1.0 INTRODUCTION

Langan Engineering and Environmental Services, Inc. (Langan) has prepared this Remedial Investigation (RI) Report for the former Riverside Cement Plant (RCP) or the "site", located at 1500 Rubidoux Boulevard in Jurupa Valley, California (Figure 1). The site consists of approximately 206 acres in the City of Jurupa, Riverside County, California.

1.1 OBJECTIVES

The purpose of this RI Report is to provide a summary of the historical operations and the site geologic/hydrologic characteristics, perform a review of the regulatory listings and previous environmental investigations, and summarize the recent investigations to provide a basis for the proposed remedial action to facilitate the redevelopment of the site.

1.2 LEAD REGULATORY AGENCY

As outlined in later sections of this report, a number of California and United States regulatory agencies have been involved with the site, as outlined below:

- United States Environmental Protection Agency (USEPA), Region IX-Evaluated for inclusion in Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) program.
- California Department of Toxic Substances Control (DTSC)-DTSC conducted Site Screening Assessments in 2006 and 2009.
- Santa Ana Regional Water Quality Control Board (RWQCB)-Monitored under Waste Discharge Requirements (WDRs) that were terminated in 1998.
- Riverside County Department of Environmental Health (RCDEH)-Closeout of underground storage tank (UST) and above ground storage tank (AST) releases.
- South Coast Air Quality Management District (SCAQMD)-Permitting for Title V, and monitoring of decommissioning and redevelopment under Rule 1156.

Based on meetings and correspondence with the above agencies, it is understood that DTSC is likely the lead agency for the remedial action related to the proposed

development.

Therefore, the purpose of this RI is also to summarize the historical activities, the previous investigations, and the current investigations for DTSC review. The SCAQMD is continuing to manage the potential for air quality impacts for the proposed redevelopment during decommissioning under Rule 1156.

1.3 SITE BACKGROUND

1.3.1 Site Description

The site is approximately 206 acres located at 1500 Rubidoux Boulevard. The approximate location is shown on Figure 1. The site includes 13 parcels in Jurupa Valley, California with the Assessor's Parcel Numbers (APNs) listed below:

APN #
175-200-001
175-200-002
175-200-003
175-200-004
175-200-005
175-200-007
175-200-008
175-200-009

175-180-001

1.3.2 General Site Background

The RCP property has been historically used by the Riverside Cement Company (RCC) for mining, quarrying, and/or cement manufacturing since the early 1900s. The main components of the site improvements include the cement plant, supporting infrastructure, various silos and kilns, storage areas, and office/maintenance buildings. Mining or quarrying operations began in 1906 and continued into the mid-1980s, with the exception of a 13 year period between 1929 and 1942.

The RCP includes four quarries designated as the Wet Weather, the Crestmore, the Commercial, and the Lone Star Quarries. An underground mine also operated by RCC is designated as the Crestmore Mine. The Wet Weather Quarry and Lone Star Quarry are located within the site, while the others are located on the parcel south of the site

(Figure 2). The RCC terminated manufacturing operations in 2008, and as of early 2017, the cement manufacturing facilities are in the process of decommissioning.

Surface mining at the Crestmore Quarry was terminated in 1927 and underground mining at the Crestmore Mine started in 1930. The Block Caving Method was used in underground mining from 1930 to 1954, and the Room and Pillar Underground Mining Method was used from 1955 to 1986. Underground mining was ceased and the Crestmore Mine/Crestmore Quarry was flooded in the mid-1980's, resulting in the lake south of the site.

Cement manufacturing operations began in 1914 and continued through 2008. The limestone obtained from the quarries/mine was mixed with materials imported from off-site, and heated in rotary kilns to manufacture cement clinker. The cement clinker was then crushed to create cement, which was then packaged and shipped offsite. Cement Kiln Dust (CKD) was one of the primary by-products generated during the manufacturing process, and was comprised of material accumulated within the kilns that could not be reused in the process stream. CKD is a fine-grained material that exhibits a slightly pinkish hue. When hydrated, CKD becomes dense and relatively impermeable to water, but does not form a cemented mass. Prior to the 1970s, CKD was hauled from the kilns using end-dump trucks and placed with fill soils/mine spoils at several locations throughout the site (Figure 2). In the 1970s, a process was implemented to incorporate CKD into the final product, and some of the previously deposited CKD was recovered.

The equipment used to manufacture cement generally relied on electrical power for material conveyance/process control, and petroleum fuels for heating. Petroleum fuels were historically provided by a 6,000,000 gallon UST storing Bunker C fuel oil. Other USTs at the site were used to store petroleum products such as gasoline, diesel fuel, fuel oil, and waste oil. The table below provides a summary of the USTs at the site:

Table 1
List of Underground Storage Tanks

Size of UST (gallons)	Chemical Storage	UST Location	Permit for Closure	Closure Report	Closure Approval (NFA)
1,000	Gasoline	Maintenance Area	5/19/1999	6/1/1999	7/1/1999
2,000	Diesel	Maintenance Area	5/19/1999	6/1/1999	7/1/1999
12,000	Diesel	White Cement Plant	6/17/1997	6/26/1997	9/3/1997

Size of UST (gallons)	Chemical Storage	UST Location	Permit for Closure	Closure Report	Closure Approval (NFA)
12,000	Diesel	White Cement Plant	6/17/1997	6/26/1997	9/3/1997
10,000	Gasoline	Maintenance Area	6/17/1997	6/26/1997	9/3/1997
6,000,000	Fuel Oil	Grey Cement Plant	*Unable to Locate*	9/23/1987	11/4/1987
10,000	Gasoline	Maintenance Area	6/1/1987	5/1/1988	*Unable to Locate*
10,000	Gasoline	Grey Cement Plant	2/18/1988	5/3/1988	*Unable to Locate*
550	Waste Oil	Maintenance Area	2/18/1988	5/3/1988	*Unable to Locate*

ASTs were also present throughout the site to provide fuels for the kilns, process equipment driven by combustion engines, and support vehicles, and to contain other fluids used at the site such as dust suppressants, acids (i.e. sodium hypochlorite), and antifreeze. The table below provides a summary of ASTs at the site:

Table 2
List of Aboveground Storage Tanks

Size of AST (gallons)	Chemical Storage	AST Location	Construction	Status
1,000	Diethylene Glycol	White Cement Plant	Steel	Removed
Unknown	Diesel Oil	White Cement Plant	Steel	Removed
210,000	No. 6 Fuel Oil	White Cement Plant	Steel	Cleaned
2,000	Unleaded Gasoline	Grey Cement Plant	Steel	Removed
2,000	Diesel	Grey Cement Plant	Steel	Removed
1,000	Diesel	Maintenance Area	Steel	Removed
5,000	Sodium Hypochlorite	Grey Cement Plant	Polyethylene	Removed
5,000	Dust Suppressant	Material Storage Area	Steel	Removed
4,000	Dust Suppressant	Material Storage Area	Polyethylene	Removed
10,000	Tall Oil	Grey Cement Plant	Steel	Cleaned
12,000	Diethylene Glycol	Grey Cement Plant	Steel	Cleaned
250	Waste Oil	Maintenance Area	Steel	Removed

Transformers were present throughout the site to convert distribution voltage (4,160V) to low voltage (120/240V), and many of these transformers remain in place. The locations of the key historical and current features are shown on Figure 2.

1.4 PROPOSED DEVELOPMENT

The proposed development for the site consists of the construction of three to four

warehouse distribution structures with associated utilities and parking. The mass grading for the site includes cuts and fills up to 35 feet, with total grading yardage estimated at between one and two million cubic yards. After completion, the site will be covered by structures, parking and landscaped areas.

The proposed development is outlined on Figure 2.

2.0 GEOLOGY AND HYDROGEOLOGY

2.1 GEOLOGY

2.1.1 Regional Geologic Setting

The site is located in the Peninsular Ranges Province of Southern California, dominated by granitic rocks of Mesozoic age that intruded pre-existing sedimentary strata. Tertiary strata were deposited west of the eroded granitic rocks, and as the area was uplifted, some of these strata formed upland coastal plains. The site is also located east of the coastal plains in an area dominated by granitic rocks that are mainly quartz diorite. As discussed above, specific areas of the site were used for mining activities due to the presence of two steeply dipping limestone formations approximately 200 to 300 feet thick in the northern end. The limestone formations are roughly parallel, with an upper and lower formation; the upper formation is known as the Sky Blue Hill Limestone and the lower formation is known as the Chino Limestone. Thin, poorly developed soils and minor sedimentary strata locally cover the bedrock on the site.

As stated above, the site is located within the fault-bounded, northwest-southeast trending Perris Block within the Peninsular Ranges geomorphic province of California. The Perris Block is bounded in the east by the San Jacinto Fault Zone, the north by Cucamonga Fault Zone, and the west by Elsinore Fault Zone. According to the United States Geologic Survey (USGS) maps, the Perris Block is underlain by lithologically diverse prebatholithic metasedimentary rocks intruded by plutons of the Cretaceous age Peninsular Ranges batholith. Erosional depositional surfaces are developed on the Perris Block and thin to relatively thick sections of Quaternary age non-marine sediments discontinuously cover the basement rock.

2.1.2 Local Geologic Setting

The site is located in the eastern end of the Jurupa Mountains on the south side of the San Bernardino Valley. The Santa Ana River drains the San Bernardino Valley towards the southwest and is located approximately one-half mile east of the Site.

Based on a review of published geologic reports, maps and referenced geologic information, the site is underlain by two geologic units consisting of artificial fill, alluvium, aeolian sands and intermixed tonalite marble and schist. The artificial fill (Qaf) reportedly consists of uncompacted and undocumented fill from mining operations,

CKD and unconsolidated talus deposits. The intermixed tonalite, marble, and schist (KtPzms) are Cretaceous and Paleozoic age and consist of intermixed biotite-hornblende tonalite and coarse grained marble containing lesser amounts of biotite-quartz schist.

Based on the information reviewed, quarrying and subsurface mining activities were initiated in 1906 to mine the limestone located on the site. Prior to quarrying, the limestone was present as two generally irregular, roughly parallel, lenticular limestone bodies dipping primarily east-northeast. As discussed above, the upper (shallower) Sky Blue Limestone and the lower (deeper) Chino limestone are mineralogically similar. The limestone is coarsely crystalline, associated with metamorphosed sediments, enveloped and cut by intrusive igneous rocks and contact metamorphic minerals, including large masses of intrusive microcrystalline quartz monzonite porphyry and quartz monzonite pegmatites. Country rock within the boundaries of the site consists of Perris quartz-biotite diorite that becomes granodiorite. Quartz monzonite pegmatites occur commonly as dikes in the porphyry and country rock and extended generally less than 2 or 3 feet into the limestone. The widespread contact rock is composed generally of grossularite garnet with and without diopside.

The shallower, Sky Blue Limestone is an arcuate shaped body, enveloped and intruded by quartz diorite and intruded by quartz monzonite porphyry. The body (prior to mining) is up to several hundred feet thick and dipped primarily east or northeast. Where the body was thinnest, the limestone was converted to contact rock. Two (2) facies were present within the limestone; a white limestone with localized yellow predazzite beds and a sky blue colored limestone present closer to the intrusive quartz monzonite porphyry and associated pegmatites.

The deeper, Chino Limestone is generally composed of alternating bands of yellowish predazzite and white crystalline limestone with widely disseminated graphite flakes. The unit dipped up to 45 degrees east, was at least 2,000 feet long, and had irregular upper and lower surfaces. Banding ranged from few inches to a few feet thick.

2.1.3 Local Faulting

The following publications and reports were reviewed to obtain information on local faulting within the site:

- Daly, John W., (1931), The Geology and Mineralogy of the Limestone Deposits

at Crestmore, Riverside County, California, dated 1931 (Daly, 1931).

- Woodford, A. O., Crippen, R. A., and Garner, K. B., (1941), Section Across Commercial Quarry, Crestmore, California, American Mineralogist, Volume 26, pages 351-381 (Woodford et al, 1941).

- ERM-West, Inc., (1991), Technical Evaluation 9/30/90 EPA FIT Report, Riverside Cement Company, Crestmore Plant, dated November 1991 (ERM-West Report).

A review of Plate 1 in the Daly report indicates that a northeast-southwest trending fault segment is mapped between the Commercial Quarry in the northeast and southwestern portion of the Crestmore Quarry to the southwest. The corresponding report text does not elaborate on this fault and the review suggests that Daly (i) identified a few small faults likely to have no particular significance regarding the site major geologic structure and (ii) Daly did not find any large faults in the area mapped west of the quarries.

The Woodford, et al, 1941 report refers to "a prominent fault oriented N50^{o}E 70^{o}SE" that extends into bedrock at Station 15 of Woodford, et al.'s Figure 3-Section "Across the Commercial Quarry, 1940". Additional information for this fault was not provided in the report.

Based on a review of the referenced publications, it appears that active faulting (Holocene or younger) is not present within the site.

2.2 HYDROLOGY

The site is located in the eastern end of the Jurupa Mountains on the south side of the San Bernardino Valley. The Santa Ana River drains the San Bernardino Valley towards the southwest and is approximately one-half mile east of the site. The ground surface elevations vary between approximately 820 feet above mean sea level (amsl) on the southern portion of the site to approximately 1150 feet amsl on the northern portion of the site.

Based on a review of the historical documents (discussed in later sections of this report), and the results of the recent investigation, groundwater flow in the shallow alluvial aquifer is likely towards the Santa Ana River, or towards the south to southeast. Groundwater is encountered in the wells onsite at depths between 60 and 135 feet

below ground surface (bgs). Wells screened in the Chino limestone may have different gradients, and it is likely that the groundwater flow direction in the limestone is influenced by the complex local geology and the historical subsurface mining activities.

3.0 REVIEW OF REGULATORY LISTINGS

3.1 REGULATORY DATABASE INFORMATION

A copy of regulatory database information was obtained from EDR in March 2016 and March 2017; the EDR reports are included in Appendix A. The site was identified in several state and federal agency databases. General information reviewed from the databases is provided below.

SEMS

The SEMS database lists the site as a "state-lead cleanup" that is not included in the National Priority List (NPL).

ENVIROSTOR

The ENVIROSTOR database indicates that the RWQCB and the USEPA are agencies that have been involved with the site. Potential Chemicals of Concern (COCs) are listed as PCBs and hexavalent chromium.

LUST

The Leaking Underground Storage Tank (LUST) database indicates the site status as "completed - case closed as of November 5, 1991". The lead agency is the Riverside County Local Oversight Program (LOP). Heating oil/fuel oil is identified as a potential COC.

AST

According to the AST database, the total AST storage capacity at the site is 5,000 gallons. The Certified Unified Program Agency (CUPA) for the site is Riverside County.

Several adjacent and surrounding properties were also identified in the regulatory databases. Based on distance, topographically cross-gradient or down-gradient relative to the site, and the non-violation status, none of the adjacent and surrounding properties are listed to have current or former releases of hazardous substances that are likely to impact the site at levels requiring regulatory clean up action.

3.2 FREEDOM OF INFORMATION ACT REQUESTS

Freedom of Information Act (FOIA) requests were submitted to the regulatory agencies. The results of the review are provided in Section 4.

4.0 REVIEW OF PREVIOUS INVESTIGATIONS/REGULATORY CORRESPONDENCE

4.1 US ENVIRONMENTAL PROTECTION AGENCY (USEPA) AND CA DEPARTMENT OF TOXIC SUBSTANCES CONTROL (DTSC)

A Screening Site Inspection was conducted in September 1990 by Ecology and Environment Inc. (E&E) at the request of the USEPA to investigate the potential for metal impacts to groundwater resulting from the reported areas containing CKD placed with mine spoils/fill soils (E&E, 1990). Groundwater samples were collected for metals analyses from the Yeager Construction Company Well (YCC) south of the site (down-gradient well), and up-gradient at the El Rivino Country Club (ERCC) Well. Two soil samples were also collected from a suspected CKD-containing soil area. Both soil samples were analyzed for metals, and one of the samples was analyzed in accordance with the California Waste Extraction Test (WET).

The report issued by E&E concluded the following:

- Chromium was detected in soil containing CKD with a maximum concentration of 4.6 milligrams per kilogram (mg/kg).
- Lead was detected in soil containing CKD with a maximum concentration of 106 mg/kg.
- No metal concentrations tested for the WET evaluation exceeded the Soluble Threshold Limit Concentration (STLC).
- Groundwater flow direction was estimated to be from north to south.
- Concentrations of aluminum, chromium, and manganese in groundwater were elevated at the down-gradient YCC well with respect to the up-gradient ERCC well. However, due to potential variability in the groundwater gradient, and the reported background concentrations, the data may also represent a background condition.

To obtain additional information on the groundwater quality beneath the site, ERM-West installed and sampled two monitoring wells in the alluvium; MW-1 (located north of the Wet Weather Quarry) and MW-3 (located southeast of the Commercial Quarry). The results from the analyses are presented in the report, titled "Technical Evaluation 9/30/90 EPA FIT Report, Riverside Cement Company, Crestmore Plant", dated November, 1991 (ERM, 1991a).

ERM-West also reviewed the history of the CKD and soil placement at the site, and stated that the Wet Weather Quarry was the main CKD disposal area up until 1990, and that the Commercial Quarry, south of the site, was a secondary CKD disposal area utilized during the 1960's. The Commercial Quarry was again mined for limestone in the 1970's, and the CKD was recovered for a mill and kiln feed supplement as part of the mining operation. It is also reported that the available CKD was recovered in the Wet Weather Quarry up until the late 1980's after the available CKD had been recovered from the Commercial Quarry. ERM-West states that the majority of the CKD and off specification cement was recovered from the west central portion of Wet Weather Quarry.

ERM-West collected samples from MW-1, MW-3, Wells 60-1, 88-1, ERCC, and YCC for analysis. Groundwater test results indicated that total chromium concentrations did not exceed 13 micrograms per liter (µg/L), which was below the Maximum Contaminant Level (MCL) of 50 µg/l. ERM-West also indicated that the chromium concentrations at the down-gradient wells were only slightly higher than those at up-gradient wells and may be attributable to a number of factors unrelated to the presence of soil containing CKD.

The conclusions of ERM-West's 1991 report were reviewed by Bechtel Environmental, Inc. (Bechtel) in the June 1994 "Site Inspection Prioritization (SIP)" performed on behalf of the USEPA (Bechtel, 1994). This SIP summarized the previous findings from E&E and ERM-West, but did not formulate any conclusions as to the validity of ERM-West's 1991 Report. The SIP reiterated the finding that a release of chromium, aluminum, and manganese to groundwater had been established based on the analytical results from the YCC and ERCC wells presented in the September 1990 E&E report.

ERM-West reviewed Bechtel's findings in their October 1994 "Technical Review of EPA Site Inspection Prioritization", and provided the following summary (ERM, 1994):

- Chromium and aluminum concentrations were measured at higher concentrations in the soil background sample than in the CKD sample.
- CKD is a material which forms a cement-like mass when it comes in contact with water and creates a barrier to further water penetration or leaching of metals.
- Data was arbitrarily selected from the YCC and ERCC wells to show that a

release had occurred, and that the YCC well is not hydraulically down-gradient of the CKD-containing soil areas.

- Data from monitoring wells MW-1 and MW-3 are more representative of potential water quality impacts across the site because they were screened in the same alluvial aquifer up-gradient and down-gradient of the CKD-containing soil areas, and the concentrations of metals in groundwater did not confirm that the impacts were a direct result of leaching from the soil/CKD areas.

As part of their support for the CERCLA, DTSC conducted a preliminary assessment dated December 8, 2006 (DTSC, 2006). The Site Screening Assessment prepared by DTSC concluded the site was CERCLA eligible; however, no action was recommended by the agency. The DTSC did a subsequent screening assessment in 2009 with similar results (DTSC, 2009).

Copies of the documents referenced within this section are provided in Appendix B.

4.2 SANTA ANA REGIONAL WATER QUALITY CONTROL BOARD (RWQCB)

4.2.1 RWQCB Order Closeout

The RWQCB regulated discharges from the RCP of untreated industrial waste water to the North Riverside Canal, Jurupa Canal, and a gravel percolation pit (i.e. "Waters of the State" under Resolution 60-17, which was in effect from June 3, 1960 through July 9, 1976 (RWQCB, 1974). Resolution 60-17 established water quality objectives for the receiving waters and requirements for the periodic testing and reporting of discharges from the site.

In a July 27, 1973 letter, the RWQCB acknowledged RCC's sample results for the July 1973 wastewater monitoring event, in which hexavalent chromium was detected at 0.55 milligrams per liter (mg/L) (RWQCB, 1973). A re-sample was requested to confirm the previous sample result. The RCC resampled the discharge and provided the results to the RWQCB in a letter dated August 1, 1973 (RCC, 1973). The re-sampling results indicated that hexavalent chromium was reported at 0.5 mg/L. The RCC indicated in the above letter that a pump failure caused treated cooling water (likely containing an algaecide) to be inadvertently discharged into the stormwater effluent during the sampling event. The RCC indicated that a standby pump will be installed in case the circulating pump fails, and water additives for cooling water will be changed to reduce or eliminate the use of chromium.

Resolution 60-17 was superseded by RWQCB Order No. 76-78, which reflected new water quality standards adopted by the Santa Ana Region and established additional monitoring and reporting requirements for the RCC (RWQCB, 1976). At the time of its adoption, Order No. 76-78 identified two additional discharge streams that were not regulated under the previous resolution; a sanitary wastewater stream and a brine wastewater stream (from the Boiler Blowdown Pond).

Order 76-78 was superseded by Order 78-27, which prohibited the discharge of sanitary wastes to the septic system and required connection to the Rubidoux Community Services District by July 1, 1978 (RWQCB, 1978).

The Boiler Blowdown Pond was subject to the discharge requirements under Order 78-27. To close out the WDR under Order 78-27, RCC initiated a removal action and remediation of the Boiler Blowdown Pond. A Closure Plan and a Closure Report for the Boiler Blowdown Pond was prepared by ERM EnviroClean-West, Inc. on behalf of RCC in August, 1991 and May, 1995, respectively (ERM, 1991b, 1995). The report documents the remedial activities performed at the boiler blowdown pond, including the excavation of soils impacted by Total Petroleum Hydrocarbons (TPH) or exhibiting elevated conductivity relative to background. Excavated soils were stockpiled on-site and confirmation samples were collected from the bottom and the sides of the excavation. The samples were analyzed for TPH, total chromium, hexavalent chromium, and conductivity. As the excavation progressed, the RWQCB requested that confirmation samples only be tested for conductivity. The average conductivity of the final confirmation samples measured approximately 667.5 micromhos per centimeter (µmhos/cm). The excavation was backfilled with clay along with 45-mil-thick liner. The clay liner system was also designed to serve as a secondary containment for the AST.

In a letter dated June 15, 1995, the RWQCB notified RCC that the closure report for the former boiler blowdown disposal pond was approved and that the closure of the former pond was complete (RWQCB, 1995).

Order 78-27 was rescinded by Order 98-77 in 1998 because the discharges from the RCP were determined to be an insignificant threat to water quality (RWQCB, 1998).

Copies of the documents referenced within this section are provided in Appendix C.

4.2.2 RWQCB Correspondence-Groundwater Quality and CKD

A review of the information/correspondence related to groundwater quality and the CKD in soils at the site was performed to obtain additional information on the historical regulatory interaction and on the groundwater quality. The information review included groundwater reports and correspondence from regulatory files obtained under the FOIA.

To comply with the provisions of the California Code of Regulations (CCR), Title 23, Subchapter 15, RCC submitted the "Closure Plan for the CKD Disposal Area and Boiler Blowdown Pond" (ERM, 1991b) to the RWQCB on August 13, 1991. The document established rationale and procedures for closing the three locations at the RCP that had been used for CKD disposal (the Wet Weather Quarry, an area south of the Commercial Quarry, and an area north of the Crestmore Quarry). The proposed activities included covering each of the three CKD disposal areas with at least 12 inches of native overburden material and maintaining the cover until vegetation begins to establish. No additional capping was proposed to control infiltration because the hydraulic properties of CKD are similar to those of typical capping materials such as clay.

RCC requested from RWQCB concurrence of closure of the CKD disposal area in a letter dated June 6, 1994 (RCC, 1994). The previously referenced Bechtel SIP (Bechtel, 1994) indicates that the RWQCB toured the closed areas at the site in August, 1992 and considered the existing soil coverage of 8 to 24 inches satisfactory for vegetation. In addition, a review of the RWQCB letter dated July 6, 1994 (RWQCB, 1994) confirms that the RWQCB has no intention of increasing its involvement with the RCP, and that its primary purpose is to permit the discharge of the plant's wastewater treatment plant.

As outlined in Section 4.1, ERM-West installed two additional groundwater monitoring wells in 1991. The purpose of the well installation was to facilitate alluvial groundwater monitoring both up-gradient and down-gradient of areas where CKD was historically disposed.

ERM-West, Inc. provided RCC with an annual groundwater monitoring report dated December 4, 1996, summarizing the depth to groundwater in monitoring wells MW-1 and MW-3 and the laboratory results for groundwater samples (ERM, 1996). Groundwater depths ranged from 107 feet to 110 feet below the top of casing for MW-1 and 74 feet to 76 feet below the top of casing for MW-3. Groundwater samples were analyzed for metals, total dissolved solids, turbidity, alkalinity, chloride, color, fluoride, nitrate (NO3), odor, pH, specific conductance, and sulfates. Groundwater sample results

were compared for the three measured sampling events (June 11, 1991, April 6, 1994 and October 18, 1995) to USEPA and State of California drinking water maximum contaminant levels, and were measured below these levels.

Copies of the documents referenced within this section are provided in Appendix C.

4.3 RIVERSIDE COUNTY DEPARTMENT OF ENVIRONMENTAL HEALTH (RCDEH)

As discussed previously, numerous USTs were historically used at the site to support the cement plant operations. A review of a UST removal application dated June 1, 1987, indicates that RCC planned to remove a number of USTs in conjunction with their UST compliance program (RCC, 1987a).

The UST removal program included the decommissioning of the 6,000,000-gallon Bunker C fuel oil UST. Although the tank was viewed as an AST, the tank was classified and handled as a UST by RCDEH due to more than 10% of the tank system being underground.

According to a report prepared by ERM-West titled, "Report of Results for the Investigation of Subsurface Conditions at a Fuel Oil Storage Tank, Riverside Cement Crestmore Plant" (ERM, 1986), two slant borings were drilled at 30-degree angles (from vertical) to investigate soil conditions beneath the 6,000,000-gallon Bunker C fuel oil UST. Boring 1-C was advanced from the east side of the UST to a maximum depth of 34 feet bgs. Boring 2-B was advanced from the west side of the UST to a maximum depth of 39 vertical feet bgs. A total of five samples were collected at depths ranging from 28 feet to 38.5 feet bgs and analyzed for TPH. TPH was detected at 410 mg/kg in one sample collected at a depth of 28 feet bgs from boring 1-C. TPH was not detected (ND<50 mg/kg) in the other four samples collected.

Additional subsurface investigation work at the 6,000,000-gallon Bunker C fuel oil UST is summarized in the report titled "Investigation of Soil Conditions Below and Adjacent to the Fuel Storage Tank at the Riverside Cement Crestmore Plant, Riverside, California, March 24 – April 1, 1987" (ERM, 1987). Four vertical borings were drilled through the concrete floor of the UST and six soil samples were collected from the soil berm surrounding the UST walls to determine the vertical and lateral extent of potential soil impacts. Vertical borings were drilled to a maximum depth of 27.5 feet. Samples from the soil berm were collected near the surface using a clean trowel or a brass tube. Soil

samples were analyzed for TPH. The highest concentration of TPH (129,000 mg/kg) was detected in VB-1 at a depth of 20 to 20.5 feet. TPH concentrations at bottom of each boring (25.5 to 27.5 feet bgs) ranged from non-detect (<1 mg/kg) to 28 mg/kg.

Following the submittal of ERM's 1987 subsurface investigation report, the RCC prepared a letter on July 6, 1987 to advise the RCDEH on the status of closure activities for the 6,000,000-gallon Bunker C fuel oil UST (RCC, 1987b). This letter indicates that RCC had coordinated with the RCDEH and the California DTSC Alternative Technology Division (ATD) to select the optimal alternative for managing contaminated soils that would be generated during UST removal and over-excavation. According to the letter, the RCC concluded that the contaminated soils were chemically similar to a raw material normally used for manufacturing cement clinker, and that the contaminants themselves were a fuel that is routinely used to fire the kilns. Based on these findings, the RCC indicated that they were proceeding to install equipment necessary to insufflate (blow) the contaminated soils into their rotary kilns as a raw material.

The RCC provided a second letter on August 4, 1987 to update the RCDEH on their management of contaminated soils generated during removal and over-excavation of the 6,000,000-gallon Bunker C fuel oil UST (RCC, 1987c). This letter indicated that the process of insufflation could not be completed as intended before the Grey Kiln was to be shut down in August 1987. RCC management agreed to postpone the shutdown until December 1987 in order to continue processing this material, but the additional time was still insufficient to process all of the contaminated soils at the intended rate. As an alternative, the RCC proposed to begin adding the contaminated soils at a faster rate until the Grey Kiln was shut down or destroyed in the process. As a result, the RCC stated that the final cement product would be well below industry specifications and would need to be stockpiled and blended in small quantities with normal-quality cement products. In the event that this approach was unable to reclaim all contaminated soils, the RCC proposed to burn the remaining soils in their kiln to remove residual TPH. If all other proposed methods were determined to be infeasible, the RCC proposed that the final option would be to back-haul the contaminated soils to their Oro Grande Plant and insufflate into the kilns at that location as a raw material.

In a letter to the RCDEH dated September 23, 1987, the RCC summarized all operations conducted to date regarding closure of the 6,000,000-gallon Bunker C fuel oil UST (RCC, 1987d). The RCC indicated that approximately 70,500 tons of soil was excavated from

the area adjacent to and beneath the UST, and confirmation samples were analyzed for TPH. TPH concentrations in soils left in-place ranged from non-detect (<1 mg/kg) to 495 mg/kg. Soil with lower TPH concentrations (approximately 24,500 tons) was blended with Capo clay and consumed in the grey cement kiln during the normal course of manufacturing operations. Soil with higher TPH concentrations (approximately 2,000 tons) was initially insufflated at the Grey Kilns at a rate that would not substantially degrade the quality of the final product. Upon realizing that the remaining soils would not be consumed at this rate before the kiln was scheduled to be shut down, the RCC began adding contaminated soils at a higher rate and producing below-grade clinker that would need to be blended with good quality clinker to achieve industry specifications. This method was used until the Grey Kiln was damaged beyond repair, at which point approximately 44,000 tons of contaminated soils remained to be processed. The RCC restated that their proposed final option would be to back-haul these remaining soils to their Oro Grande Plant and continue insufflating at that location as a raw material.

Since the proposed insufflation at the Oro Grande Plant would require special permitting through the San Bernardino County Air Pollution Control District, RCC conducted additional characterization of the stockpiled soils to determine whether they could be handled and transported safely. These soils were stockpiled in two locations - one location near the east end of the Grey Kilns, and the other location near a belt conveyor southeast of the 6,000,000-gallon Bunker C fuel oil UST excavation. As summarized in a letter report from ERM dated October 14, 1987 (ERM, 1987b), a total of four composite samples were collected from the two soil stockpiles and analyzed for TPH, priority pollutant organics, priority pollutant metals, and toxicity (fish bioassay). Analytical results indicated that the soils contained between 1,900 mg/kg and 17,300 mg/kg TPH, priority pollutant organics were limited to low-level detections of toluene (575 µg/kg) and phenanthrene (6 ug/kg), metals concentrations were similar to those of natural clays, and fish toxicity was below the detection limit. ERM's conclusion was that the soils did not exhibit any characteristics that would lead the soil to be classified as hazardous under Title 22 of the California Administrative Code.

RCDEH notified RCC in a letter dated November 4, 1987 that the last confirmation sampling results for the 6,000,000-gallon fuel UST showed no appreciable impacts and that No Further Action (NFA) was required (RCDEH, 1987).

A report titled, "Final Report, Removal of Storage Tanks, Riverside Cement Company

Facility, Riverside, California" was prepared by Cal Tank Testing, dated March 1988 (CTT, 1988a) that summarized the removals of one 550-gallon waste oil UST (located approximately 10 feet southwest of the Truck Maintenance area; Figure 2) and one 10,000-gallon diesel UST (located approximately 70 feet southwest of the Kiln Feed Silos at the former Grey Cement Plant; Figure 2). The top and bottom of the 550-gallon UST were measured at 4 feet and 8 feet bgs, respectively. The top and bottom of the 10,000-gallon UST were measured at 3 feet and 11 feet bgs, respectively. Confirmation samples were collected by LOK Environmental, Inc., from the sides of the excavation for the 550-gallon UST, and from the bottom and sides of the excavation for the 10,000-gallon UST. Confirmation samples were analyzed for TPH and two samples below the 550-gallon UST were analyzed for lead. Laboratory results showed the TPH ranged from 57 to 1,000 mg/kg in the excavation for the 550-gallon UST and 34 to 15,000 mg/kg in the excavation for the 10,000-gallon UST. Visual staining was not observed in the excavation or excavated soils, and therefore the excavations were backfilled with the excavated soil and imported soil.

The document titled "Final Report, Removal of Storage Tanks, Riverside Cement Company Facility, Riverside, California", dated May 1988 (CTT, 1988b) summarized the removal of the 10,000-gallon diesel UST located north of the Garage (Figure 2). The top and bottom of the UST were 5 feet and 13 feet bgs, respectively. The initial excavation was completed to a depth of 13 feet bgs, and LOK Environmental, Inc. collected confirmation samples for TPH analysis at depths of 15 and 17 feet bgs. TPH concentrations at 15 and 17 feet bgs were 17,000 and 5,400, respectively. Following verbal communication of these results to the RCDEH, additional excavation was conducted to remove soils to a depth of 36 feet bgs. LOK Environmental, Inc. collected confirmation samples for TPH analysis from the over-excavation. The TPH concentration in the sample collected at the base of the excavation (36 feet bgs) was 550 mg/kg. Approximately 150 cubic yards of impacted soil was added to the stockpile containing soils from the removal of the 6,000,000-gallon Bunker C fuel oil UST (see section regarding 6,000,000-Gallon Bunker C fuel oil UST, above). Approximately 250 cubic yards of imported soil was used to backfill the excavation.

In a letter dated August 31, 1988, RCC summarized a recent meeting with the RCDEH regarding their intentions for the disposition of stockpiled soils from the closure of the 6,000,000-gallon Bunker C fuel oil UST and 10,000-gallon diesel UST north of the Garage (RCC, 1988). The letter indicated that the RCC would be evaluating the suitability of the

soil stockpiles for use in road mix for paving at the site. The RCC provided results from this evaluation in a follow-up letter to RCDEH dated January 18, 1989, which indicated that less than 100 mg/kg of the total oil and grease content was extractable (RCC, 1989). Based on these findings, RCC requested confirmation in writing that the stockpiled soil could be handled as typical product from a cold process asphalt plant and that no additional permits or manifesting would be required for transportation. The RCC also requested clarification on the type of information and level of detail required by the RCDEH regarding final disposition of the road mix.

The RCDEH notified RCC in a letter on February 10, 1989 that soil stockpiles could be used as raw material for cold mix asphalt, and that further permitting would not be required for transporting the material to appropriate use sites (RCDEH, 1989).

The RCDEH issued an NFA letter on November 5, 1991, to RCC confirming the completion of site investigation and remedial action for the USTs at the site (RCDEH, 1991). The letter does not specify which USTs were included as part of the completion and no further action recommendation.

RCDEH notified RCC via letter on January 16, 1992 that the department did not issue operating permits for the 6,000,000-gallon Bunker C fuel oil UST at the site (RCDEH, 1992). The only permit issued was for the removal of the above referenced USTs at the site in the 1987 application.

The White Kiln process area measured a release in August, 1993 as summarized in the July 7, 1995 report prepared by Ryan-Murphy Incorporated (RMI) regarding the field investigation for the white kiln pipeline leak (RMI, 1995a). The report states that in August 1993, a pipeline leak was discovered from an underground pipeline connecting the 210,000-gallon No. 6 fuel oil AST to supply pumps for the white kilns. The RCDEH notification of release dated August 20, 1993 states that "approximately 750 gallons was discharged" and "700 gallons were removed by Shield's Oil" (RCDEH, 1993). Nine soil borings were advanced using a Mobile B-53 drill rig and 8-inch hollow stem augers to a maximum depth of 45 feet near the pipeline leak and diesel pumping station. Two borings were advanced horizontally using a hand auger under the boiler building to a depth of 6 to 7 feet. Soil samples were collected at 5-foot intervals and analyzed for Total Recoverable Petroleum Hydrocarbons (TRPH) using USEPA Method 418.1. Three soil samples with the highest concentration of TRPH were also analyzed for TPH and

BTEX as requested by the RCDEH in their work plan approval letter to the RCC dated December 12, 1994 (RCDEH, 1994). For soil left in place, one soil sample was collected and analyzed for Toxicity Characteristic Leaching Procedure (TCLP). Laboratory results for samples collected under the boiler building detected TRPH concentrations ranging from non-detect to 19 mg/kg. Laboratory results for samples collected at Borings B-1 and B-2 (near the pipeline leak) detected TRPH concentrations ranging from non-detect to 30,000 mg/kg. The highest concentration of TRPH was detected in Boring B-1 at a depth of 10 feet and a TCLP analysis of 14 mg/L. Laboratory results for samples collected in Boring B-7 (near the diesel pumping station) detected diesel concentrations ranging from 9,800 to 12,000 mg/kg to a depth of 45 feet.

RMI provided the RCDEH a December 11, 1995 letter summarizing the remedial excavation for hydrocarbon impacted soil related to the former white kiln fuel oil pipeline (RMI, 1995b). Impacted soil was excavated and temporarily stockpiled on-site and re-used as part of the cement manufacturing process. The excavation dimensions were approximately 59 feet in length, 23 feet in width, and 9 to 13 feet in depth. Confirmation samples were collected from the bottom, ends, and sidewalls of the excavation. Samples were analyzed for TRPH by USEPA Method 418.1 with concentrations ranging from non-detect to 12,000 mg/kg. The letter indicated that current site conditions satisfy HMMD/RWQCB criteria for site closure and requested no further action.

RMI provided the RCDEH a March 21, 1996 letter summarizing the monitoring well installation for the evaluation of potential free product in the area of the white kiln pipeline leak (RMI, 1996). A four-inch diameter PVC well was installed to a total depth of 13 feet below grade, the depth at which the boring was terminated due to refusal on granite bedrock. . The screened interval was constructed with 0.02 slotted screen and number three filter pack sand from approximately 5 to 13 feet below grade. The well was monitored for free product during four monitoring events over a three-month period. No free product was detected during the monitoring events.

RCDEH notified RCC in a letter dated May 6, 1996 that the department received and reviewed the report prepared by Ryan-Murphy, Inc. dated March 21, 1996 (RCDEH,1996). The report summarized the well installation and monitoring procedures for groundwater beneath the white kilns pipeline leak. RCDEH stated no further action was required.

Decon Environmental Services provided certificates for the UST removals at the site in a letter dated July 31, 1997 (DES, 1997). The USTs removed included two 12,000-gallon diesel USTs at the White Cement Plant and one 10,000-gallon gasoline UST northwest of the Garage Storeroom (Figure 2). Analytical results provided in this letter indicated that soils left in-place at the 12,000-gallon diesel USTs contained oil-range TPH at concentrations ranging from non-detect (< 10 mg/kg) to 79 mg/kg. At the 10,000-gallon gasoline UST, gasoline-range TPH was not detected (<1 mg/kg) in soils left in-place. A UST Closure Inspection Report, UST Permit for Closure, and UST Closure / Abandonment Application from RCDEH are included as attachments in the letter.

RCDEH notified RCC in a letter dated September 3, 1997 that the RCDEH received the closure report by Decon Environmental Services regarding the removals of two 12,000-gallon diesel USTs and one 10,000-gallon gasoline UST (RCDEH, 1997). RCDEH confirmed that no further action was required.

RCDEH notified RCC Maintenance in a letter dated July 1, 1999 that the RCDEH received soil sample results collected below a fuel UST on May 25, 1999 (RCDEH, 1999). RCDEH confirmed that no further action was required.

A UST Closure Report prepared by Altec Testing and Engineering, Inc. dated June 1999, was submitted to the RCDEH (Altec, 1999). The report indicated that on May 25, 1999, one 1,000-gallon diesel UST and one 2,000-gallon gasoline UST located west of the Garage (Figure 2) were removed from the site. After the removal of the USTs, confirmation samples were collected from the excavation and stockpiled soil. Soil samples were analyzed for organic lead, TPH-gasoline, TPH diesel, BTEX and Methyl Tertiary Butyl Ether (MTBE). All laboratory results were non-detect. The excavations were backfilled with excavated and imported soil using a backhoe, compacted with a wheel attachment and capped with asphalt. The UST Closure Inspection Report, UST Permit for Closure, and UST Closure / Abandonment Application from RCDEH are included as attachments in the report.

Copies of the documents referenced within this section are provided in Appendix D.

5.0 HISTORICAL SITE ACTIVITIES

Historical documents were reviewed to obtain additional information on the history of the site. Files were provided from map rooms at RCP for review, along with discussions with site contacts (Mr. Pat Crites - Site Manager for RCC).

5.1 HISTORICAL USGS TOPOGRAPHIC QUADRANGLES

Historical USGS Topographic Quadrangles were reviewed for the years 1896, 1898, 1901, 1943, 1953-1954, 1954, 1967, 1973, 1980, and 2012. The 1896 and 1898 topographic maps show the site and immediate vicinity as undeveloped land with two elevated areas of approximately 1100 feet and 1150 feet amsl. Three streets surround the site are likely El Rivino Road on the north, Agua Mansa Road on the south, and Rubidoux Boulevard on the west. The Santa Ana River is labels and visible east and south of the site. A small tributary stream is observed along the site's western border.

The site is shown as undeveloped in the 1901 topographic map with the exception of new street additions in the south. The area of Riverside comprising the site is labeled "Stearns". The 1943 to 2012 topographic maps show the site as being a "cement plant", with the area labeled as "Crestmore". Railroad lines and spurs are located on the western end of the site. A blue water rectangular retention area is shown north of the tracks and the plant. A canal is labeled to the south along Aqua Mansa Road. Quarrying appears to be ongoing to the southwest, with the southwest peak quarried to elevation 975 amsl.

In the 1953-1954 topographic map and later years, the term "Quarry" or "Quarries" is used to identify depressions in the south and southeast of the site, and two railroads in the south and southeast of the site are identified as "Pacific Electric" and "Union Pacific," respectively. The "Wet Weather Quarry" southeast of the site is shown with water and is labeled "Crestmore Quarry". An "Oil Tank" is listed north of the plant and the tracks.

The 1954, 1967, 1973, and 1980 topographic maps show increasing residential and industrial developments in the surrounding vicinity. The 2012 topographic map shows the site in its current configuration. Copies of the topographic maps are provided in Appendix E.

5.2 CITY DIRECTORIES

A City Directory Abstract was obtained from EDR. The City Directory Abstract is a review of available business directories, including city, cross-reference, and telephone directories, at approximately five-year intervals for the years spanning 1921 through 2013. The following listings were provided for the site:

- 1970: American Cement Corp, Land Paul B, Riverside Cement Co, Riverside Cement Transportation Department
- 1990: CDK Contracting, Crestmore Federal Credit Union
- 1996: California Caddle Feeders
- 2001: Budcr 11 DS, Crestmorediv, MKTG Dept TXIRiversdcement, Purchasing, Transloading CCF, TX IRIV 0 SD Cement
- 2002: ORO Grande Federal Credit Union
- 2003: CCF, Crestmore DIV, ORO Grande Federal CRDT Union
- 2013: Riverside Cement Co

Commercial, industrial, and light manufacturing businesses were listed at adjoining and surrounding properties. A copy of the City Directory Abstract is provided in Appendix E.

5.3 AERIAL PHOTOGRAPHS

Aerial photographs were reviewed for the site and surrounding areas for the years 1938, 1948, 1953, 1966, 1968, 1974, 1985, 1990, 1995, 2005, 2009, 2010, and 2012. The site was occupied by the cement manufacturing plant in 1938 and surface mining/excavation is apparent in the south side of the site. The center of the site is occupied by buildings, an open area, and two rectangular depressions.

The 1948 aerial photograph depicts a depression with liquid, which is likely to be the Wet Weather Quarry in the southeast portion of the site. A circular tank appears in the center and is adjacent to one of the rectangular depressions mentioned above. A third rectangular depression also appears in the center. Residential buildings are depicted in the northeast end of the site.

The 1953 aerial photograph depicts that surface mining/excavation has continued in the southern end and south of the site. Materials appear to be stockpiled within an open area in the center of the site, with apparent disturbance on the western end of the site. Residential development and buildings are shown in the northeast end of the site.

The 1966 aerial photograph shows that surface mining/excavation has continued in the southern end of the site. The cement material storage bays and the gray and white kilns have been constructed on the eastern end of the site. Regrading and filling operations are present throughout the southerly two-thirds of the site. A road leading to the underground mine south of the site (Crestmore Mine) is shown south of the site.

The 1968 aerial photograph depicts that the site is relatively unchanged compared to the 1966 aerial photograph. The 1974 aerial photograph depicts that surface mining/excavation has continued south of the site. One of the rectangular depressions in the center of the site is not shown.

The 1985 aerial photograph depicts surface mining/excavation south of the site. Another depression likely the Commercial Quarry is shown southeast of the site and appears to hold liquid. The Wet Weather Quarry is onsite and adjacent to the north; however, limited liquids are observed and a dam or earth structure appears to separate the two quarries. Of the three rectangular depressions shown in the center of the site in previous aerial photographs, only the depression adjacent to the circular tank is shown.

The 1990 aerial photograph depicts that surface mining/excavation has continued south of the site. The Wet Weather Quarry onsite does not appear to possess liquid, and the Commercial Quarry to the south of the site appears to have less liquid than the 1985 photograph. The circular tank and the adjacent rectangular depressions are not shown in the aerial photograph. Meanwhile, Crestmore Mine appears to hold liquid as a result of mine flooding in the late 1980's, and is a large north-south trending lake.

The site appears relatively unchanged in the 1995, 2005, 2009, 2010, and 2012 aerial photographs.

Surrounding properties consist of agricultural land from 1938 to 1966. A golf course is visible north of the site in 1966 until 2009. Industrial development is depicted south of the site beginning in 1966, which continues southwest of the site beginning in 1974, and in the southeast and east beginning in 2005. Surrounding properties are characterized by residential use to the west and northeast. Copies of the historical aerial photographs are included in Appendix E.

6.0 SITE VISITS

6.1 SITE OBSERVATIONS

Numerous site visits were performed on multiple occasions between April, 2016 and May, 2017. The owner's site representatives were Pat Crites (Mr. Crites) and William Brown (Mr. Brown). The following summarizes observations made during the various site visits and conversations with Mr. Brown and Mr. Crites.

The northern portion of the site contains undeveloped land with dense vegetation consisting of grass, shrubs and trees, and a paved entrance road with a guard shack. A one-story building constructed of wood and mortar was observed and subsequently identified as an abandoned electrical substation. The inside of the abandoned substation was filled with wood, plastic, and metal debris including paint cans, wiring, nails, plywood, and pipes. According to Mr. Pat Crites, to the west of the abandoned substation was a residential home that was destroyed during a fire and subsequently demolished. An air/dust monitoring station was observed in the northeast corner of the site. The former material storage area is surrounded by a dense tree line and berms to the north and east. Mr. Pat Crites indicated that the berms had been created from underground mine spoils.

The western portion of the site contains an entrance road, storage silos, a warehouse (Pack House), part of the former white cement manufacturing plant, and one to two-story administration buildings (Truck Garage, Transportation Office, Storehouse, and Garage). The Pack House contained various inoperative mechanical equipment. Former storage silos for white and grey cement are adjacent to the Pack House along with a former stockhouse and warehouse. The former white cement manufacturing plant has two white cement kilns, an open warehouse for clinker storage, boiler house, two control houses, two bag houses, and storage silos. Manholes were observed within the former white cement manufacturing plant and are associated with storm drains that traverse the area. Above-ground beltways and pipes also traverse the white cement manufacturing plant.

Mr. Pat Crites stated that material from the crushing plant was transferred via beltways to the white cement manufacturing plant for processing and the finished cement product was transferred to the Pack House via pipes. Transformers and air compressors were observed in the former white cement manufacturing plant near the

control houses and storage silos.

A truck garage is currently being used as the main administration building and to store various materials and equipment. The truck garage was formerly used to maintain company vehicles and had pits that were used to access the underside of vehicles for maintenance. The storehouse is a one-story warehouse for materials and equipment storage. A concrete pad was observed at the location of a former propane AST. A stormwater collection and off-site discharge point was observed in the southwest corner of the site. Mr. Pat Crites indicated that stormwater samples were collected at this location during rain events. He also identified sanitary leach lines near the southwest corner of the site.

The southern portion of the site contains part of the former white cement manufacturing area, one-story warehouses for clay and clinker storage, a 210,000-gallon fuel oil AST, storage silos, rock crushing plant, stockpiles, undeveloped land, and a beltway to the underground mine that had collapsed. The clay storage building is a one-story warehouse with storage silos adjacent to the building. Clay stockpiles, bags of cement, and empty 55-gallon drums were observed inside the clay storage building. The former 210,000-gallon AST was used to store fuel oil for the white kilns and is now inside a secondary containment constructed of concrete and underlain with plastic and clay. The rock crushing plant received raw materials for crushing and connects to the underground mine through a tunnel and a beltway. Stockpiles of soil and white clinker were observed along the southern portion of the site. Mr. Pat Crites commented that these stockpiles consisted of spoils from the underground mine. Transformers were observed near the crushing plant and clay storage building.

The central portion of the site contains the former grey cement manufacturing plant, vehicle parking spaces, the former hazardous waste storage area, the main electrical substation, two water wells (60-1 and 88-1), the crushed rock storage area, the former spray pond, and former material storage area. The former grey cement manufacturing plant includes storage silos, motor control house and a mill motor house. Two ASTs and two grey kilns were also formerly located at the grey cement manufacturing plant. Soil and concrete stockpiles were observed underneath and adjacent to the former grey kilns. Transformers and air compressors were observed within the former grey cement manufacturing plant.

Beltways and pipes used to transfer raw material from the former material storage yard traverse the former grey manufacturing plant. Product from the former grey cement manufacturing plant was transferred via pipes to the Pack House. Vehicle parking spaces were paved with asphalt and adjacent to open metal sheds. The hazardous waste storage area has a concrete pad and is surrounded by a chain-link fence. The former spray pond storage area has a concrete pad and is surrounded by a chain-link fence. The storage area has been used to contain drums and equipment.

The southeast corner of the former spray pond storage area has a concrete suction sump with a wooden cover. At the time of the initial site reconnaissance, the suction sump contained water along with metal and wooden debris.

The main electrical substation is a one-story building and houses electrical equipment. Production Well 60-1 provides potable water for the site and Production Well 88-1 is non-operational. Mr. Pat Crites was not aware if Production Well 88-1 had been closed or abandoned properly and commented that the bottom of Production Well 88-1 was completed within an underground mine room. The former material storage area contains beltways, mechanical equipment, two switch houses, and one former AST.

The general locations of the site features are shown on Figure 2

Manholes to storm drains are present throughout the property. Four wells (in addition to the monitoring wells) were observed onsite, including Well 88-1 near the former grey cement manufacturing plant, Well 60-1 north of the grey cement manufacturing plant, and two possible irrigation wells in the northwestern portion of the site, in the vicinity of the proposed Building 4. Production Well 60-1 is reportedly still in operation and currently provides water for the site.

Transformers were observed throughout the site. The transformers were not labeled as containing PCBs. Mr. Crites noted that all transformers had been emptied and tested to be free of PCBs in the 1980s. The locations of the transformers observed at site are shown in Figure 2.

Drums were observed during the various site visits. Approximately 100, 55-gallon drums containing 2½ and 1½-inch diameter balls of white clinker were located south of the spray pond storage area and approximately 120, 55-gallon drums containing 2½ and 1½-inch diameter steel balls were located in the former grey cement manufacturing

area.

East of the maintenance warehouse shop was a concrete lined former hazardous waste storage area and the Spray Pond Storage Area. The hazardous waste storage area was empty except for standing water believed to be from recent rains. The spray pond storage area had pipes, storage containers, empty 55-gallon drums, machinery, and other miscellaneous equipment.

A suction sump was located in the southeast corner of the spray pond storage area, which contained water and debris consisting of wood, clothing, plastic bags, and metal. The suction sump was a concrete basin that measured approximately 10 feet wide, 20 feet long, and 10 feet in depth with a cover constructed of wooden planks. An inlet/outlet was located on the southeast corner of the suction sump.

