1.0 INTRODUCTION & PURPOSE

1.1 Purpose and Scope of the Initial Study

This Initial Study/Mitigated Negative Declaration (IS/MND) has been prepared in accordance with the California Environmental Quality Act (CEQA) (California Public Resources Code [PRC] Section 21000 et seq.) and its Guidelines (California Code of Regulations [CCR], Title 14, Section 15000 et seq.), to evaluate the potential environmental effects associated with the construction and operation of the Maverik Hanford Project. Pursuant to Section 15367 of the State CEQA Guidelines, the City of Hanford (City) is the lead agency for the project. The lead agency is the public agency that has the principal responsibility for carrying out or approving a project.

As set forth in the State CEQA Guidelines Section 15070, an IS/MND can be prepared when the Initial Study has identified potentially significant environmental impacts, but revisions have been made to a project, prior to public review of the Initial Study, that would avoid or mitigate the impacts to a level considered less than significant; and there is no substantial evidence in light of the whole record before the public agency that the project, as revised, may have a significant effect on the environment.

This Initial Study has also been prepared pursuant to Section 15063 of the State CEQA Guidelines to determine whether the proposed project may have a significant effect on the environment and to identify appropriate mitigation measures, if necessary, to reduce potential impacts to less than significant levels.

1.2 Summary of Findings

Section 3.0 of this document contains the Environmental Checklist that was prepared for the proposed project pursuant to CEQA requirements. The Environmental Checklist included in Section 3.0 of this document is based on Appendix G of the State CEQA Guidelines and is used to determine whether the proposed project may result in a significant environmental impact.

Mitigation Measures

State CEQA Guidelines Section 15041, *Authority to Mitigate,* gives the lead agency for a project the authority to require feasible changes in any or all activities involved in the project in order to substantially lessen or avoid significant effects on the environment, consistent with applicable constitutional requirements such as the "nexus" and "rough proportionality" standards. CEQA Guidelines Section 15364 defines "feasible" as capable of being accomplished in a successful manner within a reasonable period of time, considering economic, environmental, legal, social, and technological factors. Mitigation measures will be adopted to reduce the environmental impacts to less than significant levels and must be consistent with all applicable constitutional requirements, including the following:

- There must be an essential nexus (i.e., connections) between the mitigation measure and legitimate governmental interest.
- The mitigation measure must be "roughly proportional" to the impacts of the project.

Several forms of mitigation under CEQA Section 15370 are summarized as follows:

- Avoiding the **impact** by not taking a certain action(s);

- **Minimizing** impacts by limiting the degree or magnitude of the action and its implementation;
- **Rectifying** the impact by repairing, rehabilitating, or restoring the impacted environment;
- **Reducing** or eliminating the impact over time by preservation and maintenance operations during the life of the action; and
- **Compensating** for the impact by replacing or providing substitute resources or environment.

Avoiding impacts is the preferred form of mitigation, followed by minimizing or rectifying the impact to less than significant levels. Compensating for impacts would be pursued if no other form of mitigation is feasible.

The conclusions of this Initial Study are based on substantial evidence in the record, including technical studies, project plans, and applicable regulatory standards, consistent with State CEQA Guidelines Sections 15064(f)(1) and 15384.

Environmental Resource Topics

This IS/MND evaluates the proposed project's impact on the following resource topics:

- Aesthetics
- Agricultural and Forestry Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Noise
- Population and Housing
- Public Services
- Recreation
- Transportation
- Tribal Cultural Resources
- Utilities and Service Systems
- Wildfire

Environmental Baseline Conditions

Pursuant to CEQA Guidelines §15125, the environmental baseline for the proposed project is defined as the existing physical conditions at the project site and its immediate vicinity at the time of release of the Notice of Preparation/Initial Study. Key data sources used to describe baseline conditions include the City of Hanford General Plan and Zoning maps, City GIS data, Kings County GIS mapping, technical studies prepared for the project, and information provided by local agencies such as Kings County Fire, Hanford Police Department, Kings County Library, and the City of Hanford Parks and Recreation Department.

Significance Thresholds

The potential environmental effects of the proposed project were evaluated using thresholds of significance derived from Appendix G of the State CEQA Guidelines. Each resource topic in the Environmental Checklist was assessed to determine whether the project's effects would exceed these thresholds. The thresholds provide objective criteria to evaluate whether impacts would be considered significant based on substantial evidence, including applicable regulatory standards, technical studies, and professional judgment.

For each checklist item, a "less than significant," "less than significant with mitigation," or "potentially significant" determination was made, consistent with Appendix G guidance. Where mitigation measures are required, they are specifically identified in the text to reduce impacts to less than significant levels.

Cumulative Impacts and Mandatory Findings

Pursuant to State CEQA Guidelines Section 15130, cumulative impacts associated with the proposed project are evaluated at the end of each resource topic in **Section 5.0**, *Environmental Analysis*, considering the combined effects of past, present, and reasonably foreseeable future projects. Mandatory Findings of Significance pursuant to Section 15065 are addressed in **Section 5.21**, including determinations of whether the project may have a significant effect on the environment, cause substantial adverse effects on sensitive resources, or result in cumulative impacts that are significant.

1.3 Initial Study Public Review Process

The Initial Study and a Notice of Intent (NOI) to adopt this MND will be distributed to responsible and trustee agencies, other affected agencies, and other parties for a 30-day public review period in accordance with State CEQA Guidelines Section 15072.

Written comments regarding this MND should be addressed to:

Gabrielle Myers
City of Hanford Senior Planner
317 N. Douty St
Hanford, California 93230
gmyers@hanfordca.gov

Responsible and Trustee Agencies

Pursuant to the California Environmental Quality Act and the State CEQA Guidelines, this Initial Study/Mitigated Negative Declaration has been circulated to responsible and trustee agencies that may

have jurisdiction by law or special expertise over resources potentially affected by the proposed project. Responsible and trustee agencies for the proposed project include, but are not limited to, the following:

- San Joaquin Valley Air Pollution Control District (SJVAPCD)
- Central Valley Regional Water Quality Control Board (RWQCB)
- California Department of Transportation (Caltrans)
- Kings County Fire Department
- California Public Utilities Commission (CPUC)

Tribal Consultation

The proposed project is subject to the California Environmental Quality Act (CEQA) provisions for tribal consultation under Assembly Bill 52 (AB 52). The City of Hanford, as lead agency, provided notification to the Santa Rosa Rancheria Tachi Yokut Tribe to notify them of the project and inquire if a consultation would be requested pursuant to Public Resources Code Section 21080.3.1. The Tribe did request a consultation which took place between the City and the Tribe. The tribe requested construction monitoring agreements be established with the applicant which the City has helped facilitate. AB 52 tribal communications are maintained in the administrative record for the project and are available for public review upon request.

1.4 Report Organization

This document has been organized into the following sections:

Section 1.0 – Introduction. This section provides an introduction and overview describing the conclusions of the Initial Study.

Section 2.0 – Project Description. This section identifies key project characteristics and includes a list of anticipated discretionary actions.

Section 3.0 – Initial Study Checklist. The Environmental Checklist Form provides an overview of the potential impacts that may or may not result from project implementation.

Section 4.0 – Environmental Factors Potentially Affected. This section identifies the environmental factors that could be potentially affected by the proposed project.

Section 5.0 – Environmental Evaluation. This section contains an analysis of environmental impacts identified in the environmental checklist.

Section 6.0 – References. The section identifies resources used to prepare the Initial Study.

2.0 DESCRIPTION OF PROPOSED PROJECT

2.1 Project Location

The project is located in the City of Hanford in Kings County, California. The project site is located at 10864 12th Avenue, approximately 1.7 miles southwest of downtown Hanford. The approximately 21.66-acre site is directly south of exit 85 to 12th Avenue on Highway 198. The project is comprised of a single Assessor's Parcel Number (APN) 011-010-013. See ***Figure 1: Regional Map*** and ***Figure 2: Local Vicinity Map***.

2.2 Environmental Setting

REGIONAL SETTING

The City of Hanford is located in south central California, approximately 180 miles southeast of San Francisco, approximately 32 miles south of Fresno, and approximately 175 miles north of Los Angeles. Hanford is located within the San Joaquin Valley region of the greater Central Valley in California. This area is an elongated valley occupying the central region of California, running on average 50 miles wide and 400 miles from north to south. The project site falls within an area of the Central Valley called the San Joaquin Basin. The San Joaquin River flows through the basin with outlets to the San Francisco Bay and Pacific Ocean. The City of Hanford is located near the southern boundary of the San Joaquin Valley and is within the Tulare Lake Sub Basin. The project site is shown on the U.S. Geological Survey's Hanford, California, 7.5-minute quadrangle map. See ***Figure 3: USGS Topographic Map***.

LOCAL SETTING

The area to the west of the project site has been historically used as an agricultural field, but is designated as medium density residential. The area directly north of the project site consists of service commercial, regional commercial, open space, and high density residential designated land uses. To the south of the site, there is low and medium density residential, neighborhood commercial, public facilities, and neighborhood mixed uses designated land uses. Directly east of the project site are regional commercial and low-density residential land uses. Approximately 150 feet to the north of the site is the off ramp for Highway 198. Directly east of the site is 12th Avenue and on the opposite side of the road is a previously disturbed undeveloped lot designated as regional commercial development (City of Hanford General Plan, 2017).

The majority of the project site has been previously disturbed from agricultural uses. Currently the site consists of non-native grasslands consisting of mustard and star-thistle vegetation. The lower east section of the parcel consists of a single-family home with hardscape and landscaping, including trees, within this portion of the site; however, there are no other areas with hardscape. See ***Figure 4: Vegetation Communities and Land Cover*.**

The proposed project area has existing water, sewer, and electrical utilities within 12th Avenue, and existing curbs and gutters along the eastern frontage of the parcel. This covers a majority of the east project site border.

The project site itself is designated as Regional Commercial in the Hanford General Plan. The parcel is zoned Regional Commercial (C-R) within the City of Hanford (City of Hanford, 2017). The Municipal Code lists the permitted uses in land use table in Section 17.08.030.

Per the Municipal Code Chapter 17.18, section I8, the proposed convenience store, with or without fuel sales, would be "Permitted by Right Use" in C-R zoning per Table 17.08.030. The proposed Maverik Gas Station is permitted upon Site Plan Review within the C-R Zoning District.

2.3 Proposed Project

The proposed project consists of two components: a subdivision and development of a convenience store and fueling area. The proposed subdivision would subdivide the existing 20.66-acre parcel into two parcels. One parcel would be 6.10 acres and would be where the proposed convenience store and fueling station would be located. The existing single-family house located on the proposed 6.10-acre parcel would be demolished and removed as part of the project. The remaining 14.56 acres would be left as an undeveloped parcel. No uses or improvements are proposed for the 14.56-acre remainder parcel at this time. Approval of the subdivision requires approval of a Tentative Parcel Map. See ***Figure 5: Tentative Parcel Map*****.** Any future subdivision or other development on the 14.56-acre remainder parcel would require a separate permitting process.

The proposed project would be implemented in two phases. Phase 1 consists of development of the convenience store and primary fueling area on approximately 6.10 acres of the 20.66-acre site. This phase includes construction of an approximately 5,637-square-foot convenience store and installation of twelve (12) fuel dispensers with an associated canopy located in front of the store. The fore-court canopy is 5,668 square feet and would have a 16-foot clearance and total height of 19.3 feet. The development will provide fueling, packaged beer and wine sales, as well as fresh food items. Restroom facilities will be open to the public. The store will operate 24 hours a day, 7 days a week. Per the Municipal Code Chapter 17.08, Section I8 "Convenience store, with or without fuel sales" is a "Permitted by Right Use" in C-R zoning per Table 17.08.030. See ***Figure 6: Phase 1 Conceptual Site Plan***. Further details regarding the operation of the convenience store and fueling area are provided below.

Phase 2, which may or may not be developed (depending on market conditions), would include the installation of five (5) high-flow commercial fueling dispensers and an associated canopy located to the rear of the store. The truck court canopy would be 2,444 square feet with a 16-foot clearance and total height of 19.3 feet. See ***Figure 7: Phases 1 and 2 Conceptual Site Plan***. If Phase 2 is not constructed, the area designated for the rear fueling improvements would remain as landscaped planter area. For purposes of impact analysis, all calculations assume the full development of both Phase 1 and Phase 2, including the rear commercial fueling area. This approach represents a conservative estimate of potential impacts. If Phase 2 is not constructed, actual impacts related to associated site operations would be lower than those presented in this analysis.

Operations

Maverik, Inc. owns and operates over 800 stores across 19 states and plans to continue a favorable growth pattern in the future. Maverik employs over 10,000 people who are eligible for health benefits (Health, Dental and Vision), long and short-term disability, tuition reimbursement, 401 (k) matching contribution opportunities, gym reimbursement, scholarships, paid time off and other benefits. This store will employ approximately 15 to 18 employees. Store employees receive training in over 40 different aspects of the job including safety, point of sale, service, identification for alcohol sales, management, and customer service. Customers are expected to be a mix of local residents and travelers on SR-198 due to close proximity to the exit onto 12th Avenue.

Store Exterior

The building elevations, building materials and floor plan depict the architectural style and themes of the Maverik brand. The exterior of the building will consist of metal roof elements, fiber cement, cultured stone, glass storefront, steel truss beams, etc. HVAC equipment will be situated on the store roof and

screened from view by a parapet wall and is consistent with code requirements for screening roof-mounted mechanical equipment and blending in with the surrounding community. The fuel canopy would incorporate the same architectural elements and materials as the convenience store to maintain a consistent design throughout the site.

Traffic Access and Parking

Site access will be from a proposed private drive aisle along the site's southern border (across from W Hayden Ave), with three (3) access driveways to the proposed development. Access to the project site will be provided via one (1) proposed full access driveway, one (1) ingress only Heavy-Duty Vehicle driveway, and one (1) egress only Heavy-Duty Vehicle driveway along the proposed extension of Hayden Avenue. Provided parking includes twenty-nine (29) standard stalls (9' x 20'), with two (2) being EV ready stalls, two (2) being EV ready accessible stalls, seven (7) of the parking stalls listed as EV capable, and two (2) accessible stalls. Bike parking is available near the entrances of the convenience store.

Landscaping

Landscaping will be provided adjacent to all rights-of-way and buffers around the edges of the property entrances. Furthermore, the northern section of the property would remain with the existing natural landscaping.

Stormwater

Stormwater runoff on the project site would be collected in onsite storm drains and delivered to bioretention areas. The project site includes four (4) onsite bioretention basins with one in the northwest corner, one in the southwest corner, one in the southeast corner, and offsite directly south of the proposed project site. See ***Figure 8: Preliminary Grading and Drainage Plan***. Stormwater at the site would be collected by storm drain catch basins onsite and conveyed into a bioretention area where the water would infiltrate into the soil. Each of the bioretention areas would be specifically sized to accommodate the amount of water that would be collected from a portion of the project site.

Utilities

The project site would tie into existing water, sewer, gas, electrical, and telecommunications utilities located along 12th Avenue. The project would construct a 12-inch water main extension within Hayden Avenue along the project frontage. The water main extension would connect into the existing water main within 12th Avenue. Water line laterals would extend from the main within Hayden Avenue to the project site.

The project would construct a 12-inch sanitary sewer main extension within Hayden Avenue along the project frontage. This line would extend from the existing 30-inch sewer main to 12th Avenue. A 4 to 6-inch sewer lateral would extend from Hayden Avenue to serve the project site.

Electrical utilities would be brought onsite from existing connections on 12th Avenue. See ***Figure 9: Preliminary Utility Plan*.**

Signage

The proposed sign plan will comply with code and is designed for visibility and minimum impact to the existing adjacent uses.

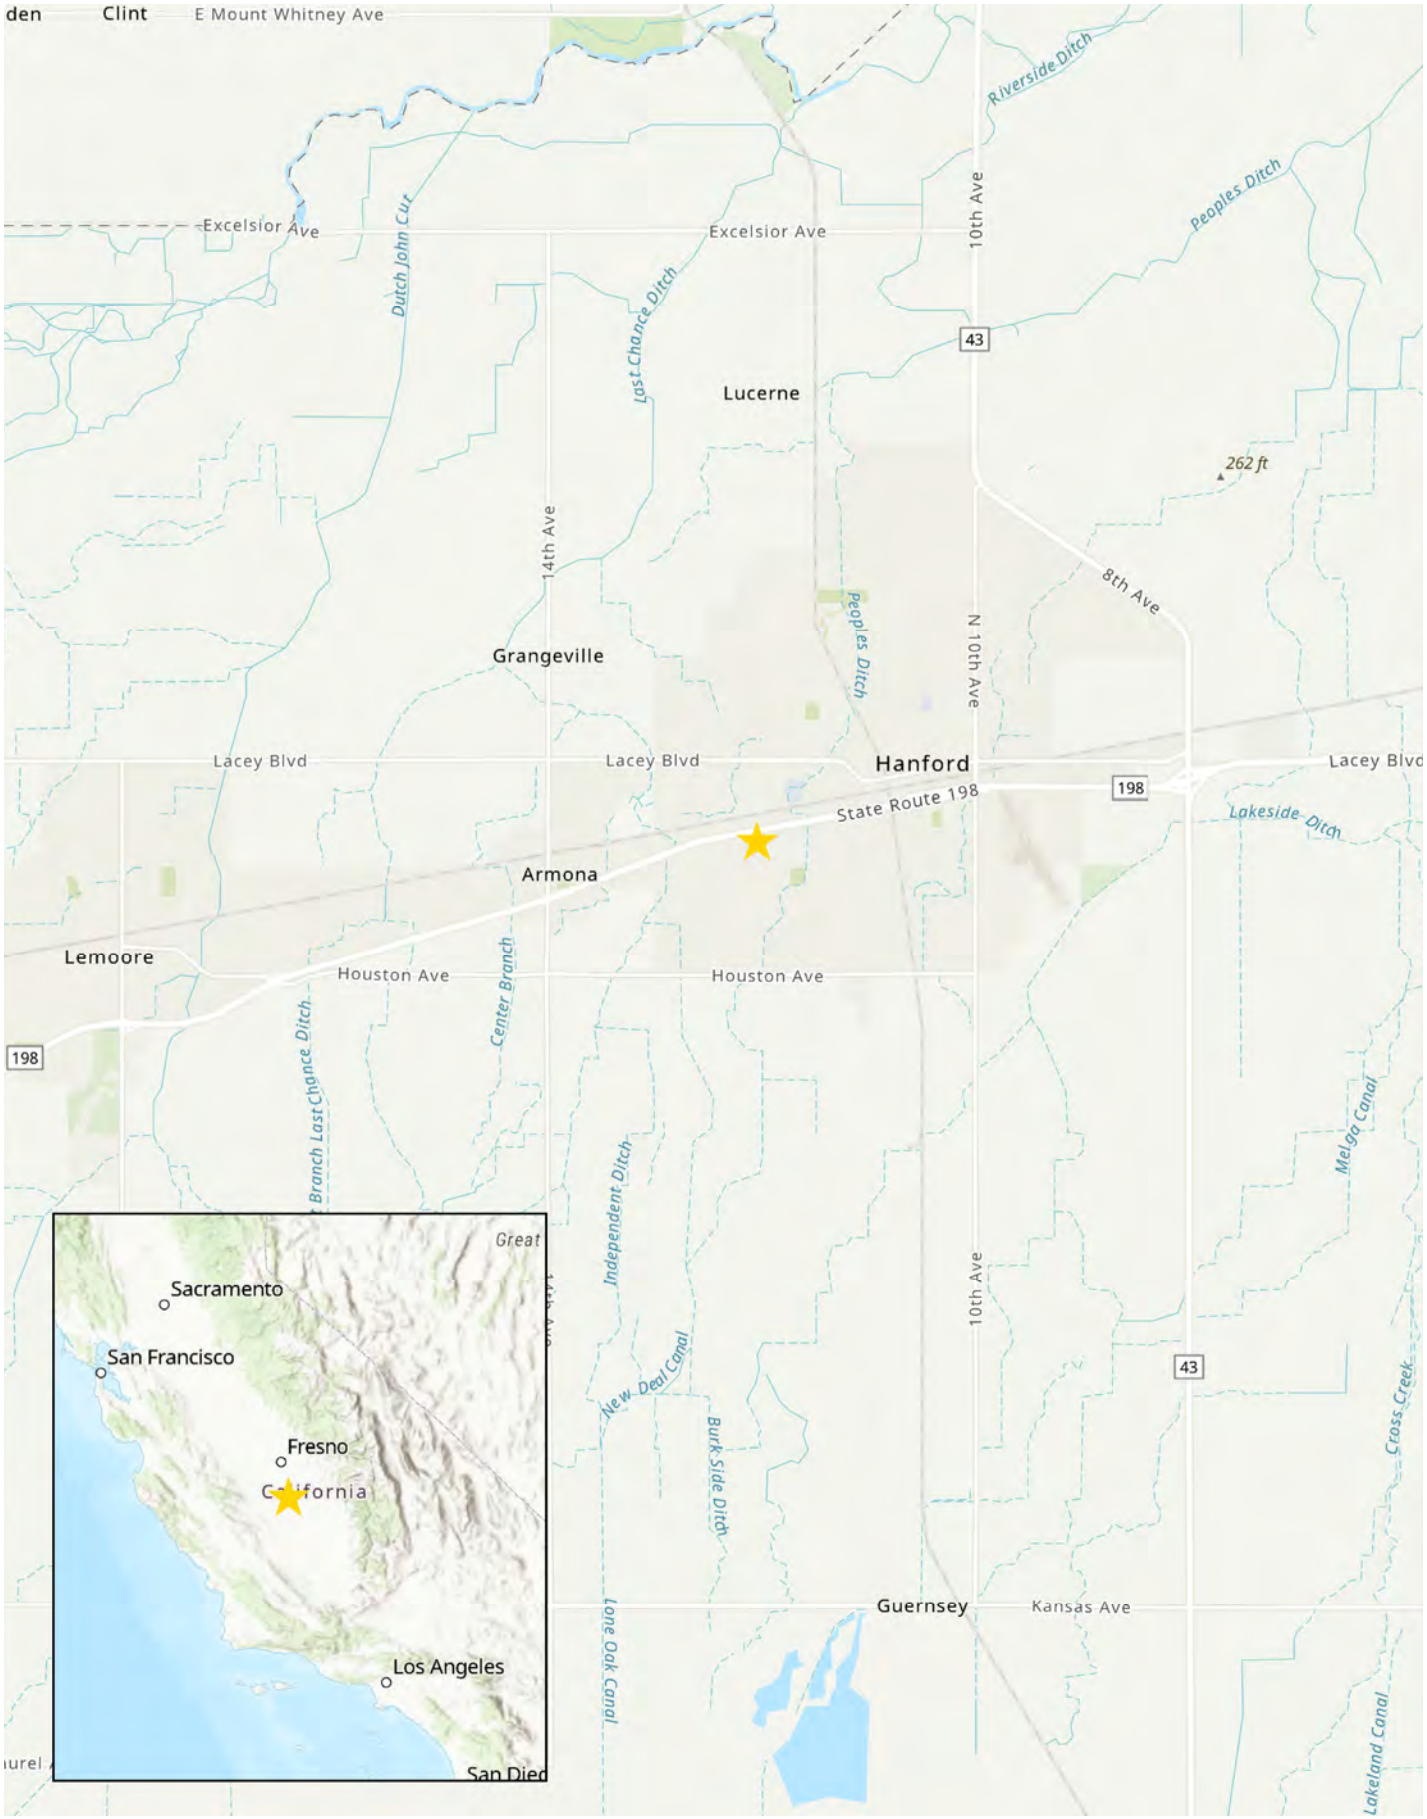
Leak Prevention

The proposed project would install double walled noncorrodible fiberglass underground storage tanks that are hooked up to non-corrodible flexible plastic piping. When gas is delivered, a vapor recovery system would prevent fumes from escaping into the air, reducing the impact on surrounding neighbors and development. In the event of an emergency if any leak were to occur, the proposed project would have state-of-the-art leak detection equipment along with in-house resources who monitor issues in real time and immediately respond to conditions.

Alcohol Licensing

The proposed project will apply for an alcohol license that allows for packaged alcohol to be purchased but not consumed on site.

Grading and Construction



Proposed construction for the convenience store and gas station is expected to start in the second quarter of 2026 and take approximately nine months to complete. The expected opening date will occur during the second or third quarter of 2027. Grading during this time is expected to take approximately one month and would involve the import of approximately 10,300 cubic yards of soil. During the construction phase of the project, there will be approximately 241 heavy truck trips made to the project site.

Other Improvements

Other improvements include the construction of concrete sidewalks added to the southern side of the project site to account for pedestrian access, lighting, striping, a crosswalk, asphalt pavement, accessible ramps, driveway and valley gutters, and a barricade.

Offsite improvements include improving Hayden Avenue to two lanes from 12th Avenue to the eastern boundary of the proposed Maverik lot. The total roadway cross section would be 48 feet plus 5-foot sidewalks and pedestrian ramps at 12th Avenue and the project driveway. Pedestrian ramps and a crosswalk would be constructed at the intersection with 12th Avenue.

The project would also install a new traffic signal at the intersection of 12th Avenue and Hayden Avenue. The traffic signal would control traffic at the intersection and facilitate left turns from Hayden Avenue to northbound 12th Avenue.

3.0 INITIAL STUDY CHECKLIST

NOTE: The following is a sample form that may be tailored to satisfy individual agencies' needs and project circumstances. It may be used to meet the requirements for an initial study when the criteria set forth in CEQA Guidelines have been met. Substantial evidence of potential impacts that are not listed on this form must also be considered. The sample questions in this form are intended to encourage thoughtful assessment of impacts, and do not necessarily represent thresholds of significance.

1. **Project title:**

   Maverik Hanford Project

2. **Lead agency name and address:**

   The City of Hanford
   City of Hanford Community Development Department
   Civic Center Building, 317 N Douty St
   Hanford, CA 93230

3. **Contact person and phone number:**

   Gabrielle Myers
   (559) 585-2578

4. **Project location:**

   10864 12th Avenue
   Hanford, California 93230

5. **Project sponsor's name and address:**

   Maverik
   Todd Meyers
   Sr. Site Development Manager
   1885 South State Street, Suite 800
   Salt Lake City, Utah 84111

6. **General plan designation:**

   Regional Commercial (C-R)

7. **Zoning:**

   Regional Commercial (C-R)

8. **Description of project: (Describe the whole action involved, including but not limited to later phases of the project, and any secondary, support, or off-site features necessary for its implementation. Attach additional sheets if necessary.)**

   The project is a proposed Maverik convenience store with fuel sales at the southwest corner of the Highway 198 off-ramp and 12th Avenue. The proposed project construction would take place in

two separate phases. Phase 1 includes a convenience store and fueling area positioned on approximately 6.10 acres of the entire 20.66-acre site. The store is approximately 5,637 square feet with twelve (12) fuel dispensers and canopy in front of the store. Phase 2 of construction, which may not occur, would include five (5) additional commercial fuel dispensers and canopy at the back of the store, for a total of 34 fueling positions on site in both phases. Site features are proposed to include an RV Dump and Air Station. The site General Plan Designation is Regional Commercial, and the site is zoned C-R Regional Commercial. Per the Municipal Code Chapter 17.08, section I8 "Convenience store, with or without fuel sales" is a "Permitted by Right Use" in C-R zoning per Table 17.08.030. Site access will be from a proposed private drive aisle along the site's southern border (across from W Hayden Ave), with three (3) access driveways to the proposed development.

9. Surrounding land uses and setting: Briefly describe the project's surroundings:

To the west of the project site, there are low and medium density residential areas and public uses. To the north are highway commercial, corridor mixed-use, and medium-density residential areas. To the south, the land includes low and medium density residential, commercial, open space, and educational facilities. To the east along 12th Avenue, there are highway and service commercial uses.

10. Other public agencies whose approval is required (e.g., permits, financing approval, or participation agreement.)

City of Hanford

- Adoption of the Initial Study/Mitigated Negative Declaration
- Approval of Minor Use Permit, Site Plan/Design Review/Tentative Parcel Map
- Grading and Improvement Plans
- Building Permits

San Joaquin Valley Air Pollution Control District

- Authority to Construct/Permit to Operate

11. Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3.1? If so, is there a plan for consultation that includes, for example, the determination of significance of impacts to tribal cultural resources, procedures regarding confidentiality, etc.?

Pursuant to Assembly Bill 52, the City of Hanford, as Lead Agency, is required to notify California Native American tribes that have requested notification of projects within the City's jurisdiction. The City contacted the Santa Rosa Rancheria Tachi Yokut Tribe to notify them of the project and inquire if a consultation would be requested. The Tribe did request a consultation which took place between the City and the Tribe. The tribe requested construction monitoring agreements be established with the applicant which the City has helped facilitate. AB 52 tribal communications

are maintained in the administrative record for the project and are available for public review upon request.

The Native American Heritage Commission (NAHC) conducted a search of Sacred Lands Files (SLF) for the Project area and vicinity at the request of the project applicant. The NAHC responded on September 24, 2024, and indicated that the results are negative for documented sacred lands in or near the Project area (Appendix D).

NOTE: Conducting consultation early in the CEQA process allows tribal governments, lead agencies, and project proponents to discuss the level of environmental review, identify and address potential adverse impacts to tribal cultural resources, and reduce the potential for delay and conflict in the environmental review process. (See Public Resources Code section 21080.3.2.) Information may also be available from the California Native American Heritage Commission's Sacred Lands File per Public Resources Code section 5097.96 and the California Historical Resources Information System administered by the California Office of Historic Preservation. Please also note that Public Resources Code section 21082.3(c) contains provisions specific to confidentiality.

4.0 ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The environmental factors checked below would be potentially affected by this project, involving at least one impact identified as "Less Than Significant With Mitigation Incorporated" as indicated by the checklist on the following pages. No environmental factors were identified to be "Potentially Significant."

☐ Aesthetics	☒ Greenhouse Gas Emissions	☐ Public Services
☐ Agricultural and Forestry Resources	☐ Hazards & Hazardous Materials	☐ Recreation
☐ Air Quality	☒ Hydrology/Water Quality	☐ Transportation
☒ Biological Resources	☐ Land Use/Planning	☒ Tribal Cultural Resources
☒ Cultural Resources	☐ Mineral Resources	☐ Utilities/Service Systems

DETERMINATION:

On the basis of this initial evaluation (check one):

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☒ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

5.0 ENVIRONMENTAL ANALYSIS

5.1 AESTHETICS

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
AESTHETICS. Except as provided in Public Resources Code Section 21099, would the project:				
a) Have a substantial adverse effect on a scenic vista?			**X**	
b) Substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway?			**X**	
c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?			**X**	
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?			**X**	

a) Have a substantial adverse effect on a scenic vista?

Less Than Significant Impact. The project site consists of the addition of a Maverik gas station and convenience store in an area that consists of land zoned for residential and commercial use. The proposed project is situated at the southwest corner of the Highway 198 off-ramp and 12th Avenue. The project site is located on a relatively flat area.

Under CEQA, a scenic vista is defined as a viewpoint that provides expansive views of a highly valued landscape for the benefit of the public. A vista is a view from a particular location or combination of locations; a scenic vista combines an aesthetically pleasing aspect, often natural, to the vista. While a scenic vista may be formally designated, they are often informal public views. An adverse effect to a scenic vista may result from a degradation of an existing vista or the loss of access to an existing viewpoint.

As outlined in the City of Hanford General Plan Background Report, the City of Hanford consists urban, agricultural, and grassland habitat areas with the flat valley floor to the west and the Sierra Nevada foothills to the east. Views from the edges of Hanford consist mostly agricultural land. Open vistas within the city are primarily located near the northern and eastern boundaries of the

City with grasslands, grazing land, and large farms defining the viewshed. Furthermore, the proposed project is located within an urban corridor that is characterized by residential and commercial uses surrounding the project site. The project would introduce new visual elements to the project site, but it does not include any features that would have the potential to affect any distant views due to the developed land in the vicinity. The changes to the visual environment would be consistent with existing uses in the immediate area to the project site. Thus, the project would not result in a substantial alteration to the visual environment and/or a scenic vista. Impacts would be less than significant, and mitigation is not required.

b) Substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway?

Less than Significant Impact. The project site is located in a relatively flat area with Highway 198 to the north, commercial area to the north and southeast, and residential uses to the south and west. This area does not contain any aesthetically significant trees, rock outcroppings, or historical buildings. Additionally, the project site is not located near a scenic highway, the site is located approximately 15.1 miles east from a segment of Highway 198 extending to Sequoia National Park (DOT, 2018), and therefore would cause a less than significant impact to scenic resources.

c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

Less Than Significant Impact. The project site is located in an urbanized area, and the project would not conflict with the Regional Commercial (C-R) zoning designation it would fall within. According to the Municipal Code Chapter 17.18, a "Convenience store, with or without fuel sales" is a "Permitted by Right Use" in C-R zoning per Table 17.08.030.

The proposed uses include a convenience store and fueling area are all allowed under this zoning district and fit into the overall aesthetic landscape. The project would align with the General Plan's Commerce Goals and Policies to support "variety of opportunities for vibrant and successful commerce activities" and "actively pursue commercial enterprises that strengthen and solidify Hanford's position as the regional retail commercial hub of Kings County". The project site would include landscaping consistent and sidewalk requirements consistent with the General Plan Guidelines. The proposed project would also have adequate and attractive signage, including fuel price signage, to update the area and alert the public to the commercial uses at the project site, which would be subject to the City of Hanford's Municipal Code sign regulations governing maximum sign height, location, illumination, and visibility for commercial uses. The project would also comply with all additional federal, state, and local regulations governing scenic quality. Therefore, impacts are less than significant.

d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Less Than Significant Impact. Due to the nature of the project, operational hours are anticipated to be 24 hours per day/7 days per week/ 365 days per year. Excessive or inappropriately directed lighting can adversely impact nighttime views by reducing the ability to see the night sky and stars. Glare can be caused from unshielded or misdirected lighting sources. Reflective surfaces (i.e., polished metal) can also cause glare. Impacts associated with glare range from simple nuisances to potentially dangerous situations (i.e., if glare is directed into the eyes of motorists). Existing outdoor lighting at and near the project site is associated with commercial/retail, industrial, and street lighting typical of suburban areas. The proposed project would generate lighting from two primary sources: lighting from building interiors that would pass through windows, and lighting from exterior sources (e.g., street lighting, vehicles, security lighting, and landscape lighting). Lighting associated with the project would not be directed towards adjacent properties. All exterior lighting would incorporate physical design features and attachments, including fully shielded luminaires, recessed or canopy-mounted fixtures, cutoff lenses, and directional aiming, to ensure that light is projected downward and confined to on-site areas.

The City of Hanford's Municipal Code Section 17.50.140 Outdoor Lighting Standards outlines exterior lighting standards. The purpose of this section is as follows:

"to establish standards for the types, construction, installation and use of outdoor electrically powered illuminating devices and systems in order to conserve energy, preserve the natural environment, and provide nighttime safety and security, while not materially interfering with the use and enjoyment of property."

The proposed project would be consistent with these standards and would not provide substantial light or glare. Consistent with Municipal Code requirements, all outdoor lighting fixtures would be fully shielded, focused, and oriented to minimize light glare and prevent light from passing across property lines, including toward nearby residential uses. Lighting would be located, aimed, and shielded to minimize spill light across residential property boundaries and skyward, in accordance with the City's performance standards. When it comes to temporary lighting from construction, the City lists construction projects exempt from the provisions made in the section as long as they will not be used for more than one continuous 30-day period within one calendar year. The project would adhere to these standards. Further, the City would also review new lighting for conformance with the 2022 California Green Building Standards Code (CALGreen) (California Code of Regulations [CCR] Title 24 Part 11) which includes requirements for lighting efficiency, controls, and reduction of unnecessary illumination, such that only the minimum amount of lighting is used, and no light spillage occurs. The Project would adhere to the City's Municipal Code, California's Green Buildings Standards Code, and all additional federal, state, or local regulations. Therefore, resulting in a less than significant impact concerning a new source of substantial light or glare.

Cumulative Impacts

The potential aesthetic impacts related to views, aesthetics, and light and glare are site-specific. As discussed above, project-related impacts to scenic vistas would be less than significant, and the proposed project would not result in any impacts to on-site visual resources because the project would retain and enhance the visual characteristic of the site. In addition, the proposed project would also be consistent and comply with the City's land use, scenic quality and development regulations contained in the City's Municipal Code and General Plan. Lighting and sources of glare, while not always site-specific, would be consistent with the majority of the surrounding urban area and would be used during similar hours as surrounding uses. Therefore, while the proposed project in conjunction with past, present, and reasonably foreseeable development would change the appearance of the site, all development projects follow applicable local planning and design guidelines regarding roadway design including materials, coloration, and landscaping as specified in the City's Municipal Code regarding lighting standards and limitations. Therefore, aesthetic impacts are not expected to be cumulatively considerable, and impacts would be less than significant.

5.2 AGRICULTURE AND FORESTRY RESOURCES

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
AGRICULTURE AND FORESTRY RESOURCES. In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?			**X**	
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?			**X**	
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?			**X**	
d) Result in the loss of forest land or conversion of forest land to non-forest use?			**X**	
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?			**X**	

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

Less Than Significant Impact. Based on the California Department of Conservation Important Farmland Monitoring and Mapping Program (FMMP), the project site is located on Grazing Land (DLRP, 2022). Grazing Land is defined as land on which the existing vegetation is suited to the grazing of livestock. This category is used only in California and was developed in cooperation with the California Cattlemen's Association, University of California Cooperative Extension, and other

groups interested in the extent of grazing activities. Implementation of the proposed project would convert the Grazing Land to non-agricultural use. However, the City of Hanford General Plan has already designated this land as Regional Commercial (C-R). Therefore, the conversion of land uses was already planned and accounted for by the City. The project is not located within Prime Farmland, Unique Farmland, Farmland of Statewide Importance, or Urban and Built-up land. See ***Figure 12: Project Area Farmland*** showing the land classification for the project vicinity, which identifies the project site as Grazing Land. The project is adjacent to Prime Farmland and Urban and Built-up Land, but none of these areas would be affected. Therefore, the project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. Overall, the proposed project would have no impact in this regard, and mitigation is not required.

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

Less Than Significant Impact. Refer to a) The project site is not under a Williamson Act contract and the nearest land under contract is approximately 0.7 miles southwest of the project site. (DLRP, 2024) The project site is zoned as Regional Commercial (C-R), as stated in the City of Hanford General Plan. The proposed project would conform with the proposed general commercial zoning. Therefore, the proposed project would have a less than significant impact on zoning for agricultural use or a Williamson Act Contract. Refer to ***Figure 11: Williamson Act Land***

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

Less Than Significant Impact. The project is not zoned as forest land, timberland, or timberland production and no land in the project vicinity is. Therefore, the project would not conflict or cause rezoning of any forest land (as defined in Public Resource Code section 12220(g)) timberland (as defined by Public Resources Code section 4526), or zoned Timberland Production (as defined by Government Code section 51104(g)). Therefore, impacts related to the loss of this agricultural resource are less than significant.

d) Result in the loss of forest land or conversion of forest land to non-forest use?

Less Than Significant Impact. Refer to c). Based on the Biological Resources Assessment done by Rincon Consultants, Inc. on February 12, 2025, the Study Area consists of recently disked fallowed agricultural land with minimal vegetation and no sensitive natural communities. Additionally, the land is not cultivated for forest resources, meaning there would be no loss of forest land or conversion of forest land to non-forest use and impacts related to this would be less than significant.

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

Less Than Significant Impact. Refer to a) and c). The proposed project includes subdivision of the existing 20.66-acre parcel into two parcels, consisting of a 6.10-acre parcel developed with a convenience store and fueling station and a 14.56-acre parcel that would remain undeveloped. No uses or improvements are proposed on the 14.56-acre parcel at this time, and approval of the subdivision would be limited to a Tentative Parcel Map. Because the majority of the site would remain undeveloped and no agricultural conversion or development activities are proposed on the 14.56-acre parcel, the project would not introduce land use changes or operational activities that could indirectly affect adjacent Prime Farmland. Therefore, impacts related to changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use are less than significant.

Cumulative Impact

The proposed project would have less than significant impacts on agricultural resources with no mitigation required. The proposed project would be consistent with the General Commercial designation in the City of Hanford General Plan. The proposed project would have no impact on forestry resources since the surrounding uses are currently used for commercial, residential, and public use. Therefore, the project would have a less than significant impact on agriculture.

5.3 AIR QUALITY

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
AIR QUALITY. Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?			**X**	
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?			**X**	
c) Expose sensitive receptors to substantial pollutant concentrations?			**X**	
d) Result in other emissions (such as those leading to odors adversely affecting a substantial number of people?)			**X**	

REGULATORY SETTING

Federal

Federal Clean Air Act

Air quality is federally protected by the Federal Clean Air Act (FCAA) and its amendments. Under the FCAA, the United States Environmental Protection Agency (U.S. EPA) developed the primary and secondary National Ambient Air Quality Standards (NAAQS) for the criteria air pollutants including ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), particulate matter less than or equal to 10 microns in diameter (PM_{10}), particulate matter less than or equal to 2.5 microns in diameter ($PM_{2.5}$), and lead. Depending on whether the standards are met or exceeded, the local air basin is classified as in "attainment" or "nonattainment." Some areas are unclassified, which means no monitoring data are available. Unclassified areas are considered to be in attainment. Proposed projects in or near non-attainment areas could be subject to more stringent air-permitting requirements. The FCAA requires that each state prepare a State Implementation Plan (SIP) to demonstrate how it will attain the NAAQS within federally imposed deadlines. Air quality attainment plans outline emissions limits and control measures to achieve and maintain these standards by the earliest practical date.

The U.S. Environmental Protection Agency (EPA) has designated enforcement of air pollution control regulations to the individual states. Applicable federal standards are summarized in Table 5.3-1: State and Federal Ambient Air Quality Standards.

California Air Resources Board

The California Air Resources Board (CARB) administers California's air quality policy. The California Ambient Air Quality Standards (CAAQS) were established in 1969 pursuant to the Mulford-Carrell Act. These standards, included with the NAAQS in Table 5.3-1, are generally more stringent and apply to more pollutants than the NAAQS. In addition to the criteria pollutants, CAAQS have been established for visibility reducing particulates, hydrogen sulfide, and sulfates. In general, the San Joaquin Valley Air Pollution Control District (SJVAPCD) experiences low concentrations of most pollutants when compared to federal standards, except for O_3, $PM_{2.5}$, and PM_{10}, for which standards are exceeded periodically. SJVAPCD has a State designation Attainment or Unclassified for all criteria pollutants except for ozone, PM10, and PM2.5. Kings County has a national designation of either "Unclassified" or "Attainment" for all criteria pollutants except for ozone, PM2.5, and PM_{10}.

The California Clean Air Act (CCAA), which was approved in 1988, requires that each local air district prepare and maintain an Air Quality Management Plan (AQMP) to achieve compliance with CAAQS. These AQMPs also serve as the basis for the preparation of the SIP for meeting federal clean air standards for the State of California. Like the EPA, CARB also designates areas within California as either attainment or nonattainment for each criteria pollutant based on whether the CAAQS have been achieved. Under the CCAA, areas are designated as nonattainment for a pollutant if air quality data shows that a state standard for the pollutant was violated at least once during the previous three calendar years. Exceedances that are affected by highly irregular or infrequent events such as wildfires, volcanoes, etc. are not considered violations of a State standard, and are not used as a basis for designating areas as nonattainment. The applicable State standards are summarized in Table 5.3-1.

Table 5.3- 1: State and Federal Ambient Air Quality Standards

Pollutant	Averaging Time	State Standards[1]		Federal Standards[2]	
		Concentration[3]	Attainment Status	Concentration[3]	Attainment Status
Ozone[4] (O_3)	8 Hour	0.070 ppm (137 µg/m^3)	N	0.070 ppm	N/Extreme[12]
	1 Hour	0.09 ppm (180 µg/m^3)	N/Severe	NA[6]	Revoked[11]
Carbon Monoxide (CO)	8 Hour	9.0 ppm (10 mg/m^3)	A/U	9 ppm (10 mg/m^3)	A/U
	1 Hour	20 ppm (23 mg/m^3)	A	35 ppm (40 mg/m^3)	A
Nitrogen Dioxide[6] (NO_2)	1 Hour	0.18 ppm (339 µg/m^3)	A	0.100 ppm	A/U
	Annual Arithmetic Mean	0.030 ppm (57 µg/m^3)	A	0.053 ppm (100 µg/m^3)	A/U
Sulfur Dioxide[7] (SO_2)	24 Hour	0.04 ppm (105 µg/m^3)	A	NA	A/U
	1 Hour	0.25 ppm	A	0.075 ppm	A/U

Pollutant	Averaging Time	State Standards[1]		Federal Standards[2]	
		Concentration[3]	Attainment Status	Concentration[3]	Attainment Status
		(655 µg/m^3)		(196 µg/m^3)	
	3 Hour	NA	A	0.5 ppm (80 µg/m^3)	A/U
Particulate Matter (PM_{10})[5]	24-Hour	50 µg/m^3	N	150 µg/m^3	A[13]
	Annual Arithmetic Mean	20 µg/m^3	N	NA	A[13]
Fine Particulate Matter ($PM_{2.5}$)	24-Hour	NA	N	35 µg/m^3	N[14]
	Annual Arithmetic Mean	12 µg/m^3	N	9 µg/m^3	N[14]
Sulfates (SO_{4-2})	24 Hour	25 µg/m^3	A	NA	-
Lead[8,9] (Pb)	30-Day Average	1.5 µg/m^3	-	NA	No Designation /Classification
	Calendar Quarter	NA	-	1.5 µg/m^3	No Designation /Classification
	Rolling 3-Month Average	NA	-	0.15 µg/m^3	No Designation /Classification
Hydrogen Sulfide (H_2S)	1 Hour	0.03 ppm (42 µg/m^3)	U	NA	-
Vinyl Chloride (C_2H_3Cl)	24 Hour	0.01 ppm (26 µg/m^3)	A	NA	-
Visibility Reducing Particles[10]	8 Hour (10:00 to 18:00 PST)	-	U	-	-

A = attainment; N = nonattainment; U = unclassified; N/A = not applicable or no applicable standard; ppm = parts per million; µg/m^3 = micrograms per cubic meter; mg/m^3 = milligrams per cubic meter; – = not indicated or no information available.

1. California standards for ozone, carbon monoxide (except Lake Tahoe), sulfur dioxide (1-hour and 24-hour), nitrogen dioxide, suspended particulate matter - PM_{10}, and visibility reducing particles are values that are not to be exceeded. The standards for sulfates, Lake Tahoe carbon monoxide, lead, hydrogen sulfide, and vinyl chloride are not to be equaled or exceeded. If the standard is for a 1-hour, 8-hour or 24-hour average (i.e., all standards except for lead and the PM_{10} annual standard), then some measurements may be excluded. In particular, measurements are excluded that CARB determines would occur less than once per year on the average. The Lake Tahoe CO standard is 6.0 ppm, a level one-half the national standard and two-thirds the state standard.
2. National standards shown are the "primary standards" designed to protect public health. National standards other than for ozone, particulates and those based on annual averages are not to be exceeded more than once a year. The 1-hour ozone standard is attained if, during the most recent three-year period, the average number of days per year with maximum hourly concentrations above the standard is equal to or less than one. The 8-hour ozone standard is attained when the 3-year average of the 4th highest daily concentrations is 0.070 ppm (70 ppb) or less. The 24-hour PM_{10} standard is attained when the 3-year average of the 99th percentile of monitored concentrations is less than 150 µg/m$_3$. The 24-hour $PM_{2.5}$ standard is attained when the 3-year average of 98th percentiles is less than 35 µg/m^3. Except for the national particulate standards, annual standards are met if the annual average falls below the standard at every site. The national annual particulate standard for PM_{10} is met if the 3-year average falls below the standard at every site. The annual $PM_{2.5}$ standard is met if the 3-year average of annual averages spatially-averaged across officially designed clusters of sites falls below the standard.
3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

Pollutant	Averaging Time	State Standards[1]		Federal Standards[2]	
		Concentration[3]	Attainment Status	Concentration[3]	Attainment Status

4. On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
5. On February 7, 2024, the national annual PM2.5 primary standard was lowered from 12.0 µg/m3 to 9.0 µg/m3. The existing national 24-hour PM2.5 standards (primary and secondary) were retained at 35 µg/m3 , as was the annual secondary standard of 15.0 µg/m3 . The existing 24-hour PM10 standards (primary and secondary) of 150 µg/m3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.
6. To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.
7. On June 2, 2010, a new 1-hour SO2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved. Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.
8. The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
9. The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 µg/m3 as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
10. In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.
11. Effective June 15, 2005, the U.S. Environmental Protection Agency (EPA) revoked the federal 1-hour ozone standard, including associated designations and classifications. EPA had previously classified the District as extreme nonattainment for this standard. EPA approved the 2004 Extreme Ozone Attainment Demonstration Plan on March 8, 2010 (effective April 7, 2010). The District Governing Board adopted the *2023 Maintenance Plan and Redesignation Request* and submitted to EPA in June of 2023. Although the standard is revoked, anti-backsliding provisions can be terminated upon final approval of the Maintenance Plan from EPA.
12. Though the Valley was initially classified as serious nonattainment for the 1997 8-hour ozone standard, EPA approved Valley reclassification to extreme nonattainment in the Federal Register on May 5, 2010 (effective June 4, 2010).
13. On September 25, 2008, EPA redesignated the San Joaquin Valley to attainment for the PM10 National Ambient Air Quality Standard (NAAQS) and approved the *2007 PM10 Maintenance Plan*.
14. The Valley is designated nonattainment for the 1997 PM2.5 NAAQS. EPA designated the Valley as nonattainment for the 2006 PM2.5 NAAQS on November 13, 2009 (effective December 14, 2009).

