IDL-Instrument Detection Limit for Waters, MDL-Method Detection Limit for Soils

D1, D2, etc.-Field Duplicate Pairs
FB-Field Blank, EB-Equipment Blank, TB-Travel Blank; BG-Background
CRDL-Contract Required Detection Limit

E The following results are considered usable for limited purposes because of problems seen with the ICP serial dilution These results are considered as estimates and are flagged "J" in Table 1A.

- Calcium, iron and magnesium in sample numbers MYE311 through MYE314
- Barium, iron, magnesium, manganese and zinc in sample numbers MYE315 through MYE318

The ICP serial dilution did not meet the 10% criteria as listed below. A percent difference of 10.2 was obtained for potassium in sample number MYE317 L Since the percent difference is only marginally above the 10% criteria, it is not expected to affect the potassium results in sample numbers MYE315 through MYE318

Parameter	MYE312 L Water % Difference	MYE317 L Soil % Difference
Barium	---	11.7
Calcium	11 1	---
Iron	30 6	16 5
Magnesium	11.5	12 6
Manganese	---	15 5
Zinc	---	20 7

F The following results are considered usable for limited purposes due to possible laboratory contamination problems The results are considered suspect and reported as estimates with a "J" flag in Table 1A

- Iron in sample number MYE311 and MYE314
- Sodium in sample number MYE314

These results were detected above the IDL and less than five times the highest laboratory blank Laboratory blank results which were less than the CRDL and less than twice the IDL or MDL were not used to determine contamination problems

G The soil background sample, MYE316, had a number of parameters with concentration levels at or above those found in the samples

H The 40 CFR 136 and SW-846 holding times were not exceeded for any of the samples There were no holding time problems

I All other results are considered valid and usable for all purposes All QC parameters, other than those discussed above, have been met and are considered acceptable

TABLE 1B
DATA QUALIFIERS

NO QUALIFIER indicates that the data are acceptable both qualitatively and quantitatively.

U Indicates that the parameter is not detected above the concentration listed (Usually the Instrument Detection Limit for waters and the Method Detection Limit for soils with a correction for percent solids)

L Indicates results which fall between the instrument detection limit for waters or the method detection limit for soils and the contract required quantitation limit. Results are considered estimates and usable for limited purposes

J Results are considered estimates and the data valid for limited purposes The results are qualitatively acceptable

R Results are rejected and data are invalid for all purposes

Data Validation Report

Case No	SAS 5424Y Memo #2	
Site	Riverside Cement	
Laboratory	Keystone Lab-Houston (KEYTX)	
Reviewer	Margie Weiner	
	ESAT/ICF Technology, Inc	4 Waters for SAS
Date	August 3, 1990	Cd & Cr Analyses

I Introduction

Keystone Environmental Resources in Houston received four (4) low concentration water samples on June 8, 1990 for SAS low detection limit cadmium and chromium metals analyses The sample numbers are 5424Y-01, 5424Y-02, 5424Y-03 and 5424Y-04 The samples were collected on May 30, 1990 and analyzed on July 9 and 11, 1990

No field blanks, background samples or field duplicates were submitted Cadmium and chromium were analyzed by AA Furnace methods EPA Method 213 2 was followed for cadmium and EPA Method 218 2 for chromium

The analytical results with qualifications are listed in Table 1A This report was prepared in accordance with the EPA Contract Laboratory Program Inorganic Statement of Work for July 1988 and the EPA document "Laboratory Data Validation Functional Guidelines For Evaluating Inorganic Analyses" (1985)

II Validity and Comments

A The results reported in Table 1A for the following analytes are considered as estimates (J) and are usable for limited purposes only

- All results above the Instrument Detection Limit but below the Contract Required Detection Limit (denoted with an "L" qualifier)

Results above the Instrument Detection Limit (IDL) but below the Contract Required Detection Limit (CRDL) are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of detection

B The following results are considered usable for limited purposes because of accuracy problems The results are considered as estimates and are flagged "J" in Table 1A

- Cadmium in sample numbers 5424Y-01, 5424Y-02, 5424Y-03 and 5424Y-04

The matrix spike recovery result for cadmium did not meet the 75-125% criteria for accuracy as listed below The possible percent bias for cadmium is also presented below Where the sample results

for cadmium in all of the samples listed above are undetected, the matrix spike recovery result shows a severe analytical deficiency and false negatives may exist

Parameter	5424Y-02 S % Recovery	5424Y-02 S % Bias
Cadmium	11 2	-88 8

A 150% matrix spike recovery for chromium was obtained in sample number 5424Y-02 S This high recovery is not expected to affect the data because the 19 4 ug/L sample concentration is greater than four times the 1 ug/L of spike added The spike recovery is therefore not considered accurate

C The 35 day contract required analysis holding time specified in the SAS request was not exceeded for any of the samples There were no holding time problems

D All other results are considered valid and usable for all purposes All QC parameters specified in the SAS Request, other than those discussed above, have been met and are considered acceptable

Date of Call: August 22, 1990

Laboratory Name: Region IX, Las Vegas

Lab Contact: Cheryl Baggett

Region: IX

Regional Contact: Margie Weiner

Call Initiated By: ___ Laboratory X Region

In reference to data for the following sample number(s).
CD3

Summary of Questions/Issues Discussed:

1. Are the interelement correction factors correct? A different result is obtained after recalculation
2. The sample is a soil sample but the LCS on Form 7 (page 25) was reported under aqueous instead of solid, why?
3. Was there a matrix spike performed on the CA WET sample other than the post spike on page 22?
4. For the soil analysis, how come there is no strontium reported in the ICV?
5. The CA WET preparation blank on page 123 is not the same as the ones reported on page 16. Please clarify.

Summary of Resolution:

1. The interelement correction factors have been simplified. There is no need to divide the concentration by 1000, just multiply the element by the factor
2. It was an error in the preparation of the sample. A liquid LCS was digested instead of a solid LCS
3. No, because the leachate wasn't digested. It was analyzed straight after nitric acid acidification of the leachate. The leachates should have been digested prior to analysis
4. Strontium was not reported because it was not included in the ICV solution obtained from the EPA.
5. The laboratory will resubmit a new page 16 (form 3) with the corrected preparation blank concentrations. Received FAX on August 23, 1990

Data Validation Report

Case No ·	LVOS15 Memo #3	
Site	Riverside Cement	
Laboratory	Region IX, Las Vegas	
Reviewer	Margie Weiner	
	ESAT/ICF Technology, Inc	1 Soil for RAS
Date	August 24, 1990	& SAS Analyses

I Introduction

The Region IX Laboratory in Las Vegas received one (1) soil sample on June 12, 1990 for RAS metals, SAS California Waste Extraction Test (WET) for Target Analyte List (TAL) metals, strontium and low detection cadmium and chromium analyses The sample number is CD3 The sample was collected on May 30, 1990 The sample was extracted for 48 hours on June 24-26, 1990 The soil sample was digested on June 25, 1990 for low detection cadmium and on June 26, 1990 for RAS metals. The soil and CA WET extract were analyzed for the above mentioned parameters on June 27 through August 8, 1990 For mercury, the sample was digested on June 28, 1990 and analyzed on June 28 and July 16, 1990

No field blank, background or duplicate samples were provided for this case. Low detection limit chromium was not analyzed because the laboratory did not have the lamp to perform the analysis

To distinguish between the RAS and the SAS analyses, the soil sample is labeled Soil CD3 and the extract, CA WET CD3, in Table 1A

The analytical results with qualifications are listed in Table 1A This report was prepared in accordance with the EPA Contract Laboratory Program Inorganic Statement of Work for July 1988 and the EPA document "Laboratory Data Validation Functional Guidelines For Evaluating Inorganic Analyses" (1985)

II Validity and Comments

A. The results reported in Table 1A for the following analytes are considered as estimates (J) and are usable for limited purposes only

- All results above the Instrument Detection Limit for the CA WET CD3 and Method Detection Limit for the Soil CD3 but below the Contract Required Detection Limit (denoted with an "L" qualifier)

Results above the Instrument Detection Limit (IDL) for the CA WET CD3 and Method Detection Limit (MDL) for the Soil CD3 but below the Contract Required Detection Limit (CRDL) are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of detection

B The following results are considered usable for limited purposes because of accuracy problems The results are considered as estimates and are flagged "J" in Table 1A.

- Antimony, lead and thallium in Soil CD3

Matrix spike recovery results did not meet the 75-125% criteria for accuracy as listed below The possible percent bias for each element is also presented below The result for lead is considered quantitatively questionable The result for lead may be biased significantly low and is the minimum concentration at which lead is present. Where the sample results for antimony and thallium are undetected, the detection limits may be biased low.

Parameter	CD3 S Soil % Recovery	CD3 S Soil % Bias
Antimony	36	-64
Lead	7	-93
Thallium	60	-40

A post-digestive spike recovery of 71% was obtained for antimony in Soil CD3. This post-digestive spike recovery result shows a severe analytical deficiency and a false negative may exist

C. The following results are considered usable for limited purposes because of accuracy problems The results are considered as estimates and are flagged "J" in Table 1A

- Antimony, arsenic, lead, mercury, selenium, silver and thallium in CA WET CD3

The CA WET extract was not digested prior to the analyses of the TAL metals as indicated in the method An analytical spike was performed instead of a matrix spike Analytical spike recovery results did not meet the 75-125% criteria for accuracy as listed below. The possible percent bias for each element is also presented below The results for arsenic and selenium are considered quantitatively questionable The results for arsenic and selenium may be biased low and are the minimum concentration at which arsenic and selenium were present Where the sample results for antimony, lead, mercury, silver and thallium are undetected, the detection limits for antimony and thallium may be biased low, and for lead, mercury and silver, the matrix spike recovery result shows a severe analytical deficiency and false negatives may exist

Parameter	CD3 A CA WET % Recovery	CD3 A CA WET % Bias
Antimony	72	-28
Arsenic	58	-42
Lead	29	-71

Parameter	CD3 A CA WET % Recovery	CD3 A CA WET % Bias
Mercury	0	-100
Selenium	61	-39
Silver	0	-100
Thallium	42	-58

D. The following results are considered usable for limited purposes because of calibration problems. The results are considered as estimates and are flagged "J" in Table 1A

- Strontium in CA WET CD3

A continuing calibration verification (CCV) percent recovery of 135 8% (limit is 90-110%) was obtained in the analysis of strontium. The reported result for strontium in CA WET CD3 could be biased approximately 35 8% high

E. The following results are considered usable for limited purposes because of precision problems The results are considered as estimates and are flagged "J" in Table 1A.

- Aluminum, iron and manganese in CA WET CD3

Laboratory duplicate results did not meet the 20% and ± CRDL criteria for precision as listed below The results for aluminum, iron and manganese in CA WET CD3 are considered quantitatively questionable

Parameter	CD3 (CA WET) Lab Dup RPD
Aluminum	28
Iron	49
Manganese	29

F. The following result is considered usable for limited purposes because of problems seen with the ICP serial dilution The result is considered as estimated and is flagged "J" in Table 1A

- Manganese in Soil CD3

The ICP serial dilution did not meet the 10% criteria as listed below

Parameter	CD3S Soil % Difference
Manganese	77 5

G The CA WET extract should have been digested prior to analyses of the TAL metals as indicated in the method Since the extract was preserved in nitric acid after filtration, it is the reviewers opinion that the concentration of the analytes in sample CA WET CD3 would remain essentially unchanged had the sample been digested In this case, the results without any qualifiers are considered acceptable and usable for all purposes

H The reported sodium result in CA WET CD3 is not considered valid due to the presence of sodium in the WET extraction solution used The WET extraction solution consist of 0 2 M sodium citrate at pH 5.0 ± 0.1.

I No initial calibration verification (ICV) standard was performed in the strontium analysis of soil CD3 because the ICV solution that the laboratory obtained from the EPA did not contain strontium This is not expected to affect the data since all of the CCVs were within the 90-110% criteria and from the two-point calibration (500 and 1000 ppb of strontium) performed, the level of the sample was at mid-range of the standards used

J A solid laboratory control sample (LCS) was inadvertently left out when the soil sample was digested A liquid LCS was digested instead. The LCS analysis is designed to serve as a monitor of the efficiency of the digestion procedure. This deficiency is not expected to significantly affect the soil CD3 data because based on past solid LCS laboratory results, all were within the control limits established by EPA

K. The 40 CFR 136 and SW-846 holding times were not exceeded for any of the samples. There were no holding time problems

L. All other results are considered valid and usable for all purposes All QC parameters, other than those discussed above, have been met and are considered acceptable

DATA QUALIFIERS

NO QUALIFIER indicates that the data are acceptable both qualitatively and quantitatively.

U Indicates that the parameter is not detected above the concentration listed. (Usually the Instrument Detection Limit for waters and the Method Detection Limit for soils with a correction for percent solids).

L Indicates results which fall between the instrument detection limit for waters or the method detection limit for soils and the contract required quantitation limit. Results are considered estimates and usable for limited purposes

J Results are considered estimates and the data valid for limited purposes. The results are qualitatively acceptable.

R Results are rejected and data are invalid for all purposes

APPENDIX C

ERM-WEST INVESTIGATION METHODS AND FIELD SHEETS

APPENDIX C

INVESTIGATION METHODS

Monitoring Well Installation Procedures

Soil samples were collected from soil borings using a truck-mounted drilling rig equipped with hollow-stem, continuous-flight augers. Soil sampling was conducted at five-foot intervals with a California-modified split-spoon soil sampler inside the hollow-stem augers. The use of hollow-stem augers provided for sample integrity by preventing the cave-in of up-hole soils to the bottom of the boring during drilling. The soil sampler was driven (pounded into the soil) ahead of the augers using a 140-pound hammer dropping 30-inches. The number of blows required to drive the sampler each 6-inch interval was noted on the drilling logs. This sampling technique allowed for the collection of relatively undisturbed soil samples

Soil recovered from one brass sample tube at each sampling interval was examined for soil classification and lithologic description. Soil was examined visually and classified according to the Unified Soil Classification system. A drilling log was maintained which recorded the vertical variations in lithology, water-content, odor, color, texture and organic vapor concentrations of the soils (Appendix C).

One of the three soil sample tubes recovered from each sampling point was preserved for possible laboratory analysis by covering each end of the tube with a film of Teflon® tape secured in place by a plastic cap to provide an airtight seal. Following labeling, sealed samples were refrigerated at the site in a cooler containing pre-frozen Blue Ice® packets. Soil sample tubes were protected from potential exposure to the Blue Ice® and each other by placing them in sealed Glad-Loc® bags Chain-of-custody forms were completed at the time of sampling (Appendix C).

Field Screening (Headspace Tests)

Recovered samples were screened in the field (utilizing the headspace test method) with a 580B ThermoEnvironmental photoionization detector (PID) instrument to determine the concentration of organic vapors. Portions of the samples were placed in a Glad-Loc® bag. The bag was sealed and placed in direct

sunlight for approximately 15 minutes to encourage volatilization of chemical constituents. Following this equilibration period, the total organic vapor concentration in the sample headspace was measured with the PID calibrated to isobutylene.

The field screening data were recorded on the drilling logs as a function of depth and instrument reading (Appendix C). The PID is sensitive to soil moisture, and several soil samples indicated readings when no odor was observed at the ground surface or from soil samples.

Well Construction

The monitoring wells installed during the subsurface investigation at the RCC facility were constructed using a 4-inch-diameter PVC screen of 0.020-inch slot size, and blank PVC riser casing to the surface. Screens were installed five feet below the water table to allow proper sampling of ground water. The bottom of the screen was sealed with a PVC cap.

The total length of the screened interval in each well was 10 feet. A graded filter pack consisting of Clementina Sand #3 or RMC Lonestar sand #3 (as indicated on each field well completion form in Appendix C) was installed into the annular space between the screen and the side of the borehole. The filter pack was extended from the bottom of the screen to a minimum of two feet above the top of the screen. The sand in the filter pack was then settled by using a surge block inside the screen to ensure that "bridging" of the filter pack did not occur.

After the filter pack had been set into place and had adequately settled, a bentonite-chip seal was added into the annular space of the well directly over the filter pack - minimum thickness of two feet. The remaining interval of annular space was tremie grouted to the surface with Volclay grout (a bentonite product) A plastic locking cap was installed at the top of the casing to protect the integrity of the well. Each well casing extended above the ground surface at least one-half foot.

Well Development

Prior to sampling, each monitoring well was developed using a PVC bailer. The purpose of well development was to purge the well of any foreign water that may have been introduced during drilling or completion operations, and to enable the well to produce a ground water sample as representative of original, pre-drilling conditions as possible.

Before initiating well development, water level readings were collected to determine the elevation of ground water in each well. A measuring point was marked on the lip of the locking cap of each well. The depth to ground water was measured with a water level indicator (an electronic sounding device) accurate to 0.01 feet. The volume of water in each well was then calculated.

Development began by removing well water using a 2-inch diameter PVC bailer. Development was considered complete after either the water parameters of pH, temperature and conductivity had stabilized or a total of ten casing volumes had been purged. This procedure normally resulted in the well water being relatively clear and free of suspended sediment. All water produced during well development was contained in 55-gallon sealed drums and will be disposed of in accordance with proper procedures based on the results of ground water analyses. Data concerning the development of each well was noted on a Well Development/Purge Form (Appendix C).

Collection of Ground Water Samples

Ground water was sampled after well development. Ground water samples collected from MW-1 and MW-3 were obtained from just below the air-water interface with a disposable polyethylene bailer and a polypropylene rope dedicated to each well. The ground water samples were immediately transferred to appropriate laboratory-supplied clean sample containers using disposable bottom-emptying devices. For each well, one 1 liter plastic container, one 1 liter amber bottle and two 500 milliliter plastic containers were filled to test for general water analyses (CAC Title 26: general mineral, general physical and inorganic chemical)

Water samples were collected from two wells on site. The wells on site are 60-1 and 88-1, the facility interchanges between these wells for industrial water supply. The day water samples were collected from the wells, 60-1 was being used. A sample from this location was collected from a spigot on the side of the pump. Water was allowed to run through the spigot prior to collecting the sample. In order to collect a sample from 88-1, the water supply for the facility had to be changed from 60-1 to well 88-1. The pump for the well was allowed to run for approximately 45 minutes prior to collecting a water sample from this well. The sample for this well was also collected from a spigot on the side of the pump. Prior to sampling, water was allowed to run through the spigot.

The water samples collected off-site were from wells at YCC and ERCC. The sample collected from the YCC well was taken from a faucet at the car wash on site. ERM-West representatives were told this faucet was the same source for YCC water sampling and that

the pump for the well had been operating all day. ERM-West representatives were informed the well at ERCC was used to irrigate the golf course. The sample for ERCC was therefore taken from a hose connected to a water sprinkler. The samples were taken at the end of the business day allowing the pump for the well to be operating all day.

A label was affixed to each sample container to identify the job number, samplers, date and time of sample collection, analyses requested and a sample number unique to that sample. This information, in addition to a description of the sample, field measurements made, sampling methodology, names of on-site personnel and any other pertinent field observations, was recorded in the field notebook. Following labeling of the sealed samples, the samples were refrigerated at the site in a cooler with pre-frozen Blue Ice® packets. Chain-of-custody forms were completed at the time of sampling and accompanied the samples to the laboratory (included in Appendix D).

CERTIFICATION

The following geological boring logs contain information generated by formally educated and trained personnel working under my general supervision. Geological field procedures and geological observational criteria used in their preparation are according to protocols either generated or reviewed and approved by me.

Sincerely,

ERM-WEST, INC.

David B. Dunbar, R.G.
Principal-in-Charge
California Registered Geologist #4249

ABBREVIATIONS

BTEX - Benzene, Toluene, Ethyl Benzene, and Total Xylenes.

CCR - California Code of Regulations.

cm3 - Cubic centimeter.

DHS - California Department of Health Services.

EPA - United States Environmental Protection Agency.

Kg - kilogram.

L - Liter.

LUFT - Leaking Underground Fuel Tank.

mg - Milligrams.

M3 - Cubic meter.

1umhos/cm - uS/cm - Micro Siemens/centimeter

NA - Not Applicable.

ND - Not Detected at or above the defined detection limit.

ppb - Parts Per Billion.

ppm - Parts per Million.

RPD - Relative percent difference.

STLC - Soluble Threshold Limit Concentration.

Surr. - Surrogates.

TCLP - Toxicity Characteristic Leaching Procedure.

TEH - Total Extractable Petroleum Hydrocarbons.

Title 26 - Title 26 of the California Code of Regulations (CCR).

TR - Trace

TTLC - Total Threshold Limit Concentration.

TVH - Total Volatile Hydrocarbons.

ug - Micrograms.

WET - Waste Extraction Test.

ERM-WEST FIELD QA/QC PROCEDURES

FIELD QUALITY ASSURANCE/QUALITY CONTROL PROCEDURES

The QA/QC procedures described in this subsection provide a system of checks designed to minimize errors and to ensure that all work is of the highest reasonable quality. Although QA/QC is an important component of each aspect of a project, it is of fundamental importance in the collection and analysis of soil and ground water samples. The following paragraphs describe the QA/QC procedures followed to ensure that samples obtained were precise and representative of actual conditions.

Soil Sampling QA/QC

Field QA/QC procedures for soil sampling included:

- complete steam cleaning of drilling equipment prior to each drilling;
- cleaning sampler and sample tubes by Alconox® solution prior to soil sampling;
- using of disposable gloves during sampling procedures to reduce chances of cross contamination; and
- preparing sample labels carefully and cross-comparing with chain-of-custody lists and field notes.

Ground Water Sampling QA/QC

Field QA/QC procedures for ground water sampling included:

- complete cleaning of all development equipment in an Alconox® and water solution prior to the development of each well;
- using disposable bailers and bottom-emptying devices with dedicated polypropylene ropes;
- proceeding from 'least' to 'most' contaminated well (if known); and
- preparing all sample labels carefully and cross-comparing against chain-of-custody lists and field notes.

Subject: Site Inspection Prioritization Report - Riverside Cement Company
Crestmore Plant - CAD 063844443

Dear Mr. Quint:

Enclosed is Riverside Cement Company's response to the Site Inspection Prioritization Report (SIP) by Mr. Daniel Wong of Bechtel Environmental, Inc. dated June 22, 1994. The delay in forwarding these comments to you was to allow our consultant and Hydrogeologist, ERM-West, sufficient time to thoroughly review the Bechtel report and prepare a clear, concise and complete statement regarding the assumed "releases" of chromium from the Crestmore Plant cement kiln dust disposal site.

In your review of this report, please note that Mr. Sterns, ERM-West, disagrees with the SIP report that a "release" has occurred. We believe your review of the facts will lead you and your staff to the same ERM-West conclusions:

1 The El Rivino and Yeager wells, used by E&E and Bechtel are not hydraulically upgradient and downgradient. Drawing any conclusions between the test results of these two wells is meaningless and "no release" to groundwater can be determined.

2. The upgradient and downgradient wells located and sampled by ERM-West, did not demonstrate a release of chromium (or any other metal) to groundwater.

This should lead EPA to close the Crestmore file with a "No Further Action" decision.

We would like to set up an appointment with you, your staff and the site investigation staff to discuss these findings and comments. Please let us know a convenient time for this meeting. If you have any questions, please call me at 909/683-6458 or Pat Hill at 909/683-3660.

Sincerely,

Eugene M. Kulesza

SECTION 1

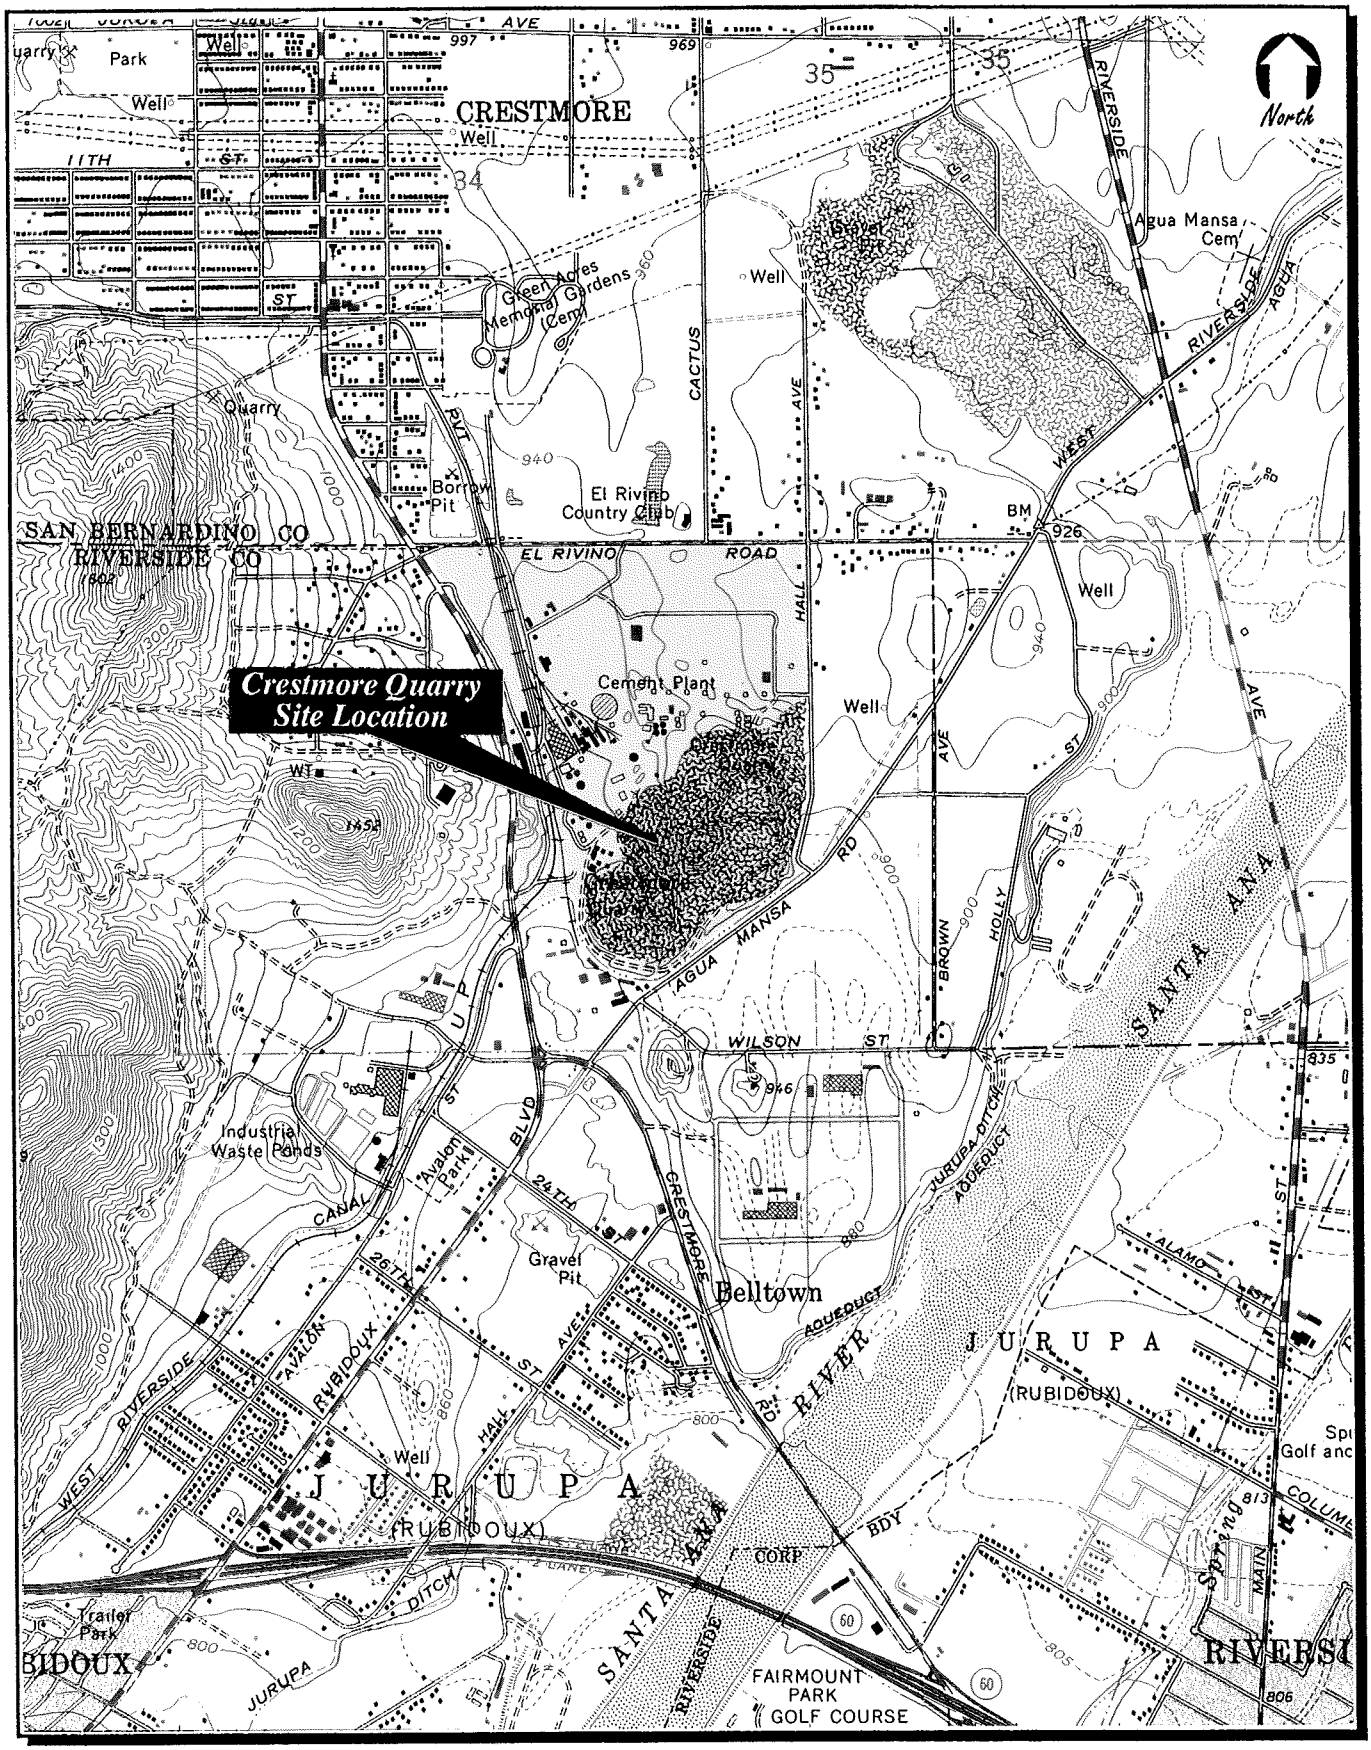
1.0 INTRODUCTION

This closure plan for the Cement Kiln Dust and Boiler Blowdown Pond has been prepared to meet the provisions of California Administrative Code, Title 23, Chapter 3, Subchapter 15 (Waste Discharges of Waste to Land). This section summarizes the site background, facility site conditions, groundwater history, and cement kiln dust and boiler blowdown disposal areas.

1.1 Background



The Crestmore Facility is owned and operated by the Riverside Cement Company. The facility, as indicated in Figure 1-1, is located approximately 2.5 miles south of Interstate 10, and south of the City of Crestmore in Riverside County (Township 2 West, Range 5 West, Sections 2 and 3, San Bernardino Base Line and Meridian).

The facility has produced cement products since 1910 and has had several owners since beginning operations. In past operations, limestone was mined from the site, combined with other materials imported from off-site, and burned in rotary kilns to produce cement clinker. The cement clinker was then crushed to produce cement that was shipped from the site.

During the operation of the kilns, off-specification materials in the form of cement kiln dust (CKD) and raw feed materials were generated and used as feed supplement in the processes. Excess CKD was disposed on-site in the specific areas identified in Figure 1-2. The disposal of the CKD was typically performed by transporting the CKD by truck from the kilns and end-dumping the material within the disposal area. The dust was extremely fine. When water came in contacted with the CKD, the resulting reaction created a cementicious crust that was impervious to further water penetration.

In 1987 the grey cement kilns stopped manufacturing grey cement clinker. Today, grey cement clinker is imported to the site, stored, and then crushed into final cement product. Since there are no grey kilns in operation, no grey CKD is generated at the site.

Today, the site is not mined and only two of the white kilns are in operation to manufacture white cement. These kilns generate white CKD during the clinker manufacturing process. On-site disposal of

CKD generated by this operation ceased in the summer of 1990. Riverside Cement now uses the white CKD as feed supplement in the white kilns or, when the white kilns are not operational, the CKD is used as part of the feed in the grey or white cement clinker grinding operations. The relative proportions of CKD use in the white kilns and grey clinker storage is 85-90 percent and 10-15 percent, respectively.

1.2 Site Conditions

The Crestmore Quarry is situated on the south side of the San Bernardino Valley at an elevation of approximately 900 feet. The predominate landmark Sky Blue Hill crests at an elevation of approximately 1120 feet. Temperatures vary from 28°F to 110°F. Rainfall ranges from 8-18 inches per year, with most of the precipitation falling between the months of November and April.

There are no streams or springs at the site. Drainage from rain storms sheet flow over the former CKD areas and accumulate in the three former quarry areas (Crestmore, Commercial, and Wet Weather quarries). The Wet Weather Quarry and Crestmore Mine are isolated from the main operation's site by a 1.5 to 2.0 foot high berm constructed on the access road to the Quarry. The berm is designed to minimize water runoff into the Quarry from the operation's area.

The Santa Ana River flows southwest about 3500 feet southeast of the site. The sites lie above and outside of the Santa Ana River floodplain. The Commercial and Crestmore Mine Quarries are flooded with ground water, and water temporarily ponds at the Wet Weather Quarry after heavy rainfall.

1.3 Hydrogeology

Ground water occurs in three distinct hydrologic units at the Crestmore facility: the Chino Limestone, the Wet Weather and Commercial Limestone (upper limestone units) and the Santa Ana River alluvium. Figure 1-3 (adapted from the 1950 report by W.P. Rowe) shows the stratigraphic relationship of these hydrologic units.

The Chino Limestone originally cropped out where the Crestmore Mine is located (Figure 1-2). Since this limestone was of exceptionally high quality, two detailed dewatering feasibility studies were conducted by W.P. Rowe in 1928 and 1950. These studies involved detailed geologic interpretation of the numerous core holes

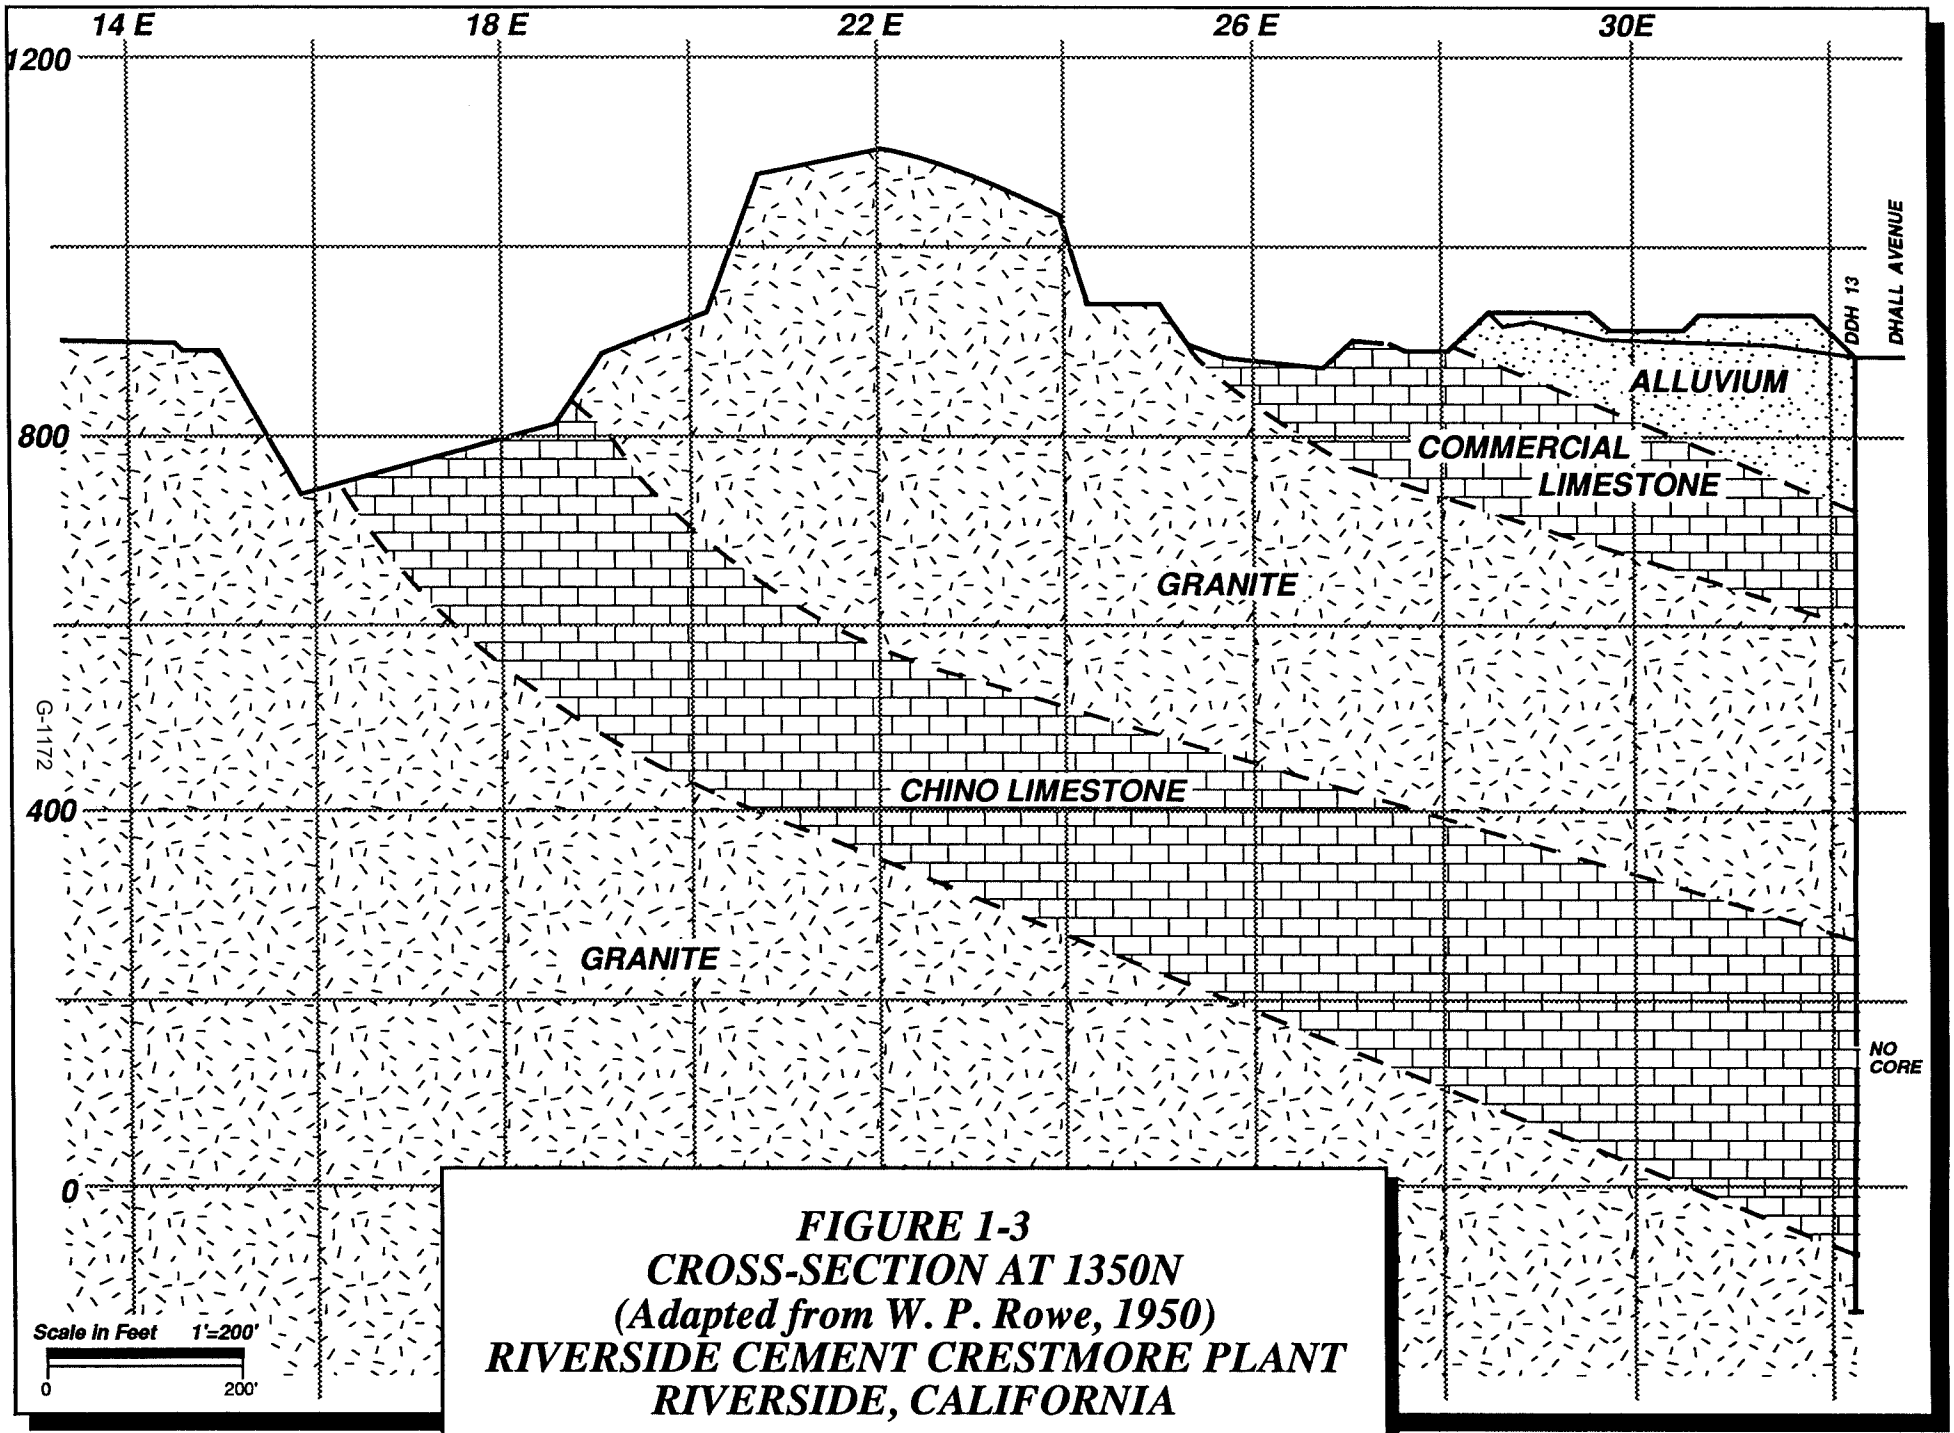

FIGURE 1-3
CROSS-SECTION AT 1350N

in the area, installation of new wells, pump tests and large scale laboratory models.

W.P. Rowe (1928) demonstrated in his studies that the quartz diorite layers (granite) above and below the Chino Limestone acted as confining layers. Only a small portion of the Chino Limestone comes into contact with alluvial deposits (Figure 1-4) of the Santa Ana River. Figure 1-4 indicates Rowe's 1928 interpretation of ground water levels prior to large volume pumping of ground water. Wells screened in the alluvium and water levels in the Wet Weather and Commercial units demonstrate a pattern of flow consistent with ground water migration in the river alluvium. Wells screened in the Chino Limestone vary in elevation only a few hundredths of a foot over nearly the same area.

The northern portion of Figure 1-4 indicates the alluvial water table approximately 9 feet higher than the Chino water level at Drill Hole 20. Based on this observation, W.P. Rowe determined that the influx of water from the Santa Ana River alluvium was restricted. During the course of dewatering the mine between 1928 and 1950, the influx of water from the northern Chino Limestone contact with the alluvium was minor. Water levels in alluvium wells dropped approximately 10 feet during the initial stages of mine dewatering. Subsequent lowering of the Chino Limestone water table had no further impact on alluvial water levels. By 1950, mining had been successfully accomplished to an elevation of 660 feet above sea level or approximately 165 feet below the water table in the river alluvium.

Based also on W.P. Rowe's 1928 observations of well water temperature measurements (Figure 1-5) and aquifer response to precipitation events, he concluded that the vast majority of the water in the Chino Limestone originated from direct percolation of rainwater at the mine and influx from a deep source somewhere below the Santa Ana River to the east. Using water quality data obtained from several wells and the mine sump combined with water balance calculations, W.R. Rowe (1950) concluded that inflow to the mine from the alluvium was approximately 400 gallons per minute (gpm). Based on sulfate ion concentrations, he concluded that the southern contact of the Chino Limestone to the alluvium provided only 30 gpm of the calculated total alluvium contribution of 400 gpm.