A 10-feet by 10-feet stormwater sump with an inlet/outlet was also located in the northeast corner of Parcel 41 and was empty.

Two ASTs were observed near the Gray Finish Mill Feeder. Posted signs stated that the ASTs had contained diethylene glycol (DEG) and Sylvantal D30LR (Tall Oil). The DEG AST was approximately 12,000 gallons, and the Tall Oil AST was approximately 10,000 gallons. Both of the ASTs were out of service and were labeled "emptied/cleaned on 12/2015."

6.2 OFFSITE OBSERVATIONS

The site is bounded on the west by Rubidoux Boulevard, northwest by residential properties, and an ascending slope in the west. A commercial property (Skanska) is adjacent to the site in the southwest corner. The site is bounded on the north by El Rivino Road followed by an auto-body repair shop (Prestige Paint and Collision) in the northwest corner, a catch basin and former golf course in the north, and residential property in the northeast corner.

The site is bounded on the east by Hall Avenue followed by undeveloped property in the northeast corner. A commercial property (Aramark Uniform Services) and undeveloped property are adjacent to the site in the east. Commercial property (Earthworks Soil Amendment) is adjacent to the site in the southeast corner.

The site is bounded on the south by the Crestmore Lake, and mined/fill areas relating to

the mining/quarrying of the Crestmore Mine and the Commercial Quarry, Agua Mansa Road is located south of the Crestmore Lake/Mine parcel, followed by commercial property (County of Riverside Household Hazardous Waste Facility) in the southeast corner and commercial property (Burrtec Waste Industries) in the south.

7.0 POTENTIAL AREAS OF INTEREST (AOIs)

7.1 SUMMARY OF POTENTIAL AREAS OF INTEREST (AOIS)

Features identified at the site during the preliminary assessments are summarized on Figure 2. Based on the information collected during the preliminary assessments, the following Areas of Interest (AOI) were evaluated for further investigation:

- Areas with Soil Containing CKD (AOI #1);
- USTs (AOI #2)
- White Kiln Pipeline and Diesel Pump (AOI #3)
- Former Boiler Blowdown Pond (AOI #4)
- Former Spray Pond (AOI #5)
- Former Sag Pond (AOI #6)
- Hazardous Waste Storage Area (AOI #7)
- Sewer Alignments (AOI #8)
- Settling Area (AOI #9)
- Major Fill Piles or Berms (AOI #10)
- Former/Existing Transformers (AOI #11)
- Stormwater Retention Basin (AOI #12)

7.2 DESCRIPTION OF AOIS

7.2.1 Area of Interest #1 – CKD-Containing Soil Areas

As described above operations at the cement kilns generated CKD as a by-product. Up to approximately 250,000 tons of CKD was reportedly generated, removed from the kilns, and placed as standard practice with soil/mine spoils in fill areas throughout the site. Three distinct CKD areas within the development parcel were identified by ERM-West (ERM, 1991a) and are shown on Figure 2.

CKD and mine spoils/fill was placed in the Wet Weather Quarry and the Commercial Quarry until the 1970s. In the 1970s and 1980s, CKD was recovered from these areas for use as a mill / kiln feed supplement. CKD recovery in these areas was discontinued in 1987. It is reported that the majority of CKD was recovered from the Commercial Quarry, and the soil containing CKD remaining at the Wet Weather Quarry was capped and covered in 1990.

CKD was selected as an area of interest due to uncertainties in the composition of CKD generated at the site. The composition of CKD depends on the composition of raw materials used as feedstock in the manufacturing process, and therefore varies among cement manufacturing facilities. However, a common feature of CKD is that it contains higher concentrations of heavy metals than the raw feed materials. CKD was historically regulated as a hazardous waste due to its alkaline nature, but it is no longer regulated as a hazardous waste.

7.2.2 Area of Interest #2 – Former USTs

USTs at the site have been permitted, managed, and/or removed under the oversight of the RCDEH. Nine USTs were removed and closed between 1988 and 1999. Documentation at the RCDEH suggests that the USTs were closed in accordance with regulatory requirements; however, documentation was not available for three of the USTs, as discussed below.

Former 10,000-Gallon Diesel UST #1

The closure report prepared by Cal Tank Testing for this UST (located approximately 60 feet northwest of the Garage; Figure 2) indicated that residual TPH impacts (up to 17,000 mg/kg) were present beneath the fill tube at the eastern end of the UST and that concentrations progressively decreased to 440 mg/kg at 36 feet bgs. Impacted soils were removed to a depth of 36 feet bgs, and it was concluded that residual impacts potentially below the depth of the excavation were likely below applicable RCDEH action levels (CTT, 1988b).

Former 10,000-Gallon Diesel UST #2

The closure report prepared by Cal Tank Testing for this UST (located approximately 70 feet southwest of the Kiln Feed Silos at the former Grey Cement Plant; Figure 2) indicated that residual TPH impacts (up to 15,000 mg/kg) were present at a depth of 13 feet (2.5 feet below the bottom of the UST) beneath the north end of the UST. Deeper sampling was precluded by a hard layer at approximately 13 feet bgs. The report concluded that vertical migration of TPH would have been limited by the hard layer below the UST (CTT, 1988a).

Former 550-Gallon Waste Oil UST

The closure report prepared by Cal Tank Testing for this UST (located approximately 10 feet southeast of the Truck Maintenance area; Figure 2) indicated that residual TPH (up to 1,000 mg/kg) and lead (up to 3.3 mg/kg) concentrations were present at a depth of 13 feet (five feet below the bottom of the UST). Follow-up samples collected at a depth of 15 feet (seven feet below the bottom of the UST) indicated that TPH and lead concentrations diminished to 27 mg/kg and 1.9 mg/kg, respectively. It was concluded in the report that the releases were likely associated with overfill and spillage and the lateral and vertical extent of impacts were limited (CTT, 1988a).

7.2.3 Area of Interest #3 – White Kiln Pipeline Release

In August 1993, a leak was discovered from an underground pipeline connecting the 210,000-gallon No. 6 fuel oil AST to supply pumps for the White Kiln. Nine soil borings were advanced to depths of up to 45 feet near the pipeline leak and diesel pumping station, and two borings were advanced horizontally using a hand auger under the boiler building to a depth of 6 to 7 feet bgs (RMI, 1995a).

A Site Assessment Report was prepared by Ryan-Murphy, Inc. in July 1995 to summarize the field investigation for the White Kiln Pipeline Release (RMI, 1995b). This report concluded that TPH released from the pipeline appeared to be localized within the piping alignment, but that the diesel pumping station had impacted soils to a depth of at least 45 feet bgs at Boring B-7 in the vicinity of the pumping station footprint. Excavation activities were conducted in November 1995 to excavate soils in the vicinity of the White Kiln Pipeline Release, but it was concluded that excavation was not feasible due to accessibility issues beneath the pump house. A Toxicity Characteristic Leaching Procedure (TCLP) analysis was conducted on the impacted soils from Boring B-7 and indicated a TPH (diesel) concentration of 1.1 mg/L in the sample. Based on these results and the interpretation that impacts were localized in the vicinity of Boring B-7 (underlain by granite bedrock), the impacted soils were left in place to allow the natural attenuation processes to remediate the soil.

7.2.4 Area of Interest #4 – Former Boiler Blowdown Pond

The boiler blowdown pond received blowdown water from 1985 to 1990. The pond was lined with plastic and covered with clayey soil, and measured approximately 50 feet in length, 30 feet in width, and 4 feet in depth. Soil samples collected from within the

pond by ERM prior to closure indicated elevated levels of conductivity and concentrations of total chromium. Based on this data, the RWQCB required remediation of these soils.

In May 1995, ERM prepared a closure report that documented remedial activities and confirmation sampling. Remedial activities for the boiler blowdown pond included excavating up to 2 feet of soil from the perimeter berm and base of the pond and removing the plastic liner. Following excavation activities, the pond was reconstructed using locally-available clays and a new plastic liner to provide secondary containment for the fuel oil AST (decommissioned) located south of the pond (ERM, 1995). On June 15, 1995, RWQCB notified RCC that closure of the former boiler blowdown pond was complete (RWQCB, 1995). The location of the former boiler blowdown pond is shown in Figure 2.

7.2.5 Area of Interest #5 – Former Spray Pond

The spray pond was a large concrete basin designed to reduce the temperature of cooling water before being returned to cooling systems at the facility. Warm water entering the spray pond was pumped through a network of horizontal piping and sprayed into the air through vertical nozzles mounted above the pond surface. The reduction in water temperature was achieved primarily through evaporative cooling. A suction sump is located in the southeast corner of the concrete basin. At the time of the site visit, the sump contained water and debris consisting of wood, clothing, plastic bags, and metals. The location of the former spray pond and suction sump are shown in Figure 2.

7.2.6 Area of Interest #6 – Former Sag Pond

The former Sag Pond was identified based on a map titled "Wells and Major Water Lines, Crestmore Plant and Vicinity" by RCC, dated January 1985; however, no information was provided regarding the usage and as-built construction of the pond. Based on a review of historical aerial photographs from 1948 to 1974, a depression was present containing water periodically where historical maps have identified the former Sag Pond location. The location of the former Sag Pond is shown in Figure 2.

7.2.7 Area of Interest #7 – Hazardous Waste Storage Area

A fenced Hazardous Waste Storage Area (HWSA) was identified that included a

concrete pad where waste oil, waste grease, waste solvents, and empty drums were stored. A sump was identified at the southwest corner of the HWSA. The location of the HWSA is shown in Figure 2.

7.2.8 Area of Interest #8 – Sewer Alignments

A review of as-built drawings during the field activities identified two sewer lines serving the mining and manufacturing areas of the facility. There is no historical information suggesting that sewers were used to dispose of chemicals at the site. Documents obtained from Martin Marietta indicate that the facility operated under a Spill Prevention, Control, and Countermeasures Plan as early as 1994 (Miller, 1994), and maintained a Hazardous Materials Business Plan as early as 1992 (RCC, 1992). However, the site has a long operational history and subsurface characterization was warranted at these locations due to the potential for leakage from the sewer lines and/or migration of contaminants through the fill materials within the sewer alignment.

7.2.9 Area of Interest #9 – Settling Areas

A map obtained during the RWQCB file review identified four areas at the site where pooling of surface water could occur (RWQCB, 2000). Although the origin of this map is unknown, it appears to reflect prior agency inquiry regarding sediment transport and deposition related to surface flows.

7.2.10 Area of Interest #10 – Major Fill Piles or Berms

Four large berms and one fill pile of previously unknown composition are located on the eastern portion of the property. The North Berm (oriented east-west) is located north of the Material Storage Area and has an estimated volume of 40,500 cubic yards. The East Berm (oriented north-south) is located east of the Material Storage Area and has an estimated volume of 48,500 cubic yards. The South Berm (oriented east-west) is located north of CKD-containing soil Area #1 and has an estimated volume of 41,500 cubic yards. The Central Berm (oriented east-west) is located south of the Material Storage Area and has an estimated volume of 20,000 cubic yards. The fill pile is located northeast of CKD-containing soil Area #1 near well MW-1 and has an estimated volume of 63,000 cubic yards. The locations of these berms and fill piles are shown on Figure 2.

7.2.11 Area of Interest #11 – Former or Existing Transformers

Twenty-five (25) former or existing transformers were identified at the site. Although there was an effort in the 1980s to remove the PCB-containing oils from transformers and replace with PCB-free transformer oils, additional characterization was warranted to evaluate the potential for previous transformer oil releases.

7.2.12 Area of Interest #12 – Stormwater Retention Basin

The stormwater retention basin is located on the western portion of the site. The western side of the retention basin has two wide concrete swales which accept water that flows across the access road from a stormwater culvert serving Rubidoux Boulevard. The culvert receives stormwater runoff from the western side of Rubidoux Boulevard. Another concrete swale was identified on the southeastern corner of the basin, serving as a spillway for excess water. Based on correspondence with Mr. Pat Crites, the area that now serves as a retention basin is part of the former parking lot that was demolished in 2014 or 2015.

A discussion of sampling activities, field observations, and analytical results from the subsequent investigation of these features is provided in the sections below.

7.3 SAMPLING ACTIVITIES

7.3.1 Soil

A field investigation was conducted in September 2016 to further evaluate whether environmental conditions at the AOIs were likely to present human health or environmental concerns during redevelopment activities (e.g. demolition and grading). The primary method used to assess subsurface conditions was trenching using an excavator. Several soil borings were also advanced using a hollow-stem auger where deeper soil assessment was warranted.

The locations selected for evaluation during the field investigation follow the AOIs outlined above. The locations of the AOIs are shown on Figure 2, and the locations of soil borings and trenches are presented in Figures 3a and 3b.

The boring and trenching operations were performed under the full-time oversight of a Langan field engineer or scientist who conducted photoionization detector (PID) screening and observed the soils to identify discolorations, odors, and non-native materials such as debris or percentage of soil containing CKD. Representative soil

samples were collected from the excavator bucket during trenching operations and from a California-modified split spoon sampler during drilling operations.

The samples were obtained from the center of excavator bucket utilizing a precleaned stainless steel trowel. The samples were placed in laboratory provided glassware. For the exploratory borings, the samples were obtained using the above referenced split spoon sampler; the sampler was precleaned prior to each use. The decontamination procedures consisted of an Alconox wash with a single deionized water rinse.

The soil samples selected for laboratory analysis were logged on a chain–of-custody form and submitted to the analytical laboratory via courier.

Samples from the soil borings were collected at 5-foot intervals from ground surface to the bottom of the borehole. In general, samples from each trench were collected for laboratory analysis at locations selected based on the following criteria, in order of priority:

- Locations where field observations indicated staining, odors, elevated PID readings, or presence of non-native materials;
- Locations that represent potential fill or mine spoils as the predominant soil types, or;
- Locations near ground surface (1-2 feet bgs) and/or the base of the trench.

The primary purpose of these criteria was to ensure that sampling efforts were aligned with the immediate project objective. These criteria were designed for consistency with the fundamental principles and objectives of site assessment that are common to most agency guidance. Additional sampling criteria were included for AOI #10. Trenches at AOI #10 (Major Fill Piles or Berms) were sampled at a frequency of at least one per 5,000 cubic yards, consistent with DTSC Guidance.

Shallow samples (<1 foot bgs) were collected at AOI #11 (Former or Existing Transformers) to attempt to identify impacts from transformers with PCB-containing soils.

The results of the soil sampling and trenching activities are presented in Section 8.

Area of Interest #1 – CKD-Containing Soil Areas

Based on the results of site visits, potential CKD-containing soil areas were identified outside of the Wet Weather and Commercial Quarries. These areas include the fill pile northeast of the Wet Weather Quarry and the northern slope of the flooded Crestmore Quarry.

A total of 15 trenches were excavated in the vicinity of the observed and reported CKD-containing soil areas to attempt to evaluate the presence and the extent of CKD within these areas. Ten trenches (LT-21, LT-27, LT-28, LT-29, LT-30, LT-31, LT-32, LT-33, LT-41, and LT-44) were excavated to depths up to 20 feet at the suspected CKD-containing soil area near the Wet Weather Quarry.

Four trenches (LT-17, LT-19, LT-20, and LT-22) were excavated to depths up to 18 feet at the reported CKD-containing soil area northeast of the Wet Weather Quarry. One trench (LT-26) was excavated to a depth of approximately 5 feet at the suspected CKD-containing soil area at the northern slope of the flooded Crestmore Quarry.

All samples collected from AOI #1 were analyzed for metals (USEPA Method 6010 / 7471), as metals were the primary focus of previous regulatory investigations associated with the environmental effects of CKD at the site. One soil sample was also analyzed for TPH (USEPA Method 8015B) and Polychlorinated Biphenyls (PCBs; USEPA Method 8082).

Area of Interest #2 – Former USTs

To evaluate current soil conditions in the vicinity of the previously removed USTs, four trenches (LT-8, LT-13, LT-18, and LT-35) were excavated to depths of up to 21 feet in four locations (former 10,000 gasoline UST north of the maintenance area, former 6,000,000-gallon Bunker C fuel oil UST, a former 10,000-gallon gasoline UST south of the electrical tunnel, and a former 550-gallon waste oil UST south of the maintenance area). Although there was no evidence of residual impacts at these locations based on field screening, limited sampling was conducted for the purpose of confirming field observations and ruling out these areas as potential concerns. Soil samples collected from the trenches were analyzed for TPH (USEPA Method 8015B) and Volatile Organic Compounds (VOCs; USEPA Method 8260B).

Area of Interest #3 – White Kiln Pipeline Release

Two trenches (LT-24 and LT-36) were excavated in the vicinity of the White Kiln Pipeline Release to evaluate the current concentrations of diesel in soil and extent of the residual impacts, if any. No evidence of residual TPH was observed at the trenches based on visual, olfactory, and PID screening, and no samples were collected for laboratory analysis.

Area of Interest #4 – Former Boiler Blowdown Pond

One trench (LT-23) was attempted at the Former Boiler Blowdown Pond to evaluate current concentrations of metals in soil. One soil sample was analyzed for metals (USEPA Method 6010 / 7471).

Area of Interest #5 – Former Spray Pond

Additional characterization of TPH, metals, and VOCs was warranted in the vicinity of the former Spray Pond due to the potential for accumulation of runoff at the suction sump. One trench (LT-11) was excavated to a depth of approximately 20 feet near the suction sump at the southeast corner of the Former Spray Pond. One soil sample was analyzed for TPH (USEPA Method 8015B), metals (USEPA Method 6010 / 7471), and PCBs (USEPA Method 8082).

Area of Interest #6 – Former Sag Pond

Additional characterization was warranted in the vicinity of the former Sag Pond due to a lack of available historical information regarding the use of the pond. One trench (LT-9) was excavated to a depth of approximately 20 feet at the southeast corner of the Former Sag Pond. Two soil samples were analyzed for TPH (USEPA Method 8015B), metals (USEPA Method 6010 / 7471), PCBs (USEPA Method 8082), Semivolatile Organic Compounds (SVOCs; USEPA Method 8270C), and VOCs (USEPA Method 8260B).

Area of Interest #7 – Hazardous Waste Storage Area

Additional characterization was warranted in the vicinity of the hazardous waste storage area due to chemicals and waste stored at this location. One trench (LT-12) was excavated to a depth of approximately 18 feet near the sump at the southwest corner of the Hazardous Waste Storage Area. No evidence of residual impact was

found at this location based on visual/olfactory observations and PID screening, but limited sampling was conducted to evaluate constituents that are not readily identifiable using standard field screening procedures. One soil sample was analyzed for metals (USEPA Method 6010 / 7471) and PCBs (USEPA Method 8082).

Area of Interest #8 – Sewer Alignments

Two trenches (LT-15 and LT-Sewer) were excavated at locations where lateral lines serving the mining and manufacturing areas of the plant tie-in to the main sewer line oriented north to south near the western boundary of the site. No evidence of residual impact was found at this location based on visual/olfactory observations and PID screening, but limited sampling was conducted to confirm field observations. Three samples were analyzed for TPH (USEPA Method 8015B), metals (USEPA Method 6010 / 7471), PCBs (USEPA Method 8082), SVOCs (USEPA Method 8270C), and/or VOCs (USEPA Method 8260B).

Area of Interest #9 – Settling Areas

Four trenches (LT-39, LT-40, LT-42, and LT-43) were excavated at locations previously identified as surface water settling areas during RWQCB inspections in September 2000. As stated above, metals have been the primary focus of previous regulatory investigations associated with the environmental effects of CKD at the site. In general, settling areas represented appreciable contaminant input locations, we would expect to see elevated metals concentrations in surface soils at these locations. No evidence of excessive sedimentation was found at these areas, but limited sampling was conducted to confirm field observations. Four samples were analyzed for metals (USEPA Method 6010 / 7471).

Area of Interest #10 – Major Fill Piles or Berms

Based on site observations and a review of the historical operations in the vicinity of the fill piles, additional characterization were conducted in these areas.

Nine discrete-depth soil samples were collected from two trenches (LT-NBermA and LT-NBermB) excavated to depths up to 18 feet at the North Berm. Two composite samples were collected from the nine samples for laboratory analysis.

Ten discrete-depth soil samples were collected from two deep trenches (LT-

EBermC and LT-EBermD) excavated to a depth of 20 feet at the East Berm. Two composite samples were collected from the ten samples for laboratory analysis.

Two additional soil samples were collected from the East Berm at two shallow trenches (LT-EBermA and LT-EBermB) excavated to a depth of 2 feet. Nine discrete-depth soil samples were collected from two trenches excavated to depths up to 20 feet at the South Berm. Two composite samples were collected from the nine samples for laboratory analysis.

Two discrete-depth soil samples were collected from one trench excavated to a depth of 20 feet at the Central Berm (LT-CBermA). One composite sample was collected from the two samples for laboratory analysis. Two discrete-depth soil samples were collected from the Central Berm due to the observations of the fill materials; observed to be homogeneous sands with no odors or discolorations. At the fill pile near MW-1, 16 discrete-depth soil samples were collected from three trenches excavated to depths up to 24 feet (LT-MW1A, LT-MW1B and LT-MW1C). Three composite samples were collected from the 16 samples for laboratory analysis. A total of 11 composite and three grab samples were analyzed for metals (USEPA Method 6010 / 7471).

Area of Interest #11 – Former or Existing Transformers

Twelve trenches (LT-2, LT-AS1, LT-AS2, and LT-XF1 through LT-XF9) were excavated in the vicinity of nine former or existing transformers. A total of 11 soil samples were analyzed for PCBs (USEPA Method 8082).

Area of Interest #12 – Stormwater Retention Basin

Additional investigation was warranted at the stormwater retention basin due to the potential infiltration of stormwater runoff that may have been impacted by off-site sources. Four trenches (CB-TP-1 through CB-TP-3 and CB-Outfall-1) were excavated to depths of up to 12 feet at locations where influent runoff material and sediments were observed. A total of six soil samples were analyzed for metals (USEPA Method 6010 / 7471), hexavalent chromium (USEPA Method 7199), and TPH (USEPA Method 8015B).

Background Sampling/Additional Areas of Sampling

Additional trenching and soil sampling was conducted to obtain a background sample, and to obtain samples in the proposed soil excavation (cut) areas. One trench (LT-4) was excavated to characterize background soils at the undeveloped parcel between the Material Storage Area and El Rivino Road.

Six trenches (LT-5, LT-6, LT-10, LT-16, LT-45, and LT-47) were excavated to provide samples within the anticipated cut area. An additional three trenches were excavated in areas containing the decommissioned Diethylene Glycol / Sylvantal AST (LT-14), the two decommissioned Dust Suppressant ASTs (LT-45), and the Material Storage Area (LT-47). A total of six soil samples were analyzed for metals (USEPA Method 6010 / 7471). A sample from LT-45 was also analyzed for TPH (USEPA Method 8015B) due to its proximity to the former Dust Suppressant ASTs, although it is unlikely that petroleum or other hazardous substances were used as dust suppressants since the ASTs were installed in the early 2000's and were reported by the RCC Site Manager to contain a foaming agent sold by GE Betz, Inc.

7.3.2 Groundwater and Surface Water

Field investigations were also conducted to evaluate concentrations of metals and/or VOCs in groundwater and surface water at the site. Sampling events were conducted in November/December 2016, March 2017, and May 2017. During each of these events, groundwater samples were collected from MW-3, MW-4, and the northern well (Monitoring Well) using a submersible pump, and surface water samples were collected from Crestmore Lake using a stainless steel dipper.

Prior to sampling the groundwater wells, Langan staff measured and recorded groundwater parameters including pH, specific conductivity, ORP, dissolved oxygen, turbidity, temperature, and depth to groundwater during purging. The wells were sampled once three consecutive readings indicated groundwater parameters had stabilized within the following values:

- ± 0.1 for pH
- ± 3% for specific conductivity and temperature
- ± 10 millivolts (mV) for ORP
- ± 10% for dissolved oxygen and turbidity

Groundwater sample collection field data sheets are provided in Appendix F.

The groundwater and surface water samples were immediately labeled, recorded on a laboratory chain-of-custody, placed in a chilled ice chest, and delivered to TestAmerica under chain-of-custody protocol. The samples were analyzed for metals (including hexavalent chromium) and general minerals. Groundwater samples collected during the November/December 2016 sampling event were also analyzed for VOCs. The results of this investigation are presented in following section. The analytical report is presented in Appendix G.

8.0 RESULTS OF ANALYTICAL SAMPLING

8.1 SOIL

Table 1 summarizes key field observations and laboratory analytical results from trenches excavated during the field investigations. All laboratory analytical results for soil are summarized in Tables 2a through 2l, and laboratory analytical reports are included in Appendix G.

To establish context in the discussion of analytical results below, comparisons are provided using the lowest of the screening levels within the following agency data sets:

- Environmental Screening Levels (ESLs) established by the San Francisco Bay Regional Water Quality Control Board (SFRWQCB) for commercial / industrial shallow soil
- Regional Screening Levels (RSLs) established by USEPA Region 9 for industrial soil
- Screening Levels (SLs) established by the DTSC for commercial / industrial soil

Section 9.0 provides additional information regarding the identification of potential exposure pathways and selection of applicable screening levels, along with a risk-based evaluation of results.

8.1.1 Metals

With the exception of arsenic, metals concentrations in soil were below the lowest of the selected screening levels. Arsenic was detected in 30 of the 40 samples analyzed for metals at concentrations ranging from 1.4 to 14 mg/kg. Arsenic concentrations measured throughout the site exhibit an approximate normal distribution, with 95% of results falling within two standard deviations of the mean and all results falling within three standard deviations of the mean. Based on a review of Bradford, 1996 and Chernoff, 2008, background concentrations of arsenic in Southern California soils typically range from 1 to 10 mg/kg, which is consistent with concentrations measured at the site.

8.1.2 Total Petroleum Hydrocarbons

Diesel-range petroleum hydrocarbons (TPH-d) were detected at 1,700 mg/kg in one trench (LT-9) in the vicinity of the Former Sag Pond (AOI #6), which is above the lowest of the selected screening levels (USEPA Region 9 RSL; 44 mg/kg). These impacts appeared to be confined to the upper 10 feet of soil. The origin and extent of TPH-d is unclear; however, the potential exists that the impacts could extend laterally throughout the Former Sag Pond.

No evidence of residual impacts was observed in the vicinity of former USTs (AOI #2) or the White Kiln Pipeline / Diesel Pump Leak (AOI #3). Previous sampling results reported by others suggest that residual impacts could be present; however, these impacts (if present) are not anticipated to require further action or special handling during future site redevelopment.

8.1.3 Polychlorinated Biphenyls

With the exception of one low-level detection of Aroclor 1248 at LT-XF1 (69 µg/kg), which is below the USEPA Region 9 RSL (0.950 µg/kg), PCBs were not detected above the laboratory reporting limit in samples collected from shallow soils near the former or existing transformers (AOI #11).

8.1.4 Volatile and Semi-Volatile Organic Compounds

Two samples from the Sag Pond (LT-9@4' and LT-9@8') were analyzed for VOCs and SVOCs based on visual observations of staining and olfactory evidence of petroleum hydrocarbons. One sample near a former 10,000-gallon UST location (LT-8@10.5) was analyzed for VOCs based on a statement in the 1988 closure report for this UST suggesting that some of the soil remaining in-place following UST removal and over-excavation may contain residual petroleum hydrocarbons. VOCs and SVOCs were also analyzed in one sample near the junction of the main sewer line and the branch sewer line serving the manufacturing area of the plant (LT-Sewer@10').

Naphthalene was detected in both samples from the Sag Pond (LT-9@4' and LT-9@8'), however the reported concentrations (7.5 µg/kg and 6.1 µg/kg, respectively) were well below the lowest of the selected screening levels (SFRWQCB ESL; 14.3 µg/kg). In addition, p-Isopropyltoluene was also detected at LT-9@8' (5.2 µg/kg), however no screening levels have been established for this compound. No other VOCs or SVOCs (with the exception of Naphthalene, discussed above) were detected in any of the

samples analyzed.

8.2 GROUNDWATER AND SURFACE WATER

The laboratory analytical results for groundwater are summarized in Tables 3a and 3b, and laboratory analytical reports are included in Appendix G.

8.2.1 Metals

Cr^{VI} was detected in MW-3 during the November/December 2016, March 2017, and May 2017 sampling events at 19 µg/l, 17 µg/l, and 16 µg/l respectively, which exceeds the California MCL (10 µg/l). Cr^{VI} concentrations have remained below the MCL at MW-4 and the Monitoring Well (northern well). No metals have been detected above their respective California MCLs in surface water samples (SW-1 and SW-2) collected from Crestmore Lake.

8.2.2 Volatile Organic Compounds

With the exception of trans-1,2-dichloroethene (t-1,2-DCE), no VOCs have been detected in groundwater samples collected from MW-3, MW-4, or the Northern Well. During the November/December 2016 sampling event, t-1,2-DCE was detected below the MCL (10 µg/l) in MW-3 (0.43 µg/l) and MW-4 (0.66 µg/l), however was not analyzed at the Monitoring Well (northern well). During the November/December 2016 sampling event, t-1,2-DCE was not detected in MW-3 or MW-4 but was detected below the MCL in the Monitoring Well (northern well) (2.1 µg/l).

9.0 SCREENING-LEVEL RISK ASSESSMENT

9.1 RECEPTORS AND EXPOSURE PATHWAYS

In a risk assessment, exposure pathways are means by which hazardous substances move through the environment from a source to a point of contact with people. A complete exposure pathway must have four parts: (1) a source of hazardous substances, (2) a mechanism for transport of a hazardous substances from the source to the air, surface water, groundwater and/or soil, (3) a point where receptors (people) come in contact with impacted air, surface water, groundwater and/or soil, and (4) a route of entry into the body. Based on a review of the analytical results for the site, there is a limited source of VOCs, rendering the inhalation pathway incomplete. Therefore, the remaining complete pathways are through dermal contact and ingestion.

Based on information provided by Crestmore Redevelopment, LLC regarding the proposed redevelopment of the RCP, potential receptors and complete exposure pathways are outlined below:

- Future Construction Worker – Redevelopment activities are anticipated to require operations such as decontamination, demolition, grading, and construction. Exposure pathways that future construction workers may be exposed to chemical constituents at the site include: (1) incidental soil/dust ingestion, (2) dermal contact with soil, (3) dermal contact with groundwater; and (4) dermal contact with equipment and debris from former site operations.

- Future Worker (Anticipated Scenario) – The proposed redevelopment is anticipated to include a commercial/industrial complex consisting of four one-story buildings with mezzanine levels with a combined building footprint of approximately 3.6 million square feet. The buildings are anticipated to cover approximately 43% of the northern 206-acre area, with the remainder of the property covered by paved surfaces such as asphalt or concrete, with limited landscaped coverage. Under this site configuration, the potential exposure pathway for future workers to fugitive dust ingestion is incomplete.

- Future Worker (Hypothetical Scenario) – In the event that the extent of surface coverage (i.e. concrete/asphalt) is modified (i.e. reduced) relative to the anticipated design, the potential direct contact with surface soil would increase

and become a potential exposure pathway for future workers. As such, the screening-level risk assessment for future workers also conservatively includes: (1) incidental soil ingestion, and (2) dermal contact with soil.

- Future Use of Shallow Groundwater – It is not anticipated that alluvial groundwater (hereafter referred to as "shallow groundwater") is to be used as a resource; therefore, dermal contact with groundwater is an incomplete pathway.

9.2 RISK CHARACTERIZATION

9.2.1 Soil

Analytical results from the field investigations were compared to the following risk-based screening levels applicable to the receptors and exposure pathways identified above:

Source	Screening Level	Applies to:
San Francisco Bay Regional Water Quality Control Board	Direct Exposure Human Health Risk Levels (Table S-1); Any Land Use/ Any Depth Soil Exposure: Construction Worker	Future Construction Worker: • incidental soil ingestion • dermal contact with soil • dermal contact with equipment and debris from former site operations
San Francisco Bay Regional Water Quality Control Board	Direct Exposure Human Health Risk Levels (Table S-1); Commercial / Industrial Shallow Soil Exposure	Future Worker (Hypothetical Scenario): • incidental soil ingestion • dermal contact with soil • inhalation of particulates in ambient air
Environmental Protection Agency Region 9	Regional Screening Levels for Industrial Soil	All human receptors at industrial sites
California Department of Toxic Substances Control Office of Human and Ecological Risk	Screening Levels for Commercial / Industrial Soil (Note 3)	All human receptors at commercial / industrial sites

Tables 2a through 2l include the screening levels listed in the table above for each of the constituents analyzed during the field investigations. Of the constituents analyzed, only four (arsenic, lead, nickel, and TPH-d) exceeded one or more of these screening levels. Further discussion of these exceedances is provided below.

Metals

The analytical results for arsenic exceeded ESLs for shallow soil in the commercial / industrial exposure scenario (0.31 mg/kg) and the construction worker exposure scenario (0.97 mg/kg), as well as the RSL (3.0 mg/kg) and the DTSC-SL (0.36 mg/kg). Concentrations ranged from < 3 mg/kg (non-detect, below the reporting limit) to 14 mg/kg, with an average detected concentration of 6.5 mg/kg. As discussed previously, arsenic concentrations at the site appear to be in the range of published background concentrations for Southern California.

Lead exceeded the ESL for shallow soil in the construction worker exposure scenario (160 mg/kg) in a sample collected at one foot bgs from LT-40 (200 mg/kg), which was excavated near a potential surface water settling area (AOI #9) identified by the RWQCB.

Nickel exceeded the ESL for shallow soil in the construction worker exposure scenario (86 mg/kg) in a sample collected at two feet bgs from LT-21 (150 mg/kg), which was excavated at the northern boundary of the potential CKD-containing soil area near the Wet Weather Quarry.

Engineering controls and personal protective measures established in a Soils Management Plan are proposed to mitigate potential risks to construction workers during redevelopment.

Diesel-Range Petroleum Hydrocarbons

TPH-d exceeded the ESLs for shallow soil in the commercial / industrial exposure scenario (1,078 mg/kg) and the construction worker exposure scenario (885 mg/kg), as well as the RSL (44 mg/kg) in a sample collected at four feet bgs from LT-9 (1,700 mg/kg) and a sample collected at eight feet bgs from LT-9 (950 mg/kg), which was excavated at the former Sag Pond. A Soils Management Plan will establish protocol and procedures for identifying, segregating, screening, and analyzing potentially impacted soils to confirm suitability for re-use or characterize for disposal. Additionally, engineering controls and personal protective measures established in a Soils Management Plan will address potential risks to construction workers during redevelopment.

None of the other constituents analyzed during the field investigations exceeded applicable screening levels.

9.2.2 Groundwater

All analytical results for groundwater were compared to MCLs. Tables 3a and 3b include the MCLs for each of the constituents analyzed during the field investigations.

The only constituent detected above MCLs in groundwater at the site is hexavalent chromium. According to the State Water Resources Control Board (SWRCB) Groundwater Information Sheet, Hexavalent Chromium (2016), chromium is a metal present in natural deposits of ores containing other elements, mostly as chrome-iron ore. It is also widely present in soil and plants. Under most conditions, natural chromium in the environment occurs as trivalent chromium. Under oxidizing conditions, alkaline pH range (greater than 7), presence of MnO2, and minerals containing chromium, part of it may occur as hexavalent chromium dissolved in groundwater.

Recent sampling of drinking water sources throughout California suggests that hexavalent chromium may occur naturally in groundwater at many locations (SWRCB, 2016).

Sampling data obtained on 12 January 2017 from SWRCB's GeoTracker Groundwater Ambient Monitoring and Assessment (GAMA) Program database for nearby water supply wells up-, down-, and cross-gradient of the RCP indicate that nearby wells have historically measured hexavalent chromium concentrations that vary between 2.6 µg/L to 20 µg/L (up-gradient) and 2 µg/L to 4.8 µg/L (down-gradient).

10.0 SUMMARY AND CONCLUSIONS

Field visits and investigations were conducted between April 2016 and February 2017. These activities included multiple site visits, interviews with RCC representatives knowledgeable about previous site operations, reviews of records provided by RCC, and reviews of regulatory databases. Twelve AOIs warranting further environmental investigation were identified.

Subsurface investigation was conducted at each of the Twelve AOIs to further evaluate the potential for environmental impacts. Work performed as part of this investigation included trenching, sampling, and laboratory analyses for constituents including metals, TPH, VOCs, SVOCs, and/or PCBs. Groundwater samples were collected from two monitoring wells in the southern portion of the site (MW-3 and MW-4) and one well in the northern portion of the site Monitoring Well (northern well). Surface water samples were also collected from two locations within Crestmore Lake (SW-1 and SW-2). Groundwater and surface water samples were analyzed for metals and/or VOCs.

Laboratory analytical results for soil were compared to screening levels for exposure pathways applicable to the site. Of the constituents analyzed in soil, only four (arsenic, lead, nickel, and TPH-d) exceeded one or more of these screening levels. Arsenic concentrations at the site appear to be in the range of published background concentrations for Southern California. Lead exceeded soil ESLs for the construction worker exposure scenario at one location near a surface water settling area, nickel exceeded soil ESLs for the construction worker exposure scenario at one location near a soil area containing suspected CKD west of the Wet Weather Quarry. TPH-d exceeded the ESL for shallow soil in the commercial / industrial exposure scenario (1,078 mg/kg) and the construction worker exposure scenario (885 mg/kg) in a sample collected at the former Sag Pond.

A Soils Management Plan will establish protocol and procedures for segregating, screening, and analyzing potentially impacted soils to confirm suitability for re-use or characterize for disposal. Engineering controls and personal protective measures established in the Soils Management Plan will address potential risks to construction workers associated with lead and nickel exposure during redevelopment.

Laboratory analytical results for groundwater were compared to California MCLs. The only constituent detected above MCLs in groundwater at the site was hexavalent

chromium in MW-3, at concentrations ranging between 16 to 19 ug/L. Shallow groundwater (alluvial groundwater) is not anticipated to be used as a resource during or after site development.

TABLES

TABLE 1
Summary of Key Field Observations and Laboratory Analytical Results
Remedial Investigation Report
Agua Mansa Commerce Park, Jurupa Valley, CA

Area of Interest #	Trench ID	Objective	Sampling Depths (feet bgs)	Field Observations	Key Analytical Results
1	LT-21 (9/19/2016)	Delineate northern boundary of soil containing CKD in Area #1	2,6	Soil containing CKD is present at south end of trench; Northern extent of CKD area delineated beneath berm on south side of road. Refusal on cemented material at 5 feet bgs. No staining, no odors, no VOC impacts.	In sample containing CKD (LT-21-2), metals were elevated with respect to the site-wide data set, including chromium (2,000 mg/kg), cobalt (16 mg/kg), nickel (150 mg/kg), and vanadium (69 mg/kg). Concentrations did not exceed ESLs, with the exception of nickel (exceeds ESL for construction worker).
1	LT-27 (9/20/2016)	Delineate western boundary of soil containing CKD in Area #1	2,5	Fine to medium sand fill interspersed with cemented materials. No CKD, no staining, no odors, no VOC impacts.	Composited sample; no metals were elevated with respect to the site-wide data set or ESLs.
1	LT-28 (9/20/2016)	Delineate southern boundary of soil containing CKD in Area #1	1,2	Native granitic material encountered at south end of trench; soil containing CKD present in lenses throughout the remainder of trench. Delineated at apparent transition to slope. No staining, no odors, no VOC impacts.	Laboratory analyses not performed.
1	LT-29 (9/23/2016)	Delineate vertical extent of soil containing CKD near northern boundary of Area #1	none	Soil containing CKD encountered at depths between 3 and 5 feet bgs in the trench, which extended from berm at west of road to berm at east of road. Thickness ranges from 5 feet at west to less than 1 foot at east. No staining, no odors, no VOC impacts.	No laboratory analyses performed.
1	LT-30 (9/23/2016)	Delineate southern boundary of soil containing CKD in Area #1	none	CKD interspersed with sandy fill in upper 5 feet of trench; terminated due to refusal on cemented materials at ~ 5 feet bgs.	No laboratory analyses performed.
1	LT-31 (9/20/2016)	Delineate southern boundary of soil containing CKD in Area #1	2,4	Sandy fill to 1-2 feet bgs, underlain by sand and gravel fill with lenses of soil containing CKD and grey/lt.grey cemented materials. No staining, no odors, no VOC impacts.	No laboratory analyses performed.

TABLE 1
Summary of Key Field Observations and Laboratory Analytical Results
Remedial Investigation Report
Agua Mansa Commerce Park, Jurupa Valley, CA

Area of Interest #	Trench ID	Objective	Sampling Depths (feet bgs)	Field Observations	Key Analytical Results
1	LT-32 (9/23/2016)	Delineate southern boundary of soil containing CKD Area #1	none	Thin layer (<¼ inch) of soil containing CKD deposited at surface, underlain by fine to medium sand and trace gravel to 1 foot bgs and fine to coarse sand with trace gravel and partially cemented materials to 10 feet bgs. Several pieces of plastic and metal debris observed throughout. No staining, no odors, no VOC impacts.	No laboratory analyses performed.
1	LT-33 (9/20/2016)	Delineate southern boundary of soil containing CKD in Area #1	1,2	Sand and gravel fill to 1-2 feet bgs, underlain by sandy fill interspersed with lt. grey and white cemented and partially cemented materials. No soil containing CKD, no staining, no odors, no VOC impacts.	No laboratory analyses performed.
1	LT-41 (9/27/2016)	Attempt measurement of water table	none	Partially cemented materials interspersed with soil containing CKD to approximately 4 feet bgs, underlain by fine to coarse sand with trace gravel and cobbles to 20 feet bgs. Trench left open for two days, no groundwater observed.	No laboratory analyses performed.
1	LT-44 (9/27/2016)	Delineate vertical extent of soil containing CKD at base of Wet Weather Quarry and attempt measurement of water table	none	Partially cemented materials interspersed with soil containing CKD to approximately 4 feet bgs, underlain by fine to coarse sand with trace gravel and cobbles to 20 feet bgs. Trench open for two days, no groundwater observed.	No laboratory analyses performed.
2	LT-17 (9/19/2016)	Delineate northern boundary of soil containing CKD in Area #2	3,5	Three layers of fine to course sand with 3" of AC and brown silt at bottom of trench. No CKD, no staining, no odors, no VOC impacts.	Composited sample; two metals were elevated with respect to the site-wide data set, including arsenic (12 mg/kg) and cobalt (6.8 mg/kg). None of these concentrations exceed ESLs.
2	LT-19 (9/19/2016)	Delineate western boundary of soil containing CKD Area #2	1,4	Sand and gravel fill to total depth explored. No CKD, no staining, no odors, no VOC impacts.	Composited sample; no metals were elevated with respect to the site-wide data set or ESLs.

TABLE 1
Summary of Key Field Observations and Laboratory Analytical Results
Remedial Investigation Report
Agua Mansa Commerce Park, Jurupa Valley, CA

Area of Interest #	Trench ID	Objective	Sampling Depths (feet bgs)	Field Observations	Key Analytical Results
2	LT-20 (9/19/2016)	Delineate eastern boundary of soil containing CKD Area #2	3,4	Sand and gravel fill to total depth explored. No CKD, no staining, no odors, no VOC impacts.	Composited sample; no metals were elevated with respect to the site-wide data set or ESLs.
2	LT-22 (9/19/2016)	Delineate southern boundary of soil containing CKD Area #2	4,5	Sand and gravel fill to total depth explored. No CKD, no staining, no odors, no VOC impacts.	Composited sample; no metals were elevated with respect to the site-wide data set or ESLs.
3	LT-26 (9/20/2016)	Evaluate depth and extent of soil containing CKD; waste/debris observed in ground	2,3	Asphalt road with base, red clay, Barite and potential soil containing CKD in upper 4 feet. Loose fill materials down to 6 feet bgs. Soil containing CKD (<1%), no staining, no odors, no VOC impacts.	Composited sample; two metals were elevated with respect to the site-wide data set, including Cd (7.1 mg/kg) and lead (79 mg/kg). Low-level detections of DRO (11 mg/kg) and ORO (39 mg/kg). None of these concentrations exceed ESLs.
2	LT-8 (9/21/2016)	Confirm/refute residual impacts identified in closure report.	3,10.5	Sandy fill to 6 feet bgs, transitions to native sand and gravel with some cobbles to total depth. No staining, no odors, no VOC impacts.	No TPH or VOCs detected.
2	LT-13 (9/21/2016)	Confirm/refute residual impacts identified in closure report.	5,10	Sand and gravel fill to total depth, some grey cemented materials between 2 and 4 feet bgs, possible transition to native near total depth. No staining, no odors, no VOC impacts.	No laboratory analyses performed.
2	LT-18 (9/27/2016)	Confirm/refute residual impacts identified in closure report.	1,15	Fine to medium sand to 4 feet bgs, underlain by fine to coarse sand with some gravel and cobbles to 18 feet bgs. No VOC impacts, no staining, no odors. UST removal confirmed by lack of signature on EM-61 magnetometer.	No laboratory analyses performed.
2	LT-35 (9/22/2016)	Confirm/refute residual impacts identified in closure report.	none	Sand and gravel fill to 6 feet bgs, underlain by native sandy gravel with some cobbles. No VOC impacts, no staining, no odors.	No laboratory analyses performed.
3	LT-24 (9/23/2016)	Confirm/refute residual impacts from diesel leak.	none	Very hard cemented klinker dust to 2 feet bgs, underlain by clean fill to 18 feet bgs. No VOC impacts, no staining, no odors.	No laboratory analyses performed.

TABLE 1
Summary of Key Field Observations and Laboratory Analytical Results
Remedial Investigation Report
Agua Mansa Commerce Park, Jurupa Valley, CA

Area of Interest #	Trench ID	Objective	Sampling Depths (feet bgs)	Field Observations	Key Analytical Results
3	LT-36 (9/23/2016)	Confirm/refute residual impacts from diesel leak.	none	Very hard cemented soil containing CKD to 1 foot bgs, underlain by clean fill to 18 feet bgs. Encountered 2-inch steel pipes at ~8 feet bgs, punctured the pipes, small amount (< 0.5L) of residual fuel oil (very viscous black fluid) drained from pipes. Impacted soil retrieved from below drainage and max PID = 47.1. No staining, no odors, no VOC impacts other than those mentioned due to drainage from pipe.	No laboratory analyses performed.
4	LT-23 (9/21/2016)	No previous investigation, no profile of previous blow down water	1 (two samples)	1-2 inches of cement underlain by plastic liner, underlain by 1-2 feet of sandy fill. Refusal encountered @ ~2 feet on concrete below sandy fill. No VOC impacts, no staining, no odors.	No metals elevated with respect to the site-wide data set or ESLs.
5	LT-11 (9/22/2016)	No previous investigation, no profile of previous blow down water	5,15	Sand and gravel fill to 7 feet bgs, underlain by native gravelly sand with some cobbles. No VOC impacts, no staining, no odors.	ORO was detected below at 33 mg/kg, below the ESL. No metals were elevated with respect to the site-wide data set or ESLs, and no PCBs were detected.
6	LT-9 (9/22/2016)	No previous investigation, no profile of fluids historically present	4,8	Sand with some gravel fill, interspersed with dark grey lenses with petroleum odor to total depth. LimitedVOC impacts in odorous soils (PID = 5 to 10 ppm)	DRO and ORO were detected in both samples, with the highest concentrations in the 4-foot sample (DRO=1,700 mg/kg and ORO=4,400 mg/kg). Some metals were elevated with respect to the site-wide data set, including Ba (100 mg/kg), Cu (46-60 mg/kg), Lead (120-140 mg/kg), and Zinc (75-76 mg/kg). None of these concentrations exceed ESLs, with the exception of lead (exceeds residential ESL for shallow soil).
7	LT-12 (9/22/2016)	Assess potential impacts from HWSA sump	4,12	Sandy fill to 6 feet bgs, transitions to native sand and gravel with some cobbles to total depth. No VOC impacts, no staining, no odors.	Composited sample; no metals were elevated with respect to the site-wide data set or ESLs.

TABLE 1
Summary of Key Field Observations and Laboratory Analytical Results
Remedial Investigation Report
Agua Mansa Commerce Park, Jurupa Valley, CA

Area of Interest #	Trench ID	Objective	Sampling Depths (feet bgs)	Field Observations	Key Analytical Results
8	LT-15 (9/27/2016)	Assess potential impacts along sewer alignment	2,12	Fine to coarse sand with some gravel and trace cobbles to total depth. Lens of lt. grey / white stone from 2 to 4 feet bgs in central portion of trench. No VOC impacts, no staining, no odors.	No metals were elevated with respect to the site-wide data set or ESLs.
8	LT-Sewer (9/29/2016)	Assess potential impacts along sewer alignment	10,20	ORO was detected at 11 mg/kg, below the ESL. No GRO, DRO, VOCs, SVOCs, or PCBs were detected. No metals were elevated with respect to the site-wide data set or ESLs.	ORO was detected at 11 mg/kg, below the ESL. No metals were elevated with respect to the site-wide data set or ESLs.
9	LT-39 (9/27/2016)	Provide geographic coverage of proposed cut area; assess potential impacts at material storage area	1,15	Fine to coarse sand to total depth, some gravel present between 0 and 3 feet and between 13 and 16 feet. No VOC impacts, no staining, no odors.	No metals were elevated with respect to the site-wide data set or ESLs.
9	LT-40 (9/26/2016)	Provide geographic coverage of proposed cut area; assess potential impacts at material storage area	1,15	Partially cemented materials to ~1 foot, underlain by fine-coarse sand with gravel and partially cemented materials to 5 feet bgs, and medium to coarse sand with gravel and trace cobbles to total depth. No VOC impacts, no staining, no odors.	Two metals were elevated with respect to site-wide data set, including arsenic (14 mg/kg) and lead (200 mg/kg). The lead concentration is also elevated with respect to the direct exposure ESL for residential shallow soil (80 mg/kg) and construction workers (160 mg/kg), but not for industrial shallow soil (320 mg/kg). No other metals were elevated with respect to the site-wide data set or ESLs.
9	LT-42 (9/26/2016	Provide geographic coverage of proposed cut area; assess potential impacts at material storage area	1,15	Fine to coarse sand with some silt to 5 feet bgs, underlain by fine to coarse sand with some silt and some gravel to total depth. No VOC impacts, no staining, no odors.	No metals were elevated with respect to the site-wide data set or ESLs.
9	LT-43 (9/26/2016)	Provide geographic coverage of proposed cut area; assess potential impacts at material storage area	1,15	Fine to medium sand with some silt to 6 feet bgs, underlain by fine to coarse sand with gravel and trace cobbles to total depth. No VOC impacts, no staining, no odors.	No metals were elevated with respect to the site-wide data set or ESLs.

TABLE 1
Summary of Key Field Observations and Laboratory Analytical Results
Remedial Investigation Report
Agua Mansa Commerce Park, Jurupa Valley, CA

Area of Interest #	Trench ID	Objective	Sampling Depths (feet bgs)	Field Observations	Key Analytical Results
10	LT-NBermA (9/28/2016)	Determine composition of fill areas to be cut during grading	3,6,10,18	Fine silty sand to total depth. Soil containing CKD interspersed with fill soils between 12 feet bgs and total depth. No VOC impacts, no staining, no odors.	Composited sample; one metal (As) was elevated with respect to the site-wide data set (9.4 mg/kg). No other metals were elevated with respect to the site-wide data set, or ESLs.
10	LT-NBermB (9/28/2016)	Determine composition of fill areas to be cut during grading	4,7,11,14,16	Fine to medium silty sand with trace gravel to total depth. Soil containing CKD interspersed with fill soils between 8 feet bgs and total depth. No VOC impacts, no staining, no odors.	No metals were elevated with respect to the site-wide data set or ESLs.
10	LT-EBermA (9/28/2016)	Determine composition of fill areas to be cut during grading	1	Shallow trench excavated by hand. Fine silty sand, no soil containing CKD.	No metals were elevated with respect to the site-wide data set or ESLs.
10	LT-EBermB (9/28/2016)	Determine composition of fill areas to be cut during grading	2	Shallow trench excavated by hand. Fine silty sand, no soil containing CKD.	Three metals were elevated with respect to the site-wide data set, including chromium (33 mg/kg), cobalt (7 mg/kg), and nickel (21 mg/kg). None of these concentrations exceed ESLs.
10	LT-EBermC (9/28/2016)	Determine composition of fill areas to be cut during grading	5,8,13,17	Fine silty sand to total depth. Soil containing CKD interspersed with fill soils between 10 feet bgs and total depth. No VOC impacts, no staining, no odors.	Composited sample; no metals were elevated with respect to the site-wide data set or ESLs.
10	LT-EBermD (9/28/2016)	Determine composition of fill areas to be cut during grading	3,6,11,14	Fine silty sand to total depth. Soil containing CKD interspersed with fill soils between 5 feet bgs and total depth. No VOC impacts, no staining, no odors.	Composited sample; no metals were elevated with respect to the site-wide data set or ESLs.
10	LT-SBermA (9/28/2016)	Determine composition of fill areas to be cut during grading	1,3,7,12,18	Partially cemented materials to 2 feet bgs, underlain by fine to medium sand with trace gravel to total depth. Trace coal present between 2 and 6 feet bgs at south end of trench. No VOC impacts, no staining, no odors.	Composited sample; no metals were elevated with respect to the site-wide data set or ESLs.
10	LT-SBermB (9/28/2016)	Determine composition of fill areas to be cut during grading	5,9,12,18	Partially cemented materials to 1 foot bgs, underlain by fine to coarse sand with trace gravel to total depth. No VOC impacts, no staining, no odors.	Composited sample; no metals were elevated with respect to the site-wide data set or ESLs.

