INTRODUCTION

LSA has prepared a construction and operational Health Risk Assessment (HRA) for the proposed 1030 Kaiser Road Project (project) in Napa, California.

An HRA is a process used to estimate the increased health risk levels for people living and/or working near a project that emits toxic air contaminants (TACs). An HRA combines results of studies on the health effects of various animal and human exposure to TACs with results of studies that estimate the exposure levels at different distances from the source of pollutants. The purpose of the HRA is to document the increased cancer and noncancer health risk levels from project-related emissions of TACs on existing nearby sensitive receptors, including residents and/or workers.

The City of Napa (City) recommends the preparation of an HRA in accordance with policies and procedures of the State Office of Environmental Health Hazard Assessment (OEHHA) and the Bay Area Air District (Air District), formerly the Bay Area Air Quality Management District. This HRA evaluates all these criteria in compliance with applicable requirements.

PROJECT LOCATION AND DESCRIPTION

The 10.21-acre project site is at 1030 Kaiser Road in Napa, at the northwest corner of Kaiser Road and Syar Way, on a site identified as Assessor's Parcel Number 046-370-004-000. Napa is approximately 35 miles north/northeast of San Francisco and is bifurcated by the Napa River. The project site is an undeveloped 10.21-acre parcel located in southern Napa within Napa's established industrial corridor, and situated between State Route (SR-) 221 to the east, and Asylum Slough and the Napa River to the west. The Napa city limits border the project site to the north and west. Regional vehicular access to the project area is provided by SR-221 and SR-12, with connections to SR-29 and the broader North Bay freight network. Kaiser Road provides a direct connection to SR-221, east of the project site. The existing land use of the proposed project site is light industrial. As such, the project is consistent with the City's General Plan land use and zoning designation. Figure 1, Project Location and Vicinity, and Figure 2, Site Plan, depict the location of the project site on regional and local scales.

The proposed building would be designed for a flexible multi-tenant occupancy and would consist of approximately 153,380 square feet broken up into approximately 130,373 square feet of warehouse space and 23,007 square feet of office space. The building would use a tilt-up concrete wall system with a maximum height of 40 feet to the top of the roof parapet. Building materials would include site-cast, tilt-up concrete panels, and tinted glazing systems. The southeast corner of the proposed building would include decorative canopies with steel framing and veneer accents with integrated accent lighting. The primary entrances on the east side of the proposed building would include glazing and metal canopies.

The site layout includes four driveway entrances, 242 vehicle parking spaces, and landscaped areas along the eastern, southern, and northern project boundaries, as well as along the eastern building entrances. Landscaping would use low-water-use, drought-tolerant plants, appropriate to the Napa region and compliant with the City's Planning and Development Code. Moderate-water-use plants

would be used sparingly and primarily placed at visual accent areas such as driveways and building entrances. Site signage would include one 3-foot-tall, single-sided monument sign at the southeast corner of the project site, and up to three wall-mounted tenant signs placed above office entry points on the east and the south elevations.

To provide for shipping and receiving needs, the proposed project would include 24 loading docks with vertical lift sectional doors along the west side of the proposed building. In addition, a total of 5 depressed loading docks, each approximately 64 feet wide, would be located on the west side of the proposed building. An additional 12 grade-level vertical lift sectional doors would also be constructed adjacent to each depressed loading dock to provide for a range of shipping and receiving options, including floor-loaded freight.

The proposed project would include an Early Suppression Fast Response sprinkler system equipped with one fire pump rated at approximately 215 horsepower. The pump would be diesel-fired, as an electric pump would not operate during a power outage. Estimated annual runtime is approximately 26 hours, based on a 30-minute weekly testing cycle.

At this time, the specific equipment that would be used during project operations is unknown, as the facility is intended to function as a multi-tenant property and tenant needs may vary. However, if forklifts are used, they are typically electric based.

Construction of the proposed project is anticipated to begin in July 2026 and is expected to last approximately 14 months, with the proposed project fully operational by September 2027. Construction staging would include initial site clearing and mass grading, followed by utility trenching, foundation work, paving, and vertical construction. Finished floor elevations, pad grades, and spot elevations reflect a balanced cut-and-fill approach that minimizes topographic disturbance. Construction of the proposed project would use Tier 2 equipment.

The proposed project would generate approximately 411 average daily trips, including 319 passenger vehicle trips, 2 two-axle truck trips, 26 three-axel truck trips, and 64 four-axel truck trips.[1] In addition, the proposed project would comply with Title 24 requirements.

Site Plan

EXISTING LAND USES IN THE PROJECT AREA

For the purposes of this analysis, sensitive receptors are considered areas of the population that have an increased sensitivity to air pollution or environmental contaminants. Sensitive receptor locations include residences, schools, daycare centers, hospitals, parks, and similar uses that are sensitive to air quality. Impacts on sensitive receptors are of particular concern because those receptors are the population most vulnerable to the effects of air pollution. The project site is surrounded primarily by industrial and residential uses. The areas adjacent to the project site include:

- **North:** The project site is bordered by an industrial site to the north. The industrial site is used to support mining operations. Immediately north of the project is Basalt Road, a private road that provides internal access to the industrial equipment. Tulucay Creek and the Napa Golf Course are beyond the industrial site to the north.