Regional

San Joaquin Valley Air Pollution Control District (SJVAPCD)

The proposed project lies within the southwestern portion of the San Joaquin Valley Air Basin (SJVAB). SJVAPCD has jurisdiction over most air quality matters in the SJVAB and is tasked with implementing programs and regulations required by the CCAA and FCAA. If a project is found to interfere with the region's ability to comply with federal and State air quality standards, local governments then need to consider project modifications or provide mitigation measures to eliminate the inconsistency of the project plans. In order for a project to be considered "consistent" with the latest Air Quality Plan (AQP), the project must be consistent with the goals, objectives, and assumptions in the respective plan to achieve CAAQS and

NAAQS. Additionally, both construction-related and long-term emissions are required to be quantified and compared to the SJVAPCD significance thresholds.

Clean Air Plan

Air quality plans developed to meet federal requirements are referred to as State Implementation Plans. The FCAA requires plans to be developed for areas designated as nonattainment. The SJVAPCD is responsible for developing a Clean Air Plan, which guides the region's air quality planning efforts to attain the CAAQS. The SJVAPCD adopted the 2022 Plan for the 2015 8-Hour Ozone Standard (2022 Ozone Plan) and 2024 Plan for the 2012 Annual $PM_{2.5}$ Standards (2024 $PM_{2.5}$ Plan).

SJVAPCD periodically develops air quality plans that outline the regional strategy to improve air quality and protect the climate. The most recent plans, 2024 $PM_{2.5}$ Plan and 2022 Ozone Plan, include a wide range of control measures designed to reduce emissions of air pollutants.

Under federal and state law, SJVAPCD is under a legal obligation to enforce air pollution regulations. These regulations are primarily meant to ensure that the surrounding (or ambient) air meets federal and state air quality standards. The following is a list of SJVAPCD rules that are required of construction and operational activities associated with the project:

- **Rule 4101 (Visible Emissions)** – This rule prohibits the emissions of visible air contaminants to the atmosphere.
- **Rule 4102 (Nuisance)** – The purpose of this rule is to protect the health and safety of the public and applies to any source operation that emits or may emit air contaminants or other materials. This rule is enforced on a complaint basis.
- **Rule 4601 (Architectural Coatings)** – The purpose of this rule is to limit Volatile Organic Compounds (VOC) emissions from architectural coatings. Emissions are reduced by limits on VOC content and providing requirements on coatings storage, cleanup, and labeling. Only compliant components are available for purchase in the San Joaquin Valley.
- **Rule 4621 (Gasoline Transfer into Stationary Storage Containers, Delivery Vessels, and Bulk Plants)** – The purpose of this rule is limit VOC emissions from stationary storage containers, delivery vessels, and bulk plants and to provide the administrative requirements for determining compliance with this rule.
- **Rule 4622 (Gasoline Transfer into Motor Vehicle Fuel Tanks)** – The purpose of this rule is to limit emissions of gasoline vapors from the transfer of gasoline into motor vehicle fuel tanks.
- **Rule 4623 (Storage of Organic Liquids)** – The purpose of this rule is to limit VOC emissions from the storage of organic liquids.
- **Rule 4624 (Transfer of Organic Liquid)** – The purpose of this rule is to limit VOC emissions from the transfer of organic liquids.
- **Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving and Maintenance Operations)** – The purpose of this rule is to limit VOC emissions from asphalt paving and maintenance

operations. If asphalt paving will be used, then the paving operations will be subject to Rule 4641. This regulation is enforced on the asphalt provider.

- **Rule 4692 (Commercial Charbroiling)** – The purpose of this rule is to limit VOC and PM_{10} emissions from commercial charbroiling. This rule applies to charbroilers used to cook meat at commercial cooking operations.
- **Rule 9510 (Indirect Source Review)** – This rule reduces the impact of NO_X and PM_{10} emissions from growth within the Air Basin. The rule places application and emission reduction requirements on development projects meeting applicability criteria in order to reduce emissions through on-site mitigation, off-site District-administered projects, or a combination of the two.
- **Regulation VIII (Fugitive Dust PM_{10} Prohibitions)** – Rules 8011–8081 are designed to reduce PM_{10} emissions (predominantly dust/dirt) generated by human activity, including construction and demolition activities, road construction, bulk materials storage, paved and unpaved roads, carryout and trackout, etc. All development projects that involve soil disturbance are subject to at least one provision of the Regulation VIII series of rules.

Local

City of Hanford Municipal Code

Section 17.50.040 of the Hanford Municipal Code describes general performance standards to ensure public health, safety, and welfare for land uses, including the following:

- No use shall cause the emission of any smoke, ash, dust, fumes, vapors, gases or other forms of air pollution that can cause damage to human health, vegetation, or other forms of air pollution that can cause excessive soiling on any other parcel. No emission shall be permitted that exceeds the requirements of the San Joaquin Valley Air Pollution Control District or the requirements of any air quality plan adopted by the City of Hanford.

City of Hanford General Plan

The Hanford General Plan includes the following relevant guiding policies intended to control or reduce air pollution impact which are applicable to the project:

OBJECTIVE AQ 1: Effectively coordinate City air quality improvement activities with regional programs and those of neighboring jurisdictions.

Policy AQ 1.1: Coordinate City efforts and work with neighboring jurisdictions and affected agencies to minimize cross-jurisdictional and regional transportation and air quality issues.

Policy AQ 1.2: Consult with the San Joaquin Valley Air Pollution Control Agency and Kings County Association of Governments during CEQA review of discretionary projects having the potential for causing adverse air quality, transportation, and climate change impacts.

OBJECTIVE AQ 3: Integrate the City's land use, transportation, and air quality planning efforts to make the most efficient and effective use of public resources and create a healthier and more livable environment.

Policy AQ 3.1: Through project review, evaluation, and conditions of approval, minimize air quality and potential greenhouse gas impacts when planning the location and design of land uses and transportation systems needed to accommodate expected City population growth. Integrate decisions on land use and development locations with the San Joaquin Valley Blueprint.

Policy AQ 3.3: Consult with Kings County Association of Governments and transit providers during the planning stages of land use and transportation projects to assess project impacts on long-range transit plans and ensure that potential impacts are avoided.

Policy AQ 3.4: During project review, approval, and implementation, work with Caltrans, San Joaquin Valley Air Pollution Control District, and Kings County Association of Governments to minimize the air quality, mobility, and social impacts of large-scale transportation projects on existing communities and planned sensitive land uses.

OBJECTIVE AQ 4: Accurately assess and mitigate potentially significant local and regional air quality and climate change impacts from proposed projects within the City. Where possible and financially feasible, retrofit existing uses and activities to reduce emissions and climate change impacts.

Policy AQ 4.1: Assess and mitigate project air quality impacts using analysis methods and significance thresholds recommended by the San Joaquin Valley Air Pollution Control District.

Policy AQ 4.2: Assess and mitigate project greenhouse gas/climate change impacts using analysis methods and significance thresholds as defined or recommended by the San Joaquin Valley Air Pollution Control District.

Policy AQ 4.3: Ensure that air quality and climate change impacts identified during California Environmental Quality Act review are minimized and consistently and fairly mitigated to the greatest extent feasible.

Program AQ 4.1: The City will advise consultants to use San Joaquin Valley Air Pollution Control District Guidelines for preparing air and climate change assessments and will refer California Environmental Quality Act documents to the San Joaquin Valley Air Pollution Control District for review and comment on potential air quality and greenhouse gas impacts and for recommendations regarding air quality mitigation measures and greenhouse gas Best Performance Standards.

Policy AQ 4.4: Identify and maintain an ongoing inventory of the cumulative transportation, air quality, and climate change impacts of all general plan amendments approved during each year.

Policy AQ 4.5: Encourage and support the development of innovative and effective mitigation measures and programs to reduce air quality and climate change impacts through proactive coordination with the San Joaquin Valley Air Pollution Control District project applicants, and other knowledgeable and interested parties.

OBJECTIVE AQ 8: Locate adequate sites for industrial development and roadway projects away from existing and planned sensitive land uses to minimize or avoid potential health risks to people that might result from hazardous air pollutant emissions.

Policy AQ 8.2: Locate new air pollution point sources such as, but not limited to, industrial, manufacturing, and processing facilities an adequate distance from residential areas and other sensitive receptors.

ENVIRONMENTAL SETTING

Climate and Topography

The project site is located in the central portion of the SJVAB, which is bound by the Sierra Nevada Mountains to the east, the Coast Range in the west, and the Tehachapi mountains in the south. The regional climate in the SJVAB is temperate and is characterized by hot dry summers and cool, mild winters, infrequent seasonal rainfall, and up valley winds. Air quality in the SJVAB is primarily influenced by meteorology and a wide range of emission sources, such as dense population centers, substantial vehicular traffic, and industry.

Air pollutant emissions in the SJVAB are generated primarily by stationary and mobile sources. Stationary sources can be divided into two major subcategories: point and area sources. Point sources occur at a specific location and are often identified by an exhaust vent or stack. Examples include boilers or combustion equipment that produce electricity or generate heat. Area sources are widely distributed and include such sources as residential and commercial water heaters, painting operations, lawn mowers, agricultural fields, landfills, and some consumer products. Mobile sources refer to emissions from motor vehicles, including tailpipe and evaporative emissions, and are classified as either on-road or off-road. On-road sources may be legally operated on roadways and highways. Off-road sources include aircraft, ships, trains, and self-propelled construction equipment. Air pollutants can also be generated by the natural environment, such as when high winds suspend fine dust particles.

Air Pollutants of Concern

The air pollutants emitted into the ambient air by stationary and mobile sources are regulated by State and federal laws. These regulated air pollutants are known as “criteria air pollutants” and are categorized into primary and secondary pollutants. Primary air pollutants are emitted directly from sources. Carbon monoxide (CO), reactive organic gases (ROG), nitrogen oxide (NO_X), sulfur dioxide (SO_2), coarse particulate matter (PM_{10}), fine particulate matter ($PM_{2.5}$), and lead are primary air pollutants; of these, CO, NO_X, SO_2, PM_{10}, and $PM_{2.5}$ are criteria pollutants. ROG and NO_X are criteria pollutant precursors and form secondary criteria pollutants through chemical and photochemical reactions in the atmosphere. For example, O_3 is formed by a chemical reaction between ROG and NO_X in the presence of sunlight; O_3 and NO_2 are the principal secondary pollutants. Sources and health effects commonly associated with criteria pollutants are summarized in *Table 5.3-2*: *Air Contaminants and Associated Public Health Concerns*.

Table 5.3-2: Air Contaminants and Associated Public Health Concerns

Pollutant[1]	Major Man-Made Sources	Human Health Effects
Particulate Matter (PM_{10} and $PM_{2.5}$)	Power plants, steel mills, chemical plants, unpaved roads and parking lots, wood-burning stoves and fireplaces, automobiles and others.	Increased respiratory symptoms, such as irritation of the airways, coughing, or difficulty breathing; asthma; chronic bronchitis; irregular heartbeat; nonfatal heart attacks; and premature death in people with heart or lung disease. Impairs visibility.

Pollutant[1]	Major Man-Made Sources	Human Health Effects
Ozone (O_3)	Formed by a chemical reaction between reactive organic gases/volatile organic compounds (ROG or VOC)[1] and nitrogen oxides (NO_X) in the presence of sunlight. Motor vehicles exhaust industrial emissions, gasoline storage and transport, solvents, paints and landfills.	Irritates and causes inflammation of the mucous membranes and lung airways; causes wheezing, coughing, and pain when inhaling deeply; decreases lung capacity; aggravates lung and heart problems. Damages plants; reduces crop yield.
Sulfur Dioxide (SO_2)	A colorless gas formed when fuel containing sulfur is burned and when gasoline is extracted from oil. Examples are petroleum refineries, cement manufacturing, metal processing facilities, locomotives, and ships.	Respiratory irritant. Aggravates lung and heart problems. In the presence of moisture and oxygen, sulfur dioxide converts to sulfuric acid which can damage marble, iron and steel. Damages crops and natural vegetation. Impairs visibility. Precursor to acid rain.
Carbon Monoxide (CO)	An odorless, colorless gas formed when carbon in fuel is not burned completely; a component of motor vehicle exhaust.	Reduces the ability of blood to deliver oxygen to vital tissues, affecting the cardiovascular and nervous system. Impairs vision, causes dizziness, and can lead to unconsciousness or death.
Nitrogen Dioxide (NO_2)	A reddish-brown gas formed during fuel combustion for motor vehicles and industrial sources. Sources include motor vehicles, electric utilities, and other sources that burn fuel.	Respiratory irritant; aggravates lung and heart problems. Precursor to O_3. Contributes to global warming and nutrient overloading which deteriorates water quality. Causes brown discoloration of the atmosphere.
Lead (Pb)	Lead is a metal found naturally in the environment as well as in manufactured products. The major sources of lead emissions have historically been motor vehicles (such as cars and trucks) and industrial sources. Due to the phase out of leaded gasoline, metals processing is the major source of lead emissions to the air today. The highest levels of lead in air are generally found near lead smelters. Other stationary sources are waste incinerators, utilities, and lead-acid battery manufacturers.	Exposure to lead occurs mainly through inhalation of air and ingestion of lead in food, water, soil, or dust. It accumulates in the blood, bones, and soft tissues and can adversely affect the kidneys, liver, nervous system, and other organs. Excessive exposure to lead may cause neurological impairments such as seizures, mental retardation, and behavioral disorders. Even at low doses, lead exposure is associated with damage to the nervous systems of fetuses and young children, resulting in learning deficits and lowered IQ.

Note:
1. Volatile Organic Compounds (VOCs or Reactive Organic Gases [ROG]) are hydrocarbons/organic gases that are formed solely of hydrogen and carbon. There are several subsets of organic gases including ROGs and VOCs. Both ROGs and VOCs are emitted from the incomplete combustion of hydrocarbons or other carbon-based fuels. The major sources of hydrocarbons are combustion engine exhaust, oil refineries, and oil-fueled power plants; other common sources are petroleum fuels, solvents, dry cleaning solutions, and paint (via evaporation).

Source: Source: California Air Resources Board, *Common Air Pollutants*, https://ww2.arb.ca.gov/resources/common-air-pollutants, accessed July 2025.

Toxic Air Contaminants

Toxic air contaminants (TACs) are airborne substances that can cause short-term (acute) or long-term (i.e., chronic, carcinogenic or cancer causing) adverse human health effects (i.e., injury or illness). TACs include

both organic and inorganic chemical substances. They may be emitted from a variety of common sources including gasoline stations, automobiles, dry cleaners, industrial operations, and painting operations. The current California list of TACs includes more than 200 compounds, including particulate emissions from diesel-fueled engines.

CARB identified DPM as a TAC (CARB, 1998). DPM differs from other TACs in that it is not a single substance but rather a complex mixture of hundreds of substances. Diesel exhaust is a complex mixture of particles and gases produced when an engine burns diesel fuel. DPM is a concern because it causes lung cancer; many compounds found in diesel exhaust are carcinogenic. DPM includes the particle-phase constituents in diesel exhaust. The chemical composition and particle sizes of DPM vary between different engine types (heavy-duty, light-duty), engine operating conditions (idle, accelerate, decelerate), fuel formulations (high/low sulfur fuel), and the year of the engine. Some short-term (acute) effects of diesel exhaust include eye, nose, throat, and lung irritation, and diesel exhaust can cause coughs, headaches, light-headedness, and nausea. DPM poses the greatest health risk among the TACs. Almost all diesel exhaust particle mass is 10 microns or less in diameter. Due to their extremely small size, these particles can be inhaled and eventually trapped in the bronchial and alveolar regions of the lung.

Ambient Air Quality

CARB monitors ambient air quality at approximately 250 air monitoring stations across the State. These stations usually measure pollutant concentrations ten feet above ground level; therefore, air quality is often referred to in terms of ground-level concentrations. Existing levels of ambient air quality, historical trends, and projections near the project site are documented by measurements made by the SJVAPCD, the air pollution regulatory agency in the SJVAB that maintains air quality monitoring stations which process ambient air quality measurements.

Pollutants of concern in the SJVAB include O_3, PM_{10}, and $PM_{2.5}$. The closest air monitoring stations to the project that monitors ambient concentrations of these pollutants are the Handford-S Irwin Street Station (located approximately 1.52 miles to the east) and the Fresno – Foundry Park Station (located approximately 27.46 miles to the north). Local air quality data from 2021 to 2023 are provided in *Table 5.3-3*: *Ambient Air Quality Data*, which lists the monitored maximum concentrations and number of exceedances of State or federal air quality standards for each year.

Table 5.3-3: Ambient Air Quality Data

Criteria Pollutant	2021	2022	2023
Ozone (O_3)[1]			
1-hour Maximum Concentration (ppm)	0.102	0.091	0.091
8-hour Maximum Concentration (ppm)	0.096	0.082	0.084
Number of Days Standard Exceeded			
CAAQS 1-hour (>0.09 ppm)	18	13	14
NAAQS 8-hour (>0.070 ppm)	16	12	11

Criteria Pollutant	2021	2022	2023
Carbon Monoxide (CO)			
1-hour Maximum Concentration (ppm)	2.61	3.49	1.66
Number of Days Standard Exceeded			
NAAQS 1-hour (>35 ppm)	—	—	—
CAAQS 1-hour (>20 ppm)	—	—	—
Nitrogen Dioxide (NO_2)[2]			
1-hour Maximum Concentration (ppm)	51.5	45.8	55.2
Number of Days Standard Exceeded			
NAAQS 1-hour (>0.100 ppm)	0	0	0
CAAQS 1-hour (>0.18 ppm)	0	0	0
Particulate Matter Less Than 10 Microns (PM_{10})[1]			
National 24-hour Maximum Concentration	175	250.8	157.3
State 24-hour Maximum Concentration	192.7	251.6	159.3
State Annual Average Concentration (CAAQS=20 µg/m3)	52.8	49.9	44.2
Number of Days Standard Exceeded			
NAAQS 24-hour (>150 µg/m^3)	—	—	—
CAAQS 24-hour (>50 µg/m^3)	—	—	—
Particulate Matter Less Than 2.5 Microns ($PM_{2.5}$)[2]			
National 24-hour Maximum Concentration	81.0	62.9	54.4
State 24-hour Maximum Concentration	81.0	62.9	54.4
Number of Days Standard Exceeded			
NAAQS 24-hour (>35 µg/m^3)	—	—	—
NAAQS = National Ambient Air Quality Standards; CAAQS = California Ambient Air Quality Standards; ppm = parts per million. µg/m3 = micrograms per cubic meter; – = not measured			
Notes: Measurements taken at the Hanford-S Irwin Street at 807 South Irwin Street, Hanford, CA 93230 (CARB# 16716) and the Fresno – Foundry Park at 2482 Foundry Park Avenue, Fresno, CA 93706 (CARB# 10252).			
Source: All pollutant measurements are from the CARB Aerometric Data Analysis and Management system database (https://www.arb.ca.gov/adam) except for CO, which were retrieved from the CARB Air Quality and Meteorological Information System (https://www.arb.ca.gov/aqmis2/aqdselect.php).			

Sensitive Receptors

Sensitive populations are more susceptible to the effects of air pollution than the general population. Sensitive receptors that are in proximity to localized sources of toxics are of particular concern. Land uses considered sensitive receptors include residences, schools, playgrounds, childcare centers, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes. The nearest sensitive receptor to the project site is a daycare center approximately 193 feet to the south. Sensitive land uses nearest to the project site are shown in *Table 5.3-4*: *Sensitive Receptors*.

Table 5.3-4: Sensitive Receptors

Receptor Description	Distance and Direction from the Project Site
Child Daycare Center	193 feet to the south
Single-family Residential	742 feet to the south
Single-family Residential	479 feet to the south
Single-family Residential	748 feet to the east
Koinonia Church	2,110 feet to the west
Single-family Residential	464 feet to the southeast
Centennial Park	1,711 feet to the southeast
Multi-family Residential	390 feet to the southwest
Hotel	1,091 feet to the northeast
Hotel	2,009 feet to the northeast
Health Center	2,140 feet to the northeast
Hotel	1,430 feet to the northwest
Source: Google Earth, 2025.	

Thresholds

SJVAPCD has identified regional construction and operational emissions thresholds to determine a project's cumulative impact on air quality in the SJVAB. The City has adopted these thresholds for project assessment and mitigation, per General Plan Policy AQ 4.1. *Table 5.3-5: SJVAPCD Criteria Pollutant Thresholds of Significance* lists SJVAPCD's regional significance thresholds.

Table 5.3-5: SJVAPCD Criteria Pollutant Thresholds of Significance

Criteria Air Pollutants and Precursors (Regional)	Construction-Related	Operational-Related
	Average Annual Emissions (tons/year)	Annual Average Emission (tons/year)
Reactive Organic Gases (ROG)	10	10
Nitrogen Oxides (NO_X)	10	10
Carbon Monoxide (CO)	100	100
Sulfur Oxides (SO_X)	27	27
Coarse Particulates (PM_{10})	15	15
Fine Particulates ($PM_{2.5}$)	15	15
Source: SJVAPCD, *Guidance for Assessing and Mitigating Air Quality Impacts*, March 19, 2015.		

In addition to the thresholds cited above, the SJVAPCD has thresholds applicable to CO emissions that require projects to perform localized CO modeling. These preliminary thresholds include the following:

- A traffic study for the project indicates that the Level of Service (LOS) on one or more streets or at one or more intersections in the project vicinity will be reduced to LOS E or F; or
- A traffic study indicates that the project will substantially worsen an already existing LOS F on one or more streets or at more or more intersections in the project vicinity.

With respect to cumulative air quality impacts, the SJVAPCD's *Guide of Assessing and Mitigating Air Quality Impacts* (GAMAQI)[1] provides that any project that would individually have a significant air quality impact (i.e. exceed criteria pollutant significance thresholds) would also be considered to have significant cumulative impacts.

Projects that would potentially generate objectionable odorous emissions that would be located near existing sensitive receptors or other land uses where people may congregate could constitute a significant air quality impact to existing uses. The SJVAPCD uses a threshold based on the distance of the odor source from people and complaint records for a facility or similar facility. The threshold would be more than one confirmed complaint per year averaged over a three-year period, or three unconfirmed complaints per year averaged over a three-year period.

Health Risk Analysis Thresholds

Consistent with the California Air Pollution Control Officers Association's *Guidance on Assessing and Mitigating Air Quality Impacts* (GAMAQI), a screening-level evaluation of potential health risks was performed for the Project. In accordance with GAMAQI Section 6.5 (Potential Land Use Conflicts and Exposure of Sensitive Receptors), the evaluation examined the types and levels of toxic air contaminants (TACs) that could be generated by the Project and the potential exposure of nearby sensitive receptors. Based on the Project's classification as a Type A project under GAMAQI, this screening-level analysis is considered sufficient to assess potential health risk impacts and to determine whether a refined health risk assessment (HRA) would be warranted.

Project health risks are determined by examining the types and levels of air toxics generated and the associated impacts on factors that affect air quality. While the final determination of significance thresholds is within the Lead Agency's purview pursuant to the State CEQA Guidelines, the SJVAPCD recommends that lead agencies use the following air pollution thresholds in determining whether a project's impacts are significant. If the lead agency finds that the project has the potential to exceed the air pollution thresholds, a project's impacts should be considered significant. The TAC emissions thresholds are as follows.

- **Cancer Risk (Individual):** Emit contaminants that result in a maximum individual incremental cancer risk equal to or greater than 20 in one million.
- **Non-Cancer Risk:** Emit contaminants that result in a chronic or acute hazard index equal to or greater than 1.0 (project increment).

Cancer risk is expressed in terms of expected incremental incidence per million population. The SJVAPCD has established an incidence rate of 20 persons per million as the maximum acceptable incremental cancer risk due to TAC exposure. This threshold is an upper-bound incremental probability to determine whether or not a given project has a potentially significant development-specific and cumulative impact and to ensure an individual new source does not contribute a cumulatively significant impact. The 10 in one million standard is a health-protective significance threshold. A risk level of 10 in one million implies a likelihood that up to 10 persons, out of one million equally exposed persons, would contract cancer if exposed continuously (24 hours per day) to the TAC levels over a specified duration of time. This risk

[1] San Joaquin Valley Air Pollution Control District, *Guidance for Assessing and Mitigating Air Quality Impacts*, March 19, 2015.

would be an excess cancer that is in addition to any cancer risk borne by a person not exposed to these TACs.

The SJVAPCD has also established non-carcinogenic risk parameters for use in HRAs. Noncarcinogenic risks are quantified by calculating a "hazard index," expressed as the ratio between the ambient pollutant concentration and its toxicity or Reference Exposure Level (REL). A REL is a concentration at or below which health effects are not likely to occur. A hazard index of less than 1.0 means that adverse health effects are not expected. Within this analysis, non-carcinogenic exposures of less than 1.0 are considered less than significant.

For purposes of impact analysis, all calculations assumed the full development of both Phase 1 and Phase 2, including the rear commercial fueling area. This approach represents a conservative estimate of potential impacts. If Phase 2 is not constructed, the area designated for rear fueling will remain landscaped, and actual impacts related to associated site operations would be lower than those presented in this analysis.

ENVIRONMENTAL IMPACTS

a) Conflict with or obstruct implementation of the applicable air quality plan?

Less Than Significant Impact. The SJVAPCD is tasked with implementing programs and regulations required by the FCAA and the CCAA. In that capacity, the SJVAPCD has prepared plans to attain Federal and State ambient air quality standards. To achieve attainment with the standards, the SJVAPCD has established thresholds of significance for criteria pollutant emissions in their GAMAQI. Projects with emissions below the thresholds of significance for criteria pollutants would be determined to “not conflict or obstruct implementation of the District’s air quality plan”. As discussed in 5.3 (b) below, the project would not exceed any SJVAPCD Criteria Pollutant Thresholds during construction or operations. Therefore, the project would not conflict with or delay the implementation of SJVAPCD attainment plans and would result in a less than significant impact.

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Less Than Significant Impact.

Construction Emissions

Project construction activities would generate short-term emissions of criteria air pollutants. The criteria pollutants of primary concern within the project area include ozone-precursor pollutants (i.e., ROG and NO_x) and PM_{10} and $PM_{2.5}$. Construction-generated emissions are short term and temporary, lasting only while construction activities occur, but would be considered a significant air quality impact if the volume of pollutants generated exceeds the SJVAPCD’s thresholds of significance.

Construction results in the temporary generation of emissions during demolition, site preparation, site grading, road paving, motor vehicle exhaust associated with construction equipment and worker trips, and the movement of construction equipment, especially on unpaved surfaces.

Emissions of airborne particulate matter are largely dependent on the amount of ground disturbance associated with site preparation activities, as well as weather conditions and the appropriate application of water.

Construction activities would include demolition, off-site infrastructure improvements, site preparation, grading, paving, building construction, and architectural coating applications. Earthwork activities would require approximately 10,300 cubic yards (cy) of import. The duration of construction activities associated with the project are estimated to last approximately eight months, beginning in July 2026 and concluding in March 2027. The project's construction-related emissions were calculated using the SJVAPCD-approved California Emissions Estimator Model version 2022.1.1.29 (CalEEMod), which is designed to model emissions for land use development projects, based on typical construction requirements. The project's predicted maximum annual construction-related emissions are summarized in *Table 5.3-6: Construction-Related Emissions*. It is noted that due to technological improvements for construction equipment, emissions from project construction activities would likely be lower than those shown in the table if construction were to occur in later years. See Appendix A: Air Quality, GHG, and Energy Modeling Data for additional information regarding the construction assumptions used in this analysis.

Table 5.3-6: Construction-Related Emissions

Construction Year	Pollutant (maximum tons per year)[1]					
	Reactive Organic Gases (ROG)	Nitrogen Oxides (NO_x)	Carbon Monoxide (CO)	Sulfur Oxides (SO_x)	Coarse Particulate Matter (PM_{10})	Fine Particulate Matter ($PM_{2.5}$)
2026	0.11	0.92	0.97	<0.01	0.12	0.07
2027	0.09	0.27	0.37	<0.01	0.01	0.01
Maximum Emissions	**0.11**	**0.92**	**0.97**	**<0.01**	**0.12**	**0.07**
SJVAPCD Significance Threshold [2]	*10*	*10*	*100*	*27*	*15*	*15*
Exceed SJVAPCD Threshold?	**No**	**No**	**No**	**No**	**No**	**No**

1. Due to rounding, total emissions may be marginally different from CalEEMod output.
2. SJVAPCD, *Guidance for Assessing and Mitigating Air Quality Impacts*, March 2015.
Source: Refer to the CalEEMod outputs provided in Appendix A.

Fugitive Dust Emissions. Fugitive dust emissions are associated with land clearing, ground excavation, cut-and-fill operations, and truck travel on unpaved roadways. Dust emissions also vary substantially from day to day, depending on the level of activity, the specific operations, and weather conditions. Fugitive dust emissions may have a substantial, temporary impact on local air quality. In addition, fugitive dust may be a nuisance to those living and working in the project vicinity. Uncontrolled dust from construction can become a nuisance and potential health hazard to those living and working nearby. Pursuant to Regulation VIII, Rule 8021, the project would be required to develop, prepare, submit, obtain approval of, and implement a dust control plan, which

would reduce fugitive dust impacts to less than significant for project construction. Pre-activity measure options include pre-watering to limit visible dust emissions (VDE) to 20% opacity and phasing work to reduce the amount of disturbed surface at any one time. During operations, measure options include constructing wind barriers and applying water or other stabilizers or suppressants to limit VDE to 20% opacity. During periods of inactivity, measure options include restricting vehicular access to the construction area and applying water or other stabilizers or suppressants to maintain a stabilized surface. Quantified construction emissions in this analysis (see *Table 5.3-6*) account for reductions associated with Rule 8021.

Construction Equipment and Worker Vehicle Exhaust. Exhaust emission factors for typical diesel-powered heavy equipment are based on the CalEEMod program defaults. Variables factored into estimating the total construction emissions include: level of activity, length of construction period, number of pieces/types of equipment in use, site characteristics, weather conditions, number of construction personnel, and the amount of materials to be transported onsite or offsite. Exhaust emissions from construction activities include emissions associated with the transport of machinery and supplies to and from the project site, emissions produced on site as the equipment is used, and emissions from trucks transporting materials and workers to and from the site. Emitted pollutants would include ROG, NO_X, PM_{10}, and $PM_{2.5}$.

ROG Emissions. In addition to gaseous and particulate emissions, the application of asphalt and surface coatings creates ROG emissions, which are O_3 precursors. In accordance with the methodology prescribed by the SJVAPCD, the ROG emissions associated with paving have been quantified with CalEEMod.

The highest concentration of ROG emissions would be generated from architectural coating beginning in January 2027 and lasting approximately two months. This phase includes the interior and exterior painting as well as striping of all paved parking areas and driveways. Paints would be required to comply with SJVAPCD's Rule 4601 (Architectural Coatings) and limit the amount of ROG emissions from cutback asphalt in compliance with the requirements of SJVAPCD's Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving and Maintenance Operations). Quantified construction emissions in this analysis (see *Table 5.3-6*) conservatively do not account for reductions associated with Rules 4601 and 4641.

Summary. As shown in *Table* 5.3-6: Construction-Related Emissions

Construction Year	Pollutant (maximum tons per year)[1]					
	Reactive Organic Gases (ROG)	Nitrogen Oxides (NO_x)	Carbon Monoxide (CO)	Sulfur Oxides (SO_x)	Coarse Particulate Matter (PM_{10})	Fine Particulate Matter ($PM_{2.5}$)
2026	0.11	0.92	0.97	<0.01	0.12	0.07
2027	0.09	0.27	0.37	<0.01	0.01	0.01
Maximum Emissions	**0.11**	**0.92**	**0.97**	**<0.01**	**0.12**	**0.07**

Construction Year	Pollutant (maximum tons per year)[1]					
	Reactive Organic Gases (ROG)	Nitrogen Oxides (NO_x)	Carbon Monoxide (CO)	Sulfur Oxides (SO_x)	Coarse Particulate Matter (PM_{10})	Fine Particulate Matter ($PM_{2.5}$)

1. Due to rounding, total emissions may be marginally different from CalEEMod output.
2. SJVAPCD, *Guidance for Assessing and Mitigating Air Quality Impacts*, March 2015.
Source: Refer to the CalEEMod outputs provided in Appendix A.

5.3-6, all criteria pollutant emissions would remain below their respective thresholds. As such, the proposed project's construction would not worsen ambient air quality, create additional violations of federal and state standards, or delay the SJVAPCD's goal for meeting attainment standards. Impacts would be less than significant.

Operational Emissions

Operational emissions for the fueling station and convenience store are typically generated from mobile sources (burning of fossil fuels in cars); energy sources (cooling and heating); and area sources (landscape equipment and consumer products). *Table 5.3-7*: *Project Operational Emissions*

Emissions Source	Pollutant (maximum tons per year)[1]

Area Source Emissions. Area source emissions would be generated due to consumer products, on-site equipment, architectural coating, and landscaping that were previously not present on the site. Consumer products are various solvents used in non-industrial applications, which emit VOCs during product use. These typically include cleaning supplies, kitchen aerosols, cosmetics, and toiletries.

Energy Source Emissions. Energy source emissions would be generated as a result of electricity usage associated with the project. As discussed in *Section 5.8*, *Greenhouse Gas Emissions*, the project would implement **Mitigation Measure MM GHG-1,** requiring all-electric development, and not utilize any natural gas. The primary use of electricity by the project would be for space heating and cooling, water heating, ventilation, lighting, appliances, and electronics.

Mobile Source Emissions. Mobile sources are emissions from motor vehicles, including tailpipe and evaporative emissions. Depending upon the pollutant being discussed, the potential air quality impact may be of either regional or local concern. For example, ROG, NO_X, PM_{10}, and $PM_{2.5}$ are all pollutants of regional concern (NO_X and ROG react with sunlight to form O_3 [photochemical smog], and wind currents readily transport PM_{10} and $PM_{2.5}$). However, CO tends to be a localized pollutant, dispersing rapidly at the source. Project-generated vehicle emissions have been estimated using CalEEMod. Trip generation rates associated with the project were based on the Transportation Impact Study prepared by Kimley-Horn (2025). Based on the Transportation Impact Study, the project would result in a gross total of 5,816 daily vehicle trips. However, with pass-by trips, the project would result in 4,986 net new trips.

Gasoline Dispensing Facility. The proposed project would include 12 vehicle fueling dispensers in phase 1 of development, and if phase 2 were to occur, an additional five truck fueling positions. The 12 vehicle fueling dispensers would dispense gasoline and therefore would be considered a gasoline dispensing facility (GDF). GDFs are regulated by the SJVAPCD, and GDFs require permits from the SJVAPCD. Thus, emissions attributed to the GDF were estimated separately from the area source operational emissions above. The emissions calculations are based on annual daily throughput of 9,912 gallons of gasoline (approximately 3.62 million gallons per year) and 8,444 gallons of diesel (approximately 3.08 million gallons per year). In addition to traffic-related emissions, the GDF is also a source of ROG emissions associated with loading, storage, refueling of vehicles and spillage that results in evaporative emissions. *Table 5.3-7* also presents the evaporative ROG emissions associated with the proposed GDF. As shown in *Table 5.3-7*, the ROG emissions from the proposed GDF would not result in an exceedance of the SJVAPCD's applicable significance thresholds.

Emergency Backup Generators. Another potential source of operational emissions is stationary equipment such as diesel engines used to power emergency back-up generators. Backup generators would only be used in the event of a power failure and would not be part of the project's normal daily operation. Nonetheless, emissions associated with one backup generator for the proposed gasoline station was included to be conservative. Emissions from an emergency backup generator for the proposed gasoline station was calculated separately from CalEEMod; refer to Appendix A. Stationary sources would be subject to SJVAPCD rules and regulations and could require permits from SJVAPCD. The SJVAPCD's permitting process requires the purchase of emission reduction credits (ERC) for any criteria pollutant exceeding the SJVAPCD's New Source Review (NSR) offset requirements. NSR offset requirements provide the basis for the SJVAPCD CEQA thresholds of significance. As such, sources of stationary air pollutant emissions will be required to comply with all applicable SJVAPCD regulations.

Total Operational Emissions. As seen in *Table* 5.3-7: Project Operational Emissions

Emissions Source	Pollutant (maximum tons per year)[1]					
	Reactive Organic Gases (ROG)	Nitrogen Oxides (NO_X)	Carbon Monoxide (CO)	Sulfur Oxides (SO_x)	Coarse Particulate Matter (PM_{10})	Fine Particulate Matter ($PM_{2.5}$)
Proposed Project						
Area	0.04	<0.01	0.02	<0.01	<0.01	<0.01
Energy	<0.01	<0.01	<0.01	<0.01	<0.01	<0.01
Mobile	2.73	4.09	14.82	0.04	3.08	0.82
Backup Generator	0.02	0.05	0.04	<0.01	<0.01	<0.01

Source: Refer to the CalEEMod outputs provided in Appendix A, Air Quality Modeling Data.

5.3-7, project operational emissions would not exceed SJVAPCD thresholds. As noted above, the SJVAPCD has set its CEQA significance threshold based on the trigger levels for the federal NSR Program. The NSR Program was created to ensure projects are consistent with attainment of health-based federal ambient air quality standards. The federal ambient air quality standards establish the levels of air quality necessary, with an adequate margin of safety, to protect the public health. Therefore, the project would not violate any air quality standards or contribute substantially to an existing or projected air quality violation, and no criteria pollutant health impacts would occur. Project operational emissions would be less than significant.

Cumulative Short-Term Emissions

The SJVAB is designated nonattainment for O_3, PM_{10}, and $PM_{2.5}$ for State standards, and nonattainment for ozone and $PM_{2.5}$ for Federal standards. Ozone formation is driven by regional emissions of NO_x and ROG, while $PM_{2.5}$ concentrations result from both direct particulate emissions and secondary formation from NO_x, SO_x, and ROG.

As discussed above, the Project's construction-related emissions of ozone precursors (NO_x and ROG) and particulate matter (PM_{10} and $PM_{2.5}$) would not exceed the SJVAPCD significance thresholds. These thresholds are designed to identify whether an individual project's emissions would be cumulatively considerable in the context of existing regional nonattainment conditions. Therefore, because construction emissions would remain below the applicable thresholds, the

Project would not meaningfully contribute to regional $PM_{2.5}$ or ozone nonattainment conditions on a cumulative basis.

The SJVAPCD recommends consistency with Regulation VIII requirements for all projects, regardless of whether construction-related emissions exceed significance thresholds. Compliance with Regulation VIII reduces fugitive dust and exhaust emissions at a basin-wide level and is considered effective in minimizing cumulative construction-related air quality impacts. As a result, construction emissions associated with the Project would not result in a cumulatively considerable contribution to significant cumulative air quality impacts related to $PM_{2.5}$ or ozone.

Cumulative Long-Term Impacts

The SJVAPCD has not established separate significance thresholds for cumulative operational emissions. Air quality impacts associated with criteria pollutants such as ozone and $PM_{2.5}$ are inherently cumulative in nature, particularly in air basins that are designated nonattainment. No single project, by itself, is sufficient to cause or resolve regional nonattainment; rather, individual projects contribute incrementally to existing cumulatively significant air quality conditions.

To address this, the SJVAPCD developed operational thresholds of significance that represent emission levels above which a project would be considered to have a cumulatively considerable contribution to regional air quality impacts, including those related to ozone formation and $PM_{2.5}$ concentrations. As shown in *Table 5.3-7*, the Project's operational emissions of ozone precursors and particulate matter would not exceed the applicable SJVAPCD thresholds. Accordingly, the Project's operational emissions would not result in a cumulatively considerable contribution to significant cumulative air quality impacts.

c) Expose sensitive receptors to substantial pollutant concentrations?

Less Than Significant Impact. Sensitive land uses are defined as facilities or land uses that include members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with illnesses. Examples of these sensitive receptors are residences, schools, hospitals, and daycare centers.

Health Risk Assessment

A Health Risk Assessment (HRA) was prepared for the proposed project and is included in Appendix B: Health Risk Assessment. The HRA evaluated potential health risks associated with the emission of diesel particulate matter (DPM) and benzene resulting from project implementation. Construction equipment and associated heavy-duty truck traffic generate diesel exhaust, which is a known TAC. Diesel exhaust from construction equipment operating at the site poses a health risk to nearby sensitive receptors. Operational activities would also emit TACs from the use of heavy-duty diesel trucks and fueling activities.

CARB identified DPM as a TAC in 1998. Mobile sources (including trucks, buses, automobiles, trains, ships, and farm equipment) are by far the largest source of diesel emissions. The exhaust from diesel engines includes hundreds of different gaseous and particulate components, many of which

are toxic. Diesel exhaust is composed of two phases, either gas or particulate – both contribute to the risk. As the project is proposed near existing sensitive receptors, an analysis of DPM was performed using the U.S. EPA-approved AERMOD model.

Benzene is also a TAC. The majority of benzene emitted in California comes from motor vehicles, including evaporative leakage and unburned fuel exhaust. Benzene is highly carcinogenic and occurs throughout California. Benzene also has non-cancer health effects. As the project is proposing to dispense gasoline, an analysis of benzene was performed using the U.S. EPA-approved AERMOD model.

Construction Sources

Construction would generate DPM emissions from the use of off-road diesel equipment required for site preparation, grading and excavation, paving, and other construction activities. For construction activity, DPM is the primary TAC of concern because it is the most potent TAC emitted from construction and includes hundreds of chemicals. Although DPM is a subset of PM10 exhaust, the analysis conservatively assumes all PM10 exhaust emissions are DPM. On-road diesel-powered haul trucks traveling to and from the construction site to deliver materials and equipment were included in the analysis, although they are typically less of a concern because they would not stay on the site for long durations.

Health-related risks associated with diesel-exhaust emissions are primarily linked to long-term exposure and the associated risk of contracting cancer. The use of diesel-powered construction equipment would be episodic and would occur throughout the project site. In compliance with state law (Section 2485 and Section 2449 of Title 13 of the California Code of Regulations), construction activities would limit diesel construction truck/equipment idling to no more than five minutes, which would further reduce nearby sensitive receptors' exposure to temporary and variable DPM emissions. Furthermore, even during the most intense period of construction, DPM emissions would be generated from different locations on the project site rather than in a single location because different types of construction activities (e.g., site preparation and building construction) would not occur at the same place at the same time. Construction emission rates for PM10 (DPM) were calculated using CalEEMod; refer to Appendix B. Project construction is proposed to occur in 2026 over approximately eight months.

Operational Sources

CARB estimates that about 70 percent of the cancer risk that the average Californian faces from breathing toxic air pollutants stems from diesel exhaust particles. This analysis also evaluates potential health risks associated with the emission of benzene. Out of the toxic compounds emitted from the gasoline stations, benzene, ethylbenzene, and naphthalene have cancer toxicity values. However, benzene is the TAC which drives the risk, accounting for 87 percent of cancer risk from gasoline vapors and constitutes more than three to four times the weight of gasoline than ethylbenzene and naphthalene, respectively. Therefore, ethylbenzene and naphthalene have not been modeled and are instead considered significant in the case that benzene emissions are significant. Additionally, there are substances emitted from gasoline stations, such as toluene and xylene which possess acute adverse health effects (though not cancer risk).

CAPCOA's Gasoline Service Station Industrywide Risk Assessment Guidelines (Appendix I) indicate that the benzene 10 in a million cancer benchmark is reached at concentrations that are orders of magnitude lower than concentrations associated with chronic or acute noncancer health benchmarks for benzene and other gasoline constituents (e.g., toluene and xylene)(CAPCOA, 2022); therefore, cancer risk from benzene is expected to be the controlling endpoint at typical gasoline vapor concentrations.

Fueling Sources

Benzene emissions would occur from the proposed on-site fuel storage tanks and fuel dispensers. The specific processes associated with fuel storage tanks and fuel dispensers that emit air toxics include loading, breathing, refueling, and spillage, as described below:

- Loading – Emissions occur when a fuel tanker truck unloads gasoline into the storage tanks. The storage tank vapors, displaced during loading, are emitted through its vent pipe. A required pressure/vacuum valve installed on the tank vent pipe significantly reduces these emissions.

- Breathing – Emissions occur through the storage tank vent pipe as a result of temperature and pressure changes in the tank vapor space.

- Refueling – Emissions occur during motor vehicle refueling when gasoline vapors escape through the vehicle/nozzle interface.

- Spillage – Emissions occur from evaporating gasoline that spills during vehicle refueling.

Fuel dispensing facility emissions were computed based on the maximum anticipated throughput of fuel (i.e., approximately 3.6 million gallons per year). Emissions of benzene, which is a TAC, were computed using CARB emission factors for fuel dispensing facilities and assuming that benzene makes up 0.46 percent of gasoline vapor.[2] Total benzene emissions were calculated at 0.0019

[2] California Air Pollution Control Officers Association, *Gasoline Service Station Industrywide Risk Assessment Technical Guidance*, February 18, 2022.

pounds per hour; refer to Appendix B for the details of the calculations. The emission factors conservatively do not reflect control technologies required by any vapor recovery regulations later than 2013 (such as Certification Procedure for Vapor Recovery Systems for Enhanced Conventional [ECO] Nozzles and Low Permeation Conventional Hoses for Use at Gasoline Dispensing Facilities [CP-207], Certification Procedure for Vapor Recovery Systems at Gasoline Dispensing Facilities [CP-201]). These emissions factors are currently being updated by CARB.

Mobile Sources. Due to the increased vehicle traffic from the project, the resulting emissions could also result in pollutant concentrations at existing sensitive receptors. Average daily trips from truck traffic to the project site were obtained from the Maverik Hanford Transportation Impact Study (Transportation Impact Study), prepared by Kimley-Horn and Associates, Inc. (dated May 6, 2025). Emission rates for PM10 (DPM) were calculated using trip data and a CARB 2021 EMission FACtors model (EMFAC) model run for San Joaquin County; refer to Appendix B. EMFAC generates emission factors in terms of grams of pollutant emitted per vehicle activity and can calculate a matrix of emission factors at specific values of vehicle speed and type. The model was run for heavy-duty diesel vehicles traveling along off-site roads, circulating the project site, and idling at proposed loading areas and the truck fueling area.

