project would not expose sensitive receptors to substantial levels of TACs.

## CONCLUSION

As these results show, with implementation of Mitigation Measure AIR-1, health risk levels to nearby sensitive receptors from project-related emissions of TACs would be well below the SCAQMD's HRA thresholds. As such, no significant health risk would occur from project-related emissions. The HARP modeling reports and AERMOD information are provided in Appendix A, HRA Model Output.
