Verbal communications will be the primary method of communication used at the site during the field activities. Cell phones and two way radios shall be used to the extent practical by field teams for communication. Hand signals will be used in instances where verbal communication is restricted. Hand signals will be covered during site-specific training. Hand signals and their message:

Hand Signal	Meaning
Hand gripping throat	Out of air; cannot breathe
Grip partner's wrists or place both hands around waist	Leave immediately without debate
Hands on top of head	Need assistance
Thumbs up	OK; I'm alright; I understand
Thumbs down	No; negative
Simulated "stick" break with fists	Take a break; stop work

9.2 Work Zones

The need to formally establish specific work zones (Support, Contamination Reduction, and Exclusion Zones) during site activities is to be determined by the HSO. For Task 1 and 2 at this site; however, a general work zone localized in the immediate vicinity of the soil boring is all that is necessary to maintain the control required.

9.3 The Buddy System

When performing field reconnaissance, teams will work in pairs of two or more, and will use the "buddy system" for all work activities to ensure that rapid assistance can be provided in the event of an emergency. This requires work groups to be organized such that workers can remain close together and maintain visual contact with one another. Workers using the "buddy system" have the following responsibilities:

- Provide his/her partner with assistance
- Observe his/her partner for signs of chemical or heat exposure
- Periodically check the integrity of his/her partner's PPE
- Notify the HSO or other site personnel if emergency service is needed

9.4 Nearest Medical Assistance

The address and telephone number of the nearest hospital:
Riverside Community Hospital
4445 Magnolia Avenue
Riverside, California 92501
951-788-3000

Map with directions to the hospital is shown in Figure 2. This information is posted conspicuously at the site, or is always available to all personnel all of the time. Furthermore, all managers will know the directions to the hospital.

9.5 Safe Work Practices

The standing orders, safe work practices that must always be followed while on site, are shown in Figure 3. Many are common sense in nature. The site HSO has responsibility for enforcing these practices which are posted conspicuously at the site. Those who do not abide by these safe work practices will be removed from the site.

10.0 EMERGENCY RESPONSE

10.1 General

Because of the hazards that may be present at the site, and the conditions under which operations are conducted, it is possible that an emergency situation may develop. Emergency situations can be characterized as injury or chemical exposure to personnel; fire or explosion; environmental release; or serious weather conditions.

10.2 Responsibilities

Site Emergency Coordinator - The HSO, or his/her alternate, will serve as the Site Emergency Coordinator and shall implement emergency procedures whenever conditions warrant such action. The Site Emergency Coordinator will be responsible for assuring the evacuation, emergency treatment, emergency transport of site personnel, and notification of emergency units and the appropriate management staff. Emergency response instructions will be provided by the HSO as part of every employee's training prior to the start of work.

Employees - All employees are familiar with emergency response procedures for this work location.

10.3 Evacuation

In the event of an emergency situation, an air horn or vehicle horn will be sounded three (3) times indicating the initiation of evacuation procedures. Loud voice command, if appropriate, can be used. All personnel will evacuate and assemble at the pre-selected site location. No one, except the emergency responders, will be allowed to proceed into the area once the emergency signal has been given. The Site Emergency Coordinator will ensure that access for emergency equipment is provided. Wind direction will be taken into consideration for evacuation plans. Evacuation plans will be discussed at the initial Site-Specific Training and as needed at the regular safety briefings.

10.4 Emergency Contacts/Notification System

The fire department and other emergency response groups will be notified by telephone of the emergency as soon as possible. Emergency telephone numbers list is found as Table 4 in this HASP. This list is also posted at the site, or is readily available to all personnel all of the time.

Langan requires that all property damage and injuries of any personnel (Langan employees, subcontractors, property owners, site visitors, etc.) associated with the field activities be reported to the Langan PM and HSM immediately (or as soon as possible).

10.5 Emergency Medical Treatment

Personnel Injury - In case of injury to personnel, immediately initiate emergency first aid. A First Aid kit is located in the Langan vehicle. The ambulance/rescue squad shall be contacted as necessary. Some situations may require transport of the injured parties by automobile. All injured workers must be escorted to the medical facility. Therefore, maps/directions to the nearest hospital are provided as Figure 2. Figure 2 is also posted at the site, or is readily available to all personnel all of the time.

Personnel Exposure to Physical Hazards - Emergency first aid procedures to be followed are:

Skin Contact: Use copious amounts of soap and water. Wash/rinse affected areas thoroughly, and then provide appropriate medical attention. Rinse eyes with water for at least 15 minutes.

Puncture/Laceration: Decontaminate, if possible, and transport to emergency medical facility.

Chemical Exposure: follow procedures on the Safety Data Sheet.

10.6 Fire or Explosion or Jobsite Evacuation:

If a monitoring alarm is recognized as a hazard, a fire occurs, or any environmental or physical hazard threatens the Langan work crew, the HSO will immediately order the evacuation of the jobsite to the Safe Briefing Area identified at the Daily Safety Meeting, depending on the location of the hazard. The HSO will take a headcount of jobsite personnel at the Safe Briefing Area. All personnel are to report to the "safe" assembly area anytime an emergency evacuation alarm is sounded or you are instructed to proceed to this area by the Person-in-Charge or a designee. Each job site will have a specific area and notification system for emergencies. Workers will receive specific training on each job site's evacuation procedure at the Daily Safety Meeting prior to starting work for the day.

10.7 Adverse Weather Conditions

In the event of heavy precipitation the field team will immediately evacuate areas where storm water is collected or stored, such as catch basins. Conditions will be reassessed on site to determine if the work can proceed safely following evacuation. If it is determined that the weather poses a significant hazard, site operations will be stopped and rescheduled. Some of the items to be considered prior to determining if work should continue include:

- Potential for heat stress and heat-related injuries
- Treacherous weather-related working conditions
- Limited visibility

Field and equipment work being conducted outside shall be stopped for 30 minutes following hearing thunder or seeing lightening.

10.8 Earthquake Response

In the event of an earthquake, the field team will immediately move to a location to avoid falling rock or other objects. Following an assessment of field conditions the team will muster at the designated area and then evacuate and follow inspections of the emergency services..

10.9 Documentation/Investigation

Immediately following an incident or near miss, unless emergency medical treatment is required, either the employee or a coworker must contact the Langan Incident/Injury Hotline at 1-800-9LANGAN (ext. #4699) and the client representative to report the incident or near miss. A written report must be completed and submitted to the client representative within 24 hours of the incident. For emergencies involving personnel injury and/or exposure, employee will complete and submit the Langan Incident/Injury Report to the Langan Corporate Health and Safety Manager as soon as possible following the incident for necessary reporting, notifications, and to kick off the investigation process.

Accidents will be investigated in-depth to identify all causes and to recommend hazard control measures. Except for rescue and emergency measures, the accident scene shall not be disturbed until it has been released by the investigating official.

11.0 CONFINED SPACE ENTRY

Confined space entry (including but not limited to excavations) is not required for this project.

12.0 SUBSURFACE UTILITIES

Private and public subsurface utilities are located throughout Jurupa Valley, CA. A minimum of 48 hours notification before any excavation activities to the One Call Notification Center, Dig Alert, will be made to notify public utilities to mark out their utilities within the vicinity of the work. The PM will verify three lines of evidence have been cleared prior to commencing any subsurface work.

13.0 HASP APPROVALS

By their signature, the undersigned certify that this HASP is approved.

_____ 6/1/2018____

Brad A. McCardell — Date

Senior Project Manager

_____ 6/1/2018____

Neil Shukla — Date

Site Health & Safety Officer (HSO)

14.0 HASP COMPLIANCE AGREEMENTS

All Langan field personnel and subcontractors will sign this HASP Compliance Agreement indicating that they have become familiar with this HASP, and that they understand it and agree to abide by it.

Printed Name	Signature	Company	Date

TABLES

TABLE 1

TASK RISK ANALYSES

A. CONTAMINANT HAZARDS OF CONCERN

Task	Contaminant	Monitoring Device	PEL	Potential Source of Contaminant on Site	Route of Exposure	Symptoms	Target Organs
3, 4, 5, 6, 7,	TPH (Benzene)	PID	10 ppm TWA 5 ppm STEL	Soil, Soil Gas, potential groundwater	Inhalation Ingestion Contact Absorption	Irritation of eyes, skin, nose, respiratory system, giddiness, headache, nausea; staggering gait, fatigue, anorexia, weakness, dermatitis, bone marrow depression, potential carcinogen	Eyes, skin, CNS, bone marrow, blood
3, 4, 5, 6, 7	Hexavalent Chromium	N/A	0.005 mg/m3	Soil containing CKD, CKD, Refractory Brick, potential groundwater	Inhalation Ingestion Contact	Irritates respiratory system, nasal, septum perforation, liver and kidney damage, leucocytosis (increased blood leucocytes), leukopenis (reduced blood leucocytes), moncytosis (increased monocytes), Eosinophilia, eye injury, conjunctivitis, skin ulcer, sensitivity dermatitis, potential carcinogen	Blood, respiratory system, liver, kidney, eyes, skin, lung cancer
3, 4, 5, 6, 7	Dust	N/A	10 mg/m3	Soil	Inhalation Ingestion Contact	Irritated eyes, respiratory system/cardiovascular, sneezing	Eyes, respiratory system (lungs), dermal
3, 4, 5, 6, 7	Arsenic (inorganic)	N/A	0.01 mg/m3	Soil, potential groundwater	Inhalation Ingestion Contact	Abdominal pain, destruction of red blood cells, shock, vomiting, diarrhea, dehydration, headache	Dermal, Blood, kidney, blood, cardiovascular, dermal

3, 4, 5, 6, 7	Lead (inorganic)	N/A	0.05 mg/m3	Soil, potential groundwater	Inhalation Ingestion Contact	High blood pressure, joint and muscle pain, memory loss, headache, abdominal pain	Liver, kidney, blood, cardiovascular, dermal

EXPLANATION OF ABBREVIATIONS

CKD = Cement Kiln Dust
PID = Photoionization Detector
PCBs = Polycyclic Aromatic Hydrocarbons
PEL = Permissible Exposure Limit
TPH = Total Petroleum Hydrocarbons
VOCs = Volatile Organic Compounds
IDLH = Immediately Dangerous to Life and Health
LEL = Lower Explosive Limit
ppm = part per million
abdom = abdominal
anor = anorexia
arrhy = arrhythmia
card = cardiac
Ca = Considered by NIOSH to be potential occupational carcinogen
[carc] = potential occupational carcinogen
CNS = central nervous system
depres = depressant/depression
derm= dermititis
dizz = dizziness
drow = drowsiness
tg = fatigue
gidd = giddiness
inco = incoordination
inj = injury
lass = lassitude (weakness, exhaustion)
muc memb = mucous membrane
nau = nausea
pares = paresthesia
som = somnolence (sleepiness, unnatural drowsiness)
verti = vertigo
vis dist = visual disturbance

B. PHYSICAL HAZARDS OF CONCERN

Task	Hazard	Description	Control Measures	First Aid
3, 4, 5, 6, 7	Skin contact	Sample spills on skin; splashes in eyes.	Wear proper PPE; follow safe practices	Wash with soap and water, dry with clean disposable cotton cloth. Do not rub affected area. Bandage as needed to protect affected area.
1, 2, 3, 4, 5, 6, 7	Lacerations, abrasions, punctures	Cutting bailer twine, pump tubing, etc. with knife. Using tools in tight spaces, etc.	Wear proper PPE; follow safe practices	See pages 48-51, NSC "First Aid and CPR Standard" manual
3, 4, 5, 6, 7	Inhalation	Opening wells, purging and sampling exposes sampler	Follow air monitoring plan; have quick access to respirator	Relocate to area of fresh air, as applicable
2, 3, 4, 5, 6, 7	Lifting	Improper lifting/carrying of equipment and materials causing strains	Follow safe lifting techniques	Follow the RICE procedures (p.99 in NSC manual)
1, 2, 3, 4, 5, 6, 7	Slips, trips, and falls	Any number of injuries could occur from slips, trips, and falls in carrying out these tasks	Good housekeeping at site, constant awareness and focus on the task, awareness of surroundings	Cease working and evaluate severity of injury, if not serious, and determine if person can resume duties. Seek professional medical attention, if necessary.

Q:\Other\Health&Safety\GenericTable1TaskRiskAnalysis

TABLE 2
Summary of Monitoring Equipment

Instrument	Operation Parameters
Combustible Gas Indicator (CGI)	**Hazard Monitored:** Combustible gases and vapors. **Application:** Measures the concentration of combustible gas or vapor. **Detection Method:** A filament, usually made of platinum, is heated by burning the combustible gas or vapor. The increase in heat is measured. Gases and vapors are ionized in a flame. A current is produced in proportion to the number of carbon atoms present. **General Care/Maintenance:** Recharge or replace battery. Calibrate immediately before use. **Typical Operating Time:** Can be used for as long as the battery lasts, or for the recommended interval between calibrations, whichever is less.
Flame Ionization Detector (FID) with Gas Chromatography Option *(i.e., Foxboro Organic Vapor Analyzer (OVA))*	**Hazard Monitored:** Many organic gases and vapors (approved areas only). **Application:** In survey mode, detects the concentration of many organic gases and vapors. In gas chromatography (GC) mode, identifies and measures specific compounds. In survey mode, all the organic compounds are ionized and detected at the same time. In GC mode, volatile species are separated. **General Care/Maintenance:** Recharge or replace battery. Monitor fuel and/or combustion air supply gauges. Perform routine maintenance as described in the manual. Check for leaks. **Typical Operating Time:** 8 hours; 3 hours with strip chart recorder.
Potable Infrared (IR) Spectrophotometer	**Hazard Monitored:** Many gases and vapors. **Application:** Measures concentration of many gases and vapors in air. Designed to quantify one or two component mixtures. **Detection Method:** Passes different frequencies of IR through the sample. The frequencies absorbed are specific for each compound. **General Care/Maintenance:** As specified by the manufacturer.
Ultraviolet (UV) Photoionization Detector (PID) *(i.e., Hnu)*	**Hazard Monitored:** Many organic and some inorganic gases and vapors. **Application:** Detects total concentration of many organic and some inorganic gases and vapors. Some identification of compounds are possible if more than one probe is measured. **Detection Method:** Ionizes molecules using UV radiation; produces a current that is proportional to the number of ions. **General Care/Maintenance:** Recharge or replace battery. Regularly clean lamp window. Regularly clean and maintain the instrument and accessories. **Typical Operating Time:** 10 hours. 5 hours with strip chart recorder.
Direct Reading Colorimetric Indicator Tube	**Hazard Monitored:** Specific gas and vapors. **Application:** Measures concentration of specific gases and vapors. **Detection Method:** The compound reacts with the indicator chemical in the tube, producing a stain whose length or color change is proportional to the compound's concentration. **General Care/Maintenance:** Do not use a previously opened tube even if the indicator chemical is not stained. Check pump for leaks before and after use. Refrigerate before use to maintain a shelf life of about 2 years. Check expiration dates of tubes. Calibrate pump volume at least quarterly. Avoid rough handling which may cause channeling.

TABLE 2 (Continued)
Summary of Monitoring Equipment

Aerosol Monitor	**Hazard Monitored:** Airborne particulate (dust, mist, fume) concentrations **Application:** Measures total concentration of semi-volatile organic compounds, PCBs, and metals. **Detection Method:** Based on light-scattering properties of particulate matter. Using an internal pump, air sample is drawn into the sensing volume where near infrared light scattering is used to detect particles. **General Care/Maintenance:** As specified by the mfr. Also, the instrument must be calibrated with particulates of a size and refractive index similar to those to be measured in the ambient air.
Oxygen Meter	**Hazard Monitored:** Oxygen (O_2). **Application:** Measures the percentage of O_2 in the air. **Detection Method:** Uses an electrochemical sensor to measure the partial pressure of O_2 in the air, and converts the reading to O_2 concentration. **General Care/Maintenance:** Replace detector cell according to manufacturer's recommendations. Recharge or replace batteries prior to explanation of the specified interval. If the ambient air is less than 0.5% CO_2, replace the detector cell frequently. **Typical Operating Time:** 8 – 12 hours.
Monitox	**Hazard Monitored:** Gases and vapors. **Application:** Measures specific gases and vapors. **Detection Method:** Electrochemical sensor relatively specific for the chemical species in question. **General Care/Maintenance:** Moisten sponge before use; check the function switch; change the battery when needed.
Gamma Radiation Survey Instrument	**Hazard Monitored:** Gamma Radiation. **Application:** Environmental radiation monitor. **Detection Method:** Scintillation detector. **General Care/Maintenance:** Must be calibrated annually at a specialized facility. **Typical Operating Time:** Can be used for as long s the battery lasts, or for the recommended interval between calibrations, whichever is less.

Q:\Data3\3542302\OfficeData\Reports\Hasp\TABLE2SummaryMonitoringEquipment

TABLE 3

INSTRUMENTATION ACTION LEVELS FOR PETROLEUM IMPACTED SITES

Photoionization Detector Action Levels	**Action Required**
Background to 5 ppm	No respirator; no further action required
> 5 ppm but < 100 ppm for > 5 minutes	1. Temporarily discontinue all activities and evaluate potential causes of the excessive readings. If these levels persist and cannot be mitigated (i.e., by slowing drilling or excavation activities), contact HSO to review conditions and determine source and appropriate response action. 2. If PID readings remain above 5 ppm, temporarily discontinue work and upgrade to Level C protection. 3. If sustained PID readings fall below 5 ppm, downgrading to Level D protection may be permitted.
> 100 ppm but < 500 ppm for > 5 minutes	1. Discontinue all work; all workers shall move to an area upwind of the jobsite. 2. Evaluate potential causes of the excessive readings and allow work area to vent until VOC concentrations fall below 100 ppm. 3. Level C protection will continue to be used until PID readings fall below 5 ppm.
> 500 ppm	Evacuate the work area

Notes:
1. 5 ppm level based on OSHA Short Term Exposure Limit (STEL) for benzene.
2. 100 ppm level based on 1 percent being the OSHA Permissible Exposure Limit (PEL) for benzene (1 ppm).
3. 500 ppm level based on NIOSH Immediately Dangerous to Life and Health (IDLH) for benzene.

FIGURE 3
STANDING ORDERS
(Must Be Posted)

GENERAL

- No smoking, eating, or drinking in this work zone.
- Upon leaving the work zone, personnel will thoroughly wash their hands and face.
- Minimize contact with contaminated materials through proper planning of work areas and decontamination areas, and by following proper procedures. Do not place equipment on the ground. Do not sit on contaminated materials.
- No open flames in the work zone.
- Only properly trained and equipped personnel are permitted to work in potentially contaminated areas.
- Always use the appropriate level of personal protective equipment (PPE).
- Maintain close contact with your buddy in the work zone
- Contaminated material will be contained in the Exclusion Zone (EZ).
- Report any unusual conditions.
- Work areas will be kept clear and uncluttered. Debris and other slip, trip, and fall hazards will be removed as frequently as possible.
- The number of personnel and equipment in the work zone will be kept to an essential minimum.
- Be alert to the symptoms of fatigue and heat/cold stress, and their effects on the normal caution and judgment of personnel.
- Conflicting situations which may arise concerning safety requirements and working conditions must be addressed and resolved quickly by the site HSO.

TOOLS AND HEAVY EQUIPMENT

- Do not, under any circumstances, enter or ride in or on any backhoe bucket, materials hoist, or any other device not specifically designed to carrying passengers.
- Loose-fitting clothing or loose long hair is prohibited around moving machinery.
- Ensure that heavy equipment operators and all other personnel in the work zone are using the same hand signals to communicate.
- Drilling/excavating within 20 feet in any direction of overhead power lines is prohibited.
- The locations of all underground utilities must be identified and marked out prior to initiating any subsurface activities.
- Check to insure that the equipment operator has lowered all blades and buckets to the ground before shutting off the vehicle.
- If the equipment has an emergency stop device, have the operator show all personnel its location and how to activate it.
- Help the operator ensure adequate clearances when the equipment must negotiate in tight quarters; serve as a signalman to direct backing as necessary.
- Ensure that all heavy equipment that is used in the Exclusion Zone is kept in that zone until the job is done, and that such equipment is completely decontaminated before moving it into the clean area of the work zone.
- Samplers must not reach into or get near rotating equipment such as the drill rig. If personnel must work near any tools that could rotate, the equipment operator must completely shut down the rig prior to initiating such work. It may be necessary to use a remote sampling device.

	A	**NA**	**D**	**Remarks**
1. HASP available on site for inspection?				
2. Health & Safety Compliance agreement (in HASP) appropriately signed by Langan employees and subcontractors?				
3. Hospital route map with directions posted on site?				
4. Emergency Notification List posted on site?				
5. First Aid kit available and properly stocked?				
6. Personnel trained in CPR/First Aid on site?				
7. MSDSs readily available, and all workers knowledgeable about the specific chemicals and compounds to which they may be exposed?				
8 Appropriate PPE being worn by Langan employees and subcontractors?				
9. Project site safe practices ("Standing Orders") posted?				
10. Project staff have 40-hr./8-hr./Supervisor HAZWOPER training?				
11. Project staff medically cleared to work in hazardous waste sites and fit-tested to wear respirators, if needed?				
12. Respiratory protection readily available?				
13. Health & Safety Incident Report forms available?				
14. Air monitoring instruments calibrated daily and results recorded on the Daily Instrument Calibration check sheet?				
15. Air monitoring readings recorded on the air monitoring data sheet/field log book?				
16. Subcontract workers have received 40-hr./8-hr./Spvsr. HAZWOPER training, as appropriate?				
17. Subcontract workers medically cleared to work on site, and fit-tested for respirator wear?				
18. Subcontract workers have respirators readily available?				
19. Markouts of underground utilities done prior to initiating any subsurface activities?				

20. Decontamination procedures being followed as outlined in HASP?				
21. Are tools in good condition and properly used?				
22. Drilling performed in areas free from underground objects including utilities?				
23. Adequate size/type fire extinguisher supplied?				
24. Equipment at least 20 feet from overhead powerlines?				
25. Evidence that drilling operator is responsible for the safety of his rig.				
26. Trench sides shored, layed back, or boxed?				
27. Underground utilities located and authorities contacted before digging?				
28. Ladders in trench (25-foot spacing)?				
29. Excavated material placed more than 2 feet away from excavation edge?				
30. Public protected from exposure to open excavation?				
31. People entering the excavation regarding it as a permit-required confined space and following appropriate procedures?				
32. Confined space entry permit is completed and posted?				
33. All persons knowledgable about the conditions and characteristics of the confined space?				
34. All persons engaged in confined space operations have been trained in safe entry and rescue (non-entry)?				
35. Full body harnesses, lifelines, and hoisting apparatus available for rescue needs?				
36. Attendant and/or supervisor certified in basic first aid and CPR?				
37. Confined space atmosphere checked before entry and continuously while the work is going on?				
38. Results of confined space atmosphere testing recorded?				
39. Evidence of coordination with off-site rescue services to perform entry rescue, if needed?				
40. Are extension cords rated for this work being used and are they properly maintained?				
41. Are GFCIs provided and being used?

APPENDIX B
Job Safety Analysis

LANGAN

Job Safety Analysis (JSA)
Health and Safety

JSA Title:

JSA Number:

A Job Safety Analysis (JSA) must identify all job steps required to complete the task, the potential hazards employees could be exposed to while performing the job step and the preventative/corrective actions required to reduce/mitigate the identified potential hazards. Employees must certify that they have either prepared the JSA or have reviewed the JSA and are aware of the potential hazards associated with this task and will follow the provided preventive/corrective actions.

PERSONAL PROTECTIVE EQUIPMENT (Required or to be worn as needed):				
☐ Safety Shoes	☐ Long Sleeves	☐ Safety Vest (Class 2)	☐ Hard Hat	☐ Hearing Protection
☐ Safety Glasses	☐ Safety Goggles	☐ Face Shield	☐ Nitrile Gloves	☐ PVC Gloves
☐ Leather Gloves	☐ Cut Resist. Gloves	☐ Fall Protection	☐ Fire Resistant Clothing	☐ Rubber Boots
☐ Insect/Animal Repellent	☐ Ivy Blocker/Cleaner	☐ Traffic Cones/Signs	☐ Life Vest/Jacket	
☐ Other:				

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
1. Transport equipment to work area	1. Back Strain 2. Slips/ Trips/ Falls 3. Traffic 4. Cuts/abrasions from equipment 5. Contusions from dropped equipment	1. Use proper lifting techniques / Use wheeled transport 2. Minimize distance to work area / Have unobstructed path to work area / Follow good housekeeping procedures 3. Wear proper PPE (high visibility vest or clothing) 4. Wear proper PPE (leather gloves, long sleeves) 5. Wear proper PPE (safety shoes)
2. Set-up HSA/SPT and CPT rigs	1. Slips/ Trips/ Falls 2. Pinch Hazards 3. High noise levels 4. Clothing entanglement 5. Electrocution/falling equipment and debris from raising HSA/SPT rig mast 6. Carbon monoxide poisoning 7. HSA/SPT and CPT rig roll-over 8. HSA/SPT and CPT rig movement	1. Be aware of potential trip hazards / Follow good housekeeping procedures / Mark significant below-grade hazards (i.e. holes, trenches) with safety cones or spray paint 2. Wear proper PPE (leather gloves) 3. Wear proper PPE (hearing protection) 4. Wear proper attire for HSA/SPT and CPT rigs (no loose clothing, strings, etc.) 5. Wear proper PPE (hard hats) / Be aware of locations at all times / Look up, down and around before raising mast / Check HSA/SPT drill rig mast for loose objects/debris before rasining 6. Stand upwind of rig engine 7. Do not move rig with mast raised / Set stabilizers prior to raising mast / Inspect work area / If area appears unstable, the boring locations should be moved. 8. All field personnel should stay clear of rig while moving / Use a spotter when backing up the rig
3. Advance HSA/SPT and CPT rods, augers and casing below ground surface	1. Strain wrist/bruise palm 2. Pinched fingers 3. Back strain 4. Clothing entanglement 5. Carbon monoxide poisoning	1. Wear proper PPE (leather gloves) / Use proper technique for preparing rods / Use second person, if necessary 2. Wear proper PPE (leather gloves) 3. Use proper lifting techniques / Obtain assistance if needed 4. Wear proper attire for HSA/SPT and SPT rigs (no loose clothing, strings,

JOB STEPS	POTENTIAL HAZARDS	PREVENTATIVE / CORRECTIVE ACTION
3.Advance HSA/SPT and CPT rods, augers and casing below ground surface (cont'd)	6. Bruised/Broken toes/feet 7. High noise levels	etc.) 5. Stand upwind of the rig 6. Wear proper PPE (safety shoes) 7. Wear proper PPE (hearing protection)
4. Remove and open split spoon	1. Pinched fingers 2. Cuts/lacerations 3. Skin contact with contaminated soil and groundwater	1. Wear proper PPE (nitrile and leather gloves) 2. Wear proper PPE (leather gloves) 3. Wear proper PPE (nitrile gloves, safety glasses)
5. Repeat steps 3 and 4 until desired depth is reached	1. See steps 3 and 4	1. See steps 3 and 4
6. Remove HSA/SPT and CPT rods, augers and casing and place in storage rack	1. Clothing entanglement 2. Back strain 3. Pinched fingers 4. Carbon monoxide poisoning 5. High noise levels	1. Wear proper attire for HSA/SPT rig (no loose clothing, strings, etc.) 2. Use proper lifting techniques / Obtain assistance if needed 3. Wear proper PPE (leather gloves) 4. Stand upwind of rig engine 5. Wear proper PPE (hearing protection)
7. Tremie-grout borehole with a cement-bentonite grout mixture	1. Splash cement/bentonite grout on face/eyes 2. Back strain 3. Pinched fingers	1. Wear proper PPE (safety glasses) 2. Use proper lifting techniques / Obtain assistance if needed 3. Wear proper PPE (nitrile gloves, leather gloves)
8. Decontaminate equipment	1. Contact with potentially impacted material 2. Contact with sharp pieces of equipment	1. Wear proper PPE (safety glasses, nitrile gloves) 2. Wear proper PPE (leather gloves)
9. Patch soil boring location to return to pre-existing conditions (i.e. concrete, asphalt, grass)	1. Cuts/lacerations 2. Splashed concrete on face/eyes 3. Hammer fingers/hands when patching asphalt	1. Wear proper PPE (leather gloves) / Use scissors for cutting 2. Use proper PPE (safety glasses) 3. Be aware of hands/fingers during hammering / Wear proper PPE (leather gloves)
10. All activities	1. Slips/ Trips/ Falls 2. Hand injuries, cuts or lacerations during manual handling of materials 3. Foot injuries 4. Back injuries 5. Traffic 6. Wildlife: Stray dogs, Mice/rats, Vectors (i.e. mosquitoes, bees, etc.) 7. High Noise levels 8. Overhead hazards 9. Heat Stress/ Cold Stress 10. Eye Injuries	1. Be aware of potential trip hazards / Follow good housekeeping procedures/ Mark significant hazards 2. Inspect for jagged/sharp edges, and rough or slippery surfaces / Keep fingers away from pinch points / Wipe off greasy, wet, slippery or dirty objects before handling / Wear leather/ cut-resistant gloves 3. Wear Langan approved safety shoes 4. Use proper lifting techniques / Consider load location, task repetition, and load weigh when evaluating what is safe or unsafe to lift / Obtain assistance when possible 5. Wear high visibility clothing & vest / Use cones or signs to designate work area 6. Be aware of surroundings at all times, including the presence of wildlife/ Do not approach stray dogs / Carry/use dog/animal repellant / Use bug spray when needed 7. Wear hearing protection 8. Wear hard hat / Avoid areas were overhead hazards exist. 9. Wear proper attire for weather conditions (sunscreen or protective clothing in sunlight, layers for cold weather) / Drink plenty of fluids to avoid dehydration / Takes breaks as necessary to avoid heat/cold stress 10. Wear safety glasses

APPENDIX C
Safe Drum Handling Techniques

SAFE DRUM HANDLING TECHNIQUES

PURPOSE

This procedure establishes general guidelines for the handling of drums and containers. OSHA 29 CFR 1910.120 has specific requirements for these types of projects. On sites where drums are handled, detailed drum handling procedures shall be developed and stated in the site-specific health and safety plan (HASP).

SCOPE

Applies to container handling operations at Langan Engineering & Environmental Services, Inc. (Langan) work sites.

RESPONSIBILITIES

Site Personnel - All site personnel must follow the procedures for safe handling of drums.

Health and Safety Coordinator (HSO) - The HSO must carefully consider these procedures in the preparation of any site-specific HASP.

Laboratory - The laboratory will conduct analyses of drum contents.

Site Manager - The site manager designated by the site-specific HASP must sign all completed drum data sheets to verify chain of custody.

PROCEDURES

General Information

Factors which must be considered before handling drums/containers on a hazardous waste site are outlined below:

1. The containers used during clean-up must meet the applicable DOT, OSHA, and EPA standards for the wastes that they contain.

2. Only DOT approved containers shall be used to overpack wastes.

3. Drums or containers shall be inspected prior to being moved. Inaccessible drums or containers shall be moved and inspected prior to further handling. Bulging or pressurized containers should not be manually disturbed.

4. Unlabeled containers shall be considered to contain hazardous substances and handled accordingly until the contents are identified and labeled. Additionally, it should be kept in mind that drums are frequently mislabled.

5. Site operations shall be organized to minimize drum or container movement.

6. Prior to movement of drums, all employees shall be warned of the potential hazards.

7. Where major spills may occur, a spill containment program shall be implemented to isolate the entire volume of hazardous substance being transferred.

8. A ground penetrating radar system or other type of detection device may be used to determine the location and depth of buried drums/containers.

9. Fire extinguishing equipment shall be on hand and ready to use.

Inspection

Appropriate procedures for handling drums varies depending on the drum contents. Prior to handling, drums should be visually inspected to identify their contents. Information that may be helpful includes:

- Symbols, words, or marks on the drum indicating that its contents are hazardous;
- Signs of deterioration such as corrosion, rust, and leaks;
- Signs that the drum is under pressure; and
- Configuration of the drumhead:
  - Whole lid removable (designed to contain solid material)
  - Has bungs (designed to contain a liquid)
  - Contains a liner (may contain highly corrosive or otherwise hazardous material)
- Drum types:
  - Polyethylene or PVC-lined (often contain strong acids or bases)
  - Exotic metal (aluminum, stainless steel, etc.) (expensive drums that usually contain an extremely dangerous material)
  - Single-walled used as pressure vessel (may contain reactive, flammable, or explosive substances)
  - Laboratory Packs (used for disposal of expired chemicals and process samples from a variety of institutions)

Planning

The results of the inspection can be used to develop a plan that specifies:

- The extent of container handling necessary
- The personnel assigned to the job
- The most appropriate procedures based on the hazards associated with the probable drum contents

Handling

The purpose of drum handling is to:

- Respond to any obvious problems that might impair worker safety
- Unstuck and orient drums of sampling
- If necessary, to organize drums into different areas on site to facilitate characterization and remedial action

Drum Opening

Drum and other containers, if possible should be opened in place since accidents can occur frequently during handling. To maximize worker safety during drum opening, the following should be adhered to:

- Keep personnel at a safe distance from the drums being opened;
- Conduct air monitoring during drum-opening activities;
- Use non-sparking bronze-beryllium tools when possible;
- Use remote-controlled devices for opening drums, when possible;
- Hang or balance the drum-opening equipment to minimize worker exertion;
- If the drum shows signs of swelling or bulging, perform all steps slowly and relieve excess pressure prior to opening;
- Open exotic metal drums and polyethylene or PVC-lined drums through the bung by removal or drilling;
- Do not open or sample individual containers within laboratory packs;
- Reseal open bungs and drill openings as soon as possible; and
- Decontaminate equipment after each use to avoid mixing incompatible wastes.

Drum Opening Equipment

The three basic techniques available for drum opening at hazardous waste sites include:

- Manual opening with non-sparking bung (or plug) wrenches;
- Drum deheading; and
- Remote-control devices:
    - Pneumatically operated impact wrench to remove drum bungs.
    - Hydraulically or pneumatically operated drum piercers
    - Backhoes equipped with bronze spikes for penetrating drum tops

The choice of drum opening techniques depends on the number of drums to be opened, their waste contents (if known), and their physical condition. Remote drum opening equipment should always be considered in order to protect worker safety, especially if the drums are damaged or corroded. Manual opening with bung wrenches or drum deheaders should be performed only with structurally sound drums with waste contents that are known to be nonreactive
and non-explosive. Picks, chisels, firearms, etc. will not be used to open drums.

APPENDIX D
Heat Stress

HEAT STRESS

Due to the increase in ambient air temperatures and the effects of protective outer wear deceasing body ventilation, there exists an increase in the potential for injury, specifically, heat casualties. Site personnel will be instructed in the identification of a heat stress victim, the First Aid treatment procedures for the victim and the prevention of heat stress casualties.

IDENTIFICATION AND TREATMENT

1. Heat Exhaustion

    a. Symptoms: Usually begins with muscular weakness, dizziness, nausea, and a staggering gait. Vomiting may be frequent. The bowels may move involuntarily. The victim is pale, his skin is clammy, and he may perspire profusely. The pulse is weak and fast, breathing is shallow. The victim may faint unless the victim lies down. This may pass, but sometimes it remains and death could occur.

    b. First Aid: Immediately remove the victim to the Personnel Decontamination Reduction Zone in a shady or cool area with good air circulations. Remove all protective outer wear. Call the local hospital for physician. Treat the victim for shock (Make victim lie down, raise feet 6-to 12-inches and keep warm but loosen all clothing.) If the victim is conscious, it may be helpful to sip an electrolytic solution. Transport victim to a medical facility as soon as possible.

2. Heat Stroke

    a. Symptoms: This is the most serious of heat casualties due to the fact that the body excessively overheats. Body temperatures often are between 107° to 110°F. First there is often pain in the bead, dizziness, nausea, oppression, and the skin is dry, red and hot. Unconsciousness follows quickly and death is imminent if exposure continues. The attack will usually occur suddenly.

    b. First Aid: Immediately evacuate the victim to a cool and shady area in the Contamination Reduction Zone. Remove all protective outer wear and all personal clothing and decontaminate the victim. Lay victim on their back on a clean sheet or blanket with the head and shoulders slightly elevated. It is imperative that the body temperature be lowered immediately. This can be accomplished by applying cold wet towels, ice bags, etc. to the head and body. Sponge off the bare skin with cool water or rubbing alcohol, if available, or even place victim in a tub of cool water. The main objective is to cool the victim without chilling him. Give no stimulants. Transport the victim by ambulance to a medical facility as soon as possible.

PREVENTION OF HEAT STRESS

1. One of the major causes of heat casualties is the depletion of body fluids. On the site there will be plenty of fluids available. Personnel should replace water and salts loss from sweating. Salts can be replaced by drinking a commercial mix of electrolytes and nutrients such as Gatorade. If drinking Gatorade for extended periods of time, the Gatorade should be mixed at 50 percent of normal strength.

2. A work schedule should be established so that the majority of the work day will be during the morning hours of the day before ambient air temperature levels reach their highs.

3. A work/rest guideline will be implemented for personnel required to wear Level B or Level C protection. These guidelines are as follows:

Ambient Temperatures	Maximum Wearing Time
Above 90°F	1 hour
80° to 90°F	1-1/2 hours
70°to 80°F	2hours
60° to 70°F	3 hours
less than 60°F	4 hours

A sufficient period will be allowed for personnel to "cool down." This may require shifts of workers during operations.

HEAT STRESS MONITORING

For monitoring the body's recuperative ability to excess heat, one or more of the following techniques should be used as a screening mechanism. Monitoring of personnel wearing protective clothing should commence when the ambient temperature is 70°F or above. Frequency of monitoring should increase as the ambient temperature increases or if slow recovery rates are indicated. When temperatures exceed 80°F workers should be monitored for heat stress after every work period.

- Heart Rate (HR): should be measured by the radial pulse for 30 seconds. The HR, 5 minutes after the beginning of the rest period, should not exceed 120 percent of the normal "at rest" HR. If the HR is higher, the next work period should be shortened by 10 minutes (or 33 percent), while the length of the rest period stays the same. This process should be repeated until an acceptable HR is achieved.

- Body Temperature: should be measured orally with a clinical thermometer as early as possible in the resting period. Oral temperature (OT), taken 5 minutes after beginning of the rest period, should not exceed 1/2 degree above normal "at rest" OT. If it does, the next work period should be shortened by 10 minutes (or 33 percent),

while the length of the rest period stays the same. If the OT taken 5 minutes after the beginning of the next resting period exceeds 1/2 degree above normal “at rest’ OT, the following work cycle should be further shortened by 33 percent.

- Body Water Loss (BWL): due to sweating, body water loss should be measured by weighing the worker in the morning and in the evening. The clothing worn should be similar at both weighings; preferably the worker should be nude. The scale should be accurate to plus or minus 1/4 pound. BWL should not exceed 15 percent of the total body weight. If it does, workers should be instructed to increase their daily intake of fluids by the weight lost.

Ideally, body fluids should be maintained at a constant level during the work day.

Good hygienic standards must be maintained by frequent change of clothing and daily showering. Clothing should be permitted to dry during rest periods. Persons who notice skin problems should immediately consult medical personnel.

APPENDIX E
Cold Exposure

COLD EXPOSURE

Persons working outdoors in temperatures at or below freezing may be frostbitten. Extreme cold for a short time may cause severe injury to the surface of the body, or result in profound generalized cooling, causing death. Areas of the body which have high surface area-to-volume ratio such as fingers, toes, and ears, are the most susceptible.

EFFECTS OF COLD EXPOSURE

Two factors influence the development of a cold injury: ambient temperature and the velocity of the wind. Wind chill is used to describe the chilling effect of moving air in combination with low temperature. For instance, 10°F with a wind of 15 miles per hour (mph) is equivalent in chilling effect of still air at -18°F.

As a general rule, the greatest incremental increase in wind chill occurs when a wind of 5 mph increases to 10 mph. Additionally, water conducts heat 240 times faster than air. Thus, the body cools suddenly when chemical-protective equipment is removed if the clothing underneath is perspiration soaked.

Local injury resulting from cold is included in the generic term frostbite. There are several degrees of damage. Frostbite of the extremities can be categorized into:

- Frost Nip or Incipient Frostbite: characterized by suddenly blanching or whitening of skin.

- Superficial Frostbite: skin has a waxy or white appearance and is firm to the touch, but tissue beneath is resilient

- Deep Frostbite: tissues are cold, pale, and solid; extremely serious injury.

To administer first aid for frostbite, bring the victim indoors and re-warm the areas quickly in water between 30°C and 41°C (102°F to 105°F). Give a warm drink – not coffee, tea or alcohol. The victim should not smoke. Keep the frozen parts in warm water or covered with warm clothes for 30 minutes, even though the tissue will be very painful as it thaws. Then elevate the injured area and protect it from injury. Do not allow blisters to be broken. Use sterile, soft, dry material to cover the injured area. Keep victim warm and get immediate medical care. After thawing, the victim should try to move the injured areas a little, but no more than can be done alone, without help.

- Do not rub the frostbitten part (this may cause gangrene).

- Do not use ice, snow, gasoline or any thing cold on frostbite.

- Do not use heat lamps or hot water bottles to re-warm the part.

- Do not place the part near a hot stove.

Systemic hypothermia is caused by exposure to freezing or rapidly dropping temperature, symptoms are usually exhibited in five stages; (1) shivering; (2) apathy, listlessness, sleepiness, and (sometimes) rapid cooling of the body to less than 95°F; (3) unconsciousness, glassy stare, slow pulse, and slow respiratory rate; (4) freezing of the extremities; and, finally (5) death.

As a general rule, field activities should be curtailed if equivalent chill temperature (ºF) is below zero unless the activity is of an emergency nature. The ultimate decision for proposing a work day at a site due to inclement weather rests with the Site Safety Officer or the HSO.

APPENDIX F

DTSC Active Soil Gas Investigation (July 2015)

ADVISORY
ACTIVE SOIL GAS INVESTIGATIONS

California Environmental Protection Agency
Department of Toxic Substances Control
Los Angeles Regional Water Quality Control Board
San Francisco Regional Water Quality Control Board

July 2015

FOREWORD

In a coordinated effort, the Department of Toxic Substances Control, the Los Angeles Regional Water Quality Control Board, and the San Francisco Regional Water Quality Control Board have jointly developed the *Advisory – Active Soil Gas Investigations*. This document attempts to ensure that high quality data used for regulatory decision making are collected during active soil gas investigations using consistent methodologies. The document was reviewed by other government organizations and the regulated community. Their comments were considered and the Advisory changed in response to those comments. The Advisory also addresses recent developments in the field of soil gas collection. As additional information and experience are obtained, this Advisory may be modified as appropriate.

The information in the Advisory should not be considered as regulations. Mention of trade names or commercial products does not constitute the agency endorsement or recommendation.