- **East:** The project site is bordered by Syar Way and a mix of light industrial uses to the east. A cemetery and mortuary are northeast of the project site alongside SR-221.

- **South:** Residential uses associated with the Riversound mixed-use development projects are immediately south of the project site. This area is intended to accommodate a range of housing types, retail, hotel, commercial, and light industrial/warehouse uses. Southeast of the project site is a business park, which runs adjacent to Riversound Way.

- **West:** The project site is bordered to the west by an industrial site associated with a steel fabrication facility. Asylum Slough and the Napa River are west of the adjacent industrial site.

The proposed project is bounded by Syar Way to the south and Kaiser Road to the west. The closest sensitive receptors will be to the south of the project, approximately 150 feet from the project boundary, where a large single-family residential project will soon be developed. Table A shows the summary of analysis in feet by the impact category.

Table A: Summary of Analysis Distances by Impact Category

Activity	Nearest Sensitive Receptor	Points of Analysis	Distance (feet)
Construction	Single-Family Residential	Perimeter of construction activities to building façade of the nearest sensitive receptor	150
Operations	Single-Family Residential	Emissions sources on-site generalized at the centroid of the project site to building façade of the nearest sensitive receptor	150

BACKGROUND

This section provides a discussion of regulatory guidance from the California Air Resources Board (CARB), the OEHHA, the California Air Pollution Control Officers Association (CAPCOA), and the Air District.

CALIFORNIA AIR RESOURCES BOARD HANDBOOK AND TECHNICAL ADVISORY

CARB has developed the *Air Quality and Land Use Handbook* (CARB Handbook)[2] and a supplement, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*,[3] which are intended to serve as general reference guides for evaluating and reducing air pollution impacts associated with new projects that are part of the land use decision-making process. According to the CARB Handbook, recent air pollution studies have shown an association between both respiratory and other noncancer health effects and proximity to high-traffic roadways and other land uses associated with high-volume truck traffic. Other studies have shown that diesel exhaust and other cancer-causing chemicals emitted from cars and trucks are responsible for much of the overall cancer risk from airborne toxics in California. The CARB Handbook recommends that planning agencies recognize that the configuration of warehouse and distribution centers can reduce population exposure and risk. For example, locating the main entry and exit points away from sensitive land uses helps to reduce cancer risks and other health impacts.

Land uses that can produce air pollution sources of concern include freeways, rail yards, ports, refineries, distribution centers, chrome plating facilities, dry cleaners, and large gasoline service stations. Key recommendations in the CARB Handbook include taking steps to avoid siting new, sensitive land uses:

- Within 500 feet of a freeway, urban roads with 100,000 vehicles per day or rural roads with 50,000 vehicles per day;
- Within 1,000 feet of a major service and maintenance rail yard;
- Immediately downwind of ports (in the most heavily impacted zones) and petroleum refineries;
- Within 300 feet of any dry cleaning operation (for operations with two or more machines, provide 500 feet); and
- Within 300 feet of a large gas station (defined as a facility with a throughput of 3.6 million gallons per year or greater).

---

2 California Air Resources Board (CARB). 2005. *Air Quality and Land Use Handbook: A Community Health Perspective*. April. Website: https://www.aqmd.gov/docs/default-source/ceqa/handbook/california-air-resources-board-air-quality-and-land-use-handbook-a-community-health-perspective.pdf (accessed January 2025).

3 CARB. 2017. *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*. April. Website: www.arb.ca.gov/ch/rd_technical_analysis_fact_sheet.pdf (accessed January 2025).

The CARB Handbook specifically states that its recommendations are advisory and acknowledges land use agencies have to balance other considerations, including housing and transportation needs, economic development priorities, and other quality of life issues.

The recommendations are generalized and do not consider site-specific meteorology, freeway truck percentages, or other factors that influence risk for a particular project site. The purpose of this guidance is to help land use agencies determine when to further examine project sites for actual health risk associated with the location of new sensitive land uses.

OFFICE OF ENVIRONMENTAL HEALTH AND HAZARD ASSESSMENT GUIDELINES

The OEHHA developed the *Air Toxics Hot Spots Program Guidance Manual*[4] in conjunction with the CARB for use in implementing the Air Toxics Hot Spots Program (Health and Safety Code Section 44360). The manual describes health effect values, exposure pathway variates (e.g., breathing rates), and a tiered approach for performing HRAs based on current science and policy assessment. The intent of the guidance manual is to incorporate children's health concerns, update risk assessment practices, and provide consistent risk assessment procedures.