Emergency Backup Generators. It is unknown whether emergency backup generators would be used. However, one backup generator was assumed for the proposed convenience store. Backup generators would only be used in the event of a power failure and would not be part of the project's normal daily operations. Nonetheless, emissions associated with testing and maintenance of one backup generator for the proposed convenience store was included to be conservative. If a backup generator is required, the end user would be required to obtain a permit from the SJVAPCD prior to installation. Emergency backup generators must meet SJVAPCD's Best Available Control Technology (BACT) requirements and comply with SJVAPCD rules related to generators, which would minimize emissions.

Carcinogenic Risk

As noted above, the project would generate TACs from construction and operations (i.e. truck traveling along local roads, idling, and on-site circulation; backup generator; and fueling activities); refer to Appendix B for a further discussion of project TAC sources. The project would be required to install vapor recovery systems per CARB's ATCM, comply with CARB's Vapor Recovery System Certification Procedure, and Use Enhanced Conventional (ECO) and Enhanced ORVR-Vehicle Recognition (EOR) nozzles, among others. The project would also be required to comply with SJVAPCD Rule 4622 (Gasoline Transfer Into Motor Vehicle Fuel Tanks), which would reduce fueling emissions.

Table 5.3-8: Carcinogenic Risk Assessment shows the unmitigated health risk for project construction and operations. Based on SJVAPCD methodology, the exposure duration for a resident is 70 years, beginning with the third trimester, and the worker and student exposure duration is 40 years and 5 years, respectively; refer to Table 5.3-8. Operations would commence following construction. As such, construction would not overlap with operations. The analysis calculates risk based on exposure to construction concentrations during the initial eight months of the exposure

duration and operational concentrations for the remainder of the exposure duration. The project (construction and operations combined scenario) would result in a maximum cancer risk of 1.69 in one million at the residential receptors, 1.57 in one million at the worker receptors, and 2.76 in one million at the student receptors. Therefore, the SJVAPCD threshold of 20 in one million would not be exceeded at the nearest receptors and impacts would be less than significant.

Table 5.3-8: Carcinogenic Risk Assessment

Receptors	Cancer Risk (per million)[1, 2, 3]				
		Operations			Construction and Operations Combined[4]
	Construction	Trucks + Generator	Gas Dispensing Facility	Total Operations

1. The reported risk is at the closest receptor (maximally exposed individual receptor (MEIR) for each exposure category.
2. Risk from "Construction" and "Trucks + Generator" is from PM_{10} and risk from the "Gas Dispensing Facility" is benzene.
3. Refer to Appendix B, Table 1, for exposure assumptions.
4. As cancer risk accumulates over time, the combined risk evaluates cancer risk with operational exposure starting at the end of construction. The combined risk assumes construction exposure starts from the third trimester for a year (8-month construction period) and operational exposure starts immediately after construction continues for the specified exposure duration shown in Appendix B, Table 1.

Refer to Appendix B.

Non-Carcinogenic Hazards

The significance thresholds for TAC exposure also require an evaluation of non-cancer risk stated in terms of a hazard index. Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at

which no adverse non-cancer health effects are anticipated. The potential for acute non-cancer hazards is evaluated by comparing the maximum short-term exposure level to an acute REL. RELs are designed to protect sensitive individuals within the population. The calculation of acute non-cancer impacts is similar to the procedure for chronic non-cancer impacts.

RELs are designed to protect sensitive individuals within the population. According to OEHHA, the REL for DPM is 5 and the target organ is the respiratory system. There is no acute REL for DPM and the acute health risk cannot be calculated. The chronic and acute REL for benzene is 3 and 27, respectively and the target organ is the hematologic system.

Acute and chronic impacts are shown in Table 5.3-9: Chronic and Acute Hazard Assessment Results. An acute or chronic hazard index of 1.0 is considered individually significant. The hazard index is calculated by dividing the acute or chronic exposure by the reference exposure level. Table 5.3-9 shows that non-carcinogenic hazards are calculated to be within acceptable limits and a less than significant impact would occur.

Table 5.3-9: Chronic and Acute Hazards Assessment Results

Emissions Sources	Chronic Hazard	Acute Hazard
Residential Receptors

Health Risk Assessment Conclusion

As concluded above, the project's cancer and non-cancer risks from construction and operational emissions would be less than significant, as both would be below SJVAPCD's thresholds of significance. It should be noted that the impacts assess the project's incremental contribution to health risk impacts, consistent with the OEHHA guidance and methodology. The SJVAPCD has not

established separate cumulative thresholds and does not require combining impacts from cumulative projects. The SJVAPCD considers projects that do not exceed the project-specific thresholds to generally not be cumulatively significant. Therefore, because the project's health risks (i.e., cancer and non-cancer) would not exceed the project-specific incremental thresholds, the project would not result in a cumulatively significant impact and the project's contribution would be less than cumulatively considerable. Impacts would be less than significant and no mitigation is required.

Carbon Monoxide Hotspots

Local air quality is a major concern along roadways. CO is a primary pollutant, and unlike ozone, is directly emitted from a variety of sources. For this reason, CO concentrations are usually indicative of the local air quality generated by a roadway network and are used as an indicator of its impacts upon the local air quality. Areas of vehicle congestion have the potential to create "pockets" of CO called "hot spots." These pockets have the potential to exceed the 1-hour CAAQS of 20 parts per million (ppm) and/or the 8-hour CAAQS of 9 ppm.

To identify CO hotspots, SJVAPCD recommends performing a CO hotspot preliminary screening analysis using the following thresholds:

- A traffic study for the project indicates that the Level of Service (LOS) on one or more streets or at one or more intersections in the project vicinity will be reduced to LOS E or F; or

- A traffic study indicates that the project will substantially worsen an already existing LOS F on one or more streets or at more or more intersections in the project vicinity.

Based on *Maverik Hanford Transportation Impact Study* (TIS) prepared by Kimley-Horn (May 6, 2025), study intersections in the project area would operate at an acceptable LOS.

Additionally, as part of a CO Hotspot Analysis performed by the South Coast Air Quality Management District (SCAQMD), the Wilshire Boulevard and Veteran Avenue intersection, one of the most congested intersections in Southern California with an average daily traffic (ADT) volume of approximately 100,000 vehicles per day, was modeled for CO concentrations. This modeling effort identified a CO concentration high of 4.6 ppm, which is well below the 20-ppm CAAQS. The project considered herein would not produce the volume of traffic required to generate a CO hot spot in the context of SCAQMD's CO Hotspot Analysis. Based on the TIS, peak hour traffic volumes at intersections in the project area do not exceed 3,000 vehicles per hour. As the CO hotspots were not experienced at the Wilshire Boulevard and Veteran Avenue intersection even as it accommodates 100,000 vehicles daily, it can be reasonably inferred that CO hotspots would not be experienced at any intersections in the vicinity of the project site resulting from 4,986 daily vehicle trips attributable to the project. Therefore, the project would not result in a CO hotspot, and impacts would be less than significant.

d) Result in other emissions (such as those leading to odors adversely affecting a substantial number of people?

Less Than Significant Impact.

According to the SJVAPCD, land uses associated with odor complaints typically include wastewater treatment plants, landfills, confined animal facilities, composting stations, food manufacturing plants, refineries, and chemical plants. The project does not include any uses identified by the SJVAPCD as being associated with odors.

Construction

Construction activities associated with the project may generate detectable odors from heavy duty equipment (i.e., diesel exhaust), as well as from architectural coatings and asphalt off-gassing. Odors generated from the referenced sources are common in the man-made environment and are not known to be substantially offensive to adjacent receptors. Any construction-related odors would be short-term in nature and cease upon project completion. As a result, impacts to existing adjacent land uses from construction-related odors would be short-term in duration and therefore would be less than significant.

Operational

The project would be subject to the SJVAPCD's Rule 4102, which allows members of the public to submit complaints regarding odor. The SJVAPCD's GAMAQI provides guidance for odor minimization practices, including establishing a buffer zone with dimensions sufficient to prevent exposing the public to nuisance levels of odorous emissions or relocation of stacks or vents, for projects that include uses associated with odors. The GAMAQI also provides guidance for determining the significance of odor problems based on a review of District complaint records for projects that are located in the vicinity of existing odor sources. As noted above, the project would not include any uses identified by SJVAPCD as being associated with odors. Moreover, the project is not located in the vicinity of any existing or planned land uses that would be considered major sources of odors. Impacts would be less than significant.

Cumulative Impacts

The SJVAPCD does not include separate significance thresholds for cumulative operational emissions. As discussed in Threshold AQ-2 above, the project would not exceed any SJVAPCD Criteria Pollutant Thresholds during construction or operations. Therefore, the project would not conflict with or delay the implementation of SJVAPCD attainment plans and would result in a less than significant impact. The SJVACPD notes that the nature of air emissions is largely a cumulative impact. As a result, no single project is sufficient in size by itself to result in nonattainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulatively significant adverse air quality impacts. Consistency with the SJVAPCD control measures would ensure that the project would not cumulatively contribute to air quality impacts in the Basin. Therefore, the project's cumulative contribution of air quality emissions would be less than significant, and the project's cumulative air quality impacts would also be less than cumulatively considerable.

5.4 BIOLOGICAL RESOURCES

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
BIOLOGICAL RESOURCES. Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?		**X**		
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?		**X**		
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological?				**X**
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?		**X**		
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?			**X**	
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?				**X**

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Less Than Significant with Mitigation Incorporated.

Special-Status Plants

Four special-status plants have low potential to occur within the Study Area based on regional database review, the presence of potentially suitable grassland habitat, and alkaline soil. The survey was conducted in the winter when special-status species may not have been detectable. Ground disturbances associated with project activities could result in direct impacts to special-status plants if they are present.

Implementation of **MM BIO-4** would ensure that any special-status plants are identified before project activities and that mitigation measures are implemented if found within the Study Area. Therefore, impacts to special-status plants would be less than significant with implementation of **MM BIO-4**.

Special-Status Wildlife

Crotch's Bumble Bee

Crotch's bumble bee has moderate potential to occur within the Study Area while foraging due to the seasonal availability of ruderal flowering forbs (e.g., mustard) as vegetation regrows following disking of the Study Area. The landscaped portions of the Study Area and adjacent parcels may also provide flowering resources for the species. Project related ground disturbance and vegetation removal could result in direct impacts to individuals if present and the species can be indirectly impacted through removal of foraging resources. **Mitigation Measures MM BIO-2, MM BIO-5,** and **MM BIO-6** are recommended to reduce impacts to Crotch's bumble bee to less than-than-significant levels by requiring pre-construction surveys, conducting environmental training for all workers, and avoiding impacts to the species, if detected.

Hoary Bat

Hoary bat has moderate potential to occur in the Study Area due to the presence of onsite ornamental trees that may provide limited roosting habitat and the availability of nearby open foraging habitat. If project activities include removal or trimming of trees within or immediately adjacent to the project footprint, the project could result in direct impacts to roosting bats if present, and indirect impacts from disturbance within 100-feet of roost sites. **Mitigation Measures MM BIO-3, MM BIO-5**, and **MM BIO-6** are recommended to reduce impacts to special-status bats to less-than-significant by requiring pre-construction tree assessments and roost avoidance measures, conducting environmental training for all workers, and implementing general best management practices to avoid impacts if bats are detected.

Swainson's Hawk

Swainson's hawk has low potential to occur within the Study Area. The Study Area consists primarily of disturbed, disked agricultural land and does not provide substantial nesting habitat. Ornamental trees are present within the southeastern corner of the Study Area and in adjacent residential landscaping. These trees provide limited nesting suitability due to the ornamental setting and proximity to urban development and major roadways. Swainson's hawk may occur as a transient flyover or occasional forager over the Study Area and adjacent agricultural lands. Project implementation could result in direct or indirect impacts if an active nest were present within trees located in the Study Area or immediately adjacent parcels (e.g., disturbance from vegetation removal, noise, vibration, and human activity during the nesting season). **Mitigation Measures MM BIO-1, MM BIO-5,** and **MM BIO-6** are recommended to reduce impacts to Swainson's hawk to less-than-significant levels by requiring pre-construction nesting bird surveys and establishment of no-disturbance buffers, conducting environmental training for all workers, and implementing general best management practices to avoid impacts if the species is detected.

Burrowing Owl

Burrowing owl has potential-to-occur within the Study Area. Although field surveys conducted as part of the Biological Resources Assessment (BRA) did not identify active burrows, the species was identified as "Not Expected." This determination was based on a December field survey when burrow visibility and California ground squirrel activity are typically reduced. However, burrowing owl is documented within the nine-quadrangle California Natural Diversity Database (CNDDB) search area, and the Study Area consists of recently disked agricultural land, which is a habitat type known to support the species.

Given these factors, burrowing owls may utilize the Study Area for foraging and could occupy suitable burrows if present during the breeding or non-breeding season. Project-related ground disturbance and vegetation removal could result in direct impacts on individuals, including potential take, as well as indirect impacts from habitat disturbance. For these reasons, the burrowing owl is considered to have a "Potential to Occur," and mitigation is required to reduce potential impacts to less than significant.

Implementation of **Mitigation Measures MM BIO-1, MM BIO-5,** and **MM BIO-6**, including pre-construction surveys with an appropriate buffer (300 feet)[3] for burrowing owls and active raptor nests, worker environmental awareness training, and general best management practices, would reduce potential impacts to burrowing owl to less-than-significant levels. If burrowing owls are detected during pre-construction surveys, appropriate avoidance and minimization measures, including establishment of no-disturbance buffers or additional coordination with the California Department of Fish and Wildlife, would be implemented.

[3] Buffer distance consistent with California Department of Fish and Wildlife *Staff Report on Burrowing Owl Mitigation, March 7, 2012*

Nesting Birds

The Study Area does however contain habitat with the potential to support nesting birds protected under the CFGC and the MBTA. Therefore, the project could result in direct or indirect impacts to nesting birds. Direct impacts may include mortality from vehicle or equipment strikes as foraging birds move through the project site, and physical impacts to active nests within project site. Indirect impacts could result from noise, vibrations, and dust from construction activities throughout the project site. Noise, vibrations,

and dust can cause birds to flush out of cover and become exposed to predators or vehicle strikes. If construction activities occur during the nesting season (generally February 1 to August 31), noise, vibrations, and dust can also cause nest failures. Adults may not return to nests, predators may feed on eggs or chicks in unprotected nests, or vibrations could cause eggs to fall out of nests. Noise, dust, and vibrations may also cause avian species to leave regular foraging areas. Potential direct and indirect impacts to special-status avian species would be reduced to less than significant through implementation of **Mitigation Measures MM BIO-1, MM BIO-5,** and **MM BIO-6.**

Mitigation Measures

MM BIO-1: **Pre-construction Survey and Impact Avoidance for Burrowing Owls, Raptors, and Other Nesting Birds**. To prevent the loss of active special-status and non-special-status bird nests, juveniles or adults, project activities including vegetation clearing shall be conducted outside of the breeding season (February 1 through August 31) to the extent feasible.

If project activities will occur between February 1 and August 31, a pre-construction nesting bird survey shall be conducted by a qualified biologist no more than 7 working days prior to the activity to survey for special-status and non-special-status bird and raptor nests. The survey area shall include the project footprint and a 100-foot buffer for passerine species, a 300-foot buffer for burrowing owls, and a 300-foot buffer for raptor species. Following the survey, the following shall be implemented:

- A nesting bird survey report shall be submitted prior to the initiation of project activities. The report shall detail the methods and results of the survey including identification of the location of any active nests and make a determination if ongoing monitoring should be conducted and/or no-disturbance buffers should be established.
- If active nests are identified during the survey and/or work is scheduled to take place within 100 feet of active passerine nests, or 300 feet of active burrowing owl burrows or active raptor nests, a qualified biologist shall determine appropriate no-disturbance buffers. The buffer shall be the minimum distance required to avoid take of the nest and shall be determined based on the species identified, activities proposed, level of existing noise, and line of sight from the disturbance to the nest.
- A qualified biological monitor shall be present at the initiation of project activities

occurring within 100 feet of active passerine nests, or 300-feet of active burrowing owl burrows and active raptor nests, to ensure that project activities do not negatively affect the success of the nest. Duration and frequency of monitoring shall be determined at the discretion of the qualified biologist.

- If nesting bird monitoring is conducted, a nesting bird monitoring report shall be submitted to the City detailing the results of monitoring activities. The report shall be submitted within 30 days of the completion of the activities or nesting season.

MM BIO-2: **Pre-Construction Survey and Impact Avoidance for Crotch's Bumble Bee**. To avoid potential impacts to Crotch's bumble bee (*Bombus crotchii*), the following measures should be implemented:

- To the extent feasible, ground disturbance and vegetation removal should be conducted outside of the colony active period (April 1 through August 31).
- If ground-disturbing activities are scheduled to occur during the colony active period, a qualified biologist should conduct a pre-construction survey of the project footprint and within 100-feet of anticipated disturbance areas, no more than 14 days prior to ground disturbance to determine the presence of suitable floral resources and potential bumble bee activity.
- If Crotch's bumble bee individuals or nesting colonies are observed, a qualified biologist should establish appropriate no-disturbance buffers around occupied habitat areas. The size of the buffer should be determined by the qualified biologist based on site conditions and species behavior.
- If an active colony is identified and cannot be avoided, the qualified biologist in coordination with the applicant should coordinate with the California Department of Fish and Wildlife, as appropriate, and implement additional avoidance measures as necessary to avoid impacts.
- A pre-construction survey report should be submitted to the City following completion of the pre-construction survey.

MM BIO-3: **Pre-Construction Survey and Impact Avoidance for Special-Status Bats.** Although suitable bat roosting habitat is limited within the project footprint, special-status bats such as hoary bat (*Lasiurus cinereus*) may occur in adjacent areas. To avoid and minimize potential impacts, the following measures shall be implemented:

- If project activities include removal or trimming of trees within or immediately adjacent to the project footprint, a qualified biologist should conduct a pre-construction assessment of trees to identify potential bat roosting no more than 14 days prior to tree removal or trimming.
- If evidence of bat roosting is observed, the qualified biologist should establish appropriate no-disturbance buffers around the roost site until bats have vacated the area.

- To the extent feasible, tree removal should occur outside of the bat maternity season (April 1 through August 31).
- If bats are observed during construction activities and are in jeopardy of being directly impacted, work in the immediate vicinity should cease until a qualified biologist evaluates the situation and provides appropriate avoidance recommendations.

MM BIO-4: **Pre-Construction Survey and Impact Avoidance for Special-Status Plants.** The biological field survey for the project was conducted during the winter season when special-status plant species may not have been detectable. To avoid or minimize potential impacts to special-status plant species, the following measures shall be implemented:

- Within one year prior to the initiation of ground-disturbing activities, a qualified botanist should conduct a focused rare plant survey of the project footprint and within fifty feet of proposed disturbance areas.
- The focused rare plant survey should be conducted in accordance with the California Native Plant Society (CNPS) Botanical Survey Guidelines, be conducted during the appropriate blooming period for special-status plant species with potential to occur in the site (refer to Attachment 2), and should confirm the presence or absence of special-status plant species.
- If special-status plant species are identified, the qualified botanist should map the boundaries of the population. The biologist should work with the project design and/or contractor team to avoid the special-status plant occurrence(s), as mapped in the field by the botanist.

If complete avoidance of the special-status plant occurrence(s) is not feasible, the following mitigation measures should be implemented:

- If the identified species is listed under the CESA as candidate, threatened, or endangered, all project activities that could impact the occurrences should cease and the applicant should coordinate with the CDFW to determine the need for a 2081-Incidental Take Permit. Direct or indirect impacts to the occurrence(s) or within 50-feet of the occurrence(s) must be avoided unless the applicant obtains a 2081-Incidental Take Permit or other authorization from the CDFW.
- If the special-status plant species are not CESA-listed and are CNPS Rare Plant Rank 1 or 2 and/or listed under the Federal Endangered Species Act, the following should be implemented:
    - For annual and perennial species, the biologist will collect seed prior to project disturbance, store the seed in a cool and dry place, and redistribute the collected seed in suitable soil in the temporarily disturbed portions of the project area following completion of disturbance.
    - If seed is not available due to project timing, the applicant and the botanist should implement a soil seed bank salvage program to promote the continued existence of the species on the parcel. Soil from the project

disturbance areas containing the special-status species seed should be collected and reapplied. To accomplish this, the upper 6 inches of soil located within the vicinity of occurrence(s) should be collected prior to grading activities. The collected soil should be distributed in the temporary disturbance areas following completion of the grading activities or in adjacent undisturbed areas on the parcel.

- The broadcasted seed and/or salvaged soil distribution area should be monitored for two consecutive seasons to determine if the redistributed seed and/or soil supports germination of the targeted species. If germination is not observed, the applicant and their biologist should continue the seed collection and distribution efforts until germination is confirmed in the distribution areas.

- A rare plant survey report should be submitted to the City prior to initiation of ground-disturbing activities if focused surveys are conducted.

MM BIO-5: **Worker Environmental Awareness Program (WEAP).** Prior to initiation of construction activities (including staging and mobilization), all personnel associated with project construction should attend a WEAP training, conducted and prepared by a qualified biologist, to aid workers in recognizing special-status species, native or nesting birds and other biological resources that may occur in the construction area. The specifics of this program will include identification and habitats of special-status species with potential to occur at the project site, a description of the regulatory status and general ecological characteristics of sensitive resources, a review of the limits of construction, and an explanation of the mitigation measures required to reduce impacts to biological resources within the work area. A fact sheet conveying this information shall also be prepared by the qualified biologist for distribution to all contractors, their employers, and other personnel involved with construction. All personnel shall sign a form provided by the trainer indicating they have attended the WEAP and understand the information presented to them.

MM BIO-6: **General Best Management Practices.** The following General BMPs would be implemented by project personnel:

- Prior to mobilization, the contractor would clearly delineate the project limits and prohibit any project-related work outside those boundaries.
- Project-related vehicles would observe a 5-mile-per-hour speed limit within the unpaved limits of the project.
- All food-related trash items such as wrappers, cans, bottles, and food scraps generated during the proposed project would be disposed of in closed containers only and removed daily from the project site.
- No deliberate feeding of wildlife would be allowed.
- No pets would be allowed on the project site.
- No firearms would be allowed on the project site.

- If vehicle or equipment maintenance is necessary, it would be performed in the designated staging areas.
- If project activities must occur at night (between dusk and dawn), all lighting would be shielded and directed downward to minimize the potential for glare or spillover onto adjacent properties and to reduce impacts on local wildlife.
- Heavy equipment would be operated in accordance with standard BMPs. Equipment used on-site would be properly maintained to avoid leaks of oil, fuel, or residues. Provisions would be in place to remediate any accidental spills.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Less than Significant Impact with Mitigation Incorporated. No sensitive plant communities or riparian habitats are present within the project site. However, vegetation within the project site was surveyed in December, which is not the optimal season for plant identification. The only plants identified were general groups (e.g., mustards), limiting characterization of on-site plant communities.

Due to these seasonal limitations, the potential presence of special-status plant species and associated sensitive natural communities cannot be fully ruled out based on the reconnaissance-level survey. Taking this into account, MM BIO-4 will be implemented. Implementation of **Mitigation Measure MM BIO-4** would require focused floristic surveys to be conducted during the appropriate blooming period, in accordance with applicable protocols, to confirm the presence or absence of special-status plant species and evaluate the potential for sensitive natural communities. If any sensitive natural communities or special-status plant populations are identified, they would be avoided to the extent feasible or otherwise mitigated in coordination with the California Department of Fish and Wildlife, as appropriate. With implementation of **MM BIO-4**, potential impacts to sensitive natural communities would be reduced to less than significant.

c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological?

No Impact. As identified in the Biological Resource Assessment by Rincon, there are no identified state or federally protected wetlands within the project site or Study Area. Therefore, there would be no impacts to jurisdictional waters and wetlands.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Less Than Significant with Mitigation Incorporated. The Study Area is a disturbed, recently disked agricultural field bounded by major roadways, surrounding development, and agriculture. Common disturbance tolerant wildlife may move through the Study Area for local travel and foraging. However, the Study Area does not connect larger habitat areas and movement in the general region is already constrained by Highway 198, 12th Avenue, and adjacent development. Therefore, the project would not substantially interfere with wildlife movement or established corridors. Wildlife nursery sites were not observed during the reconnaissance survey, and no evidence of bat maternity roosting was observed in trees present within or adjacent to the Study Area. **Mitigation Measures MM BIO-3, MM BIO-5**, and **MM BIO-6** will be implemented to reduce impacts on wildlife movement and nursery sites to less-than-significant levels by requiring pre-construction bat roost surveys if tree work is proposed, conducting environmental training for all workers, and implementing general best management practices.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Less than Significant Impact. Ornamental trees are present within the southeastern corner of the Study Area near an existing residence, and landscaped shrubs occur along portions of the northern and eastern margins of the Study Area. Consistent with applicable local policies regarding preservation of mature trees and installation of drought-tolerant/native landscaping, project design should retain and avoid impacts to onsite trees to the extent feasible. If tree removal or trimming is required, the applicant should coordinate with the City to confirm applicability of local tree preservation requirements and obtain any required approvals prior to removal. landscaping associated with the project should be designed to comply with local policies by incorporating native and/or drought-tolerant plant species to the extent feasible. With implementation of these design considerations and adherence to applicable City requirements, the proposed project is not expected to conflict with local policies or ordinances protecting biological resources. Therefore, impacts are less than significant.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

No Impact. The project area does not fall within the jurisdiction of any Habitat Conservation Plans (HCP). Therefore, there would be no conflicts with HCPs.

Cumulative Impacts

The Study Area consists of recently disked fallowed agricultural land with minimal vegetation and no sensitive natural communities, jurisdictional waters or wetlands, or designated critical habitat. Four special-status plant species have low potential to occur within the Study Area due to the presence of suitable alkaline soil and the potential presence of suitable grassland habitat. However, the winter reconnaissance survey conducted outside of the appropriate blooming season limited the ability to detect special-status plants. One special-status wildlife species, Swainson's hawk, was determined to have a low potential to

occur within the Study Area and may occur as a transient flyover or use the area for foraging. Burrowing owl has potential to occur within the Study Area due to the presence of suitable open, disturbed agricultural habitat and documented occurrences within the surrounding region. Mitigation measures to implement pre-construction surveys to identify and avoid active burrowing owl burrows and raptor nests are required to reduce potential impacts to sensitive bird species onsite. Crotch's bumble bee and hoary bat have moderate potential to occur within the Study Area as foraging, roosting, or transient individuals associated with the ruderal flowering forbs and ornamental trees found within the Study Area. The Study Area also provides marginal habitat for nesting birds, and potential impacts to nesting birds protected under the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (CFGC) could occur if vegetation removal or construction activities take place during the nesting season.

With implementation of the recommended **Mitigation Measures MM BIO-1 through MM BIO-6**, including pre-construction nesting bird surveys, focused rare plant surveys during the appropriate blooming period, pre-construction surveys and assessments for Crotch's bumble bee and bats, WEAP training, and general best management practices, potential impacts to biological resources would be avoided or reduced to less-than-significant levels.

5.5 CULTURAL RESOURCES

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
CULTURAL RESOURCES. Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource pursuant to in § 15064.5?			**X**	
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?		**X**		
c) Disturb any human remains, including those interred outside of dedicated cemeteries?		**X**		

a) Cause a substantial adverse change in the significance of a historical resource pursuant to in § 15064.5?

Less Than Significant Impact. A Cultural Resources Study for project site was conducted by Kimley-Horn and Associates, Inc. on October 2024 (Appendix D). Historical resources findings were supported by a cultural resources records search, Sacred Lands File search, literature review, review of cultural databases and repositories, review of historic maps and imagery, and an intensive-level pedestrian survey of the Project area. Survey transects were spaced approximately 15 meters apart, and ground visibility was approximately 100 percent due to prior disturbance. From the cultural resources records search through the Southern San Joaquin Valley Information Center (SSJVIC) of the two resources within 0.5 miles, none were recorded within the project site. The study also conducted a review of the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), National Historic Landmarks list (NHL), the Built Environment Resource Directory (BERD), and historic aerials. No listed resources were identified within the project area. However, the review of historic aerials noted a single-family residence within the Project area that was initially erected on site prior to 1957. This resource has been evaluated and newly recorded as KHA-HMA-2024-01. The identified residence was evaluated under all four CRHR criteria. The resource is not associated with significant historic events (Criterion 1) or persons (Criterion 2), does not embody distinctive architectural characteristics or represent the work of a master (Criterion 3), and lacks the potential to yield important information about prehistory or history (Criterion 4). Due to redevelopment in 1975 and subsequent alterations, the structure has been deemed insignificant. Furthermore, the resource was found not eligible under any of the four CRHR criteria and therefore does not qualify as a "historical resource" under CEQA. In addition to this, 9 cultural resource studies were found within 0.5 miles of the project site. Of these, two included a portion of the project site. Neither of the studies identified any cultural resources on site. The 9 cultural studies identify the closest cultural resources as a historic ditch, approximately 0.44 miles east, and the Southern Pacific Railroad, approximately 0.17

miles north. From the review of historical topographic maps, the project site has primarily consisted of an agricultural field with a small structure in the southeast corner in the late 1950s. By 1984, the structure has slightly increased in size, Highway 198 has been developed, and north-south dirt roads exist where present day 12th Avenue is located. The existing structure is not eligible under any of the four criteria of CRHR and does not qualify as a historical resource. Historical imagery showcases few changes to the project area between 1984 and present day. The structure was found to not have any historical significance and would not be significant. Overall, there were no historical cultural resources or unique archaeological resources identified on the project site and therefore the project would have a less than significant impact.

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Less Than Significant With Mitigation Incorporated. The Project site has been subject to extensive agricultural use, grading, and infrastructure development, resulting in surface and near-surface soil disturbance. As indicated above there were no archaeological resources found on-site, this is substantiated through a SSJVIC records search, NRHP records search, CRHR records search, NHL records search, and BERD records search, a pedestrian survey of the project area, a cultural resources records search, Sacred Lands File search, literature review, review of cultural databases and repositories, and review of historic maps and imagery. However, the absence of substantial surface prehistoric or historic-period archeological remains within the project vicinity and the existing level of disturbance does not preclude the possibility of subsurface resources. Though the circumstances would present a low possibility, **Mitigation Measures MM CUL-1** and **MM CUL-2** would reduce impacts in the unanticipated discovery of archaeological resources and inadvertent discoveries of human remains. Given the disturbed conditions and negative records and field results, archaeological sensitivity is low. With the implementation of **MM CUL-1** and **MM CUL-2**, impacts would be less than significant.

Mitigation Measures

MM CUL-1: **Inadvertent Discoveries of Cultural Resources**. In the event that cultural resources are discovered during Project implementation, all earthwork and ground-disturbing activities will halt within 50 feet of the discovery. An archaeologist meeting the Secretary of Interior's professional qualification standards (Qualified Archaeologist) will coordinate with the City of Hanford and identify whether the resource may qualify as a historical resource or unique archaeological resource (defined in CEQA Guidelines Section 15064.5), a tribal cultural resource (defined in PRC Section 21080.3), and if it requires further evaluation. If the cultural resources are Native American in origin, the Consulting Tribe(s) must be immediately contacted and consulted regarding potential significance and treatment of the resource. For any potential significant cultural resources, the Qualified Archaeologist will make recommendations to the City to avoid or mitigate impacts on the resource.

Preservation in place (i.e. avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery to excavate the resource along with subsequent laboratory processing and analysis. Disposition of significant Native American archaeological materials, such as reburial or curation by a qualified repository within Kings County, will be agreed upon by the City and Consulting Tribe(s). Any significant non-Native American archaeological material shall be curated at a public, non-profit institution with a research interest in the materials within Kings County, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes.

All identified cultural resources will be recorded on appropriate CA DPR 523 series forms and evaluated for significance. All findings will be included within a Monitoring Report drafted by the Qualified Archaeologist and submitted to the City and Consulting Tribe(s) for review. Final copies of the Monitoring Report will be submitted to the City, Consulting Tribe(s), and Southern San Joaquin Valley Information Center (SSJVIC).

MM CUL-2: **Inadvertent Discoveries of Human Remains**. If human remains are encountered during the undertaking, California State Health and Safety Code Section 7050.5 states that excavation shall stop and no further disturbance shall occur within 100 feet of the discovery until the County Coroner has made a determination of origin and disposition of the remains pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the coroner will notify the Native American Heritage Commission (NAHC), who will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery within 48 hours of notification. If the NAHC is unable to identify an MLD, the MLD fails to make a recommendation, or the landowner or his/her authorized representative rejects the recommendation, the human remains, and associated items will be interred on the property with appropriate dignity in a location that will not be subject to future disturbance.

c) Disturb any human remains, including those interred outside of dedicated cemeteries?

Less Than Significant With Mitigation Incorporated. No human remains are known to be present within the project site. If human remains are found, those remains would require proper treatment in accordance with applicable laws, including Health and Safety Code (HSC) §§ 7050.5-7055 and PRC § 5097.98 and § 5097.99. HSC §§ 7050.5-7055 describe the general provisions for treatment of human remains. Specifically, HSC § 7050.5 prescribes the requirements for the treatment of any human remains that are accidentally discovered during excavation of a site. HSC § 7050.5 also requires that all activities cease immediately, and a qualified archaeologist and Native American monitor be contacted immediately. As required by state law, the procedures set forth in PRC §

5097.98 would be implemented, including evaluation by the County Coroner and notification of the NAHC. The NAHC would then designate the "Most Likely Descendent" of the unearthed human remains. If human remains are found during excavation, excavation would be halted in the vicinity of the discovery and any area that is reasonably suspected to overlay adjacent remains shall remain undisturbed until the County Coroner has investigated, and appropriate recommendations have been made for the treatment and disposition of the remains. Compliance with the established regulatory framework (i.e., HSC § 7050.5-7055 and PRC §§ 5097.98 and 5097.99) and implementation of **MM CUL-2**, above, would ensure potential project impacts concerning human remains are reduced to less than significant.

Cumulative Impacts

Overall, the project would not cause a considerable impact to historical cultural resources, archaeological cultural resources, or human remains. Due to the project location and previously disturbed project site ground, and the addition of the above listed mitigation measures, the proposed project would not cause a cumulatively considerable impact to occur

5.6 ENERGY

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
ENERGY. Would the project:				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?			**X**	
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?			**X**	

REGULATORY SETTING

State

Renewable Energy Standards

In 2002, California established its Renewable Portfolio Standard program[4] with the goal of increasing the annual percentage of renewable energy in the state's electricity mix by the equivalent of at least 1 percent of sales, with an aggregate total of 20 percent by 2017. The California Public Utilities Commission subsequently accelerated that goal to 2010 for retail sellers of electricity (Public Utilities Code Section 399.15(b)(1)). Then-Governor Schwarzenegger signed Executive Order S-14-08 in 2008, increasing the target to 33 percent renewable energy by 2020. In September 2009, then-Governor Schwarzenegger continued California's commitment to the Renewable Portfolio Standard by signing Executive Order S-21-09, which directs the California Air Resources Board under its Assembly Bill (AB) 32 authority to enact regulations to help the State meet its Renewable Portfolio Standard goal of 33 percent renewable energy by 2020. In September 2010, the California Air Resources Board adopted its Renewable Electricity Standard regulations, which require all of the State's load-serving entities to meet this target. In October 2015, then-Governor Brown signed Senate Bill 350 legislation, which requires retail sellers and publicly owned utilities to procure 50 percent of their electricity from eligible renewable energy resources by 2030. Signed in 2018, SB 100 revised the goal of the program to achieve the 50 percent renewable resources target by December 31, 2026, and to achieve a 60 percent target by December 31, 2030. SB 100 also established a further goal to have an electric grid that is entirely powered by clean energy by 2045. Under the bill, the State cannot increase carbon emissions elsewhere in the western grid or allow resource shuffling to achieve the 100 percent carbon-free electricity target.

[4] The Renewable Portfolio Standard is a flexible, market-driven policy to ensure that the public benefits of wind, solar, biomass, and geothermal energy continue to be realized as electricity markets become more competitive. The policy ensures that a minimum amount of renewable energy is included in the portfolio of electricity resources serving a state or country.

2008 California Energy Action Plan

The 2008 Energy Action Plan Update provides a status update to the 2005 Energy Action Plan II, which is the State of California's principal energy planning and policy document. The plan continues the goals of the original Energy Action Plan, describes a coordinated implementation plan for State energy policies, and identifies specific action areas to ensure that California's energy is adequate, affordable, technologically advanced, and environmentally sound. First-priority actions to address California's increasing energy demands are energy efficiency, demand response (i.e., reduction of customer energy usage during peak periods in order to address system reliability and support the best use of energy infrastructure), and the use of renewable sources of power. If these actions are unable to satisfy the increasing energy and capacity needs, the plan supports clean and efficient fossil-fired generation.

Building Codes

Energy conservation standards for new residential and nonresidential buildings were adopted by the California Energy Resources Conservation and Development Commission (now the California Energy Commission) in June 1977 and are updated every three years (Title 24, Part 6, of the California Code of Regulations). Title 24 requires the design of building shells and building components to conserve energy. The standards are updated periodically to allow for consideration and possible incorporation of new energy efficiency technologies and methods. On September 11, 2024, the CEC adopted the 2025 Title 24 standards (2025 Energy Code). Among other updates like strengthened ventilation standards for gas cooking appliances, the 2025 Energy Code includes updated standards in three major areas:

- The expansion of the use of electric heat pumps for space conditioning and water heating in most new residential and commercial buildings.
- The expansion of solar photovoltaic and battery storage requirements to more building types
- The requirement for electric-ready infrastructure to support future appliance electrification

Projects whose permit applications are applied for on or after January 1, 2026, must comply with the 2025 Energy Code.[5]

California Green Building Standards Code

The California Green Building Standards Code (California Code of Regulations, Title 24, Part 11), commonly referred to as the CALGreen Code, is a statewide mandatory construction code that was developed and adopted by the California Building Standards Commission and the California Department of Housing and Community Development. CALGreen standards require new residential and commercial buildings to comply with mandatory measures under five topical areas: planning and design; energy efficiency; water efficiency and conservation; material conservation and resource efficiency; and environmental quality. CALGreen also provides voluntary measures (CALGreen Tier 1 and Tier 2) that local governments may adopt which encourage or require additional measures in the five green building topics. The most recent update to the CALGreen Code, the 2025 CALGreen Code, was adopted by the CEC on September 11, 2024,

[5] California Energy Commission, *Energy Commission Adopts Updated Building Standards Expanding Requirements for Heat Pumps and Electric-Ready Buildings*, https://www.energy.ca.gov/news/2024-09/energy-commission-adopts-updated-building-standards-expanding-requirements-heat, accessed July 2025.

and will go into effect January 1, 2026. Projects whose permit applications are applied for on or after January 1, 2026, must comply with the 2025 CALGreen Code.[6]

2006 Appliance Efficiency Regulations

The California Energy Commission adopted Appliance Efficiency Regulations (Title 20, CCR Sections 1601 through 1608) on October 11, 2006. The regulations were approved by the California Office of Administrative Law on December 14, 2006. The regulations include standards for both Federally regulated appliances and non-Federally regulated appliances. While these regulations are now often viewed as "business-as-usual," they exceed the standards imposed by all other states and they reduce GHG emissions by reducing energy demand.

California Utility Efficiency Programs (Senate Bill 1037 and Assembly Bill 2021)

SB 1037 and AB 2021 require electric utilities to meet their resource needs first with energy efficiency. California Utility Efficiency Programs have also set new targets for statewide annual energy demand reductions. Regional and Local

City of Hanford General Plan

The City of Hanford General Plan includes policies targeting energy applicable to development projects in Hanford, including the following which are applicable to the project:

OBJECTIVE AQ 7: Increase the use of energy conservation features, renewable sources of energy and low-emission equipment in new and existing development projects within the City.

Policy AQ 7.2: Initiate and sustain ongoing efforts with local water and energy utilities and developers to establish and implement voluntary incentive based programs to encourage the use of energy efficient designs and equipment in new and existing development projects within the City.

Policy AQ 7.3: Support and recognize developers proposing projects that comply with the state's Green Building Standards voluntary tier levels or other enhanced energy conservation and sustainable rating systems such as LEED certification, Greenpoint Rating, and Energy Star.

Policy AQ 7.5: City staff will proactively work with the California Energy Commission, local water and energy utilities, industry, and other potential partners to seek funding sources and implement programs which reduce water and energy use, reduce air emissions and reduce the creation of greenhouse gases.

Policy AQ 7.6: Encourage the use of solar-ready roofs into residential and commercial development. New residential development should include proper solar orientation (southfacing roof area sloped at 20° to 55° from the horizontal), clear access on the south sloped roof (no chimneys, heating vents, plumbing vents, etc.), electrical conduit installed for solar electric system wiring, plumbing installed for solar hot water systems, and space provided for a solar hot water storage tank. Roofs for commercial development should

[6] California Energy Commission, *California Energy Commission September 11, 2024 Business Meeting Backup Materials for Item 08: Adoption of Voluntary Standards in the 2025 California Green Building Standards Code*, https://www.energy.ca.gov/filebrowser/download/6637?fid=6637, accessed July 2025.

be designed to maximize potential area available for solar panels and provide electrical conduit to support future installation.

Program AQ 7.3: The City will work with the building industry to incorporate designs improving solar readiness into building plans through voluntary green building guidelines.

ENVIRONMENTAL IMPACTS

a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Less Than Significant Impact.

Construction

The energy consumption associated with construction of the proposed project includes primarily diesel fuel consumption from on-road hauling trips and off-road construction diesel equipment, and gasoline consumption from on-road worker commute and vendor trips. The amount of electricity used during construction would be minimal; typical demand would stem from the use of electrically powered hand tools and several construction trailers by managerial staff during the hours of construction activities. The majority of the energy used during construction would be from petroleum. This analysis relies on the construction equipment list and operational characteristics, as provided in the CalEEMod (version 2022.1.1.29) outputs for the project; see Appendix A. Energy consumption associated with project construction is summarized in *Table 5.6-1: Project Energy Consumption During Construction*.

Table 5.6-1: Project Energy Consumption During Construction

Source	Project Construction Usage	Kings County Annual Energy Consumption[1]	Percentage Increase Countywide
Electricity Use	**Megawatt Hours (MWh)**		
Water Consumption[2]	0.51	1,752,054	<0.0001%
Diesel Use	**Gallons**		
On-Road Construction Trips [3]	4,240	42,755,538	0.01%
Off-Road Construction Equipment[4]	20,502	42,755,538	0.048%
Construction Diesel Total	***24,742***	***42,755,538***	***0.058%***
Gasoline	**Gallons**		
On-Road Construction Trips[3]	620	71,589,612	0.0009%

1. Most recent Kings County electricity consumption (2024) from California Energy Commission (https://www.energy.ca.gov/files/energy-consumption-data-files). Projected Kings County fuel usage (2026) from EMFAC2021 model (https://arb.ca.gov/emfac/emissions-inventory/).
2. Construction water use based on acres disturbed per day per construction sequencing and estimated water use per acre.

Source	Project Construction Usage	Kings County Annual Energy Consumption[1]	Percentage Increase Countywide
3. On-road mobile source fuel use based on vehicle miles traveled (VMT) from CalEEMod and fleet-average fuel consumption in gallons per mile from EMFAC2021 in Kings County for construction year 2026. 4. Construction fuel use was calculated based on CalEEMod emissions outputs and conversion ratios from the Climate Registry. 5. Total Construction Energy is the combined energy usage over approximately eight months of construction. Abbreviations: CalEEMod: California Emission Estimation Model; EMFAC: Emission Factor Model 2021. Source: Refer to energy calculations in Appendix A.			

In total, construction of the project would consume approximately 0.51 megawatt hours (MWh) of electricity, 24,742 gallons of diesel and 620 gallons of gasoline. Water for project construction would represent less than 0.0001 percent of the County's water consumption. The project's fuel from the entire construction period would increase fuel use in the County by approximately 0.058 percent for diesel and 0.0009 percent for gasoline.

There are no unusual project characteristics that would necessitate the use of construction equipment that would be less energy-efficient than at comparable construction sites in the region or state. In addition, some incidental energy conservation would occur during construction through compliance with State requirements. Project construction would be subject to CARB's Off-Road Regulation, which limits diesel-fueled idling to a maximum of five minutes, reducing diesel consumption and consequent air emissions. Project construction equipment would also be required to comply with the Off-Road Regulation, as well as EPA Nonroad Diesel Engine Emission Standards, which phase in "tiers" of engines over time, increasing energy efficiency and reducing fuel consumption. The minimum engine tier certification required for construction equipment depends on model year and the size of the respective construction fleet.

The CEQA Guideline Appendix G and Appendix F criteria requires the project's effects on local and regional energy supplies and on the requirements for additional capacity to be addressed. A 0.059 percent increase in construction fuel demand is not anticipated to trigger the need for additional capacity. Fuel consumption is based on a conservative construction phasing (occurring over approximately nine months) and conservative estimates for annual construction fuel consumption. Longer phases would result in lower construction intensity and a lower annual fuel consumption, resulting in lower annual demand on energy supplies. Additionally, use of construction fuel would cease once the project is fully developed. As such, project construction would have a nominal effect on the local and regional energy supplies. Therefore, it is expected that construction fuel consumption associated with the project would not be inefficient, wasteful, or unnecessary. The project would not substantially affect existing energy or fuel supplies, or resources and new capacity would not be required. Impacts would be less than significant in this regard.

Operations

Project energy consumption would include building electricity and water usage, as well as fuel usage from on-road vehicles. The project's annual energy use during operation is shown in *Table*

5.6-2: Annual Energy Consumption During Operations. Project operations would annually consume approximately 465 MWh of electricity, 153,016 gallons of diesel, and 339,430 gallons of gasoline.

Table 5.6-2: Annual Energy Consumption During Operations

Source	Project Operational Usage	Kings County Annual Energy Consumption[1]	Percentage Increase Countywide
Electricity Use	**Megawatt Hour/Year (MWh/year)**		
Area[2]	463	1,752,054	0.0265%
Water[2]	2		0.0001%
Total Electricity	465		0.0266%
Natural Gas Use	**Therms/year**		
Area[2]	0	62,179,484	0%
Diesel Use	**Gallons/Year**		
Mobile[3]	153,016	42,584,054	0.359%
Gasoline Use	**Gallons/Year**		
Mobile[3]	339,430	70,243,118	0.483%

Notes:
1. Most recent Kings County electricity consumption (2024) from California Energy Commission (https://www.energy.ca.gov/files/energy-consumption-data-files). Projected Kings County fuel usage (2027) from EMFAC2021 model (https://arb.ca.gov/emfac/emissions-inventory/).
2. The electricity usage is based on project-specific estimates and CalEEMod defaults. With implementation of **Mitigation Measure MM GHG-1,** the project would be an all-electric development and not utilize any natural gas.
3. Calculated based on the mobile source fuel use based on vehicle miles traveled (VMT) and fleet-average fuel consumption (in gallons per mile) from EMFAC2021 for operational year 2027. Mobile energy use includes a high percentage of heavy-duty vehicle fueling resulting from truck stop trips (refer to Operational Fuel in Appendix A).

Abbreviations: CalEEMod: California Emission Estimation Model; EMFAC2021: California Air Resources Board Emission Factor Model; MWh: Megawatt-hour
Source: Energy Calculations in Appendix A.

In total, project operations would use approximately 465 MWh of electricity. Kings County used 1,752 GWh of electricity in 2024. Project operational electricity use would represent approximately 0.027 percent of the current electricity use in Kings County. Therefore, there is adequate capacity to meet the project's anticipated electricity demand.

As discussed in *Section 5.8*, *Greenhouse Gas Emissions*, the project would implement **Mitigation Measure MM GHG-1,** requiring all-electric development, and not utilize any natural gas. Therefore, the project would not impact natural gas supply and capacity in Kings County.

In 2027, Californians are anticipated to use approximately 13,169,065,097 gallons of gasoline and approximately 3,160,833,123 gallons of diesel fuel. Kings County annual gasoline fuel use in 2027 is anticipated to be 70,243,118 gallons and diesel fuel is anticipated to be 42,584,054 gallons. Expected project operational use of gasoline and diesel would represent 0.003 percent of current gasoline use and 0.005 percent of current diesel use in the state. Project operational use of gasoline and diesel would represent 0.483 percent of gasoline use and 0.359 percent of diesel use in the County.