If you have any questions or comments regarding this document, please contact Theodore Johnson of DTSC at via email at tjohnson@dtsc.ca.gov.

ACKNOWLEDGMENTS

April 2012 Version

Preparation of this Advisory was achieved through the efforts of the following individuals at the California Environmental Protection Agency:

Rafat Abbasi	Department of Toxic Substances Control
Elizabeth Allen	San Francisco Bay Regional Water Quality Control Board[1]
Bill Bosan	Department of Toxic Substances Control
Phil Chandler	Department of Toxic Substances Control
Craig Christmann	Department of Toxic Substances Control
Dan Gallagher	Department of Toxic Substances Control
Joe Hwong	Department of Toxic Substances Control
Theo Johnson	Department of Toxic Substances Control
Dot Lofstrom	Department of Toxic Substances Control
Lynn Nakashima	Department of Toxic Substances Control
Yue Rong	Los Angeles Regional Water Quality Control Board
Thizar Williams	Los Angeles Regional Water Quality Control Board
Peter Wong	Department of Toxic Substances Control[2]

Also, David Berry, Ken Chiang, Rebecca Chou, Bryan Eya, Jeffrey Hu, and Christine Papagni provided invaluable assistance in the revision of this document. The California Environmental Protection Agency thanks them for their efforts.

This document was developed jointly under the direction of Debbie Raphael, Director, Department of Toxic Substances Control, Samuel Unger, Executive Officer, Los Angeles Regional Water Quality Control Board, and Bruce Wolfe, Executive Officer, San Francisco Regional Water Quality Control Board. Without their support, completion of this document would not have been possible.

July 2015 Version

The Advisory was revised to address recent developments in the field of soil gas collection. The Soil Gas Workgroup thanks all contributors for their efforts which improved the Advisory through their thoughtful observations.

1.0 INTRODUCTION

The Advisory – Active Soil Gas Investigations (ASGI or Advisory) provides technically defensible and consistent approaches for collecting and analyzing soil gas samples. This Advisory applies to both subsurface soil gas samples and soil gas samples collected in sub-slab areas under buildings. The Advisory is not a regulation. It does not impose any requirements or obligations on the regulated community. Rather, it provides a technical framework and reference for addressing soil gas sample collection and analysis. It is not intended to determine the need for soil gas samples, but rather to serve as a guide once a decision has been made to collect soil gas samples. Other technically equivalent procedures may exist. This Advisory is not intended to exclude alternative approaches or methodologies. The Advisory is a compilation of available information, knowledge, experience and best practices regarding soil gas sampling. The mention of trade names or commercial products in this Advisory is for illustrative purposes only, and does not constitute an endorsement or exclusive recommendation by the contributing government agencies.

Active soil gas sampling and analysis refers to the methods utilized to collect vapor phase data at sites potentially affected by volatile organic compounds (VOCs), chlorinated solvents, petroleum hydrocarbons, methane, hydrogen sulfide and semi-volatile organic compounds (SVOCs). The data obtained from a soil gas investigation can be used to identify the source and spatial distribution of contamination at a site or to estimate contaminant indoor air concentrations for risk assessment purposes. For sub-slab sampling, evaluating risk associated with vapor intrusion to indoor air, cleanup and mitigation approaches, along with the public outreach associated with vapor intrusion investigations, mitigations and remediations, consult the following DTSC documents:

- *Final Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air* (October 2011) VIG [http://www.dtsc.ca.gov/AssessingRisk/upload/Final_VIG_Oct_2011.pdf]
- *Vapor Intrusion Mitigation Advisory Final Revision 1* (October 2011) VIMA [http://www.dtsc.ca.gov/SiteCleanup/upload/VIMA_Final_Oct_20111.pdf]
- *Vapor Intrusion Public Participation Advisory Final* (March 2012) VIPPA [http://www.dtsc.ca.gov/SiteCleanup/upload/VIPPA_Final_03_05_12.pdf]
- *Proven Technologies and Remedies Guidance – Remediation of Chlorinated Volatile Organic Compounds in Vadose Zone Soil* (April 2010) PTR [http://www.dtsc.ca.gov/SiteCleanup/upload/cVOC_040110.pdf]

The ASGI, along with the above-referenced documents, represents a “compendium” of guidance documents available to stakeholders for the evaluation of all aspects of vapor intrusion.

This document supersedes the 2012 and 2003 *Advisory – Active Soil Gas Investigations* (Cal/EPA, 2003) and 1997 LARWQCB *Interim Guidance for Active Soil Gas Investigations* (CRWQCB, 1997). It is the opinion of Cal/EPA that active soil gas investigations should be performed in accordance with this document. However, as noted above, other technically equivalent procedures may exist, and this Advisory is not intended to exclude alternative approaches or methodologies.

2.0 INITIAL PROJECT PLANNING AND WORKPLAN DEVELOPMENT

2.1 STUDY PURPOSE AND DATA QUALITY OBJECTIVES

A soil gas investigation may be undertaken for a number of different reasons and a single investigation may have multiple objectives. The data quality objectives (DQOs) for each investigation will vary according to the overall goals of each specific investigation. Examples of different purposes for performing a soil gas investigation are provided below:

1) Determining if discharges of contaminants have occurred which may impact indoor air, outdoor air and groundwater, such as leaks at aboveground storage tanks (AST), underground storage tanks (USTs) or other underground pollution sources;
2) Determining the spatial patterns and extent of vapor phase soil contamination,
3) Designing and monitoring the performance of a soil vapor extraction system;
4) Mapping soil vapor plumes to select buildings for indoor air monitoring;
5) Creating a data set for performing a vapor intrusion risk assessment using either generic attenuation factors or a mathematical model to estimate indoor air concentrations from soil gas data;
6) Remedy performance monitoring; and
7) Providing data for no-further-action determinations at impacted sites.

The DQO process is a systematic planning tool based on the scientific method for establishing criteria for data quality and for developing data collection procedures. By using the DQO process to plan environmental data collection efforts, the effectiveness, efficiency and defensibility of decisions can be improved. DQOs should be established before an investigation is started. Example input parameters to the DQOs include past, current and future land uses, regulatory action levels for contaminated media, laboratory method reporting limits, and the appropriate sample collection method. The expected output is the most resource-effective design for the study. Information concerning DQOs is provided in USEPA (1994a, 1994b, 2000a). A critical step in developing site-specific DQOs is the generation of a conceptual site model (CSM), discussed below in Section 2.3.2.

Within the subsurface, contaminants may exist in the following phases:

- Solid phase by adsorbing onto the organic fraction of soil;
- Aqueous phase by dissolving in groundwater and pore water;
- Non-aqueous phase liquid (NAPL); and/or
- Gaseous phase, by accumulating in the interstitial space of soil particulates as soil gas.

Thus, soil matrix and groundwater sampling and analysis should be considered for site characterization in addition to soil gas sampling to ensure that all potential phases of VOCs are evaluated and their associated exposure pathways. Soil gas sampling is

practical and preferred for many geologic materials, and, with care, can be successful in fine-grained soils.

2.2 TECHNICAL DOCUMENTS

Each soil gas investigation should have two technical documents: a workplan that describes the investigation in detail, and a report that summarizes the results of the investigation and the analysis of data. The workplan should incorporate the CSM and DQOs as a framework for the planned investigation. The CSM should be updated during the investigation as data gaps are addressed.

2.3 WORKPLAN

A workplan should be prepared and submitted to the regulating agency for review and approval according to the agreed upon schedule. Any variations or deviations from this Advisory should be specified in the workplan. The workplan should include a CSM, sampling and analysis plan (SAP), and DQOs. The decision making criteria for step-out sampling should be included in the workplan.

The workplan should have contingences to address unexpected field conditions, such as larger than anticipated contaminant plumes, low flow or no flow conditions, and resampling when anomalous data are obtained. Anomalous data are defined as data which are inconsistent with the CSM. Additional points may be required to resolve anomalies.

The regulating agency should be informed of any problems, unforeseen site conditions or deviations from the approved workplan. If modifications to the approved workplan are going to be implemented, the regulating agency should be notified and provided an opportunity to review the changes prior to implementation. Changes made without prior agency approval should be clearly documented in subsequent reports, including justification for these changes.

The project proponent should notify the regulating agency 10 working days prior to implementation of field activities. All necessary permits and utility clearances should be obtained prior to conducting any investigations described in this Advisory.

Project tasks and time lines, including dates anticipated for initiating and completing sampling activities, should also be included in the workplan or discussed with the agencies in writing.

2.3.1 Elements of the Workplan

Specific information that the regulating agencies will expect to see in a workplan include the following:

1) Site background, including known or inferred extent of contamination, potential or known areas of concern and pertinent features such as existing or former sumps,

trenches, utility corridors, drains, sewer lines, clarifiers, septic systems, piping, ASTs, USTs and waste management units, and surrounding land uses;

2) CSM (see Section 2.3.2);

3) SAP (see Section 2.3.3);

4) A statement of the investigation objectives relative to the site-specific DQOs;

5) A statement as to whether permanent or temporary soil gas wells or sub-slab probes are to be installed.[3] See DTSC's Vapor Intrusion Guidance concerning the need for the installation of permanent soil gas wells;

6) A statement as to whether a mobile and/or stationary laboratory will be used, and the rationale for making this decision;

7) A geological cross-section of the site showing the major lithologic units and zones for vapor monitoring;

8) Procedures to properly decommission soil gas wells to effectively prevent cross-contamination in the subsurface;

9) A project-specific quality assurance project plan (QAPP) for the project if no existing approved QAPP is applicable;

10) Procedures for handling and disposing of investigation-derived waste in accordance with federal, state and local agency requirements; and

11) A site-specific Health and Safety Plan.

2.3.2 Conceptual Site Model

A CSM is an integral part of all site investigations. The purpose of a CSM is to provide a conceptual understanding of the potential for exposure to hazardous contaminants at a site based on:

- Sources of contamination;
- Release mechanisms;
- Transport media;
- Exposure pathways; and
- Potential receptors.

The CSM also aids in the justification for the number, location and frequency of samples. The CSM should consist of descriptive text and diagrammatic or schematic figures relating the sources of contamination to receptors and the environment. The

3 The term "vapor probe", "soil gas probe", "soil gas monitoring well", and "soil vapor well" are considered equivalent and are used interchangeably within this Advisory.

CSM organizes and communicates information about the site characteristics and provides all interested parties with an understanding of the potential for exposure to chemicals of potential concern (COPCs) at a site. Resources regarding CSMs include: (1) SWRCB, 2012; (2) DTSC, 2011; (3) ITRC, 2007; (4) DTSC, 1994; (5) USEPA, 1994; (6) USEPA, 1989; and (7) USEPA, 1988.

The basic components of a CSM are:

1) Type of contaminants, including VOCs, currently or previously stored or handled at the site, to develop a site-specific target analyte list;
2) Known concentrations of COPCs in media such as soil gas, soil and groundwater;
3) Identification of the primary and secondary sources of COPCs;
4) Location, depth, and phase(s) of COPCs;
5) Primary release mechanism;
6) Exposure media such as surface soil, drinking water and air;
7) Potential human and ecological receptors and groundwater; and
8) Unique site features.

The CSM is a dynamic and iterative tool, and is updated as new information becomes available. Therefore, it should be reviewed after each stage of investigation and revised as appropriate.

The following information should be considered to identify contaminant sources, potential release mechanism(s) and pathway(s) for vapor migration:

- Soil types;
- Subsurface geology;
- Hydrogeology (local and regional), including depth to groundwater and groundwater flow direction;
- Subsurface heterogeneity;
- Preferential pathways, such as fractures, sand lenses, and utility corridors;
- Groundwater quality data;
- Contamination plume extent;
- Well records;
- Boring logs;
- Building construction details; and
- Surficial features of the area, such as ground cover and surface water bodies.

A CSM should be supported by contaminant plume maps and geological cross sections. The narrative description should clearly describe known site conditions and state what assumptions were made to generate the CSM.

2.3.3 Sampling and Analysis Plan

The SAP should specify all procedures and techniques used for soil gas sample collection, shipment, analytical procedures and chain of custody documentation. Field personnel should follow the SAP while collecting and analyzing soil gas samples.

Generally, the SAP should contain:

- Sample location and frequency;
- Pre-sampling activities;
- Schematic diagram of well design;
- Schematic diagram of sampling train;
- Sample equipment and collection procedures;
- Sample handling and analytical methods;
- Contaminant analyte list;
- Chain of custody control and records management;
- Field instrument and laboratory detection limits;
- Field and laboratory quality assurance/quality control (QA/QC); and
- Evaluation of data quality.

The SAP should contain a QAPP describing the policy, organization, activities and protocols necessary to achieve the DQOs dictated by the intended use of the data. The QAPP should include the following applicable information:

- Project description, management/organization and responsibilities;
- Quality assurance objectives;
- Sampling, calibration and analytical procedures;
- Data acquisition, reduction, validation and reporting;
- Documentation;
- Internal quality control;
- Performance and systems audits;
- Preventative maintenance;
- Data assessment procedures;
- Corrective actions; and
- Quality assurance reports.

2.4 SOIL GAS INVESTIGATION REPORTS

A soil gas investigation report should be submitted to the regulating agency at the conclusion of the investigation. Electronic data files should be submitted in accordance with the electronic data format requirements of the oversight agency.

Reports should include the following information:

- Description of field operations (including shut-in testing and leak check compounds, and purge volume data);
- Analytical methods used;
- Analytical results;
- Analysis and revision of the CSM based on data obtained from the soil gas investigation;
- Deviations from the approved workplan;
- Data inconsistencies;

- Data gaps identified based on the revised CSM; and
- Conclusions and recommendations.

Additionally, the following tables and diagrams should be included in the Report:

1) Site plan and sample location maps;

2) Plume maps and geologic cross sections with isoconcentration contours displaying the limits of contamination. Data from previous investigations may be included provided the data are presented in a way that distinguishes them from the current investigation;

3) Boring logs;

4) Construction diagrams for soil gas wells;

5) Summary tables for analytical data;

6) Legible copies of field and laboratory notes or logs;

7) All analytical results and QA/QC information including tables and explanation of procedures, results, corrective actions and effect on the data;

8) All raw data including chromatograms and calibration data if specifically requested by the regulating agency; and

9) Electronic data deliverables submitted in the format specified by the regulating agency.

All engineering or geologic work should be performed or supervised by a California Registered Professional in accordance with the Business and Professions Code, chapters 7 and 12.5, and the California Code of Regulations, title 16, chapters 5 and 29.

3.0 SOIL GAS INVESTIGATION DESIGN

The number, location and depth of soil gas samples should be based on the CSM and the project-specific DQOs, as well as the following general guidelines.

3.1 LOCATION, SPACING AND DEPTH

Subsurface contamination should be delineated three-dimensionally. Vertical soil gas delineation is achieved by collecting soil gas samples at varying depths in a single location, or by using closely spaced soil gas wells installed at varying depths.

3.1.1 Lithology

Locations and depths for soil gas monitoring wells should be based on site-specific lithologic information. If on-site lithologic information is not available prior to conducting

the soil gas investigation, one or more continuously cored boring(s) should be installed at the first location to the proposed greatest depth of the soil gas investigation. If the soil gas data are to be used for human health risk assessment, geotechnical data may be needed. Geotechnical information needed for vapor intrusion risk assessment purposes can be found in DTSC's Vapor Intrusion Guidance (DTSC, 2011).

Lithologic logs should be prepared for all borings, including soil matrix and geotechnical borings. Information gathered from the continuously cored borings may include lithologic descriptions, geotechnical data and contaminant data. Information collected from borings should be used to update the CSM. All boring logs generated during the soil gas survey should be provided to the regulating agency.

3.1.2 Sample Spacing

Sample locations may be based on historical site use and potential contaminant release points. Initial spacing can be grid-based such as sampling on a 50- by 50-foot grid. Alternatively, initial sampling can be based on historical or suspected site use. When areas of contamination are identified, a more focused grid spacing or biased sampling approach may be employed. Use a close interval grid or radial or step-out sampling pattern such as 10- to 20-foot grid pattern and multi-level sampling at 5-, 10-, 15-feet vertically to delineate identified contaminant areas. If historical information for the area is unknown, a screening grid pattern, such as 100- by 100-foot, may be used.

3.1.3 Sample Depth

All available information such as boring logs and field instrument readings from soil cuttings or cores should be used to select the correct depths to collect soil gas samples. Probes should be installed at depths with elevated vapor readings. Vertical sampling should continue until vapor-phase contaminants are no longer encountered. If vertical characterization to groundwater is needed, the deepest soil gas sample should be collected near the capillary fringe. Soil gas wells or probes should not be installed too close to the water table because low flow conditions might be encountered due to the high moisture content. Nested soil gas wells may be installed in the annular space of groundwater monitoring wells to serve as a dual-purpose well if both vapor and groundwater monitoring are required.

Soil gas sample depths should be chosen to minimize the effects of changes in barometric pressure and temperature, breakthrough of ambient air from the surface, and to ensure that representative samples are collected. Soil gas samples collected at less than 5 feet below ground surface (bgs) may be subject to barometric pressure effects and prone to breakthrough of ambient air through the soil column and, hence, samples are not typically collected from depths of less than five feet unless site-specific conditions dictate otherwise. Consideration should be given to source location, types of chemicals of concern and the lithology encountered. Variation of sample depths and the need for deeper sample locations should be evaluated based on site-specific characteristics and DQOs.

When evaluating vapor intrusion, sampling soil gas immediately adjacent to a building's foundation is only appropriate if the samples are collected near the contaminant source.

Soil gas samples collected immediately above the source of contamination are more likely to be representative of what may be in contact with the building's foundation (Hers et al., 2006; DiGiulio and Cody, 2006; and USEPA, 2012). Likewise, the numerical modeling conducted by Abreu and Johnson (2005), Abreu and others (2006), and Bozkurt and others (2009) also suggests this relationship. Hence, risk estimates may be biased low if quantified with shallow soil gas measurements when using the Johnson and Ettinger (1991) model. Maximum subsurface concentrations, or soil vapor concentrations representative of source conditions, should be used for preliminary vapor intrusion screening evaluations. A five foot deep sample is not appropriate if there is a deeper source. Accordingly, collecting soil gas samples near contaminant sources is recommended for vapor intrusion modeling. Vertical soil gas sampling should be conducted to determine the source of subsurface contamination. Ideally, numerous vertical profiles of soil gas should be developed at the site to accurately locate subsurface sources. Once located, soil gas collection can be targeted at these depths site-wide. Typically, contaminant sources are adjacent to the areas of highest subsurface concentration.

3.2 INSTALLATION PROCEDURES

Soil gas well installation procedures are described below. Soil gas well construction should ensure a good seal between the formation and sampling assembly, and minimize ambient air breakthrough. Additional standards may be required by local oversight agencies.

3.2.1 Installation Methods and Design

Soil gas wells may be installed using a variety of drilling methods such as direct push, hollow stem auger or hand auger. Certain drilling methods that significantly disrupt soil gas equilibrium, such as air rotary and rotosonic, may be employed if longer equilibration times are used prior to sampling. The mud rotary drilling method is not acceptable for soil gas probe emplacement under any circumstances. Following is a step-by-step guide to soil gas well (probe) installation after the borehole has been drilled:

1) Sand Pack. Install a sand pack to minimize disruption of airflow to the sampling tip. A tremie pipe should be used for soil gas wells deeper than 15 feet to avoid bridging or segregation during placement of the sand pack and annular seal. Place the probe tip midway in the sand pack, as shown on Figure 1 with at least six inches of sand above and below the probe tip.

2) Transition Seal. Emplace at least six inches of dry granular bentonite on top of each sand pack, as shown on Figure 1. Granular bentonite is preferred over bentonite in powdered or pellet form for the sand pack / annular seal transition. Following the dry bentonite, fill the borehole to the surface with an appropriate annular sealing material (see below). The purpose of the dry granular bentonite between the sand pack and the annular seal is to prevent water and clay from the annular seal infiltrating into the sand pack. A tremie pipe should be used for the emplacement of the transition seal in soil gas wells that are deeper than 15 feet, otherwise the material can be gravity fed (freefall) from the surface.

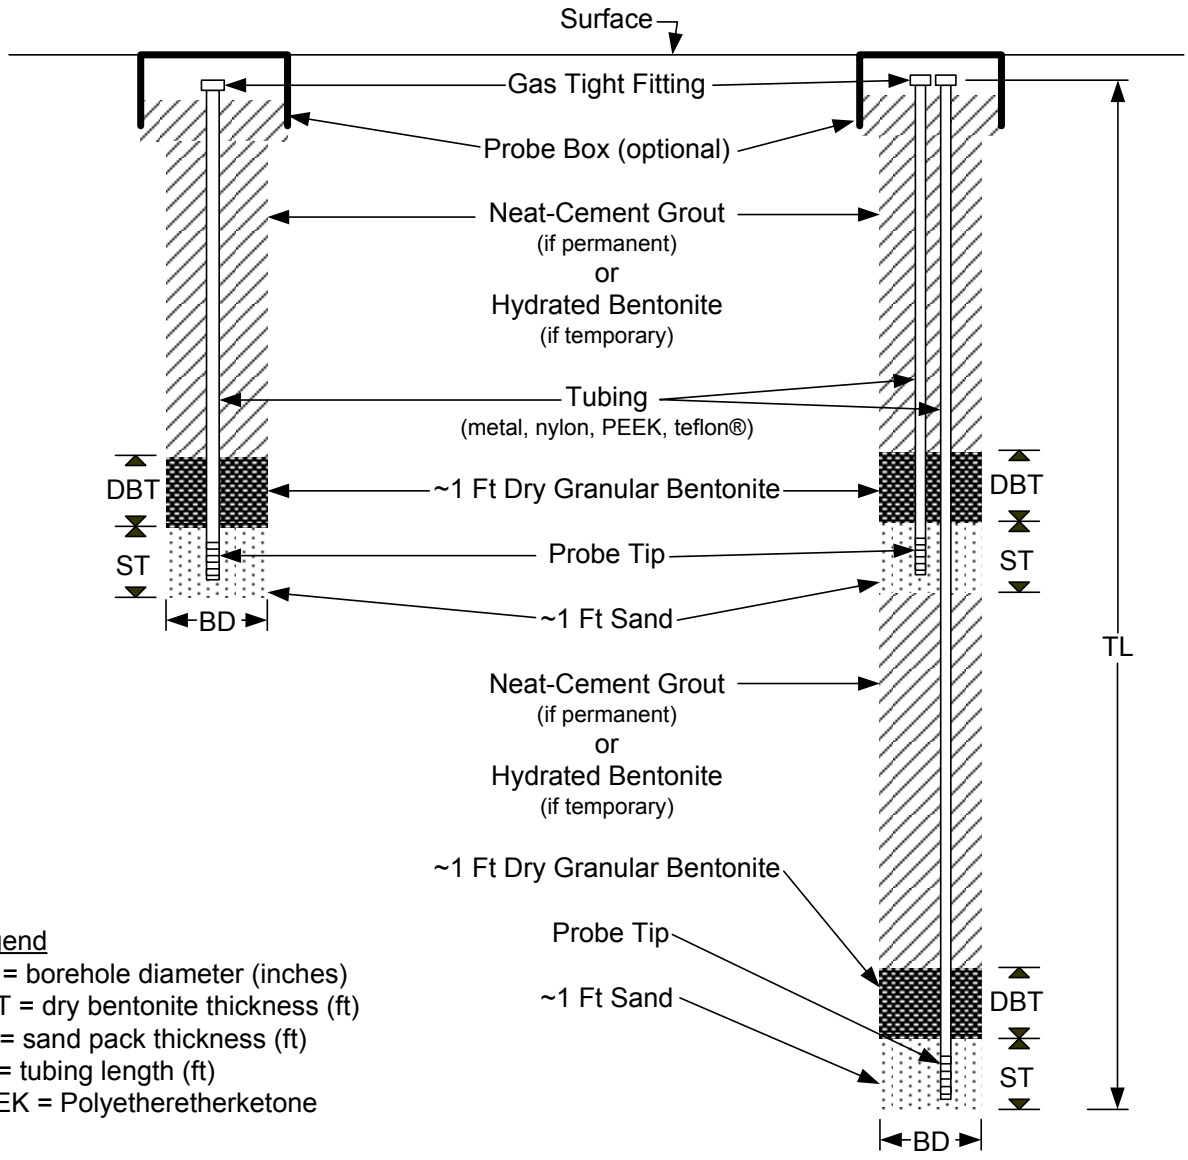
3) Annular Seal. The composition of the annular seal is a function of the long-term use of the soil gas well, as follows:

- Temporary Soil Gas Wells. For wells that will be sampled for less than one year, the annular seal can be hydrated bentonite or other materials, as appropriate. Studies have shown that bentonite annular seals in the vadose zone desiccate readily and will not rehydrate once damaged (Lackey et al., 2009). Hence, bentonite-only annular seals are discouraged for long-term use. The integrity of a bentonite annular seal can be increased by adding sand to the grout mixture as indicated by Lackey (2009).

- Permanent Soil Gas Wells. For wells that will be used for longer than one year, the annular seal should be neat cement with bentonite. Typically, the bentonite content is 1 – 5 percent. The integrity of a neat cement annular seal can be increased by adding sand to the grout mixture as indicated by Lackey (2009).

When using a bentonite seal on a temporary soil gas well, the bentonite should be hydrated at the surface in a container and then slowly poured or pumped into the borehole. If the borehole is deeper than 15 feet, a tremie pipe should be used to place the hydrated bentonite.[4]

It is important to have a good annular seal to prevent "short circuiting" of air from the upper portions of the borehole into the sample, yielding contaminant concentrations not indicative of the targeted interval. Follow a similar procedure for deep well construction with multiple probe depths, in that one foot of dry granular bentonite should be emplaced on top of the sand pack encasing each probe, followed by the annular sealing material. The annular seal should continue until the next sand pack, as shown on Figure 1. Accordingly, soil gas probe construction should be consistent with California Department of Water Resources Bulletin 74-90 (California Well Standards) (DWR 1991) and the annular seal should be appropriate for the local climate, subsurface conditions, and permanence of the soil gas well.



4) Probe Support Rod. A down-hole rod should be used to support the well tubing in the borehole. A down-hole rod is a support device used in boreholes deeper than 15 feet to ensure that probe tips are placed at appropriate depths. A small diameter PVC pipe that is capped at both ends is the most commonly used material for probe support. The probe support is created by attaching the probe tip and tubing to the exterior of the PVC pipe. Other materials may be used, such as metal, as long as the support rod is free of contaminants. Depending on the depth, centralizers may be necessary to ensure the support rod is in the center of the borehole. Alternative probe support designs with accompanying descriptions may be proposed in the project workplan. Justification should be

4 The protocol for the placement of the hydrated bentonite is similar to the approach in USEPA (2014).

included in the project workplan if the project proponent chooses not to use probe support for deep soil gas wells.

Figure 1

Typical Single and Nested Soil Gas Probe Design

Neat-Cement Grout means a mixture in the proportion of 94 pounds of Portland cement and not more than 6 gallons of water. Bentonite up to 5 percent by weight of cement (4.7 pounds of bentonite per 94 pounds of Portland cement) may be used to reduce shrinkage.

3.2.2 Sampling Tubing

Small diameter (1/8 to 1/4 inch) tubing is typically used for probe construction, made of material which will not react or interact with site contaminants. At sites where soil

moisture is high and/or finer-grained materials are present, larger diameter tubing, up to 3/4-inch, may also be used. Using larger diameter tubing is less susceptible to plugging by high soil moisture and fine-grained materials. The same soil gas sampling protocols for smaller tubing apply to the larger tubing. The probe tip, probe and probe connectors should all have the same diameter to provide a good seal between the formation and the sampling assembly. The following steps will help ensure a good-quality soil gas sample.

- Clean, dry tubing should be used at all times. If any moisture or unknown material is present in the tubing prior to insertion, decontaminate or replace the tubing;

- The bottom-end of the tubing should be attached to a soil gas probe tip. Downhole equipment (probe screens, tie wires, etc.) or drive heads should be free of cutting oils and other contaminants;

- Metal tubes should not be used to collect hydrogen sulfide samples. Nylaflow®, polyetheretherketone (PEEK), and Teflon® are recommended for soil vapor sampling. Low-density polyethylene (L-D PE) should not be used due to decreased performance relative to other tubing types in both off-gassing of VOCs inherent in the tubing structure (contribution to background) and for decreased contaminant recovery (reactivity). Reduced recovery of naphthalene was observed when using Nylaflow® tubing with small sample sizes. For additional information, see Appendix B;

- Prior to sampling, an assembled soil gas probe, tip and tubing should be blank tested at a frequency of one analysis per new batch of tubing or material used. Demonstration of equipment cleanliness enhances the quality of soil gas data. The need for blank testing of tubing, probe tips, or an assembled soil gas probe should be evaluated through the DQO process. Demonstrating cleanliness is needed because even new, unused, tubing may be stored inappropriately, such as near fuel sources or exhaust ports. Likewise, probe tips may contain residual oils from the manufacturing process. Some common ways of blank testing are as follows:

    a. Coiled Tubing. Spools of tubing can be blank tested by collecting a sample of the dead air within the tubing. The tubing should not be purged prior to sampling and the sampling volume should be less than the dead space within the tubing. The air should be analyzed for site constituents. The air sample from the coiled tubing can be collected by either the field crew or by laboratory personnel prior to taking the tubing to the site.

    b. Assembled Soil Gas Probe. A soil gas probe can be assembled and then blank tested prior to insertion into the subsurface. A length of tubing representative of the maximum sampling depth for the site should be cut from the tubing spool and a probe tip attached to one end. Pressure gauges, fittings and valves can also be attached as appropriate. A sample of dead air from the probe should be collected in the same manner as when

collecting a soil gas sample. The sampling volume should not exceed the dead space in the probe. This testing can be conducted in the field or by the stationary or mobile laboratory prior to using the tubing. If conducted by a stationary laboratory, the dead air in the assembled probe may be replaced by zero-grade air and this zero-grade air may be tested;

c. Probe Tips. Probe tips can be blank tested with distilled water. The most common method is to pour distilled water over the tip and through the inside, collecting the water in a container appropriate to the analytical method. The collected water should be tested for all site contaminants.

3.2.3 Drive Point Method

Post-run tubing (PRT) and drive point methods[5] used to create temporary soil gas wells may be used to rapidly acquire soil gas samples when carefully installed. Contractors should ensure that installation includes regularly checking and cleaning of the PRT tip threads and its seat and changing the O-rings on a daily basis. Contractors should use stiff tubing to couple the PRT tip to the connective hose and use ¼ inch outer diameter, thick-wall tubing to ensure sufficient torque is available to screw the tip tightly into the seat. If the O-ring is not seated properly into the drill rod, ambient air from inside the rod could enter into the sampling system, introducing ambient air into the soil gas sample, biasing the sampling results. The integrity of the seal of the O-ring cannot be readily evaluated with a leak check compound, and the inability to evaluate the integrity of the O-ring seal should be evaluated with the DQO process.

Representative soil gas samples may be difficult to obtain with PRT and drive point methods in certain lithologies. Drive point probes may be deflected by consolidated lithologies and strata containing cobbles or boulders, which can create gaps between the outer wall of the drive rod and the subsurface that are difficult to observe and equally difficult to seal. A hydrated bentonite plug at ground surface does not stop communication along the annular space. Samples collected under these circumstances will potentially draw soil gas primarily from the most permeable layer above the probe tip which may introduce a significant bias. Moreover, this condition is difficult to identify by a leak check compound applied at or near ground surface. Collecting representative soil gas samples in these conditions may require alternative sampling methods such as passive soil gas sampling or the installation of permanent sampling wells.

3.3 SOIL GAS WELL COMPLETION

Soil gas wells should be secured, capped and completed to prevent infiltration of water or ambient air into the subsurface, and to prevent accidental damage or vandalism. Mark the tubing at the surface to identify the probe location and depth. For surface completions, the following components may be installed:

---

[5] Drive point methods may be appropriate for certain site conditions or circumstances depending on DQOs. The use of post-run tubing should be discussed with the regulating agency prior to inclusion in the workplan.

1) Gas-tight valve or fitting for capping the sampling tube;
2) Utility vault or meter box with ventilation holes and lock;
3) Surface seal; and
4) Guard posts.

3.4 DECOMMISSIONING

When sample collection ceases at a vapor well, properly remove or decommission wells with concurrence from the regulating agency. The decommissioning process should prevent the well and associated borehole from becoming a conduit for the preferential migration of contamination. The decommissioning procedures within the California Well Standards (Bulletin 74-90) should be followed along with any local requirements.

When decommissioning vapor wells with tubing, the following decommissioning steps should be followed:

1) Excavate the borehole down to approximately three feet below grade, exposing the upper portion of the tubing.
2) Either cut the tubing near the bottom of the excavated hole or pull the tubing out of the ground by hand, removing as much tubing as possible.
3) If tubing is still visible in the hole upon removal by hand, cut the tubing near the bottom of the hole, then insert[6] sealant, such as powdered bentonite grout, or silicone caulk, into the exposed tubing, filling it as much as possible;
4) Fill the open hole with cement grout to within one foot of the surface grade;
5) Fill the last foot of the hole with compacted native material; and,
6) Restore pavement and vegetation to original conditions, if needed.

When decommissioning vapor wells constructed with ridged casing, wells can be overdrilled or cement grouted in place pursuant to local requirement. When overdrilling, a casing guide should be used to prevent the drill bit from drifting during the decommissioning. A casing guide will allow the drill bit to remain aligned on the top of the well casing, allowing for effective removal of the well material. Once the well material is removed, the borehole should be filled with cement grout. If vapor wells penetrate clay units, consideration should be given to overdrilling rather than abandonment in place in order to prevent preferential contaminant migration.

[6] Inserting sealant may be accomplished by using a peristaltic pump or large syringe. Sealant must be free of lumps to freely pass down the tubing.

3.5 DECONTAMINATION

Decontaminate all reusable equipment to prevent cross contamination. Tubing is not reusable and should not be decontaminated. Instead, use new or unused sampling tubing for each probe location.

Decontamination may consist of steam cleaning or a three-stage decontamination process consisting of a wash with a non-phosphate detergent, a rinse with tap water and a final rinse with distilled water. Collect one equipment blank at the beginning of sampling and at least one each day after decontamination. Equipment should be air-dried before reuse.

The most common method of collecting an equipment blank is to pour distilled water over recently decontaminated piece of equipment and collect the water in an appropriate container for analysis of site constituents. Drill rods contacting contaminated soil should be decontaminated before reuse and blank tested as appropriate. If soil gas samplers arrive at the site after drill rig demobilization, equipment blanks should be provided by the drilling contractor. As discussed in Section 3.2.2, an equipment blank is recommended for probe tubing and probe tips. A syringe blank may be collected by sampling ultra-pure air as it passes through the syringe, and a syringe blank is not an acceptable substitute for the driller's equipment blank. The equipment blanks demonstrate there is no residual contaminant carryover from other sites or the manufacturing process.

3.6 SUB-SLAB INVESTIGATION METHODS

The procedures for collecting sub-slab soil gas samples directly under a building's foundation are the same as for collecting subsurface soil gas samples. When collecting sub-slab samples, if a building is determined to have a moisture barrier and/or a tension slab, special care should be given when hand-drilling through the concrete slab. In particular, for tension foundation slabs, the tension cables within the slab should be located prior to drilling either through visual observation or through remote-sensing with either a metal detector or ground penetrating radar. The cutting of a tension cable within a slab during drilling could disrupt the integrity of the slab and potentially cause injury to the field crew.

When evaluating sub-slab soil gas for a building, permanent sampling points should be installed so repeated sampling can be conducted, as necessary, to evaluate seasonal or temporal variations.

For sub-slab samples, after removal of the floor covering, a small-diameter hole should be drilled through the concrete of the foundation slab. Typically, holes are 1.0 to 1.25 inches in diameter. Either an electric hand drill or concrete corer is used to drill the holes. All sub-slab utilities, such as water, sewer, and electrical, should be located and clearly marked on the slab prior to drilling. Sub-slab holes should be advanced three to four inches into the engineering fill below the slab. All drill cuttings should be removed from the borehole. A typical sub-slab probe design is shown in Figure 2. The sampling probe should be constructed with the following specifications:

- Vapor probes are typically constructed of 1/8 inch or 1/4 inch diameter tubing, with a permeable probe tip. Alternate sub-slab sampling devices are commercially available. The reviewing agency should be consulted on the vapor probe construction prior to development of the workplan.

- Depending on the type of sub-slab probe construction, install a sand pack to minimize disruption of airflow to the sampling tip. Place the probe tip midway in the sand pack, as shown on Figure 2.

- Dry granular bentonite should be used to fill the borehole annular space to above the base of the concrete foundation.

- Hydrated bentonite should then be placed above the dry granular bentonite. The bentonite for this portion of probe construction should be hydrated at the surface to ensure proper sealing. Care should be used in placement of the bentonite to prevent post-emplacement expansion which might compromise both the probe and cement seal.

- The remainder of the hole should be filled with neat cement mixed with bentonite if the probe is permanent or with hydrated bentonite if the probe will be used for less than a year. Prior to the introduction of this material, the concrete surfaces in the borehole should be cleaned with a damp towel to increase the potential of a good seal and, ideally, all concrete dust should be removed from the borehole.

- All water used in the construction of the probe should be deionized, the cement should be contaminant-free and quick drying, and all metal probe components should be thoroughly cleaned to remove manufacturer-applied cutting oils.

- Each probe should be constructed with a gas-tight fitting and flush-mounted well box so that the probe completion is not a tripping hazard.

- Prior to sampling, at least two hours of time should elapse following installation of a probe to allow the construction materials to cure and allow for the subsurface to equilibrate (USEPA, 2006).

- The collection of sub-slab samples should follow the procedures in this Advisory, which recommends leak testing and shut-in testing. Purging and sampling rates should not exceed 200 milliliters per minute. To avoid air breakthrough from nearby, unobserved foundation cracks within the slab, DTSC recommends using sampling containers with volumes of less than or equal to one liter. If using passivated metal canisters, the canisters should be returned to the laboratory slightly depressurized, such as -2 inches of mercury.

- All laboratory analytical methods should meet the site-specific DQOs and the analytical method reporting limits should be low enough for risk determination.

- A sufficient number of sub-slab sampling events should be conducted to account for seasonal and spatial variability. At a minimum, two sub-slab sampling events are warranted before a final risk determination is made.

- Upon completion of all sampling, the sub-slab probes should be properly decommissioned. The probe tip, probe tubing, bentonite, and grout should be removed by over-drilling. The borehole should be filled with grout and concrete patch material. Surface restoration should include a follow-up visit for final sanding and finish work to restore the floor slab, and associated coverings, to their original condition.

At least two sub-slab probes should be installed at each residential structure, with one probe installed in the center of the building's foundation. The probes should be installed in inconspicuous areas, such as utility closets or beneath stairs. Sub-slab probes should not be installed near the edges of the foundation due to the effects of wind on the representativeness of contaminant concentrations (Luo et al., 2009).

Numerous sub-slab sampling devices, are commercially available. Cal/EPA encourages the use of innovative technologies as long as the devices are capable of meeting project DQOs and established performance criteria. Accordingly, sampling procedures recommended in this Advisory should be followed when using innovative technologies.

3.6.1 High Purge Volume Sub-Slab Sampling

Extracting a large volume of soil gas from beneath a foundation may provide representative average concentrations that minimize spatial variability in the data and can minimize the possibility of missing an area of elevated concentrations when using multiple discrete sampling points. Unlike conventional sub-slab sampling, high purge volume (HPV) testing provides information over a broader area by removing a larger volume of soil gas. The volume of gas beneath a typical residence in the engineered subgrade fill is a few thousand liters. In this context, the volumes of sub-slab soil gas samples currently collected for vapor intrusion assessments are very small, and larger samples may provide more spatially averaged concentrations. Examples of high purge volume methods can be found in Lewis and others (2004) and McAlary and others (2010).

HPV sampling consists of extracting sub-slab soil gas at a slow, constant rate of five to ten liters per minute, or higher if warranted, and collecting a soil gas sample after about two hours. Hence, over five hundred liters of sub-slab gas can be removed prior to sample collection using the HPV technique. The use of HPV sampling should be based on the site conditions and the project DQOs. All HPV sampling should follow the recommendations in this Advisory concerning leak checking, shut-in testing, and DQOs. As HPV sampling becomes further developed, quantitatively accurate results for contaminant concentrations can be achieved and the HPV samples can be used in quantitative risk assessments.

When utilizing HPV at a site, the protocols within McAlary and others (2010) should be followed. Some items to consider when using HPV are as follows:

- Vacuum during purging should not exceed 100 inches of water.

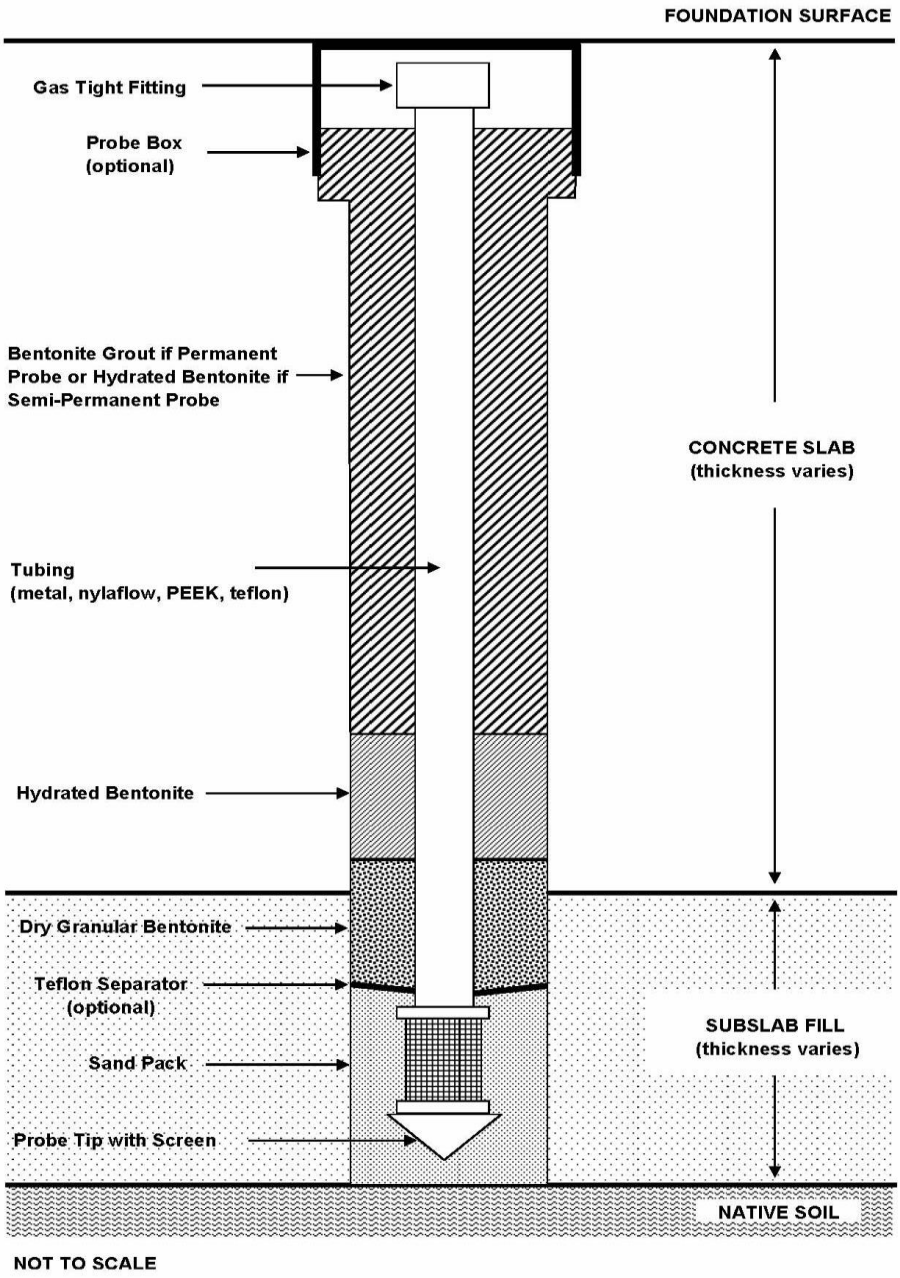
- The anticipated spatial influence of the HPV should not extend beyond the building's footprint, otherwise, ambient air may enter into the sample from the edges of the foundation. This situation can be alleviated by installing probes subject to HPV in the interior portions of the building.