CALIFORNIA AIR POLLUTION CONTROL OFFICERS ASSOCIATION

In 2009, the CAPCOA published guidance[5] on assessing the health risk impacts from and to proposed land use projects, focusing on the acute, chronic, and cancer impacts of sources affected by the California Environmental Quality Act (CEQA). The document recommends procedures to identify when a project should undergo further risk evaluation, procedures for conducting an HRA, guidelines to engage the public, presentation guidelines for results from the HRA, and mitigation measures that may be appropriate for various land use projects.

BAY AREA AIR QUALITY MANAGEMENT DISTRICT

The Bay Area Air District (formerly the Bay Area Air Quality Management District) seeks to attain and maintain air quality conditions in the San Francisco Bay Area Air Basin through a comprehensive program of planning, regulation, enforcement, technical innovation, and education. The clean air strategy includes the preparation of plans for the attainment of ambient air quality standards, adoption and enforcement of rules and regulations, and issuance of permits for stationary sources. The Air District also inspects stationary sources and responds to citizen complaints, monitors ambient air quality and meteorological conditions, and implements programs and regulations required by law.

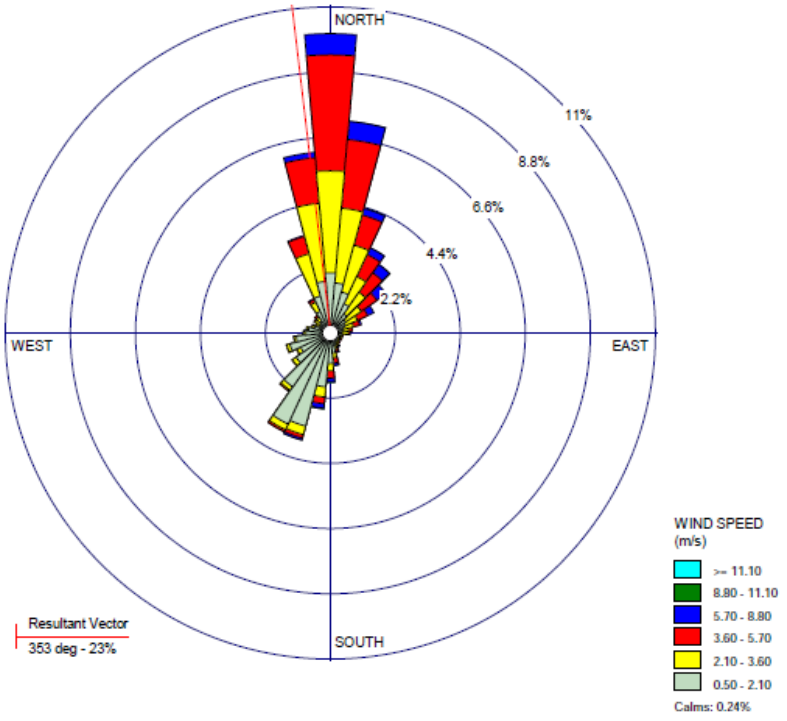
5 California Air Pollution Control Officers Association (CAPCOA). 2009. *Health Risk Assessments for Proposed Land Use Projects*. July. Website: https://ww2.valleyair.org/media/glsdzpx3/capcoa_hra_lu_guidelines_8-6-09.pdf (accessed January 2025).

The Air District's CEQA Air Quality Guidelines were prepared to assist in the evaluation of air quality impacts of projects and plans proposed within the Bay Area. The guidelines provide recommended procedures for evaluating potential air impacts during the environmental review process, consistent with CEQA requirements, and include recommended thresholds of significance, mitigation measures, and background air quality information. They also include recommended assessment methodologies for air toxics. The Air District's guidelines incorporate the OEHHA guidance and the options to be used when using the CARB's Hotspots Analysis and Reporting Program (HARP), Version 2, for risk assessment calculations.



SETTING

REGIONAL AIR QUALITY

The project site is in Napa, California, which is part of the San Francisco Bay Area Air Basin (Basin) and is under the jurisdiction of the Air District.

Climate/Meteorology

Air quality in the planning area is not only affected by various emission sources (e.g., mobile and industry), but also by atmospheric conditions (e.g., wind speed, wind direction, temperature, and rainfall). The nearest representative meteorological station that provides the American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) ready meteorological data is the Napa College Meteorological Station. Figure 3, Project Area Wind Patterns, shows the windrose[6] from data measured at this station and the wind patterns for the project area.

Source: Bay Area Air District AERMOD-Ready Meteorological Data. Website: https://www.baaqmd.gov/en/plans-and-climate/california-environmental-quality-act-ceqa/ceqa-tools/ceqa-modeling-data (accessed May 2026).

Figure 3: Project Area Wind Patterns

[6] A windrose provides a succinct view of how wind speed and direction are typically distributed at a particular location. Presented in a circular format, the windrose shows the frequency of winds blowing from particular directions.

Toxic Air Contaminants

The public's exposure to TACs is a significant environmental health issue in California. In 1983, the California Legislature enacted a program to identify the health effects of TACs and to reduce exposure to these contaminants to protect the public health. The Health and Safety Code defines a TAC as "an air pollutant which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health." A substance that is listed as a hazardous air pollutant pursuant to subsection (b) of Section 112 of the Federal Act (42 United States Code Section 7412) is a TAC. Under State law, the California Environmental Protection Agency, acting through CARB, is authorized to identify a substance as a TAC if it determines the substance is an air pollutant that may cause or contribute to an increase in mortality or an increase in serious illness, or that may pose a present or potential hazard to human health.