The project would be consistent with Title 24 Building Energy Efficiency Standards, which would take effect on January 1, 2026. Prior to issuance of a building permit, the City of Hanford would review and verify that the project plans demonstrate compliance with the current version of the Building and Energy Efficiency Standards. Title 24 compliance requires energy conservation features in new construction (e.g., expansion the use of electric heat pumps for space conditioning or water heating and of solar photovoltaic and battery storage requirements. As a nonresidential use, the project would be subject to mandatory energy efficiency requirements, particularly related to indoor and outdoor lighting and electrical power distribution. The 2025 Energy Code also contains solar-ready requirements for nonresidential buildings, including the development of a solar zone where panels can be installed at a future date with appropriate surface area and orientation, and construction documents that include information about structural loads and potential plans for interconnecting a solar photovoltaic (PV) system.

Additionally, the project would also be required adhere to the provisions of CALGreen, which establishes planning and design standards for sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and internal air contaminants. The insulation and design code requirements would minimize wasteful energy consumption.

The CEQA Guideline Appendix G and Appendix F criteria requires the project's effects on local and regional energy supplies and on the requirements for additional capacity to be addressed. Energy and fuel consumption associated with project operation does not exceed one percent of annual use in Kings County for any fuel type, as shown in *Table 5.6-2*. As such, project operation would have a nominal effect on the local and regional energy supplies. Project operation would be consistent with all applicable energy efficiency requirements, including the Building Energy Efficiency Standards and CalGreen. Therefore, it is expected that construction fuel consumption associated with the project would not be inefficient, wasteful, or unnecessary. The project would not substantially affect existing energy or fuel supplies, or resources and new capacity would not be required. Impacts would be less than significant in this regard.

b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Less Than Significant Impact. The project would be required to comply with existing regulations, including applicable measures from the City's General Plan, or would be directly affected by the outcomes (vehicle trips and energy consumption would be less carbon intensive due to statewide compliance with future low carbon fuel standard amendments and increasingly stringent Renewable Portfolio Standards). As such, the project would not conflict with any other state-level regulations pertaining to energy. The project would comply with existing State energy standards and would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

Cumulative Impacts

As discussed above, construction fuel consumption associated with the Project would be temporary in nature and would not be inefficient, wasteful, or unnecessary. Construction-related fuel use would consist primarily of diesel consumption by off-road equipment and on-road haul trucks, consistent with typical

construction activities occurring throughout Kings County and the San Joaquin Valley region. When viewed in the context of the regional baseline, which includes ongoing agricultural, industrial, and transportation-related fuel consumption, the Project's short-term construction fuel use would represent a very small incremental increase.

Regional growth projections anticipate continued increases in truck activity and goods movement throughout the San Joaquin Valley due to population growth, agricultural production, and industrial development. The Project's construction-related truck trips would be limited in duration and scale and would not result in a long-term increase in regional truck activity or fuel demand. Accordingly, the Project would not contribute to a proliferation of fuel throughput or sustained increases in diesel consumption beyond existing and projected regional growth trends.

Operationally, the Project would not substantially affect existing energy or fuel supplies, and no new energy generation or fuel delivery infrastructure would be required. The Project's operational energy demand represents less than one percent of total Kings County energy use. In addition, the Project would be required to comply with CALGreen, which establishes planning and design standards for sustainable site development, enhanced energy efficiency beyond California Energy Code requirements, water conservation, material conservation, and indoor air quality. Building insulation, equipment efficiency, and design features would further minimize wasteful energy consumption over the life of the Project.

As discussed above, none of the project energy uses exceed one percent of Kings County use and it is expected that operational fuel and energy consumption associated with the project would not be inefficient, wasteful, or unnecessary. Therefore, the project's cumulative contribution of energy use would be less than significant, and the project's cumulative energy impacts would also be less than cumulatively considerable.

5.7 GEOLOGY AND SOILS

ENVIRONMENTAL Issues	IMPACTS	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
7. GEOLOGY AND SOILS. Would the project:					
a)	Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i)	Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.			**X**	
ii)	Strong seismic ground shaking?		**X**		
iii)	Seismic-related ground failure, including liquefaction?		**X**		
iv)	Landslides?			**X**	
b)	Result in substantial soil erosion or the loss of topsoil?		**X**		
c)	Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?		**X**		
d)	Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?		**X**		
e)	Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?			**X**	
f)	Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?		**X**		

a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

Less Than Significant Impact. The closest known Alquist-Priolo Earthquake Fault Zone is the Nunez Fault located approximately 43 miles southwest. The closest known fault to the project site is the Great Valley Thrust Fault located approximately 31 miles southwest. There are no earthquake fault zone boundaries or County designated fault zones identified at the project site or within the city of Hanford. The Seismic Hazards Mapping Act, passed in 1990, requires mapping of seismic hazard zones and sets requirements for projects located within such zones. The project site is not within a seismic hazard zone map prepared under the Seismic Hazards Mapping Act (California Geological Survey, 2021). Based on this information, the project would have no impact related to fault rupture hazards. Overall, impacts associated with the rupture of a known earthquake fault would be less than significant.

ii) Strong seismic ground shaking?

Less Than Significant With Mitigation Incorporated. The project site, located in the Central Valley has a low to moderate shaking potential (DOC, 2016). Design and construction would still comply with the latest 2022 California Building Code (CBC), City regulations, and other applicable state standards which would minimize the potential of strong seismic ground shaking impacts. The CBC provides procedures for earthquake-resistant structural design based on the buildings risk or seismic design category that include considerations for on-site soil conditions, occupancy, and the configuration of the structure including the structural system and height. Compliance with the CBC and the below outlined mitigation measure would ensure seismic group shaking impacts would be at a less than significant level. **Mitigation Measure MM GEO-1** would require the project applicant to submit design level geotechnical study to the City of Hanford for review. Therefore, with the project conforming to the latest CBC Building Codes and **Mitigation Measure MM GEO-1**, impacts due to strong seismic ground shaking would be less than significant.

Mitigation Measure

MM GEO-1: **Final Geotechnical Report**. Prior to issuance of building permits, the project applicant shall submit a design-level geotechnical study and building plans to the City of Hanford for review and approval. The design-level geotechnical study shall evaluate site-specific geologic and seismic hazards, including liquefaction potential, seismic settlement, lateral spreading, compressible soils, and regional land subsidence, and shall provide design-level recommendations to address these conditions. The geotechnical recommendations shall be incorporated into the project design to prevent structural damage, infrastructure failure, or safety

hazards that could result from geotechnical conditions. The building plans shall demonstrate that they incorporate all applicable recommendations of the design-level geotechnical study and comply with all applicable requirements of the most recent version of the California Building Standards Code. A licensed professional engineer shall prepare the plans, including those that pertain to soil engineering, structural foundations, pipeline excavation, and installation. The approved plans shall be incorporated into the proposed project. All onsite soil engineering activities shall be conducted under the supervision of a licensed Geotechnical Engineer or Certified Engineering Geologist.

iii) Seismic-related ground failure, including liquefaction?

Less Than Significant with Mitigation Incorporated. Seismically induced liquefaction occurs when loose, water-saturated sediments of relatively low density are subjected to cyclic shaking that causes soils to lose strength or stiffness because of increased pore water pressure. The project does not fall within or near an Alquist-Priolo Fault Hazard Zone, Landslide Zone, or Liquefaction Zone as designated on the Department of Conservations (DOC) map viewer (DOC, 2024). The project site is not designated within one of the above zones and all structures included in the project would be required by State law to be constructed in accordance with all applicable International Building Code (IBC) and CBC earthquake construction standards, including those relating to soil characteristics, and would adhere to **Mitigation Measure MM GEO-1**. The potential for substantial adverse effects to the project due to seismic-related ground failure, including liquefaction, would therefore be less than significant after mitigation is incorporated.

iv) Landslides?

Less Than Significant Impact. The project site is located in a generally flat area and does not contain any steep slopes that could result in landslides on or in the vicinity of the project site. Also identified in the Seismic hazards Map by the California Geological Survey, there are no landslide zone boundaries that fall within the project site (DOC, 2011). The project would also conform with all applicable General Plan policies and additional federal, state, and local regulations. Therefore, impacts associated with landslides would be less than significant

b) Result in substantial soil erosion or the loss of topsoil?

Less Than Significant With Mitigation Incorporated. According to the project site plans prepared for the proposed project, development of the proposed project would result in the creation of new impervious surface areas on the proposed gas station. The development of the project site would also cause ground disturbance of topsoil. The ground disturbance would be limited to the areas proposed for grading and excavation, including the proposed internal roadways and drain infrastructure improvements. After grading and excavation, and prior to overlaying the disturbed ground surfaces with impervious surfaces and structures, the potential exists for wind and water erosion to occur, which could adversely affect downstream storm drainage facilities.

Without implementation of appropriate Best Management Practices (BMPs) related to prevention of soil erosion during construction, development of the project would result in a potentially significant impact with respect to soil erosion. BMPs would include wind erosion control measures consistent with San Joaquin Valley Air Pollution Control District (SJVAPCD) Rule 8021.**Mitigation Measure MM HYD-1** requires the project applicant to prepare and submit a Stormwater Pollution Prevention Plan identifying specific actions and BMPs to prevent stormwater pollution during construction activities. In addition, final drainage and grading plans shall incorporate erosion protection measures, as needed, to prevent on-site and off-site erosion and sedimentation. The SWPPP shall include, among other things, temporary erosion control measures to be employed for disturbed areas. Implementation of the following mitigation measure, therefore, would ensure the impact is less than significant.

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Less Than Significant With Mitigation Incorporated. The project site and surrounding areas are generally flat, which is not anticipated to result in significant landslides. However, according to the U.S. Geological Survey (USGS), the project site is located within an area affected by regional land subsidence. As previously mentioned, there are no active faults, Seismic Hazard Program Liquefaction Zones, or Alquist-Priolo Fault Hazard Zones on the project site. Subsidence is one factor that can cause unstable soil. To further prevent the above adverse effects all project components would be constructed in accordance with applicable City goals and policies, as well as Codes established by the CBC. All construction plans and related geotechnical plans and studies would be reviewed by the City further ensuring compliance with all building construction standards. Compliance with all construction standards would reduce the potential for an off-site landslide, lateral spreading, subsidence, liquefaction or collapse and reduce the impacts to a less than significant level. In addition, the project applicant would be required to submit a geotechnical investigation report to the City as part of **Mitigation Measure MM GEO-1**. As a result, with implementation of **Mitigation Measure MM GEO-1** and the SWPPP, impacts associated would be less than significant.

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Less Than Significant With Mitigation Incorporated. Expansive soils are those that undergo volume changes as moisture content fluctuates; swelling substantially when wet or shrinking when dry. Soil expansion can damage structures by cracking foundations, causing settlement and distorting structural elements. Expansion is a typical characteristic of clay-type soils. Expansive soils shrink and swell in volume during changes in moisture content, such as a result of seasonal rain events, and can cause damage to foundations, concrete slabs, roadway improvements, and pavement sections. Soil expansion is dependent on many factors. The more clayey, critically expansive surface soil and fill materials would be subjected to volume changes during seasonal fluctuations in moisture content.

According to the USDA Web Soil Survey, the project site consists of approximately 100 percent Nord complex soils. The Nord complex consists of deep, well-drained alluvial soils occurring on nearly level valley fan landforms, with slopes of 0 to 2 percent. These soils are characterized by a fine sandy loam surface horizon over stratified sandy loam to loam, with moderately high to high permeability, low runoff potential, and no flooding or ponding hazards. Available water capacity is moderate to low, and salinity ranges from non-saline to slightly saline. These characteristics generally indicate low shrink-swell potential relative to clay-dominated soils.

There are no expansive (i.e., shrink-swell) soils within the project site. However, the potential for expansive soils at the project site will be further confirmed through laboratory testing conducted as part of the design-level geotechnical study required under **Mitigation Measure MM GEO-1**. According to the USDA Web Soil survey, the project site contains approximately 100% Nord complex soil throughout the site (USDA, 2024). Given the soil type identified on site, adherence to applicable Federal, State, and Local rules and regulations, and compliance with **Mitigation Measure MM GEO-1,** impacts would be less than significant.

e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

Less Than Significant Impact. Less Than Significant Impact. The project site would tie into existing 30-inch lateral sewer line along 12th Avenue within the public right of way. Therefore, the project would not involve a septic system and there would be a less than significant impact from incompatible soils.

f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Less Than Significant With Mitigation Incorporated. Based on review of available geologic mapping from the United States Geological Survey, the project site is underlain by Quaternary and Recent (Holocene) alluvial deposits.[7] These geologic units are relatively young in geologic terms (generally less than approximately 2.6 million years old, and in many cases less than approximately 11,700 years old). From a paleontological perspective, such young alluvial and basin deposits are generally considered to have low paleontological sensitivity. These deposits typically have a low likelihood of preserving significant fossil resources because insufficient time has elapsed for fossilization processes to occur extensively. Any materials encountered are more likely to consist of fragmentary or relatively recent biological remains. While Quaternary deposits can occasionally contain scientifically important fossils, such occurrences are typically localized and not widespread. Furthermore, the Bureau of Land Management (BLM) classifies Quaternary deposits as Class 2-Low[8], which is reserved for geologic units that are not likely to contain paleontological resources.[9]

[7] https://ngmdb.usgs.gov/Prodesc/proddesc_381.htm
[8] https://www.blm.gov/sites/default/files/uploads/IM2016-124_att1.pdf
[9] Supporting information found on page 36 at: https://www.blm.gov/sites/blm.gov/files/MT-DAKs%20MCFO%20EA%20May13.pdf

Accordingly, these geologic units are commonly assigned low to moderate paleontological sensitivity in the absence of documented fossil localities.

In addition, a records search conducted using the public Paleobiology Database[10] did not identify any recorded paleontological resources within the project site. No unique geologic features have been identified on or adjacent to the site.. Based on reviews of available geologic mapping and site reconnaissance, no unique geologic features are present on or adjacent to the project site. However, development of the proposed project could result in the discovery and disturbance of previously unknown or undiscovered paleontological resources. While fossils are not expected to be discovered during construction, it is possible that significant fossils could be discovered during excavation activities, even in areas with a low likelihood of occurrence. Fossils encountered during excavation could be inadvertently damaged. If a unique paleontological resource is discovered, the impact to the resource could be substantial. **Mitigation Measure MM GEO-2** would require that a qualified paleontologist monitor grading and excavation activities, and a paleontologist be notified if paleontological resources are found. If any scientifically important large fossil remains are uncovered, the paleontologist would have the authority to divert heavy equipment away from the fossil site. With implementation of **Mitigation Measure MM GEO-2** and consistency with City ordinances, policies and goals, impacts associated with paleontological resources would be less than significant.

Mitigation Measures

MM GEO-2: **Paleontological Monitor** Prior to issuance of improvement plans, the City shall ensure that a qualified paleontologist shall be retained to prepare a Paleontological Resources Monitoring and Mitigation Plan (PRMMP). This plan will address specifics of monitoring and mitigation and comply with the recommendations of the Society of Vertebrate Paleontology's 2010 Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources. All ground disturbances in the project area that occur in previously undisturbed native sediment with high paleontological sensitivity will require monitoring. The project Paleontologist may periodically inspect construction activities to adjust the level of monitoring in response to subsurface conditions. In the event that any potentially significant paleontological resources are discovered, the paleontological monitor shall stop work inside a zone designated by him/her where additional paleontological resources could be found. A plan for the evaluation of the resource shall be submitted to the Community Development Department for approval.

Cumulative Impacts

Geology and soil-related impacts are generally site-specific and are determined by a particular site's soil characteristics, topography, and proposed land uses. Past, present, and reasonably foreseeable future projects in the region could incrementally increase exposure of people and structures to existing geologic

[10] Information found at Paleobiology Database Interactive Mapper found at : https://paleobiodb.org/navigator/

hazards, including seismic ground shaking and related secondary effects. Long-term impacts related to geology include the exposure of people to the potential for seismically induced ground shaking. Implementation of other cumulative projects would incrementally increase the number of people and structures subject to a seismic event. Seismic and geologic significance would be considered on a project-by-project basis through the preparation of a design-level geotechnical study, and such exposures would be minimized through strict engineering guidelines as they pertain to protection against known geologic hazards and potential geologic and soil related impacts. The proposed project would not contribute substantially to any cumulatively considerable geologic and/or paleontological impacts with the implementation of **Mitigation Measures MM GEO-1** and **MM GEO-2**. Therefore, cumulative effects of increased seismic risk would be less than significant.

5.8 GREENHOUSE GAS EMISSIONS

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
GREENHOUSE GAS EMISSIONS. Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?		**X**		
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?		**X**		

REGULATORY SETTING

Federal

To date, national standards have not been established for nationwide GHG reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and GHG emissions reduction at the project level. Various efforts have been promulgated at the federal level to improve fuel economy and energy efficiency to address climate change and its associated effects.

Energy Independence and Security Act of 2007. The Energy Independence and Security Act of 2007 (December 2007), among other key measures, requires the following, which would aid in the reduction of national GHG emissions:

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct the National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

Additional provisions of the Energy Independence and Security Act (EISA) address energy savings in government and public institutions, promote research for alternative energy, additional research in carbon capture, international energy programs, and the creation of "green jobs."

U.S. Environmental Protection Agency Endangerment Finding. The U.S. Environmental Protection Agency's (EPA) authority to regulate GHG emissions stems from the U.S. Supreme Court decision in

Massachusetts v. EPA (2007). The Supreme Court ruled that GHGs meet the definition of air pollutants under the existing Federal Clean Air Act (FCAA) and must be regulated if these gases could be reasonably anticipated to endanger public health or welfare. Responding to the Court's ruling, the EPA finalized an endangerment finding in December 2009. Based on scientific evidence, it found that six GHGs – carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6) – constitute a threat to public health and welfare. Thus, it is the Supreme Court's interpretation of the existing FCAA and the EPA's assessment of the scientific evidence that form the basis for the EPA's regulatory actions.

Federal Vehicle Standards. In response to the U.S. Supreme Court ruling discussed above, Executive Order 13432 was issued in 2007 directing the EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011, and in 2010, the EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016.

In 2010, an Executive Memorandum was issued directing the Department of Transportation, Department of Energy, EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017–2025 light-duty vehicles. The proposed standards projected to achieve 163 grams per mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017–2021, and NHTSA intends to set standards for model years 2022–2025 in a future rulemaking. On January 12, 2017, the EPA finalized its decision to maintain the current GHG emissions standards for model years 2022–2025 cars and light trucks. It should be noted that the EPA is currently proposing to revert the vehicle fuel efficiency standards to a lower baseline and annual increase.

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the EPA, this regulatory program will reduce GHG emissions and fuel consumption for the affected vehicles by 6 to 23 percent over the 2010 baseline.

In August 2016, the U.S. EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program applies to vehicles with model year 2018 through 2027 for certain trailers, and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all types and sizes of buses and work trucks. The final standards lower CO_2 emissions by approximately 1.1 billion metric tons and reduce oil consumption by up to two billion barrels over the lifetime of the vehicles sold under the program.

On March 31, 2020, the U.S. EPA and NHTSA finalized rulemaking for the Safer Affordable Fuel Efficient (SAFE) Rule Part Two, which sets CO_2 emissions standards and corporate average fuel economy (CAFE) standards for passenger vehicles and light duty trucks, covering model years 2021-2026. The EPA finalized the rescission of the Endangerment Finding on February 12, 2026. The action repeals federal GHG

emissions standards for light-, medium-, and heavy-duty on-highway vehicles and engines. However, CAFE fuel-economy requirements and traditional air pollutant standards remain in place. It should be noted that the finding is subject to an administrative challenge and several petitions in federal district court.

GHG and fuel economy standards for on-road vehicles have evolved significantly since their initial adoption. These actions reflect the continuation and strengthening of federal regulations that indirectly aid the reduction of GHG emissions.

State

California Air Resources Board. The California Air Resources Board (CARB) is responsible for the coordination and oversight of State and local air pollution control programs in California. Various statewide and local initiatives to reduce California's contribution to GHG emissions have raised awareness about climate change and its potential for severe long-term adverse environmental, social, and economic effects. California is a significant emitter of CO_2e in the world and produced 371.1 million gross metric tons of CO_2e in 2022. In the state, the transportation sector is the largest emitter of GHGs, followed by industrial operations such as manufacturing and oil and gas extraction.

The State of California legislature has enacted a series of bills that constitute the most aggressive program to reduce GHGs of any state in the nation. Some legislation, such as the landmark AB 32 California Global Warming Solutions Act of 2006, was specifically enacted to address GHG emissions. Other legislation, such as Title 24 building efficiency standards and Title 20 appliance energy standards, were originally adopted for other purposes such as energy and water conservation, but also provide GHG reductions. This section describes the major legislation related to GHG emissions reduction.

Assembly Bill 32 (California Global Warming Solutions Act of 2006). AB 32 instructs the CARB to develop and enforce regulations for the reporting and verification of statewide GHG emissions. AB 32 also directed CARB to set a GHG emissions limit based on 1990 levels, to be achieved by 2020. It set a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner.

CARB Scoping Plan. Adopted December 15, 2022, CARB's *2022 Scoping Plan for Achieving Carbon Neutrality* (2022 Scoping Plan) sets a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045 in accordance with AB 1279. To achieve the targets of AB 1279, the 2022 Scoping Plan relies on existing and emerging fossil fuel alternatives and clean technologies, as well as carbon capture and storage. Specifically, the 2022 Scoping Plan focuses on zero-emission transportation; phasing out use of fossil gas use for heating homes and buildings; reducing chemical and refrigerants with high GWP; providing communities with sustainable options for walking, biking, and public transit; displacement of fossil-fuel fired electrical generation through use of renewable energy alternatives (e.g., solar arrays and wind turbines); and scaling up new options such as green hydrogen.

The key elements of the 2022 CARB Scoping Plan focus on transportation. Specifically, the 2022 Scoping Plan aims to rapidly move towards zero-emission transportation (i.e., electrifying cars, buses, trains, and trucks), which constitutes California's single largest source of GHGs. The regulations that impact the transportation sector are adopted and enforced by CARB on vehicle manufacturers and are outside the

jurisdiction and control of local governments. The 2022 Scoping Plan accelerates development of new regulations as well as amendments to strengthen regulations and programs already in place.

Included in the 2022 Scoping Plan is a set of Local Actions (2022 Scoping Plan Appendix D) aimed at providing local jurisdictions with recommendations to reduce GHGs and assist the state in meeting the ambitious targets set forth in the 2022 Scoping Plan. Appendix D to the 2022 Scoping Plan is not regulatory, is not exhaustive, and does not include everything local governments can implement to support the State's climate goals. It focuses primarily on climate action plans (CAPs) and local authority over new residential development. It includes a section on evaluating plan-level and project-level alignment with the State's Climate Goals in CEQA GHG analyses. In this section, CARB identifies several recommendations and strategies that should be considered for new development in order to determine consistency with the 2022 Scoping Plan. CARB specifically states that Section 3 of Appendix D, which discusses land use plans and development projects, does not address land uses other than residential and mixed-use residential, such as industrial. However, CARB plans to explore new approaches for other land use types in the future.

CARB Advanced Clean Truck Regulation. CARB adopted the Advanced Clean Truck Regulation in June 2020 requiring truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024.[11] By 2045, every new truck sold in California is required to be zero-emission. This rule directly addresses disproportionate risks and health and pollution burdens and puts California on the path for an all zero-emission short-haul drayage fleet in ports and railyards by 2035, and zero-emission "last-mile" delivery trucks and vans by 2040. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8. The regulation has two components including a manufacturer sales requirement, and a reporting requirement:

- Zero-Emission Truck Sales: Manufacturers who certify Class 2b through 8 chassis or complete vehicles with combustion engines are required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales need to be 55 percent of Class 2b – 3 truck sales, 75 percent of Class 4 – 8 straight truck sales, and 40 percent of truck tractor sales.
- Company and Fleet Reporting: Large employers including retailers, manufacturers, brokers and others would be required to report information about shipments and shuttle services. Fleet owners, with 50 or more trucks, would be required to report about their existing fleet operations. This information would help identify future strategies to ensure that fleets purchase available zero-emission trucks and place them in service where suitable to meet their needs.

On January 13, 2025, CARB withdrew its requests for FCAA waivers from the U.S. EPA needed to support four adopted vehicle emissions regulations: (1) the Advanced Clean Fleets Regulations; 2) the In-Use Locomotive Regulations; 3) part of the Commercial Harbor Craft and Ocean-Going Vessels At-Berth Regulations; and 4) part of the Transport Refrigeration Unit Engine Standards Regulations. The implementation of these regulations is currently unknown.

[11] The Advanced Clean Truck regulation, which requires manufacturers to sell increasing percentages of zero-emission vehicles, was granted a separate waiver in 2023. On May 22, 2025, the U.S. Senate voted to revoke the waiver granted by the Biden administration for California's ACT rule. On June 12, 2025, President Trump formally nullified the California's ACT rule (Congressional Resolution H.J. Res 87).

Senate Bill 32 (California Global Warming Solutions Act of 2006: Emissions Limit. Signed into law in September 2016, SB 32 codifies the 2030 GHG reduction target in Executive Order B-30-15 (40 percent below 1990 levels by 2030). The bill authorizes CARB to adopt an interim GHG emissions level target to be achieved by 2030. CARB also must adopt rules and regulations in an open public process to achieve the maximum, technologically feasible, and cost-effective GHG reductions.

SB 375 (The Sustainable Communities and Climate Protection Act of 2008). Signed into law on September 30, 2008, SB 375 provides a process to coordinate land use planning, regional transportation plans, and funding priorities to help California meet the GHG reduction goals established by AB 32. SB 375 requires metropolitan planning organizations to include sustainable community strategies in their regional transportation plans for reducing GHG emissions, aligns planning for transportation and housing, and creates specified incentives for the implementation of the strategies. The Project site is within the jurisdiction of the Kings County Association of Governments, which serves as the region's metropolitan planning organization and is responsible for preparing the applicable regional transportation plan and SCS.

AB 1493 (Pavley Regulations and Fuel Efficiency Standards). AB 1493, enacted on July 22, 2002, required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. Implementation of the regulation was delayed by lawsuits filed by automakers and by the EPA's denial of an implementation waiver. The EPA subsequently granted the requested waiver in 2009, which was upheld by the U.S. District Court for the District of Columbia in 2011. The regulations establish one set of emission standards for model years 2009–2016 and a second set of emissions standards for model years 2017 to 2025. By 2025, when all rules will be fully implemented, new automobiles will emit 34 percent fewer CO_2e emissions and 75 percent fewer smog-forming emissions. In 2018, the EPA proposed the SAFE Vehicles Rule, which would roll back fuel economy standards and revoke California's waiver. However, in December 2021, the NHTSA repealed the SAFE Vehicle Rule Part One.

SB 1368 (Emission Performance Standards). SB 1368 is the companion bill of AB 32, which directs the California Public Utilities Commission (CPUC) to adopt a performance standard for GHG emissions for the future power purchases of California utilities. SB 1368 limits carbon emissions associated with electrical energy consumed in California by forbidding procurement arrangements for energy longer than 5 years from resources that exceed the emissions of a relatively clean, combined cycle natural gas power plant. The new law effectively prevents California's utilities from investing in, otherwise financially supporting, or purchasing power from new coal plants located in or out of the state. The CPUC adopted the regulations required by SB 1368 on August 29, 2007. The regulations implementing SB 1368 establish a standard for baseload generation owned by, or under long-term contract to publicly owned utilities, for 1,100 pounds of CO_2 per megawatt-hour.

SB 1078, SB 107 and SBX1-2 (Renewable Electricity Standards). SB 1078 required California to generate 20 percent of its electricity from renewable energy by 2017. This goal was accelerated with SB 107, which changed the due date to 2010 instead of 2017. On November 17, 2008, Executive Order S-14-08 established a Renewable Portfolio Standard target for California requiring that all retail sellers of electricity serve 33 percent of their load with renewable energy by 2020. Executive Order S-21-09 also directed CARB to adopt a regulation by July 31, 2010, requiring the state's load serving entities to meet a 33 percent renewable energy target by 2020. CARB approved the Renewable Electricity Standard on September 23, 2010 by Resolution 10-23. SB X1-2 codified the 33 percent by 2020 goal.

SB 350 (Clean Energy and Pollution Reduction Act of 2015). Signed into law on October 7, 2015, SB 350 implements the goals of Executive Order B-30-15. The objectives of SB 350 are to increase the procurement of electricity from renewable sources from 33 percent to 50 percent (with interim targets of 40 percent by 2024, and 45 percent by 2027) and to double the energy efficiency savings in electricity and natural gas end uses of retail customers through energy efficiency and conservation. SB 350 also reorganizes the Independent System Operator to develop more regional electricity transmission markets and improve accessibility in these markets, which will facilitate the growth of renewable energy markets in the western United States.

AB 398 (Market-Based Compliance Mechanisms). Signed on July 25, 2017, AB 398 extended the duration of the Cap-and-Trade program from 2020 to 2030. AB 398 required CARB to update the Scoping Plan and for all GHG rules and regulations adopted by the State. It also designated CARB as the statewide regulatory body responsible for ensuring that California meets its statewide carbon pollution reduction targets, while retaining local air districts' responsibility and authority to curb toxic air contaminants and criteria pollutants from local sources that severely impact public health. AB 398 also decreased free carbon allowances over 40 percent by 2030 and prioritized Cap-and-Trade spending to various programs including reducing diesel emissions in impacted communities.

SB 150 (Regional Transportation Plans). Signed on October 10, 2017, SB 150 aligns local and regional GHG reduction targets with State targets (i.e., 40 percent below their 1990 levels by 2030). SB 150 creates a process to include communities in discussions on how to monitor their regions' progress on meeting these goals. The bill also requires the CARB to regularly report on that progress, as well as on the successes and the challenges regions experience associated with achieving their targets. SB 150 provides for accounting of climate change efforts and GHG reductions and identify effective reduction strategies.

SB 100 and SB 1020 (California Renewables Portfolio Standard Program: Emissions of Greenhouse Gases). Signed into law in September 2018, SB 100 increased California's renewable electricity portfolio from 50 to 60 percent by 2030. SB 100 also established a further goal to have an electric grid that is entirely powered by clean energy by 2045. SB 1020 provides additional goals for the path to the 2045 goal of 100 percent clean electricity retail sales. It creates a target of 90 percent clean electricity retail sales by 2035 and 95 percent clean electricity retail sales by 2040.

AB 1346 (Air Pollution: Small Off-Road Engines). Signed into law in October 2021, AB 1346 requires CARB, to adopt cost-effective and technologically feasible regulations to prohibit engine exhaust and evaporative emissions from new small off-road engines, consistent with federal law, by July 1, 2022. The bill requires CARB to identify and, to the extent feasible, make available funding for commercial rebates or similar incentive funding as part of any updates to existing applicable funding program guidelines to local air pollution control districts and air quality management districts to implement to support the transition to zero-emission small off-road equipment operations.

AB 1279 (The California Climate Crisis Act). AB 1279 establishes the policy of the State to achieve carbon neutrality as soon as possible, but no later than 2045; to maintain net negative GHG emissions thereafter; and to ensure that by 2045 statewide anthropogenic GHG emissions are reduced at least 85 percent below 1990 levels. The bill requires CARB to ensure that Scoping Plan updates identify and recommend measures to achieve carbon neutrality, and to identify and implement policies and strategies that enable CO_2 removal solutions and carbon capture, utilization, and storage technologies.

Executive Orders Related to GHG Emissions

California's Executive Branch has taken several actions to reduce GHGs using executive orders. Although not regulatory, they set the state's tone and guide the actions of state agencies.

Executive Order S-3-05. Executive Order S-3-05 was issued on June 1, 2005, which established the following GHG emissions reduction targets:

- By 2010, reduce greenhouse gas emissions to 2000 levels.
- By 2020, reduce greenhouse gas emissions to 1990 levels.
- By 2050, reduce greenhouse gas emissions to 80 percent below 1990 levels.

The 2050 reduction goal represents what some scientists believe is necessary to reach levels that will stabilize the climate. The 2020 goal was established to be a mid-term target. Because this is an executive order, the goals are not legally enforceable for local governments or the private sector.

Executive Order S-01-07. Issued on January 18, 2007, Executive Order S-01-07 mandates that a statewide goal shall be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. The executive order established a Low Carbon Fuel Standard (LCFS) and directed the Secretary for Environmental Protection to coordinate the actions of the California Energy Commission, CARB, the University of California, and other agencies to develop and propose protocols for measuring the "life-cycle carbon intensity" of transportation fuels. CARB adopted the LCFS on April 23, 2009.

Executive Order S-13-08. Issued on November 14, 2008, Executive Order S-13-08 facilitated the California Natural Resources Agency development of the 2009 California Climate Adaptation Strategy. Objectives include analyzing risks of climate change in California, identifying and exploring strategies to adapt to climate change, and specifying a direction for future research.

Executive Order S-14-08. Issued on November 17, 2008, Executive Order S-14-08 expands the state's Renewable Energy Standard to 33 percent renewable power by 2020. Additionally, Executive Order S- 21- 09 (signed on September 15, 2009) directs CARB to adopt regulations requiring 33 percent of electricity sold in the state come from renewable energy by 2020. CARB adopted the Renewable Electricity Standard on September 23, 2010, which requires 33 percent renewable energy by 2020 for most publicly owned electricity retailers.

Executive Order S-21-09. Issued on July 17, 2009, Executive Order S-21-09 directs CARB to adopt regulations to increase California's Renewable Portfolio Standard (RPS) to 33 percent by 2020. This builds upon SB 1078 (2002), which established the California RPS program, requiring 20 percent renewable energy by 2017, and SB 107 (2006), which advanced the 20 percent deadline to 2010, a goal which was expanded to 33 percent by 2020 in the 2005 Energy Action Plan II.

Executive Order B-30-15. Issued on April 29, 2015, Executive Order B-30-15 established a California GHG reduction target of 40 percent below 1990 levels by 2030 and directs CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of CO_2e ($MMTCO_2e$). The 2030 target acts as an interim goal on the way to achieving reductions of 80 percent below 1990 levels by 2050, a goal set by Executive Order S-3-05. The executive order also requires the state's climate adaptation plan to be updated every three years and for the state to continue its climate change research program, among

other provisions. With the enactment of SB 32 in 2016, the Legislature codified the goal of reducing GHG emissions by 2030 to 40 percent below 1990 levels.

Executive Order B-55-18. Issued on September 10, 2018, Executive Order B-55-18 establishes a goal to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. This goal is in addition to the existing statewide targets of reducing GHG emissions. The executive order requires CARB to work with relevant state agencies to develop a framework for implementing this goal. It also requires CARB to update the Scoping Plan to identify and recommend measures to achieve carbon neutrality. The executive order also requires state agencies to develop sequestration targets in the Natural and Working Lands Climate Change Implementation Plan.

Executive Order N-79-20. Issued on September 23, 2020, Executive Order N-79-20 established a goal to end the sales of new internal combustion engine vehicles in the state as soon as possible, and no later than 2035, and continue to phaseout fossil-fueled cars and trucks. By setting a course to end sales of internal combustion passenger vehicles by 2035, the Governor's Executive Order establishes a target for the transportation sector that helps put the state on a path to carbon neutrality by 2045. It is important to note that the Executive Order focuses on new vehicle sales for automakers, and therefore does not require Californians to give up the existing cars and trucks they already own.

California Regulations and Building Codes

California has a long history of adopting regulations to improve energy efficiency in new and remodeled buildings. These regulations have kept California's energy consumption relatively flat, even with rapid population growth.

Title 20 Appliance Efficiency Regulations. The appliance efficiency regulations (California Code of Regulations [CCR] Title 20, Sections 1601-1608) include standards for new appliances. Twenty-three categories of appliances are included in the scope of these regulations. These standards include minimum levels of operating efficiency, and other cost-effective measures, to promote the use of energy-and water-efficient appliances.

Title 24 Building Energy Efficiency Standards. California's Energy Efficiency Standards for Residential and Nonresidential Buildings (CCR Title 24, Part 6) was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions. The California Energy Commission (CEC) adopted the 2025 Energy Code on September 11, 2024, which was subsequently approved by the California Building Standards Commission for inclusion into the California Building Standards Code. The 2025 Energy Code requires electric heat pumps for space and water heating in most new residential and commercial buildings, expands solar photovoltaic and battery storage requirements to more building types, and

mandates electric-ready infrastructure to support future appliance electrification. Projects whose permit applications are applied for on or after January 1, 2026, must comply with the 2025 Energy Code.[12]

Title 24 California Green Building Standards Code. The California Green Building Standards Code (CCR Title 24, Part 11) commonly referred to as the CALGreen Code, is a statewide mandatory construction code developed and adopted by the California Building Standards Commission and the Department of Housing and Community Development. The CALGreen standards require new residential and commercial buildings to comply with mandatory measures under the topics of planning and design, energy efficiency, water efficiency/conservation, material conservation and resource efficiency, and environmental quality. CALGreen also provides voluntary tiers and measures that local governments may adopt that encourage or require additional measures in the five green building topics. The current 2025 CALGreen Code was adopted in 2024 and went into effect January 1, 2026. Projects whose permit applications are applied for on or after January 1, 2026, must comply with the 2025 CALGreen Code.[13]

California Vehicle Regulations

Advanced Clean Cars I and II

Advanced Clean Cars combines several regulations into one package including the Low-Emission Vehicle (LEV) criteria and greenhouse gas regulations and the zero-emission vehicle (ZEV) regulation. Advanced Clean Cars I was adopted in 2012 and Advanced Clean Cars II was adopted in 2022. These regulations rapidly scale down emissions of light-duty passenger cars, pickup trucks and SUVs and require an increased number of zero-emission vehicles to meet air quality and climate change emissions goals. By 2035 all new passenger cars, trucks and SUVs sold in California will be zero emissions. The Advanced Clean Cars II regulations take the State's already growing zero-emission vehicle market and robust motor vehicle emission control rules and augments them to meet more aggressive tailpipe emissions standards and ramp up to 100% zero-emission vehicles.

CARB Advanced Clean Fleets Regulation

CARB approved Advanced Clean Fleets Regulation (ACF) on April 28, 2023, requires fleet owners to begin transitioning toward ZEVs starting in 2024. Due to the impact that truck traffic has on residents living near heavily trafficked corridors, drayage trucks will need to be zero emissions by 2035. All other fleet owners have the option to transition a percentage of their vehicles to meet expected zero-emission milestones, which gives owners the flexibility to continue operating combustion-powered vehicles as needed during the move toward cleaner technology.[14]

California Energy Commission, *Energy Commission Adopts Updated Building Standards Expanding Requirements for Heat Pumps and Electric-Ready Buildings*, https://www.energy.ca.gov/news/2024-09/energy-commission-adopts-updated-building-standards-expanding-requirements-heat, accessed July 2025.

[14] On January 13, 2025, California withdrew its request for federal approval of the Advanced Clean Fleets and is evaluating next steps. CARB will not enforce portions of the regulation requiring federal authorization, such as those affecting high-priority and drayage fleets. However, State and local government fleet requirements remain unchanged. (Source: California Air Resources Board, *ACF Waiver Update*, https://ww2.arb.ca.gov/our-work/programs/advanced-clean-fleets. Accessed February 2025.)

Regional and Local

San Joaquin Valley Air Basin Air Quality Management District

The San Joaquin Valley Air Pollution Control District (SJVAPCD) is made up of eight counties in California's Central Valley: San Joaquin, Stanislaus, Merced, Madera, Fresno, Kings, Tulare, and the San Joaquin Valley Air Basin portion of Kern. The City of Hanford and the project site are located within the jurisdiction of the SJVAPCD. The SJVAPCD adopted a Climate Change Action Plan in August 2008. However, the State has enacted several significant GHG reduction measures since the adoption of the Climate Change Action Plan. Therefore, this analysis does not address the SJVAPCD Climate Change Action Plan; refer to the *Thresholds* discussion below.

City of Hanford Climate Action Plan

The City of Hanford adopted the Final Regional Climate Action Plan (CAP) on May 28, 2014. The CAP is a long-term planning document that outlines cost-effective strategies to reduce GHG emissions within Kings County. The CAP goals align with AB 32 and the States efforts to reduce GHG emissions to 1990 levels by 2020.

City of Hanford General Plan

The Hanford General Plan includes multiple objectives, policies, and programs to alleviate GHG emissions and potential effects that may lead to climate change. The General Plan includes the following relevant GHG guidelines, which are applicable to the project:

OBJECTIVE AQ 4: Accurately assess and mitigate potentially significant local and regional air quality and climate change impacts from proposed projects within the City. Where possible and financially feasible, retrofit existing uses and activities to reduce emissions and climate change impacts.

Policy AQ 4.2: Assess and mitigate project greenhouse gas/climate change impacts using analysis methods and significance thresholds as defined or recommended by the San Joaquin Valley Air Pollution Control District.

Program AQ 4.1: The City will advise consultants to use San Joaquin Valley Air Pollution Control District Guidelines for preparing air and climate change assessments and will refer California Environmental Quality Act documents to the San Joaquin Valley Air Pollution Control District for review and comment on potential air quality and greenhouse gas impacts and for recommendations regarding air quality mitigation measures and greenhouse gas Best Performance Standards.

Policy AQ 4.4: Identify and maintain an ongoing inventory of the cumulative transportation, air quality, and climate change impacts of all general plan amendments approved during each year.

Program AQ 4.2: The City will provide project applicants with the San Joaquin Valley Air Pollution Control District's Best Performance Standards list for greenhouse gas reductions

when available, and will work with applicants to incorporate design features that reduce emissions.

OBJECTIVE AQ 7: Increase the use of energy conservation features, renewable sources of energy and low-emission equipment in new and existing development projects within the City.

Program AQ 7.1: The City will work with the Kings County Economic Development Corporation to attract businesses that provide local employment and use or provide green/renewable energy and related products.

Policy AQ 7.2: Initiate and sustain ongoing efforts with local water and energy utilities and developers to establish and implement voluntary incentive based programs to encourage the use of energy efficient designs and equipment in new and existing development projects within the City.

Policy AQ 7.3: Support and recognize developers proposing projects that comply with the state's Green Building Standards voluntary tier levels or other enhanced energy conservation and sustainable rating systems such as LEED certification, Greenpoint Rating, and Energy Star.

Policy AQ 7.5: City staff will proactively work with the California Energy Commission, local water and energy utilities, industry, and other potential partners to seek funding sources and implement programs which reduce water and energy use, reduce air emissions and reduce the creation of greenhouse gases.

Program AQ 7.2: Track conservation related grant and incentive programs and provide this information to public and private sector partners through the city's website, email distribution lists, and other outreach opportunities.

Policy AQ 7.6: Encourage the use of solar-ready roofs into residential and commercial development. New residential development should include proper solar orientation (south facing roof area sloped at 20° to 55° from the horizontal), clear access on the south sloped roof (no chimneys, heating vents, plumbing vents, etc.), electrical conduit installed for solar electric system wiring, plumbing installed for solar hot water systems, and space provided for a solar hot water storage tank. Roofs for commercial development should be designed to maximize potential area available for solar panels and provide electrical conduit to support future installation.

Program AQ 7.3: The City will work with the building industry to incorporate designs improving solar readiness into building plans through voluntary green building guidelines.

OBJECTIVE AQ 10: Identify and achieve greenhouse gas emission reduction targets consistent with the City's proportionate fair share as may be allocated by the California Air Resources Board and Kings County Association of Governments. Policy AQ 10.1: As recommended in the San Joaquin Valley Air Pollution Control District's Guidance for

Valley Land-use Agencies in Addressing GHG Emission Impacts for New Projects under CEQA (December 2009), the City establishes an initial goal of reducing greenhouse gas emissions from development projects within its authority by 29 percent below year 2020 business as usual emissions. The City will also work with Kings County Association of Governments to ensure that it achieves its proportionate fair share reduction in greenhouse gas emissions as may be identified under the provisions of SB 375 (2008 Chapter 728) for any projects or activities requiring approval of Kings County Association of Governments.

Policy AQ 10.4: The City will participate in the Sustainable Communities Strategy/Regional Blueprint Planning effort and will ensure that local plans are consistent with the Regional Plan.

ENVIRONMENTAL SETTING

Certain gases in the earth's atmosphere classified as GHGs, play a critical role in determining the earth's surface temperature. Solar radiation enters the earth's atmosphere from space. A portion of the radiation is absorbed by the earth's surface and a smaller portion of this radiation is reflected toward space. This absorbed radiation is then emitted from the earth as low-frequency infrared radiation. The frequencies at which bodies emit radiation are proportional to temperature. Because the earth has a much lower temperature than the sun, it emits lower-frequency radiation. Most solar radiation passes through GHGs; however, infrared radiation is absorbed by these gases. As a result, radiation that otherwise would have escaped back into space is instead "trapped," resulting in a warming of the atmosphere. This phenomenon, known as the greenhouse effect, is responsible for maintaining a habitable climate on earth.

The primary GHGs contributing to the greenhouse effect are CO_2, CH_4, and N_2O. Fluorinated gases also make up a small fraction of the GHGs that contribute to climate change. Examples of fluorinated gases include chlorofluorocarbons (CFCs), HFCs, PFCs, SF_6, and nitrogen trifluoride (NF_3); however, it is noted that these gases are not associated with typical land use development. Human-caused emissions of GHGs exceeding natural ambient concentrations are believed to be responsible for intensifying the greenhouse effect and leading to a trend of unnatural warming of the Earth's climate, known as global climate change or global warming.

GHGs are global pollutants, unlike criteria air pollutants and toxic air contaminants (TACs), which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects have relatively short atmospheric lifetimes (about one day), GHGs have long atmospheric lifetimes (one to several thousand years). GHGs persist in the atmosphere for long enough time periods to be dispersed around the globe. Although the exact lifetime of a GHG molecule is dependent on multiple variables and cannot be pinpointed, more CO_2 is emitted into the atmosphere than is sequestered by ocean uptake, vegetation, or other forms of carbon sequestration. Of the total annual human-caused CO_2 emissions, approximately 55 percent is sequestered through ocean and land uptakes every year, averaged over the last 50 years, whereas the remaining 45 percent of human-caused CO_2 emissions remains stored in the

atmosphere.[15] *Table 5.8-1: Description of Greenhouse Gases* describes the primary GHGs attributed to global climate change, including their physical properties.

Table 5.8-1: Description of Greenhouse Gases

Greenhouse Gas	Description
Carbon Dioxide (CO_2)	CO_2 is a colorless, odorless gas that is emitted naturally and through human activities. Natural sources include decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic sources are from burning coal, oil, natural gas, and wood. The largest source of CO_2 emissions globally is the combustion of fossil fuels such as coal, oil, and gas in power plants, automobiles, and industrial facilities. The atmospheric lifetime of CO_2 is variable because it is readily exchanged in the atmosphere. CO_2 is the most widely emitted GHG and is the reference gas (Global Warming Potential of 1) for determining Global Warming Potentials for other GHGs.
Nitrous Oxide (N_2O)	N_2O is largely attributable to agricultural practices and soil management. Primary human-related sources of N_2O include agricultural soil management, sewage treatment, combustion of fossil fuels, and adipic and nitric acid production. N_2O is produced from biological sources in soil and water, particularly microbial action in wet tropical forests. The atmospheric lifetime of N_2O is approximately 120 years. The Global Warming Potential of N_2O is 298.
Methane (CH_4)	CH_4, a highly potent GHG, primarily results from off-gassing (the release of chemicals from nonmetallic substances under ambient or greater pressure conditions) and is largely associated with agricultural practices and landfills. Methane is the major component of natural gas, about 87 percent by volume. Human-related sources include fossil fuel production, animal husbandry, rice cultivation, biomass burning, and waste management. Natural sources of CH_4 include wetlands, gas hydrates, termites, oceans, freshwater bodies, non-wetland soils, and wildfires. The atmospheric lifetime of CH_4 is about 12 years and the Global Warming Potential is 25.
Hydrofluorocarbons (HFCs)	HFCs are typically used as refrigerants for both stationary refrigeration and mobile air conditioning. The use of HFCs for cooling and foam blowing is increasing, as the continued phase out of CFCs and HCFCs gains momentum. The 100-year Global Warming Potential of HFCs range from 124 for HFC-152 to 14,800 for HFC-23.
Perfluorocarbons (PFCs)	PFCs have stable molecular structures and only break down by ultraviolet rays about 60 kilometers above Earth's surface. Because of this, they have long lifetimes, between 10,000 and 50,000 years. Two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Global Warming Potentials range from 6,500 to 9,200.
Chlorofluorocarbons (CFCs)	CFCs are gases formed synthetically by replacing all hydrogen atoms in methane or ethane with chlorine and/or fluorine atoms. They are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at the earth's surface). CFCs were synthesized in 1928 for use as refrigerants, aerosol propellants, and cleaning solvents. The Montreal Protocol on Substances that Deplete the Ozone Layer prohibited their production in 1987. Global Warming Potentials for CFCs range from 3,800 to 14,400.
Sulfur Hexafluoride (SF_6)	SF_6 is an inorganic, odorless, colorless, and nontoxic, nonflammable gas. It has a lifetime of 3,200 years. This gas is manmade and used for insulation in electric power transmission equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas. The Global Warming Potential of SF_6 is 23,900.
Hydrochlorofluoro-carbons (HCFCs)	HCFCs are solvents, similar in use and chemical composition to CFCs. The main uses of HCFCs are for refrigerant products and air conditioning systems. As part of the Montreal Protocol, HCFCs are subject to a consumption cap and gradual phase out. The United States is scheduled to achieve a 100 percent

[15] Intergovernmental Panel on Climate Change, Carbon and Other Biogeochemical Cycles. In: Climate Change 2013: The Physical Science Basis, Contribution of Working Group I to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change, 2013. https://www.ipcc.ch/site/assets/uploads/2018/02/WG1AR5_all_final.pdf. Accessed July 2025.