- A leak check compound should be used during the purging and sampling.

- The amount of purge volume should be measured with a calibrated extraction pump.

- During the purging, site contaminants should be measured with a field instrument, such as a photoionization detector capable of reading in the parts per billion range, at the start of purging and then every 30 minutes thereafter, at a minimum.

- Fixed gases, such as oxygen and carbon dioxide, should be monitored every 10 minutes during purging to evaluate potential ambient air breakthrough into the sample system. Typically, oxygen and carbon dioxide should remain constant during the purging of sub-slab soil gas. Changes of fixed gas concentrations may be indicative of unacceptable leakage through the foundation slab.



- To evaluate the radial influence of the HPV sampling, vacuum measurements should be continuously monitored at a nearby sub-slab probe locations. These data, along with all other field data, should be reported to the oversight agency.

- As an additional line of evidence for the integrity of the final laboratory sample, the leakage of air through the foundation slab should be quantified by the methods within McAlary and others (2010).

If ambient air breakthrough from the foundation slab occurs, the contaminant data collected upon completion of the purging should not be used for risk assessment purposes. Data indicating breakthrough include the detection of the leak check compound, significant increases of oxygen and/or significant decreases in carbon dioxide while purging. Likewise, significant decreases in VOC concentrations, as collected with a field instrument during purging, may be indicative of breakthrough.

FIGURE 2

Sub-Slab Vapor Probe Typical Diagram

4.0 SOIL GAS SAMPLE COLLECTION

4.1 EQUILIBRATION TIME

Subsurface conditions are disturbed during drilling and probe placement. To allow for the subsurface to equilibrate back to representative conditions, the following equilibration times are recommended before proceeding with soil gas sampling:

1) For soil gas wells installed with the direct push method, do not conduct the purging, leak testing and soil gas sampling for at least two hours following vapor probe installation. Finer-grained material may take longer, up to 48 hours, to equilibrate;

2) The equilibration time for sub-slab probes is two hours (see Section 3.6);

3) For soil gas wells installed with hollow stem or hand auger drilling methods, do not conduct purging, leak testing and soil gas sampling for at least 48 hours after soil gas probe installation;

4) For soil gas wells installed with a combination of hand auger drilling or hollow stem auger and direct push methods, do not conduct purging, leak testing and soil gas sampling for at least two hours following vapor probe installation provided that at least five feet of the borehole was drilled by direct push technology. The five feet of direct push borehole should be drilled after the completion of hand augering or hollow stem augering. The well screen should be located below this five-foot interval. If the well screen is located above the five-foot interval, do not conduct purging, leak testing and soil gas sampling for at least 48 hours after soil gas probe installation; and

5) For soil gas wells installed with the rotosonic or air rotary method, do not conduct purging, leak testing, and soil gas sampling until it can be empirically demonstrated that the subsurface equilibrium time is sufficient to collect representative samples. Due to site-specific conditions, the re-establishment of equilibrium could vary from a few days to a few weeks.

Note: The best option to verify that equilibrium has re-established is to collect time-series data. Soil gas samples for VOC analysis, along with oxygen and carbon dioxide measurements, should be collected shortly after installation, and then at a frequency that will demonstrate the time needed to attain representative samples. A field instrument may be used to analyze the soil gas samples to evaluate representativeness. If the subsurface lithology is homogeneous, one monitoring point could serve as a surrogate for all others when installing multiple sampling probes.

Soil gas well installation method and equilibration time should be recorded in the field log book or field form.

4.2 SOIL GAS ASSEMBLY TESTS

Complete shut-in, leak test and purging before collecting soil gas samples after the soil gas well has equilibrated.

4.2.1 Shut-In Test

Prior to purging or sampling, a shut-in test should be conducted to check for leaks in the above-ground sampling system. To conduct a shut-in test, assemble the above-ground valves, lines and fittings downstream from the top of the probe. Evacuate the system to a minimum measured vacuum of about 100 inches of water using a purge pump. The test is conducted while the sampling canister, if used, is attached with its valve in the closed position. Observe the vacuum gauge connected to the system with a “T”-fitting for at least one minute or longer. If there is any observable loss of vacuum, the fittings are adjusted until the vacuum in the sample train does not noticeably dissipate. After a successful shut-in test, the sampling train should not be altered. The vacuum gauge should be calibrated and sensitive enough to indicate a water pressure change of 0.5 inches. A shut-in test is not a replacement for a leak test.

4.2.2 Leak Test

A leak test is used to evaluate whether ambient air is introduced into the soil gas sample during the collection process. Atmospheric leakage occurs in three ways:

1) Advection through voids in the probe packing material and along the borehole sidewall;
2) Advection directly through the soil column; and
3) Through the fittings in the sampling train at the surface (Banikowski et al, 2009).

A leak test should be conducted at every soil gas well each time a soil gas sample is collected to evaluate the integrity of the sample. Introducing ambient air may result in an underestimation of actual site contaminant concentrations or, alternatively, may introduce external contaminants into samples from ambient air.

The two types of leak check compounds available for use when soil gas sampling are liquid compounds and gaseous compounds. Both types have their advantages and disadvantages, and practitioners should select a leak check compound based on their project’s DQOs. See Appendix C for quantitative leak testing.

4.2.2.1 LEAK CHECK COMPOUNDS (LIQUID)

Liquid tracer compounds, such as hexane, pentane, diflouroethane and n-propanol, can be used to evaluate sample integrity. Other compounds not listed here may also be appropriate. Typically, liquid tracer compounds are applied to towels or clean rags and placed around all connections in the sampling train in order to evaluate potential leaks of ambient air into the sampling train. The liquid tracer should not be directly sprayed or poured onto a fitting, but rather applied to a cloth which should be placed near the connection. Towels or rags with the liquid tracer should also be placed on the ground

adjacent to the probe to evaluate soil column and probe construction breakthrough. The leak check compound selected should not be a suspected site-specific contaminant. Seal integrity is confirmed by analyzing the soil gas sample for the tracer compound. Alternatively, each connection can be individually checked by placing the tracer cloth in a plastic bag and then using the bag to enclose individual connections. Instruments can be used in the field to evaluate whether leakage is occurring rather than waiting for the mobile or stationary laboratory results. Liquid leak check compounds should be included in the laboratory analyte list. The laboratory reports should quantify and annotate all detections of the leak check compound at the reporting limit of the target analytes. If the concentration of the leak check compound is greater than or equal to 10 times the reporting limit for the target analyte(s), then corrective action is necessary as discussed below.

4.2.2.2 LEAK CHECK COMPOUNDS (GASEOUS)

Gaseous tracer compounds, such as helium and sulfur hexafluoride, can be used along with a shroud or tent placed over all the sampling equipment. Other compounds not listed here may also be appropriate. Procedures for conducting a quantitative leak test are described in Appendix C. An ambient air leak up to 5 percent is acceptable if quantitative tracer testing is performed by shrouding.

4.2.2.3 LEAK CHECK CONSIDERATIONS

A soil gas well should be decommissioned if the leak cannot be corrected. Replacement soil gas wells should be installed at least five feet from the location where the original soil gas well was decommissioned due to a confirmed leak. The leak check compound concentrations detected in the soil gas samples should be included in the laboratory report and the ambient air breakthrough should be discussed in the site characterization report.

The intent of the leak check compound is to enhance the integrity of the soil gas sample by demonstrating that minimal or no ambient air breakthrough during sampling is occurring. Although it is preferable not to have any tracer gas breakthrough, minor amounts of breakthrough may be acceptable if the breakthrough is appropriate for the site's DQOs. Detecting leak check compounds indicate potential field problems. Some potential sources of leaks in sampling trains are poor quality fittings, stripped, over tightened, dirty or worn threads, and excessive sampling train connections. Regardless of the cause of the leak, a data adjustment factor based upon the concentration of the leak check compound to compensate for the inability to collect representative samples is inappropriate.

Note that if a passivated stainless steel canister is used to collect a sample that is later analyzed at a stationary laboratory and there is a significant leak, it will typically not be identified until after demobilization of the field crew. Therefore, field screening prior to laboratory analysis is recommended.

Commercially available leak check compounds, both liquid and gaseous, may contain unanticipated impurities. Therefore, laboratories should analyze the leak check compound to aid in the interpretation of the data.

When designing a field study, the tracer compound should be carefully selected. The following items should be considered when choosing a tracer compound.

- Excessive concentrations of the tracer can elevate analytical detection limits;
- Tracer compounds can cause interference with target analytes;
- Field detectors may produce biased results in the presence of water vapor or other compounds;
- The tracer compound may be naturally occurring;
- Field detectors may not be routinely calibrated; and
- Pressurized canisters of tracer gas may be dangerous to transport.

4.2.3 Purging

The purpose of purging is to remove stagnant air from the sampling system so that representative samples can be collected from the subsurface. A default of **three purge volumes** should be used. Purge volume testing is no longer recommended.

One purge volume includes the following:

- The internal volume of the tubing and probe tip.
- The void space of the sand pack around the probe tip.
- The void space of the dry bentonite in the annular space.

No distinction should be made between new and old probes or whether probes are shallow or deep. All probes should be subject to similar procedures.

Purging should commence after the shut-in test. Sample containers are not included in the purge volume calculation except when non-evacuated glass bulbs are used. In those instances, the volume of the non-evacuated glass bulbs should be added to the purge volume to account for mixing and dilution of gasses inside the glass bulb.

Shallow soil gas and sub-slab probes, where screens and associated sand packs are less than five feet below surface grade, are subject to purging. For shallow soil gas probes, sample collection containers should be less than or equal to one liter to avoid excessive air removal, avoiding the possibility of ambient air entering the subsurface and into the sample. All permanent probes should have an air-tight seal or cap to prevent ambient air from entering the tubing or casing.

Include the purg ing data in the report to verify an adequate volume of air was removed prior to sampling. The soil gas report data set should include the purged volume as well as the flow rate, and vacuum exerted on the formation. Additionally, dependent on the objectives of the characterization activities, collecting pneumatic data during purging may be warranted to determine the air permeability of the subsurface (see Appendix D for more information).

4.3 PURGE/SAMPLE FLOW RATE AND APPLIED VACUUM

Flow rates between 100 to 200 milliliters per minute (mL/min) and vacuums less than 100 inches of water should be maintained during purging and sampling to minimize stripping (partitioning of vapors from pore water to soil gas), to prevent ambient air from diluting the soil gas samples, and to reduce variability between contractors. Maintaining these flow rates and vacuums will increase the likelihood that representative samples will be collected. A flow rate greater than 200 mL/min may be used when purging times are excessive, such as for deep wells with larger-diameter tubing. However, a vacuum of 100 inches of water or less must be maintained during sampling whenever a higher flow rate is used. The pressure gauge used to measure vacuum should be calibrated and in good working order. When purging at rates of greater 200 mL/min, reduce the flow rate to 200 mL/min for sampling.

A vacuum gauge should be used between the soil gas sample tubing and the soil gas purging device to verify that 100 inches of water or less is maintained during sampling. Gas-tight syringes may also be used to qualitatively determine if a high vacuum soil condition is present. If a high vacuum condition is present due to low permeability soil, the sampling technician can feel the suction while the plunger on the syringe is being withdrawn. If low permeability conditions are encountered where 100 inches of water is exceeded, the well can be sampled using the techniques in Appendix D (Soil Gas Sampling in Low Permeability Soil).

4.3.1 Vacuum Pump

When a vacuum pump is used, collect samples on the intake side to prevent potential contamination from the internal parts of the pump. To collect the sample in a polymer gas sampling bag, a lung box[7] is required. Record the vacuum readings and corresponding flow rates on field data sheets for each sample. If the pump is battery-operated, the batteries should be checked before and during the operation to ensure that a proper charge is maintained. As batteries lose charge the flow rate is lowered, effectively changing the purge rate.

5.0 SAMPLE HANDLING AND TRANSPORT

5.1 SAMPLE CONTAINERS

Collect samples in gas-tight containers and handle in a manner that will prevent photodegradation of the target analytes. Sample containers should not compromise the integrity of the samples.

---

[7] A lung box is a small airtight chamber into which the polymer gas sampling bag is placed. The connective tubing to the bag protrudes out a hole in the chamber. The sealed chamber is evacuated by a pump, causing the bag to expand, drawing the soil gas from the probe into the bag.

5.1.1 Syringes

Syringes should be checked for leaks before each use by closing the exit valve and attempting to force ambient air through the needle. Gas-tight glass syringes with Teflon® seals are preferred. Glass syringes should be leak tested periodically to verify integrity with age.

Plastic syringes should not be used because of the potential interaction with some target analytes.

5.1.2 Passivated Stainless Steel Canisters

Passivated stainless steel canisters need a flow regulator and vacuum gauge when sampling soil gas. If the canister is not fitted with a permanent vacuum gauge, a field vacuum gauge should be attached between the flow regulator and the canister inlet during sampling. To prevent stripping, connections should be initially hand-tightened. To verify the integrity of the seal on the steel canisters during transit, pressure readings should be collected during the canister's journey. The stationary laboratory should record the pressure when the canisters leave the laboratory and record it again on receipt of the canisters. Likewise, the field crew should record the pressure upon start and completion of the sampling. Typically, canisters are returned to the stationary laboratory with a slight vacuum (two to four inches of mercury). These pressure measurements should be included in the laboratory's analytical report as a mechanism to verify the integrity of the sample.

Pressure measurements should be collected using a calibrated pressure gauge, using the same gauge at the laboratory and in the field. Field crews should only rely on canister-dedicated pressure gauges if the gauges are calibrated and working properly. Canister-dedicated gauges tend to be inaccurate due to overuse.

Note that for passivated stainless steel canisters, storage pressure and humidity in a canister are also important factors that determine analyte recovery. Additionally, mercaptans, dimethyl acetal and bis-[chloromomethyl] ether at low concentrations are not suitable for collection in passivated canisters pursuant to a study by Brymer and others (1996).

5.1.3 Polymer Gas Sampling Bags or Glass Bulbs

Samples in polymer gas sampling bags or glass bulbs should be analyzed within six hours after collection. Appendix B discusses the merits of collecting samples in polymer gas sampling bags.

Surrogates do not need to be added to polymer gas sampling bags because surrogate recovery levels cannot be precisely calculated since the volume of soil gas collected in a polymer gas sampling bag cannot be measured precisely. Thus, adding surrogates to polymer gas sampling bags is unnecessary.

Samples collected in glass bulbs should have surrogates added within 15 minutes of collection and the samples analyzed within six hours after collection.

5.1.4 Sorbent Tubes

Sorbent tubes are used with USEPA (1999) Compendium Method TO-17 (Method TO-17). Method TO-17 describes:

1) Sorbent tube sampling procedures;
2) Sorbent tube selection;
3) Tube conditioning;
4) Sampling apparatus;
5) Sampling rates;
6) Sample collection preparation;
7) Flow rates; and
8) Other sampling procedures.

Method TO-17 is used for VOCs and SVOCs including naphthalene (See Appendix E for additional details on collecting and analyzing for naphthalene in soil gas).

5.1.5 Alternate Sample Containers

Non-traditional sample containers are available for collecting soil gas samples. Mini-passivated stainless steel canisters (~400 milliliters), may be useful in many field applications. Evacuated glass bottles may also be used but their holding time should be limited to 48-hours. The use of non-traditional size or types of containers should be discussed in the workplan.

5.2 FIELD CONDITIONS

Adjustments or modifications to the sampling program may be required by the regulating agency to accommodate changes mandated by evaluation of the data set or unforeseen site conditions. Field conditions, such as rainfall, irrigation, low permeability lithology or drilling conditions may affect the ability to collect soil gas samples.

5.2.1 Rainfall and Barometric Pressure (See Appendix G)

Rainfall decreases the air-filled porosity of the shallow soil, thereby limiting diffusional transport of volatile contaminants. Also, soil gas contaminants may partition into the clean infiltrating rainwater, both of which may potentially bias soil gas sampling results. Hence, soil gas sampling should not occur during a significant rain event and should only occur after five days without a significant rain event. A significant rain event is defined as 1/2 inch or greater of rainfall during a 24-hour period. The waiting period is based upon soil drainage curves. Appendix G provides additional information. Irrigation or watering of soil should stop at least five days prior to the soil gas sampling event. Likewise, areas subject to soil gas sampling should be free of standing or ponded water for at least five days prior to sampling. Do not perform soil gas sampling in swales or depressions where water might have accumulated. However, soil gas sampling after rainfall can proceed where infiltration has not occurred, such as under buildings or beneath high-integrity pavement.

Barometric pressure fluctuations associated with the passage of frontal systems can introduce atmospheric air into the shallow vadose zone. Therefore, soil gas sampling should be delayed until frontal systems have passed the area.

5.2.2 Wet Conditions

Moisture may have the effect of biasing the soil gas samples. If moisture is observed in the sample tubing or container, the vapor well should be abandoned and a new well installed. Moisture entrainment can be avoided by sampling a sufficient distance from the water table or by avoiding highly saturated soil. Also, experiences with soil gas sampling indicate that larger diameter tubing is less susceptible to plugging by moisture and fine-grained materials. All protocols for soil gas sampling in this Advisory apply to larger tubing.

The degree of potential sample bias is a function of subsurface equilibrium. When soil moisture and soil gas are in equilibrium, the VOCs in the pore water entrained in the sampling system may be released into the air stream during the agitation of the water, biasing the sampling results high. Conversely, when soil moisture and soil gas are not in equilibrium, soil gas contamination may partition into newly introduced pore water, biasing the sampling results low. Hence, vapor samples could be biased either low or high depending on the subsurface equilibrium. In either scenario, moisture should be avoided to alleviate potential bias. Areas of high soil moisture or areas where irrigation is present, should be allowed to drain, if possible, prior to soil gas sampling.

If no flow or low flow conditions are encountered where water is drawn into the sampling system due to wet soils caused by rain or irrigation, cease soil gas sampling and wait five days for the soils to drain.

5.2.3 Soil Gas Sampling in Low-Permeability Soil

Soil gas sampling in silt and clay-rich soils is feasible by following the sampling protocols described in Appendix D. Low flow or no flow conditions correspond to conditions where the minimum flow rate of 100 mL/min cannot be sustained at the maximum applied vacuum of 100 inches of water. High quality data can be produced by implementing the following field practices:

- Good annular seals;
- Careful monitoring of flow rate and vacuum during purging; and
- Use of tracer gas for leak-testing.

If the soil gas permeability is too low to allow sustainable purging at appreciable flow rates without applying excessive vacuum, follow the protocols described in Appendix D by using an alternative sample collection method or re-drilling and constructing a soil gas well in a non-traditional manner.

If low flow or no flow conditions are encountered, a new soil gas well in a coarser lithology at a different depth or lateral location may be installed. The following should be considered if low-flow conditions persist:

1) Evaluate site lithologic logs and adjust sample depth and location;
2) Collect new continuous soil core samples;
3) Use alternate low-flow sampling methods (see Appendix D);
4) Use passive soil gas methods (see Appendix A); and
5) Collect soil matrix VOC samples using USEPA Method 5035/8260 (DTSC, 2004).

If moisture or unknown material is observed in the sample container, cease soil gas sampling until the cause of the problem is determined and corrected. Moisture detected in either the sampling train or the sample container may indicate saturated conditions in the subsurface. Vapor phase compounds may partition into the dissolved phase, affecting the recovery of target analytes and causing analytical results to be biased low.

5.2.4 Drilling Refusal

If refusal occurs during drilling, soil gas samples should be collected as follows:

1) Install a replacement borehole at least five feet laterally from the original boring location. If refusal still occurs after three tries, collect a soil gas sample at the depth of refusal or use an alternate drilling method; and

2) If refusal occurs at depths less than five feet, collect the soil gas sample following the precautions in Appendix D. Sealing off the probe to ambient air is critical to obtaining high quality data.

5.3 SAMPLE CONTAINER HANDLING

Sample handling procedures cited in the analytical methods should be followed. However, since most methods are not designed for soil gas, additional safeguards should be implemented to maintain the integrity of the samples. If samples need to be shipped to a stationary laboratory, then follow the container-specific handling procedures below.

5.3.1 Syringes and Glass Bulbs

Samples in syringes and glass bulbs should be analyzed as soon as possible after collection in a mobile laboratory and should never be transported. Samples in syringes and glass bulbs should be kept in a cool dark location at all times, protected from exposure to light, until the samples are analyzed. A cooler without ice works well for syringe and glass bulb sample storage.

Do not subject syringe and glass bulb samples to extreme temperatures. Heat can cause compound degradation and leakage from the syringe or glass bulb. Cold can cause moisture condensation, which can affect the recovery of target analytes. If condensation is observed, the sample should be discarded and a new sample should be collected.

5.3.2 Sorbent Tubes

Samples collected in sorbent tubes may be shipped for analysis at a stationary laboratory. Samples tubes should be capped with Swagelok®-type caps and combined Teflon (PTFE) ferrules, rewrapped in aluminum foil, and placed in the storage container immediately after sampling.

Sorbent tubes should be stored at 4°C or less and analyzed within 30 days after collection. For compounds likely to undergo chemical degradation, such as bis-chloromethyl ether and sulfur or nitrogen-containing volatiles, analysis should be done within one week (USEPA, 1999; Compendium Method TO-17, Section 10.10).

Samples collected on tubes containing multiple sorbent beds should be analyzed as soon as possible after collection unless it can be verified that storage will not affect analyte recovery (USEPA, 1999; Compendium Method TO-17, Section 10.10).

5.3.3 Polymer Gas Sampling Bags

These procedures should be followed when transporting samples in polymer gas sampling bags:

1) Do not expose soil gas samples in polymer gas sampling bags to light or extreme temperatures. Photodegradation of target analytes is possible with light exposure. Heat can cause expansion of the bag and possibly result in leakage. Cold can cause moisture condensation in the bags;

2) Do not ship polymer gas sampling bags by air because changes in ambient pressure can adversely affect the integrity of the bags. Increases in pressure may collapse the bag and decreases in pressure may expand the bag. These changes in pressures, coupled with possible flaws in the bag, may cause sample loss; and

3) Do not ship polymer gas sampling bags by vehicle where changes in elevation, such as over mountain passes, will result in ambient pressure changes.

5.3.4 Passivated Stainless Steel Canisters

Samples collected in passivated stainless steel canisters may be shipped for analysis at a stationary laboratory. Passivated stainless steel canisters have minimal problems associated with their handling. Therefore, no additional precautions or safeguards are needed.

5.4 SAMPLE CONTAINER CLEANLINESS AND DECONTAMINATION

New containers should be shown to be free of contaminants by providing data from either the supplier or the analytical laboratory. After each use, reusable sample containers should be decontaminated as follows:

- Glass syringes and bulbs may be decontaminated by disassembling and heating them. Some components of the syringes and glass bulbs, such as the syringe barrel and bulb stopcock, cannot be heated and should be decontaminated by other methods such as rinsing with methanol and/or expunging with nitrogen or clean air. If a syringe is reused, it should be blank tested;

- Passivated stainless steel canisters should be decontaminated as specified in USEPA Method TO-15, either batch or individually certified, according to project DQOs;

- Polymer gas sampling bags should not be reused; and

- Equipment blanks should be analyzed to verify and evaluate the effectiveness of decontamination procedures for recycled or reused containers, except for certified containers. At a minimum, one equipment blank should be run per 20 sample containers cleaned, or at least one per day.

5.5 CHAIN OF CUSTODY RECORDS

The chain of custody documents the identity and integrity of the sample from the time of collection through receipt at the laboratory.

A chain of custody form should be completed in the field and include any relevant problems encountered during sample collection. The starting and ending pressures for passivated stainless steel canisters should be recorded on the chain of custody form. USEPA provides a complete description of chain of custody protocols and records management (USEPA, 1998, 2000b). To avoid loss or damage, the chain of custody forms should be placed into a sealable bag and attached to the inside of the shipping container.

6.0 ANALYSIS OF SOIL GAS SAMPLES

The sections below summarize analytical methods, QA/QC, holding times, reporting and laboratory certification. Additional details are provided in Appendices F and H.

6.1 TARGET COMPOUNDS

Target compounds are chemicals believed to be present, used, or released at the site. Common target compounds are listed below. Compounds may be added or excluded from the list below based on site history and DQOs. A vapor intrusion-specific list can be found in DTSC's Vapor Intrusion Guidance (DTSC, 2011).

6.1.1 Common Organic Compounds

Halogenated

1) Bromochloromethane
2) Bromodichloromethane

3) Bromomethane
4) Carbon tetrachloride
5) Chloroethane
6) Chloroform
7) 1,1-Dichloroethane
8) 1,2-Dichloroethane
9) 1,1-Dichloroethylene
10) cis-1,2-Dichloroethylene
11) trans-1,2-Dichloroethylene
12) Dichlorodifluoromethane (Freon 12)
13) Dichloromethane(Methylene chloride)
14) Tetrachloroethylene
15) 1,1,1,2-Tetrachloroethane
16) 1,1,2,2-Tetrachloroethane
17) 1,1,1-Trichloroethane
18) 1,1,2-Trichloroethane
19) Trichloroethylene (TCE)
20) Trichlorofluoromethane (Freon 11)
21) 1,1,2-Trichloro-1,2,2-trifluoroethane (Freon 113)
22) Vinyl chloride

Aromatics and Oxygenates

23) Benzene
24) n-Butylbenzene
25) sec-Butylbenzene
26) tert-Butylbenzene
27) 1,4-Dichlorobenzene
28) Di-isopropyl ether (DIPE)
29) Ethylbenzene
30) Ethyl tertiary butyl ether
31) Isopropylbenzene
32) p-Isopropyltoluene
33) Methyl tertiary butyl ether (MTBE)
34) Naphthalene
35) n-Propylbenzene
36) Tertiary amyl methyl ether
37) Tertiary butyl alcohol
38) Toluene
39) 1,2,4-Trichlorobenzene
40) 1,2,4-Trimethylbenzene
41) 1,3,5-Trimethylbenzene
42) Xylenes

Others

43) Total petroleum hydrocarbon
44) Acetone

45) Carbon disulfide
46) 2-Hexanone
47) Styrene
48) Methyl ethyl ketone
49) Methyl isobutyl ketone
50) Ethylene dibromide
51) 1,4-Dioxane

6.2 REPORTING LIMITS FOR TARGET COMPOUNDS

Reporting limits (RLs) should be based on the DQOs of the investigation. Corresponding analytical methods should be selected to achieve RLs that are below regulatory or risk-based screening levels. The RLs for the leak check compound should be reported at the RL of the target analytes.

When RLs are elevated due to sample dilution, the laboratory should provide a written explanation of why the project-specific RLs were not achieved. In some instances, sample dilution is necessary because of high concentrations of non-target compounds (background). It may be necessary to collect new samples for reanalysis to achieve appropriate RLs pursuant to the project's DQOs. A higher RL as a result of sample dilution is acceptable for the compound(s) whose concentration in an undiluted sample exceeds the upper level of an initial calibration range. Non-detected results for all target compounds shall be reported at the lowest dilution(s) concentration or no dilution concentration.

6.3 QUALITY ASSURANCE/QUALITY CONTROL

This section primarily focuses on field laboratory QA/QC and not stationary laboratory QA/QC. For a detailed discussion on stationary laboratory QA/QC, refer to Appendix F.

Laboratories should comply with the project QAPP, USEPA Methods, and the criteria in this Advisory. The analytical data should be consistent with the DQOs established for the project.

The regulating agency may inspect the field and/or stationary laboratory QA/QC procedures. Copies of the QA/QC plan and laboratory calibration data should be presented upon request.

All calibration and QA/QC standards, traceable to a source, should be documented by the laboratory. Continuing calibration and QC standards should be from a second source or a different lot from the same supplier. Vapor phase standards should be used to calibrate laboratory instruments.

The following items should be included when using USEPA Methods:

- Initial calibration;
- Daily calibration/continuing calibration;
- Laboratory control spike;
- Internal standards;

- Surrogates;
- Method blank; and
- Field blank.

All surrogate recovery data should comply with laboratory-derived control limits. Control limits should be included in the laboratory reports for reference.

Surrogate recovery limits should be approximately 70 percent to 130 percent (30 percent deviation). The laboratory-derived recovery limits may be wider or narrower than the 30 percent figure depending on sample introduction technique and compound used. If a compound-specific recovery limit is not selected, an explanation should be provided to justify the recovery limit used. See Appendix F for surrogate introduction techniques.

6.3.1 Sample Blanks

- Method Blanks: Method blanks should be used to verify the effectiveness of decontamination procedures in the laboratory, and to detect any possible interference from ambient air;

- Trip Blanks for Off-site Shipments: Trip blanks should be included in the shipping containers when collecting USEPA TO-17 samples;

- Material Blanks: Prior to soil gas sampling, an assembled soil gas probe, tip and tubing should be blank tested at a frequency of one analysis per new batch of tubing or material used; and

- Equipment Blanks: Equipment blanks should be collected from decontaminated equipment before reuse at a frequency specified in the workplan. One equipment blank should be collected and analyzed for each batch of 20 samples, or at least one per day, whichever is more often.

6.3.2 Field Duplicate/Replicate Samples

Duplicate samples are collected simultaneously, whereas replicate samples are collected sequentially. At least one duplicate/replicate sample should be collected and analyzed per 20 samples or per batch, whichever is more often.

Duplicate/replicate samples should be collected from contaminated areas at a frequency based on the project DQOs. The workplan should state the duplicate/replicate collection frequency.

Duplicate/replicate samples should be collected in separate sample containers at the same location and depth. Replicate samples can be collected immediately after the original sample, or a duplicate sample can be collected simultaneously by use of a T-splitter at the point of collection to divide the sample stream into two separate sample containers.

The field replicate mentioned in this section should not be confused with the laboratory replicate (see Table 2 in Section 6.5, and the QA/QC Section of Appendix F).

When comparing the results from field duplicate/replicate samples, a wider allowance should be given for the differences (e.g., 50 percent Relative Percent Difference [RPD]) because of the inherent variability associated with soil gas samples. The specific guideline for the RPD should be based on DQOs and be specified in the QAPP.

6.3.3 Laboratory Control Samples

Laboratory Control Samples (LCS) are optional as described in Appendix F.

6.3.4 Split Samples

The regulating agency may request split samples be collected and analyzed by a separate laboratory.

6.3.5 Holding Times

Holding times for soil gas samples should be specified in the workplan. All soil gas samples should be analyzed pursuant to container-specific holding times, as follows:

TABLE 1
Soil Gas Sample Holding Time

Container	Holding Time	Comments
Glass syringes	30 minutes	
Polymer gas sampling bags	6 hours	
Glass bulbs	24 hours	Must have surrogate added within 15 minutes of collection
Passivated stainless steel canisters	30 days	
Sorbent Tubes	30 days	Sulfur and nitrogen compounds and bis-chloromethyl ether should be analyzed with one week.
Hydrogen sulfide	See Section 7.1	

6.4 ANALYTICAL METHODS

There are no approved USEPA methods specifically designed to analyze soil gas samples. Consequently, modified versions of existing USEPA methods were adopted.

Numerous modifications of USEPA methods are being used for soil gas analysis. Each modification has advantages and disadvantages. Soil gas analysis should be performed in accordance with the protocols noted in the respective USEPA method(s) concurrently with the specific recommended practices for soil gas samples outlined in Table 2.

Methods/Parameters not included in Table 2 should be followed as stated in the original USEPA method.

For a more detailed discussion on the various types of modifications and other applications, consult Appendix F.

TABLE 2
Preferred Analytical Methods and Modifications*

Method/ Parameter	GC/MS Methods			GC Methods	COMMENTS
	Modified USEPA 8260	Modified USEPA TO-15	Modified USEPA TO-17	Modified USEPA 8015 and Modified USEPA 8021	
Applicability/Analytes	Most VOCs: confirmation sampling for naphthalene should be performed by USEPA TO-17.	Most VOCs: confirmation sampling for naphthalene should be performed by USEPA TO-17.	Most VOCs: approximate concentrations should be known prior to sampling.	Limited number of VOCs: gasoline/TPH most VOCs: confirmation sampling for naphthalene should be performed by USEPA TO-17.	See Appendix F of this guidance for discussion.
Sample Introduction Technique	Modified Purge-and-trap (USEPA 5030).	Samples collected in passivated canisters: VOCs are concentrated on sorbent trap.	Samples pulled through sorbent pack, thermally desorbed into GC.	Modified purge-and-trap (USEPA 5030).	See Appendix F of this guidance for discussion.
Sample Size	Purge-and-trap: 5 to 250 mL (cc) (See Appendix F for discussion).	To be determined by sample delivery technique and sample concentration; typically 1 to 6 liters.	To be determined by a combination of factors: sorbent selected, tube length, humidity, temperature; 50 to 250 ml of sample suggested.	Purge-and-trap: 5 to 250 mL (cc) (See Appendix F for discussion).	See Appendix F of this guidance for discussion. Dilution may be needed if high concentration is suspected.
Method Validation [(1)]	As per Section 8.4 of USEPA 8000B.	As per Section 8.4 of USEPA 8000B.	As per Section 8.4 of USEPA 8000B.	As per Section 8.4 of USEPA 8000B.	
Initial Calibration	Minimum of 5 levels, lowest at reporting level. Use method acceptance criteria.	Minimum of 5 levels, lowest at reporting level. Use method acceptance criteria.	Minimum of 5 levels, lowest at reporting level. Use method acceptance criteria. Preloaded certified standard tubes may be used for calibration.	Minimum of 5 levels, lowest at reporting level. Use method acceptance criteria.	Vapor-phase standards are preferred. Liquid standards may be used for USEPA Methods 8260, 8015, 8021 and TO-17 provided calibration curve is validated. See Appendix F of this guidance.
Continuing Calibration	Mid-level calibration standard run every 12 hours. Use method acceptance criteria.	Mid-level calibration standard run every 24 hours. Use method acceptance criteria.	Mid-level calibration standard every 10 sample batch (Section 12 of USEPA TO-17).	Mid-level calibration standard run every 12 hours. Use method acceptance criteria.	
Calibration Validation	At minimum, vapor-phase validation check standard [(2)] analyzed and evaluated for each new calibration curve (% difference ≤ 20%).	Not Applicable.	No vapor-phase standard validation needed for liquid standards.	At minimum, vapor-phase validation check standard [(2)] analyzed and evaluated for each new calibration curve (% difference ≤ 20%).	Validation not needed if calibration curve is prepared with vapor-phase standards.

TABLE 2 (continued)
Preferred Analytical Methods and Modifications*

Method/ Parameter	GC/MS Methods			GC Methods	COMMENTS
	Modified USEPA 8260	Modified USEPA TO-15	Modified USEPA TO-17	Modified USEPA 8015 and Modified USEPA 8021	
End of Run Calibration Check	Optional.	Optional.	Optional.	Mid-level calibration standard run for each 20 sample batch or at end of run, whichever is more often.	See Appendix F of this guidance for discussion.
Surrogates	Surrogates needed for glass bulbs but not for syringes or polymer sampling bags.	Optional.	Optional.	**8015:** To be determined by lab. (3) **8021:** Surrogates needed for glass bulbs but not for syringes or polymer sampling bags.	Recovery acceptance limits to be determined by lab. Default=70-130%.
Internal Standards	As per Section 5.10 of USEPA 8260.	As per Section 9.2.2.3 of USEPA TO-15.	As per Sections 6.12.2 and 9.4 of USEPA TO-17.	**8015:** To be determined by lab. (3) **8021:** As per Section 5.9 of USEPA 8021.	
Accuracy/Precision Matrix Spike/Matrix Spike Duplicate	See Appendix F of this guidance.	Optional.	Optional.	See Appendix F of this guidance.	See Appendix F of this guidance for discussion. Recovery acceptance limits to be determined by lab. Default=70-130% and %RPD=25%.
Duplicates	One per 20 samples or batch, whichever is more often.	One per 20 samples or batch, whichever is more often.	One per 20 samples or batch, whichever is more often.	One per 20 samples or batch, whichever is more often.	See Appendix F of this guidance for discussion. %RPD=25%.
Replicates	One per 20 samples or batch, whichever is more often.	One per 20 samples or batch, whichever is more often.	One per 20 samples or batch, whichever is more often.	One per 20 samples or batch, whichever is more often.	See Appendix F of this guidance for discussion. %RPD=25%.
Laboratory Control Samples (LCS)	Optional.	Not Required.	Not Required.	Optional.	See Appendix F of this guidance for discussion.
Method Detection Limit/Reporting Limit	See Appendix F of this guidance.	See Appendix F of this guidance.	See Appendix F of this guidance.	See Appendix F of this guidance.	See Appendix F of this guidance.
Reporting Limit Verification	One per batch of samples. (4)	One per batch of samples. (4)	One per batch of samples. (4)	One per batch of samples. (4)	See Appendix F of this guidance for discussion.
Method Blanks	Method blank using humidified lab grade ultra-pure air as sample and per Section 8.4.1 of USEPA 8260.	Analyze at least once in a 24-hour analytical sequence.	At least two are required per monitoring exercise.	**8015:** Method blank using humidified lab grade ultra-pure air as sample and per Section 9.5 of USEPA 8015C. **8021:** Per Section 8.4 of USEPA 8021.	

TABLE 2 (continued)
Preferred Analytical Methods and Modifications*

Method/ Parameter	GC/MS Methods			GC Methods	COMMENTS
	Modified USEPA 8260	Modified USEPA TO-15	Modified USEPA TO-17	Modified USEPA 8015 and Modified USEPA 8021	
Container Blank	One sample container per 20 samples or per batch, whichever is more often.	One sample container per 20 samples or per batch, whichever is more often.	One sorbent tube blank per 20 samples or per batch, whichever is more often.	One sample container per 20 samples or per batch, whichever is more often.	Monitor other components (i.e., fittings/ valves) of sampling system if needed.
Holding Time	Analyze syringes within 30 minutes of collection; analyze glass bulbs within 24 hours following surrogate addition; analyze passivated stainless steel canisters within 30 days; analyze polymer gas sampling bags within 6 hours.	Analyze passivated stainless canisters within 30 days; sulfur and nitrogen compounds and bis-chloromethyl ether should be analyzed within one week.	Up to 30 days refrigerated. Exceptions as noted in Section 10.10 of USEPA TO-17.	Analyze syringes within 30 minutes of collection; analyze glass bulbs within 24 hours following surrogate addition; analyze passivated stainless steel canisters within 30 days; analyze polymer gas sampling bags within 6 hours.	
Other Requirements	Tuning: 50 ng Bromofluorobenzene (BFB) initially and every 12 hours. Meet acceptance criteria as per Table 4 of USEPA 8260.	1. Tuning: 50 ng BFB initially and every 24 hours. Meet acceptance criteria as per Table 3 of USEPA TO-15. 2. Must meet equipment specifications in Section 7.2 of USEPA TO-15 or report results as modified TO-15.	1. Analytical protocol as per USEPA TO-15. 2. Condition freshly packed (new) sorbent tubes. 3. Collect and analyze "Distributed Volume Pairs" for uncharacterized sites as per Section 10.7 of USEPA TO-17. 4. Determine/ validate "Safe Sampling Volume" (SSV) if needed as per Sections 10.8 and 13.1.2 of USEPA TO-17; analyze as per USEPA TO-15 and Section 11.2 of USEPA TO-17. 5. Analytical precision test as per Section 11.3.2.2 of USEPA TO-17. 6. Performance criteria as per Section 14 of USEPA TO-17.	Use only for routine monitoring at well-characterized sites. Other than TPH, identification of new compounds must be confirmed either by second column or different detector, and then 10% of those samples must be confirmed with a GC/MS method.	

* Adapted from "Guide to Environmental Analytical Methods" 5th edition, Edited by Roy-Keith Smith, Ph.D., Genium Publishing Corp., 2003.
(1) Initial, one-time demonstration of ability to generate acceptable accuracy and precision. Procedure may need to be repeated if changes in instrument, methodology or personnel occur. USEPA Method 8000B (Determinative Chromatographic Separations), Revision 2, December 1996 (SW-846 Manual).
(2) Mid-level NIST (National Institute of Standard and Technology) traceable (where available or equivalent) vapor-phase standard.
(3) No internal standards and surrogates were suggested by the method. The compounds are to be selected by the laboratory analyst and they must be similar in analytical behavior to the compounds of interest. The analyst needs to demonstrate the internal standards are not affected by method or matrix interferences.
(4) There is no limit on the number of samples per batch for Reporting Limit Verification. If the RL is set at the lowest calibration point, then this verification is not needed.

6.5 SOIL GAS SAMPLE ANALYSIS AND LABORATORY REPORTING

6.5.1 Analytical Methods

At sites that are not fully characterized, soil gas samples should be analyzed using only USEPA modified analytical methods 8260B, TO-15, TO-17, or equivalent. At well-characterized sites, alternative methods may be used for monitoring contamination where VOCs are known to be present and confirmed based on previous gas chromatograph/ mass spectrometer (GC/MS) analyses. Non-specific portable organic vapor analyzers and/or GC-based hand-held detectors can provide useful information for selecting samples for laboratory analysis and verifying the integrity of collected samples. However, these instruments are not acceptable substitutes for compound-specific analysis due to a lack of QA/QC protocols. The various available VOC analytical methods are discussed in detail in Appendix F. Additional discussion is provided in Appendix E specific to soil gas containing naphthalene.