California regulates TACs primarily through Assembly Bill (AB) 1807 (Tanner Air Toxics Act), AB 2588 (Air Toxics "Hot Spot" Information and Assessment Act of 1987), and Senate Bill 25, the Children's Environmental Health Protection Act. The Tanner Air Toxics Act sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an "airborne toxics control measure" for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology to minimize emissions.

Air toxics from stationary sources are also regulated in California under AB 2588. Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the designated air quality management district or air pollution control district. High-priority facilities are required to perform an HRA and, if specific thresholds are exceeded, are required to communicate the results to the public in the form of notices and public meetings.

To date, CARB has designated nearly 200 compounds as TACs. Additionally, CARB has implemented control measures for a number of compounds that pose high risks and show potential for effective control. The majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from diesel-fueled engines (diesel particulate matter [DPM]).

THRESHOLDS OF SIGNIFICANCE

Both the State and federal governments have established health-based ambient air quality standards for seven air pollutants. For other air pollutants without defined significance standards, the definition of substantial pollutant concentrations varies. For TACs, "substantial" is taken to mean that the individual health risk exceeds a threshold considered to be a prudent risk management level.

The following limits for maximum individual cancer risk (MICR) and noncancer acute and chronic Hazard Index (HI) from project emissions of TACs are considered appropriate for use in determining the health risk for projects in the Basin:

- **MICR:** MICR is the estimated probability of a maximally exposed individual (MEI) contracting cancer as a result of exposure to TACs over a period of 30 years for adults and 9 years for children in residential locations and over a period of 25 years for workers. The MICR calculations include multipathway consideration, when applicable.

  The cumulative increase in MICR that is the sum of the calculated MICR values for all TACs would be considered significant if it would result in an increased MICR greater than 10 in 1 million (1×10^{-5}) at any receptor location.

- **Chronic HI:** Chronic HI is the ratio of the estimated long-term level of exposure to a TAC for a potential MEI to its chronic reference exposure level. The chronic HI calculations include multipathway consideration, when applicable.

  The project would be considered significant if the cumulative increase in total chronic HI for any target organ system would exceed 1 at any receptor location.

- **Acute HI:** Acute HI is the ratio of the estimated maximum 1-hour concentration of a TAC for a potential MEI to its acute reference exposure level.

  The project would be considered significant if the cumulative increase in total acute HI for any target organ system would exceed 1 at any receptor location.

- **$PM_{2.5}$ concentration:** To estimate the project site's exposure to cancer risk and particulate matter less than 2.5 microns in size ($PM_{2.5}$) levels associated with the proposed project from diesel vehicle engine exhaust, a dispersion model is used to translate an emission rate from a source location to a concentration at a receptor location of interest (i.e., the proposed project site).

  The project would be considered significant if the annual average $PM_{2.5}$ concentration is greater than the Air District threshold of 0.3 micrograms per cubic meter ($\mu g/m^3$)

METHODOLOGY

CONSTRUCTION HEALTH RISK ASSESSMENT

General Information

A construction HRA, which evaluates construction-period health risk to off-site receptors, was performed for the proposed project. To estimate the potential cancer risk associated with construction of the proposed project from equipment exhaust (including DPM), a dispersion model was used to translate an emission rate from the source location to a concentration at the receptor location of interest (i.e., a nearby residence and worksites). Dispersion modeling varies from a simpler, more conservative screening-level analysis to a more complex and refined detailed analysis. This refined assessment was conducted using the CARB exposure methodology with the air dispersion modeling performed using the United States Environmental Protection Agency's (EPA) AERMOD air dispersion model. The model provides a detailed estimate of exhaust concentrations based on site and source geometry, source emissions strength, distance from the source to the receptor, and meteorological data.

Emission Sources

Construction emissions were estimated for the project using the California Emissions Estimator Model (CalEEMod) version 2022.1, consistent with Air District recommendations. Construction of the proposed project is anticipated to begin in July of 2026 and continue for approximately 14 months, ending in September 2027, which was included in CalEEMod. The project site is currently undeveloped, and no demolition is proposed as part of the project. Construction activities would include site preparation, grading, building construction, paving, and architectural coating activities. The proposed project would require the export of 18,720 cubic yards of soil, which was included in CalEEMod. In addition, this analysis conservatively assumes use of Tier 2 construction equipment. Other detailed construction information is currently unavailable; therefore, this analysis uses CalEEMod default assumptions (e.g. construction equipment and fleet activities, construction trips and truck trips). CalEEMod output sheets are included in Appendix A.

CalEEMod results are included in the Air Quality section of the Initial Study/Mitigated Negative Declaration prepared for the proposed project.[7]

OPERATIONAL HEALTH RISK ASSESSMENT

General Information

To determine the potential health risk to people living and working near the proposed project associated with the exhaust of diesel-powered trucks and equipment, an operational HRA was conducted for the proposed project.