Greenhouse Gas	Description
	reduction to the cap by 2030. The 100-year Global Warming Potentials of HCFCs range from 90 for HCFC-123 to 1,800 for HCFC-142b.
Nitrogen Trifluoride (NF_3)	NF_3 was added to Health and Safety Code section 38505(g)(7) as a GHG of concern. This gas is used in electronics manufacture for semiconductors and liquid crystal displays. It has a high global warming potential of 17,200.

GHG THRESHOLDS

Based upon the criteria derived from State CEQA Guidelines Appendix G, a project normally would have a significant effect on the environment if it would:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment or
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Section 8.3 of the City's General Plan identifies SJVAPCD as the applicable air district for air quality matters. However, the SJVAPCD has not adopted a numeric threshold of significance for GHG emissions under CEQA. In the absence of an adopted local GHG threshold, CEQA allows lead agencies to rely on thresholds developed by other air districts or agencies, provided those thresholds are supported by substantial evidence and are consistent with statewide climate policy.

The Bay Area Air Quality Management District (BAAQMD) has adopted GHG significance thresholds that are based on California's long-term climate goals, including Assembly Bill 32, Senate Bill 32, and the State's 2030 and 2050 emissions reduction targets. These thresholds are widely used by lead agencies throughout California, including in air districts that have not adopted their own numeric GHG thresholds, and have been upheld in CEQA practice as a reasonable and conservative screening tool.

Accordingly, the BAAQMD GHG significance thresholds are used in this analysis to evaluate the Project's GHG emissions in a manner that is consistent with CEQA, statewide climate policy, and available guidance, notwithstanding the absence of an adopted SJVAPCD GHG threshold.

BAAQMD's approach to developing significance criteria for GHG emissions for local development projects that are not stationary sources is to identify features that, if included, would show that the project would not interfere with the state's goal to have net zero emissions by 2045. Under the BAAQMD thresholds a project that meets either A or B is a project that would make a less than cumulatively considerable contribution to significant cumulative climate change impacts:

A. Projects must include, at a minimum, the following project design elements:
    1. Buildings
        a. The project will not include natural gas appliances or natural gas plumbing (in both residential and nonresidential development).

b. The project will not result in any wasteful, inefficient, or unnecessary energy usage as determined by the analysis required under CEQA Section 21100(b)(3) and Section 15126.2(b) of the State CEQA Guidelines.

2. Transportation
   a. The project will achieve a reduction in project-generated VMT below the regional average consistent with the current version of the California Climate Change Scoping Plan (currently 15 percent) or meet a locally adopted Senate Bill 743 VMT target that reflects the recommendations provided in the Governor's Office of Planning and Research's Technical Advisory on Evaluating Transportation Impacts in CEQA:
      i. Residential projects: 15 percent below the existing VMT per capita
      ii. Office projects: 15 percent below the existing VMT per employee
      iii. Retail projects: no net increase in existing VMT
   b. Achieve compliance with electric vehicle requirements in the most recently adopted version of CALGreen Tier 2.

B. Be consistent with a local GHG Reduction Strategy that meets the criteria under the CEQA Guidelines section 15183.5(b) C

A qualified GHG Reduction Strategy adopted by a local jurisdiction should include the following elements as described in the State CEQA Guidelines Section 15183.5(b)(1):

i. Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area;
ii. Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable;
iii. Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area;
iv. Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;
v. Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels; and
vi. Be adopted in a public process following environmental review

Neither SJVAPCD nor BAAQMD has an adopted threshold of significance for construction-related GHG emissions. However, the BAAQMD recommends quantification and disclosure of construction GHG emissions. The BAAQMD also recommends that the Lead Agency should make a determination on the significance of these construction generated GHG emission impacts in relation to meeting AB 1279 GHG reduction goals, as required by the Public Resources Code, Section 21082.2. The Lead Agency is encouraged to incorporate best management practices to reduce GHG emissions during construction, as feasible and applicable.

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Less than Significant Impact with Mitigation.

Short-Term Construction Greenhouse Gas Emissions

Construction of the project would result in direct emissions of CO_2, N_2O, and CH_4 from the operation of construction equipment and the transport of materials and construction workers to and from the project site. SJVAPCD does not have a threshold for construction GHG emissions, which are one-time, short-term *emissions* and therefore would not significantly contribute to long-term cumulative GHG emissions impacts of the proposed project. However, the SJVAPCD advises that construction GHG emissions should be disclosed and a determination on the significance of construction GHG emissions in relation to meeting the State's GHG reduction goals should be made. Total GHG emissions generated during all phases of construction were combined and are presented in *Table 5.8-2: Construction Greenhouse Gas Emissions*. CalEEMod (version 2022.1.1.29) outputs are contained within Appendix A.

Table 5.8-2: Construction Greenhouse Gas Emissions

Year	$MTCO_2e$[1]
2026	197
2027	61
Total Construction Emissions	**258**
30-Year Amortized Construction Emissions	9

$MTCO_2e$ = metric tons of carbon dioxide equivalent.
1. Due to Rounding, Total $MTCO_2e$ may be marginally different from CalEEMod output.
Source: Refer to Appendix A for model outputs.

As shown in *Table 5.8-2*, project construction-related activities would generate approximately 258 $MTCO_2e$ of GHG emissions over the course of construction. Construction GHG emissions are typically summed and amortized over a 30-year period, then added to the operational emissions. The amortized Project construction emissions would be 9 $MTCO_2e$ per year. Once construction is complete, the generation of construction-related GHG emissions would cease.

Long-Term Operational Greenhouse Gas Emissions

Operational or long-term emissions would occur over the project's life. GHG emissions would result from direct emissions such as project generated vehicular traffic and operation of any landscaping equipment. Operational GHG emissions would also result from indirect sources, such as off-site generation of electrical power over the life of the project, the energy required to convey water to, and wastewater from the project site, the emissions associated with solid waste generated from the project site, and any fugitive refrigerants from air conditioning or refrigerators. Total GHG emissions associated with the project are summarized in *Table 5.8-3: Operational Greenhouse Gas Emissions*. As shown in *Table 5.8-3*, the project's GHG emissions would be approximately 4,456 $MTCO_2e$ per year.

Table 5.8-3: Operational Greenhouse Gas Emissions

Emission Source	Annual $MTCO_2e$[1]
Area Source	<1
Energy (Electricity)[2]	73
Energy (Natural Gas)[2]	0
Mobile	4,154
Waste	6
Water	1
Refrigerant	205
Backup Generator	8
30-Year Amortized Construction Emissions	9
Total	**4,456**

$MTCO_2e$ = metric tons of carbon dioxide equivalent.
1. Due to rounding, total $MTCO_2e$ may be marginally different from CalEEMod outputs.
2. With implementation of **Mitigation Measure MM GHG-1**, the project would be an all-electric development, not utilizing any natural gas.
Source: Refer to Appendix A for model outputs.

It should be noted that the project would comply with the 2025 Title 24 Part 6 Building Energy Efficiency Standards. The standards require electric heat pumps, solar photovoltaic and battery storage, and electric-ready infrastructure. The project would also comply with the appliance energy efficiency standards in Title 20 of the California Code of Regulations. The Title 20 standards include minimum levels of operating efficiency, and other cost-effective measures, to promote the use of energy- and water-efficient appliances. The project would be constructed according to the standards for high-efficiency water fixtures for indoor plumbing and water efficient irrigation systems required in 2025 Title 24, Part 11 (CALGreen). The GHG emissions shown in *Table 5.8-3* conservatively do not include reductions associated with the 2025 Title 24 Part 6 Building Energy Efficiency Standards.

At the State and global level, improvements in technology, policy, and social behavior can also influence and reduce operational emissions generated by a project. The state is currently on a pathway to achieving the Renewable Portfolio Standards goal of 60 percent renewables by 2030 per SB 100.

The majority of project emissions would occur from mobile and energy sources. Energy and mobile sources are targeted by statewide measures such as low carbon fuels, cleaner vehicles, strategies to promote sustainable communities and improved transportation choices that result in reducing VMT, continued implementation of the Renewable Portfolio Standard (the target is now set at 60 percent renewables by 2030), and extension of the Cap-and-Trade program (requires reductions from industrial sources, energy generation, and fossil fuels). The Cap-and-Trade

program covers approximately 85 percent of California's GHG emissions as of January 2015. The statewide cap for GHG emissions from the capped sectors (i.e., electricity generation, industrial sources, petroleum refining, and cement production) commenced in 2013 and will decline approximately three percent each year, achieving GHG emission reductions throughout the program's duration. The passage of AB 398 in July 2017 extended the duration of the Cap-and-Trade program from 2020 to 2030.

According to the BAAQMD, the project would result in less than significant GHG impacts if the following project design features were met:

1. Buildings
    a. The project will not include natural gas appliances or natural gas plumbing (in both residential and nonresidential development).
    b. The project will not result in any wasteful, inefficient, or unnecessary energy usage as determined by the analysis required under CEQA Section 21100(b)(3) and Section 15126.2(b) of the State CEQA Guidelines.
2. Transportation
    a. The project will achieve a reduction in project-generated VMT below the regional average consistent with the current version of the California Climate Change Scoping Plan (currently 15 percent) or meet a locally adopted Senate Bill 743 VMT target that reflects the recommendations provided in the Governor's Office of Planning and Research's Technical Advisory on Evaluating Transportation Impacts in CEQA:
        i. Residential projects: 15 percent below the existing VMT per capita
        ii. Office projects: 15 percent below the existing VMT per employee
        iii. Retail projects: no net increase in existing VMT
    b. Achieve compliance with electric vehicle requirements in the most recently adopted version of CALGreen Tier 2.

To further reduce GHG emissions the project would implement **Mitigation Measures GHG-1 and MM GHG-2**. **Mitigation Measure MM GHG-1** would require the project to use all-electric appliances and end uses instead of natural gas. **Mitigation Measure MM GHG-2** would require the project to meet CALGreen Tier 2 electric vehicle requirements. As discussed in *Section 5.17, Transportation,* the project is considered a local-serving retail use and the facility itself is not expected to be the principal catalyst for new trips. The proposed uses would not generate new demand, rather they would satisfy existing demand that would therefore shorten the distance that customers would otherwise travel. Therefore, the project would meet the transportation design features identified by BAAQMD for retail projects. Further, as discussed in *Section 5.6*, *Energy*, the project would not result in any wasteful, inefficient, or unnecessary use of energy. Therefore, with implementation of **Mitigation Measure MM GHG-1** and **Mitigation Measure MM GHG-2**, the project would meet the BAAQMD GHG significance criteria and impacts would be less than significant.

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Less Than Significant Impact with Mitigation.

The City of Hanford adopted the Final Regional Climate Action Plan (CAP) on May 28, 2014. The CAP is a long-term planning document that outlines cost-effective strategies to reduce GHG emissions within Kings County. The CAP's goals align with AB 32 and the States efforts to reduce GHG emissions to 1990 levels by 2020. The CAP includes policies aimed at reducing GHG emissions associated with new development. The project has been evaluated for consistency with these applicable policies, as summarized below in *Table 5.8-4: Project CAP Consistency*.

Table 5.8-4: Project CAP Consistency

CAP Policy	Project Consistency
E-4.2: Work with the building industry to incorporate designs improving solar readiness into building plans through voluntary green building guidelines.	**Consistent:** The project will comply with Title 24 solar readiness requirements for new nonresidential developments.
E-5.2: Provide project applicants with green building resources, including the SJVAPCD's Best Performance Standards list for GHG reductions, and promote workshops offered by community organizations.	**Consistent:** The project will incorporate GHG reduction features as required by SJVAPCD rules, Title 24 standards, and City requirements.
TL-2.4: Encourage the installation of adequate and secure bicycle parking at all multi-family residential, commercial, governmental, and recreational locations throughout the region.	**Consistent:** The project will comply with Title 24 bicycle parking requirements
TL-2.5: Support land use planning that will promote pedestrian and bicyclist access to and from new development by encouraging land use and subdivision designs that provide safe bicycle and pedestrian circulation, including bicycle parking facilities and internal bicycle and pedestrian routes, where feasible.	**Consistent:** The project will comply with Title 24 bicycle parking requirements and City design standards related to pedestrian access.
$MTCO_2e$ = metric tons of carbon dioxide equivalent. 1. Due to rounding, total $MTCO_2e$ may be marginally different from CalEEMod outputs. Source: Refer to Appendix A for model outputs.	

Since adoption of the CAP in 2014, the State has enacted several significant GHG reduction measures, including AB 1279. AB 1279 sets a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045. As discussed above, the BAAQMD GHG significance criteria aligns with the State's goal to meet net zero emissions by 2045, and the project was determined to be consistent with the BAAQMD GHG significance criteria with implementation of **Mitigation Measure MM GHG-1** and **Mitigation Measure MM GHG-2**. Therefore, implementation of the project would not conflict with an

applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions, and impacts would be less than significant.

Mitigation Measures:

MM GHG-1: **Require All-Electric Development.** Prior to the issuance of building permits, the Building Department shall confirm that building plans require the project to use all-electric appliances, and end uses instead of natural gas. The project shall not include natural gas utility lines or connections.

MM GHG-2: **CALGreen Tier 2 Electric Vehicle Requirements.** Prior to the issuance of a building permit, the Project Applicant or successor in interest shall provide documentation to the Building Department demonstrating that the project is designed to meet or exceed 2025 CALGreen Tier 2 electric vehicle requirements in effect at the time of building permit application.

Cumulative Impacts

It is generally the case that an individual project of the project's size and nature is of insufficient magnitude by itself to influence climate change or result in a substantial contribution to the global GHG inventory. GHG impacts are recognized as exclusively cumulative impacts; there are no non-cumulative GHG emission impacts from a climate change perspective. The additive effect of project-related GHG emissions would not result in a reasonably foreseeable cumulatively considerable contribution to global climate change. In addition, the project as well as other cumulative related projects, would be subject to all applicable regulatory requirements, which would further reduce GHG emissions. As discussed in 5.8 b) above, the project would not conflict with any GHG reduction plan. Therefore, the project's cumulative contribution of GHG emissions would be less than significant and the project's cumulative GHG impacts would also be less than cumulatively considerable.

5.9 HAZARDS AND HAZARDOUS MATERIALS

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
HAZARDS AND HAZARDOUS MATERIALS. Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?			**X**	
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?			**X**	
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?			**X**	
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?			**X**	
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?			**X**	
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?			**X**	
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?			**X**	

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Less Than Significant Impact.

Construction

Any potentially hazardous materials used during project construction would be handled on-site. This generally includes paints and solvents and other petroleum-based products, usually used for on-site construction equipment and for building exterior finishes. The use or handling of these potentially hazardous materials would be short-term only during the construction phase of project. Although these materials could be stored on-site, they would be required to comply with the guidelines established by the City of Hanford. The transport, removal, and disposal of hazardous materials on the project site would be conducted by a permitted and licensed service provider consistent with federal, state, and local requirements including the EPA, the California Department of Toxic Substances Control (DTSC), the California Occupational Safety and Health Administration (Cal/OSHA), Caltrans, the Resource Conservation and Recovery Act, and the Hanford Fire Department (HFD). With the compliance with local, state, and federal regulations short-term construction impacts associated with the handling, transport, use, and disposal of hazardous materials would be less than significant.

Operations

During project operations, widely used hazardous materials common at commercial/retail and office uses include cleaners, pesticides, and food waste would be present. The remnants of these and other products are disposed of as household hazardous waste that are prohibited or discouraged from being disposed of at local landfills. Regular operation and maintenance of the project structures would not result in significant impacts involving use, storage, transport or disposal of hazardous wastes and substances. Use of common commercial/retail and office hazardous materials and their disposal does not present a substantial health risk to the community Additionally, the project site is not included on the list of hazardous waste sites (Cortese List) compiled by the Department of Toxic Substances Control (DTSC) pursuant to Government Code § 65962.5 and therefore would not release known hazardous materials due to ground-disturbing activities.[16] Project impacts associated with the routine transport and use of hazardous materials or wastes would be less than significant.

Direct hazardous waste would be generated from landscaping involving the use of pesticides/herbicides and fertilizers. Landscaping maintenance best management practices (BMPs) would be conducted according to the California Stormwater Quality Associations; Stormwater BMPs which would reduce pesticides and fertilizers from running off-site. Indirect hazardous materials such as sediment, metals, oils and grease, trash/debris and other organic compounds that are usually known as stormwater pollutants would be captured via infiltration basins to avoid

[16] Department of Toxic Substances Control (DTSC) EnviroStor. 2024. *Hazardous Waste and Substances Site List.* https://www.envirostor.dtsc.ca.gov/public/map/?global_id=39990003. Accessed August 2024.

stormwater runoff from seeping off-site consistent with the City's stormwater management requirements.

Hazardous waste generated from the proposed vehicle service station could include cleaning agents, sediments, oil/grease, etc. The waste associated with this will conform to applicable federal, state, and local agency regulations. Proposed development is subject to the requirements of Chapter 12.08.170 of the Hanford Municipal Code. – Stormwater Management. The purpose of these requirements is in place with the goal to "minimize runoff and increase infiltration which recharges groundwater and improves water quality. Implementing stormwater best management practices into the landscape and grading design plans to minimize runoff and to increase onsite retention and infiltration are encouraged." These requirements are intended to assist in the protection and enhancement of the water quality of watercourses, water bodies, and wetlands in a manner pursuant to and consistent with the Federal Water Pollution Control Act (Clean Water Act, 33 USC Section 1251 et seq.), Porter- Cologne Water Quality Control Act (California Water Code Section 13000 et seq.) and National Pollutant Discharge Elimination System ("NPDES") Permit No. CAS000004, as such permit is amended and/or renewed.

Operations of the gas station would include the use, transport and handling of hazardous materials. Specifically, operation activities would include the regular transportation of gasoline to refill USTs, refilling USTs and pumping gasoline to fuel dispensers, and regular use of the fuel dispensers by motorists. As a result, the proposed Maverik gas station could result in potentially adverse impacts to people and the environment as a result of hazardous materials being accidentally released into the environment (e.g., operators or motorists could spill gasoline while refueling, USTs or pipes dispensing fuel from USTs could leak, automobiles could crash into fuel dispensers, or motorists could refuel while having engine running causing a fire hazard). However, the proposed gas station would be required to operate in compliance with all with applicable federal, state, and local requirements which lessen the potential for these impacts. Some of these regulations include:

- California State Water Resources Control Board (SWRCB) Health and Safety Code, Section 25280, underground storage tanks (USTs) installed after 1988 are required to have a leak detection system consisting of at least one of the following detection methods: secondary containment with interstitial monitoring, automatic tank gauging systems (including continuous automatic tank gauging systems), vapor monitoring (including tracer compound analysis), groundwater monitoring, statistical inventory reconciliation, or other method meeting established performance standards.
- Efficacy requirements established by Environmental Protection Agency (EPA) require that leak detection methods be able to detect certain leak rates and that they also give the correct answer consistently. In general, methods must detect the specified leak rate with a probability of detection of at least 95 percent and a probability of false alarm of no more than 5 percent. EPA found that, with effective leak detection, operators can respond quickly to signs of leaks and minimize the extent of environmental damage and the threat to human health and safety.
- USTs and associated fuel delivery infrastructure (i.e., fuel dispensers) would be required to comply with applicable federal, state, and local regulations, including those provisions

established by Section 2540.7, Gasoline Dispensing and Service Stations, of the California OSHA Regulations; Chapter 38, Liquefied Petroleum Gases, of the California Fire Code; the Resource Conservation and Recovery Act; and the County Fire Department Hazardous Materials Division.

- The proposed project would also be required to incorporate high-efficiency Phase I and Phase II enhanced vapor recovery (EVR) systems to capture and control gasoline fumes. EVR refers to a new generation of equipment to control emissions at gasoline dispensing facilities in California. EVR systems collect gasoline vapors that would otherwise escape into the atmosphere during bulk fuel delivery (Phase I) or fuel storage and vehicle refueling (Phase II). Since 2009, the installation of Phase I and Phase II EVR systems has been required for gasoline dispensing facilities.
- The fuel dispensers, USTs, and associated fuel delivery infrastructure would be subject to routine inspection by federal, state, and local regulatory agencies with jurisdiction over convenience service station facilities.
- The handling, transport, use, and disposal of hazardous materials must comply with applicable federal, state, and local agencies and regulations.
- In addition to compliance with local, state, and federal requirements, Maverick would take additional measures to prevent environmental and safety impacts. Some of these additional measures, which are proposed as project design features, include:
    - Product, vapor, and vent piping would be noncorrosive and would provide three levels of protection. First, product piping would be monitored with pressure line leak detection. Second, piping would be double walled to provide secondary containment. Third, fiberglass piping would be additionally monitored under vacuum in accordance with AB 2481 regulations such that, if a breach is detected in the vacuum, the product delivery system would shut down, and the system would sound an audible alarm.
    - Piping connections to the tanks and dispensers would be flexible. Flexible connectors would be used to prevent rupture from any form of ground movement.
    - Piping would slope to the pumps at the USTs. If a piping leak occurs, the gasoline would flow through the secondary pipe to the sump, where a sensor would be triggered to immediately shut down the system and activate an audible/visual alarm.
    - Tanks and dispensers would be equipped with the latest Phase I and Phase II EVR vapor recovery air pollution control equipment technology in accordance with the California Air Resources Board regulations and associated Executive Orders. The Phase I EVR equipment would control the vapors in the return path from the tanks back to the tanker truck during offloading filling operations. Phase I EVR systems are 98 percent effective in controlling fugitive emissions from escaping into the environment. Phase II EVR equipment, which also includes “in-station diagnostics,” would control and monitor the vapors in the return path from the

vehicles back to the tanks and are 95 percent effective in controlling fugitive emissions from escaping into the environment.

- The UST monitoring system incorporates automatic shutoffs. If gasoline is detected in the sump at the fuel dispenser, the dispenser would shut down automatically, and an alarm would sound. If a problem is detected with a tank, the tank would be automatically shut down, and an alarm would sound. If the product piping system detects a failure of the 0.1 gallons per hour test, the line would be automatically shut down, and the alarm would sound. Pursuant to federal requirements, monitoring equipment must be able to detect a minimum leak of 3 gallons per hour (equivalent to the accuracy of a mechanical leak detector). Each fuel dispenser would include several safety devices. Specifically, each dispenser sump would be equipped with an automatic shutoff valve to protect against vehicle impact. In addition, each fuel hose would include a breakaway device that would stop the flow of fuel at both ends of the hose in the event of an accidental drive-off. Also, each dispenser would be equipped with internal fire extinguishers. Lastly, dispensers would include leak detection sensors connected to the alarm console inside the controller closure.

Therefore, based on compliance with federal, state, and local regulations, and the incorporation of the proposed project design features, impacts associated with the handling, transport, use, and disposal of hazardous materials and the release of hazardous materials into the environment would be less than significant

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Less Than Significant Impact. The project is located adjacent the Highway 198 Off-ramp to the north, 12th Avenue to the east, Hanford Armona Road to the south may have all been constructed prior to 1992 when lead was still being added to gasoline. Aerially deposited lead (ADL) contaminated soils may exist along roadsides up to 30 feet[17] from the pavement and within the top 6 inches of the soil. Development of the project does not include any disturbance of soils within 30 ft of Highway 198. The off ramp is over 30 feet from the project site boundaries and is far away enough from the project site that no ADL contaminated soils are expected to be encountered on the north boundary of the project site. At the time of potential ADL exposure, the distance between the paved Highway 198 and project site would be greater than 30 feet. 12th Avenue may not have been heavily utilized prior to 1992. Additionally, Hanford Armona Road is approximately 650 feet south of the project site. Although 12th Avenue is within the immediate vicinity of the project site, the proposed project would not install hardscape within there would be low potential for lead given that it was not heavily utilized prior to 1992. Furthermore, Highway 198 and Hanford Armona Road are over 30 feet away from the project site. Overall, there is not expected to be any ADL

[17] DTSC factsheet (available online here: https://dot.ca.gov/-/media/dot-media/programs/environmental-analysis/documents/env/f0004055-caltrans-fs-a11y.pdf\)

contaminated soils on the project site. The project does not propose any widening of 12th Avenue. As such, potential impacts are considered less than significant.

Given the previous uses of the project site it is unlikely hazardous material would be discovered on-site. However, there is the potential for inadvertent discovery of hazardous waste from historic or future activities on or near the project site. At such time the proper agencies (i.e., fire department, DTSC, and/or Cal/OSHA), would be notified to determine what future actions and/or remediation would be required to identify the extent and potential impact to human health.

Overall, with compliance to federal, state, and local regulations, and the incorporation of the proposed project design features, impacts would be less than significant.

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Less Than Significant Impact. There are no schools within 0.25 miles of the project site and as noted above the project would be in compliance with federal, state, and local regulations. As such, all preventive measures would be in place to limit the hazardous emissions and waste in such a way that would not impact the neighboring school. As such impacts are expected to be less than significant.

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Less than Significant Impact. There are no superfund sites or hazardous waste and substances sites (Cortese List) within the project site boundaries (Envirostor, 2024). Additionally, there are no known hazardous materials sites within the projects boundaries as identified on the State of California Geotracker Map (State Water Resources Control Board, 2024). Therefore, a less than significant impact associated with hazardous materials sites would occur.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

Less than Significant Impact. There are no public airports or public use airports within 2 miles of the project site. The closest airport is Hanford Municipal Airport, approximately 2.52 miles east of the project site. Additionally, the project site does not fall within any airport land use plan boundaries and therefore impacts associated with a safety hazard or excessive noise would be less than significant.

f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Less Than Significant Impact. The project is not anticipated to physically impede the existing emergency response plans, emergency vehicle access, or personnel access to the site. The project

would not change local roadway circulation patterns or access. Emergency vehicle access must be maintained at all times throughout construction activities, in accordance with the County's routine/standard construction specifications and would comply with the requirements of CA Fire Code Section 503, Fire Access. Further, construction activities would not be permitted to impede emergency access to any local roadways or surrounding properties. All driveways and internal site access roads would be constructed to accommodate all emergency vehicles and personnel. Site access for the project would be maintained on the southern edge of the side, along Hayden Avenue. Kings County released an Emergency Operations Plan (EOP) in November 2015. The primary purpose of the EOP is to outline the County's all-hazard approach to emergency operations to protect the safety, health, and welfare of its citizens throughout all emergency management mission areas. The project with the proposed zone change would be consistent with the site's current land use and zoning designations, and the project would not physically interfere with the EOP. As such, the project would have a less than significant impact associated with the impairment or interference with an adopted emergency response plan.

g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

Less Than Significant Impact. The project site is not located within an area identified as having wildland fire potential. Therefore, the project would not expose people or structures to a significant risk of loss, injury or death involving wildland fires. According to CALFIRE, the project site is not located in a Very High Fire Hazard Severity Zone (VHFHSZ) (CALFIRE, 2025). The project site is in a Local Responsibility Area (LRA), meaning the financial responsibility of preventing and suppressing wildfires is primarily the responsibility of a Local agency (city, county, city and county, or district). However, the geographic center of this parcel is located in an area that the State Fire Marshal has identified as having no Fire Hazard Severity Zone in Local Responsibility Area, per Government Code section 51178. As such, the project would not expose people or structures to a significant risk of loss, injury or death involving wildland fires. A Less Than Significant impact would occur.

Cumulative Impacts

The incremental effects of the proposed project related to hazards and hazardous materials, if any, are anticipated to be minimal, and any effects would be site-specific. The project is also not within an area classified as a VHFHSZ. Therefore, the proposed project would not result in incremental effects to hazards or hazardous materials that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. The proposed project would not result in cumulatively considerable impacts to or from hazards or hazardous materials.

5.10 HYDROLOGY AND WATER QUALITY

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
HYDROLOGY AND WATER QUALITY. Would the project:				
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?		**X**		
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?			**X**	
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
i) Result in substantial erosion or siltation on- or off-site?		**X**		
ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite?		**X**		
iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?		**X**		
iv) Impede or redirect flood flows?		**X**		
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?			**X**	
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?			**X**	

a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Less Than Significant With Mitigation Incorporated. The project site is located within the Tulare Lake Subbasin and is therefore subject to the jurisdiction of the Central Valley Regional Water Quality Control Board and the requirements of the Water Quality Control Plan for the Tulare Lake Basin Third Edition (Revised May 2018). The project would comply with applicable Basin Plan provisions and water quality objectives. There are no surface waters or wetlands located on or adjacent to the project site per the National Wetlands Inventory (USFWS, 2024). Under existing conditions, the project site is generally flat, and stormwater runoff flows via overland sheet flow toward adjacent drainage features, including roadside or agricultural ditches located along portions of the site boundaries.

The proposed project includes a fueling area with underground storage tanks (USTs). USTs would be designed, installed, and operated in accordance with applicable federal and State regulations, including requirements of the U.S. Environmental Protection Agency and the California State Water Resources Control Board (SWRCB) Underground Storage Tank Program, which would require underground storage tanks to be designed with multiple layers of protection, such as double-walled tanks and piping, corrosion-resistant materials, and continuous leak detection systems in order to prevent releases. They also mandate spill and overfill prevention equipment, regular inspections, and rapid response to any detected leaks, which together minimize the risk of fuel seeping into surrounding soil and groundwater. As noted in the Project Description, the proposed project would install double walled noncorrodible fiberglass underground storage tanks that are hooked up to non-corrodible flexible plastic piping. In the event of an emergency if any leak were to occur, the proposed project would have state-of-the-art leak detection equipment along with in-house resources who monitor issues in real time and immediately respond to conditions. Compliance with these regulatory requirements would minimize the potential for leaks or fuel migration to soil or groundwater and potential impacts are considered less than significant.

During the early stages of project construction activities, topsoil would be exposed due to grading, trenching for utilities, and other standard ground-disturbing activities. After grading and prior to overlaying the ground surface with impervious surfaces and structures, the potential exists for wind and water erosion to discharge sediment and/or urban pollutants into stormwater runoff, which could adversely affect water quality downstream.

The State Water Resources Control Board (SWRCB) National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit, Order No. 2022-0057-DWQ) regulates stormwater discharges associated with construction activities where clearing, grading, or excavation results in land disturbances of one or more acres. The City's National Pollutant Discharge Elimination System (NPDES) permit requires applicants to show proof of coverage under the State's General Construction Permit prior to receipt of any construction permits. The State's General Construction Permit requires that subject projects must file a Notice of Intent with the SWRCB and develop a site-specific Storm Water Pollution Prevention Plan (SWPPP). A SWPPP describes Best Management Practices (BMPs) to control or minimize pollutants from entering

stormwater and must address both grading/erosion impacts, and non-point source pollution impacts of the development project. BMPs include, but are not limited to, tracking controls, perimeter sediment controls, drain inlet protection, wind erosion/dust controls, and waste management control. Because the proposed project would disturb greater than one acre of land, the project would be subject to the requirements of the State's General Construction Permit.

Mitigation Measure MM HYD-1 would require the preparation of a SWPPP to ensure that the proposed project prepares and implements a SWPPP throughout the construction phase of the project. By implementing and maintaining proper BMPs, the potential for short-term sediment introduction should be minimized. The SWPPP (**Mitigation Measure MM HYD-1**) would reduce the potential for the proposed project to violate water quality standards during construction.

Compliance with applicable federal, State, and local water quality regulations would ensure that violations of water quality standards and waste discharge requirements are avoided. During construction, implementation of the SWPPP and associated BMPs (e.g., erosion control, sediment containment, spill prevention, and material management) would prevent pollutants from entering stormwater and eliminate unauthorized non-stormwater discharges. During operation, implementation of the stormwater quality control plan and permanent treatment BMPs (e.g., bioretention basins and drainage controls) would capture and treat runoff prior to discharge. In addition, compliance with underground storage tank (UST) design, monitoring, and spill prevention requirements would minimize the potential for releases to soil or groundwater. Collectively, these measures would avoid exceedances of applicable water quality objectives and prevent violations of waste discharge requirements.

Post construction surface water at the site would be collected and run through multiple catch basins to a bioretention basin. To ensure that such a system is implemented, mitigation is proposed requiring the project applicant, as part of the stormwater quality control plan required under **Mitigation Measure MM HYD- 2**, to include a drainage plan that demonstrates attainment of pre-project runoff volumes and peak flows prior to release in the City's storm drain system.

The project site includes four (4) bioretention basins located in the northwest, southwest, and southeast corners of the site, and one offsite directly south of the project site. These facilities are designed to detain, infiltrate, and treat stormwater prior to discharge, thereby reducing pollutant loads and peak flows. The stormwater quality control plan required under **MM HYD-2** would be consistent with applicable Water Quality Control Plans adopted by the Regional Water Quality Control Board (RWQCB) for the Tulare Lake Subbasin and applicable NPDES requirements.

With the above compliance with and implementation of **Mitigation Measures MM HYD-1** and **MM HYD-2**, and adherence to applicable UST regulations the project would have a less than significant impact related to water quality and water discharge requirements.

Mitigation Measures

MM HYD-1: **Stormwater Pollution Prevention Plan**: Prior to the issuance of grading or building permits for each proposed activity within the project area, the project applicant

shall prepare and submit a Stormwater Pollution Prevention Plan (SWPPP) to the City of Hanford for approval that identifies specific actions and Best Management Practices (BMPs) to prevent stormwater pollution during construction activities. The SWPPP shall identify a practical sequence for BMP implementation, monitoring, and maintenance; site restoration; contingency measures; responsible parties; and agency contacts. The SWPPP shall include but not be limited to the following elements:

- Temporary erosion control measures shall be employed for disturbed areas.
- Specific measures shall be identified to protect the onsite open drainages during construction of the proposed project.
- No disturbed surfaces shall be left without erosion control measures in place during the winter and spring months.
- Sediment shall be retained onsite by a system of sediment basins, traps, or other appropriate measures.
- The construction contractor shall prepare Standard Operating Procedures for the handling of hazardous materials on the construction site to eliminate or reduce discharge of materials to storm drains.
- BMP performance and effectiveness shall be determined either by visual means where applicable (e.g., observation of above-normal sediment release), or by actual water sampling in cases where verification of contaminant reduction or elimination (such as inadvertent petroleum release) is required by the RWQCB to determine adequacy of the measure.
- In the event of significant construction delays or delays in final landscape installation, native grasses or other appropriate vegetative cover shall be established on the construction site as soon as possible after disturbance, as an interim erosion control measure throughout the wet season.

MM HYD-2: **Stormwater Quality Control Plan** Prior to the issuance of building or grading permits for any development activities, the project applicant shall submit a stormwater quality control plan to the City of Hanford for review and approval. The plan shall include a detailed drainage plan and identify expected site-specific pollutants and required measures to treat those pollutants before they reach the municipal storm drain. The approved measures shall be incorporated into the proposed project. The plan will describe monitoring and performance measures and standards required in order to ensure water quality is adequately protected during operation of all proposed sites within the project area. Examples of stormwater pollution prevention measures and practices to be incorporated into the plan include but are not limited to:

- Strategically placed bioswales and landscaped areas that promote percolation of runoff
- Pervious pavement
- Roof drains that discharge to landscaped areas
- Trash enclosures with screen walls and roofs
- Stenciling on storm drains

- Curb cuts in parking areas to allow runoff to enter landscaped areas
- Rock-lined areas along landscaped areas in parking lots
- Catch basins
- Oil/water separators
- Regular sweeping of parking areas and cleaning of storm drainage facilities
- Employee training to inform maintenance personnel of stormwater pollution prevention measures

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

And,

e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Less Than Significant Impact. As previously mentioned, the project is within the San Joaquin Valley Groundwater Basin and Tulare Lake Subbasin. The project site is also subject to the requirements of the Water Quality Control Plan for the Tulare Lake Basin (Third Edition, Revised May 2018), which is administered by the Central Valley Regional Water Quality Control Board. The Water Quality Control Plan establishes designated beneficial uses for surface water and groundwater, including municipal and domestic supply, agricultural supply, and groundwater recharge, and includes both narrative and numeric water quality objectives to protect those uses. These objectives address pollutants such as sediment, nutrients, pathogens, oil and grease, and other constituents, and are implemented through regulatory mechanisms including National Pollutant Discharge Elimination System (NPDES) permits, waste discharge requirements, and prohibitions on discharges that could degrade water quality. Furthermore, all new development within the City of Hanford Planning Area must conform to standards and plans contained in the Hanford Stormwater Drainage Master Plan. By conforming to all standards and policies as outlined, potential impacts are considered less than significant.

As noted in the Project Description, stormwater runoff on the project site would be collected in onsite storm drains and delivered to bioretention areas. The project site includes four (4) onsite bioretention basins with one in the northwest corner, one in the southwest corner, one in the southeast corner, and offsite directly south of the proposed project site. See Figure 8: Preliminary Grading and Drainage Plan. Stormwater at the site would be collected by storm drain catch basins onsite and conveyed into a bioretention area where the water would infiltrate into the soil. Each of the bioretention areas would be specifically sized to accommodate the amount of water that would be collected from a portion of the project site.

The Department of Water Resources has designated the San Joaquin Valley Tulare Lake Subbasin as within a probationary period requiring well owners, with small domestic well owners exempt, to file online annual groundwater extraction reports and the City's groundwater withdrawal rate is of vital concern to the City as this poses a long-term risk to the reliability of the groundwater supply.

According to the City's 2020 Urban Water Management Plan (UWMP), to reduce dependence on groundwater and ensure sustainable yields, the City has implemented overdraft mitigation measures, which includes water conservation and education programs, increasing surface water imports, and increasing groundwater recharge. Furthermore, the UWMP outlines levels of shortage response actions consisting of restrictions, procedures, and penalties that would encourage water conservation and that the project would comply to, consisting of the following levels: Minor Shortage Potential, Moderate Shortage Potential, and Critical Shortage Potential. The resulting reduction in groundwater withdrawal would stabilize groundwater levels in the Hanford area. The proposed project is located within City Limits. The proposed project would connect to the City Water Service Area, which is supplied by groundwater from the Tulare Lake Subbasin, and surface water purchased from the Kings County Water District (KCWD). The proposed project would be located within the City's Planning Area and would be consistent with the City's UWMP.

The proposed project would generate an increase in water demand. However, such demand would be met through a combination of the aforementioned water sources. Development of the project site would not result in an increase in groundwater pumping because the City cannot exceed the sustainable groundwater pumping yield.

In addition, the project site constitutes a relatively small area compared to the size of the groundwater basin and, thus, does not constitute a substantial source of groundwater recharge. The project would allow for continued infiltration through the proposed bioretention basins and native and/or drought-tolerant plants, in compliance with local policies, proposed throughout the site. Therefore, the project would not substantially interfere with groundwater recharge.

As discussed above, the project would comply with applicable Water Quality Control Plan requirements during both construction and operation. Construction-related discharges would be regulated through coverage under the State's Construction General Permit and implementation of a Storm Water Pollution Prevention Plan (SWPPP) in **Mitigation Measure MM HYD-1**, which includes Best Management Practices (BMPs) to control erosion, sediment transport, and pollutant discharge. Operationally, the project would implement a stormwater quality control plan, as per **Mitigation Measure MM HYD-2**, including bioretention basins and site design features that reduce pollutant loads and control runoff prior to discharge. In addition, compliance with federal and State requirements for underground storage tanks (USTs) would minimize the potential for accidental releases that could affect soil or groundwater quality. These measures are consistent with Water Quality Control Plan objectives and implementation provisions and would not obstruct their implementation.

The proposed project is consistent with the City's General Plan land use designations and would be consistent with the zoning land uses; therefore, groundwater use associated with development of the project has been anticipated by the City and accounted for in regional planning efforts, including the projections included in the City's UWMP. Therefore, the proposed project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin. Similarly, because the project would comply with applicable water quality regulations and implement required measures to protect water quality, it would not conflict with or obstruct implementation

of the Water Quality Control Plan. The proposed project would have a less than significant impact in this regard.

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i) Result in substantial erosion or siltation on- or off-site?

ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

iv) Impede or redirect flood flows?

Less Than Significant With Mitigation Incorporated. Project construction work could have an impact on surface water quality due to exposure of soils to potential erosion. Construction activities that would disturb more than an acre of land area would need to obtain a Construction General Permit, which would require preparation of a SWPPP that includes construction BMPs to control soil erosion, runoff, and waste discharges, including methods to clean up contaminants if they are released. Under existing conditions, stormwater flows as sheet flow toward adjacent drainage ditches offsite. The proposed project would create a drainage system through grading, catch basins, and bioretention areas, maintaining the overall drainage pattern while improving flow control and water quality treatment. Implementation of the SWPPP would reduce potential drainage pattern impacts from construction activities to a level that would be less than significant. In addition, the proposed project would not violate any federal, state, or local water quality standards or waste discharge requirements, as compliance with the Construction General Permit, preparation and implementation of a SWPPP, as part of **MM HYD-1,** and implementation of a Stormwater Quality Control Plan, as part of **MM HYD-2**, would ensure that pollutants are appropriately controlled during both construction and operation**.**. With the above compliance with and implementation of Mitigation Measures MM HYD-1 and MM HYD-2 the project would have a less than significant impact related to soil erosion, increased surface water runoff, and polluted surface water runoff.

The project site includes four (4) bioretention basins, with one in the northwest corner, one in the southwest corner, one in the southeast corner, and offsite directly south of the proposed project site.

The project site falls within FEMA's National Flood Hazard FIRM Panel 06031C0185C, Zone X Area with Minimal Flood Hazard (FEMA, 2024). The project site is not located within a 100-year flood hazard area and none of the structure or buildings surrounding the site are within

a 100-year flood hazard zone. The project would comply with the city stormwater management requirements and BMPs with the implementation of **Mitigation Measure MM HYD-1**. Overall, with the project location in an area with low flood risk, the project would not impede or redirect flood flow which would result in a less than significant impact.

In conclusion, the proposed project would not substantially alter the existing drainage pattern of the site or area in a manner which would result in erosion, siltation, or flooding on- or off-site, create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems, or provide substantial additional sources of polluted runoff. Consequently, implementation of the proposed project would result in a less-than-significant impact.

d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

Less Than Significant Impact. The project site is located approximately 100 miles inland from the Pacific Ocean. As such, the potential for the project site to be inundated by a tsunami is negligible. No steep slopes are located in the project vicinity; therefore, the risk of mudflow is also negligible. Therefore, impacts would be less than significant**.**

Cumulative Impacts

The potential impacts related to hydrology and storm water runoff are typically site specific and site specific BMPs are implemented at the project level. The analysis above determined that the implementation of the proposed project would not result in significant impacts. In regard to proposed project impacts that would be considered less than significant, such impacts are not expected to result in compounded or increased impacts when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects, as other projects would be subject to similar laws and requirements regarding hydrology practices.

Projects would be required to adhere to applicable General Plan goals, policies, and action statements; the City of Hanford's Municipal Zoning Code, the City's stormwater management guidelines regarding stormwater runoff and infrastructure, the City's UWMP, and the Water Quality Control Plan for the Tulare Lake Basin Third Edition. In addition, other projects would be required to implement stormwater pollution best management practices during construction and design measures to reduce water quality impacts and comply with the NPDES Municipal Regional Permit. Future developments in the watershed would also be required to comply with the SWRCB and RWQCB. Depending on the size of future projects, they would be required to obtain and comply with all required water quality permits and the Water Quality Control Plan for the Tulare Lake Basin Third Edition, as needed and prepare and implement SWPPPS, implement construction BMPs, including BMPs to minimize runoff, erosion, and storm water pollution, and comply with other applicable requirements. As part of these requirements, projects would be required to implement and maintain source controls, and treatment measures to minimize polluted discharge and prevent increases in runoff flows that could substantially decrease water quality. Conformance to these measures would minimize runoff from those sites and reduce contamination of runoff with pollutants. Therefore, past, present, and reasonably foreseeable future projects are not expected to cause substantial

increases in storm water pollution. With compliance with State and local mandates, cumulative impacts would be less than significant, and project impacts would not be cumulatively considerable.

5.11 LAND USE AND PLANNING

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
LAND USE AND PLANNING. Would the project:				
a) Physically divide an established community?			**X**	
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?			**X**	

a) Physically divide an established community?

Less Than Significant Impact. An example of a project that has the potential to divide an established community includes the construction of a new freeway or highway through an established neighborhood. The project proposes a commercial development on a Regional Commercial land use designation as listed in the General Plan. The project would be located near already established commercial uses to the north where it is bounded by Highway 198 and residential uses to the south and east. The project site is fenced, is surrounded by roadways on two sides and agricultural land on a third side and is not currently used as an access route between neighborhoods. Given the project's nature, scope, and location, the project would not physically divide an established community. A less than significant Impact would occur in this regard.

b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Less Than Significant Impact. The project site is designated as Regional Commercial (C-R) in the Hanford General Plan planning area and zoned as such. The project would be consistent with the City's zoning and General Plan land use designation. Furthermore, the adjacent parcels are zoned as commercial and residential in the Hanford General Plan. Therefore, the project would not conflict with the City's land use plan, policy, or regulation and therefore, would be less than significant.

Cumulative Impacts

Implementation of the project would not create a significant cumulative impact to the surrounding region since its surrounding area is planned for residential and commercial use. As a result, no cumulative impacts related to land use and planning would occur.

5.12 MINERAL RESOURCES

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
MINERAL RESOURCES. Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?			**X**	
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?			**X**	

a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

Less Than Significant Impact. There are no wells located on the project site. There are no wells within a mile of the project site. The closest well is located approximately 4.7 miles southeast of the project site and is a dry hole well that is plugged and not used. The closest Oil and Gas Field is Hanford (ABD) located approximately 7.1 miles east of the project site. Overall, there are no known available mineral resources on the project site and therefore impacts from the proposed project would be less than significant.

b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

Less Than Significant Impact. The project site has no known mineral resources that would be of value to the region and the residents of the state. However, it has historically been used as agricultural land until now. According to the Department of Conservation Mineral Resource Map and the United States Geologic Survey, the western majority of the City of Hanford, including the project site, has not been included in any SMARA Study Areas, and there is no determination of the exact Mineral Classification Zone the project site, or the vicinity, falls under. The project site has been planned for commercial development in the Hanford General Plan with a regional commercial (C-R) development designation. According to section 5.3 Mineral and Energy Resources in the City of Hanford General Plan, it states that, “at this time there are no known significant deposits of minerals, and no active mines (City of Hanford, 2017).” Therefore, the proposed project would not result in the loss of availability of a regionally or locally important mineral resource recovery site and a less than significant impact would occur

Cumulative Impacts

Implementation of the proposed project, in combination with other past, present, and reasonably foreseeable future projects, would not result in cumulatively considerable impacts to mineral resources.