If new VOC(s) are detected by a non-GC/MS method during routine monitoring, then at least 10 percent of the samples for each newly identified VOC should be confirmed by a GC/MS method. Thereafter, routine monitoring can resume with the non-GC/MS method, including the newly identified analyte(s).

6.5.2 Contaminant Reporting

Laboratory reports should contain the analytical results for all identified quantifiable contaminants, along with all tentatively identified compounds (TICs) with an estimated concentration. The site's QAPP should specify that TICs will be identified and reported.

6.5.3 Leak Check Compounds

Liquid and gaseous leak check compounds should be included in the laboratory analyte list. The laboratory reports should quantify and annotate all detections of the leak check compound the target analyte reporting limits. For additional information on leak check compounds, refer to Section 4.2.

6.5.4 Auto Samplers

Using an autosampler with modified USEPA Method 8260B/C for soil gas analysis is not reliable. Sample loss may occur from the vials during the sample transfer and sample run. In addition, the vials may sit in the autosampler for an extended period of time which may compromise the sample through leakage at the vial seal (See Appendix F, GC/MS Methods Section for additional information).

7.0 METHANE AND HYDROGEN SULFIDE SAMPLING PROGRAMS

7.1 METHANE

There are several analytical methods appropriate for methane, including:

- USEPA Methods 8015B modified;
- TO-3, 3C;
- ASTM Method D1945; or
- ASTM Method D1946.

Methane may also be measured with a hand held gas emissions monitor or analyzer. The RLs for methane analysis should be determined by project-specific DQOs.

7.1.1 Methane Field Collection

The following procedures should be followed when collecting samples for methane analysis:

- Methane should be collected in gas-tight sample containers such as passivated stainless steel canisters or polymer gas sampling bags.

- Fixed and biogenic gases such as oxygen, carbon dioxide, methane and ethylene should be analyzed to determine whether methanogenesis is occurring. The RL for oxygen and carbon dioxide should be one percent or less.

- Prior to sampling, tubing or probe pressure should be recorded in the field logs and reported along with the methane concentration to determine if the area is pressurized.

7.1.2 Methane Laboratory Analysis

GC calibration curves for methane should be recorded and reported. Hand-held instruments should be calibrated in accordance with the manufacturer's specifications. At least 10 percent of all positive detections with concentrations more than 5,000 parts per million by volume (ppmv) should be confirmed by another hand-held instrument (either different unit or a different brand) or by a GC method when a hand-held instrument is used.

7.2 HYDROGEN SULFIDE

Hydrogen sulfide may be analyzed using:

- South Coast Air Quality Management District Method 307-91;
- ASTM D5504;
- USEPA Method 16;
- Draeger™ tubes; or
- Other equivalent methods.

Hand held multi-gas monitors equipped with a hydrogen sulfide sensor may also be used. The RL should be equal to or less than 0.5 ppmv, be at least one microgram per liter or sensitive enough to allow for a modeled ambient air concentration at the soil surface.

7.2.1 Sample Containers

The following sample containers are recommended for hydrogen sulfide:

- Black polymer gas sampling bags fitted with polypropylene valves or equivalent. Clear polymer gas sampling bags can be used, stored and/or transported provided they are protected from light;
- 100 mL gas-tight glass syringe or gas-tight glass bulb fitted with an inert valve and wrapped in aluminum foil; and
- Passivated stainless steel canister. Note that recovery of hydrogen sulfide in passivated stainless steel canisters will deteriorate naturally with time with repeated hydrogen sulfide sampling.

7.2.2 Hydrogen Sulfide Field Collection

Hydrogen sulfide samples should be analyzed by a hand-held instrument within 30 minutes of collection to minimize sample degradation from reaction with the container surfaces. If a hand-held instrument is not used, hydrogen sulfide samples should be analyzed as follows:

1) Within 30 minutes of collection using GC procedures;

2) Within 24 hours of collection if duplicate samples are collected and analyzed; or

3) Within 6 hours of collection in polymer gas sampling bag using ASTM D5504 with no surrogate addition needed.

7.2.3 Precautions Particular to Hydrogen Sulfide

1) Contact with oxygen and moisture should be avoided because hydrogen sulfide is extremely unstable;

2) Due to the high reactivity of hydrogen sulfide gas, avoid contact of hydrogen sulfide samples with metallic or other active surfaces during sample collection, storage, and analysis;

3) Ensure GC components do not react with the sample. Typically, glass-lined injection ports, thick-film capillary columns and silcosteel® lined tubing are used to avoid loss of hydrogen sulfide during analysis;

4) Exposure of samples to light should be minimized to prevent photodegradation; and

5) USEPA Method 16 should be used with caution because it is a source-testing method which has limitations, including non-linear detector response, high reporting limits and susceptibility to hydrocarbon interference.

8.0 LABORATORY CERTIFICATION

The State Water Resources Control Board, Environmental Laboratory Accreditation Program (ELAP), offers certification for soil gas analysis. Laboratories utilizing USEPA Methods 8015B, 8021B, and 8260B for analyses of soil gas samples should obtain ELAP certifications for these methods. Accreditation under National Environmental Laboratory Accreditation Program (NELAP) for USEPA Methods TO-13A, TO-15 and TO-17 for ambient air testing is acceptable as certification for soil gas testing.

As of the date of this document, the development of a laboratory certification program for soil gas is in progress in California. Once a certification program is available by the State Water Resources Control Board, laboratories should apply to be certified. Further information concerning laboratory certification is provided in Appendix F.

Any laboratory analyzing soil gas samples may be subject to inspection by regulatory agency staff.

APPENDIX A PASSIVE SOIL GAS METHOD

Passive soil gas sampling consists of burying an adsorbent material into the subsurface soil and subsequently retrieving and measuring organic vapors passively amassed onto the absorbent material. Unlike active soil gas sampling, passive soil gas sampling does not force soil gas into the sampling vessel through pumping or vacuum. Instead, as the vapors disperse from a subsurface contaminant source, the sorbent acts as a sink for the VOCs and SVOCs found in soil gas.

Passive soil gas methods provide a quantified contaminant mass value for the absorbent material and a semi-quantitative soil gas result. In contrast to active soil gas samples, which yield concentration data in micrograms per cubic meter ($\mu g/m^3$) or micrograms per liter ($\mu g/L$), passive soil gas samples do not directly yield contaminant concentration data. For this reason, the results from a passive sampler must be corrected by a contaminant-specific sampling rate, also called an uptake rate, to obtain concentration data. As passive sampler technology becomes further developed, quantitatively accurate results for contaminant concentrations in soil gas can be achieved.

Potential uses of the passive soil gas method are as follows:

1) To delineate contaminant plumes, contaminant sources, and hot spots;

2) To identify potential preferential pathways where sewer and utility corridors provide vapor migration pathways into and around buildings. Passive methods can also identify preferential pathways resulting from lithologic variability;

3) To collect soil gas in areas where active soil gas samples are difficult to obtain. These areas include low-permeability lithology, high-moisture soils and shallow groundwater conditions. When the depth to groundwater is within five feet of the surface, the capillary fringe may prevent sample collection by active soil gas methods due to the high soil moisture content; and

4) To evaluate whether a release has occurred. Active soil gas data should be collected following the detection of subsurface contamination by the passive method.

Advantages of the passive soil gas methods are:

1) Provides a time-integrated measurement, which reduces uncertainty due to temporal variations;
2) Detects compounds with low vapor pressures not easily captured by active methods, such as naphthalene (see Appendix E);
3) Maintains subsurface equilibrium during sampling since there is no forced movement of soil gas into the sampling vessel with passive methods; and
4) Simple to design, install, and retrieve.

Passive Sampling Procedures

Analytical procedures, deployment depths, and sampling durations will depend on the manufacturer's recommended procedures. Some samplers currently available can be installed at any depth, and at the same sampling density as the active method. Typically, passive samplers are deployed in hand-drilled boreholes that are three to five feet deep and one-inch in diameter. The sampler is lowered into the borehole with a string and the surface is covered to prevent the introduction of ambient air. Deployment duration is usually 10 to 14 days. The samplers are retrieved by pulling the device from the borehole with its string. Analysis of the absorbent material is conducted by Methods 8260, 8270 or TO-17. Sample preparation prior to analysis can be very simple and may involve cutting the tip off the bottom of the sampler and transferring an exposed sorbent material to a thermal desorption tube.

Replicate samples, if collected, are retained for approximately two weeks after initial analysis. Two trip blanks should be collected and analyzed for passive soil gas sampling. One trip blank should accompany the passive samplers to the field and then be analyzed. The second trip blank should accompany the samples from the field to the laboratory.

APPENDIX B POLYMER GAS SAMPLING BAGS AND TUBING TYPES

Polymer Gas Sampling Bags

Polymer gas sampling bags require similar quality assurance/quality control as other sample containers, specifically container blanks, laboratory control samples and trip blanks. Additional information on quality assurance requirements is presented in Appendix F.

Polymer gas sampling bags should not be reused because contaminants may adhere to the surface of the bag. Also, the bags themselves may off-gas various organic compounds. Manufacture specifications of the bag material should be checked to verify site-specific COCs are compatible.

Relative humidity inside polymer gas sampling bags may affect recovery of polar compounds. Additionally, water may permeate into and out of polymer gas sampling bags during storage.

Advantages are:

- Inexpensive;
- Disposable;
- Easily handled and transported; and
- Recommended for reduced sulfur compounds such as hydrogen sulfide and the fixed gases such as O_2, N_2, CH_4, etc.

Disadvantages are:

- Potential bag material off gassing (toluene and ketones);
- Adsorption of some VOCs;
- Sample loss (mostly via hose valve assembly);
- Limited holding time;
- Vulnerable to puncture;
- Should not be used when moisture content of soil gas is high (condensation);
- Highly polar compounds adhere to the inner surface of the bag; and
- Low molecular weight compounds may permeate the bag.

Tubing Types

Nylaflow®, polyetheretherketone (PEEK), and Teflon® are recommended tubing materials for soil vapor sampling. Low-density polyethylene (L-D PE) should not be used due to decreased performance relative to other tubing types in both off-gassing of VOCs inherent in the tubing structure (contribution to background) and for decreased recovery (reactivity). Reduced recovery of naphthalene has been observed when using Nylaflow® tubing with small sample sizes.

Justification

Nylaflow®, PEEK, Teflon®, and L-D PE were evaluated for contribution to background. Of the four tubing types, L-D PE exhibited the highest frequency of VOCs and hydrocarbons in background samples and the poorest recovery for target analytes. Some off-gassing of toluene, and to a lesser extent, benzene, propylbenzene and methanol, were noted with the Nylaflow® tubing.

The following table summarizes the results of several studies:

TABLE B-1
Tubing Type Study Results

Tubing Type	Study		
	Ouellette (2004)	Hayes and others (2006)	Nicholson and others (2007)
L-D PE	Sorption of hexane and pentane	Sorption of numerous compounds	N/A
Tygon	Sorption of hexane and pentane	N/A	N/A
Nylaflow®	Acceptable	Sorption of naphthalene	Sorption of aromatics
Teflon®	Acceptable	Acceptable	N/A
Vinyl	Sorption of hexane and pentane	N/A	N/A
PEEK	N/A	Acceptable	N/A

APPENDIX C QUANTITATIVE LEAK TESTING USING A TRACER GAS

Background

Soil gas data collection is driven by project-specific data quality objectives (DQOs). Quantitative leak testing may be conducted using a shroud and a gaseous tracer compound. This method of leak detection ensures that soil gas wells are properly constructed and the sample train components do not leak. Gaseous leak check compounds differ from liquid leak check compounds in that liquid leak check compounds can interfere with target analytes. Soil gas samples containing liquid tracers frequently require extensive sample dilution resulting in elevated reporting limits. These elevated reporting limits may not meet project DQOs. Most gaseous tracer compounds do not affect target analyte measurements nor does their detection require sample dilution. Also, gaseous leak tracer compounds allow a quantitative determination of a leak either in the sampling train or from ambient air intrusion down the borehole.

Shroud Design

The shroud should be designed to contain the entire sampling system, including the sampling container, and the soil gas well annulus. Shrouds typically have rigid walls so that an air space can be maintained and controlled over the sampling equipment. The size of the shroud depends on the sampling equipment used but should be designed to minimize the shroud volume and gaseous leak tracer compound used. It is easier to maintain initial gaseous leak tracer compound concentrations within the shroud if the shroud volume is kept small, the number of holes in the shroud is kept minimal, and the shroud has good contact with the ground surface. The sampling train should be constructed of material that does not react with the sample analytes and will not off gas or adsorb volatile compounds. The sampling equipment should be clean and shut-in tested prior to use.

Shrouds should be designed for ease of use during purging and sampling, minimizing disturbance of the shroud. The gaseous leak tracer compound concentration inside the shroud should be monitored frequently for the duration of purging and sampling to verify target concentrations (See Figure C-1). Shroud design should also take into account the need for duplicate or multi-depth sampling.

Tracer compound detectors provide measurements of tracer gas concentrations inside the shroud and in the purge stream. Several types of detectors are available for field use including hand held, diffusion cell type (inside shroud), and flow through detectors for measuring the purge stream. Alternatively, an external lung box/polymer gas sampling bag setup may be used to quantify tracer compound breakthrough prior to sampling. Detection of tracer compounds prior to sampling enables the samplers to correct the source of the leak(s) or relocate well(s) before taking a compromised soil gas sample.

Soil gas probes installed with good seals throughout the borehole annulus and the use of compression fittings provide assurance against ambient air leaks.

Field Use

A detailed illustrated Standard Operating Procedure should be submitted to the regulating agency for review prior to sampling. Field personnel should be familiar with the procedures and practices necessary to successfully collect soil gas samples using this equipment. If the shroud and sampling train will be reused, all components should be cleaned and shut-in tested prior to reuse.

USEPA Method TO-15 requires sample trains be tested by passing both spiked and clean dry air through the sampling trains to validate performance characteristics.

Purging and Sampling

The tracer compound concentration around the sample train and above the well annulus should be maintained at a minimum concentration. The shroud should be infused with the tracer compound at least five minutes prior to purging to allow the tracer compound time to equilibrate (See Figure C-2).

All methods of tracer compound detection should be capable of measuring the tracer compound in air to an accuracy and precision of 0.1 percent. Shroud concentrations should be two orders of magnitude higher than the reporting limit of the laboratory analytical method or the field meter used to analyze the sample. Tracer compound concentrations inside the shroud should be carefully monitored and maintained to correct variations in tracer compound concentration due to wind and uniformity of the ground surface. Additional tracer compound should be added to the shroud incrementally to maintain the desired concentration. Field personnel should record the measured tracer compound concentration in the shroud periodically during the sampling event.

The calculation of a leak is based on the ratio of tracer compound concentration in the shroud to that in the sample, assuming that the tracer compound is continuously infused during sampling. The tracer compound in the shroud should be kept within ± 10% of its target value, and if not achieved then its lowest measured value should be used for calculation purposes. The tracer compound concentration in the shroud should be maintained for the duration of the purging and sampling.

The soil gas probe and sampling train assembly can be field screened for leaks by drawing purge gas through the well and then through the tracer compound detector while the shroud is in position and filled with the initial tracer compound concentration. Detecting a significant leak in the probe or sampling train at the time of purging provides the opportunity for the field crew to correct the leak early in the sampling process, thereby ensuring the samples analyzed by the laboratory meet the project-specific DQOs.

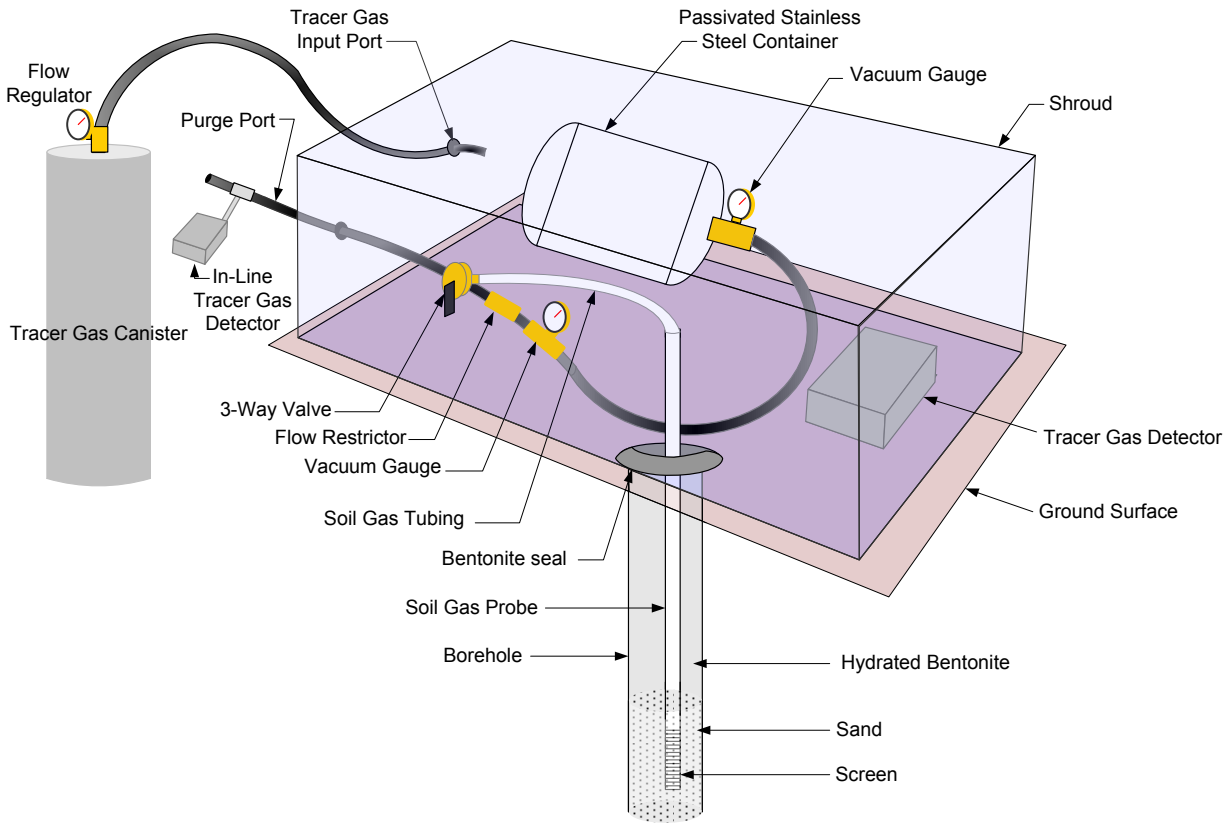
If the concentration of the tracer compound in the purge sample is greater than or equal to five percent of the tracer compound concentration in the shroud, corrective action is

necessary to either remedy the leak or relocate the probe prior to collecting a soil gas sample.

Regardless of the cause of the leak, a data "adjustment factor" based upon the concentration of the leak check compound to compensate for the inability to collect representative samples is inappropriate.

FIGURE C-1

Shroud Components



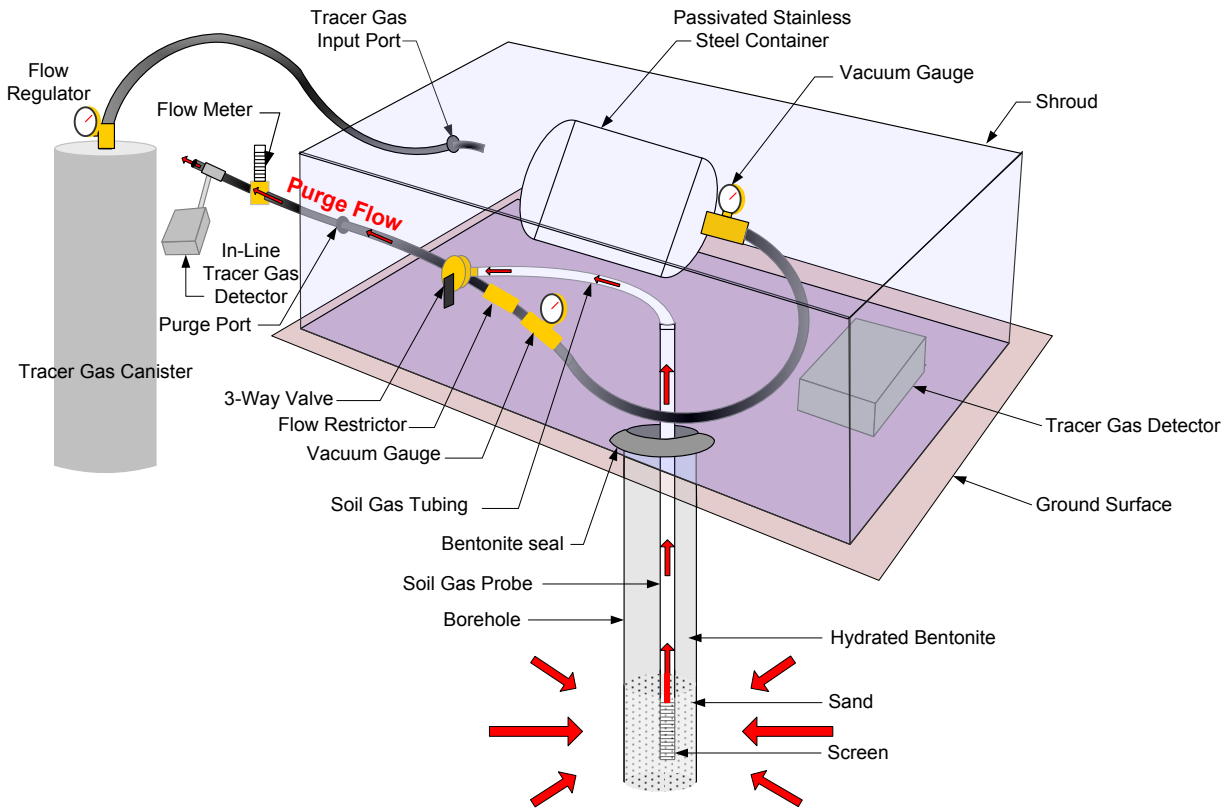


FIGURE C-2

Shroud Components – Purge Conditions

APPENDIX D SOIL GAS SAMPLING IN LOW PERMEABILITY SOIL

Representative soil gas samples can be collected from low permeability soil by utilizing specialized field procedures in addition to the protocols described in the main text of this Advisory. Hence, the procedures described in this Appendix do not replace the recommended procedures in the main text but rather supplement the procedures.

When low flow, high vacuum conditions are encountered during soil gas sample collection, two options are available for field technicians. Sampling can continue at the probe with an alternative sample collection method or the probe can be re-drilled and constructed in a non-traditional manner. Typically, low flow conditions are defined as the inability to maintain an appreciable flow rate (100 mL/min or greater) without applying excessive vacuum (any vacuum greater than about 100 inches of water). In the field, the determination of low flow, high vacuum conditions can be done quantitatively or qualitatively. The probe in question should be subject to applied vacuum for three minutes prior to rendering a decision about flow conditions.

In low permeability soil, it is helpful to initially perform passive soil gas sampling to determine whether active soil gas samples are required at low permeability sites. The passive soil gas samples are used to screen areas for contamination with follow-up active soil gas sampling for risk assessment. Passive soil gas sampling is described in Appendix A.

ALTERNATIVE SAMPLING METHOD

A modified purging and sampling procedure can be used for low flow vapor probes. In a study conducted by McAlary and others (2009), several nested soil gas probes were installed in low-flow conditions, as defined above. About a third of a liter of soil gas was collected from each soil gas probe under an applied vacuum of 100 inches of water before the flow diminished to a negligible amount. Once this vacuum threshold was obtained and it was determined that a flow rate of 100 mL/min was not sustainable, the probe valve was closed to allow the vacuum to dissipate and to allow soil gas to slowly enter the sand pack and tubing from the surrounding soils. When the vacuum dissipated, the probe valve was reopened, and another aliquot of sample was collected. This procedure was repeated until the soil gas probe was adequately purged and sampled. In this manner, probes can be appropriately purged and enough sample volume can be collected for analysis.

If this procedure is used, the rate of vacuum dissipation should be monitored with a dedicated vacuum gauge. The sampling crew may proceed with other nearby activities during the pressure rebound cycle. Additional pressure gauges, fittings, and a flow meter will be needed to implement this procedure in the field. Prior to purging and sampling, the sampling system should be shut-in tested to ensure that vacuum rebound is attributable to subsurface processes and not system leakage. Likewise, leak check compounds should be used during the entire sampling process to confirm the integrity of the sample.

REINSTALLATION METHOD

This approach requires the reinstallation of a vapor probe with a sand pack larger than traditional size. A large sand pack assures the availability of subsurface air for sampling. For this method, the sand pack should have an interstitial void volume of approximately 3 liters, which implies the use of approximately 10 liters of sand for the sand pack. To accommodate this large volume of sand, both the length and the radius of the sand pack must be larger than sand packs typically installed with direct push technology. Approximately ten liters of sand equates to a sand pack length of two feet for a six-inch borehole and a sand pack length of four feet for a four-inch borehole. A study by Neznal and Neznal (2005) indicates that measured radon concentrations in soil gas are not dependent on the subsurface well geometry when the soil is homogeneous and of low permeability.

When using this method, the following should be considered:

- The length of the sand pack should not be longer than the zone of interest;
- The vapor probe tip should be located in the center of the sand pack;
- The top of the sand pack should be at least five feet below surface grade;
- Excessively long sand packs (greater than five feet) should be avoided;
- The diameter of the vapor probe should be small to reduce purge volumes (less than or equal to ¼-inch); and
- The soil gas well should have a high integrity annular seal.

The vapor probe should only be sampled after the sand pack has reached equilibrium with the native material. The establishment of equilibrium can be expected to take approximately two weeks. Purging should be conducted on the probe to remove ambient air entrapped during installation. Probe tubing size should be selected so that the purge volume does not exceed 200 milliliters. Purging 200 milliliters should not induce any significant vacuum in the probe given the void volume in the sand pack. Excessive vacuum during sample collection can be avoided if the sample collection vessel is small. To avoid excessive vacuum, sample size should be no more than one liter. Vacuum within the vapor probe should be measured to ensure that 100 inches of water is not exceeded during the purging and sampling.

AIR PERMEABILITY TESTING

Air permeability is determined by measuring the gas pressure in a vapor probe as a metered flow of air is passed through the probe. These in-situ tests should only be conducted after soil gas sampling due to potential disruption of subsurface conditions by the movement of air. In-situ testing should continue until steady-state conditions occur. The occurrence of steady-state conditions is defined as less than a 130 Pascal pressure change within 30 minutes. The air permeability is calculated using the data obtained during steady-state conditions. The method also requires the measurement of the soil gas air temperature along with ambient air pressure. See DTSC'S Vapor Intrusion Guidance for more information (Appendix J).

APPENDIX E NAPHTHALENE SOIL GAS COLLECTION

Soil gas sampling for naphthalene is more complex than traditional soil gas sampling procedures. Naphthalene analysis by USEPA Method TO-15 presents several challenges, such as contaminant carryover and variability in recovery (Hayes et al., 2005). Likewise, naphthalene readily sorbs onto traditional soil gas sample tubing such as polyethylene and nylaflow (Hayes et al., 2006). USEPA Method TO-15 defines target analytes as having vapor pressures greater than 0.1 millimeter (mm) of mercury (Hg) at standard conditions, and is suitable for organic compounds with carbon content ranging from C3 to C10. However, naphthalene with vapor pressure of 0.087 mm Hg falls just below this threshold and hence is not listed as an analyte for TO-15. USEPA Method TO-17 allows greater flexibility in targeting lower vapor pressure compounds, and hydrophobic sorbents can trap organic compounds ranging from C7 to C20. Nonetheless, naphthalene samples can be analyzed by both USEPA Methods TO-15 and TO-17 provided the appropriate protocols described below are followed. Table E1 is a comparison of the two methods, and can be used to assist practitioners in the selection process in conjunction with the project's data quality objectives (DQOs).

To collect a naphthalene sample, the entire sampling system should be composed of Teflon®, polyetheretherketones (PEEK) or other tubing types with demonstrated inertness (Hayes et al., 2006). Using proper materials in the sampling system will ensure that soil gas samples are representative of subsurface conditions. Soil gas sampling workplans should describe how the field investigation will meet all the recommendations within this appendix as well as those noted in the USEPA TO methods. Both passive and active soil gas samples may need to be collected in order to provide multiple lines of evidence to evaluate vapor intrusion exposure to naphthalene.

Naphthalene Sample Collection by TO-15 (USEPA, 1999a)

Many stationary laboratories are capable of obtaining naphthalene data of acceptable quality using TO-15. If TO-15 is used for naphthalene sampling, then the laboratory conducting the analysis should utilize certain procedures, as follows:

1) **Naphthalene Recovery:** Naphthalene may condense onto the interior surface of sampling canisters. Therefore, storage stability tests with prepared naphthalene vapor standards should be performed for the duration of expected holding times. These storage stability tests should be conducted in the laboratory using certified clean canisters. Acceptable recovery of naphthalene should be demonstrated using a gas standard at a concentration of 32 $\mu g/m^3$ or less prepared in a passivated canister of the same make and approximate age as those used for sampling. The recovery testing information should be provided in the laboratory reports.

2) **Naphthalene Carryover**: Laboratory blanks should be used to check for instrument carryover. The blank should be run after the introduction of the highest naphthalene standard used to generate the instrument's calibration curve. Likewise, blanks should be run after the analysis of soil gas samples with

high naphthalene concentrations. Any instrument carryover of naphthalene from the blank sample should be substantially lower than the reporting limit to assure that the analyses are not compromised. The laboratory blank information should be provided in the laboratory reports.

3) **Canister Cleanliness:** Canisters used for naphthalene analysis should be certified clean before and after use, and the certification sheets provided in the laboratory reports. The canisters can be either batched or individually certified dependent upon the project's DQOs.

4) **Canister Age:** Laboratories should consider utilizing newer canisters for naphthalene sample collection. In older canisters, the passivated interior surface degrades over time, allowing greater surface area for the sorption of naphthalene. The age of the sampling canisters should be provided in the laboratory reports.

5) **Matrix Spikes (MS) and Matrix Spike Duplicates (MSD):** As stated in Table 2 in the Advisory and repeated in Appendix F, MS and MSD are impractical and not required when using TO-15.

If TO-15 is used for naphthalene sampling, TO-17 should be used to confirm TO-15 sampling results at a frequency of five to ten percent of the field samples. The number of confirmatory samples should be a function of the DQOs for the site. Confirmation sampling is especially prudent when using data for risk assessment purposes or when verifying cleanup objectives.

Naphthalene Sample Collection by TO-17

Soil gas samples for analysis by TO-17 are collected in sampling tubes packed with an appropriate sorbent material. USEPA (1999b) contains lists of chemicals amenable to TO-17 analysis along with guidelines for sorbent selection. For naphthalene, the sorbent material is usually Tenax® GR or Tenax® TA, but others may be appropriate. Practitioners should reference Table I in the Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air, Second Edition (USEPA 1999b). The air flow rate through the tubes is monitored during sample collection and a vacuum of less than 100 inches of water should be maintained during sampling. Shut-in tests should be conducted and leak check compounds should be used to evaluate sample integrity.

Items to consider when soil gas sampling pursuant to TO-17 are as follows:

1) Practitioner's Unfamiliarity: Practitioner's unfamiliarity with sampling by TO-17 may lead to field errors, potentially reducing the integrity of the sampling data.

2) Perceived Limitations with Sorbent Tubes: Other concerns and perceived limitations with use of the sorbent tube include lack of repeat analysis for samples collected by TO-17, breakthrough of target analytes during sampling and potential mass spectrometer overload from high concentration samples. To

address these concerns, practitioners should consider pre-screening all soil gas samples subject to TO-17 procedures. By estimating the anticipated concentration range of the sample prior to sorbent tube sampling, practitioners can determine optimal sampling durations to avoid breakthrough and provide notification to the stationary laboratory about possible instrumentation overload. Field equipment capable of measuring in the microgram per cubic meter range may be warranted.

3) Breakthrough Volumes: The sampling air volume is calculated from the anticipated subsurface concentration, sampling tube sorption capacity and sorbent tube temperature. Equations for breakthrough are typically provided by either the sorbent tube manufacturer or the analytical laboratory. Calculations for breakthrough should include an adequate safety factor to ensure that breakthrough does not transpire during sampling. If breakthrough volumes cannot be determined due to unknown conditions, sorbent tubes should be arranged in series and all tubes should be submitted to the laboratory for analysis.

4) Pump Placement: The sorbent tube should be upstream of the sampling pump.

5) Sample Collection Flow Rate: Flow rates for sample collection are typically less than 50 milliliters per minute, and the flow rate should not vary by more than 10 percent during sample collection.

6) Sorbent Tube Orientation: Tube orientation is usually annotated on the tube by the sorbent manufacturer or laboratory. For thermal desorption methods, the sorbent tube must be oriented during sample collection in the direction indicated on the tube. Multiple tubes may be placed in series in the sampling train if analytes other than naphthalene are required or if duplicate samples are necessary.

7) Field Documentation: Data sheets should be completed in the field and submitted to the analytical laboratory. The sheets should contain the sampling flow rates and sampling volumes required to quantify contaminant concentrations. These field data sheets should be included within the characterization report.

8) Leak Check Compounds: Leak test compounds should be used to verify sample integrity when sampling pursuant to TO-17, but it should be noted that most sorbent tubes will not retain many typical leak check compounds. For example, compounds smaller than C7 are not captured by Tenax® GR or Tenax® TA. In these situations, practitioners cannot depend upon the analysis of sampling tube for quantification of the leak check compound. Instead, additional sampling and analytical procedures may be warranted. Leakage can be readily measured and quantified on-site with a field meter, or by a stationary laboratory after the soil gas sample is collected. If a leak test compound with a carbon range of greater than C7 is used, the additional mass absorbed onto the sorbent tube may elevate the reporting limit or even overload the mass

spectrometer upon analysis. Additionally, a shut-in test of the above-ground apparatus downstream from the probe should be performed prior to sampling.

9) Collection Tube Composition: Sorbent tubes composed of metal should be used due to potential photochemical reactions. However, if only glass sampling tubes are available, the tubes should be wrapped entirely in aluminum foil during and after sample collection to avoid photodegradation.

10) Duplicate Samples: Duplicate sorbent tube samples should be collected at a predetermined frequency, usually at a rate of 10 percent of the number of samples.

11) Trip Blanks: Each shipping cooler should contain a trip blank. The trip blank should be a sealed tube filled with the same sorbent used during the field procedures.

Other Analytical Methods for Naphthalene Sample Collection

1) **Method 8260:** Due to the potential for low data quality when collecting and analyzing naphthalene soil gas samples pursuant to Method 8260, sample results should not be used for risk assessment purposes. Similar to the concerns about naphthalene analysis by TO-15, Method 8260 presents issues concerning contaminant carryover, variability in recovery and sorption to sampling equipment, such as plastic and glass syringes, glass bulbs and Tedlar bags.

2) **TO-13A:** Naphthalene analysis by TO-13A is not recommended. While TO-13A procedures are similar to TO-17 in many respects, two fundamental differences exist. First, the sorbent material within the sampling tubes for TO-13A is composed of polyurethane foam, typically PUF® and XAD-2®. Second, the sorbent material is removed by solvent (soxhlet) extraction prior to introduction into the gas chromatography/mass spectrometry instrumentation rather than by thermal desorption as in TO-17. Both PUF® and XAD-2® are known to have marginal collection efficiency for vapor phase naphthalene. Additionally, there is a potential for substantial losses of naphthalene due to its tendency to sublimate and its relatively high vapor pressure during TO-13A soxhlet extraction and evaporative concentration (Fortune et al., 2010).

TABLE E-1
Comparison of Methodologies

Issues	TO-15	TO-17
Application to naphthalene	Naphthalene is not a listed constituent due to its low vapor pressure.	Method specifically designed for constituents with low vapor pressure.
Familiarity with method	Method is commonly used.	Method is not widely used. Some laboratories may not have the necessary analytical equipment.
Sample collection	Canisters are expensive, expensive to clean, and bulky to transport. Only one sampling canister is needed per sample if numerous constituents warrant analysis. Sample remains stored as a gas until analysis.	Sorbent tubes are inexpensive as compare to canisters, and are small and easy to transport. Numerous sampling tubes may be needed if numerous constituents warrant analysis. Samples are no longer in the gas phase once collected, and hence, less likely to interact or react until analysis.
Sample analysis	The GC/MS analysis is the same for both methods. The difference is how the sample is introduced into the GC.	The GC/MS analysis is the same for both methods. The difference is how the sample is introduced into the GC.
Sample recovery	Naphthalene may sorb into the interior surface of the sampling canister, biasing the sampling results.	Naphthalene readily desorbs from the sampling tube material.
Sampling rate	Canister sampling rate is controlled by a regulator which is pre-calibrated and usually provided by the laboratory.	Sampling rate is controlled by a purge pump in the field. Hence, the field crew is responsible for maintaining the flow rate and for determining the sample volume.
Subsurface concentration	Highly concentrated samples can be handled, but canisters need to be cleaned thoroughly afterward.	Constituent breakthrough can occur without realization, compromising the integrity of the sample.
Capacity for multiple runs	Multiple analyses can be performed on the canister air if needed.	Typically, only one analytical run is possible on a sorbent tube. Samples cannot be diluted in most cases.
Detection limits	Typically greater than 10 $\mu g/m^3$ for naphthalene.	Typically less than 10 $\mu g/m^3$ for naphthalene.
Water management	Both methods are effective in removing water. Sorbent trap in the concentrator allows for the passage of some water, and then a dry gas purge is performed prior to thermal desorption in the GS/MS.	Both methods are effective in removing water. Uses a combination of hydrophobic sorbents, and then a dry gas purge is performed prior to thermal desorption in the GS/MS.
QA/QC	Analytical QA/QC is same for both methods.	Analytical QA/QC is same for both methods. Relatively extensive QA/QC on the sorbent tubes before and during sampling.

APPENDIX F SOIL GAS ANALYTICAL METHOD REVIEW

SOIL GAS ANALYSIS METHODS

There are two methods generally used in California for soil gas analysis. One is Gas Chromatography with Mass Spectrometer (GC/MS), which is able to confirm the identity of compounds. The second is GC with a single specific detector such as a Flame Ionization Detector (FID), Electron Capture Detector (ECD), Photoionization Detector (PID) or a series of these detectors. The GC/MS technique is preferred because of its specific compound identification ability.

There are no approved USEPA methods specifically designed to analyze volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) in soil gas samples. Consequently, modified versions of existing USEPA methods are used to analyze soil gas samples.

The modifications made to accommodate soil gas samples include the sample introduction technique and the calibration approach. It is important for consultants, regulators and other stakeholders to evaluate the technique(s) being employed before work begins on a site. All of the modifications have advantages and disadvantages with some working better for certain compounds than others. Project data quality objectives (DQOs) should be the deciding factor on which technique is the best to use for each phase of work on a particular site. If possible, the parties involved should perform preliminary performance tests or trial runs using a selected number of techniques and determine the best method to use on the site.

PERFORMANCE-BASED MEASUREMENT SYSTEM

This appendix summarizes some common methods used to analyze soil vapor samples. Laboratories are not restricted to the methods described in this document. Modifications and other adjustments may be needed to accommodate matrix, background, or other analytical issues. These modified methods can be used provided they have been validated and it can be demonstrated that the modified methods are capable of meeting the project DQOs and established performance criteria. Innovations and creativity are encouraged.

Methods that do not follow the specifics of published written methods (such as USEPA Method TO-15) but have been validated and can be demonstrated to be effective are considered to be “performance-based measurement system” (PBMS) with stipulations.

USEPA published the PBMS in 1997. The intent of PBMS was to allow the regulated community to select any suitable analytical method for regulatory compliance, to improve data quality and to encourage development of better analytical techniques. PBMS conveys what needs to be accomplished, but does not prescriptively describe how to do it. PBMS are defined as a set of processes where the data needs of a program or project are specified, and serve as the criteria for selecting appropriate methods to meet data or project objectives.

Since there are no analytical methods specifically designed to analyze soil gas samples, laboratories may develop and implement PBMS for soil gas samples. PBMS can be used for soil gas samples provided the criteria stated above are met, specifically that:

- The process can be validated;
- It can be demonstrated that the process can meet project DQOs; and
- It can be demonstrated that the process can meet the specified method performance criteria.

Laboratories may independently validate their PBMS. All validation documentation, such as raw data, should be kept on file and available for review by parties that may have vested interests in a particular project.

The regulating agency should review all PBMS in detail before accepting the proposed modification. Data from projects where the proposed PBM will be used should be compared side-by-side with an existing method. The proposed PBMS should be scrutinized to make sure they are not simply short-cut methods disguised as performance-based measurement systems.

Project consultants and contractors should provide the necessary documentation to support the use of any proposed PBMS for a project. Documentation should substantiate that the proposed method is capable of meeting the project DQOs and meet performance criteria.

Laboratory results from a PBM should reference the method used as “Performance-Based” followed by the base method. For example, if the PBM is based on USEPA Method TO-15, then the method should be referenced as “Performance-Based USEPA Method TO-15.” In the report narrative, a short description of the modification and/or adjustment made to the established method should also be included.

HISTORICAL AND LATEST VERSIONS OF ANALYTICAL METHODS

Multiple versions of USEPA methods exist. Analytical methods are revised in order to add more analytes, update instrumentation and clarify requirements and recommendations. Most revisions do not involve substantial changes to the method technique. In general, laboratories should use the latest method revision in their work. However, before using a new revision, laboratories should carefully review and compare their existing method with the new revision to verify that there are no significant changes that can affect data quality and the DQOs of their clients. Likewise, laboratories using older revisions of methods, for historical or consistency reasons, should confirm that the older method version will serve the intended purpose. Laboratories should clearly indicate the exact revision of the method used in their laboratory reports to their clients.

Letter suffixes to a method such as “A”, “B”, etc. are used to identify the revision status of the method. The first version of a method (revision “0” [zero]) does not have a letter suffix.

Occasionally a revision or method may be declared obsolete by the USEPA and should therefore no longer be used by laboratories. For the current status of USEPA methods, refer to the Status Tables for SW-846, Third Edition.