The upper limestone unit (Figure 1-3) has been mined in three separate areas as indicated on Figure 1-5. The Lone Star Limestone was well above the water table and has been mined out. The Wet Weather and Commercial Limestones are part of a continuous limestone unit in cross-section that were partially separated at the original surface outcrops by a lobe of granite. The upper limestone was hydraulically connected to the alluvium east of the outcrop. This fact is apparent when the hydraulic contours are compared between the alluvium and the limestone on Figure 1-4.

RIVERSIDE CEMENT CRESTMORE PLANT
RIVERSIDE, CALIFORNIA

According to W.P. Rowe (1928), the Wet Weather Limestone was honeycombed and fissured. Hydraulic connection to lower portions of this limestone and the alluvium were inferred to be very strong. The Commercial Limestone was more dense and massive, analogous to the structure of the Chino Limestone. Since many of the fractures and fissures were filled with fine-grained alluvium, the hydraulic connection was not 100%, and W.P. Rowe noted a small decrease in gallons pumped per foot of drawdown in the Wet Weather Limestone as drawdown in the pumping well increased. Dewatering efforts at the Wet Weather Quarry allowed mining down to an elevation of approximately 780 feet.

In 1985, a 12-foot diameter drift approximately 200 feet above sea level was cut across from the Chino Limestone in the Crestmore Mine to the upper limestone unit that was mined in the Wet Weather and Commercial Quarries. The drift was installed because mining in the Chino Limestone had reached to approximately 65 feet below sea level, and the cost of mining deeper was not economical.

Unfortunately, the granite above the Wet Weather Limestone and below the alluvium could not support the roof, and the Crestmore Mine began to flood. An attempt was made to seal the drift, but the seal was only partially successful, and the mine was allowed to flood to the present water level in Crestmore Lake. Crestmore Lake is therefore hydraulically connected to the Wet Weather Limestone and from there to the Santa Ana River alluvium to the east through this drift.

Ground water is pumped from production wells and used on-site. Production well 88-1 is located in the Chino Limestone; well 60-1 is located in the alluvium. Ground water in the Chino Limestone migrates toward the production wells. Since the drift was not completely sealed between the upper and lower limestone units, the sources of recharge for the Chino Limestone water consumed on-site include precipitation, the northern Chino Limestone contact with the river alluvium, water from within the Chino Limestone aquifer deeper to the east and the drift to the Wet Weather Limestone at 220 feet above sea level. The southern contact of the Chino Limestone with the river alluvium (Figure 1-4) has probably become a minor influent and discharge point to the river alluvium as water levels in Crestmore Lake and the alluvium vary.

Therefore, the areas where CKD was disposed in the Quarries lie within the capture zone of on-site production wells. Water samples have been collected from the production wells and analyzed for specific water quality compounds (Appendix A). There have not been any reports of water quality degradation.

1.4 Cement Kiln Dust Disposal Areas

Cement Kiln Dust has been disposed on-site in the areas indicated on Figure 1-2. The past disposal areas are located primarily in the eastern portion of the site and to the north of Crestmore Lake and Sky Blue Hill. On the eastern portion of the Wet Weather Quarry and to the east and south of the flooded Commercial Quarry the site is underlain by alluvial soils. Below the CKD areas to the north of Sky Blue Hill and Crestmore Lake, the site is underlain with alternating quartz diorite and limestone (marble) zones. These zones dip downward at an approximate forty-five degree angle towards the east.

In the three specific disposal areas (Figure 1-2, Crestmore Lake, Commercial Quarry, and the Wet Weather Quarry) the CKD has been dumped on the edges of steeply mined areas. The CKD is estimated to be between one foot and to greater than 10 feet thick in these areas; however, the CKD depth will vary considerably because 1) the steep sideslopes of the mined areas do not allow CKD to accumulate in large quantities and, 2) in the case of the Commercial and Wet Weather Quarries, some of the CKD was reclaimed and reused in past operations. Portions of these three areas are covered with native overburden material.

The former main disposal area, north of Sky Blue Hill, varies in depth from two feet to greater than 60 feet. Riverside Cement last used this disposal area in 1990 and has since ceased disposal of CKD on site. To maintain dust control, the normal practice on-site was to periodically cover the CKD active disposal area. Soon after Riverside Cement stopped dumping CKD on-site, the former active disposal site was covered and capped with overburden soils from other on-site activities. The estimated depth of this overburden capping in the main disposal area is from 2 to 3 feet.

1.5 Boiler Blowdown Disposal

The boiler blowdown pond is located just north of the white kilns (Figure 1-2). It was in operation from 1985 to June, 1990. It is approximately 30 feet by 60 feet in area and approximately 4 feet in total depth. It is presently not in use. Riverside Cement has changed the blowdown operation and now uses the boiler blowdown as cooling water in the operating kilns. The pond is located within a containment area for an above ground diesel storage tank. The pond is lined with plastic and covered by clay soil. Rainwater occasionally collects within the pond and evaporates.

SECTION 2

2.0 CLOSURE AND POST-CLOSURE PROCEDURES

The closure and post-closure procedures for the disposal area, contained in this Plan, meet the requirements of Articles 8 and 9 of Subchapter 15 and will be performed under the direct supervision of a registered civil engineer or a certified engineering geologist. In addition, this closure and post-closure maintenance plan provides for waste containment, precipitation, and drainage controls meeting the requirements of Article 4 of Subchapter 15.

Additionally, the Riverside Cement Company is planning to mine the rocks from Sky Blue Hill and Beckett Hill. A Mining and Reclamation Plan (revised February 7, 1991) is currently under review by Riverside Planning Department. The reclamation plan is included in Appendix B. When mining operations begin, the land surface and topography to the north and east of Sky Blue Hill will rise as a result of disposal of off-specification mining materials. Ultimately, the main CKD disposal areas north of Sky Blue Mountain and the Wet Weather Quarry will be covered with 15-20 feet of rock and other material generated by the mining operations.

The closed disposal area will be provided with at least two permanent monuments installed by a licensed land surveyor or a registered civil engineer, from which the location and elevation of the disposal sites can be determined throughout the post-closure maintenance period.

The following closure procedures apply to the three CKD disposal areas and the boiler blowdown pond (Figure 1-2). As the mining operations begin to cover the CKD areas, the post-closure maintenance operations of this plan will be suspended and the reclamation procedures of the Plan will take precedence.

2.1 Cement Kiln Dust Closure Procedures

The three disposal sites shown in Figure 1-2 will be closed by a licensed contractor. The name of the contractor is not known at this time, however, the company selected to performed the work will be provided at a later date.

The final closure procedures for each CKD disposal site will include settlement projections, cover material selection, and post closure maintenance.

2.1.1 Settlement

Since the cement kiln dust waste is very fine and uniform and when mixed with water forms a dense, impermeable mass, settlement within each disposal sites is not expected to occur.

2.1.2 Cover Material

The cover material for each closed disposal site will be native overburden generated from on-site activities. This material has already been used to cover much of the CKD area north of Sky Blue Hill. Overburden soil is the selected cover material since the CKD when in contact with water reacts to form a cementitious crust that is impervious to water penetration. This system of reactive CKD and overburden soil will provide equivalent protection to the systems required by Subchapter 15.

It is not anticipated to regrade or change the drainage pattern of the existing disposal sites except as described in the mining plan. The overburden soils will be end-dumped in the area of the CKD and spread to a compacted depth of a least 12 inches. In the areas where the slope is too great to use equipment (commercial and wet weather quarries, and Crestmore Lake) the cover soils will be end-dumped down the slope and allowed to stabilize at the natural angle of repose or the existing slope of the quarry. When the mining operation begins, most if not all of the slope surfaces at the Wet Weather Quarry will be covered by the mining operations, reducing the tendency for rutting and channeling of the material during rainstorms.

2.1.3 Post Closure Maintenance Activities

Maintenance of closed sites will include inspection and correction of eroded cover material. As CKD disposal areas are closed, inspection will occur regularly as the remaining CKD sites are covered and compacted. After the CKD sites are closed, inspections will be conducted after intense rains or wind storms.

Experience on previously closed disposal sites, indicates that some periodic replacement of cover material will be required until plants and shrubs begin to reclaim the area. It is anticipated that some cover material will be required to replace washouts and eroded

sideslopes. Natural vegetation will be permitted to grow over the cover material.

2.2 Boiler Blowdown Pond Closure

The final closure procedure for the pond will include closure overview, cover material selection, settlement projections, and post closure maintenance.

2.2.1 Closure Overview

Free liquid remaining in the pond at the time of closure will be removed and disposed according to appropriate regulations. If the material is designated as hazardous, the liquid will be disposed using a hazardous waste manifest. For this purpose, Riverside Cement will use their EPA generator number CAD 063844443.

Once the liquid is removed, the soils and plastic liner will be removed by excavation and stockpiled on-site. Soils will be removed from all four interior sides of the existing dikes and the bottom of the pond. Depth of the excavation is assumed to be two feet, however, the ultimate depth of excavation will be based on visual observations for stained soils and the use of field instruments for chemical off-gasing potential.

The stock-piled soils will be sampled and analyzed at a state certified laboratory. Depending on the analytical results, the soil material will be classified as either hazardous (to be disposed off-site using RCRA and/or state regulations) or non-hazardous (to be disposed of on- or off-site). One on-site disposal method would be to incorporate the soils with clay material used in capping the CKD areas.

After excavation is complete, confirmation soil samples will be taken and analyzed for the following compounds: total petroleum hydrocarbons (EPA Method 418.1), total chromium and total lead (EPA Method 6010).

2.2.2 Cover Material

The cover material for the pond will be a locally available clay. This clay material has low permeability (less than 10^{-7} to 10^{-8} cm/sec) and is available in sufficient quantity required for the closure of the pond. It is anticipated that no more than two feet of existing soils will be removed from the pond surfaces (bottom and dike areas); thus the thickness of the clay cover will be no less than two foot and more likely between two to three feet in depth.

2.2.3 Settlement Projections

The soils under the pond are native soils and they have consolidated over time. The cover material will be compacted using rubber tired equipment or other type of rolling equipment. Thus, no settlement is expected after pond closure. Additionally, every effort will be used to leave the outer containment berm in place and as undisturbed as possible.

2.2.4 Post Closure Maintenance Activities

Maintenance of the closed pond will include inspection and correction of eroded cover material. It is anticipated that some cover material will be required to replace washouts and eroded sideslopes from intense rainstorms. Since the area of the pond will continue to be used as an extension of the secondary containment for an above ground diesel fuel tank, the sideslopes and bottom of the containment area will continue to receive necessary inspections.

2.3 Post-Closure Land-Use

The closed CKD disposal sites will be allowed to revegetate naturally. The areas will be allowed to return to a non-irrigated open space native environmental setting until the mining operations begin to fill the CKD disposal sites. At the time of the mining operations, the post-closure land-use requirements will be subservient to the Reclamation Plan (Appendix B).

The boiler blowdown pond area will continue as an extension of the secondary containment basin for the above ground diesel fuel tank.

SECTION 3

3.0 CLOSURE SCHEDULE

It is anticipated that the closure of the CKD areas will require up to 3 months and the pond closure will require two months, both activities will proceed concurrent with one another.

Maintenance of the closed disposal sites will be required until the CKD areas are reclaimed by nature or until the Sky Blue Hill mining and reclamation project begin. Based on observations of the experimental reclamation areas and experience at other similar closed sites, and conservative assumptions, we anticipate a reasonable post closure maintenance period of 5 years. This five year period will allow for either partial revegetation or the Sky Blue Hill mining and reclamation plan will become an on-going operation. The maintenance activities will include inspection after rains and repair of washouts and eroded areas.

Prior to beginning the final closure of the CKD areas and the pond site, the owner will notify the Regional Board of its intent to close. The notification statement to the Regional Board will include a provision that all closure activities conform to the approved closure plan and that the plan is in compliance with applicable regulations.

After completion of closure activities, the Riverside Cement will notify the Regional Board within 30 days. The owner will be required to certify under penalty of perjury that all closure activities were performed in accordance to the Closure Plan, and that the site will be maintained and monitored according to the post-closure maintenance requirements included in this Plan.

SECTION 4

ESTIMATED COSTS

The estimated cost for the complete closure and post-closure maintenance of the disposal sites on a present worth basis, is $470,000. This estimate is detailed in Table 4-1 and divided into capital and operating (maintenance) costs. Closure is assumed to occur in 1991 dollars and it is further assumed that a third party will be completing the final closure.

Capital expenditure to close the site is estimated at $440,000. This figure assumes that the CKD closure sites have a fill area of approximately 15 acres and are covered with one foot of clay imported from Corona Clay. Additionally, it is assumed that he area for guniting the northern area of Crestmore Lake is 25,000 square feet. The predominant costs for pond closure are for disposal of soils as hazardous waste.

Annual operating costs are estimated at $7,500 per year for the post closure period. Post closure operating (maintenance) costs include inspections and labor and materials to repair eroded areas. The assumptions used are stated at the bottom of Table 4-1.

In developing the project costs, it is assumed that the post-closure period for maintaining the disposal sites will not exceed five years. The post-closure maintenance period of five years assumes that sufficient rainstorms will have consolidated the majority of the site and will have identified erosion areas. Further, through the periodic maintenance required of this closure plan, these eroded areas will have been corrected and consolidated to prevent further erosion.

Riverside Cement Company
1500 Rubidoux Boulevard
P. O. Box 832
Riverside, CA 92502

APPROVAL OF CLOSURE REPORT AND CERTIFICATION OF CLOSURE, BOILER BLOWDOWN DISPOSAL POND, LOCATED AT: RIVERSIDE CEMENT COMPANY, 1500 RUBIDOUX BOULEVARD, RIVERSIDE, CALIFORNIA

Dear Mr. Smith:

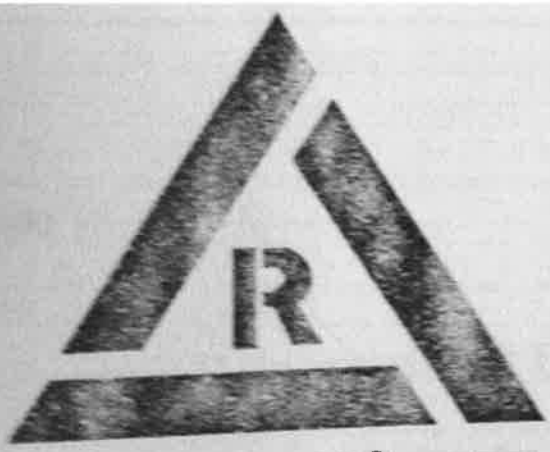
The closure report for the former boiler blowdown disposal pond at the above-referenced Riverside Cement Company facility is hereby approved. Closure of the former pond is complete.

The former pond area now serves as a lined, secondary containment basin for the aboveground storage tank containing fuel oil for the cement kilns. Our staff will continue to conduct routine inspections of the aboveground tank, its appurtenances, and the secondary containment area.

As a reminder, you are required to submit a revised Spill Prevention Control and Countermeasure Plan (SPCC) for the aboveground storage tank. The location of the dewatering sump should be shown on the map in the SPCC, and you must include a description of the sump clean-out procedures to be implemented in the event of a spill or leak.

Thank you for your cooperation throughout the closure project. If you have any questions or comments regarding this letter, you may contact me at (909) 782-4904.

Sincerely,



Ann E. Sturdivant

Ann E. Sturdivant

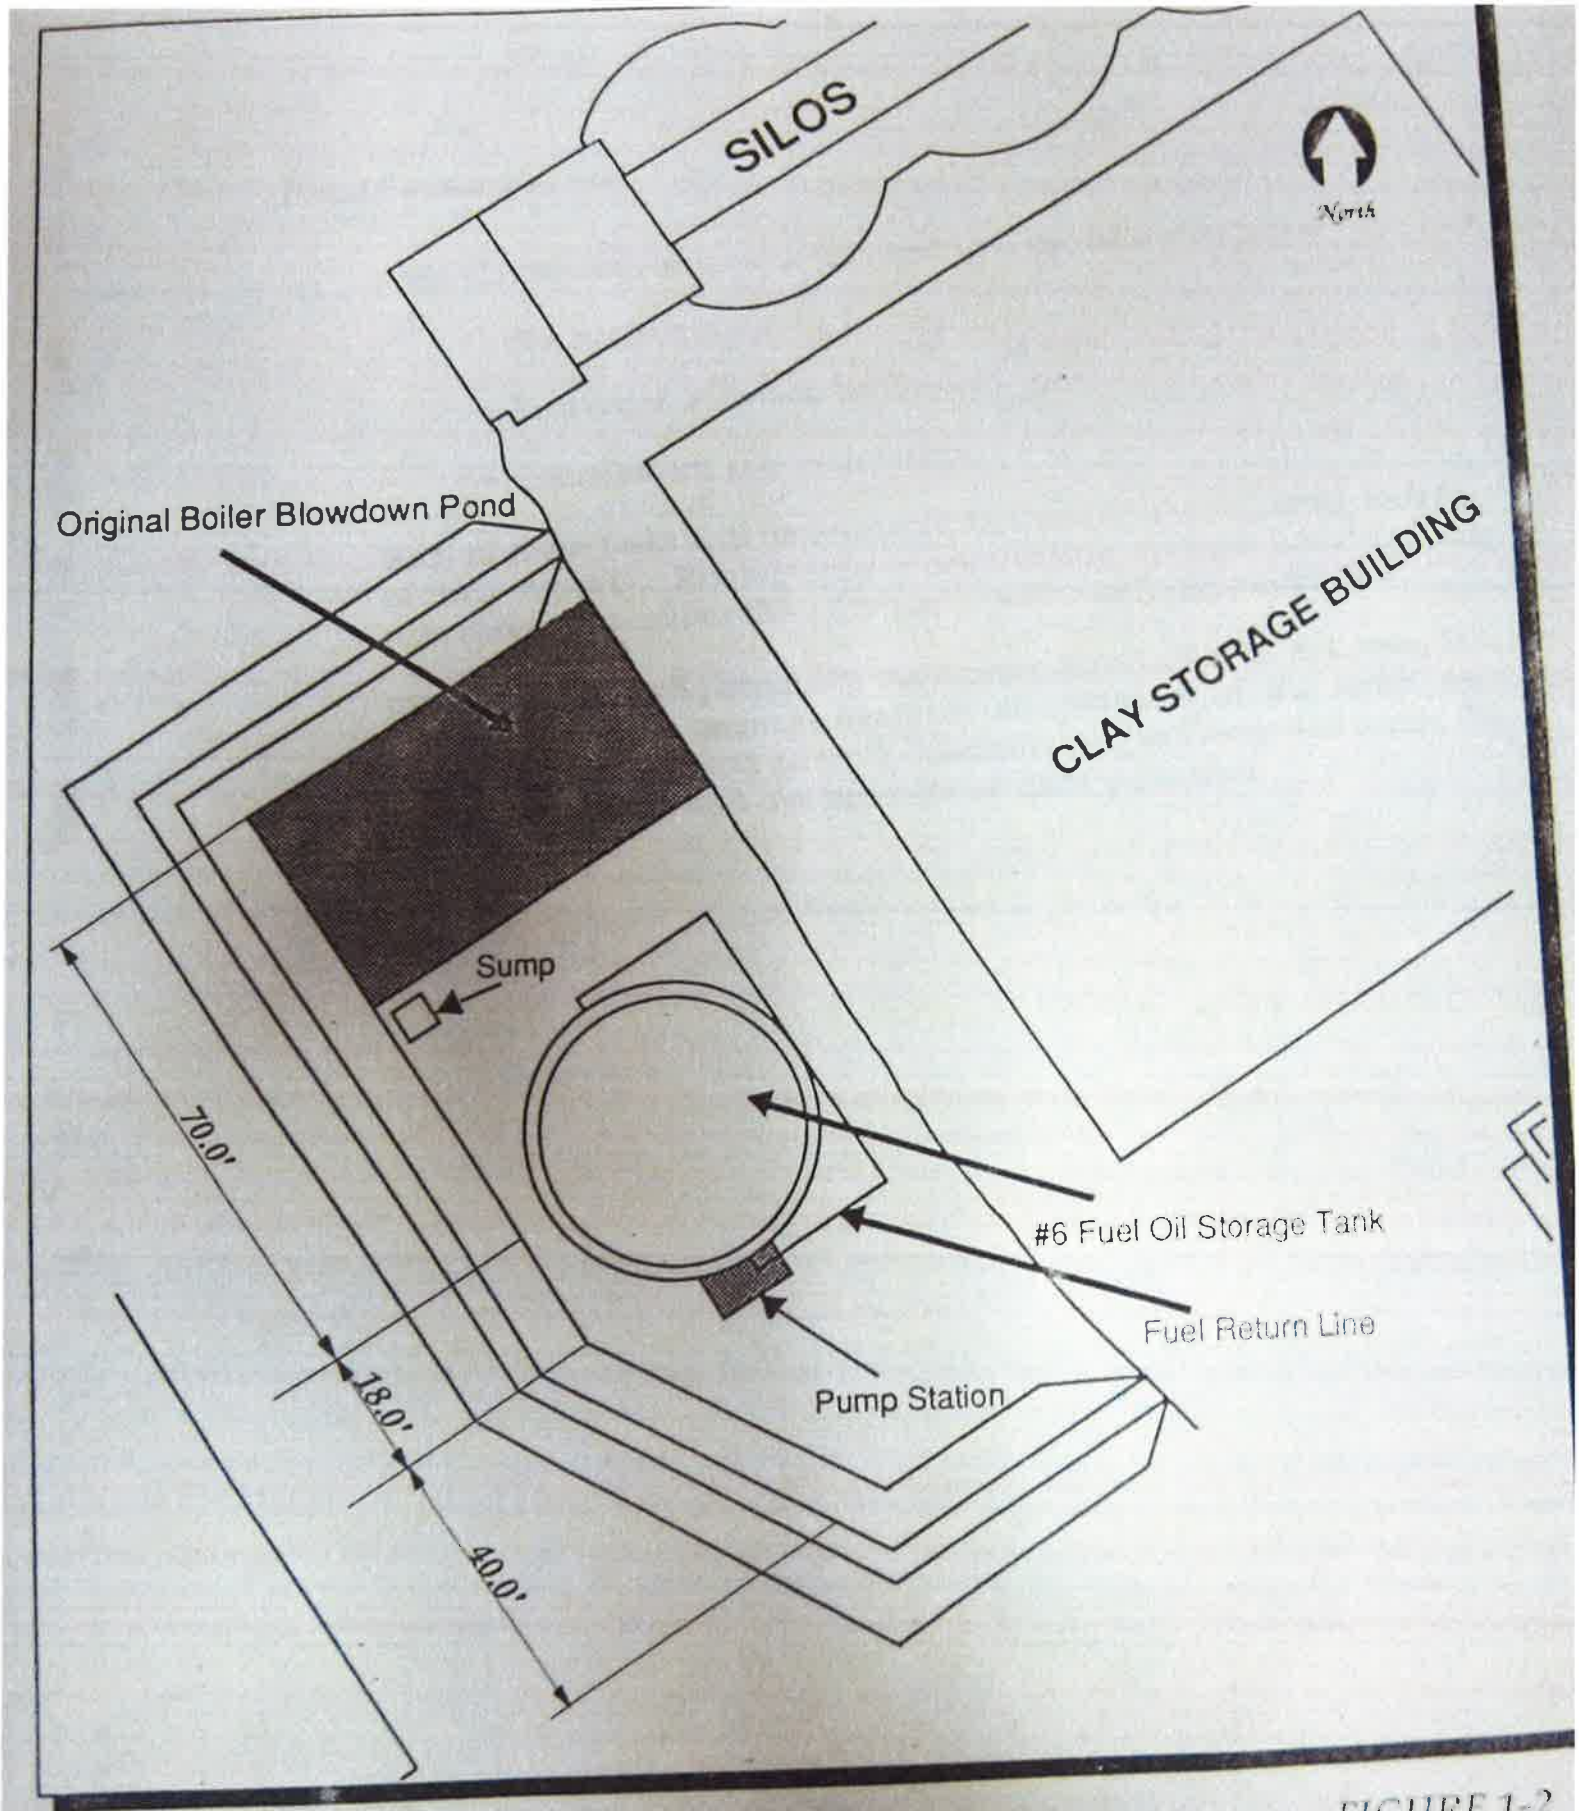
INTRODUCTION



On behalf of Riverside Cement Company (RCC), ERM EnviroClean-West, Inc., (ERM) is pleased to present this closure report documenting remedial activities performed at the Boiler Blowdown Pond (Pond) at RCC. The remedial activities performed by ERM were in accordance with the *Closure Plan Boiler Blowdown Pond* report submitted to the Regional Water Quality Control Board (RWQCB) in January 1994.

Site Description and Background

The RCC facility is located at 1500 Rubidoux Boulevard in Riverside, California (Figure 1-1) and has produced cement products since 1910. In past operations, limestone was mined from the site, combined with other imported materials, and burned in rotary kilns to produce cement clinker. The Pond was used as a surface impoundment to receive the blowdown discharge.

The Pond is located immediately west of the Clay Storage Building (Figure 1-2). The Pond has been in operation from 1985 to 1990 and occupies the northern quarter of a secondary (spill) containment basin. The secondary containment basin is associated with a 210,000-gallon #6 fuel oil aboveground storage tank (AST). The Pond is approximately 30 by 50 feet in area and approximately 4 feet in total depth. Prior to these closure efforts, the Pond was lined with plastic and covered by clayey soil. Rainwater occasionally collected within the Pond and was allowed to evaporate. The surface of the Pond was cementacious in nature due to the deposition and spillage of clinker dust.

RCC has changed the blowdown operation and now uses the boiler blowdown as cooling water in the operating kilns. As a result, blowdown water is no longer discharged to the Pond.

Pond Closure Tasks

Pond closure activities can be divided into the following tasks:

- Site preparation;
- Excavation activities; and
- Containment area restoration.

Each of these tasks will be discussed in detail in the following sections of this report. Photographs documenting closure activities are referenced throughout this report and provided in Appendix A.

ERM subcontracted portions of the closure activities to H. B. Covey, Inc. (Covey). Project management for all portions of the work was performed by ERM and all work subcontracted to Covey was under the direct supervision and management of ERM personnel.

SITE PREPARATION

This section describes the work performed to prepare the Pond and the remainder of the containment area for excavation activities.

Fuel Return Line Suspension

A fuel return line extends from the north side of the AST, along the east side, and terminates at the product pumps on the south side of the AST, as shown in Photo A. This line was supported by concrete footers at a height of approximately one foot above the surface of the Pond.

RCC required that the AST and fuel return line be maintained in operating condition throughout closure activities. In order to maintain the line while removing the footers and the underlying soils, it was necessary for ERM to suspend the fuel line with cables attached to the tank.

ERM accomplished this by attaching wire cables to the catwalk surrounding the top of the tank and looping the wire around the fuel line. This allowed enough clearance to remove the concrete footers and excavate the soils underneath the line.

Berm Cover Removal

The berm surrounding the Pond was covered by both an asphalt-like substance and a buildup of cementacious material due to the deposition and spillage of clinker dust. This covering material was removed from both the interior and exterior portions of the berm.

In several areas, weeds and small plants had grown through the cover of the Pond and berm. ERM removed these plants to prevent their growth from cracking or puncturing the proposed liner.

Pond Entry Construction

A requirement of the closure activities was that the berm forming the walls of the Pond be maintained to allow the Pond to function as a storage area for storm water. ERM constructed an entry through the north berm to allow equipment to enter the Pond. All equipment required to work inside the Pond was directed through this entrance. During closure activities, ERM temporarily closed the berm entrance with fill dirt, during periods of inactivity, to prevent storm water from breaching the Pond.

Pump Slab Construction

A series of transfer pumps are located on the south side of the AST. These pumps are used to transfer the fuel oil from delivery tankers into the AST and to pump the oil from the AST to the rotary kilns.

These pumps sit on a concrete pad with a drip tray under the pumps and associated piping. Prior to closure activities, the pad was not connected to the concrete base of the AST. As part of the closure activities, ERM poured an additional area of concrete to connect the pad to the tank base and enlarged the drip pan to cover the entire area of the slab.

EXCAVATION ACTIVITIES

This section describes confirmational sampling procedures, laboratory results, and excavation of soils in the Pond and secondary containment area.

Background Sample Analyses

At the request of the RWQCB, ERM collected a series of six soil samples from various locations north and south of the excavation area. These samples were analyzed to determine background levels of conductivity for soils not impacted by the boiler blowdown.

Two samples were collected from separate locations north of the excavation area and one sample was collected northeast of the excavation and north of the silos. The remaining three samples were collected south, southwest, and southeast of the excavation area, respectively. Results of these conductivity samples show an average background conductivity level of 173 umhos/cm. Laboratory results and Chain-of-Custody Forms for these samples are included in Appendix B.

Excavation Activities in Blowdown Pond

ERM collected four soil samples from the Pond area prior to excavation. Analysis of these samples revealed an average conductivity level of 5,350 umhos/cm and minor impact from petroleum hydrocarbons and chrome. These results were provided to the RWQCB who expressed concern over the levels of conductivity. The RWQCB required RCC to remove soils with high levels of conductivity.

ERM excavated the soils (Photo B) and transferred the soils to a prepared stockpile (Photo C). After excavating all visibly stained soils, ERM performed confirmational sampling to determine the remediation status. Additional excavation and sampling events were continued until confirmational samples yielded results acceptable to the RWQCB.

Excavation Activities in Secondary Containment Area

Soils outside the Pond area were not impacted by chemicals of concern because of a small interior berm that separated the Pond from the remainder of the containment area. Within the containment area, south of the Pond, the top six to twelve inches of clean soils were excavated and stockpiled on site. Excavation around the fuel return line and pump station was performed by hand; while the remaining area around the tank was excavated by mechanical means.

An extremely hard layer of concrete-like material was found underneath some areas. This layer is evident in Photo D. This material proved to be extremely difficult to excavate and, in some areas, required the use of jack hammers to break. After consultation with RCC and the RWQCB, it was decided that this material would not be removed since it would form a natural barrier to possible migration of contaminants, if a future leak were to occur.

A small sump existed approximately midway along the west berm. This sump was removed by ERM and reinstalled by RCC to serve as a collection sump for pumping of accumulated water. The reinstalled sump is approximately 3 by 3 feet wide and 3 feet deep, constructed of concrete, and covered with a steel grate. Photo E shows the sump under construction.

Confirmational Sampling Procedures

ERM collected confirmational samples by filling a clean laboratory jar with soil scooped from designated areas of the excavation. As specified in the *Closure Plan Boiler Blowdown Pond* report, samples were collected from 2 locations in the Pond floor and one each from the east and west berms. Each jar was sealed immediately with a screw top equipped with a Teflon® or similar nonreactive substance that provides an air-tight seal. Each jar was labeled with an unique sample number, sample location, time, date, and sampler's name. The samples were entered on a Chain-of-Custody Form and delivered to a California state-certified laboratory for analysis.

Confirmational Sampling Results

Initial samples were analyzed for total petroleum hydrocarbons, total chrome, hexavalent chrome, and conductivity. As the excavation

progressed, samples were analyzed only for conductivity, since this was the major concern expressed by the RWQCB. ERM continued to excavate and collect samples until reaching a level of conductivity in the soil that was acceptable to the RWQCB. The average conductivity results of the final samples, was 667.5 umhos/cm. Copies of these laboratory reports and Chain-of-Custody Forms are also provided in Appendix B.

CONTAINMENT AREA RESTORATION

The RWQCB reviewed the confirmational soil sampling results and granted verbal approval for the backfilling and restoration operations to begin. This section describes the containment area restoration activities.

Installation of Cathodic Protection

ERM installed a cathodic protection system for the AST prior to backfilling operations. This system is intended to serve as an additional level of protection to the integrity of the tank.

The system consists of a series of 5 sacrificial anodes installed in borings around the base of the tank. The prepackaged-magnesium anodes were lowered into the borings with the copper connecting wire extending out of the hole. Once the anodes were in place, the holes were backfilled with native soil and tamped to normal compaction. The lead wires were then Cadwelded to the tank as specified in the manufacturers instructions. A copy of the cathodic protection specifications is provided in Appendix C. Photo F shows one of the anodes placed in a boring.

Backfilling with Clay

ERM used locally-available clay as the new liner material for the berms and flooring of the secondary containment basin. This material has low permeability (less than 10^{-7} to 10^{-8} cm/sec) and was available from RCC in quantities sufficient for rebuilding of the AST containment basin.

The thickness of the final clay cover varied from 3 to 12 inches. The original closure plan called for a uniform thickness of 12 inches throughout the Pond. As mentioned earlier, there were portions of the Pond which had an underlying cement-like material. In order to maintain drainage gradients toward the sump, it was not possible to maintain a uniform 12-inch thickness of clay. This was reviewed with the RWQCB representative and verbal approval was granted.

Following placement of the clay liner, compaction testing was performed. The nuclear gauge method (Photos G and H) was used to evaluate the compaction of the clay in two locations (one north and one south of the AST). The results of these compaction tests showed an average compaction value of 98% and near ideal moisture content. Copies of the field compaction reports are provided in Appendix D.

Installation of Liner

Following placement and compaction of the clay, ERM installed an oil and gas resistant membrane liner over the floor and berms of the containment basin. The liner is a 45-mil thick, reinforced liner, manufactured by Watersaver Company, Inc. (Watersaver). A copy of the manufacturer's specifications for this liner is included in Appendix E.

The liner was installed according to the manufacturer's instructions, with a representative of Watersaver supervising the installation. The liner was battened to the tank, sump, and concrete pump station slab. (Photos I, J, and K)

Several I-beams formed supports for pipes running from the pump station to areas outside the Pond. To batten the liner to these beams, it was necessary to install a plastic collar around the base of the beam (Photos L and M). The liner was then battened to the collar and the collar filled with gunite.

All seams were chemically welded according to the manufacturer's instructions (Photo N). Welds were tested using an air lance to direct high pressure air at the welded seams as shown in Photo O. There were no reported seam failures during the testing, indicating that the welding process was successful.

Surface Finishing

The Pond area was finished by applying layers of both sand and gunite over the liner. Four inches of sand, supplied by RCC, was placed on top of the liner. The sand was then moistened for compaction, and to provide optimum moisture levels for the application of gunite. Following placement of the sand, a two-inch thick layer of gunite was applied to the berms and flooring of the Pond (Photos P, Q, R, and S). In addition, a continuous support pillar of gunite was formed under

SECTION 5

CONCLUSIONS

ERM performed the remedial activities in accordance with the *Closure Plan Boiler Blowdown Pond* report submitted to the RWQCB in January 1994.

Since RCC has changed the blowdown operation and now uses the boiler blowdown as cooling water in the operating kilns, blowdown water is no longer discharged to the Pond. The Pond continues to serve as a secondary containment basin for the AST containing fuel oil for the kilns.

The remedial tasks outlined in this report have served the dual purpose of removing impacted soils from the former Pond and providing a containment area properly designed to serve as a secondary containment for the AST. The installation of both a clay and an oil and gas resistant liner provide an adequate level of protection, if a leak occurs in the AST.

Based on the above, ERM recommends that the RWQCB grant approval of the Pond Closure activities to RCC.

SUBJECT: Annual Ground Water Monitoring Report

ERM

Dear Mr. Smith:

On October 28, 1996, ERM-West, Inc., (ERM) conducted an annual ground water monitoring event at the Riverside Cement Company (RCC) facility in Riverside, California (site). During this monitoring event, ERM collected water level measurements and ground water samples from two ground water monitoring wells (MW-1 and MW-3) at the site. After collection, the ground water samples were analyzed by a qualified laboratory. This report briefly describes these activities and presents the results of chemical analysis of the ground water samples.

WATER LEVEL MEASUREMENT

ERM collected undisturbed water level measurements from wells MW-1 and MW-3 with a water level indicator accurate to 0.01 feet. The water levels in wells MW-1 and MW-3 measured 110.80 feet below the top of casing (btc) and 76.43 feet btc, respectively. These water levels were 1.02 feet (MW-3) to 4.75 feet (MW-1) lower than in October 1995, when these wells were last measured. Historical depth-to-ground water measurements in these wells are listed in Table 1.

TABLE 1
HISTORICAL WATER LEVEL MEASUREMENTS

DATE	MONITORING WELL MW-1 (feet btc)	MONITORING WELL MW-3 (feet btc)
June 11, 1991	107.03	74.80
April 6, 1994	105.34	74.61
October 18, 1995	106.05	75.41
October 28, 1996	110.80	76.43

WELL PURGING

After collecting water level measurements, ERM purged each well. The purpose of well purging was to enable the wells to produce a sample of ground water that was as representative of actual aquifer conditions as possible. Purging was accomplished using a Grundfos Rediflo2 submersible pump to remove ground water from the wells. ERM purged 28 gallons (MW-3) to 40 gallons (MW-1) from these wells, which represented approximately three to five casing volumes of water.

Measurements of the temperature, conductivity, turbidity, and pH of the ground water were recorded on Groundwater Monitoring Data Forms during the purging of each well. The turbidity of purged ground water was reduced to approximately 10 nephelometric turbidity units (NTUs) or less by the completion of purging. Completed copies of these forms are included as Attachment A.

GROUND WATER SAMPLING

Ground water sampling from each well took place immediately after well purging. Ground water samples were obtained from just below the air-water interface with disposable polyethylene bailers suspended by dedicated polypropylene ropes. The ground water samples were immediately transferred to appropriate sample containers. For each well, the ground water samples were contained in eight appropriate-sized plastic or glass bottles.

A label was affixed to each sample container to identity the job number, sampler, date and time of sample collection, analyses requested, and a sample number unique to that sample. Following labeling, the samples were refrigerated at the site in an iced cooler. Chain-of-Custody Forms were completed at the time of sampling and accompanied the samples to the laboratory.

QUALITY ASSURANCE/QUALITY CONTROL PROCEDURES

The following QA/QC procedures were used during the collection of ground water samples in October 1996 to ensure that the resulting data were representative of actual field conditions:

- The submersible pump and connecting hose that were used to purge the monitoring wells were flushed with an Alconox solution and rinse water prior to purging these wells to prevent cross-contamination;

- Ground water samples were collected with disposable polyethylene bailers and polypropylene rope that were dedicated to each specific well; and
- Vinyl gloves were used during the measurement, purging, and sampling of ground water.

ANALYTICAL METHODS

Ground water samples collected during the October 1996 sampling event were submitted to Del Mar Analytical (Del Mar), a California-certified analytical laboratory. Del Mar analyzed the samples for:

- Aluminum, arsenic, barium, cadmium, calcium, copper, iron, magnesium, manganese, selenium, silver, sodium, and zinc by EPA Method 6010;
- Total chromium by EPA Method 7191;
- Hexavalent chromium by EPA Method 7196;
- Lead by EPA Method 7421;
- Alkalinity by EPA Method 310.2;
- Chloride, nitrate (as NO_3), and sulfate by EPA Method 300 Series;
- Color by EPA Method 110.2;
- Conductivity by EPA Method 120.1;
- Fluoride by EPA Method 340.2;
- Odor by SM 207;
- pH by EPA Method 150.1;
- Surfactants by EPA Method 425.1;
- Total dissolved solids by EPA Method 160.1; and
- Turbidity by EPA Method 180.1.

RESULTS

The results of chemical analyses of the ground water samples collected at the RCC facility in October 1996 are listed in Table 2 (for metals) and Table 3 (for general chemistry). These tables also include the results of chemical analyses for these tested parameters generated during three previous ground water sampling events which were conducted in June 1991, April 1994, and October 1995. Copies of the original laboratory reports and Chain-of-Custody Forms for the October 1996 analyses are included as Attachment B.

If you have any questions concerning the results of the October 1996 ground water sampling event, please contact the undersigned at (714) 476-3040.

Sincerely,

ERM-WEST, INC.

Bruce A. Neuschaefer, R.G.
Project Manager

APPENDICES

A 40 CFR Part 112: Oil Pollution Prevention - (Regulations for Preparation of SPCC Plans)

B Monthly Inventory Reconciliation Form

SECTION 1

GENERAL INFORMATION AND CERTIFICATION

The purpose of a Spill Prevention Control and Countermeasure (SPCC) Plan is to adopt procedures that will 1) reduce the likelihood of an oil spill event, and 2) prevent oil from entering the municipal water system in the event of such a spill. This plan is required by Federal EPA legislation since Riverside Cement currently maintains in excess of 1,320 gallons of above ground oil storage capacity. (See Appendix A - 40 CFR Part 112 (Oil Prevention), Environmental Protection Agency).

In the State of California, a release of waste oils is also considered a discharge of hazardous waste, covered under separate legislation. This plan does not address the requirement under such State legislation, since hazardous waste handling, storage, and disposal is covered by other plans prepared for the facility.

E. Management Approval
The SPCC Plan for the above facility will be implemented as described:

Signature Patrick M. Hill

Name: Pat Hill
Title: Plant Manager
Company: Riverside Cement Company

F. Review
This SPCC Plan has been reviewed by the Operator:

Signature C Russ Damann

Date Sept. 16, 1994
(Updating and recertification required in 3 years)

G. Operations
Facilities began operation in 1910.

H. Certification
This SPCC Plan has been reviewed by the undersigned Registered Professional Engineer and certified here with:

I, Dennis Miller, being a Registered Professional Engineer having examined this facility and being familiar with the provisions of 40 CFR Part 112, attest that this SPCC Plan has been prepared in accordance with good engineering practices. (112.3D)

Signature of Registered Engineer
Registration No.: 28108
State: CA
Date: 9/14/94

SECTION 2

SPILL RECORD

No recorded spill events have occurred at the facility.

Reporting Future Spills

Spill reporting depends on the quantity and concentration of product spilled. Examples of spills that may not be reportable are:

1. A spill of oil or gasoline on concrete or asphalt paving that is small in volume and totally contained may not be a reportable spill event.

2. Residual oil or gasoline that flows onto the ground and is absorbed by vermiculite or absorbent mats may not be a reportable spill event.

A reportable spill is defined as any discharge of oil products that:

1. Violate applicable water quality standards, or which may directly or indirectly, by means of surface or subsurface routes, enter any drain ditch, storm drain, lake, stream, river, or ocean.

2. Causes a film or sheen upon or discoloration of the surface waters or adjoining shoreline, or causes a sludge or emulsion to be deposited beneath the surface of the water or upon adjoining shorelines.

If a reportable spill occurs, the emergency and cleanup procedures described in this Plan will need to be initiated as well as notification of the appropriate regulatory agencies. Additionally, the provisions of section 112.4 (Amendment of SPCC Plans by Regional Administration - Appendix A) of the regulations may need to be enacted with the preparation of a report encompassing the requirements of section 112.4.

For additional information on spill reporting and follow-up, see Section 5.