Based on regional Mineral Resource Zone (MRZ) mapping prepared by the California Department of Conservation pursuant to SMARA, the project site and surrounding area are not classified as MRZ-2 or MRZ-3, indicating the absence of known or potentially significant mineral resources. This is consistent with the City of Hanford General Plan, which identifies no significant mineral deposits or active mining operations within the city. As a result, no cumulative impacts related to mineral resources would occur.

5.13 NOISE

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
NOISE. Would the project result in:				
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?			**X**	
b) Generation of excessive groundborne vibration or groundborne noise levels?			**X**	
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?			**X**	

NOISE BACKGROUND

Sound is technically described in terms of amplitude (loudness) and frequency (pitch). The standard unit of sound amplitude measurement is the decibel (dB). The decibel scale is a logarithmic scale that describes the physical intensity of the pressure vibrations that make up any sound. The pitch of the sound is related to the frequency of the pressure vibration. Since the human ear is not equally sensitive to a given sound level at all frequencies, a special frequency-dependent rating scale has been devised to relate noise to human sensitivity. The A-weighted decibel scale (dBA) provides this compensation by discriminating against frequencies in a manner approximating the sensitivity of the human ear.

Noise, on the other hand, is typically defined as unwanted sound. A typical noise environment consists of a base of steady ambient noise that is the sum of various distant and indistinguishable noise sources. The sound from individual local sources is superimposed on this background noise. These can vary from an occasional aircraft or train passing by to virtually continuous noise from traffic on a major highway.

Several rating scales have been developed to analyze the adverse effect of community noise on people. Since environmental noise fluctuates over time, these scales consider that the effect of noise on people is largely dependent on the total acoustical energy content of the noise as well as the time of day when the noise occurs. Most commonly, environmental sounds are described in terms of L_{eq} that has the same acoustical energy as the summation of all the time-varying events. While the equivalent continuous sound level (L_{eq}) represents the continuous sound pressure level over a given period; the Day-Night Sound level (L_{dn}) is a 24-hour average L_{eq} with a 10 dBA “weighting” added to noise during the hours of 10:00 p.m. to

7:00 a.m. to account for noise sensitivity in the nighttime. The Community Noise Equivalent Level (CNEL) is a 24-hour average L_{eq} with a 10-dBA weighting added to noise during the hours of 10:00 p.m. to 7:00 a.m. and an additional 5 dBA weighting during the hours of 7:00 p.m. to 10:00 p.m. to account for noise sensitivity in the evening and nighttime.

REGULATORY SETTING

State

California Government Code

California Government Code Section 65302(f) mandates that the legislative body of each county and city adopt a noise element as part of its comprehensive general plan. The local noise element must recognize the land use compatibility guidelines established by the State Department of Health Services. The guidelines rank noise land use compatibility in terms of "normally acceptable", "conditionally acceptable", "normally unacceptable", and "clearly unacceptable" noise levels for various land use types. Single-family homes are "normally acceptable" in exterior noise environments up to 60 dBA CNEL and "conditionally acceptable" up to 70 dBA CNEL. Multiple-family residential uses are "normally acceptable" up to 65 dBA CNEL and "conditionally acceptable" up to 70 CNEL. Schools, libraries, and churches are "normally acceptable" up to 70 dBA CNEL, as are office buildings and business, commercial, and professional uses.

Title 24 – Building Code

The State's noise insulation standards are codified in the California Code of Regulations, Title 24: Part 1, Building Standards Administrative Code, and Part 2, California Building Code. These noise standards are applied to new construction in California for interior noise compatibility from exterior noise sources. The regulations specify that acoustical studies must be prepared when noise-sensitive structures, such as residential buildings, schools, or hospitals, are located near major transportation noise sources, and where such noise sources create an exterior noise level of 65 dBA CNEL or higher. Acoustical studies that accompany building plans must demonstrate that the structure has been designed to limit interior noise in habitable rooms to acceptable noise levels. For new multi-family residential buildings, the acceptable interior noise limit for new construction is 45 dBA CNEL.

Local

City of Hanford General Plan

The City of Hanford General Plan identifies and assess noise concerns within the community and develops the basis for land use distribution. The noise element is found in Chapter 7 of the 2035 General Plan Policy Document. Table 5.13-1: Land Use/Noise Compatibility Guidelines lists the compatibility of land uses at various noise levels and offers criteria the City can use in evaluating land use decisions.

Table 5.13-1: Land Use/Noise Compatibility Guidelines

Land Use	Exterior Noise Exposure (dBA CNEL)				
	<60	60-65	65-70	70-75	75+
Residential					
Single-Family, Senior Housing, Mobile Homes	Compatible	Conditionally Compatible	Conditionally Compatible	Normally Incompatible	Incompatible
Multi-Family	Compatible	Compatible[1]	Conditionally Compatible[1]	Normally Incompatible[1]	Incompatible
Mixed Use	Compatible	Compatible	Conditionally Compatible[1]	Normally Incompatible[1]	Normally Incompatible[1]
Commercial					
Automotive, Service Commercial	Compatible	Compatible	Compatible	Conditionally Compatible	Conditionally Compatible
Office	Compatible	Compatible	Compatible	Conditionally Compatible	Normally Incompatible
Shopping Center	Compatible	Compatible	Compatible	Conditionally Compatible	Normally Incompatible
Visitor Accommodations	Compatible	Compatible	Conditionally Compatible[1]	Conditionally Compatible[1]	Normally Incompatible[1]
Industrial					
Institutional					
Infrastructure	Compatible	Compatible	Compatible	Compatible	Compatible
Worship Facilities, Educational Facilities, Community Centers, Libraries, Museums, Cultural Centers	Compatible	Conditionally Compatible[1]	Conditionally Compatible[1]	Normally Incompatible[1]	Incompatible
Open Space, Parks and Recreation					
Community and Neighborhood Parks	Compatible	Compatible	Compatible	Conditionally Compatible	Normally Incompatible
Golf Courses, Athletic Fields	Compatible	Compatible	Compatible	Conditionally Compatible	Normally Incompatible

1. Internal noise level of 45 dBA CNEL.
2. Compatible Indoor Uses: Standard construction methods should attenuate exterior noise to an acceptable indoor noise level. Compatible Outdoor Uses: Activities associated with the land uses may be carried out.
3. Compatible Outdoor Uses: Activities associated with the land uses may be carried out.
4. Conditionally Compatible Indoor Uses: Building structure must attenuate exterior noise to the indoor noise level. Conventional construction, but with closed windows and fresh air supply systems will normally suffice.
5. Conditionally Compatible Outdoor Uses: Best practices for reducing noise interference should be incorporated to make outdoor activities acceptable.
6. Normally Incompatible Indoor Uses: If new construction or development does proceed, a detailed acoustical analysis is needed to identify the nose reduction requirements and needed nose insulation features shall be included in the design.
7. Normally Incompatible Outdoor Uses: Feasible noise mitigation techniques shall be analyzed and incorporated to make the outdoor activities acceptable.
8. Incompatible Indoor Uses: New construction should not be undertaken.
9. Incompatible Outdoor Uses: Severe nose interference makes outdoor activities unacceptable.

Land Use	Exterior Noise Exposure (dBA CNEL)

Source: City of Hanford, *2034 General Plan Background Report*, 2014.					

The Hanford General Plan Policy Document includes the following applicable guiding policies for noise which are applicable to the project:

Policy H41: **Interior Noise Exposure.** Adopt State Noise Insulation Standards (California Code of Regulations, Title 24) and Chapter 35 of the Uniform Building Code (UBC) concerning interior noise exposure for new single, multi-family housing, hotels and motels.

Policy H42: **Noise Evaluation for New Development.** Evaluate proposed development proposals against existing and future noise levels from ground transportation noise sources.

Policy H43: **Non-Transportation Noise.** Mitigate noise created by non-transportation noise sources so as not to exceed the maximum allowable interior and exterior noise level standards.

Policy H46: **Noise Ordinance.** Adopt ordinances that limit noise-generating sources to acceptable, safe levels.

Policy H47: **City Equipment Purchases.** Purchase only equipment and vehicles that comply with noise level performance standards based upon the best available noise reduction technology.

Policy H48: **Noise Mitigation for Construction Activities.** Require all development projects to mitigate noise impacts associated with construction activities.

Policy H49: **Acoustical Analysis.** The City shall utilize procedures for project review and issuance of building permits to ensure that noise mitigation measures identified in an acoustical analysis are implemented in the project design.

City of Hanford Municipal Code

The City of Hanford Municipal Code (HMC) Loud or Annoying Noises (Chapter 9.10) includes regulations to protect and foster the health, peace, safety, and welfare of Hanford residents by reducing, controlling, and preventing loud and annoying noise. Section 9.10.050, General Prohibition, states the following:

A. Unless an exemption identified in this chapter applies, no person shall make, continue, or cause to be made or continued:

   1. Any unreasonable noise; or
   2. Any noise which unreasonably disturbs, injures, or endangers the comfort, repose, health, peace, or safety of reasonable persons of ordinary sensitivity, within the jurisdictional limits of the city; or

3. Any noise which is so harsh, prolonged, unnatural, or unusual in time or place as to occasion unreasonable discomfort to any persons within the neighborhood from which said noise emanates, or as to unreasonably interfere with the peace and comfort of neighbors or their guests, or operators or customers in places of business, or as to detrimentally or adversely affect such residences or places of business.

HMC Chapter 9.10.070(E) exempts noise from repairs or excavations of bridges, streets, highways, and other public improvements by or on behalf of the city, the state, or the federal government, between the hours of 8:00 p.m. and 7:00 a.m., when public welfare and convenience renders it impractical to perform the work between 7:00 a.m. and 8:00 p.m.

Additionally, HMC Section 9.10.060(A)(10) states the following:

Construction or Repair of Buildings, Excavation of Streets and Highways. The construction, demolition, alteration or repair of any building or the excavation of streets and highways other than between the hours of 7:00 a.m. and 8:00 p.m. In cases of emergency, construction or repair noises are exempt from this provision. In non-emergency situations, the city manager, or designee, may issue a permit, upon application, if the city manager, or designee, determines that the public health and safety, is affected by loud and raucous noise caused by construction or repair of buildings or excavation of streets and highways between the hours of 8:00 p.m. and 7:00 a.m. will not be impaired, and if the city manager, or designee, further determines that loss or inconvenience would otherwise result. The permit shall grant permission in non-emergency cases for a period of not more than three days. The permit may be renewed once for a period of three days or less.

Existing Noise Sources

The City of Hanford is impacted by various noise sources. Major sources include vehicle traffic along highways and major roads. Highway noise is influenced by factors such as vehicle speed, roadway condition, traffic volume, and the effectiveness of mufflers. Noise on major roads also increases with increased traffic. Other sources of noise include rail transportation, industrial activities, and events at the Kings Speedway at the Kings County Fairgrounds.

Sensitive Receptors

Noise exposure standards and guidelines for various types of land uses reflect the varying noise sensitivities associated with each of these uses. Residences, hospitals, schools, guest lodging, libraries, and churches are treated as the most sensitive to noise intrusion and therefore have more stringent noise exposure targets than do other uses, such as manufacturing or agricultural uses that are not subject to impacts such as sleep disturbance. The surrounding land uses are predominantly residential to the southeast and southwest and commercial use to the south. As shown in *Table 5.13-2: Sensitive Receptors*, the nearest sensitive receptors in the project vicinity include residences, school, parks, hotels, religious centers, and a health center. Other surrounding uses that do not represent the nearest sensitive receptors are discussed in *Section 2.2, Environmental Setting*. These distances are from the project site to the sensitive receptor property line.

Table 5.13-2: Sensitive Receptors

Receptor Description	Distance and Direction from the Project Site
Single-family Residential	748 feet to the east
Single-family Residential	464 feet to the southeast
Centennial Park	1,711 feet to the southeast
Educational Facility (Daycare Center)	193 feet to the south
Single-family Residential	742 feet to the south
Single-family Residential	479 feet to the south
Multi-family Residential	390 feet to the southwest
Koinonia Church	2,110 feet to the west
Hotel	1,430 feet to the northwest
Hotel	1,091 feet to the northeast
Hotel	2,009 feet to the northeast
Health Center	2,140 feet to the northeast
Source: Google Earth, 2025.	

Ambient Noise Level

As vehicle traffic is the predominant noise source in the project vicinity, ambient noise levels were calculated at the nearest receptors using the FHWA's Highway Noise Prediction Model (FHWA-RD-77-108). *Table 5.13-3: Ambient Noise Levels* provides the ambient noise levels calculated at the nearest sensitive receptors. As shown in *Table 5.13-3*, noise levels at the nearest sensitive receptors would range from 54.6 dBA CNEL to 64.4 dBA CNEL.

Table 5.13-3: Ambient Noise Levels

Receptor Location (Coordinates)	**Ambient Noise Level (dBA CNEL)**
Daycare Center (259918.23, 4022181.49)	64.4
Residential Uses to the Southwest (259739.22, 4022244.26)	54.6
Residential Uses to the Southeast (260127.30, 4022178.17)	58.9
1. Noise levels were calculated using the FHWA's Highway Noise Prediction Model (FHWA-RD-77-108); Refer to Appendix E for noise methodology and calculations. 2. Traffic volumes used to calculate ambient noise levels are based on the *Maverik Hanford Transportation Impact Study* (TIS) prepared by Kimley-Horn (May 6, 2025).	

THRESHOLDS

Construction Noise

The City has not established quantitative construction noise standards. However, HMC Chapter 9.10 prohibits noise-generating activities during nighttime hours (8:00 p.m. to 7:00 a.m.). Therefore, this analysis uses the following noise thresholds during daytime hours (7:00 a.m. to 8:00 p.m.) to evaluate construction noise impacts:

- The FTA's construction noise threshold of 80 dBA (8-hour L_{eq}) for residential uses; and
- The FTA's construction noise threshold of 85 dBA (8-hour L_{eq}) for non-residential uses.

Operational Noise

Operational noise is evaluated based on the standards within the City's Land Use and Compatibility Guidelines; refer to *Table 5.13-1*. As the nearest sensitive receptors are residential uses and a daycare center (i.e., educational facility), the City's Land Use and Compatibility Guidelines standard of 60 dBA CNEL has been used in this analysis.

Vibrations

The City currently does not have a significance threshold to assess vibration impacts. The FTA guidelines show that a vibration level of up to 0.2 in/sec PPV is considered safe and would not result in any construction vibration damage for a building that is constructed with reinforced concrete with no plaster. Therefore, this analysis uses the FTA and Caltrans structural damage criterion of 0.2 inch-per-second (in/sec) peak particle velocity (PPV) and the human annoyance criterion of 0.4 in/sec PPV.

ENVIRONMENTAL IMPACTS

a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Less Than Significant Impact.

Construction

Construction noise typically occurs intermittently and varies depending on the nature or phase of construction (e.g. land clearing, grading, excavation, paving). Noise generated by construction equipment, including earth movers, material handlers, and portable generators, can reach high levels. During construction, exterior noise levels could affect sensitive receptors surrounding the construction site. However, construction activities would occur throughout the project site and would not be concentrated at a single point near sensitive receptors. Noise levels typically attenuate (or drop off) at a rate of 6 dB per doubling of distance from point sources, such as concrete saws.

Construction activities associated with development of the project would include some demolition, site preparation, grading, paving, building construction, architectural coating, and off-site infrastructure improvements. Such activities may require dozers, excavators, and concrete and

industrial saws during demolition; dozers and tractors during site preparation; graders, excavators, tractors, and dozers during grading; forklifts, generator sets, cranes, welders, and tractors during building construction; pavers, paving equipment, and rollers during paving; air compressors during architectural coating; and trenchers, pavers, rollers, and dozers during off-site infrastructure improvement. Typical operating cycles for these types of construction equipment may involve 1 or 2 minutes of full power operation followed by 3 to 4 minutes at lower power settings. Other primary sources of acoustical disturbance would be random incidents, which would last less than one minute (such as dropping large pieces of equipment or the hydraulic movement of machinery lifts). The grading phase of project construction tends to be the shortest in duration and create the highest construction noise levels due to the operation of heavy equipment required to complete these activities. It should be noted that only a limited amount of equipment can operate near a given location at a particular time. Typical noise levels associated with individual construction equipment are listed in ***Error! Reference source not found.***.

As indicated in *Table 5.13-4*, construction noise levels would be noticeable at sensitive receptors in the project vicinity. However, actual construction-related noise activities would be lower than the conservative levels shown in *Table 5.13-4* and would cease upon completion of construction. Due to the variability of construction activities and equipment for the project, overall construction noise levels would be intermittent and would fluctuate over time. In addition, the noise levels shown in *Table 5.13-4* assume that construction noise is constant, when, in fact, construction activities and associated noise levels would fluctuate and generally be brief and sporadic, depending on the type, intensity, and location of construction activities.

Table 5.13-4: Typical Construction Noise Levels

Equipment	**Maximum Noise Level (dBA) from Source[1]**
	50 feet (reference level)
Air Compressor	80
Backhoe	80
Compactor	82

Generator	82
Grader	85
Impact Wrench	85
Jack Hammer	88
Loader	80
Paver	85
Pneumatic Tool	85

Equipment	Maximum Noise Level (dBA) from Source[1]
	50 feet (reference level)
Pump	77
Roller	85
Saw	76
Scarifier	83
Scraper	85
Shovel	82
Truck	84
1. Calculated using the inverse square law formula for sound attenuation: $dBA_2 = dBA_1+20Log(d_1/d_2)$ Where: $QWdBA_2$ = estimated noise level at receptor; dBA_1 = reference noise level; d_1 = reference distance; d_2 = receptor location distance.	
Source: Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, September 2018.	

Pursuant to HMC Chapter 9.10, project construction activities would be prohibited to take place between the hours of 8:00 p.m. and 7:00 a.m. While the City has established allowable construction hours, the City has not identified specific construction noise level limits. The nearest noise-sensitive receptors to the project site include the daycare center to the south, single-family residences to the southeast, and multi-family residences to the southwest. The proposed project may expose these sensitive receptors to elevated noise levels during project construction. However, it is acknowledged that construction activities would occur throughout the project site and would not be concentrated at the point closest to the sensitive receptors.

The City has not identified specific construction noise level limits. Thus, this analysis uses the FTA's threshold of 80 dBA (8-hour L_{eq}) for residential uses and 85 dBA (8-hour L_{eq}) for non-residential uses.[18] The Federal Highway Administration (FHWA) Roadway Construction Noise Model (RCNM) was used to calculate noise levels during construction activities; refer to Appendix E: Noise Modeling Data. RCNM is a computer program used to assess construction noise impacts and allows for user-defined construction equipment and user-defined noise limit criteria. Noise levels were calculated for each construction phase and are based on the equipment used, distance to the nearest property/receptor, and acoustical use factor for equipment.

The noise levels calculated in *Error! Reference source not found.*, show estimated exterior construction noise levels at the closest noise-sensitive receptor property line to the south, southeast, and southwest of the project site. Based on calculations using the RCNM model, construction noise levels would range from approximately 54.4 dBA L_{eq} to 77.0 dBA L_{eq} at the nearest sensitive receptors; see *Table 5.13-5*.

As shown in *Table 5.13-5*, construction noise levels could reach 77.0 dBA L_{eq} at the daycare center (i.e., educational facility) and up to 70.8 dBA L_{eq} at the residential uses. Therefore, construction noise levels would not exceed FTA's threshold of 80 dBA (8-hour L_{eq}) for residential uses or 85 dBA

[18] Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, Table 7-2, Page 179, September 2018.

(8-hour L_{eq}) for non-residential uses. As a result, construction noise levels would be less than significant.

Table 5.13-5: Project Construction Noise Levels

Construction Phase	Receptor Location			Modeled Exterior Noise Level (dBA L_{eq}) [2]	FTA Noise Threshold (dBA L_{eq}) [3]	Exceeded?
	Land Use/ Location	Direction	Distance (feet) [1]			
Demolition	Educational Facility	South	193	73.9	90	No
	Residential	Southwest	390	67.8	80	No
	Residential	Southeast	464	66.3	80	No
Off-site Infrastructure Improvements	Educational Facility	South	193	70.3	90	No
	Residential	Southwest	390	64.2	80	No
	Residential	Southeast	464	62.7	80	No
Site Preparation	Educational Facility	South	193	75.9	90	No
	Residential	Southwest	390	69.8	80	No
	Residential	Southeast	464	68.3	80	No
Grading	Educational Facility	South	193	75.5	90	No
	Residential	Southwest	390	69.4	80	No
	Residential	Southeast	464	67.9	80	No
Paving	Educational Facility	South	193	74.8	90	No
	Residential	Southwest	390	68.7	80	No
	Residential	Southeast	464	67.2	80	No
Building Construction	Educational Facility	South	193	75.3	90	No
	Residential	Southwest	390	69.2	80	No
	Residential	Southeast	464	67.7	80	No
Architectural Coating	Educational Facility	South	193	62.0	90	No
	Residential	Southwest	390	55.9	80	No
	Residential	Southeast	464	54.4	80	No
Overlapping Phases						
Building Construction + Architectural Coating	Educational Facility	South	193	75.5	90	No
	Residential	Southwest	390	69.4	80	No
	Residential	Southeast	464	67.9	80	No
Site Preparation + Off-site Infrastructure Improvements	Educational Facility	South	193	77.0	90	No
	Residential	Southwest	390	70.8	80	No
	Residential	Southeast	464	69.3	80	No

Notes:
1. Distance is from the nearest receptor's property line to the project site's property line. Not all equipment would operate at the closest distance to the receptor.
2. The distances used in the RCNM model can be seen in Appendix E. Modeled noise levels conservatively assume the simultaneous operation of all pieces of equipment.
3. Federal Transit Authority's threshold of 80 dBA (8-hour L_{eq}) for residential uses and 85 dBA (8-hour L_{eq}) for non-residential uses.

Source: Federal Highway Administration, *Roadway Construction Noise Model,* 2006. Refer to Appendix E for noise modeling results.

Construction Traffic Noise

Because of the logarithmic nature of noise levels, a doubling of the traffic volume (assuming that the speed and vehicle mix do not also change) would result in a noise level increase of 3 dBA. As shown in *Table 5.13-7*, 12th Avenue (north and south of Hayden Avenue), the main access route for project construction, has an average daily trip volume between 17,489 and 17,500 vehicles. Project construction would generate 19 daily trips during demolition, 18 daily trips during site preparation, 79 daily trips during grading, 3 daily trips during building construction, 15 daily trips during paving, and 10 daily trips during off-site infrastructure improvement. Therefore, conservatively assuming all construction phases would occur at the same time, a maximum of 144 daily project construction trips would not double the existing traffic volume of 17,500 vehicles per day along the roadway segment north of Hayden Avenue or 17,489 vehicles per day along the roadway segment south of Hayden Avenue. Construction related traffic noise would not be noticeable and would not create a significant noise impact. Large trucks would be necessary to deliver building materials, remove waste materials, and haul soil to and from off-site locations. This would be temporary and short-term.

Larger trucks needed to haul materials could result in additional noise from acceleration from engines, braking, and loading and unloading. The State of California establishes noise limits for vehicles licensed to operate on public roads using a pass-by test procedure. Pass-by noise refers to the noise level produced by an individual vehicle as it travels past a fixed location. The pass-by procedure measures the total noise emissions of a moving vehicle with a microphone. When the vehicle reaches the microphone, the vehicle is at full throttle acceleration at an engine speed calculated for its displacement. For heavy trucks, the State pass by standard is consistent with the federal limit of 80 decibels (dB). The State pass by standard for light trucks and passenger cars (less than 4.5 tons gross vehicle rating) is also 80 dB at 15 meters from the centerline. According to the FHWA, dump trucks typically generate noise levels of 76 dBA and flatbed trucks typically generate noise levels of 74 dBA, at a distance of 50 feet from the truck.[19] As such, noise from truck trips associated with the proposed project would not exceed FTA threshold levels of 80 dBA (8-hour L_{eq}) for residential uses or 85 dBA (8-hour L_{eq}) for non-residential uses.

Operations

Implementation of the project would create new sources of noise in the project vicinity. The major noise sources associated with the project that would potentially impact existing sensitive receptors include the following:

- Mechanical equipment (i.e., air conditioners, etc.);
- Truck movements (i.e., maneuvering and idling trucks);
- Fuel dispensing activities;
- Parking areas (i.e., car door slamming, car radios, engine start-up, and car pass-by);

[19] Federal Highway Administration, *Roadway Construction Noise Model*, 2006.

- Landscape maintenance activities; and
- Off-site traffic noise.

Stationary Noise Sources

New sources of stationary noise in the project vicinity include: mechanical equipment, truck back-up alarms, truck movements, fuel dispensing activities, parking lot activities, and landscape maintenance activities. *Table 5.13-6: Operational Stationary Source Noise Levels,* shows the noise levels generated by various stationary noise sources at the receptor, as well as the combined noise level at the receptor.

Mechanical Equipment

Regarding mechanical equipment, the project would generate stationary-source noise associated with heating, ventilation, and air conditioning (HVAC) units. HVAC units typically generate noise levels of approximately 52 dBA at 50 feet.[20] Based on the site plan, HVAC units would be located near the convenience store. Therefore, the nearest HVAC units could be located as close as 434 feet from the nearest sensitive receptors to the south. At this distance mechanical equipment noise would attenuate to 33.2 dBA L_{eq}.

Truck Movement Noise

The project is a refueling station that would include truck movements. Truck movement noise would be generated by the trucks' diesel engines, exhaust systems, and brakes during low gear shifting' braking activities. Typically, heavy truck operations generate a noise level of 64 dBA at a distance of 50 feet.[21] The nearest truck movement area (i.e., truck fueling area) would be located approximately 451 feet from the nearest sensitive receptor (daycare center to the south). At this distance, loading area activities would be approximately 32.2 dBA L_{eq}. While there would be temporary noise increases during truck maneuvering and engine idling, these impacts would be of short duration and infrequent.

It should be noted that the project would not receive deliveries from heavy-duty trucks, rather vans and light-duty trucks. Noise levels from project deliveries would be similar to parking lot noise levels, discussed below.

Truck Back-up Alarms

Heady-duty trucks maneuvering and reversing on the project site would produce noise from back-up alarms (also known as back-up beepers). Back-up alarms produce a typical volume of 97 dBA at one meter (3.28 feet) from the source.[22] Over the duration of an hour, trucks may utilize back-up alarms near the refueling area located approximately 451 feet from the nearest sensitive receptor

[21] Elliott H. Berger, Rick Neitzel, and Cynthia A. Kladden, *Noise Navigator Sound Level Database with Over 1700 Measurement Values*, July 6, 2010.

[22] Environmental Health Perspectives, *Vehicle Motion Alarms: Necessity, Noise Pollution, or Both?*, https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3018517/, accessed June 2024.

(daycare center to the south). At this distance, exterior noise levels from back-up alarms would be approximately 40 dBA L_{eq}.

Parking Lot and Gas Station Activities

The project would include vehicle parking spaces near the proposed convenience store. Additionally, 12 vehicle fueling dispensers would also include similar noise sources as parking spaces, which would include vehicular circulation, louder engines, car alarms, and door slams. Per the *Maverik Hanford Transportation Impact Study* (TIS) prepared by Kimley-Horn (May 6, 2025), the Project would generate up to 253 one-way trips during the peak hour. For the purpose of providing a conservative, quantitative estimate of the noise levels that would be generated from the vehicles entering and exiting the parking lots and fueling positions, the methodology recommended by FTA for the general assessment of stationary transit noise sources is used. Using the methodology, the Project's peak hourly noise level that would be generated by the on-site parking levels was estimated using the following FTA equation:

$$L_{eq(h)} = SEL_{ref} + 10 \log (NA/1{,}000) - 35.6$$

Where:

$L_{eq(h)}$ = hourly L_{eq} noise level at 50 feet

SEL_{ref} = reference noise level for stationary noise source represented in sound exposure level (SEL) at 50 feet

NA = number of automobiles per hour

35.6 is a constant in the formula, calculated as 10 times the logarithm of the number of seconds in an hour

Using FTA's reference noise level of 92 dBA SEL[23] at 50 feet from the noise source, the Project's highest peak hour vehicle trips would generate noise levels of approximately 50.4 dBA L_{eq} at 50 feet from the parking lot and fueling positions. Vehicle noise would occur within the surface parking lots and fueling positions on the project site. Vehicle noise would be consistent with the existing noise in the vicinity and would be partially masked by background noise from traffic along surrounding roadways. The nearest sensitive receptors (single-family residences to the east) would be located approximately 337 feet from the closest parking spaces. At this distance, parking lot noise levels would be approximately 33.9 dBA L_{eq}.

Landscape Maintenance Activities

The project proposes new landscaping that would require periodic maintenance. Noise generated by a gasoline-powered lawnmower is estimated to be approximately 70 dBA at a distance of five feet.[24] The nearest landscape maintenance activity would be located approximately 286 feet from

[23] Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, 2018.

[24] U.S. EPA, *Noise from Construction Equipment and Operations, Building Equipment, and Home Appliances*, 1971

the closest sensitive receptors (daycare center to the south). At this distance, landscape maintenance noise levels would be approximately 34.9 dBA L_{eq}.

Landscape maintenance activities would operate during daytime hours for brief periods of time and would not permanently increase ambient noise levels in the project vicinity. Additionally, landscape maintenance noise levels would be consistent with activities that currently occur at nearby uses.

Combined Noise Levels

Given the project is assumed to operate 7 days a week, 24 hours per day, the potential maximum project-related noise level increase at the nearest receptor was conservatively quantified by combining the project's operational noise sources (i.e., composite noise level). As shown in *5.13-6*, the project's combined stationary noise sources would range from 38.1 dBA CNEL to 43.1 dBA CNEL. Therefore, the City's noise standard (60 dBA CNEL) would not be exceeded and impacts would be less than significant. Additionally, stationary noise levels would not exceed existing ambient noise levels in the project vicinity; refer to *Table 5.13-6*.

Table 5.13-6: Operational Noise Levels

Sensitive Receptor Location	Noise Source	Reference Level (dBA)	Reference Distance (feet)	Distance to Receptor (feet)[1]	Level at Receptor (dBA L_{eq})[2]	Combined Level at Receptor (dBA L_{eq})[3]	Combined Level at Receptor (dBA CNEL)[3]	City Noise Standard (dBA CNEL)	Significant?
Daycare Center (South)	Mechanical Equipment	52	50	434	33.2	43.1	49.8	60	No
	Truck Movement	64	50	451	32.2				
	Truck Back-up Alarms	97	3.28	451	40.5				
	Parking / Fueling	50.4	50	337	33.9				
	Landscape Maintenance	70	5	286	34.9				
Multifamily Residential (Southwest)	Mechanical Equipment	52	50	662	29.6	39.7	46.3	60	No
	Truck Movement	64	50	653	29.0				
	Truck Back-up Alarms	97	3.28	653	37.3				
	Parking / Fueling	50.4	50	529	29.9				
	Landscape Maintenance	70	5	459	30.7				
Single-family Residential (Southeast)	Mechanical Equipment	52	50	745	28.5	38.1	44.8	60	No
	Truck Movement	64	50	803	27.2				

Sensitive Receptor Location	Noise Source	Reference Level (dBA)	Reference Distance (feet)	Distance to Receptor (feet)[1]	Level at Receptor (dBA L_{eq})[2]	Combined Level at Receptor (dBA L_{eq})[3]	Combined Level at Receptor (dBA CNEL)[3]	City Noise Standard (dBA CNEL)	Significant?
	Truck Back-up Alarms	97	3.28	803	35.5				
	Parking / Fueling	50.4	50	618	28.6				
	Landscape Maintenance	70	5	513	29.8				

1. The distance is from the location of the operational noise source to the sensitive receptor property line.
2. Calculated using the inverse square law formula for sound attenuation: $dBA_2 = dBA_1+20Log(d_1/d_2)$, where dBA_2 = estimated noise level at receptor; dBA_1 = reference noise level; d_1 = reference distance; d_2 = receptor location distance.
3. Refer to Appendix E for noise methodology and calculations.

Off-Site Traffic Noise

The proposed project would result in additional traffic on adjacent roadways from daily activities, thereby increasing vehicular noise in the vicinity of existing and proposed land uses. Based on the TIS, typical daily activities are forecast to generate a total of 5,816 daily vehicle trips. However, with pass-by trips, the project would result in 4,986 net new trips. In general, traffic noise level increases of less than 3 dBA is barely perceptible to people, while a 5-dBA increase is readily noticeable. Generally, traffic volumes on project area roadways would have to approximately double for the resulting traffic noise levels to increase by 3 dBA. Therefore, permanent increases in ambient noise levels of less than 3 dBA are considered to be less than significant.

Traffic noise levels for roadways primarily affected by the project were calculated using the FHWA-RD-77-108. Traffic noise modeling was conducted for conditions with and without the project, based on traffic volumes obtained from the TIS. The calculated traffic noise levels for the "Opening Year Without Project" and "Opening Year With Project" scenarios are compared in *Table 5.13-7: Opening Year and Opening Year Plus Project Traffic Noise Levels.* As depicted in *Table 5.13-7*, under the "Opening Year Without Project" scenario, noise levels would be approximately 67.5 dBA along 12th Avenue. The "Opening Year With Project" scenario noise levels would range from approximately 68.6 dBA to 68.9 dBA along 12th Avenue.

Table 5.13-7: Opening Year and Opening Year Plus Project Traffic Noise Level

Roadway Segment	Opening Year Without Project		Opening Year With Project		Change	Land Use Compatibility Standard (dBA CNEL)[2]	Significant Impacts
	ADT[1]	dBA CNEL at 50 feet from Roadway Centerline	ADT[1]	dBA CNEL at 50 feet from Roadway Centerline			
12th Avenue							
North of Hayden Avenue	17,500	67.5	21,489	68.9	1.4	60	No
South of Hayden Avenue	17,489	67.5	18,486	68.6	1.1	60	No

ADT = average daily trips; dBA = A-weighted decibels; CNEL = community noise equivalent level.
1. ADTs derived from the Kimley-Horn Associates (April 2025).

2. The acceptable land use compatibility standard is used in this analysis (60 dBA CNEL); refer to *Table 5.13-1*.

As depicted in *Table 5.13-7*, the "Opening Year With Project" scenario traffic noise levels would not exceed the 3.0 dBA increase significance threshold along the surrounding roadways. Therefore, the project would not result in a perceptible increase in traffic noise levels and impacts would be less than significant.

b) Generation of excessive groundborne vibration or groundborne noise levels?

Less Than Significant Impact.

Construction

Increases in groundborne vibration levels attributable to the project would be primarily associated with construction-related activities. Construction on the project site would have the potential to result in varying degrees of temporary groundborne vibration, depending on the specific construction equipment used and the operations involved. Ground vibration generated by construction equipment spreads through the ground and diminishes in magnitude with increases in distance. The effect on buildings located in the vicinity of the construction site often varies depending on soil type, ground strata, and construction characteristics of the receiver building(s). The results from vibration can range from no perceptible effects at the lowest vibration levels, to low rumbling sounds and perceptible vibration at moderate levels, to slight damage at the highest levels. Groundborne vibrations from construction activities rarely reach levels that damage structures.

The types of construction vibration impacts include human annoyance and building damage. Human annoyance occurs when construction vibration rises significantly above the threshold of human perception for extended periods of time. Building damage can be cosmetic or structural. Ordinary buildings that are not particularly fragile would not experience cosmetic damage (e.g., plaster cracks) at distances beyond 30 feet. This distance can vary substantially depending on the soil composition and underground geological layer between vibration source and receiver. In addition, not all buildings respond similarly to vibration generated by construction equipment. For example, for a building that is constructed with reinforced concrete with no plaster, the FTA guidelines show that a vibration level of up to 0.2 in/sec PPV is considered safe and would not result in any construction vibration damage. The City does not provide numerical vibration standards for construction activities. As the nearest structure is a daycare building to the south of the project site, this impact discussion uses the FTA and Caltrans structural damage criterion of 0.2 in/sec PPV and the human annoyance criterion of 0.4 in/sec PPV.

*Table 5.13-8: Typical Construction Equipment Vibration Levels****Error! Reference source not found.****,* lists reference vibration levels at 25 feet for typical construction equipment. As indicated in ***Error! Reference source not found.*** *5.13-8,* based on FTA data, vibration velocities from typical heavy construction equipment operations that would be used during project construction range from 0.003 to 0.210 in/sec PPV at 25 feet from the source of activity.

The nearest structure to proposed construction activities is a daycare building located approximately 193 feet to the south. As indicated in *Table 5.13-8*, construction vibration levels at the nearest structure would range from less than 0.001 in/sec PPV to 0.010 in/sec PPV. Therefore, construction groundborne vibration would not exceed the structural damage criterion (0.2 in/sec PPV) and human annoyance criterion (0.035 in/sec PPV). In addition, construction activities would occur throughout the project site and would not be concentrated at the point closest to the nearest structure. Therefore, vibration impacts associated with the project construction activities would be less than significant.

Table 5.13-8: Typical Construction Equipment Vibration Level

Equipment	Peak Particle Velocity At 25 feet (in/sec)	Peak Particle Velocity At 193 feet (in/sec)
Large Bulldozer	0.089	0.004
Loaded Trucks	0.076	0.004
Small Bulldozer/Tractors	0.003	<0.001
Vibratory Compactor/Roller	0.210	0.010

Notes:
1. Calculated using the following formula: $PPV_{equip} = PPV_{ref} \times (25/D)^{1.5}$
where: PPV_{equip} = the peak particle velocity in in/sec of the equipment adjusted for the distance
PPV_{ref} = the reference vibration level in in/sec from Table 7-4 of the Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, 2018.
D = the distance from the equipment to the receiver

Source: Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, September 2018.

Operations

The project would include truck movement activity at the project site. These movements would generally be low-speed (i.e., less than 15 miles per hour) and would occur over new, smooth surfaces. For perspective, Caltrans has studied the effects of propagation of vehicle vibration on sensitive land uses and notes that "heavy trucks, and quite frequently buses, generate the highest earthborn vibrations of normal traffic." Caltrans further notes that the highest traffic-generated vibrations are along freeways and state routes. Their study finds that "vibrations measured on freeway shoulders (five meters from the centerline of the nearest lane) have never exceeded 0.08 in/sec, with the worst combinations of heavy trucks and poor roadway conditions (while such trucks were moving at freeway speeds). This level coincides with the maximum recommended safe level for ruins and ancient monuments (and historic buildings)".[25] Since the Project's truck movements would be at low speed (not at freeway speeds) and would be over smooth surfaces (not under poor roadway conditions), Project-related vibration associated with truck activity would not result in excessive groundborne vibrations; no vehicle-generated vibration impacts would occur. In addition, there are no sources of substantial groundborne vibration associated with the Project, such as rail or subways. The Project would not create or cause any vibration impacts due to operations. Impacts would be less than significant in this regard.

[25] California Department of Transportation, *Technical Noise Supplement to the Traffic Noise Analysis Protocol ("TeNS")*, September 2013.

c) *For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?*

Less Than Significant Impact. The nearest airport to the project site is Hanford Municipal Airport located approximately 2.52 miles east of the project site. Therefore, the project would not be located within two miles of a public airport or within an airport land use plan. Additionally, there are no private airstrips located within the project vicinity. Therefore, the Project would not expose people residing or working in the project area to excessive airport- or airstrip-related noise levels and no impact would occur.

Cumulative Impacts

Cumulative Construction Noise

The City limits construction to the hours of 7:00 a.m. to 8:00 p.m. The project would contribute to other proximate construction noise impacts if construction activities were conducted concurrently. However, based on the noise analysis above, the project's construction-related noise impacts would be less than significant following compliance with local regulations.

Construction activities at other planned and approved projects would be required to take place during daytime hours, and the City and project applicants would be required to evaluate construction noise impacts and implement mitigation, if necessary, to minimize noise impacts. Each project would be required to comply with the applicable HMC limitations on allowable hours of construction. Therefore, project construction would not contribute to cumulative impacts and impacts in this regard are not cumulatively considerable.

Cumulative Operational Noise

Cumulative noise impacts describe how much noise levels are projected to increase over existing conditions with the development of the project and other foreseeable projects. Cumulative noise impacts would occur primarily as a result of increased traffic on local roadways due to buildout of the project and other projects in the vicinity. However, noise from generators and other stationary sources could also generate cumulative noise levels.

Stationary Noise

As discussed above, impacts from the project's operations would be less than significant. Due to site distance and the fact that noise dissipates as it travels away from its source, noise impacts from on-site activities and other stationary sources would be limited to the project site and vicinity. No known past, present, or reasonably foreseeable projects would compound or increase the operational noise levels generated by the project. Thus, cumulative operational noise impacts from related projects, in conjunction with project-specific noise impacts, would not be cumulatively significant.

Traffic Noise

A project's contribution to a cumulative traffic noise increase would be considered significant when the combined effect exceeds perception level (i.e., auditory level increase) threshold. A described above,

implementation of the project would generate increased traffic volumes along study roadway segments. The project is expected to generate a net of 4,986 average daily trips, which would not result in an increase above ambient noise levels. Therefore, project traffic noise would not be perceptible and would not be cumulatively significant.

5.14 POPULATION AND HOUSING

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
POPULATION AND HOUSING. Would the project:				
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?			**X**	
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?			**X**	

a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Less Than Significant Impact. The project site is designated as Regional Commercial (C-R) in the Hanford General Plan. The proposed project does not propose any residential uses that could generate new residents within the City. The proposed project includes a gas service station, convenience store, and RV Dump and air station. The gas station would serve the existing population in the surrounding area and would not substantially induce unplanned population growth. Operation of the proposed project is anticipated to generate approximately 15 to 18 permanent jobs. Employment in the City of Hanford is forecast to increase from approximately 17,042 jobs in 2023 to 25,921 jobs by 2050, representing an increase of about 8,879 jobs (approximately 52 percent) (USCB 2025; KCAG, 2022). In this context, project-related operational employment would represent a very small increment of overall employment growth and would not substantially alter population or housing demand in the City or region. In addition, project construction and operation would create new employment opportunities. The workers are anticipated to come from within the City or surrounding jurisdictions and commute daily to the site. Construction employment would be temporary and would rely on the existing regional construction labor force. Kings County's unemployment rate was approximately 8.4 percent as of September 2025, indicating that an available labor pool exists to support both construction and long-term operational employment without inducing significant growth (EDD. 2025). Additionally, the proposed project would connect to existing City water and sanitary sewer infrastructure located along 12th Avenue and would not require the extension or upsizing of utility mains to serve the project. While utility infrastructure exists in Hayden Avenue and could serve future development to the west, lands west of the project site are already zoned for medium-density residential uses under the General Plan, and any future development in that area would occur independently of the proposed project and consistent with planned growth assumptions. Although it is possible that demand for workers and new connection to city utilities could induce some

people to move to the area this is anticipated to be a small number relative to total demand for construction workers and permanent employees. It is anticipated that, with the recent and continuing growth of the City, there are adequate numbers of people already residing in the area to work on or at the Maverik Hanford site. Therefore, impacts from the proposed project to unplanned population growth are less than significant.

b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

Less Than Significant Impact. As mentioned above, the project site is not zoned or designated in the General plan to be used for residential uses. There is one existing single-family residence on the project site which will be demolished and removed as part of the project. However, the removal of one single-family residence does not result in the displacement of a significant number of people or housing units. The City of Hanford contained approximately 20,353 housing units as of 2020, with low vacancy rates of approximately 0.3 percent for owner-occupied units and 0.6 percent for renter-occupied units (KGGP, 2010). Housing units in the City are forecast to increase to approximately 25,921 units by 2050, reflecting long-term planned growth and housing availability (KCAG, 2022). The project does not require construction of replacement housing in another location. Therefore, impacts would be less than significant.

Cumulative Impacts

The proposed project would not result in cumulative population or housing impacts when considered together with other past, present, and reasonably foreseeable projects in the City of Hanford. The project would generate approximately 15 to 18 permanent operational jobs and temporary construction employment. However, this level of employment represents a very small percentage relative to forecast employment growth in the City, which is expected to increase by approximately 8,879 jobs between 2023 and 2050. Additionally, Kings County's unemployment rate of approximately 8.4 percent shows that an available labor force exists in the county to accommodate cumulative employment growth without inducing growth or increased housing demand. The project would result in the removal of one single-family residence, which represents a negligible fraction of the City's existing housing of approximately 20,353 units and would not significantly contribute to cumulative housing displacement. In addition, the City's housing supply is forecast to increase to approximately 25,921 units by 2050. The proposed project would be consistent with the planned land uses in the City's General Plan and the population and employment projections for the City and the region as a whole. Impacts from cumulative growth are considered in the context of their consistency with these local and regional planning efforts. Therefore, the proposed project would not cause a cumulatively considerable impact on population and housing and no mitigation is required.

5.15 PUBLIC SERVICES

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
PUBLIC SERVICES. Would the project:				
a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
i) Fire protection?			**X**	
ii) Police protection?			**X**	
iii) Schools?			**X**	
iv) Parks?			**X**	
v) Other public facilities?			**X**	

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

i) Fire protection?

Less Than Significant Impact. There are three Fire Stations located within the City of Hanford. Fire Station 3 at 1070 S 12th Ave is the closest to the project site, located 0.23 miles south. The Hanford Fire Department maintains an average emergency response time of approximately five minutes, and emergency services to the project site are provided up-to-date equipment, including a 2019 Pierce Velocity 110 ladder truck (Unit 162) (City of Hanford, 2025). The City of Hanford's Fire Department will review the development plans for the project to ensure the development adheres to the Fire Departments requirements and the project would include the payment of standard City development impact fees, which include a fee for fire protection service impacts. As of 2024, the Hanford Fire Department staffs approximately 10 firefighters on duty at all times, while the Department has experienced an

approximate 2,000 percent increase in call volume over a 50-year study period ending in 2023, it continues to meet applicable service ratios and response time objectives (City of Hanford, 2024). The nominal population growth associated with the project would incrementally increase the demand for fire protection and emergency medical services to the project site. However, the project would employ approximately 15 to 18 people during operation, and the limited scope of development would not meaningfully increase service demands. The project site is included as a commercial area in the City's General Plan. Furthermore, the project does not propose, and would not create a need for, new/physically altered fire protection facilities. Fire protection services would continue to be provided in accordance with the California Fire Code, which generally requires fire hydrants at intervals of approximately 300 to 400 feet, and the project would remain in compliance with these standards. . Finally, the project would be constructed to meet the latest CBC requirements, and the project is subject to fire suppression development impact fees, other standards and conditions required by the City and County Fire and would be in compliance with the California Fire Code (CFC). Accordingly, the project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, nor would it require new or expanded facilities whose construction could cause significant environmental impacts in order to maintain acceptable service ratios, response times, or other performance objectives for public services. As such, a less than significant impact would occur.

ii) Police protection?

Less Than Significant Impact. The City of Hanford's Police Department is under contract to provide police protection and public safety services within the City, which would include the project site. The Hanford Police Department is located approximately 1.6 miles northeast from the project site. The Hanford Police Department maintains an average response time of approximately eight minutes for Priority 1 calls, consistent with acceptable service standards. The Hanford Police Department consists of approximately 65 sworn officer positions and 28 professional staff positions, with officers responding to an average of 13 calls for service per day and maintaining a service ratio of approximately 1.08 officers per 1,000 residents (City of Hanford, 2024). The nominal population growth associated with the project would incrementally increase the demand for police protection services to the project site. However, the proposed commercial development would not result in any unique or more extensive crime problems that cannot be handled with the existing level of police resources. In addition, the project would incorporate substantial on-site lighting and security camera systems designed to deter criminal activity, further reducing the potential demand for police services. Furthermore, the project would not have a significant impact on police response times, because the project site is planned commercial consistent with the City's General Plan and is subject to police fee for development per unit. Therefore, project impacts concerning police protection services would be less than significant and no mitigation is required. Additionally, the project does not propose, and would not create a need for, new/physically altered police protection facilities; thus, less than significant environmental impacts would occur in this regard.

iii) Schools?