Table F-1 displays the various versions of USEPA methods referenced in this advisory modified for soil gas testing:

TABLE F-1
USEPA Soil Gas Testing Methods

USEPA Method	Description	Revisions (Date)	Comments
8015	Nonhalogenated Organics by Gas Chromatography	0 (September 1986) A (July 1992) B (December 1996) C (February 2007) D (June 2003)	Revision D is the latest revision in spite of the later date for revision C. Revision C was introduced in 2000 as a draft update, but not finalized until 2007.
8021	Aromatic and Halogenated Volatiles by Gas Chromatography Using Photoionization and/or Electrolytic Conductivity Detectors	0 (July 1992) A (September 1994) B (December 1996)	Replaced methods 8010 and 8020.
8260	Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry (GC/MS)	0 (July 1992) A (September 1994) B (December 1996) C (August 2006)	
TO-13A	Polycyclic Aromatic Hydrocarbons (PAHs) in Ambient Air Using Gas Chromatography/Mass Spectrometry (GC/MS)	First Edition (TO-13) (March 1989) Second Edition (January 1999)	"Edition" refers to the Compendium of Methods for the Determination of Toxic Organic Compound in Ambient Air, and not the revision of the method.
TO-15	Volatile Organic Compounds (VOCs) in Air Collected in Specially-Prepared Canisters and Analyzed By Gas Chromatography/Mass Spectrometry (GC/MS)	Second Edition (January 1999)	Method TO-15 was a new method added to the Second Edition of the Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air. TO-15 is based on Method TO-14A.
TO-17	Volatile Organic Compounds (VOCs) in Ambient Air Using Active Sampling Onto Sorbent Tubes	Second Edition (January 1999)	Method TO-17 was a new method added to the Second Edition of the Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air. It is an update of Methods TO-1 and TO-2 from the first compendium (1989).

MODIFIED GC/MS METHODS

USEPA Method 8260

USEPA Method 8260 (Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry (GC/MS)) is designed to determine the concentration of VOCs in a variety of solid and liquid matrices (USEPA, 2000). There are two modifications made to this analytical method for soil gas sampling. In the first modification, a volume of soil gas sample is injected into the sparge vessel (sparger) containing water. Helium gas is then used to purge the VOCs out of the sparger and onto a sorbent trap. VOCs in the sorbent trap are thermally desorbed into the GC column for separation and analysis. This is equivalent to USEPA Method 5030 (Purge-and-Trap for Aqueous Samples). In the second modification, a small volume of the soil gas sample is directly injected into the GC.

Laboratories employing a modification of USEPA Method 8260 to analyze soil gas samples should adhere to all the analytical requirements of the original method including purge time, calibration and Quality Assurance/Quality Control (QA/QC). Modifications for soil gas samples are outlined in the following sections.

a) Sample Introduction

The original USEPA Method 8260 outlines five specific methods for sample introduction, none of which were designed for soil gas. Therefore, modifications of the introduction step are needed for soil gas samples. DTSC contacted several stationary and mobile laboratories that use Method 8260 for soil gas, and determined that soil gas samples are usually introduced by either purge-and-trap or direct injection, as described above. Each sample introduction technique has its own advantages and disadvantages. The advantages and disadvantages are summarized in Table F-2.

TABLE F-2
Advantages and Disadvantages of 8260 Sample Introduction Techniques for Soil Gas

Sample Introduction Technique	Advantages	Disadvantages	Comments
A volume of soil gas sample is injected into a purge-and-trap sparger containing water. Analytes are purged out of sparger into the sorbent trap using helium gas. Analytes in the trap are thermally desorbed into the GC column for separation.	• Larger volumes of soil gas sample may be forced into water to achieve lower reporting limits with limitations. • Surrogates, internal standards and spikes are added into the sparger before sample introduction and purging. • Soil gas volumes can be changed by using a smaller syringe or concentrated soil gas samples can be diluted in glass bulb before injecting into sparger.	• Analytes are forced into a water matrix and purged out into trap before entering into GC column. Loss of target analytes possible. • Depending on the type of sample container/vessel in which the sample is collected, sample may need to be transferred before injection into sparger –potential sample loss in transfer process. • Low recovery of polar/water soluble compounds. • Calibration curve not matrix-matched if liquid standards are used.	• Not recommended for polar/water soluble compounds. • Surrogates (liquid-phased) are used, but introduced separately into sparger. Does not actually provide true QA/QC information on soil gas. • Ideal for higher concentration samples. • Not recommended for low level (low concentration) samples. • Recommended for screening of oxygenates and other compounds with poor purging efficiency. Consult the compound list in the method for purging efficiency characteristics.
Direct injection of soil gas sample into GC column for separation.	• Technique is quick with limited sample handling. • Holding time not an issue, provided samples are injected immediately after collection. • No transfer of analytes from one phase to another (i.e., gas to liquid to gas). • Can handle high level (concentrated) samples.	• Limited sample size; threshold limit on how much sample can be injected into GC column may result in elevated reporting limits • Elevated reporting limits may not meet the DQOs for risk assessment purposes. • Calibration not matrix-matched.	• Recommended for screening purposes (qualitative data) and routine monitoring of limited number of known compounds. • Calibration standards prepared by expansion of liquid standards in vials/bulb may not be amenable to all compounds.

b) Calibration for 8260

Analytical laboratories should use vapor-phase standards to calibrate their instruments when employing USEPA Method 8260B/C for soil gas analysis. Vapor-phase standards used for ambient air testing are readily available and can be used

for soil gas analyses. Many laboratories use liquid-phase standards to prepare the calibration curve, for logistical and economic reasons, rather than using a vapor-phase standard. This is problematic because the vapor pressure, solubility, and other properties of a compound may be different in a liquid-phase standard than in a vapor-phase standard, especially when it is subjected to being forced into an aqueous phase in the sparger and then forced out into a gaseous phase again during the purge. Therefore, the calibration curve should be matrix-matched by using a vapor-phase standard.

Some laboratories are essentially using a headspace technique modification that attempts to matrix-match a liquid-phase calibration standard to soil gas samples. The technique entails injecting the liquid standard into an empty volatile organic analysis (VOA) vial through the septum or into glass bulbs and allowing the standard to vaporize and equilibrate before taking an aliquot of the vapor and injecting it into the gas chromatograph. This technique may not be amenable to all VOCs since it is dependent on the vapor pressures of the target analytes and how well each compound will vaporize in the vial or bulb. The few laboratories that use this technique are analyzing a limited number of analytes. Laboratories using this approach should standardize their temperature range, time for equilibration, and other practices in preparing the calibration standards. Furthermore, laboratories using this technique should validate and verify the accuracy of their vaporized standards by comparing their calibration with vapor-phase standards (see next section).

c) Calibration Validation for 8260

Calibration curves are validated by analyzing a mid-level National Institute of Standard and Technology (NIST) traceable vapor-phase validation check standard on a routine basis. The vapor-phase validation check standard, or equivalent, should be analyzed and evaluated every time a calibration curve is generated. Routinely, a vapor-phase check standard should be analyzed with each analytical batch to verify the validity of the liquid calibration curve. In addition, the vapor-phase validation check standard should include all the target analytes in the calibration curve. Because the purging characteristic of each compound is different, laboratories should establish their own acceptance criteria for each compound for the validation. The acceptance criteria should be based on experimental and/or historical data. This validation procedure is recommended, regardless of the sample introduction technique being used, to provide technically sound and defensible data.

For laboratories that calibrate their analytical system using the headspace technique, validation of the calibration curve should be conducted by injecting an aliquot of a vapor-phase NIST traceable or equivalent standard at a volume equal in concentration to the mid-point of the calibration curve to validate and to verify the accuracy of their standard preparation technique. The volume needs to be calculated based on the volume of the vaporized standard injected and the concentration of the standard. The frequency of the validation, percent differences of validation check and reportable data should be the same as for liquid standards.

If vapor-phase standards are used to prepare the calibration curve with USEPA Method 8260B, the validation referenced above is not necessary. However, analytical laboratories should verify the accuracy of their vapor-phase standards periodically by comparing them to a secondary standard either from another source or to a different lot of standards from the same supplier.

d) Sample Volume for 8260

The sample volume is determined by the sample introduction technique in conjunction with the project reporting limits. If lower reporting limits are desired, then a larger volume of sample should be injected. The volume for the direct injection technique is limited since only a very small volume can be injected onto the GC, whereas a larger volume can be used with the sparger technique. Sample volumes of five to 250 milliliters (mL) are typically used, although some laboratories use up to 500 mL of sample.

Larger volume samples are introduced in aliquots into a sparger filled with water by forcing the water directly through the trap. The contact time with the water is minimal. More water-soluble compounds such as ketones and methyl tertiary butyl ether will preferentially stay in the water phase until purged out.

Laboratories should validate their injection technique by injecting aliquots of vapor-phase standards into the sparger and evaluating the recovery levels. The recommended recovery range is 70 to130 percent for most compounds.

e) Purge Time for 8260

USEPA Method 8260B specifies a purge time of 11 minutes. Laboratories should not deviate from this specification as the method is optimized for the recovery of all target analytes. If modifications are required, they should be documented and validated with vapor-phased standards.

f) Autosamplers for 8260

Using an autosampler with modified USEPA Method 8260B/C is not reliable. The soil gas sample is transferred for analysis from a soil gas collection vessel such as a syringe to another secondary container such as a VOA vial, resulting in sample loss. This technique is not capable of handling variable volumes of soil gas sample, especially larger sample volumes needed to adjust for the desired site-specific compound RLs. Furthermore, gases and the more water-soluble compounds have questionable recoveries.

g) Screening

When using a GC/MS, laboratories should screen samples before analysis with a GC/FID to avoid saturation of the mass spectrometer. This will also provide information on the proper dilution(s) needed for quantification.

h) Applicability of 8260

Modified Method 8260B works well for soil gas samples with VOC concentrations greater than 0.1 μg/L or 100 μg/m^3 and for most compounds.

i) Other Modifications

The project proponent should propose method modifications to the regulatory agencies prior to implementation, leaving an adequate time for regulatory review and comment. Standard operating procedures (SOP) for the modified sample preparation and analysis should be provided. The laboratory using the modification must validate the procedures before implementation and provide the data and report for review. Refer to the Performance-Based Measurement System Section above.

USEPA Method TO-15

Although TO-15 (USEPA, 1999) was designed for collecting and analyzing VOCs in ambient air samples, this method can successfully be used for soil gas analysis. A known volume of sample is collected into a passivated stainless steel canister, then concentrated onto a solid sorbent trap in the laboratory and refocused on a second trap before being thermally desorbed onto the GC column for separation.

There are two techniques for introducing whole air samples by TO-15 from the canister into the gas chromatograph. These are the multisorbent pack method and a cold trap method. The multisorbent pack method uses different types of solid sorbent traps with different retentive properties selectively concentrating VOCs depending on the analytes. The cold trap method concentrates VOCs by condensing them on a cold surface.

TO-15 was designed for ambient air where the analyte concentrations have a narrow concentration range. In contrast, soil gas samples have a wide range of concentrations. Therefore, soil gas samples should be pre-screened before analysis. Pre-screening provides for adjusting the operating parameters such as dilution and recalibration to avoid overloading the instrument and/or creating problems such as carryovers.

Of all the USEPA methods, Method TO-15 is best suited for soil gas analysis since it is designed for gas samples. Laboratories employing TO-15 to analyze soil gas samples should adhere to all the basic requirements of the method including calibration and QA/QC protocols.

Advantages and disadvantages of TO-15 modifications are described in Table 3. Since a soil gas sample is treated in the same manner as an ambient air sample, there should be no modification needed to analyze soil gas samples with this method.

TABLE F-3
Advantages and Disadvantages of Modifications to TO-15

Modification	Advantages	Disadvantages	Comments
Samples collected in polymer gas sampling bags	• Lower Cost; • Easily; transported • Selected compounds have been shown to be stable. [1]	• Potential background issues (bag off-gas); • Adsorption of some compounds; • Bags do not conform to TO-15 protocol; and • Limited holding time (6 hours).	
Samples injected into instrument by filling injection loop with syringe	• Good for highly concentrated samples.	• Limited volume can be analyzed (0.5 – 5 cc); and • Not suited for low concentration samples.	• May only be used for highly concentrated samples.
Use of portable GC/MS system (e.g., Hapsite®) [2]	• Ideal for field screening.	• May not be able to handle the various types of sampling media. Samples have to be transferred for analysis (e.g., canister to syringe or polymer gas sampling bag.	• Considered to be an automated gas chromatograph under Section 1.6 of method.

[1] Hartman (2006)
[2] DTSC Environmental Chemistry Laboratory should be consulted.

a) Quality Assurance/Quality Control for TO-15

The QA/QC requirements for Method TO-15 differ from USEPA Method 8260B/C. The calibration curve and tuning need to be checked every 24 hours for Method TO-15 compared to every 12 hours for Method 8260B/C. There are no requirements to verify the calibration curve with a second-source standard, to analyze matrix spike/matrix spike duplicate samples (MS/MSD), to run laboratory control samples (LCS) or to use surrogates for Method TO-15.

b) Use of Autosamplers for TO-15

Samples in passivated stainless steel canisters may be analyzed without any further sample transfer if the canisters are directly connected to an autosampler. Additional blank samples should be included in the sample sequence to evaluate possible carryover of highly contaminated samples.

Samples in polymer gas sampling bags may also be analyzed with an autosampler provided the sample container is connected in such a way to ensure there is no leakage. A vacuum pump is needed to pull the sample into the instrument. Additional blank samples should be included in the sample sequence to evaluate possible carryover of highly contaminated samples.

Polymer gas sampling bags are sometimes used for dilution of highly concentrated samples from canisters. The bags used for dilutions should be new and thoroughly cleaned.

c) Canister Certification for TO-15

Although canister certification may not be appropriate for all projects, certifying canisters as clean canisters decreases the level of uncertainty associated with the prior use of the canister. Certified canisters are leak tested and documented to be clean and free of any contaminants. The project DQOs dictate the certification level and certification frequency. The certification level is determined by the reporting limits. The certification frequency refers to the number or percent of canisters requiring certification. Canisters should be certified with the same data acquisition mode as the sample analysis.

Soil gas samples collected in canisters may be shipped since they are under vacuum. The Department of Transportation (DOT) in title 49 Code of Federal Regulations, Parts 100-185, requires that canister pressure must not exceed 400 pound-force per square inch gauge (psig). Consult with the federal code of regulations and the shipping agent on specific regulations pertaining to shipping and transporting various materials.

USEPA Method TO-17

Method TO-17 (USEPA, 1999) is primarily a sampling method coupled with the analytical approach used in USEPA Method TO-15. In TO-17, a known volume of soil gas is pulled through a sorbent tube to collect the VOCs followed by VOC desorption onto the GC column for separation and analysis by the mass spectrometer. Other detectors or combinations of detectors, such as the ECD/FID in series, can be used with this method provided that the criteria specified in Section 14 of the method are met.

Like TO-15, TO-17 was designed for collecting and analyzing VOCs in ambient air samples, but can successfully be used for soil gas sampling and analysis.

Since a soil gas sample is treated in the same manner as an ambient air sample, there should be no modification needed to analyze soil gas samples with this method.

a) Conditioning and Calibration for TO-17

Freshly packed or new sorbent tubes must be conditioned before use. Conditioning entails heating the tubes at specific temperatures with a set gas flow rate (See Table 2 of method). Tubes can be reused for multiple thermal desorption cycles until the safe sampling volume validation procedures fails (USEPA, 1999, Method TO-17, Section 13.1.2).

For calibration, either vapor-phase or liquid standards can be used. Liquid standards are directly injected into the sorbent tubes for calibration. No calibration validation with gas-phase standards is needed if liquid standards are used.

According to USEPA 1999, "Sample tubes awaiting analysis on an automated desorption system must be completely sealed before thermal desorption to prevent ingress of VOC contaminants from the laboratory air and to prevent losses of weakly retained analytes from the tube." (Method TO-17, Section 8.2.1.2)

b) Advantages and Disadvantages

The TO-17 method has some advantages over Methods TO-15 and 8260. One advantage is the ability to collect and concentrate a larger volume of sample, resulting in lower reporting limits because the entire volume of VOCs trapped on the sorbent tube is desorbed completely as a single aliquot of sample. In comparison, for TO-15, only a smaller sub-sample is usually analyzed at a time, resulting in elevated reporting limits. Another advantage of Method TO-17 is that this method can be used on low vapor pressure compounds such as naphthalene. Finally, the collection apparatus and sample tubes for Method TO-17 are compact and easily transportable.

However, there are disadvantages in using a sorbent tube as required by TO-17. Some of the primary disadvantages include:

- The inability to repeat an analysis on the same sample;
- Potential MS overload due to desorption of concentrated sample; and
- Column breakthrough.

The unfamiliarity of practitioners in handling and collecting soil gas samples onto sorbent tubes is another potential disadvantage, since in the United States, soil gas samples are mostly collected in canisters and syringes rather than onto sorbent tubes. Sorbent tubes, however, are used widely in Europe.

With Method TO-15, additional analysis on the same sample can be easily performed by withdrawing another sample aliquot from the sample canister. With Method TO-17, once all the compounds are desorbed from the sorbent tube the sample is completely used. Repeating a sample analysis is possible only if multiple (duplicate) sorbent tubes are collected. Multiple sorbent tubes can be collected concurrently if several sorbent tubes are assembled in parallel during sampling. Moreover, recent advances in thermal desorption (TD) technology have made it possible to split sample into fractions for repeat runs from the same sorbent tube.

For quantification, the volume of air passing through the cartridge must be measured and documented. Moisture can be a problem with sorbent cartridges, but it can be managed by using alternative sorbents, sample splitting or dry purging (USEPA, 1999, Method TO-17, Section 7.2). The use of in-line water traps is not recommended since the traps may absorb target analytes. Other issues with TO-17

include interferences from sorbent artifacts (USEPA, 1999, Method TO-17, Section 7.1). There is no single universal sorbent that can be used for all possible VOCs. The choice of sorbent depends on the target VOCs. However, multi-bed (sorbent) tubes are also available that can be used to sample for a wide range of target compounds.

Method TO-17 should not be used to analyze highly concentrated soil gas samples. Highly concentrated soil gas samples will saturate the MS if completely desorbed into the GC. Therefore, the approximate concentration of VOCs or SVOCs should be predetermined by field screening specific soil gas sampling locations using another analytical method such as USEPA 5035/8260 or USEPA 5030/8260, prior to deployment.

USEPA Method TO-13A

Although TO-13A (USEPA, 1999) was designed for collecting and analyzing PAHs in ambient air, this method can successfully be used for soil gas sampling and analysis.

Samples are collected/adsorbed onto a combination of filter and sorbent cartridges followed by solvent extraction, cleanup (if needed) and concentration before analysis by GC/MS. Since a soil gas sample is treated in the same manner as an ambient air sample, there should be no modification needed to analyze soil gas samples with this method. The following need to be evaluated prior to sampling:

- Volume needed to meet the required reporting limits; and
- Sampling flow rate relative to the capacity of the sampling tube.

Scan vs. SIM Mode

Scan and Selected Ion Monitoring (SIM) are two data acquisition modes with GC/MS methods. The most common mode is the Scan mode in which the detector scans from high to low across a range of masses continuously. In scan mode, compound identification is made by comparing the samples mass spectrum against a spectral library. In SIM mode, only a few selected ion fragments or masses are monitored. Because the detector concentrates its time only on selected masses, the sensitivity is maximized. Due to the increase in sensitivity, lower reporting limits are possible.

Although SIM can provide lower reporting limits, its utility is limited and should only be used for a site that is completely characterized. It should never be used for initial site characterization because the instrument is set to monitor only the selected target compounds. SIM may be used to overcome some background problems in soil and water matrices. However, there are inherent matrix effects with soil gas samples; therefore, SIM is not always the best choice to use with soil gas samples.

MODIFIED GC METHODS

Two primary GC methods associated with soil gas analysis are USEPA Methods 8015 and 8021. GC methods may be used for routine monitoring when the contaminants and their approximate concentrations are known. The GC method should not be used for initial characterization. When new, unknown compounds are detected, these should be confirmed by analysis with a GC/MS method. On a routine basis, at least 10 percent of positive results from GC analysis should be confirmed by analysis with a GC/MS method.

Various versions of each method exist in the SW-846 manual (USEPA 2000). Laboratories should use the most updated versions of the method and state in their analytical reports which version of the method was used.

USEPA Method 8015 (8015, 8015A, 8015B, 8015C and 8015D)

USEPA Method 8015 (Non-halogenated Organics by Gas Chromatography) is used to determine the concentration of volatile and semi-volatile nonhalogenated organic compounds, triethylamine and petroleum hydrocarbons (C5-C32) (USEPA 2000). Samples are introduced into the GC by one of the following methods:

- Purge-and-trap;
- Equilibrium headspace;
- Direct injection;
- Injection of azeotropic distillation concentrate;
- Injection of vacuum distillation concentrate; and
- Injection of solvent extraction concentrate.

A FID is used with all modifications of Method 8015. In order to apply this method to soil gas samples, the same types of modifications described for Method 8260B/C should be used. Samples are either injected into a purge-and-trap sparger filled with water and purged or directly injected into the GC.

USEPA Method 8021 (8021, 8021A and 8021B)

USEPA Method 8021B (Aromatic and Halogenated Volatiles by Gas Chromatography Using Photoionization and/or Electrolytic Conductivity Detectors) is used to determine the concentration of halogenated and aromatic volatile organic compounds (USEPA 2000). Samples are introduced into the GC by one of the following methods:

- Direct injection;
- Purge-and-trap;
- Headspace; and
- Injection of vacuum distillation concentrate.

Both a PID and a Hall electrolytic conductivity detector (HECD) are used with Method 8021 in either series or as a single detector. In order to apply Method 8021 to soil gas

samples, the same types of modifications described for Method 8260B/C should be used.

QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

QA/QC requirements for soil gas testing should be outlined in the project-specific Quality Assurance Project Plan (QAPP) or the specific modified USEPA Method being employed. Soil gas analytical laboratories should comply with those QA/QC requirements and add additional checks as needed.

QA/QC for Soil Gas Testing

The following are the QA/QC protocols that should be included with soil gas testing. Most of these QA/QC protocols are required with USEPA methods as well as laboratory certification (see later):

a) Daily Tune

For GC/MS methods, laboratories should conduct the daily tune as specified in the respective method. The instrument must meet the tuning criteria before sample analysis.

b) Initial Calibration

The calibration curve should consist of a minimum of five points. The maximum percent relative standard deviation (%RSD) for each target compound should not exceed 30 percent. For USEPA Methods TO-15 and TO-17, two compounds are allowed up to 40 percent RSD.

c) Daily Calibration (Continuing Calibration)

The calibration curve for each compound of interest should be verified with each analytical batch, or once every 12 hours (24 hours for TO-15 and TO-17). Verification is conducted by analyzing the mid-point calibration standard. The results from the mid-point standard should be within 20 percent (30 percent for TO-15 and TO-17) of the initial calibration in order to assume the calibration curve is valid.

d) End of Run Calibration Check

A mid-level calibration standard should be run for each 20-sample batch or at the end of the run, whichever is more often. Verification is conducted by analyzing the mid-point calibration standard. The results from the mid-point standard should be within 20 percent of the initial calibration in order to ensure the calibration curve is still valid at the end of the batch run and the instrument sensitivity has not deteriorated. For USEPA 8260B/C, TO-15 and TO-17 methods, there is no requirement for this analysis. The instrument is monitored by internal standards which are added to every sample. The need for an end-of-the-run calibration check for GC/MS methods is at the discretion of the parties involved in the project and

should be based on DQOs. For those methods where there is no internal standard monitoring, the end of run calibration check may be needed to evaluate the instrument.

e) Method Blanks

Method blanks are used to evaluate contamination from the analytical process. This is a sample prepared by the analytical laboratory using an analyte-free matrix and carried through the entire sample preparation and analytical procedure. The analyte-free matrix for soil gas is humidified laboratory grade ultra-pure air or ultra-pure nitrogen.

f) Container Blanks

If sampling containers are reused or recycled then at least one decontaminated sample container per 20 samples or per batch, whichever is more often, should be analyzed as a container blank sample to verify the effectiveness of the decontamination procedures. Other components such as fittings and valves of the sampling stream that are subject to carryover/contamination should also be monitored. Note: This was previously referred to as the “Method Blank” in the 2003 Advisory – Active Soil Gas Investigations).

g) Trip Blanks

Trip blanks consist of humidified laboratory-grade ultra-pure air. Trip blanks evaluate whether shipping and handling procedures are introducing contaminants into the samples, and if cross-contamination in the form of VOC migration has occurred between the collected VOC samples. Trip blanks are only required if samples are collected in polymer gas sampling bags or sorbent tubes for TO-17 analysis. A minimum of one trip blank per shipping container should be collected and analyzed for target compounds whenever VOC samples are shipped offsite for analysis. The trip blank containers and media should be the same as the site samples. USEPA Method TO-15 does not have specific trip blank requirements. Therefore, trip blanks are not needed if samples are collected in passivated stainless steel canisters.

h) Duplicate Samples

Duplicate sample analysis evaluates the reproducibility (precision) of the sampling process. At least one duplicate sample per 20 samples or per batch, whichever is more often, should be collected and analyzed. Duplicate samples should be collected in separate containers at the same location and depth. A duplicate sample can be collected by using a T-splitter at the point of collection to divide the sample stream into two separate sample containers.

i) Replicate Samples

Replicate sample analysis evaluates the reproducibility (precision) of the laboratory’s analytical ability and is used to estimate sample variability. At least one replicate

sample per 20 samples or per batch, whichever is more often, should be reanalyzed by the laboratory to assess analytical precision.

j) Matrix Spike/Matrix Spike Duplicates (MS/MSD)

The requirement for MS/MSD with modified USEPA Method 8260B/C is discretionary. Although MS/MSD samples are required with the USEPA 8000 series methods, there is no practical approach to apply this requirement to soil gas samples. For true MS/MSD samples, spike compounds must be added to the sample during the collection process. With soil gas samples, this is not technically feasible. The addition of a spike into the sparger with modified USEPA Method 8260B/C does not duplicate the actual condition of the sample as it is collected, processed and analyzed.

There is also no requirement for MS/MSD with USEPA Method TO-15 as the analysis of MS/MSD with TO-15 is impractical. Spike compounds are added at the same time that the sample is transferred into the concentrator. Because this does not truly assess the impact of the matrix on the recovery of the target compounds, the need for MS/MSD with Method TO-15 is at the discretion of the parties involved in the project and should be based on the DQOs.

k) Laboratory Control Sample (LCS)

LCS is a sample made with an aliquot of a clean (control) matrix similar to the sample matrix spiked with compounds that are representative of the target analytes and is used to document laboratory performance. For soil gas analysis, this QA/QC sample is not necessary since the “clean” matrix is humidified laboratory grade ultra-pure air. When prepared as such, this is equivalent to the daily calibration (continuing calibration) sample. It would be redundant to analyze this QA/QC sample; therefore, LCS samples are optional depending on the requirement of the project QAPP. Methods TO-13, TO-15 and TO-17 do not have any requirements for LCS sample analysis.

l) Surrogates

The use of surrogates in soil gas analysis is dependent on the method and container used. USEPA Method 8260B/C requires surrogates whereas Method TO-15 does not. Introducing surrogates into soil gas samples can present some logistical challenges, depending on the type of container being used to collect the sample. Surrogates are designed to monitor recoveries of target analytes. Therefore, they should be introduced at the point of sample collection in order to fully assess the recovery process.

For most laboratories that use modified USEPA Method 8260B/C, the surrogates are usually added to the water in the sparger either before or after the soil gas sample has been forced into the water. Vapor-phase surrogates (which are available for air analysis) can be theoretically added into soil gas sample aliquot in a gas-tight syringe just before injecting into the sparger. However, few if any laboratories are

using this practice for various reasons.

For laboratories using USEPA Method TO-15 the surrogates are added to the sample loop at the same time the soil gas sample is being loaded onto the concentrator. In both instances the surrogates are added after the sample has already been collected. There is a gap between when the sample is collected and when the sample is analyzed where there are no surrogates to monitor the process.

Commercially prepared surrogates or standards should be used. Preparing vapor internal standards or surrogates with liquid standards in either polymer gas sampling bags or glass bulbs is not recommended because of the inherent difficulty in preparing the surrogates or standards. Some laboratories add vapor surrogates immediately after sampling to samples collected in glass bulbs. The vapor surrogates are actually liquid surrogates injected into a glass bulb and allowed to expand. Aliquots of the vapor surrogates are injected into the glass bulb with the soil gas sample. The internal standards or surrogates should be completely vaporized before aliquots are taken. Droplets of liquid standards or surrogates can adhere to the internal surface of the bags or bulbs. Due to variations with where and when the surrogates are added to the soil gas samples, laboratories are advised to note in their final analytical reports the exact step in the process where the surrogates (if used) are added so the results can be evaluated accordingly.

m) Reporting Limit Verification

The RL is the limit of quantification reported by the analyzing laboratory. The RL should not be lower than the lowest calibration point. The RL should be validated periodically (recommended with each batch of samples) by spiking a blank sample at the RL level. There is no limit on the number of samples per batch for RL verification. If the RL is set at the lowest calibration point then verification is not needed.

n) Acceptance Limits

Based on laboratory performance, laboratories should establish their own acceptance limits for their QA/QC parameters. QA/QC parameters include percent recoveries for surrogates, matrix spikes, laboratory control samples and percent relative difference for duplicates. The limits should be evaluated and updated periodically. For guidance on establishing acceptance limits consult USEPA Method 8000B (December 1996), Section 8.0 of SW-846 (USEPA 2000).

o) Standard Operating Procedures

Laboratories should have detailed written Standard Operating Procedures (SOP) for their soil gas sampling and testing procedures. Copies of the SOP should be available in the laboratory for review and reference. The SOP should be reviewed on an annual basis and updated as needed. Field procedures, including sampling procedures, can be written as a separate SOP from the laboratory analytical procedures.

DATA REVIEW

All soil gas data should be reviewed in detail to ensure all QA/QC parameters are within specified control limits.

Soil gas data should be reviewed and evaluated as described in the most current version of DTSC's *"Guidance for the Evaluation of Subsurface Vapor Intrusion to Indoor Air"*.

DETECTION LIMITS VERSUS REPORTING LIMITS

A detection limit is defined as the *"the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, and is determined from analysis of a sample in a given matrix type containing the analyte"* (SW-846, Chapter One, Quality Control, Revision 1, July 1992). A RL is defined as the lowest concentration of an analyte that can be detected in a sample by the given analytical procedure taking into account sample matrix, interferences, dilution factor and the lowest point of the calibration curve. Laboratories should use the RL in their analytical reports since it is a more reliable indicator of the limit of detection.

Reporting Limits

Reporting limits should be selected prior to choosing analytical methods and be based on project DQOs. Sampling protocols, analytical method(s) used, list of target compounds, and other DQOs should be considered when selecting project RLs. For risk assessments, the reporting limits should be lower than the screening levels for the site.

Table F-4 delineates the reporting limits of the common soil gas analytical techniques for select analytical methods. The ranges in this table are based on a survey of analytical laboratories conducted by the Soil Gas Advisory Workgroup. For the reporting limits of other methods/techniques, consult with the analytical laboratory.

TABLE F-4
Reporting Limits

Analytical Method/Technique	Reporting Limit Range*	Comments
Modified USEPA 8260B/C: Direct injection of soil gas into sparger with water.	20 – 5000 μg/m^3 (most compounds at 1000 μg/m^3 or lower)	Sample size dependent. Most samples are 5-250 cc (mL).
Modified USEPA 8260B/C: Direct injection of soil gas into GC column.	100 – 1000 μg/m^3	
Modified USEPA TO-15 (Conventional GC/MS system).	Scan Mode: 0.7 – 200 μg/m^3 SIM Mode: 0.004 – 0.20 μg/m^3	
Modified USEPA TO-15 (Using portable GC/MS system (e.g., Hapsite®).	4 – 100 μg/m^3	

Reporting Units

Analytical laboratories should report soil gas results in μg/m^3 rather than μg/L or parts per billion by volume (ppbv). Although 1,000 μg/m^3 is equivalent to one μg/L, neither can be converted to ppbv by simply moving the decimal point. The ppbv conversion is a function of the molecular weight of the compound in question, as shown in the example below. Environmental practitioners should verify that soil gas sample results are calculated correctly and reported in the proper units.

Example: benzene in air/soil gas with molecular weight=78.11 is converted as follows:

1.0 μg /L Benzene = 1000 μg /m^3 Benzene = 315 ppbv Benzene*

*ppbv = [(μg/L) x (RT)] x 1000/(MW) x P **or** ppbv = [(μg/m^3) x (RT)] /(MW) x P

where:
$\mu g/L$ = 1.0
$\mu g/m^3$ = 1000
R = 0.0825 L-atm/mole-°K (Ideal Gas Law Constant)
T = 298°K (Standard Temperature)
1000 = Conversion of 1 m^3 = 1000 L
MW = 78.11 (Molecular Weight of Benzene)
P = 1 atm (Standard Pressure)

Laboratories using TO methods generally report results in ppbv, and may continue to do so, but should also provide the conversion to μg/m^3.

VARIABILITY AND COMPARING RESULTS

Variability in soil gas results comes from differences in the laboratory instruments,

sample introduction techniques, and the analyst's skill, experience and practices, as well as variability in field sample collection methods and in sample containers. Finally, there is also a variation in the sample matrix. A replicate sample collected immediately after the original sample may not be the same due to spatial and temporal differences.

To evaluate the comparability of results from two different methods, calculate the Relative Percent Difference (RPD) of the results. The RPD is calculated with the formula:

$$RPD = 100 \times (C_1-C_2)/[(C_1+C_2)/2]$$

where: C_1 = Result from the first method
C_2 = Result from the second method

In instances where soil gas results from the same source analyzed by two different methods differ by more than 50 percent RPD, the results should be validated. Validation involves reviewing the sampling procedures, collection containers, sample introduction technique and QA/QC data. Any differences should be evaluated and explained. All QA/QC results should be reviewed to make sure the parameters are within the established control limits and the calculations checked. The final analytical results from modified 8260B/C should be reported and calculated as $\mu g/m^3$ or $\mu g/L$ (see section above on reporting units).

Some compounds are better analyzed by one method than the other due to their physical nature. Some compounds have a better recovery if a liquid standard is used whereas, the vapor phase standard will purge poorly. Highly volatile VOCs are recovered well with modified 8260B/C compared to TO-15. Resampling and reanalyzing samples may be necessary if the recovery discrepancies cannot be explained after validation.

METHOD REFERENCES IN ANALYTICAL REPORTS

The analytical method used to test soil gas samples and any modifications to the analytical method should be described in the laboratory reports. Refer to the Performance-Based Measurement Systems Section above for information on referencing PBMS.

LABORATORY CERTIFICATION

All laboratories performing soil gas testing should be certified. According to the California Health and Safety Code Section 25356.1.5(e), exposure assessments shall include development of reasonable maximum estimates or exposure to VOCs that may enter existing or future structures on a site. Section 25358.4 requires that analysis of any material, that is required to show compliance with Chapter 6.8 of the Health and Safety Code, shall be performed by a laboratory accredited by the Department of Public Health pursuant to Article 3 of Chapter 4 of Part 1 of Division 101.

Soil gas testing laboratories can obtain certification from the State Water Resources Control Board's Environmental Laboratory Accreditation Program (ELAP) for all analytical methods they are using for soil gas testing. Certification ensures that the laboratories have the requisite facilities, equipment and personnel to perform the testing, and have demonstrated competence and compliance with the methods being certified.

In addition, certification entails the validation of the analytical method as well as periodic checks with performance evaluation or blind samples (where available) to assess laboratory continued competence with the method.

Soil gas certification for USEPA Methods 8015, 8021, and 8260 is available from ELAP.

National Environmental Laboratory Accreditation Program (NELAP) accreditation for USEPA Methods TO-13A, TO-15 and TO-17 should be accepted in lieu of California ELAP certification for soil gas testing.

Laboratories that have either certification from ELAP or NELAP for USEPA Methods 8015, 8021 or 8260B for either soil or water matrices should obtain separate certification from ELAP for soil gas work with those methods.

ELAP will provide certification for PBMS as warranted. PBMS may be new techniques using available equipment, an entirely new method with novel techniques and equipment, or modifications of known published methods. PBMS must meet the criteria below:

- The process can be validated;
- It can be demonstrated that the process can meet project DQOs; and
- It can be demonstrated that the process can meet the specified method performance criteria.

APPENDIX G BAROMETRIC PRESSURE, RAINFALL, AND SOIL DRAINAGE

BAROMETRIC PRESSURE FLUCTUATIONS

Soil Gas

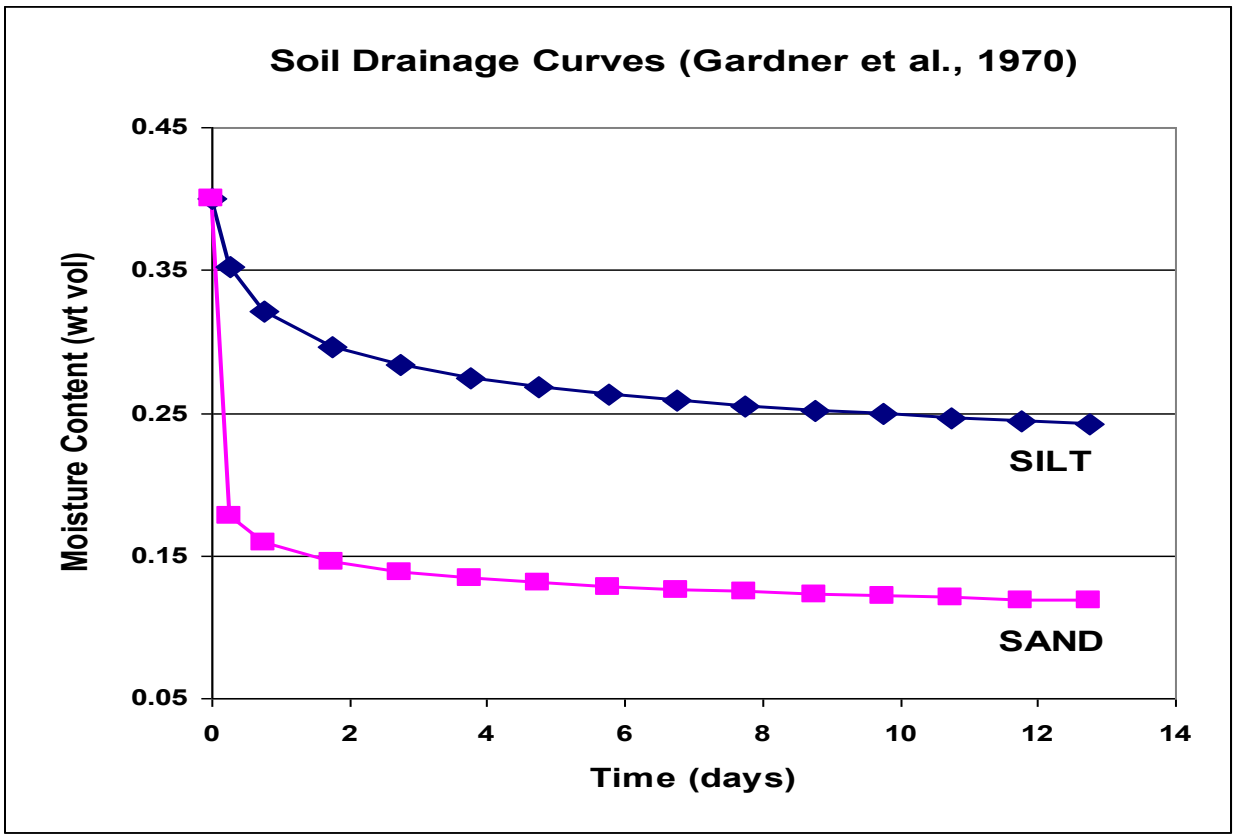
Massmann and Farrier (1992) evaluated the significance of barometric pressure fluctuations on the transport of atmospheric gas into the vadose zone. They examined situations in which barometric fluctuations will yield a significant effect on the vadose zone. Model calculations showed that fresh air may migrate several meters into a highly permeable subsurface during large barometric pressure cycles and the depth of penetration increases as the thickness and permeability of the vadose zone increases. Massmann and Farrier (1992) thus suggested that the concentration of volatile contaminants may be lower when barometric pressures are high and that soil gas measurements will show the largest fluctuations during times of rapidly rising or falling barometric pressures. During these large barometric pressure changes, as indicated by Figure 8 of their paper, soil gas at 1.5 meters (5 feet) may be diluted with atmospheric air by 30 to 50 percent.

Surface Flux

Clements and Wilkening (1974) demonstrated empirically that atmospheric pressure changes of one to two percent associated with the passage of frontal systems will produce changes in the flux of radon from the subsurface by 20 to 60 percent. The actual magnitude of the change in the radon flux depends upon the rate of change of the barometric pressure and its duration. The effect of pressure changes on VOC concentrations in soil gas is expected to be similar.

RAINFALL EVENTS

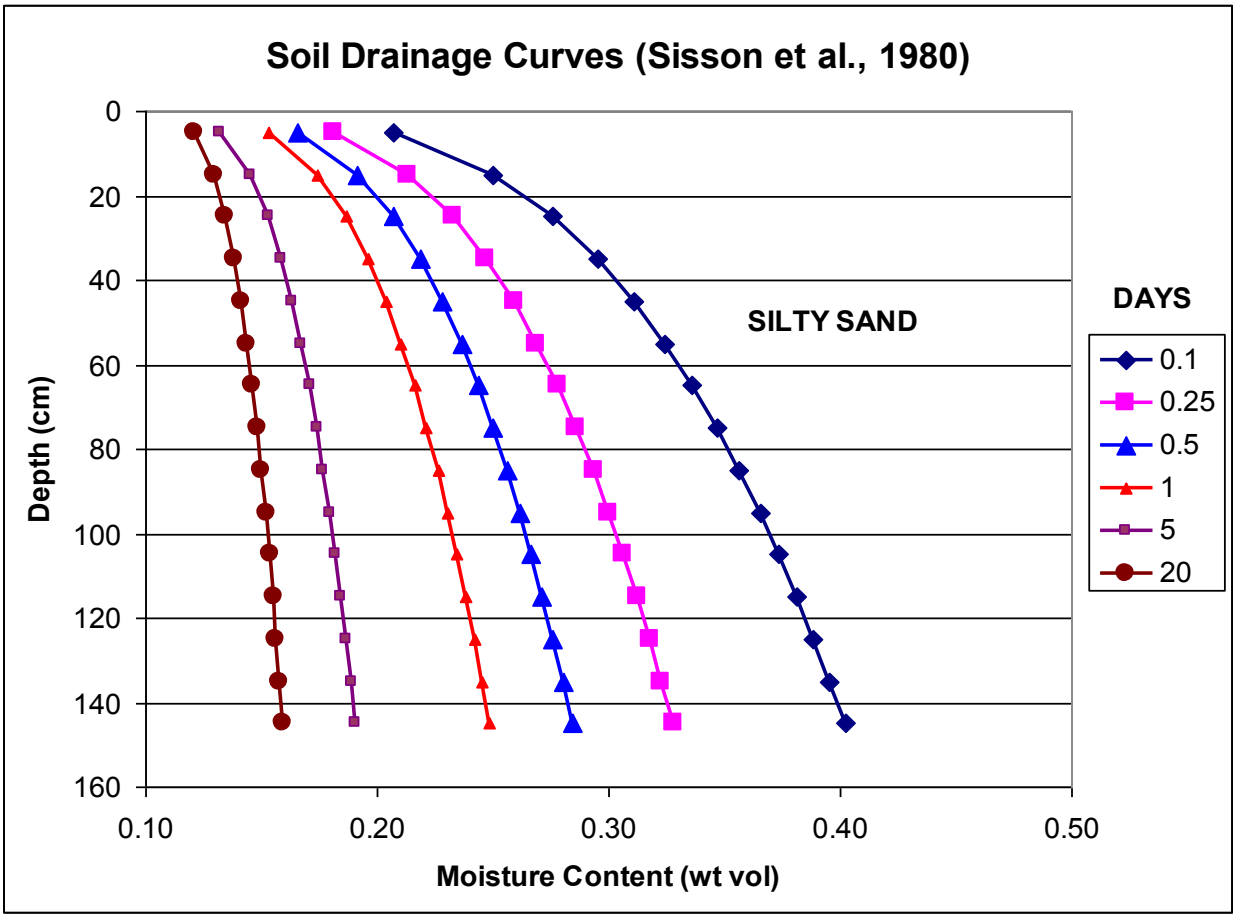
Surface flux



Kienbusch and Ranum (1986) evaluated the effects of rainfall on the collection of flux chamber measurements on open ground. In tests at a simulated landfill, water was added to dry soil cells to simulate rainfall. Trace precipitation (0.01 inches) had no effect on measured emission fluxes from the ground. Heavier rainfall (0.4 inches), however, did have an effect. The emission flux was decreased by 90 to 95 percent and the reduction in emissions lasted for over eight days. These results are consistent with other field observations (Radian Corporation, 1984; Eklund, 1992).