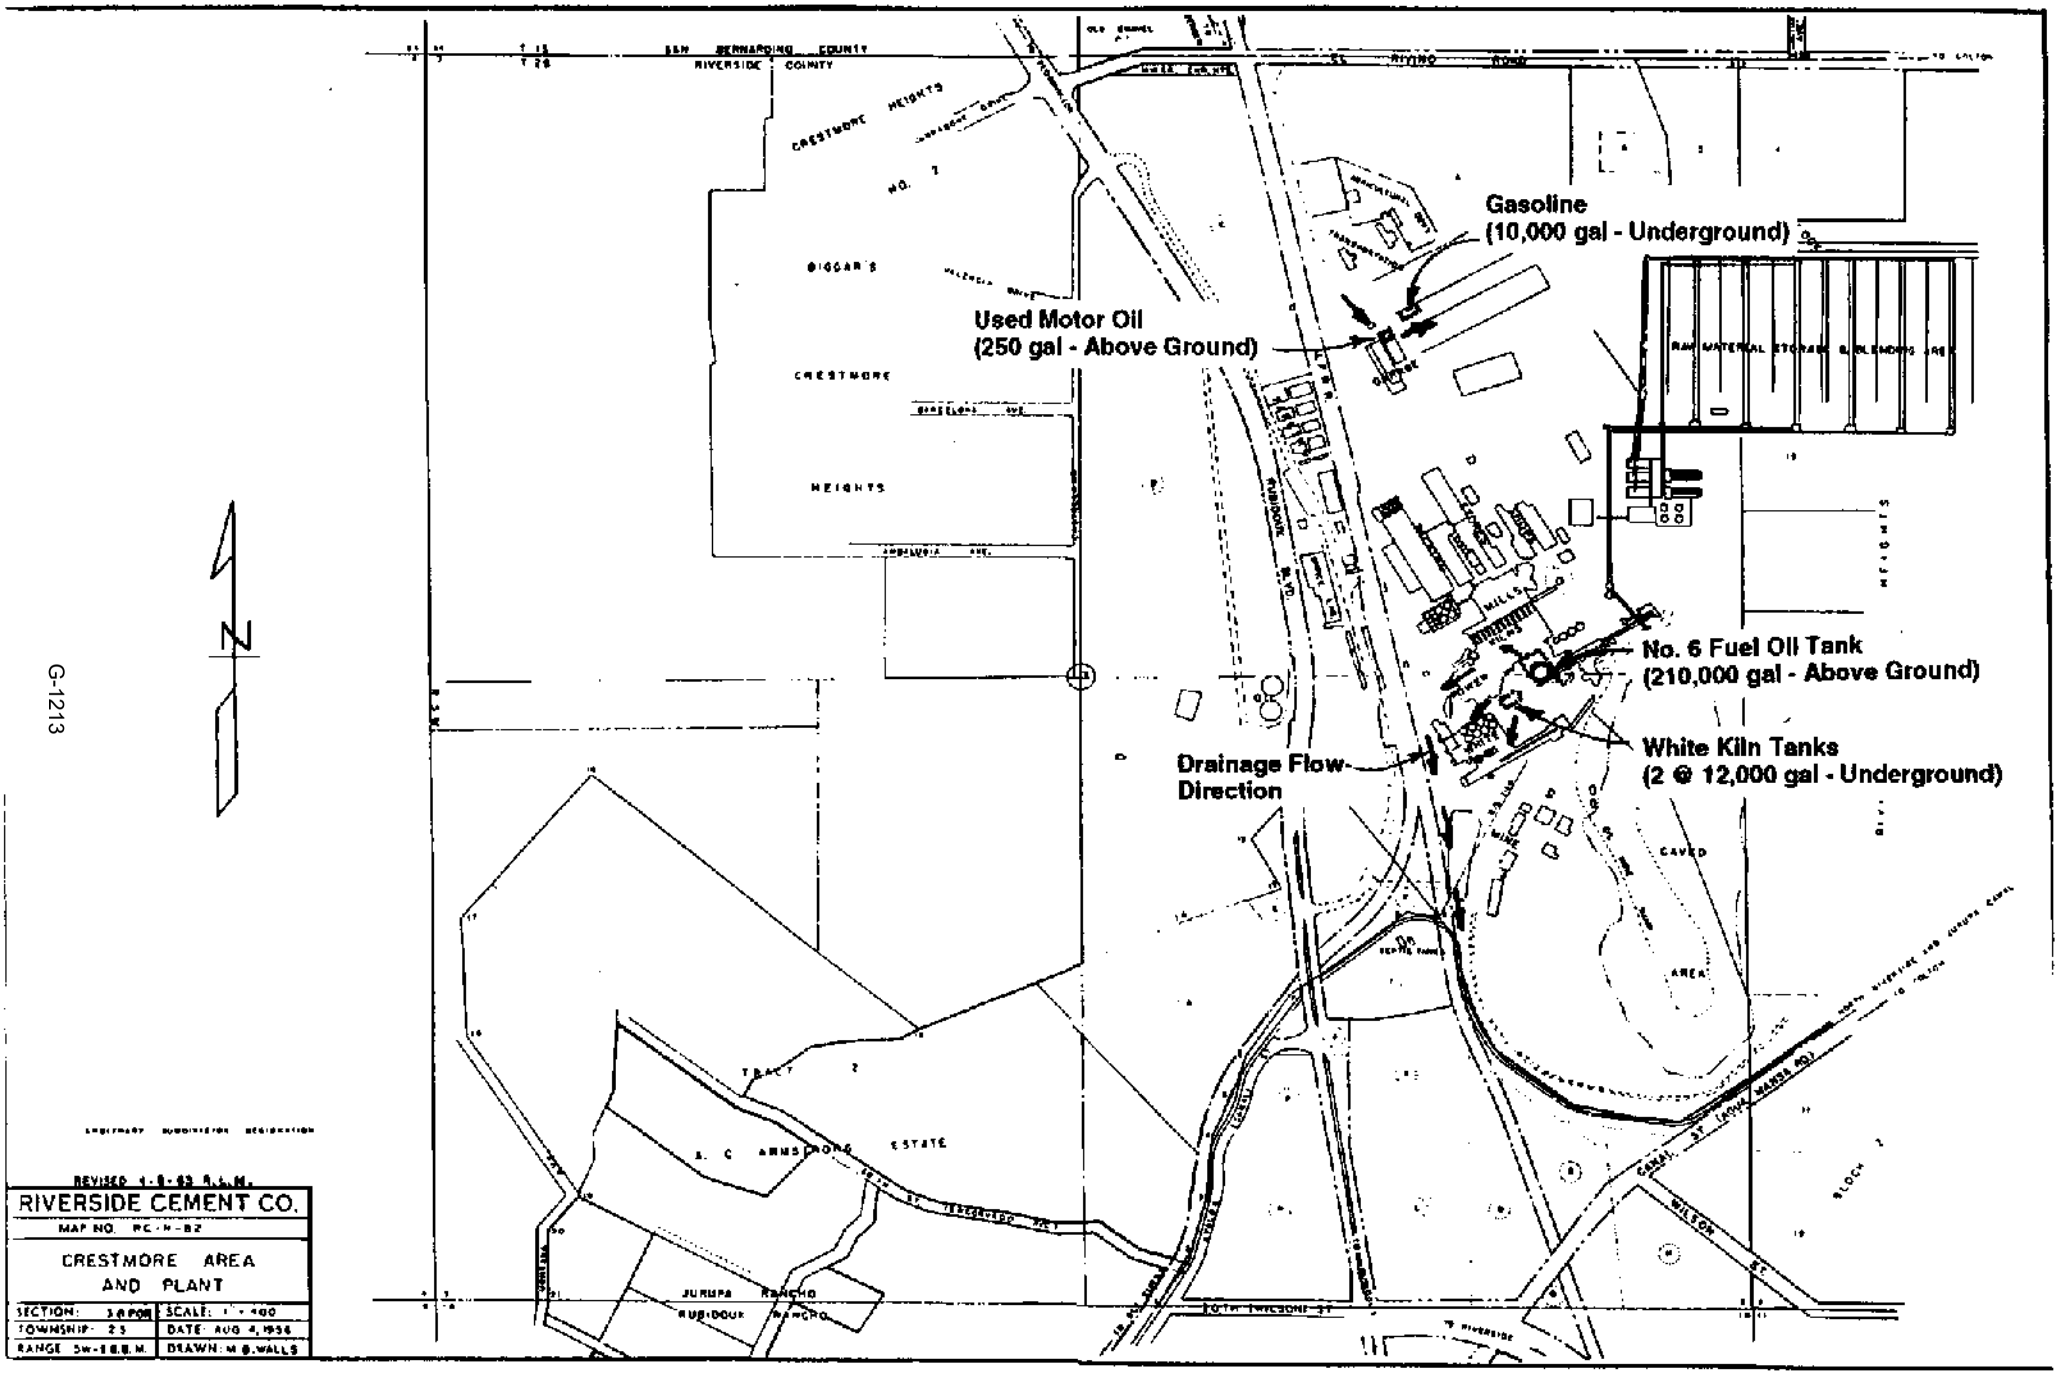
SECTION 3

FACILITY ANALYSIS

The Crestmore facility is located approximately 2.5 miles south of Interstate 10, and south of the City of Crestmore in Riverside County. The Santa Ana River flows southwest about 3500 feet southeast of the site. The site lies above and outside of the Santa Ana River floodplain. Rainfall ranges from 8-18 inches per year, with most of the precipitation falling between the months of November and April.

Groundwater flow in the area is complex because of past mining activities. Groundwater is detected between 70 and 100 feet below ground. Several wells have been installed on site for water production and monitoring purposes. No oil products have been reported in the wells.

Facility operations include production of cement products, material storage, office administration, and garage servicing of support vehicles used at the facility. Figure 3-1 indicates the tank location and the local surface drainage patterns.



This section describes the fuel storage and usage, as well as the surface drainage patterns and collection systems associated with each fuel storage area.

OIL STORAGE

Oil storage activities occur in two areas of the facility in above ground and below ground tanks: white kilns and the garage area. Specifics on oil storage usage and monitoring are provided in Table 3-1.

White Kilns

Within the White Kilns area there are two 12,000 gallon underground tanks and one 210,000 gallon above ground tank. The underground tanks contain diesel #2 for fueling maintenance vehicles and as supplementary fuel to the white kilns. Separate dispenser pumps for fueling vehicles and the white kilns are located about 50 feet south of the underground tank site. Bulk deliveries are brought onto the facility by truck and off-loaded into the underground fuel tanks.

G-1213

Figure 3-1
Tank Locations and Drainage Patterns

TABLE 3-1

TANK SUMMARY
RIVERSIDE CEMENT

Tank No.	Location	Tank Storage Capacity, gals		Product	Construction Material	Secondary Containment/ Monitored
		Above Ground, Gals	Below Ground, Gals			
	While Kilns (Clay Bldg)	210,000		Fuel Oil #6	Steel, Sngl Wall	Contained
	Garage Area-North	250		Used Motor Oil	Steel, Sngl Wall	No Containment
	Garage Area-East		10,000	Unleaded Gas	Steel, Sngl Wall	Monitored
	White Kilns-2 @ 12,000		24,000	Diesel #2	Steel, Sngl Wall	Monitored
	TOTALS	210,250	24,000			

The underground tanks are single-walled steel and monitored by daily sticking and inventory reconciliation. Although a Vadose Zone Monitoring System with well and hydrocarbon sensors has been installed by Riverside Cement Company, the County, at this time, does not allow this type of continuous monitoring. The daily tank stick readings and reconciliation are summarized in a yearly report that is forwarded to the County in accordance with the underground tank permit. Appendix B contains a typical reconciliation form approved for use by Riverside County, Department of Environmental Health.

The 210,000 gallon above ground No. 6 fuel oil tank is an AWWA D103-80 bolted steel tank with a diameter and height of approximately 38 feet 9 inches and 24 feet 2 inches, respectively. The tank is installed on an oiled sand base and supported and bolted to a concrete ring wall. The tank is coated with Thermo-thane-7000. The tank is filled by truck. Depending on fuel demand and cement production, two to three 8,000 gallon capacity trucks per day can be expected to off-load fuel to the storage tank. Maximum fuel usage is 16,500 gal/day.

Oil within the tank is heated by circulating steam through internal steam coils within the tank. Kiln supply pumps are located south of the tank in a contained area and supply oil to the kiln through two pumping systems. A low pressure pumping system operates at 60 psig and supplies fuel to a boiler and the high pressure kiln feed pumps. The low pressure supply pipe is steel and routed primarily above ground. A 75 to 100 feet section of piping is buried between the tank and the kilns. The kiln fuel pumps operate a 600 psig. The piping on the high pressure fuel system is above ground. All above ground piping is inspected daily. Oil is pumped by withdrawing fuel from the bottom of the tank. Water within the tank is not normally check since it is assumed that the bottom withdrawal system will remove condensate from within the tank. Oil level within the tank is visually monitored by tank gauge that is checked three times each 24 hours.

The above ground No. 6 fuel oil tank is located within an earthen secondary containment area with a plastic liner underneath. The containment area is constructed of a clay soil mixture compacted to 90 percent. Surfaces of the berm are covered with a 3 inch layer of crushed rock (3/8 to 1 1/2 inch size), overlayed by a gunite surface. The containment volume can hold

approximately 240,000 gallons. Drawing 1600M-56, dated December 28, 1984, depicts the secondary containment berm design.

Garage Area

The garage area uses two tanks: one 250 gallon above ground used motor oil tank and one 10,000 gallon below ground gasoline tank. The 250 gallon above ground used oil tank is steel, located outdoors, and stores 30 weight used oil generated from truck oil changes. It is located north of the garage and within a 350 gallon polyethylene containment tank.

The 10,000 gallon underground tank at the service garage is located on the east side of the garage. The immediate area of the tank and dispenser island is located in a dirt area. The dispenser pumps are located adjacent to the gas tank. The tank is replenished with gasoline through bulk tanker truck deliveries. The area surrounding the tank is not paved or covered by a concrete pad. The tank is single-walled steel and monitored by daily sticking and inventory reconciliation. Although a vadose zone monitoring system with wells and hydrocarbon sensors has been installed by Riverside Cement, the County, at this time, does not allow this type of continuous monitoring. The daily tank stick readings and reconciliation are summarized in a yearly report that is forwarded to the County in accordance with the underground tank permit (See Appendix B, Monthly Inventory Reconciliation Form).

FUELING TRANSFER OPERATIONS

Fueling operations occur at two areas: white kilns and the service garage.

White Kilns

Diesel trucks are fueled from the 12,000 gallon tanks at the white kilns. The fueling operation is manual and attended at all times by an operator. The tank is filled by tanker truck and manned continuously during the transfer of fuel from the truck to the tank. The dispenser is calibrated annually. The tank is precision tested annually.

Service Garage

Maintenance vehicles are fueled with unleaded gasoline by a dispenser pump located at the tank. The fueling operation is manual and attended at all times by an operator. The tank is filled by a tanker truck and manned continuously during the transfer of fuel from the truck to the tank. The dispenser is calibrated annually. The tank is precision tested annually.

DRAINAGE

The white kilns are constructed in the southerly portion of the site. Drainage in the immediate area of the underground tanks will be over native soils in a southwesterly direction. At the above ground tank drainage sheet flows towards the northwest over native soils. There are no storm drain inlets within the immediate vicinity of both tank sites.

The terrain is generally flat in the area of the service garage. In the garage area, the drainage pattern is towards the north, east and west at the underground unleaded gasoline tank area. Towards the north and east is a grove of trees with no stormwater drainage system. Water and fuel flowing in this direction will either evaporate or percolate within the soils. To the west of the tank site is the garage area that is paved with asphalt. Drainage in this portion of the garage area (east side) is southerly toward the above ground motor oil tank. At the used motor oil tank, drainage sheet flows toward the grove of trees to the east.

Security

The facility is fenced and there is only one entrance to the facility. Other gated access points on the perimeter of the facility are locked and used only by authorized personnel. The main entrance to the property is under 24 hour camera surveillance that is wired to the main control room. Additionally, all of the operational areas within the site are well lighted for security and night-time work.

SECTION 4

PREDICTION AND PREVENTION OF POTENTIAL SPILLS

In this section the potential for spills is evaluated in each of the oil storage areas. Where appropriate, systems to prevent spills are recommended and, if a major spill should occur (i.e. a tank rupture), techniques to mitigate spilled oils and fuels from leaving the drainage system are described for each area.

Potential Spills

Potential sources of spills within the facility can result from:

1) an above ground storage tank failure, such as a piping leak at the fuel and motor oil storage tanks,
2) an underground tank leak
3) a product pipe failure, and
4) a pump, nozzle, connecting pipe failure during the unloading of fuels and oils

A release of oil at the facility and the potential for oils entering the Santa Ana River by a series of drainage and irrigation ditches is considered low. Figure 3-1 indicates the drainage patterns within each tank area.

Oil released from the bulk No. 6 fuel oil tank reaching the Santa Ana River is also considered low. A catastrophic failure of the tank will be contained primarily in the designed and constructed containment structure. The oil that may flow beyond the containment structure will sheet flow in a northwesterly direction onto an open soil covered area. It is possible that continued flow of oil in this direction could reach the western boundary of the property where a drainage swale directs flow in a southerly direction to a drainage system. Although this scenario is considered remote, if the bulk tank does rupture, Riverside Cement must act quickly to berm off the entrance to the drainage system on the southern boundary of the property.

The lowest potential for oil entering the Santa Ana River system is from the tanks at the service garage. In this area of the site, drainage will either

evaporate or percolate. There are no storm water collection systems in the area. A sanitary sewer is installed in a north-south direction on the east side of the garage, however, the manhole covers and rims on the sewer are installed above the local grade.

Each of the potential failure modes and countermeasure plans are described below. Minor leakage from tanks, piping, connections, valves, and transfer operations must be identified, corrected, and cleaned-up as soon as practical. Attention to periodic inspection and maintenance will prevent larger releases from occurring from the oil storage systems.

ABOVE GROUND STORAGE TANK FAILURE

The above ground No. 6 fuel oil tank at the white kilns is contained by an earthen berm. At the No. 6 fuel oil tank, stormwater accumulation within the containment area is checked after every storm and allowed to evaporate. Water within the tank is normally not checked by the facility. Water content in the tank should be check on a periodic basis and, when accumulated, released through bottom withdrawal piping and valving. If water is allowed to accumulate on the bottom of the steel tank, rusting and weakening of the steel may result in a leak and potential release of oil to the sand base underneath the tank.

Drainage valves on tanks and containment structures must be closed and locked to prevent unauthorized opening of the valves. After a rainstorm, the accumulated storm water should be check for oil sheen or floating oils. If none are observed, the drainage valve is unlocked, opened, and rain water observed flowing from the containment area. When flow stops, the drainage valve is closed and locked. The inspection and drainage is then noted on the inspection block in the daily production log.

In all above ground tank locations, the best preventative actions is to have regular inspections of each storage area and to maintain sufficient containment at the potential sources of spills. The tanks are filled by tanker truck and there is a potential for spills during the transfer operation or during the piping connection or disconnection process. Since the process is continually manned during the transfer process, the spills would be minor and can be contained, absorbed, and cleaned by the off-loading personnel. Material used in cleaning process (rags and adsorbent material) are stored

in drums within the concrete containment structure at the No. 6 fuel oil unloading station.

UNDERGROUND TANKS

The underground tanks at the site are permitted and operated within underground tank guidelines. The single-walled tanks are monitored by daily sticking and reconciliation. This tank monitoring technique is preferred and permitted by the County. Additionally, the tanks are precision tested annually. Previous tests have been reported as passing the precision testing criteria mandated by the State of California.

The tank volumes are determined each day by sticking of the tanks. Fuel usage is reconciled on a daily basis with records kept at the white kiln stores/purchasing office. The dispenser pumps are calibrated on an annual basis.

By tank sticking and daily reconciliation, leakage of hydrocarbons from the tanks can be detected within a reasonable time period. If a leak is suspected through the reconciliation process, the operators at the facility should immediately determine if a leak has occurred at the tank. With the vadose wells installed at the site, vapor surveillance of the wells would be an initial action. This action should be followed by either drilling bore holes and sampling soil underneath the tank(s), or uncovering the tank(s) and piping. If confirmed, the underground tank regulations must be followed by Riverside Cement personnel to determine the extent of leak, notification, and potential decommissioning of the tank.

The tanks are not cathodically protected. The potential exists for the steel tanks to degrade and lose metal to surrounding soils. Riverside Cement should schedule to install cathodic protection for the underground tanks to comply with the State's latest underground tank regulation changes.

PIPING FAILURE

Oil piping routes are minimal at the facility. The only significant product pumping occurs at the white kiln between the No. 6 fuel oil tank and the kiln and between the underground diesel fuel tanks and the dispenser

pumps and kiln. This piping is for the most-part above-ground and subject to the pressure created by the transfer pumps, piping, and dispenser nozzle system. Leakage potential is considered minimal and periodically checked by plant personnel. Minor leaks can be contained with absorbent materials.

Underground piping is minimal. The underground piping system must be periodically hydrostatically tested to confirm pipeline integrity.

PUMP, NOZZLE, PIPING, AND FILTER FAILURE

Transfer pumps convey fuels and oils to and from the storage tanks and to maintenance vehicles. Leaks at the piping connections, nozzles, air releases, filters, and the pump seals will usually be minor in quantity and easily contained with absorbent materials. Additionally, these fuel transfers are continually manned and monitored during the operation. Transfer flow rates are normally low such that a pump failure or breach in the delivery nozzle to a vehicle will be small and minor in volume.

The No. 6 fuel oil transfer operation occurs in a two stage process. The first stage is a recirculation and feed system to a boiler. The circulation pumps are located to the south of the storage tank and within the containment area. The flow and operating pressure are 25 gpm and 60 psig, respectively. Since the piping is primarily above ground, leakage in the system can be detected during the daily visual inspections. The portion of this piping that is routed underground can be checked by periodic hydrostatic testing.

The second stage of pumping is from the recirculation system to the kilns. In this part of the fuel feed system, all of the piping is above ground and visually inspected on a daily basis. The system operates at 600 psig. If leaks are noticed in this system, a work order is normally written and the repairs made by plant personnel when time permits. The minor leaks are normally contained by adsorbent material. If the leak is determined to be significant, then the procedure would be to stop the kilns, contain the oils, isolate the piping section, and repair the leak.

SECTION 5

SPILL CLEANUP PROCEDURES AND EQUIPMENT

The following are general actions that will always be carried out in a spill:

- Anyone finding a spill will immediately NOTIFY the Emergency Coordinator (EC).
- The EC will activate internal alarms and dispatch available personnel to the scene to assist in containing the spilled oils.
- The EC will go to the spill scene and immediately: identify the character, exact source, amount, and areal extent of any released material; determine the severity of the spill and hazards to human health; take charge of the spill scene; and initiate the clean up.
- The EC will notify the appropriate persons and agencies as listed in the following paragraphs of this Section.
- The EC or designee will remain at the spill scene to direct the clean up and initiate disposal.
- Response personnel will cover spills with earth, sand, or dry absorbant and use earth or sand to make dikes.
- If the material is combustible, responders will be aware of the fire hazard and contain such spills carefully to ensure that fires, explosions, and releases do not occur, recur, or spread to other hazardous wastes at the facility.
- Responders will never allow the oil or oil sludges to enter the storm drain system.
- Prior to pumping dewatering sumps at the facility, responders will ensure the sumps are free of oil by checking for surface oil sheens.

Reporting

The Clean Water Act requires reporting to the National Response Center (NRC) whenever oil is "spilled". The following notifications are required in the event of an oil spill:

- **NRC (Federal Requirement) (800) 424-8802**

  Written follow-up to the Department of Transportation on Form F 5800.1 within 10 days.

- **California Office of Emergency Services (OES) (800) 852-7550**

  No written follow-up required.

- **Riverside County - Hazardous Materials Division - Emergency Response (909) 358-5055 or 909-657-3183 after hours**

  Written follow-up is required.

When a spill is reported, the following information must be communicated:

- Type of oil (gasoline, diesel, journal oil, etc.);
- Approximate quantity released;
- Time and duration of release;
- Current status of containment;
- Health risks posed by the release; and
- Name of person reporting and call-back phone number.

If the facility has a "spill" of more than 1,000 gallons or two "spills" in any twelve month period, then the Emergency Coordinator must submit the following to the EPA Regional Administrator within 60 days of the triggering spill:

- Name of the facility;
- Name of the owner or operator of the facility;
- Location of the facility;
- Date and year of initial facility operation;

- Maximum storage or handling capacity and normal daily throughput;
- Description of the facility, including maps, flow diagrams, and topographical maps;
- A complete copy of the SPCC Plan with amendments;
- The cause of the spill, including a failure analysis for systems in which the failure occurred;
- The corrective actions and/or countermeasures taken;
- Additional preventive measures taken to minimize recurrence; and
- Other action that the Regional Administrator may require relevant to the spill or Plan (see 40 CFR 112.4).

EMERGENCY EQUIPMENT AND SUPPLIES

A spill cart is located in the mill foreman's truck which is manned 24 hours a day. The following equipment should be stored and maintained in each Emergency Spill Control cart:

- one 55-gallon drum;
- one recovery drum;
- two Tyvek suits;
- one PVC splash suit;
- two MSA 1/2-face, negative-pressure respirators with combination-type cartridges;
- a pallet of dry absorbant;
- acid and oil absorbant spill pillows;
- one broom; one shovel;
- one roll of caution tape
- one plastic liner for 55 gallon drum;
- two pairs of rubber boots, neoprene gloves, and splash goggles;
- three rolls of duct tape;
- one response guide book
- one copy of the SPCC plan; and
- one tool pouch (hammer, pliers, screwdriver, adjustable wrench).

In addition to the equipment listed above, 50 pound sacks of absorbant are available throughout the facility. The Environmental Coordinator should inventory the contents of the cart against the above list and check the mobility of cart each quarter. The completion of each quarterly inventory will be reported in writing to the Plant Manager. These inventory reports will be maintained on file in the Plant Manager's office for three years.

SECTION 6

PERSONNEL TRAINING AND SPILL PREVENTION

Training in the SPCC spill response procedures will be conducted annually and reviewed quarterly. In addition, new employees with emergency response responsibilities will be trained in SPCC response procedures within 60 days of employment.

To comply with the SPCC Regulation, Rick Neumann, the Environmental Coordinator, is designated as the person responsible for oil spill prevention and training. He will be responsible for:

1. Instructing facility personnel in the operation of equipment in such a manner as to prevent an oil spill.

2. Informing facility personnel of the applicable pollution laws, rules and regulations affecting the facility.

3. Maintaining equipment necessary to prevent spills.

4. Observing on a regular basis loading and unloading operations to determine that proper operating procedures are being followed and to afford an opportunity to inspect equipment under operating conditions.

5. Checking that the spill prevention plans are coordinated and complied with on the schedule set forth in Section 7.

6. Holding spill prevention briefings with personnel on a quarterly basis and with special attention given to reviewing and updating this SPCC Plan.

7. Signing and maintaining records of inspection and spills on discharges with this SPCC Plan for a minimum period of 3 years.

8. Maintaining a complete copy of this SPCC Plan at the facility at all times.

9. Updating this SPCC Plan within three years of certification or sooner if significant changes to facility have occurred.

SECTION 7

SPILL PREVENTION CHECKLIST

Prevention of a spill event requires following procedures to minimize failures and accidents from occurring at the Riverside Cement Facility. The following is a general checklist of procedures and inspections to be followed on a periodic basis.

CHECKLISTS

1.) Daily
   - A. Visually inspect all tanks, piping, pumps, and related equipment for leakage, corrosion and fatigue.
   - B. Check product inventory for possible losses due to leaks in tanks and underground piping.
   - C. Drain containment areas and sumps as required to provide maximum volume for containment of potential spills.
   - D. Check structural bolting around the outside of the No. 6 fuel oil tank. Check for leaks from bolted sidewall seams of tank. Check for corrosion.
   - E. Log the inspection results and other tank monitoring inspections (See Daily Production Shif Supervisors Log).

2.) Monthly
   - A. Exercise manually actuated isolating valves and inspect automatic valves.
   - B. Test that tank float level switches are functioning properly.

3.) Quarterly
   - A. Review spill prevention plans and hold spill prevention briefing with staff.
   - B. Check inventory and mobility of spill cart.

4.) Annually

A. Precision test underground tanks for tightness and leaks as required.

B. Pressure test underground oil piping and above ground piping.

C. Calibrate dispenser meters.

D. Calibrate gaging tapes on storage tanks.

E. Pressure test fuel oil steam heat piping.

APPENDIX A

40 CFR Part 112: Oil Pollution Prevention (Regulation for Preparation of SPCC Plans)

area, 426-2675). If direct reporting to the NRC is not practicable, reports may be made to the Coast Guard or EPA predesignated On-Scene Coordinator (OSC) for the geographic area where the discharge occurs. All such reports shall be promptly relayed to the NRC. If it is not possible to notify the NRC or the predesignated OCS immediately, reports may be made immediately to the nearest Coast Guard unit, provided that the person in charge of the vessel or onshore or offshore facility notifies the NRC as soon as possible. The reports shall be made in accordance with such procedures as the Secretary of Transportation may prescribe. The procedures for such notice are set forth in U.S. Coast Guard regulations, 33 CFR Part 153, Subpart B and in the National Oil and Hazardous Substances Pollution Contingency Plan, 40 CFR Part 300, Subpart E. (Approved by the Office of Management and Budget under the control number 2050-0046)

§ 110.11 Discharge at deepwater ports.

(a) Except as provided in paragraph (b) below, for purposes of section 18(m)(3) of the Deepwater Port Act of 1974, the term "discharge" shall include but not be limited to, any spilling, leaking, pumping, pouring, emitting, emptying, or dumping into the marine environment of quantities of oil that:

(1) Violate applicable water quality standards, or

(2) Cause a film or sheen upon or discoloration of the surface of the water or adjoining shorelines or cause a sludge or emulsion to be deposited beneath the surface of the water or upon adjoining shorelines.

(b) For purposes of section 18(m)(3) of the Deepwater Port Act of 1974, the term "discharge" excludes:

(1) Discharges of oil from a properly functioning vessel engine, (including an engine on a public vessel), but not discharges of such oil accumulated in a vessel's bilges (unless in compliance with MARPOL 73/78, Annex I); and

(2) Discharges of oil permitted under MARPOL 73/78, Annex I.

PART 112—OIL POLLUTION PREVENTION

Sec.

112.1 General applicability.
112.2 Definitions.
112.3 Requirements for preparation and implementation of Spill Prevention Control and Countermeasure Plans.
112.4 Amendment of SPCC Plans by Regional Administrator.
112.5 Amendment of Spill Prevention Control and Countermeasure Plans by owners or operators.
112.6 Civil penalties for violation of oil pollution prevention regulations.
112.7 Guidelines for the preparation and implementation of a Spill Prevention Control and Countermeasure Plan.

APPENDIX—MEMORANDUM OF UNDERSTANDING BETWEEN THE SECRETARY OF TRANSPORTATION AND THE ADMINISTRATOR OF THE ENVIRONMENTAL PROTECTION AGENCY

AUTHORITY: Secs. 311(j)(1)(C), 311(j)(2), 501(a), Federal Water Pollution Control Act (sec. 2, Pub. L. 92-500, 86 Stat. 816 et seq. (33 U.S.C. 1251 et seq.)); sec. 4(b), Pub. L. 92-500, 86 Stat. 897; 5 U.S.C. Reorg. Plan of 1970 No. 3 (1970), 35 FR 15623, 3 CFR 1966-1970 Comp.; E.O. 11735, 38 FR 21243, 3 CFR.

SOURCE: 38 FR 34165, Dec. 11, 1973, unless otherwise noted.

§ 112.1 General applicability.

(a) This part establishes procedures, methods and equipment and other requirements for equipment to prevent the discharge of oil from non-transportation-related onshore and offshore facilities into or upon the navigable waters of the United States or adjoining shorelines.

(b) Except as provided in paragraph (d) of this section, this part applies to owners or operators of non-transportation-related onshore and offshore facilities engaged in drilling, producing, gathering, storing, processing, refining, transferring, distributing or consuming oil and oil products, and which, due to their location, could reasonably be expected to discharge oil in harmful quantities, as defined in Part 110 of this chapter, into or upon the navigable waters of the United States or adjoining shorelines.

(c) As provided in section 313 (86 Stat. 875) departments, agencies, and instrumentalities of the Federal gov-

ernment are subject to these regulations to the same extent as any person, except for the provisions of § 112.6.

(d) This part does not apply to:

(1) Facilities, equipment or operations which are not subject to the jurisdiction of the Environmental Protection Agency, as follows:

(i) Onshore and offshore facilities, which, due to their location, could not reasonably be expected to discharge oil into or upon the navigable waters of the United States or adjoining shorelines. This determination shall be based solely upon a consideration of the geographical, locational aspects of the facility (such as proximity to navigable waters or adjoining shorelines, land contour, drainage, etc.) and shall exclude consideration of manmade features such as dikes, equipment or other structures which may serve to restrain, hinder, contain, or otherwise prevent a discharge of oil from reaching navigable waters of the United States or adjoining shorelines; and

(ii) Equipment or operations of vessels or transportation-related onshore and offshore facilities which are subject to authority and control of the Department of Transportation, as defined in the Memorandum of Understanding between the Secretary of Transportation and the Administrator of the Environmental Protection Agency, dated November 24, 1971, 36 FR 24000.

(2) Those facilities which, although otherwise subject to the jurisdiction of the Environmental Protection Agency, meet both of the following requirements:

(i) The underground buried storage capacity of the facility is 42,000 gallons or less of oil, and

(ii) The storage capacity, which is not buried, of the facility is 1,320 gallons or less of oil, provided no single container has a capacity in excess of 660 gallons.

(e) This part provides for the preparation and implementation of Spill Prevention Control and Countermeasure Plans prepared in accordance with § 112.7, designed to complement existing laws, regulations, rules, standards, policies and procedures pertaining to safety standards, fire prevention and pollution prevention rules, so as to form a comprehensive balanced Federal/State spill prevention program to minimize the potential for oil discharges. Compliance with this part does not in any way relieve the owner or operator of an onshore or an offshore facility from compliance with other Federal, State or local laws.

[38 FR 34165, Dec. 11, 1973, as amended at 41 FR 12657, Mar. 26, 1976]

§ 112.2 Definitions.

For the purposes of this part:

(a) "Oil" means oil of any kind or in any form, including, but not limited to petroleum, fuel oil, sludge, oil refuse and oil mixed with wastes other than dredged spoil.

(b) "Discharge" includes but is not limited to, any spilling, leaking, pumping, pouring, emitting, emptying or dumping. For purposes of this part, the term "discharge" shall not include any discharge of oil which is authorized by a permit issued pursuant to section 13 of the River and Harbor Act of 1899 (30 Stat. 1121, 33 U.S.C. 407), or sections 402 or 405 of the FWPCA Amendments of 1972 (86 Stat. 816 et seq., 33 U.S.C. 1251 et seq.).

(c) "Onshore facility" means any facility of any kind located in, on, or under any land within the United States, other than submerged lands, which is not a transportation-related facility.

(d) "Offshore facility" means any facility of any kind located in, on, or under any of the navigable waters of the United States, which is not a transportation-related facility.

(e) "Owner or operator" means any person owning or operating an onshore facility or an offshore facility, and in the case of any abandoned offshore facility, the person who owned or operated such facility immediately prior to such abandonment.

(f) "Person" includes an individual, firm, corporation, association, and a partnership.

(g) "Regional Administrator", means the Regional Administrator of the Environmental Protection Agency, or his designee, in and for the Region in which the facility is located.

(h) "Transportation-related" and "non-transportation-related" as applied to an onshore or offshore facility, are defined in the Memorandum of Understanding between the Secretary of Transportation and the Administrator of the Environmental Protection Agency, dated November 24, 1971, 36 FR 24080.

(i) "Spill event" means a discharge of oil into or upon the navigable waters of the United States or adjoining shorelines in harmful quantities, as defined at 40 CFR Part 110.

(j) "United States" means the States, the District of Columbia, the Commonwealth of Puerto Rico, the Canal Zone, Guam, American Samoa, the Virgin Islands, and the Trust Territory of the Pacific Islands.

(k) The term "navigable waters" of the United States means "navigable waters" as defined in section 502(7) of the FWPCA, and includes:

(1) All navigable waters of the United States, as defined in judicial decisions prior to passage of the 1972 Amendments to the FWPCA (Pub. L. 92-500), and tributaries of such waters;

(2) Interstate waters;

(3) Intrastate lakes, rivers, and streams which are utilized by interstate travelers for recreational or other purposes; and

(4) Intrastate lakes, rivers, and streams from which fish or shellfish are taken and sold in interstate commerce.

(l) "Vessel" means every description of watercraft or other artificial contrivance used, or capable of being used as a means of transportation on water, other than a public vessel.

§ 112.3 Requirements for preparation and implementation of Spill Prevention Control and Countermeasure Plans.

(a) Owners or operators of onshore and offshore facilities in operation on or before the effective date of this part that have discharged or, due to their location, could reasonably be expected to discharge oil in harmful quantities, as defined in 40 CFR Part 110, into or upon the navigable waters of the United States or adjoining shorelines, shall prepare a Spill Prevention Control and Countermeasure Plan (hereinafter "SPCC Plan"), in writing and in accordance with § 112.7. Except as provided for in paragraph (f) of this section, such SPCC Plan shall be prepared within six months after the effective date of this part and shall be fully implemented as soon as possible, but not later than one year after the effective date of this part.

(b) Owners or operators of onshore and offshore facilities that become operational after the effective date of this part, and that have discharged or could reasonably be expected to discharge oil in harmful quantities, as defined in 40 CFR Part 110, into or upon the navigable waters of the United States or adjoining shorelines, shall prepare an SPCC Plan in accordance with § 112.7. Except as provided for in paragraph (f) of this section, such SPCC Plan shall be prepared within six months after the date such facility begins operations and shall be fully implemented as soon as possible, but not later than one year after such facility begins operations.

(c) Owners or operators of onshore and offshore mobile or portable facilities, such as onshore drilling or workover rigs, barge mounted offshore drilling or workover rigs, and portable fueling facilities shall prepare and implement an SPCC Plan as required by paragraphs (a), (b) and (d) of this section. The owners or operators of such facility need not prepare a new SPCC Plan each time the facility is moved to a new site. The SPCC Plan may be a general plan, prepared in accordance with § 112.7, using good engineering practice. When the mobile or portable facility is moved, it must be located and installed using the spill prevention practices outlined in the SPCC Plan for the facility. No mobile or portable facility subject to this regulation shall operate unless the SPCC Plan has been implemented. The SPCC Plan shall only apply while the facility is in a fixed (non-transportation) operating mode.

(d) No SPCC Plan shall be effective to satisfy the requirements of this part unless it has been reviewed by a Registered Professional Engineer and certified to by such Professional Engineer. By means of this certification

the engineer, having examined the facility and being familiar with the provisions of this part, shall attest that the SPCC Plan has been prepared in accordance with good engineering practices. Such certification shall in no way relieve the owner or operator of an onshore or offshore facility of his duty to prepare and fully implement such Plan in accordance with § 112.7, as required by paragraphs (a), (b) and (c) of this section.

(e) Owners or operators of a facility for which an SPCC Plan is required pursuant to paragraph (a), (b) or (c) of this section shall maintain a complete copy of the Plan at such facility if the facility is normally attended at least 8 hours per day, or at the nearest field office if the facility is not so attended, and shall make such Plan available to the Regional Administrator for on-site review during normal working hours.

(f) Extensions of time.

(1) The Regional Administrator may authorize an extension of time for the preparation and full implementation of an SPCC Plan beyond the time permitted for the preparation and implementation of an SPCC Plan pursuant to paragraph (a), (b) or (c) of this section where he finds that the owner or operator of a facility subject to paragraphs (a), (b) or (c) of this section cannot fully comply with the requirements of this part as a result of either nonavailability of qualified personnel, or delays in construction or equipment delivery beyond the control and without the fault of such owner or operator or their respective agents or employees.

(2) Any owner or operator seeking an extension of time pursuant to paragraph (f)(1) of this section may submit a letter of request to the Regional Administrator. Such letter shall include:

(i) A complete copy of the SPCC Plan, if completed;

(ii) A full explanation of the cause for any such delay and the specific aspects of the SPCC Plan affected by the delay;

(iii) A full discussion of actions being taken or contemplated to minimize or mitigate such delay;

(iv) A proposed time schedule for the implementation of any corrective actions being taken or contemplated, including interim dates for completion of tests or studies, installation and operation of any necessary equipment or other preventive measures.

In addition, such owner or operator may present additional oral or written statements in support of his letter of request.

(3) The submission of a letter of request for extension of time pursuant to paragraph (f)(2) of this section shall in no way relieve the owner or operator from his obligation to comply with the requirements of § 112.3 (a), (b) or (c). Where an extension of time is authorized by the Regional Administrator for particular equipment or other specific aspects of the SPCC Plan, such extension shall in no way affect the owner's or operator's obligation to comply with the requirements of § 112.3 (a), (b) or (c) with respect to other equipment or other specific aspects of the SPCC Plan for which an extension of time has not been expressly authorized.

[38 FR 34165, Dec. 11, 1973, as amended at 41 FR 12657, Mar. 26, 1976]

§ 112.4 Amendment of SPCC Plans by Regional Administrator.

(a) Notwithstanding compliance with § 112.3, whenever a facility subject to § 112.3 (a), (b) or (c) has: Discharged more than 1,000 U.S. gallons of oil into or upon the navigable waters of the United States or adjoining shorelines in a single spill event, or discharged oil in harmful quantities, as defined in 40 CFR Part 110, into or upon the navigable waters of the United States or adjoining shorelines in two spill events, reportable under section 311(b)(5) of the FWPCA, occurring within any twelve month period, the owner or operator of such facility shall submit to the Regional Administrator, within 60 days from the time such facility becomes subject to this section, the following:

(1) Name of the facility;

(2) Name(s) of the owner or operator of the facility;

(3) Location of the facility;

(4) Date and year of initial facility operation;

G-1233

(5) Maximum storage or handling capacity of the facility and normal daily throughput;

(6) Description of the facility, including maps, flow diagrams, and topographical maps;

(7) A complete copy of the SPCC Plan with any amendments;

(8) The cause(s) of such spill, including a failure analysis of system or subsystem in which the failure occurred;

(9) The corrective actions and/or countermeasures taken, including an adequate description of equipment repairs and/or replacements;

(10) Additional preventive measures taken or contemplated to minimize the possibility of recurrence;

(11) Such other information as the Regional Administrator may reasonably require pertinent to the Plan or spill event.

(b) Section 112.4 shall not apply until the expiration of the time permitted for the preparation and implementation of an SPCC Plan pursuant to § 112.3 (a), (b), (c) and (f).

(c) A complete copy of all information provided to the Regional Administrator pursuant to paragraph (a) of this section shall be sent at the same time to the State agency in charge of water pollution control activities in and for the State in which the facility is located. Upon receipt of such information such State agency may conduct a review and make recommendations to the Regional Administrator as to further procedures, methods, equipment and other requirements for equipment necessary to prevent and to contain discharges of oil from such facility.

(d) After review of the SPCC Plan for a facility subject to paragraph (a) of this section, together with all other information submitted by the owner or operator of such facility, and by the State agency under paragraph (c) of this section, the Regional Administrator may require the owner or operator of such facility to amend the SPCC Plan if he finds that the Plan does not meet the requirements of this part or that the amendment of the Plan is necessary to prevent and to contain discharges of oil from such facility.

(e) When the Regional Administrator proposes to require an amendment to the SPCC Plan, he shall notify the facility operator by certified mail addressed to, or by personal delivery to, the facility owner or operator, that he proposes to require an amendment to the Plan, and shall specify the terms of such amendment. If the facility owner or operator is a corporation, a copy of such notice shall also be mailed to the registered agent, if any, of such corporation in the State where such facility is located. Within 30 days from receipt of such notice, the facility owner or operator may submit written information, views, and arguments on the amendment. After considering all relevant material presented, the Regional Administrator shall notify the facility owner or operator of any amendment required or shall rescind the notice. The amendment required by the Regional Administrator shall become part of the Plan 30 days after such notice, unless the Regional Administrator, for good cause, shall specify another effective date. The owner or operator of the facility shall implement the amendment of the Plan as soon as possible, but not later than six months after the amendment becomes part of the Plan, unless the Regional Administrator specifies another date.

(f) An owner or operator may appeal a decision made by the Regional Administrator requiring an amendment to an SPCC Plan. The appeal shall be made to the Administrator of the United States Environmental Protection Agency and must be made in writing within 30 days of receipt of the notice from the Regional Administrator requiring the amendment. A complete copy of the appeal must be sent to the Regional Administrator at the time the appeal is made. The appeal shall contain a clear and concise statement of the issues and points of fact in the case. It may also contain additional information from the owner or operator, or from any other person. The Administrator or his designee may request additional information from the owner or operator, or from any other person. The Administrator or his designee shall render a decision within 60 days of receiving the appeal and shall notify the owner or operator of his decision.

[38 FR 34165, Dec. 11, 1973, as amended at 41 FR 12658, Mar. 26, 1976]

§ 112.5 Amendment of Spill Prevention Control and Countermeasure Plans by owners or operators.

(a) Owners or operators of facilities subject to § 112.3 (a), (b) or (c) shall amend the SPCC Plan for such facility in accordance with § 112.7 whenever there is a change in facility design, construction, operation or maintenance which materially affects the facility's potential for the discharge of oil into or upon the navigable waters of the United States or adjoining shore lines. Such amendments shall be fully implemented as soon as possible, but not later than six months after such change occurs.

(b) Notwithstanding compliance with paragraph (a) of this section, owners and operators of facilities subject to § 112.3 (a), (b) or (c) shall complete a review and evaluation of the SPCC Plan at least once every three years from the date such facility becomes subject to this part. As a result of this review and evaluation, the owner or operator shall amend the SPCC Plan within six months of the review to include more effective prevention and control technology if: (1) Such technology will significantly reduce the likelihood of a spill event from the facility, and (2) if such technology has been field-proven at the time of the review.

(c) No amendment to an SPCC Plan shall be effective to satisfy the requirements of this section unless it has been certified by a Professional Engineer in accordance with § 112.3(d).

§ 112.6 Civil penalties for violation of oil pollution prevention regulations.

Owners or operators of facilities subject to § 112.3 (a), (b) or (c) who violate the requirements of this Part 112 by failing or refusing to comply with any of the provisions of § 112.3, § 112.4 or § 112.5 shall be liable for a civil penalty of not more than $5,000 for each day such violation continues. Civil penalties shall be imposed in accordance with procedures set out in Part 114 of this Subchapter D.