TABLE 1
Summary of Key Field Observations and Laboratory Analytical Results
Remedial Investigation Report
Agua Mansa Commerce Park, Jurupa Valley, CA

Area of Interest #	Trench ID	Objective	Sampling Depths (feet bgs)	Field Observations	Key Analytical Results
10	LT-CBermA (9/29/2016)	Determine composition of fill areas to be cut during grading	5,10	Partially cemented materials to approximately 2 inches bgs, underlain by clean, homogeneous fine to coarse sand.	Composited sample; no metals were elevated with respect to the site-wide data set or ESLs.
10	LT-MW1A (9/27/2016)	Determine composition of fill areas to be cut during grading	3,6,12,15,18,21	Fine silty sand to total depth. Soil containing CKD interspersed with fill soils between 10 feet bgs and total depth. No VOC impacts, no staining, no odors.	Composited sample; no metals were elevated with respect to the site-wide data set or ESLs.
10	LT-MW1B (9/28/2016)	Determine composition of fill areas to be cut during grading	5,10,15,20,25	Fine silty sand to total depth. Soil containing CKD interspersed with fill soils from 0 to 8 feet bgs and from 13 feet bgs to total depth. No VOC impacts, no staining, no odors.	Composited sample; no metals were elevated with respect to the site-wide data set or ESLs.
10	LT-MW1C (9/28/2016)	Determine composition of fill areas to be cut during grading	5,10,15,20,25	Fine silty sand to total depth. Soil containing CKD interspersed with fill soils from 0 to 3 feet bgs. No VOC impacts, no staining, no odors.	Composited sample; no metals were elevated with respect to the site-wide data set or ESLs.
11	LT-2 (9/21/2016)	Assess potential PCB impacts associated with abandoned substation	5,13	Fine to medium sand with trace gravel to 13 feet bgs, underlain by fine to coarse sand with gravel and some cobbles to 19 feet bgs. No VOC impacts, no staining, no odors.	No laboratory analyses were performed.
11	LT-AS1 (9/22/2016)	Assess potential PCB impacts associated with abandoned substation	0.5	Shallow trench excavated by hand. Fine to medium sand with trace gravel. No VOC impacts, no staining, no odors.	No PCBs were detected.
11	LT-AS2 (9/22/2016)	Assess potential PCB impacts associated with abandoned substation	0.5	Shallow trench excavated by hand. Fine to medium sand with trace gravel. No VOC impacts, no staining, no odors.	No PCBs were detected.

TABLE 1

Summary of Key Field Observations and Laboratory Analytical Results

Remedial Investigation Report

Agua Mansa Commerce Park, Jurupa Valley, CA

Area of Interest #	Trench ID	Objective	Sampling Depths (feet bgs)	Field Observations	Key Analytical Results
11	LT-XF1 (9/28/2016)	Assess potential PCB impacts associated with former or existing transformers	0.5	Locations except LT-XF3 were sampled beneath at least 2-3 inches of surficial asphalt, concrete, or heavily cemented materials. Ground surface at LT-XF3 was vegetated overburden. No VOC impacts, staining, or odors were observed at any of these locations.	Low-level concentrations of Aroclor 1248 were detected at LT-XF1 (0.069 mg/kg). No other PCBs were detected at LT-XF1 or any of the other locations.
11	LT-XF2 (9/28/2016)		0.5		
11	LT-XF3 (9/28/2016)		0.5		
11	LT-XF4 (9/29/2016)		0.5		
11	LT-XF5 (9/29/2016)		0.5		
11	LT-XF6 (9/29/2016)		0.5		
11	LT-XF7 (9/29/2016)		0.5		
11	LT-XF8 (9/29/2016)		0.5		
11	LT-XF9 (9/29/2016)		0.5		
12	LT-4 (9/21/2016)	Characterize background soils	5	Fine sand to total depth (15 feet bgs). No VOC impacts, no staining, no odors.	No metals were elevated with respect to the site-wide data set or ESLs.
12	LT-5 (9/27/2016)	Provide geographic coverage of proposed cut area	1,15	Partially cemented materials ("hard pan") to ~1 foot, underlain by fine-medium sand to total depth. No VOC impacts, no staining, no odors.	No metals were elevated with respect to the site-wide data set or ESLs.
12	LT-6 (9/27/2016)	Provide geographic coverage of proposed cut area	1,15	Fine to medium sand to total depth, with trace gravel and trace cobbles present from 7 to 15 feet bgs. No VOC impacts, no staining, no odors.	Composited sample; one metal (arsenic) was elevated with respect to site-wide data set (9.5 mg/kg). No other metals were elevated with respect to the site-wide data set, or ESLs.
12	LT-10 (9/27/2016)	Provide geographic coverage of proposed cut area	1,15	Fine to coarse sand to 2 feet bgs, underlain by fine to medium sand with silt and clay to 18 feet bgs. No VOC impacts, no staining, no odors.	Composited sample; no metals were elevated with respect to the site-wide data set or ESLs.

TABLE 1
Summary of Key Field Observations and Laboratory Analytical Results
Remedial Investigation Report
Agua Mansa Commerce Park, Jurupa Valley, CA

Area of Interest #	Trench ID	Objective	Sampling Depths (feet bgs)	Field Observations	Key Analytical Results
12	LT-14 (9/27/2016)	Provide geographic coverage of proposed cut area; assess potential impacts near decommissioned diethylene glycol/sylvantal AST	2,15	Partially cemented materials to ~1 foot, underlain by fine to coarse sand with some gravel to 6 feet, and fine to medium sand with some silt to total depth. No VOC impacts, no staining, no odors.	No laboratory analyses were performed.
12	LT-16 (9/27/2016)	Provide geographic coverage of proposed cut area	1,15	Partially cemented materials to ~0.5 foot, underlain by fine to coarse sand to 12 feet, and fine to medium sand with trace cobbles to total depth. No VOC impacts, no staining, no odors.	No laboratory analyses were performed.
12	LT-45 (9/27/2016)	Provide geographic coverage of proposed cut area; assess potential impacts near decommissioned dust suppressant AST	1,15	Asphalt and partially cemented materials to ~6 inches, underlain by fine-medium sand with clay and silt to total depth. No VOC impacts, no staining, no odors.	Composited sample; DRO and ORO were detected at 100 mg/kg and 600 mg/kg, respectively. GRO was not detected. No metals were elevated with respect to the site-wide data set or ESLs.
12	LT-46 (9/27/2016)	Provide geographic coverage of proposed cut area	none	Fine to medium sand to 4 feet bgs, underlain by fine to coarse sand with some gravel and some cobbles to ~8 feet bgs, underlain by fine to medium sand with trace gravel and trace cobbles to total depth. No VOC impacts, no staining, no odors.	No laboratory analyses were performed.
12	LT-47 (9/29/2016)	Provide geographic coverage of proposed cut area; assess potential impacts at material storage area	1,5,20	Heavily cemented materials to 2.5 feet bgs, underlain by fine-medium sand with some silt and clay to total depth. No VOC impacts, no staining, no odors.	Composited sample; three metals were elevated with respect to site-wide data set, including arsenic (12 mg/kg), Cd (4 mg/kg), and lead (51 mg/kg). None of these concentrations exceed ESLs.
13	CB-TP-1 (4/10/2017)	Assess subsurface conditions near northern inlet swale.	2.5,10.5	Clayey silt from 0 to 2 feet bgs, underlain by lens of silty fine sand from 2 to 3 feet bgs. Fine sand from 3 to 8 feet bgs and medium to coarse sand from 8 to 11 feet bgs. No staining, no odors, no VOC impacts.	With the exception of arsenic, no metals were detected above the ESL. Low levels of oil-range (C23-C40) petroleum hydrocarbons were detected below the ESL at 2.5 feet bgs.

TABLE 1

Summary of Key Field Observations and Laboratory Analytical Results

Remedial Investigation Report

Agua Mansa Commerce Park, Jurupa Valley, CA

Area of Interest #	Trench ID	Objective	Sampling Depths (feet bgs)	Field Observations	Key Analytical Results
13	CB-TP-2 (4/10/2017)	Assess subsurface conditions near southern inlet swale.	9	Clayey silt from 0 to 2 feet bgs, underlain by medium sand with trace fine rounded gravel from 2 to 12 feet bgs. No staining, no odors, no VOC impacts.	With the exception of arsenic, no metals were detected above the ESL. No petroleum hydrocarbons were detected.
13	CB-TP-3 (4/10/2017)	Assess subsurface conditions near observed sedimentation area.	3,9	Clayey silt from 0 to 1.5 feet bgs, underlain by medium sand from 1.5 to 9 feet bgs and medium to coarse sand with trace fine rounded gravel from 9 to 12 feet bgs. No staining, no odors, no VOC impacts.	With the exception of arsenic, no metals were detected above the ESL. No petroleum hydrocarbons were detected.
13	CB-Outfall-1 (4/10/2017)	Assess surface conditions near northern inlet swale.	0	Minor surficial staining and sedimentation observed on soil.	With the exception of arsenic, no metals were detected above the ESL. Low levels of oil-range (C23-C40) petroleum hydrocarbons were detected below the ESL.

- Area of Interest #2 - Locations of Former USTs
- Area of Interest #3 - White Kiln Pipeline and Diesel Pump
- Area of Interest #4 - Former Boiler Blowdown Pond
- Area of Interest #5 - Former Spray Pond
- Area of Interest #6 - Former Sag Pond
- Area of Interest #7 - Hazardous Waste Storage Area
- Area of Interest #8 - Sewer Alignments
- Area of Interest #9 - Settling Area
- Area of Interest #10 - Major Fill Piles or Berms
- Area of Interest #11 - Former / Existing Transformers)
- Area of Interest #12 - Storm Water Retention Basin
- Proposed Building Footprint
- Approximate Limits of Development
- Approximate Limits of Former Riverside Cement Manufacturing Plant
- Approximate Location of Key Site Features

Notes:
1. Background referenced from plan titled "Encumbrance Map, Vacant Commercial Property, Jurupa Valley, California, Topographic Information by DRC Engineering, Inc., Dated 2 March 2016.

2. Approximate site limits referenced from plan titled "Crestmore Redevelopment, Jurupa Valley, CA - Preliminary Site Plan - Scheme A.01," Prepared by RGA Office of Architectural Design, Dated 11 May 2016.

3. Approximate limits of areas are referenced from "Crestmore Plant, Hazardous Material Business Plan (HMBP)" by Riverside TXI Cement, Dated 2009.

4. Limits of Cement Kiln Dust (CKD) Disposal Areas area referenced from "Draft Technical Memorandum No.1" by Sector, Dated 25 January 2001.

5. Transformer locations referenced from "Figure 2 - Site Map, for TXI Riverside Cement Crestmore Plant, 1500 Rubidoux Boulevard, Riverside, California 92509" by Stantec, Dated 26 July 2013.

6. Underground Storage Tank (UST)

7. Above Ground Storage Tank (AST)

8. Map grid shown in California State Plane Zone 6, NAD 83. U.S. Feet.

Legend

- Approximate Groundwater Well Locations (MW-3)
- Approximate Boring Locations (LB-12, ALB-12 and ELB-1)
- Approximate Trench Locations (LT-10)
- Approximate Trench Location, 2017 (CB-TP-1)
- Area of Interest #11 - Former / Existing Transformers
- Area of Interest #1 - Areas with Soil Containing CKD
- Area of Interest #2 - Locations of Former USTs
- Area of Interest #3 - White Kiln Pipeline and Diesel Pump
- Area of Interest #4 - Former Boiler Blowdown Pond
- Area of Interest #5 - Former Spray Pond
- Area of Interest #6 - Former Sag Pond
- Area of Interest #7 - Hazardous Waste Storage Area
- Area of Interest #8 - Sewer Alignments
- Area of Interest #9 - Settling Area
- Area of Interest #10 - Major Fill Piles or Berms
- Area of Interest #12 - Storm Water Retention Basin
- Proposed Building Footprint
- Approximate Limits of Development
- Approximate Limits of Former Riverside Cement Manufacturing Plant
- Approximate Location of Key Site Features

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

EXECUTIVE SUMMARY

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 06/09/2015 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
BURRTEC WASTE INDUST	***1830 AGUA MANSA RD***	***S 0 - 1/8 (0.053 mi.)***	***B18***	***89***

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 06/09/2015 has revealed that there are 8 RCRA-SQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent NPL

RESPONSE: Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

A review of the RESPONSE list, as provided by EDR, and dated 11/07/2015 has revealed that there is 1 RESPONSE site within approximately 1 mile of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 11/07/2015 has revealed that there are 2 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, and dated 11/16/2015 has revealed that there are 4 SWF/LF sites within approximately 0.5 miles of the target property.

State and tribal leaking storage tank lists

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the State Water Resources Control Board Leaking Underground Storage Tank Information System.

A review of the LUST list, as provided by EDR, and dated 12/14/2015 has revealed that there are 4 LUST sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 5 EDR Hist Auto sites within approximately 0.125 miles of the target property.

Environmental Interest/Information System
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

CERCLIS (Comprehensive Environmental Response, Compensation, and

TXI RIVERSIDE CEMENT CO CRESTMORE PLANT (Continued) **1016068533**

Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
California Department of Toxic Substances Control EnviroStor System (DTSC-EnviroStor) is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

RB Case Number:	Not reported
LOC Case Number:	200420231
File Location:	Local Agency
Potential Media Affect:	Soil
Potential Contaminants of Concern:	Gasoline
Site History:	Site History/Release Information Two 2,000 gallon gasoline USTs were removed along with associated piping and fuel dispensers in November 2003. Soil samples were collected beneath the dispensers at 2 feet and 5 feet bgs, beneath piping, adjacent to and west of the USTs at 6

MVP RV INC (Continued) **S106387361**

feet bgs, and within the UST cavity at 2 feet and 6 feet bgs. Maximum concentrations were 3780 ppm TPHg (T2-6), 520 ppb B (T2-6), 52600 ppb T (T2-6), 20000 ppb E (T2-6), 522000 ppb X (T2-6), 46 ppb MTBE (LED2), ND<4000 ppb TBA (T2-6), 9.45 ppm lead (T2-6). Samples were analyzed for TPHg, BTEX and oxygenates. The site was placed into LOP on October 23, 2003 for further assessment. Assessment Two soil borings (SB-1 and SB-2) were advanced to groundwater (approximately 76 feet bgs) in the vicinity of the former USTs on April 16, 2004. Soil samples from SB-1 and SB-2 were collected at five-foot intervals to a maximum explored depth of 76.5 feet bgs. The highest concentrations were observed from soil samples collected from soil boring SB-1 (UST cavity) at the 15 and 20 foot depths. Maximum concentrations: 350 ppm TPHg (SB-1 at 20 feet bgs), 0.13 ppm B (SB-1 at 20 feet bgs), 5.6 ppm T (SB-1 at 20 feet bgs), 3.8 ppm E (SB-1 at 20 feet bgs), 35 ppm X (SB-1 at 20 feet bgs), 0.53 ppm MTBE (SB-1 at 15 feet bgs), 0.36 ppm tert-Butylbenzene (SB-1 at 20 feet bgs), 1.2 ppm Naphthalene (SB-1 at 20 feet bgs), 5.6 ppm 1,2,4-Trimethylbenzene (SB-1 at 20 feet bgs), 2.7 ppm 1,3,5-Trimethylbenzene (SB-1 at 20 feet bgs), ND<0.50 ppm Ethanol and Methanol. SVE Pilot Testing One vapor extraction well (VE-1) was installed on July 8, 2006 near the southeast corner of the former UST location. SVE well VE-1 was installed to 30 feet bgs and screened between 15 and 30 feet bgs. Soil samples were collected at 5 foot intervals and select samples were analyzed for gasoline and VOCs by EPA Method 8260B. Soil samples collected at 10, 20 and 30 feet bgs were analyzed and were ND for all constituents tested. A SVE pilot test was conducted July 12th through 14th, 2006. The SVE test was proposed for 5-days but was terminated after 48 hours due to a VOC breakthrough. PID readings reported during the SVE test were between 92 to >9999 ppmV and were believed to be erroneous. The consultant stated that laboratory analysis results for vapor samples were at relatively low levels and were inconsistent with field PID readings and more consistent with soil data. The overall mass of vapor phase gasoline recovered over the 48-hour duration of system operation was estimated at 34 lbs (average of 0.7 lbs per hour). Flow rates at VE-1 fluctuated between 50 and 75 cfm. Maximum vapor concentrations were: 740 ppmV TPHg (VE1-3), 2.5 ppmV B (VE1-3), 110 ppmV T (VE1-3), 23 ppmV E (VE1-3), 149 ppmV X (VE1-3), ND MTBE, 11 ppmV 1,2,4 TMB (VE1-3), 5.5 ppmV 1,3,5, TMB (VE1-3). Closure was requested based on the results of the pilot test and five quarters of groundwater monitoring RCDEH denied closure and required the 5-day SVE test to be repeated since vapor concentrations increased over time and the test was terminated after two days. A 5-day SVE pilot test using VE-1 was performed February 17th through 23rd, 2009. Flow rates at VE-1 were erroneously reported to fluctuate between 98 and 269.5 cfm and later corrected to range from 84 to 146 cfm. PID readings throughout the SVE test ranged from 40.4 to >15,000 ppmV. The ROI was calculated to include the entire footprint of the former UST cavity and dispensers. MW-1 is screened from 60 to 95 feet bgs and VE-1 is screened between 15 to 30 feet bgs. The overall mass of vapor phase gasoline recovered over the 143-hr duration of system operation was estimated at 233 lbs (avg of 1.6 lbs/hr). Maximum vapor concentrations were: 1100 ppmV TPHg, 0.97 ppmV B, 80 ppmV T, 20 ppmV E, 176 ppmV X, ND<0.28 ppmV MTBE, 0.94 ppmV isopropylbenzene, 2.4 ppmV n-propylbenzene, 0.24 ppmV PCE, 0.20 ppmV sec-butylbenzene, 11 ppmV 1,2,4-TMB, 5.7 ppmV 1,3,5-TMB. Ending vapor concentrations for most constituents detected were higher at the end of the 5-day SVE pilot test than at the beginning of the test. Based on the elevated

MVP RV INC (Continued) **S106387361**

vapor concentrations detected and mass of vapor phase gasoline recovered during the 5-day SVE pilot test, a 30-day SVE test was required by RCDEH to clearly demonstrate that vapor recovery has reached the point of diminishing returns (asymptotic levels). Soil Excavation Excavation of contaminated soil was proposed in lieu of performing additional SVE testing to expedite site cleanup. Approximately 3200 tons of impacted soil was excavated March 1st through March 23rd, 2010. Twelve (12) confirmation soil samples were collected at the bottom and side walls of the approximately 8192 square feet excavation pit. All soil samples were non-detect for all constituents tested except for 0.006 ppm Xylene and 0.006 ppm 1,2,4 TMB detected in the deep soil sample collected at the west wall of the excavation pit (X24 Deep Wall-W@ approximately 30 feet bgs). Groundwater Monitoring To assess the potential for groundwater impact near the UST, one groundwater monitoring well (MW-1) was installed on July 19, 2004 approximately 20 feet southeast of the former UST cavity that is believed to be downgradient. Soil samples were analyzed at 5 foot intervals from 5 feet to 75 feet bgs. MW-1 was advanced to a depth of 95.5 feet bgs and screened from 56 to 95 feet bgs. Groundwater was encountered at 75 feet bgs. Analytical results for the groundwater sample collected from MW-1 were non-detect for all constituents tested. Maximum soil concentrations were at 65 feet bgs: ND<0.5 ppm TPHg, ND<0.001 ppm B, 0.004 ppm T, 0.002 ppm E, 0.012 ppm X, 0.011 ppm MTBE, ND<0.002 ppm tert-BBNZ, ND<0.002 ppm Napthalene, ND<0.001 ppm 1,2,4-TMB, ND<0.001 ppm 1,3,5-TMB. Five groundwater sampling events were conducted from August 2004 through October 2007. Maximum groundwater concentrations: ND<0.50 ppm TPHg, ND<0.5 ppb B, 0.6 ppb T (10/17/07), ND<1.0 ppb E, ND<1.0 ppb X, ND<5.0 ppb MTBE, 7.6 ppb Naphthalene (9/19/05). Water levels have fluctuated from 73.20 to 78.66 feet bgs. Anticipated groundwater flow direction is to the southeast towards the Santa Ana River. The closest domestic water supply well (Well 04 Old Skotty) is located approximately 1049 feet west of the site and according to the well report on Geotracker, VOCs have not been detected in this well. Regional Board concurred with closure on 5/13/2010 and the no further action/closure letter was issued 6/14/2010

Description:	RP states that a pump seal failed causing the release of cooling tower water to a drainage swale. The storm drain system would discharge into the Santa Ana River. However, the water has not been detected any further than 100' into the drainage swale. The estimated amount of the release is in excess of 10,000 gallons.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 10/30/2015

Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 10/30/2015

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 03/26/2015

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Date of Government Version: 06/09/2015

US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

Data Release Frequency: Varies

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Local Lists of Hazardous waste / Contaminated Sites

US HIST CDL: National Clandestine Laboratory Register
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 09/17/2015

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

SSTS: Section 7 Tracking Systems

Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

Date of Government Version: 12/31/2009

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

HAZNET: Facility and Manifest Data
Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water board?s review found that more than one-third of the region?s active disposal pits are operating without permission.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historic Dry Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

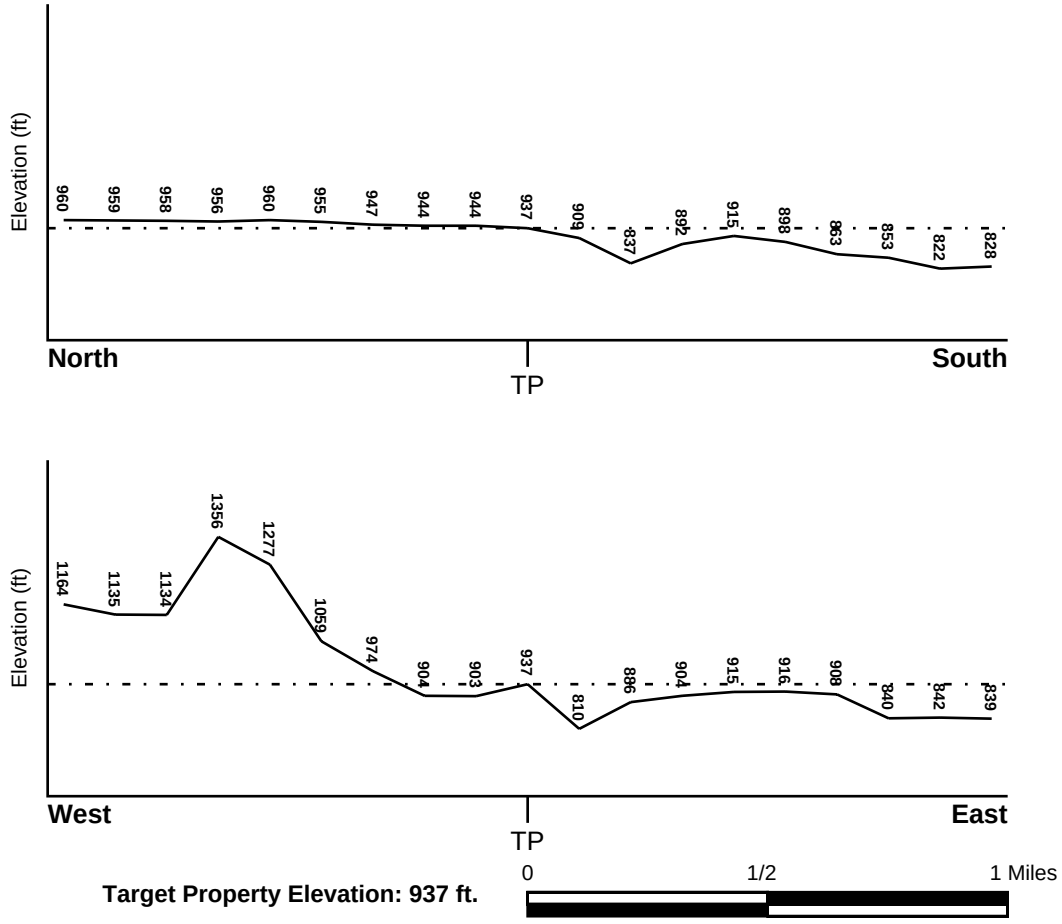
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
RIVERSIDE, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 06065C - FEMA DFIRM Flood data

Additional Panels in search area: 06071C - FEMA DFIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
FONTANA	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	1/4 - 1/2 Mile West
Site Name:	Riverside Cement Co Crestmore Plt
Site EPA ID Number:	CAD063844443
Groundwater Flow Direction:	SW ON A REGIONAL BASIS.
Measured Depth to Water:	not available, but a well 2,000 feet east of the site had a water level of 800 feet above mean sea level.
Hydraulic Connection:	Information is not available about the hydraulic connection between aquifer(s) underlying the site.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information is inferred in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
1	1/4 - 1/2 Mile West	Varies

For additional site information, refer to Physical Setting Source Map Findings.

* ©1996 Site--specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Paleozoic
System:	Pennsylvanian
Series:	Upper Paleozoic
Code:	uPze *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: QUARRIES

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 2

Soil Component Name: DELHI

Soil Surface Texture: fine sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	9 inches	fine sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.8 Min: 6.1
2	9 inches	48 inches	sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.8 Min: 6.1
3	48 inches	59 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.8 Min: 6.1

Soil Map ID: 3

Soil Component Name: CIENEBA

Soil Surface Texture: sandy loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	14 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.3 Min: 5.1
2	14 inches	22 inches	weathered bedrock	Not reported	Not reported	Max: 0.42 Min: 0	Max: Min:

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/12/2016 has revealed that there is 1 RCRA-SQG site within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
ADVANCE COLLISION	***12073 CEDAR AVE***	***NW 0 - 1/8 (0.050 mi.)***	***B16***	***84***

State- and tribal - equivalent NPL

RESPONSE: Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

A review of the RESPONSE list, as provided by EDR, has revealed that there is 1 RESPONSE site within approximately 1 mile of the target property.

CERTAINTEED CORP	***2100 AVALON ST.***	***S 1/2 - 1 (0.706 mi.)***	***C20***	***90***

Database: RESPONSE, Date of Government Version: 10/31/2016

Status: Certified
Facility Id: 33320002

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 10/31/2016 has revealed that there is 1 ENVIROSTOR site within approximately 1 mile of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto site within approximately 0.125 miles of the target property.

Target **1500 RUBIDOUX BOULEVARD** **ECHO N/A**
Property **RIVERSIDE, CA 92509**

Site 4 of 14 in cluster A

Actual: 927 ft.

FINDS:

Registry ID: 110001199587

Environmental Interest/Information System
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
California Department of Toxic Substances Control EnviroStor System (DTSC-EnviroStor) is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 12/05/2016

Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 12/05/2016

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 09/14/2016

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006
Date Data Arrived at EDR: 03/01/2007

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water board?s review found that more than one-third of the region?s active disposal pits are operating without permission.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historic Dry Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

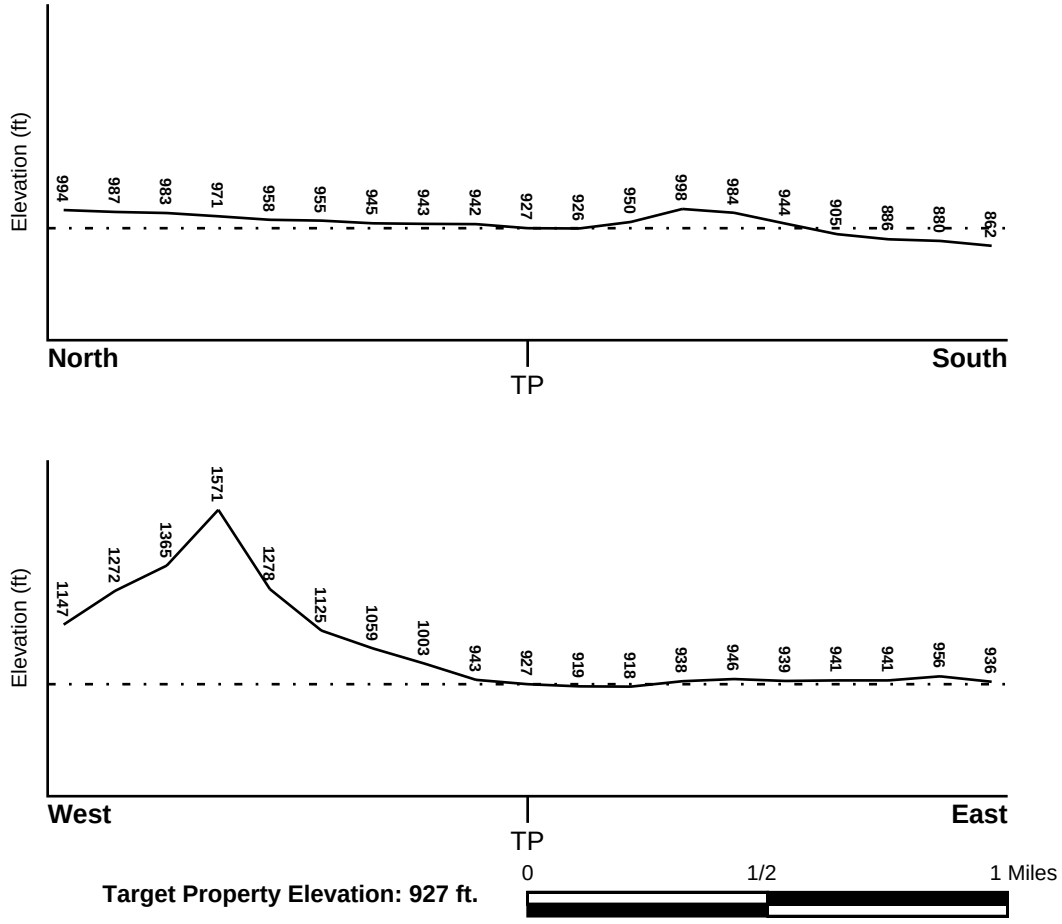
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

General Topographic Gradient: General East

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

FONTANA	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	1/4 - 1/2 Mile South
Site Name:	Riverside Cement Co Crestmore Plt
Site EPA ID Number:	CAD063844443
Groundwater Flow Direction:	SW ON A REGIONAL BASIS.
Measured Depth to Water:	not available, but a well 2,000 feet east of the site had a water level of 800 feet above mean sea level.
Hydraulic Connection:	Information is not available about the hydraulic connection between aquifer(s) underlying the site.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information is inferred in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

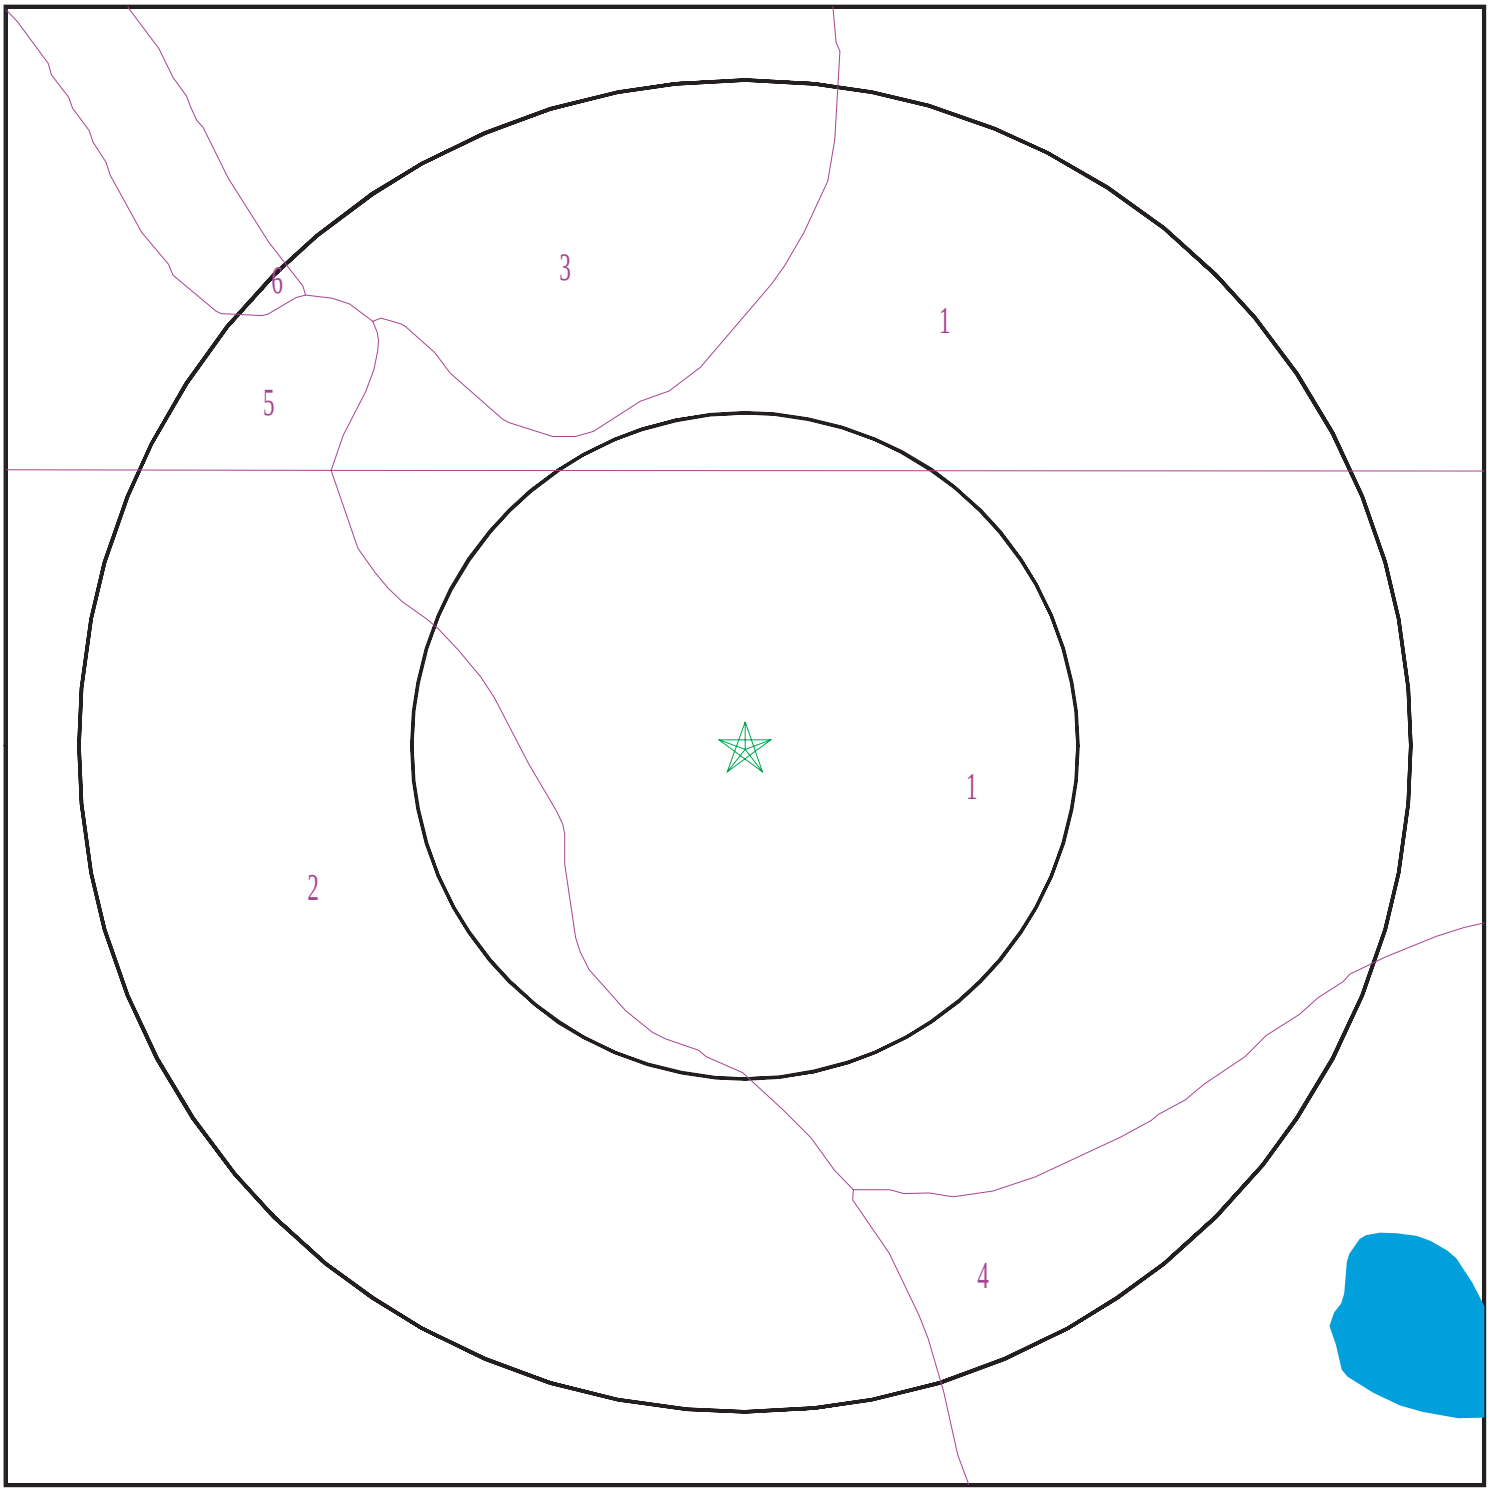
GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT



Era:	Paleozoic
System:	Pennsylvanian
Series:	Upper Paleozoic
Code:	uPze *(decoded above as Era, System & Series)*

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: DELHI

Soil Surface Texture: fine sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	18 inches	fine sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.3 Min: 5.6
2	18 inches	59 inches	sand	Granular materials (35 pct. or less passing No. 200), Fine Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.8 Min: 6.1

Soil Map ID: 2

Soil Component Name: HANFORD

Soil Surface Texture: coarse sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	7 inches	coarse sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.8 Min: 5.6
2	7 inches	40 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.8 Min: 5.6
3	40 inches	59 inches	stratified loamy sand to coarse sandy loam	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.8 Min: 5.6

Soil Map ID: 3

Soil Component Name: TUJUNGA

Soil Surface Texture: gravelly loamy sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	35 inches	gravelly loamy sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.3 Min: 6.1
2	35 inches	59 inches	gravelly sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Clean Sands, Poorly graded sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.3 Min: 6.1

Soil Map ID: 4

Soil Component Name: DELHI

Soil Surface Texture: fine sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish & Game
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/12/2016 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
AGUA MANSA MRF, LLC	***1830 AGUA MANSA ROAD***	***SW 0 - 1/8 (0.052 mi.)***	***B18***	***88***

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/12/2016 has revealed that there are 6 RCRA-SQG sites within approximately 0.25 miles of the target property.

CAN FIBRE	***1755 BROWN AVENUE***	***ESE 1/8 - 1/4 (0.244 mi.)***	***F34***	***116***

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 12/12/2016 has revealed that there is 1 RCRA-CESQG site within approximately 0.25 miles of the target property.

FLYERS #469	5840 20TH STREET	SW 1/8 - 1/4 (0.244 mi.)	E33	114

State- and tribal - equivalent NPL

RESPONSE: Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

A review of the RESPONSE list, as provided by EDR, has revealed that there is 1 RESPONSE site within approximately 1 mile of the target property.

Status: Certified
Facility Id: 33320002

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 10/31/2016 has revealed that there are 2 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, has revealed that there are 4 SWF/LF sites within approximately 0.5 miles of the target property.

State and tribal leaking storage tank lists

LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the LUST list, as provided by EDR, has revealed that there are 6 LUST sites within approximately 0.5 miles of the target property.

Environmental Interest/Information System
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that

TXI RIVERSIDE CEMENT CO CRESTMORE PLANT (Continued) **1016068533**

these facilities release directly to air, water, land, or that are transported off-site.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RB Case Number:	Not reported
LOC Case Number:	200420231
File Location:	Local Agency
Potential Media Affect:	Soil
Potential Contaminants of Concern:	Gasoline
Site History:	Site History/Release Information Two 2,000 gallon gasoline USTs were removed along with associated piping and fuel dispensers in November 2003. Soil samples were collected beneath the dispensers at 2 feet and 5 feet bgs, beneath piping, adjacent to and west of the USTs at 6 feet bgs, and within the UST cavity at 2 feet and 6 feet bgs. Maximum concentrations were 3780 ppm TPHg (T2-6), 520 ppb B (T2-6), 52600 ppb T (T2-6), 20000 ppb E (T2-6), 522000 ppb X (T2-6), 46 ppb MTBE (LED2), ND<4000 ppb TBA (T2-6), 9.45 ppm lead (T2-6). Samples were analyzed for TPHg, BTEX and oxygenates. The site was placed into LOP on October 23, 2003 for further assessment. Assessment Two soil borings (SB-1 and SB-2) were advanced to groundwater (approximately 76 feet bgs) in the vicinity of the former USTs on April 16, 2004. Soil samples from SB-1 and SB-2 were collected at five-foot intervals to a maximum explored depth of 76.5 feet bgs. The highest concentrations were observed from soil samples collected from soil

FLEETWOOD VIA RICARDO (Continued) **S106387361**

boring SB-1 (UST cavity) at the 15 and 20 foot depths. Maximum concentrations: 350 ppm TPHg (SB-1 at 20 feet bgs), 0.13 ppm B (SB-1 at 20 feet bgs), 5.6 ppm T (SB-1 at 20 feet bgs), 3.8 ppm E (SB-1 at 20 feet bgs), 35 ppm X (SB-1 at 20 feet bgs), 0.53 ppm MTBE (SB-1 at 15 feet bgs), 0.36 ppm tert-Butylbenzene (SB-1 at 20 feet bgs), 1.2 ppm Naphthalene (SB-1 at 20 feet bgs), 5.6 ppm 1,2,4-Trimethylbenzene (SB-1 at 20 feet bgs), 2.7 ppm 1,3,5-Trimethylbenzene (SB-1 at 20 feet bgs), ND<0.50 ppm Ethanol and Methanol. SVE Pilot Testing One vapor extraction well (VE-1) was installed on July 8, 2006 near the southeast corner of the former UST location. SVE well VE-1 was installed to 30 feet bgs and screened between 15 and 30 feet bgs. Soil samples were collected at 5 foot intervals and select samples were analyzed for gasoline and VOCs by EPA Method 8260B. Soil samples collected at 10, 20 and 30 feet bgs were analyzed and were ND for all constituents tested. A SVE pilot test was conducted July 12th through 14th, 2006. The SVE test was proposed for 5-days but was terminated after 48 hours due to a VOC breakthrough. PID readings reported during the SVE test were between 92 to >9999 ppmV and were believed to be erroneous. The consultant stated that laboratory analysis results for vapor samples were at relatively low levels and were inconsistent with field PID readings and more consistent with soil data. The overall mass of vapor phase gasoline recovered over the 48-hour duration of system operation was estimated at 34 lbs (average of 0.7 lbs per hour). Flow rates at VE-1 fluctuated between 50 and 75 cfm. Maximum vapor concentrations were: 740 ppmV TPHg (VE1-3), 2.5 ppmV B (VE1-3), 110 ppmV T (VE1-3), 23 ppmV E (VE1-3), 149 ppmV X (VE1-3), ND MTBE, 11 ppmV 1,2,4 TMB (VE1-3), 5.5 ppmV 1,3,5, TMB (VE1-3). Closure was requested based on the results of the pilot test and five quarters of groundwater monitoring RCDEH denied closure and required the 5-day SVE test to be repeated since vapor concentrations increased over time and the test was terminated after two days. A 5-day SVE pilot test using VE-1 was performed February 17th through 23rd, 2009. Flow rates at VE-1 were erroneously reported to fluctuate between 98 and 269.5 cfm and later corrected to range from 84 to 146 cfm. PID readings throughout the SVE test ranged from 40.4 to >15,000 ppmV. The ROI was calculated to include the entire footprint of the former UST cavity and dispensers. MW-1 is screened from 60 to 95 feet bgs and VE-1 is screened between 15 to 30 feet bgs. The overall mass of vapor phase gasoline recovered over the 143-hr duration of system operation was estimated at 233 lbs (avg of 1.6 lbs/hr). Maximum vapor concentrations were: 1100 ppmV TPHg, 0.97 ppmV B, 80 ppmV T, 20 ppmV E, 176 ppmV X, ND<0.28 ppmV MTBE, 0.94 ppmV isopropylbenzene, 2.4 ppmV n-propylbenzene, 0.24 ppmV PCE, 0.20 ppmV sec-butylbenzene, 11 ppmV 1,2,4-TMB, 5.7 ppmV 1,3,5-TMB. Ending vapor concentrations for most constituents detected were higher at the end of the 5-day SVE pilot test than at the beginning of the test. Based on the elevated vapor concentrations detected and mass of vapor phase gasoline recovered during the 5-day SVE pilot test, a 30-day SVE test was required by RCDEH to clearly demonstrate that vapor recovery has reached the point of diminishing returns (asymptotic levels). Soil Excavation Excavation of contaminated soil was proposed in lieu of performing additional SVE testing to expedite site cleanup. Approximately 3200 tons of impacted soil was excavated March 1st through March 23rd, 2010. Twelve (12) confirmation soil samples were collected at the bottom and side walls of the approximately 8192 square feet excavation pit. All soil samples were non-detect for all constituents tested except for 0.006 ppm Xylene and 0.006 ppm 1,2,4

FLEETWOOD VIA RICARDO (Continued) **S106387361**

TMB detected in the deep soil sample collected at the west wall of the excavation pit (X24 Deep Wall-W@ approximately 30 feet bgs). Groundwater Monitoring To assess the potential for groundwater impact near the UST, one groundwater monitoring well (MW-1) was installed on July 19, 2004 approximately 20 feet southeast of the former UST cavity that is believed to be downgradient. Soil samples were analyzed at 5 foot intervals from 5 feet to 75 feet bgs. MW-1 was advanced to a depth of 95.5 feet bgs and screened from 56 to 95 feet bgs. Groundwater was encountered at 75 feet bgs. Analytical results for the groundwater sample collected from MW-1 were non-detect for all constituents tested. Maximum soil concentrations were at 65 feet bgs: ND<0.5 ppm TPHg, ND<0.001 ppm B, 0.004 ppm T, 0.002 ppm E, 0.012 ppm X, 0.011 ppm MTBE, ND<0.002 ppm tert-BBNZ, ND<0.002 ppm Napthalene, ND<0.001 ppm 1,2,4-TMB, ND<0.001 ppm 1,3,5-TMB. Five groundwater sampling events were conducted from August 2004 through October 2007. Maximum groundwater concentrations: ND<0.50 ppm TPHg, ND<0.5 ppb B, 0.6 ppb T (10/17/07), ND<1.0 ppb E, ND<1.0 ppb X, ND<5.0 ppb MTBE, 7.6 ppb Naphthalene (9/19/05). Water levels have fluctuated from 73.20 to 78.66 feet bgs. Anticipated groundwater flow direction is to the southeast towards the Santa Ana River. The closest domestic water supply well (Well 04 Old Skotty) is located approximately 1049 feet west of the site and according to the well report on Geotracker, VOCs have not been detected in this well. Regional Board concurred with closure on 5/13/2010 and the no further action/closure letter was issued 6/14/2010

Environmental Interest/Information System

California Department of Toxic Substances Control EnviroStor System (DTSC-EnviroStor) is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

POTW: Not reported
Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Description:	RP states that a pump seal failed causing the release of cooling tower water to a drainage swale. The storm drain system would discharge into the Santa Ana River. However, the water has not been detected any further than 100' into the drainage swale. The estimated amount of the release is in excess of 10,000 gallons.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 12/05/2016
Date Data Arrived at EDR: 01/05/2017
Date Made Active in Reports: 02/03/2017
Number of Days to Update: 29

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 12/05/2016
Date Data Arrived at EDR: 01/05/2017
Date Made Active in Reports: 02/03/2017

Next Scheduled EDR Contact: 04/17/2017
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 12/05/2016

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 09/14/2016
Date Data Arrived at EDR: 10/04/2016
Date Made Active in Reports: 10/21/2016
Number of Days to Update: 17

Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Northeast Map:	5620416 SAN BERNARDINO SOUTH, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

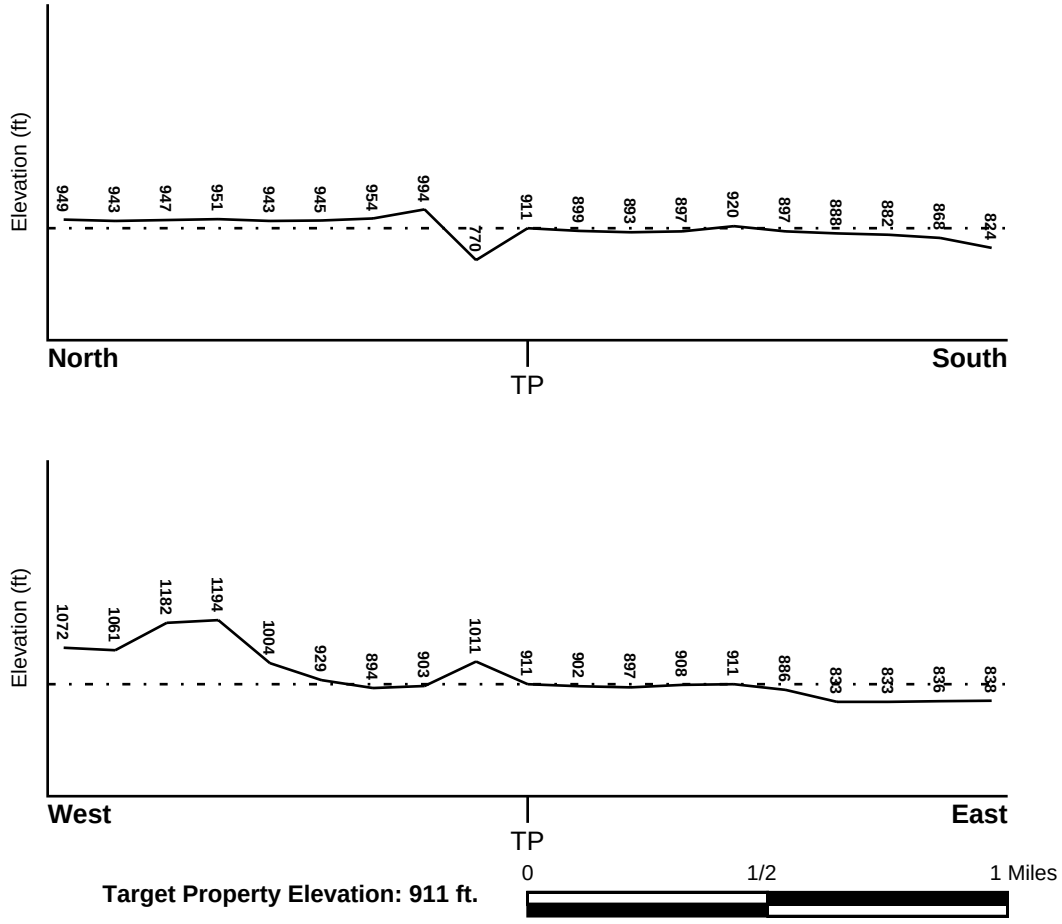
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06065C0045G	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06065C0065G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
FONTANA	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	1/4 - 1/2 Mile WNW
Site Name:	Riverside Cement Co Crestmore Plt
Site EPA ID Number:	CAD063844443
Groundwater Flow Direction:	SW ON A REGIONAL BASIS.
Measured Depth to Water:	not available, but a well 2,000 feet east of the site had a water level of 800 feet above mean sea level.
Hydraulic Connection:	Information is not available about the hydraulic connection between aquifer(s) underlying the site.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information is inferred in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
2	1/4 - 1/2 Mile WNW	Varies

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: QUARRIES

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 2

Soil Component Name: RAMONA

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	14 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 14 Min: 4	Max: 7.3 Min: 5.6
2	14 inches	22 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay. FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 14 Min: 4	Max: 7.3 Min: 6.1
3	22 inches	68 inches	sandy clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 4 Min: 1.4	Max: 7.3 Min: 6.1
4	68 inches	74 inches	gravelly sandy loam	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 8.4 Min: 6.6