Soil Drainage

Gardner and others (1970) derived approximate solutions for unsaturated flow following irrigation. Their solutions can be used to evaluate the impact of rainfall on subsurface moisture conditions. The drainage of soil by gravity following infiltration of one centimeter of water for two soil types, sand and silt, is shown in Figure G-1. The initial



unsaturated hydraulic conductivity within the infiltration zone for the silt and sand was assumed to be one centimeter per day and 1000 centimeters per day, respectively. An instantaneous infiltration of one centimeter was used in the evaluation. The figure demonstrates that drainage to approximately asymptotic moisture conditions occurred within about five days for these two soil types.

FIGURE G-1

Likewise, Sisson and others (1980) derived a one-dimensional unsaturated flow equation to evaluate water movement in the vadose zone. Soil drainage curves from Sisson and others (1980) where a unit gradient was assumed are shown in Figure G-2. The figure denotes a silty sand scenario where the initial unsaturated hydraulic conductivity was assumed to be 100 centimeters per day. The model assumed that the vadose was saturated to 0.40 and allowed to drain. Moisture profiles are shown for five different time intervals. The figure demonstrates that drainage to near ambient moisture conditions of 0.10 occurred within about five days, agreeing with the approximations by Gardner and others (1970).

APPENDIX H REPORTING FORMAT AND PARAMETERS

RECORDKEEPING IN THE MOBILE LABORATORY

The following records concerning calibration standards and QA/QC should be maintained as hard copies in the mobile laboratory:

a) Date of calibration standard receipt;
b) Name of calibration supplier;
c) Calibration lot number;
d) Date of preparation for intermediate standards (dilution from the stock or concentrated solution from supplier);
e) Calibration ID number or other identification data;
f) Name of technician who performed the dilution;
g) Volume of concentrated solution taken for dilution;
h) Final volume after dilution;
i) Calculated concentration after dilution;
j) The latest and current initial calibration data for each instrument used; and
k) The currently-used laboratory standard operating procedures.

REPORTING OF SOIL GAS SAMPLE RESULTS AND QA/QC DATA

1) Report all sample test results for all compounds in the analyte list and QA/QC data. Compounds may be listed by retention time or in alphabetical order. Report any unidentified or tentatively identified peaks. Submit all data in electronic format and raw data, including the chromatograms for samples and standards, as requested.

2) Report the following for all calibration standards, QA/QC standards, and soil gas samples:

   a) Site name;
   b) Laboratory name;
   c) Date of analysis;
   d) Initials of analyst;
   e) Instrument identification;
   f) Injection amount;
   g) Injection time;
   h) Concentrations of each analysis;
   i) Laboratory quality control limits;
   j) Calculated results; and
   k) Notes or explanation of any outliers

3) Provide additional information, as specified, for different types of analyses. Tabulate and present in a clear legible format all information according to the following grouping:

a) Initial calibration

i) Source of standard (STD Lot ID No.);
ii) Detector;
iii) Retention time (RT);
iv) Standard mass or concentration;
v) Peak area;
vi) Response factor (RF);
vii) Average response factor (RF_{Ave});
viii) Standard deviation (SD_{n-1}) of RF;
ix) Percent relative standard deviation (% RSD); and
x) Acceptable range of %RSD (ACC RGE).

b) Daily calibration check sample and Laboratory Control Sample (LCS)

i) Source of standard;
ii) Detector;
iii) Retention time (RT);
iv) Standard mass or concentration;
v) Peak area;
vi) Response factor (RF);
vii) Percent difference between RF and RF_{Ave} from initial calibration (% DIFF); and
viii) Acceptable range of %DIFF (ACC RGE).

c) Soil Gas Sample

i) Sample identification;
ii) Sampling depth;
iii) Purge volume;
iv) Vacuum pressure;
v) Sampling date and time;
vi) Injection date and time;
vii) Injection amount;
viii) Dilution factor (or concentration factor if trap is used);
ix) Detector;
x) Retention time (RT);
xi) Peak area;
xii) Concentration in either μg/L or $\mu g/m^3$. Specific reporting units should be specified in the QAPP;
xiii) Total number of peaks found by each detector;
xiv) Unidentified peaks and/or other analytical remarks;
xv) Surrogate results; and
xvi) Control limits.

APPENDIX F

Sampling Analysis Plan (SAP)

Appendix F
Sampling Analysis Plan

Executive Summary

This document presents the constituents and sampling and analysis plan (SAP) for the Site Assessment Work Plan for the former Riverside Cement Plant (RCP) located in Jurupa Valley, California. The objectives of the SAWP are to determine and evaluate potential chemicals of potential concern (COPCs) and the lateral and vertical extents of COPCs in former known or suspected source areas to support a health risk evaluation and the Response Plan; determine and characterize the onsite soils for potential reuse as onsite fill or for off-Site disposal; to identify hexavalent chromium (Cr^{VI}) bearing materials that could generate dusts/emissions especially during grading or demolition activities; and Evaluate potential leaching of metals and hexavalent chromium into groundwater.

Site Background

The Site is approximately 206 acres located at 1500 Rubidoux Boulevard. The Site is bound to the west by Union Pacific Railroad (UPRR) track and Rubidoux Boulevard, to the north by El Rivino Road, to the south by three inactive quarries and Agua Mansa Road, and to the east by industrial development and Hall Avenue. As shown on Figure 1, the northwestern section of the Site contains undeveloped land and unpaved roads, while the northern section contains undeveloped land and a paved entrance road with a guard shack. The western section encompasses an entrance road, along with storage silos, a warehouse (Pack House), part of the former white cement manufacturing plant, and a one to two-story administration buildings (Truck Garage, Transportation Office, Storehouse, and Garage). The eastern section contains the raw materials storage area and the remnants from the Grey Cement Plant (primarily the support structures for the rotary kilns).

Historical Site Operations

The Site was in operation from the early 1900s until 2014. Operations on Site were divided into either the cement manufacturing operations or the Crestmore mine where mining of limestone and quarrying activities were conducted. The Crestmore mine was an underground mine and the four quarries were designated as the Wet Weather, the Chino, the Commercial, and the Lone Star quarries. The Wet Weather Quarry and Lone Star Quarry are located within the Site boundary, while the other quarries are located on the parcel located to the south of the Site

(Figure 1) which is not part of this SAWP. In addition, the Site includes various support facilities, heavy machinery, and administrative buildings that were related to the cement manufacturing plant and limestone quarrying and mining operations.

The facility underwent three major redevelopment phases over the life of the operation. From the early 1900s and the 1950s, the cement plant was located in the south western portion of the Site just north of the present day White Cement Plant. The facility at that time was operated using petroleum-based fuels (i.e. Bunker C) stored in fuel tanks. As the cement manufacturing process evolved through the use of updated technology and other changes in the industry, the facility went through an expansion and redevelopment phase from the late 1950's through early 1960's, which included conveyor belt systems and compress air, development of raw material storage areas, and upgrades to processing of raw materials to manufacture cement product.

During the second renovation phase, the facility was operated using both coal and petroleum-based fuels. By the 1960's, the original plant had been demolished and the present day facility was constructed that generated both grey and white cement product. The current facility was operated until it was shutdown in 2014.

In 1909, limestone and silicate rock quarrying activities began at the Site. In 1930, underground mining commenced at the Crestmore mine, which furnished most of the plant's requirements until 1939. The Wet Weather quarry was deepened and extended between 1940 and 1954. From 1930 to 1954, the block caving method was used, which was a process that allows for the bulk mining of large, relatively lower-grade materials. The room and pillar underground mining method was used between 1954 and 1986. Mining of limestone at the Site ceased in the late 1980s when mining operations penetrated the underlying aquifer eventually flooding the mine shafts. The resulting flood created the present day Crestmore Lake located on the parcel south of the Site which is not part of this SAWP (Figure 1).

Cement manufacturing operations began in 1914 and continued through 2008. The limestone obtained from the onsite quarries/mines was mixed with raw sand and clay materials imported from off-Site sources, and heated in rotary kilns to manufacture cement clinker. The raw materials were stored in onsite silos prior to 1960s until the Raw Material Storage Area (RMSA), located along the northwestern portion of the Site, was developed at which point the materials were staged there. The cement clinker was then crushed to create two primary types of cement (i.e., White and Grey Cement), which was then packaged and shipped offsite.

Cement Kiln Dust (CKD) was one of the primary by-products generated during the manufacturing process, and it exhibits a slight pinkish hue. When hydrated, CKD becomes dense and relatively impermeable to water, but does not form a cemented mass.

Prior to the 1970s, CKD was hauled from the kilns using end-dump trucks and reportedly placed with fill soils/mine spoils at several locations throughout the Site (Figure 1). The placement of CKD material primarily occurred from 1955 to 1979, and the primary location was the Wet Weather Quarry. Due to the advancement in the cement manufacturing process during the 1970's, previously discarded CKD material was reclaimed and used as feedstock in the cement making process. Also during the 1950s and early 1960s, the cement manufacturing process developed a closed-loop system with the incorporation of bag houses to capture CKD and other particulate materials generated during the cement manufacturing process. The CKD material was reclaimed beginning in the early 1970s until the operations were shutdown in 2014.

The equipment used to manufacture cement generally relied on electrical power for material conveyance/process control, and petroleum fuels for heating at various times over the life of the facility. Petroleum fuels were historically provided by a 6,000,000 gallon UST storing Bunker C fuel oil. Other underground storage tanks (USTs) at the Site were used to store petroleum products such as gasoline, diesel fuel, fuel oil, and waste oil.

1.0 Objectives

The proposed additional Site assessment and data collection activities will provide supplemental data within the six study areas identified in Langan's Preliminary Environmental Assessment (PEA), dated 20 December 2018. Certain areas will be deferred to the decontamination and demolition plan and the soil management plan address in the Site Assessment Work Pam (SAWP), due to areas not accessible because of buildings and structures that will be removed. The sampling activities were designed to address data gaps and additional data requests identified by the DTSC in their review comments of the PEA dated 28 February 2018

- DQO-1: determine and evaluate potential chemicals of potential concern (COPCs) and the lateral and vertical extents of COPCs in former known or suspected source areas to support a health risk evaluation and the Response Plan.
- DQO-2: determine and characterize the onsite soils for reuse as onsite fill or for off-Site disposal
- DQO-3: to identify hexavalent chromium (Cr^{VI}) bearing materials that could generate

dusts/emissions especially during grading or demolition activities

- DQO-4: Evaluate potential leaching of metals and hexavalent chromium into groundwater

2.0 Sampling and Analysis Plan

The investigation will include:

Advance an estimated eight (8) soil borings to collect soil samples for chemical analysis,

Advance an estimated eleven (11) soil gas borings and convert to them to nested soil gas probes completed at 5 feet and 15 feet below ground surface (bgs), and

Advance an estimated thirty-two (32) test pits and collect soil samples for chemical analysis

Based on a review of Site operational history and previous investigation results, the sampling locations are designed to provide supplemental data within the six study areas identified in Langan's Preliminary Environmental Assessment (PEA), dated 20 December 2018. The sampling activities were designed to address data gaps and additional data requests identified by the DTSC in their review comments of the PEA dated 28 February 2018. The current SAWP was developed based on these DTSC comments to the PEA, Site visits, dated 25 January 2018 and 16 March 2018, and meetings with DTSC, dated 23 February 2018, 24, 26 April, and 21 June 2018. Table 27 summarizes the sampling and analytical testing.

2.1 Analytical Plan

Samples collected during the investigation will be submitted to an offsite laboratory for analysis in accordance with the schedule presented in Table 27 of the SAWP. The primary samples will be given a unique designated ID during collection. An example identifier will be SMC-SB1-15, which identifies a soil boring sample collected in the Surface Mining and Crushing (SMC) study area at 15 feet below ground surface.

Analytical methods for soil and soil gas samples are presented in Table 27 of the SAWP, and will include:

Title 22 Metals by EPA Method 6010/7000

Hexavalent chromium by EPA Method 7199

TPH (carbon chain) by US EPA Method 8015 modified

SVOCs and PAHs by EPA Method 8270C SIM

PCBs by EPA by EPA Method 8082

Pesticides using EPA Method 8081

Dioxins by EPA Method 1613

Soil gas sample analyses will include the following:

VOCs (including TPH) by EPA Method 8260 (mobile laboratory)

2.2 Utility Clearance

Prior to initiating intrusive activities, each drilling and test pit location will be finalized and marked in the field using flagging and marking paint. A utility clearance subcontractor will clear each location using multiple geophysical methods. Langan will contact Dig Alert/811 system for utility clearance at least 48 hours prior to the start of field activities.

2.3 Test Pit Excavation

Test pits will be excavated at locations previously marked and cleared for subsurface utilities a by subcontractor. As necessary, dust control during field activities will be accomplished using a water truck. As presented in Section 8.0 in the SAWP, soil will be excavated from the test pits to a maximum depth of approximately 20 feet bgs at the discretion of Langan field personnel by a subcontractor using an excavator or similar type of equipment. Soil samples will be collected from the initially exposed side walls or pit floors to ensure, to the extent practicable, slough material is not commingled with the samples. The samples will be collected using hand tools or from the excavator bucket attachment and placed directly into laboratory supplied containers for analytical testing. The sample containers will consist of EPA 5035 sample kits with four (4) VOA vials for VOC and TPH analyses and two (2) 8 oz. jars for metals, hexavalent chromium, SVOCs/PAHs, PCBs, pesticides, and dioxin analyses. Soil samples will be field-screened using a photoionization detector (PID), visually examined, and classified in the field in accordance ATSM Method D-2488 with the Unified Soil Classification System (USCS) and recorded on a trench of field log. Excavated soils will be stockpiled at least five feet from the edge of the excavation on plastic sheeting for further characterization and sampling, as necessary.

The proposed SCAQMD Hexavalent Chromium Sampling Plan will consist of collecting composite samples at designated locations. The samples will be collected using hand tools or from the excavator bucket attachment. Four of the samples will be collected in a step out (100

feet) radial pattern around a center point sample location. Samples will be collected at one feet and five feet at each trench location. Samples collected from the Materials Storage Area will be collected in a linear fashion to provide adequate coverage for the storage bay they are collected in.

Following completion of field observation and sampling activities, the test pits will be backfilled with the excavated soils and partially compacted using the excavator bucket. Excavated soil with suspected impacts based on visual observations and/or PID readings will be placed on and covered with visqueen and analyzed, as necessary, for potential reuse or offsite disposal. All test pit locations will be staked or marked to allow subsequent surveying of coordinates by Langan personnel for preparation of as-built drawings, as necessary.

2.4 Soil Gas Sampling

Soil borings will be advanced to the depths specified in Table 27 of the SAWP followed by installation of nested soil gas probes. A California-certified mobile on-site analytical laboratory will be used to purge, sample and analyze the soil vapor samples collected from the soil gas vapor probes. The borings for the temporary soil gas vapor probes will be advanced with a hollow-stem auger. The soil gas vapor probes will be nested at each location at five (5) feet and fifteen (15) feet bgs. Split-spoon sampling will be performed during drilling operations to the total depth drilled. California ring samples will be collected at selected depths using a split barrel California sampler lined with brass rings in accordance with ASTM D3550. The vapor points will be constructed of Teflon® tubing or similar to a soil vapor screen with a 1.5-inch length and 3/8-inch diameter for sample collection. Monterey kiln-dried sand will be used for the one foot filter pack at the bottom of the vapor well borehole based on the DTSC Active Soil Gas Investigations guidance manual. The 1.5-inch screen will be set at the midpoint of the sand filter pack and place a one-foot layer of dry bentonite chips above the filter pack, followed by hydrated bentonite to the shallower interval at five feet. The shallower interval will be installed in the same manner with hydrated bentonite up to the ground surface. The hydrated bentonite will serve as a seal around the sample collection tubing to prevent ambient air intrusion into the soil gas sample. A closed valve will be installed at the end of the sample-collection tubing at the surface. The nested soil gas vapor probes will be completed at the surface with a locking protective well box. Soil gas vapor installation, sampling, and testing will be conducted in accordance with Jones Environmental Inc. Standard Operating Procedures Mobile Lab 8260B dated January 2016 Version 13 (see attached) in accordance with the Active Soil Gas Investigation (ASGI) released in July 2015 by the Department of Toxic Substances Control (DTSC). At minimum two rounds of soil gas samples will be collected from each of the soil gas

vapor points. Soil gas samples will be collected at a minimum of 48 hours following installation. Soil gas samples will be analyzed for volatile organic compounds (VOCs) and TPH using the onsite mobile laboratory using EPA method 8260B.

2.5 **Hollow Stem Auger and Soil Sampling**

Soil borings will be advanced using standard hollow-stem auger drilling equipment and methods to collect soil samples. The borings will be advanced to a total depth of approximately 20 to 100 feet bgs, or to refusal, whichever is encountered first. Completion depths and sampling intervals are presented in Table 27 of the SAWP. At locations where geophysical methods could not adequately clear utilities, a hand auger will be used to clear the boring to a depth of 5 feet bgs. The soil borings will be sampled at 5-foot intervals and at notable lithologic changes. The samples will be collected using a split-spoon sampler lined with three 2-inch diameter by 6-inch long stainless-steel sample tubes. Each soil sample interval will be screened for VOCs using a PID and recorded on the boring log. Each soil boring will be visually logged by Langan personnel in general accordance with ASTM Method D-2488 with the USCS to describe subsurface materials. Soil samples will be retained for chemical analysis from each boring at the depths specified in Table 27 of the SAWP. One stainless steel tube from the split-spoon sampler will be retained at the desired depth interval. The ends of these samples will be covered with Teflon sheets, capped at each end, appropriately labeled, bagged, and placed on ice inside an ice chest. Additional samples from the same interval will be collected using Terra core/EPA 5035 sample kits for analysis of VOCs and TPH in four VOA vials with preservative, labeled appropriately, bagged, and placed on ice inside on ice chest. The samples will be submitted to California-certified analytical laboratory under chain-of-custody protocol. Arrangements have been made to have the samples picked up at the site by the laboratory at the end of each work day or the following morning.

After the final sample is collected, each soil boring will be backfilled with the drill cuttings, unless suspected impacted soil is encountered based on observations, odor, and/or PID readings. If suspected impacted soil is encountered, this material will be contained either in 55-gallon drums or placed on and covered with plastic sheeting for additional analysis to evaluate the potential for reuse onsite or offsite disposal.

2.5 Equipment Decontamination Procedures

To avoid cross contamination, all drilling and sampling equipment used during investigation activities will be thoroughly cleaned prior to or upon arrival to the site, before and after each use, and before leaving the site with a non-phosphate detergent such as Alconox and rinsed

with clean water and methods to remove soil and debris from the tools. Decontamination water is managed as investigation derived waste (IDW), and will be transferred to 55 gallon drums and stored in an approved waste management area. As necessary, drilling equipment will be cleaned with a pressure washer.

2.6 Waste Management

Drilling and excavation soil cuttings generated during field activities will be evaluated by Langan. This material is anticipated to be placed back in the test pits and borings unless suspected impacted soil is encountered based on PID readings and odors. If suspected impacted soil is encountered, this material will be contained either in 55-gallon drums or placed on plastic and covered with plastic sheeting for additional analysis to evaluate the potential for reuse onsite or offsite disposal.

2.7 Land Survey

The locations of the soil borings, soil gas vapor probes and, test pits will be established using a hand held Trimble or other similar type system tied to GPS and plotted on existing plan sheets with established survey control.

APPENDIX G

Quality Assurance and Quality Control Plan (QAPP)

Appendix G
Quality Assurance
And Quality Control Plan

Executive Summary

This document presents the quality assurance and quality control plan (QAPP) for the Site Assessment Work Plan for the former Riverside Cement Plant located in Jurupa Valley, California. Jones Environmental, Inc. (Santa Fe Springs, CA) will be collecting and analyzing the soil gas samples from the soil gas probes using their mobile laboratory. Performance Analytical Laboratories (Signal Hill, CA) will be analyzing the soil samples collected from the soil borings and excavation test pits.

During field investigations and sampling events Quality Assurance and Quality Control (QA/QC) samples will be collected to demonstrate the reliability and defensibility of the data. QC samples collected in the field will be used to assess the overall quality of the sampling and analysis process. Field QC samples will include source-water blank, trip blanks, equipment rinsate blanks, field duplicate samples, and matrix spike/matrix spike duplicates (MS/MSD) samples. QA/QC sampling details for each sampling matrix are presented below.

1.0 Duplicate Samples (FDs)

Field duplicate (FD) samples are two samples collected at the same time, from the same source at the same depth or sample location as the associated field sample in an effort to duplicate the collection of a particular sample. Field duplicates are submitted to the project laboratory as separate samples ("blind"). Duplicates sample nomenclature is sequentially as DUP#-year-month-date (e.g., DUP1-2018-06-10, the first duplicate sample of the day June 10 2018). The primary sample and duplicate sample ID pairs will be recorded in the field logs.

The purpose of collecting field duplicates is to assess the consistency and precision of the field sampling process, including collection, transport, and analysis. The purpose of submitting blind duplicate samples is to assess the consistency and precision of the laboratory's analytical system. Field duplicates will be collected at a frequency of one for every 10 samples collected from soil borings and/or soil probes.

1.1 Equipment Rinsate Blanks (EBs)

A maximum of one equipment rinsate blank (EB) will be collected per reusable sampling device per day. EB sample nomenclature is sequentially as EB#-year-month-date (e.g., EB1-2018-06-10, the first EB

sample of the day June 10 2018). The EB sample will be collected following decontaminating the sampling device by pouring ASTM Type II laboratory supplied blank water over the decontaminated sampler directly into the sampling container to evaluate the success of decontamination on non-dedicated/disposable equipment. The EB will be collected and placed in appropriate sample containers and analyzed for the same parameters as the corresponding samples.

1.2 Trip Blanks (TBs)

The laboratory will supply 40-milliliter trip blanks (TB) comprised of laboratory deionized water with each shipment of VOC sampling containers sent from the laboratory, and transported to the site with the sample containers to be used during sampling, handled as an environmental sample, and returned to the laboratory for analysis. Trip blanks are not opened in the field. Trip blanks are prepared only when VOCs are collected for analysis to assess to potential introduction of contaminants from sample containers or during the transportation and storage procedures. Trip blank sample nomenclature is sequentially as TB#-year-month-date (e.g., TB1-2018-06-10, the first trip blank sample of the day June 10 2018). One trip blank will be included with each cooler containing field samples planned for VOC analyses.

1.3 Temperature Blanks

Temperature blanks are sent with each cooler shipped to the offsite laboratory that contains soil or groundwater samples requiring preservation at 4°C. Temperature blanks consist of a VOC vial or similar laboratory container filled with water. Temperature blanks are measured with a thermometer at the laboratory upon receipt to verify the temperature of the sampled contained in that cooler. One temperature blank will be shipped with each cooler to each offsite lab.

1.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

A matrix spike is a normal field sample that is spiked by the analytical laboratory with a known concentration of target analyte prior to sample preparation and then carried through the entire preparatory and analytical procedure. The matric spike duplicate is an intra-laboratory split of the same sample used for the MS that is also spiked with identical concentrations of target analyte and treated the same as the MS sample. MS/MSDs are used to monitor and document possible bias for a given analytical method in a given sample matrix. MS/MSDs are also used to measure the precision and accuracy of the laboratory analytical procedure.

MS/MSDs will be analyzed at a frequency of five percent.

1.5 Data Validation

The QA/QC samples described above will be used to help validate laboratory data. Ten percent of the data will undergo third-party data validation. The SI data packages will be provided in EPA Level III (using EPA-approved procedures) format with at least 10 percent of the data in Level IV (rigorous QA/QC protocols and documentation) format to meet data validation requirements. Data deliverables will go through data validation prior to being imported into summary tables or graphical programs. The analytical laboratory data quality will be measured and evaluated in terms of precision, representativeness, completeness, and comparability parameters. Data qualifiers prepared by the analytical laboratory and the data validation firm will be included on soil summary tables in the SI report.

In addition to the Jones Environmental QA/QC procedures identified in their SOP (January 2016), soil gas data will be validated by Jones Environmental, Inc. for soil gas samples collected from the soil gas vapor probes. Performance Analytical Laboratories, Inc. will validate the soil samples collected from the soil borings and excavation test pits.

2.0 Sample Handling and Custody

This section describes the sample preservation, hold times, and custody and shipping procedures.

2.1 Sample Custody and Shipping Requirements

Sample custody procedures include the use of field logbooks, sample labels, custody seals, and Chain of Custody (CoC) forms. Each person involved with sample handling must be familiar with CoC procedures prior to the start of field operations. The CoC must accompany the samples during shipment from the field to the laboratory.

A sample is considered to be in one's custody under the following circumstances:

- It is in one's actual possession.
- It is in one's view, after being in one's physical possession.
- It was in one's physical procession and locked up to prevent tampering.
- It is in a designated and identified secure area.

2.2 Sample Shipping and Chain of Custody

Proper sample handling, shipment, and maintenance of a CoC's are components of the quality system designed to obtain data that can be used to make project decisions. Sampling handling protocols and CoC requirements will be followed completely, accurately, and consistently. A properly completed CoC form must accompany all samples to the laboratory.

The unique sample IDs and descriptive information (such as site location, date, and time) will be listed on the CoC. Individuals relinquishing and receiving possession of samples will sign and note the time on the CoC form. The CoC must document the transfer of sample custody from the person who collected the sample to the offsite laboratory

Field samples should be sealed in individual bags and positioned within the cooler to prevent damage and maintain sample integrity. Hard plastic ice chest or coolers with similar durability will be used to ship samples. A signed CoC will be included in each shipment, and the cooler will be closed and secured. Arrangements will be made to have the samples picked up at the site by the laboratory at the end of each work day or the following morning. Sufficient quantities of ice will be used to ensure the samples remain in a chilled state.

2.3 Sample Preservation and Holding Time

Constituent	Measurement Parameter	Volume/Weight Required	Type of Container(s)	Preservative	Holding Time
VOC	Aqueous	3 – 40.0 mL VOAs	• VOA	• 4 ± 2°C • HCl (pH <2) • No	14 days
VOC	Soil	8 oz. jar (20g)	Glass Jar Acetate/ Stainless Steel/Brass Sleeve	• 4 ± 2°C • No headspace	14 days
		4 Terra Cores	Terra Core	• 4 ± 2°C	48 hours
		3 Preserved VOAs (20g)	3 VOAs (2-NaHSO4, 1-	• NaHSO4 • MeOH	14 days
VOC	Soil Gas/Air	Max: 250cc	Gas-tight glass	• Protect from	30 minutes
		1 Liter	Tedlar® Bag	• Protect from light	• 6 hours (DTSC) • 3 Days
TPH	Soil/Aqueous	4 – 40.0 mL VOAs	VOA	• 4 ± 2°C • HCl (pH <2) • No	14 days
Metals	Soil	8 oz Jar (20g)	Glass Jar	• 4 ± 2°C	180 days

Metals	Aqueous	500 ml	Polyethylene/Glass	• $HN0_3$	180 days
Cr^{VI}	Soil	8 oz. jar (20g)	Glass Jar	• 4 ± 2°C	28 days
Cr^{VI}	Aqueous	500 ml	Polyethylene/Glass	• 4 ± 2°C	24 hours
PCB	Soil	8 oz. jar (20g)	Glass Jar	• 4 ± 2°C	7 days
PCB	Aqueous	1000 ml	Amber Glass	• 4 ± 2°C	7 days
SVOC/PAH	Soil	8 oz. jar (20g)	Glass Jar	• 4 ± 2°C	7 days
SVOC/PAH	Aqueous	1000 ml	Amber Glass	• 4 ± 2°C	7 days

2.4 Soil Vapor Sample Handling Method Procedures

The following soil vapor sampling handling procedure is cited from Jones Environmental's Standard Operating Procedure and will be followed. The soil vapor samples will be collected on site by Jones Environmental using their State-certified mobile analytical laboratory. The samples will be analyzed for VOCs and TPH using EPA Method 8260B and by gas chromatograph/mass spectrometry (GC/MS).

Prior to use, each gas-tight syringe is leak-checked by closing the exit valve and attempting to force ambient air through the Luer fitting. Plastic syringes are not used and should be avoided in collecting samples.

Glass gas-tight syringes and bulbs may be decontaminated by disassembling and heating them. Some components of the syringes and glass bulbs, such as the syringe barrel and bulb stopcock, cannot be heated and should be decontaminated by other methods such as rinsing with methanol and/or expunging with nitrogen or clean air.

Samples received in polymer gas sampling bags (Tedlar® Bags) should not be exposed to light or extreme temperatures. They should be kept in an opaque container (i.e. cooler or black trash bag) until analyzed. Polymer gas sampling bags are not reused.

Passivated stainless steel canisters (SUMMA®s) are cleaned using an automated cleaning station which cycles through evacuating and pressurizing the canister using UHP-grade nitrogen gas (N2). Upon completion of cleaning all Jones canisters are individually certified.

The person who is sampling will record the pressure upon start and completion of the sampling. If the samples are analyzed at a fix-based laboratory, the canisters are returned to the laboratory with a slight vacuum (two to four inches of mercury). These pressure measurements should be included in the laboratory's analytical report as a mechanism to verify the integrity of the sample.

2.5 Other Sample Containers

Glass Jars – A minimum of two 8 oz. jars should be collected without any headspace. Samples must be received chilled and properly labeled with information matching the COC. Glass jars will be used for analyzing metals, hexavalent chromium, SVOCs/PAHs, and dioxins. The glass jars will be used for collection of soil from the excavation test pits.

Stainless Steel/Brass/Acetate Sleeves – Must be received chilled and properly labeled with information matching the COC. A split-spoon sampler lined with six-inch long tubes will be used to collect the soil samples from the boreholes drilled with a hollow-stem auger. Soil samples for analytical testing will be collected from the lead sample tube using the Terra core/EPA 5035 sample kits and contained in four VOA vials and 8 oz. glass jars.

VOAs (Preserved) EPA 5035 – Preservation must be clearly marked on the label of the VOA along with the tarred weight of the VOA before sample was added. A minimum of four (4) VOAs should be collected per sample. Two VOAs should be preserved in Sodium Bisulfate (NaHSO4) and one should be preserved in Methanol (MeOH). These samples must be received chilled and properly labeled with information matching the COC. These samples will be collected using the Terra core/EPA 5035 sampling kits.

Terra Core (Un-preserved) – A minimum of four (4) 5.0-g Terra Core samples must be provided to allow for dilutions if necessary. Must be received chilled and properly labeled with information matching the COC.

3.0 Field Documentation and Record Keeping

Langan field personnel will maintain bound field logbooks to provide a daily record of significant events, observations, and measurements, during activities and sampling. All information pertinent to sampling will be recorded in the logbooks. Information will also be recorded in soil boring, soil gas, and trench logs. All entries will be signed and dated, and must include at minimum the following information;

- Name and title of author, date and time of entry, and weather/environmental conditions during the field activity.
- Location of sampling activity
- Name and title of field crew
- Name and title of site visitors
- Sample media (such as soil)

- Sample collection methods
- Number and volume of samples collected
- Date and time of collection
- Sample identification numbers
- Sample description (such as color, odor) and identification of conditions that might affect the representativeness of a sample (such as refueling operations, etc.)
- Sample distribution (such as which samples went to the laboratory)
- Field observations
- Field equipment serial numbers and calibration results/records
- Field measurements

Data recorded in field logbooks, sample labels, and COC forms will be written legibly and with waterproof, black, indelible ink. None of these accountable documents are to be destroyed or thrown away, even if illegible or containing inaccuracies. If an error is made on an accountable document assigned to an individual, that individual should make all the corrections by crossing a line through the error, initialing and dating the correction, and entering the correct information. The erroneous information will not be obliterated. Any subsequent error discovered on an accountable document should be corrected by the person who made the entry. All subsequent corrections will be initialed and dated.

Summary of Findings Report

EXECUTIVE SUMMARY

Langan Engineering and Environmental Services, Inc. (Langan) implemented the California Department of Toxic Substances Control (DTSC) approved Site Assessment Work Plan (SAWP) for the Agua Mansa Commerce Park from 11 July 2018 to 26 July 2018. The investigation included the excavation and soil sampling of twenty (20) composite shallow test pits (SWs), thirty-two (32) deep excavations (i.e. MAP-LT), six (6) soil borings (i.e. MAP-SB), installation of eleven dual-nested soil gas probes (i.e., MAP-SG), and collection of soil gas samples. The locations of the sampling activities are shown on Figure 2. A total of 144 soil samples were collected. The soil samples were collected from the trenches and soil boring for the one or more of the following analysis: TPH, VOCs, SVOCs, PAHs, Title 22 Metals, PCBs, Dioxins, and Cr^{VI}.

Soil gas samples collected from the eleven (11) soil gas locations were analyzed for VOCs and TPH following EPA Method 8260B using an on-site mobile laboratory. The results indicated that VOCs and TPH were not detected above their respective reporting limits. Therefore, no further soil gas investigation is recommended.

The following constituents were not reported above their respective reporting limits in the soil samples analyzed: PCBs, Pesticides and herbicides, VOCs and SVOCs. PAHs were reported in three samples of the forty-eight (48) analyzed above their respective detection limit; however, there is not a corresponding DTSC soil commercial/industrial screening level (SL) for these compounds. The PAH compounds detected included 2-methylanphthalene, anthracene, phenanthrene, pyrene, chrysene, and fluoranthene. The highest concentration of these compounds (phenanthrene) was reported in sample MAP-LT-2-10 at 31 micrograms per kilogram (µg/kg). Dioxins were reported below the residential SL of 50 ppt in sixty-eight (68) samples analyzed at the Site. A total of eighty-seven (87) soil samples were analyzed for TPH. The maximum TPH concentration reported was 524.5 milligrams per kilogram (mg/kg) within the motor oil range (C_{23} – C_{40}) in the Material Storage Area at SW-15-1. No further assessment is recommended for these compounds.

Based on the results of the investigation, the following conclusions are provided:

- Arsenic was reported above the DTSC SL site-wide (114 samples) and above the published upper bound regional background concentrations of 10 mg/kg (29 samples). Published literature indicates that Arsenic is a metal commonly measured in soils throughout California. The maximum arsenic concentration associated with soils above the regional background was 28.9 mg/kg. Based on the information provide above, no further action is recommended for arsenic.

- The single lead concentration detected above the SL of 320 mg/kg in sample SW-13-5-white (514 mg/kg) was encountered in the Material Storage Area in a white clay material, which was a feed product in the cement manufacturing process. The other 170 samples analyzed for lead were below the SL of 320 mg/kg. Based on this information, no further action is recommended for lead.

- Cr^{VI} was reported above the Environmental Protection Agency (EPA) commercial/industrial Regional Screening Level (RSL) of 6.3 mg/kg in only three samples (GCP-LT-9-10, SMC-SB-1-5, and SMC-SB-1-10). Sample GCP-LT-9-10 is located in a berm east of the Grey Kilns and former baghouses where previous Cement Kiln Dust (CKD) material was placed during the cement plant operations (Table 12 and Figure 3). Samples SMC-SB-1-5 and SMC-SB-1-10 are located in the Wet Weather Quarry area where non-specification cement product was deposited during the cement plant operations (Table 12 and Figure 3). Based on this information, no further action is recommended for Cr^{VI}.

- At the request of DTSC in a meeting on 2 July 2018, a synthetic precipitation leaching procedure (SPLP) test was performed on two samples, SMC-SB-1-5 (9.24 mg/kg) and SMC-SB-1-30 (5.32 mg/kg), to evaluate the potential leachability of Cr^{VI} into the groundwater. The results of the SPLP test reported concentrations of 28.5 micrograms per liter (µg/L) and 34.4 µg/L in SMC-SB-1-5 and SMC-SB-1-30, respectively (Figure 2 and Table 7). A Maximum Contaminant Level (MCL) does not exist in California for Cr^{VI}; however, the above values are less than the total chrome MCL of 50 µg/L.

The lead and Cr^{VI} concentrations that exceed their respective SLs appear to be associated primarily with former cement feed product (i.e. white clay and/or CKD), and appear to be localized within the Material Storage Area, Gray Cement Plant, and in the vicinity of the Wet Weather Quarry.

The areas that encountered refusal during the proposed SAWP trench sampling activities are located in the Maintenance, Administration, and Packaging and Grey Cement Plant study areas. The trenches located in these areas are located where the former original cement plant was demolished prior to the subsequent renovations and construction of the present day cement plant. In addition, the area of the former Sag Pond (Figure 2) where TPH concentrations were encountered (LT-9, 1,700 mg/kg and 950 mg/kg at 4 feet and 8 feet, respectively) during Langan's Preliminary Environmental Assessment (PEA) was not accessible during this assessment due to the debris prohibiting access. These areas will need to be addressed during the demolition phase of the project along with the areas underlying the existing buildings/structures as outlined in the DSTC approved SAWP. These areas will be addressed in the Response Plan, which will include a Demolition and Soils Management Plan that will be submitted and approved by DTSC prior to implementation.

1.0 INTRODUCTION

Langan Engineering and Environmental Services, Inc. (Langan) has prepared this Summary of Findings report for the former Riverside Cement Plant (RCP) (hereinafter referred to as the "Site"), located at 1500 Rubidoux Boulevard in Jurupa Valley, California (Figure 1). The Site consists of approximately 206 acres in the City of Jurupa Valley, Riverside County, California. The Site is under nine (9) separate California Land Reuse and Revitalization Act (CLRRA) agreements with the Department of Toxic Substances Control (DTSC) for the proposed redevelopment project. The CLRRA agreements were executed on 16 January, 2018. The purpose of the Summary of Findings Report is to document the field implementation and results of the additional soil and soil gas sampling activities completed as part of the DTSC approved Site Assessment Work Plan (SAWP) dated 10 July 2018.

The proposed development for the Site consists of the construction of six (6) warehouse distribution structures with associated utilities and parking. As part of the redevelopment program, the onsite structures will be decommissioned, decontaminated and demolished, and mass grading activities will be performed to construct building pads for the proposed structures. The mass grading project for the Site includes a balanced cut and fill with a total grading estimated at between one and two million cubic yards (yd^3). After demolition and grading operations are completed, the Site will be covered by the proposed development which includes concrete tilt-up structures, paved circulation and parking and landscaped areas.

1.1 OBJECTIVES

The purpose of this Summary of Findings Report is to obtain additional field and analytical information to meet the data quality objectives (DQOs) defined in the SAWP for the future Site development project. The supplemental site assessment and data collection activities provided additional data within the six study areas identified in Langan's Preliminary Environmental Assessment (PEA), dated 20 December 2018. Certain areas of the supplemental site assessment were deferred to the decontamination and demolition and the soil management phases due to accessibility issues. These areas were identified in the SAWP and will be addressed once the onsite buildings and structures have been removed. The sampling activities preformed also addressed additional data requested in DTSC's review comments of the PEA dated 28 February 2018. The supplemental site assessment activities were conducted in accordance with the DTSC approved SAWP dated 10 July 2018 and subsequent revisions to the SAWP as requested in DTSC's letter dated 19 July 2018.

The four data quality objectives (DQO) for the supplement site assessment are:

- DQO-1: Determine and evaluate potential chemicals of potential concern (COPCs) and the lateral and vertical extents of COPCs in former known or suspected source areas to support a health risk evaluation, as required, and the Response Plan.

- DQO-2: Determine and characterize the onsite soils for reuse as onsite fill or for off-Site disposal

- DQO-3: Identify hexavalent chromium (Cr^{VI}) containing materials that have a potential to generate dusts/emissions especially during grading or demolition activities

- DQO-4: Evaluate potential leaching of metals and hexavalent chromium into groundwater

2.0 SITE DESCRIPTION

2.1 Site Description and Location

The Site is approximately 206 acres located at 1500 Rubidoux Boulevard. The approximate location is shown on Figure 1. The Site includes 13 parcels in Jurupa Valley, California with the Assessor's Parcel Numbers (APNs) listed below:

APN #
175-200-001 (Portion)
175-200-002
175-200-003
175-200-004
175-200-005
175-200-007
175-200-008
175-200-009

APN#
175-170-035
175-170-036
175-170-040
175-170-041 (Portion)
175-180-001

The Site is bound to the west by Union Pacific Railroad (UPRR) tracks and Rubidoux Boulevard, to the north by El Rivino Road, to the south by three inactive quarries and Agua Mansa Road, and to the east by industrial development and Hall Avenue. As shown on Figure 1, the northwestern section of the Site contains undeveloped land and unpaved roads, while the northern section contains undeveloped land and a paved entrance road with a guard shack.

The western section encompasses an entrance road, along with storage silos, a warehouse (Pack House), part of the former white cement manufacturing plant, and one to two-story administration buildings (Truck Garage, Transportation Office, Storehouse, and Garage). The eastern section contains the raw materials storage area and the remnants of the Grey Cement Plant (primarily the support structures for the rotary kilns).

2.2 Site History

The Site was in operation from the early 1900s until 2014. Operations on Site were divided into either the cement manufacturing operations or the Crestmore mine where mining of limestone and quarrying activities were conducted. In addition, the Site included various support facilities, heavy machinery, and administrative buildings that were related to the cement manufacturing plant and limestone quarrying and mining operations.