[7] LSA. 2026. *Initial Study Mitigated Negative Declaration for the 1030 Kaiser Road Project, Napa, California. Appendix A1.* June.

For the purposes of an HRA, emissions are analyzed for acute health impacts, chronic, and carcinogenic health impacts. A multipathway assessment has been conducted to evaluate the project's emissions during construction and operation following the modeling techniques recommended in the OEHHA *Air Toxic Hot Spots Program Risk Assessment Guidelines*.[8] The analysis herein has been conducted in accordance with Air District requirements for HRAs.

This HRA has been conducted using three models: (1) the CARB's California Emissions Factor Model, Version 2025 (EMFAC2025) for vehicle emission factors and percentages of fuel type within the overall vehicle fleet; (2) the EPA AERMOD dispersion model to determine how the TACs would move through the atmosphere after release from sources both on site and along the truck routes; and (3) the CARB's HARP2 model to translate the pollutant concentrations from AERMOD into individual health risks at the nearby sensitive receptor locations.

The OEHHA has determined that long-term exposure to diesel exhaust particulates poses the highest cancer risk of any TAC it has evaluated. Exposure to diesel exhaust can also have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles (also known as DPM) made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to DPM also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. For risk assessment procedures, the OEHHA specifies that the surrogate for whole diesel exhaust is DPM. The HRA analyses used particulate matter less than 10 microns in diameter (PM_{10}) emissions to represent DPM emissions, consistent with OEHHA guidance.

The conservative nature of this analysis is due primarily to the following three factors:

- The CARB-adopted diesel exhaust unit risk factor (URF) of 300 in 1 million $\mu g/m^3$ is based on the upper 95th percentile of estimated risk for each of the epidemiological studies used to develop the URF. Therefore, the risk factor is already representative of the conservative risk posed by DPM.

- The risk estimates assume sensitive residence receptors would be subject to DPM for 24 hours per day, 350 days per year, and worker receptors for 8 hours per day, 350 days per year. As a conservative measure, Air District does not recognize indoor adjustments for residents or workers. However, people typically spend the majority of their time indoors versus remaining outdoors for 24 hours per day, 350 days per year.[9] Therefore, the actual exposure any person

[8] OEHHA. 2015. *Air Toxics Hot Spots Program Guidance Manual*. March. Website: oehha.ca.gov/air/crnr/notice-adoption-air-toxics-hot-spots-program-guidance-manual-preparation-health-risk-0 (accessed January 2025).

[9] In May 1991, the CARB Research Division, in association with the University of California, Berkeley, published research findings titled *Activity Patterns of California Residents*. The findings of that study indicate that, on average, adults and adolescents in California spent almost 15 hours per day inside their homes and 6 hours in other indoor locations, for a total of 21 hours (87 percent of the day). About 2 hours per day were spent in transit, and just over 1 hour per day was spent in outdoor locations.

would experience would be less than considered in this analysis. This results in much lower actual health risk levels than presented in this analysis.

- The exposure to DPM is assumed to be constant for the given period analyzed (i.e., 30 years for the residential receptors and 25 years for the worker receptors). However, emissions from DPM are expected to substantially decrease in the future with the implementation of standard regulatory requirements and technological advancements to reduce DPM. Therefore, the health risk levels from these future trucks would be less than presented in this analysis.

Improvements over the last 40 years to diesel fuel and diesel engines have resulted in lower emissions of some of these TACs.[10] These improvements have resulted in a 75 percent reduction in particle emissions from diesel-powered trucks and other equipment in 2010 and an 85 percent reduction in 2020 compared to 2000 levels.[11] These improvements are anticipated to continue into the foreseeable future. Electric trucks are also being phased in and, once in use, would eliminate the emissions of DPM associated with truck travel.

Emission Sources

The first step of an HRA is to characterize the project-related emissions of TACs. The proposed project would generate approximately 411 average daily trips, including 319 passenger vehicle trips, 2 two-axle truck trips, 26 three-axle truck trips, and 64 four-axle truck trips.[12] The trucks would access the site from Kaiser Road. Although the TAC emissions from gasoline-powered vehicles have a small health effect compared to DPM, this HRA includes all the traffic information described and both gasoline- and diesel-powered vehicle emissions. For the diesel exhaust emissions, it is sufficient to only consider the DPM (PM_{10}) portion of the exhaust; all of the TACs for the gasoline exhaust emissions are contained in the reactive organic gas (ROG) emissions. Using speciation data from CARB, the emission rates of the TAC components are derived from the total ROG emissions.

Project trucks would operate in two modes: stationary idling and moving on and off the site. The emissions from trucks while idling result in a much higher concentration of TACs at nearby sensitive receptors compared to the emissions from moving trucks. This is due to the dispersion of emissions that occurs with distance and with travel of the vehicle. For this HRA, the truck travel emissions were modeled as a series of volume sources along the on-site driveway on Kaiser Road going east and west. LSA assumed vehicles traveling on site would maneuver slowly, averaging approximately 5–15 miles per hour (mph), and that vehicles traveling on roadways would average 5–55 mph. This analysis also assumes that on-site truck idling would occur for approximately 15 minutes.