(Secs. 311(j), 501(a), Pub. L. 92-500, 86 Stat. 868, 885 (33 U.S.C. 1321(j), 1361(a)))

[39 FR 31602, Aug. 29, 1974]

§ 112.7 Guidelines for the preparation and implementation of a Spill Prevention Control and Countermeasure Plan.

The SPCC Plan shall be a carefully thought-out plan, prepared in accordance with good engineering practices, and which has the full approval of management at a level with authority to commit the necessary resources. If the plan calls for additional facilities or procedures, methods, or equipment not yet fully operational, these items should be discussed in separate paragraphs, and the details of installation and operational start-up should be explained separately. The complete SPCC Plan shall follow the sequence outlined below, and include a discussion of the facility's conformance with the appropriate guidelines listed:

(a) A facility which has experienced one or more spill events within twelve months prior to the effective date of this part should include a written description of each such spill, corrective action taken and plans for preventing recurrence.

(b) Where experience indicates a reasonable potential for equipment failure (such as tank overflow, rupture, or leakage), the plan should include a prediction of the direction, rate of flow, and total quantity of oil which could be discharged from the facility as a result of each major type of failure.

(c) Appropriate containment and/or diversionary structures or equipment to prevent discharged oil from reaching a navigable water course should be provided. One of the following preventive systems or its equivalent should be used as a minimum:

(1) Onshore facilities:

(i) Dikes, berms or retaining walls sufficiently impervious to contain spilled oil;

(ii) Curbing;

(iii) Culverting, gutters or other drainage systems;

(iv) Weirs, booms or other barriers;

(v) Spill diversion ponds;

(vi) Retention ponds;

(vii) Sorbent materials.

(2) Offshore facilities:

30-142 O—89——2

(i) Curbing, drip pans;

(ii) Sumps and collection systems.

(d) When it is determined that the installation of structures or equipment listed in § 112.7(c) to prevent discharged oil from reaching the navigable waters is not practicable from any onshore or offshore facility, the owner or operator should clearly demonstrate such impracticability and provide the following:

(1) A strong oil spill contingency plan following the provision of 40 CFR Part 109.

(2) A written commitment of manpower, equipment and materials required to expeditiously control and remove any harmful quantity of oil discharged.

(e) In addition to the minimal prevention standards listed under § 112.7(c), sections of the Plan should include a complete discussion of conformance with the following applicable guidelines, other effective spill prevention and containment procedures (or, if more stringent, with State rules, regulations and guidelines):

(1) *Facility drainage (onshore); (excluding production facilities).* (i) Drainage from diked storage areas should be restrained by valves or other positive means to prevent a spill or other excessive leakage of oil into the drainage system or inplant effluent treatment system, except where plan systems are designed to handle such leakage. Diked areas may be emptied by pumps or ejectors; however, these should be manually activated and the condition of the accumulation should be examined before starting to be sure no oil will be discharged into the water.

(ii) Flapper-type drain valves should not be used to drain diked areas. Valves used for the drainage of diked areas should, as far as practical, be of manual, open-and-closed design. When plant drainage drains directly into water courses and not into wastewater treatment plants, retained storm water should be inspected as provided in paragraphs (e)(2)(iii) (B), (C) and (D) of this section before drainage.

(iii) Plant drainage systems from undiked areas should, if possible, flow into ponds, lagoons or catchment basins, designed to retain oil or return it to the facility. Catchment basins should not be located in areas subject to periodic flooding.

(iv) If plant drainage is not engineered as above, the final discharge of all in-plant ditches should be equipped with a diversion system that could, in the event of an uncontrolled spill, return the oil to the plant.

(v) Where drainage waters are treated in more than one treatment unit, natural hydraulic flow should be used. If pump transfer is needed, two "lift" pumps should be provided, and at least one of the pumps should be permanently installed when such treatment is continuous. In any event, whatever techniques are used facility drainage systems should be adequately engineered to prevent oil from reaching navigable waters in the event of equipment failure or human error at the facility.

(2) *Bulk storage tanks (onshore); (excluding production facilities).* (i) No tank should be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature, etc.

(ii) All bulk storage tank installations should be constructed so that a secondary means of containment is provided for the entire contents of the largest single tank plus sufficient freeboard to allow for precipitation. Diked areas should be sufficiently impervious to contain spilled oil. Dikes, containment curbs, and pits are commonly employed for this purpose, but they may not always be appropriate. An alternative system could consist of a complete drainage trench enclosure arranged so that a spill could terminate and be safely confined in an inplant catchment basin or holding pond.

(iii) Drainage of rainwater from the diked area into a storm drain or an effluent discharge that empties into an open water course, lake, or pond, and bypassing the in-plant treatment system may be acceptable if:

(A) The bypass valve is normally sealed closed.

(B) Inspection of the run-off rain water ensures compliance with applicable water quality standards and will

not cause a harmful discharge as defined in 40 CFR Part 110.

(C) The bypass valve is opened, and resealed following drainage under responsible supervision.

(D) Adequate records are kept of such events.

(iv) Buried metallic storage tanks represent a potential for undetected spills. A new buried installation should be protected from corrosion by coatings, cathodic protection or other effective methods compatible with local soil conditions. Such buried tanks should at least be subjected to regular pressure testing.

(v) Partially buried metallic tanks for the storage of oil should be avoided, unless the buried section of the shell is adequately coated, since partial burial in damp earth can cause rapid corrosion of metallic surfaces, especially at the earth/air interface.

(vi) Aboveground tanks should be subject to periodic integrity testing, taking into account tank design (floating roof, etc.) and using such techniques as hydrostatic testing, visual inspection or a system of non-destructive shell thickness testing. Comparison records should be kept where appropriate, and tank supports and foundations should be included in these inspections. In addition, the outside of the tank should frequently be observed by operating personnel for signs of deterioration, leaks which might cause a spill, or accumulation of oil inside diked areas.

(vii) To control leakage through defective internal heating coils, the following factors should be considered and applied, as appropriate.

(A) The steam return or exhaust lines from internal heating coils which discharge into an open water course should be monitored for contamination, or passed through a settling tank, skimmer, or other separation or retention system.

(B) The feasibility of installing an external heating system should also be considered.

(viii) New and old tank installations should, as far as practical, be fail-safe engineered or updated into a fail-safe engineered installation to avoid spills. Consideration should be given to providing one or more of the following devices:

(A) High liquid level alarms with an audible or visual signal at a constantly manned operation or surveillance station; in smaller plants an audible air vent may suffice.

(B) Considering size and complexity of the facility, high liquid level pump cutoff devices set to stop flow at a predetermined tank content level.

(C) Direct audible or code signal communication between the tank gauger and the pumping station.

(D) A fast response system for determining the liquid level of each bulk storage tank such as digital computers, telepulse, or direct vision gauges or their equivalent.

(E) Liquid level sensing devices should be regularly tested to insure proper operation.

(ix) Plant effluents which are discharged into navigable waters should have disposal facilities observed frequently enough to detect possible system upsets that could cause an oil spill event.

(x) Visible oil leaks which result in a loss of oil from tank seams, gaskets, rivets and bolts sufficiently large to cause the accumulation of oil in diked areas should be promptly corrected.

(xi) Mobile or portable oil storage tanks (onshore) should be positioned or located so as to prevent spilled oil from reaching navigable waters. A secondary means of containment, such as dikes or catchment basins, should be furnished for the largest single compartment or tank. These facilities should be located where they will not be subject to periodic flooding or washout.

(3) *Facility transfer operations, pumping, and in-plant process (onshore); (excluding production facilities).* (i) Buried piping installations should have a protective wrapping and coating and should be cathodically protected if soil conditions warrant. If a section of buried line is exposed for any reason, it should be carefully examined for deterioration. If corrosion damage is found, additional examination and corrective action should be taken as indicated by the magnitude of the damage. An alternative would

be the more frequent use of exposed pipe corridors or galleries.

(ii) When a pipeline is not in service, or in standby service for an extended time the terminal connection at the transfer point should be capped or blank-flanged, and marked as to origin.

(iii) Pipe supports should be properly designed to minimize abrasion and corrosion and allow for expansion and contraction.

(iv) All aboveground valves and pipelines should be subjected to regular examinations by operating personnel at which time the general condition of items, such as flange joints, expansion joints, valve glands and bodies, catch pans, pipeline supports, locking of valves, and metal surfaces should be assessed. In addition, periodic pressure testing may be warranted for piping in areas where facility drainage is such that a failure might lead to a spill event.

(v) Vehicular traffic granted entry into the facility should be warned verbally or by appropriate signs to be sure that the vehicle, because of its size, will not endanger above ground piping.

(4) *Facility tank car and tank truck loading/unloading rack (onshore).* (i) Tank car and tank truck loading/unloading procedures should meet the minimum requirements and regulation established by the Department of Transportation.

(ii) Where rack area drainage does not flow into a catchment basin or treatment facility designed to handle spills, a quick drainage system should be used for tank truck loading and unloading areas. The containment system should be designed to hold at least maximum capacity of any single compartment of a tank car or tank truck loaded or unloaded in the plant.

(iii) An interlocked warning light or physical barrier system, or warning signs, should be provided in loading/unloading areas to prevent vehicular departure before complete disconnect of flexible or fixed transfer lines.

(iv) Prior to filling and departure of any tank car or tank truck, the lowermost drain and all outlets of such vehicles should be closely examined for leakage, and if necessary, tightened, adjusted, or replaced to prevent liquid leakage while in transit.

(5) *Oil production facilities (onshore)*—(i) *Definition.* An onshore production facility may include all wells, flowlines, separation equipment, storage facilities, gathering lines, and auxiliary non-transportation-related equipment and facilities in a single geographical oil or gas field operated by a single operator.

(ii) *Oil production facility (onshore) drainage.* (A) At tank batteries and central treating stations where an accidental discharge of oil would have a reasonable possibility of reaching navigable waters, the dikes or equivalent required under § 112.7(c)(1) should have drains closed and sealed at all times except when rainwater is being drained. Prior to drainage, the diked area should be inspected as provided in paragraphs (e)(2)(iii) (B), (C), and (D) of this section. Accumulated oil on the rainwater should be picked up and returned to storage or disposed of in accordance with approved methods.

(B) Field drainage ditches, road ditches, and oil traps, sumps or skimmers, if such exist, should be inspected at regularly scheduled intervals for accumulation of oil that may have escaped from small leaks. Any such accumulations should be removed.

(iii) *Oil production facility (onshore) bulk storage tanks.* (A) No tank should be used for the storage of oil unless its material and construction are compatible with the material stored and the conditions of storage.

(B) All tank battery and central treating plant installations should be provided with a secondary means of containment for the entire contents of the largest single tank if feasible, or alternate systems such as those outlined in § 112.7(c)(1). Drainage from undiked areas should be safely confined in a catchment basin or holding pond.

(C) All tanks containing oil should be visually examined by a competent person for condition and need for maintenance on a scheduled periodic basis. Such examination should include the foundation and supports of tanks that are above the surface of the ground.

(D) New and old tank battery installations should, as far as practical, be fail-safe engineered or updated into a fail-safe engineered installation to prevent spills. Consideration should be given to one or more of the following:

(*1*) Adequate tank capacity to assure that a tank will not overfill should a pumper/gauger be delayed in making his regular rounds.

(*2*) Overflow equalizing lines between tanks so that a full tank can overflow to an adjacent tank.

(*3*) Adequate vacuum protection to prevent tank collapse during a pipeline run.

(*4*) High level sensors to generate and transmit an alarm signal to the computer where facilities are a part of a computer production control system.

(iv) *Facility transfer operations, oil production facility (onshore).* (A) All above ground valves and pipelines should be examined periodically on a scheduled basis for general condition of items such as flange joints, valve glands and bodies, drip pans, pipeline supports, pumping well polish rod stuffing boxes, bleeder and gauge valves.

(B) Salt water (oil field brine) disposal facilities should be exained often, particularly following a sudden change in atmospheric temperature to detect possible system upsets that could cause an oil discharge.

(C) Production facilities should have a program of flowline maintenance to prevent spills from this source. The program should include periodic examinations, corrosion protection, flowline replacement, and adequate records, as appropriate, for the individual facility.

(6) *Oil drilling and workover facilities (onshore).* (i) Mobile drilling or workover equipment should be positioned or located so as to prevent spilled oil from reaching navigable waters.

(ii) Depending on the location, catchment basins or diversion structures may be necessary to intercept and contain spills of fuel, crude oil, or oily drilling fluids.

(iii) Before drilling below any casing string or during workover operations, a blowout prevention (BOP) assembly and well control system should be installed that is capable of controlling any well head pressure that is expected to be encountered while that BOP assembly is on the well. Casing and BOP installations should be in accordance with State regulatory agency requirements.

(7) *Oil drilling, production, or workover facilities (offshore).* (i) Definition: "An oil drilling, production or workover facility (offshore)" may include all drilling or workover equipment, wells, flowlines, gathering lines, platforms, and auxiliary nontransportation-related equipment and facilities in a single geographical oil or gas field operated by a single operator.

(ii) Oil drainage collection equipment should be used to prevent and control small oil spillage around pumps, glands, valves, flanges, expansion joints, hoses, drain lines, separators, treaters, tanks, and allied equipment. Drains on the facility should be controlled and directed toward a central collection sump or equivalent collection system sufficient to prevent discharges of oil into the navigable waters of the United States. Where drains and sumps are not practicable oil contained in collection equipment should be removed as often as necessary to prevent overflow.

(iii) For facilities employing a sump system, sump and drains should be adequately sized and a spare pump or equivalent method should be available to remove liquid from the sump and assure that oil does not escape. A regular scheduled preventive maintenance inspection and testing program should be employed to assure reliable operation of the liquid removal system and pump start-up device. Redundant automatic sump pumps and control devices may be required on some installations.

(iv) In areas where separators and treaters are equipped with dump valves whose predominant mode of failure is in the closed position and pollution risk is high, the facility should be specially equipped to prevent the escape of oil. This could be accomplished by extending the flare line to a diked area if the separator is near shore, equipping it with a high liquid level sensor that will automatically shut-in wells producing to the

separator, parallel redundant dump valves, or other feasible alternatives to prevent oil discharges.

(v) Atmospheric storage or surge tanks should be equipped with high liquid level sensing devices or other acceptable alternatives to prevent oil discharges.

(vi) Pressure tanks should be equipped with high and low pressure sensing devices to activate an alarm and/or control the flow or other acceptable alternatives to prevent oil discharges.

(vii) Tanks should be equipped with suitable corrosion protection.

(viii) A written procedure for inspecting and testing pollution prevention equipment and systems should be prepared and maintained at the facility. Such procedures should be included as part of the SPCC Plan.

(ix) Testing and inspection of the pollution prevention equipment and systems at the facility should be conducted by the owner or operator on a scheduled periodic basis commensurate with the complexity, conditions and circumstances of the facility or other appropriate regulations.

(x) Surface and subsurface well shut-in valves and devices in use at the facility should be sufficiently described to determine method of activation or control, e.g., pressure differential, change in fluid or flow conditions, combination of pressure and flow, manual or remote control mechanisms. Detailed records for each well, while not necessarily part of the plan should be kept by the owner or operator.

(xi) Before drilling below any casing string, and during workover operations a blowout preventer (BOP) assembly and well control system should be installed that is capable of controlling any well-head pressure that is expected to be encountered while that BOP assembly is on the well. Casing and BOP installations should be in accordance with State regulatory agency requirements.

(xii) Extraordinary well control measures should be provided should emergency conditions, including fire, loss of control and other abnormal conditions, occur. The degree of control system redundancy should vary with hazard exposure and probable consequences of failure. It is recommended that surface shut-in systems have redundant or "fail close" valving. Subsurface safety valves may not be needed in producing wells that will not flow but should be installed as required by applicable State regulations.

(xiii) In order that there will be no misunderstanding of joint and separate duties and obligations to perform work in a safe and pollution free manner, written instructions should be prepared by the owner or operator for contractors and subcontractors to follow whenever contract activities include servicing a well or systems appurtenant to a well or pressure vessel. Such instructions and procedures should be maintained at the offshore production facility. Under certain circumstances and conditions such contractor activities may require the presence at the facility of an authorized representative of the owner or operator who would intervene when necessary to prevent a spill event.

(xiv) All manifolds (headers) should be equipped with check valves on individual flowlines.

(xv) If the shut-in well pressure is greater than the working pressure of the flowline and manifold valves up to and including the header valves associated with that individual flowline, the flowline should be equipped with a high pressure sensing device and shut-in valve at the wellhead unless provided with a pressure relief system to prevent over pressuring.

(xvi) All pipelines appurtenant to the facility should be protected from corrosion. Methods used, such as protective coatings or cathodic protection, should be discussed.

(xvii) Sub-marine pipelines appurtenant to the facility should be adequately protected against environmental stresses and other activities such as fishing operations.

(xviii) Sub-marine pipelines appurtenant to the facility should be in good operating condition at all times and inspected on a scheduled periodic basis for failures. Such inspections should be documented and maintained at the facility.

(8) *Inspections and records.* Inspections required by this part should be

in accordance with written procedures developed for the facility by the owner or operator. These written procedures and a record of the inspections, signed by the appropriate supervisor or inspector, should be made part of the SPCC Plan and maintained for a period of three years.

(9) *Security (excluding oil production facilities).* (i) All plants handling, processing, and storing oil should be fully fenced, and entrance gates should be locked and/or guarded when the plant is not in production or is unattended.

(ii) The master flow and drain valves and any other valves that will permit direct outward flow of the tank's content to the surface should be securely locked in the closed position when in non-operating or non-standby status.

(iii) The starter control on all oil pumps should be locked in the "off" position or located at a site accessible only to authorized personnel when the pumps are in a non-operating or non-standby status.

(iv) The loading/unloading connections of oil pipelines should be securely capped or blank-flanged when not in service or standby service for an extended time. This security practice should also apply to pipelines that are emptied of liquid content either by draining or by inert gas pressure.

(v) Facility lighting should be commensurate with the type and location of the facility. Consideration should be given to: (A) Discovery of spills occurring during hours of darkness, both by operating personnel, if present, and by non-operating personnel (the general public, local police, etc.) and (B) prevention of spills occurring through acts of vandalism.

(10) *Personnel, training and spill prevention procedures.* (i) Owners or operators are responsible for properly instructing their personnel in the operation and maintenance of equipment to prevent the discharges of oil and applicable pollution control laws, rules and regulations.

(ii) Each applicable facility should have a designated person who is accountable for oil spill prevention and who reports to line management.

(iii) Owners or operators should schedule and conduct spill prevention briefings for their operating personnel at intervals frequent enough to assure adequate understanding of the SPCC Plan for that facility. Such briefings should highlight and describe known spill events or failures, malfunctioning components, and recently developed precautionary measures.

APPENDIX—MEMORANDUM OF UNDERSTANDING BETWEEN THE SECRETARY OF TRANSPORTATION AND THE ADMINISTRATOR OF THE ENVIRONMENTAL PROTECTION AGENCY

SECTION II—DEFINITIONS

The Environmental Protection Agency and the Department of Transportation agree that for the purposes of Executive Order 11548, the term:

(1) "Non-transportation-related onshore and offshore facilities" means:

(A) Fixed onshore and offshore oil well drilling facilities including all equipment and appurtenances related thereto used in drilling operations for exploratory or development wells, but excluding any terminal facility, unit or process integrally associated with the handling or transferring of oil in bulk to or from a vessel.

(B) Mobile onshore and offshore oil well drilling platforms, barges, trucks, or other mobile facilities including all equipment and appurtenances related thereto when such mobile facilities are fixed in position for the purpose of drilling operations for exploratory or development wells, but excluding any terminal facility, unit or process integrally associated with the handling or transferring of oil in bulk to or from a vessel.

(C) Fixed onshore and offshore oil production structures, platforms, derricks, and rigs including all equipment and appurtenances related thereto, as well as completed wells and the wellhead separators, oil separators, and storage facilities used in the production of oil, but excluding any terminal facility, unit or process integrally associated with the handling or transferring of oil in bulk to or from a vessel.

(D) Mobile onshore and offshore oil production facilities including all equipment and appurtenances related thereto as well as completed wells and wellhead equipment, piping from wellheads to oil separators, oil separators, and storage facilities used in the production of oil when such mobile facilities are fixed in position for the purpose of oil production operations, but excluding any terminal facility, unit or process integrally associated with the handling or transferring of oil in bulk to or from a vessel.

(E) Oil refining facilities including all equipment and appurtenances related thereto as well as in-plant processing units, storage units, piping, drainage systems and waste treatment units used in the refining of oil, but excluding any terminal facility, unit or process integrally associated with the handling or transferring of oil in bulk to or from a vessel.

(F) Oil storage facilities including all equipment and appurtenances related thereto as well as fixed bulk plant storage, terminal oil storage facilities, consumer storage, pumps and drainage systems used in the storage of oil, but excluding inline or breakout storage tanks needed for the continuous operation of a pipeline system and any terminal facility, unit or process integrally associated with the handling or transferring of oil in bulk to or from a vessel.

(G) Industrial, commercial, agricultural or public facilities which use and store oil, but excluding any terminal facility, unit or process integrally associated with the handling or transferring of oil in bulk to or from a vessel.

(H) Waste treatment facilities including in-plant pipelines, effluent discharge lines, and storage tanks, but excluding waste treatment facilities located on vessels and terminal storage tanks and appurtenances for the reception of oily ballast water or tank washings from vessels and associated systems used for off-loading vessels.

(I) Loading racks, transfer hoses, loading arms and other equipment which are appurtenant to a nontransportation-related facility or terminal facility and which are used to transfer oil in bulk to or from highway vehicles or railroad cars.

(J) Highway vehicles and railroad cars which are used for the transport of oil exclusively within the confines of a nontransportation-related facility and which are not intended to transport oil in interstate or intrastate commerce.

(K) Pipeline systems which are used for the transport of oil exclusively within the confines of a nontransportation-related facility or terminal facility and which are not intended to transport oil in interstate or intrastate commerce, but excluding pipeline systems used to transfer oil in bulk to or from a vessel.

(2) "Transportation-related onshore and offshore facilities" means:

(A) Onshore and offshore terminal facilities including transfer hoses, loading arms and other equipment and appurtenances used for the purpose of handling or transferring oil in bulk to or from a vessel as well as storage tanks and appurtenances for the reception of oily ballast water or tank washings from vessels, but excluding terminal waste treatment facilities and terminal oil storage facilities.

(B) Transfer hoses, loading arms and other equipment appurtenant to a nontransportation-related facility which is used to transfer oil in bulk to or from a vessel.

(C) Interstate and intrastate onshore and offshore pipeline systems including pumps and appurtenances related thereto as well as in-line or breakout storage tanks needed for the continuous operation of a pipeline system, and pipelines from onshore and offshore oil production facilities, but excluding onshore and offshore piping from wellheads to oil separators and pipelines which are used for the transport of oil exclusively within the confines of a nontransportation-related facility or terminal facility and which are not intended to transport oil in interstate or intrastate commerce or to transfer oil in bulk to or from a vessel.

(D) Highway vehicles and railroad cars which are used for the transport of oil in interstate or intrastate commerce and the equipment and appurtenances related thereto, and equipment used for the fueling of locomotive units, as well as the rights-of-way on which they operate. Excluded are highway vehicles and railroad cars and motive power used exclusively within the confines of a nontransportation-related facility or terminal facility and which are not intended for use in interstate or intrastate commerce.

PART 113—LIABILITY LIMITS FOR SMALL ONSHORE STORAGE FACILITIES

Subpart A—Oil Storage Facilities

Sec.

113.1 Purpose.
113.2 Applicability.
113.3 Definitions.
113.4 Size classes and associated liability limits for fixed onshore oil storage facilities, 1,000 barrels or less capacity.
113.5 Exclusions.
113.6 Effect on other laws.

AUTHORITY: Sec. 311(f)(2), 86 Stat. 867 (33 U.S.C. 1251 (1972)).

SOURCE: 38 FR 25440, Sept. 13, 1973, unless otherwise noted.

Subpart A—Oil Storage Facilities

§ 113.1 Purpose.

This subpart establishes size classifications and associated liability limits for small onshore oil storage facilities with fixed capacity of 1,000 barrels or less.

1/4" = 1'-0" (B/—)

1/4" = 1'-0" (C/—)

¾" = 1'-0" (D/—)

GENERAL NOTES

1. CONCRETE [illegible] f'c = 3000 PSI.
2. REINFORCING STEEL SHALL CONFORM WITH [illegible] DEFORMED, GRADE 40, EXCEPT THAT [illegible] GRADE 40.
3. SAND BASE FOR OIL STORAGE TANK SHALL BE [illegible] FREE FROM CORROSIVE ELEMENTS. OIL AND SAND SHALL BE THOROUGHLY MIXED EITHER IN A CONCRETE MIXER OR BY WINDROWING ONLY. SUFFICIENT OIL SHOULD BE USED TO THOROUGHLY WET THE SAND.
4. TOLERANCE ON CONCRETE RING WALL UPPER SURFACE SHALL BE LEVEL WITHIN ±1/8 IN. ERRANT 30 FT. CIRCUMFERENCE. THE LEVELNESS OF THE CIRCUMFERENCE SHALL NOT VARY BY MORE THAN ±1/4 IN. FROM AN ESTABLISHED PLANE. THE TOLERANCE ON POURED CONCRETE BEFORE GROUTING SHALL BE ±1 IN.

GRADING NOTES

1. COMPACTION - 90% MAXIMUM LAB DENSITY PER ASTM D1557 AT OPTIMUM MOISTURE ±2%.
2. OBTAIN FULL COMPACTION TO SURFACE OF BERM EITHER BY SLOPE ROLLING TO FINISH GRADE OR OVERFILLING AND CUTTING BACK.
3. CONSTRUCT BERM OF SAND-CLAY OR SAND-SILT-CLAY MIXTURE HAVING SUFFICIENT FINES TO PRODUCE AN IMPERVIOUS BERM AND SERVE AS BINDER FOR THE SOIL MATRIX. LIMIT COARSE AGGREGATE TO STONES SMALLER THAN 3 IN. IN MAXIMUM DIMENSION AND LESS THAN 10% OF THE BERM FILL. AVOID FAT CLAY SUBJECT TO EXCESSIVE CRACKING WHEN DRY.
4. COVER SURFACE OF BERM WITH 3 IN. LAYER OF CRUSHED STONE. 1-1/2 IN. MAXIMUM SIZE AND 3/8 IN. MINIMUM SIZE STONE.
5. CONDUCT ALL GRADING AND FOUNDATION PREPARATION UNDER INSPECTION BY A SOILS ENGINEER.

Riverside, California 92502

AUG - 2 1973
SANTA ANA REGION

Dear Sir:

The Plant waste water was resampled on July 26th. This sample contained .05 PPM of Hexavalent Chromium. Certificate of Analysis is enclosed.

In checking into why the Chromate was unusually high in the first sample, it was found that a pump failure caused treated cooling water to be dumped into the ditch during the sampling period.

To prevent this from happening in the future, we will install a standby pump to take over should the circulating pump fail. We will change our water treatment in cooling water to reduce or eliminate, if possible, the use of Chromate.

We are most desirous of maintaining the quality of our waste water well within acceptable limits.

Sincerely,

E. M. Shull

Elton M. Shull
Supervisor of Quality

Subject: Expanded Closure Plan Details for Riverside Cement Company's Boiler Blowdown Pond

Dear Mr. Robertson:

We are enclosing the finalized details for Riverside Cement Company's Boiler Blowdown Pond Closure Plan. This is an expansion of the earlier report sent to you August 13, 1991; You had requested this addendum in your visit to the plant on August 25, 1992. This information should supply you with all of the details needed to show a good closure plan for the Boiler Blowdown Pond.

During your August 25, 1992 visit, you and Dixie Lass commented that the Cement Kiln Dust disposal area closure was fairly straight forward and that the existing dirt coverage for vegetation propagation would be satisfactory. This area has now been closed for four years (August, 1990); therefore, Riverside Cement would like to have your concurrence of closure of the Cement Kiln Dust Disposal Area.

We look forward to answering any questions you may have on either closure for the Boiler Blowdown Pond or the Cement Kiln Dust Disposal Area. We look forward to your concurrence on these closure plans in the near future.

Sincerely,

Eugene M. Kulesza
Manager of Regulatory Matters

Attention: Plant Superintendent

This will acknowledge receipt of your July 1973 wastewater analysis which was submitted in conformance with this Board's waste discharge requirements for your Crestmore operations.

The value of hexavalent chromium shown in this analysis 0.55 mg/l, is excessive and must be explained. If a re-sample indicates any significant chromate your waste discharge operations must be promptly reviewed and the source of chromate eliminated.

Please provide your comments regarding the above prior to August 2, 1973.

JAMES W. ANDERSON
Executive Officer

Santa Ana Regional Water Pollution Control Board

RESOLUTION 60-17

PRESCRIBING REQUIREMENTS FOR THE DISPOSAL OF INDUSTRIAL WASTES ONLY BY THE RIVERSIDE CEMENT COMPANY CRESTMORE

Rescinded by Order No. 76-78

WHEREAS, on August 13, 1959 the Riverside Cement Company in compliance with Section 13054, Water Code, State of California, filed with this Board a Report on Waste Discharge wherein it is proposed to discharge untreated industrial waste into the North Riverside and Jurupa Canal or into a gravel pit for percolation; and

WHEREAS, this Board has caused the following investigations and actions with respect to the aforesaid proposal to be made: (1) Field investigations and office studies have been conducted by the staff of this Board and consultations were held between the staff and representatives of the Riverside Cement Company. (2) Technical assistance and recommendations were requested in writing from interested official agencies and the following have been received and considered: Memorandum dated December 21, 1959 from the State Department of Fish & Game; Joint letter dated January 14, 1960 from the Riverside County Health Department and the State Department of Public Health; Memorandum dated February 2, 1960 from the Department of Water Resources; and

WHEREAS, based on the foregoing this Board finds that: (1) The gravel pit disposal site is located in the NE 1/4 of the NE 1/4 of Section 10, Township 2 S, Range 5 W, S. B. B. & M. (2) The disposal site is located in the Riverside Ground Water Basin and is underlain by older alluvium containing sand, silt, and clay. These materials are porous and permeable and will transmit fluids to the ground waters. (3) The ground water depth is estimated to be 60 feet beneath the ground surface at the site with the ground water movement in a westerly direction. (4) Ground waters downstream from the disposal site are beneficially used for domestic and agricultural purposes. Ground water quality is acceptable for prevailing beneficial uses. (5) Estimated quantity of discharge is 600 gallons per minute, approximately 90% of which is discharged into the North Riverside and Jurupa Canal for use as irrigation water. (6) Quality of discharge is: Total dissolved solids 490 milligrams per liter; sodium 45 milligrams per liter; chlorides 84 milligrams per liter; nitrates 30 milligrams per liter; hardness 239 milligrams per liter. (7) On May 9, 1960 letters were forwarded to the Riverside Cement Company and to other interested agencies and to all persons known or believed to have an official interest in the aforesaid discharge stating the above findings and forwarding tentative requirements for the aforesaid discharge of waste. (8) Said tentative requirements, forwarded as described above, are identical with the requirements prescribed hereinafter; and

WHEREAS, on October 17, 1952, this Board adopted a policy statement which reads in part "water quality objectives for all surface streams, underground water basins, the ocean, its bays and tide water areas, will be formulated from time to time"; and

WHEREAS, on February 25, 1960 this Board adopted Resolution 59-10 which resolution establishes water quality objectives for the Arlington Riverside Basins.

NOW THEREFORE BE IT RESOLVED that in order to prevent unreasonable impairment in quality of the ground water in the Arlington Riverside Basin for the aforesaid beneficial uses and of the quality of surface or underground water to which that basin is tributary and in accordance with the authority granted this Board by Division 7 of the aforesaid Water Code, this Board hereby prescribes the following requirements with respect to the aforesaid discharge of waste by the Riverside Cement Company, Crestmore, subject to the provisions of Section 13054 of the aforesaid Water Code, which reads in part that "requirements may be revised from time to time":

(1) The discharge shall not cause the concentration of any below named substances in the ground water to exceed the values listed:

Total dissolved solids (by evaporation)	700	mg/l
Total hardness (as $CaCO_3$)	350	mg/l
Chlorides	125	mg/l
Bicarbonate	300	mg/l
Nitrates	44	mg/l
Boron	0.4	mg/l
Fluoride	0.9	mg/l
Hexavalent chromium	0.05	mg/l
Arsenic	0.05	mg/l
Selenium	0.05	mg/l
Lead	0.1	mg/l
Phenolic compounds	0.001	mg/l
Sodium per cent	45	

(2) The discharge shall not cause an increase in concentration of any below named substance in the receiving water over that normally found in adjacent ground water unaffected by sewage or industrial waste:

Total dissolved solids (by evaporation)	250	mg/l
Total hardness (as $CaCO_3$)	50	mg/l
Chlorides	40	mg/l
Bicarbonate	100	mg/l
Boron	0.1	mg/l
Fluoride	0.2	mg/l
Tastes and odors	None	
Sodium per cent	20	

(3) The discharge shall be handled in a manner to prevent unsightliness and odor nuisances.

(4) The discharge shall not cause toxic concentrations of any substance in the receiving waters.

BE IT FURTHER RESOLVED that in accordance with Section 13055, of the aforesaid Water Code, technical reports of the quality and quantity of the waste discharged at the disposal site shall be submitted to this Board in accordance with

17

specifications appearing in Exhibit "A" to this resolution, which specifications the staff of this Board is authorized to revise, whenever necessary, and such revision being subject to review by this Board at the request of the Riverside Cement Company, Crestmore; and

BE IT FURTHER RESOLVED that compliance with the foregoing requirements shall be based on:

(1) Periodic analyses of samples of water from the North Riverside and Jurupa Canal downstream from the Riverside Cement Company point of discharge and from the water supplied to the plant will be checked for meeting the conditions in requirement (2) regarding the incremental increases.
OR

(2) The effluent from the plant in itself has been found to be of high chemical quality meeting the objectives adopted by the Board for the Arlington-Riverside Ground Water Basin as stated in requirement (1). As long as the quality of the discharge is equal to or less than the concentrations set in requirement (1) no additional analyses of receiving water need be made.

BE IT FURTHER RESOLVED that the Riverside Cement Company, Crestmore, be notified that: (1) The requirements herein prescribed are predicated on the terms of the aforesaid Report on Waste Discharge, that is, that the aforesaid waste shall be discharged to the therein described location, and not elsewhere, and in the therein described manner. (2) Any proposed change in the point or method of disposal of waste or significant change in the character of waste shall be promptly reported to this Board; and

BE IT FURTHER RESOLVED that a certified copy of this resolution be forwarded by mail to an authorized officer of the Riverside Cement Company, Crestmore and to such other agencies and persons who may have need therefor or who may request same.

I, Raymond V. Stone, Jr., hereby certify that the foregoing is a true and correct copy of a resolution adopted by the Santa Ana Regional Water Pollution Control Board, State of California, at a regular meeting held on June 3, 1960.

Raymond V. Stone, Jr.
Executive Officer

Revised 10-11-74

Exhibit "A"

RESOLUTION 60-17

Specifications for Technical Reports to be Submitted by the Riverside Cement Company, Crestmore

1. A sample of the effluent shall be taken on the first working day of January, April, July and October.

2. The above sample shall be taken at the point of diversion to the canal or gravel pit and shall be collected continuously in proportion to flow over a 24-hour period or composited in proportion to flow from individual samples collected at intervals of one hour or less for a period of 24 hours.

3. The following determinations shall be made in accordance with standard methods on the samples so taken: total dissolved solids (by evaporation), calcium, magnesium, sodium, sulfate, carbonate, bicarbonate, nitrate, chloride, boron, fluoride, and pH.

4. The following determinations shall be made annually on the sample taken in July, in addition to the determinations called for in paragraph 3, in accordance with standard methods on the sample so taken: phenolic compounds and hexavalent chromium.

5. Monthly records of flow are to be maintained and submitted to the Board on a quarterly basis. Included in the above will be all dates that flow was diverted to the gravel pit. All of the above reports must be received by this Board within 30 days of the above sampling dates.

Monitoring and Reporting Program
for
Riverside Cement Company, Crestmore

Effluent Monitoring

A sampling station shall be established for each point of discharge and shall be located where representative samples of that effluent can be obtained. The following shall constitute the effluent monitoring program:

Constituents	Units	Type of Sample	Minimum Frequency of Analysis
Sodium	mg/l	Composite	Quarterly
Potassium	"	"	"
Calcium	"	"	"
Magnesium	"	"	"
Total Hardness	"	"	"
Ammonium	"	"	"
Sulfate	"	"	"
Chloride	"	"	"
Bicarbonate	"	"	"
Carbonate	"	"	"
Nitrate	"	"	"
Fluoride	"	"	"
Boron	"	"	"
pH	pH units	"	"
Electrical Conductivity	micromhos/cm	"	"
Phenolic Compounds	mg/l	"	Yearly in July
Hexavalent Chromium	"	"	" " "

1. Quarterly samples shall be collected on the fifth working day of January, April, July, and October.

2. Monthly records of flow are to be maintained and submitted to the board on a quarterly basis. Included in the above will be all dates that flow was diverted to the gravel pit. All of the above reports must be received by this board within 30 days of the above sampling dates.

3. The above sample shall be taken at the point of diversion to the canal or gravel pit and shall be collected continuously in proportion to flow over a 24-hour period or composited in proportion to flow

17

from individual samples collected at intervals of one hour or less for a period of 24 hours.

Reporting

Monitoring reports shall be submitted by the fourth Monday of January, April, July, and October.

All reports shall be signed by a responsible officer of Riverside Cement Company and submitted under penalty of perjury.

ORDER NO. 75-28

Waste Discharge Requirements
for
Riverside Cement Company
Riverside County

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Board), finds that:

1. The Riverside Cement Company (hereinafter discharger) presently discharges industrial wastes under requirements issued by this Board in Resolution No. 60-17 on June 3, 1960.

2. The discharger presently discharges the following wastes in Section 3, T2S, R5W, SBB&M:

   a. 1.75 MGD (6,600 m^3/day) of industrial wastes pumped from the company's mine to the West Riverside Canal;

   b. 5,000 GPD (19 m^3/day) of sanitary wastes to septic tanks and subsurface leaching; and,

   c. 5,000 gallons per month (19 m^3/month) of saline boiler blowdown and water softener regeneration wastes to an impervious facility.

3. A Water Quality Control Plan was adopted by the Regional Board on April 11, 1975. The Plan contains water quality objectives and beneficial uses of waters in the Santa Ana Region.

4. The discharge is in the Riverside Groundwater Basin, where the beneficial uses of water include:

   a. Municipal and domestic supply,
   b. Agricultural supply,
   c. Industrial process supply,
   d. Industrial service supply.

5. The Board has notified the discharger and interested agencies and persons of its intent to prescribe waste discharge requirements.

6. The Board, in a public meeting, heard and considered all comments pertaining to the discharge.

IT IS HEREBY ORDERED that the discharger shall comply with the following:

A. Discharge Requirements

1. The industrial wastes as described in Finding 2.a., above, shall meet the following limitations:

Therefore, a time schedule to comply with the total chromium limitation by July 1, 1977, is also included in this order.

This order also contains incremental limitations to assure that there are no unreasonable increases in these constituents above the water supplies.

Compliance with these requirements should be adequate to protect the beneficial uses of the Riverside Groundwater Basin.

RECOMMENDATION:

Adopt Order No. 76-78 as presented.

California Regional Water Quality Control Board
Santa Ana Region

ORDER NO. 78-27

Waste Discharge Requirements
for
Riverside Cement Company
Riverside County

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Board), finds that:

1. On July 9, 1976, the Board adopted Order No. 76-78, which prescribes requirements for the discharge of industrial and sanitary wastes from Riverside Cement Company (hereinafter discharger).

2. Order No. 76-78, as amended, prohibits the discharge of sanitary wastes to septic tank-subsurface disposal systems after July 1, 1978.

3. To eliminate the discharge to septic tanks, the discharger has proposed to treat the sanitary wastes by a package biological treatment plant prior to discharging to subsurface disposal systems. Due to equipment delivery problems, the treatment plant will not be operational until approximately June 30, 1978.

4. The discharger filed a revised report of waste discharge, dated November 4, 1977, for this proposed material change in the discharge.

5. The discharger proposes to discharge approximately 13,000 gallons per day (49 m^3/day) of treated sanitary wastes to a subsurface disposal system.

6. The discharger discharges the following industrial wastes:

   a. 1.75 MGD (6,600 m^3/day) of industrial wastes pumped from the company's limestone mine to the West Riverside Canal;

   b. 5,000 gallons per month (19 m^3/month) of highly mineralized boiler blowdown and water softener regeneration wastes to an impervious facility.

7. A Water Quality Control Plan was adopted by the Board on April 11, 1975. The Plan contains water quality objectives and beneficial uses of waters in the Santa Ana Region.

8. The discharges are tributary to the Riverside Groundwater Subbasin, the beneficial uses of which include:

a. Municipal and domestic supply,
b. Agricultural supply,
c. Industrial process supply,
d. Industrial service supply.

9. These requirements are necessary to implement the Water Quality Control Plan.

10. These waste discharge requirements provide only minor revisions to the requirements which have been previously adopted for an existing facility and, as such, are exempt from the provisions of the California Environmental Quality Act (Public Resources Code 21000 et seq.) in accordance with Section 15101, Chapter 3, Title 14, California Administrative Code.

11. The Board has notified the discharger and interested agencies and persons of its intent to prescribe waste discharge requirements.

12. The Board, in a public meeting, heard and considered all comments pertaining to the discharge.

IT IS HEREBY ORDERED that the discharger shall comply with the following:

A. Discharge Specifications

1. a. The discharge of either industrial or sanitary wastes in excess of the following limits is prohibited:

Constituent	Average Concentration
Filtrable Residue	600 mg/l
Sodium	70 "
Chloride	90 "
Sulfate	105 "
Boron	0.5 "
Fluoride	1.0 "
Total Chromium	0.05 "
Phenolic Material	0.01 "

1. b. The discharge of either industrial or sanitary wastes shall not contain concentrations of any of the below named constituents which exceed the concentration of the same constituent in the water supply by more that the following values:

Constituent	Average Increment
Filtrable Residue	230 mg/l
Chloride	55 "

For Discharge Specifications 1.a. and 1.b., whichever limitation results in the lower concentration shall be controlling.

1. c. The discharge of sanitary wastes in excess of the following limits is prohibited:

Constituent	Average Concentration
BOD	30 mg/l
Suspended Solids	30 "
Ammonia	15 "

2. The discharge of highly mineralized wastes, such as water treatment brines and boiler blowdown, to waters of the State is prohibited.

3. The discharge to any saline waste storage facility which has less than 12 inches (31 cm) of freeboard is prohibited.

B. Provisions

1. The discharger shall comply with Monitoring and Reporting Program No. 78-27.

2. This order includes the "General Monitoring and Reporting Provisions."

3. Neither the treatment nor the discharge of wastes shall cause a nuisance or a pollution, as defined in the California Water Code.

4. The discharge of treated sanitary wastes shall be maintained below the surface of the ground.

5. Compliance with Discharge Specifications A.1.a., A.1.b., and A.1.c. shall be based on the arithmetic average of the last three (3) consecutive samples.

6. The use of septic tank-subsurface disposal systems for the discharge of sanitary wastes is prohibited after July 1, 1978.

7. The discharger shall comply with the following time schedule to assure compliance with Discharge Specification A.1.c.:

Task	Completion Date	Report of Compliance Due
Status Report	4/1/78	4/15/78
Full Compliance	7/1/78	7/15/78

Daniel L. Wong, Site Leader
Bechtel Environmental , Inc.
P.O. Box 193965
San Francisco, CA 94119-3965

RIVERSIDE CEMENT CO.

Dear Mr. Wong:

I have received your June 22, 1994 letter and attached draft contact report concerning our May 31, 1994 telephone conversation. It should be noted that Santa Ana Regional Water Quality Control Board staff is not currently considering increasing its activity at this site. I have modified the draft contact report accordingly, which I have signed and enclosed.

In addition to its regulation of the site's waste water treatment plant, Board staff is also currently involved with closure of a former brine evaporation pond and with above-ground storage tank (AGT) containment and soil contamination issues at the facility.

If you have any questions concerning the brine pond or AGT, please contact Dixie B. Lass, chief of the Board's Land Disposal Section, at (909) 782-3295. Other questions should be directed to me at (909) 782-3234.

Sincerely,

Mark G. Adelson

BEI PERSON MAKING CONTACT: Daniel L. Wong DLW		DATE: 5/31/94
SUBJECT: Regulatory Involvement		
SITE NAME: Riverside Cement Co.	EPA ID: CAD 063844443	

DISCUSSION:

Mr. Adelson stated that the RWQCB ~~has no intention of~~ is not currently considering increasing its involvement with the Riverside Cement Co. site. Currently, the site permit to discharge water from its wastewater treatment plant is the primary focus of the RWQCB.