The facility underwent three major redevelopment phases over the life of its operation. From the early 1900s to the 1950s, the cement plant was located in the south western portion of the Site just north of the present day White Cement Plant. The facility at that time was operated using petroleum-based fuels (i.e. Bunker C) stored in fuel tanks. As the cement manufacturing process evolved through the use of updated technology and other changes in the industry, the facility went through an expansion and redevelopment phase from the late 1950's through early 1960's, which included conveyor belt systems and compressed air, development of raw material storage areas, and upgrades to processing of raw materials to manufacture cement product. During the second renovation phase, the facility was operated using both coal and petroleum-based fuels. By the 1960's, the original plant had been demolished and the present day facility was constructed that generated both grey and white cement product. The current facility was operated until it was shutdown in 2014.

Cement manufacturing operations began in 1914 and continued through 2008. The limestone obtained from the onsite quarries/mines was mixed with raw sand and clay materials imported from off-Site sources, and heated in rotary kilns to manufacture cement clinker. The raw materials were stored in onsite silos prior to 1960s until the Raw Material Storage Area (RMSA), located along the northwestern portion of the Site, was developed at which point the materials were staged there. The cement clinker was then crushed to create two primary types of cement (i.e., White and Grey Cement), which was then packaged and shipped offsite. Cement Kiln Dust (CKD) was one of the primary by-products generated during the manufacturing process. The CKD can often be identified by its slight pinkish hue. When hydrated, CKD becomes dense and relatively impermeable to water, but does not form a cemented mass.

Prior to the 1970s, CKD was hauled from the kilns using end-dump trucks and reportedly placed with fill soils/mine spoils at several locations throughout the Site (Figure 1). The placement of CKD material primarily occurred from 1955 to 1979, and the primary location was the Wet Weather Quarry. Due to the advancement in the cement manufacturing process during the 1970's, previously discarded CKD material was reclaimed and used as feedstock in the cement making process. Also during the 1950s and early 1960s, the cement manufacturing process developed a closed-loop system with the incorporation of bag houses to capture CKD and other particulate materials generated during the cement manufacturing process. The CKD material was reclaimed beginning in the early 1970s until the operations were shutdown in 2014.

The equipment used to manufacture cement generally relied on electrical power for material conveyance/process control, and petroleum fuels for heating at various times over the life of the facility. Petroleum fuels were historically provided by a 6,000,000 gallon tank storing Bunker C fuel oil. Other underground storage tanks (USTs) at the Site were used to store petroleum products such as gasoline, diesel fuel, fuel oil, and waste oil.

3.0 FIELD IMPLEMENTATION ACTIVITIES

3.1 Boring Clearance and Geophysical Survey

On 6 July 2018, Langan contacted DigAlert prior to the subsurface investigation activities conducted at the Site. In addition, Langan's subcontractor, Pacific Coast Locators (PCL), conducted a geophysical survey on the Site to clear utilities in and around the proposed and marked investigation trench and boring locations.

3.2 Summary of Activities

Field activities were conducted from 11 July 2018 to 23 July 2018 in accordance with the DTSC approved SAWP, dated 10 July 2018 with revisions noted below. The investigation included the excavation and soil sampling of twenty (20) composite shallow test pits (SWs), thirty-two (32) deep excavations (i.e. MAP-LT), seven (7) soil borings (i.e. MAP-SB), installation of eleven dual-nested soil gas probes (i.e., MAP-SG), and collection of soil gas samples. The locations of the sampling activities are shown on Figure 2. Table 1 provides a summary of the field observations. The logs of the soil borings and trenches are presented in Appendices A and B, respectively.

Langan's SAWP was revised based on DTSC's letter dated 19 July 2018. The additions to the SAWP requested by the DTSC are summarized below:

1. Wet Weather Quarry Area (WWQ)
    - Soil boring, SMC-SB-3, added based on field evaluation by DTSC geologist
    - Drilling depths for soil borings, SMC-SB-1 through SMC-SB-3, to extend to top of native layer/bedrock, likely 100 feet (ft.) instead of 20 ft. as shown in Table 27
    - Soil samples collected from four (4) depths and analyzed for TPH, SVOCs, PAHs, and PCBs, with half to be analyzed for Dioxins
    - Samples analyzed for Cr^{VI} and total metals collected at 1, 5, and 10 feet below ground surface (bgs) as indicated in Table 27
2. White Cement Plant Area (WCP)
    - Soil gas probe, WCP-SG-3, added near the location of WCP-SB-1 in the White Cement Plant area, to evaluate the potential impact from the former 210,000-gallon aboveground storage tank (AST).
    - The soil samples from 5 feet and 15 feet analyzed for TPH and VOCs, and the soil boring at WCP-SB-1 will no longer be performed.

3. Former 6,000,000-gallon tank area
    - The location of soil boring, MAP-SB-3, relocated near the former sampling location VB-1, where elevated TPH was identified during previous investigations by others (ERM West, 1987).
    - Analyze samples from MAP-SB-2 for TPH at depths of 10, 30, and 50 feet below ground surface (bgs), to be consistent with other analytes at the other two locations.
4. Material Storage Area (MSA)
    - Analyze samples from MSA-LT-2 and MSA-LT-4 for TPH at sample depths of 5, 10, and 15 feet bgs.
5. Trench location GCP-LT-2 in Grey Cement Plant area moved to the south of the grey kiln line
6. Trench, SMC-LT-1, moved to the black iron ore location.
7. Soil samples at the bottom of each trench (i.e., 20 feet bgs) to be archived for possible analytical needs

One of the seven (7) proposed soil borings, WCP-SB-1, was not drilled after the additional soil gas probe (WCP-SG-3) noted above was installed in the same area at the request of DTSC. This modification was verbally approved by DTSC and documented in an email dated 16 July 2018 (Appendix C). The locations of the trenches, soil borings, and nested soil gas probes are shown on Figure 2.

Areas Not Investigated/Completed

Several areas were not investigated as presented in the DTSC approved SAWP due to field accessibility and refusal conditions. Evaluation of these areas was unsuccessful due to either hard ground conditions and/or obstructions that prohibited excavation in these areas. The areas that could not be investigated are listed below and shown on Figure 2. Table 1 provides a description of the field observations encountered in each of these areas.

- MAP-LT-4, MAP-LT-5, and MAP-LT-6 (Maintenance, Administration, and Packaging)
- SW-18 (Maintenance, Administration, and Packaging)
- SW-17 (south of center point, Grey Cement Plant)
- SMC-LT-2 (Surface, Mining, and Crushing)

MAP-LT-4, MAP-LT-5, and MAP-LT-6 are located in the area of the original cement plant that was constructed prior to the 1920s. Ground conditions were extremely dense in these areas and possible former concrete foundations were encountered in the area of MAP-LT-4. As discussed in the approved SAWP, these types of areas as well as inaccessible areas due to structures will be evaluated during the decontamination and demolition phase of the project. The six areas listed above were appropriately marked so they can be accurately located during the demolition phase of the project.

3.2.1 Soil Gas Probe Installation

A total of eleven (11) borings were drilled and converted to dual-nested soil gas probes that were completed at 5 feet and 15 feet bgs in a single borehole (Figure 2). The soil gas probe locations include: WCP-SG-1, WCP-SG-2, WCP-SG-3, GCP-SG-1, MAP-SG-1, MAP-SG-2, MAP-SG-3, MAP-SG-4, MAP-SG-5, MAP-SG-6, and MAP-SG-7.

The drilling was completed using a CME-95 hollow-stem auger (HSA) drill rig equipped with 8-inch outside diameter augers. The soil borings and soil gas probe installations were observed by a Langan professional geologist. The soil encountered was logged in accordance with the Unified Soil Classification System (USCS).

The soil gas probes were constructed of ¼-inch Teflon tubing. At the bottom of each tube, a 6-inch long stainless steel screen was connected. The annular space around the stainless steel screen was filled with No. 3 sand to approximately one foot above the screen. An approximate one foot thick granular bentonite seal was placed on top of the sand. The 6-inch screen was set at the approximate midpoint of the sand filter pack. Hydrated bentonite chips then filled the remaining borehole annular space to near the base of the shallower 5 foot bgs soil gas probe. An approximate 6-inch layer of No. 3 sand was placed on top of the bentonite and then the 5 foot soil gas probe was installed and completed similar to the 15 foot bgs soil gas probe. The hydrated bentonite serves as a seal around the sample collection tubing to reduce the potential for ambient air intrusion into the soil gas sample. A closed valve was installed at the end of each sample collection tube at the surface. The soil gas probes were completed at the surface with an 8-inch Emco-Weaton Traffic Rated flush-mount box set at grade level. The soil cuttings were placed in 55-gallon drums that were labeled and sealed for subsequent handling based on analytical data.

Soil samples were collected at 5 foot bgs and 15 foot bgs and placed on hold at the laboratory pending soil gas results.

3.2.2 Soil Borings

A total of six (6) soil borings (refer to Section 3.2 Summary of Activities) were drilled and sampled at the Site using a CME-95 HSA. Three soil borings were drilled and sampled in the Surface, Mining, and Crushing area to attempt to determine the potential depth of fill materials above the groundwater table. The target depth for the three borings (SMC-SB-1, 2, and 3) was 100 feet bgs based on the approximate groundwater depth at the Site. Refusal was encountered and the borings were terminated at 33 feet, 45 feet, and 40 feet bgs, respectively.

Two borings were drilled and sampled in the Maintenance, Administration, and Packaging area (MAP-SB-2 and MAP-SB-3). These borings were drilled to 50 feet bgs to assess potential residual soil impacts from the former 6-million gallon Bunker C fuel oil tank, which was previously remediated by others through excavation of the impacted soils to an approximate depth of 40 feet bgs (ERM West, 1987).

A soil boring, MAP-SB-1, was drilled and sampled near a former 550-gallon waste oil tank that had previously been removed in the late 1990s by others (Cal Tank Testing, 1988b). The soil boring was drilled to a depth of 20 feet bgs to assess residual soil conditions from the prior UST removal action.

Upon completion, the boreholes were backfilled with the soil cuttings.

During the drilling, split spoon sampling was conducted at five foot intervals to the termination depth of the each boring. The samples were screened in the field with a photoionization detector (PID) calibrated to isobutylene. Soil samples were collected using an 18-inch long California modified split-spoon sampler lined with brass tubes that was driven into the subsurface with a 140-pound hammer. The blow counts per six-inch interval as well as the PID readings were recorded on the field boring logs. The split spoon sampler was decontaminated using tri-sodium phosphate and then rinsed with deionized water. The augers were steam cleaned between soil borings.

Disposable 5.0 gram Terra Core sample kits with four (4) volatile organic analysis (VOA) vials were used to collect soil from the bottom 6-inch brass tube from the split-spoon sampling device. The collected soil was transferred into a glass VOA vial containing preservative (two

VOAs contained sodium bisulfate and one VOA contained methanol), sealed, and labeled with a unique designation corresponding to the boring identification and sample depth. A total of four (4) VOA vials were collected at each sample interval. The remaining soil in the bottom 6-inches was contained in eight ounce (8 oz.) glass jars, sealed, and labeled similar to the VOA vials. The drilling equipment and split-spoon sampling device that came into contact with soils were decontaminated using the three bucket rinse process. The samples were recorded on a chain-of-custody and placed in an ice chest with ice for pick up by the analytical laboratory at the Site. Analytical testing was conducted by Performance Analytical Laboratories, Inc. (PAL).

Soil samples collected from borings SMC-SB-1, 2, and 3 were analyzed for total petroleum hydrocarbons (TPH, carbon chain), hexavalent chromium (Cr^{VI}), Title 22 metals, semi-volatile organic compounds (SVOCs), polycyclic aromatic hydrocarbons (PAH), dioxins, and polychlorinated biphenyls (PCB). Soil samples from SMC-SB-1-5 and SMC-SB-1-30 were also analyzed for the synthetic precipitation leaching procedure (SPLP). Soil samples from MAP-SB-1 were analyzed TPH and VOCs. Soil samples from MAP-SB-2 and MAP-SB-3 were analyzed for TPH, metals, VOCs, and SVOCs.

3.2.3 SCAQMD Hexavalent Chromium Sampling

A total of twenty (20) composite shallow test pits (SWs) were completed relative to the SCAQMD Title V permit closure requirements and to evaluate Cr^{VI} in shallow soils that may come into contact with workers during future demolition and mass grading activities (DQO-3). The twenty (20) composite SWs were completed using a CASE 430 Backhoe, operated by Langan's subcontractor, American Integrated Services, Inc. (AIS). Shallow test pit SW-16, located in the Grey Cement Plant area, was completed using a CASE CX-290 excavator due to a steep slope that was not accessible by the backhoe. Each test pit location consisted of one center location and four step-out locations spread radially approximately 100 feet north, south, east, and west of the center location to collect analytical data as part of DQO-3. At the request of DTSC, the samples collected from the locations in the Material Storage Area (SW-8, SW-9, SW-10, SW-13, SW-14, and SW-15) were collected in a linear pattern (i.e. north-south) to provide coverage for the specific bay (see Figure 2).

A total of five test pits were excavated per Material Storage Area bay. At each location, a pit was excavated to a depth of five (5) feet bgs with samples collected at 1 foot and 5 feet bgs. The samples at 1 foot bgs from the five (5) test pits within each bay were composited into one sample for chemical analysis. The samples at 5 feet bgs from the five (5) test pits within each

bay were also composited into one sample for chemical analysis.

The composite samples were created by placing the soils from each depth interval per location into a stainless steel bowl and mixing with a stainless steel trowel until the soil was homogenized. The samples were recorded on a chain-of-custody and placed in an ice chest with ice for pick up by PAL. Each test pit location was backfilled with the excavated material. The samples for the SCAQMD sampling plan (SW-1 to SW-20) were analyzed for Cr^{VI} and Title 22 metals. At the request of DTSC, certain locations were designated as site-wide samples (Figure 2) and therefore were also analyzed for TPH-carbon chain and PCBs.

The sampling equipment was decontaminated prior to use at each location using a wire-brush to remove soil and then cleaned with tri-sodium phosphate (TSP) followed by thorough rinsing with deionized water.

3.2.4 Deep Excavations

Trenching for the SAWP test pits throughout the Site was conducted based on the approved SAWP using a CASE CX-290 Excavator. In general, trenches were excavated to approximately 20 feet bgs, with the exception of trenches that collapsed or encountered refusal before 20 feet (see Table 1). The samples collected from the trenches were analyzed for Cr^{VI} and Title 22 metals. Additional chemical analysis included: TPH, PCBs, SVOCs, VOCs, PAHs, and dioxins. Soils were screened with a PID and then collected in laboratory-provided, 8-oz. sample glass jars. Soils collected for pH purposes were collected in one-gallon freezer plastic bags with a hand trowel. Soils samples analyzed for VOCs were collected with Encore sampling kits from the excavator bucket. The soil samples were stored on ice in a cooler for picked up by PAL. The trenches were backfilled with the excavated trench material.

The hand trowel used to collect soils samples was decontaminated prior to use at each investigation location using a wire-brush to remove soil and debris from the trowel and then cleaned with TSP followed by rinsing with deionized water.

3.2.5 Site Specific Background Samples

At the request of DTSC, locations in the Vacant Land study area were selected to represent site specific background conditions based on the limited historical operation in that portion of the Site. These locations include SW-4, SW-5, SW-6, VL-LT-2, and VL-LT-3. The sampling scheme for these shallow test pits was the same as previously described in the paragraph above for the

deep excavations.

In addition, five (5) shallow composite samples were collected at 6-inches bgs to evaluate potential near surface impacts. Test pits VL-LT-2 and VL-LT-3 were analyzed for Cr^{VI}, Title 22 metals, and dioxins at 1 foot and 5 feet bgs. Samples from test pit SW-4 were analyzed for Cr^{VI} and Title 22 metals at 1 foot and 5 feet bgs. Samples from test pits SW-5 and SW-6 were analyzed for Cr^{VI}, Title 22 metals, TPH, dioxins, and PCBs.

The locations of the background samples are shown on Figure 2. The hand trowel used to collect soils samples was decontaminated prior to use at each investigation location using a wire-brush to remove soil and debris from the trowel and then cleaned with TSP followed by rinsing with deionized water.

4.0 FIELD INVESTIGATION RESULTS

The results of the field investigation are summarized below.

4.1 Soil Gas Sampling and Analytical Results

Langan's subcontractor, Jones Environmental Inc. (JEI), conducted two rounds of soil gas sampling on 16 July 2018 and 26 July 2018 with oversight from Langan and DTSC personnel. Using an onsite mobile laboratory, a JEI technician purged, collected, and analyzed soil gas samples from the 11 soil gas boring: WCP-SG-1, WCP-SG-2, WCP-SG-3, GCP-SG-1, MAP-SG-1, MAP-SG-2, MAP-SG-3, MAP-SG-4, MAP-SG-5, MAP-SG-6, and MAP-SG-7. The locations of the soil gas probes are shown on Figure 2. The purging, sampling, and quality assurance/quality control (QA/QC) protocols were pursuant to JEI's Standard Operating Procedures Mobile Lab 8260B dated January 2016, version 13 and the Active Soil Gas Investigation (ASGI) released in July 2015 by the DTSC presented in the approved SAWP.

During the 16 July 2018 event, the soil gas probes were purged at a rate of approximately 2,000 cubic centimeters per minute (cc/min) with a sampling rate of approximately 200 cc/min. The purge rate of 2,000 cc/min was chosen due to the larger than normal borehole (8-inches) and increased purge volume required to adequately purge the air column within the borehole prior to collection of the soil gas sample. In accordance with the 2015 DTSC/RWQCB active soil gas investigations advisory document, increased purge volumes are acceptable in the case of larger than typical boreholes and/or deeper completion depths than what is typical for soil gas assessments.

At the direction of Mr. Chris Guerre and Mr. Jose Marcos of DTSC, the purge rate was adjusted prior to sampling the soil gas probes for the 26 July 2018 sampling event. Two sets of pumps were used to accommodate two flow rates that included purging some of the soil gas probes at 200 cc/min and the remaining at 500 cc/min prior to soil gas sample collection. The DTSC directed the purge rate for each soil gas probe. Following purging, the soil gas probes were allowed to stabilize prior to sample collection. The soil gas samples from the probes were collected using a 200 cc/min flow rate in accordance with EPA Method 8260B and EPA SW-846 Method 5030 and 5035 for sample collection and then analyzed for VOCs and TPH by gas chromatography/mass spectrometry (GC/MS). A summary of the purge rates for the 26 July 2018 sampling event are presented in Table 2.

The soil gas samples were analyzed in JEI's mobile laboratory using EPA Method 8260B for VOCs and TPH. A laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) were analyzed with each batch of soil gas samples for a total of four (4) control samples. A replicate sample was analyzed for each sampling event. A summary of the analytical results is presented in Table 3.

The analytical results indicate that VOCs and TPH were not detected above their respective reporting limits in the soil gas samples for 16 July and 23 July 2018 sampling events. The analytical reports are presented in Appendix D.

4.2 Soil Analytical Results and Evaluation

The analytical results for SCAQMD sampling and each study area are summarized below and are presented in Tables 4 through 12. The laboratory reports for the soils are presented in Appendix E. Below is a list of the compounds that were analyzed for in accordance with the DTSC approved SAWP for samples collected at the former Riverside Cement Plant.

- Volatile Organic Compounds (VOCs)
- Semi-Volatile Organic Compounds (SVOCs)
- Total Petroleum Hydrocarbons (TPH)
- Title 22 Metals
- Hexavalent Chromium (Cr^{VI})
- Polychlorinated Biphenyl (PCBs)
- Dioxins
- Polycyclic Aromatic Hydrocarbons (PAHs)

Soil samples were analyzed for certain analytes from the list above based on historical operational area (i.e. Study Area) and feature information and potential chemicals that may have been used at that particular study area and/or feature. A subset of sample locations were designated as site-wide samples to address DOQ-2, which were analyzed for the site-wide COCs that included Title 22 metals, Cr^{VI}, TPH, and PCBs. The sample locations were selected to provide site-wide spatial coverage as shown on Figure 2. The analytical results were compared to the DTSC screening levels (SL) for commercial/industrial soils, dated June 2018. The analytical results for Cr^{VI} were compared to the Environmental Protection Agency (EPA) commercial/industrial Regional Screening Level (RSL) of 6.3 mg/kg, dated May 2018.

4.2.1 SCAQMD Analytical Results

Twenty (20) SWs were conducted for the SCAQMD closure requirements to evaluate the near surface soils for dust generation during future demolition and grading operations (DQO-3). The results of the analytical testing are presented in Table 4 and the laboratory reports are presented in Appendix D.

None of the samples analyzed for Cr^{VI} exceeded the RSL of 6.3 mg/kg. Arsenic exceeded the SL of 4.2 mg/kg in twenty-two samples with a range from 4.25 mg/kg to 68.1 mg/kg. The highest concentration of 68.1 mg/kg was reported in a sample collected of white clay in the Material Storage Area (SW-3-5-white) which was used as feed product for the former cement manufacturing process. This sample is not representative of the soils within the Material Storage Area and is clearly identifiable at the Site.

None of the other metals analyzed exceeded their respective SLs.

4.2.2 Site-Specific Background Analytical Results

The DTSC suggested site-specific background samples were collected from five (5) test pit locations (SW-4, SW-5, SW-6, VL-LT-2 and VL-LT-3) in the Vacant Land area. These locations were selected as a result of limited historical cement plant operations. The results of the site-specific background samples are summarized in Table 5. The samples collected from VL-LT-2 and VL-LT-3 were composited and analyzed for Cr^{VI}, Title 22 metals, and dioxins at 1 foot, 5 feet, and 10 feet bgs. Samples from SW-4 and SW-6 were analyzed for Cr^{VI} and Title 22 metals and samples from SW-5 were analyzed for Cr^{VI}, Title 22 metals, TPH, PCBs, and dioxins at 1 foot and 5 feet bgs. In addition, shallow surficial samples (6-inches) were composited from these five locations. The 6-inch samples were analyzed for Title 22 metals, Cr^{VI}, and dioxins, except the sample from SW-5 which was also analyzed for PCBs.

The results indicated that arsenic was above the SL of 4.2 mg/kg in two samples (SW-5-6-inches and SW-5-5, 5.18 mg/kg and 5.6 mg/kg, respectively), two samples (VL-LT-2-1 and VL-LT-2-5, 4.81 mg/kg and 4.35 mg/kg, respectively) and three samples (VL-LT-3-6 inches, VL-LT-3-1, and VL-LT-3-5, 4.94 mg/kg, 8.94 mg/kg, 8.66 mg/kg, respectively). The other compounds analyzed from these locations were either below reporting limits or below their respective SLs and RSLs. Dioxins were either below reporting limits or below the residential SL of 50 parts

per trillion (ppt), which is the residential screening level published in DTSC's Human Health Risk Assessment (HHRA) Note No. 2 dated April 2017.

4.2.3 PCBs, SVOCs, and Pesticides and Herbicides

A total of fifty-seven (57) samples were analyzed for PCBs, two (2) samples were analyzed for pesticides and herbicides, and forty-six (46) samples were analyzed for SVOCs. The following constituents were not reported above their respective reporting limits: PCBs, pesticides and herbicides, and SVOCs.

4.2.4 Polycyclic Aromatic Hydrocarbons

A total of forty-eight (48) samples were analyzed for PAHs. PAHs were detected in three samples (MAP-LT-2-10, SMC-SB-1-5, and SMC-SB-3-20). In MAP-LT-2-10, 2-methylnaphthalene was reported at a concentration of 15 µg/kg, benz (a) anthracene at a concentration of 13 µg/kg, phenanthrene at a concentration of 31 µg/kg, and pyrene at a concentration of 24 µg/kg. In SMC-SB-1-5, phenanthrene was reported at a concentration of 12 µg/kg. In SMC-SB-3-20, chrysene was reported at a concentration of 11 µg/kg, fluoranthene at a concentration of 12 µg/kg, phenacnthrene at a concentration of 17 µg/kg, and pyrene at 12 µg/kg. None of these compounds have DTSC commercial/industrial screening levels for soils.

4.2.5 Volatile Organic Compounds

Soil samples in the Surface, Mining, and Crushing, Grey Cement Plant, White Cement Plant, Material Storage Area, and Vacant Land study areas were not analyzed for VOCs due to no known historical solvent use and/or other sources of potential COCs in these study areas/operational areas. In addition, the Vacant Land area has never been developed or used for any operational activities associated with the former Riverside Cement Plant.

Maintenance, Administration, and Packaging

Soil samples analyzed for VOCs were collected within the Maintenance, Administration, and Packaging area from the following locations and associated features:

- MAP-SG-3-5' (former 10,000 gallon diesel UST)
- MAP-SG-3-15'(former 10,000 gallon diesel UST)

- MAP-SB-3-10' (former 6,000,000 gallon Bunker C Fuel Oil UST)
- MAP-SB-3-30' (former 6,000,000 gallon Bunker C Fuel Oil UST)
- MAP-SB-3-50' (former 6,000,000 gallon Bunker C Fuel Oil UST)
- MAP-SB-2-10' (former 6,000,000 gallon Bunker C Fuel Oil UST)
- MAP-SB-2-30' (former 6,000,000 gallon Bunker C Fuel Oil UST)
- MAP-SB-2-50' (former 6,000,000 gallon Bunker C Fuel Oil UST)
- MAP-SB-1-20' (former 550 gallon waste oil UST)
- MAP-LT-3-1' (wash rack discharge point)
- MAP-LT-3-5' (wash rack discharge point)
- MAP-LT-3-10' (wash rack discharge point)
- MAP-LT-3-20' (wash rack discharge point)

VOCs were not detected above their respective reporting limits in the samples analyzed from these locations with the exception of acetone. Acetone was reported in only one sample at a concentration of 120 microgram per kilogram (µg/kg) at 10 feet in MAP-SB-2-10', which is located in the former 6,000,000 Gallon Bunker C Fuel Oil UST area. Acetone is not an expected contaminant of concern in this area and is known to be a common laboratory contaminant. The sample locations are shown on Figure 3 and the results are summarized in Table 6.

4.2.6 Total Petroleum Hydrocarbons

Surface, Mining, Crushing Area

Three samples located in the Wet Weather Quarry and northwest of the Wet Weather Quarry area were analyzed for TPH. The sample locations and associated features are as follows:

- SW-19-1 and 5 (northwest of Surface, Mining, and Crushing)
- SMC-SB-1 (Wet Weather Quarry),

TPH concentrations ranged from non-detect (< 2.48 mg/kg) to 89.99 mg/kg (SW-19-5', C_{21}-C_{40}) in the area northwest of the Wet Weather Quarry, which is within the diesel to motor oil range (Figure 2). Based on this data, no further investigation regarding the extent of TPH is considered necessary in this area. The sample locations are shown on Figure 3 and the results are summarized in Table 7.

White Cement Plant

Twelve samples from the White Cement Plant were analyzed for TPH. The sample locations and associated features are as follows:

- WCP-LT-1-5,10, and 15 (Kiln area)
- WCP-LT-2-5, 10, and 15 (Kiln area)
- WCP-LT-3-5, 10, and 15 (Kiln area)
- WCP-LT-4-5, 10, and 15 (Kiln area)

TPH concentrations ranged from non-detect (< 2.48 mg/kg) to 92 mg/kg (WCP-LT-1-5', C_{28}-C_{40}), which is within the diesel to motor oil range (Figure 2). Based on this data, no further investigation regarding the extent of TPH is considered necessary in this area. The sample locations are shown on Figure 3 and the results are summarized in Table 8.

Grey Cement Plant

Eighteen samples were collected in the Grey Cement Plant area and were analyzed for TPH. The sample locations and associated features are as follows:

- SW-16-1 and 5 (former 10,000 gallon diesel UST)
- SW-17-1 and 5 (former 10,000 gallon diesel UST)
- GCP-LT-2-5 and 10 (former Grey Kilns, 1 and 2)
- GCP-LT-4-5, 10, and 15 (former Baghouses)
- GCP-LT-7-5, 10, and 15 (north, east, and south berms)
- GCP-LT-10-5, 10, and 15 (north, east, and south berms)
- GCP-LT-11-5, 10, and 15 (north, east, and south berms)

The TPH concentrations in samples from these locations ranged from non-detect (< 2.48 mg/kg) to 144.18 mg/kg (SW-17-1' C_{23}-C_{40}), which is within the diesel to motor oil range. Based on this data, no further investigation regarding the extent of TPH is considered necessary in this area. The sample locations are shown on Figure 3 and the results are summarized in Table 9.

Material Storage Area

Nineteen samples were collected from the Material Storage Bays and berm areas and were analyzed for TPH. The sample locations and associated features are as follows:

- SW-9-1 and 5 (raw material storage bay)
- SW-10-1, 5, 5 white (raw material storage bay)
- SW-15-1-brn (clinker storage bay)
- SW-15-1 and 5 (clinker storage bay)
- SW-15-5-white (clinker storage bay
- MSA-LT-2, 10, and 15 (eastern berm)
- MSA-LT-4-5, 10, and 15 (eastern berm)
- MSA-LT-5-1, 5, 10, and 15 (clinker storage bay)

TPH concentrations ranged from non-detect (< 2.48 mg/kg) to 524.5 mg/kg (SW-15-1' C_{25}-C_{40}), which is within the diesel and motor oil range. Based on this data, no further investigation regarding the extent of TPH is considered necessary in this area. The sample locations are shown on Figure 3 and the results are summarized in Table 10.

Maintenance, Administration, and Packaging

Thirty samples were collected from areas of the Former Agriculture Division, East of Former Fleet Truck Parking and the Former Fleet Truck Parking , 6,000,000 gallon Bunker C Fuel Oil UST, former 1,000 gallon Diesel UST, and Washrack Discharge Point (Figure 2). The sample locations and associated features are as follows:

- SW-3-1 and 5 (former Agriculture Division)
- SW-11-1 and 5 (former east Fleet Truck Parking)
- SW-12-1 and 5 (former 6M gallon Bunker C Fuel Oil UST)
- SW-20-1 and 5 (former Material Yard)
- MAP-SB-1-15 (former 550 gallon Waste Oil UST)
- MAP-SG-3-5 and 15 (former 1,000 gallon diesel UST)
- MAP-SB-2-10, 30, and 50 (former 6M gallon diesel UST)
- MAP-SB-3-10, 30, and 50 (former 6M gallon Bunker C Fuel Oil UST)
- MAP-LT-1-1, 5, 10, and 15 (former Parking Northwest)
- MAP-LT-2-5, 10, and 15 (former Fleet Truck Parking)
- MAP-LT-3-1, 5, 10, and 15 (Wash rack discharge point)

The TPH concentrations ranged from non-detect (< 2.48 mg/kg) to 266 mg/kg (MAP-SB-2-30, C_{25}-C_{40}), which is within the motor oil range. Based on this data, no further investigation regarding the extent of TPH is considered necessary in this area. The sample locations are shown on Figure 3 and the results are summarized in Table 6.

Vacant Land

Seven samples were collected in the Vacant Land area and analyzed for TPH. The sample locations and associated features are as follows:

- SW-2-1 and 5 (northwest corner of Northern Parcel)
- SW-5-6-inches (Northern Parcel)
- SW-5-1 and 5 (Northern Parcel)
- SW-7-1 and 5 (Northern Berm)

TPH concentrations ranged from non-detect (< 2.48 mg/kg) to 12.15 mg/kg (SW-5-6", C_{28}-C_{40}), which is in the motor oil range (Figure 2). Based on this data, no further investigation regarding the extent of TPH is considered necessary in this area. The sample locations are shown on Figure 3 and the results are summarized in Table 11.

4.2.7 Title 22 Metals

Surface, Mining, Crushing Area

Arsenic was reported above the commercial/industrial RSL of 4.2 mg/kg in twenty (20) samples collected from the Surface, Mining, and Crushing area at concentrations ranging from 3.14 mg/kg (SMC-LT-1-5') to 15.6 mg/kg (SMC-SB-3-10). The SMC sample locations above the arsenic SL are associated with the following features and are shown on Figure 2 and summarized in Table 7.

- South of the Secondary Reduction,
- Wet Weather Quarry
- Northwest of the Wet Weather Quarry

The reported arsenic concentrations are generally higher than the regional arsenic levels as reported by Bradford, 1996 and Chernoff, 2008, which range from 1 mg/kg to 10 mg/kg and the site specific background concentrations that range from 1.0 mg/kg to 8.94 mg/kg.

With the exception of two samples collected from the Wet Weather Quarry, Cr^{VI} was either non-detect (below the laboratory reporting limit, 0.4 mg/kg) or reported below the Cr^{VI} commercial/industrial RSL of 6.3 mg/kg in samples collected from this study area. The two samples that exceeded the RSL were SMC-SB-1-5 and SMC-SB-1-10 at concentrations of 9.24 mg/kg and 8.66 mg/kg, respectively (Figure 2). As requested by DTSC, two of the samples from this boring were analyzed for SPLP to determine the leachability and potential for impacts to the groundwater. The results of the SPLP test reported concentrations of 28.5 micrograms per liter (µg/L) and 34.4 µg/L in SMC-SB-1-5 and SMC-SB-1-30, respectively (Figure 2 and Table 7). A Maximum Contaminant Level (MCL) does not exist in California for Cr^{VI}; however, these concentrations are less than the total chrome MCL of 50 µg/L.

For the three soil borings drilled in the Wet Weather Quarry and Lone Start Quarry areas, Cr^{VI} was either below reporting limits or did not exceed the RSL below 10 feet bgs in the samples analyzed. The results are summarized in Table 7.

White Cement Plant

Metals were not reported above their respective SLs in samples analyzed in the White Cement Plant area with the exception of arsenic. Arsenic was reported in eleven samples, above the RSL (4.2 mg/kg) at concentrations ranging from 5.24 mg/kg (WCP-LT-3-10') to 28.9 mg/kg (WCP-LT-2-5'). The reported concentrations appeared to be limited to the upper 10 feet of soil.

As discussed in the previous paragraph, the reported arsenic concentrations are generally higher than the regional arsenic levels and the site specific background levels. The higher concentrations are likely the result of the former cement plant operations in and around this study area, which included the white kilns that created clinker that was crushed to make the cement product.

Cr^{VI} was not reported above the commercial/industrial RSL of 6.3 mg/kg. The results are summarized in Table 8.

Grey Cement Plant

Eighteen (18) samples in the Grey Cement Plant area were reported above the arsenic SL (4.2 mg/kg). The concentrations ranged from 3.04 mg/kg (SW-16-1') to 11 mg/kg (GCP-LT-6-1') The samples are associated with the features that include former 10,000 gallon diesel UST , east

berm, former Grey Kiln 1 & 2, former Coal Storage, and north/east/south berms. The sample locations are shown on Figure 2 and summarized in Table 9.

Cr^{VI} was reported slightly above the RSL of 6.3 mg/kg in one sample at 8.35 mg/kg in GCP-LT-9-10', which was sampled in the eastern berm (Figure 2).

Material Storage Area

Arsenic was reported in twenty-seven (27) samples above the SL of 4.2 mg/kg. The arsenic concentrations ranged from 3.12 mg/kg (MSA-LT-5-10') to 68.1 mg/kg (SW-13-5-White) and are located in the Material Storage Area and Eastern Berms. Lead was reported at a concentration of 514 mg/kg in one sample (SW-13-5-White), which is above the lead SL of 320 mg/kg. This sample was located on the west side of the Material Storage Area and was associated with a white clay-like material at a depth of approximately 5 feet bgs that was distinguishable from the native soils encountered. This material was used as a feed product as part of the cement manufacturing process. The remaining metals concentrations were reported below their respective SLs (Table 10).

Cr^{VI} was not reported above the RSL of 6.3 mg/kg. The maximum Cr^{VI} concentration was reported at 5.29 mg/kg in sample SW-8-1-other (Table 10).

Maintenance, Administration, and Packaging

Eighteen (18) samples were reported above the arsenic SL (4.2 mg/kg) at concentrations ranging from 3.39 mg/kg (SW-3-1') to 24.2 mg/kg (MAP-SB-3-30') located at the following features/areas: Former Agriculture Division, East of Former Fleet Truck Parking and Former Fleet Truck Parking, Former Material Yard, 6,000,000 Gallon Bunker C Fuel Oil UST, Washrack Discharge Point, and Former Power House (Figure 2). Selenium was reported in one sample, located east of the Former Fleet Truck Parking (SW-11-1'), above the RSL (10 mg/kg) at a concentration of 12 mg/kg at 1 ft. bgs. The results are summarized in Table 6.

Vacant Land

With the exception of arsenic, metals and Cr^{VI} concentrations were either reported below their respective SLs or were not detected above the reporting limit. Arsenic was reported above the SL (4.2 mg/kg) in eighteen samples in this study area. The arsenic concentrations ranged from 3.1 to 18.6 mg/kg in the upper ten feet of soil located at the following features/areas: the

Northern Parcel and northwest of the Northern Parcel, and Northern Berms. The results are summarized in Table 11.

4.2.8 pH Results

Surface, Mining, and Crushing Area

Twenty-one (21) samples in the surface, mining, and crushing area were analyzed for pH. The sample locations are as follows:

- SW-19-1, 5
- SMC-LT-1-1, 5 and 10
- SMC-LT-2-1,5, iron
- SMC-LT-3-1, 5, and 10
- SMC-SB-1-5, 10, and 30
- SMC-SB-2-1, 10, and 30
- SMC-SB-3-10, 20, 30 and 40

The pH levels ranged from 7.57 to 12.5. The average pH of the twenty-one (21) samples is 10.87. The results are summarized in Table 7.

White Cement Plant

Twelve (12) samples in the white cement plant area were analyzed for pH. The sample locations are as follows:

- WCP-LT-1-1, 5, and 10
- WCP-LT-2-1, 5, and 10
- WCP-LT-3-1, 5, and 10
- WCP-LT-4-1, 5, and 10

The pH levels ranged from 8.34 and 11. The average pH of the twelve (12) samples is 9.44. The results are summarized in Table 8.

Grey Cement Plant

Twenty-six (26) samples in the grey cement plant area were analyzed for pH. The sample locations are as follows:

- SW-17-1 and 5

- SW-16-1 and 5
- GCP-LT-1-1
- GCP-LT-2-1, 5, and 10
- GCP-LT-3-1, 5, and 10
- GCP-LT-4-1, 5, and 10
- GCP-LT-6-1, 5, and 10
- GCP-LT-7-1, 5, and 10
- GCP-LT-8-1, 5, and 10
- GCP-LT-9-1, 5, and 10

The pH levels ranged from 7.05 and 11.4. The average pH of the twenty-six (26) samples is 8.63. The results are summarized in Table 9.

Material Storage Area

Twenty-one (21) samples in the material storage area were analyzed for pH. The sample locations are as follows:

- SW-8-1, 5 and other
- SW-9-1 and 5
- SW-10-1 and 5; SW-10-5-white
- SW-13-1 and 5; SW-13-1-white; SW-13-5-white
- SW-14-1 and 5
- SW-15-1 and 5; SW-15-1-brn; SW-15-5-white
- MSA-LT-5-1, 5 and 10

The pH levels ranged from 9.12 and 13. The average pH of the twenty-one (21) samples is 11.11. The results are summarized in Table 10.

Maintenance, Administration, and Packaging

Eighteen (18) samples in the maintenance, administration, and packaging area were analyzed for pH. The sample locations are as follows:

- SW-3-1 and 5
- SW-11-1 and 5
- SW-12-1 and 5
- SW-20-1 and 5

- MAP-SB-2-10, 30 and 50
- MAP-LT-2-1, 5 and 10
- MAP-LT-3-1, 5 and 10
- MAP-LT-4-1

The pH levels ranged from 6.18 and 9.65. The average pH of the eighteen (18) samples is 8.21. The results are summarized in Table 6.

Vacant Land

Twenty-one (21) samples in the Vacant Land were analyzed for pH. The sample locations are as follows:

- SW-1-1 and 5
- SW-2-1 and 5
- SW-4-6", 1 and 5
- SW-5-6", 1 and 5
- SW-6-6", 1 and 5
- SW-7-1 and 5
- VL-LT-2-6", 1 and 5
- VL-LT-3-6", 1 and 5

The pH levels ranged from 6.59 and 9.02. The average pH of the twenty-one (21) samples is 7.76. The results are summarized in Table 11.

5.0 COMPOUNDS ABOVE SCREENING LEVELS

Based on the analytical results, only arsenic, lead, and Cr^{VI} exceeded their respective SLs. Of these three constituents, arsenic was encountered above its SL site wide (Figure 3). Of the 144 soil samples that were analyzed for metals (i.e., Arsenic), 114 soil samples had concentrations of arsenic above its commercial/industrial SL of 4.2 mg/kg. These arsenic concentrations are in the range of regional levels reported by Bradford, 1996 and Chernoff, 2008, for soils in Southern California which typically range from 1 mg/kg to 10 mg/kg. Of the 114 arsenic results above the SL, only 28 samples reported arsenic above the upper bound of the regional background level of 10 mg/kg. The average of the 28 samples is 19.6 mg/kg with a maximum level of 68.1 mg/kg.

Only one (1) soil sample out of 144 samples analyzed for metals reported lead concentrations above its commercial/industrial SL of 320 mg/kg. Lead was detected in SW-13-5-white which is located in the Material Storage Area at a concentration of 514 mg/kg. This sample was associated with a white clay material, which is distinguishable from the surrounding soils, that was used as a feed product during the cement manufacturing process. The remaining 143 samples were below the SL of 320 mg/kg with an average lead concentration of 19.56 mg/kg.

Only three (3) soil samples out of 144 samples analyzed for Cr^{VI} exceeded its commercial/industrial RSL of 6.3 mg/kg. The three samples were GCP-LT-9-10, SMC-SB-1-5, and SMC-SB-1-10 at concentrations of 8.35 mg/kg, 9.24 mg/kg, and 8.66 mg/kg, respectively. The Cr^{VI} concentration in GCP-LT-9-10 is located in a berm east of the former Grey Kilns, where previous cement kiln dust (CKD) was placed with soil during cement operations (Figure 3 and Table 12). The material excavated from this berm contained CKD material based on observations during the excavation of the trench. An approximate 2-foot thick layer of CKD material is also observed along the southern boundary of this berm. The Cr^{VI} concentrations in the SMC-SB borings are located in the vicinity of the Wet Weather Quarry where prior raw and non-specification cement materials were deposited.

6.0 CONCLUSIONS

Langan Engineering and Environmental Services, Inc. (Langan) implemented the California Department of Toxic Substances Control (DTSC) approved Site Assessment Work Plan (SAWP) for the Agua Mansa Commerce Park from 11 July 2018 to 26 July 2018. The investigation included the excavation and soil sampling of twenty (20) composite shallow test pits (SWs), thirty-two (32) deep excavations (i.e. MAP-LT), six (6) soil borings (i.e. MAP-SB), installation of eleven dual-nested soil gas probes (i.e., MAP-SG), and collection of soil gas samples. The locations of the sampling activities are shown on Figure 2. A total of 144 soil samples were collected. The soil samples were collected from the trenches and soil boring for the one or more of the following analysis: TPH, VOCs, SVOCs, PAHs, Title 22 Metals, PCBs, Dioxins, and Cr^{VI}.