EMFAC2025 was used to determine the emissions factors of idling and operating diesel trucks to determine the total emissions of PM_{10}. Although the TAC of concern from diesel trucks is DPM,

---

10 United States Environmental Protection Agency. n.d. *Learn About Impacts of Diesel Exhaust and the Diesel Emissions Reduction Act (DERA)*. Website: www.epa.gov/dera/learn-about-impacts-diesel-exhaust-and-diesel-emissions-reduction-act-dera (accessed January 2025).

11 OEHHA. 2001. *Health Effects of Diesel Exhaust*. May 21. Website: oehha.ca.gov/air/health-effects-diesel-exhaust (accessed January 2025).

12 LSA. 2026. *Initial Study Mitigated Negative Declaration for the 1030 Kaiser Road Project, Napa, California. Section 4.17.* June.

EMFAC2025 does not include emissions factors for this TAC. DPM is a component of the overall exhaust from the project-related trucks. This HRA conservatively assumes the DPM emissions to be equal to the PM_{10} emissions, when actually the DPM is only a portion of the overall PM_{10} in the truck exhaust. Although it is expected that the truck emissions rate will continue to reduce over time, an HRA only allows for a single emission rate to represent the entire 25- or 30-year exposure period. The use of emission factors for the earliest year the proposed project could start operations (2027) was selected for this HRA to be conservative. For instance, based on operations starting in 2026, using emission factors for a 2031 vehicle fleet (the midpoint of the 9-year exposure period) or using emissions for a 2042 vehicle fleet (the midpoint of the 30-year exposure period) could be used; however, either of these would be less conservative.

American Meteorological Society/Environmental Protection Agency Regulatory Model Dispersion Modeling

To assess the dispersion of emissions associated with the project, air dispersion modeling was performed using AERMOD. The model is approved by the EPA when estimating the air quality impacts associated with point and fugitive sources in simple and complex terrain. The model was used to calculate the annual average pollutant concentrations associated with each emitting source. Inputs for each emitting source were based on the characterizations described above. Details of these inputs are included in Appendix A.

For the volume sources used to represent on-road mobile source activity, vertical (sigma z) dispersion parameters were developed as described in the Air District modeling guidance for trucks. For the truck unloading locations, individual point sources represent the trucks idling at each loading dock. For all the idling sources, the release parameters were set to the Air District default parameters. Receptors were placed at the nearest sensitive receptor locations.

The model requires additional input parameters, including local meteorology. Due to the model's sensitivity to individual parameters (e.g., wind speed, temperature, and direction), the EPA recommends meteorological data used as input into dispersion models be selected on the basis of relative spatial and temporal conditions that exist in the area of concern. As such, 5 years of meteorological data from the Air District's Napa College Meteorological Station (the nearest available station) was used to represent local weather conditions and prevailing winds. Figure 3, above, shows the graphical representation of the wind patterns. Receptors were placed at the nearest sensitive receptor locations, as shown in Figure 4, Sensitive Receptor Grid.