Mr. Adelson knows of environmental reports that have been generated for the Jensen Quarry, a plant formerly operated by the Riverside Cement Co. However, these reports did not cite concerns to prompt any RWQCB action.

SUBJECT: Crestmore Brine Pond Closure

After a long of long and hard work by Crestmore Plant personnel, this area has received a closure, according to the letter attached from California Regional Water Quality Control Board, Santa Ana Region's Ann Sturdivant. You may have already received this, but wanted to make sure you had this information.

We are still awaiting closure notification of the Crestmore kiln dust dump from Ms. Sturdivant.

APPROVAL OF CLOSURE REPORT AND CERTIFICATION OF CLOSURE, BOILER BLOWDOWN DISPOSAL POND, LOCATED AT: RIVERSIDE CEMENT COMPANY, 1500 RUBIDOUX BOULEVARD, RIVERSIDE, CALIFORNIA

Dear Mr. Smith:

The closure report for the former boiler blowdown disposal pond at the above-referenced Riverside Cement Company facility is hereby approved. Closure of the former pond is complete.

The former pond area now serves as a lined, secondary containment basin for the aboveground storage tank containing fuel oil for the cement kilns. Our staff will continue to conduct routine inspections of the aboveground tank, its appurtenances, and the secondary containment area.

As a reminder, you are required to submit a revised Spill Prevention Control and Countermeasure Plan (SPCC) for the aboveground storage tank. The location of the dewatering sump should be shown on the map in the SPCC, and you must include a description of the sump clean-out procedures to be implemented in the event of a spill or leak.

Thank you for your cooperation throughout the closure project. If you have any questions or comments regarding this letter, you may contact me at (909) 782-4904.

Sincerely,

Ann E. Sturdivant

Riverside, CA. 92507-2409

Dear Ms. Sturdivant:

Referencing our phone conversation on May 11, 1995 I will give some detail regarding our proposal to blending the Brine Pond materials with our product.

Basically the manufacturing process for Portland cement manufacture is very forgiving, in spite of being a series of complex chemical combinations. Our proposal entails the blending of the Brine Pond soils with other ingredients indigenous to Portland cement i.e., clinker, gypsum, limestone, plant spills, etc. The spoils would be intermixed prior to the finish grinding stage of production, resulting in the chemical matrix common to our products. When used in concrete applications, this material will be encapsulated into a cementicious product which would harden upon drying, and be impervious to attack or leach ability. ONE WORD

During the logistics of performing this task, Riverside Cement would leave the covered piles where there at and haul bucket loads, as needed, to blend with our grey cement clinker. Production would record in the shift supervisor's log the number of buckets taken and date used. They ARE

Presently Riverside Cement blends in all clean-up from the plant in with our grey cement clinker. We estimate it would take two (2) months to use up the approximate 535 tons of material.

The material from the Brine Pond Project would not have a negative effect on the cements produced with its use.

This is a logical way to reuse this material and is ecologically sound as it saves landfill space.

If you have any questions, please contact me at (909) 683-3660.

Respectfully,

Dennis Smith

Dear Ann:

On Thursday, February 23, 1995 when the contractor opened the crate with the liner for the containment area, he found that the manufacture had shipped a 45 mil. liner instead of a 60 mil liner, as specified by the Closure Plan.

It will take an additional 4-6 weeks to get the correct liner, as the liner is cut to size at the factory.

Rather than hold up the job for another 4-6 weeks, can we go ahead and install the 45 mil liner in place of the 60 mil liner?

An addendum to the Closure Plan would be made when we completed the project, spelling out the change and reasons for it.

We will finish putting the layer of clay in the containment area on Friday, February 24, 1995, and with your permission, could start putting the liner in the containment area and cover with 4" of sand and the specified 2" of gunnite cover material.

Please contact me regarding your thoughts relating to substituting the 45 mil liner from the 60 mil liner. You can reach me at (909) 684-7850 or Pat Hill at (909) 683-3660 ext. 268.

Riverside, CA. 92507

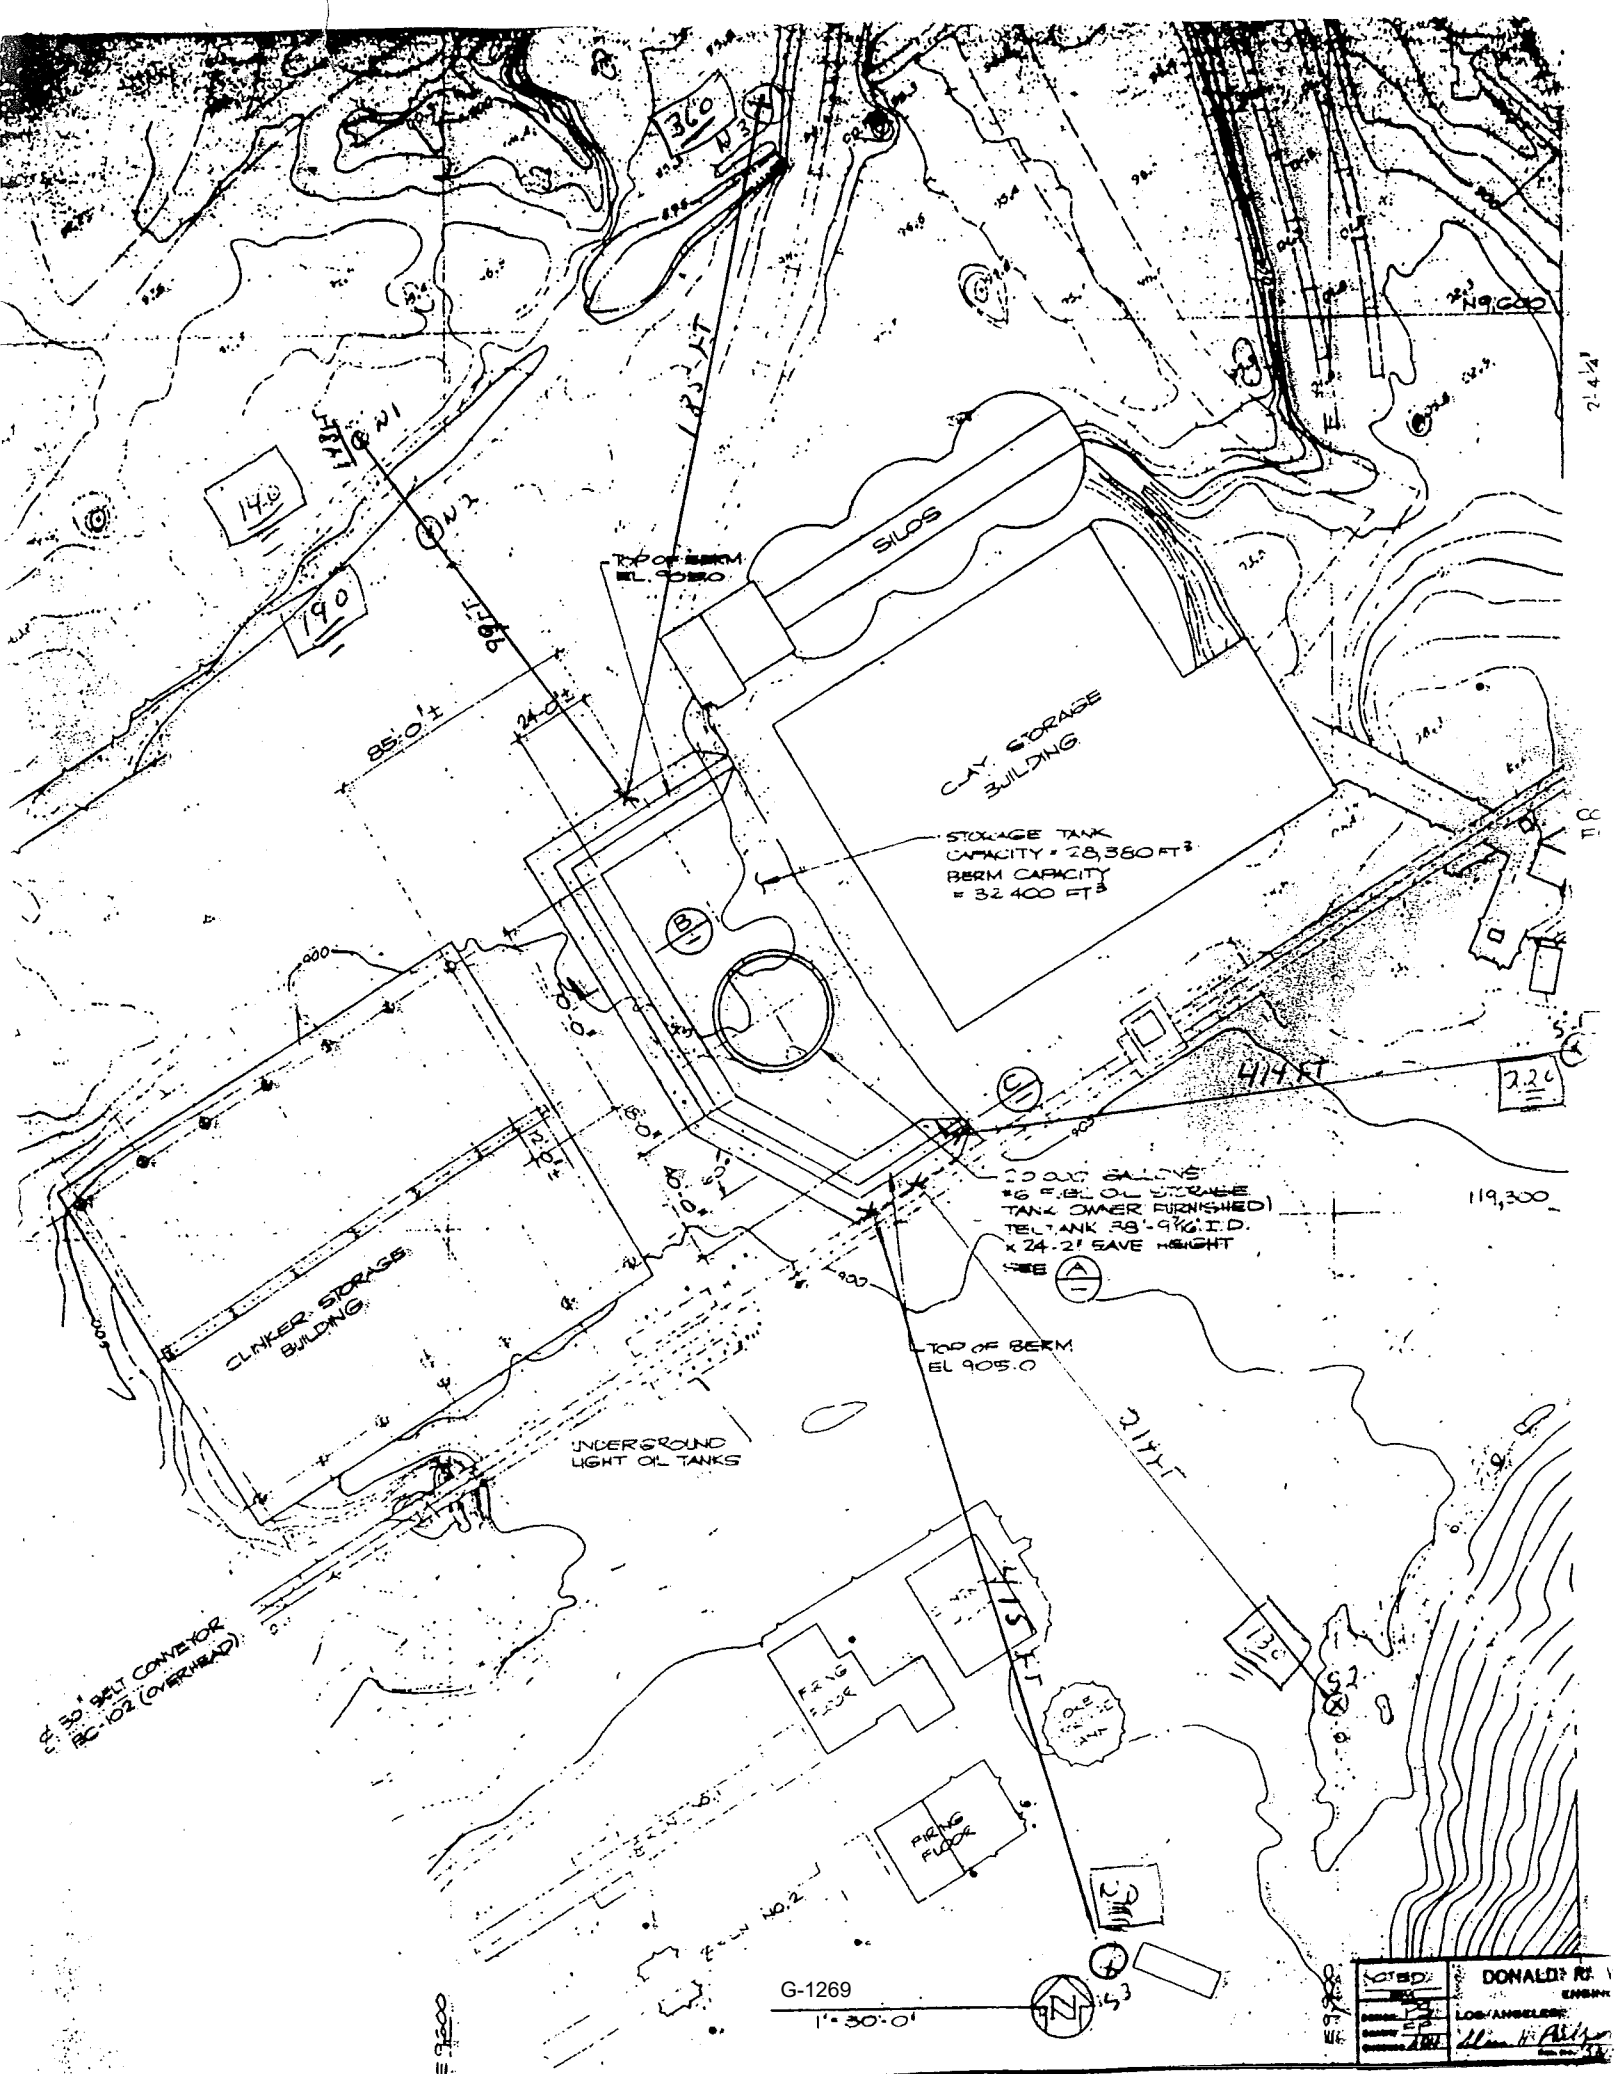
Dear Ann:

On January 23, 1995 we did 6 background tests. This was due to a background sample we took on January 4, 1995, Sample #5 which had a high reading of 3,500 (umhos/cm). The sample was taken approximately 300 ft. southeast of the tank berm, at the edge of the asphalt road.

The 6 samples taken for conductivity were 3 samples taken north and northeast of berm, and 3 samples taken southeast, south and southwest of the berm. Due to the concrete slab north of the berm, the lst hole (N1) was 148 ft. from berm and tested at 140 (umhos/cm), the second hole (N2) was 99 ft. from berm and tested 190 (umhos/cm), the third hole (N3) was 185 ft. northeast of berm and tested at 360 (umhos/cm).

Due to the asphalt road by the berm, the 3 samples taken were further away. The first hole (S-1) was 414 ft. southeast of the berm and tested at 220 (umhos/cm), the second hole (S-2) was 214 ft. south of berm and tested 130 (umhos/cm), and the third hole was 415 ft. southwest of the berm and tested **ND.** Note: See attached map and test results.

The test sample (#5) taken on January 4, 1995 is located between samples S-1 and S-2 taken on January 23, 1995. That area had been dug-up to replace the manifold valves for our plant well and was backfilled with sand, from our Smith Sand Quarry.



Original sampling taken on December 28, 1994 inside Brine Pond averaged 5,350 (umhos/cm) per hole. After removing soil from Brine Pond Area and finding the concrete slab, the average sampling taken on January 4, 1995 per is hole is 1,850 (umhos/cm).

In summary, based on the background sample taken on January 23, 1995 showing no contamination and with the concrete slab, we found under the Brine Pond. We would like to go ahead and cap the Brine Pond Area, rather than break through the concrete possibly contaminating the ground under the concrete.

SUBJECT: Closure Plan for the Cement Kiln Dust Disposal Area and the Boiler Blowdown Pond at the Riverside Cement Company Crestmore Facility in Riverside, California.

Dear Mr. Adelson:

We have completed a thorough study of plant areas and present the enclosed Closure Plan for the cement kiln dust (CKD) disposal area and the former boiler blowdown pond. The Closure Plan was done after careful selection by ERM-West Inc. We feel they have done a very thorough plan.

In accordance with the provisions of CAC Title 23, Chapter 3, Subchapter 15, the CLosure Plan describes the activities which will be conducted at the Crestmore facility to close the CKD disposal areas and to excavate and cover the boiler blowdown pond. The Closure Plan also describes the post-closure maintenance of the closure areas and use of the land, particularly as it applies to planned future mining and milling operations.

We look forward to discussing this closure with you in the near future. If you have any questions please call Pat Hill or myself at 714/683-3660.

Sincerely,

Gene Kulesza lm

Diamond Bar, CA 91765

SUBJECT: Crestmore Facility - 2nd Draft of Closure Plan for Cement Kiln Dust and Boiler Blowdown Pond

Dear Gene:

Enclosed are three copies of the subject closure plan. We have incorporated Riverside Cement's and Pat Cafferty's comments. This 2nd draft is substantially different than the first. The result is a shorter, more concise plan.

Substantial changes were made in the following areas:

1. Groundwater (Section 1, pages 2 through 4) - The section is now more complete, descriptive, and informative. It may border on being too technical, however, it sets the stage for our conclusion that no water degradation has occurred onsite.

2. Cement kiln dust and pond disposal areas are now separate paragraphs within Section 1.

3. The cover material for the cement kiln dust areas is now a continuation of the overburden material that has been placed on top of the CKD area north of Sky Blue Hill. We have eliminated clay from this portion of the project.

   The justification is that the reaction of the CKD with water creates a cementitious type material that is impervious to water penetration. Soil cover provides aesthetic as well as structural protection of the top CKD layer. We can take the position that this soil/CKD system is equivalent to the intent of Subchapter 15 capping and covering requirements. The RWQCB may argue differently, however, the covering system described in the plan is a good starting position.

An affiliate of The Environmental Resources Management Group with offices worldwide

The ERM Group®

4. We have eliminated the cost section from the report. Pat Cafferty believes that the financial issues can be described in the cover letter to the RWQCB.

5. We have eliminated the post-closure groundwater monitoring variance request. In discussion with Pat Cafferty, he recommended that we take a strong position that the groundwater has not been impacted (i.e. our revision and expansion of the groundwater portion of the report - Section 1) and that by inference we are not going to monitor groundwater in the future because there is no need for the monitoring.

6. We have renumbered the Appendixes. Essentially, Appendix A and B have been interchanged from the first draft.

We hope this 2nd draft meets Riverside Cement's needs. Please call if you have any questions or require further information.

Sincerely,

ERM-WEST

TRANSMITTAL OF ADOPTED ORDER

At the regular Board meeting held on May 29, 1998, the Regional Board adopted Order No. 98-77, a blanket order rescinding waste discharge requirements for eleven facilities located in San Bernardino, Orange and Riverside counties. Orders for these specific facilities were rescinded because the facilities are no longer in operation, the discharges from the facilities have ceased, the ownership of the facilities has changed or because discharges from the facilities have no significant impact on the quality of waters of the Region.

A copy of the order is enclosed for your records. To ascertain the specifics related to each individual facility, please refer to Attachment "A" of the order.

Sincerely,

GERARD J. THIBEAULT

RESCISSION OF WASTE DISCHARGE REQUIREMENTS AND WASTEWATER RECLAMATION REQUIREMENTS FOR SPECIFIC FACILITIES, ORDER NO. 98-77

Ladies and Gentlemen:

Enclosed is a copy of tentative Order No. 98-77, which is a blanket order rescinding waste discharge requirements for specific dischargers. The requirements for the dischargers and reclaimed water users listed in Attachment "A" were adopted by the Board at various times. Rescission of these requirements is being considered because the facilities are no longer in operation, discharges from the facilities have no significant impact on the quality of waters in the area, discharges from the facilities have been eliminated, the facilities no longer use reclaimed water, or the facilities are regulated under other waste discharge requirements.

This order is scheduled for consideration by the Board at the May 29, 1998 meeting. Please provide any comments that you may have to this office by May 8, 1998.

If you have any questions, please contact Jawed Shami at (909) 782-3288.

Sincerely,

Joanne E. Schneider
Environmental Program Manager

RESCISSION OF WASTE DISCHARGE REQUIREMENTS FOR SPECIFIC FACILITIES, ORDER NO. 98-77

Dear Mr. Ball:

Enclosed is a copy of tentative Order No. 98-77, which is a blanket order rescinding several waste discharge requirements, including those for Riverside Cement Company (Order No. 78-27). Order No. 78-27 is being rescinded because the discharge from your facility poses an insignificant threat to water quality.

This order is scheduled for consideration by the Regional Board at the May 29, 1998 meeting. Please submit any comments that you may have to this office by May 8, 1998.

If you have any questions, please contact Jawed Shami at (909) 782-3288.

Sincerely,

Joanne E. Schneider

ORDER NO. 98-77

Rescission of Waste Discharge Requirements and Wastewater Reclamation Requirements
for
Specific Facilities

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Board), finds that:

1. The orders listed in Attachment "A" were issued by the Board at various times for the facilities described therein. Attachment "A" is hereby made a part of this order.

2. Waste discharge requirements and wastewater reclamation requirements for the facilities listed in Attachment "A" are no longer necessary because the facilities are no longer in operation, discharges from the facilities have no significant impact on the quality of waters in the area, discharges from the facilities have been eliminated, the facilities no longer use reclaimed water, or the facilities are regulated under other waste discharge requirements.

3. This action is based on the cessation of discharges of waste, which poses no significant adverse impact on the environment, or on the finding that specific discharges have no significant environmental impacts. As such, this action is exempt from the requirements of the California Environmental Quality Act in accordance with Section 15061 (b) (3), Chapter 3, Title 14 of the California Code of Regulations.

4. The Board has notified the dischargers and interested agencies and persons of its intent to rescind waste discharge requirements for the facilities listed in Attachment "A", and has provided them with an opportunity to submit written comments and recommendations.

5. The Board, in a public meeting, heard and considered all comments pertaining to the rescission of waste discharge requirements.

IT IS HEREBY ORDERED that the orders listed in Attachment "A" be rescinded.

I, Gerard J. Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on May 29, 1998.

Gerard J. Thibeault
Executive officer

TENTATIVE

California Regional Water Quality Control Board
Santa Ana Region

May 29, 1998

Staff Report

ITEM:

SUBJECT: Rescission of Waste Discharge Requirements and Wastewater Reclamation Requirements for specific facilities, Order No. 98-77

DISCUSSION:

Waste discharge requirements and wastewater reclamation requirements for the facilities listed in Attachment "A" of Order No. 98-77 are no longer necessary because the facilities are no longer in operation, discharges from the facilities have no significant impact on the quality of waters in the area, discharges from the facilities have been eliminated, the facilities no longer use reclaimed water, or the facilities are regulated under other waste discharge requirements.

RECOMMENDATION:

Adopt Order No. 98-77, as presented.

In addition to the dischargers listed in Attachment "A", comments were solicited from the following agencies:

State Water Resources Control Board, Office of the Chief Counsel, Ted Cobb
State Water Resources Control Board - John Youngerman
State Department of Water Resources - Glendale
State Department of Health Services - San Bernardino, Kalyanpur Baliga
State Department of Health Services - San Diego, Toby Roy
San Bernardino County Department of Environmental Health Services- Pam Bennett
San Bernardino County Transportation/Flood Control District - Ken Guidry
Riverside County Department of Health - John Silva

1.0 INTRODUCTION

Cal Tank Testing and Repair Company (CTT) completed all work and furnished all labor, materials, tools, equipment, and services necessary to properly remove two underground storage tanks (UST's) on property operated by Riverside Cement Company in Riverside, California (Plate I). Plates 2 and 3 show where the tanks were located on the site. Removal procedures were conducted in accordance with applicable requirements stipulated by the Riverside County Department of Health, Environmental Health Division.

Tank-removal field work initiated on March 3, 1988, and was completed by March 4, 1988. Appropriate removal and disposal permits were obtained and approved by Riverside County, prior to initiating the field work. Overall project management was provided by CTT. Tank-cleaning was provided by Kal-Vac Liquid Waste Removal of Whittier, California, and haul-off services were provided by American Metal Recycling, Inc., of Ontario, California. Soil sampling and environmental services (i.e., final report generation) were provided by LOK Environmental, Inc., of Ventura, California. Copies of pertinent documentation including permits, notifications, receipts, and manifests are provided in Appendix A.

The contents of this report include a description of the procedures followed for the removal of the UST's. Field observations and results of laboratory analysis for tank excavation and soil samples are also described. A discussion of the project findings and interpretations is included at the end of the report along with recommendations for potential followup work.

2.0 TANK-SITE DESCRIPTION

The site is located on the east side of Rubidoux Blvd., south of El Rivino Road in Riverside County, just south of the San Bernardino/Riverside County line (Plate 1). Access to the site was via Rubidoux Blvd. onto the Riverside Cement Company facility at 1500 Rubidoux Road, Riverside, California.

Two tank sites were involved in removal. One tank was located south of the crane parking building (Plate 2). This 550-gallon tank (approximately 4'x6') was of single-walled steel construction. According to site records, the tank was manufactured in July 1976. Since installation, the tank was used for waste-oil storage. Additional site-specific information and tank characteristics are detailed on Plate 2. The top of the tank was located approximately 4-feet below ground surface. The bottom of the tank was 8-feet below grade.

The subsurface geologic conditions that characterize the soils surrounding the waste-oil tank consist of two different soil units. Below a two-foot thick, gravelly-sand backfill unit at the surface, the soils consist of a fine-grained, yellowish-brown sand that extends from 3-feet to more than 8-feet below grade at the site (see Soil Profile in Appendix B).

The other tank was located west of the boiler building (Plate 3). This 10,000-gallon tank (approximately 8'x27') was of single-walled steel construction. This tank was used for storage and dispensing of diesel to support fueling of Riverside Cement Company operations. Exact age of this tank is unknown. Additional site-specific information and tank characteristics are detailed on Plate 3.

The top of the boiler building tank was located 3-feet below ground surface. The ground is comprised of gravelly-sand fill material that occupies the remainder of the local facility yard. The bottom of the tank was 11 feet below grade within this fill material. A hard bedrock unit was encountered at less than one foot below tank bottom level (i.e., approximately 11.5 feet below grade).

3.0 TANK REMOVAL PROCEDURES

3.1 Access Tanks For Liftout

A backhoe was used to expose the top of both tanks and to excavate soils on the sides of the tank. All product piping lines associated with both UST's were disconnected and removed. Other

tank fixtures, if present, including the fill pipes, gauge pipes, and vapor-recovery truck connections were also disconnected and removed.

3.2 Empty Tanks Of Product

As much of the tank contents as possible were emptied by hand-held suction hose in the UST's by the use of a vacuum truck. Cleaning out the tank interior was limited to tank-top openings, too small to permit worker entry. Required safety precautions were maintained at all times to ensure a safe-working environment (i.e., protective clothing, gloves, boots, etc.).

The tank underwent a cleansing, flushing, and triple-rinsing procedure using a cleaning agent that helped neutralize tank interior walls and was then flushed with a high-pressure water spray capable of rinsing down the product. The rinseate was transferred to vacuum truck and transported off site by Kal-Vac. The process for the cleaning and rinsing of the tanks was inspected by Mr. Joseph Asbury, Hazardous Materials Specialist with the Environmental Health Division of Riverside County.

3.3 Purging

The tank atmosphere was purged of flammable vapors with dry ice (solid carbon dioxide) for on-site inerting of tank prior to removal from the site. A minimum of 15 pounds of dry ice per 1000 gallons of tank capacity was deposited through the tank openings. Approximately 20 pounds and 200 pounds of dry ice was inserted into the 550 gal. tank and 10,000 gal. tank, respectively. The dry ice was crushed and distributed evenly over the greatest possible area in the tanks to promote rapid evaporation. The dry ice was allowed to vaporize for a minimum of one hour to achieve sufficient venting of all tank vapors from the tanks. A combustible gas indicator was used to monitor vapor concentrations in the tanks and work areas to ensure that the atmosphere in each tank did not exceed 20 percent of the lower flammable limit.

3.4 Official Inspection/Approval

On-site inspection and approval to remove the tanks from the excavation/vault was conducted by Mr. Joseph Asbury. Mr. Asbury was present onsite on both the 3rd and 4th of March, 1988, to view the exposed tanks. Following physical inspection of the tank, Mr. Asbury approved the removal of both tanks after ensuring that proper vapor-purging procedures had been followed. Mr. Asbury was also present to witness tank liftouts and direct the acquisition of soil samples from beneath both tanks. Mr. Asbury thereafter approved the removal and transfer of the tanks from the sites.

3.5 Tank Liftout

The smaller tank (i.e., 550 gal.) was lifted out of the ground by cables attached to a backhoe. For the larger tank (i.e. 10,000 gal.), cables were attached to tank eyelets and the tank was lifted out of the excavation with a crane. Both tanks were placed on level ground and chocked with wood blocks to allow cleaning and visual inspection of the exterior walls. The tanks were always positioned with vent openings on the top to allow an escape route of possible residue vapors that may have accumulated.

3.6 Tank Disposal

The tanks were loaded and secured onto American Metal Recycling, Inc., trucks, manifested and hauled off for further cleaning and disposal, in accordance with all applicable local, state, and federal regulations. Each tank was transported off site the same day as removed from its excavation. The tanks were transported to American Metal Recycling, Inc., facilities at 2202 South Milliken Avenue, California, to be cut up for scrap. A "Certificate of Destruction" will be provided by American Metal Recycling, Inc., to the appropriate agencies to verify that proper disposal procedures were completed.

LOK/CT

3.7 Field Sampling

Soils were sampled beneath the tanks at locations as noted on Plates 2 and 3. Because the 550 gal. waste-oil tank was relatively small, only the soils from beneath tank center were required to be sampled at two- and five-feet depths (Plate 2). For the tank at the boiler building locality, Mr. Asbury directed that two discrete soil samples be collected from the two- and six-feet intervals below and near the ends of the 10,000 gal. tank (Plate 3). However, only three soil samples were collected beneath this tank since hard bedrock material precluded the acquisition of any soil samples deeper than 2.5 feet below tank bottom.

All soil samples were contained in glass sample jars with teflon-lined lids. Once collected, these samples were immediately capped, sealed, and labeled. All samples were placed in a chilled ice chest for subsequent shipment to a certified laboratory for analysis. Sample collection and site monitoring were completed under the guidance of Mr. David H. Klise, R.G, LOK Environmental, Inc., of Ventura, California. The samples are identified as follows:

Sample #	Sample Point (See Plates 2 and 3)
S-01-02	2' below tank bottom: tank center
S-01-05	5' below tank bottom: tank center
S-02-02	2' below tank bottom: north end of tank
S-03-02	2' below tank bottom: south end of tank
S-03-06	2.5' below tank bottom: south end of tank

The samples were shipped to Chemical Research Laboratories (CRL), Santa Maria, California, via overnight delivery. Appropriate chain of custody forms were filled out and accompanied the samples to the lab. Completed chain of custody forms are provided in Appendix C.

3.8 Tank Excavation Backfill

Following tank removal and sampling of soils beneath the 550 gal. waste-oil tank, the excavation soils were replaced into the excavation hole. Additional soils (i.e., clean-fill dirt) were

delivered to the site as replacement for the former volume occupied by the 550-gal. tank. This amounted to about 4 cubic yards. The backfill material was recompacted to relative compaction of 90 per cent. The site was completed by leveling to existing grade within the facility yard.

4.0 RESULTS

Once both tanks at each locality were clear of their respective excavations, the tank exteriors were cleaned and visually inspected. No corrosion holes were observed in either of the tank shells.

All soil samples were analyzed for Total Petroleum Hydrocarbons (TPH) by EPA Method 418.1 by IR per the direction of Environmental Health Division of Riverside County. In addition, the two samples from below the 550 gal. waste-oil tank at the crane parking locality were analyzed for total lead content by EPA Method 7421.

The laboratory analyses show that all soil samples contained detectable concentrations of petroleum hydrocarbons. The concentrations, in mg/kg (ppm) range from 57 to 1000 ppm for soils below the waste-oil tank and from 34 to 15,000 ppm for soils below the diesel tank. Concentrations of lead in the two samples from beneath the waste-oil tank were 0.9 ppm and 3.3 ppm in the two-and five-feet samples,respectively. Verbal reporting of these results was relayed to Mr. Joseph Asbury via telephone on 3/15/88. Hard copy reports of the laboratory analyses are provided in Appendix D.

5.0 DISCUSSION and CONCLUSIONS

Laboratory analyses of the soil samples taken from below both of the removed underground storage tanks at the Riverside Cement Company facility show evidence of petroleum-substance contamination. However, visual evidence of contamination or spillage of tank-storage product was not readily apparent in the soils removed from either tank excavation. Only a moderately strong petroliferous odor was noticed from soils about the fill pipe area at

C1291

the north end of the 10,000 gal. diesel tank. Both tank systems appear to have maintained integrity throughout use history as no corrosion holes were observed in either of the tank sides. Thus, evidence of petroleum-substance presence in the soils is apparently the result of either piping leaks, surface spillage, or overfill leakage that occurred while the tank systems were in operation.

6.0 RECOMMENDATIONS

1. A site assessment investigation is recommended for the two tank-removal localities near the areas of the crane parking and boiler buildings. Further testing of the soils by organic vapor-sensing instruments (e.g., Photovac TIP , HNU-PID, OVA) would help delineate and isolate the presence or non-presence of product plumes in the overburden soils above bedrock.

2. It is recommended that excavated soils containing suspected hydrocarbon components be treated, stored, and disposed by utilizing onsite facility equipment used in the cement manufacturing process. This could include incorporation of the material into the manufactured product by controlled heat applications in the onsite kilns.

3. Additional soil sampling collection by drilling methods is recommended to explore those localities where deeper product migration may be suspected (i.e., those subsurface depths beyond the practical limitation of reach for conventional excavation equipment). If, for example, product plumes are discovered at depths of greater than 20 to 30 feet below ground surface, then alternate means of remediation would be recommended.

4. It is recommended that a finalized copy of this report be submitted to the Riverside County Department of Health - Environmental Health Division to attain compliance with local tank-removal regulations.

CT

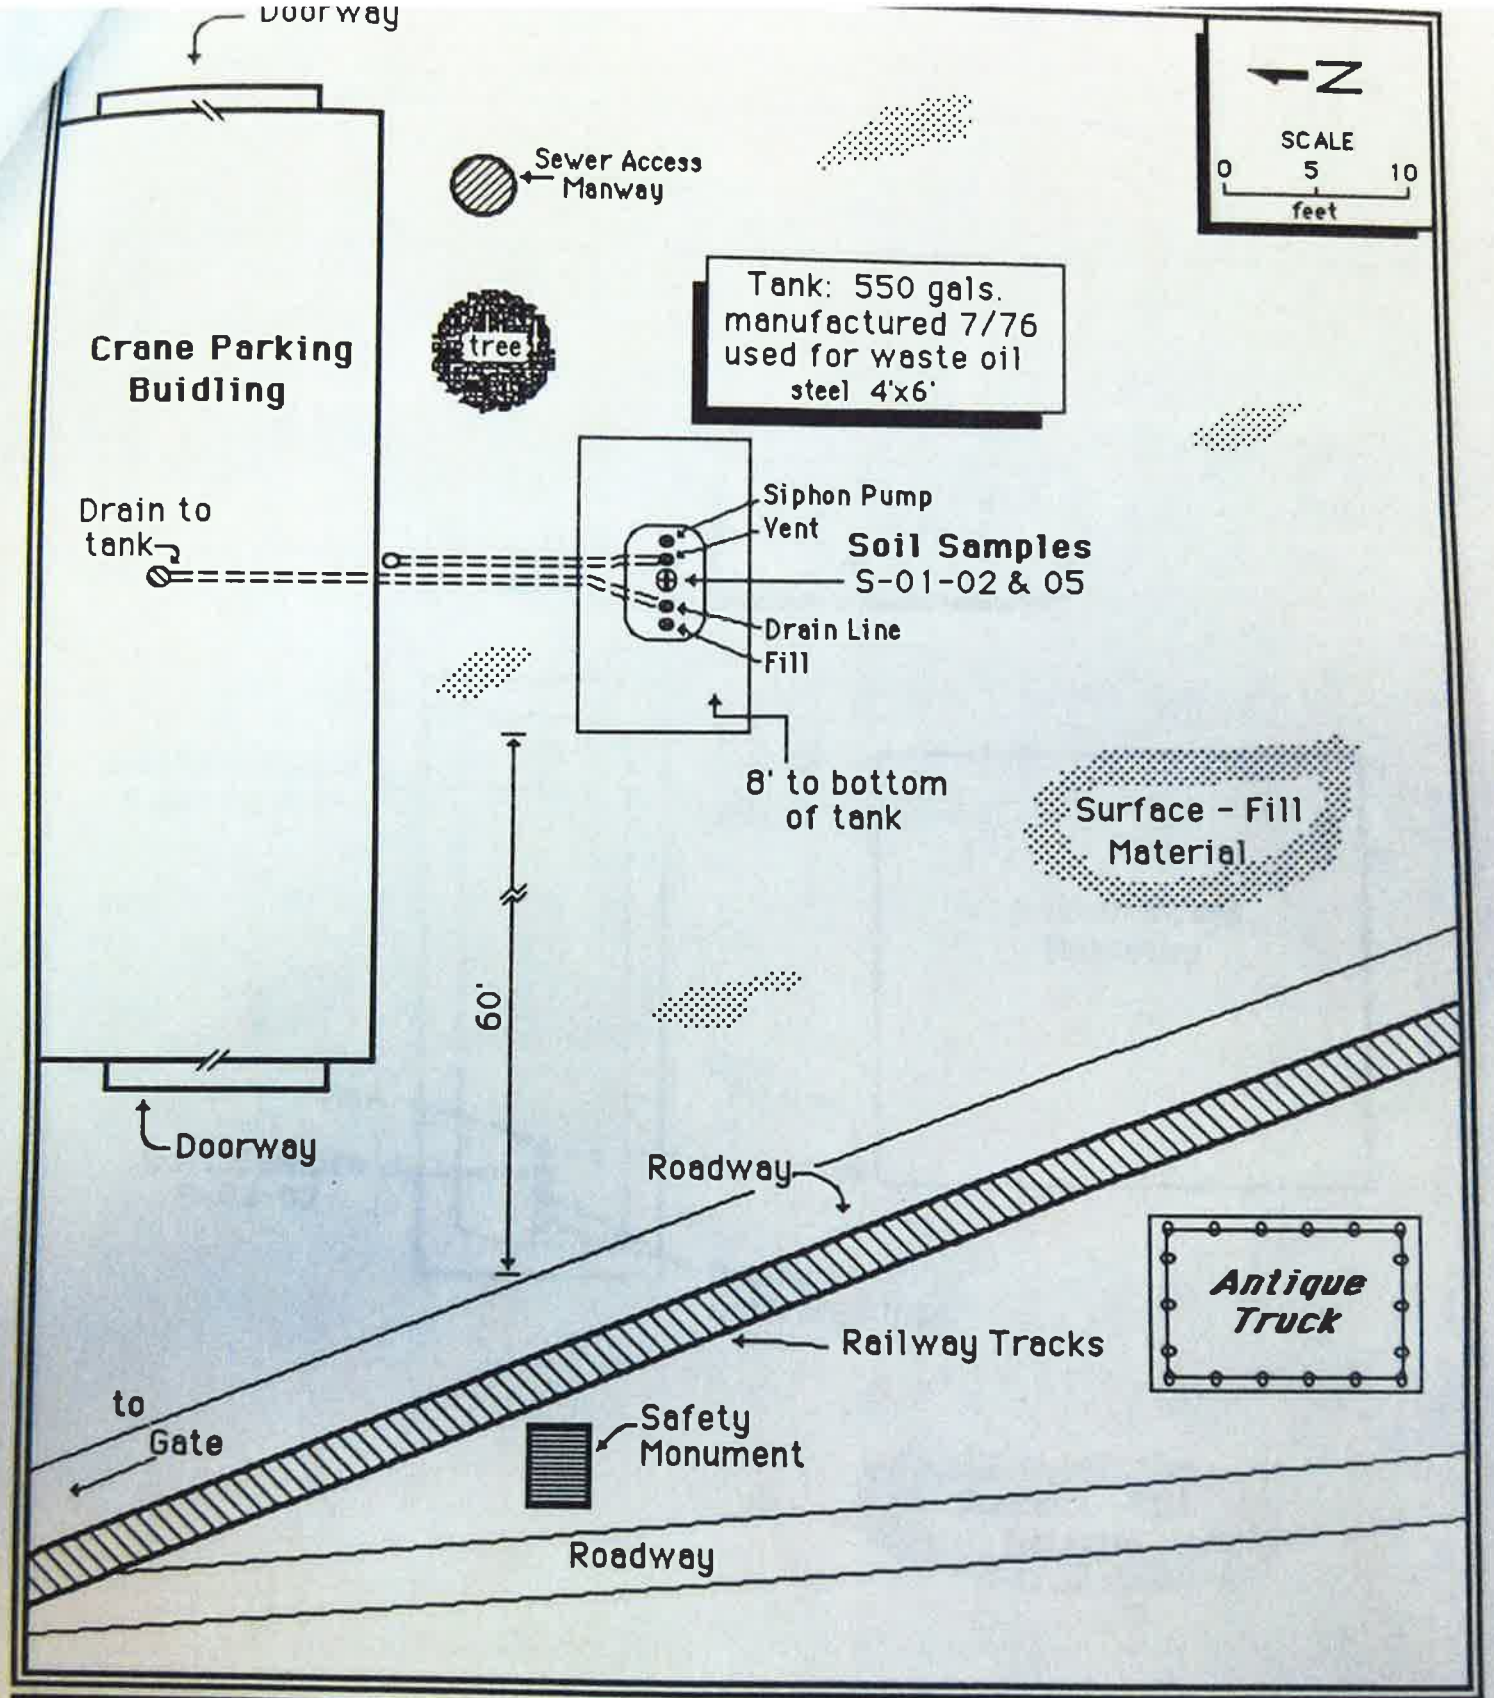
7.0 LIMITATIONS

This report has limitations, and as such, it should not be construed that all possible site conditions were identified. It should be recognized that there is no guarantee this study has covered all possible environmental issues at the sites. A more detailed environmental investigation is warranted, if potential future liability is of concern.

The standard of services performed by CTT was conducted in a manner consistent with the level of care and skill ordinarily exercised by the industry operating under similar conditions in the State of California. No other warranty is expressed or implied.

CTT looks forward to working with Riverside Cement Company on any continuation of this project and future projects. If we can provide additional services or information, please contact us.

Sincerely,



Cal Tank Testing

Attn: Mr. Joe Ashbury

Subject: Investigation of excavation soils beneath two tank-removal localities at the Riverside Cement Company in the County of Riverside.

Dear Mr. Ashbury:

In early March of 1988, Cal Tank Testing and Repair Company (CTT) in conjunction with LOK Environmental, Inc., followed applicable closure procedures to properly remove two underground storage tanks (UST's) located at the Riverside Cement Company facility in the County of Riverside (Plate 1). Your in-house reference to this work can be found in the previously-submitted report entitled "Final Report - Removal of Storage Tanks - Riverside Cement Company Facility - Riverside, California", dated March, 1988 as numbered project P-1149-88. In brief, laboratory analysis of below-tank soils from both excavations initially revealed the presence of hydrocarbon concentrations. This reported finding prompted the verbal request by Mr. Joe Ashbury of Riverside Environmental Health Services that collecting and testing of additional soil samples would be required to better determine the extent and magnitude of hydrocarbon product in soils below the tank-removal localities. The contents in this letter report describe how and where the additional soil samples were collected and notifies Riverside Environmental Health Services of the latest laboratory-analyses results.

The first tank-removal locality is located near the crane-parking building (Plate 2). After the tank was removed, initial soil samples were collected at depth intervals of two and five feet below tank-bottom level. These sample intervals are equivalent to depths of 10 and 13 feet below grade level. The later follow-up sample was collected from a soil-depth interval of 15 feet below grade level (Plate 2). The chain of custody and laboratory analysis report for this sample are attached. All three soil samples were analyzed for Total Petroleum Hydrocarbons (TPH) and total lead by EPA methods 418.1 and 7421, respectively, as required for a tank-history content of waste oils. Analytical results of these samples are compiled in Table 1.