Soil gas samples collected from the 11 soil gas locations were analyzed for VOCs and TPH following EPA Method 8260B using an on-site mobile laboratory. The results indicated that VOCs and TPH were not detected above their respective reporting limits. Therefore, no further soil gas investigation is recommended.

The following constituents were not reported above their respective reporting limits in the soil samples analyzed: PCBs, Pesticides and herbicides, VOCs and SVOCs. PAHs were reported in three samples above their respective detection limit; however, there was not a corresponding DTSC screening levels (SL) for commercial/industrial soils (June 2018) for these compounds. Dioxins were reported below the residential SL of 50 ppt in sixty-eight (68) samples collected and analyzed at the Site. A total of eighty-seven (87) soil samples were collected and analyzed for TPH. The maximum TPH concentration reported was 524.5 mg/kg within the motor oil range (C_{23} – C_{40}) in the Material Storage Area at SW-15-1. No further assessment is recommended for these compounds.

Based on the results of the investigation, the following conclusions are provided:

- Arsenic was reported above the DTSC SL site-wide (114 samples) and above the published upper bound regional background concentrations of 10 mg/kg (29 samples). Published literature indicates that Arsenic is a metal commonly measured in soils throughout California. The maximum arsenic concentration associated with soils above the regional background was 28.9 mg/kg. Based on the information provided above, no further action is recommended for arsenic.

- The single lead concentration detected above the SL of 320 mg/kg in sample SW-13-5-white (514 mg/kg) was encountered in the Material Storage Area in a white clay material, which was a feed product in the cement manufacturing process. The other 170 samples analyzed for lead were below the SL of 320 mg/kg. Based on this information, no further action is recommended for lead.

- Cr^{VI} was reported above the Environmental Protection Agency (EPA) commercial/industrial RSL of 6.3 mg/kg in only three samples (GCP-LT-9-10, SMC-SB-1-5, and SMC-SB-1-10). Sample GCP-LT-9-10 is located in a berm east of the Grey Kilns and former baghouses where previous Cement Kiln Dust (CKD) material was placed during the cement plant operations (Table 12 and Figure 3). Samples SMC-SB-1-5 and SMC-SB-1-10 are located in the Wet Weather Quarry area where non-specification cement product was deposited during the cement plant operations (Table 12 and Figure 3).

  At the request of DTSC in a meeting on 2 July 2018, a synthetic precipitation leaching procedure (SPLP) test was performed on two samples, SMC-SB-1-5 (9.24 mg/kg) and

SMC-SB-1-30 (5.32 mg/kg), to evaluate the potential leachability of Cr^{VI} into the groundwater. The results of the SPLP test reported concentrations of 28.5 micrograms per liter (µg/L) and 34.4 µg/L in SMC-SB-1-5 and SMC-SB-1-30, respectively (Figure 2 and Table 7). A Maximum Contaminant Level (MCL) does not exist in California for Cr^{VI}; however, the above values are less than the total chrome MCL of 50 µg/L. Based on this information no further action is recommended for Cr^{VI}.

The lead and Cr^{VI} concentrations that exceed their respective SLs appear to be associated primarily with former cement feed product (i.e. white clay and/or CKD), and appear to be localized within the Material Storage Area, Gray Cement Plant, and in the vicinity of the Wet Weather Quarry.

The areas that encountered refusal during the proposed SAWP trench sampling activities are located in the Maintenance, Administration, and Packaging and Grey Cement Plant study areas. The trenches located in the above areas are located where the former original cement plant was demolished prior to the subsequent renovations and construction of the present day cement plant. In addition, the area of the former Sag Pond (Figure 2) where TPH concentrations were encountered (LT-9, 1,700 mg/kg and 950 mg/kg at 4 feet and 8 feet, respectively) during Langan's Preliminary Environmental Assessment (PEA) was not accessible during this assessment due to the debris prohibiting access. These areas will need to be addressed during the demolition phase of the project along with the areas underlying the existing buildings/structures as outlined in the DSTC approved SAWP. These areas will be addressed in the Response Plan, which will include a Demolition and Soils Management Plan that will be submitted and approved by DTSC prior to implementation.

TABLES

Table 1: Summary of Field Observations
Agua Mansa Commerce Park

STUDY AREA	BLDG/STRUCTURE	FEATURE	Trench ID	No. Trench	Trench Depth (ft bgs)	Boring ID	No. Borings	Boring Depth (ft bgs)	No. Samples	Analytical Scheme									Soil Gas		
										TPH	Cr^{VI}	Metals	VOCs	SVOCs	PAHs	Dioxins	PCBs	Pesticides/ herbicides	TPH and VOCs as 8260B	Field Observations	Rationale for Deviation
SMC	Former Iron Ore Storage	Former Iron Ore Storage	SMC-LT-1	1	20	--	--	--	5 (1', 5', 10', 15', 20')		3 (1', 5', 10')	3 (1', 5', 10')								Fill to 1' bgs, pinkish and red gravelly hard clay to 3' bgs, brown fine grained silty sand to 11' bgs. Observed white hard clay at 7' bgs. No odors detected. Refusal at 11' bgs.	DTSC Letter dated 7/19/18 - relocated to iron ore location
SMC	Wet Weather Quarry	Wet Weather Quarry	--	--	--	SMC-SB-1	1	100	21 (1', 5', 10', 15', 20', 25'. 30', 35', 40', 45', 50', 55', 60', 65', 70', 75', 80', 85', 90', 95', 100')	4 (5', 15', 30', 40")	4 (5', 15', 30', 40")	4 (5', 15', 30', 40")		4 (5', 15', 30', 40")	4 (5', 15', 30', 40")	2 (5', 15')	4 (5', 15', 30', 40")			Upper 24' bgs composed of very dense, 70% fine to coarse subangular sand, 15% fines, 15% gravel and dry. From 24' bgs to 33' bgs is very dense, 70% fine to medium subangular to angular sand, 15% gravel, and 10% fines, dry. No recovery obtained at 25' bgs due to very dense material. No stains or odors observed throughout. Boring terminated at 33' bgs due to refusal.	DTSC Letter dated 7/19/18 - drilling depths and analytical testing revised. Depth not achieved due to refusal
		Wet Weather Quarry	--	--	--	SMC-SB-2	1	100	21 (1', 5', 10', 15', 20', 25'. 30', 35', 40', 45', 50', 55', 60', 65', 70', 75', 80', 85', 90', 95', 100')	4 (5', 15', 30', 40")	4 (5', 15', 30', 40")	4 (5', 15', 30', 40")		4 (5', 15', 30', 40")	4 (5', 15', 30', 40")	2 (5', 15')	4 (5', 15', 30', 40")			Dense 90% fine to coarse subangular sand,10% fines, trace gravel to 25' bgs. Dense, 70% fine subangular sand, 30% fines, low to medium plasticity to 40' bgs. Observed smeared pink-ish-red mottled sand at 30' bgs. At 40' bgs, mostly fine to coarse sand, with fines and trace gravel. No stains or odors observed throughout. Boring terminated at 45' bgs due to refusal.	DTSC Letter dated 7/19/18 - drilling depths and analytical testing revised. Depth not achieved due to refusal
	Lone Star Quarry	Lone Star Quarry	--	--	--	SMC-SB-3	1	100	21 (1', 5', 10', 15', 20', 25'. 30', 35', 40', 45', 50', 55', 60', 65', 70', 75', 80', 85', 90', 95', 100')	4 (5', 15', 30', 40")	4 (5', 15', 30', 40")	4 (5', 15', 30', 40")		4 (5', 15', 30', 40")	4 (5', 15', 30', 40")	2 (5', 15')	4 (5', 15', 30', 40")			Very dense to dense, 80% fine to coarse sand, gravel, and fines to 40' bgs. Observed large pieces of weathered granite or diorite from 30' to 40' bgs. No stains or odors observed throughout. Boring terminated at 40' bgs due to refusal	DTSC Letter dated 7/19/18 - added soil boring to Lone Star Quarry Area. Depth not achieved due to refusal.
SMC	South of Secondary Reduction Crusher	South of Secondary Reduction Crusher	SMC-LT-2	1	20				5 (1', 5', 10', 15', 20')		3 (1', 5', 10')	3 (1', 5', 10')				3 (1', 5', 10')				Pinkish brown fine silty sand and cobbles at 1' bgs, very dense. Pocket of iron ore at 2' bgs. Brown fine grained silty sand with cobbles, white cement/clay, red clay and grey cement debris. Refusal at 5' bgs.	Refusal at 5' bgs.
SMC	Southeast of Secondary Reduction Crusher	Southeast of Secondary Reduction Crusher	SMC-LT-3	1	20				5 (1', 5', 10', 15', 20')		3 (1', 5', 10')	3 (1', 5', 10')				3 (1', 5', 10')				Very dense, white fine grained silty sand to 1' bgs, white to light brown moist silty sand with minor amounts of clay to 10' bgs. Equipment change to backhoe.	Refusal at 12' bgs.
SMC	Northwest of Wet Weather Quarry	Northwest of Wet Weather Quarry	SW-19	5 composite per depth	5	--	--	--	2 (1' & 5')	2 (1' & 5')	2 (1' & 5')	2 (1' & 5')					2 (1' & 5')			Silty sand, white and grey cement waste, red clay. TD 5' bgs. No stains or odors detected.	N/A
WCP	Boiler Blowdown Pond	Boiler Blowdown Pond	--	--	--	WCP-SB-1	1	20	5 (1', 5', 10', 15', 20')	3 (5', 10', 15')	3 (1', 5', 10')	3 (1', 5', 10')	3 (5', 10', 20')							Boring not drilled. Soil samples collected at 5' and 15' bgs from soil gas probe boring WCP-SG-3 analyzed due to proximity to WCP-SB-1.	On-site approval from DTSC on 7/18/18 SZ
WCP	Boiler Blowdown Pond	Boiler Blowdown Pond	--	--	--	WCP-SG-3	1	15	2 (5' & 15')				2* (5' & 15')						2 (5' & 15')	Fine sand to coarse sand from 5' bgs to 15' bgs. No stains or odors detected. Boring terminated at 15.5' bgs.	DTSC Letter dated 7/19/18 - added nested soil gas probe (5' and 15') location.
WCP	South of Boiler Blowdown Pond	Two Former Diesel USTs 12,000 Gallons	--	--	--	WCP-SG-1	1	15	2 (5' & 15')				2* (5' & 15')						2 (5' & 15')	Sandy clay, medium to dense fine sand. No stains or odors detected. Boring terminated at 15.5' bgs.	N/A

Table 1: Summary of Field Observations
Agua Mansa Commerce Park

STUDY AREA	BLDG/STRUCTURE	FEATURE	Trench ID	No. Trench	Trench Depth (ft bgs)	Boring ID	No. Borings	Boring Depth (ft bgs)	No. Samples	Analytical Scheme									Soil Gas		
										TPH	Cr^{VI}	Metals	VOCs	SVOCs	PAHs	Dioxins	PCBs	Pesticides/ herbicides	TPH and VOCs as 8260B	Field Observations	Rationale for Deviation
WCP	Kilns	Kilns	WCP-LT-1	1	20	--	--	--	5 (1', 5', 10', 15', 20')	3 (5', 10', 15')	3 (1', 5', 10')	3 (1', 5', 10')		3 (1', 5', 10')	3 (1', 5', 10')	3 (1', 5', 10')	2 (1' & 5')			Mostly fine grained silty sand. Hard white cement observed at 2.5' bgs. No stains or odors detected.	N/A
WCP			WCP-LT-2	1	20	--	--	--	5 (1', 5', 10', 15', 20')	3 (5', 10', 15')	3 (1', 5', 10')	3 (1', 5', 10')		3 (1', 5', 10')	3 (1', 5', 10')	3 (1', 5', 10')				Mostly fine grained silty sand with gravel and clinker to16' bgs. Dark gray clay at 16' bgs. No stains or odors detected. Trench collapsed at 17' bgs.	Soil loose and fine-grained, walls not stable to 20' bgs.
			--	--	--	WCP-SG-2	1	15	2 (5' & 15')				2* (5' & 15')						2 (5' & 15')	Medium dense sand to 15' bgs. No stains or odors detected. Boring terminated at 15.5' bgs.	N/A
WCP			WCP-LT-3	1	20	--	--	--	5 (1', 5', 10', 15', 20')	3 (5', 10', 15')	3 (1', 5', 10')	3 (1', 5', 10')		3 (1', 5', 10')	3 (1', 5', 10')	3 (1', 5', 10')				Brown fine grained silty sand to 13' bgs. Pebbles and cobbles observed at 13' bgs. No stains or odors detected. Trench collapsed at 17' bgs.	Soil loose and fine-grained, walls not stable to 20' bgs.
WCP			WCP-LT-4	1	20	--	--	--	5 (1', 5', 10', 15', 20')	3 (5', 10', 15')	3 (1', 5', 10')	3 (1', 5', 10')		3 (1', 5', 10')	3 (1', 5', 10')	3 (1', 5', 10')	2 (1' & 5')			Fine grained silty sand to 20' bgs. Observed some pebbles from 12' bgs to 20' bgs. No stains or odors detected. Trench terminated at 20' bgs.	N/A
GCP	Southwest of Former Finish Grind Feed Bins	Former Water Coolers	GCP-LT-1	1	20	--	--	--	5 (1', 5', 10', 15', 20')		3 (1', 5', 10')	3 (1', 5', 10')								Five locations attempted at and around GCP-LT-1. Extremely hard material - encountered refusal before 2' bgs. One sample taken (GCP-LT-1-1').	Encountered refusal after five attempted locations.
GCP	Former Grey Kiln 1 & 2	Former Grey Kiln 1 & 2	GCP-LT-2	1	20	--	--	--	5 (1', 5', 10', 15', 20')	3 (5', 10', 15')	3 (1', 5', 10')	3 (1', 5', 10')		3 (1', 5', 10')	3 (1', 5', 10')	3 (1', 5', 10')	2 (1' & 5')			15' bgs sample not collected due to trench collapse. Soil fine-grained, loose, and dry.	Trench location relocated southeast of kiln feed silos by DTSC. Sample at 15' bgs not collected due to trench collapse at 10' bgs
			GCP-LT-3	1	20	--	--	--	5 (1', 5', 10', 15', 20')		3 (1', 5', 10')	3 (1', 5', 10')		3 (1', 5', 10')	3 (1', 5', 10')	3 (1', 5', 10')				Loose fine-grained silty sand. No stains or odors detected. TD at 12' bgs.	Trench collapse at 12' bgs.
GCP	Baghouses	Baghouses	GCP-LT-4	1	20	--	--	--	5 (1', 5', 10', 15', 20')	3 (5', 10', 15')	3 (1', 5', 10')	3 (1', 5', 10')		3 (1', 5', 10')	3 (1', 5', 10')	3 (1', 5', 10')				Loose fine-grained silty sand. No stains or odors detected. Terminated at 18' bgs due to trench collapse.	Trench collapse at 18' bgs.
GCP	Northwest corner of Grey Cement Plant	Former Diethylene Glycol AST 12,000 Gallons	GCP-LT-5	1	20	--	--	--	5 (1', 5', 10', 15', 20')	3 (5', 10', 15')	3 (1', 5', 10')	3 (1', 5', 10')		3 (1', 5', 10')	3 (1', 5', 10')		2 (1' & 5')			No samples collected. Refusal before 1' bgs.	Three attempts - refusal encountered before 1' bgs.
GCP	Former Coal Storage	Former Coal Storage	GCP-LT-6	1	20	--	--	--	5 (1', 5', 10', 15', 20')		3 (1', 5', 10')	3 (1', 5', 10')		3 (1', 5', 10')	3 (1', 5', 10')	3 (1', 5', 10')				Fine-grained silty sand, some red clay and CKD at 3' bgs. Very hard and dense material encountered at 15' bgs. TD at 18' bgs.	Refusal at 18' bgs.
GCP	North of Former Boiler House	Former Diesel UST 10,000 Gallons				GCP-SG-1	1	15	2 (5' & 15')				2* (5' & 15')						2 (5' & 15')	Fine-grained sand. No stains or odors. Boring terminated at 15.5' bgs.	N/A
	North/East/South Berms	North/East/South Berms	GCP-LT-7	1	20	--	--	--	5 (1', 5', 10', 15', 20')	3 (5', 10', 15')	3 (1', 5', 10')	3 (1', 5', 10')				3 (1', 5', 10')	2 (1', 5')			Fine-grained silty sand. No stains or odors.	N/A
			GCP-LT-8	1	20	--	--	--	5 (1', 5', 10', 15', 20')		3 (1', 5', 10')	3 (1', 5', 10')				3 (1', 5', 10')				Fine-grained silty sand. No stains or odors.	N/A

APPENDIX C
Correspondence

Brad Mccardell

From: Brad Mccardell
Sent: Monday, July 16, 2018 7:24 PM
To: Zhai, Xihong@DTSC
Cc: 'Guerre, Christopher@DTSC'; Neil Shukla
Subject: Agua Mansa, Implementation of SAWP

Hello Scarlett,

I understand from Chris that he spoke to you after our conversation today regarding soil gas probe WCP-SG-3 and soil boring WCP-SB-1. Soil gas probe WCP-SG-3 was an add on by CY last week during our meeting on Monday. Both of these locations are adjacent to each other near the former 210,000 No. 6 Fuel AST by the White Cement Plant. We would like to analyze the soil samples collected from the 5' and 15' location from WCP-SG-3 in lieu of drilling and sampling soil boring WCP-SB-1. We would analyze the soil samples from WCP-SG-3 for the same constituents proposed in soil boring WCP-SB-1 that are currently at the laboratory on hold. According to Chris, he indicated you are in agreement with this approach and he requested I memorialize this understanding in an email. Please confirm our understanding of this request.

Regarding the Raw Material Storage Bays on the northeast portion of the property. As communicated in my email on Friday last week and discussed with Chris this morning onsite, we had tremendous difficulties completing AQMD test pit SW-15 (clinker storage side) and got refusal at about 2.5 feet below ground surface. This area may be challenging to excavate the test pits and may need to be deferred to the demolition phase of the project. We will try again with a smaller excavation bucket with different teeth on the west side to see if we can achieve the depths needed in the Raw Material Storage Area. My concern is spending a tremendous amount of time in this area trying to complete the test pits and not being able to complete the other test pits in the SAWP. If we get refusal on any of test pits (i.e., including the step outs), I'll move onto the next one and so on. If I believe this area will be too difficult to complete with this equipment, I would like to discuss with you and Chris about deferring the Raw Material Storage Area to the demolition phase.

I understand from Chris that you will be onsite this Wednesday to tour the Motor Control Room near the Gray Cement Plant area. I look forward to discussing this with you. Thank you,

Sincerely

Brad A. McCardell, PG

CONDITIONAL APPROVAL OF SITE ASSESSMENT WORKPLAN – AGUA MANSA COMMERCE PARK, JURUPA VALLEY, CALIFORNIA (SITE CODE: 401799)

Dear Mr. Ganch:

The Department of Toxic Substances Control (DTSC) reviewed the Revised Site Assessment Workplan (SAWP) prepared by Langan Engineering and Environmental Services, Inc. (Langan), on behalf of the Crestmore Redevelopment LLC, a Colorado LLC (Proponent), dated and received electronically on July 10, 2018. The SAWP was revised based on discussions during several meetings on June 21, 2018 and July 9, 2018, and in response to DTSC comments on the draft version forwarded in a letter dated June 28, 2018. The SAWP includes site background information, summarizes previous investigation results, and proposed sampling and analysis activities to fill the data gap at the Riverside Cement Plant site (Site).

According to the SAWP, the approximately 206-acre site is located at 1500 Rubidoux Boulevard in Jurupa Valley, California. The Site is bordered by Rubidoux Boulevard on the west, El Rivino Road on the north, Hall Avenue on the east, and the Crestmore Lake on the south. The Site is surrounded by residential properties on the northwest and northeast corners, and commercial properties on the other sides. The Site was used for cement manufacturing from the early 1900s to 2015. Surface mining terminated in 1927 and underground mining ceased in the 1980s with subsequent flooding of the mine workings circa 1986. The kiln lines shut down in the mid 1980's and 2008. The remaining cement related manufacturing operations (e.g. clinker and cement grinding) ended in 2015.

The Proponent is proposing to redevelop the Site into several warehouse distribution structures. Redevelopment includes balanced cut and fill grading operations. The Proponent entered into a California Land Reuse and Revitalization Agreement (CLRRA) with DTSC on January 16, 2018. A scoping meeting and a strategy meeting were held

Printed on Recycled Paper

among representatives from the Proponent, Langan, and DTSC on January 12, 2018, and February 23, 2018 respectively. DTSC conducted a Site tour on January 25, 2018. A Preliminary Environmental Assessment (PEA) Report was prepared in December 2017. The PEA identified 12 Areas of Interest (AOIs) based on previous cement related manufacturing and operation processes. These AOIs were investigated by trenching, sampling, and laboratory analyses conducted between April 2016 and February 2017 without DTSC oversight. Soil samples were analyzed for metals, total petroleum hydrocarbons (TPHs), polychlorinated biphenyls (PCBs) and volatile and semi-volatile organic compounds (VOCs and SVOCs) in soil, and groundwater and surface water samples were analyzed for metals and/or VOCs. Preliminary risk characterization was conducted by comparing the analytical results with screening levels (SLs). Sporadic exceedance was identified with metal and TPH concentrations above SLs for commercial/industrial use scenario and construction worker scenario. Based on its review of the PEA, DTSC identified data gaps, and determined that a comprehensive Site assessment is needed to determine the nature and extent of contamination. The SAWP proposed sampling and analysis activities to fill the data gaps.

DTSC has identified discrepancies in the revised SAWP, which were clarified during DTSC Site visits from July 11 through July 18 of 2018. The comments below summarize the discrepancies and resolutions:

1. Wet Weather Quarry (WWQ) area
    a. A third soil boring location SMC-SB-3 is added in the WWQ area based on field evaluation of Site conditions by DTSC geologist and Lagan personnel.
    b. The drilling depth at the three borings in WWQ area, SMC-SB-1 through SMC-SB-3, will be to the top of native layer/bedrock, likely 100 feet (ft), instead of 20 ft as shown in Table 27.
    c. Soil samples will be collected from four depths distributed across the total drilling depth at each location, and analyze for TPH, SVOCs, PAHs, and PCBs, and approximately half of these samples will also be analyzed for dioxins.
    d. Samples for hexavalent chromium (Cr^{6+}) and total metals will be collected at 1, 5, and 10 ft below ground surface (bgs) as indicated in Table 27.
2. White Cement Plant (WCP) area
    e. A third soil gas location WCP-SG-3 is added near the proposed location of WCP-SB-1 in the White Cement Plant area, to evaluate the potential impact from the former 210,000-gallon above-ground storage tank, as shown on Figure 3.
    f. Soil samples from 5 ft and 15 ft bgs will be analyzed for TPH and VOCs, and soil boring at WCP-SB-1 will no longer be performed.

3. Former 6,000,000-gallon tank area
    g. Soil boring location MAP-SB-3 is relocated to near the former sampling location VB-1 where high TPH was identified.
    h. PAH sampling depth at boring locations MAP-SB-2 and MAP-SB-3 will be 10, 30, and 50 ft bgs, to be consistent with other analytes at these two locations.
4. Material Storage Area (MSA): TPH sample depths at trench locations MSA-LT-2, MSA-LT-4, and MSA-LT-5 will be 5, 10, and 15 ft bgs, instead of those listed in Table 27.
5. Trench location GCP-LT-2 in the Grey Cement Plant area is move to the south of the grey kiln line.
6. Trench location SMC-LT-1 is moved to the black iron ore spot.
7. Langan clarified that the various depths listed in the column of "No. Samples" in Table 27 are depth of soil logging.
8. Langan indicated that soil samples at the bottom of each trench (i.e. 20 ft) will be archived for possible analytical needs.

DTSC hereby approves the SAWP provided these comments are incorporated during field work/future report. Further revision to the SAWP is no longer needed.

If you have any questions regarding this project, please contact Scarlett Xihong Zhai, Project Manager, at (714) 484-5316 or by e-mail at Xihong.Zhai@dtsc.ca.gov, or contact me at (714) 484-5368 or by e-mail at Shahir.Haddad@dtsc.ca.gov.

Project Address:	1500 Rubidoux Blvd Riverside, CA 92509	**Physical State:**	Soil Gas

ANALYSES REQUESTED

1. EPA 8260B – Volatile Organics by GC/MS + Oxygenates/Gasoline Range Organics

Sampling – Soil Gas samples were collected in glass gas-tight syringes equipped with Teflon plungers.

A tracer gas mixture of n-pentane, n-hexane, and n-heptane was placed at the tubing-surface interface before sampling. These compounds were analyzed during the 8260B analytical run to determine if there were surface leaks into the subsurface due to improper installation of the probe. No n-pentane, n-hexane, or n-heptane was found in any of the samples reported herein.

The sampling rate was approximately 200 cc/min, except when noted differently on the chain of custody record, using a glass gas-tight syringe. Purging was completed using a pump set at approximately 2000 cc/min. Per the 2015 DTSC/RWQCB active soil gas investigations advisory (Section 4.3), this rate was selected over the standard 200 cc/min due to the large purge volume attributable to the large boring diameter. A default of 3 purge volumes was used as recommended by the 2015 DTSC/RWQCB advisory.

Prior to purging and sampling of soil gas at each point, a shut-in test was conducted to check for leaks in the above ground fittings. The shut-in test was performed on the above ground apparatus by evacuating the line to a vacuum of 100 inches of water, sealing the entire system and watching the vacuum for at least one minute. A vacuum gauge attached in parallel to the apparatus measured the vacuum. If there was any observable loss of vacuum, the fittings were adjusted as needed until the vacuum did not change noticeably. The soil gas sample was then taken.

No flow conditions occur when a sampling rate greater than 10 mL/min cannot be maintained without applying a vacuum greater than 100 inches of water to the sampling train. The sampling train is left at a vacuum for no less than three minutes. If the vacuum does not subside appreciably after three minutes, the sample location is determined to be a no flow sample.

Analytical – Soil Gas samples were analyzed using EPA Method 8260 that includes extra compounds required by DTSC/RWQCB (such as Freon 113). Instrument Continuing Calibration Verification, QC Reference Standards, Instrument Blanks and Sampling Blanks were analyzed every 12 hours as prescribed by the method. In addition, a Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) were analyzed with each batch of Soil Gas samples. A duplicate/replicate sample was analyzed each day of the sampling activity. All samples were injected into the GC/MS system within 30 minutes of sampling.

Approval: 

Angela Haar, Ph. D.

LABORATORY RESULTS

Client:	Langan	**Report date:**	7/26/2018
Client Address:	32 Executive Park, Ste 130 Irvine, CA 92614	**JEL Ref. No.:**	E-0895
Attn:	Brad McCardell	**Date Sampled:**	7/26/2018
		Date Received:	7/26/2018
Project Name:	Aquamansa Commerce Park	**Date Analyzed:**	7/26/2018
Project Address:	1500 Rubidoux Blvd Riverside, CA 92509	**Physical State:**	Soil Gas

ANALYSES REQUESTED

1. EPA 8260B – Volatile Organics by GC/MS + Oxygenates/Gasoline Range Organics

Sampling – Soil Gas samples were collected in glass gas-tight syringes equipped with Teflon plungers.

A tracer gas mixture of n-pentane, n-hexane, and n-heptane was placed at the tubing-surface interface before sampling. These compounds were analyzed during the 8260B analytical run to determine if there were surface leaks into the subsurface due to improper installation of the probe. No n-pentane, n-hexane, or n-heptane was found in any of the samples reported herein.

The sampling rate was approximately 200 cc/min, except when noted differently on the chain of custody record, using a glass gas-tight syringe. Purging was completed using a pump set at approximately 200 cc/min and 500 cc/min, except when noted differently on the chain of custody record. A default of 3 purge volumes was used as recommended by July 2015 DTSC/RWQCB guidance documents.

Prior to purging and sampling of soil gas at each point, a shut-in test was conducted to check for leaks in the above ground fittings. The shut-in test was performed on the above ground apparatus by evacuating the line to a vacuum of 100 inches of water, sealing the entire system and watching the vacuum for at least one minute. A vacuum gauge attached in parallel to the apparatus measured the vacuum. If there was any observable loss of vacuum, the fittings were adjusted as needed until the vacuum did not change noticeably. The soil gas sample was then taken.

No flow conditions occur when a sampling rate greater than 10 mL/min cannot be maintained without applying a vacuum greater than 100 inches of water to the sampling train. The sampling train is left at a vacuum for no less than three minutes. If the vacuum does not subside appreciably after three minutes, the sample location is determined to be a no flow sample.

Analytical – Soil Gas samples were analyzed using EPA Method 8260 that includes extra compounds required by DTSC/RWQCB (such as Freon 113). Instrument Continuing Calibration Verification, QC Reference Standards, Instrument Blanks and Sampling Blanks were analyzed every 12 hours as prescribed by the method. In addition, a Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) were analyzed with each batch of Soil Gas samples. A duplicate/replicate sample was analyzed each day of the sampling activity. All samples were injected into the GC/MS system within 30 minutes of sampling.

Approval:

Angela Haar, Ph. D.
Mobile Lab Manager

Re: DTSC Riverside

Project No. : Aqua Mansa

Work Order: P807009

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/17/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

CALIFORNIA DEPARTMENT OF TOXIC SUBTANCES CONTROL (DTSC)
HUMAN AND ECOLOGICAL RISK OFFICE (HERO)

HUMAN HEALTH RISK ASSESSMENT (HHRA) NOTE

HERO HHRA NOTE NUMBER: 2

ISSUE DATE: April 2017

ISSUE: Soil Remedial Goals for Dioxins and Dioxin-like Compounds for Consideration at California Hazardous Waste Sites

SUMMARY

This HHRA Note presents the recommended remedial goals for soils contaminated by dioxins and dioxin-like compounds expressed as dioxin toxicity equivalent (Dioxin-TEQs) concentrations. The US Environmental Protection Agency (EPA) has released only the non-cancer reassessment for dioxins (May 2010) (8); therefore, this note has been revised to present new information on how the non-cancer effects of dioxins and dioxin-like compounds can inform the development of health-protective remedial goals for mitigation sites in California. These goals may be further revised in the future, as new scientific information becomes available or when the U.S. EPA completes its reassessment of dioxins to also include the potential cancer risk.

These soil remedial goals do not supplant the US EPA Regional Screening Levels (RSLs) in a screening risk evaluation but are intended for use in the remediation process. The rationale for the use of these recommended remedial goals is provided in this note.

Table 1 - Dioxin-TEQ Soil Remedial Goals for Sites in California

Exposure Scenario	**ng WHO-TEQ/kg dry matter (ppt)** (9)	**Comments**
Residential[a,b]	50	• 10^{-5} risk level[c] • Noncancer HQ=1 • Compare to 95% UCL exposure concentration
Commercial/Industrial[d, e]	220 - 700	• 10^{-5} risk level to the HQ of 1 • Compare to 95% UCL exposure concentration
Agricultural[f]	<40	• Based on Germany Guideline (4) • Ceiling value

a) This is based on the US EPA residential soil RSL of 5 x 10^{-6} mg/kg (five parts per trillion (ppt)). The RSL was calculated based on a target carcinogenic risk of one-in-a-million (10^{-6}) (7). HERO is supporting a cleanup goal associated with a theoretical potential cancer risk of 10^{-5} because epidemiological studies have demonstrated that exposure to dioxin-contaminated soil is responsible for only a minimal contribution to the dioxin human body burden which suggest that the value of 10^{-5} is likely a large overestimation of the actual risk. The University of Michigan Dioxin Exposure Study (6), conducted on 946 persons, showed that less than 0.01% of the variation in serum dioxin concentrations could be attributed to polychlorinated dibenzo-p-dioxins (PCDDs) in soil and household dust. A study of women in West Virginia led to similar conclusions (3). The recommended remedial goal, based on both theoretical cancer risk and the information from the epidemiological studies, is the same as the US EPA non-cancer residential RSL of 50 ppt at the hazard quotient (HQ) threshold of one (7). If this remedial goal is used, EPA SW-846 screening level bioanalytical assays (4000 series) may be considered in initial site investigation activities, rather than the more sensitive (and more costly) 8000 series methods.

b) The recommended residential remedial goal should only be considered if farming or raising of food animals as the majority of the food supply for residents is not likely to take place at the site. Otherwise, the remedial goal should revert to 5 ppt, representing a 10^{-6} cancer risk level, and accounting for the more frequent soil exposure by residents and long-term ingestion of potentially contaminated food products.

c) Although this suggested residential remedial goal technically represents a theoretical 10^{-5} potential cancer risk, HERO supports this cleanup goal when animal farming as the main source of food for residents is excluded, because the studies referenced in footnote a) show that exposure to soil under normal residential conditions has minimal influence on the serum of exposed individuals and accordingly the 10^{-5} potential risk level is likely an overestimation of the actual potential risk.

d) The US EPA commercial/industrial, cancer-risk-based RSL is 22 ppt, representing a target risk of 10^{-6}. However, if the worker primarily works indoors, HERO recommends using remedial goal of 220 ppt, using the same reasoning as presented in footnote a). Depending on site-specific circumstances and through consultation with a HERO toxicologist, the non-cancer derived remedial goal of 700 ppt, representing a HQ of one may be adequately protective.

e) The commercial/industrial, cancer-risk-based remedial goal of 220 ppt may not be adequately protective if the receptor primarily works outdoors and is in direct contact with site soils while performing daily work activities so that regular incidental ingestion of contaminated soil may occur. In this case, the recommended remedial goal should revert to 22 ppt.

f) A HERO toxicologist should be consulted before using this remedial goal as a ceiling value, since an alternative remedial goal may need to be considered, based on site-specific agricultural land use. Agricultural use standards for some countries, as listed in Table 3, are in the range of California rural background concentrations.

Dioxin-TEQ remedial goals based on the protection of ecological health: The soil remedial goals derived herein are not necessarily protective of ecological organisms (receptors). Protectiveness is variable depending on the ecological receptors of concern at the site. Invertebrates and plants are generally not sensitive to dioxins, while some wildlife receptors can be markedly susceptible and could drive a risk-based cleanup. Consult with a HERO ecological risk assessor if your site contains habitat or could release dioxins to off-site habitat(s).

Table 2 – 2005 World Health Organization Human Toxic Equivalency Factors (TEFs) for Dioxins and Dioxin-like Compounds (9)

Compound	WHO 2005 TEF
Chlorinated dibenzo-p-dioxins	
2,3,7,8-TCDD	1
1,2,3,7,8-PeCDD	1
1,2,3,4,7,8-HxCDD	0.1
1,2,3,6,7,8,-HxCDD	0.1
1,2,3,7,8,9-HxCDD	0.1
1,2,3,4,6,7,8-HpCDD	0.01
OCDD	0.0003
Chlorinated dibenzofurans	
2,3,7,8-TCDF	0.1
1,2,3,7,8-PeCDF	0.03
2,3,4,7,8-PeCDF	0.3
1,2,3,4,7,8-HxCDF	0.1
1,2,3,6,7,8-HxCDF	0.1
1,2,3,7,8,9-HxCDF	0.1
2,3,4,6,7,8-HxCDF	0.1
1,2,3,4,6,7,8-HpCDF	0.01
1,2,3,4,7,8,9-HpCDF	0.01
OCDF	0.0003
Non-ortho substituted PCBs	
PCB 77	0.0001
PCB 81	0.0003
PCB 126	0.1
PCB 169	0.03
mono-ortho substituted PCBs	
105	0.00003
114	0.00003
118	0.00003
123	0.00003
156	0.00003
157	0.00003
167	0.00003
189	0.00003

TEQ concentrations are calculated by multiplying the measured congener concentration in a soil sample by its TEF (Table 2), and adding these converted values to produce the Dioxin-TEQ concentration for the sample. These TEFs were accepted by the DTSC Human and Ecological Risk Division in October 2006 and are equivalent to those adopted by the California Environmental Protection Agency (CalEPA) Office of Environmental Health Hazard Assessment (OEHHA) in January 2011 (2).

Table 3 - Current Agricultural Dioxin-TEQ Guidelines/Standards

Country/Entity	Landscape Scenario	ng WHO-TEQ per kg dry matter (ppt)	Comments	Reference
Finland	Agricultural/Residential	500	Limit value	4
Germany	Agricultural	5 – 40		5
	Agricultural	<5	Target concentration	5
The Netherlands	Agricultural	1		5
	Dairy farming	10		5
Sweden	Sensitive use	10		5
	Less sensitive use	250		5
California ambient	Urban	7-20	Mean ~ 9	1
	Rural	1-6	Mean ~ 3	1

A range of standards have been proposed or put in place for agricultural land use scenarios by various regulatory entities as listed in Table 3. This is not meant to be a complete list but provides a range of remedial goals to consider for agricultural land use.

Work Order: P807003

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/12/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Re: DTSC Riverside

Project No. : Aqua Mansa

Work Order: P807005

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/13/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
D	RPD was not within control limits. The sample data was reported without further clarification.
M	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits due to matrix interference. The associated LCS and/or LCSD was within control limits and the sample data was reported without further clarification.
S	The surrogate recovery was out of control limits due to matrix interference. The associated method blank surrogate recovery was within control limits and the sample data was reported without further clarification.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

ENTHALPY ANALYTICAL

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: Performance Analytical Project: P807005

Date Received: 7/13/18 Sampler's Name Present: ☑ Yes ☐ No

Section 2

Sample(s) received in a cooler? ☑ Yes, How many? 1 ☐ No (skip section 2) Sample Temp (°C) (No Cooler): _____

Sample Temp (°C), One from each cooler: #1: 1.8 #2: _____ #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: ☑ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: 1.0 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			✓
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____

☐ Email (email sent to/on): _____ / _____

Project Manager's response:

Completed By: _____ Date: 7/13/18

Re: DTSC Riverside

Project No. : Agua Mansa

Work Order: P807007

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/14/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
D	RPD was not within control limits. The sample data was reported without further clarification.
L	The laboratory control sample (LCS) or laboratory control sample duplicate (LCSD) was out of control limits. Associated sample data was reported with qualifier.
M	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits due to matrix interference. The associated LCS and/or LCSD was within control limits and the sample data was reported without further clarification.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

ENTHALPY ANALYTICAL

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: Performance Analytical

Project: _____

Date Received: 07/16/18

Sampler's Name Present: ☐ Yes ☑ No

Section 2

Sample(s) received in a cooler? ☑ Yes, How many? 1 ☐ No (skip section 2)

Sample Temp (°C) (No Cooler): _____

Sample Temp (°C), One from each cooler: #1: 9.3 #2: _____ #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: ☐ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: 3.9 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)	✓		
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____

☐ Email (email sent to/on): _____ / _____

Project Manager's response:

Completed By: _____ Date: 7/16/18

Re: DTSC Riverside

Project No. : Agua Mansa

Work Order: P807008

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/14/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
L	The laboratory control sample (LCS) or laboratory control sample duplicate (LCSD) was out of control limits. Associated sample data was reported with qualifier.
M	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits due to matrix interference. The associated LCS and/or LCSD was within control limits and the sample data was reported without further clarification.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

ENTHALPY ANALYTICAL

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: Performance Analytical

Project: _____

Date Received: 07/16/18

Sampler's Name Present: ☐ Yes ☑ No

Section 2

Sample(s) received in a cooler? ☑ Yes, How many? 1 ☐ No (skip section 2)

Sample Temp (°C) (No Cooler): _____

Sample Temp (°C), One from each cooler: #1: 9.3 #2: _____ #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: ☐ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: 3.9 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)	✓		
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____

☐ Email (email sent to/on): _____ / _____

Project Manager's response:

Completed By: _____ Date: 7/16/18

Re: DTSC Riverside
Project No. : Agua Mansa
Work Order: P807010

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/17/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
L	The laboratory control sample (LCS) or laboratory control sample duplicate (LCSD) was out of control limits. Associated sample data was reported with qualifier.
M	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits due to matrix interference. The associated LCS and/or LCSD was within control limits and the sample data was reported without further clarification.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: Performance Analytical Project: _____

Date Received: 07/18/18 Sampler's Name Present: ☐ Yes ☑ No

Section 2

Sample(s) received in a cooler? ☑ Yes, How many? 1 ☐ No (skip section 2) Sample Temp (°C) (No Cooler): _____

Sample Temp (°C), One from each cooler: #1: 4.9 #2: _____ #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: ☑ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: 2.6 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)	✓		
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____

☐ Email (email sent to/on): _____ / _____

Project Manager's response:

Completed By: _____ Date: 7/18/18

Re: DTSC Riverside

Project No. : Agua Mansa

Work Order: P807011

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/18/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
D	RPD was not within control limits. The sample data was reported without further clarification.
M	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits due to matrix interference. The associated LCS and/or LCSD was within control limits and the sample data was reported without further clarification.
S	The surrogate recovery was out of control limits due to matrix interference. The associated method blank surrogate recovery was within control limits and the sample data was reported without further clarification.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: DTSC Riverside
Project No. : Agua Mansa
Work Order: P807011

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/18/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Re: DTSC Riverside

Project No. : Agua Mansa

Work Order: P807014

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/20/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
D	RPD was not within control limits. The sample data was reported without further clarification.
D2	Reporting limit is elevated due to sample matrix. Target analyte was not detected above the elevated reporting limit.
M	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits due to matrix interference. The associated LCS and/or LCSD was within control limits and the sample data was reported without further clarification.
S	The surrogate recovery was out of control limits due to matrix interference. The associated method blank surrogate recovery was within control limits and the sample data was reported without further clarification.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: DTSC Riverside
Project No. : Agua Mansa
Work Order: P807014

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/20/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Re: DTSC Riverside
Project No. : Agua Mansa
Work Order: P807015

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/20/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Re: DTSC Riverside

Project No. : Agua Mansa

Work Order: P807019

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/20/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
0	0
D2	Reporting limit is elevated due to sample matrix. Target analyte was not detected above the elevated reporting limit.
L	The laboratory control sample (LCS) or laboratory control sample duplicate (LCSD) was out of control limits. Associated sample data was reported with qualifier.
L2	LCS did not meet recovery criteria, however, the MS and MSD met LCS recovery criteria, validating the batch.
M	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits due to matrix interference. The associated LCS and/or LCSD was within control limits and the sample data was reported without further clarification.
S	The surrogate recovery was out of control limits due to matrix interference. The associated method blank surrogate recovery was within control limits and the sample data was reported without further clarification.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: DTSC Riverside
Project No. : Agua Mansa
Work Order: P807019

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/20/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
M	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits due to matrix interference. The associated LCS and/or LCSD was within control limits and the sample data was reported without further clarification.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: DTSC Riverside
Project No. : Agua Mansa
Work Order: P807019

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/20/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: DTSC Riverside

Project No. : Agua Mansa

Work Order: P807020

Dear Neil Shukla

Enclosed are the results of analyses for samples received by our laboratory on 7/21/2018. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager