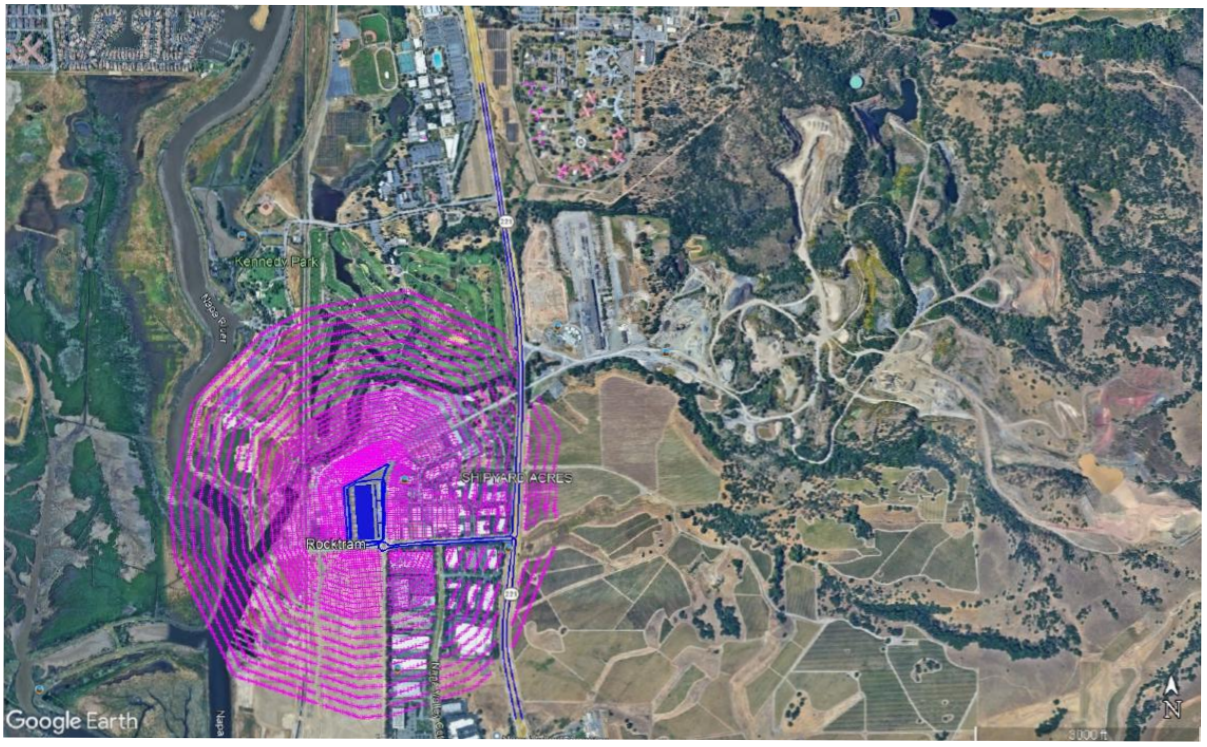


Figure 4: Sensitive Receptor Grid

Hotspots Analysis and Reporting Program Modeling

CARB's HARP2 model is a tool that assists with the programmatic requirements of the Air Toxics "Hot Spots" Program (AB 2588). HARP2 was used to translate the TAC concentrations from AERMOD into long-term carcinogenic and chronic health risk levels and short-term acute health risk levels following the guidance in the Air District and OEHHA risk assessment guidelines. These guidelines specify a minimum set of TAC pathways and HARP2 modeling options for the carcinogenic assessment. To estimate chronic noncancer risks at residential receptors, the "RMP-Derived Method" risk-calculation option was used. Following the OEHHA guidance, an 8-hour chronic noncancer risk was calculated for residential receptors because the project would operate more than 8 hours per day and 5 days per week.

The dose-response relationship for a specific pollutant describes the association between exposure and the observed response (health effect). In other words, the relationship estimates how different levels of exposure to a pollutant change the likelihood and severity of health effects. The dose-response relationship (the response occurring with increasing doses) varies with each pollutant, individual sensitivity, and type of health effect. Combining the results of the emission characterization and dispersion modeling described above with the dose-response assessment gives an estimate of the increased health risk for an individual exposed to the maximum predicted long-term concentrations of TACs.

Discrete variants for daily breathing rates, exposure frequency, and exposure duration were default rates as presented in the OEHHA guidance document entitled *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*[13] and guidance from the Air District.

[13] OEHHA. 2015. *Air Toxics Hot Spots Program Guidance Manual*. March. Website: oehha.ca.gov/air/crnr/notice-adoption-air-toxics-hot-spots-program-guidance-manual-preparation-health-risk-0 (accessed January 2025).

HEALTH RISK IMPACTS

MODEL ANALYSIS RESULTS

Construction Health Risk Assessment

A construction HRA, which evaluates construction-period health risk to off-site receptors, was performed for the proposed project. Table B identifies the results of the analysis at the MEI. Appendix A includes model snapshots of the sources.

Table B: Health Risks from Project Construction to Off-Site Receptors

Location	Carcinogenic Inhalation Health Risk in 1 Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index	Annual Average $PM_{2.5}$ Concentration
Residential Receptor Risk	0.34	0	0	0
Worker Receptor Risk	0.73	0.03	0	0.15
Air District Significance Threshold	**10 in 1 million**	**1.0**	**1.0**	**0.3**
Significant?	**No**	**No**	**No**	**No**

Source: Compiled by LSA (May 2026).
Air District = Bay Area Air District
$PM_{2.5}$ = particulate matter 2.5 microns or less

Carcinogenic and Chronic Impacts

As shown in Table B, the maximum cancer risk for the residential MEI would be 0.34 in 1 million, which would not exceed the Air District cancer risk of 10 in 1 million. The worker MEI would be 0.73 in 1 million, which would not exceed the threshold. The total chronic hazard index for the residential MEI would be nominal, which is below the threshold of 1. The worker MEI would be 0.03, which would not exceed the threshold.

Acute Emission Impacts

As shown in Table B, the total acute inhalation hazard index for the residential MEI would be 0, which is below the threshold of 1. The worker MEI would be 0, which would not exceed the threshold.

Fine Particulate Matter ($PM_{2.5}$) Impacts

As shown in Table B, the annual average $PM_{2.5}$ concentration would be 0.15 micrograms $\mu g/m^3$, which is below the threshold of 0.3 $\mu g/m^3$.

Results of the analysis are graphically shown in Appendix A.