Less Than Significant Impact. The following schools are in the local vicinity of the project site; Roosevelt Elementary School approximately 0.87 mile to the east, Martin Luther King Jr Elementary School approximately 1.1 miles southeast, Lincoln Elementary School approximately 1.6 miles east, Learn4Life – Kings Valley Academy II approximately 1.5 miles northeast, and Crossroads Charter Academy approximately 1.45 miles northeast. The nominal population growth due to the proposed project would not cause any significant increase in demand on the above listed schools in the area. According to Government Code Section 65996, the payment of development fees authorized by SB 50 are deemed to be full and complete school facilities mitigation. The project would be required to pay mandated development fees for commercial buildings. As such, impacts are anticipated to be less than significant impact.

iv) Parks?

Less Than Significant Impact. Parks in the local vicinity to the project site include Centennial Park approximately 0.42 miles southeast, Rotary Park approximately 1.2 miles northeast, Hood Park approximately 1.87 miles southwest, Coe Park approximately 1.70 miles east, and Lacey Park approximately 2.0 miles northeast of the project site. The City's Parks and Recreation Department is supported by an estimated staff of up to approximately 50 parks and recreation personnel, and existing facilities are maintained to serve current and planned development consistent with the City's General Plan. Due to proposed commercial uses it is not anticipated that the project would create additional need for recreational facilities. The project overall would only result in nominal population growth and would employ approximately 15 to 18 people, which would not meaningfully increase the use of nearby parks or recreational facilities. Although the project would bring new residents to the general area, the use of surrounding parks and other facilities has been accounted for in the General Plan. Furthermore, the proposed gas station would provide regional commercial land uses that primarily serves customers at a regional scale. The proposed commercial development would not significantly increase the demand of such services and a less than significant impact would occur.

v) Other public facilities?

Less Than Significant Impact. Other public facilities in the area such as health care, production, libraries, etc. would not be adversely impacted by the proposed project. Library services are provided by the Kings County Library – Hanford Branch, which serves the project area and surrounding community. The proposed project would be consistent with the City of Hanford General Plan and would employ 15-18 people, which would not significantly increase usage and demand for public facilities. Accordingly, the project would not require the expansion or construction of new public facilities to maintain acceptable service levels, and impacts on public facilities, including library services, would be less than significant.

Cumulative Impacts

The project would be consistent with the current General Plan and Zoning designations, the project would not result in substantial incremental effects to public services or facilities that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable projects. While employment growth in the City of Hanford is anticipated to increase by approximately 8,879 jobs between 2023 and 2050, regional service demand associated with this growth has been evaluated and accounted for through the City's long-range planning efforts and General Plan buildout assumptions. Accordingly, the proposed project would not result in a substantial increase in regional demand for public services. The City collects fees at the time of building permit issuance to offset the cumulative impact on new development on fire and police services. Given the limited employment generated by the project and the City's established fee programs and service planning for past, present, and future development, the project would not contribute to a cumulatively considerable impact on public services or public facilities. Therefore, the project, individually or cumulatively, would not result in cumulatively considerable impacts on public services or facilities.

5.16 RECREATION

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
RECREATION.				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?			**X**	
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?			**X**	

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Less Than Significant Impact. The closest existing neighborhood park is Centennial Park at 11731 Hanford Armona Rd approximately 0.42 miles southeast from the project site. The nature of the commercial uses of the proposed project is not likely to generate an increase in population that would use existing recreational facilities in the area. The proposed commercial uses include a gas service station, convenience store, and RV Dump and air station. These uses would not increase population in a manner that would increase demand for recreational facilities. Such that substantial physical deterioration of recreational facilities would occur or be accelerated. Therefore, the project would have a less than significant impact.

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Less Than Significant Impact. The proposed project does not include any recreational facilities. The proposed commercial uses include a gas service station, convenience store, and RV Dump and air station. The proposed project would not induce population growth in a way that would require the construction or expansion of recreational facilities. The proposed uses do not lead to a population that would increase use in the surrounding area. Therefore, the proposed project would not have a significant adverse physical effect on the environment, and potential impacts would be less than significant.

Cumulative Impacts

Development of the proposed project is not anticipated to create a significant cumulative increase of recreational facilities. The proposed project would not create a substantial population increase that would result in a significant impact on existing recreational facilities. Therefore, no cumulative impacts on recreational facilities would occur.

5.17 TRANSPORTATION

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
TRANSPORTATION. Would the project:				
a) Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?			**X**	
b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?			**X**	
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?			**X**	
d) Result in inadequate emergency access?			**X**	

a) Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Less Than Significant Impact. Based on Policy T29 of the Hanford General Plan, the project is required to maintain a peak hour Level of Service D of service on streets and intersections with the project study area. A Traffic Impact Study (TIS) was prepared for the project (**Appendix F**) and evaluated Existing (2025), Existing (2025) plus Project, Cumulative (2045), and Cumulative (2045) plus Project conditions.

Under Existing (2025) plus Project conditions, *Table 5.17-1: Existing (2025) plus Project Intersection Levels of Service*, shows that all study intersections would operate at LOS D or better except the intersection of 12th Avenue at Hayden Avenue, which would experience project-related movement delays resulting in LOS F during both the AM and PM peak hours due to increased minor-street turning volumes.

Under Cumulative (2045) plus Project conditions, *Table 5.17-2: Cumulative (2045) plus Project Intersection Levels of Service* indicates LOS deficiencies would occur at 12th Avenue at Hayden Avenue and Hayden Avenue at the Project Full Access Driveway, with LOS F conditions during peak hours. These deficiencies would represent conflicts with General Plan Policy T29 if unaddressed.

Table 5.17-1 – Existing (2025) plus Project Intersection Levels of Service

ID	Intersection	Peak Hour	LOS Threshold	Control	Existing (2025)		Existing (2025) plus Project	
					Delay (sec)	LOS	Delay (sec)	LOS
1	12th Ave at Hwy 198 WB Ramps	AM	D	Signal	19.6	B	21.8	C
		PM			16.2	B	19.6	B
2	12th Ave at Hwy 198 EB Ramps	AM	D	Signal	9.1	A	9.6	A
		PM			9.1	A	9.2	A
3	12th Ave at Hayden Ave	AM	D	SSSC	2.1(16.7 WBL)	A(C)	**9.6(55.2 EBL)**	**A(F)**
		PM			2.4(17.0 WBL)	A(C)	**8.9(61.6 EBL)**	**A(F)**
4	12th Ave at Hanford Armona Rd	AM	D	Signal	15.7	B	16.8	B
		PM			17.9	B	19.6	B
5	Hayden Ave at Full Access Dwy	AM	D	SSSC	-	-	12.3(25.4 SBL)	B(C)
		PM			-	-	11.0(22.2 SBL)	B(C)

Table 5.17-2 – Cumulative (2045) plus Project Intersection Levels of Service

ID	Intersection	Peak Hour	LOS Threshold	Control	Cumulative (2045)		Cumulative (2045) plus Project	
					Delay (sec)	LOS	Delay (sec)	LOS
1	12th Ave at Hwy 198 WB Ramps	AM	D	Signal	17.5	B	20.2	C
		PM			18.8	B	20.9	C
2	12th Ave at Hwy 198 EB Ramps	AM	D	Signal	11.7	B	11.9	A
		PM			11.0	B	11.0	B
3	12th Ave at Hayden Ave	AM	D	SSSC	2.2(15.6 WBL)	A(C)	**11.6(76.1 EBL)**	**B(F)**
		PM			2.4(16.1 WBL)	A(C)	**13.3(130.1 EBL)**	**B(F)**
4	12th Ave at Hanford Armona Rd	AM	D	Signal	17.6	B	19.1	B
		PM			24.4	C	31.5	C
5	Hayden Ave at Full Access Dwy	AM	D	SSSC	-	-	**26.8(56.4 SBL)**	**D(F)**
		PM			-	-	**52.5(108.4 SBL)**	**F(F)**

To ensure compliance with Policy T29, the project design includes installation of a traffic signal at the intersection of 12th Avenue and Hayden Avenue. With this improvement in place, all study intersections, including the previously deficient intersections, would operate at LOS D or better during both the AM and PM peak hours under cumulative conditions, as shown in *Table 5.17-3: Cumulative (2045) plus Project Improved Conditions Intersection Levels of Service*. Signalization at this location would also improve traffic progression, reduce queue spillback, and alleviate secondary effects at the project driveway.

Table 5.17-3 – Cumulative (2045) plus Project Improved Conditions Intersection Levels of Service

ID	Intersection	Peak Hour	LOS Threshold	Control	Cumulative (2045)		Cumulative (2045) plus Project		Cumulative (2045) plus Project (Improved)	
					Delay (sec)	LOS	Delay (sec)	LOS	Delay (sec)	LOS
3	12th Ave at Hayden Ave	AM	D	Signal	2.2(15.6 WBL)	A(C)	**11.6(76.1 EBL)**	**B(F)**	8.2	A
		PM			2.4(16.1 WBL)	A(C)	**13.3(130.1 EBL)**	**B(F)**	8.8	A
5	Hayden Ave at Full Access Dwy	AM	D	SSSC	-	-	**26.8(56.4 SBL)**	**D(F)**	2.9 (5.6 SBL)	A(A)
		PM			-	-	**52.5(108.4 SBL)**	**F(F)**	2.7 (5.0 SBL)	A(A)

A queueing issue is also identified at 12th Avenue and Hanford Armona Road during the PM peak hour, which is addressed through retiming of the existing traffic signal. Crash data show higher-than-average collision rates at nearby Highway 198 ramps; however, the project is not expected to worsen conditions, and planned improvements at the project driveway may enhance safety.

The proposed project is being executed in a manner consistent with the City's 2035 General Plan. Trips generated by the proposed project are not anticipated to generate sufficient demand to warrant transit network expansion. Therefore, implementation of the proposed project will not conflict with a program plan, ordinance or policy addressing the circulation systems, including transit, roadway, bicycle, and pedestrian facilities. Impacts would be less than significant.

b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

Less Than Significant Impact. Passed in 2013, SB 743 changes the focus of transportation impact analysis in CEQA from "measuring impacts to drivers" to "measuring the impact of driving". The change has been made by replacing Level of Service (LOS) with Vehicle Miles Traveled (VMT). This shift in transportation impact focus is intended to better-align transportation impact analysis and mitigation outcomes with the State's goals to reduce greenhouse gas (GHG) emissions, encourage infill development, and improve public health through more active transportation. Level of service, or other delay metrics, may still be used to evaluate the impact of projects on drivers as part of land use entitlement review and impact fee programs, and was considered for the analysis of this project (documented separately).

In January 2019, the Natural Resources Agency finalized updates to the CEQA Guidelines including the incorporation of SB 743 modifications. The Guidelines' changes were approved by the Office of Administrative Law and are now in effect. The provisions apply statewide as of July 1, 2020.

To help aid lead agencies with SB 743 implementation, the Governor's Office of Planning and Research (OPR) produced the Technical Advisory on Evaluating Transportation Impacts in CEQA (December 2018) that provides guidance regarding the variety of implementation questions they face with respect to shifting to a VMT metric. Key guidance from this document includes:

- VMT is the most appropriate metric to evaluate a project's transportation impact.

- OPR recommends tour- and trip-based travel models to estimate VMT but ultimately defers to local agencies to determine the appropriate tools.

- OPR recommends measuring VMT for residential and office projects on a "per rate" basis.

- OPR recommends that a per capita or per employee VMT that is fifteen percent below that of existing development may be a reasonable threshold. In other words, an office project that generates VMT per employee that is more than 85 percent of the regional VMT per employee could result in a significant impact. OPR notes that this threshold is supported by evidence that connects this level of reduction to the State's emissions goals.

- OPR recommends that where a project replaces existing VMT-generating land uses, if the replacement leads to a net overall decrease in VMT, the project would lead to a less-than-significant transportation impact. If the project leads to a net overall increase in VMT, then the thresholds described above should apply.

- OPR states that by adding retail opportunities into the urban fabric and thereby improving retail destination proximity, local-serving retail development tends to shorten trips and reduce VMT. Generally, retail development including stores smaller than 50,000 square feet might be considered local serving.

- Lead agencies have the discretion to set or apply their own significance thresholds.

Based on the proposed project's land use information and for the purposes of completing this SB 743 analysis to identify transportation-related significant impacts, the project was analyzed as a "Retail" land use. Based on the nature of the land use description provided, the retail use was analyzed qualitatively. The City of Hanford has adopted SB 743 guidance and accompanying thresholds. The City's VMT Thresholds and Implementation Guidelines document from November 2022 was used as the basis for the analysis documented herein.

Page i of the Guidelines specifically addresses how local-serving retail should be evaluated in terms of its VMT impact. As described, the threshold for significance for retail projects is "a net increase." This threshold definition means that if a proposed facility produces one additional VMT, it will result in a finding of significance. However, page 6 of the document further explains that local retail stores can be determined to result in an overall VMT reduction. This finding is consistent with the desire to develop more sustainable communities that have fewer transportation impacts.

Local-serving retail (e.g., gas station/convenience market) primarily serves pre-existing needs (i.e. they do not generate new trips because they meet existing demand). Because of this dynamic, local-serving retail uses can be presumed to reduce trip lengths when a new use is proposed. Essentially, the assumption is that someone will travel to a newly constructed, local-serving establishment because of its proximity, rather than the proposed retail store fulfilling an unmet need (i.e. the person had an existing need that was met by the retail located farther away and is now traveling to the new use because it is closer to the person's origin location). This relationship results in a trip on the roadway network becoming shorter, rather than a new trip being added to

the roadway network. Conversely, residential and office land uses often drive new trips given that they introduce new participants to the transportation system. The Guidelines provides a threshold of 55,000 square feet per establishment as an indicator as to whether a retail use can be considered local-serving or not. Based on the understanding that no single building within the proposed project would exceed 55,000 square foot, it is presumed that the proposed retail uses will not result in a significant impact.

Exhibit 1: *Vehicle Miles Traveled (VMT) by Land Use* is provided to visually demonstrate the basis of this finding. As shown in Exhibit 1, the introduction of a new retail use often has the effect of redistributing existing customer trips in a manner that reduces average trip lengths, thereby resulting in a VMT reduction (i.e. trip segments that were 3 miles prior to the new retail store are reduced to 1 mile with the addition of the new retail store).

In terms of employee trips, most often an important strategy for reducing VMT in a rural community is to improve the local jobs/housing balance by increasing the number of employment opportunities. As such, it is reasonable to expect that increasing local employment opportunities will reduce the average commuter trip lengths of residents, thereby resulting in a net decrease to regional net VMT.

OPR's Technical Advisory indicates that, although heavy-duty vehicle traffic can be included for analysis convenience, the VMT analysis requirements are specific to passenger-vehicles and light duty trucks. It is generally understood that Interstate commerce and related heavy-duty vehicle traffic are regulated by the Federal government as it relates to commerce. Irrespective of this guidance, it is reasonable to assume that the location of this project adjacent to SR-198 offers services for the traveling public and truck drivers that are already on the roadway system and need to stop for services. With the exception of employee commute trips, the trips for this type of use are generally pass-by or diverted link. Accordingly, it is reasonable to assume that the proposed Maverik would not generate new demand, rather it would satisfy existing demand that would therefore shorten the distance that customers would otherwise travel.

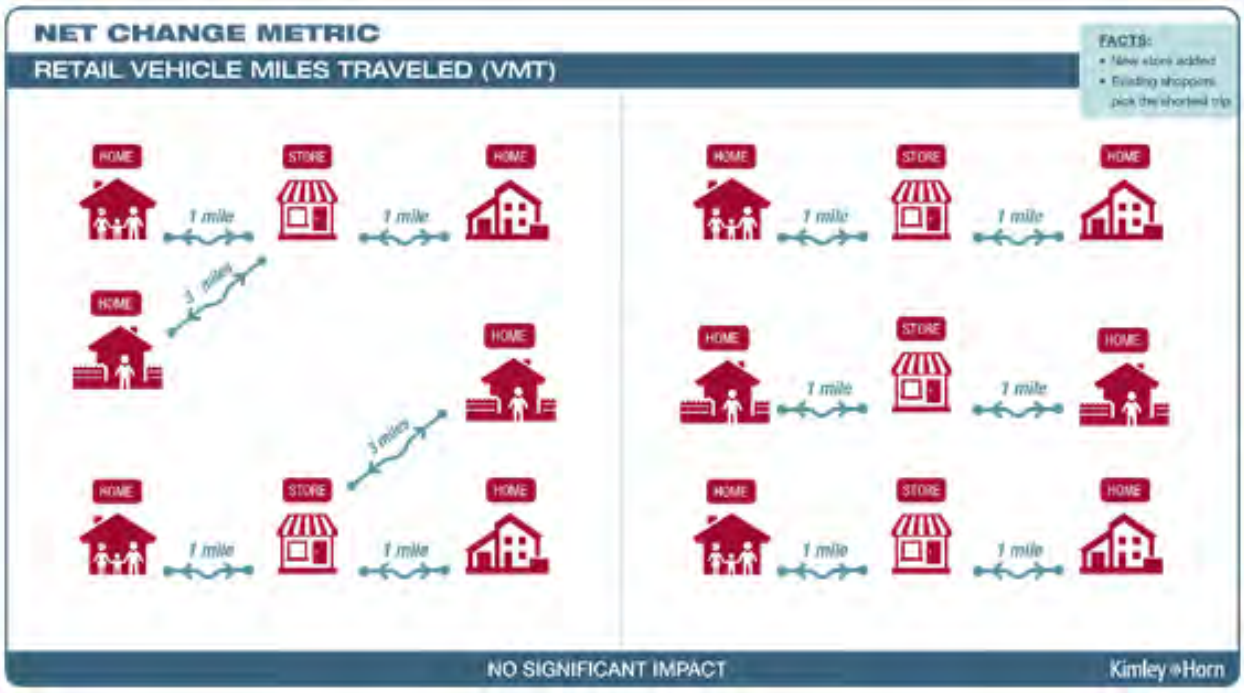

Exhibit 1: Vehicle Miles Traveled (VMT) by Land Use

Other site-related trips, often the smallest number and shortest distance of trips for a facility such as the proposed project, include employee lunches offsite, maintenance teams for on-site infrastructure, supply deliveries, etc. As such, their impact to the overall VMT of the site is likely minimal and it is not likely that they are impactful to the local transportation system and are secondary to the other two trip types discussed above.

Finally, as noted above, while this facility is expected to provide additional jobs and some related trips to the area, the facility itself is not expected to be the principal catalyst for new trips. Rather, it is anticipated that these trips would most likely occur regardless of whether this location was developed. The proposed project is reasonably considered to be proposed in response to an existing demand for services for road users already on the roadway network. Accordingly, if this site were not developed, a similar site would be developed elsewhere to meet this demand and, as such, the alternative to this development would likely not eliminate any related VMT. In consideration of this and the other points discussed above, the project is not anticipated to result in a significant impact under CEQA pursuant to SB 743.

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less Than Significant Impact. The proposed project would not substantially increase hazards to vehicle safety due to increased traffic at locations with geometric design features (e.g., sharp curves or dangerous intersections). Construction of the project would generate temporary vehicle trips associated with workers, vendors, and material hauling, varying by construction phase. As

shown in the CalEEMod assumptions, daily construction activity would include worker trips ranging from approximately 10 to 18 one-way trips per day per phase, vendor trips as needed, and hauling trips during select phases, including up to approximately 64 one-way haul trips per day during grading activities. Haul trips are assumed to travel an average distance of approximately 20 miles, while worker trips average approximately 10.6 miles. Construction vehicle activity would consist of a mix of light-duty automobiles and light-duty trucks for worker trips, and heavy-duty diesel trucks for vendor deliveries and material hauling, consistent with CalEEMod default vehicle class assignments. The project does not introduce incompatible users (e.g., farm equipment) to a roadway or transportation facility not intended for those users. The project's impact with regard to roadway design and users is not considered significant. Impacts would be less than significant.

d) Result in inadequate emergency access?

Less Than Significant Impact. Emergency vehicle access would be maintained at all times throughout construction activities, in accordance with the City's routine/standard construction specifications. Further, construction activities would not impede emergency access to any local roadways or surrounding properties. All driveways and internal site access roads would be constructed to accommodate all emergency vehicles and personnel. Further emergency access discussion is located within Section 5.9, Hazards. Project impacts regarding emergency access would be less than significant.

Cumulative Impacts

The project would remain consistent with existing transportation standards in accordance with the City of Hanford 2035 General Plan. Therefore, the proposed project would not result in incremental effects to transportation that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. Potential impacts are not cumulatively considerable and less than significant.

5.18 TRIBAL CULTURAL RESOURCES

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
TRIBAL CULTURAL RESOURCES. Would the project:				
a) Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: i) Listed or eligible for listing in the California:				
i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?		**X**		
ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?		**X**		

a) Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: i) Listed or eligible for listing in the California:

i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?

And,

ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

Less Than Significant With Mitigation Incorporated. A Cultural Resources Study for the project site was conducted by Kimley-Horn in October 2024. As previously mentioned, there were no historical resources found on-site found to be significant, this is substantiated through a SSJVIC records search, NRHP records search, CRHR records search, NHL records search, and BERD records search, a pedestrian survey of the project area, a cultural resources records search, Sacred Lands File search, literature review, review of cultural databases and repositories, and review of historic maps and imagery. However, the absence of substantial surface prehistoric or historic-period archeological remains within the project vicinity and the existing level of disturbance does not preclude the possibility of subsurface resources. Though the circumstances would present a low possibility, the following mitigation measure (MM) would reduce impacts in the unanticipated discovery of cultural resources during construction. With the implementation of **MM CUL-1** and **MM CUL-2**, impacts would be less than significant.

Pursuant to Assembly Bill 52, the City of Hanford, as Lead Agency, is required to notify California Native American tribes that have requested notification of projects within the City's jurisdiction. The City contacted the Santa Rosa Rancheria Tachi Yokut Tribe to notify them of the project and inquire if a consultation would be requested. The Tribe did request a consultation which took place between the City and the Tribe. The tribe requested construction monitoring agreements be established with the applicant which the City has helped facilitate. AB 52 tribal communications are maintained in the administrative record for the project and are available for public review upon request.

The Native American Heritage Commission (NAHC) conducted a search of Sacred Lands Files (SLF) for the Project area and vicinity at the request of the project applicant. The NAHC responded on September 24, 2024, and indicated that the results are negative for documented sacred lands in or near the Project area (Appendix B).

Impacts on tribal cultural resources are considered less than significant with mitigation.

Cumulative Impacts

The combination of the proposed project as well as past, present, and reasonably foreseeable projects in the local area would be required to comply with all applicable State, federal, and County and local regulations concerning preservation, salvage, or handling of cultural and paleontological resources, including compliance with required mitigation. Similar to the proposed project, these projects also would be required to implement and conform to mitigation measures, which would be likely to reduce impacts to less than significant. Although in the process of development, some known or unknown resources may be lost, it is not anticipated that these impacts would be cumulatively considerable. In addition,

implementation of **Mitigation Measures MM CUL-1** and **MM CUL-2**, would reduce project-specific impacts to a less than significant level. Therefore, the project's contribution to cumulative impacts would be less than significant.

5.19 UTILITIES AND SERVICE SYSTEMS

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
UTILITIES AND SERVICE SYSTEMS. Would the project:				
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?			**X**	
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?			**X**	
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?			**X**	
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?			**X**	
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?			**X**	

a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

And,

c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Less Than Significant Impact. The proposed project would connect to the City's existing water and sanitary sewer system. As part of this connection, the proposed project would not be required to

increase the size of existing water and sanitary sewer lines in order to serve the proposed project. The current diameter of existing collector lines within the city range in size from 4 to 42 inches with a daily flow of 4.5 million gallons per day (mgd) (City of Hanford, 2022). The proposed project would be consistent with planned growth in the General Plan, in that it would be consistent with the type of development planned for this area in the General Plan. The City has sufficient capacity, approximately 8 mgd, in its domestic water and sanitary sewer systems to accommodate development within the proposed project. Furthermore, available data from a comparable Maverik gas station in Sacramento indicate an annual operational water and wastewater demand of approximately 513,000 gallons. Based on this comparison, the proposed project is anticipated to have a similar level of demand that would not significantly affect the City's water supply or wastewater systems. Thus, the project would not require the extension of sewer mains, water lines, storm water drainage lines, or natural gas pipelines to the project site, as these lines are already available on 12th Avenue. Only connecting lines from the project site to these existing facilities would be required. Electrical and telecommunication lines are available in the project vicinity and can be extended to the project site as necessary. Electrical utilities for the project site are provided by Pacific Gas & Electric (PG&E). Based on the analysis from **Section 5.6**, *Energy*, the construction and operational phases combined make up less than 0.6% of King County's annual energy consumption. Therefore, the project overall will not have a significant impact on electrical utilities. Furthermore, The project does not propose the relocation of any existing utility lines or facilities. Thus, Project impacts would be less than significant.

b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Less Than Significant Impact. In 2021, the City adopted the City of Hanford 2020 Urban Water Management Plan (UWMP), as required by the Urban Water Management Planning Act of 1983. The UWMP serves as a long-term planning document for sustainable water supply, and includes a description of water sources, historical and projected water use, and a comparison of water supply and demand during normal and dry years. The UWMP has identified regional water demand in normal, single dry, and multiple dry years in five-year increments. Water demand projections were based on buildout of the City's General Plan. *Table 5.19-1* and *Table 5.19-2* show the projected water supply and demand totals during a normal year and during a single dry year, respectively. *Table 5.19-3* shows the projected supply and demand totals under multiple dry year conditions for the first, second, third, fourth, and fifth years.

Table 5.19-1: Normal Year Supply and Demand Comparison

	2025	2030	2035	2040	2045

NOTES:
(-) indicates a negative value
SOURCE: City of Hanford 2020 Urban Water Management Plan, October 2021

Based on the above, the City of Hanford does not anticipate a water supply shortage. Nonetheless, the City of Hanford UWMP lists shortage response actions pertaining to demand reduction, supply augmentation, operation changes, additional mandatory restrictions, and an emergency response plan.

Inclusion of the UWMP as well as implementation of the City's Water Shortage Contingency Plan would ensure that adequate water supplies are available to serve buildout of the General Plan. Therefore, projected water supplies would be sufficient to satisfy water demands associated with the proposed project while still meeting the current and projected water demands of existing customers within the service area. Impacts would be less than significant.

d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

And,

e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Less Than Significant Impact. The City of Hanford, in partnership with Kings Waste and Recycling Authority (KWRA), provides recycling services for the City of Hanford, however, KWRA does not operate an active landfill. Solid waste is hauled from the Material Recovery Facility (MRF), located approximately 4.35 miles to the southeast of the project site, to the State permitted 320-acre Chemical Waste Management Landfill site in Kettleman Hills (CWMI – KHF), or MSW Landfill B-19, located approximately 31.4 miles southwest of the project site. According to the Landfill Methane Outreach Program (LMOP) Landfill and Landfill Gas Energy Project Database[26], the CWMI - KHF (MSW Landfill B-19) has a closure date of 2083 and is currently operating at 29% capacity.

[26] U.S. Environmental Protection Agency, 2024, Landfill Methan Outreach Program (LMOP) Landfill Technical Data, Available at https://www.epa.gov/lmop/landfill-technical-data#:~:text=The%20LMOP%20Landfill%20and%20Landfill,gas%20collection%20system%20status%20and.

Estimates for projects of similar scale states that Construction typically generates approximately 3.9 pounds of debris per square foot of building area and operational waste for a combined retail and auto service facility is estimated at roughly 0.9 lb/100 sq ft/day (CMI Group, 2025). Based on the landfill capacity, above the project would not significantly impact landfill capacity. Additionally, the proposed project would be consistent with planned growth in the Hanford 2035 General Plan, in that it would be consistent with the type of development planned for this area in the General Plan. Furthermore, the proposed project would comply with AB 341, AB 1826, and SB 1383 through participation in the City of Hanford and KWRA recycling and organics diversion programs, provision of on-site recycling and organics containers, and employee education, and would comply with CalGREEN Section 4.408 by diverting a minimum of 65 percent of construction and demolition waste, including demolition of the existing residence, through recycling and salvage. Therefore, the capacity identified by the LMOP Landfill and Landfill Gas Energy Project Database, is more than sufficient to serve the proposed project. Because the MSW Landfill B-19 has adequate capacity for the construction and operation of the Proposed project would have a less than significant impact.

The proposed project would not interfere with regulations related to solid waste or generate waste in excess of the capacity of local infrastructure. The proposed project would have a less than significant impact in this regard.

Cumulative Impacts

Utilities are generally provided or delivered on a local level but often originate from sources outside of the City as part of a regional distribution system. Similar to the project, other projects within the City would be required to adhere to the Standard Conditions of Approval related to water efficiency, utilities services and plans, and drainage. As shown above a cumulative analysis of water supply and demand was identified for multiple water years. There was no identified shortage in their five-year comparison. Additionally, the proposed project would connect to existing stormwater facilities. Furthermore, the proposed project would be consistent with the General Plan. Therefore, implementation of the project would not result in a cumulatively considerable contribution to impacts on water supply and wastewater, stormwater, or solid waste generation.

The coordination process associated with the preparation of development and infrastructure plans is intended to ensure that adequate resources are available to serve both individual projects and cumulative demand for resources and infrastructure as a result of cumulative growth and development in the area. Individual projects are subject to review for utility capacity to avoid unanticipated interruptions in service or inadequate supplies. Other planned projects are subject to connection and service fees to assist in facility expansion and service improvements triggered by an increase in demand. The proposed project would not result in incremental impacts to utilities or service systems, that taken in sum with past, present, and reasonably foreseeable projects, would not result in significant cumulative utility impacts.

5.20 WILDFIRE

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
WILDFIRE. If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?			**X**	
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?			**X**	
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?			**X**	
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?			**X**	

a) Substantially impair an adopted emergency response plan or emergency evacuation plan?

Less Than Significant Impact. The project site is not located in or near a LRA or SRA, nor is the site designated as a Very High Fire Severity Zone (VHFHSZ), as seen in **Figure 9: Fire Hazard Severity Zone**. The project site is served by direct access to Hayden Avenue, with regional access provided via the 12th Avenue/Highway 198 interchange. In the event of a wildfire evacuation, on-site drive aisles would facilitate orderly vehicle egress to the surrounding roadway network. Due to the site's limited size and occupancy, evacuation demand would be low. Project design includes adequate driveway geometry and internal circulation to avoid dead-end conditions and to accommodate emergency vehicle access and maneuvering. Additionally, the project would comply with all local regulations related to emergency access/evacuation. As such, a less than significant impact would occur in this regard.

b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

Less Than Significant Impact. Refer to the previous response a). In addition, the proposed fueling station includes potential ignition sources (e.g., fuel dispensers and vehicle engines). However, these features would be designed, constructed, and operated in accordance with applicable fire and building codes, including California Fire Code requirements. Underground storage tanks and associated piping would meet applicable State standards for leak prevention and fire safety. Compliance with these requirements would minimize the potential for ignition and fire spread. Therefore, the project would not exacerbate wildfire risks or expose occupants to significant pollutant concentrations from wildfire.

c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

Less Than Significant Impact. The project includes standard infrastructure, including roadways, utilities, and fire suppression systems.

The proposed project will utilize existing utility stubs onsite, street lighting along 12th Avenue, and curbs and gutters already in place along the eastern frontage of the parcel. All of this infrastructure is designed to reduce the risk of fire. Following compliance with the established local and state regulatory framework discussed above, the project would not expose people or structures to a significant risk involving wildland fires and impacts would be less than significant in this regard.

d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

Less Than Significant Impact. The project site is not in a VHFHSZ nor located near steep slopes or hillsides (OSFM, 2026). The project would implement efficient landscape maintenance practices and design measures to decrease the release of stormwater running off the site; therefore, the proposed project site would not expose people to downstream flooding or landslides as a result of runoff. Impacts would be less than significant.

Cumulative Impacts

The proposed project area is not within a natural wildfire zone. While development along the Highway 198 corridor could incrementally increase traffic and evacuation demand during an emergency, the project's limited size and occupancy would contribute minimally to regional evacuation needs. The site provides direct access to Hayden Avenue and the 12th Avenue/Highway 198 interchange, facilitating efficient egress for vehicles and emergency responders. Regional wildfire trends are primarily associated with wildland and wildland–urban interface areas, which are not present near the project site. Compliance with applicable fire codes, building standards, and fueling infrastructure safety requirements would further reduce ignition risk. Therefore, the project would not result in a cumulatively considerable

contribution to wildfire risk, evacuation constraints, or fire hazards, and impacts would be less than significant.

5.21 MANDATORY FINDINGS OF SIGNIFICANCE

ENVIRONMENTAL IMPACTS Issues	Potentially Significant Issues	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
21. MANDATORY FINDINGS OF SIGNIFICANCE. Does the project:				
a) Have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?		**X**		
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?		**X**		
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?		**X**		

a) Have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

Less Than Significant With Mitigation Incorporated. Evaluation of the proposed project as provided in Section 5.4, Biological Resources, has shown that the activities of the proposed project do not have the potential to degrade the quality of the environment and will not substantially reduce the habitat or cause wildlife populations to drop below self-sustaining levels. The project site does not contain any natural vegetation communities and consists of previously disturbed and modified land. Therefore, it does not support sensitive plant communities or substantial wildlife habitat. No sensitive plant species have the potential to occur within the project site. Mitigation measures for biological resources have been developed to reduce potential impacts on sensitive habitats and species to less than significant levels. Swainson's hawk is the only sensitive wildlife species with a low potential to occur on-site due to limited and low-quality foraging habitat, and

no suitable nesting habitat is present. Refer to **Mitigation Measures BIO-1** through **BIO-3** in Section 5.4, Biological Resources.

Also, based on the discussion and findings in Section 5.5, Cultural Resources, there is evidence to support a finding that the proposed project is not eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historic Resources (CRHR) under any significance criteria. The project is located in an area that does not appear to be sensitive for prehistoric or historic occupation and is considered to have a low to moderate sensitivity for surface sites and very low sensitivity for subsurface sites. Although no archaeological deposits or features were found during the *Cultural Resources Study* (2024), implementation of mitigation measures will ensure that any additional archaeological deposits or features may be discovered are fully protected during implementation of the project. Refer to **Mitigation Measures CUL-1** and **CUL-2** in Section 5.5, Cultural Resources. Therefore, impacts would be less than significant.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Less Than Significant With Mitigation Incorporated. As discussed throughout this document, implementation of the proposed project has the potential to result in impacts to the environment that are individually limited, but are not cumulatively considerable, including impacts to biological and cultural resources. In all instances where the project has the potential to contribute to cumulatively considerable impacts to the environment (including the resources listed above) mitigation measures have been imposed to reduce the potential effects to less than significant levels. As such, with incorporation of the mitigation measures imposed throughout this Initial Study, including compliance with local, State, and federal rules and regulations, the proposed project would not contribute to environmental effects that are individually limited, but cumulatively considerable, and impacts would be less than significant.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Less Than Significant With Mitigation Incorporated. The potential for the proposed project to result in environmental effects that could adversely affect human beings, either directly or indirectly, has been discussed throughout this document. In instances where the proposed project has the potential to result in direct or indirect adverse effects to human beings, including impacts to water quality, noise, cultural resources, hazards and hazardous materials, and wildfire, mitigation measures have been applied to reduce the impact to below a level of significance. In other instances, the project design and compliance with existing laws and regulations would reduce impacts of the project to less than significant levels. Therefore, the proposed project as designed, mitigated, and in compliance with existing regulatory requirements, would not have environmental effects, which will cause substantial adverse effects on human beings, either directly or indirectly. Therefore, impacts would be less than significant with mitigation incorporated.

Potential To Emit Calculator for Gasoline Dispensing Facilities

5/8/2024 - Version 2.0

This sheet calculates the maximum fuel throughput, based on the number of vehicle refueling positions at your GDF. The calculations use fixed values for hours of operation, the time required for each refueling event, and the average amount of fuel dispensed per refueling event.
The sheet than calculates the emissions of VOC from your GDF, based on emissions factors and the attainment status of your location. Note that while this calculator is designed primarily to address emissions of gasoline vapor, it includes algorithms to account for diesel fuel vapor as well and could even be used if the sole fuel dispensed was diesel.

HD truck diesel refueling positions	6					
Automotive dispensers with gasoline or diesel	0					
Automotive/Nonroad Diesel Refueling Positions	0					
Gasoline Vehicle Refueling Positions	**16**					
Location - Ozone Attainment Status	**Nonattainment Area**					
Max. Gasoline Throughput If No Automotive/nonroad Diesel	**3,618,000**	**gallons/year**	**Max. Automotive/Nonroad Diesel Throughput**	**0**	**gallons/year**	9,912
Max. Combined Automotive plus HD Truck Diesel Throughput	**3,082,000**	**gallons/year**	**Max. HD Truck Diesel**	**3,082,000**	**gallons/year**	8,444

Internally fixed values in calculation -- gasoline and automotive/nonroad diesel

Average time between start of refueling events	0.25	hours
Number of hours of GDF operation per day	24	hours/day
Number of days per year open for business	365	days/year
Number of gallons per refueling event	11	gal/refueling event
Percent of refueling events which use automotive diesel dispensers	5	%/year

Internally fixed values -- HD truck diesel

Average time between start of refueling events	0.33	hours
Number of hours of GDF operation per day	24	hours/day
Number of days per year open for business	365	days/year
Number of gallons per refueling event	110	gal/refueling event

Gasoline VOC Emissions -- apply these values to GDFs using USTs or ASTs[7]

Description [4]	VOC Emission factor (lb/1,000 gal)	Potential to Emit VOC (tons/yr)
Add'l Emissions for Small Volume GDFs[6]	11.5	0.000
Storage Tank Filling [1]	0.30	**0.543**
Storage Tank Breathing Losses [2]	0.25	**0.452**
Dispensing [3]	0.32	**0.579**
Totals	**0.870**	**1.574**

Diesel VOC Emissions -- apply these values to GDFs using USTs or ASTs

Description [4]	VOC Emission factor[5]	Potential to Emit VOC
	(lb/1,000 gal)	(ton/yr)
Storage Tank Filling	0.040	**0.062**
Storage Tank Breathing Losses	0.028	**0.042**
Dispensing	0.040	**0.062**
Totals	**0.108**	**0.166**

Methodology

Maximum Throughput (gal/yr) = vehicle refueling positions / refueling event time (hrs) x hours of operation (hr/yr) x fuel dispensed (gal/refueling event)
Potential to Emit of VOC (tons/yr) = Maximum Throughput (gal/yr) x VOC Emission Factor (lb/1,000 gal) x 1 ton/2,000 lbs

Notes:

Emission factors are from AP 42, Chapter 5.2, Transportation and Marketing of Petroleum Liquids, Table 5.2-7, (June 2008), except where noted.

[1] Assume Stage 1 controls are in place. 40 CFR 63, Subpart CCCCCC requires that new or modified gasoline dispensing facilities with a monthly throughput greater than 100,000 gallons per month install Stage 1 vapor balance system that achieves a 90% emissions reduction.

[2] 40 CFR 63, Subpart CCCCCC requires that new or modified gasoline dispensing facilities with a monthly throughput greater than 100,000 gallons per month install pressure/vacuum (PV) vent valves on the storage tank vent pipes. This model uses a 75 percent efficiency for PV valves in reducing breathing losses.

[3] The displacement VOC emission rate in lbs/1000 gallons depends on the gasoline Reid Vapor Pressure, the dispensed fuel temperature, and the difference between the temperature of the fuel in the tank and the dispensed fuel. For these purposes EPA calculated the uncontrolled displacement VOC emission rate in lbs/1000 gallons. EPA has used 10 psi RVP and national average summer-time temperatures for ozone attainment areas. This yields a value of about 10.8 lbs/1000 gallons. EPA has used 7 psi RVP and temperatures representative of the summer-time western US for ozone non-attainment areas. This yields a value of about 7.5 lbs/1000 gallons. In 76 FR 41723, EPA determined that 80% of the vehicle fleet will have ORVR installed as of 2014, and widespread use will be achieved on a national basis on June 30, 2013. Therefore, this value has been reduced by 80% for 2014 and increases each year subsequent to 2014 as fleet turnover occurs.
See memorandum to Public Docket EPA-HQ-OAR-2010-1076, Updated Data for ORVR Widespread Use Assessment, Glenn Passavant, OTAQ, 2012 and U.S.EPA, Guidance on Removing Stage II Gasoline Vapor Control Programs from State Implementation Plans and Assessing Comparable Measures, EPA-457/B-12-001, August 7, 2012.

[4] Even though spillage is a specific category of emissions related to fuel dispensing in AP-42, it is considered a fugitive emission for purposes of NSR permits and thus is not included here.

[5] Diesel emission factors were derived using the no.2 diesel true vapor pressure and vapor molecular weight from AP-42 Table 7.1-2 at 70F and equation 1 of section 5.2.2 with an S factor value of 1.45 for storage tank and vehicle tank filling and an S factor of 1.0 for breathing losses.

[6] GDFs with a gasoline throughput of < 10,000 gallons per month have higher storage tank filling and breathing loss emissions because they are not required to install Stage I vapor recovery controls under 40 CFR 63 CCCCCC.

[7] Using these values for an AST assumes a 45% average ullage in a 2000 gal AST

Construction Fuel Consumption

On-Site Diesel[1] (off-road construction Equipment)	$MTCO_2e$	Gallons of Fuel[4]	Kings County Fuel	Percent
Demolition	16	1,528

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Maverik Hanford
Construction Start Date	7/11/2026
Operational Year	2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.40000
Precipitation (days)	23.0000
Location	36.31743859243447, -119.67646601321842
County	Kings
City	Hanford
Air District	San Joaquin Valley APCD
Air Basin	San Joaquin Valley
TAZ	2612
EDFZ	9
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.37

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description

Convenience Market with Gas Pumps	5.98200	1000sqft	0.13733	5,982.00	0.00000	—	—	—
Parking Lot	246.747	1000sqft	5.96270	0.00000	12,986.7	—	—	—
Other Asphalt Surfaces	52.2720	1000sqft	1.20000	0.00000	0.00000	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	31.1600	annual days of extreme heat

Extreme Precipitation	0.65000	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00000	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	4	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score

Temperature and Extreme Heat	4	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	82.4767
AQ-PM	99.0292
AQ-DPM	71.6615
Drinking Water	55.6013
Lead Risk Housing	68.5570

APPENDIX B

HEALTH RISK ASSESSMENT (HRA) MODELING DATA

MEMORANDUM

To:	Alex Jewell, Kimley-Horn and Associates, Inc.
From:	Danielle Millar, Kimley-Horn and Associates, Inc.
Date:	July 30, 2025
Subject:	Maverik Hanford Project – Health Risk Assessment

1.0 Purpose

The purpose of this Health Risk Assessment (HRA) is to evaluate potential health risks associated with Toxic Air Contaminants (TACs) resulting from the implementation of the proposed Maverik Hanford Project ("project" or "proposed project"). This HRA was prepared in accordance with the requirements of the Office of Environmental Health Hazard Assessment (OEHHA) to determine if health risks are likely to occur from the project. Technical data are included in Appendix A: Modeling Data.

2.0 Project Location and Description

The project site is located in the City of Hanford in Kings County, California. The project site is located at the edge of the City, approximately 1.7 miles southwest of the downtown Hanford. The site is directly south of exit 85 to 12th Avenue on Highway 198. The project is comprised of a single Assessor's Parcel Number (APN) 011-010-013. Additionally, the project site is located along 12th Avenue and can be accessed through this corridor.

The proposed project consists of two components: a subdivision and development of a convenience store and fueling area. The proposed subdivision would subdivide the existing 21.4-acre parcel into two parcels. One parcel would be 5.95 acres and would be where the proposed convenience store and fueling station would be located. The remaining 15.45 acres would be left as an undeveloped parcel. No proposed uses or improvements on the 15.45-acre are proposed at this time. Approval of the subdivision requires an approval of a Tentative Parcel Map. Off-site improvements would include the Hayden Avenue extension, which encompasses approximately 1.2 acres.

The proposed convenience store and fueling area sits on approximately 5.95 acres of the entire 21.4-acre site. The store is approximately 5,982 square feet with twelve (12) fuel dispensers and canopy in front of the store and five (5) additional dispensers and canopy for commercial fueling at the back of the store, for a total of 17 fueling positions on site. The development will provide fueling, packaged beer and wine sales, as well as fresh food items. Restroom facilities will be open to the public. The store will operate 24 hours a day, 7 days a week.

3.0 Regulatory Setting

Federal

Federal Clean Air Act

The Federal Clean Air Act (FCAA) was amended in 1990 to address the numerous air pollutants that are known to cause or may reasonably be anticipated to cause adverse effects to human health or adverse environmental effects. 188 specific pollutants and chemical groups were initially identified as hazardous air pollutants (HAPs), and the list has been modified over time. The FCAA Amendments included new regulatory programs to control acid deposition and for the issuance of stationary source operating permits.

In 2001, the United States Environmental Protection Agency (U.S. EPA) issued its first Mobile Source Air Toxics Rule, which identified 21 mobile source air toxic (MSAT) compounds as being HAPs that required regulation. A subset of six of these MSAT compounds were identified as having the greatest influence on health and included benzene, 1,3-butadiene, formaldehyde, acrolein, acetaldehyde, and diesel particulate matter (DPM). More recently, the U.S. EPA issued a second MSAT Rule in February 2007, which generally supported the findings in the first rule and provided additional recommendations of compounds having the greatest impact on health. The rule also identified several engine emission certification standards that must be implemented. Unlike the criteria pollutants, toxics do not have National Ambient Air Quality Standards (NAAQS) making evaluation of their impacts more subjective.

National Emissions Standards for Hazardous Air Pollutants (NESHAPs) were incorporated into a greatly expanded program for controlling toxic air pollutants. The provisions for attainment and maintenance of the NAAQS were substantially modified and expanded. Other revisions included provisions regarding stratospheric ozone protection, increased enforcement authority, and expanded research programs.

Section 112 of the FCAA Amendments governs the federal control program for HAPs. NESHAPs are issued to limit the release of specified HAPs from specific industrial sectors. These standards are technology-based, meaning that they represent the best available control technology an industrial sector could afford. The level of emissions controls required by NESHAPs are not based on health risk considerations because allowable releases and resulting concentrations have not been determined to be safe for the general public. The FCAA does not establish air quality standards for HAPs that define legally acceptable concentrations of these pollutants in ambient air.

Federal Emissions Standards for On-Road Trucks

To reduce emissions from on-road, heavy-duty diesel trucks, the U.S. EPA established a series of increasingly strict emission standards for new engines, starting in 1988. The U.S. EPA promulgated

the final and cleanest standards with the 2007 Heavy-Duty Highway Rule.[1] The particulate matter (PM) emission standard of 0.01 gram per horsepower-hour (g/hp-hr) is required for new vehicles beginning with model year 2007. Also, the oxides of nitrogen (NO_X) and nonmethane hydrocarbon (NMHC) standards of 0.20 g/hp-hr and 0.14 g/hp-hr, respectively, were phased in together between 2007 and 2010 on a percent of sales basis: 50 percent from 2007 to 2009 and 100 percent in 2010. In December 2022, the U.S. EPA final rule set new, more stringent standards to reduce NO_X pollution from heavy-duty vehicles and engines starting in model year 2027. The rule will reduce NO_X emissions from heavy-duty trucks by almost 50 percent by 2045, producing significant health-related benefits.[2]

Emission Standards for Off-Road Diesel Engines

To reduce emissions from off-road diesel equipment, the U.S. EPA established a series of cleaner emission standards for new off-road diesel engines. Tier 1 standards were phased in from 1996 to 2000 (year of manufacture), depending on the engine horsepower category. Tier 2 standards were phased in from 2001 to 2006. Tier 3 standards were phased in from 2006 to 2008. Tier 4 standards, which generally require add-on emission control equipment to attain them, were phased in from 2008 to 2015. The Tier 4 standards require that emissions of PM and NO_X be further reduced by about 90 percent from Tier 3 standards.