Water System Information:

Prime Station Code:	02S/05W-11C02 S	User ID:	WAT
FRDS Number:	3310044004	County:	Riverside
District Number:	14	Station Type:	WELL/AMBNT
Water Type:	Well/Groundwater	Well Status:	Active Raw
Source Lat/Long:	340102.0 1172231.0	Precision:	100 Feet (one Second)
Source Name:	WELL 04 - OLD SKOTTY		
System Number:	3310044		
System Name:	Rubidoux Community SD		
Organization That Operates System:			
	P.O. Box 3098		
	Rubidoux, CA 92519		
Pop Served:	25000	Connections:	6554
Area Served:	RUBIDOUX		

Sample Collected:	04-MAY-11	Findings:	7.6
Chemical:	PH, LABORATORY		
Sample Collected:	04-MAY-11	Findings:	55. MG/L

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

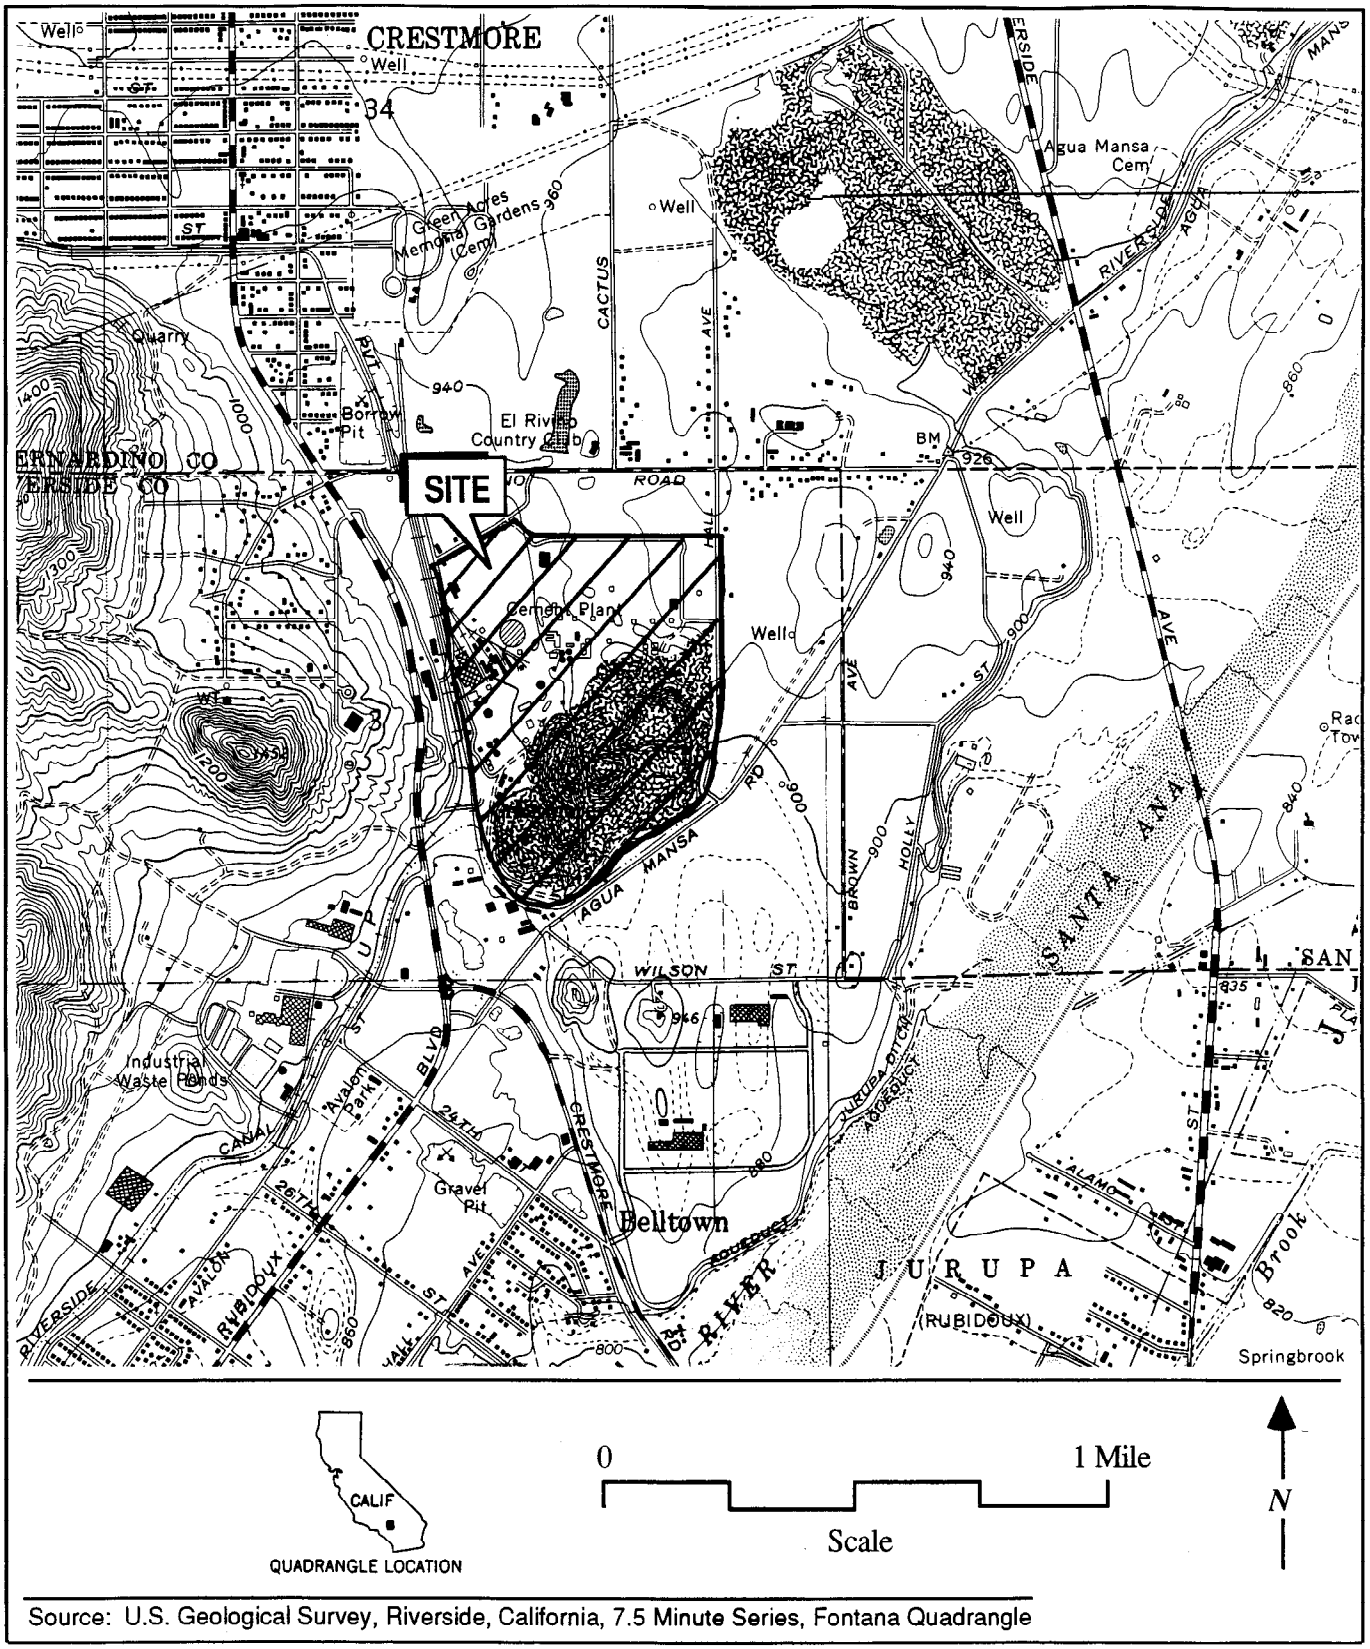
1.0 INTRODUCTION

The U.S. Environmental Protection Agency (EPA), Region IX, under the authority of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) and the Superfund Amendments and Reauthorization Act of 1986 (SARA), has tasked Bechtel Environmental, Inc. (BEI) to conduct a site inspection prioritization (SIP) of the Riverside Cement Co., Crestmore Plant (Riverside Cement Co.), site in Riverside, Riverside County, Calif., using the EPA's Hazard Ranking System (HRS) criteria. The HRS assesses the relative threat associated with actual or potential releases of hazardous substances at the site. The HRS has been adopted by the EPA to help set priorities for further evaluation and eventual remedial action at hazardous waste sites. The HRS is the primary method of determining a site's eligibility for placement on the National Priorities List (NPL). The NPL identifies sites at which the EPA may conduct remedial response actions. This report summarizes the results of the SIP of the Riverside Cement Co. site.

The Riverside Cement Co. site is located at 1500 Rubidoux Blvd., in Riverside, Calif. The geographic coordinates for the site are 34° 01' 36.0" N latitude and 117° 22' 50.5" W longitude (Township 2 South, Range 5 West, Section 3, Fontana, Calif., 7.5-minute quadrangle) (1). The location of the site is shown in Figure 1-1.

The Riverside Cement Co. site was identified as a potential hazardous waste site and entered into the Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) on August 1, 1980 (CAD 063844443) (2). A site inspection (SI) was conducted for the EPA on September 30, 1990 by Ecology and Environment, Inc. (3).



1.1 Apparent Problem

The apparent problems at the site are as follows:

- Between 1964 and 1990, approximately 250,015 tons of cement kiln dust (CKD) were disposed of on site (4). In 1990, analytical results of samples taken of the onsite CKD indicated the presence of cadmium, chromium, and lead at concentrations up to 2.9 milligrams per kilogram (mg/kg), 7.1 mg/kg, and 106 mg/kg, respectively (3,5).

- In 1990, analytical results of groundwater samples collected upgradient of the site indicated the presence of aluminum and chromium at concentrations of 26.9 micrograms per liter (µg/l) and 3.8 µg/l, respectively, and manganese at concentrations less than the analytical detection limit of 1 µg/l. During the same sampling event, analytical results of groundwater samples collected downgradient of the site indicated the presence of aluminum, chromium, and manganese at concentrations of 155 µg/l, 19.4 µg/l, and 34.4 µg/l, respectively. (3)

Figure 1-1 Site Location

2.0 SITE DESCRIPTION

The Riverside Cement Co. site is located at 1500 Rubidoux Blvd. in an industrial area of Riverside, Calif. The site is bordered to the west by Rubidoux Boulevard, to the south by the E.L. Yeager Construction Co. and agricultural land, to the east by agricultural land, and to the north by El Rivino Road. The site occupies approximately 40 acres and is enclosed by a 6-foot chain-link fence with a main entrance gate on Rubidoux Boulevard. (6)

The site contains several buildings and process structures, including a wastewater treatment plant, which currently support production of gray and white cement. Approximately two-thirds of the site is currently not used. Portions of the site where operations currently take place or have taken place in the past include the former CKD disposal areas, the gray and white cement kiln areas, the cement clinker storage area, the Wet Weather and Commercial quarries, a former boiler blowdown pond, and Crestmore Lake. Currently, 80 people work on site in three shifts, 24 hours daily, providing continuous plant operations. The company produces white and gray cement from the raw product, cement clinker, which is trucked in from off site. (6)

The inactive areas of the site are primarily in the eastern section. Past mining and process operations gradually ceased in these areas; however, many of the buildings and some large equipment still remain. Most of the former CKD disposal areas are in the central portion of the site and extend to the Wet Weather Quarry. In 1993, most of the disposal areas were capped with native soils. The gray and white cement kiln areas are located in the western portion of the site and were operating during the April 25, 1994 BEI site reconnaissance. The cement clinker storage area is located in the northern portion of the site and has cement clinker in outdoor storage piles. The boiler blowdown pond is located in the western portion of the site and was used to receive white plant discharge from 1985 to June 1990. The boiler blowdown pond is approximately 30 feet by 60 feet in area and approximately 4 feet deep. The pond is lined with plastic and covered by clay soil. (7) Crestmore Lake occupies approximately 8 acres and was formerly the Crestmore Mine. The sides of the lake slope to a depth of approximately 100 feet below ground surface. The lake was formed by past mining operations of the Crestmore Mine, which led to direct penetration of the underlying aquifer. Mining ceased in 1985 and groundwater continues to form the lake. (6)

CKD is no longer produced or disposed of on site. Waste refractory brick, also known as "basic brick," containing 10 percent hexavalent chromium, was used to line the hottest area of the rotary kilns. Over time these bricks eroded and were periodically replaced. From 1955 until 1979, approximately 48 cubic yards of basic brick were disposed of along with CKD at an unspecified onsite disposal area. From 1980 to 1987, these bricks were either recycled into the raw feed and made into cement or manifested for offsite disposal. (3) Currently, hazardous substances stored on site include a minor amount of lubricants and solvents used for maintaining equipment operation, cleaning equipment, and maintaining onsite vehicles. Riverside Cement Co. has arranged with chemical distributor companies to have new cleaning solutions trucked onto the site and to have spent solutions hauled away to be recycled. (6)

Two monitoring wells were installed on site in June 1991 but are not sampled regularly. Regular sampling of these wells may occur if plans to build an additional plant on the former CKD disposal areas commence. (4,6)

Printed on 50% recycled paper.

3.0 SITE INSPECTION PRIORITIZATION CONSIDERATIONS

Groundwater sampling was conducted as part of the SI completed for the EPA in September 1990. In November 1991, ERM-West, Inc., on behalf of Riverside Cement Co., conducted a study of the geology and hydrogeology beneath the site and submitted a report to the EPA summarizing its findings. The report stated that the hydraulically upgradient well located off site at the El Rivino Country Club (Well ERCC) and the downgradient well located off site at the E.L. Yeager Construction Co. (Well YCC), which were sampled at the time of the SI, may not be hydraulically connected. Furthermore, the report suggested that the detection of aluminum, chromium, and manganese in downgradient wells during the SI in 1990 may not be attributable to the former onsite disposal areas. ERM-West, Inc. installed Well MW-1, hydraulically upgradient and north of the former main disposal area and the Wet Weather Quarry, and Well MW-3, downgradient and south of the Commercial Quarry. In June 1991, ERM-West, Inc. collected groundwater samples from onsite and offsite wells and had the samples analyzed for metals by Curtis and Tompkins, Ltd. using EPA methods 6010, 7060, 7421, and 7740. Analytical results of samples collected from groundwater wells MW-1 and MW-3 indicated the presence of manganese at concentrations of 84 µg/l and 140 µg/l, respectively. Analytical results of these samples did not indicate the presence of aluminum or chromium above the analytical detection limits of 100 µg/l and 10 µg/l, respectively. Analytical results of a sample collected from Well YCC indicated the presence of chromium and manganese at concentrations of 12 µg/l and 10 µg/l, respectively. Analytical results of a sample collected from Well ERCC did not indicate the presence of aluminum, chromium, or manganese above the analytical detection limits. (4)

The California Environmental Protection Agency, Regional Water Quality Control Board (RWQCB), Santa Ana Region (formerly known as the California Regional Water Quality Control Board), has minimal involvement with the former CKD disposal areas. Currently, the RWQCB is involved in monitoring discharge of the wastewater at the site under Cleanup and Abatement Order 78-27. The order establishes wastewater discharge requirements for the onsite wastewater treatment plant, which is used to treat process wastewater. (8,9) The California Environmental Protection Agency, Department of Toxic Substances Control, Long Beach Region (DTSC) (formerly known as the California Department of Health Services, Toxic Substances Control Division), has not had any regulatory involvement with the site since the closure and removal of a 6-million-gallon oil tank from the site prior to 1988. (3)

The California Integrated Waste Management Board and the RWQCB conducted site inspections between 1991 and 1993; however, no citations were issued. Riverside Cement Co. currently maintains several operating permits from the South Coast Air Quality Management District (SCAQMD). In November 1993, the SCAQMD issued a citation for dust emissions from the cement clinker system and another, in 1990, for failure of the dust collection system. These citations were immediately resolved. (6)

Riverside Cement Co. submitted a plan in August 1991 to the RWQCB for closure of the former onsite CKD disposal areas. The plan called for using onsite overburden soil to cover the disposal areas with at least 12 inches of soil. (7) Closure of portions of the former CKD disposal areas began shortly after submittal of the plan. In August 1992, the RWQCB toured the closed areas and deemed that the existing soil coverage of 8 inches to 24 inches would be satisfactory for vegetation propagation. Currently, Riverside Cement Co. is seeking approval from the RWQCB for closure of the former boiler blowdown pond. (5)

According to reports and representatives from local municipal water companies, recent analytical results of samples collected from local municipal water supply wells have not indicated the presence of metals at levels above the state maximum contaminant levels (10,11,12,13,14).

Printed on 50% recycled paper.

As of April 15, 1994, the Riverside Cement Co. site is not listed in the Resource Conservation and Recovery Information System (RCRIS) database (15).

4.0 PERTINENT HAZARD RANKING SYSTEM FACTORS

The following pertinent Hazard Ranking System factors are associated with the site:

- A release of aluminum, chromium, and manganese from the site to the groundwater appears to be established. A release to groundwater is established when a hazardous substance is detected in a hydraulically downgradient groundwater sample at a concentration at least three times greater than the concentration detected in a hydraulically upgradient sample, and some portion of the release is attributable to the site. Analytical results of the May 1990 groundwater sampling effort indicate the presence of aluminum, chromium, and manganese downgradient of the site at concentrations of 155 µg/l, 19.4 µg/l, and 34.4 µg/l, respectively. Analytical results of groundwater samples collected upgradient of the site indicated the presence of aluminum and chromium at concentrations of 26.9 µg/l and 3.8 µg/l, respectively, and manganese at concentrations less than the analytical detection limit of 1 µg/l. (3) Analytical results of samples collected from wells ERCC and YCC in June 1991 indicate a release of chromium and manganese. Several municipal water companies operate drinking water wells within 4 miles of the site and rely solely on groundwater for their drinking water supply. (10,11,12,13,14)

- The surface water migration pathway does not appear to be of concern because the nearest surface water body to the site, the Santa Ana River, receives treated sewage effluent. There are no drinking water intakes, fisheries, or sensitive environments that may be impacted by the site within 15 miles downstream of the site. (16, 17)

- The air migration and soil exposure pathways do not appear to be of concern because most of the CKD disposal areas within the site are capped and the site is entirely fenced. Additionally, there are no residences, schools, or daycare centers on site. (5,7)

Printed on 50% recycled paper.

REMEDIAL SITE ASSESSMENT DECISION - EPA REGION IX

Site Name: Riverside Cement Co., Crestmore Plant EPA ID#: CAD 063844443

Alias Site Names: _____

City: Riverside County or Parish: Riverside State: CA

Refer to Report Dated: 6/22/94 Report type: Site Inspection Prioritization

Report developed by: Bechtel Environmental, Inc.

DECISION:

| | 1. **Further Remedial Site Assessment under CERCLA (Superfund) is not required because:**

| | 1a. Site does not qualify for further remedial site assessment under CERCLA (Site Evaluation Accomplished - SEA)

| | 1b. Site may qualify for further action, but is deferred to: | | RCRA | | NRC

|X| 2. **Further Assessment Needed Under CERCLA:** 2a. (optional) Priority: | | Higher |X| Lower

2b. Activity Type: | | PA |X| ESI | | SI | | HRS evaluation

| | Other: _____

DISCUSSION/RATIONALE:

RWQCB involved w/ closure of cement kiln dust disposal areas.

APPENDIX C

A168 0002

CONTACT REPORT

AGENCY/AFFILIATION: Rubidoux Community Services District		CODE: GW
DEPARTMENT: Water Department		
ADDRESS: 3590 Rubidoux Blvd.	CITY: Rubidoux	
COUNTY: Riverside	STATE: CA	ZIP: 92509
CONTACT(S) Joseph Zoba	TITLE Assistant General Manager	PHONE (909) 684-7321
BEI PERSON MAKING CONTACT: Daniel L. Wong DLW		DATE: 5/5/94 and 5/6/94
SUBJECT: Drinking Water Service in Rubidoux		
SITE NAME: Riverside Cement Co.	EPA ID: CAD 063844443	

DISCUSSION:

Mr. Zoba stated that the Rubidoux Community Services District Water Dept. has 5,200 connections. The water is currently extracted from eight wells. Five wells in the system have remained inactive since the late 1980s due to the presence of high levels of nitrate or total dissolved solid concentrations. The fully blended system relies entirely on groundwater with no well contributing greater than 40 percent of the supply.

The active wells are at the following locations:

- Well 1 - Crestmore Road and 34th Street
- Well 2 - Rubidoux Boulevard, north of Mission Boulevard at Arbuckle School Road
- Wells 5 and 7 - Daly Avenue and 36th Street
- Well 12 - Fort Drive
- Wells 13 and 16 - Callehermosa near Rio Road
- Well 14 - 46th Street at Jensen Road

The inactive wells are at the following locations:

- **Well 3 - 28th Street between Hall Avenue and Rubidoux Boulevard**
- **Wells 4 and 6 - Fleetwood Drive and Via Ricardo**
- **Well 8 - Daly Avenue and 35th Street**
- **Well 11 - Jensen Ranch Road and Riverview Drive**

CONTACT REPORT (Cont'd)

AGENCY/AFFILIATION: Rubidoux Community Services District		
CONTACT(S) Joseph Zoba	TITLE Assistant General Manager	DATE: 5/5/94 and 5/6/94
SITE NAME: Riverside Cement Co.		EPA ID: CAD 063844443

DISCUSSION (Cont'd):

The Water Dept. does not test each well on a programmatic basis, but tests are conducted as required and directed by the State Office of Drinking Water, San Diego Branch. In the future, the Water Dept. will extend its services to include the community of Crestmore and will take over operation of wells under the Crestmore Heights Mutual Water Co.

CONTACT REPORT

AGENCY/AFFILIATION: Mutual Water Co. of West Riverside		CODE: GW
DEPARTMENT: Water Department		
ADDRESS: 2475 Hall Ave.	CITY: Rubidoux	
COUNTY: Riverside	STATE: CA	ZIP: 92509
CONTACT(S) Joe S. Lara	TITLE President	PHONE (909) 682-8537
BEI PERSON MAKING CONTACT: Daniel L. Wong DLW 5/6		DATE: 5/6/94
SUBJECT: Drinking Water Service in Rubidoux		
SITE NAME: Riverside Cement Co.	EPA ID: CAD 063844443	

DISCUSSION:

Mr. Lara stated that the Mutual Water Co. of West Riverside operates one groundwater well which serves approximately 125 residences in the Belltown area within Riverside County. The well is located on Hall Avenue between Bell and El Rio avenues in Rubidoux. The well has been tested by the State Office of Drinking Water and recent findings have indicated the presence of nitrates at slightly above the state maximum contaminant level of 45 milligrams per liter. The groundwater table is at an approximate 50 foot depth and the groundwater in the vicinity of the well flows in the south-southeast direction. The well extends 160 feet below the ground surface (bgs) and the well pump extends down to 90 feet bgs.

CONTACT REPORT

AGENCY/AFFILIATION: Fort Fremont Mutual Water Co.		CODE: GW
DEPARTMENT: Water Department		
ADDRESS: 3918 Mennes Ave.	CITY: Riverside	
COUNTY: Riverside	STATE: CA	ZIP: 92509
CONTACT(S) Charlie Knox	TITLE Board of Director	PHONE (909) 683-6605
BEI PERSON MAKING CONTACT: Daniel L. Wong DLW		DATE: 5/6/94
SUBJECT: Drinking Water Service in Rubidoux		
SITE NAME: Riverside Cement Co.	EPA ID: CAD 063844443	

DISCUSSION:

Mr. Knox stated that the Fort Fremont Mutual Water Co. serves approximately 196 residences in the Riverside/Rubidoux area. The company operates two drinking water wells located on Fort Fremont Alley between Wallace and Mennes Aves. The system relies on 100 percent groundwater and the water is extracted utilizing a one-on and one-off approach. The choice of which well is used depends on the current demand at the time. Historically, testing of the water from these two wells has indicated the presence of nitrates at concentrations below those levels found in other wells in the vicinity. These wells have recently been tested two times per month by Babcock and Sons, Inc. under the jurisdiction of the State Office of Drinking Water and the Riverside County Department of Environmental Health.

SUBJECT: Drinking Water Wells in Bloomington		
SITE NAME: Riverside Cement Co.	EPA ID: CAD 063844443	

DISCUSSION:

Mr. Sikorski stated that there is one drinking water well in Bloomington, Well 29, operating within the West San Bernardino County Water system. The supply system has 2,000 connections and provides water to residents in Bloomington and Rialto. Well 29 relies solely on groundwater and is blended with water primarily from Well 16. Well 29 is located at Slover and Riverside avenues and is pumped only when demand is high. At most it provides up to 10 percent of the water for the supply system. The water from Well 29 is tested monthly for nitrates, PCE, and TCE. Previous analyses have indicated the presence of nitrates up to 39 milligrams per liter, PCE up to 1 microgram per liter (µg/L), and TCE up to 3 µg/L.

SUBJECT: Drinking Water Service in Crestmore		
SITE NAME: Riverside Cement Co.	EPA ID: CAD 063844443	

DISCUSSION:

Mr. Rither stated that the Crestmore Heights Mutual Water Co. operates two groundwater wells which provide the drinking water for the Crestmore community. The wells rely solely on groundwater and are located on El Rivino Road just east of Rubidoux Boulevard approximately 70 feet apart from each other. Water usage is monitored by 103 connection meters. The wells are tested monthly under the jurisdiction of Riverside County Department of Health and results over the past few years have indicated a presence of nitrates at near or above the state maximum contaminant level of 45 milligrams per liter.

BEI PERSON MAKING CONTACT: Daniel L. Wong DLW 12		DATE: 5/26/94
SUBJECT: Hydrogeological Effects of the Santa Ana River		
SITE NAME: Riverside Cement Co.	EPA ID: CAD 063844443	

DISCUSSION:

Mr. Makinde stated that the Santa Ana River may be dry during periods of the year. The amount of water in the river is dependent upon the amount of treated sewage effluent discharged into it from Colton, Rialto, and San Bernardino. To the best of his knowledge, the Santa Ana River does not serve as a hydrogeological barrier for groundwater flowing on either side of it. When the river is flowing, it flows in the southwest direction at the Riverside and San Bernardino County boundary.

SITE RECONNAISSANCE INTERVIEW AND OBSERVATIONS REPORT

Bechtel Environmental, Inc.
P.O. Box 193965
San Francisco, CA 94119-3965

OBSERVATIONS MADE BY: Daniel L. Wong and Tom Genolio DATE: April 25, 1994

FACILITY REPRESENTATIVE(S) and TITLE(S):

Eugene M. Kulesza, Manager of Regulatory Matters, Riverside Cement Co.
Patrick M. Hill, Plant Manager, Riverside Cement Co.
Frank T. Sheets, III, Director of Manufacturing, Riverside Cement Co.
Bruce G. Stevens, Hydrogeologist/Geologic Engineer, ERM-West, Inc.

SITE: Riverside Cement Co., Crestmore Plant

EPA ID: CAD 063844443

A site reconnaissance was conducted at the Riverside Cement Co., Crestmore Plant (Riverside Cement Co.), site on April 25, 1994. The weather was cloudy with occasional rain and the temperature was approximately 60°F. The Bechtel Environmental, Inc. (BEI) team, Daniel L. Wong and Tom Genolio, conducted the site reconnaissance with Eugene M. Kulesza, Patrick M. Hill, Frank T. Sheets, and Bruce G. Stevens at 1:00 p.m. to gather information on the site location and size, site history, processes used, and any hazardous substances generated, treated, stored, or disposed of on site. The BEI team was provided with a packet of information prepared in response to BEI's letter dated April 8, 1994. The reconnaissance included a site tour during which photographs were taken.

The following information was obtained during the site reconnaissance:

The Riverside Cement Co. site is located at 1500 Rubidoux Blvd. in an industrial area of Riverside, Calif. The site is bordered to the west by Rubidoux Boulevard, to the south by the E.L. Yeager Construction Co. and agricultural land, to the east by agricultural land, and to the north by El Rivino Road. The site occupies approximately 40 acres and is enclosed by a 6-foot chain-link fence with a main entrance gate on Rubidoux Boulevard. There are no residences, schools or daycare centers on site.

The site includes several buildings, process structures, and a wastewater treatment plant to support the production of gray and white cement. Approximately two-thirds of the site is currently not used. Portions of the site where operations currently take place or have taken place in the past include the former cement kiln dust (CKD) disposal areas, the gray and white cement kiln areas, the cement clinker storage area, a boiler blowdown pond, and Crestmore Lake. Currently, 80 people work on site in three shifts, 24 hours daily, providing continuous plant operations. The company produces white and gray cement from the raw product, cement clinker, which is trucked in from off site.

SITE RECONNAISSANCE INTERVIEW AND OBSERVATIONS REPORT (Cont'd)

Site: Riverside Cement Co., Crestmore Plant

The unused areas of the site are primarily in the eastern section. Past mining and process operations gradually ceased in these areas; however, many of the buildings and some large equipment still remain. Most of the former CKD disposal areas are located in the central portion of the site and extend to the Wet Weather Quarry. Several years ago, disposal of CKD in these areas ceased. In 1993, most of the former CKD disposal areas were capped with native soils. The current gray and white cement kiln areas are in the western portion of the site and were operating during the time of the BEI site reconnaissance. The cement clinker storage area is located in the northern section of the site and has cement clinker in outdoor storage piles. Crestmore Lake occupies approximately 8 acres of the site and was formerly the Crestmore Mine. The sides of the lake slope to a depth of approximately 100 feet below ground surface. The lake water had a clear appearance. The lake was formed by mining operations of the Crestmore Mine, which led to direct penetration of the underlying aquifer. Mining ceased in 1985 and the groundwater seeped through the excavated ground surface.

CKD is no longer produced or disposed of on site. Currently, hazardous substances stored on site include lubricants that are used for maintaining equipment operation, and other chemicals used for vehicle maintenance and equipment cleaning. Equipment cleaning solutions are supplied and brought on site by chemical distributor companies. Soiled rags used in cleaning processes and spent cleaners are usually taken off site by these haulers in bins or totes. The bins and totes are replaced with new supplies and clean rags. Site inspections by the California Integrated Waste Management Board and the California Environmental Protection Agency, Regional Water Quality Control Board, were infrequent between 1991 and 1993 and no citations were issued. Riverside Cement Co. currently maintains several operating permits from the South Coast Air Quality Management District (SCAQMD). In November 1993, the SCAQMD issued a citation for dust emissions from the cement clinker system and, in 1990, for failure of the dust collection system. These citations were immediately resolved.

Two monitoring wells, MW-1 and MW-3, were installed on site in the 1990s but are not sampled regularly. Regular sampling of these wells may occur if future plans for an additional plant to be built on the former CKD disposal areas commence.

Printed on 50% recycled paper.

Attachment F – Enforcement and Regulatory Agency Reference Documentation Cover Page

1.0 GENERAL INSTRUCTIONS

Complete this section electronically using readily available information and contact information from appropriate individuals. A Site Screening Assessment Contact Log (Attachment A) should be used to document information gained through correspondence, interviews, file reviews and telephone calls. Add extra pages if necessary

1.1 Origin of Site Under Assessment: Pick one

Origin		Required Information for submittal to EPA
New site from a discovery project	☐	Fill out entire SSA Form
Discovery Project Title:		
Existing CERCLIS Site which is a candidate for triage?	☒	Sections 1 and 3 minimum
New site: Independent Discovery Vehicle	☐	Fill out entire SSA Form

1.2 Core Locational Information:

Site Name: Riverside Cement Company – Crestmore Plant

Other Names:

Site Street Address: 1500 Rubidoux Boulevard

City, County, State: Riverside , Riverside , California

Zip Code: 92502 -

Primary EPA ID Number: CAD063844443

Secondary EPA ID #s:

In Calsites Database? ☒ Yes ☐ No If, yes, specify ID number 33140002

CA DTSC REGION: Cypress (4)

CA RWQCB REGION: Santa Ana (8)

Latitude: 34.02558 Longitude: -117.38991

MAD Code:

Note: Latitude and Longitude coordinates along with MAD code will be generated by the USEPA GIS Center along with an accompanying "Site Evaluation Map and Site Report (Attachment B) of this document. Latitude and Longitude coordinate and accompanying Site Evaluation Maps should be requested via email to the EPA Document Control Officer, Joan Simmons

1.3 CERCLA Eligibility

Complete the following checklist. If Ayes@ is marked, the site may not be eligible for CERCLA assessment without further justification. Please explain in the Decision / Rationale section below.		**YES**	**NO**
1	Does the site already appear in CERCLIS?	☒	☐
2	Is the release from products that are part of the structure of, and result in exposure within, residential buildings or businesses or community structures?	☐	☒
3	Does the site consist of a release of a naturally occurring substance in its unaltered form, or altered solely through naturally occurring processes or phenomena, from a location where it is naturally found?	☐	☒
4	Is the release into a public or private drinking water supply due to deterioration of the system through ordinary use?	☐	☒
5	Is some other program actively involved with the site (i.e., another Federal, State, or Tribal program)?	☐	☒
6	Are the hazardous substances potentially released at the site regulated under a statutory exclusion (i.e , petroleum, natural gas, natural gas liquids, synthetic gas usable for fuel, normal application of fertilizer, release located in a workplace, naturally occurring, or regulated by the NRC, UMTRCA, or OSHA)?	☐	☒
7	Are the hazardous substances potentially released at the site excluded by policy considerations (e.g., deferral to RCRA Corrective Action)?	☐	☒
8	Is there sufficient documentation that clearly demonstrates that there is no potential for a release that could cause adverse environmental or human health impacts (e.g., comprehensive remedial investigation equivalent data showing no release above ARARs, completed removal action, documentation showing that no hazardous substance releases have occurred, EPA approved risk assessment completed)?	☐	☒
9	Part of a NPL-Site?	☐	☒

Briefly explain all "yes" answers in "Decision/Rationale" section below. Use number reference.

Number **Explanation of "yes" answer:**

1 Riverside Cement Company – Crestmore Plant was identified as a potential hazardous waste site and entered into the Comprehensive Environmental Response, Comprehensive and Liability Information System (CERCLIS) as of August 1, 1980

	Yes	No
SITE IS CERCLA ELIGIBLE	☒	☐
Note: This recommendation should be included on Executive Summary Page		

1.4 Removal Assessment Eligibility

Use the following eligibility criteria to determine if the site should be referred for emergency response. If the answer to any question is yes, get the site may be eligible for referral emergency response If a question cannot be answered, explain why in the Comments section below.

1.	Is there actual or potential exposure to nearby populations, animals, or the food chain from hazardous substances, pollutants, or contaminants?	☐ Yes	☒ No
2.	Is there actual or potential contamination of drinking supplies or sensitive ecosystems?	☐ Yes	☒ No
3.	Are hazardous substances, pollutants, or contaminants in drums, barrels, tanks, or other bulk storage containers which may pose a threat of release?	☒ Yes	☐ No
4.	Are there high levels of hazardous substances, pollutants, or contaminants are soils largely at or near the surface, which may migrate and affect populations or the environment?	☐ Yes	☒ No
5.	Could weather conditions cause hazardous substances, pollutants, or contaminants to migrate or be released?	☐ Yes	☐ No
6.	Is there a threat of fire or explosion?	☐ Yes	☒ No
7.	Are there appropriate Federal or State response mechanisms to respond to the release or potential release?	☒ Yes	☐ No
8	Are there other situations or factors which may pose threats to public health, welfare, or the environment?	☐ Yes	☒ No
9	For the situation where there appears to be primarily a groundwater contamination problem, is there a near-surface source which can be removed?	☐ Yes	☒ No

Please explain all "yes" answer(s), noting question number (character max = 400, attach additional page if necessary):

3. Bulk tanks on site include Diethyl Glycol (DEG) and acetic acid. Used oil, oil rags and other cleanup material is stored in drums in the hazardous waste concrete storage area. DEG, gasoline, diesel oil are flammable, but they are not easily combustible or hazardous in the manner they are stored in.

Past groundwater analyses have shown that disposal activities at the Riverside Cement Co (RCC) have not significantly impacted groundwater. The results of groundwater sampling showed that the concentrations of metals and other constituents were not elevated at the quarry area with respect to upgradient and downgradient wells and also were not above drinking water action limits (MCLs).

According to Mr. Gregory A. Knapp of the Riverside Cement Company, the RCC Crestmore Plant does not generate any more waste All waste is recycled back into the kilns to become a product and there is no more land disposal. In the mid-1980's, Crestmore stopped production of grey cement and currently only produces white cement.

7 The Regional Water Quality Control Board, Santa Ana (RWQCB) is overseeing the closure of the following areas: closure of the Boiler blow down, Disposal Pond, and the CKD Dust Disposal Area. RCC still needs to supply RWQCB with site soil cover depths before closure. The Riverside County Health Services Agency oversaw the remedial excavation of the hydrocarbon impacted soil.

	Yes	No
Refer to Emergency Response	☐	☒
Note: This recommendation should be included on Executive Summary Page		

3.0 REGULATORY AND ENFORCEMENT HISTORY

Provide information regarding past and present regulatory and enforcement activity associated with the site Citations and reference documentation should be included *for **initiation, status, and certification*** documents used for substantiating site status. Web links may be used when accompanying a short narrative regarding what the document in the link states about the site. *Sections 3 1 through 3.4 are limited of 1800 characters (approximately two paragraphs). Responses requiring more space should be included as a reference to this report and identified below with the statement "See Attachment F".*

This section, along with section 1 required for Other Cleanup Activity (OCA sites ("G4 sites"))

Primary Regulatory Agency Involved ☐ Federal ☒ State ☐ Local ☐ None

Note: This recommendation should be included on Executive Summary Page

3.1 Regulatory Agencies: Federal

The site discovery date in the Comprehensive Environmental Response, Comprehensive and Liability Information System (CERCLIS) is August 1, 1980

U.S. EPA approved a Preliminary Assessment on September 1, 1988 and a Site Inspection on December 1, 1990.

The Department of Toxic Substances Control (DTSC) conducted a Site Investigation Reassessment for the U S EPA in December of 2002.

3.2 Regulatory Agencies: State

The Lahontan RWQCB enforced waste discharge requirements for the site in 1989.

The Regional Water Quality Control Board, Santa Ana (RWQCB) is overseeing the closure of the Boiler blow down, Disposal Pond, and the CKD Dust Disposal Area. RCC still needs to supply RWQCB with site soil cover depths before closure.

The South Coast Air Quality Management District (SCAQMD) permitted numerous processes at the site. RCC was in compliance with its permits SCAQMD updates the facility's permits to require further air pollution controls on open stockpiles and conveyors that contribute to the site's dust emissions

3.3 Regulatory Agencies: Local

The County of Riverside, Department of Health completed a site investigation and remedial action for the underground storage tanks at the Site in November of 1991. It was decided that no further action was required at that time.

3.4 PRP Viability

Riverside Cement Company (RCC) was established in 1906. In January of 1958, RCC became part of American Cement Corporation whose name was changed to Amcord in May 1973. In December 1979, Gifford-Hill & Co. Inc., a Texas Co , acquired Amcord and in October 1986, Beazerm Plc , an English firm, acquired Gifford-Hill & Co. Inc. In January 1991, RCC became a California General partnership. Then, in June of 1991, half of the partnership was acquired by Ssangyong Cement of Korea and the other half was controlled by Beazer West.

In February of 1995, Ssangyong Cement Industrial Co Ltd became the 100% owner of the Riverside Cement Company (RCC). On September 9, 1997, a press release from Dallas indicated that Texas Industries, Inc. reached an agreement to purchase RCC from Ssangyong Cement Industrial Co. Ltd.

The Riverside Cement Company is viable.

Is the contamination petroleum related: No

Section 2: Operational History

Current owner: Riverside Cement Co. - Crestmore
Current operator: Riverside Cement Company
Hazardous materials used: Kiln brick-containing chromium
Hazardous materials suspected: Chromium
Dates of operation: 1914 until Present

Historical owners/operators that may have used Hazardous Materials onsite:
Specify dates and materials that may have been used:

Owners:
Operators:
Hazardous materials used:
Hazardous materials suspected:
Dates of operation:

Section 3: Site Impact Information

What is the site setting: Industrial
Details:

Land use surrounding the site: Industrial
Details:

Are there residences within 200 feet: No
Details:

Are there schools/day care centers within 200 feet: No
Details:

Surface water within 2 miles of the site? Yes
Details: The nearest surface water bodies are the Santa Ana River and the Riverside Canal which are both used for irrigation or flood control purposes.

Are there any sensitive environments or wetlands within 2 miles of site: No
Details: A habitat for the federally-listed endangered species Kangaroo Rat (Stevens Kangaroo Rat) is located 15 miles from the site. The Delhi Sands Giant Flower-Loving Fly has been recognized as endangered, but presently, no habitat has been established.

Is this site a source of contamination to surface water? No
Details:

Is surface water used for drinking water within 15 miles of the site? No

If yes, is the surface water used for public / commercial supply:

If yes, is the surface water used for private supply:

If yes, approximately how many people served by the surface water:

Details:

Is groundwater used for drinking water within 4 miles of site? Yes

If yes, are the drinking wells public / commercial: Public **or private**

If yes approximately how many people served by the ground water: 60,058

Details: The closest drinking water well is the Crestmore Heights Mutual Water Company. The closest operating down-gradient public water supply wells are 3.75 miles away in the river alluvium and are not likely to be impacted by the cement kiln dust (CKD) disposal since the proximal wells in the alluvium show no impact.

Is groundwater within 4 miles of the site known to be contaminated with hazardous substances? Yes

If yes, what hazardous substances: Chromium, lead, and manganese

If yes, do any of the levels exceed drinking water standards? No

Details: In 1991, Ecology and Environment, Inc. sampled two existing wells hydraulically upgradient and downgradient of the Wet Weather Quarry. Analyses of the samples indicated the presence of chromium, lead, and manganese in the downgradient well at concentrations greater than three times than in the upgradient well.

Is this site a source of ground water contamination? Unknown
Details: Contamination of groundwater could possibly be caused by migration of soil contamination into groundwater.

Any Community Involvement? No
Details:

Site Reconnaissance

1. **Date of visit:** March 30, 2009
2. **Adjacent properties:**

   North El Ravino Golf Course
   South Industrial
   East Industrial
   West Residential & Industrial

3. **Structures onsite (e.g. Office Bldg, Paint Booth, Repair Shop etc.):** Office building, packing house, maintenance shop, the plant (all operations idled); Railroad tracks run though the property and are operational.

4. **Any visual staining:** No

5. **Any hazardous Materials storage onsite:** Waste oil

6. **Specify any hazardous Materials used onsite:** None

7. **Indicate if following are present onsite, specify volume, content and how many:**

a) **Drums:** Yes, a number of 55-gallon drums of waste oil
b) **ASTs:** Yes, diesel & gas
c) **USTs:** No
d) **Clarifiers:** Yes, for truck wash
d) **Other:**

8. **Any transformers containing PCBs?** Possibly; Southern California Edison Company is currently leasing a portion of the facility

9. **Any previous sampling results:** Yes, see Attachment E.

Section 4: Recommendations/Conclusions

Does the site pose an immediate threat and require Removal? No

Have there been any historical releases at the site: Yes. Used kiln brick containing chromium, was disposed of in a landfill located on-site from 1955 to 1979. As of June 1984, records from the RWQCB show that well 60-1 located on-site is contaminated with chromium. Old mine shafts were also used to dispose of various wastes according to the same records.

Based on the site reconnaissance and/or regulatory search is there a potential for a release at the site? No

Summary

Riverside Cement Company (RCC) was established in 1906. In January 1958, RCC became part of American Cement Corporation whose name was changed to Amcord in May 1973. In December 1979, Gifford-Hill & Co. Inc., a Texas Co., acquired Amcord and in October 1986, Beazerm Plc., an English firm, acquired Gifford-Hill & Co. Inc. In January 1991, RCC became a California General partnership. Then, in June of 1991, half of the partnership was acquired by Ssangyong Cement of Korea and the other half was controlled by Beazer West.

In February of 1995, Ssangyong Cement Industrial Co. Ltd became the 100% owner of Riverside Cement Company (RCC). On September 9, 1997, a press release from Dallas indicated that Texas Industries, Inc. reached an agreement to purchase RCC from Ssangyong Cement Industrial Co. Ltd.

The RCC - Crestmore Plant (Crestmore) was identified as a potential hazardous waste site and entered into the Comprehensive Environmental Response, Comprehensive and Liability Information System (CERCLIS) as of August 1, 1980.

Crestmore operates a cement-manufacturing plant utilizing limestone from a mine located on-site. The Site has been in operation since approximately 1914. Four kilns are used to heat a mixture of limestone, clay, and sand, producing cement. Calcium carbonate, aluminum oxide, iron oxide, and silica oxide are mixed together and then sent through the kiln with the resulting charcoal-like substance pulverized into cement powder and then bagged. The kiln bricks are stressed by extreme heat and must be replaced every eight or nine months. According to a CERCLA form submitted by the company, used kiln brick containing chromium was disposed in a landfill located on-site from 1955 to 1979. As of June 1984, records from the Regional Water Quality Control Board (RWQCB) show that well 60-1 located on-site is contaminated with chromium. Old mine shafts were also used to dispose of various wastes according to the same records. (Department of Health Services – Toxic Substances Control Division, 1984.)

Bulk tanks on site include Diethyl Glycol (DEG) and acetic acid. Used oil, oil rags, and other cleanup materials are stored in drums in the hazardous waste concrete storage area. DEG, gasoline, diesel oil are flammable, but they are not easily combustible or hazardous in the manner they are stored in.

Past groundwater analyses have shown that disposal activities at Crestmore have not significantly impacted groundwater. The results of groundwater sampling showed that the concentrations of metals and other constituents were not elevated at the quarry area with respect to upgradient and downgradient wells and also were not above drinking water action limits (MCLs).

According to Mr. Gregory A. Knapp of RCC, Crestmore does not generate any more waste. All waste is recycled back into the kilns to become a product and there is no more land disposal. In the mid-1980's, Crestmore stopped production of grey cement and currently only produces white cement.

The Regional Water Quality Control Board, Santa Ana (RWQCB) is overseeing the closure of the following areas: closure of the Boiler blow down, Disposal Pond, and Cement Kiln Dust

(CKD) Dust Disposal Area. RCC still needs to supply RWQCB with site soil cover depths before closure. The Riverside County Health Services Agency oversaw the remedial excavation of the hydrocarbon impacted soil. (See attachment)

The South Coast Air Quality Management District (SCAQMD) permitted numerous processes at the site. RCC was in compliance with its permits. SCAQMD updates the facility's permits to require further air pollution controls on open stockpiles and conveyors that contribute to the site's dust emissions.

The County of Riverside, Department of Health completed a site investigation and remedial action for the underground storage tanks at Crestmore in November of 1991. It was decided that no further action was required at that time.

The Department of Toxic Substances Control (DTSC) conducted a number of Site Reassessments for the U.S. EPA, the last taking place in December of 2006.

In November of 1995 Ryan-Murphy, Inc. (RMI) conducted a remedial excavation for the Site in which approximately 525 cubic yards of hydrocarbon impacted soil in the area of the former white kiln fuel pipeline was removed. (See attachment)

In a letter from RRC to Mr. Johnson Abraham of DTSC dated March 14, 2003, Mr. Gregory Knapp indicated that all CKD, limestone quarry, and bricks removed from the white kilns are recycled back into kilns as feed and become product.

As of the date of the site visit conducted (March 30, 2009), for this site reassessment, all kilns and mills operations had been idled (due to the economic downturn.)

EXECUTIVE SUMMARY

The United States Environmental Protection Agency, Region IX (EPA) issued a Field Investigation Team (FIT) report in September 1990 which recommended that the Riverside Cement Company (RCC) Crestmore facility be assigned a higher priority for a Listing Site Investigation (LSI). The primary basis for this recommendation was the conclusion that disposal operations at the RCC site had adversely impacted ground water with chromium. ERM-West, Inc. (ERM-West) has reviewed the FIT Report and after further analysis and extensive hydrogeological studies, has found significant differences in the technical analyses, the underlying assumptions, and the resulting conclusions of the FIT Report

ERM-West concludes through their extensive analysis of existing and new information that the RCC facility has not impacted ground water with chromium. This would close the case for RCC's Crestmore Facility with an EPA finding of NO FURTHER ACTION

The important findings of the FIT Report were the following:

- The predominant waste stream from the cement manufacturing operations was cement kiln dust (CKD);
- A minor waste stream was waste refractory brick containing 10% hexavalent chromium. Approximately 48 cubic yards of this brick was codisposed with 250,015 tons of CKD between 1955 and 1979; and
- Ground water has apparently been impacted by the facility

ERM-West reviewed the geology and hydrogeology in the vicinity of the Crestmore facility and determined that the field conditions were much more complex than presented in the FIT report and did not support the conclusions in the FIT report. ERM-West installed and sampled two new monitoring wells, MW-1 and MW-3, which are immediately upgradient and downgradient of the former CKD disposal area. ERM-West also collected ground water samples from the wells originally sampled for the FIT report.

Based on the ground water analyses from samples collected by ERM-West (Table 3-2 and Appendix D), the disposal activities at the RCC site have not significantly impacted ground water. In summary, the results of ground water sampling showed that the concentrations of metals and other constituents were not elevated at the quarry area with respect to upgradient and downgradient wells, and further were not above drinking water action limits. The data collected by ERM-West confirms that concentrations of trace metals of any health

concern are below EPA maximum contaminant levels (MCLs) even in MW-1, MW-3, and the Yeager Construction Company (YCC) well.

Based on ERM-West's technical review of the information presented in the FIT Report and the data collected during ERM-West's field investigation, the FIT Report conclusions and summary of significant HRS factors are not supported by site conditions. The RCC site does not warrant further action by the EPA under CERCLA for the following reasons:

- The data do not support the FIT Report conclusion that ground water has been impacted by disposal of CKD and basic brick.

- Chromium concentrations in the ground water and surface water samples collected at the RCC facility and in the ground water from the YCC well are well below the drinking water standard of 50 µg/l (Tables 3-1 and 3-2) and may be attributable to natural conditions. The fact that no chromium was detected in the monitoring wells directly upgradient (MW-1) and downgradient (MW-3) of the CKD disposal areas supports this conclusion and confirms that the disposal has not impacted the ground water in the river alluvium.

- The YCC well may not be directly downgradient of the CKD disposal areas based on the hydrologic interpretation by Rowe as shown on Figure 2-5 MW-3 is directly downgradient and shows no impact by chromium (Table 3-2).

- The volume of basic (refractory) brick containing hexavalent chromium that was disposed of in the quarries was extremely small (less than 0.02%) compared to the large volume of CKD. Due to the property of CKD and cement to hydrate in the presence of water and to neutralize acid, the potential to leach trace metals from CKD or from basic brick codisposed with CKD is minimal

- The closest operating downgradient public water supply wells are 3.75 to 4 miles away in the river alluvium and are not likely to be impacted by the CKD disposal since the proximal wells in the alluvium (MW-1, MW-3 and the YCC well) show no impact.

SECTION 1

1.0 INTRODUCTION

The Riverside Cement Company (RCC) Crestmore Facility is owned and operated by RCC. The facility, as indicated in Figure 1-1, is located approximately 2.5 miles south of Interstate 10, and south of the City of Crestmore in Riverside County (Township 2 West, Range 5 West, Sections 2 and 3, San Bernardino Base Line and Meridian)

The United States Environmental Protection Agency, Region IX (EPA) issued a Field Investigation Team (FIT) report in September 1990 which recommended that a further investigation be performed at the Crestmore facility, which would be considered a Listing Site Investigation (LSI) The primary basis for this recommendation was the conclusion that disposal operations at the RCC site had adversely impacted ground water with chromium. ERM-West, Inc. (ERM-West) has reviewed the FIT Report and, after further analysis and extensive hydrogeological studies, has found significant differences in the technical analyses, the underlying assumptions, and the resulting conclusions Our technical evaluation of the FIT Report is presented below and demonstrates that the disposal operations have had no significant impact on ground water

1.1 EPA Contractor Activities

On August 11, 1989, personnel from Ecology and Environment, Inc. (E&E), the EPA contractor, met with facility representatives from RCC and toured the Crestmore Plant (Figure 1-1). This visit was the Screening Site Inspection (SSI) at RCC's Crestmore Plant. The SSI was conducted under the authority of the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA) and the Superfund Amendments and Reauthorization Act of 1986 (SARA).

The FIT collected soil and ground water samples during the second visit to the plant on May 30, 1990. A report summarizing the findings of the FIT was issued on September 30, 1990. The important findings of the FIT Report were the following:

- The predominant waste stream from the cement manufacturing operations was cement kiln dust (CKD);

- A minor waste stream was waste refractory brick containing 10% hexavalent chromium. Approximately 48 cubic yards of this brick was codisposed with 250,015 tons of CKD between 1955 and 1979; and

- Ground water has apparently been impacted by the facility

The EPA recommendation based on the FIT Report was to perform a further site investigation at RCC's Crestmore facility within the Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS). The primary technical basis for this decision was the conclusion that ground water was impacted by the CKD disposal.

1.2 Focus of Technical Evaluation

This technical evaluation concentrates on the hydrogeology and potential impacts to ground water. In developing this evaluation, ERM-West reviewed the following information in addition to that presented in the FIT Report.

- Unpublished mine dewatering and ground water reports on the Crestmore Mine;

- Boring logs of diamond drill holes, mine dewatering wells and ground water wells in the immediate vicinity of the mine;

- Historical mining and water handling plans;

- Correspondence with the Santa Ana Regional Water Quality Control Board (RWQCB); and

- Ground water and surface water chemical analyses from Crestmore Lake, the Commercial Quarry and ground water wells in the area.

Based on the review of available data, ERM-West installed three new monitoring wells around the CKD disposal areas. ERM-West sampled two of the new monitoring wells and several key ground water wells in the area (see Section 3).

1.3 Generation and Disposal of CKD and Basic Brick

During the operation of the kilns, off-specification materials were generated in the form of CKD, raw feed materials and cement. Refractory brick in the cement kilns was physically abraded at high

temperatures by the clinker moving across the surface The brick was replaced when it was so thin (2-3 inches) that insulation protection to the outer steel shell was compromised. The approximately 48 cubic yards of refractory (basic) brick that were codisposed with approximately 250,000 tons of CKD were normally small fragments.

Figure 1-2 shows the disposal areas for CKD at the Crestmore Plant. In the three Crestmore Plant disposal areas (Commercial Quarry, Wet Weather Quarry and Crestmore Lake) the CKD was disposed of along the edges of steeply mined areas. The disposal area boundaries are modified from Figure 2-2 in the FIT Report to reflect the fact that nearly all of the CKD and raw feed adjacent to the Commercial Quarry was recovered and used as a mill or kiln feed supplement.

1.3.1 Wet Weather Quarry

The Wet Weather Quarry (Figure 1-2) was the main CKD disposal area. The CKD ranges in thickness from two feet to greater than 60 feet. RCC last used this disposal area in 1990 when they ceased disposal and has since capped and covered the CKD on site A closure plan for this disposal area has been submitted to the Santa Ana Regional Water Quality Control Board.

After the available CKD at the Commercial Quarry was exhausted, CKD and off-specification cement was recovered for mill and kiln feed supplement from the west central portion of the Wet Weather Quarry. This area was chosen because of accessibility to trucks and front-end loaders Recovery of CKD was halted in this area in 1987.

1.3.2 Commercial Quarry

The Commercial Quarry (Figure 1-2) was a secondary CKD disposal area used primarily during the 1960s The Commercial Quarry was mined again in the 1970s, and the majority of the CKD was removed Nearly all of the remaining CKD was recovered in the late 1980s for mill or kiln feed supplement. The disposal area shown on Figure 1-2 represents the area where only traces of CKD are found.

Limestone crops out along the western edge of the Commercial Quarry, and the limestone/alluvium contact is present on the western edge of the excavated area. Mining records indicate that a pocket of limestone was planned to be mined out to an approximate elevation of 790 feet on the west side of the excavation. This mined out area is now partially covered by water and is referred to as Sky Blue Pond.

1.3.3 North Side of Crestmore Mine

The north side of the Crestmore Mine was not designated as a disposal area for CKD. Some spillage may have occurred in this area from trucks transporting CKD to the Wet Weather Quarry, or CKD may have been temporarily stored in this area prior to disposal. The small amount of CKD which appears to be present on the slope at the north end of the Crestmore Mine was probably pushed over the slope by heavy equipment when this area was leveled for storage of clay, limestone and other raw materials.

1.4 Chemical Analyses and Properties of CKD

Metals analyses of CKD were summarized in the FIT Report in Tables 5-1 (page 5-2) and 5-5 (page 5-8). These analyses demonstrated that CKD is not a hazardous waste under total or leachable metals tests. However, the FIT Report tables do not compare CKD metals concentrations with similar results from the background soil sample BD-1 (FIT Report, Appendix D, Table 1A in the ICF Technology August 3, 1990 laboratory report).

Table 1-1 summarizes the trace metals concentrations in CKD from the data presented in the FIT Report and total threshold limit concentration (TTLC) waste evaluation criteria. Table 1-1 demonstrates that the concentrations of trace metals in the background sample exceeds those in the CKD sample by the following percentages:

- Aluminum (by 23.5%)
- Chromium (by 69.0%)
- Nickel (by 27 5%)
- Vanadium (by 820.4%)

The majority of the soil in the area is derived from the natural processes of mechanical and chemical breakdown of the granitic and metasedimentary bedrock present at the surface. CKD generated at the Crestmore Plant resulted from processing of metamorphosed limestone and related granitic rocks that were mined from the same bedrock terrain. The presence of these metals in the background sample at concentrations exceeding those in CKD is therefore not surprising.

The concentrations of some trace metals in CKD are higher relative to the concentrations in background sample BD-1. This is due to the fact that the raw materials used in the kiln process (i.e., on-site

Table 1-1

limestone and off-site clays, sands, etc.) are, in many cases, totally unlike the background material as far as trace metals are concerned. Even though some of the metals are higher in concentration than in the background sample, all of the metals concentrations in the CKD are less than 10% of the applicable TTLC

Since CKD is a calcined material (containing silicates and oxides), water that comes in contact with the extremely fine-grained CKD causes the CKD to form a cement-like mass. Based on this property, CKD naturally binds water that comes in contact with it and creates a barrier to further water penetration.

1.5 Other Factors

In the following sections, the factors that affect E&E's assessment of the HRS factors are presented. The complex hydrogeology of the site is presented in Section 2. Ground water chemistry is discussed in Section 3 with particular emphasis on the sample collection performed by E&E and later by ERM-West, Inc. The conclusions of the technical evaluation are summarized in Section 4.

SECTION 2

2.0 GEOLOGY AND HYDROGEOLOGY

During the course of aboveground and underground mining operations at the Crestmore Plant, a large amount of information has been compiled concerning geology and ground water. This research was conducted because the flow of ground water into the open quarry areas and Crestmore Mine directly affected the feasibility of mining and cement production.

The majority of the data was organized and reported in 1928 by W P Rowe and in the 1950s by W. P. Rowe and Son. The water level data used in interpreting the hydrogeology was based on numerous small diameter diamond drill holes completed in the alluvium and bedrock and on mine dewatering wells.

2.1 Geology and Hydrogeology of the Crestmore Plant Area

Plate I shows the surface geology of the eastern portion of the Jurupa Mountains, including the Jensen Quarry and Crestmore Mine. The Crestmore Mine is located in the east central portion of the map with mine coordinates superimposed over the bedrock exposure. The Crestmore facility is located in an area which constitutes an isolated extension of the Jurupa Mountains surrounded by alluvial deposits. The Jurupa Mountains consist of granitic bedrock containing isolated metamorphosed limestone units, including the exceptionally high-quality Chino, Wet Weather and Commercial Limestone deposits at the Crestmore facility.

Figure 2-1 shows the surface geology at the Crestmore facility that existed in 1930 prior to extensive development of the Wet Weather and Commercial Quarries (Daly, 1931). Figure 2-1 shows a slightly larger exposed area of bedrock compared to Plate I because the exposure of the Chino Limestone in the Crestmore mine workings is included in the detailed geologic map. Ground water occurs in three distinct hydrologic units at the Crestmore Plant:

- Santa Ana River Alluvium;
- Wet Weather and Commercial (upper) Limestone; and
- Chino (lower) Limestone

Figures 2-2, 2-3 and 2-4 are cross-sections (located on Figure 2-1) that show the stratigraphic relationships of these hydrologic units.

The Chino Limestone originally cropped out where the Crestmore Mine is located (Figure 1-2). Since this limestone was of exceptionally high quality, two detailed dewatering feasibility studies were conducted by W.P. Rowe in 1928 and 1950. These studies involved detailed geologic interpretation of the numerous core holes in the area, installation of new wells, pump tests and large scale laboratory models.

2.2 Review of Historical Studies for Mine Dewatering Activities

W P Rowe (1928) demonstrated in his studies that the quartz diorite layers (granite) above and below the Chino Limestone acted as confining layers (Figure 2-2). Only a small portion of the Chino Limestone comes into contact with alluvial deposits (Figure 2-5 and cross-sections 2-2, 2-3, 2-4) of the Santa Ana River Inflow to the Chino Limestone from the alluvial deposits is extremely limited due to clay layers in the lower portion of the alluvium and natural clay seals within the cracks and fissures along the Chino Limestone-alluvium contact.

The limestone in the Wet Weather and Commercial Quarries (Figure 2-5) is in contact with the alluvium over a wide area east of the outcrop as shown on Figure 2-1. Figure 2-5 presents Rowe's 1928 interpretation of ground water levels prior to large volume pumping of ground water to dewater the Crestmore Mine. Water levels in wells screened in the two upper limestone units (Wet Weather and Commercial) were identical in elevation and demonstrated that the shallow limestone was in direct hydraulic contact with the river alluvium. In contrast the deeper limestone unit (Chino Limestone) was demonstrated to be effectively isolated from the river alluvium because wells screened in the Chino Limestone vary in elevation only a few hundredths of a foot over nearly the same map area (well elevation numbers in parentheses in Figure 2-5).

The northern portion of Figure 2-5 indicates the alluvial water level is approximately 9 feet higher than the Chino water level at drill hole 20. Rowe concluded that the vast majority of the water in the Chino Limestone originated from direct percolation of rainwater at the mine and influx from a deep source somewhere below the Santa Ana River to the east based on his 1928 observations of well water temperature measurements and of aquifer response to precipitation events. During the course of dewatering the mine between 1928 and 1950, the influx of water from the northern Chino Limestone contact with the alluvium was minor Water levels in alluvium wells dropped approximately 10 feet during the initial stages of mine

dewatering Subsequent lowering of the Chino Limestone water table had no further impact on alluvial water levels.

By 1950, underground mining had been successfully accomplished to an elevation of 660 feet above sea level or approximately 165 feet below the water table in the river alluvium. Using water quality data obtained from several wells and the mine sump combined with water balance calculations, W.P. Rowe (1950) concluded that inflow to the mine from the Santa Ana River alluvium was approximately 400 gallons per minute (gpm) The southern contact of the Chino Limestone with the alluvium covers a much smaller area than the northern contact (Figure 2-5) and represents the area over which the limestone aquifer discharged to the alluvium prior to mine dewatering activities. Based on sulfate ion concentrations, W.P Rowe (1950) concluded that the southern contact of the Chino Limestone to the alluvium provided only 30 gpm of the calculated total alluvium contribution of 400 gpm to the Chino Limestone during mine dewatering.

During mining, the upper limestone unit (Figure 2-1) was considered to be two separate limestones. The Wet Weather and Commercial Limestones are actually part of a continuous limestone unit in cross-section (Figure 2-4) that were partially separated at the original surface outcrops by a lobe of granite. The lobe of granite is shown on Figure 2-1 as the protuberance between WD8 and diamond drill hole 32.

According to W P Rowe (1928), the Commercial Limestone was more dense and massive, analogous to the structure of the Chino Limestone but the Wet Weather Limestone was honeycombed and fissured. Hydraulic connection of lower portions of the wet weather limestone and the alluvium were inferred to be very strong, but since many of the fractures and fissures were filled with clay, the hydraulic connection was restricted. and W.P Rowe noted a small decrease in gallons pumped per foot of drawdown in the Wet Weather Limestone as drawdown in the pumping well increased. Dewatering efforts at the Wet Weather Quarry confirmed that ground water influx to the quarry decreased as the water table was lowered. The sealing properties of the clay layers in the alluvium above the contact with the Wet Weather Limestone allowed mining down to an elevation of approximately 780 feet.

2.3 Hydrogeologic Effect of Final Mining Activities and Mine Closure

Aboveground and underground mining activities at the Crestmore facility have affected the hydrogeology of the Chino Limestone, the Wet Weather Limestone and the Santa Ana River alluvium. Overall,

the pre-mining primary sources of water to these aquifers have not changed. The following sections describe the current sources of water and hydrologic conditions for these aquifers.

2.3.1 Chino Limestone

In 1985, a 12-foot diameter drift approximately 200 feet above sea level was cut across from the deeper limestone unit (Chino Limestone) in the Crestmore Mine to the upper limestone unit that was mined in the Wet Weather and Commercial Quarries. The drift was installed because mining in the Chino Limestone had reached to approximately 65 feet below sea level, and mining at deeper levels was not feasible.

Unfortunately after the drift was cut, water from the alluvium and the upper limestone unit began to flood the Crestmore Mine through the drift. An attempt was made to seal the drift, but the seal was only partially successful, and the mine was allowed to flood to the present water level in Crestmore Lake.

Since the drift was not completely sealed between the upper and lower limestone units, the sources of recharge for Crestmore Lake and the Chino Limestone water used on site from Well 88-1 (formerly Chino Test Well #1) now include:

- Precipitation;
- Northern Chino Limestone contact with the river alluvium;
- Water from within the Chino Limestone aquifer deeper to the east; and
- Drift to the Wet Weather Limestone at 220 feet above sea level.

The relative contributions from these sources to balance the water withdrawal in production well 88-1 vary seasonally The southern contact of the Chino Limestone with the river alluvium (Figure 2-5) has probably resumed its pre-1930s role as a minor ground water discharge point to the river alluvium. This southern contact is certainly less efficient in allowing discharge than in pre-mining conditions because of efforts to seal off this zone during mining to reduce pumping costs.

The contribution of ground water from the upper limestone unit and the river alluvium to the Chino Limestone through the drift to the upper limestone is probably minor because of the following factors:

- Efforts to seal the drift,

- Historically higher water levels in the Chino Limestone compared to the Commercial and Wet Weather Limestone since the hydrologic conditions have reverted back to pre-mining conditions;

- Greater storage capacity of the Chino Limestone created by the underground mining activities; and

- Easier flow path through the Chino Limestone from deeper levels due to grouting operations to control water inflow in the upper areas of the mine during mining operations.

2.3.2 Wet Weather Limestone

Surface mining of the Wet Weather Limestone in both the Wet Weather and Commercial Quarries relied on the partial sealing effect of degraded granite overlying the limestone to the east and the presence of a clayey zone in the lower portion of the river alluvium. No grouting was reportedly required to enhance dewatering activities. The sources for water in the Wet Weather Limestone are therefore the same as before mining activities began and include the following·

- Precipitation;

- Wet Weather Limestone contact with the river alluvium (partially sealed by degraded granite and clay); and

- Water from within the Wet Weather Limestone aquifer deeper to the east.

Although the relative contributions of these sources vary seasonally, the contact with the alluvium provides the primary source for ground water and the surface water in the Commercial Quarry as demonstrated on Figure 2-5

2.3.3 Santa Ana River Alluvium

Aboveground and underground mining activities have affected the sources of water to the alluvium over time. Some alluvium was directly excavated during surface mining, but the majority of this material was above the historic water table The sources of water to the alluvium include the following:

- Precipitation;

- Upgradient ground water from within the Santa Ana River alluvium to the north and northeast;

- Southeastern contact of the Wet Weather Limestone in the Commercial Quarry with the alluvium;

- Surface recharge from the Riverside Irrigation Canal southwest of the Crestmore Mine. A significant portion of the water in this canal in the past was treated water from the Chino Limestone during active underground mining; and

- Southern Chino Limestone contact with the river alluvium (partially sealed with grout during active underground mining).

The base flow of ground water and precipitation are the primary sources for ground water in the Santa Ana River alluvium in the area. The additional sources may significantly contribute to the alluvium ground water only in the immediate area where these sources are present.

2.4 Summary

The hydrogeology at and in the vicinity of the Crestmore plant is extremely complex. An understanding of that hydrogeology is essential to understanding the source of the ground water in the nearby wells and of the surface water found in the Sky Blue Pond and Crestmore Lake.

Based on the hydrogeology discussed in this section, the El Rivino Country Club well, the Yeager Construction Company well, well 60-1, MW-1 and MW-3 are all installed in the alluvium However, although the Yeager Construction Company well appears to be generally downgradient of the Crestmore facility (particularly Well 60-1), it is probably not directly downgradient of wells MW-1 and MW-3 or the former kiln dust disposal areas. Surface water in Sky Blue Pond is comprised of alluvium water and water from the upper limestone unit.

Well 88-1 draws primarily from the deep limestone unit (Chino Limestone) with minor contributions from the alluvium and upper limestone unit through the drift. Similarly, water in Crestmore Lake (the flooded mine) primarily consists of water from the deep limestone unit. The Crestmore Heights water well is screened in deep bedrock, but is not screened in either the deep limestone unit, the upper limestone unit, or the alluvium.

SECTION 3

3.0 GROUND WATER CHEMISTRY

The evidence cited in the FIT Report was primarily used to support the assertion that a release to ground water was observed (FIT Report, page 8-1). Before further action is undertaken by EPA, a thorough technical evaluation should be made to determine whether a basis exists substantiating that an impact has occurred or is occurring on the ground water. An understanding of the ground water (and surface water) chemistry and of the hydrogeology that controls ground water flow, is therefore critical to evaluating whether the site should remain in the EPA CERCLA program.

3.1 Available Data Prior to EPA Site Screening Investigation

E&E reviewed the data from the public water supply wells in the vicinity of the Crestmore Mine. The closest well is operated by the Crestmore Heights Mutual Water Company, which serves approximately 100 households. This well, which is located near the entrance to the cement plant on El Rivino Road (Figure 3-1), was installed in bedrock but not in the Chino Limestone. Ground water from this well is therefore not likely to be in hydraulic connection with the Chino Limestone. Although E&E assumed that this well could be impacted, ground water gradients clearly demonstrate that the well is upgradient. This well could not therefore be impacted by activities at the Crestmore Plant.

3.1.1 Well Sampling Data

RCC voluntarily sampled the on-site wells in 1976 and has sampled well 60-1 every year since 1984 because this water is used for industrial purposes on site. In the FIT Report (Table 5-2 on page 5-5 and Table 5-3 on page 5-6), chromium data are presented which indicate elevated chromium concentrations in 1976. No details are available on how the ground water samples were collected or whether the water collected in 1976 was filtered. The analyses for total chromium were high enough to justify subsequent analytical testing for hexavalent chromium, the valence state for which the federal maximum contaminant level (MCL) was set at 0.05 mg/l This subsequent sampling showed concentrations of hexavalent chromium below the MCL. The hexavalent chromium is normally a

low percentage of the total chromium. In this case, the hexavalent chromium comprised 33% of the total chromium concentration

Since 1984, RCC has sampled well 60-1, and well 88-1 has been sampled since 1988. Total chromium concentrations have remained at or below 0.02 mg/l over that entire period of time. The 1976 analyses for total chromium therefore represent an anomaly that has not been repeated.

The FIT Report states that chromium was detected in plant wastewater in 1973. The chromium detected at that time was due to an unusual one-time release to the facility water treatment unit of recirculated cooling water treated with a chromate corrosion inhibitor. The outfall for the water treatment plant is located on the Riverside Irrigation Canal southwest of the Crestmore Mine. This outfall location is definitely downgradient of alluvial well 60-1, and consequently the 1973 chromium discharge from the wastewater treatment plant would not have impacted this well.

3.1.2 Surface Water Sampling Data

Several recent water samples were collected from Sky Blue Pond, which is the standing water in the Commercial Quarry, and from Crestmore Lake (Appendix B). Although in close proximity to the former kiln dust disposal areas, these analyses have shown similar chromium concentrations to analytical results from water samples collected from the wells and are well below drinking water action levels. In most cases, the chromium test results are either below the minimum detection limit (0.01 mg/l) or barely above that concentration.

The pH and general water chemistry from Crestmore Lake shows strong similarity to the water chemistry from ground water samples collected from Well 88-1, which draws water directly from the flooded Crestmore Mine workings. The pH and general water chemistry from Sky Blue Pond show some differences from the general water chemistry of ground water samples collected from alluvium wells, but the concentration of chromium is also well below drinking water action levels.

3.2 Data Generated During the EPA Investigation

During the two site visits associated with the SSI, E&E collected samples of CKD and background soil, plus water samples from two wells: one they assumed was an upgradient irrigation well in the river alluvium at the El Rivino Country Club (ERCC) and the other

they assumed was a downgradient well in the alluvium used for truck washing at the Yeager Construction Company (YCC) site Figure 3-1 shows the location of these wells.

3.2.1 Ground Water Well Data Presented in the FIT Report

Table 3-1 summarizes the complete results from the FIT Report for the metals discussed in the FIT Report plus a few other important metals. As stated in Section 3.2.1, no field observations were made concerning the appearance of the ground water samples. These analyses are therefore considered for the purpose of this discussion to represent total metal concentration in the sample collected and may therefore include trace metals leached from sediment during sample preservation.

In the FIT Report (Table 5-4, page 5-7), E&E chose to present selected analyses for aluminum, chromium and manganese Arsenic and copper concentrations are actually slightly lower in the YCC well than in the ERCC well, and barium and iron are higher in the YCC well compared to the ERCC well.

Chromium concentrations were the critical item presented on Table 5-4 in the FIT Report. Table 3-1 shows the chromium concentrations from all water samples analyzed as part of the SSI. Chromium concentrations in the ground water samples from the YCC well are slightly higher than in the ERCC well, but the difference in concentrations is not significant and does not demonstrate that RCC has impacted ground water to the extent that any further actions (including investigation) are required. The slightly higher concentrations of 10 µg/l could be attributable to any combination of the following circumstances:

- Impact from local alluvial aquifer recharge by YCC use of truck wash water for dust control;
- Impact from gravel pit operations adjacent to the YCC site,
- Leaching of chromium from sediment in the unfiltered water sample as a result of field sample preservation with nitric acid; and
- Natural local ground water conditions.

In the May 1990 E&E Sampling Plan (page 3-7), the potential for on-site wastewater at the YCC site to adversely impact the ground water collected from the downgradient well was discussed and dismissed. ERM-West concludes that this potential should not be dismissed. All evidence must be considered for the investigation and its conclusions to be considered technically thorough and sound. The wastewater

that is generated from the truck wash (located above the well) comes in contact with grease, oils and hydraulic fluids in addition to finished asphalt product. Trace heavy metals are associated with these products and could account for some increased metal concentrations detected in ground water at the YCC site.

Regardless of source, the highest concentration of chromium detected in the YCC well (less than 20 µg/l), is considerably lower than the chromium MCL of 50 µg/l.

Aluminum, barium, manganese and iron are also present at higher concentrations in the YCC well compared to the ERCC well (Table 3-1), but these higher concentrations could all be attributable to one or any combination of the sources listed above. Indeed the concentrations of these metals were higher in background soil sample BD-1 compared to the two samples of CKD collected by the FIT. E&E assumed that the YCC well was downgradient and being impacted by CKD. However, a comparison of the chromium test results for the YCC well, 60-1 and 88-1 (FIT report Table 5-2 page 5-5) indicates that no leaching of chromium from the CKD has occurred since all of the chromium test results are in the same range.

In a telephone conversation on September 7, 1990 (Appendix A to the FIT Report), E&E reported that Mr. Adelson at the RWQCB stated that the concentrations were not high enough to warrant action by the RWQCB at the RCC facility. Mr. Adelson also noted that the trace metals in the YCC and ERCC wells were inconsequential and could be attributable to natural ground water conditions.

3.2.2 CKD Leachability Testing

To evaluate the potential for CKD to impact ground water, E&E requested that S&S analyze the CKD samples using the California Department of Health Services (DHS) WET procedure, which is analogous to the federal EP Toxicity analysis. The results were presented on Table 5-5 (page 5-8) in the FIT Report, and other metals from the E&E testing are combined in Table 1-1 to show leachability tendencies. The units for both Total and Leachable metals have been changed to mg/L so that an easier comparison can be made

The extraction procedure demonstrated that an extremely small (5% or less) of the total metals were leachable and all were considerably below the STLC limits. This WET procedure was developed by the DHS to simulate the leachability of metals under general landfill conditions. At the RCC site, the CKD (and basic brick) is codisposed with off-specification cement, and the entire mass of disposed materials has a high potential for acid neutralization. In addition, the materials naturally harden to a cement-like mass in the presence of water, which would further reduce the leachability of the

materials. Under the conditions of disposal, in-situ acid leaching of the disposed materials is extremely unlikely, and the STLC concentrations presented in Table 1-1, while very low in absolute terms, overstate what the actual leachability of CKD would be.

3.3 Collection of Recent Ground Water Data

In June 1991, ERM-West installed three monitoring wells in the river alluvium on the east side of the RCC facility as shown on Figures 1-2 and 3-2. Each well was installed for the following purpose

- MW-1 was installed upgradient of the disposal areas in the Wet Weather and Commercial Quarries.
- MW-2 was installed adjacent to the southeastern Wet Weather Quarry disposal area. After review of the hydrogeology, it was decided that MW-2 would not be the best representative upgradient or downgradient well location. MW-1 and MW-3 were determined to be the best choices for upgradient or down gradient wells, respectively.
- MW-3 was installed downgradient of the disposal areas in the Wet Weather and Commercial Quarries.

ERM-West also collected samples from the ERCC and YCC wells for comparison with analytical results from the FIT sampling efforts and from the new monitoring wells installed as part of this investigation.

3.3.1 Installation and Sampling Procedures

Well installation and sampling procedures are presented in Appendix C. The complete analytical results from the ground water sampling performed by ERM-West is included in Appendix D. Since MW-2 was not appropriately located upgradient or down-gradient, no water samples were collected from this well. The QA/QC procedures followed during ERM-West's investigation are summarized in Appendix E.

3.3.2 Analytical Results

Table 3-2 summarizes selected data from the analytical results of ground water samples collected by ERM-West. The data presented on Table 3-2 corresponds to similar parameters on Table 3-1.

TABLE 3-2

1 El Rivino Country Club Well
2 Yeager Construction Company Well
3 All analyses are in µg/l

The ERCC well and well 60-1 are the upgradient alluvial wells on Figure 3-1, whereas, well 88-1 primarily draws water from the lower limestone unit (Chino Limestone). Chromium, which is the metal of most interest for this site given the co-disposal of chromium bricks with the CKD, was found in almost identical concentrations in well 60-1, well 88-1, and the YCC well but was found at slightly lower concentrations in the El Rivino Country Club well This pattern suggests that the chromium concentrations in 60-1, 88-1, and the YCC wells are naturally-occurring, resulting from close contact with the bedrock (i.e., Chino limestone and granite) at the bottom of those wells.

In any event, the chromium concentrations the 60-1, 88-1, and YCC wells is not related to the former CKD disposal area since none of those wells are located downgradient from that area. Chromium concentrations in MW-1 and MW-3, which are immediately upgradient and downgradient of the former CKD disposal area, were below detection limits (as were the chromium concentrations in Sky Blue Pond and Crestmore Lake), further indicating that the former CKD disposal area is not releasing chromium into the ground water The concentrations of other metals (except barium) listed on Table 3-2 for the ERCC well and well 60-1 are below laboratory detection limits

As in the previous ground water sample analyses presented on Table 3-1, iron and manganese were higher in concentration in the YCC well compared to their concentration in the ERCC well The iron and manganese concentrations in the YCC well were less than one-third the concentrations in the sample collected in the YCC well by E&E in 1990. Since these water samples were collected toward the end of the work day when the well had been pumped all day long, the concentrations presented in Table 3-2 may more accurately report actual aquifer conditions due to more complete purging.

The water quality for all the ground water samples collected by ERM-West was good as all of the metal concentrations were considerably below the Primary Drinking Water MCL standards. The data from the new wells, as well as the existing wells, show that chromium is not being leached from the brick within the CKD or from the CKD itself. In fact, there is no data to indicate that any metals are being leached from the CKD area.

SECTION 4

4.0 EVALUATION OF GROUND WATER CONDITIONS

This section summarizes the evidence cited in the FIT Report and the ground water data collected more recently by ERM-West and presents a technical basis for evaluating the ground water data for the Crestmore facility.

4.1 FIT Report Hazard Ranking System Factors

The FIT Report (page 8-1) presented a summary of significant HRS considerations based on the results of the SSI The conclusion drawn by E&E that primarily impacts the HRS considerations was that an observed release to ground water has occurred. The most significant HRS considerations consist of the following:

- High toxicity of hexavalent chromium;
- Observed release to ground water,
- Community supply well located 0 4 miles from site, and
- Moderate ground water target population.

The following sections address these significant HRS factors raised in the FIT Report and demonstrate that the waste materials placed in the quarries have not impacted ground water in the area

4.2 Hazard Posed by CKD and Basic Brick Disposal

Based on the chemical analyses from Section 1.4, CKD does not pose a significant hazard due to metals content. The hazard is further mitigated by the properties of the CKD and codisposed off-specification cement. These materials tend to hydrate in the presence of water to form a hard and dense cement-like mass. Under natural conditions this material is relatively impermeable.

Since a maximum of 48 cubic yards basic brick was codisposed with 250,015 tons of CKD, this material is encased within the cement-like CKD and off-specification cement. The relatively small volume of

basic brick is therefore not likely to leach hexavalent chromium to ground water. The ground water analyses presented in Table 3-2 support the conclusion that an observed release to ground water did not occur and is therefore not a significant factor.

4.3 Evidence from Chemical Analysis of Ground Water and Surface Water Samples

The FIT Report states that the ground water analyses indicate an impact on ground water downgradient of the RCC site Table 3-1 summarized the ground water data from the SSI and indicated that many trace metals that are also present in CKD were not detected above the laboratory detection limits. Arsenic and copper were in fact detected at reduced concentrations in the YCC well compared to the ERCC well.

Chromium concentrations were the critical item presented on Table 3-1 Chromium concentrations in the ground water samples from the YCC well are only slightly higher than those of the ERCC well, but the difference in concentrations does not demonstrate that RCC has impacted ground water to the extent that any further actions (including investigation) are required. The net average increase in concentrations of 10 µg/l could be attributable to any combination of the following circumstances:

- Natural local ground water conditions;
- Impact from local alluvial aquifer recharge by YCC use of truck wash water for dust control;
- Impact from gravel pit operations adjacent to the YCC site; and
- Leaching of chromium from sediment in the unfiltered water sample as a result of field sample preservation with nitric acid

Regardless of source, the highest concentration of chromium detected in the YCC well was less than 20 µg/l, while the MCL for chromium in drinking water is 50 µg/l.

In addition, Mr. Mark Adelson at the CARWQCB stated that the concentrations of trace metals were inconsequential and could be attributable to natural ground water conditions. This statement provides independent technical confirmation that the downgradient concentrations of metals in Table 3-1, particularly the aluminum, chromium and manganese cited in the FIT Report as the primary evidence for ground water impact, do not constitute evidence of downgradient ground water impact. The data presented in Table 3-2 from the ground water sampling performed by ERM-West further

confirms that the concentrations of metals may be completely natural and do not support a conclusion that ground water in the alluvium has been adversely impacted by disposal of CKD.

The field investigation performed by ERM-West confirmed that existence of fill materials on the eastern side of the Wet Weather and Commercial Quarries. The investigation of previous ground water studies provided information from Rowe's field work in 1928 which indicated the presence of a fault (Figure 2-5). Based on Rowe's interpretation, the YCC well may not be directly downgradient of the CKD disposal areas due to the potential influence of the fault on the flow of ground water in the alluvium.

However, the ground water samples collected from MW-1 and MW-3 provide ground water data immediately adjacent to the main CKD disposal areas. Chromium concentrations in these wells were below the laboratory detection limit of 10 µg/l. Chromium concentrations in the YCC well and the upgradient on-site production wells from the alluvium (60-1) and Chino Limestone (88-1) were consistent at the 12-13 µg/l level and well below the 50 µg/l MCL.

The pH and general water chemistry from Crestmore Lake show strong similarity to the water chemistry from ground water samples collected from well 88-1, which draws water directly from the flooded Crestmore Mine workings. The pH and general water chemistry from Sky Blue Pond represent a mixture between Chino Limestone water from Crestmore Lake and alluvium ground water. The concentration of chromium is well below drinking water action levels in both locations, and the analytical results do not indicate any impact from disposal of CKD in these areas. This again supports the fact that an observed release to ground water did not occur and is therefore not a significant factor.

4.4 Location of Crestmore Heights Public Water Supply Well

Figure 3-1 shows the location of the Crestmore Heights water supply well. The well is located upgradient (northwest) of the RCC disposal sites. Any potential impact on ground water from the disposal of CKD and basic brick would be to the east of the Crestmore Mine based on the direction of ground water flow (as determined from the extensive records collected for mine dewatering efforts presented in Section 2). The presence of this public water supply well upgradient of the facility is therefore not a significant factor In addition this well is not completed in either the alluvium or the deep limestone unit (Chino Limestone) so that, in any event there is no hydraulic connection between that well and the Crestmore facility aquifers

4.5 Ground Water Target Population

The technical analysis by E&E (Table 5-7 on page 5-11 in the FIT Report) regarding the population statistics for the area was reasonable. As discussed in Section 4.4, the closest water supply well is upgradient of the disposal operations at the RCC site

The floodplain of the Santa Ana River is downgradient of the site. This area is zoned for industrial and agricultural use because of the potential for flooding. Due to the long agricultural history of the area, excess nitrate concentrations are a problem further downgradient of the site. On page 5-3 of the FIT Report, the two wells operated by the Rubidoux Community Service District (RCSD) approximately 3.75 miles downgradient of the RCC site are discussed without implication concerning any adverse impact from the RCC site on these wells. In the FIT Report Contact log, the RCSD reported that one of these wells was shut down in 1988 due to nitrate contamination. However, the highest nitrate concentration detected during the ERM-West's investigation was in the upgradient ERCC well, thus demonstrating that no adverse nitrate impact on ground water has occurred from the RCC operations (Appendix D).

Due to the potential for nitrate contamination, it is unlikely that any additional public water supply wells will be installed east or south of the RCC site. Since the EPA has declared the Santa Ana River a Toxic River, installation of public water supply wells in the river alluvium is even less likely. The target population downgradient of the RCC site will probably remain the same or decrease as river alluvium wells are retired due to contamination from agricultural nitrate and pesticide application or storm water and city sewer outfalls.

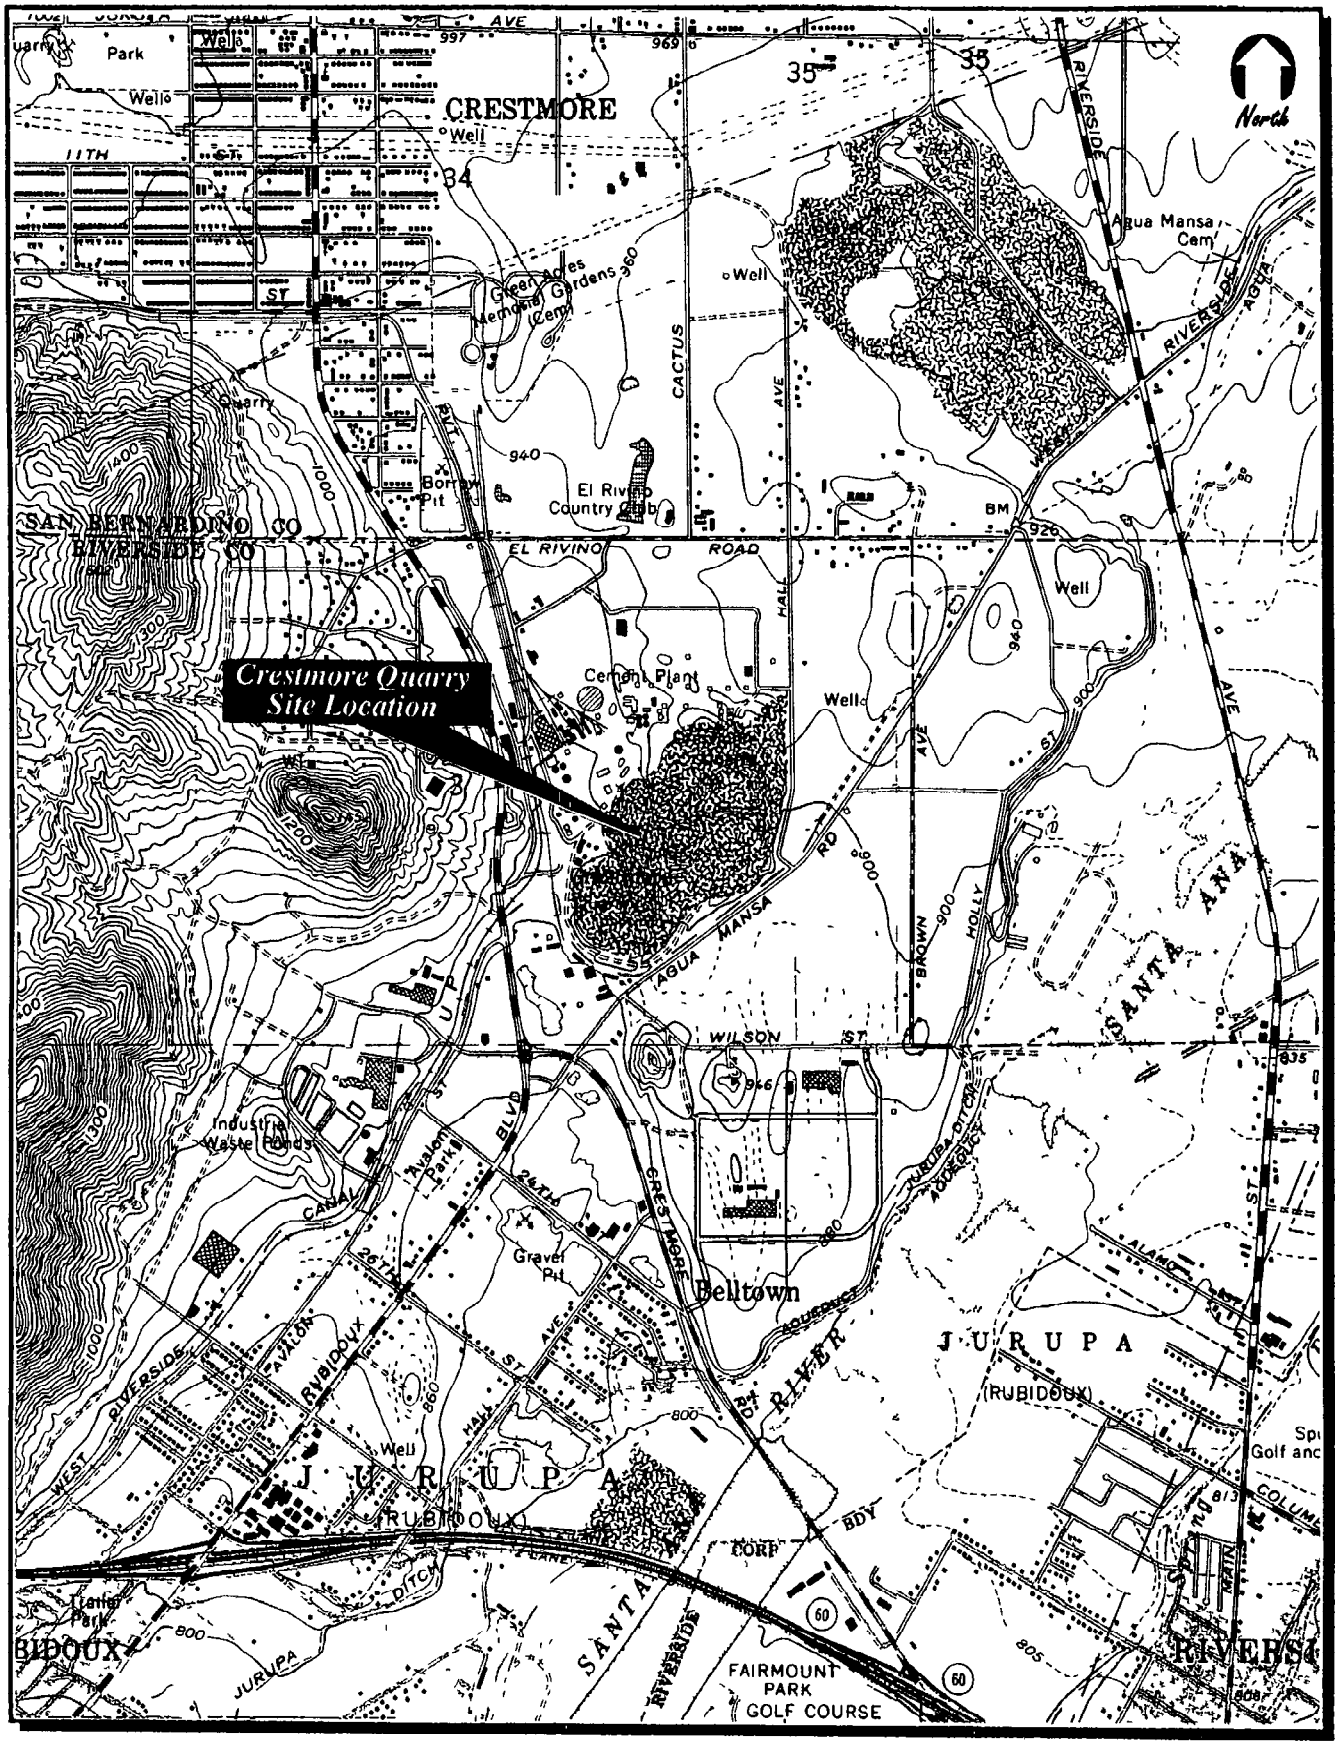
4.6 Summary of Key Technical Findings

Based on ERM-West's technical review of the information presented in the FIT Report and the data collected during ERM-West's field investigation, the FIT Report conclusions and summary of significant HRS factors are overstated. The RCC site does not warrant further action by the EPA under CERCLA for the following reasons:

- The data do not support the FIT Report conclusion that ground water has been impacted by disposal of CKD and basic brick. The chromium concentrations in the YCC well which serve as the primary basis for the E&E conclusions are approximately equal to the chromium levels in wells 60-1 and 88-1, and the concentrations in all three wells appear to be naturally-occurring.

- Chromium concentrations in the ground water and surface water samples collected at the RCC facility and in the ground water from the YCC well are well below the drinking water standard of 50 µg/l (Tables 3-1 and 3-2) and may be attributable to natural conditions. The fact that no chromium was detected in the monitoring wells directly upgradient (MW-1) and downgradient (MW-3) of the CKD disposal areas supports this conclusion and confirms that the disposal has not impacted the ground water in the river alluvium.

- The YCC well may not be directly downgradient of the CKD disposal areas based on the hydrologic interpretation by Rowe as shown on Figure 2-5. MW-3 is directly downgradient and shows no impact by chromium (Table 3-2).



- The volume of basic (refractory) brick containing hexavalent chromium that was disposed of in the quarries was extremely small compared to the volume of CKD. Due to the property of CKD and cement to hydrate in the presence of water and to neutralize acid, the potential to leach trace metals from CKD or from basic brick codisposed with CKD is minimal.

- The one-time 0.55 mg/l chromium release from the wastewater treatment plant in 1973 could not have impacted well 60-1 (as inferred in the FIT report, page 5-5) because that well is located substantially upgradient of the treatment plant outfall.

- The closest operating downgradient public water supply wells are 3.75 to 4 miles away in the river alluvium and are not likely to be impacted by the CKD disposal since the proximal wells in the alluvium (MW-1, MW-3 and the YCC well) show no impact.

After reviewing all the existing and new technical information, ERM-West concludes that the former kiln dust disposal area at the Crestmore facility has had no impact on metal concentrations in ground water, including chromium, and recommends that EPA should close the case at Crestmore by declaring NO FURTHER ACTION.

1. INTRODUCTION

Under the authority of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) and the Superfund Amendments and Reauthorization Act of 1986 (SARA) the U.S. Environmental Protection Agency (EPA) has tasked Ecology and Environment Inc.'s Field Investigation Team (FIT) to conduct a Screening Site Inspection (SSI) of Riverside Cement Co., Crestmore Plant in Riverside, California. This report summarizes FIT's investigative efforts.

2. SITE DESCRIPTION

2.1 SITE LOCATION AND OWNERSHIP HISTORY

The Riverside Cement Company's Crestmore Plant is an active cement manufacturing facility located at 1500 Rubidoux Boulevard in Riverside, California (Township 2 South, Range 5 West, Sections 2 and 3, San Bernardino Base Line and Meridian; Latitude: 34° 1′ 30", Longitude: 117° 23′ 6")(1,2). The site includes two facilities: the Crestmore facility and the Jensen Quarry. The Crestmore facility includes two inactive limestone quarries: the Wet Weather Quarry and the Commercial Quarry; and two cement processing plants: an inactive gray cement plant and an active white cement plant. The entire Crestmore facility covers 10 acres of land approximately 1 mile west of the Santa Ana River (see Figure 2-1 Site Location Map). The Jensen Quarry is a separate quarry and solid waste dump area which is currently inactive. It was formerly owned by Riverside Cement, and is located approximately 3 miles west of the Crestmore facility in the Jurupa Mountains. (Township 2 South, Range 5 West, Section 5)(see Figure 2-1 Site Location Map) (3).

Cement has been manufactured at the Crestmore facility in 12 on-site kilns since 1909 except for a 13-year period between 1929-1942. The site ownership has passed from several corporations. Originally incorporated as Southern California Cement Company in 1906, the company changed its name to Riverside Portland Cement Company in 1909 and to Riverside Cement Company in 1928. There are several Riverside Cement operations in the Southern California area which handle all phases of cement production and distribution. In 1958 Riverside Cement merged with Peerless Cement and Hercules Cement and bought Phoenix Cement. These companies then became American Cement Corporation, or Amcord. Amcord was bought out by Giffard-Hill in 1979. In 1987 Beazer Holdings Ltd. purchased the Giffard-Hill company which included Riverside Cement (4). Throughout this report "Riverside Cement" will refer to these past and current owners and operators of the site.

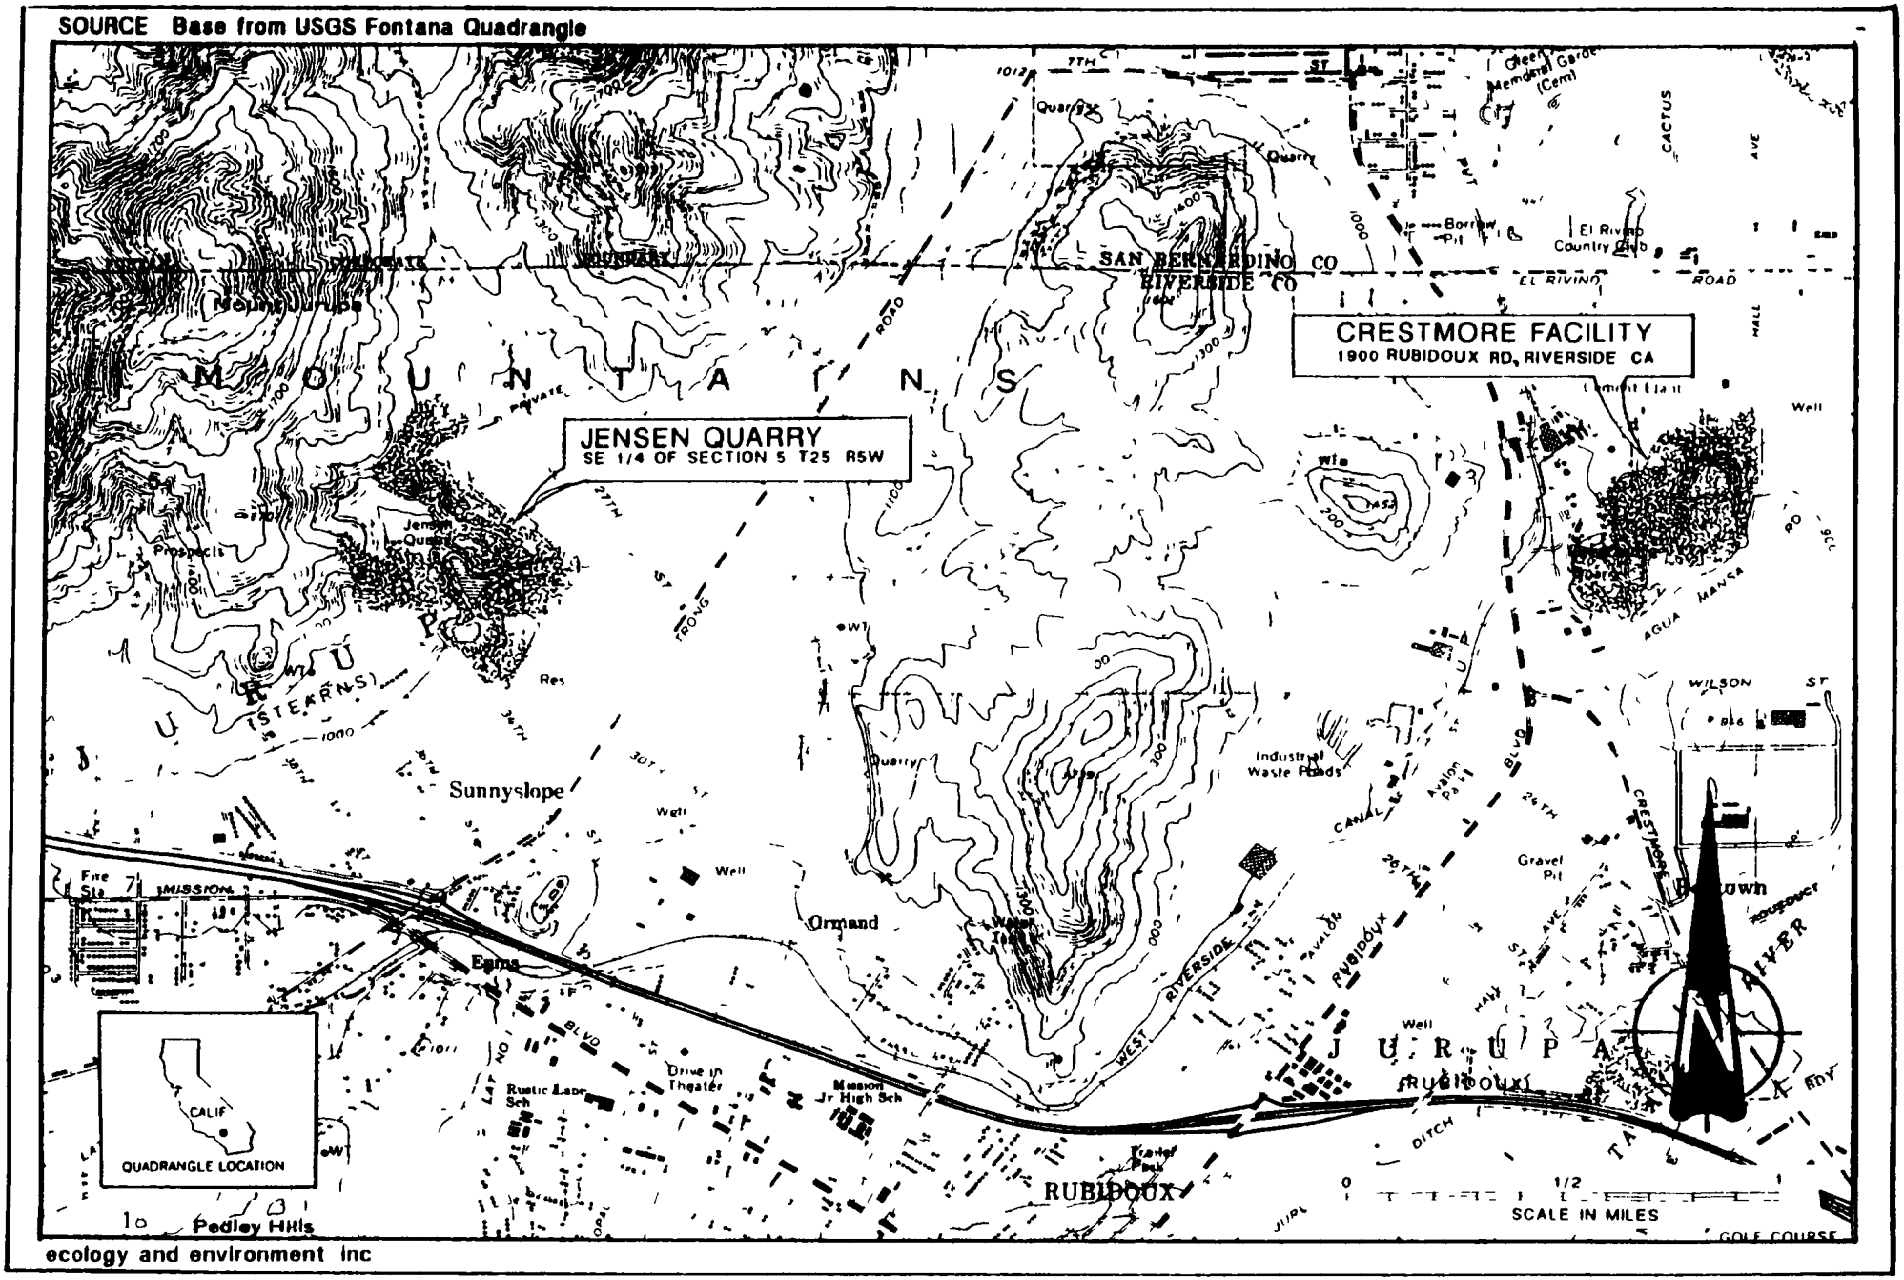

Figure 2-1 SITE LOCATION MAP
RIVERSIDE CEMENT JENSEN QUARRY AND CRESTMORE FACILITY

The Jensen Quarry was developed during World War I by the Riverside Cement Company and operated until 1927. Large scale operations at the quarry began again in 1948 and were discontinued sometime in the early 1950s (5,4). A California Department of Water Resources report indicated that in 1966 the quarry was used for riprap mining and as a disposal area for waste from cement processing at the Crestmore facility (4). Jensen Quarry was sold by Riverside Cement some time after 1964 and is currently owned by Walter and Elizabeth Taylor of Fountain Valley, California (6).