Table 1. Results of laboratory analysis for soils below tank-removal locality near crane-parking building.

Sample Number	Depth Interval	Date Sampled	Lead mg/kg	TPH mg/kg
S-01-02	10'	3/3/88	0.9	57
S-01-05	13'	3/3/88	3.3	1000
S-01-15A	**15'**	**4/8/88**	**1.9**	**27**

*Depth in feet below grade.
Follow-up sample in bold type.

The follow-up sample collected from sandy soils at a depth of 15 feet below grade level for the tank at the crane-building locality contained relatively low concentrations of TPH and lead. The earlier sample collected two feet above contained TPH concentrations of about two orders of magnitude greater. This rapid diminution in TPH concentrations within soils beneath the former tank locality suggests that extensive amounts of hydrocarbon components (i.e., waste oils) have not been released throughout the use history of this UST. That some TPH concentrations have been discovered in soils below this tank can probably be explained as the consequence of overfill occurrences and spillage while pumping out by vacuum truck for disposal of used oils.

The second tank-removal locality is located near the boiler building (Plate 3). After the tank was removed, initial soil samples were collected from two feet below the tank-bottom level at both the north and south ends of the tank. Another soil sample was also collected from 2.5 feet below tank-bottom level on the north end. As you may recall, deeper soil sampling was precluded by a hard lithofied layer at a depth of about 2.5 feet below the tank-bottom level at this site. Because of this, the later follow-up sample was taken from soils hollowed out atop the hard lithofied layer residing five feet farther north of the north tank end (Plate 3). The chain of custody and laboratory analysis report for this sample are attached. All samples from this tank-removal site locality were analyzed for TPH by EPA method 418.1 as required for a tank-history content of diesel fuel. Analytical results of these samples are compiled in Table 2.

LOK/CTT

Table 2. Results of laboratory analysis for soils below tank-removal locality near boiler building.

Sample Number	Depth Interval*	Date Sampled	Tank End	TPH mg/kg
S-02-02	13'	3/4/88	south	34
S-03-02	13'	3/4/88	north	15,000
S-03-06	13.5'	3/4/88	north	2,000
S-02-13N	**13'**	**4/8/88**	**north**	**18**

*Depth in feet below grade.
Follow-up sample in bold type.

Elevated levels of TPH in soils beneath the north end of the boiler-building tank are likely the result of overspill at times of tank refilling. Only lateral migration of this spilled product could ensue since the hard lithofied layer immediately below the tank prevented any deeper (i.e., vertical) product migration. However, lateral product migration appears to have been limited to soils within the proximity of the fill-tube situated near the north end of the boiler-building tank. Extensive concentrations of hydrocarbon product were not found at the follow-up soil-sample site, a distance of more than ten feet from the previous location of the fill-tube area of the tank (see Plate 3).

Comparison of the analytical laboratory results between the initial and follow-up samples of the soils below the two tank-removal localities indicate reduced hydrocarbon concentrations with increased distance from previous tank emplacements. This suggests that although some tank-system products at both localities had escaped to surrounding soils in the past, the amounts were probably not excessive. All excavated soils from both tank-removal localities were loaded into trucks and transported to the on-site temporary storage location for subsequent use in the manufacturing of Riverside Cement Company products.

The above information is based on the limited data derived from the work performed to date according to standard professional practice. Additional data may allow for reinterpretation of conditions. No other warranty is expressed or implied.

LOB/CTT

We hope the above information is satisfactory for your needs at the present time. If you have any questions or require additional information, please contact us.

Sincerely,

Cal Tank Testing & Repair Company

1.0 INTRODUCTION

A Leak Detection Program was completed by Cal Tank Testing and Repair Company (CTT) in conjunction with LOK Environmental, Inc., (LOK) for underground storage tanks (UST's) located at the Riverside Cement Company facility in Riverside County (Plate 1). The methods and procedures necessary to implement this program were performed under applicable requirements established by the County of Riverside, Environmental Health Department.

Tank-precision tests were first conducted to verify the current integrity of the UST systems prior to the initiation of the field investigation. Results of these latest tests indicate that the underground tanks have provided suitable storage. Specific details and data for the tank-precision tests have been previously submitted to the County of Riverside - Environmental Health Services. This test information along with the quantity, type, and contents of the underground storage-tank systems at the Riverside Cement Company facility is again provided for convenience in Appendix A.

The field investigation of subsurface soils adjacent to two separate UST localities on the premises of the facility was undertaken on the 13th & 14th of April, 1988. The work was authorized through Riverside Cement Company in February, 1988 under purchase-order number D-33926. The investigation was pre-approved in accordance with methods and procedures described in the Work Plan submitted by CTT/LOK to the Riverside County, Environmental Health Department.

Overall project management for field-data acquisition, construction of monitoring wells, and installation of an electronic-monitoring system was provided by CTT/LOK. Concrete work, outside electrical, and various tank-top plumbing modification services were completed by Cal Tank Testing and Repair of Visalia, California. Soil sampling and environmental services (i.e., field investigation, sample analysis, and report generation) were provided by LOK Environmental, Inc., of Ventura, California. Drilling services were performed by Drill-Line Division of Norwalk, California. The electronic monitoring devices were connected, calibrated, and started up by Advantage Services, Inc., of Fontana, California.

The contents of this report include a description of the field-exploration techniques used for on-site drilling and soil-sample collection. The geology and subsurface conditions encountered along with results of laboratory analyses are also discussed. In addition, tank modifications and standards for construction of the monitoring wells installed with continuous electronic-monitoring systems are described. The submittal of this report partially satisfies the compliance requirements of the County of Riverside - Environmental Health Services to operate underground storage tanks at the Riverside Cement Company facility.

2.0 FIELD-INVESTIGATION METHODS

2.1 Drilling Procedures

A mobile, trailer-mounted drill rig with 8-inch diameter, continuous-flight, hollow-stem auger was used to drill the exploratory borings. Prior to borehole drilling, all drill bits, auger flights, and associated down-hole equipment were steam cleaned to avoid potential cross-contamination between borings. Drill cuttings from both UST localities were loaded into trucks and transported to an on-site temporary storage location for subsequent use in the manufacturing of Riverside Cement Company products.

2.2 Soil-Sample Acquisition

Two exploratory borings were drilled to sample soils adjacent to and beneath the level of the gasoline-product tank. Plate 2 shows the location of these borings converted to monitoring wells with respect to tank position. Four exploratory borings were drilled about the perimeter of the two diesel-tank cluster at the White Plant. Plate 3 shows the location of these borings converted to monitoring wells with respect to the tank cluster. Soil samples were collected at 5-feet intervals in each exploratory boring, if possible. The samples were obtained utilizing a 2-inch diameter, split-barrel modified Sprague and Henwood (S&H) sampler driven by a 140-pound, down-hole hammer. All retained soil samples were collected in six-inch brass-sampling tubes, sealed with teflon-lined caps, and chilled in an ice chest to stabilize the chemical conditions within the samples. Each sample was labeled to correspond to both the exploratory boring and depth interval from which collected.

LOK/CTT

Soil samples were visually logged and described by the field geologist utilizing the Unified Soil Classification System (USCS). A complete description of the soils encountered in each borehole is presented on the final boring logs provided in Appendix B. A chart of the USCS is also included in Appendix B.

2.3 Quality Control

Precautions were taken in the field to minimize cross-contamination of the samples to insure precision and accuracy in the chemical analysis of soils destined for the laboratory. The soil sampler was steam-cleaned before use and between borings. The sampler was washed with TSP (Trisodium Phosphate) solution and then rinsed with clean tapwater between successive soil-sample attempts. Only clean, laboratory-washed, brass-sampling tubes were used for sample collection. An expanded version of the soil-sampling protocol and quality-control procedures is presented in Appendix C.

2.4 Sample Analyses

A total of 32 soil samples were recovered from the six soil borings. At the conclusion of the field work, all soil samples were delivered to Chemical Research Laboratories, Inc., (CRL) located in Ventura, California. The samples were accompanied by the appropriate Chain-of-Custody forms. Copies of the Chain-of-Custody forms completed for these samples are provided in Appendix D.

Two soil samples from each of the exploratory borings adjacent to the gasoline tank were analyzed for the presence of total petroleum hydrocarbons (TPH) as gasoline by California Department of Health Services method (i.e., EPA method 8015). Only those soils from sample-depth intervals of 15 feet and bottom of borehole were analyzed. The remaining soil samples were placed on hold, pending the outcome of test results of the two initial samples from each borehole. Similarly, only those soils from the 15-feet and bottom-hole sample intervals from each of the exploratory borings adjacent to the two-tank diesel cluster at the White Plant were analyzed. These soil samples were analyzed for TPH by EPA method 418.1 as required for a tank-content history of diesel fuel.

LOK/CTT

2.5 Monitoring Well Construction

Following completion of drilling and sampling, the six exploratory boreholes were completed as monitoring (detection) wells. The wells were constructed as vadose-zone monitoring wells. Only the construction standards for vadose-zone (vapor) monitoring wells are discussed in detail in this report since groundwater beneath the site was not encountered within the first 30 feet. The locations of the wells for the both tank localities are shown on Plates 2 & 3.

Wells were constructed with 2-inch diameter PVC well casing with flush-threaded joints. Well casing for the monitored interval consists of factory-perforated PVC well screen with 0.020-inch slot widths. Blank PVC casing was emplaced above the screened section. The ends of the well are capped by threaded and push-on end plugs. The annulus coincident to the perforated screen interval was packed with washed sand (Monterey grade #3) to prevent migration of native soil into the well. This filter pack extends from the bottom of the borehole to one foot above the top of the perforated casing. A two-feet thick bentonite seal (wetted bentonite pellets) was placed above the filter pack. The remaining annulus was filled to the surface with concrete. No solvent or casing cement was used in connecting casing sections. A diagram showing a vadose-monitoring well in relation to a tank in cross-sectional view is presented in Plate 4.

Wells are protected at ground surface with 14-inch diameter fill-rings with tamper-resistant steel lids raised 1 inch above grade and mounted in 3' 1" x 3' 1" concrete pad. The design of the surface protection will minimize flow of rainfall or surface runoff into the well. The construction design of the well-head completion is shown in Plate 5. Construction details specific to each well are graphically presented in the boring logs (Appendix B). Monitoring well information is also summarized in Table 2-1.

Each well will have an identification number permanently affixed to the installation. Further identification information such as well owner, depth of well, hole and casing diameters, and depth of a screened interval will be kept on file at an accessible office on the site.

Table 2-1. Monitoring well information, Riverside Cement Company,1500 Rubidoux Blvd., Riverside, California.

Well No. (type)	Total Depth	Screened Interval	Casing Diameter	Bentonite Seals	Geology	Date Drilled
MW-1* (vadose)	30'	5' - 25'	2"	2'-4'	Sand,Gravelley sand	4/13/88

* Interval from 25 to 30 feet backfilled (tremied) with cement/bentonite slurry in MW-1 and MW-3.

2.6 Electronic Monitoring System Installation

The continuous monitoring of the UST's at the facility is provided by the Tankgard electronic system. The system gives both visual and audible warnings of vapors given off by leaking products. Various sensor types are offered that detect vapors produced by gasoline, diesel, and organic solvents. Particular design features available for this system include the following:

- individual monitoring of each well.
- individual calibration ranging from 50 ppm to >1000 ppm for each well.
- ease of operation and a 24-hour leak-response technician available at tank-owner's option.
- ease of installation and expansion capability to meet changing needs.

The Tankgard leak detection system is designed for monitoring well applications and used to detect volatile-organic compounds that may escape to nearby soils around underground storage tanks. The system consists of one vapor-sensing probe per well that is directly wired to an on-site alarm panel by low-voltage electrical cable. Design features and operation of the Tankgard system are attached for reference in Appendix E.

Cable entry to well-vapor sensors is accessed through an electrical fitting in the top of well endcap (Plate 5). Sensor position within the well is located within the upper blank PVC casing approximately 2 to 3 feet below the top of the well. Extra cable was coiled inside the well-head junction box should changes occur that would require lengthening sensor emplacement. The alarm-control units are hard wired to a dedicated electrical circuit and sealed to prevent tampering by unauthorized personnel. Both alarm panels are located in areas where the audible and visual alarms can be readily noticed by responsible personnel (see Plates 2 & 3).

2.7 Overspill Protection Boxes

Fill tubes on all existing tanks were retrofitted with 5-gallon capacity spill-protection boxes to eliminate accidental overfill spillage during time of tank filling. The covers to these boxes are water tight and mounted 1-inch above grade to prevent inflow of rainwater runoff into the tanks. A POMECO Model III-VE with drain valve (or equivalent model) was installed. Special features and design of this spill-protection model are specified in Appendix F.

3.0 RESULTS

3.1 Geologic Conditions

The Riverside Cement Company facility resides within the Peninsular Ranges geomorphic province. Near Riverside, there are outcrops of late Paleozoic limestone from which cement is processed. The course of the Santa Ana River flows nearby, contributing Recent alluvium deposits of gravel, sand, and mud (i.e., silt & clay). These sediments cover and restrict the outcrop exposures of the metasedimentary (i.e., limestone) rocks in the area.

3.2 Hydrogeologic Conditions

The exploratory drilling conducted at both UST locations encountered mostly sandy soils to the depths explored (i.e., 30 feet). Thin intervals of gravelly sands and clayey silts were also penetrated. The predominant soil materials were classified as SP, the group symbol for poorly-graded sands with little or no fines (see Appendix B, Plate B-O). Layers intermixed with the sand deposit were classified as SW and ML, the group symbols for gravelly sands and clayey silts, respectively. Appendix B contains the boring logs of the sections described above.

Groundwater was not encountered in any of the exploratory borings drilled. Within this sector of the Santa Ana hydrogeologic basin, depth to groundwater is estimated to be greater than 100 feet, based on nearest well information.

3.3 Laboratory Analysis

Laboratory analysis was performed on soil samples from two depth intervals in each of the six exploratory borings. All samples from the 15-feet depth interval, as well as, the bottom of borehole were analyzed. Thus, a total of 12 laboratory-test analyses were performed. These soil samples were analyzed for concentrations of total petroleum hydrocarbons (TPH). The results of discrete analysis performed on each sample are tabulated for the corresponding borings in Table 3-1. Copies of the laboratory analytical reports analyses and the quality-control data are provided in Appendix G.

LOK

Table 3-1. Analytical results of laboratory analysis of soil samples.

Sample ID Number	Map Location (Plates 2&3)	Sample Depth	TPH* (mg/kg)
S-01-15	MW-1	15'	ND<5**
S-01-30	MW-1	30'	ND<5
S-02-15	MW-2	15'	ND<5
S-02-25	MW-2	25'	ND<5
S-03-15	MW-3	15'	ND<1
S-03-30	MW-3	30'	33
S-04-15	MW-4	15'	ND<1
S-04-25	MW-4	25'	ND<1
S-05-15	MW-5	15'	ND<1
S-05-25	MW-5	25'	ND<1
S-06-15	MW-6	15'	ND<1
S-06-25	MW-6	25'	ND<1

* TPH = Total Petroleum Hydrocarbons by CA DHS or EPA 418.1 methods; values in mg/kg (ppm).

** ND = Not Detected;(below indicated level of detection).

4.0 DISCUSSION

Two specific options were approved by the Riverside County Department of Environmental Health Services to provide for the continuous monitoring of UST's at the Riverside Cement Company facility. These options were presented in the previously submitted CTT/LOK Work Plan. In review, Option 1 would have been implemented if groundwater was anticipated to occur at depths shallower than 100 feet. If groundwater was deeper than 100 feet, then criteria established under Option 2 would be implemented. Since groundwater is estimated to be deeper than 100 feet and groundwater occurrence was not encountered within the subsurface depths explored, the construction standards for installation of vadose-zone monitoring wells were followed. This monitoring method is consistent with the intent of regulations adopted by the California State Water Resources Control Board and by the County of Riverside.

The Tank Monitoring Program was developed for facilities where soils or groundwater have not been adversely affected by the existing underground tank systems. With the exception of only one soil sample, the concentration levels of hydrocarbon/motor-fuel components for those samples analyzed were all below the limit of detection. The one soil sample found to contain a detectable TPH concentration came from the 30-feet sample-depth interval in the boring for MW-3 (i.e., adjacent to the two diesel-tank cluster near the White Plant). However, this isolated soil sample contained a relatively low TPH concentration of only 33 mg/kg (ppm) which is low enough to calibrate out as background interference.

Under these conditions, the Tank Monitoring Program provides for the earliest detection of tank-leaking materials. The monitoring wells in combination with the electronic monitoring system are designed to intercept and detect escaped hydrocarbon products should any tank-system leakage occur in the future. The continuous monitoring of the vadose-zone soils in the vicinity of the tanks will allow for timely response in the event an unauthorized release takes place.

To complete the Underground Tank Program, the overspill-protection containers installed on each tank-fill tube will minimize surface-spillage release of product during refill. Any motor-fuel product captured in these containers can be returned to the respective tank in the event of tank overfill. Tank-precision tests have also demonstrated the current integrity of the tank systems. Precision tests can be conducted periodically to verify the future integrity of the UST systems at the Riverside Cement Company facility.

5.0 CONCLUSIONS

A Leak Detection Investigation was conducted as part of a Leak Detection Program for the underground storage tanks (UST's) used to store fuel products at the Riverside Cement Company facility in Riverside, California. Field data and laboratory analytical results of soil samples from the facility suggest the following conclusions:

1. Subsurface soils are alluvial sediments, predominantly composed of sandy soils intermixed with units of gravelly sands and clayey silts.

2. Groundwater (i.e., saturated-soil zone) was not encountered within the subsurface depths explored to 30 feet.

3. The soil-sampling scheme and monitoring-well construction design (i.e., vadose-zone wells) followed procedures established for areas where deep-groundwater conditions exist.

4. Total petroleum hydrocarbon (TPH) concentrations in all but one soil sample were below the limit of detection. One soil sample (i.e., S-03-30) contained a relatively low TPH concentration of only 33 mg/kg (ppm).

5. Evidence of free hydrocarbons in the soil was not detected by olfactory or visual observations.

6. The latest tank-precision tests indicate that the tanks and associated piping systems are free of leakage.

6.0 RECOMMENDATIONS

1. The findings and results of the work as presented in this report should be submitted to the County of Riverside, Department of Environmental Health Service, as required by regulation for compliance of the underground storage tank program.

2. Inventory reconciliation procedures for each tank should continue as already practiced at the facility to offer an additional safeguard in the detection of any product leakage that may occur at some future time.

3. Annual tank-precision tests should be scheduled.

4. A qualified maintenance company may be contracted to maintain proper working order of the electronic-monitoring components and to provide 24-hour alarm response service.

5. Motor-fuel suppliers should be advised to practice caution in the filling of tanks and in the event of overfilling, to be aware of the function and operation of the overfill-protection boxes now installed on each tank-fill tube.

7.0 LIMITATIONS

This report has limitations, and as such, it should not be construed that all possible site conditions were identified. It should be recognized that there is no guarantee this study has covered all possible environmental issues at the site. A more detailed environmental investigation is warranted, if potential future liability is of concern.

It is possible that variations in the soil or groundwater conditions could exist beyond the points explored in this investigation. Also, changes in the groundwater conditions as noted could occur at some time in the future due to variations in rainfall, temperature, regional water usage, or other factors.

LOK/CTT

The standard of services performed by CTT/LOK was conducted in a manner consistent with the level of care and skill ordinarily exercised by the industry operating under similar conditions in the State of California. No other warranty is expressed or implied.

CTT/LOK look forward to working with Riverside Cement Company on any continuation of this project and future projects. If we can provide additional services or information, please contact us.

Sincerely,

Cal Tank Testing

DECON
ENVIRONMENTAL SERVICES, INC.

July 31, 1997
Riverside Co. Environmental Health Dept.
Attn: Mr. Dan Workman

Dear Mr. Workman,

Enclosed is a packet of required certificates for the tank removal performed for the Riverside Cement Co. at 1500 Rubidoux Blvd., Riverside, CA.

The tank removal project considered of the removal of two 12K diesel tanks, one 10K gas tank, and one 250gal. kerosene tank. Although the 250gal kerosene tank was under a second permit, we hope that this summary will suffice.

The contents of this packet are as follows:

Page 1	Cover letter
Sec. 1, page 2	Copy of tank closure permits
Sec. 2, page 3	Rinsate Manifest
Sec. 3, page 4	Tank Manifest
Sec. 4, page 5	Tank Certifications
Sec. 5, page 6	Tank Disposal Certificates
Sec. 6, page 7	Chain of custody and soil analysis.

Decon Environmental Services hopes that the enclosed information is sufficient. If you find there is something we overlooked, please let us know and we will take care of it right away. I can be reached at 909-357-0559.

Sincerely,

JD Knecht
Project Manager

SUBJECT: Report of Results for the Investigation of Subsurface Conditions at a Fuel Oil Storage Tank, Riverside Cement Crestmore Plant.

Dear Mr. Rieser:

The purpose of this letter report is to describe the drilling and sampling activities and document the results of the subsurface soil investigation for the fuel storage tank at the Riverside Cement Crestmore Plant in Riverside, California. Drilling and sampling activities were performed on September 4 and 5, 1986.

SITE LOCATION AND DESCRIPTION

The Riverside Cement Crestmore Plant is located at 1500 Rubidoux Boulevard in Riverside, California. Figure 1 shows the location of the plant. Figure 2 provides a site plan indicating the two drilling locations. Both locations were adjacent to the large tank which historically contained fuel oil. The two borings were slant drilled beneath the bottom of the tank. Photographs documenting the sampling areas are attached in Appendix A.

FIELD ACTIVITIES

Prior to drilling and sampling, two areas were selected and "cleared" (Figure 2) on approximately opposite sides of the fuel oil tank. Clearing consisted of excavating and removing a portion of a compacted soil berm that supports the concrete walls of the tank (refer to photographs in Appendix A).

A truck-mounted drilling rig was used to perform the subsurface soil sampling beneath the tank. The drilling rig was equipped with 8-inch diameter hollow-stem continuous flight augers. Use of these hollow-stem augers ensured sample integrity by preventing soils from caving to the bottom of the hole during

FIGURE 1 RIVERSIDE CEMENT PLANT LOCATION MAP

GIFFORD HILL

ERM-WEST 9/86

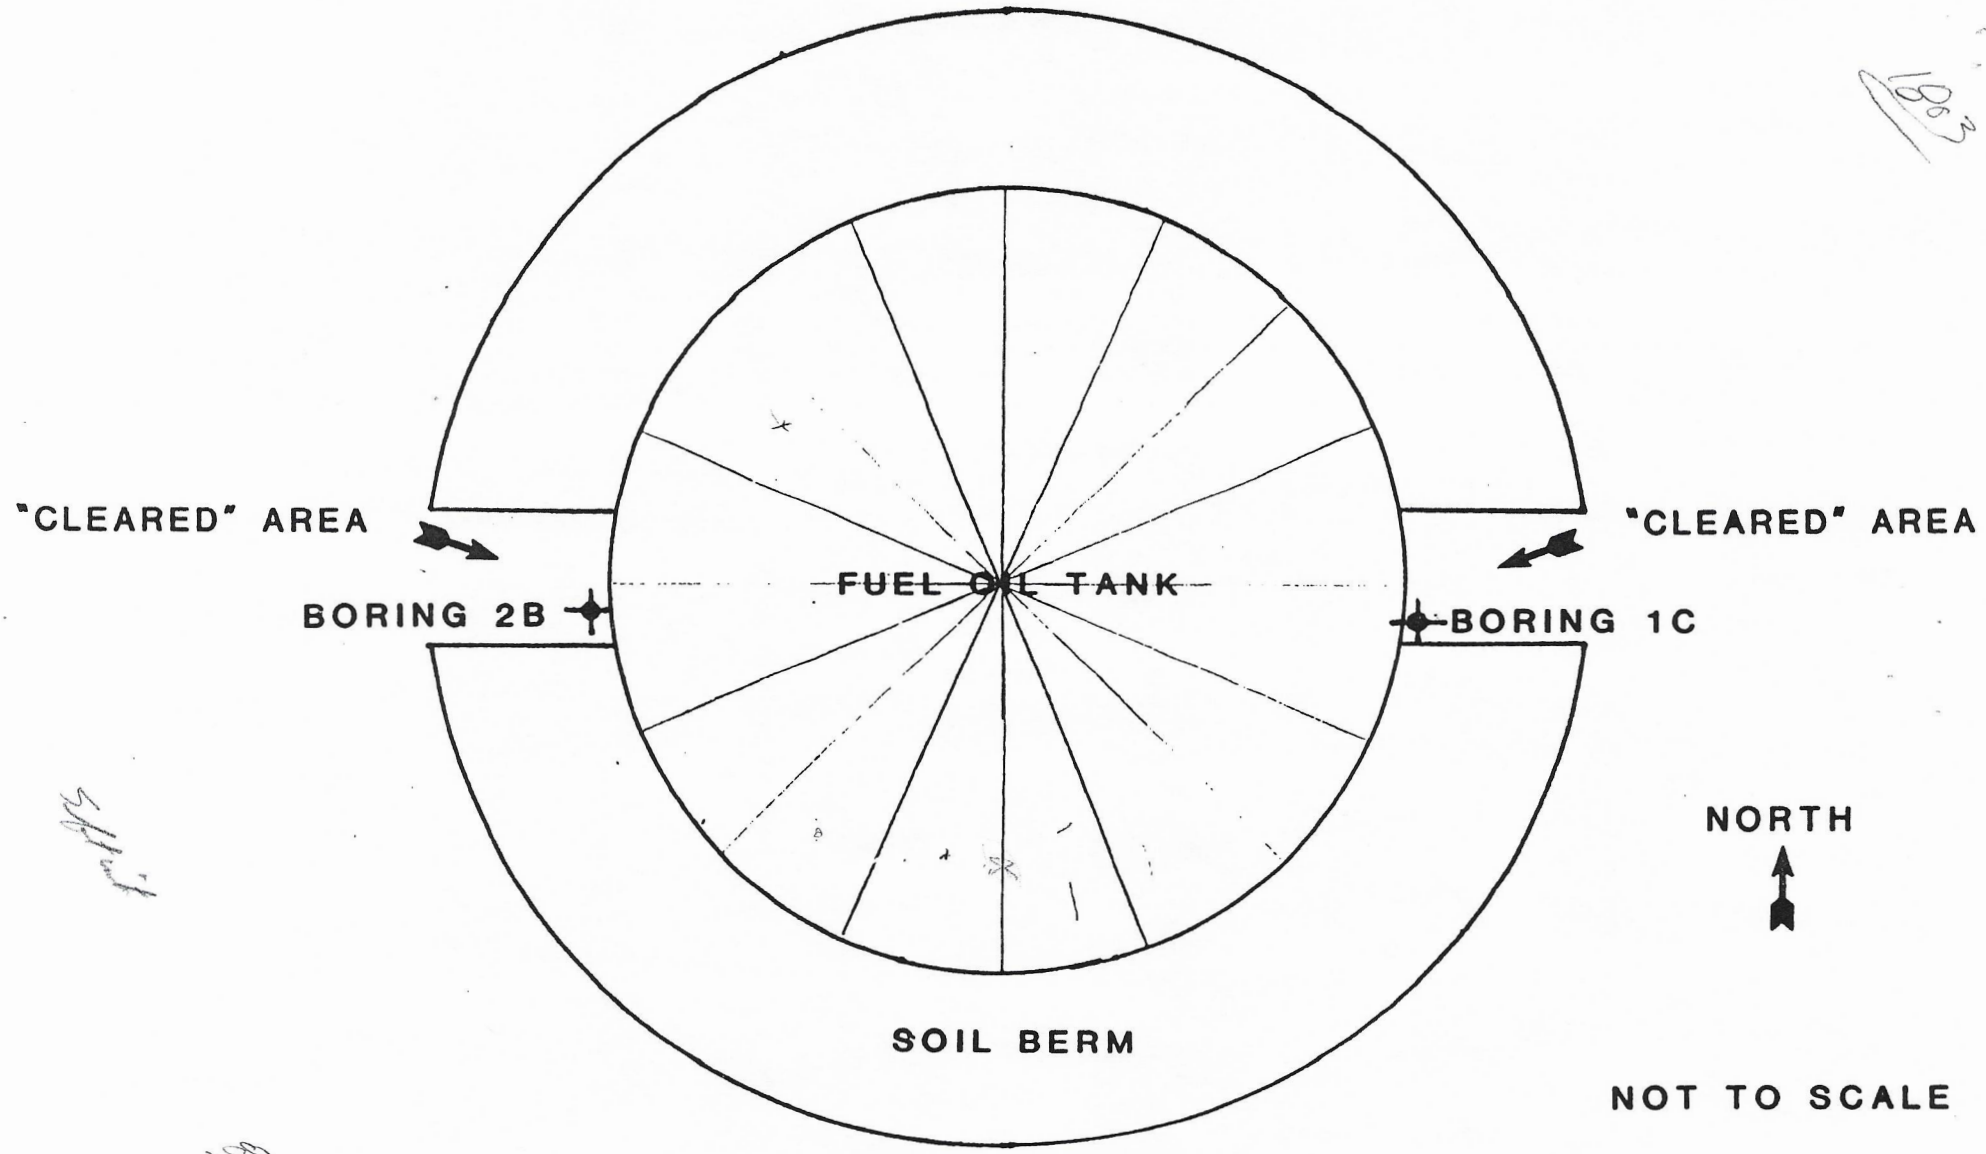

FIGURE 2 SCHEMATIC OF FUEL OIL TANK AND BORING LOCATIONS

ERM-WEST 9/86

drilling. Prior to drilling each hole, all sampling equipment was steam cleaned to prevent cross-contamination between borings.

Two slant borings (#1C and #2B) were drilled at 30° angles (from vertical) to desired depths beneath the tank (Figure 3). Several drilling attempts (Borings #1A, 1B, and 2A) were made prior to successfully attaining the desired depths. Boring #1C was drilled to a maximum auger depth of 34 feet below the east side of the tank; boring #2B was drilled to a depth of 39 feet below the west side of the tank. These maximum drilling depths corresponded to depths beneath the outside bottom edge of the tank.

To collect soil samples, Shelby tubes (30" x 2" dia.) were pushed ahead of the auger. An undisturbed soil core was retained in each tube. Shelby tubes containing soil samples were cut into several sections using a pipe cutter. Exposed ends were visually classified for lithology and then covered with Teflon film and plastic caps. Shelby tube sections selected for laboratory analysis were labeled and placed on ice in a cooler. Samples were shipped overnight to the laboratory accompanied by a completed chain of custody form (copy contained in Appendix B).

The types of soils encountered from each subsurface boring were classified visually according to the Unified Soil Classification (USC) system. A key to the USC system precedes the drill logs recorded for each drill hole, presented in Appendix C. Drill logs were based upon information obtained from drill cuttings, actual soil samples, and observed changes in drilling characteristics.

In addition to the soil samples collected, a sample of the liquid fuel oil from the tank was collected and shipped to the laboratory along with the soils. This fuel oil was obtained to represent a standard for comparison during analysis.

ANALYTICAL RESULTS

Five soil samples were submitted to the laboratory (Anlab Analytical Laboratory, Sacramento, California) for total petroleum hydrocarbon analyses. Samples were shipped and received on September 8, 1986. Analyses were performed on a rush basis. The analytical data from the laboratory are presented in Table 1. Original laboratory test results are contained in Appendix D.

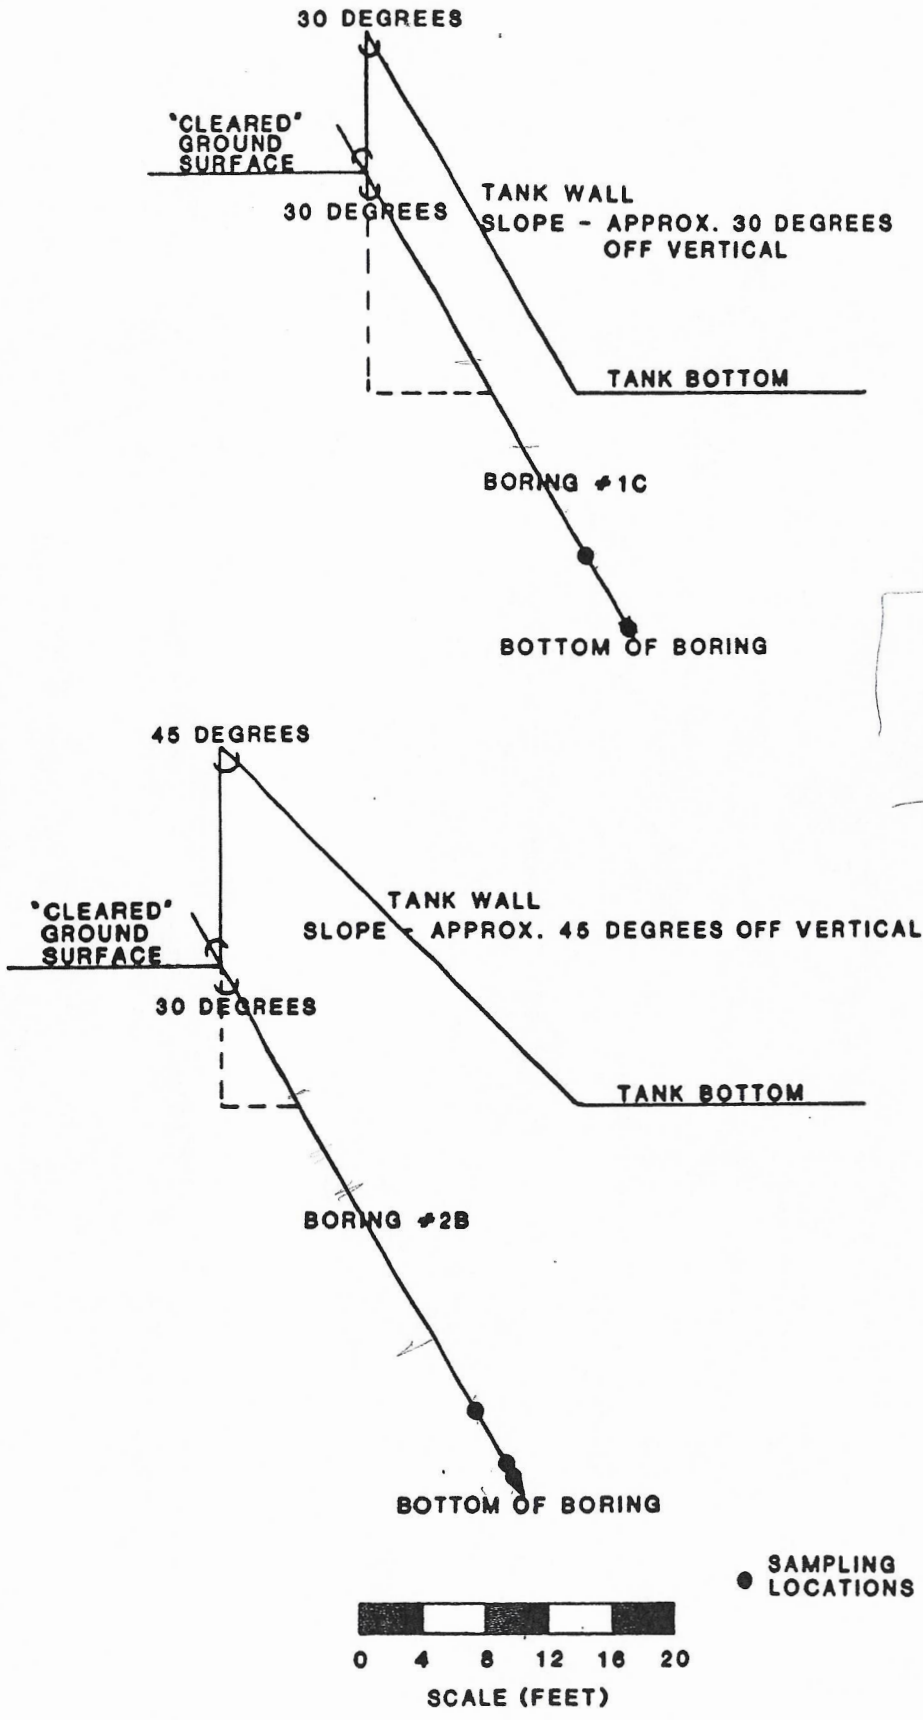

FIGURE 3 - SLANT BORING GEOMETRY BENEATH TANK

TABLE 1
ANALYTICAL RESULTS OF
TOTAL PETROLEUM HYDROCARBON
ANALYSES

SAMPLE IDENTIFICATION	SAMPLE DEPTH (feet)	TOTAL PETROLEUM HYDROCARBONS (mg/kg)*
Boring 1C	28.0 - 28.5	410
Boring 1C	33.5 - 34.0	<50
Boring 2A	32.5 - 33.0	<50
Boring 2A	37.5 - 38.0	<50
Boring 2A	38.0 - 38.5	<50

* Based on fuel oil "standard" submitted by ERM-West along with the samples

FINDINGS

Several findings are apparent from this investigation:

- only one sample (Boring 1C: 28.0'-28.5') contained total petroleum hydrocarbons (TPHC) above detection limits
- the concentration (410 mg/kg) detected in the sample mentioned above is less than the in-place tank abandonment guide line value (500 mg/kg), as per Environmental Health Services Division, Riverside County Health Department.
- based on discussions with the laboratory, soil sample chromatograms corresponded closely with the fuel oil standard collected from the tank.
- clayey-sand soils were encountered directly beneath the tank, which partially limited TPHC movement.
- dense clay soils were present at depths of about 15 to 25 feet below the tank; these soil appeared to restrict vertical TPHC movement.

We trust this letter report meets your current needs. Please call me if you have any questions or need further information.

Very truly yours,

APPENDIX C

Drilling Logs

APPENDIX C

KEY TO DRILLING LOGS

Information on the types of soil encountered while drilling and the depths at which these soils were found is contained in the drilling logs. The drilling logs are based upon information from drill cuttings, actual soil samples, and changes in drilling characteristics. A description of key terms used in the logs is presented below.

Soil Boring Designation. Each drilling site is designated by a unique number.

Depth. Measured in feet below surface.

Recovery. Approximate amount of soil recovered in sampler or Shelby tube for given sample interval.

Sample Interval. Soil samples retained for analysis at indicated interval are marked by an "X".

Description. The texture, color, and moisture content of soils were described, plus any other significant observations.

USC Soil Type. Soils were classified visually in the field according to the Unified Soil Classification (USC) system using ASTM Method D2488-69. The USC system is presented in the table on the following page.

"BOH". Bottom of hole indicating total depth in feet below land surface.

MAJOR DIVISIONS			GROUP SYMBOLS	TYPICAL NAMES
COARSE–GRAINED SOILS MORE THAN 50% RETAINED ON NO. 200 SIEVE*	GRAVELS 50% OR MORE OF COARSE FRACTION RETAINED ON NO. 4 SIEVE	CLEAN GRAVELS	GW	WELL–GRADED GRAVELS AND GRAVEL–SAND MIXTURES, LITTLE OR NO FINES
			GP	POORLY GRADED GRAVELS AND GRAVEL–SAND MIXTURES, LITTLE OR NO FINES
		GRAVELS WITH FINES	GM	SILTY GRAVELS, GRAVEL–SAND–SILT MIXTURES
			GC	CLAYEY GRAVELS, GRAVEL–SAND–CLAY MIXTURES
	SANDS MORE THAN 50% OF COARSE FRACTION PASSES NO. 4 SIEVE	CLEAN SANDS	SW	WELL–GRADED SANDS AND GRAVELLY SANDS, LITTLE OR NO FINES
			SP	POORLY GRADED SANDS AND GRAVELLY SANDS, LITTLE OR NO FINES
		SANDS WITH FINES	SM	SILTY SANDS, SAND–SILT MIXTURES
			SC	CLAYEY SANDS, SAND–CLAY MIXTURES
FINE–GRAINED SOILS 50% OR MORE PASSES NO. 200 SIEVE*	SILTS AND CLAYS LIQUID LIMIT 50% OR LESS		ML	INORGANIC SILTS, VERY FINE SANDS, ROCK FLOUR, SILTY OR CLAYEY FINE SANDS
			CL	INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS
			OL	ORGANIC SILTS AND ORGANIC SILTY CLAYS OF LOW PLASTICITY
	SILTS AND CLAYS LIQUID LIMIT GREATER THAN 50%		MH	INORGANIC SILTS, MICACEOUS OR DIATOMACEOUS FINE SANDS OR SILTS, ELASTIC SILTS
			CH	INORGANIC CLAYS OF HIGH PLASTICITY, FAT CLAYS
			OH	ORGANIC CLAYS OF MEDIUM TO HIGH PLASTICITY
HIGHLY ORGANIC SOILS			PT	PEAT, MUCK AND OTHER HIGHLY ORGANIC SOILS

P. O. Box 832
Riverside, CA 92502

SUBJECT: Analysis of Excavated Soil From Closure of Fuel Oil Storage Tank

Dear Mr. Rieser:

This letter report has been prepared to summarize the results of our analysis of soil samples collected from two large piles of soil excavated from beneath an abandoned fuel oil storage tank at the Crestmore Plant. The soil was excavated and stockpiled based upon discussions and agreements with staff of the Riverside County Health Department.

The work described herein was performed at your request to identify whether or not the material could be handled and transported safely. The work involved sampling and analysis of the stockpiled soil for the following:

- o total petroleum hydrocarbons (i.e. the level of fuel residuals in the soil)
- o priority pollutant organics
- o priority pollutant heavy metals
- o toxicity, as measured by acute fish bioassay

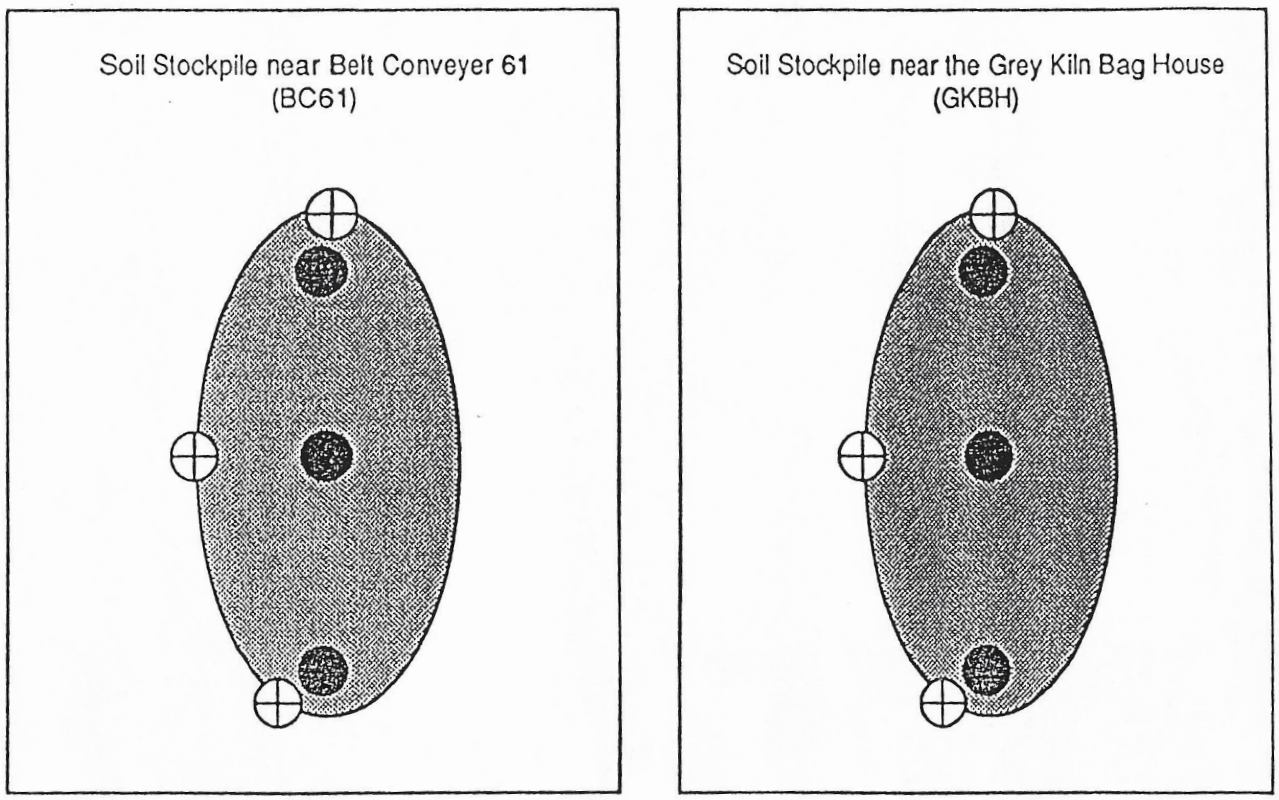
SAMPLING METHODS

Two sets of composite samples were collected at each of the two soil stockpiles for a total of four composite samples. Grab samples were collected from three sampling points to make up each composite sample (see Figure 1). At each grab sample sampling point, approximately eight inches of material was shoveled away

before sampling. Two brass tubes were then filled by pushing them into the soil, withdrawing them and then capping them for analysis of volatile organics. A Teflon liner was placed between the caps and the soil. Soil material for the other chemical tests was scooped into a glass jar with a Teflon lined cap. The jar was filled one-third full at each grab sample sampling point. Samples were kept on ice after collection and chain of custody procedures were followed through delivery to Curtis and Thompkins Laboratories personnel.