State of California

California Air Resources Board

The California Air Resources Board (CARB) statewide comprehensive air toxics program was established in 1983 with Assembly Bill (AB) 1807 the Toxic Air Contaminant Identification and Control Act (Tanner Air Toxics Act of 1983). AB 1807 created California's program to reduce exposure to air toxics and sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an airborne toxics control measure (ATCM) for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology (T-BACT) to minimize emissions. CARB also administers the state's mobile source emissions control program and oversees air quality programs established by state statute, such as AB 2588. Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the air quality management district or air pollution control district. High priority facilities are required to perform a health risk assessment and, if specific thresholds are exceeded, required to communicate the results to the public in the form of

[1] United States Environmental Protection Agency (U.S. EPA), *Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards and Highway Diesel Fuel Sulfur Control Requirements*, Final Rule. 40 Code of Federal Regulations, Parts 69, 80, and 86. January 18, 2001.

[2] United States Environmental Protection Agency (U.S. EPA), Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards and Highway Diesel Fuel Sulfur Control Requirements, Final Rule. 40 Code of Federal Regulations, s 2, 59, 60, 80, 85, 86, 600, 1027, 1030, 1031, 1033, 1036, 1037, 1039, 1042, 1043, 1045, 1048, 1051, 1054, 1060, 1065, 1066, 1068, and 1090. January 24, 2023.

notices and public meetings. In September 1992, the AB 2588 was amended by Senate Bill (SB) 1731 which required facilities that pose a significant health risk to the community to reduce their risk through a risk management plan.

Emission Standards for Off-Road Diesel Engines

To reduce emissions from off-road diesel equipment, the U.S. EPA established a series of cleaner emission standards for new off-road diesel engines. CARB is currently developing potential amendments to the off-road diesel engine standards, in a Tier 5 rulemaking. CARB is currently developing potential amendments to the off-road diesel engine standards, in a Tier 5 rulemaking. The Tier 5 rulemaking aims to reduce NO_X and PM emissions from new, off-road compression-ignition (CI) engines, by an additional 50 percent to 90 percent, compared to what is allowed by today's Tier 4 final emission standards.

Diesel Risk Reduction Plan

The identification of DPM as a TAC in 1998 led CARB to adopt the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles (DRRP) in October 2000. The DRRP's goals include an 85 percent reduction in DPM by 2020 from the 2000 baseline.[3] CARB estimates that emissions of DPM in 2035 will be less than half those in 2010, further reducing statewide cancer risk and non-cancer health effects.[4] The DRRP includes regulations for cleaner new diesel engines, cleaner in-use diesel engines (retrofits), and cleaner diesel fuel.

Truck and Bus Regulation Reducing Emissions from Existing Diesel Vehicles

On December 12, 2008, CARB approved the Truck and Bus Regulation to significantly reduce PM and NO_X emissions from existing diesel vehicles operating in California. The regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Heavier trucks were required to be retrofitted with PM filters beginning January 1, 2012, and older trucks were required to be replaced starting January 1, 2015. Effective January 1, 2023, nearly all trucks and buses are required to have 2010 model year engines or equivalent.

The regulation applies to most privately and federally-owned diesel fueled trucks and buses and to privately and publicly owned school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. Small fleets with three or fewer diesel trucks can delay compliance for heavier trucks and there are several extensions for low-mileage construction trucks, early PM filter retrofits, adding cleaner vehicles, and other situations. Privately and publicly owned school buses have different requirements.

[4] California Air Resources Board, *Overview: Diesel Exhaust & Health*, https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health, accessed July 2025.

Heavy-Duty Vehicle Idling Emission Reduction Program

The purpose of the CARB ATCM to Limit Diesel-Fueled Commercial Motor Vehicle Idling is to reduce public exposure to DPM and criteria pollutants by limiting the idling of diesel-fueled commercial vehicles including transportation refrigeration units (TRUs). The driver of any vehicle subject to this ATCM is prohibited from idling the vehicle's primary diesel engine for greater than five minutes at any location and is prohibited from idling a diesel-fueled auxiliary power system (APS) for more than five minutes to power a heater, air conditioner, or any ancillary equipment on the vehicle if it has a sleeper berth and the truck is located within 100 feet of a restricted area (homes and schools). On February 24, 2022, CARB approved amendments to the TRU ATCM (2022 Amendments) to achieve additional emission and health risk reductions from diesel-powered TRUs and increase the use of zero emission technology in the off-road sector. The 2022 Amendments will help meet the State's multiple risk reduction, air quality, and climate goals, as well as the directive of Executive Order N-29-20, which set a goal for 100 percent zero-emission off-road vehicles and equipment in the State by 2035. On January 3, 2025, the U.S. EPA granted California authorization for parts of the TRU ATCM but did not act on the zero-emission TRU fleet turnover requirements. CARB has withdrawn its request for the unapproved provisions and is assessing next steps.[5]

CARB Final Regulation Order, Requirements to Reduce Idling Emissions from New and In-Use Trucks, beginning in 2008, requires that new 2008 and subsequent model-year heavy-duty diesel engines be equipped with an engine shutdown system that automatically shuts down the engine after 300 seconds of continuous idling operation once the vehicle is stopped, the transmission is set to "neutral" or "park", and the parking brake is engaged. Section 2485 and Section 2449 of Title 13 of the California Code of Regulations limits diesel-fueled motor vehicle and off-road idling to no more than five minutes. Section 2485 limits idling for diesel-fueled commercial motor vehicles with gross vehicle weight ratings of greater than 10,000 pounds that are or must be licensed to operate on publicly maintained highways and streets within California. Section 2449 limits idling for off-road diesel-fueled fleets.

California Energy Commission – Title 24 Building Energy Efficiency Standards

The Energy Efficiency Standards for Residential and Nonresidential Buildings, as specified in California Code of Regulations (CCR) Title 24 Part 6, were established in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods. The 2025 Energy Standards include requirements for mandatory mechanical ventilation intended to improve indoor air quality in homes, and requirements for Minimum Efficiency Reporting Value (MERV) 13 air filtration on space conditioning systems, and ventilation systems that provide outside air to a dwelling's occupiable space. The Residential Compliance

[5] California Air Resources Board, *2022 Amendments to the TRU ATCM*, https://ww2.arb.ca.gov/our-work/programs/transport-refrigeration-unit, accessed July 2025.

Manual for the 2025 Building Energy Efficiency Standards notes that air filter efficiencies of at least MERV 13 protect occupants from exposure to the smaller airborne particles (i.e., $PM_{2.5}$) that are known to adversely affect respiratory health. CCR Title 24 Part 6 requires a particle size efficiency rating equal to or greater than 50 percent in the 0.30 to 1.00 µm range and 85 percent in the 1.0 to 3.0 µm range.

CalEnviroScreen

OEHHA developed CalEnviroScreen 4.0, which is a mapping tool that helps identify California communities that are most affected by many sources of pollution, and where people are often especially vulnerable to pollution's effects. CalEnviroScreen uses environmental, health, and socioeconomic information to produce scores for every census tract in the State. The scores are mapped so that different communities can be compared. An area with a high score is one that experiences a much higher pollution burden than areas with low scores. According to CalEnviroScreen, the project site is located within Census Tract 6031001002, which is within the 91st overall percentile.[6] It should be noted that the CalEnviroScreen scores are relative to other census tracts and are not an expression of health risk, and do not provide quantitative information on increases in cumulative impacts for specific sites or projects. Further, as a comparative screening tool, the results do not provide a basis for determining when differences between scores are significant in relation to public health or the environment.

CARB Advanced Clean Truck Regulation

CARB adopted the Advanced Clean Truck regulation in June 2020 requiring truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024. By 2045, every new truck sold in California is required to be zero-emission. This rule directly addresses disproportionate risks and health and pollution burdens and puts California on the path for an all zero-emission short-haul drayage fleet in ports and railyards by 2035, and zero-emission "last-mile" delivery trucks and vans by 2040. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8. The regulation has two components including a manufacturer sales requirement, and a reporting requirement:

- Zero-Emission Truck Sales: Manufacturers who certify Class 2b through 8 chassis or complete vehicles with combustion engines are required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales need to be 55 percent of Class 2b – 3 truck sales, 75 percent of Class 4 – 8 straight truck sales, and 40 percent of truck tractor sales.
- Company and Fleet Reporting: Large employers including retailers, manufacturers, brokers and others are required to report information about shipments and shuttle services. Fleet

[6] California Office of Environmental Health Hazard Assessment, *CalEnviroScreen 4.0 Results*, https://experience.arcgis.com/experience/11d2f52282a54ceebcac7428e6184203/page/CalEnviroScreen-4_0, accessed July 2025.

owners, with 50 or more trucks, are required to report about their existing fleet operations. This information helps to identify future strategies to ensure that fleets purchase available zero-emission trucks and place them in service where suitable to meet their needs.

The Advanced Clean Truck regulation was granted a separate waiver in 2023 by the Biden administration. On May 22, 2025, the U.S. Senate voted to revoke the waiver granted by the Biden administration for California's Advanced Clean Truck rule (as well as the Advanced Clean Cars [ACC] II program and Heavy-Duty Omnibus regulation). On June 12, 2025, President Trump formally nullified California's Advanced Clean Truck rule and ACC II program (Congressional Resolutions H.J. Res 87 and H.J. Res 88, respectively). Implementation is currently unknown.

CARB Advanced Clean Fleets Regulation

CARB approved Advanced Clean Fleets Regulation (ACF) on April 28, 2023, requiring fleet owners to begin transitioning toward ZEVs starting in 2024. Due to the impact that truck traffic has on residents living near heavily trafficked corridors, drayage trucks will need to be zero-emissions by 2035. All other fleet owners have the option to transition a percentage of their vehicles to meet expected zero-emission milestones, which gives owners the flexibility to continue operating combustion-powered vehicles as needed during the move toward cleaner technology.

On January 13, 2025, California withdrew its request for federal approval of the ACF and is evaluating next steps. CARB will not enforce portions of the regulation requiring federal authorization, such as those affecting high-priority and drayage fleets. However, State and local government fleet requirements remain unchanged.[7]

Executive Order N-79-20

Signed in September 2020, Executive Order N-79-20 establishes as a goal that where feasible, all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035. The executive order sets a similar goal requiring that all medium and heavy-duty vehicles will be zero-emission by 2045 where feasible. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium- and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new zero emission vehicles (ZEVs) "towards the target of 100 percent." The executive order directs the California Environmental Protection Agency, the California Geologic Energy Management Division (CalGEM), and the California Natural Resources Agency to transition and repurpose oil production facilities with a goal toward meeting carbon neutrality by

[7] California Air Resources Board, *ACF Waiver Update*, https://ww2.arb.ca.gov/our-work/programs/advanced-clean-fleets, accessed July 2025.

2045. Executive Order N-79-20 builds upon the CARB Advanced Clean Trucks regulation[8], which was adopted by CARB in July 2020.

Senate Bill 535

SB 535 directs 25 percent of the proceeds from the Greenhouse Gas Reduction Fund (i.e., funds from the AB 32 cap-and-trade program) to go to projects that provide a benefit to disadvantaged communities (DACs) (as identified by the OEHHA mapping). These funds must be used for programs that further reduce greenhouse gas emissions. Funding programs that reduce greenhouse gas emissions would also potentially reduce exposure to other emissions including TACs. Based on OEHHA mapping, the project site is located within an SB 535 designated disadvantaged community (Census Tract 6031001002).[9] SB 535 does not include project specific requirements or prohibit developments in proximity to the designated communities.

Gasoline Dispensing Facility Vapor Recovery Regulations

Since 2001, CARB has adopted a number of significant enhancements to gasoline dispensing facilities' (GDFs') vapor recovery systems. These efforts are necessary to ensure the continued effective operation of the vapor recovery systems during the transfer and dispensing of gasoline at these facilities.

Vapor recovery systems collect gasoline vapors that would otherwise escape into the atmosphere during fuel delivery to the underground storage tanks (Phase I) or fuel storage and vehicle fueling (Phase II). The Enhanced Vapor Recovery (EVR) regulations became state law on April 1, 2001. These regulations provide more stringent requirements for vapor recovery systems in order to reduce gasoline vapor emissions.

CARB Air Quality and Land Use Handbook – Gasoline Dispensing Facilities

The CARB *Air Quality and Land Use Handbook* (2005) recommends avoiding siting new sensitive land uses within 300 feet of a large gas station (defined as a facility with a throughput of 3.6 million gallons per year or greater). A 50-foot separation is recommended for typical gas dispensing facilities. CARB notes that a typical gasoline dispensing facility in California dispenses under 3.6 million gallons of gasoline per year. The cancer risk for a typical facility is likely to be less than 10 in a million at the fence line under urban air dispersion conditions.

Gasoline Service Station Industrywide Risk Assessment Technical Guidance

CARB and the California Air Pollution Control Officers Association (CAPCOA) developed the 2021 Gasoline Service Station Industrywide Risk Assessment Technical Guidance Manual (Technical Guidance) based on health analyses conducted to evaluate the health impacts of emissions from

[8] On January 13, 2025, California withdrew its request for federal approval of the ACF and is evaluating next steps. CARB will not enforce portions of the regulation requiring federal authorization, such as those affecting high-priority and drayage fleets. However, State and local government fleet requirements remain unchanged

[9] California Office of Environmental Health Hazard Assessment, *Disadvantaged Communities Map*, https://oehha.ca.gov/calenviroscreen/sb535, accessed July 2025.

gasoline service stations operating throughout the state. The Technical Guidance provides an update to the CAPCOA Air Toxics "Hot Spots" Program Gasoline Service Station Industrywide Risk Assessment Guidelines (1997). The Technical Guidance also provides recommended procedures for preparing gas station emission inventories and HRAs to meet the requirements of individual facilities subject to AB 2588.

Gasoline Service Station Industrywide Risk Assessment Supplemental Policy Guidance Document

CARB developed the 2022 *Gasoline Service Station Industrywide Risk Assessment Supplemental Policy Guidance Document* (Supplemental Policy Guidance or Guidance) to provide recommendations regarding public policy for gas stations and discuss potential community-scale health impacts caused by gas station emissions. In addition to discussing community-scale health impacts, the Supplemental Policy Guidance provides considerations and recommendations for the siting and permitting of new and modified gas stations. The Guidance also outlines the significant challenges in addressing cumulative impacts from multiple sources of gas stations and other sources.

Regional

San Joaquin Valley Air Pollution Control District

The San Joaquin Valley Air Pollution Control District (SJVAPCD) is the regional agency responsible for managing air quality within the San Joaquin Valley Air Basin. Since the 1980s, the SJVAPCD has regulated TACs and implements State and federal air quality standards, including CEQA guidance, to evaluate project impacts. Under its permitting authority, the SJVAPCD enforces regulations such as Best Available Control Technology (BACT) for new or modified sources emitting pollutants. The SJVAPCD prioritizes regulation of TAC-emitting sources based on emissions toxicity and proximity to sensitive receptors, ensuring public health protection.

The California Clean Air Act provides the SJVAPCD with the authority to manage transportation activities at indirect sources and regulate stationary source emissions. Indirect sources refer to multiple minor emitters that collectively contribute to significant pollution, such as motor vehicles at intersections or highways. At the State level, CARB regulates emissions from motor vehicles and fuels, complementing the SJVAPCD's efforts to reduce air pollution and protect air quality in the region.

SJVAPCD Rule 4622 - Gasoline Transfer Into Motor Vehicle Fuel Tanks

This rule requires gasoline dispensing facilities to use certified vapor recovery systems to minimize emissions during the transfer of gasoline into motor vehicle fuel tanks. It applies to the transfer of gasoline from storage tanks or mobile fuelers into motor vehicle fuel tanks. Facilities must ensure

that vapor recovery systems are properly installed and maintained to comply with emission standards.

Vapor recovery systems must be tested by certified testing companies or contractors. Testing is required within 10 calendar days of the initial operation of the dispensing equipment. Subsequent testing must occur annually for facilities with a monthly throughput of less than 100,000 gallons or semi-annually for facilities with a throughput of 100,000 gallons or more.

4.0 Health Risk Analysis

Project health risks are determined by examining the types and levels of air toxics generated and the associated impacts on factors that affect air quality. While the final determination of significance thresholds is within the Lead Agency's purview pursuant to the State CEQA Guidelines, the SJVAPCD recommends that lead agencies use the following air pollution thresholds in determining whether a project's impacts are significant. If the lead agency finds that the project has the potential to exceed the air pollution thresholds, a project's impacts should be considered significant. The TAC emissions thresholds are as follows.[10]

- **Cancer Risk (Individual)**: Emit contaminants that result in a maximum individual incremental cancer risk equal to or greater than 20 in one million.
- **Non-Cancer Risk**: Emit contaminants that result in a chronic or acute hazard index equal to or greater than 1.0 (project increment).

Cancer risk is expressed in terms of expected incremental incidence per million population. The SJVAPCD has established an incidence rate of 20 persons per million as the maximum acceptable incremental cancer risk due to TAC exposure. This threshold is an upper-bound incremental probability to determine whether or not a given project has a potentially significant development-specific and cumulative impact and to ensure an individual new source does not contribute a cumulatively significant impact. The 20 in one million standard is a health-protective significance threshold. A risk level of 20 in one million implies a likelihood that up to 20 persons, out of one million equally exposed persons, would contract cancer if exposed continuously (24 hours per day) to the TAC levels over a specified duration of time. This risk would be an excess cancer that is in addition to any cancer risk borne by a person not exposed to these TACs.

The SJVAPCD has also established non-carcinogenic risk parameters for use in HRAs. Noncarcinogenic risks are quantified by calculating a "hazard index," expressed as the ratio between the ambient pollutant concentration and its toxicity or Reference Exposure Level (REL). A REL is a concentration at or below which health effects are not likely to occur. A hazard index of less than 1.0

[10] San Joaquin Valley Unified Air Pollution Control District, *APR -1906 Framework for Performing Health Risk Assessments*, revised February 12, 2020.

means that adverse health effects are not expected. Within this analysis, non-carcinogenic exposures of less than 1.0 are considered less than significant.

4.1 Methodology

This HRA was prepared in accordance with SJVAPCD guidance which largely follows OEHHA but includes some notable local preferences. This HRA evaluates potential health risks associated with the emission of DPM and benzene resulting from project implementation. Construction equipment and associated heavy-duty truck traffic generate diesel exhaust, which is a known TAC. Diesel exhaust from construction equipment operating at the site poses a health risk to nearby sensitive receptors. Operational activities would also emit TACs from the use of heavy-duty diesel trucks and fueling activities.

Construction Sources

Construction would generate DPM emissions from the use of off-road diesel equipment required for site preparation, grading and excavation, paving, and other construction activities. For construction activity, DPM is the primary TAC of concern because it is the most potent TAC emitted from construction and includes hundreds of chemicals. Although DPM is a subset of PM_{10} exhaust, the analysis conservatively assumes all PM_{10} exhaust emissions are DPM. On-road diesel-powered haul trucks traveling to and from the construction site to deliver materials and equipment were included in the analysis, although they are typically less of a concern because they would not stay on the site for long durations.

Health-related risks associated with diesel-exhaust emissions are primarily linked to long-term exposure and the associated risk of contracting cancer. The use of diesel-powered construction equipment would be episodic and would occur throughout the project site. In compliance with state law (Section 2485 and Section 2449 of Title 13 of the California Code of Regulations), construction activities would limit diesel construction truck/equipment idling to no more than five minutes, which would further reduce nearby sensitive receptors' exposure to temporary and variable DPM emissions. Furthermore, even during the most intense period of construction, DPM emissions would be generated from different locations on the project site rather than in a single location because different types of construction activities (e.g., site preparation and building construction) would not occur at the same place at the same time. Construction emission rates for PM_{10} (DPM) were calculated using the California Emissions Estimator Model (CalEEMod); refer to Appendix A. Project construction is proposed to occur in 2026 over approximately eight months.

Operational Sources

CARB estimates that about 70 percent of the cancer risk that the average Californian faces from breathing toxic air pollutants stems from diesel exhaust particles. This HRA also evaluates potential health risks associated with the emission of benzene. Out of the toxic compounds emitted from the gasoline stations, benzene, ethylbenzene, and naphthalene have cancer toxicity values. However, benzene is the TAC which drives the risk, accounting for 87 percent of cancer risk from gasoline vapors and constitutes more than three to four times the weight of gasoline than ethylbenzene and

naphthalene, respectively. Therefore, ethylbenzene and naphthalene have not been modeled and are instead considered significant in the case that benzene emissions are significant. Additionally, there are substances emitted from gasoline stations, such as toluene and xylene which possess acute adverse health effects (though not cancer risk). However, it is not until the benzene concentrations are more than two orders of magnitude above the 10 per million cancer risk that the emissions of toluene and xylene begin to cause adverse health effects, according to the California Air Pollution Control Officers Association's (CAPCOA) *Gasoline Service Station Industrywide Risk Assessment Guidelines*. Therefore, toluene and xylene emissions have not been modeled and are instead considered significant in the case that benzene concentrations are identified at two orders of magnitude above the 10 per million cancer risk.

Fueling Sources. Benzene emissions would occur from the proposed on-site fuel storage tanks and fuel dispensers. The specific processes associated with fuel storage tanks and fuel dispensers that emit air toxics include loading, breathing, refueling, and spillage, as described below:

- Loading – Emissions occur when a fuel tanker truck unloads gasoline into the storage tanks. The storage tank vapors, displaced during loading, are emitted through its vent pipe. A required pressure/vacuum valve installed on the tank vent pipe significantly reduces these emissions.
- Breathing – Emissions occur through the storage tank vent pipe as a result of temperature and pressure changes in the tank vapor space.
- Refueling – Emissions occur during motor vehicle refueling when gasoline vapors escape through the vehicle/nozzle interface.
- Spillage – Emissions occur from evaporating gasoline that spills during vehicle refueling.

Fuel dispensing facility emissions were computed based on the maximum anticipated throughput of fuel (i.e., approximately 3.6 million gallons per year). Emissions of benzene, which is a TAC, were computed using CARB emission factors for fuel dispensing facilities and assuming that benzene makes up 0.46 percent of gasoline vapor.[11] Total benzene emissions were calculated at 0.0019 pounds per hour; refer to Appendix A for the details of the calculations. The emission factors conservatively do not reflect control technologies required by any vapor recovery regulations later than 2013 (such as Certification Procedure for Vapor Recovery Systems for Enhanced Conventional [ECO] Nozzles and Low Permeation Conventional Hoses for Use at Gasoline Dispensing Facilities [CP-207], Certification Procedure for Vapor Recovery Systems at Gasoline Dispensing Facilities [CP-201]). These emissions factors are currently being updated by CARB.

Mobile Sources. Due to the increased vehicle traffic from the project, the resulting emissions could also result in pollutant concentrations at existing sensitive receptors. Average daily trips from truck traffic to the project site were obtained from the *Maverik Hanford Transportation Impact Study*

[11] California Air Pollution Control Officers Association, *Gasoline Service Station Industrywide Risk Assessment Technical Guidance*, February 18, 2022.

(Transportation Impact Study), prepared by Kimley-Horn and Associates, Inc. (dated May 6, 2025). Emission rates for PM_{10} (DPM) were calculated using trip data and a CARB 2021 EMission FACtors model (EMFAC) model run for San Joaquin County; refer to Appendix A. EMFAC generates emission factors in terms of grams of pollutant emitted per vehicle activity and can calculate a matrix of emission factors at specific values of vehicle speed and type. The model was run for heavy-duty diesel vehicles traveling along off-site roads, circulating the project site, and idling at proposed loading areas and the truck fueling area.

Emergency Backup Generators. It is unknown whether emergency backup generators would be used. However, one backup generator was assumed for the proposed convenience store. Backup generators would only be used in the event of a power failure and would not be part of the project's normal daily operations. Nonetheless, emissions associated with one backup generator for the proposed convenience store was included to be conservative. If a backup generator is required, the end user would be required to obtain a permit from the SJVAPCD prior to installation. Emergency backup generators must meet SJVAPCD's Best Available Control Technology (BACT) requirements and comply with SJVAPCD rules related to generators, which would minimize emissions.

Dispersion Modeling

The HRA's construction and operational air dispersion modeling was performed using the American Meteorological Society (AMS) and U.S. Environmental Protection Agency (EPA) Regulatory Model (AERMOD). AERMOD is a steady-state, multiple-source, Gaussian dispersion model designed for use with emission sources situated in terrain where ground elevations can exceed the stack heights of the emission sources. AERMOD estimates hourly concentrations for each source/receptor pair and calculates concentrations for user-specified averaging times, including an average concentration for the complete simulation period. AERMOD includes atmospheric dispersion options for both urban and rural environments and can address flat, gently rolling, and complex terrain situations. The modeling and analysis were prepared in accordance with the SJVAPCD Modeling Guidance for AERMOD.[12] The parameters used in AERMOD include the following:

- **Meteorological Data.** AERMOD requires hourly meteorological data consisting of wind vectors, wind speed, temperature, atmospheric stability, and mixing height. The latest 5-year meteorological data set for the Hanford Monitoring Station (Station 53119) was obtained from the SJVAPCD.[13] Surface and upper air meteorological data from this station were selected as being the most representative of meteorology based on proximity to the project site, as well as terrain, surrounding land uses, and surface characteristics.

[13] San Joaquin Valley Air Pollution Control District, *Meteorological and Air Monitoring Data*, https://gis.valleyair.org/arcgisportal/apps/experiencebuilder/experience/?id=06e940565d0345b6915f89b76c182ed9&page=Main-Page&views=MET-Map-View, accessed July 2025.

- **Project Sources**. Both construction and operational emission sources were modeled in AERMOD. The following discusses emission sources for construction and operations:
    - Construction Sources. The model's emission sources are line volume sources (comprised of smaller adjacent volume sources) for on-site construction and off-site haul truck operations. Off-road construction equipment operating on-site and on-road construction equipment (hauling materials to and from the project site) were assigned a release height of 8.2 feet (2.5 meters) and a plume height of 54.8 feet (16.7 meters) based on a vehicle height of 9.8 feet (3 meters). The methodology used to determine release and plume heights was based on U.S. EPA guidance for vehicle volume sources.[14]
    - Operational Sources. Emission sources used in AERMOD include line-volume, area, and point sources. Truck travel emissions were represented in the model via line-volume sources along local roads and circulating on-site. Emissions from heavy trucks were assigned a release height of 2.55 meters and a plume height of 16.7 meters. Area sources were modeled to represent refueling emissions. The emergency backup generator was modeled as a point source. Refer to Appendix A for a depiction of the source and receptor locations.
- **Receptor Grid**. To identify the maximum impacted sensitive receptors, a uniform Cartesian grid was placed over the sensitive receptors in the project site's vicinity. Given the project site's size, sensitive receptors were modeled with a maximum of 20-meter grid spacing.
- **Terrain Characteristics**. As recommended by the SJVAPCD, the United States Geological Survey (USGS) National Elevation Dataset (NED) terrain data was imported into AERMOD.
- **Averaging Times.** AERMOD was run to obtain the peak 1-hour and annual average (period) concentration in micrograms per cubic meter ($\mu g/m^3$) of PM_{10} at the nearby sensitive receptors. According to SJVAPCD's guidance[15], air dispersion modeling is required to estimate annual average concentrations to calculate the Maximally Exposed Individual Resident (MEIR), the maximum chronic hazard index, and the zones of impact.

Risk and Hazard Assessment

Cancer Risk. Based on the OEHHA methodology, residential inhalation cancer risk from annual average TAC concentrations are calculated by multiplying the daily inhalation dose, cancer potency factor, age sensitivity factor (ASF), frequency of time spent at home, and exposure duration divided by averaging time, yielding the excess cancer risk. These factors are discussed in more detail below. Exposure through inhalation (Dose-air) is a function of breathing rate, exposure frequency, and

[14] U.S. EPA. 2012. *Haul Road Workgroup Final Report*, https://www.epa.gov/sites/default/files/2020-10/documents/haul_road_workgroup-final_report_package-20120302.pdf, accessed July 2025.

[15] San Joaquin Valley Unified Air Pollution Control District, San Joaquin Valley Unified Air Pollution Control District Guidance for Assessing and Mitigating Air Quality Impacts, March 19, 2015.

concentration of substance in the air. To estimate cancer risk, the dose was estimated by applying the following formula to each ground-level concentration:

$$\text{Dose-air} = C_{air}*(BR/BW)*A*EF*10^{-6}$$

Dose-air =	dose through inhalation (mg/kg/day)
C_{air} =	air concentration (µg/m^3) from air dispersion model
(DBR/BW) =	daily breathing rate normalized to body weight (L/kg bodyweight-day)
A =	inhalation absorption factor (unitless)
EF =	exposure frequency (approximately 350 days per year for residential)
10^{-6} =	conversion factor (micrograms to milligrams, liters to cubic meters)

Table 1: Exposure Assumptions presents assumptions utilized to calculate cancer risk. The construction exposure duration totals eight months (0.67-year) to represent the total construction period. The operational exposure duration totals 70 years for residents, 5 years for student receptors, and 40 years for workers, consistent with SJVAPCD methodology. OEHHA developed ASFs to consider the increased sensitivity to carcinogens during early-life exposure. In the absence of chemical-specific data, OEHHA recommends default ASFs presented in Table 1. Fraction of time at home (FAH) during the day is used to adjust exposure duration and cancer risk from a specific facility's emissions, based on the assumption that exposure to the facility's emissions is not occurring away from home. ASFs, FAH, and daily breathing rates are based on the OEHHA methodology.

Table 1: Exposure Assumptions

Scenario	Age	Exposure Frequency (days/year)[1]	Exposure Duration (years)[2]	Age Sensitivity Factor (ASF)[3]	Fraction of Time at Home (FAH)[4]	Daily Breathing Rate (L/kg BW-day^2)[5,6]
Construction	**Residential**					
	Third trimester	250	0.25	10	85%	361
	0 to 2 years	250	0.42	10	85%	1090
	Ages 2 through 8 years	250	0	3	72%	631
	Ages 9 through 15 years	250	0	3	72%	572

1. The exposure frequency is based on OEHHA *Air Toxics Program Guidance Manual for the Preparation of Health Risk Assessments*, February 2015 (OEHHA Manual); refer to OEHHA Manual Section 5.4.1, Estimation of Exposure through Inhalation.
2. The exposure duration is based on SJVAPCD's AB 2588 Health Risk Assessment Modeling Protocol Guidance (March 18, 2021).
3. The age sensitivity factor is based on OEHHA Manual Table 8.3, *Age Sensitivity Factors by Age Group for Cancer Risk Assessment*.
4. The fraction of time at home is based on OEHHA Manual Section 8.2.2, *Fraction of Time Spent at Home for Cancer Risk Assessment*.
5. Daily breathing rate normalized to body weight (L/kg body weight – day) (95th percentile for 3rd trimester to 2 years and 80th percentile for other age groups) per OEHHA Manual Table 5.7, *Daily Breathing Rate Distributions by Age Group for Residential Stochastic Analysis (L/kg BW-day)*.
6. Worker and student breathing rates are 95th percentile 8-hour breathing rates based on moderate intensity activity.
7. The student age category was modeled for ages 0 through 5 as the nearest school to the project site is the KCAO Margaret Crawford Infant Toddler Center to the south.

Source: California Office of Environmental Health Hazard Assessment, *Air Toxics Program Guidance Manual for the Preparation of Health Risk Assessments*, February 2015; and SJVAPCD, *AB 2588 Health Risk Assessment Modeling Protocol Guidance*, March 18, 2021.

To estimate the cancer risk, the dose is multiplied by the cancer potency factor, the ASF, the exposure duration divided by averaging time, and the frequency of time spent at home (for residents only):

$$Risk_{inh\text{-}res} = (Dose_{air}*CPF*ASF*(ED/AT)*FAH)$$

$Risk_{inh\text{-}res}$ = residential inhalation cancer risk (potential chances per million)
$Dose_{air}$ = daily dose through inhalation (mg/kg-day)
CPF = inhalation cancer potency factor (mg/kg-day^{-1})
ASF = age sensitivity factor for a specified age group (unitless)
ED = exposure duration (years)
AT = averaging time of lifetime cancer risk (years)
FAH = fraction of time spent at home (unitless)

Chronic Non-Cancer Risk. The chronic non-cancer risk is calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. The following equation was used to determine the chronic non-cancer risk hazard index:

$$Hazard\ Index = C_i/REL_i$$

C_i = concentration in the air of substance i (annual average concentration in µg/m^3)
REL_i = chronic noncancer Reference Exposure Level for substance (µg/m^3)

Acute Non-Cancer Hazard. The potential for acute non-cancer hazards is evaluated by comparing the maximum short-term exposure level to an acute REL. RELs are designed to protect sensitive individuals within the population. The calculation of acute non-cancer impacts is similar to the procedure for chronic non-cancer impacts. The equation is as follows:

Acute HQ = Maximum Hourly Air Concentration (µg/m^3) / Acute REL (µg/m^3)

Health Risk Computation. A health risk computation was performed to determine the cancer risk and chronic/acute non-cancer risk using the approach described in the OEHHA *Air Toxics Program Guidance Manual for the Preparation of Health Risk Assessments*, dated February 2015 (OEHHA Guidance Manual). Health risks were analyzed at the point of maximum impact and are a conservative estimate. The pollutant concentrations are then used to estimate the long-term cancer risk to an individual as well as the chronic/acute non-cancer risk hazard index.

The individual cancer and chronic/acute non-cancer risks are based on the annual average concentration of PM_{10} (used as a proxy for DPM) and benzene. As noted above, the chronic/acute and carcinogenic health risk calculations are based on the standardized equations contained in the U.S. EPA *Human Health Evaluation Manual* (1991) and the OEHHA Guidance Manual. The concentration estimates developed using this methodology are conservative and not a specific prediction of the actual concentrations that would occur at the project site at any given point in time. Actual 1-hour and annual average concentrations are dependent on many variables, particularly the number and types of vehicles and equipment operating at specific distances during periods of adverse meteorology. The health risk computation was performed to determine the risk of developing an excess cancer risk calculated on these worst-case exposure duration scenarios. Only the risk associated with the project's worst-case location was assessed.

5.0 Potential Health Risk Impacts

CARB identified DPM as a TAC in 1998. Mobile sources (including trucks, buses, automobiles, trains, ships, and farm equipment) are by far the largest source of diesel emissions. The exhaust from diesel engines includes hundreds of different gaseous and particulate components, many of which are toxic. Diesel exhaust is composed of two phases, either gas or particulate – both contribute to the risk. As the project is proposed near existing sensitive receptors, an analysis of DPM was performed using the U.S. EPA-approved AERMOD model.

Benzene is also a TAC. The majority of benzene emitted in California comes from motor vehicles, including evaporative leakage and unburned fuel exhaust. Benzene is highly carcinogenic and occurs throughout California. Benzene also has non-cancer health effects. As the project is

proposing to dispense gasoline, an analysis of benzene was performed using the U.S. EPA-approved AERMOD model.

According to OEHHA, if multiple substances are emitted, the non-cancer risk from each of the individual substances is summed only if they affect the same organ system. While DPM is particularly associated with increased potential for lung cancer, diesel exhaust has many individual substances contained in it, including benzene. Therefore, the non-cancer risk from each of the project-emitting substances, DPM and benzene, are summed to give the total non-cancer risk for the entire facility at the receptor location. Cancer risks from different substances are treated additively in the Hot Spots Program in part because many carcinogens act through the common mechanism of DNA damage. However, this assumption fails to take into account the limited information on substance interactions. The overall uncertainty in the cancer potency factors and the variability in the human population is probably far greater than the uncertainty from the assumption of additivity.

5.1 Carcinogenic Risk

As noted above, the project would generate TACs from construction and operations (i.e. truck traveling along local roads, idling, and on-site circulation; backup generator; and fueling activities); refer to Section 4.1, *Methodology*, for a further discussion of project TAC sources. The project would be required to install vapor recovery systems per CARB's ATCM, comply with CARB's Vapor Recovery System Certification Procedure, and Use Enhanced Conventional (ECO) and Enhanced ORVR-Vehicle Recognition (EOR) nozzles, among others. The project would also be required to comply with SJVAPCD Rule 4622 (Gasoline Transfer Into Motor Vehicle Fuel Tanks), which would reduce fueling emissions.

Table 2: Carcinogenic Risk Assessment shows the unmitigated health risk for project construction and operations. Based on SJVAPCD methodology, the exposure duration for a resident is 70 years, beginning with the third trimester, and the worker and student exposure duration is 40 years and 5 years, respectively; refer to Table 2. Operations would commence following construction. As such, construction would not overlap with operations. The analysis calculates risk based on exposure to construction concentrations during the initial eight months of the exposure duration and operational concentrations for the remainder of the exposure duration. The project (construction and operations combined scenario) would result in a maximum cancer risk of 1.69 in one million at the residential receptors, 1.57 in one million at the worker receptors, and 2.76 in one million at the student receptors. Therefore, the SJVAPCD threshold of 20 in one million would not be exceeded at the nearest receptors and impacts would be less than significant.

Table 2: Carcinogenic Risk Assessment					
	Cancer Risk (per million)[1, 2, 3]				
		Operations			Construction and Operations Combined[4]
Receptors	Construction	Trucks + Generator	Gas Dispensing Facility	Total Operations	
Residences					
Approximately 464 feet southeast (260142.80, 4022066.18)	0.13	1.06	0.54	1.59	1.69

Exceeds Significance Threshold?	**No**	**No**	**No**	**No**	**No**
Worker Exposure					
KCAO Margaret Crawford Infant Toddler Center located approximately 193 feet to the south (260000.63, 4022165.03)	0.02	0.21	0.89	1.10	1.57
Significance Threshold (Risk per Million)	*20*	*20*	*20*	*20*	*20*
Exceeds Significance Threshold?	**No**	**No**	**No**	**No**	**No**
Student Exposure					
KCAO Margaret Crawford Infant Toddler Center located approximately 193 feet to the south (260000.63, 4022165.03)	0.18	0.29	1.25	1.54	2.76
Significance Threshold (Risk per Million)	*20*	*20*	*20*	*20*	*20*
Exceeds Significance Threshold?	**No**	**No**	**No**	**No**	**No**

1. The reported risk is at the closest receptor (maximally exposed individual receptor (MEIR) for each exposure category.
2. Risk from "Construction" and "Trucks + Generator" is from PM_{10} and risk from the "Gas Dispensing Facility" is benzene.
3. Refer to Table 1 for exposure assumptions.
4. As cancer risk accumulates over time, the combined risk evaluates cancer risk with operational exposure starting at the end of construction. The combined risk assumes construction exposure starts from the third trimester for a year (8-month construction period) and operational exposure starts immediately after construction continues for the specified exposure duration shown in Table 1.

Refer to Appendix A: Modeling Data.

5.2 Non-Carcinogenic Hazards

The significance thresholds for TAC exposure also require an evaluation of non-cancer risk stated in terms of a hazard index. Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. The potential for acute non-cancer hazards is evaluated by comparing the maximum short-term exposure level to an acute REL. RELs are designed to protect sensitive individuals within the population. The calculation of acute non-cancer impacts is similar to the procedure for chronic non-cancer impacts.

RELs are designed to protect sensitive individuals within the population. According to OEHHA, the REL for DPM is 5 and the target organ is the respiratory system.[16] There is no acute REL for DPM and the acute health risk cannot be calculated. The chronic and acute REL for benzene is 3 and 27, respectively and the target organ is the hematologic system.

Acute and chronic impacts are shown in Table 3: Chronic and Acute Hazard Assessment Results. An acute or chronic hazard index of 1.0 is considered individually significant. The hazard index is calculated by dividing the acute or chronic exposure by the reference exposure level. Table 3 shows that non-carcinogenic hazards are calculated to be within acceptable limits and a less than significant impact would occur.

Table 3: Chronic and Acute Hazards Assessment Results

Emissions Sources	Chronic Hazard	Acute Hazard
Residential Receptors		
Construction	5.2E-04	N/A
Trucks + Generator	3.0E-04	N/A
Gas Dispensing Facility	2.7E-03	4.9E-03

Gas Dispensing Facility	3.0E-03	1.4E-02
Threshold	*1.0*	*1.0*
Threshold Exceeded?	**No**	**No**

Refer to Appendix A: Modeling Data.

5.3 Conclusion

As described above, impacts related to cancer risk would be less than significant. Additionally, non-carcinogenic hazards are calculated to be within acceptable limits. It should be noted that the impacts assess the project's incremental contribution to health risk impacts, consistent with the OEHHA guidance and methodology. The SJVAPCD has not established separate cumulative

[16] California Office of Environmental Health Hazard Assessment, *OEHHA Acute, 8-hour and Chronic Reference Exposure Level (REL) Summary*, https://oehha.ca.gov/air/general-info/oehha-acute-8-hour-and-chronic-reference-exposure-level-rel-summary, accessed July 2025.

thresholds and does not require combining impacts from cumulative projects. The SJVAPCD considers projects that do not exceed the project-specific thresholds to generally not be cumulatively significant. Therefore, impacts related to health risk from the project would be less than significant.

Mitigation Measures: No mitigation measures are required.

Level of Significance: Less than significant.

Residential DOSEair = **(Cair*(BR/BW)*A*EF*10^{-6})**

A	1	Inhalation absorption factor[1]
EF	0.68	Exposure frequency (250/year)[2]
10^{-6}	1.0E-06	Micrograms to milligrams conversions, liters to cubic meters conversion[3]

Residential Risk = **DOSEair * CPF * ASF * ED/AT * FAH**

CPF	1.1	Cancer Potency Factor for DPM[4]
AT	70	Averaging Time[5]

Age	BR/BW	ASF	FAH	ED (Const)
3rd	361	10	0.85	0.25
0<2	1090	10	0.85	0.42
2<9	631	3	0.72	0
9<16	572	3	0.72	0
16<70	261	1	0.73	0

Notes:

1 Inhalation Absorption Factor, OEHHA 2015, p 5-24
2 Exposure Frequency (days/year), OEHHA 2015, p 5-24, 350/365 days in a year for a resident, and OEHHA 2015, p 5-28, 250/365 days, 5 days/week, 50 weeks/year
3 µg to mg conversions, liters to cubic meters conversion, OEHHA 2015, Equation5.4.1.1, page 5-24
4 Cancer Potency Factor for DPM, OEHHA 2015, Table 7.1, page 7-5
5 Averaging Time, OEHHA 2015, Equation 8.2.4 A, page 8-7
6 Daily Breathing Rate normalized to Body Weight, OEHHA 2015, Table 5.7, page 5-25 (95 %ile for 3rd-2yrs, 80th for other age groups)
7 Age Sensitivity Factor, OEHHA 2015, Table 8.3, page 8-5
8 Exposure Duration, OEHHA 2015, Equation 8.2.4 A, page 8-7
9 Fraction of Time at Home, OEHHA 2015, Table 8.4, page 8-5
10 Worker Adjustment Factor, OEHHA 2015, Equation 5.4.1.2 B, page 5-29

Residential DOSEair = **$(Cair*(BR/BW)*A*EF*10^{-6})$**

Residential Risk = **DOSEair * CPF * ASF * ED/AT * FAH**

A	1	Inhalation absorption factor[1]
EF	0.96	Exposure frequency (350/year)[2]
10^{-6}	1.0E-06	Micrograms to milligrams conversions, liters to cubic meters conversion[3]

CPF	1.1	Cancer Potency Factor for DPM[4]
AT	70	Averaging Time[5]

Age	BR/BW	ASF	FAH	ED (Ops)
3rd	361	10	0.85	0.25
0<2	1090	10	0.85	2
2<4	572	3	0.72	2
4<9	572	3	0.72	5
9<16	572	3	0.72	7
16<30	261	1	0.73	53.75

Notes:

1 Inhalation Absorption Factor, OEHHA 2015, p 5-24
2 Exposure Frequency (days/year), OEHHA 2015, p 5-24, 350/365 days in a year for a resident, and OEHHA 2015, p 5-28, 250/365 days, 5 days/week, 50 weeks/year
3 µg to mg conversions, liters to cubic meters conversion, OEHHA 2015, Equation5.4.1.1, page 5-24
4 Cancer Potency Factor for DPM, OEHHA 2015, Table 7.1, page 7-5
5 Averaging Time, OEHHA 2015, Equation 8.2.4 A, page 8-7
6 Daily Breathing Rate normalized to Body Weight, OEHHA 2015, Table 5.7, page 5-25 (95 %ile for 3rd-2yrs, 80th for other age groups)
7 Age Sensitivity Factor, OEHHA 2015, Table 8.3, page 8-5
8 Exposure Duration, OEHHA 2015, Equation 8.2.4 A, page 8-7
9 Fraction of Time at Home, OEHHA 2015, Table 8.4, page 8-5
10 Worker Adjustment Factor, OEHHA 2015, Equation 5.4.1.2 B, page 5-29

Residential DOSEair =		**(Cair*(BR/BW)*A*EF*10^{-6})**
A	1	Inhalation absorption factor[1]
EF	0.96	Exposure frequency (350/year)[2]
10^{-6}	1.0E-06	Micrograms to milligrams conversions, liters to cubic meters conversion[3]

Residential Risk =		**DOSEair * CPF * ASF * ED/AT * FAH**
CPF	0.1	Cancer Potency Factor for Benzene[4]
AT	70	Averaging Time[5]

Age	**BR/BW**	**ASF**	**FAH**	**ED (Ops)**
3rd	361	10	0.85	0.25
0<2	1090	10	0.85	2
2<9	631	3	0.72	7
9<16	572	3	0.72	7
16<30	261	1	0.73	53.75

Notes:

1 Inhalation Absorption Factor, OEHHA 2015, p 5-24
2 Exposure Frequency (days/year), OEHHA 2015, p 5-24, 350/365 days in a year for a resident, and OEHHA 2015, p 5-28, 250/365 days, 5 days/week, 50 weeks/yea
3 µg to mg conversions, liters to cubic meters conversion, OEHHA 2015, Equation5.4.1.1, page 5-24
4 Cancer Potency Factor for Benzene, OEHHA 2015, Table 7.1, page 7-4
5 Averaging Time, OEHHA 2015, Equation 8.2.4 A, page 8-7
6 Daily Breathing Rate normalized to Body Weight, OEHHA 2015, Table 5.7, page 5-25 (95 %ile for 3rd-2yrs, 80th for other age groups)
7 Age Sensitivity Factor, OEHHA 2015, Table 8.3, page 8-5
8 Exposure Duration, OEHHA 2015, Equation 8.2.4 A, page 8-7
9 Fraction of Time at Home, OEHHA 2015, Table 8.4, page 8-5
10 Worker Adjustment Factor, OEHHA 2015, Equation 5.4.1.2 B, page 5-29

Residential DOSEair =	**(Cair*(BR/BW)*A*EF*10^{-6})**	
A	1	Inhalation absorption factor[1]
EF	0.68	Exposure frequency (250/year)[2]
WAF	1	Worker Adjustment Factor[10]
10^{-6}	1.0E-06	Micrograms to milligrams conversions, liters to cubic meters conversion[3]

Residential Risk =	**DOSEair * CPF * ASF * ED/AT * FAH**	
CPF	1.1	Cancer Potency Factor for DPM[4]
AT	70	Averaging Time[5]

Age	**BR/BW**	**ASF**	**FAH**	**ED (Const)**	**ED (Ops)**
Worker	230	1	1	0.666667	40
Worker (Combined)	230	1	1	0.666667	39.33333

Notes:

1 Inhalation Absorption Factor, OEHHA 2015, p 5-24
2 Exposure Frequency (days/year), OEHHA 2015, p 5-24, 350/365 days in a year for a resident, and OEHHA 2015, p 5-28, 250/365 days, 5 days/week, 50 weeks/year
3 µg to mg conversions, liters to cubic meters conversion, OEHHA 2015, Equation5.4.1.1, page 5-24
4 Cancer Potency Factor for DPM, OEHHA 2015, Table 7.1, page 7-5
5 Averaging Time, OEHHA 2015, Equation 8.2.4 A, page 8-7
6 Daily Breathing Rate normalized to Body Weight, OEHHA 2015, Table 5.7, page 5-25 (95 %ile for 3rd-2yrs, 80th for other age groups)
7 Age Sensitivity Factor, OEHHA 2015, Table 8.3, page 8-5
8 Exposure Duration, OEHHA 2015, Equation 8.2.4 A, page 8-7
9 Fraction of Time at Home, OEHHA 2015, Table 8.4, page 8-5
10 Worker Adjustment Factor, OEHHA 2015, Equation 5.4.1.2 B, page 5-29