Limestone, the principal constituent of cement, has been mined on site both at the Jensen Quarry and at the Crestmore facility by various methods including block caving, room and pillar, and surface extraction quarrying. A large room and pillar mine at the Crestmore facility, the Crestmore Mine, flooded in 1986. Currently a small lake covers the mine entrance (3). Mining at the Commercial and the Wet Weather surface quarries extracted limestone deposits until production was halted when groundwater was encountered (7). Since 1986, only cement manufacturing and packaging from imported raw materials has occurred at the Crestmore facility (3). (See Figure 2-2 Facility Diagram).

2.2 FACILITY PROCESSES AND WASTE MANAGEMENT HISTORY

The cement manufacturing process involves homogenizing and blending raw feed composed of 90% limestone with 9% clay and 1% iron oxide. This raw feed is then heated in a sloped rotary kiln to a temperature of 2700° F where it undergoes a chemical reaction. When the mixture is rapidly cooled, it forms into marble-sized balls called "klinker". It is stored in this form until crushed and mixed with gypsum to form cement (3).

The predominant waste stream generated in this process is cement kiln dust (CKD). CKD is extracted from the kiln to lower the pH of the final cement product. CKD is collected in baghouses and has been disposed of at several disposal areas on site including the quarry excavations at the Jensen, Commercial, and Wet Weather quarries and in a depression near the

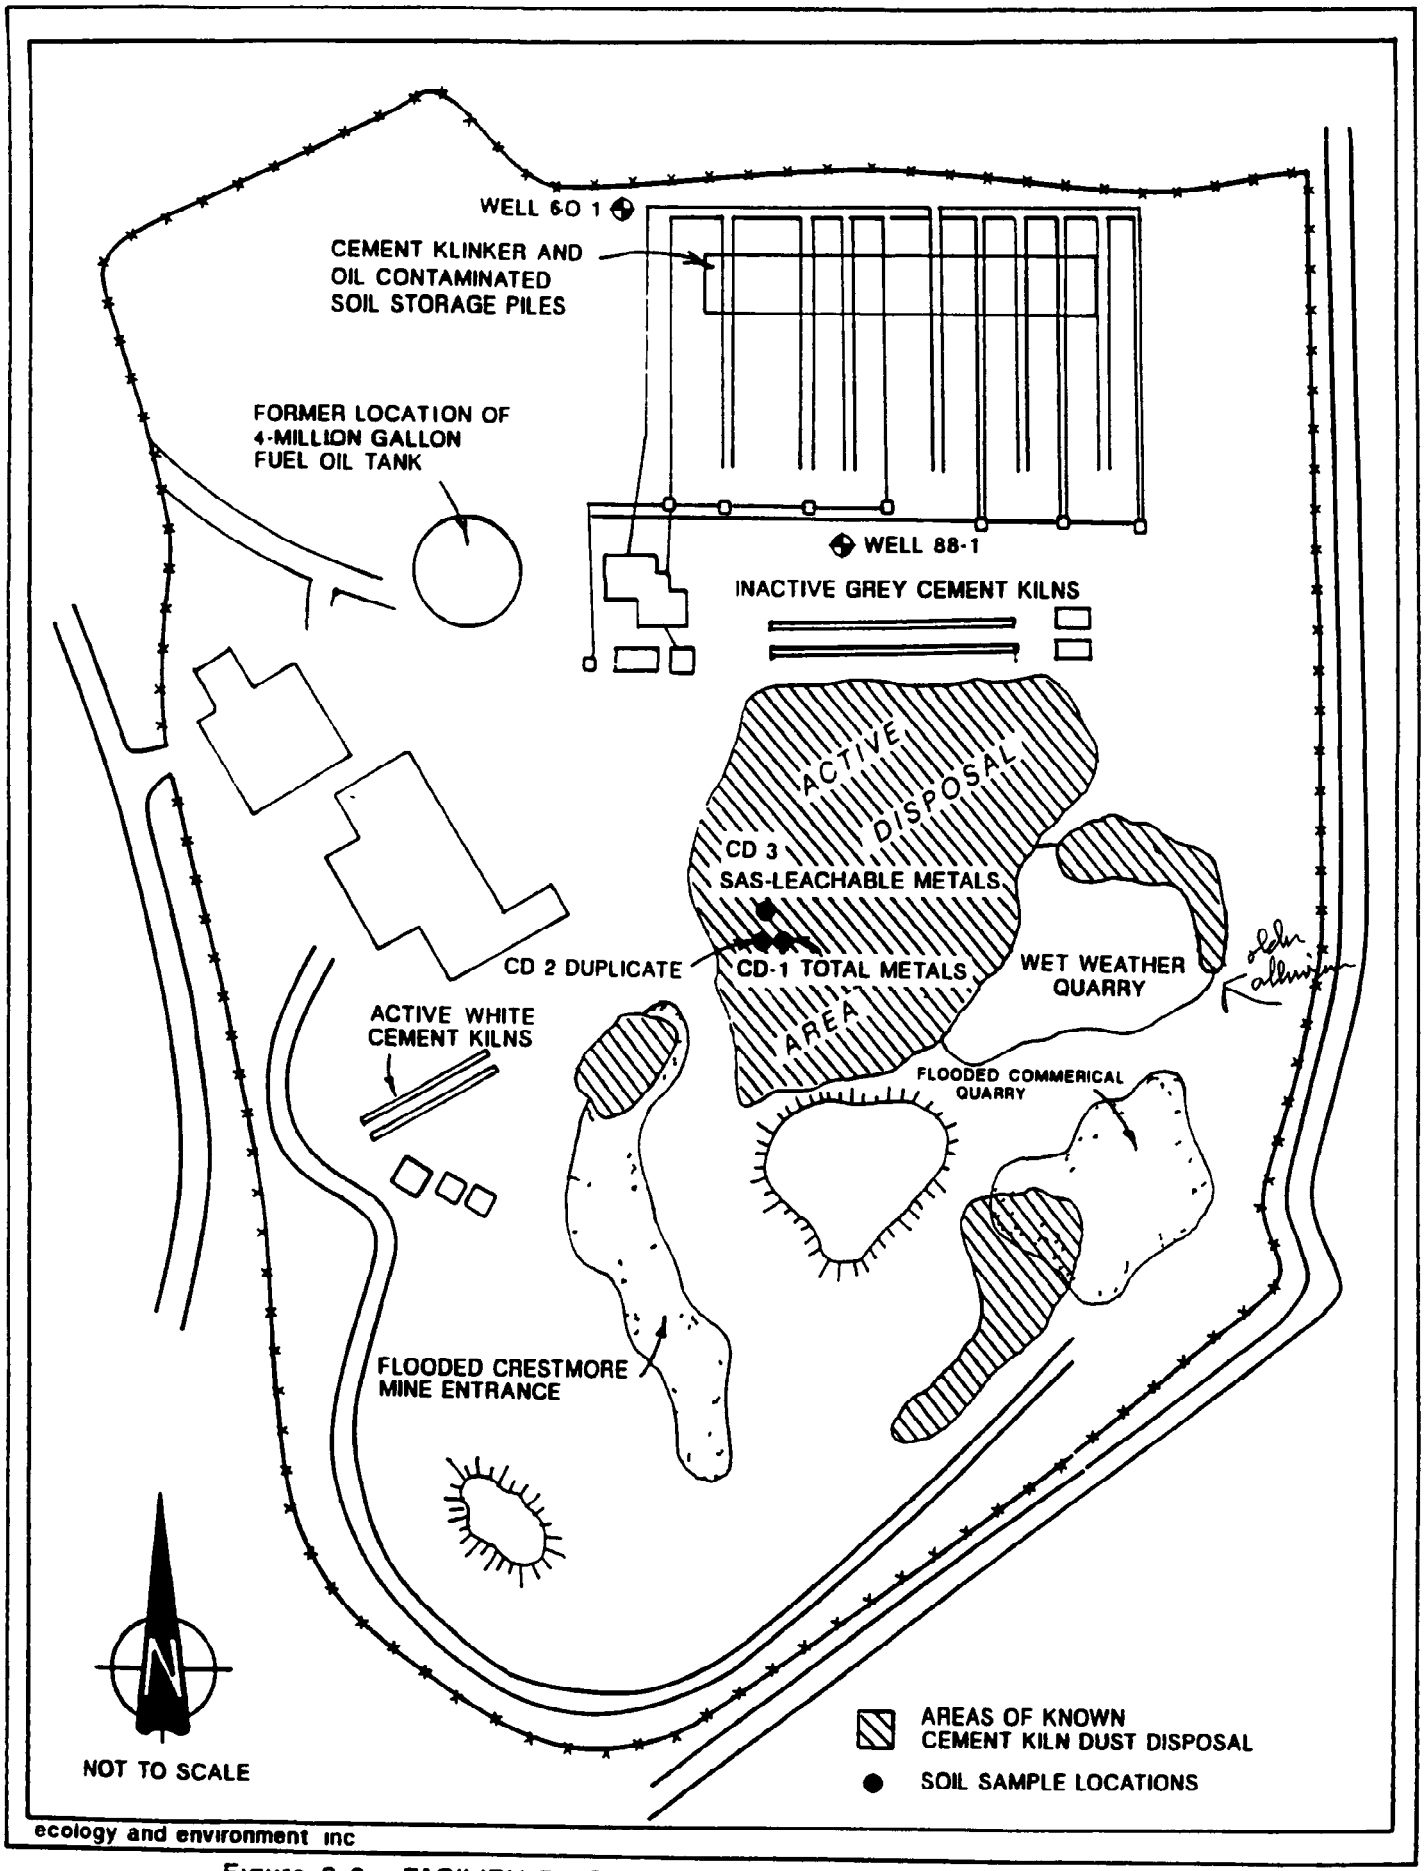

Figure 2-2 FACILITY DIAGRAM WITH WASTE DISPOSAL AND SOIL SAMPLE LOCATIONS
RIVERSIDE CEMENT CRETMORE PLANT
1500 RUBIDOUX BOULEVARD, RIVERSIDE, CA

G-92

entrance to the Crestmore Mine (see Figure 2-2, Facility Diagram and Figure 2-3 Disposal Areas at Jensen Quarry) (9,7). Disposal at the Jensen and Commercial Quarries was discontinued sometime prior to 1969. At that time Riverside Cement began disposing of CKD in a ravine between the Crestmore mine entrance and the Wet Weather Quarry (9). A dam was constructed from demolition debris across the lower end of this ravine by Riverside Cement in 1968 (9). Disposal of CKD waste in this area has continued to the present (3). This disposal area will be referred to as the active CKD dump. Some recovery and reuse of CKD and raw feed disposed of in the commercial quarry area has been done by Riverside Cement (3). Riverside Cement has estimated that 250,019 tons of CKD was disposed of at the Crestmore facility between 1964 and 1987 (8). One set of analytical results indicated the presence of several CERCLA-defined hazardous substances in CKD. (See Section 5.1, Waste Type and Quantity).

Another waste stream of concern at the facility is waste refractory brick, also known as "basic brick," containing 10% hexavalent chromium. Basic brick is used to line the hottest area of the rotary kiln due to it's resistance to heat and abrasion. These bricks wear down periodically and are replaced. From 1955 until 1979, approximately 48 cubic yards of basic brick was disposed of at unspecified on-site disposal areas along with CKD (1). From 1980 to 1987, these bricks were either recycled back into the raw feed and made into cement or manifested for off-site disposal (8).

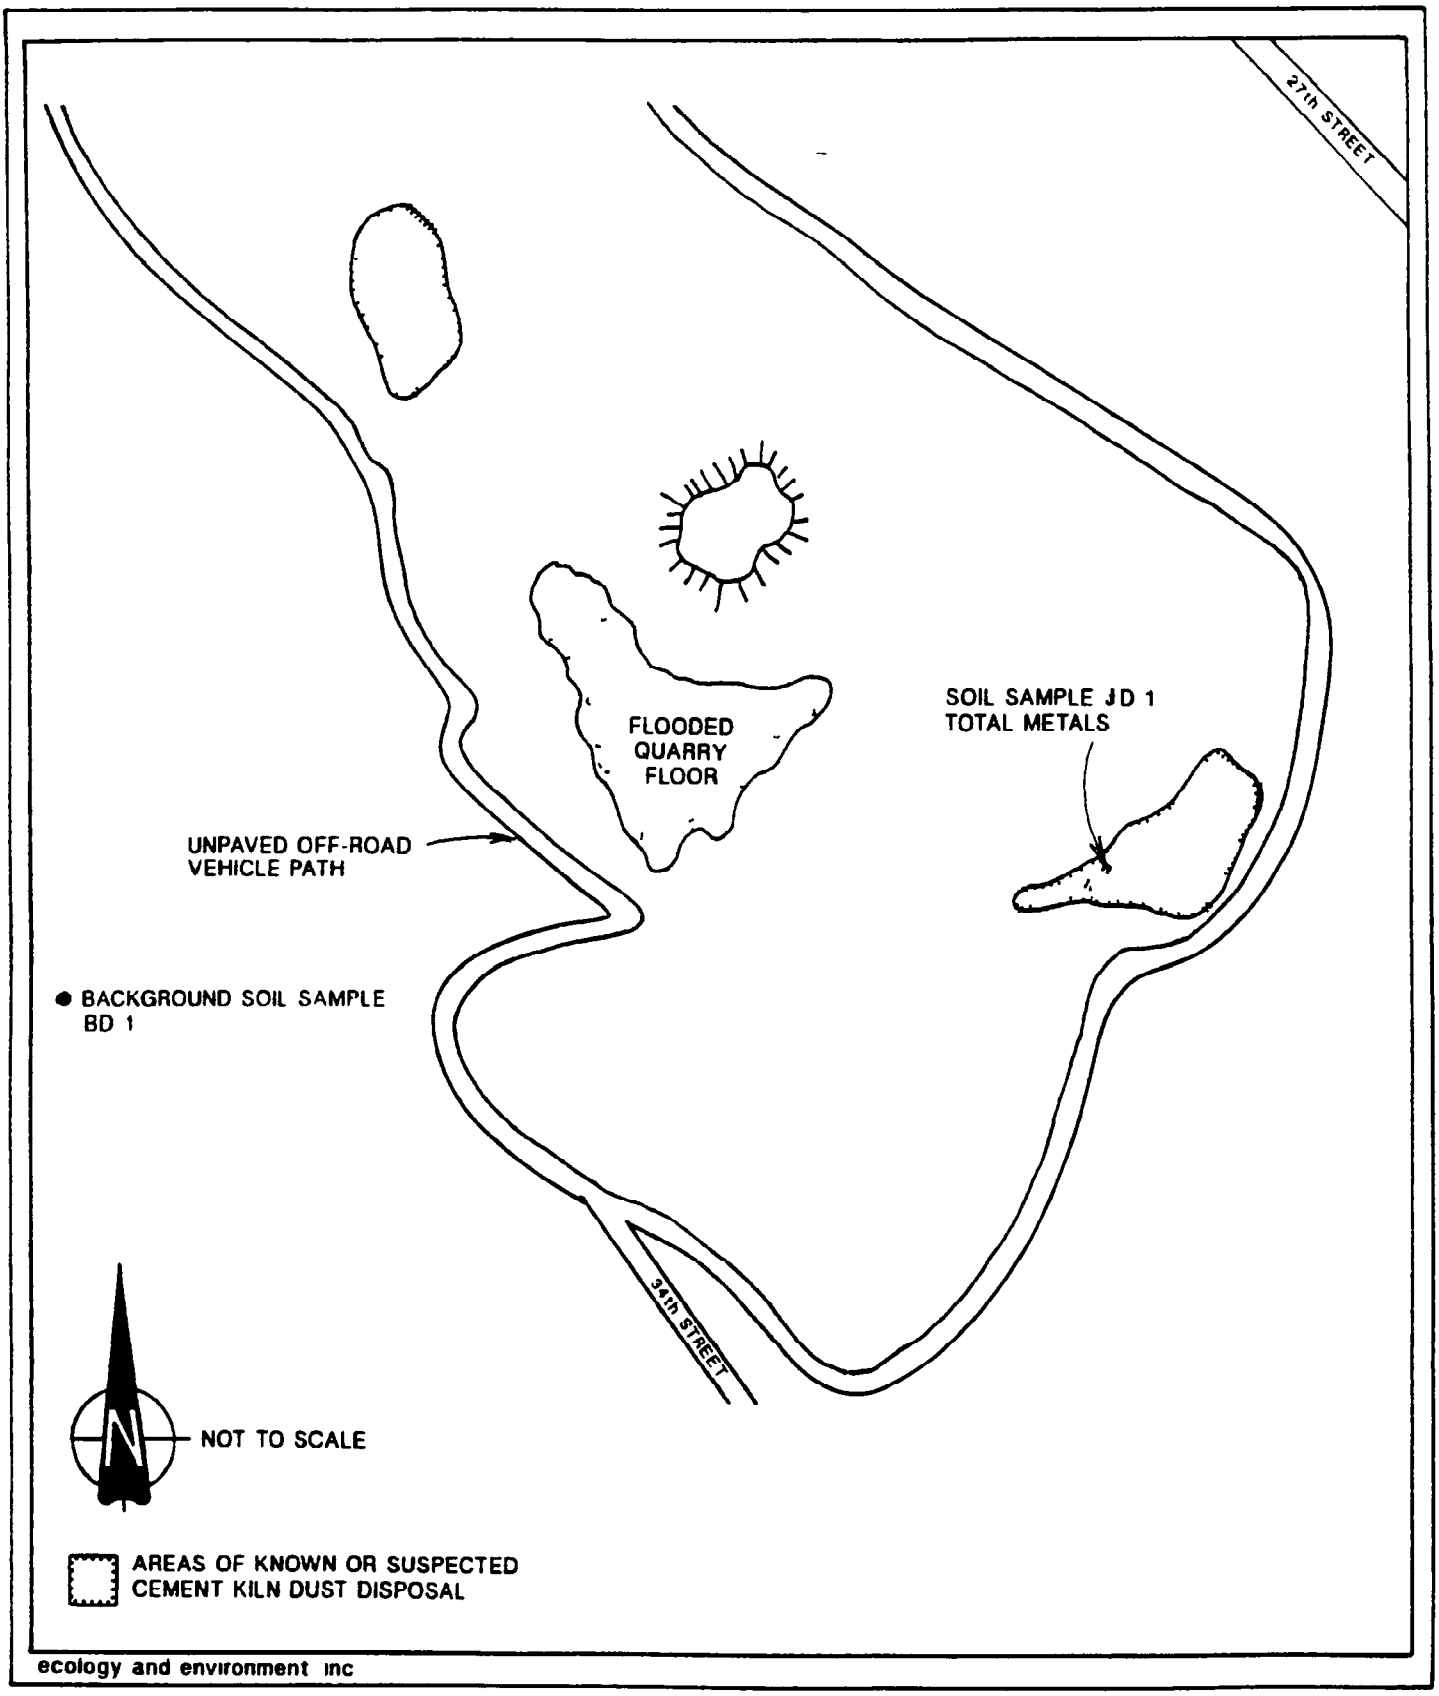

Figure 2-3 AREAS OF KNOWN OR SUSPECTED WASTE DISPOSAL AND SOIL SAMPLE LOCATION JENSEN QUARRY

G-976

3. APPARENT PROBLEM

The waste material disposal areas on site are centered around three limestone quarries: the Wet Weather Quarry, the Commercial Quarry, and the Jensen Quarry (3,7).

The Wet Weather and Commercial Quarries are located adjacent to the Crestmore cement plant. The Jensen Quarry is located two miles west of the cement plant in the Jurupa Hills (see Figure 2-1) (5).

Wastes including basic brick and CKD were possibly disposed of in excavations at the Wet Weather Quarry at or near the historical groundwater elevation. Saturation of these wastes could cause the leaching of soluble heavy metal contaminants into the alluvial aquifer serving Riverside Basin groundwater users (see Section 5.2, Groundwater Pathway). Chromium contamination was detected by Santa Ana Regional Water Quality Control Board (RWQCB) monitoring in two on-site production wells in 1973. Subsequent monitoring by RWQCB revealed that chromium levels in these wells have diminished (10,11). FIT sampling confirmed that groundwater downgradient from the Wet Weather Quarry CKD disposal area contains higher levels of heavy metals relative to upgradient groundwater samples. (See Section 5.2 Groundwater).

4. REGULATORY INVOLVEMENT

Riverside Cement has been regulated by RWQCB since approximately 1959 (12). RWQCB attention has been directed to numerous water quality-affecting processes on site including on-site disposal of CKD and chromium-containing refractory brick, as well as discharge of chromium-contaminated cooling water and sanitary waste disposal (13).

The South Coast Air Quality Management District has numerous active permits covering Riverside Cement's raw feed stockpiles and processing equipment and kilns (14).

The facility is also regulated by the Riverside County Air Pollution Control Board (4).

The California Department of Health Services (DHS) has been involved in the closure removal and clean-up of the facility's 6-million-gallon oil tank (3,10,26).

The Riverside Cement Company is listed as a generator in the Resource Conservation and Recovery Act (RCRA) data base as of May 8, 1990. RCRA hazardous wastes generated on-site include basic brick, asbestos insulation from plant refurbishing, and some PCB containing transformers. CKD is excluded from being a hazardous waste under RCRA. The Riverside County Sanitation District has designated CKD disposed on-site as inert waste (4). Riverside Cement is not listed on the 1989 California State Bond Expenditure Plan.

5. HRS FACTORS

The Hazard Ranking System (HRS) is a scoring system used to assess the relative threat associated with actual or potential releases of hazardous substances from sites. It is the principal mechanism EPA uses to place sites on the National Priorities List (NPL). EPA has proposed revisions to the HRS, pursuant to the Superfund Amendments and Reauthorization Act of 1986 (SARA). FIT has evaluated the following proposed revised HRS factors relative to this site.

5.1 WASTE TYPE AND QUANTITY

FIT identified two sources of potentially uncontained hazardous substances at the Riverside Cement Crestmore Plant: CKD and Basin Brick.

Riverside Cement managers have estimated that approximately 250,015 tons of CKD have been disposed of on site. There has been no effective barrier constructed to contain the waste CKD which had been disposed of in quarry excavations, one of which was at or near the historical groundwater elevation (7,8).

FIT obtained and analyzed a sample of CKD through a CLP laboratory. The sample location is identified as CD-1 on Figure 2-2. A complete listing of the analytical results is in Appendix D. Table 5-1 shows the most significant concentrations of CERCLA-defined hazardous substances detected.

Table 5-1

CONCENTRATIONS OF SELECTED CERCLA HAZARDOUS SUBSTANCES DETECTED IN CKD (in mg/kg)

	CKD	*TTLC
Aluminum	9270	N/A
Barium	473	10,000
Cadmium	2.9	100
Chromium	4.6	2500
Lead	106	1000
Vanadium	5.5	2400

*TTLC - California Title 22 Total Threshold Limit Concentration

Constituent data is not available for the basic brick disposed of on site. In a notification of Hazardous Waste site activity, Riverside Cement indicated that its waste refractory kiln brick contained approximately 10% hexavalent chromium and that approximately 48 cubic yards of basic brick have been disposed of on site. The exact location of this basic brick disposal is unknown.

5.2 GROUNDWATER

The Crestmore site is located in the Riverside Hydrologic Subarea at the base of an isolated rock outcropping at the eastern end of the Jurupa Mountains. Local ground surface elevations range from 900 to 920 feet above mean sea level (msl), not including quarry excavations. Two limestone beds, separated by a 500-foot bed of quartz diorite striking north and slightly east, directly underlie the area. The upper limestone bed is called the Sky Blue Limestone. The lower bed is called the Chino Limestone. Both formations range in thickness from 200 to 300 feet (7).

The Wet Weather Quarry mined the Sky Blue Limestone formation prior to the quarry's use as a CKD disposal area. The quarry excavation exposed Aeolian sand dune deposits to the southeast. Underlying these deposits near the facility are granite and limestone beds. As these beds dip into the valley floor, older alluvium directly underlies the Aeolian deposits. The underlying older alluvium is composed of lenses of unconsolidated, poorly sorted gravel, sand, silt, and clay. These older alluvial

deposits are the major source of groundwater in the Riverside Basin. Although the aquifer of concern is found in the older alluvium, on-site production wells that have previously shown contamination, may extract water from both the Sky Blue and the Chino limestones. A California Department of Water Resources memorandum concerning waste disposal at the Crestmore facility stated that differences in water quality and static water elevations between the limestone aquifers and the alluvial water-bearing zones indicate that these formations may be isolated from each other. The regional groundwater flow gradient in the alluvial aquifer is to the southwest (see Figure 5-1) (7).

In 1965, the depth of limestone excavations in the Wet Weather Quarry was at an elevation of 825 feet above msl. Excavation ceased at this elevation likely due to the presence of groundwater (7). It is unclear if the water encountered at that elevation was in communication with the alluvial aquifer or with the Sky Blue Limestone aquifer. A well located 2,000 feet east of the site, screened in the alluvial aquifer, had a static water level of 800 feet above msl in 1965 and a historic high level of 830 feet above msl in 1945 (7).

The Rubidoux Community Service District operates two wells approximately 3.75 miles south from the site that contribute to a well system which serves over 5,000 households. These wells are screened, beginning at 60 feet below ground surface (bgs) (15). Recent sampling data do not indicate that elevated levels of heavy metals exist in these wells (16). The Crestmore Heights Mutual Water Company operates a well located on Riverside Cement Property which serves approximately 100 households. This well is located approximately 0.4 miles from the Crestmore active CKD dump. This well was originally constructed as a Mine de-watering well for the Crestmore Mine. It has an open-ended casing at approximately 250 feet bgs. The high detection limits of sampling data from this well is inadequate for determining levels of specific heavy metals (17).

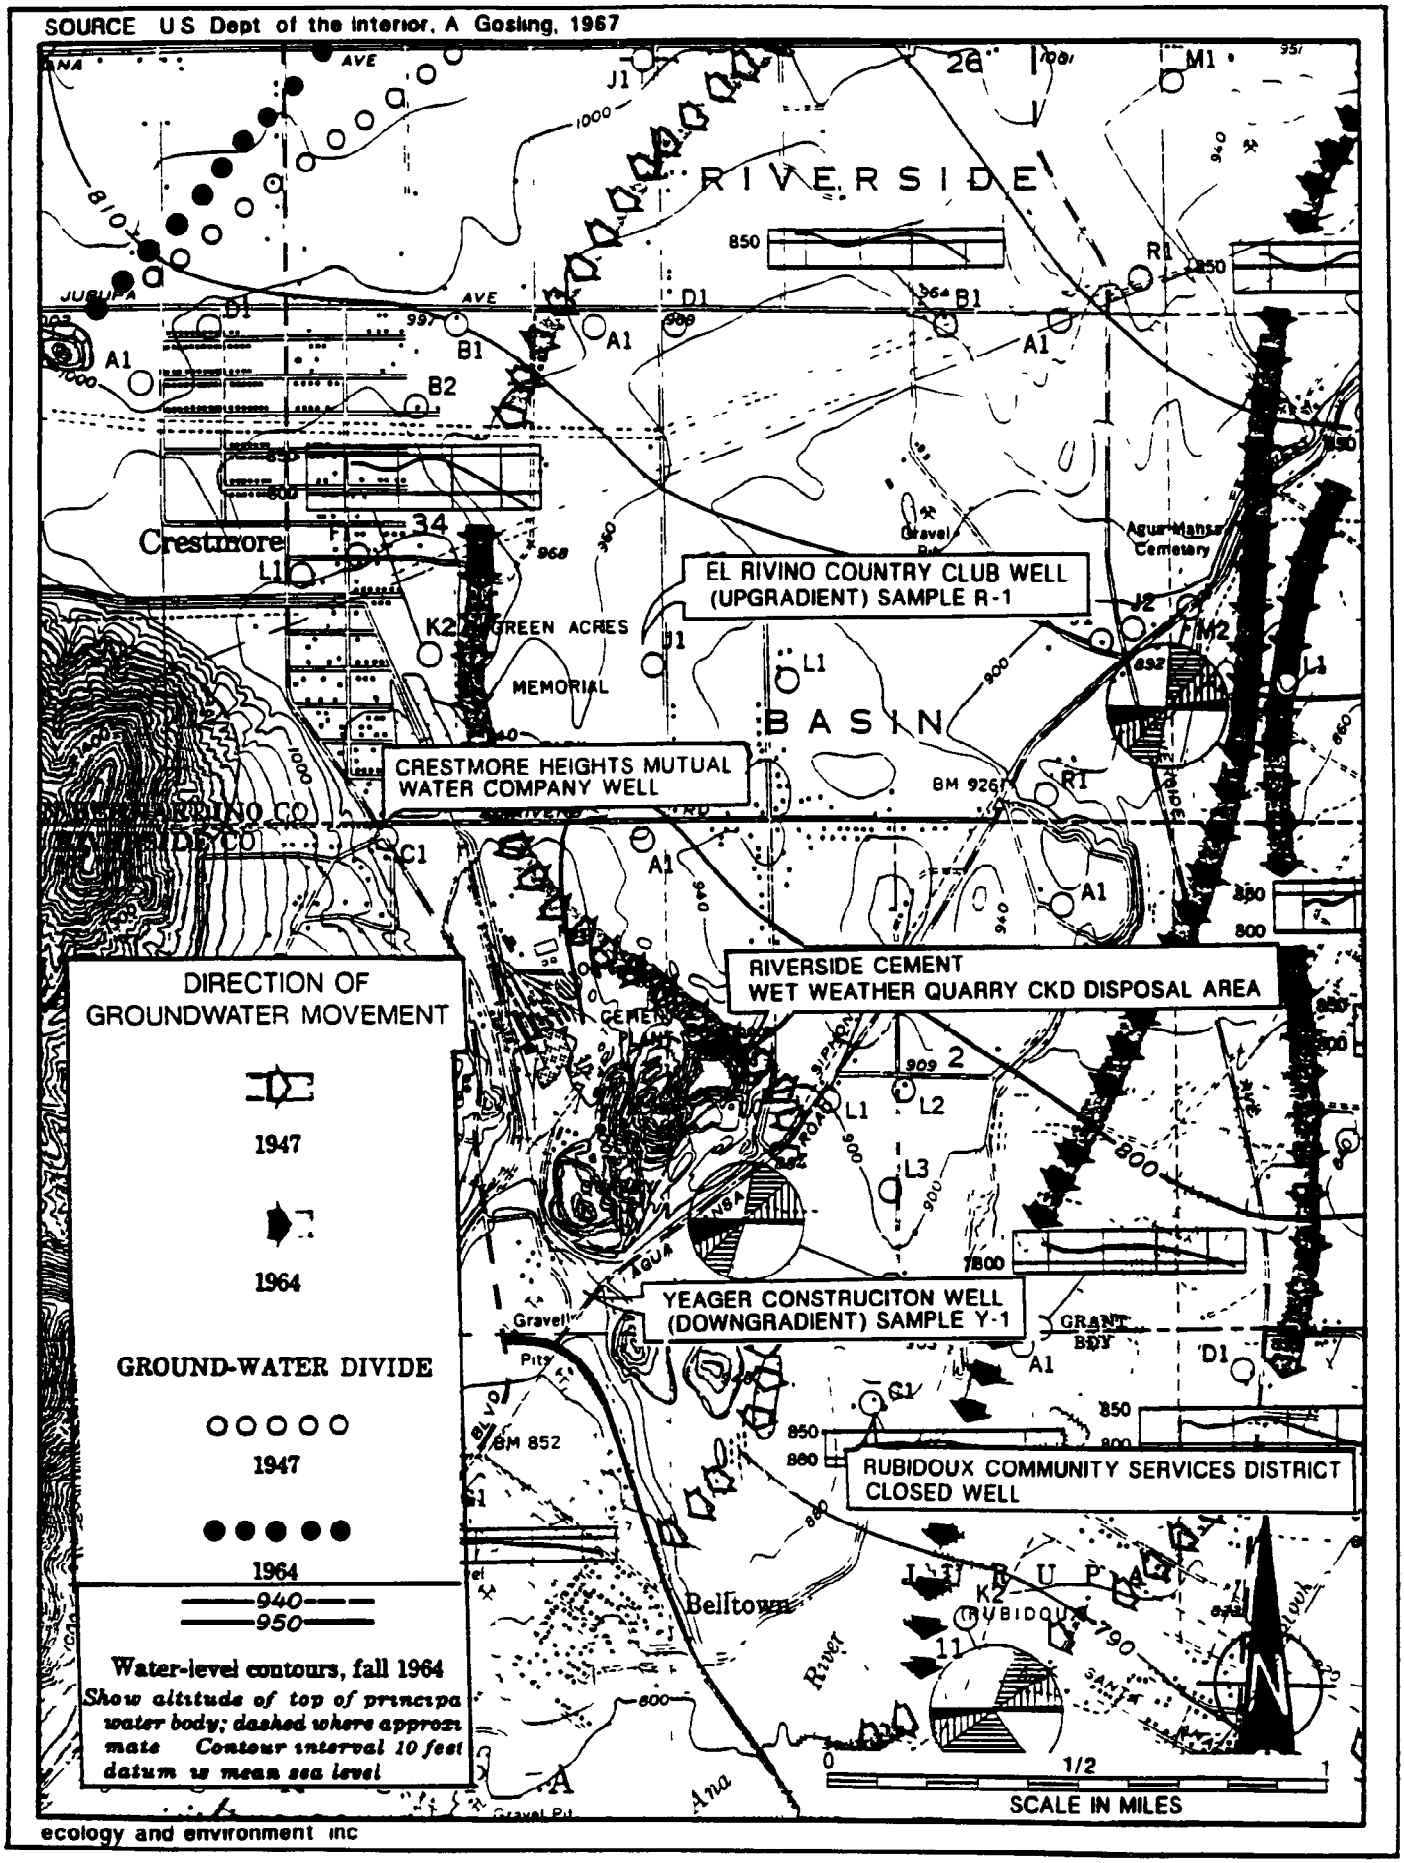

Figure 5-1 GROUNDWATER FLOW DIRECTION AND GROUNDWATER SAMPLE LOCATIONS

Possible groundwater contamination at the site came to the attention of RWQCB in 1973 when a high level of chromium (0.55 mg/L) was detected in the facility's wastewater which is released to the Riverside Irrigation Canal. Riverside Cement investigated this incident and determined it to be an unusual release of recirculated cooling water treated with chromate (18). However, subsequent sampling by Riverside Cement of its on-site well, #60-1 (see Figure 2-2), revealed levels of chromium as indicated in Table 5-2 (11):

Table 5-2

CHROMIUM LEVELS IN WELL #60-1 (mg/L)

Year of Sample	Hexavalent Chromium	Total	Current Maximum Contaminant Level for Chromium
1976 (January)	.03	.09	.05
1976 (June)	.04	*	
1984	*	.03	
1985	*	.02	
1986	*	.02	
1988	*	.02	
1989	*	.01	

* Analyses not performed.

Another on-site well, #88-1, has shown total chromium levels of .02 mg/L in 1988 and in 1989. (See Figure 2-2).

Well logs for these wells are unavailable and it is unknown if these wells are screened in limestone or alluvial deposits (7).

Water from the flooded Crestmore Mine was also sampled by Riverside Cement. Table 5-3 lists the analyses results.

Table 5-3

CHROMIUM LEVELS IN CRESTMORE MINE WATER (mg/L)

Year of Sample	Hexavalent Chromium	Total	Current Maximum Contaminant Level for Chromium
1976	.03	.05	.05
1984	*	.01	
1987	*	.01	
1989	*	.02	

* Not analyzed

Additionally, in 1988 a well owned by the Rubidoux Community Services District, located 0.5 miles southeast of the site showed levels of lead at .01 mg/L and total chromium at .01 mg/L (see Figure 5-1). This well was closed in 1989 due to high nitrate levels (16).

Background levels of chromium and lead in other on-site wells sampled by Riverside Cement were not detected with detection limits of 0.01 mg/L (11).

5.2.1 GROUNDWATER SAMPLING RESULTS

Despite the availability of local groundwater analytical data, no wells directly downgradient from the disposal area, screened in the alluvial aquifer, were previously sampled. FIT sampled the Yeager Construction Company's well, located 0.5 miles southwest and downgradient of the active waste disposal area.

Several CERCLA-defined hazardous substances were detected in the downgradient Yeager well at concentrations significantly greater than those detected in the upgradient El Rivino Country Club well. Table 5-4 presents selected results of FIT's groundwater sampling. Appendix D contains the complete results of groundwater sampling.

Table 5-4

SELECTED RESULTS OF FIT GROUNDWATER SAMPLING (µg/L)[1]

Constituent	Y-1 Downgradient Concentration	R-1 Background Upgradient Concentration	IDL[2]	CRDL[3]
Aluminum	155	26.9	13	200
Chromium	19.4	3.8		
Manganese	34.4	<1	1	15

1 All units are micrograms per liter
2 Instrument detection limit
3 Contract Required Detection limit

The elevated levels of metals detected in the downgradient well relative to the upgradient well indicate an observed release to groundwater. However, the limestone outcropping which is located in the active CKD disposal area possibly contributes to the elevated metals in downgradient samples (19).

5.2.2 CKD LEACHABILITY SAMPLING RESULTS

To more accurately determine the potential for on-site waste CKD disposal to leach toxic metals into groundwater, FIT performed a California Waste Extraction Test (Cal Wet) on a sample of CKD. A duplicate of this sample was also analyzed for total metals. The analysis was conducted by the EPA Region IX laboratory. Table 5-5 lists the total concentration of extracted metals detected and the total concentration of metals leached from the CKD in the Cal Wet test for several metals of concern at Riverside Cement. Appendix D contains the complete results of this test.

5.3 SURFACE WATER PATHWAY

While analytical data documenting the site's past chromium release to surface water is available, it is unlikely that any further sampling would document subsequent surface water contamination.

Table 5-5

Selected Results of CKD Analysis for Total Metals and Leachable Metals[a] (CD-3)

	Total Metals in mg/kg[b]	TTLC[c] in mg/kg	Leachable Metals[a] in µg/L[d]	STLC[e] in µg/L[d]
Aluminum	10,200	g	17,300	g
Barium	529	10,000	419	100,000
Cadmium	1.7	100	ND	1,000
Chromium	7.1[h]	500f	195[h]	50,000
Lead	96.4	1,000	ND	5,000
Nickel	6.9	2,000	ND	20,000
Selenium	.91	100	33.2	1,000
Vanadium	5.4	2,400	194	24,000

a - Cal Wet process
b - Milligrams per kilogram
c - Total threshold limit concentration
d - Micrograms per liter
e - Soluble threshold limit concentration
f - Concentration for hexavalent chromium
g - No standard

None of the metal concentrations detected exceeded either TTLCs or STLCs. However, this test does indicate that CKD has the potential to leach out several metals including aluminum, barium, chromium, selenium, and vanadium.

A release of cooling water containing .55 mg/L chromium to the Riverside Irrigation Canal was documented by RWQCB in 1973 (see Section 5.2, Groundwater Pathway) (20,27). The Riverside Canal is unlined and runs adjacent to the Crestmore facility's southern boundary and is used for irrigation only (21).

The Santa Ana River is located 1 mile east of the Crestmore plant. This river has no use other than flood control and wildlife habitat. Several listed and Candidate Federal Endangered and Threatened Plant and Animal species likely exist in this area. Table 5-6 lists those species (22).

5.4 AIR PATHWAY

Although there is a moderate potential for documenting an air release at the site, air sampling was not within the scope of this Screening Site Inspection.

The Crestmore facility's uncovered storage piles of cement raw materials and "klinker" cover approximately 20 acres. However a large part of this area is currently used to store contaminated soil from Riverside Cement's closure of its 6-million-gallon aboveground fuel storage tank. This waste is excluded from CERCLA under Section 104(a) (18) of the National Contingency Plan. The active CKD disposal area covers approximately another 18 acres (3,23). Both of these areas are sources of potential releases to the air. The storage piles are continuously homogenized with large earth moving conveyers. Dumping of CKD at the disposal area is also ongoing. Both of these processes likely contribute to the entrainment of particulate emissions (3,24).

The federally designated endangered species possibly found within 4 miles of the site are listed in Table 5-6.

Table 5-7 shows the population distribution within 4 miles of the site (25).

Table 5-6

LISTED ENDANGERED AND THREATENED SPECIES AND CANDIDATE SPECIES THAT MAY OCCUR ON OR IN THE VICINITY OF RIVERSIDE CEMENT (22)

LISTED ENDANGERED SPECIES

Table 5-7 Nearby Population

Distance From Site (miles)	Population
0 - 0.25	937
.25 - 0.5	0
0.5 - 1	7
1 - 2	6962
2 - 3	28,156
3 - 4	33,384
Total	69,446

Riverside Cement is actively regulated by the South Coast Air Quality Management District and the Riverside County Air Pollution Control Board. Riverside Cement has a good record of compliance with these agencies (4,14).

5.5 ON-SITE PATHWAY

The on-site pathway is not a concern at the Crestmore area of the site. This area is fenced, guarded, patrolled and in continuous operation, thereby restricting on-site access. However, the Jensen Quarry area is unfenced and in use as a recreation lake and off-road vehicle area by trespassers (3). FIT collected samples at a suspected CKD dump area at the Jensen Quarry to determine if uncontained CKD, containing elevated levels of heavy metals, poses a potential for exposure to humans entering this area.

No significantly increased levels of CERCLA hazardous substances were detected in the sample from the suspected CKD dump area relative to the background sample (see Appendix D). The on-site pathway therefore does not appear to be of acute concern at the Jensen Quarry.

6. SUMMARY OF FIT INVESTIGATIVE ACTIVITIES

6.1 AGENCIES CONTACTED

FIT contacted RWQCB to interview the project manager for the site and copy the agency's files (13). FIT also contacted the Riverside County Health Department Sanitation District regarding the regulation of Riverside Cement's landfill, and the Environmental Health Department concerning possible complaints about the facility. FIT contacted the local enforcement office of the South Coast Air Quality Management District concerning the permit and enforcement status of Riverside Cement (14). FIT contacted the Department of Health Services concerning the facility's aboveground tank removal and other information about the site. FIT also contacted the California Department of Water Resources and obtained well logs of nearby wells.

6.2 RECONNAISSANCE OBSERVATIONS

FIT conducted a site reconnaissance at Riverside Cement on August 11, 1989. A meeting with facility representatives was conducted during which FIT explained the scope and purpose of the site inspection and identified the areas and pieces of specific information required for the investigation. Riverside Cement representatives were very helpful in providing an overview of the plant's history, waste disposal practices, sampling data, and site specific hydrology both at the meeting and in subsequent correspondence following the interview. A tour of the plant site was conducted by Pat Hill, the plant manager. Several areas of concern were identified during the tour. The active CKD disposal area, which may have received waste refractory kiln brick, partially fills in the Wet Weather Quarry. Water visible at the bottom of the quarry is likely to be at historic groundwater levels. However, Riverside Cement representatives have indicated that the source of this water is a leak at a nearby process building (8). This situation appeared to pose a potential for waste disposal on site to effect groundwater quality. Another area of concern identified during the site visit was the

potential for an air release from the site emanating from the earth moving activities at the site's open raw material stockpiles and active CKD dump. Drainage from the site would either be to the quarry floors or into the West Riverside Canal which would prevent any surface water runoff to the Santa Ana River. The entire Crestmore facility was fenced, and guarded. After departing the Crestmore facility, FIT inspected the Jensen Quarry site and located areas of CKD disposal. The Jensen Quarry floor is flooded and is used as a recreational area for swimming and off-road vehicle use by trespassers. Barriers to entry of the facility are ineffective. Appendix A contains a complete account of the information obtained during the site reconnaissance. A second visit to the Riverside area was made to coordinate the groundwater sampling at the two adjacent facilities and the soil sampling at the Jensen Quarry.

6.3 SAMPLING

6.3.1 SUMMARY AND OBJECTIVE

FIT members collected soil and groundwater samples for this investigation on May 30, 1990. Upgradient groundwater was sampled from an irrigation well at the El Rivino Country Club approximately 0.5 miles north of the Crestmore Plant. Downgradient groundwater was sampled from the Yeager Construction Company's industrial well located approximately 0.2 miles south of the Crestmore Plant. Soil samples were collected at a suspected CKD disposal area at the Jensen Quarry, and from native soil adjacent to the quarry for background comparison. Soil samples of CKD were collected to document the levels of CERCLA-defined hazardous substances in this waste stream.

The objective of the sampling was to collect groundwater and soil samples to provide information about groundwater and on-site contamination, as well as waste characteristics information, to complete an rHRS evaluation of the site.

The specific objectives of the sampling effort were to:

- Sample existing upgradient and downgradient wells to document an observed release to groundwater from on-site disposal of CKD and refractory brick.
- Analyze samples of CKD to determine the leachability of metals from this waste and its total metal content.
- Analyze other accessible wastes for heavy metals to determine if a direct contact threat is posed by the site.

6.3.2 SAMPLE PLAN AMENDMENTS

Some derivation from the sample plan occurred. The location of the CKD sample was specified in the Sample Plan as the active CKD dump. However waste "raw feed" which is indistinguishable from CKD was also being disposed of in this location. Therefore the CKD sample was taken from the baghouse unloading hopper area where a more representative sample of this waste stream could be obtained.

At the time that the sample plan was written, the construction and static water level of the Yeager Construction well were unknown; however, during the FIT sampling visit to the Yeager facility, recent well maintenance records were located.

On May 24, 1988 the well was serviced and had a total depth of 217 feet with a 12-inch diameter and 65-foot depth to static water level. This yielded a wet casing volume of 294 gallons, necessitating a purge volume of 883 gallons prior to sampling. This information and the pumping rate of over 1,500 gallons per minute, as measured by FIT, eliminated the need for the 15 to 20 minutes of pumping specified in the sample plan to ensure proper purging.

Due to the unavailability of a Contract Laboratory Program (CLP) laboratory, the groundwater analysis for hexavalent chromium was not performed as specified in the sample plan (28).

6.3.3 SAMPLING PROCEDURES

Both wells sampled were sounded and then purged while pH, temperature, and conductivity were monitored. After these parameters were stabilized and at least three wet well casing volumes were evacuated, groundwater samples including duplicates and splits were collected in bottles, labeled, preserved to a pH of less than 2, taped, custody-sealed, packaged, and stored in sealed coolers. A field blank was collected and handled in the same manner at the downgradient sample location.

Soil samples, including the background, from the suspected CKD disposal area fill and the Crestmore CKD were all handled in a similar manner. Surface debris was removed from the collection point and a 6-inch by 6-inch area of soil was collected by trowel in a paper bucket and homogenized. Sample collection jars were then filled, labeled, taped, custody sealed, packaged, and stored in a sealed cooler. At the completion of sampling, splits were turned over to Riverside Cement representatives and the samples collected for CLP analysis were shipped to the laboratories.

7. EMERGENCY RESPONSE CONSIDERATIONS

The Riverside Cement Co. Crestmore Plant does not present any apparent circumstances which would warrant emergency response action. Levels of heavy metals in groundwater have not exceeded any health based benchmarks. The facilities air discharges are regulated by the Riverside County Air Pollution Control District and Riverside Cement has a good record of compliance. The Crestmore facility is fenced and continuously guarded reducing the potential for on-site exposure.

8. SUMMARY OF HRS CONSIDERATIONS

The Riverside Cement Co. Crestmore Plant has been an active cement manufacturing facility located in an outlying community of Riverside California since 1909.

Two waste streams from the manufacturing process have been disposed of on site. Approximately 250,015 tons of cement kiln dust have been disposed of in several disposal areas at the plant. Disposal of this material is ongoing (1,8). From 1955 until 1979, 48 cubic yards of basic refractory kiln brick containing approximately 10% hexavalent chromium were disposed of along with the cement kiln dust (1,3). One on-site disposal area is a limestone quarry which appears to have received waste at the historic groundwater elevation (3). Sampling by FIT of downgradient wells indicate that an observed release to groundwater has occurred (see Appendix D).

The facility generates dust in the process of managing large stockpiles of cement components and from disposing of waste cement kiln dust on site. However it is unlikely that this dust contains significant levels of CERCLA hazardous substances and the facilities dust generating processes are regulated by the local Air Quality Management District.

The site's most significant rHRS considerations include:

- Large waste quantity;
- High toxicity of hexavalent chromium;
- Observed release to groundwater;
- Community supply well located 0.4 miles from site;
- Moderate groundwater target population;
- Observed release to surface water; and
- Surface water used for agriculture.

9. EPA RECOMMENDATION

	Initial	Date
No Further Action Under CERCLA		
Higher-Priority LSI Under CERCLA	eyd	12/11/90
Lower-Priority LSI Under CERCLA		
Defer to Other Authority (e.g., RCRA, TSCA, NRC)

APPENDIX A

Contact Log and Reports

CONTACT LOG

Facility Name: Riverside Cement
Facility ID: CAD063844443

Name	Affiliation	Phone #	Date	Information
Joe Ashbury	Riverside County Health Department	714-369-1141	6/27/88	See Contact Report.
Henry Snyder	Rubidoux Comm. Serv. District	714-684-7321	7/6/88	See Contact Report
Gene Kulesza	Riverside Cement Diamond Bar	714-683-3660	7/10/89	Kulesza is the Cement Divisions regulatory manager. He suggested I contact Pat Hill, the plant manager and direct my inquiries through him.
Pat Hill	Riverside Cement	714-683-3600	7/12/89	Looking forward to site visit on August 9 and responding to our correspondence.
Mark Adelson	RWQCB	714-782-4130	7/12/89	See Contact Report.
Judy Iverson	Riverside County Health Hazardous Waste	714-358-5055	7/12/89	Iverson indicated that her office was not actively regulating Riverside Cement; but she is interested in following progress.
Bill Briaz	Riverside County Health Solid Waste	714-787-6543	7/13/89	Briaz indicated that Riverside Cement has been exempt; CKD's are an RCRA inert waste. He will make file copies and send them on.

2.		
E & E PERSON MAKING CONTACT: Paul H. Brown		**DATE:** 6/27/88
SUBJECT:		
SITE NAME: Riverside Cement, Crestmore Plant		**EPA ID#:** CAD063844443

Mr. Ashbury indicated that Riverside County Health Dept. is the lead agency in the closure of Riverside Cement's 6-million-gallon #6 heating oil tank cleanup. 50,000 cubic yards of soil were excavated from 45 feet below the tank. The soil is stored in the on-site piles and will either be burned in the kiln on-site or at the Riverside Cement Oro Grande facility. The Ca. alternative technology office of DHS also oversaw the cleanup. The South Coast Air Quality Management District permitted the burning of the contaminated soil. No monitoring well was required as areas of contamination were obvious and easily removed. There was likewise no post removal sampling. A clay layer was present 45 feet below ground surface.

1. Ray Hassel		714-872-6000
2.		
E & E PERSON MAKING CONTACT: Paul H. Brown		**DATE:** 8/7/89
SUBJECT: Permits/Violations		
SITE NAME: Riverside Cement Crestmore		**EPA ID#:** CAD063844443

Mr. Hassel indicated that he has overseen the Riverside Cement Plant's enforcement for the past two years. No violations have been issued in that time. He knew of one dust emission violation three years ago but no others.

The only violations he could possibly cite the plant for would be visible dust emissions (rule 403) migrating off Riverside Cement property. In the past year he has received two dust complaints. Both times he went out to inspect and did note this as a problem. He indicated that the Cement plant is located on the west side of the facility property. The wind blows from west to east; so most dust settles within the property boudaries. Some nearby junkyards are covered in dust, indicating that dust generally does migrate offsite. The SCAQMD's permits cover the facility's stockpiles and processing equipment, conveyors, crashers, kilns, etc.