ANALYSIS METHODS

The analysis of total petroleum hydrocarbons (TPH) was carried out using two different analytical procedures. EPA Method 3550/8015 employs gas chromatography (GC) as the quantitation technique, whereas EPA Method 3550/418.1 utilizes infrared spectrophotometry (IR) for quantitation. These two methods were chosen because; (1) the GC procedure can provide speciation data on hydrocarbons with boiling points less than 350 degrees Centigrade(C), and (2) the IR procedure can quantitate higher molecular weight (i.e. boiling point greater than 350 degrees C) compounds, though it cannot speciate those compounds.



Analysis of priority pollutant organics was performed according to EPA procedures. EPA Method 8240 was used for volatile organics and Method 8270 was utilized for extractable organics.

Heavy metals were analyzed using acid digestion (EPA Method 3050 for <u>total</u> metals), and analysis using EPA Method 6010 (ICP scan), except mercury, which utilized Method 7470 (cold vapor generation).

The 96-hour static acute fish bioassay was performed in accordance with Section 66696, Title 22 of the California Administrative Code and draft "Static Acute Bioassay Procedures for Hazardous Waste Samples" (California Department of Fish and Game, 1985).

In conducting the bioassay, a test sample was first typed and pretreated according to Waste Extraction Test (WET), Section 66700 (Title 22, California Administrative Code, 1985), as applicable for bioassays. Replicate samples of 250 and 750 mg/L final test concentrations were weighed and placed into an individual container with 200 milliliters of charcoal-filtered deionized water, and mixed for 24 hours in a laboratory rotator.

The bioassay consisted of testing replicate tanks of ten fish per sample concentration for 96 hours under carefully controlled and monitored physical conditions. Test and control tanks were not

Key		Sample Identification Codes

(Soil stockpile shapes are generalized, sampling locations are approximate, and figure is not to scale.)

initially aerated to minimize loss of test substance volatility. If the dissolved oxygen level from a tank measured below 60 percent saturation, the tank was aerated and maintained at 25 to 35 mL/minute with diffused, oil-free low pressure air and noted on summary tables. Bioassays were conducted in a controlled atmosphere laboratory. Water quality data were measured to the lowest detectable limits using methods outlined in Standard Methods for the Examination of Water and Wastewater, 16th Edition (APHA, 1985).

TEST RESULTS

Total petroleum hydrocarbon data are summarized in Table 1. These results show that TPH values vary considerably, depending upon the individual test method as well as sampling location within the piles. Overall, however, it appears that the stockpiled soils contain 0.2% (1,900 mg/kg) to 1.7% (17,300 mg/kg) hydrocarbons by weight. These hydrocarbons may be characterized as fuel oil residuals, based upon visual observations of the soil samples and recognition of the previous use of the storage tank.

Priority pollutant organics data are presented in Table 2. The only volatile priority pollutant organic constituent detected in the four composites was toluene at 575 ug/kg (slightly above detection limit of 500 ug/kg). The only extractable priority pollutant detected in one composite sample was phenanthrene at 6 ug/kg (slightly above the detection limit of 5 ug/kg). Overall, it appears that in the aggregate (i.e. completely blended) soil in the two stockpiles, no priority pollutant organics would be observable above analytical detection limits.

Table 3 summarizes heavy metals data for the four composite samples. All samples had very low total metals values, several orders of magnitude below total threshold limit concentrations (TTLC). Metals values in Table 3 appear to be representative of metal levels in natural clay soils.

Fish bioassay data for the four composite samples are presented in Table 4. Fish survival was excellent for all samples and all bioassay test concentrations.

Copies of all individual laboratory data sheets are attached.

		750	0
GKBH - Bottom	>750	250	0
		750	0

[1] LC50 is the sample concentration lethal to 50 percent of the test organisms in 96 hours.

CONCLUSIONS

The soil stockpiles at the Riverside Cement Company Crestmore Plant contain hydrocarbon residues of approximately 0.2% to 1.7% by weight.

With the exception of minor and insignificant concentrations of toluene and phenanthrene found in individual samples, no priority pollutant organics were detected in soil samples. Heavy metals concentrations in the stockpiles were very low and appear to be comparable to levels of metals in natural clays. The fish bioassays documented that the toxicity of the material to test fish is below the test detection limit. In short, the samples do not exhibit any characteristics which would lead the soil to be classified as hazardous under Section 66693 et. seg. of Title 22, California Administrative Code (1985).

We hope that this letter and the enclosed material provides the information you requested. If you have any questions, or if I can be of further assistance, please contact me.

Very truly yours,

ERM-WEST

FOR ERM-West

REPORT ON Four Soil Samples

MARK Riverside Cement Co.
Job No. 178-02

Four soil samples,

BC61-Top, BC61-Bottom, GKBH-Top, and GKBH-Bottom

were submitted for the following analyses:

1) 96 Hr. Fish Bioassay with Fathead Minnows
2) EPA 8270
3) EPA 418.1
4) CAM-17 Metals

Twelve soil samples were composited,

BC61-Top: BC61, Top-N; BC61, Top-M; BC61, Top-S

BC61-Bottom: BC61, Bottom-S; BC61, Bottom-W; BC61, Bottom-N

GKBH-Top: GKBH, Top-N; GKBH, Top-M; GKBH, Top-S

GKBH-Bottom: GKBH, Bottom-S; GKBH, Bottom-W; GKBH, Bottom-N

and analyzed per the following:

5) EPA 8240
6) EPA 3550/8015

See attached for results.

BIOASSAY PROCEDURE AND ORGANISM DATA

Parameter	Data
Test	
Test Type	Title 22 initial screening
Test Duration	96 hours
Test Photoperiod	16hrL:8hrD
Start Date; Time	9/1/87; 0915
Completion Date	9/5/87
Test Container	15-L aquaria
Exposure Volume	10L
Control Water	Charcoal-filtered soft water
Dilution Water	Charcoal-filtered soft water
Organisms per Container	10
No. of Test Containers	4 per test, 2 controls
Sample Storage Conditions	4°C in the dark
Treatment Problems	Aeration needed for some samples
Organism	
Test Species	Fathead minnows, Pimephales promelas
Source	Thomas Fish Company
Date Acquired	8/4/87
Age	3-6 weeks
Acclimation Period	3 weeks
Acclimation Water	Charcoal-filtered hard water
Acclimation Temperature	21°C
Acclimation Photoperiod	16hrL:8hrD
Diet	Tetramin "Growth" flake food

Size
n = 15

	Mean	Maximum	Minimum

INVESTIGATION OF SOIL CONDITIONS BELOW AND ADJACENT TO THE FUEL STORAGE AT THE RIVERSIDE CEMENT CRESTMORE PLANT RIVERSIDE, CALIFORNIA March 27 - April 1, 1987

PREPARED BY

ERM-West
Walnut Creek, California

June 26, 1987

INVESTIGATION OF SOIL CONDITIONS BELOW AND ADJACENT TO THE FUEL STORAGE TANK AT THE RIVERSIDE CEMENT CRESTMORE PLANT RIVERSIDE, CALIFORNIA 27 MARCH -1 APRIL 1987

INTRODUCTION

This investigation focused on a large concrete tank located at the the Riverside Cement Company Crestmore Plant. The tank was historically used for fuel oil storage and more recently has been emptied and cleaned out. The plant is located at 1500 Rubidoux Boulevard in Riverside, California. Figure 1 shows the Plant location.

ERM-West commenced its investigation of soil conditions and chemistry beneath the tank in September 1986 by drilling two slant borings beneath the tank from outside the tank perimeter. A total of four samples, two from each boring, were collected from beneath the tank. Only one sample had detectable concentrations of total petroleum hydrocarbons: 410 mg/kg. Sample results from those two borings were included in the document titled "Closure Plan, Fuel Oil Storage Tank" that was submitted to the Riverside County Health Department and the fire department in March 1987.

Further investigation of soil conditions and chemistry was performed 27 March 1987 and 1 April 1987 and is described in this report. Field work included drilling vertical borings through the concrete tank floor, sample collection of soil from borings and the tank wall berm for chemical analysis and field description of soil samples. The purpose of this investigation was to further assess the extent and magnitude of potential soil contamination that may have been caused by fuel oil stored in the tank.

SCOPE OF WORK

Figure 2 shows the locations of the six tank wall soil sampling points, the four vertical borings advanced during this further investigation, and the locations of the two original slant borings drilled during the initial investigation by ERM-West. The simplified plan view shows the tank as if it were still completely intact, however, portions of the tank wall have been destroyed for investigatory purposes. Locations shown for sampling points and borings are approximate.

Four vertical borings were advanced to depths of 25.5 to 27.5 feet below the floor of the tank. At each boring, samples were collected approximately every five feet; in some cases, additional samples were collected to more precisely characterize soil chemistry. Six samples of soil material from the berm supporting the tank walls were collected for field description and chemical analysis.

Field descriptions from soil boring samples and tank wall soil samples included notes describing the soil or rock type and any odors or stains observed in the samples. All soil samples selected for chemical analysis were analyzed for total petroleum hydrocarbons (TPH).

1,300 mg/kg and minimum concentrations less than 30 mg/kg. Vertical boring 1, nearest to the sump, had the highest concentrations. Laboratory reports of TPH data from borings and tank wall soil samples are given in Appendix D. Boring logs in Appendix C give notes on the observation of odors and stains observed in soil samples. These observations correlate well with laboratory chemistry.

Table 1 presents presents all TPH data for the vertical borings and verifies field observations that the relative degree of contamination changed sharply across some vertical interfaces. Some of the six-inch long soil samples that were split to analyze the cleaner portions separately from the more contaminated portions showed striking results. For example, in boring 1, the TPH concentration ranged from 13,000 mg/kg to 27 mg/kg over a distance of less than six inches.

Table 2 presents tank wall soil chemistry sample data. Figure 5 shows the distribution of TPH concentrations found in tank wall soil samples at their collection points around the perimeter of the tank in plan view. Tank wall sample 6, the only seriously contaminated tank wall sample, had a concentration three orders of magnitude greater than samples 1-5: 47,000 mg/kg. The tank was completely broken away at sampling point 6 allowing collection of this sample from the former interface between the tank wall and the soil berm.

Figure 6 illustrates the vertical distribution of TPH concentrations found in soil samples from vertical borings 1-4. If TPH concentrations were assumed to change linearly (concentration versus depth) between sampling points, then the areas enclosed by the lines plotted in Figure 6 suggest that boring 1 is clearly the most contaminated throughout its depth and boring 3 is much less contaminated than the other three borings. Borings 2 and 3 have their peak contamination at approximately 15 feet deep and borings 1 and 4 have their peak contamination at approximately 20 feet deep based on available data. TPH concentrations appear to decrease to insignificant levels at a depth of 20 feet in borings 2 and 3 and at approximately 27 feet in borings 1 and 4 based on the projections in Figure 6.

Figure 7 shows boring stratigraphy and an extrapolation of chemical analysis data projected onto a North-South crossection through the tank. Data are not sufficient to present such a projection as a reliable estimate of the distribution of a TPH plume, but it is presented here to examine the relationship between observed stratigraphy and TPH concentrations. Actual stratigraphy and chemistry along such a line or at other points below the tank may differ considerably from this illustration. The projected TPH concentrations suggest that a primary source may be near boring 1: possibly the sump shown in Figure 1. Although the relatively tight clay layers in borings 1 and 4 may have attenuated the downward migration of hydrocarbons in this area, data show there has been significant vertical migration through a depth of about 27 feet below land surface (boring 1). Moving North toward boring 2 and away from the sump, it appears that much smaller concentrations of petroleum hydrocarbons are present in the soil but that significant amounts have migrated downward through or laterally to below the 1 foot clay zones at about 14 feet in borings 2 and 3.

It apears that large amounts of petroleum hydrocarbons have not migrated through the more permeable sand and silt zones logged in borings 2 and 3 below 14 feet. This may possibly be explained by the fact that in the vadose zone, the capillary forces which are normally much greater in clays than in sands for instance, are significant relative to gravitational forces; these capillary forces in the clays may be preventing the downward movement of contaminants. This hypothesis is plausible in an environment where infiltration of rainwater is prevented from flushing contaminants down to the saturated zone such as would be expected under a concrete floor.

CONCLUSIONS

Total petroleum hydrocarbon concentrations in five of six soil samples collected adjacent to the oil tank wall were less than 45 mg/kg. Tank wall sample 6 had a TPH concentration of 47,000 mg/kg.

All borings had one or more sample intervals with significant TPH concentrations but also had minimum concentrations less than 30 mg/kg. Although significant TPH concentrations appear to extend roughly 23 to 27 feet beneath the Southern end of the tank floor, the greatest depth of significant TPH concentrations may be as shallow as about 17 feet beneath the Northern portion of the tank floor . Borings in the Southern half of the tank near the sump had much higher TPH concentrations up to a maximum of 129,000 mg/kg in boring 1. Sharp changes in TPH concentrations observed across horizontal interfaces indicates that estimates of the vertical distribution of TPH concentrations should be evaluated with caution.

The comparison of soil stratigraphy and apparent distribution of petroleum hydrocarbons suggests that contaminants have apparently moved downward through significant thicknessses of clays near borings 1 and 4. However, that comparison also suggests that the interface with sand below clay in boring 2 at 15 feet below the tank floor and the interface with silt below clay in boring 3 at 15 feet may be exerting an attenuating influence on vertical migration. The fact that clays have much stronger capillary forces than sand or silt and that the significance of gravitational forces affecting fluid migration is reduced relative to capillary forces in the vadose zone may explain the apparent attenuation at these interfaces. This potential control feature may be lost if rainwater infiltration is allowed in this area.

TABLE 1 - Total Petroleum Hydrocarbon Concentrations in mg/kg in Vertical Borings 1-4

Attention: Mr. Joe Asbury,
Hazardous Materials Specialist

Dear Mr. Asbury,

This correspondence is in response to your request to be advised on the course of events surrounding the closure of our fuel oil storage tank located at the Riverside Cement Company, Crestmore Plant location.

As this is a very unusual tank, both in size and method of construction, investigations of soil chemistry beneath the tank began in 1986. Based on these initial findings, we felt reasonably confident that the integrity of the concrete floor of the tank had not been disturbed. Only one sample of four taken from two slant borings had detectable concentrations of total petroleum hydrocarbon: 410 MG/Kg.

Further investigation of soil conditions and chemistry were performed during the first quarter of this year. Field work included vertical borings through the concrete tank floor, sample collection of soil from the borings, and the tank wall berm for chemical analysis and field description of soil samples. The purpose of this investigation was to further assess the extent and magnitude of potential soil contamination that may have been caused by fuel oil stored in the tank.

All of the aforementioned investigative work was conducted at our request by our environmental consultants, E.R.M.- West of Walnut Creek, CA. Their results of analysis and results of the investigation may be reviewed via two documents, (1) "Closure Plan, Fuel Oil Storage Tank" and (2) "Investigation of Soil Conditions Below and Adjacent to the Fuel Oil Storage at the Riverside Cement Company, Crestmore Plant". These documents may be reviewed upon request at our Plant location.

Coordinating our efforts and results with the Riverside County, Underground Storage Tanks Division of the Department of Health Services, we determined that the magnitude of the soils contaminated, volume wise, dictated that methods other than usual would be investigated. After several meetings with Dr. David Leu, Chief of the Alternative Technology Division of the California State Toxic Substance Control Division, and his staff, we have come to the conclusion that we have four options open to us, potentially.

1. Remove contaminated soils and dispose of same at a Class I landfill.

2. Remove the soil to another area of the Plant, and commence bio-degredation.

3. Remove the soil, utilize it for "road tack" under A. C. paving.

4. Remove the soil, then burn this material in one of our rotary cement kilns.

During the subsequent discussions to review these options, the following is a synopsis of the pro's and con's of each option.

Option 1. The estimated volume of material involved is approximately 20,000 yds.^{3} This option would be very expensive and, as environmental concerns for Class I facilities are mounting daily, does not seem a good choice environmentally or financially.

Option 2. A sample "Pilot Farm" was established several months ago with contaminated soil removed from the tank floor. This "farm" was sampled then "seeded" with micro-organisms and maintained in a method accepted in biodegredation projects. The analysis revealed that this would be a viable option, but a very long term project involving large costs maintaining the soils to provide proper propagation of the micro-organisms.

Option 3. After meeting with construction tradesmen and sieve analysis results being reviewed, it was determined that this material was not suitable for "road tack", but could be used for sub-road fill, in small quantities. Again, a long term solution.

Option 4. Due primarily to the fact that we are a pyro processing industry dealing with large volume consumption of raw material components, and permitted to burn several types of fuels of which "Bunker C" is one of, this option seems the most expedient, cost effective, and environmentally positive than any other alternative. The

attached M.S.D.S. shows the chemical breakdown of one of our raw material components, "Capo Clay". Also attached is the chemical analysis of the contaminated soil. Comparison of these two documents will show that the contaminated material is, in fact, a component used in our process, but it does contain a B.T.U. value due to the contamination by the "Bunker C" fuel oil stored in the tank.

After discussion and review by the staff of the Alternative Technology Division, we concluded as thus:

1. The soil is chemically similar to a raw material normally used in our process for the manufacture of Portland Cement clinker.

2. The fuel contaminate is a fuel we routinely use during the pryo processing cycle of our manufacturing process.

Based on these two facts, we are proceeding to install equipment necessary to allow us to insulflate this contaminated soil in our rotary kiln. Our intention is to pulverize the soil to an approximate average of fineness of 60 - 70% -200 mesh sieve size, then blow this dust into the firing end of the rotary kiln, along with the firing of 11-13 TPH of pulverized, low sulfur coal, that we normally use during the firing of our kiln. Our present estimate on the total consumption time for this soil is August 15, 1987, however, as we are just starting the excavation project, this date could move forward or back.

I hope this letter clarifies our status at present, and allows you to understand our goals for the future. Any additional information desired can be requested either through the Tank Division of Riverside County Department of Health Services, or by contact with the undersigned at the Crestmore Plant of the Riverside Cement Company. Thank you again for your cooperation. As in the past, we understand your obligations to the community and the environment, and will do all that is necessary to assist you in maintaining your goals.

Best Regards,
RIVERSIDE CEMENT COMPANY

RE: Planned Activities Surrounding the Closure of
The Underground Fuel Oil Storage Tank at
Riverside Cement Company, Crestmore Plant

Dear Joe:

We have thus far removed 75,000 tons of material from the excavation connected with the closure of our Bunker C fuel oil storage tank. Of these tons, approximately 50,000 tons were considered minor, or grossly contaminated, and were stockpiled into several different locations within the Plant premises. The remaining excavated soil has either been used for fill during the excavation, and for material to build ramps, or stockpiled for fill to reclaim this pit. Random samples of the stockpiled soils have been tested via a mobile laboratory operated by GeoTest Inc., an independent laboratory. The tests run are via the "freon extraction method" measuring total petroleum hydrocarbons (TPH) in part per million (PPM). Results are shown on attached documents.

Our current plan for disposal is three-fold in scope. Working with the lead agency, Riverside County Department of Health Services, we have developed these three scenarios and they will be implemented in the following order:

Alternative #1

As the chemical analysis of the contaminated soil is nearly identical to the compounds found in one of our typical raw material components, i.e. "Capo clay", we have, for the past two weeks, been substituting these soils in place of our normal clay additions.

We ascertained very quickly that this option could be utilized, to make an acceptable quality product, by ASTM standards relating to our industry. We also quickly realized that in maintaining specifications, which are met by proper proportioning of raw components, the time period necessary for total consumption was very extensive. Normal consumption of "Capo clay" in our raw mix design is approximately 4000 to 5000 tons per month. As we extimate we have 50,000 tons of contaminated materials, one can easily see it would take nearly one year to totally consume all the material.

This time period was unacceptable to the management of Riverside Cement, as a decision was reached to terminate the operation of our #2 Grey Kiln on or about August 1, 1987. Due to the nature and magnitude of our situation at Crestmore, upper management has consented to extend this shutdown date until the contaminated soil issue is resolved, but not exceeding a December 1, 1987 mandate. This is a purely economic move, and each week's extension of our pyroprocessing portion of the manufacturing process, is causing additional financial burdens on the Corporation as a whole.

Bearing all of this in mind, we have formulated a consumption timetable which will allow for eliminating the material totally, or as close as possible. This methodology requires massive addition of the contaminated soils blended with the other components. It also calls for insulflation of contaminated soil through addition into the firing end of our rotary kiln. In addition, we are in the process of installing a metered system that will allow for addition of precrushed contaminated soil in with our feed system that will be put into action based on the ability of the process to withstand any additional soil, without destroying equipment within or after the rotary kiln.

With these 3 systems in place and functioning, it is feasible that we have an opportunity to reduce or eliminate entirely the amount of contaminated soil we have excavated.

On the downside of this endeavor, we will, in utilizing the three systems, produce a product which will be greatly below standards and specifications acceptable by the industry. Because of this, we will be required to stockpile this material, and blend it with normal quality product in very minute quantities, over a very long period of time. Naturally, this will again be a financial burden, as normal, modern, material handling methods will not be allowed during the stockpiling or reclaiming of this large amount of materials.

Based on all of this information, we are pursuing Alternative #1 as quickly as logistics permit. We will attempt to eradicate our problem as quickly as the process permits. If further refractory or equipment damage occurs, we will judge each case on its economic merit, as to continuing this course of action. Fallback to Alternative #1 is Alternative #2.

Alternative #2

Laboratory studies, utilizing controlled conditions (i.e. weighed amounts of materials, and an electric muffle) have shown that grossly contaminated soil from the excavation have received massive reduction in TPH levels, upon as little as 1 hour at 1000°F (see Attachment). Realizing that our feed system and our rotary kiln are far from "controlled conditions", we feel that an attempt at converting the contaminated soil to "virgin soils" is a good possibility using our in-place pyroprocessing system.

We have placed in our system a TPH monitoring station, which produces hard copy of our TPH levels in our gas stream prior to, and during, our contaminated burns. Again, noting that we are using much higher temperatures during our normal manufacturing process, our monitoring has not shown an appreciable increase in TPH levels while monitoring has occurred. This data leads us to the assumption that a straightforward "virgin soil" burn is a possible alternative toward the solution to our problem.

From the financial standpoint, this option leaves us with very little other than 50,000 tons of sterile dirt, and the many costs in obtaining its sterility. Off-quality product, even though it must be handled many times, and blended in very small quantities, is a better alternative economically speaking, via recapturing product.

If this alternative is attempted, and for any reason is found to be an unacceptable solution, we would fall back to our final solution, which is Alternative #3.

Alternative #3

Riverside Cement Company, Crestmore Plant, has a "sister" plant located in San Bernardino County, specifically, the community of Oro Grande, California. This plant operates 7 rotary kilns and

routinely consumes 200,000 tons per month of raw materials, during normal production months. At this location, an oil spill occurred, in which San Bernardino County Department of Health Services assisted management of the Oro Grande Plant in resolving. They were allowed to mix the contaminated soil with their raw materials, and consumed the mixture in their rotary kilns. The quantity of materials consumed was very small in comparison to our spill (i.e. 250 tons) but was nonetheless allowed.

The Crestmore Plant location, routinely receives raw materials and clinker from our Oro Grande facility, utilizing a trucking firm named D.T.I. (Dalton Trucking, Inc.). Due to the quantities of materials which DTI handles for the Riverside Division, they have received from the California PUC a deviated hauling rate, which is economically lucrative versus the normal PUC rates.

If the jurisdictional differences between Riverside County, and San Bernardino County could be agreed upon and resolved, we would propose that we utilize a backhaul from the DTI trucks, and substitute the contaminated soil from Crestmore as a raw material component we normally supply to Oro Grande (i.e. "Capo clay"). To Riverside Cement this is a reasonably economic solution to our current situation, via the PUC deviated rate.

In summary, our proposals call for the utilization of alternative #1, until such time that its realized as an uneconomic alternative. We would then propose we attempt Alternative #2, for a sterile soil burn. We feel this is viable, but our concerns for TPH emissions are not optimistic. If Alternative #2 is not fruitful, we would then hope the two-county regulatory agencies could come to a jurisdictional agreement that would allow for alternative #3.

Respectfully yours,

Patrick M. Hill
Production/Project Manager

Attention: Mr. Joe Asbury
Hazardous Materials Specialist

Dear Joe:

In response to your request for information regarding our current status and future planned activities surrounding the final closure of the large underground storage tank located at our Crestmore Plant, I will discuss, in depth, our situation.

A. Efforts to Date

Primary efforts to date have involved excavation of soil containing TPH in excess of 500 ppm from the area of the former six million gallon fuel storage tank. By way of aerial photography and subsequent aerial survey, we have estimated that the total number of tons excavated from the area underneath and adjacent to the former storage tank is approximaterly 70,531 tons.

Attachment #1 is comprised of several aerial contour drawings of the underground storage tank excavation site and of the stock pile areas located in the Plant. Legends have been inserted on these drawings to show sample numbers and dates taken. These drawings attempt to show relative sampling stations. Also in the attachment will be found the laboratory analysis of total petroleum hydrocarbons in parts per million, as derived by Geotest Laboratories, an independent subcontractor. Sample numbers found on the drawings can be referenced on the Geotest Laboratory data and hydrocarbon levels can be established.

As you are aware, and with your approval, we attempted several alternative methods of processing these raw materials within our plant processing equipment. One of these methods addressed raw material we mutually considered very high in petroleum hydrocarbon content. This raw material was stockpiled in an existing, empty, raw material stock pile area, commonly referred to as a "raw bay". We ground this material in our raw

milling system and eventually conveyed it to an isolated raw material storage silo. During this time, we were involved in the design and construction of an insulflation system to allow us to "pump" this material into the firing end of our grey Portland Cement rotary kiln.

The above being accomplished, we began the addition of insulflated material at the maximum rate we were able to consume, without effecting our process. In this fashion, we were capable of consuming approximately 1,000 tons of this material. As the kiln was shut down prematurely, we currently have approximately 1,000 tons of this material stockpiled in the isolated silo. This represents the remainder of the high petroleum hydrocarbon content materials.

One item is of interest regarding observations made during the insulflation process; the insulflation resulted in a reduction in the nitrous oxides emission levels! Because of our continuous monitoring equipment, we observed periods of reduced NOx levels while insulflation dust was being injected. The reduction level varied considerably, but its overall effect was noticeable.

Another alternative method employed at Crestmore addressed the raw material with lower petroleum hydrocarbon levels, which was removed from around and under the tank during excavation. As this material was very similar in chemical composition to our raw material (Capo clay) (see Attachment II), we built several raw material mounds blending all ingredients with different quantities of the clayey soil from the excavation. We effectively consumed these raw material mounds in our grey cement kiln during the normal course of activities routine to the manufacture of Portland Cement clinker.

During our burning process, we routinely monitor NOx, SOx, O2, and CO, along with many temperature pick up points that are routine to our pyroprocessing. We also added to our instrumentation, a rental piece of hardware obtained via KVB Co. This device monitored total petroleum hydrocarbons, in parts per million, drawing the sample from the exit gas stream behind our I. D. fan. This system was operated on an 8 hr./day basis (when the kiln was in operation, and when the device was capable of use). In this manner, we were able to monitor TPH levels at 15 minute intervals from our Main Control Room.

It was quickly ascertained that this method could be effectively used without any adverse effect on the environment or our product. However, due to the large amount of soils excavated, it also became apparent that the time frame required to introduce this material as a raw material would be approximately one and one-half years -- a time period inconsistent with the long-planned termination of operation of our grey cement kiln scheduled for shortly after August 1, 1987.

Upon realizing that we would not have the time necessary to "routinely" consume the remaining tons of stockpiled raw materials, we changed our

processing philosophy to attempt to process the stockpiled soil more rapidly. Initially, the material we utilized was processed into good quality Portland Cement clinker. With the change in philosophy, we increased our addition rate of the stockpiled soils up to the point of manufacturing clinker that was below A.S.T.M. Specifications. This clinker was isolated and stockpiled in an area not normally used for clinker storage and will be blended in with good quality clinker at a rate that will not effect the quality of the finish cement.

This was our mode of operation until the grey kiln system was damaged beyond the extent of economical repair. At that point, we ceased burning in the kiln to re-evaluate our position. Our re-evaluation resulted in the following conclusions:

1. The clayey material excavated under and around the tank are a chemical equivalent to a product routinely consumed during the pyroprocessing portion of the Portland Cement clinker manufacturing process.

2. The Bunker "C" (#6) fuel oil which is contained in this raw material is immobile and shows no tendency to migrate from its place in the soil.

3. This raw material does possess a residual fuel content. (Approximately 500 B.T.U./lb.).

4. It has been shown by the Crestmore experiments, conducted in concert with the Riverside County D.O.H.S., that this particular soil, raw material blended in the proper proportions, can effectively be used as a substitute raw material to manufacture Portland Cement clinker in a cement kiln, with no adverse effects on the environment, the process, or the equipment.

5. Because of the low risk of contamination and the large quantity of stockpiled raw materials, it does not appear feasible or reasonable to dispose of these soils in a Class I landfill.

6. Although Crestmore no longer has at its disposal the necessary equipment used during the manufacture of Porland Cement clinker, we do operate within our division a "sister plant" located at Oro Grande, California, in San Bernardino County. They possess the necessary equipment and processing expertise to allow for the blending and consumption of the stockpiled raw materials.

7. The Crestmore Plant routinely receives raw materials and clinker from the Oro Grande facility. A subcontractor, Dalton Trucking Industries, daily has a minimum of 110 double trailer bottom dumps running in a circuit from Oro Grande to Crestmore, with an empty return. (This type of tractor/trailer typically hauls 27 tons each.)

8. Because of the monthly volumes involved, D.T.I., on behalf of Riverside Cement, applied for and was granted a "deviated rate" from the California P.U.C. As a result, the costs associated with "back-hauling" the stockpiled materials to our Oro Grande facility, as a substitute raw material, is economically viable, versus typical P.U.C. rate drayage.

B. Proposal For Further Use of Stockpiled Soils

All of the above information was studied and discussed at length with you and the appropriate government regulatory officers. In summary, I will outline our proposal for final disposition of our stockpiled raw materials.

We propose that permission to burn the stockpiled soils be obtained from the San Bernardino County Air Pollution Control District. We are permitted, under a long history of permits, to burn raw material components, normal to the chemical composition required for Portland Cement, to manufacture clinker. We are also permitted to burn several different types of fuel, relative to the pyroprocessing portion of the process. (Bunker "C" or #6 fuel oil being one type.) Thus, burning the stockpiled materials should be viewed as nothing unusual or out of the ordinary.

Utilizing D.T.I. trucks on a back-haul arrangement, we can load the stockpiled soils for transport to Oro Grande. These trucks are all equipped with tarpaulins and they will routinely be used. Routing for these back-haul vehicles will be the same as the empty vehicles (shown on Attachment III) and, as such, will have no additional impact on the traffic flow normal for this route. We feel we can load a minimum of 37 truck loads per day for back-haul. This minimum number of trucks would calculate a time table of ~~77~~ 10 five day weeks necessary for the transport of stockpiled soils.

The proposed stockpile area at the Oro Grande facility is shown on Attachment IV. Historically, this area was typically used for stockpiled Capo clay, and has been built-up and compacted through the years of use. This, coupled with the physical nature of Capo clay, we feel is an ideal stockpile site and will be impervious to migration into the subsoils. The area in question will be properly bermed for containment.

Our Oro Grande facility operates seven (7) rotary cement kilns and routinely consumes 150,000 tons of proportioned raw materials per month, during normal production. The Oro Grande plant management team feel that they can substitute 500 tons per week of the stockpiled soil in place of Capo clay, and produce a quality product virtually unchanged in all regards to typical Portland Cement clinker. Compared to total production, the 500 tons per week estimate is obviously conservative. Nevertheless, at this conservative rate, the stockpiled soils will be consumed over 88 weeks (22 months).

I hope that the above scenario can be approved by all appropriate regulatory agencies as a reasonable solution to our current situation. It is also our hope that, with your assistance and the assistance of the California State Alternative Technologies Department, we can expeditiously begin transferring the stockpiled soils to Oro Grande and begin the burning of same with our process.

As you are aware, since being commenced by Riverside Cement Co., this project has imposed a large financial burden. Since the start of the project in late 1986, until the excavation was completed in August, 1987, we have expended in excess of $600,000. In keeping with the Company philosophy of being "a good neighbor", and a "concerned citizen", we have kept all regulatory agencies fully apprised of our actions. In addition to the lead agency, the County of Riverside Department of Health Services Underground Tank Division, we have cooperated with and received support from representatives of the State of California Alternative Technology Division, the South Coast Air Quality Management District, the Federal E.P.A., and the Regional Water Quality Board. We have also met with the representatives of the San Bernardino County Air Quality Control District, in the high desert, to discuss and obtain their input.

It has been our goal since the inception of this project to return the area excavated to grade elevation. To accomplish this, we propose to use soil indigenous to the Plant, and excavated material possessing documented total petroleum hydrocarbon levels acceptable to the lead agency. We will then place nutritious top soil as a cap and hydroseed the entire area. This will evolve into a greenbelt enclave within the Plant where we plan to plant trees and create an employee recreation area for use during lunches and breaks.

The cost surrounding the aforementioned ecological endeavors are relatively high. Additionally, the cost of transporting this quantity of materials for stockpiling and ultimate consumption, even utilizing a "deviated rate", are outstanding. The combined estimated cost for the total closure of this very unusual tank will be in excess of $700,000.00. As you have stated in the past, the type of regard for environmental concerns, as demonstrated by Riverside Cement Company, has been exemplary. It is my belief that we have pursued this project diligently, with all of the tools at our disposal. We have demonstrated our integrity and credibility at all times. The cooperation we have received from the "lead agency" has been exceptional and has allowed us to advance this tank closure towards a successful conclusion.

I believe this summary contains all the information that has been requested. If, after review, you wish additional information, I will be available to meet or correspond with you at any mutually agreeable time. Thank you once again for your cooperation and assistance throughout this project.

Best regards,
RIVERSIDE CEMENT COMPANY

G-1417

Patrick M. Hill

Section V - HEALTH HAZARD DATA

THRESHOLD LIMIT VALUE

Respirable Dust 5 mg/M^3
Total Dust 10 mg/M^3
20 Mppcf

EMERGENCY AND FIRST AID PROCEDURES

Irrigate eyes with water, consult physician if irritation continues. Follow normal personal hygene procdures of washing exposed skin areas with soap and water.

EFFECTS OF OVEREXPOSURE

Acute: Clay (like other forms of common dirt) can dry the skin. It can irritate or scracth the eyes and may irritate the upper respiratory system.

Chronic: Clay may cause inflammation of the upper respiratory tract. Exposure to excessive concentrations may cause pulmonary disease.

Section VI - REACTIVITY DATA

STABILITY
Clay is stable

INCOMPATIBILITY
None

HAZARDOUS DECOMPOSITION PRODUCTS
None

HAZARDOUS POLYMERIZATION
Will not occur

Section VII - SPILL PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS SPILLED
Use vacuum or sweep up spill. Can be wet and scooped up.

WASTE DISPOSAL METHOD
Can be disposed as common waste. Comply with Federal, State and Local Regulations.

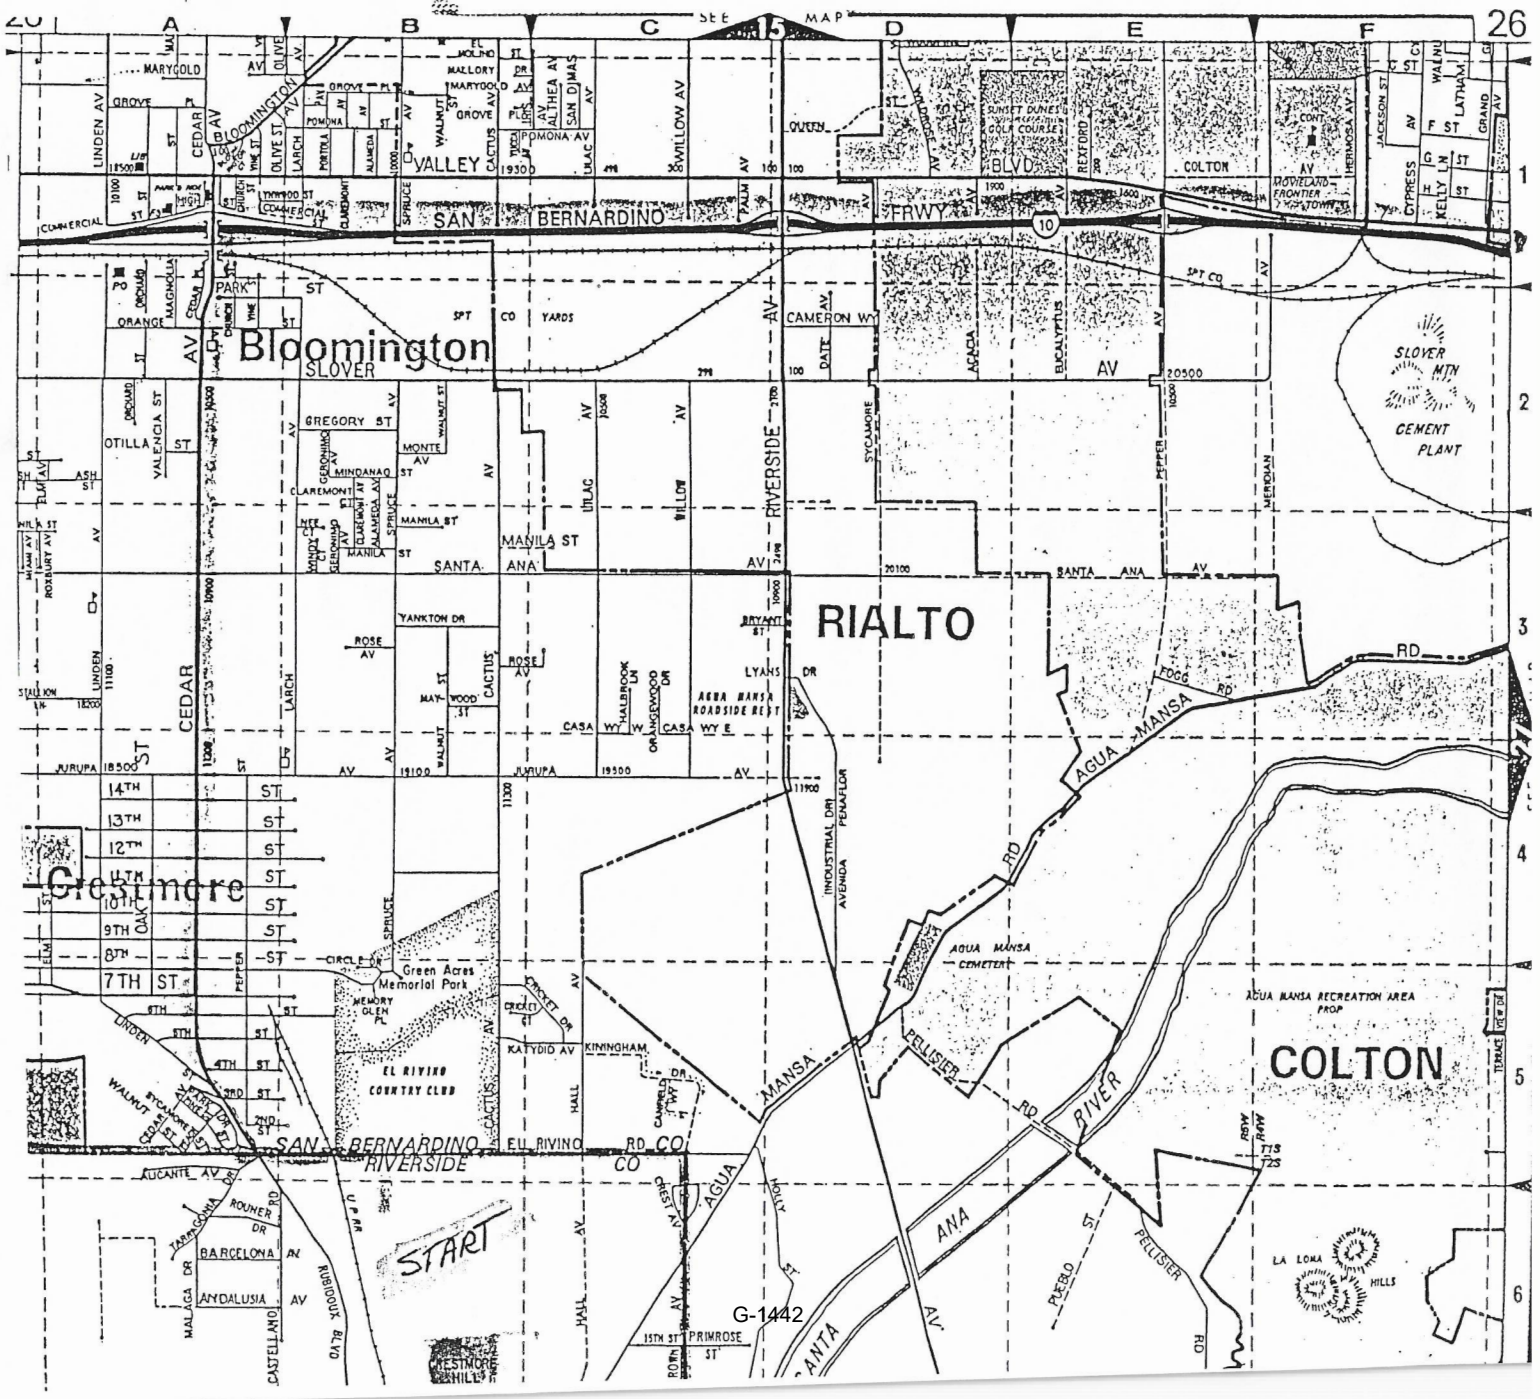
Section VII - SPECIAL PROTECTION INFORMATION

RESPIRATORY PROTECTION
In dusty environments, use NIOSH approved respirator for Pneumoconiosis producing dusts.