Operational Health Risk Assessment

To determine the potential health risk to people living and working near the proposed project associated with the exhaust of diesel-powered trucks and equipment, an operational HRA was

conducted for the proposed project. Table C shows the carcinogenic and chronic health risks from the proposed project. The residential risk conservatively incorporates both the risk for a child living in a nearby residence for 9 years (the standard period of time for child risk) and an adult living in a nearby residence for 30 years (considered a conservative period of time for an individual to live in any one residence). An exposure period of 25 years was assumed for worker receptors.

Table C: Health Risks from Project Operation to Off-Site Receptors

Location	Carcinogenic Inhalation Health Risk in 1 Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index	Annual Average $PM_{2.5}$ Concentration
Residential Receptor Risk	2.20	0	0	0
Worker Receptor Risk	5.28	0.02	0.01	0.08
Air District Significance Threshold	**10 in 1 million**	**1.0**	**1.0**	**0.3**
Significant?	**No**	**No**	**No**	**No**

Source: Compiled by LSA (May 2026).
Air District = Bay Area Air District
$PM_{2.5}$ = particulate matter 2.5 microns or less

Carcinogenic and Chronic Impacts

As shown in Table C, the maximum cancer risk for the residential MEI would be 2.20 in 1 million, which would not exceed the Air District cancer risk of 10 in 1 million. The worker MEI would be 5.28 in 1 million, which would not exceed the threshold. The total chronic hazard index for the residential MEI would be 0, which is below the threshold of 1. The worker MEI would be 0.02, which would not exceed the threshold.

Acute Emission Impacts

As shown in Table C, the total acute inhalation hazard index for the residential MEI would be 0, which is below the threshold of 1. The worker MEI would be 0.01, which would not exceed the threshold.

Fine Particulate Matter ($PM_{2.5}$) Impacts

As shown in Table C, the annual average $PM_{2.5}$ concentration would be 0.08 micrograms $\mu g/m^3$, which is below the threshold of 0.3 $\mu g/m^3$.

CUMULATIVE IMPACTS

To assess the potential risk from stationary sources, LSA used the Air District's latest Stationary Source Screening Tool, which provides a map of all the stationary sources permitted by the Air District with risk and hazard estimates of stationary emission sources such as gas stations, diesel emergency generators, and incinerators. Health risk data was provided for each facility. Google Earth's measurement tool was used to determine the distance from the emission source to the location of the sensitive receptor.

The Air District's Stationary Source Screening Tool identified four stationary sources within 1,000 feet of the project site, as shown in Table D. Appendix B presents the calculation of the stationary source adjusted cancer risk. LSA further refined the results through the Public Air District Health Risk Calculator Beta Version 5.0 to evaluate source-specific health risks at the project site based on source proximity. Specifically, the distance between each identified stationary source and the project site was measured and compared to the screening distances available within the Air District Health Risk Calculator. Where the exact measured distance was not available within the calculator, the nearest available screening distance was conservatively selected for evaluation. The corresponding carcinogenic hazard index and annual average $PM_{2.5}$ concentration values associated with the selected screening distances were then used to estimate source-specific health risk exposure at the project site.

In addition, roadway screening was conducted consistent with Air District screening methodologies to evaluate potential exposure to mobile-source emissions from nearby roadways. Nearby roadway sources were identified based on roadway screening contours within the vicinity of the project. The Air District screening tool provides a range of cancer risk, chronic hazard index, and $PM_{2.5}$ concentration values associated with the identified roadway sources. To provide a conservative evaluation, the higher end of the applicable screening range was used for the cumulative health risk assessment.

Table D: All Sources Within 1,000 Feet of the Project Site

Source Type	Distance (feet)	Carcinogenic Inhalation Health Risk in 1 Million	Chronic Hazard Index	Annual Average $PM_{2.5}$ Concentration ($\mu g/m^3$)
Mobile Sources (Basalt Road)	-	20	0.1	0.1
Mobile Source (Syar Way)	-	20	0.1	0.1
Mobile Source (Kaiser Road)	-	20	0.1	0.3
Paupaiz Fine Coffees, 978B Kaiser Road (manufacturing)	320.01	0	0	0
Regulus, 860 Latour Court (generator)	958.61	4	0	0
Royal Coach Limousine Services, 988 Enterprise Way (nonretail gas station)	130.62	0	0	0
Syar Concrete LLC, 760 north of the west end of Kaiser Road (manufacturing)	692.67	0	0	0.38
Total Risk Levels		**64**	**0.3**	**0.43**
Air District Threshold		100	10	0.80
Exceeds?		**No**	**No**	**No**

Source: Compiled by LSA (May 2026).
Air District = Bay Area Air District
$PM_{2.5}$ = particulate matter less than 2.5 microns in size

As shown in Table D, the cumulative health risk of mobile and stationary sources and roadway sources would be less than the Air District's cumulative risk and hazard thresholds. Therefore, receptors at the project site would not be exposed to significant cumulative health risk impacts.

CONCLUSION

Based on the results of the analysis, all health risk levels to nearby sensitive receptors from project-related emissions of TACs would be well below the Air District's HRA thresholds. As such, no significant health risk would occur from project-related emissions. The HARP2 modeling reports and AERMOD information are included in Appendix A.