ADDRESS/CITY:		
COUNTY/STATE/ZIP:		
CONTACT(S)	**TITLE**	**PHONE**
1. Mark Adelson	Staff Engineer	(714) 782-4130
2.		
E & E PERSON MAKING CONTACT: Paul H. Brown		**DATE:** 8/10/89
SUBJECT: Interview notes concerning Riverside Cement		
SITE NAME: Riverside Cement, Crestmore Plant		**EPA ID#:** CAD063844443

Mr. Adelson indicated that the 1965 sampling that showed Cr^{+6} in well #60-1 had very questionable QA/QC and was therefore unreliable. This data has continued to keep Riverside Cement in the focus of public attention however. He is therefore recommending to the Board that a sampling of several nearby wells be conducted in the near future. In addition to the wells most likely to contain Cr^{+6}, the flooded quarry and fish from the quarry will also be recommended for sampling.

The quarry area is geologically very complex. The quarry (Crestmore) was flooded when excavations met a very deep artesian aquifer which is of excellent quality. He is unaware of any disposal of CKD in the Crestmore quarry.

Mr. Adelson Mark does not believe chromium or lead will be a problem in CKD due to the covalent bonding effect of the highly alkaline minerals in CKD. RWQCB regulation has covered several on-site processes including disposal of waste kiln brick, CKD, cooling water, sanitary waste and mine de-watering wastewater.

DEPARTMENT: Santa Ana Region		
ADDRESS/CITY: Riverside		
COUNTY/STATE/ZIP: Riverside, California		
CONTACT(S)	**TITLE**	**PHONE**
1. Mark Adelson	Staff Engineer	(714) 782-4130
2.		
E & E PERSON MAKING CONTACT: Paul H. Brown		**DATE:** 9/7/90
SUBJECT:		
SITE NAME: Riverside Cement, Crestmore Plant		**EPA ID#:** CAD063844443

I described the metals levels that were detected in our sampling, and asked what RWQCB was doing at the site. Mr. Adelson indicated that due to staffing problems he has not been able to put together a proposal for the sampling he planned earlier. RWQCB currently regulates only the facility's sewage treatment plant and surface impoundment for compressor cooling water.

He indicated that the low levels of metals detected (all below drinking water standards), are not likely to stir the board into taking any action with Riverside Cement. He further indicated that these low levels of metals may be attributable to natural mineral levels in the limestone's effect on water quality.

SITE RECONNAISSANCE INTERVIEW AND OBSERVATIONS REPORT

Ecology and Environment, Inc.		
Field Investigation Team (FIT)		
160 Spear Street, Suite 1400		
San Francisco, California 94105		
(415) 777-2811		
E & E PERSON(S) CONDUCTING INTERVIEW AND MAKING OBSERVATIONS:		
Paul H. Brown, Toner Mitchell, Laurie Campbell		
FACILITY REPRESENTATIVE(S):	**TITLE:**	**PHONE:**
Eugene M. Kulesza	Regulatory Manager	714-683-3660
Patrick M. Hill	Plant Manager	
Pat Cafferty	Corporate Counsel	
SITE NAME: Riverside Cement Co. Crestmore		**DATE:** 8/11/89
CITY/STATE: Riverside, California		**EPA ID#:** CAD063844443

The following information was obtained during the interview:

Pat Hill began with an overview of the plants. Limestone is no longer mined on site. The Crestmore Mine, which began operations in 1927, reached a depth of 1,500 feet below ground surface, 600 feet below sea level.

Cement "raw feed" is composed of 90% limestone, 9% clay, and 1% iron oxide (Fe_2O_3). Since the mine shut down, all raw feed components are imparted to the site, stored, crushed, homogenized, and blended together in the stockpiles. When ready the raw feed is heated in the kiln and becomes "klinker". This is also stored in piles until it is ground up and mixed with gypsum to form finished cement. This mixture is stored in silos prior to bagging, or shipped in bulk.

Currently the only kilns in operation at the site are two white cement kilns. These kilns have never been lined with "basic" or chromium-containing bricks. The price of white cement is twice that of grey cement due to its demand for swimming pools and buildings.

Cement kiln dust is highly alkaline dust which is removed from cement kilns in order to lower the pH of the final cement product. This is not always necessary and sometimes no cement kiln dust is generated.

pb/pc/recon

The Wet Weather Quarry became a solid waste dump sometime in the late 1960s. It received cement kiln dust as well as "basic" and regular refractory bricks.

Pat Cafferty indicated that, based on Riverside Cement's research of old invoices, "basic" bricks were probably first used around 1964 when #1 and #2 grey kilns began operation. Therefore, the 48 cubic yards of basic brick disposed on site referred to in Riverside's CERCLA notification is likely an overestimation. he added that this is considered a conservative estimate. There are several manufacturers Riverside used to obtain basic bricks: Harbison, Walker, North American Refractories, and Kaiser Refractories.

Pat Cafferty explained that the Wet Weather Quarry is still used for Cement Kiln Dust disposal, but ceased receiving bricks in 1979. Since 1979, basic bricks have either been drummed and manifested for off-site disposal, or recycled into the raw feed either here or at the Oro Grande Riverside Cement Plant. Here recycling was directly into the raw feed piles. Some raw feed dust is recirculated via a baghouse into the kiln feed. Spilled kiln dust is removed and collects in a dust pile.

The current net deposits of white dust to the Wet Weather Quarry disposal area is between 1,500 to 1,800 tons per year.

Disposal at the Commercial Quarry began at an unknown date and ended in approximately 1968. All bricks generated during these years were disposed of at the commercial quarry. Bricks still exist in this quarry, there despite reclamation.

Pat Hill, Pat Cafferty, and Gene Kulesza know of no other disposal sites operated by the Riverside Cement Co. The Jensen Quarry was sold in 1986 or 1987. The water table is found from 60 to 80 feet below ground surface from the Wet Weather Quarry surface. Pat Hill does not believe the bottom of the Wet Weather Quarry exceeds 80 feet below ground surface.

The Crestmore facility recently completed a fairly extensive air pollution study: to check sulfur oxide, nitrogen oxide, and carbon monoxide levels in stack emissions.

The California Department of Heath Services, Alternative Treatment Technology Evaluation Office has overseen the removal of the 6-million-gallon heating oil tank.

Gene Kulesza will attempt to obtain logs of on-site wells.

When presented with the Truesdail Lab report which indicated 4,600 part per million (ppm) lead in white dust from Crestmore, both Gene Kulesza and Pat Hill were concerned about the accuracy of the analysis. Their conjectured, a possible source of the lead but rejected that idea. During the operation of the kiln, molten cement cakes up on the interior surface of the kiln. To reduce the build-up, a large caliber shotgun mounted at the cool end of the kiln fires lead slugs at the

caked up build-up to reduce it. This source was debated, then rejected, due to the small amount of introduced lead possible from this source. When I conjectured that the steel mill slag (FE_2O_3) component of the raw feed was a possible source of the lead, Pat Cafferty indicated that the lead was more likely originating in the limestone than with the shotgun. The firing rate was approximately 30 pounds per minute.

The following observations were made during the site reconnaissance visit:

At 11:30 a.m. the facility representatives and FIT boarded a van owned by Riverside Cement for a tour of the plant. The first area visited was the white cement plant. The general area was covered with fine white powder. The #2 white cement kiln was shut down for maintenance; #1 was producing and was being cleaned out.

At 11:45 the group visited the flooded entrance to the Crestmore Mine. The area is fenced. Catfish are stocked to control insects.

At 11:54 the group visited an area of the Commercial Quarry. CKD had been disposed of in this area, along with improperly proportioned raw feed, and reclaimed at a later date. A lot of CKD is still present.

At 12:02 the group observed the discharge point where mine de-watering water was formerly discharged to the West Riverside Canal.

At 12:15 the group visited the lower quarry area of the Commercial Quarry. The quarry floor is under water and considerable mature vegetation is present, indicating that the water was not of a seasonal nature, but rather was inflow from groundwater.

At 12:25 the group moved to the Wet Weather Quarry and observed a truck discharge a load of CKD; a large dust cloud was generated. A fairly large earth moving project has recently placed fill in between the Wet Weather and Commercial quarries. Patrick Hill indicated that this was part of a longterm reclamation project. Standing water was also observed in the bottom of the Wet Weather Quarry. Reeds and trees were also growing there.

At 12:50 the group drove to well #88-1. The well head pressure read 40 pounds per square inch (PSI). A 2" valve was located near the well head. The klinker storage piles could be seen from this point. The three-southernmost piles in this area hold oil-contaminated soil from the 6-million-gallon #6 heating oil tank after it was removed.

At 1:00 the group visited well #60-1.

At 1:12 the group visited the blowdown pond which contained condensed steam which had been used to heat heating oil prior to its use in the kiln. The pond is cement-lined with adequate free board, and measured approximately 20′ x 20′ x 3′ deep. The water in the pond contained floating chunks of oil globules which came from a leak in the oil heating system.

pb/pc/recon

At 1:30 the group returned to the office and departed the Crestmore Plant.

At 1:45 FIT visited the Jensen Quarry and noted areas of imported white fill dirt (possibly containing CKD) and teenagers swimming in the water covering the quarry floor. The fence surrounding the Quarry was torn down in several places and the area appeared to receive considerable off-road vehicle use.

At 2:00 FIT departed the Jensen Quarry.

ICF TECHNOLOGY INCORPORATED

MEMORANDUM

TO Carolyn Douglas, (H-8-1)
Site Assessment Manager

THROUGH Kent Kitchingman, Chief (P-3-2)
Quality Assurance Management Section

FROM Susan M Sanders
ESAT Investigation Coordinator

DATE May 25, 1990

SUBJECT Review of Final Revisions to Riverside Cement Sampling and Analysis Plan

The revised SAP for Riverside Cement has been reviewed and is approved for use A typographical error on Table 4-1 has been discussed with the sample plan author It is understood that the preservative to be used should be added to bring the sample pH to a level below 2, not greater than 2 as stated on the revised table

Questions regarding this review should be addressed to me at 957-0110

1. OBJECTIVE OF SAMPLING EFFORT

Ecology and Environment, Inc.'s Field Investigation Team (FIT) will conduct this field sampling effort to gather data as part of a Screening Site Inspection (SSI) under the authority of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA or Superfund). The SSI builds upon the body of information developed during the Preliminary Assessment (PA) by verifying and substantiating data collected during the PA, collecting additional data through a site reconnaissance visit, and collecting physical environmental samples to analyze for the presence of hazardous substances. Four routes of human exposure are evaluated as part of the revised Hazard Ranking System (rHRS): air, groundwater, surface water, and on-site pathways.

Field sampling will be conducted using protocol accepted by the U.S. Environmental Protection Agency (EPA) as specified in the "Preparation of a U.S. EPA Region 9 Sample Plan for EPA-Lead Superfund Projects" guidance document (Quality Assurance Management Section, U.S. EPA, Region 9, April 1989). Contract laboratories will be utilized for analyses.

The objective of the proposed sampling is to collect groundwater and soil samples to provide information about groundwater and on-site contamination, as well as waste characteristics information to complete a rHRS evaluation of the site. The sampling plan describes the protocols used for collecting groundwater, on-site, and waste characteristics information.

The primary objectives of the sampling effort are:

- Sample existing upgradient and downgradient wells to document an observed release to groundwater from on-site disposal of cement kiln dust and refractory brick.
- Analyze samples of cement kiln dust to determine the leachability of metals from this waste and it's total metal content.
- Analyze other accessible wastes for heavy metals to determine if a direct contact threat is posed by the site.

2. BACKGROUND

2.1 SITE AND OWNERSHIP HISTORY

The Riverside Cement Company's Crestmore Plant is an active cement manufacturing facility located at 1500 Rubidoux Boulevard in Riverside, California in Township 2 South, Range 5 West, Sections 2 and 3 San Bernardino Base Line and Meridian. The site includes two facilities: the Crestmore facility and the Jensen Quarry. The Crestmore facility includes two inactive limestone quarries, the Wet Weather and Commercial quarries, and two cement processing plants, the inactive gray cement plant and the active white cement plant. The entire Crestmore facility covers 10 acres of land approximately 1 mile west of the Santa Ana River (see Figure 2-1 Site Location Map). The Jensen Quarry is a separate quarry and solid waste dump area which is currently inactive. It was formerly owned by Riverside Cement, and is located approximately 3 miles west of the Crestmore facility in the Jurupa Mountains in Township 2 South, Range 5 West, Section 5 (see Figure 2-1 Site Location Map).

Cement has been manufactured at the Crestmore facility in 12 on-site kilns since 1909 except for a 13-year period between 1929-1942. The site ownership has passed from several corporations. Originally incorporated as Southern California Cement Company in 1906, the company changed it's name to Riverside Portland Cement company in 1909 and to Riverside Cement Company in 1928. There are several Riverside Cement operations in the Southern California area which handle all phases of cement production and distribution. In 1958 Riverside Cement merged with Peerless Cement and Hercules Cement and bought Phoenix Cement and became American Cement Corporation, or Amcord. Amcord was bought out by Giffard-Hill in 1979. In 1987 Beazer Holdings Ltd. purchased the Giffard-Hill company which included Riverside Cement. Throughout this sample plan "Riverside Cement" will refer to these past and current owners and operators of the site.

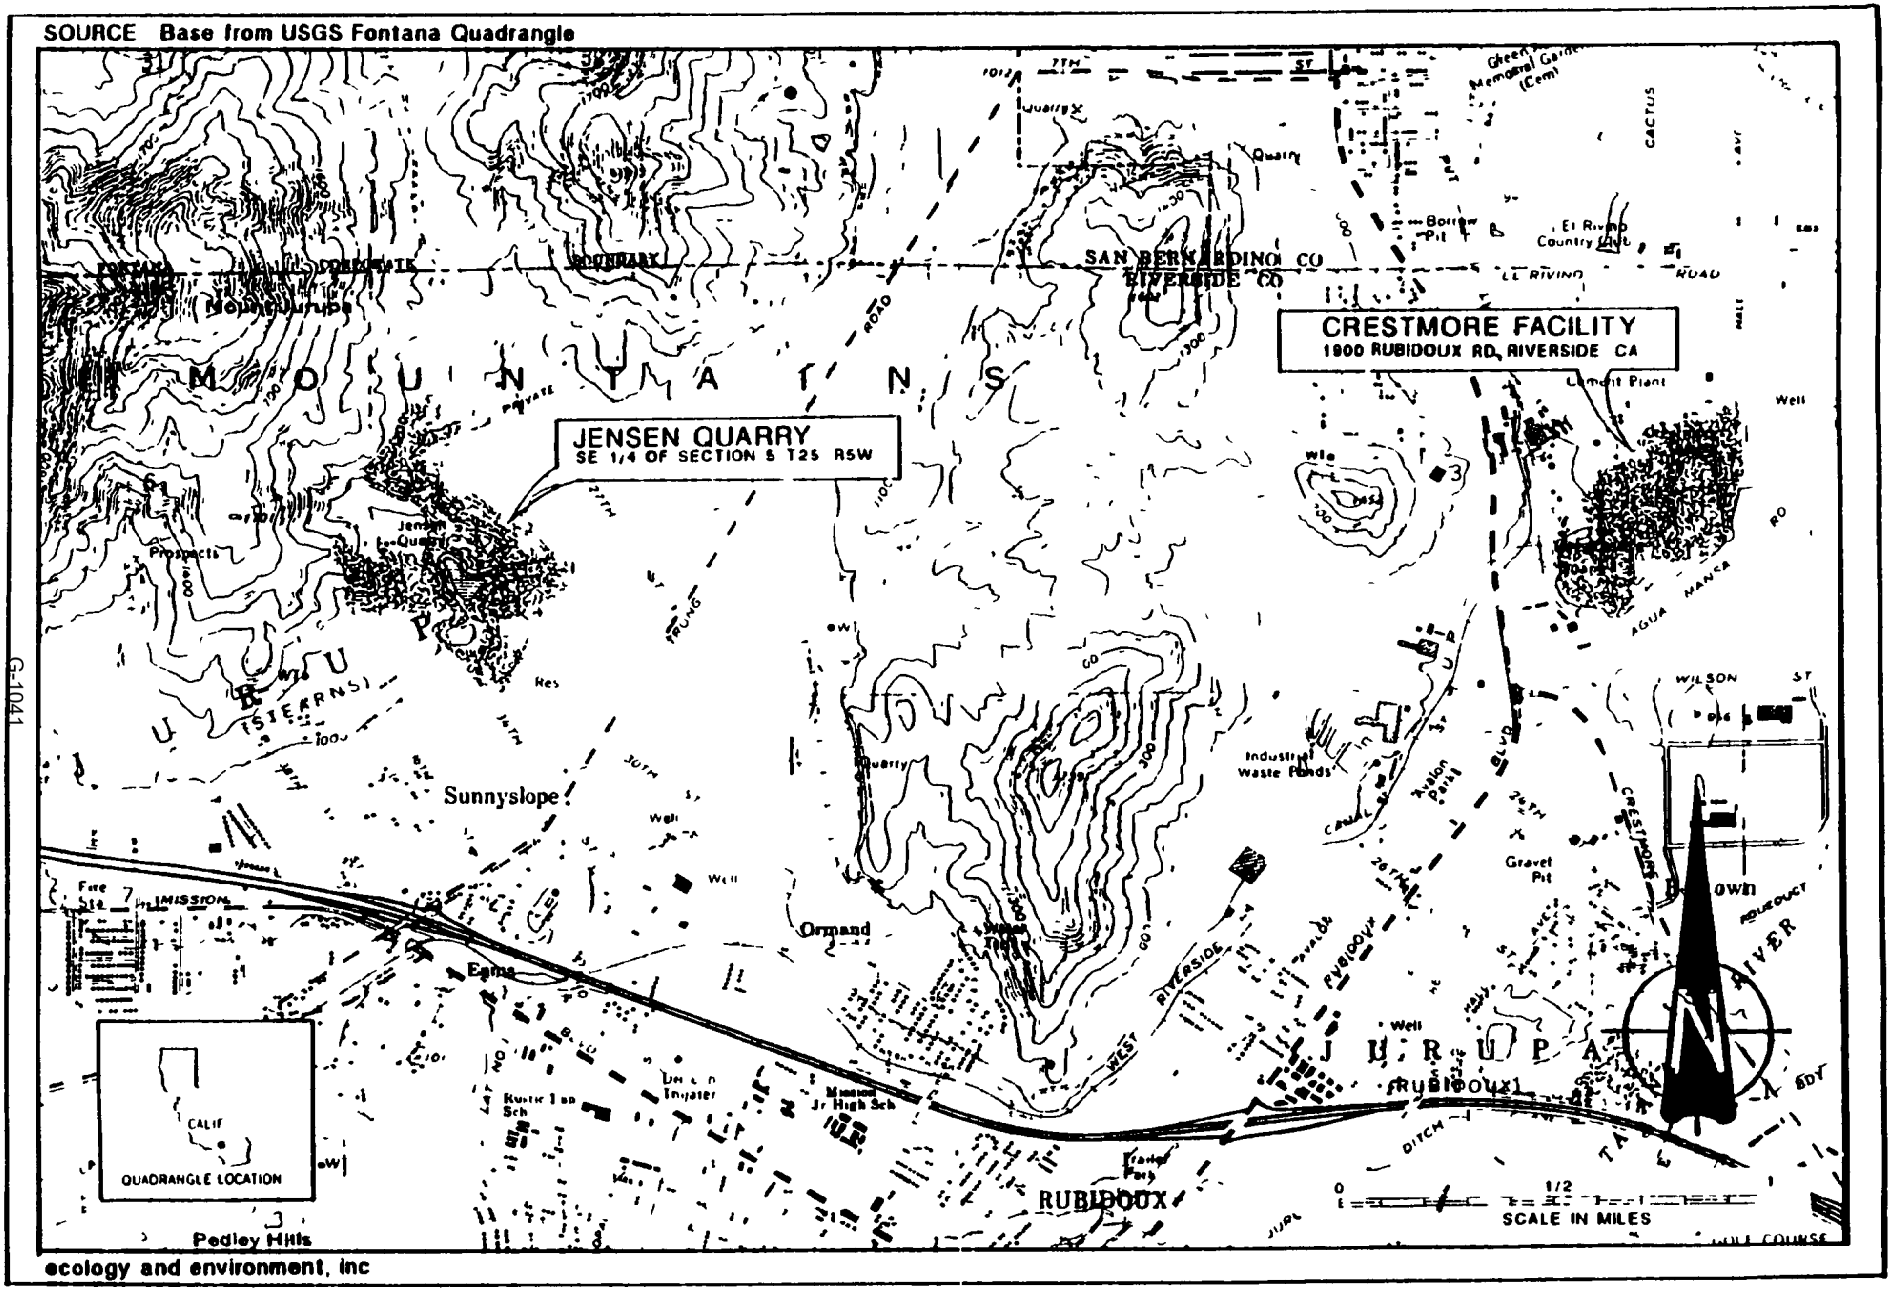

Figure 2-1 SITE LOCATION MAP
RIVERSIDE CEMENT JENSEN QUARRY AND CRESTMORE FACILITY

The Jensen Quarry was developed during World War I by the Riverside Cement Company and operated until 1927. Large scale operations at the quarry began again in 1948 and were discontinued sometime in the early 1950s. A California Department of Water Resources report indicated that in 1966 the quarry was used for riprap mining and as a disposal area for waste from cement processing at the Crestmore facility. Jensen Quarry was sold by Riverside Cement some time after 1964 and is currently owned by Walter and Elizabeth Taylor of Fountain Valley, California.

Limestone, the principal constituent of cement, has been mined on-site both at the Jensen Quarry and at the Crestmore facility by various methods including block caving, room and pillar, and surface extraction quarrying. A large room and pillar mine at the Crestmore facility, The Crestmore Mine, flooded in 1986. Currently a small lake covers the mine entrance. Mining at the Commercial and the Wet Weather surface quarries extracted limestone deposits until groundwater was encountered halting production. Since 1986, only cement manufacturing and packaging from imported raw materials has occurred at the Crestmore facility.

2.2 WASTE MANAGEMENT HISTORY

The cement manufacturing process involves homogenizing and blending raw feed composed of 90% limestone with 9% clay and 1% iron oxide. This raw feed is then heated in a sloped rotary kiln to a temperature of 2700° F where it undergoes a chemical reaction. When the mixture is rapidly cooled, it forms into marble sized balls called klinker. It is stored in this form until crushed and mixed with gypsum to form cement.

The predominant waste stream generated in this process is cement kiln dust (CKD). CKD is extracted from the kiln to lower the pH of the final cement product. CKD is collected in baghouses and has been disposed of at several disposal areas on site including the quarry excavations at the Jensen, Commercial, and Wet Weather quarries and in a depression near the entrance to the Crestmore Mine (see Figure 2-2, Facility Diagram and Figure 2-3 Disposal Areas at Jensen Quarry). Disposal at the Jensen and Commercial Quarries was discontinued sometime prior to 1969. At that

time Riverside Cement began disposing of CKD in a ravine between the Crestmore mine entrance and the Wet Weather Quarry. A dam was constructed from demolition debris across the lower end of this ravine by Riverside Cement in 1968. Disposal of CKD waste in this area has continued to the present. This disposal area will be referred to as the active CKD dump. Some recovery and reuse of CKD and raw feed disposed of in the commercial quarry area has been done by Riverside Cement. Riverside Cement has estimated that 250,019 tons of CKD was disposed of at the Crestmore facility between 1964 and 1987. One set of analytical results indicated the presence of several CERCLA hazardous substances in CKD.

Another waste stream of concern at the facility is waste refractory brick, also known as "basic brick," containing 10% hexavalent chromium. From 1955 until 1979, approximately 48 cubic yards of basic brick was disposed of at unspecified on-site disposal areas along with CKD. From 1980 to 1987, these bricks were either recycled back into the raw feed and made into cement or manifested for off-site disposal.

2.3 APPARENT PROBLEMS

The waste material disposal areas on-site are centered around three limestone quarries: the Wet Weather Quarry, the Commercial Quarry, and the Jensen Quarry.

The Wet Weather and Commercial Quarries are located adjacent to the Crestmore cement plant. The Jensen Quarry is located two miles west of the cement plant in the Jurupa Hills (see Figure 2-1).

One apparent problem at the site is that wastes including basic brick and CKD were disposed of in excavations at the Wet Weather Quarry at or near the historical groundwater elevation. Saturation of these wastes could cause the leaching of soluble heavy metal contaminants into the alluvial aquifer serving Riverside Basin groundwater users (see Section 3.2

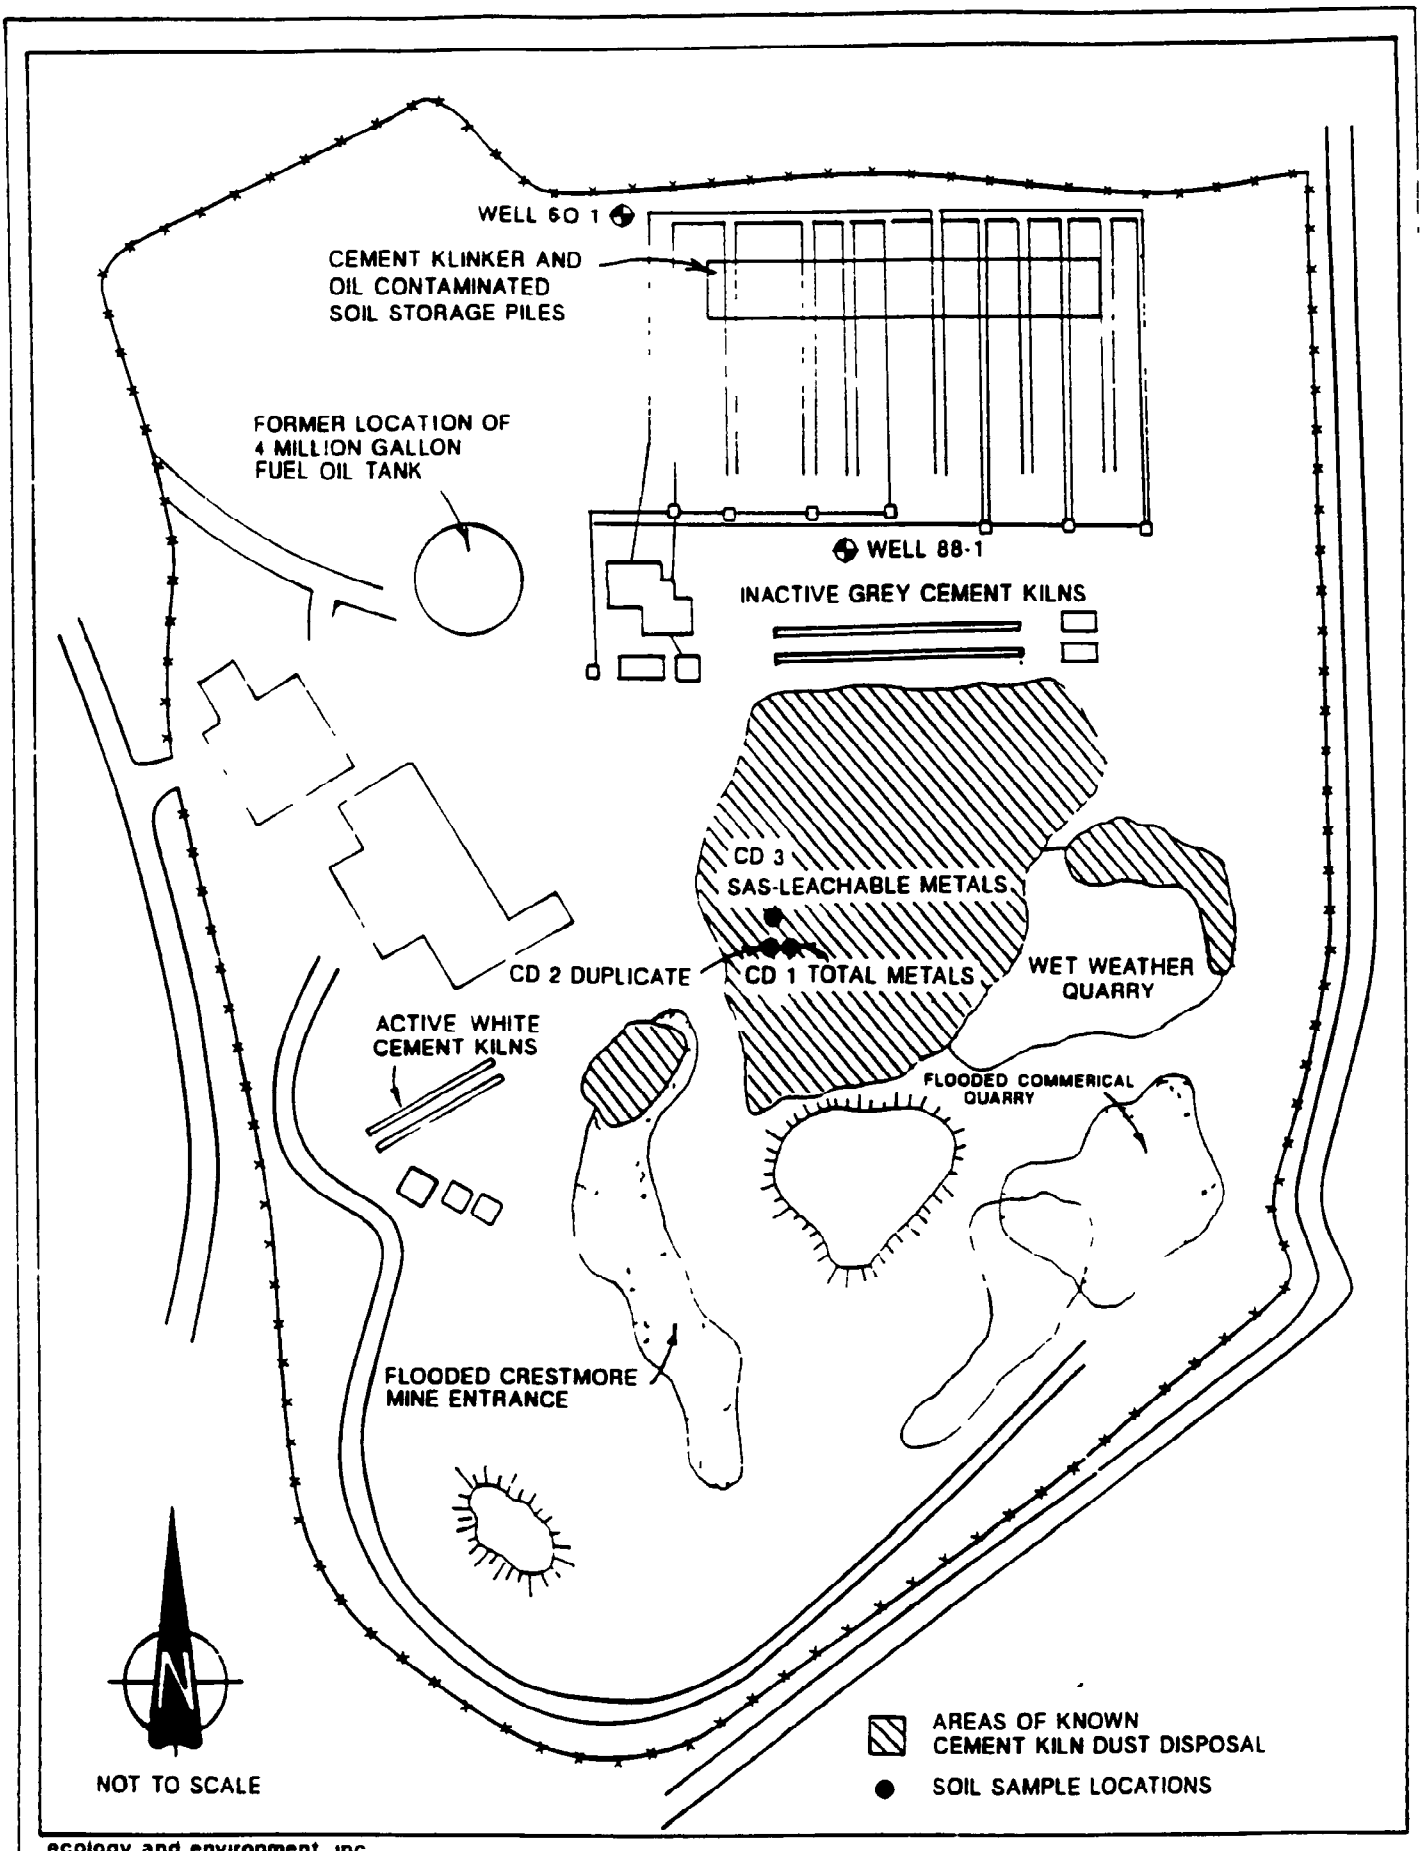

Figure 2-2 FACILITY DIAGRAM WITH WASTE DISPOSAL AND SOIL SAMPLE LOCATIONS
RIVERSIDE CEMENT CRETMORE PLANT
1500 RUBIDOUX BOULEVARD, RIVERSIDE CA

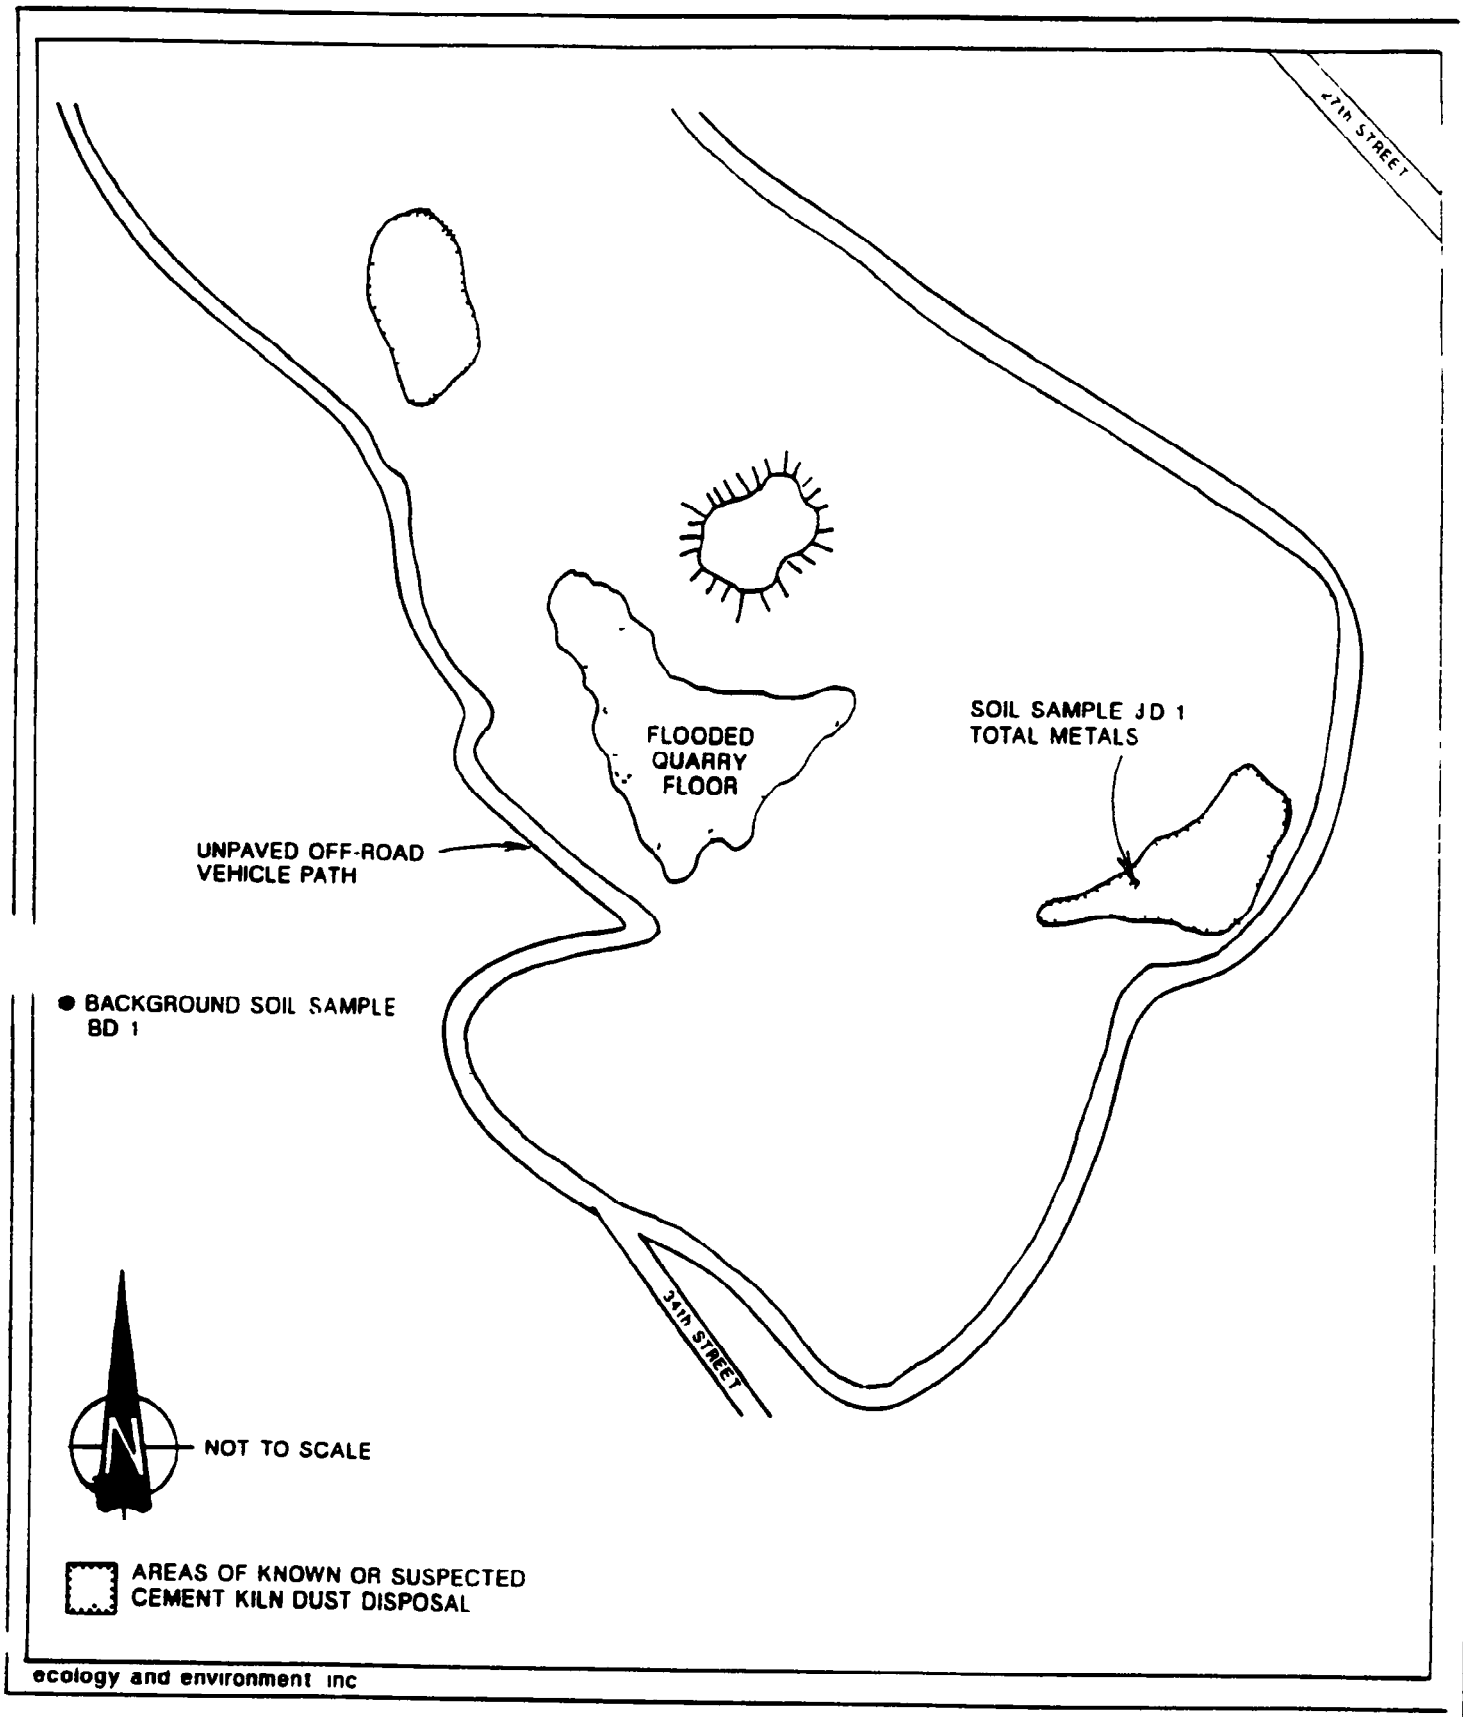

Figure 2-3 AREAS OF KNOWN OR SUSPECTED WASTE DISPOSAL AND SOIL SAMPLE LOCATION JENSEN QUARRY

Groundwater Pathway). Chromium contamination was detected in two on-site production wells in 1973. Since then chromium levels in these wells have diminished.

Another problem at the site is the potential for on-site exposure to CKD by trespassers at the Jensen Quarry. The flooded Jensen Quarry is a popular swimming and off-road vehicle area with ineffective barriers to trespassers.

3. HRS FACTORS

3.1 WASTE CHARACTERISTICS

Two types of CKD, white dust and gray dust, have been disposed of on site. The only total metals analyses of the facility's CKD were conducted by Riverside Cement in 1979. Table 3-1 lists the metals that were detected.

Table 3-1

CKD ANALYTICAL RESULTS

	White Dust (ppm)	Gray Dust (ppm)
Copper	4.2	33
Cobalt	5.6	7.6
Zinc	38	260
Manganese	78	170
Selenium	12	<0.1
Molybdenum	<21	<21
Chromium	41	26
Lithium	4.7	7.9
Strontium	250	500
Cadmium	56	150
Mercury	<0.1	0.1
Arsenic	21	6
Lead	4600	3600

3.1.1 Cement Kiln Dust Sampling

FIT proposes to collect a sample of CKD for total metals analyses to confirm the levels of metals detected in this 1979 sampling. A duplicate of this sample is proposed due to the high concentrations of hazardous substances in CKD.

In addition, FIT proposes to analyze a second sample of CKD from the same location for leachable metals. This analysis is required to assist in determining if a groundwater quality problem is posed by the CKD waste disposed of on site. All Crestmore CKD samples will be collected from the Crestmore active CKD dump. This is where CKD waste is currently being disposed of. Table 3-2 lists the samples proposed to characterize CKD wastes.

Table 3-2

CKD CHARACTERISTICS SAMPLE LOCATION AND RATIONALE

Sample Type	Sample #	Location	Rationale
Soil-Total metals (Lab QC)	CD-1	Crestmore Active CKD Dump	To determine the concentration of CERLCA hazardous substance present in CKD. A lab QC and duplicate of this sample are proposed because the concentrations of hazardous substances are expected to be the highest in this sample.
Duplicate of CD-1	CD-2	Crestmore Active CKD Dump	See above.
Soil-Leachable metals	CD-3	Crestmore Active CKD Dump	To determine the leachability of metals from CKD.

3.2 GROUNDWATER PATHWAY

The Crestmore disposal area is located in the Riverside Hydrologic Subarea at the base of an isolated rock out-cropping at the eastern end of the Jurupa Mountains. Local ground surface elevations range from 900 to 920 feet, above mean sea level (msl), not including quarry excavations. Two limestone beds, separated by a 500 foot bed of quartz diorite striking north and moderately east, directly underlie the area. The upper limestone bed is called the Sky Blue limestone. The lower bed is called the Chino limestone. Both formations range in thickness from 200 to 300 feet.

The Wet Weather Quarry mined the Sky Blue limestone formation prior to its use as a CKD disposal area. The Quarry excavation exposed aeolian sand dune deposits to the southeast. Underlying these deposits near the facility are granite and limestone beds. As these beds dip into the valley floor, older alluvium directly underlies the aeolian deposits. The aeolian deposits are composed of sand. The underlying older alluvium is composed of lenses of unconsolidated, poorly-sorted gravel, sand,

silt, and clay. These older alluvial deposits are the major source of groundwater in the Riverside Basin. Although the aquifer of concern is found in the older alluvium, on-site production wells that have previously shown contamination possibly extract water from both the Sky Blue limestone and the Chino limestone. A California Department of Water Resources Memorandum concerning waste disposal at the Crestmore facility stated that differences in water quality and static water elevations between the limestone aquifers and the alluvial water bearing zones indicate that these formations may be isolated from each other. The regional groundwater flow gradient in the alluvial aquifer is to the southwest (see Figure 3-1).

In 1965, the bottom of limestone excavations in the Wet Weather Quarry were at an elevation of 825 feet above msl. Excavation likely ceased at this elevation due to the presence of groundwater. It is unclear if the water encountered at that elevation was in communication with the alluvial aquifer or with the Sky Blue limestone aquifer. A well located 2,000 feet east of the site, screened in the alluvial aquifer, had a static water level of 800 feet above msl in 1965 and a historic high level of 830 feet above MSL in 1945.

✓ The Rubidoux Community Service District operates two wells approximately 3.75 miles from the site that contribute to a blended system which serves over 5,000 household customers. These wells are screened beginning at 60 feet bgs. Recent sampling data from these wells does not indicate elevated levels of heavy metals. The Crestmore Heights Mutual water company operates a well located on Riverside Cements Property which serves approximately 100 household customers. This well is located approximately 0.4 miles from the Crestmore active CKD dump. This well was originally constructed as a mine de-watering well for the Crestmore mine. It has an open ended casing approximately 250 feet bgs. Sampling data from this well is inadequate for determining levels of specific heavy metals.

Possible groundwater contamination at the site came to the attention of the California Regional Water Quality Control Board in 1973 when a high

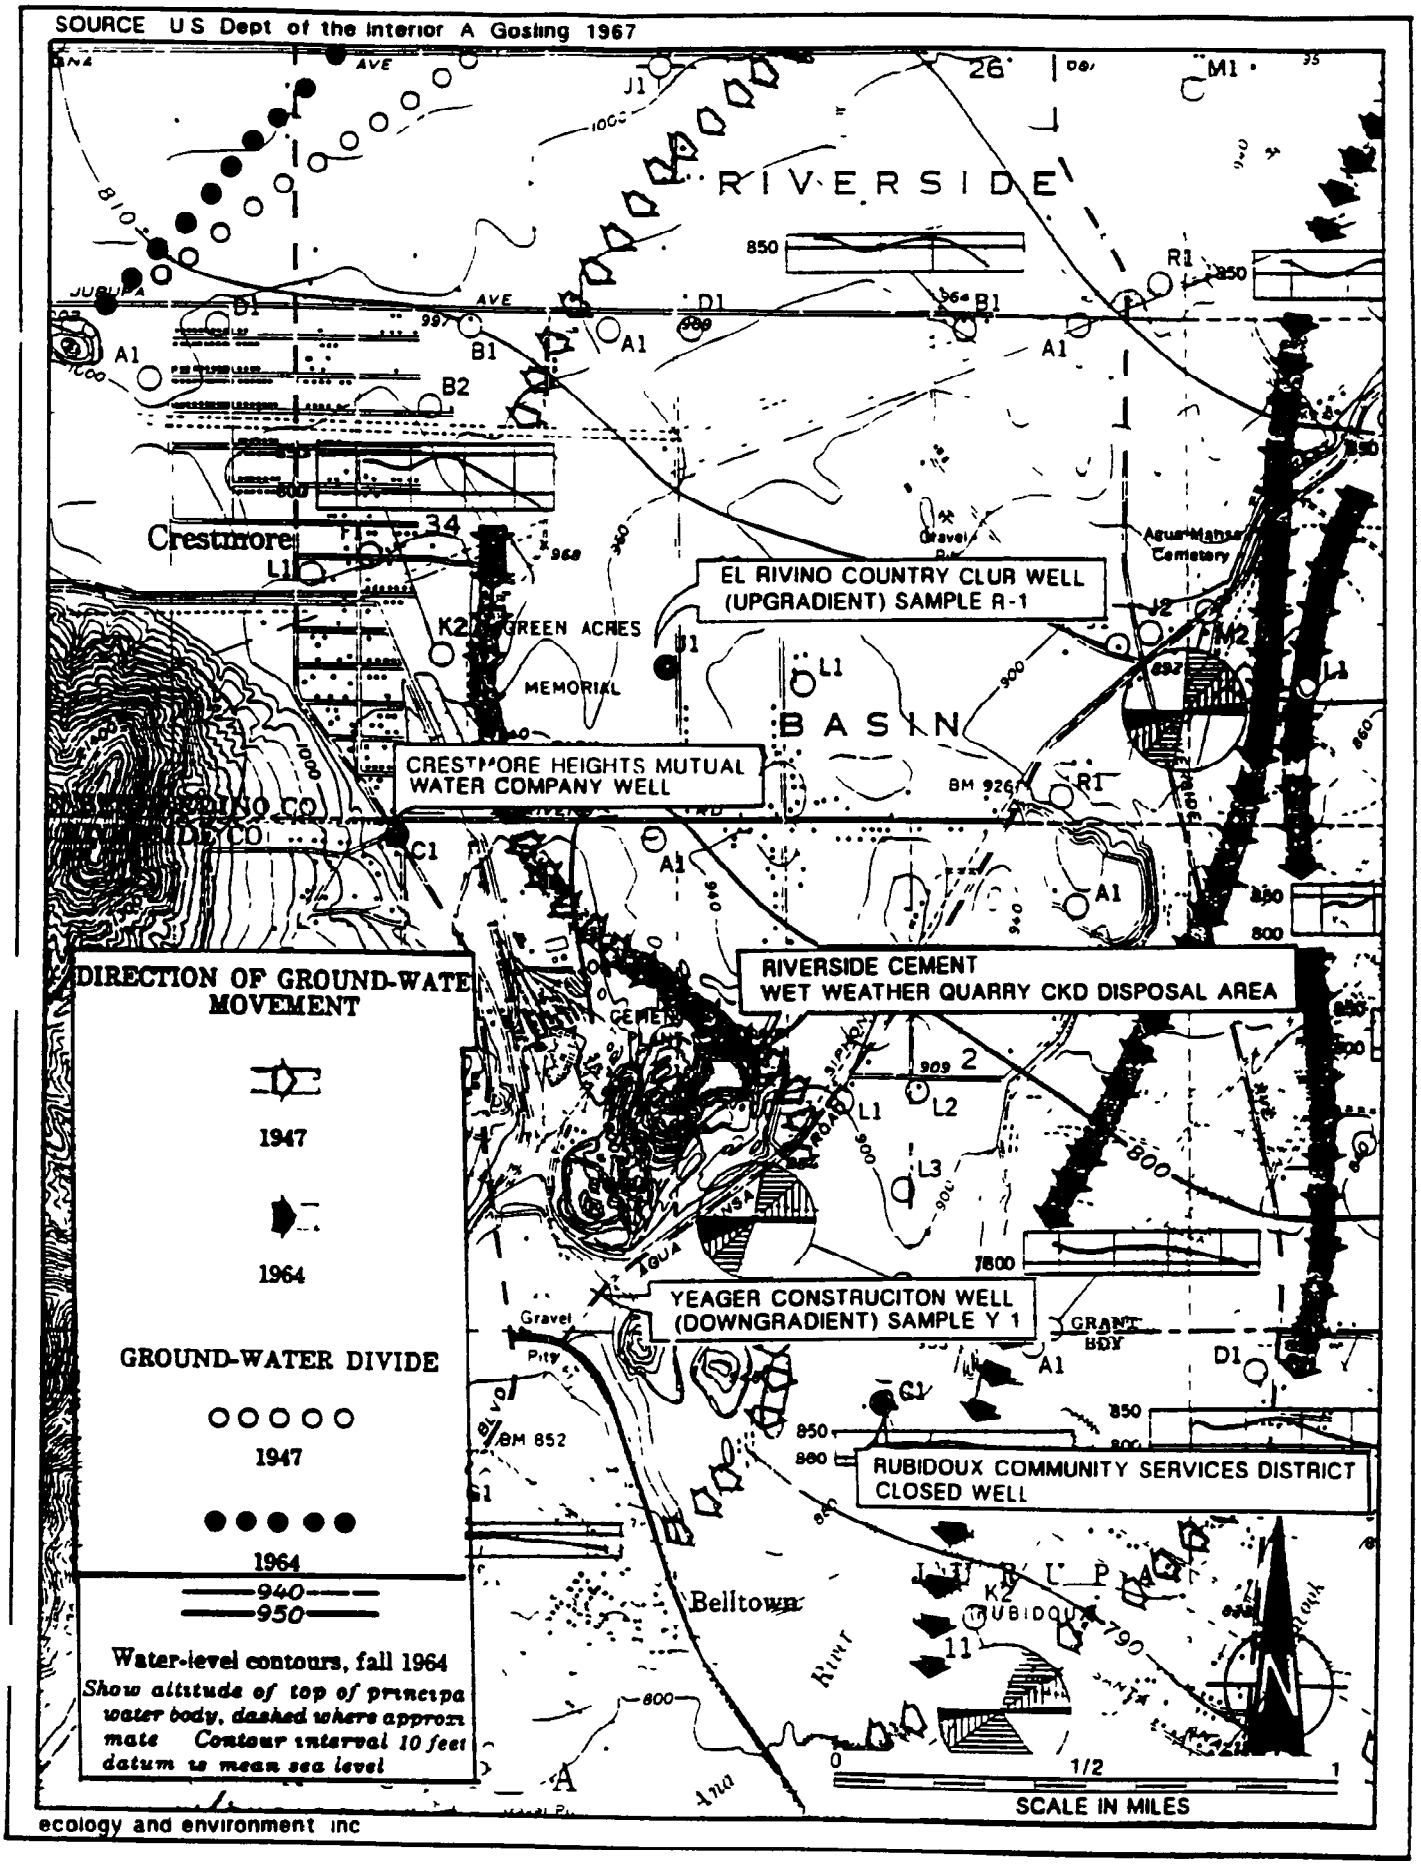

Figure 3-1 GROUNDWATER FLOW DIRECTION AND GROUNDWATER SAMPLE LOCATIONS

level of chromium (0.55 mg/L) was detected in the facility's wastewater which is released to the Riverside Irrigation Canal. This incident was investigated by Riverside Cement and determined to be an unusual release of recirculated cooling water treated with chromate. However, subsequent sampling by Riverside Cement of their on-site well, 60-1 (see Figure 2-2), revealed levels of chromium as indicated in Table 3-3:

Table 3-3

CHROMIUM LEVELS IN WELL 60-1 (mg/L)

Year of Sample	Hexavalent Chromium	Total	Current Maximum Contaminant Level for Chromium
1976 (January)	.03	.09	.05 mg/L
1976 (June)	.04	*	
1984	*	.03	
1985	*	.02	
1986	*	.02	
1988	*	.02	
1989	*	.01	

* analyses not performed.

Another on-site well, 88-1 which was reconditioned in 1988, has shown total chromium levels of .02 mg/L in 1988 and in 1989.

Well logs for these wells are unavailable and it is unknown if these wells are screened in limestone or alluvial deposits.

Water from the flooded Crestmore Mine was also sampled by Riverside Cement. Table 3-4 list the analyses results.

Table 3-4

CHROMIUM LEVELS IN THE CRESTMORE MINE WATER (mg/L)

Year of Sample	Hexavalent Chromium	Total	Current Maximum Contaminant Level for Chromium
1976	.03	.05	.05 mg/L
1984	*	.01	
1987	*	.01	
1989	*	.02	

* Not analyzed

Additionally, in 1988 a well owned by the Rubidoux Community Services District, located 0.5 miles southeast of the site showed levels of lead at .01 mg/L and total chromium at .01 mg/L (see Figure 3-1).

3.2.1 Groundwater Sampling

Background levels of chromium and lead in other on-site wells sampled by Riverside Cement were not detected at detection limits of 0.01 mg/L.

Despite the availability of groundwater analytical data, no wells directly downgradient from the disposal area, screened in the alluvial aquifer, have been sampled. FIT proposes to sample the Yeager Construction Company's well located 0.5 mile southwest of the waste disposal area. This well is down-gradient of the disposal area and there is no available sampling data for this well.

The Yeager well water is used in a drive-through truck wash at the Yeager yard. It is collected on a concrete pad and pumped into a polymer lined settling and storage pond. This water is then sprayed on the facilities yard and at other construction sites to control dust. There is no analytical analysis of this wastewater available to determine it's potential effect on groundwater quality.

However, it is unlikely that this water is contaminated with dissolved heavy metal contaminants which samples collected in this investigation are to be sampled for. The Yeager Construction Company's wastewater appears to lack a source for heavy metals contaminants. The processes at the construction yard include an asphalt batch plant, a cement ready-mix plant and equipment maintenance and storage. The asphalt manufacturing and equipment maintenance processes could produce organic contaminants from their use of parts cleaning solvents, paint or lubricants. However heavy metal contamination from these sources is unlikely. The finished cement used in Yeager's Ready-mix Cement plant likely contains low levels of heavy metals. However, it is unlikely that heavy metal constituents of cement are soluble given the low concentrations normally found in finished cement. In addition, the waste water sprayed on the facility for dust control would not likely come in contact with finish cement handled in the batch plant.

Groundwater sampling data is required to determine if waste disposal at the Crestmore Plant is degrading water quality in the alluvial aquifer used by Riverside Basin groundwater users. This information is required to evaluate the site under the rHRS. Table 3-5 lists groundwater sample locations and rationales.

Table 3-5

SAMPLE LOCATION AND RATIONALE

Sample Type	Sample #	Location	Rationale
Water (Lab QC)	Y-1	Yeager Construction well	To analyze groundwater quality downgradient from CKD disposal areas for possible observed release. This well was chosen for Lab QC and duplicate analysis because it is the only well being sampled for suspected contamination.
Water (Duplicate Y-1)	S-1	Yeager Construction well	See above.
Water	R-1	El Rivino Country Club well	To determine upgradient (background) groundwater conditions.
Water	p-1	Field Blank	QC Procedure

3.3 SURFACE WATER PATHWAY

Analytical data documenting the site's past chromium release to surface water is currently available. It is unlikely that any further documentation of contamination of surface water could be obtained.

A release of cooling water containing .55 mg/L chromium to the Riverside Canal was documented by the Regional Water Quality Control Board in 1973 (see Section 3.2 Groundwater Pathway). The Riverside Canal runs adjacent to the Crestmore facility's southern boundary and is used for irrigation only.

The Santa Ana River is located 1 mile east of the Crestmore plant. This river has no use other than flood control and wildlife habitat. Several listed and Candidate Federal Endangered and Threatened Plant and Animal species likely exist in this area. Table 3-6 lists those species.

3.4 AIR PATHWAY

Although there is a moderate potential for documenting an air release at the site, air sampling is not within the scope of this Screening Site Investigation.

The Crestmore facility's uncovered storage piles of cement raw materials and klinker covers approximately 20 acres. However a large part of this area is currently used to store contaminated soil from Riverside Cement's closure of it's 6 million gallon-above ground fuel storage tank. This waste is excluded under CERCLA by the petroleum exclusion. The active CKD disposal area covers approximately another 18 acres. Both of these areas are sources of potential air releases from the facility. The storage piles are continuously homogenized with large earth moving conveyers. Dumping of CKD at the disposal area is also ongoing. Both of these processes likely contribute to the entrainment of particulate emissions from these sources.

The nearby communities which are partially within 4 miles of Riverside Cement's Crestmore facility or the Jensen Quarry include: Riverside (pop. 170,591), Crestmore Heights (pop. 200), Fontana (pop. 37,107), Rubidoux (pop. 12,400), and Sunnyslope (pop. 1,200).

In addition the federally designated endangered species listed on Table 3-6 are also possibly found within the site's air pathway target distance limit.

Table 3-6

LISTED ENDANGERED AND THREATENED SPECIES AND CANDIDATE SPECIES THAT MAY OCCUR ON OR IN THE VICINITY OF RIVERSIDE CEMENT

LISTED ENDANGERED SPECIES	
Mammals	
Stephen's Kangaroo Rat	Dipodomys stephensi
Birds	
Least Bell's vireo	Vireo bellii pusillus
Plants	
Slender-horned spineflower	Centrostegia leptoceras
Santa Ana River Woolly-star	Eriastrum densifolium sanctorum
CANDIDATE THREATENED SPECIES	
Mammals	
Spotted bat	Enderma maculatum
Greater mastiff bat	Eumops perotis californicus
Los Angeles pocket mouse	Perognathus longimembris brevinasus
Birds	
White-faced ibis	Plegadis chihi
Swainson's hawk	Buteo swainsoni
Ferruginous hawk	Buteo regalis
Long-billed curlew	Numenius americanus
Tricolored blackbird	Agelaius tricolor
Reptiles	
Orange-throated Whiptail	Cnemidophorus hyperythrus
San Diego Horned Lizard	Phrynosoma coronatum blainvillei
Western pond turtle	Clemmys marmorata
Amphibians	
California red-legged frog	Rana aurora draytoni
Invertebrates	
Greenest tiger beetle	Cincindela tranquebarica viridissima

3.5 ON-SITE PATHWAY

The on-site pathway is not a consideration at the Crestmore area of the site. This area is fenced, guarded, patrolled and in continuous operation, thereby restricting on-site access. However, the Jensen Quarry area is unfenced and in use as a recreation lake and off-road vehicle area by trespassers. Additionally the federally designated endangered and threatened plant and animal species listed on Table 3-6 possibly exist on or near both the Jensen Quarry and the Crestmore facility. These species also contribute to the site's on-site pathway target population.

FIT proposes to collect samples at a suspected CKD dump area at the Jensen Quarry to determine if uncontained CKD, containing elevated levels of heavy metals, poses a potential to be exposed to humans or sensitive habitats in this area. Table 3-7 lists the on-site pathway soil sample locations and rationales.

Table 3-7

JENSEN QUARRY CKD SAMPLE LOCATION AND RATIONALE

Sample Type	Sample #	Location	Rationale
Soil	JD-1	Jensen Quarry	To document the presence of CERCLA hazardous substances in exposed waste on-site, for on-site exposure pathway.
Soil	BD-1	Jensen Quarry Native soil upslope from the Quarry	Background soil conditions.

4. REQUEST FOR ANALYSES

4.1 GROUNDWATER SAMPLE ANALYSES

The analytical parameters for groundwater sampling at Riverside will include Target Analyte List (TAL) metals and strontium. The metals analyses will require a Routine Analytical Services (RAS) request for the TAL metals plus a Special Analytical Services (SAS) request for the additional analyte and low contract required quantitation limits (CRQLs) required for several analytes. The entire groundwater analyses request includes RAS + SAS TAL metals with the addition of strontium (5 ppb detection limit) and low detection limits for hexavalent chromium, total chromium, and cadmium.

The analytical and quality assurance (QA) procedures for these methods are included in Appendix D. The laboratory services requested are intended to detect any increase in the levels of soluble metals downgradient from the Riverside Cement site. Metal contamination from the cement kiln dust and refractory kiln brick disposed of on site is suspected. Low detection limits are requested because previous samples of on-site wells showed levels of metals near the standard CRQL.

A total of four groundwater samples will be collected. One upgradient background, one downgradient, one duplicate downgradient, and one equipment blank.

The upgradient sample location is the El Rivino Country Club well, 0.7 miles north of the active Crestmore CKD dump. The downgradient sample location is the Yeager Construction Company well located 0.15 miles south of the flooded Crestmore mine (see Figure 3-1).

The upgradient well was chosen because it is the closest upgradient well which is screened in the alluvial aquifer which has not shown contamination in previous sampling. No previous sampling data for this well is available. The downgradient well was selected due to it's downgradient proximity to the area of waste disposal on site. It has

never been sampled before. This well was chosen for the laboratory Quality Control (QC) and duplicate samples because it is the only sample location where contamination is expected. Table 4-1 summarizes the groundwater request for analysis.

4.2 Soil Sample Analysis

The soil sampling objective at Riverside Cement will require both SAS and RAS requests.

The SAS request is to have the California Waste Extraction Test (WET) Procedure performed on one sample of cement kiln dust. The Laboratory QC procedures for this method are included in Appendix D. The extracted liquid will be analyzed for TAL metals plus strontium (5 µg/L detection limit) with low CRQL for hexavalent chromium, chromium, and cadmium. The analytical and quality control procedures for these methods are also included in Appendix D.

The purpose of this WET analysis for metals is to determine the potential for heavy metals to leach from waste dust disposed of on site. The historic disposal of these wastes at or near the water table elevation makes this potential of particular concern at the site.

The RAS request for soil analyses includes three samples of cement kiln dust and one background soil sample for TAL metals. One sample will be collected from the Crestmore active CKD disposal area. The purpose of this sample is to determine the levels of hazardous constituents in CKD. This information is required to provide supplementary toxicity information to evaluate the site under the proposed revised Hazard Ranking System (rHRS) model. The second RAS soil sample is a duplicate of this sample. This sample location was chosen for the laboratory QC and duplicate collection because, of the two cement kiln dust sample locations, this is the one with the highest suspected metal concentrations.

The third RAS metals soil sample will come from a suspected cement kiln dust disposal area at the Jensen Quarry. This analysis is required to investigate possible contamination in a publicly accessible area.

The fourth RAS metals soil sample is a background sample of native soil upslope from the Jensen Quarry area. This sample location is approximately .25 miles west of the Jensen Quarry excavation on an undisturbed vegetated hillside. Table 4-2 summarizes the soil sample request for analysis.

Table 4-2

SOIL SAMPLE REQUEST FOR ANALYSES TABLE

CLP ANALYSES REQUESTED				SPECIAL ANALYTICAL SERVICES + Routine Analytical Services RAS + SAS	
CHEMISTRY TYPE				Inorganics	
SPECIFIC ANALYSES REQUESTED				CAM WET Extraction and TAL Metals*	TAL Metals + Strotium (1mg/G detection limit)
PRESERVATIVES				None	
ANALYTICAL HOLDING TIME(s)				Hold to <6 mos.	
CONTRACT HOLDING TIME(s)				Hold to <6 mos.

CD-2 Dup.	Crestmore	4/30/90	X		1
CD-3	Crestmore	4/30/90	X	3	
JD-1	Jensen	4/30/90	X		1
BD-1	Jensen Background	4/30/90	X		1
TOTALS low conc			5		

*Adding Strotium with low CRQL for Hexavalent Chromium, Chromium, and Cadmium.

5. METHODS AND PROCEDURES

5.1 GROUNDWATER SAMPLING AT OFF-SITE IRRIGATION AND INDUSTRIAL WELLS

5.1.1 Well Purging Procedures

The El Rivino County Club Irrigation well (Rivino) and the Yeager Construction Company Industrial well (Yeager) will be properly purged prior to sampling in order to ensure that water in the aquifer is being sampled and not the standing water in the well or pump. Prior to purging, both wells will be sounded if possible to record the depth to groundwater. The El Rivino Country Club well has a total depth of 190 feet. It has a fully enclosed 14 inch diameter casing with an open bottom. In 1985, the well had a static water level of 112.4 feet msl. The wet casings well volume is 86 cubic feet, or 640 gallons. The well is equipped with a shaft driven impeller pump powered by a 125-horse power electric motor. During a pump test in 1985, the well had a capacity to pump 1,120 gallons per minute. At this rate purging 5 well volumes from the El Rivino well will take less than 3 minutes. During this time, pH conductivity and temperature will be monitored continuously. After at least 3 minutes of pumping has occurred and these parameters have stabilized to within 10% of the last reading. The well will be considered sufficiently purged and sampling will commence.

Information about the Yeager Construction Co. well construction (casing diameter, static water level, total depth, pump rate) is unavailable. This well pump will be run continuously for 15-20 minutes prior to sampling. During this time, pH, conductivity, and temperature will be monitored at least every five minutes. When these parameters have stabilized to within 10% of the last reading, the well will be considered sufficiently purged and sampling will commence.

5.1.2 Obtaining Samples

Water samples collected from the Yeager and El Rivino wells will be obtained from outlets as close as possible to the pumps. Samples will not be collected from faulty or leaking spigots. Samples will be taken from a steady flowing stream at moderate pressure in order to prevent splashing or dislodging particles in the faucet or water line. Water will be taken directly into sample bottles. Aerators, strainers, and hose attachments on the tap will be removed before sampling. In addition, all samples will be collected prior to any filter, water softening devices, chlorinators, or pressure tanks. Refer to Section 4 for sample bottle and preservative requirements.

Samples will be measured for pH, conductivity, and temperature. These measurements and the names of the owner, the exact mailing address, and home and work telephone numbers will be recorded in the project managers logbook.

5.1.3 Decontamination

Decontamination of sampling equipment will not be necessary due to the lack of equipment which will be used to collect samples.

5.2 SURFACE SOIL GRAB SAMPLING

5.2.1 Obtaining Samples

Surface soil samples will be collected from pre-determined areas where grass, leaves, and other debris have been removed. Soil samples will include the upper 6 inches of soil from an area 6 inches in diameter. Each sample will be mixed in a sample-dedicated, disposable, paper mixing bucket to ensure sample homogeneity prior to transfer to the appropriate sample container (refer to Section 4 for sample bottle and preservative requirements). Each sample will be obtained using a sample dedicated stainless steel trowel. Soil sampling locations at the Jensen Quarry

were determined from a letter dated November 1, 1966 from the California Department of Water Resources to the Santa Ana Regional Water Quality Control Board. This letter described the CKD disposal areas at the Jensen Quarry which were active at that time and included a map showing their location. The active CKD dump at the Crestmore facility was selected as the CKD sample location because it is where a sample of known CKD can most easily be obtained.

5.2.2 Decontamination

Field equipment used during the collection of surface soil samples is generally disposable. However, should any decontamination be necessary, the following sequence will be followed:

1. Rinse with potable water to remove gross contamination.
2. Clean with non-phosphorus detergent and potable water using a brush if necessary.
3. Rinse with potable water.
4. Triple rinse with 0.1 Nitric Acid.
5. Triple rinse with de-ionized (organic-free) water.

6. DISPOSAL OF INVESTIGATIVE DERIVED WASTE

Water from the purging of both the Yeager and El Rivino Country Club wells will be discharged in the manner of their normal use.

The Yeager well is used for equipment washing and then flows into a polymer lined settling and storage pond approved by the Santa Ana Regional Water Quality Control Board (RWQCB). This water is then reused for dust control in the facilities yard and at other construction sites. The El Rivino Country Club well is used for irrigation water for a golf course.

Other investigation derived waste including tyvek suits, gloves, trowels, and packaging materials will be disposed of by Riverside Cement as municipal trash. Approval has been received from Riverside Cement for this disposal.

7. SAMPLE DOCUMENTATION AND SHIPMENT

7.1 FIELD LOGBOOKS

Field logbooks will document where, when, how, and from whom any vital project information was obtained. Logbook entries will be complete and accurate enough to permit reconstruction of field activities. At a minimum, the following sampling information will be recorded:

- Sample location description;
- Station numbers;
- Sampler's name;
- Sample collection time;
- Designation of sample as composite or grab;
- Type of sample;
- On-site measurement data (e.g., pH, temperature, conductivity, etc.);
- Field observations and details important to analysis or integrity of samples (e.g., heavy rains, odors, colors, etc.);
- Preliminary sample descriptions (e.g., clay loam soil, very wet);
- Type of preservation used;
- Instrument reading (e.g., dust meter, etc.);
- Site sketch;
- Lot numbers of the sample containers, sample tag numbers, chain-of-custody form numbers, and chain-of-custody seal numbers;
- Shipping arrangements (Federal Express airbill number); and
- Recipient laboratory.

A separate logbook is maintained for every different TDD or project. The logbooks are bound with consecutively numbered pages. Each page will be dated, time notated (24 hour clock), legible, written in black ink, and signed by the individual making the entries. Language will be factual, objective, and free of personal opinions or other terminology which might prove inappropriate. In addition to the sampling information, the following specifics will also be recorded in the field logbook:

- Team members and their responsibilities;
- Time of site arrival/entry onto site and time of site departure;
- Other personnel on site;
- A summary of any meetings or discussions with potentially responsible parties (PRPs), representatives of PRPs, or federal, state, or other regulatory agencies;
- Any deviations from project scope, work plans, sampling plans, site safety plans, and QA procedures;
- Any changes in personnel and responsibilities as well as reasons for the changes;
- Documentation of all photographs taken, along with detailed descriptions of the contents of the photographs;
- Levels of safety protection;
- Equipment calibration and equipment model and serial number; and
- Well construction details as well as purge volumes.

7.2 BOTTLES AND PRESERVATIVES

The number of sample containers, volumes, and materials are detailed in Tables 4-1 and 4-2. The containers are pre-cleaned according to the protocols already in place for Contract Laboratory Program (CLP). Water samples will be acidified to a pH of less than 2 with nitric acid (HNO_3). Preservative(s) will be added to the filled sample container(s) using a pipet and mixed by turning the container upside down. The pH is checked using pH paper to test a small amount of sample poured into the sample lid. The sample in the lid will be discarded, and if necessary, more acid will be added. No preservative will be added to the soil samples,

but all samples, water and soil, will be placed in coolers and chilled to 4° C. Sample preservatives and methods are also detailed in Tables 4-1 and 4-2.

7.3 SAMPLE TRAFFIC REPORTS AND CHAIN-OF-CUSTODY RECORDS

The collection of each sample will be documented on RAS traffic reports. The top copy of the forms will be sent to the Sample Management Office (SMO). The second copy will be retained by EPA Region IX, Regional Sample Control Center (RSCC). The third and fourth copies accompany the samples to the laboratory. A photocopy of the forms will be made for the FIT master file. One traffic report or SAS packing list will accompany each shipment to the laboratory.

All EPA sample shipments will be accompanied by a chain-of-custody record identifying their contents. The original records will accompany the shipment. The copies of the custody records will be sent to the EPA Region IX RSCC. A photocopy of the records will be made for the FIT master file. Until shipped or transferred, custody will be the responsibility of the sampling team. A separate chain-of-custody record will accompany each cooler.

Each sample container will have a gummed EPA custody seal placed across its lid. Samples will be packaged and placed in ice chests, which will have custody seals placed across the lid prior to shipment or when not with view of a sampler. All custody seals will be signed and dated by one of the samplers.

The "CLP Paperwork Instructions," Appendix G to the guidelines on "Preparation of a U.S. EPA Region IX Sample Plan," will be taken to the field as a reference, and a Field QA/QC Summary Form will be completed at the end of the sampling event. Corrections on sample paperwork will be made by placing a single line through the mistake and initialing and dating the change. The correct information can be entered above, below, or after the mistake.

7.4 PHOTOGRAPHS

Photographs will be taken at every sample location and at other areas of interest on site. They will serve to verify information entered in the field logbook. When a photograph is taken, the following information must be written in the logbook:

- Time, date, location, and, if appropriate, weather conditions;
- Complete description of the subject photographed; and
- Name of person taking photograph.

When the photographs are developed, the information recorded in the field logbook will be transcribed onto photodocumentation sheets.

7.5 LABELING, PACKAGING, AND SHIPMENT

All samples collected will be labeled in a clear and precise way for proper identification in the field and for tracking in the laboratory. The CLP samples have a pre-assigned, identifiable, and unique number. At a minimum, the sample labels will contain the following information: CLP Case/SAS number, station location, date of collection, time of collection, analytical parameter(s), and any preservatives added. Different sample numbers will be used for all samples. Samples collected from the same location but going to different laboratories will have different sample numbers.

All sample containers will be placed in a strong, outside shipping container (usually a sturdy picnic cooler with hard plastic inside). The following outlines the packaging procedures that will be followed for low concentration samples.

1. Secure the drain plug of the cooler with Fiberglass tape to prevent melting ice from leaking out of the cooler;
2. Line the bottom of the cooler with bubble wrap to prevent breakage during shipment;

3. Check screw caps for tightness and mark the sample volume level on the outside of all sample bottles with a wax pencil;

4. Secure bottle/container tops with strapping tape and custody seal all container tops;

5. Affix sample labels onto the containers and cover with clear tape;

6. All glass sample bottles will be wrapped in bubble wrap to prevent breakage; and

7. All samples will be placed in heavy duty plastic bags and sealed. The sample numbers will be written on the outside of the plastic bags with indelible ink.

All samples will be placed in coolers with the appropriate traffic report, sample ID labels, chain-of-custody seals, SAS packing lists, and chain-of-custody forms. All forms will be enclosed in a large plastic bag and affixed to the underside of the cooler lid. Empty space in the cooler will be filled with bubble wrap to prevent movement and breakage during shipment. When ice is needed, it will be placed in plastic bags and placed on top and around the samples to chill them to the correct degree. Each ice chest will be securely taped shut with nylon strapping tape, and custody seals will be affixed to the front, right, and back left of each cooler. The Region IX RSCC will be notified daily (phone 415-556-5034) of the sample shipment schedule (Friday shipments must be reported no later than noon) and will be provided with the following information:

1. Sampling contractor's name;

2. Case number/SAS number;

3. Total number(s) by concentration and matrix of samples shipped to each laboratory;

4. The name of the site;

5. Carrier, airbill number(s), method of shipment (priority next day);

6. Shipment date; and

7. Irregularities or anticipated problems associated with the samples.

8. QUALITY CONTROL

8.1 BLANKS

Blank samples are used during sampling to determine if contamination is introduced by the sampling environment or by collection equipment. Field blanks or equipment blanks are required for all water sampling. No blank samples are taken during soil sampling. When required, one blank sample must be collected per day per site. A blank is treated as a separate sample.

Field water blank samples for inorganics are prepared by bringing laboratory grade water to the field and using this water to prepare a sample. Field blanks are prepared near the end of the day at a sample location by pouring laboratory grade water into a sample container and preserving the sample the same as with the other groundwater samples. Sample P-1 is a field blank which will be collected at the completion of groundwater sampling.

8.2 BACKGROUND SAMPLES

A minimum of one background sample (or upgradient sample for groundwater) will be collected for each of the parameters selected. The background sample will be collected in an area which is unlikely to have received contaminants. The sample will be representative of conditions that existed on site before hazardous waste was deposited. Because the background sample will be used for comparison with concentrations of samples from the hazardous waste site in the revised Hazard Ranking System, great care will be exercised in the selection of the background sampling location. A background sample is required for all matrices of samples (refer to Section 4, Request for Analyses, for exact locations at background samples). Groundwater sample R-1 and soil sample BD-1 are background samples.

8.3 DUPLICATE SAMPLES

Duplicate samples are collected simultaneously with a standard sample from the same source under identical conditions into separate sample containers. A duplicate sample is treated independently of its counterpart in order to assess laboratory performance through comparison of the results. Duplicate samples will be collected from areas of known or suspected contamination. Duplicates will be collected for at least 10% of the samples per event for each sample matrix and for every analytical group tested.

All blanks, background samples, and duplicates will be submitted in the same manner as the other field samples, with no distinguishing marks or labels. The QC samples will be analyzed for the same parameters as the regular samples (refer to Section 4 Request for Analyses, for exact locations of background and duplicate samples). Groundwater sample S-1 is a duplicate of Y-1. Soil sample CD-2 is a duplicate of CD-1. The Yeager Well and the Crestmore active CKD dump were chosen for duplicate samples because they are suspected of having the highest concentration of hazardous substances.

8.4 LABORATORY QC SAMPLES

Laboratory quality control (QC) samples are analyzed by the EPA contract lab as part of the CLP standard laboratory quality control protocols. A laboratory QC sample is an additional sample volume collected at a specific sample location of known or suspected contamination. This extra volume provides the laboratory with sufficient sample to duplicate their analyses on a given sample. One laboratory QC sample is required per site per analytical group tested. The bottle labels, traffic reports, and chain-of-custody for these samples will identify them as laboratory QC samples (refer to Section 4, Request for Analyses, for exact locations of Lab QC samples). Groundwater sample Y-1 and Soil Sample CD-1 were both designated Laboratory QC Samples because they are suspected of having the highest concentration of hazardous substances.

SITE SAFETY PLAN

APPENDIX C

ANALYTICAL AND QUALITY CONTROL PROCESS FOR SPECIAL ANALYTICAL SERVICES METHODS REQUESTED

Analysis of Hexavalent Chromium (Cr+6) in Water by EPA Method 218.4:

Analytes: Chromium, hexavalent

Sample Matrices: Groundwater

Laboratory Procedure and Detection Limits: Follow the EPA Method 218.4 (Atomic Absorption, Chelation-extraction). Contract required detection limit (CRDL) is 10 µg/L Cr^{+6} or lower.

1. Samples are to be transported and stored at 4°C until analysis and validation of results are completed.
2. Domestic and industrial wastes samples are to be filtered prior to the determination of hexavalent chromium.

Contract Holding Times: Contract required analysis holding time is 12 hours from the time of sample receipt by the laboratory.

Calibration Procedure and Criteria:

1. Use at least five calibration standards (not including a zero standard) to obtain a standard calibration curve. The analytical working range must not exceed 10 to 250 µg of chromium per liter.
2. Calibration verification standards at the mid-point concentration are to be analyzed at a frequency of one per group of 10 or fewer samples and at the end of the analysis of a sample delivery group. Recoveries of 90-110% are required.

Internal Quality Control Checks, Control Limits and Corrective Action:

1. Analyze laboratory blanks at the frequency of one per group of 20 or fewer samples. Laboratory blanks must contain less than 10 µg/L Cr^{+6}.
2. Analyze laboratory duplicates at a frequency of one per group of 20 or fewer samples. Relative percent difference (RPD) of less than ± 10% are required.
3. Analyze matrix spikes at a frequency of one per group of 20 or fewer samples. Matrix spike concentrations are to be greater than 30% of the sample concentrations, but spiked samples must not exceed the working range of the standard curve.
4. Samples containing hexavalent chromium concentrations above the calibration range are to be diluted and re-analyzed. Report the results and documentation for both analyses.
5. If above control limits are exceeded, take appropriate actions to correct the problems and re-analyze the affected samples.

Analysis of Hexavalent Chromium (Cr+6) in Water by EPA Method 218.4 (Continued):

Data Calculations and Reporting Units: Calculate the sample results according to Section 8 of Method 218.4. Sample results are to be reported to the nearest µg/L for concentrations less than 10 µg/L Cr^{+6} and to 2 significant figures for concentrations exceeding 10 µg/L Cr^{+6}. All records of analysis and standard curve must be legible and sufficient to recheck all sample concentrations and QC results.

Documentation and Deliverables: Report all bench records tabulating volume of sample used, sample duplicate readings and the average duplicate results, laboratory blanks, samples, laboratory duplicates, matrix spikes, etc. Indicate date and time of analysis. Provide all raw data, including scale readings of standards and calibration curves used to determine sample results. Raw data are to be organized systematically and each page is to be numbered.

Analysis of Cadmium and Chromium in Water by EPA Methods 213.2 and 218.2:

Analytes: Cadmium and Chromium

Sample Matrices: Groundwater

Laboratory Procedure and Detection Limits: For the cadmium analysis, follow the EPA Method 213.2 (Atomic Absorption, Furnace). Contract required detection limit (CRDL) is 1 µg/L Cd or lower. For the chromium analysis, follow the EPA Method 218.2 (Atomic Absorption, Furnace) Contract required detection limit (CRDL) is 5 µg/L Cr or lower.

1. Samples are to be transported and stored at 4°C until analysis and validation of results are completed.
2. Domestic and industrial wastes samples are to be filtered prior to the determination of cadmium or chromium.

Contract Holding Times: Contract required analysis holding time is 35 days from the time of sample receipt by the laboratory.

Calibration Procedure and Criteria:

1. Use at least five calibration standards (not including a zero standard) to obtain a standard calibration curve. The analytical working range must not exceed 10 to 250 µg of cadmium or chromium per liter.
2. Calibration verification standards at the mid-point concentration are to be analyzed at a frequency of one per group of 10 or fewer samples and at the end of the analysis of a sample delivery group. Recoveries of 90-110% are required.

Internal Quality Control Checks, Control Limits and Corrective Action:

1. Analyze laboratory blanks at the frequency of one per group of 20 or fewer samples. Laboratory blanks must contain less than 1 µg/L of Cd for the cadmium samples or less than µg/L Cr.
2. Analyze laboratory duplicates at a frequency of one per group of 20 or fewer samples. Relative percent difference (RPD) of less than ± 10% are required.
3. Analyze matrix spikes at a frequency of one per group of 20 or fewer samples. Matrix spike concentrations are to be greater than 30% of the sample concentrations, but spiked samples must not exceed the working range of the standard curve.
4. Samples containing cadmium and chromium concentrations above the calibration range are to be diluted and re-analyzed. Report the results and documentation for both analyses.
5. If above control limits are exceeded, take appropriate actions to correct the problems and re-analyze the affected samples.

Analysis of Cadmium and Chromium in Water by EPA Methods 213.2 and 218.2: (Continued):

Data Calculations and Reporting Units: Calculate the sample results according to Section 8 of Methods 213.2 and 218.2. Sample results are to be reported to the nearest µg/L for concentrations less than 1 µg/L Cd or 5 µg/L and to 2 significant figures for concentrations exceeding 1 µg/L Cd or 5 µg/L. All records of analysis and standard curve must be legible and sufficient to recheck all sample concentrations and QC results.

Documentation and Deliverables: Report all bench records tabulating volume of sample used, sample duplicate readings and the average duplicate results, laboratory blanks, samples, laboratory duplicates, matrix spikes, etc. Indicate date and time of analysis. Provide all rav data, including scale readings of standards and calibration curves used to determine sample results. Rav data are to be organized systematically and each page is to be numbered.

Waste Extraction Test (WET) Procedure by California Administrative Code Title 26, Section 22-66700 (formerly Title 22)

Analytes: Waste Extraction Test (WET)

Sample Matrices: Liquid, solid and multiphase waste samples

Analytical Procedure: Follow Section 22-66700 of the California Administrative Code Title 26, pages 1550-1553 Refer to Section 22-66699 for a list of inorganic and organic persistent and bioaccumulative toxic substances with the soluble threshold limit concentration (STLC) and total threshold limit concentration (TTLC) values The waste extraction test (WET) is performed when the total concentration of any of the substances listed in Section 22-66699 in the waste sample equals or exceeds the STLC value but does not exceed the TTLC value given for that substance

1 The total concentrations of substances listed in Section 22-66699 are to be determined by analysis of the waste samples which have been prepared according to subsections (c) and (d) of Section 22-66700 Refer to subsection (b) for a list of the methods to be used in the analyses of the total concentration of the substances

2 For liquid samples containing less than five-tenths (0 5) percent by weight of undissolved solids, the samples are to be analyzed directly for substances listed in Section 22-66699 and not be subjected to the WET procedure. Refer to subsection (d) for the proper steps to take if the total concentration is less than the TTLC but exceeds the STLC when expressed on a mg/L basis

3. Follow the extraction procedure as described in subsection (f) The WET extraction solution, which consist of 0 2 M sodium citrate at pH 5 0 ± 0 1, is to be prepared by titrating an appropriate amount of analytical grade citric acid in deionized water with 4 0 N NaOH For the determination of chromium (VI), the extraction solution shall consist of deionized water.

4 For fifty grams of sample, five hundred milliliters of extraction solution is to be used. A ratio of ten milliliter of extraction solution per gram of solid is to be employed depending on the extraction vessel size. The temperature during the 48 hours extraction shall be maintained between 20 and 40 degrees centigrade

5. The proper extraction vessels and filtrate containers shall be utilized For samples to be analyzed for metal elements listed in Section 22-66699(b) and fluoride, clean polyethylene bottles are to be used For organic substances listed in Section 66699(c), a glass container shall be used.

6 For metals analysis, the filtered extracts from the sample and blank extractions are to be acidified with nitric acid to five percent by volume acid content and stored at room temperature or frozen in polyethylene bottles. The extracts to be analyzed for organic substances or fluoride should not be acidified.

Waste Extraction Test (WET) Procedure by California Administrative Code Title 26, Section 22-66700 (Continued)

7 Follow the sample analysis and data treatment procedure described in subsection (g)

Contract Holding Times Contract required analysis holding time for metals is 25 days from the date of sample receipt by the laboratory for the waste extraction test and analysis of the samples For volatiles, the contract required holding time is 10 days from the date of sample receipt by the laboratory for the WET and volatile analysis of the samples For pesticides/PCBs, herbicides and phenols, the contract required holding time is 5 days from the date of sample receipt by the laboratory for the WET and pesticides/PCBs extractions and within 40 days after extraction for the analysis of the extracts.

Calibration Procedure and Criteria· Not applicable

Internal Quality Control Checks, Control Limits and Corrective Action

1 Follow the RAS protocols and quality control requirements for the metals and organic analyses as stated in the inorganic and organic statement of work.
2 Laboratory blanks are to be subjected to the same treatment and extraction but without addition of the sample, at a frequency of one per group of twenty or fewer samples to determine if contamination or any memory effects are occurring Laboratory blanks must be free of the analytes of interest and any interfering compounds at or above the detection limit
3 Laboratory duplicates are to be analyzed at a frequency of one per group of twenty or fewer samples.
4 Analyze matrix spikes at a frequency of one per group of twenty or fewer samples Spike compounds are to be added to the extracts

Data Calculations and Reporting Units Calculate the sample results as specified in the analytical methods All records of analyses and calculations must be legible and sufficient to recheck and recalculate all sample concentrations and QC results

Documentation and Deliverables Report all bench records tabulating weight of waste samples and volume of extraction solution used, sample readings, laboratory blanks, samples, laboratory duplicates, matrix spikes, etc Indicate date and time of extraction/analysis Provide all raw data Raw data are to be organized systematically and each page is to be numbered

APPENDIX D

FIELD MEASUREMENTS FOR PH AND CONDUCTIVITY

FIELD MEASUREMENTS

1. pH

Instrument:

Model DspH-3 pH/Conductivity Meter, Environmental Instruments Inc.

Matrix:

Ground water

Analytical Procedure:

Follow instrument manufacturer's instructions. Stir the electrode in the sample until the reading stabilizes.

Holding Time:

Analyze immediately.

Calibration Procedures and Criteria:

Calibrate according to the instrument manufacturer's instructions. Calibrate pH with a buffer that is within 3 pH units of the test sample. Calibrate for pH in the field before each use. Check the instrument battery daily.

Quality Control Checks, Control Limits, and Corrective Action:

Check the pH meter against a buffer solution after each well is sampled. Recalibrate the meter if the reading is greater than 0.05 pH units of the buffer solution value. Analyze one in every ten samples in duplicate. If the percent difference is greater than 10%, recalibrate the instrument.

Reporting Units:

Report pH to the nearest 0.1 units.

Documentation:

Document instrument calibration, QC checks, and sample readings in the field notebook

RECEIVED DATE

2. CONDUCTIVITY

Instrument

Model DspH-3 pH/Conductivity Meter, Environmental Instruments Inc

Matrix:

Groundwater

Analytical Procedure:

Follow instrument manufacturer's instructions. Record sample temperature with the conductivity measurement.

Holding Time:

Analyze immediately.

Calibration Procedures and Criteria:

Calibrate according to the instrument manufacturer's instructions. Only a single point calibration in the 2K range is required to standardize. However, if unit is to be used primarily in higher ranges, it is recommended that the single point calibration be performed near point of use for best resolution. Conductivity calibration is performed periodically in house. Check the instrument battery daily.

Quality Control Checks, Control Limits, and Corrective Action:

Analyze one in every 10 samples in duplicate. If the percent difference is greater than 10%, recalibrate the instrument.

Reporting Units:

Correct for sample temperature by adding 2% of the reading per degree below 25°C, or by subtracting 2% of the reading per degree above 25°C. Report results as umhos/cm at 25°C to the nearest 1 umhos/cm.

Documentation:

Document instrument calibration, QC checks, sample readings, and calculations in the field notebook.

OPERATING/CALIBRATION INSTRUCTIONS FOR THE MODEL DSPH-3
PH/CONDUCTIVITY METER MANUFACTURED BY ENVIRONMENTAL INSTRUMENTS INC.

PH CALIBRATION IS TO BE PERFORMED IN THE FIELD BEFORE EACH USE.
CONDUCTIVITY CALIBRATION IS PERFORMED PERIODICALLY IN HOUSE.

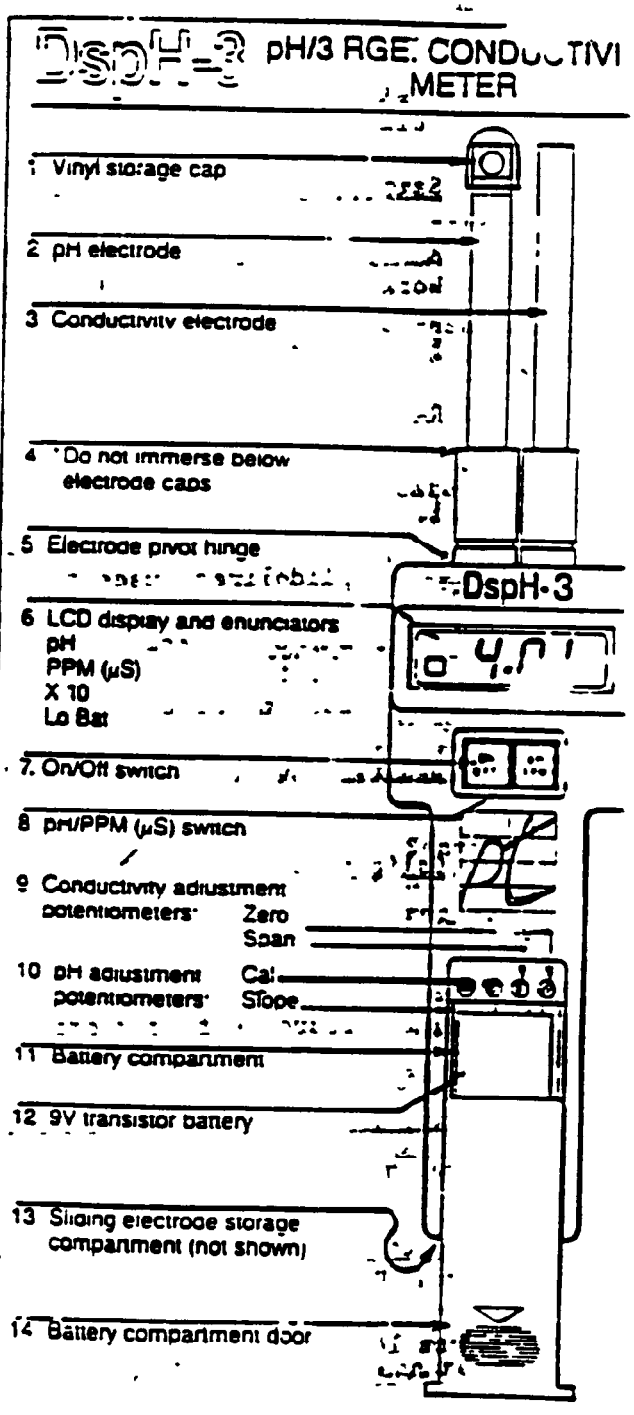
OPERATING INSTRUCTIONS

1. Slide back electrode compartment to release pH and conductivity electrodes
2. Deploy electrodes in either the 90 or 180 degree measurement position
3. Energize by depressing the On/Off switch once
4. Immerse electrodes into solution to be measured. For proper operation, immerse electrodes ½ their length
5. When energized, the LCD enunciator will indicate which parameter is being measured. E.G. pH, PPM (µS) or PPM (µS) X10. Only the 200K range utilizes the X10 enunciator. 20K and 2K are direct readings. Note selection sequence in #7. Overrange conductivity is indicated by a 1. Proceed to higher range for reading.
6. Agitate electrodes briefly and observe the reading.
7. For each range change desired, depress the pH/PPM (µS) switch once. This unit utilizes 3 ranges of conductivity. The range sequence is: pH-200K-20K-2K.
8. Rinse electrodes thoroughly and replace pH storage cap before returning to storage compartment.

CALIBRATION INSTRUCTIONS

Your instrument has been pre-calibrated prior to shipment. Calibration should be performed periodically with fresh pH buffers and known conductivity solutions.

pH MODE



1. Rinse the pH probe in distilled water.
2. Insert in a fresh #7 buffer solution.
3. Slide back the battery compartment cover to the first stop exposing the adjustment pots.
4. Adjust the CAL pot until the display reads 7.00.
5. Remove probes, rinse and insert in a #4 or 10 buffer solution.
6. Adjust the SLOPE pot until the display reads the correct value.

CONDUCTIVITY MODE

1. Rinse probes thoroughly by agitating in pure water.
2. Wipe off conductivity probe and allow to dry.
3. Once dry, conductivity should read 0 in air.
4. Adjust ZERO pot if reading is incorrect.
5. Immerse sensor in known conductivity solution. Adjust SPAN pot to desired conductivity value.
6. Only a single point calibration in the 2K range is required to standardize. However, if unit is to be used primarily in higher ranges, it is recommended that the single point calibration be performed near point of use for best resolution.
7. Rinse probes and return to storage compartment.

HELPFUL HINTS

1. Electrodes should be rinsed thoroughly after each test.
2. Be sure to replace the protective pH cap after each use.
3. Fill the cap with a small amount of pH 4 buffer or tap water.
4. If the conductivity probe does not zero, it may indicate dried solids on the sensor. Clean with a mild detergent solution.
5. For best results, calibrate pH with a buffer that is within 3 pH units of the test sample.
6. Choose a conductivity calibration solution that is near the samples to be measured.
7. Remove the battery when the instrument will be stored for

SUBJECT. Review of Riverside Cement Sample and Analysis Plan

The Riverside Cement Sample and Analysis Plan has been reviewed Before final approval, the following comments need to be addressed

1. Section 3.2, Groundwater Pathway

   - A discussion of the Yaeger Construction Company practices should be given to support whatever chemicals might be found in this well. How might this company's disposal practices impact the samples from this well?

   - If no contamination from Riverside is found here, what will be the next step for investigating downgradient groundwater?

   - Have the Crestmore Heights or Rubidoux community wells been sampled? These wells should be located on Figure 3-1. What are the details of these wells?

2 Section 3 5, On-Site Pathway

   - Groundwater sample CD-3, to be analyzed for leachable metals, should be shown on Figure 2-2, and a discussion of the rationale for its location should be described in the appropriate section of the plan

   - The location of the background soil sample JD-2 should be shown on Figure 2-3 and described in the plan in terms of its relative distance from the site

   - Figure 3-1: Sample #G-1 (El Rivino Country Club Well) should be labeled R-1, as it is in the Request for Analysis

3. Table 4-2, Request for Analysis

   - Although duplicate volumes are normally not required for soil samples the WET extraction method may require a portion greater than the suggested 4 ounces to be collected. Collect 8 ounces of the soil at sample location CD-1 for these QC purposes.

4. Section 5.2.1, Surface Soil Grab Sampling

   - Clarify the correspondence reviewed to support the rationale for sample locations. Were these locations suggested by the California DWR or Santa Ana RWQCB? Please specify how the proposed locations related to the correspondence held with the agencies.

If you have any questions concerning this review, please call me at (415) 957-0110.

MEMORANDUM

TO: Carolyn Douglas, Site Assessment Manager

FROM: Paul H. Brown, Ecology and Environment, Inc.

THROUGH: Jim James, Ecology and Environment, Inc.

DATE: May 11, 1990

SUBJECT: Response to the Review of the Riverside Cement Sample and Analysis Plan.

1. Section 3.2, Groundwater Pathway

   - A discussion of the Yeager Construction Company's on-site processes and wastewater disposal method and the potential for their wastewater to effect their on-site well was added to this section of the sample plan.

   - If no contamination is detected in the planned sampling project, the next step in investigating down gradient groundwater is undetermined. The sampling included in this scope of work is not a comprehensive characterization of down gradient conditions, only a sampling of the most likely effected downgradient well based on preliminary information. If in the future a more comprehensive study was determined necessary by EPA other downgradient wells could be sampled.

   - No sampling information on the Crestmore Heights Mutual water company well was obtained. FIT did obtain and include in the sample plan some sampling data from a nearby closed Rubidoux Community Services District well. Sampling data from this company's active well, located 3.75 miles from the site, were obtained but revealed no detectable levels of heavy metals which are of concern at the site. The screened depth of this well was added to the sample plan. The active Rubidoux Community Services District well it too far from the site to include it on Figure 3-1. However, the closed nearby well for which analysis were obtained was added to this figure.

     The Crestmore Heights Mutual Water Company well draws water from 250 to 300 feet bgs and is located upgradient of the CKD disposal area. The location of this well was annotated on Figure 3-1. This Well is sampled and analyzed regularly. However, given the nature of this analysis, (BOD, TDS, Nitrates, etc.), it is unsuitable for detecting anomalies in levels of heavy metals near the detection limits, which are the focus of this groundwater sampling effort. FIT therefore, did not obtain these analyses.

pb/rc/priorm

2. Section 3.5, On-site Pathways

   - Sample CD-3 for leachable metals is a soil sample not a groundwater sample and its collection location was relabeled more completely on Figure 2-2 as CD-3, SAS Leachable Metals Soil Sample Location.

     A rationale for this sample location was added to Section 3.1.1, Cement Kiln Dust Sampling on Page 3-1. The location of this sample in the active CKD dump insures that a representative sample of CKD is obtained.

   - The approximate Background Soil Sample collection location has been added to Figure 2-3 and a description of the location has been added to Section 4.2 Soil Sample Analysis. The background sample number in Table 3-7 was corrected to BD-1 to correspond to the request for analysis table.

   - The El Rivino County Club background groundwater sample was relabeled R-1 on Figure 3-1 to correspond to the request for analysis table.

3. Table 4-2, Request for Analysis Table

   - The collection Volume for the WET test soil sample was increased to 8 ounces.

4. Section 5.2.1, Surface Soil Grab Sampling

   - Clarification of the historical reference for the soil sample location at the Jensen Quarry was added to the Sample Plan, as well as the rationale for the CKD sample location at the active CKD dump. The additions were made to Section 5.2.1, Surface Soil Grab Sampling.

Data Validation Report

Case No	14192 Memo #1	
Site	Riverside Cement	
Laboratory	Skinner & Sherman Laboratories, Inc (SKINER)	
Reviewer	Margie Weiner	
	ESAT/ICF Technology, Inc	4 Water & 4 Soils
Date	August 3, 1990	for RAS Metals

I Introduction

Skinner & Sherman Laboratories, Inc received four (4) low concentration water samples and four (4) low concentration soil samples on June 8, 1990 for RAS metals analyses Sample numbers MYE311, MYE312, MYE313 and MYE314 are water samples Sample numbers MYE315, MYE316, MYE317 and MYE318 are soil samples The samples were collected on May 30, 1990

No field blanks were submitted Sample number MYE316 is a background sample Sample numbers MYE317/MYE318 are field duplicates The field duplicate pairs were considered to be collocated Field duplicate pairs have a D# suffix (D1 for the first field pair, D2 for the second field pair, etc) in Table 1A.

The analytical results with qualifications are listed in Table 1A This report was prepared in accordance with the EPA Contract Laboratory Program Inorganic Statement of Work for July 1988 and the EPA document "Laboratory Data Validation Functional Guidelines For Evaluating Inorganic Analyses" (1985)

II Validity and Comments

A The results reported in Table 1A for the following analytes are considered as estimates (J) and are usable for limited purposes only

- All results above the Instrument Detection Limit for waters and Method Detection Limit for soils but below the Contract Required Detection Limit (denoted with an "L" qualifier)

Results above the Instrument Detection Limit (IDL) for water samples and Method Detection Limit (MDL) for soil samples but below the Contract Required Detection Limit (CRDL) are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of detection

B The following results are considered usable for limited purposes because of accuracy problems The results are considered as estimates and are flagged "J" in Table 1A

- Antimony and selenium in sample numbers MYE315 through MYE318
- Mercury in sample numbers MYE315 through MYE317
- Thallium in sample numbers MYE311 through MYE314

Matrix spike recovery results did not meet the 75-125% criteria for accuracy as listed below The possible percent bias for each element is also presented below Mercury and selenium results that are above the MDL are considered quantitatively questionable The results for mercury in sample numbers MYE315 through MYE317 may be biased high and are the maximum concentration at which mercury is present The result for selenium in sample number MYE315 may be biased low and is the minimum concentration at which selenium is present Where the sample results for antimony in sample numbers MYE315 through MYE318, selenium in sample numbers MYE316 through MYE318 and thallium in sample numbers MYE311 through MYE314 are undetected, the detection limits may be biased low

Parameter	MYE312 S Water % Recovery	MYE312 S Water % Bias	MYE317 S Soil % Recovery	MYE317 S Soil % Bias
Antimony	---	---	70	-30
Mercury	---	---	129	+29
Selenium	---	---	38	-62
Thallium	41	-59	---	---

C The following results are considered usable for limited purposes because of accuracy problems The results are considered as estimates and are flagged "J" in Table 1A

- Selenium in sample numbers MYE313 and MYE315

The Method of Standard Addition (MSA) correlation coefficient for selenium in sample numbers MYE313 and MYE315 did not meet the 0 995 criteria for accuracy as shown below The results are considered quantitatively questionable

Sample Number	Parameter	Correlation Coefficient
MYE313	Selenium	0 9914
MYE315	Selenium	0 9936

D The following results are considered usable for limited purposes because of precision problems The results are considered as estimates and are flagged "J" in Table 1A

- Selenium in sample numbers MYE311 through MYE314

Laboratory duplicate result for selenium did not meet the ± CRDL criteria for precision as listed below The results for selenium in the samples listed above are considered quantitatively questionable

Parameter	MYE312 D Lab Dup RPD
Selenium	94