VENTILATION
Local exhaust can be used if necessary to control airborne dust levels

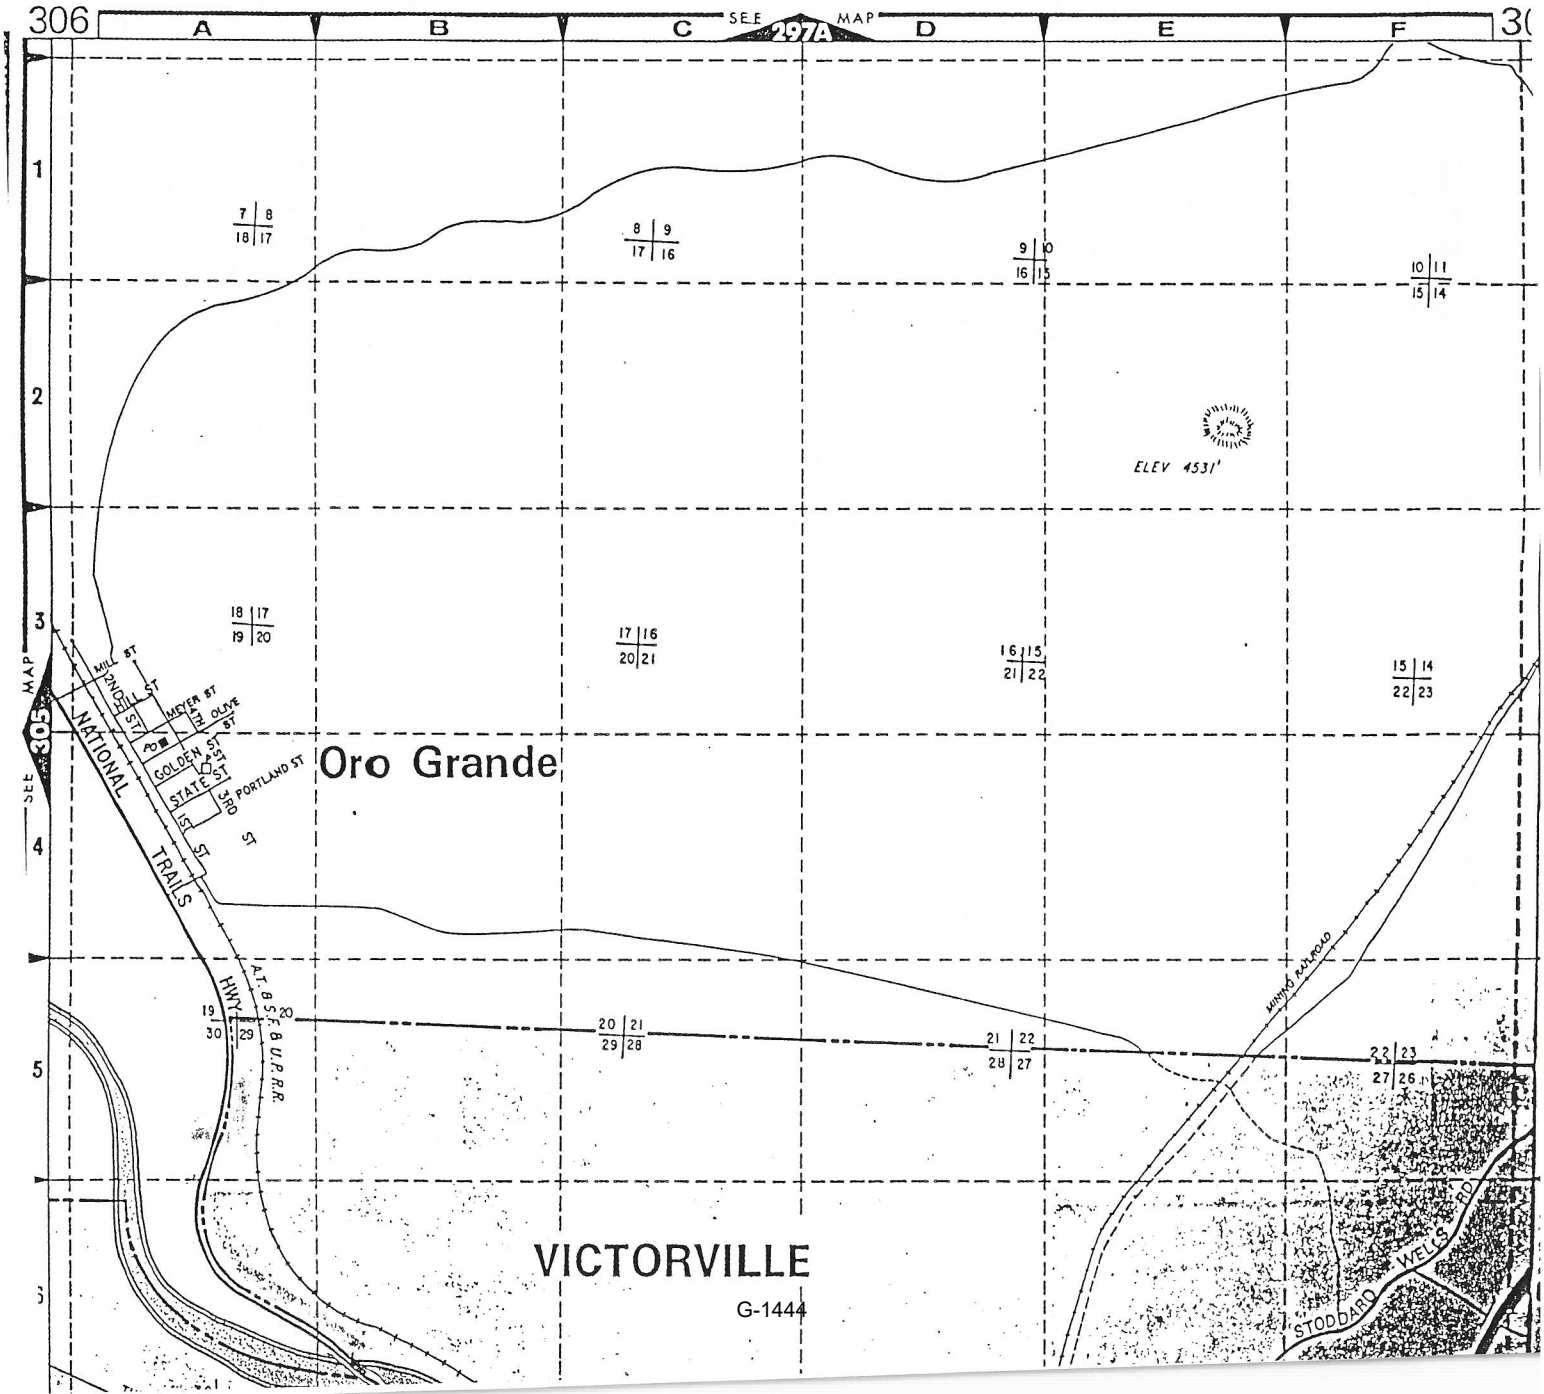
EYE PROTECTION
Normally not necessary

SKIN PROTECTION
Normally not necessary



Section IX - SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORING



OTHER PRECAUTIONS

ATTACHMENT III

Trucks will exit Crestmore Plant via El Rivino St. (westbound). Turning north on Cedar Avenue, they continue to the 10 Freeway, entering eastbound. At the I-10 and the I-215 intersection, they will exit onto the northbound I-215, continuing onto I-15 northbound as it merges with I-215. They will exit I-15 in Victorville using the "E" Street exit, going west as it becomes National Trails Highway. Continuing on National Trails Highway to the second plant entrance for the Oro Grande Plant, then onto the clay stockpile area. (See attached detail maps).

Mr. Joseph Asbury
Hazardous Materials Specialist
3636 University Avenue
Riverside, CA 92501

Dear Joe,

In reference to our recent meeting at your office, the purpose of this correspondence is to restate Riverside Cement Company's intentions, regarding the disposition of the excavated soils we have stockpiled at our Crestmore facility.

As we discussed, the opportunity to utilize these materials as a "substitute raw material" during the production process for Portland cement clinker, does still exist at our Oro Grande facility. Although this is a very expensive option, it is environmentally, a better solution than disposing of these materials in a Class 1 landfill.

The option we discussed at this morning's meeting, and agreed to begin as a trial, would involve using the excavated soils to formulate a "Road Mix", which would be used to pave roads at the Crestmore facility. The specific amounts of "Road Mix" to be formulated must still be quantified by the E. L. Yeager Company. As soon as these quantities are ascertained, I will forward them to you.

Our test area is shown in highlight on the attached plot plan. We will begin with a 3" lift of the "Road Mix", being applied to an area measuring approximately 100 ft. x 525 ft. Since many details still need to be worked out regarding the proper mix, we do not know at this time, how much of the excavated soils we will be utilizing on this test plot. Providing we have attained a suitable quality for "Road Mix", and assuming your agency agrees after viewing the site and its result, Riverside Cement Company then intends to utilize the entire quantity of the excavated materials in formulating "Road Mix" to be used throughout the Crestmore Plant facility.

This option is consistent with the suggestion offered by the State of California, Department of Health Services, in mid-year 1987, when they suggested the utilization of these soils as road base for asphalt paving. Investigation at that time resulted in the opinion that this material's density and compactability did not meet minimum standards for sub-base materials. However "Road Mix" paving, by virtue of being a blend of materials, should provide adequate paving for our Plant. It will also assist in reducing potential dust emissions due to truck traffic on unpaved road surfaces.

Sometime in the future we will submit a proposal to you, addressing the disposition of the 30,000 - 40,000 tons of chemically blended raw materials to which we added some of these excavated soils. These raw material piles have been circulated through our sample collection equipment where samples withdrawn at a given volumetric rate, to form composite samples representative of the entire pile. The composite samples were analyzed for T.P.H. (Total Petroleum Hydrocarbons) by an independent, certified testing laboratory. As you recall, the analysis showed an average content of 1500 PPM total T.P.H. using approved EPA testing methods.

I hope this correspondence adequately summarizes the contents of the meeting with your staff, Bruce Rieser, and myself.

If anything further is required, please contact me at (714) 683-3660, ext. 342. If not, I will notify you in a timely manner, prior to the date of the application for the proposed test area.

Sincerely,

Patrick M Hill

JAN 23 1989
RIVERSIDE CO.
HEALTH DEPT.
Environmental Health

Dear Joe:

Pursuant to our meeting at E. L. Yeager Construction Company, Inc.'s offices on December 2, 1988, I would like to summarize our discussions since some of the points we discussed represent a change from our last correspondence dated August 31, 1988 (attached).

Prior to our meeting we initiated preliminary testing, via an independent laboratory, to determine if the stockpiled raw materials stored at Crestmore could be used as asphalt base or "road mix". A quantity of the materials were mixed 1:1 proportionately with a 5% solution of SC 800; the resulting mixture was compacted and placed inside cylinders to cure. After curing, the mixture was then tested for stability. The results of the stability test show that the materials could be used for either road mix or base.

During our meeting on December 2, 1988, we asked you how your agency would view the stockpiled material after it had been mixed with the SC 800. If it is considered to be stabilized, our plan would be to run the entire stockpile through the proportioning and treatment process and stockpile it at Crestmore. Some of this material will then be used for paving projects within the Plant, while the remainder could be sold to one of the paving companies within our parent company for use as base materials.

In order to assess the extractability of the petroleum product from the finished mixed product, we agreed to have an independent laboratory perform tests under EPA Methods 9070 and 9071. The EPA Method 9071 test is designed to determine the total oil and grease content of the sample material, while the EPA

Method 9070 test is designed to determine the amount of the total oil and grease which is extractable.

The EPA Method 9070 and 9071 tests were performed by Babcock Laboratories and the total oil and laboratory reports containing those test results were previously "faxed" to your office. For your convenience, I have enclosed copies of those laboratory reports with this letter. As indicated in those laboratory reports, the EPA Method 9071 result showed very high concentrations of total oil and grease -- 45,000 mg/kg or 4.5%. The EPA Method 9070 results, on the other hand, indicated that less than 10 mg/l of the total oil and grease was extractable which is equivalent to less than 100 mg/kg of the total oil and grease in the mixture.

Based on our prior conversations and these test results, it appears that the oil and grease in the mixture of stockpiled raw materials and SC 800 is very stable and that, consequently, extraction of total petroleum hydrocarbons ("TPH") will be minimal. Therefore, I would appreciate it if you would confirm in writing that --

A. The mixture of stockpiled raw material and SC 800 can be handled and considered as typical product from a cold process asphalt plant;

B. Riverside Cement Company will not need any additional permits to transport the product mixture nor will it have to comply with any manifesting requirements;

C. The type of information and level of detail which the county will need regarding any uses of the product mixture.

As this process will involve considerable expense to implement, I would like your written response to the above points, as they are all factors in the final equation.

Joe, thank you again for your help through this situation. Your knowledge and assistance have been invaluable.

Best regards,

Pat Hill

Patrick M. Hill
Plant Manager

GENERAL BUSINESS INFORMATION:

Facility Description

Riverside Cement Company is a manufacturer of Portland cement. The Plant covers over 135 acres of land and employs almost 150 workers. The adjoining land surrounding the Plant consists of agricultural, light industrial and some private residences. The actual physical layout of the Plant can be described in the various areas according to the manufacturing or support functions in that area.

The GREY PLANT is primarially a dry material storage, handling, and milling operation. The dry materials consist of finely ground cement dust, limestone, and gypsum in various mixtures. Of primary concern from a hazardous materials standpoint is the presence of ACINTOL (tall oil, fatty acids) and DIETHYLENE GYLCOL, both of which are stored in aboveground undiked storage tanks. Other hazardous materials in the area would include LUBRICATING GREASES or OILS in 55 gallon drums or in smaller containers.

The WHITE PLANT is similar to the Grey Plant in operation except for the presence of two cement calcining kilns. The kilns can contain temperatures of up to 3000 degrees F, and can use a combination of fuels including DIESEL FUEL, #6 FUEL OIL and NATURAL GAS. The DIESEL FUEL is stored in underground storage tanks. The #6 FUEL OIL is stored in an aboveground diked storage tanks. At the milling operations ACETIC ACID (80% concentration) and DIETHYLENE GYLCOL is used as grinding aids. They are stored in aboveground diked storage tanks. LUBRICATION GREASES and OILS are also used throughout the White Plant.

The SHOPS are located near the Packhouse and at the north end of the Plant. They provide all of the maintenance support for the Plant. In these areas, these substances may be encountered in 55 gallon drums or smaller containers: ACIDS (battery and cleaners) and small amounts of other corrosives, SAFETY SOLVENT and other solvents, various AEROSOL SPRAYS, and compressed gasses including ACETYLENE, OXYGEN, and NITROGEN. UNLEADED GASOLINE is stored underground at the garage.

The PACKHOUSE is a distribution and packing operation for the Plant and does not have any large amounts of hazardous materials. There is a small aboveground DIESEL FUEL storage tank used to fuel the forklifts in the packhouse area.

Throughout the Plant HIGH VOLTAGES may be encountered. They can be found in all Motor Control Centers (MCC's) and can contain voltages of up to 4160 volts. Other areas also contain high voltages, but are generally well marked. Any switchgears or wires encountered should be considered live. NATURAL GAS is piped throughout the Plant in underground lines. Large underground WATER LINES run throughout the Plant. In many of the storage silos sealed RADIATION sources of CESIUM 137 can be found.

Building construction includes poured concrete walls, sheet metal over metal or wood framework, masonry, and wood framed stucco. Some transite panels exist in the Plant.

For further information see specific Emergency Response Procedures.

GENERAL EMERGENCY INFORMATION:
*** IN THE EVENT OF AN EMERGENCY ***

1. If necessary, and if possible, evacuate persons affected or potentially affected by the incident.

2. Announce Emergency Situation:

   a.) Radio to RC 40 or phone extension 280.
   b.) Describe situation to supervisor or foreman
   c.) Foreman contact emergency coordination or emergency response personnel.

FIRE/RESCUE	911
POLICE	911
AMBULANCE	911
HOSPITAL	788-3000
(4445 Magnolia, corner of 14th and Magnolia)	
COMMUNITY INDUSTRIAL CLINIC	781-8828
(4444 Magnolia, across from Community Hospital)	
CONTAINERIZED CHEMICAL	(800)233-3748
LARRY LARGENT	(619)242-8510
PAT HILL	(714)783-8928
RICK BALL	(714)799-9531
ROBERT SHARP	(714)924-3329

3. If possible, abate the emergency with personnel on site.

4. If necessary, Emergency Coordinator will direct the abatement of emergency:

   a.) Determine the nature and scope of emergency
   b.) Contain spill or leak
   c.) Direct response until relieved.
   d.) Contact appropriate agencies or response personnel

5. When emergency is abated:

   a.) Coordinator will notify employees and others affected by emergency that the emergency is over or the status of emergency.

   b.) Clean up operation will commence as necessary.

6. Following emergency:

   a.) Reports will be filled with appropriate agencies.
   b.) An in-plant report will be generated by coordinator.

7. Incident review will take place with Plant personnel and

Chemical Release

In the event of a chemical release or threatened release:

1. If the release is a small one and does not pose a threat to human health or to the environment, clean up the spill yourself or contact a maintenance crew to clean up the spill.

2. If the release is a large one or threatens human health or the environment;

   a.) Contact the mill foreman on duty;
   -Mill foreman may direct clean up or containment or contact the emergency coordinator;

Larry Largent	Extension: 315 Home: (619) 242-8510
Patrick Hill	Extension: 268 Home: (714) 783-8928
Rick Ball	Extension: 342 Home: (714) 799-9531
Robert Sharp	Extension: 365 Home: (714) 924-3329
Disposal Control Services:	(714) 983-0342

   b.) Explain the nature of the chemical spill:
   -Chemical
   -Amount
   -Where the release is taking place.
   -Are there any injured?
   -Does the release threaten environment?
   -Have there been any containment procedures?
   -Agencies contacted?

3. Emergency coordinator may direct containment or direct response agencies to contain release. Clean-up operations will commence at the end of the emergency.

4. Emergency coordinator will notify the appropriate agencies- (See Notification Plan)

5. After the emergency has been abated, an In-plant "Incident Report" will be filed.

6. An emergency response review and assessment will be conducted and response plans will be modified as needed.

Chemical Release

NOTIFICATION PLAN

In an emergency involving a release or threatened release of a hazardous material the appropriate agencies will be notified. When contacting the agencies, provide the following information;

- -Name and telephone number of reporter.
- -Name and address of facility.
- -Time and type of release (Drum leakage, spilled material from truck, etc.)
- -Name and amount of material released and threatened release amounts
- -Extent and number of injuries
- -Actions taking place to mitigate or reduce the emergency
- -Potential hazards to human health or environment
- -Other pertinent information

EARTHQUAKE

In the event of a major quake that results in rupture of service lines, or other factors that indicate the shutdown of business for a period of time, the following procedures should be followed:

1.) The Plant Manager will determine if the Plant's operation should be shutdown. This decision will be based on a variety of factors including safety of employees and surrounding communities, protection of equipment and protection of environment.

2.) The Plant Manager may delegate responsibilities, as needed to various plant employees to carry out the safe shutdown of the Plant, in addition to carry out of needed emergency response. In general, the duties will follow this basic pattern:

a.) SHUT OFF UTILITIES:
-Gas Lines (Mike Jordan; Supervisor-Pipe Fitters)
-Water Lines/Pumps (Mike Jordan, or Rick Neumann-Maintenance Manager)
-Electrical (Paul Fogg, Supervisor-Electricians)

b.) SHUT DOWN OF KILNS:
-Shut down of kilns (Rick Ball, Supervisor-Production)

c.) FIRST-AID:
-Robert Sharp, Packhouse Manager

d.) DEBRIS REMOVAL:
-Joe Nava, Supervisor-Labor Gang

e.) RESOURCE EVALUATION:
-Dave Vernon, Supervisor-Storeroom
-Robert Valle, Office Manager

3.) In the event of a quake, all plant personnel will meet in the parking area south of the safety training building. A headcount and announcement of the immediate plans will be made at that time. Injured employees will be brought to this are which will be referred to as the "Staging Area." Any further treatment should be carried out there.

4.) As assessment of action will be made at this staging area. If the magnitude of the quake is such that Plant shutdown is necessary and subsequent evacuation is in order the announcement will be made at that time.

5.) The Plant Manager will assume the role of coordinator or in his absence, the Production Manager or Safety Engineer will assume the role.

6.) If needed, plant equipment can be used for community emergency response. Plant employees may be asked to assist in emergency response.

7.) Also, it should be noted that it may become necessary for employees to remain on plant premises until such time as a evacution is in order. This decision will be made in conjunction with local emergency responders and directors.

RE: Soil Sample Results From Under The 6,000,000 Gallon Oil Tank

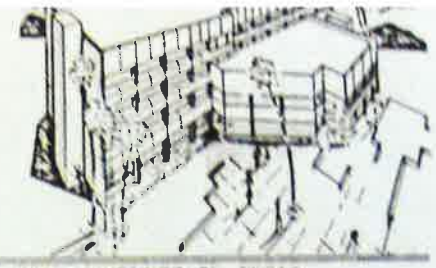
This letter is in response to your request for a confirmation that the last soil sampling results taken from below your 6,000,000 gallon underground storage tank show no significant contamination and will require no further site mitigation.

With the provision that the results obtained from the soil sampling were accurate and properly taken, it is the position of this Department that no further action will be needed at this location.

It should also be pointed out that the contaminated soil removed from below the tank still needs to be disposed of in accordance with your previous plans that are on file with this office.

This letter does not relieve you or your company from any responsibilities mandated under the California Health & Safety Code if additional or previously unidentified contamination is discovered at this same location.

If you have any questions regarding this correspondence, please contact me at (714) 369-1141.



Sincerely,

Joseph L. Asbury

RE: Contaminated Soil at Riverside Cement Company, 1500 Rubidoux Blvd., Riverside

Dear Pat:

This correspondence is in response to your request for written confirmation. The stock piles of soil that are contaminated with Bunker 6 heating fuel located at the Crestmore Plant in Riverside can be used as raw materials for a typical product for cold mix asphalt.

After the stock piles are used for cold mix asphalt, the County of Riverside will not require any further permits for transporting the product to appropriate use sites. However, the County will require the approximate location and quantity of materials upon final destination.

If you have any questions regarding this letter, please contact me at (714) 369-1141.

Best Regards,

Joseph Asbury

Dear Mr. Hill:

Subect: Riverside Cement, 1500 Rubidoux Blvd., Riverside

This letter confirms the completion of site investigation and remedial action for the underground storage tanks at the above site. With the provision that the information provided to this agency was accurate and representative of existing conditions, it is the position of this office that no further action is required at this time.

Please be advised that this letter does not relieve you of any liability under the California Health and Safety Code or Water Code for past, present, or future operations at the site. Nor does it relieve you of the responsibility to clean up existing, additional or previously unidentified conditions at the site, which cause or threaten to cause pollution or nuisance or otherwise pose a threat to water quality or public health.

Additionally, be advised that changes in the present or proposed use of the site may require further site characterization and mitigation activity. It is the property owner's responsibility to notify this agency of any changes in report content, future contamination findings, or site usage.

If you have any questions regarding this matter, contact this office at (714) 358-5055.

Jan 16, 1992

Dear Mr. Hill:

This correspondence is in response to a request from Riverside Cement regarding the permitting status of one (1) six million gallon (Bunker C-# 6 fuel oil) tank that was removed during the summer of 1987.

The tank in question was a concrete above ground storage tank with more than 10% of the tank below grade, thus regulated by the County of Riverside, Department of Health as an underground storage tank. The contamination below the tank impacted in excess of 50,000 cubic yards of soil (Reference Project # 87-127).

Prior to the removal of the six million gallon tank the County of Riverside did not issue operating permits. Further, due to the size of the tank no monitoring alternative or precision testing options were available. Therefore, the only permits that were issued were the permits for removal of the six million gallon tank.

If you have any further question please contact me or Sandra Bunchek at (714) 358-5055.

Sincerely,

Michael R. Shetler

Topic #93-776

REMARKS:

9-6-94: Reinspection conducted at above property. Reinspection focused on soil contamination resulting from a piping leak of Bunker oil #6. See workplan submitted on 1-6-94. Entire site of ~~excavation~~ contamination was excavated. Dennis Smith stated that their consultants were currently preparing a new work-plan to address the possible contamination below the boiler room. (see photos.) Current plan will conduct a maximum of three (3) boring. Analysis shall be EPA 418.1 All work shall be approved by this office prior to commencing.

RE: Site Assessment Workplan for the White Kilns Pipeline

Dear Mr. Hill:

The Riverside County Department of Environmental Health, Hazardous Materials Management Division has received and reviewed the Workplan for Site Assessment for the White Kilns Pipeline. The workplan will be acceptable provided the following requirements are met:

- **Analytical testing** - Three (3) of the highest contaminated boring samples, as determined by the field geologist, based on visual observations and an ultraviolet photoionization detector shall be analyzed according to an EPA fuel screen, EPA method 8020 and 418.1. The remaining samples shall be analyzed according to the best suited analytical method. As discussed on Friday, December 9, 1994 remediation may not be a practicable or a economical option. If the contamination will be left in place, a Toxicity Characteristic Leaching Procedure (TCLP) shall be conducted on the three (3) samples that exhibit the highest levels of contamination. The TCLP shall be conducted using water as the solvent.

- **Vertical and Horizontal Borings** - It is acceptable that the actual number of soil samples selected for laboratory analysis will be based on field observations. However, two (2) consecutive clean samples (10 ft.) will be required to confirm the extent of the contamination in each boring

As you requested, I have scheduled January 10, 1995 to oversee the implementation of the site assessment and sampling. If you have any questions regarding this matter, you may contact me at (909) 358-5055.

Sincerely,

Daniel T. Workman

RE: Site Assessment Report for Riverside Cement Company dated July 7, 1995

Dear Mr. Suher:

This correspondence is regarding our telephone conservation on November 21, 1995. This office and the Regional Water Quality Control Board has received and reviewed the above referenced work plan for the Riverside Cement Company.

For the work plan to be approved, the proposed remediation plan shall be revised to include the following:

- The disposal method of the 450 cubic yards of contaminated soil (33,000 - 37,000 mg/kg TPH) that will be excavated.
- All generated materials must be properly disposed within ninety (90) days from the date of generation.
- All materials generated as a result of field activities at this site must be labeled, secured and containerized or completely covered, lined and bermed to prevent further discharge to the environment.
- A 4-inch well be installed at the midpoint between the original point of release and boring #7. The well shall be drilled to the point of auger refusal. Please submit a well completion diagram, indicating seal, screen etc. The well shall be monitored for TPH twice the first month and then once a month for an additional two months. The report for the three month monitoring period shall be submitted to my attention on/before March 31, 1996.

Please schedule with myself a minimum of five working days prior to anticipated commencement of all field activities. Feel free to contact me at (909) 358-5055 if you have any questions regarding this matter.

Sincerely,

Daniel T. Workman

RE: Closure of the White Kilns Pipeline Remediation Project

Dear Mr. Hill:

This Department is in receipt of the report prepared by Ryan-Murphy Inc., dated March 21, 1996. The referenced report detailed the well installation and described the monitoring procedures at the site of the diesel release. The report indicated that the well was checked for the presence of free product on four (4) separate occasions over a three month period (January 96- March 96).

With the provision that the results obtained from the soil sampling, well installations and monitoring were accurate and properly implemented, it is the position of this Department that no further action will be required at this location.

It should be pointed out that this letter does not relieve you of any responsibilities mandated under the California Health and Safety Code if additional or previously unidentified contamination is discovered at this same location.

If you have any questions regarding this matter, please feel free to call me at (909) 358-5055.

Dear Mr. Smith:

RE: Removal of four underground storage tanks (USTs) at 1500 Rubidoux Blvd., Riverside

This Department is in receipt of the closure report prepared by *Decon Environmental Services Inc.*, regarding the removal of two 12,000 gallon diesel tanks, the 10,000 gallon gasoline tank and the 250 gallon kerosene tank. The diesel and gasoline tanks were removed on June 23, 1997 under permit #97-144. The kerosene tank was removed on July 21, 1997 under permit #97-169. It has been determined that no significant contamination exists (reference APCL analytical report, lab I.D. # 801-972947, dated 06/25/97).

With the provision that the results obtained from the soil sampling were accurate and properly handled, it is the position of this Department that no further action will be required at this location.

It should be pointed out that this letter does not relieve you of any responsibilities mandated under the California Health and Safety Code if additional or previously unidentified contamination is discovered at this same location.

If you have any questions regarding this matter, please feel free to telephone me at (909) 358-5055.

PERMIT FOR CLOSURE

#1602

TYPE OF PERMIT

- [X] Removal
- [ ] Abandonment in Place
- [ ] Temporary Closure (12 Months Only)

This permit shall not be construed so to allow the violation of any law, nor does it prevent further corrections of errors found on the application, plans, or at the site. Plans must be resubmitted for approval if any additional changes are made by the applicant.

In addition to this permit, all applicable permits required by the local fire department, building department, and the air quality management district must be obtained and should be available for review at the closure site.

All tank closures must, at a minimum, comply with the California Underground Storage Tank Regulations and the appropriate section of the California Health & Safety Code.

RIVERSIDE CEMENT CO. has applied for and is granted a permit to
Owner/Corporation/Applicant

REMOVE 1 underground storage tank(s) at
Remove/Abandon/Temp. Close No.

RIVERSIDE CEMENT CO. located at
Facility Name

1500 RUBIDOUX BLVD. in RIVERSIDE, California
Street Address City/Town

Underground tank closure inspections **must be scheduled five (5) business days in advance.** Telephone (714) 358-5055.

Permit Approved By — 07-14-87 Date — 87-169 Plan Check #

*This Permit for Closure is VALID FOR 90 DAYS from the date of approval. If no reasonable action is taken within that period, the applicant will be required to reapply for a closure permit with all pertinent fees associated.

Riverside Cement - Maintenance
Facility No. 81502 ✓
1490 Rubidoux Blv.
Riverside, California 92509.

Dear Sirs;

RE: Underground Storage Tanks removed at Riverside Cement - Maintenance, 1490 Rubidoux Blv., Riverside, California, 92509, Ca..

This department is in receipt of results from soil sampling done below your fuel tank on May 25, 1999. It has been determined that no significant contamination exists under the UST and that no further site mitigation will be required (reference Associated Laboratories, Inc. Analytical Results Report, Lab Request #37710, 806 North Batavia, Orange, California, Ca., 92868 , lab analyses dated May 26, 1999).

With the provision that the results obtained from soil sampling were accurate and properly handled, it is the position of this department that no further action will be required under the UST at this location.

Be advised that this letter does not relieve you of any responsibilities mandated under the California Health & Safety Code if additional or previously unidentified contamination is discovered at this same location.

If you have any questions regarding this matter, please feel free to contact me at (909) 358-5055.

Sincerely,

Roy Bryant

WHITE KILNS PIPELINE SITE ASSESSMENT

In August, 1993 a pipeline leak was discovered at the Crestmore facility. The leak occurred in an underground pipeline connecting an above ground No. 6 diesel fuel tank to supply pumps for the White Kilns. On January 30 and 31, 1995, soil borings were advanced and soil samples retrieved for hydrocarbon analysis. This report describes the work performed and summarizes the results.

BACKGROUND

In November, 1995, a workplan for the site assessment work was submitted to the Riverside County Department of Environmental Health, Hazardous Materials Management Division for review and approval. The workplan described the site history, background of fuel transfer activities, initial excavation work on the white kiln pipeline, and site assessment approach.

Workplan Summary and County Acceptance

Two areas of the white kilns were to be covered by the site assessment: 1) soils beneath and adjacent to the former routing of the No. 6 fuel oil pipeline; and 2) soils beneath a former diesel pumping station. Eight vertical borings would be drilled in the assessment area. Borings would be advanced to 30 feet below ground surface (BGS) or refusal. Additionally, two horizontal boreholes were proposed for assessing soils beneath the boiler building. Soil samples would be analyzed by using EPA method 418.1 (Total Recoverable Petroleum Hydrocarbons - TRPH).

The County's acceptance letter (Attachment A) approved the workplan with two provisions:

1. Soil samples are to be analyzed using the most suitable analytical method. In addition, the three borehole samples with the highest hydrocarbon concentrations are to be further analyzed according to EPA fuel screen, EPA method 8020, and 418.1. If soils are to be left in-place, a Toxicity Characteristic Leaching Procedure (TCLP) is to be performed on the samples that exhibit the highest levels of hydrocarbons. The TCLP will use water as the solvent.

2. The number of samples per borehole will be based on field observations. However, two consecutive clean samples (10 ft.) will be required to confirm the extent of the hydrocarbons in each borehole.

On-site Geology and Assumed Groundwater Depth

The soils at the site are reported to be identified by the USDA Soil Conservation Service as the Greenfield type. The soils are characterized as sandy loams found on the west and southwest side of the quarry. The soils are brown sandy loam derived from granitic materials. The soils are well-drained and typical of alluvial deposits. Beneath these deposits, granitic rock predominates the area. It is anticipated that the granitic formation will be encountered during borehole drilling at about 30 feet below ground surface (BGS).

Crestmore Lake located southeast of the white kilns is approximately 80 feet below the white kiln's ground surface. It is therefore assumed that groundwater beneath the site is approximately 80 feet BGS.

ASSESSMENT PROCEDURES

With few exceptions, the work plan, as amended by Riverside County, was followed explicitly. The only exception to the workplan was the addition of one additional soil boring, B-9. Boring B-9 was included within the work to define the horizontal and vertical extent of hydrocarbons identified in boring B-1. Figure 2 identifies the location of the nine soil borings. The location of each boring is as follows:

Borings 1, 2, and 3:	drilled within the excavation and along the pipeline;
Boring 9:	drilled on the northern edge of the excavation along the pipeline route to determine horizontal and vertical impact of hydrocarbons in soil;
Borings 4, 5, and 6:	drilled on the south-southwest side of the valve pit to determine if hydrocarbons have migrated both vertically and horizontally from the pipeline as it entered the underground, concrete valve pit; and
Borings 7 and 8:	drilled to the east/southeast of the boiler building to determine if diesel fuel from past pumping activities has migrated into the underlying soils.

The soil boring, sampling and chemical analysis work was performed on January 30 and 31, 1995. Ryan Murphy Inc. mobilized a drill rig to the site on January 30, 1995, and began advancing borings in the area of each of the eight planned locations identified in the workplan. For each boring, soil samples were retrieved at five foot incremental depths, reviewed by an on-site geologist, classified using the Unified Soil Classification System (USCS), and reported on soil boring logs. The logs, located in Attachment B, identify depth of sample, USCS lithology, blow counts, PID/FID concentration

recordings, and a description of the soil sample. Each boring log also identifies the final depth of the boring. In several of the borings, drill refusal was encountered due to bedrock conditions.

Soil samples were covered, capped, taped, labeled, and stored on ice within an ice chest. Chain-of-custody's were prepared and accompanied the samples to the laboratory.

As drilling proceeded on January 31, 1995, Centrum Analytical Laboratories mobilized an on-site laboratory to Riverside Cement. Soil samples, retrieved the previous day, were delivered to the on-site lab for immediate analysis of TRPH and/or diesel. Samples selected for analysis were determined by field observations, PID readings, or depth of sample. Since one of Riverside County's criteria was to have at least "two consecutive clean samples" to confirm the extent of hydrocarbons in each borehole, at least two to three soil samples were selected from each boring. Analytical results reported on January 31, 1995, assisted in determining the need for an additional boring (B-9) to assess the impact of hydrocarbons detected in boring B-1 (See Figure 2).

Additionally, in accordance with the County's acceptance letter, three soil samples exhibiting the highest hydrocarbon concentrations (borings B1-10, B2-25, and B7-45) were selected and forwarded to Centrum's off-site laboratory for fuel screen analysis. This suite of hydrocarbon evaluations includes analysis for Total Extractable Hydrocarbons (TEPH) and BTEX.

Based on in-field evaluations and preliminary data reported by the on-site laboratory, it appeared that the soils in boring B-7 (located adjacent to the diesel pumping station) would remain in place. Thus, in accordance with the County's letter, a soil sample (B7-45) was submitted to the off-site laboratory for TCLP analysis.

At the completion of the drilling work, each borehole was grouted with hydrated bentonite chips.

RESULTS

Reported hydrocarbon concentrations are summarized in Table 1. Laboratory data sheets and chain-of-custody forms are included in Attachment C. Four borings (three vertical: B1, B2, and B7;, and one horizontal HB-2) were reported with detectable concentrations of hydrocarbons.

Lithology

The boring logs support the generalized geologic site description. The soils within the white kilns study area can very generally be described as follows:

starting at ground surface to five feet BGS - fill; 5 feet to 20 feet BGS - clays to silty clays to silty sands; 20 feet to 40 feet sand, medium to fine, grading to zones of decomposed granite. All soil samples were described as brown (various shades of color) to reddish brown. Decomposed granite was described as white to brown to black, some with black mica flakes. Auger refusal was encountered in four borings (B-3 @ 35 feet, B-5 @ 40 feet, B-6 @ 45 feet; and B-7 @ 45 feet.

Decomposed granite, grading into a formation causing refusal to a hollow stem drill rig, occurs generally between 40 to 45 feet below grade. This is a very generalized description, as the site is not level and drilling depths recorded in the boring logs are described as beginning at ground surface. Analysis of the bedrock formation is provided in Attachment D. The analysis indicate the material is primarily calcium carbonate (i.e. quartz diorite, granite).

Boiler Building

Two horizontal borings were hand-augured underneath the boiler building at a depth of approximately 6 to 7 feet BGS. Boring HB-2 met refusal 8 feet into the side wall of the excavation. The reason for the refusal is unknown. A TRPH of 19 mg/kg was reported at the five foot horizontal retrieval zone. This concentration is not significant and could have resulted from the clays located under the building. Horizontal boring HB-1 was reported with no detectable concentrations of recoverable hydrocarbons at 5 to 10 feet horizontally underneath the boiler building.

As indicated in the following descriptions, the hydrocarbons reported in borings B1 and B2 are related to the release from the No. 6 fuel oil pipeline. Boring B7 is located adjacent to the diesel pumping station and reflects the diesel release from this area of the site.

Pipeline Impact

Borings B-1, -2, -3, -4 and -9 bound the area of the pipeline. From the results summarized in Table 1, the highest concentrations of hydrocarbons are in boring B-1 at 10 feet below ground surface (30,000 mg/kg TRPH and 37,000 mg/kg TEPH, with detectable concentrations of BTEX). A TCLP analysis requested on the soil sample at B-1 at 10 feet was reported at 14 mg/l. Low concentrations of TRPH are reported in boring B-1 at 30 feet (6 mg/kg) and B-2 at 25 feet (34 mg/kg). No detectable concentrations of TRPH were reported in borings B-3, B-4, and B-9.

The detectable concentrations of TRPH in borings B-1 and B-2 were two of the three highest reported hydrocarbons during the assessment work. In accordance with the County's approval letter, a fuel screen was performed on these two samples. As indicated in Table 1, the high concentration of TRPH in B1-10 was confirmed with the fuel screen (extractable hydrocarbons

(TEPH) and BTEX). However, the relatively low TRPH concentration reported in B2-25 (34 mg/kg) was reported with non-detectable concentrations of fuel screen compounds. The indication is that the hydrocarbons reported in B2-25 are of a heavier, longer-chain compound. The naturally occurring fats and oils in clays and silts can be reported by this testing method (418.1). Thus the concentration of 34 mg/kg is not considered as impacting the site. This conclusion is supported by two non-detectable concentrations of TRPH at depths of five (B2-30) and 10 feet (B2-35) below B2-25.

Based on the analysis summarized in Table 1, the impact of the hydrocarbons reported in boring B1-10 appears to be localized within the pipeline zone. This boring is bounded by two borings (B-3 and B-9) with no reported hydrocarbon concentrations. At deeper depths within boring B-1, the hydrocarbon concentrations trend to non-detectable concentrations. Additionally, when the new replacement pipeline was installed north of the leaking pipeline (see Figure 2), the depth of the pipeline trench was approximately 12 to 14 feet below ground surface. During the construction process there were no reports of stained or odorous soils.

Corrective action for the pipeline soils can be excavation. Soil excavation should start with trenches on either side and paralleling the former pipeline orientation. Boring B-1 location is the benchmark for defining the initial hydrocarbon release area. Because diesel fuel No. 6 tends to not readily flow when cooled, the trenches should be located initially on either side of the pipeline center line. Visual observations and soil odor observations can initially be used to define the extent of the fuel oil. Based on the boring logs, the excavated soils will primarily be clays to approximately 15 feet below grade level at B-1. Below this strata the soils transition to silty sands. Since fuel oil will not easily mobilize within the clays, it is assumed that fuel oils are contained within the clays. The PID readings support this hypothesis (See boring B-1 log).

Diesel Pumping Station Impact

Boring B-7 was installed adjacent to the former diesel pumping station. From a depth of 25 feet BGS to auger refusal at 45 feet BGS, the PID readings increased from non-detect to a high of 447 ppm. Soil samples taken at 40 and 45 feet were reported with diesel concentrations of 7,200 and 9,800 mg/kg, respectively. The fuel screen on sample B7-45 confirmed diesel in the soil, in addition to detectable concentrations of BTEX compounds.

Based on soil results of borings surrounding B-7, namely B-3, -4, -5, -6, and -8, the diesel concentrations reported at the base of B7-45 appear to be localized within the area defined by the circumscribing borings B-3, -4, -5, -6, and -8. Diesel analysis on the deepest samples from borings B4-40, B5-41, and B6-25, -30, and -35 were all reported at non-detectable concentrations (i.e. <5 mg/kg). These results support the local impact theory relative to boring B-7.

Since the impact of the diesel on soils within boring B-7 is deep and the diesel release area is surrounded by operating equipment, buildings, and other surface structures, it is not practical or economically feasible to excavate soils. Therefore, in accordance with the County's approval letter, a TCLP analysis was requested on sample B7-45. As indicated in Table 1, the results were reported at 1.1 mg/l.

As indicated by the boring logs, decomposed granite was encountered during the work and this granite formation caused auger refusal when attempting to advance a boring into the formation. Research into the detail geology of the area surrounding boring B-7 (the boiler diesel release area) indicate that the boiler area is within a granite formation with no apparent groundwater beneath the site. A series of historical drawings (Drawings 1, 2, 3, 4 and 5) retrieved from Riverside Cement archives, supports this statement.

Drawing 1: Crestmore Area - Hydrographic Map (circa 1927)
This is an overview area drawing indicating the location of diamond drilled holes. The significant item is the location of the boiler release area within an outcrop known as bed rock hills - a granite/diorite formation. Groundwater contours do not penetrate the bed rock formation; the contours tend to flow by the bedrock formation.

According to the Crestmore "Mining and Reclamation Plan", Revised June 29, 1990, "Minimal ground water existed on the site until prior to the flooding of the mine in 1979. Since bedrock resides at a depth of only a few feet below ground surface, no aquifers are present." The water forming "Crestmore Lake" and subsequent water noted in the diamond hole drilling, resulted from primarily alluvium groundwater flowing into the area when the alluvium was penetrated in 1979. Further literature searches also indicated that there could be a secondary deeper water source, separate from the alluvium.

However, in the area of the boiler release area, there is no known groundwater due to the granite formation beneath the site.

Drawing 2: W.P. Rowe & Son, June 18, 1952: Crestmore Area Map
This is an overview site map indicating the primary mined areas at the site. The boiler release area is at coordinates 1825 N,1350 E. As indicated by the drawing, the boiler release area is west of the active mining zones.

Mining of the limestone did not advance any further west than indicated on the drawing. The reason was the encountering of granite bed rock material as the mining operation proceeded west. This granite formation was encountered to depths of at least 600 feet below ground surface.

Drawings 3 and 4: W.P. Rowe & Son, circa 1928 Figures.
These two figures indicate the site area and the location of the limestone mining areas. The significance of the Drawing 3 is the location and the notation of the footwall and hanging wall contours. The footwall, the demarcation between the granite and limestone, decreases with depth as the formation dips to the east. The dipping of the limestone to the east is represented in Drawing 4 (Cross-Section C-C). As indicated in Drawing 4, the granite formation is located west and beneath the limestone formation. This same granite formation prohibited mining toward the west (i.e. toward the boiler release area).

Drawing 5: ERM-West, "Technical Evaluation 9/30/1990 EPA FIT Report" prepared for Riverside Cement, November, 1991.
The alluvium groundwater contours are summarized on this drawing. As indicated the groundwater flow is complex and tends to flow around the granite outcropping noted in Drawing 1 above. The location of the diesel release area is outside of the ground water flow influence.

Considering the diesel release area is covered with concrete, the source of the diesel has been eliminated (i.e. the underground tanks and pipeline to the diesel pumps have been isolated from the diesel sump), the diesel pumps have been removed, and the absence of groundwater in the localized surroundings of the release area, the diesel concentrations residing at the granite interface at 45 feet below ground surface do not appear to be impacting the environment. Migration of diesel within the fissures and cracks is assumed to be limited by the naturally occurring clays filling the cracks (reference ERM-West, November, 1991, FIT response).

CONCLUSIONS

1. Soils within the White Kilns area can generally be described from ground surface to depths of 40 to 45 feet as: 5 feet of fill overlaying 5 to 20 feet of clays/silty-clays/ silty-sands; beneath this strata is 10 to 15 feet of sand (fine to medium); the sand grades into a decomposed granite overlaying a bedrock formation ranging between 40 to 45 feet below ground surface.

2. Based on horizontal borings, hydrocarbons have not impacted the soils at a depth of 6 to 7 feet beneath the boiler building.

3. Two consecutive clean soil samples (hydrocarbon concentration < 5 mg/kg) were reported in all but one borehole (B-7). With the one exception, the vertical extent of hydrocarbons in soil has been defined by the work.

4. Hydrocarbon release at the No. 6 fuel oil pipeline appears to be localized within the pipeline alignment. The soils immediately underlying the pipeline are of a clay nature. No. 6 fuel oil released to the soils appear to

be contained within a relatively small area based on non-detectable hydrocarbons in adjacent borings and at depths within boring B-1 beneath the 10 foot depth interval.

5. The diesel pumping station has impacted soils beneath the site. Diesel hydrocarbons have migrated through soils to a depth of at least 45 feet (BGS). Hydrocarbons in soil appear to be limited to the general area surrounding boring B-7. Soil samples at similar depths (up to 40 feet BGS) in borings surrounding the diesel pumping station were not reported with diesel concentrations above a detection level of 5 mg/kg.

6. The vertical extent of hydrocarbons have not been defined at the diesel pumping station (boring B-7). Diesel concentration range between 9,800 to 12,000 mg/kg at a refusal depth of 45 feet below ground surface in Boring B-7. An extracted diesel concentration using the TCLP procedure is 1.1 mg/l. However, the deepest soil samples from borings circumscribing B-7 were reported with non-detectable concentrations of diesel. The indication is the release is localized beneath the former diesel pumping station.

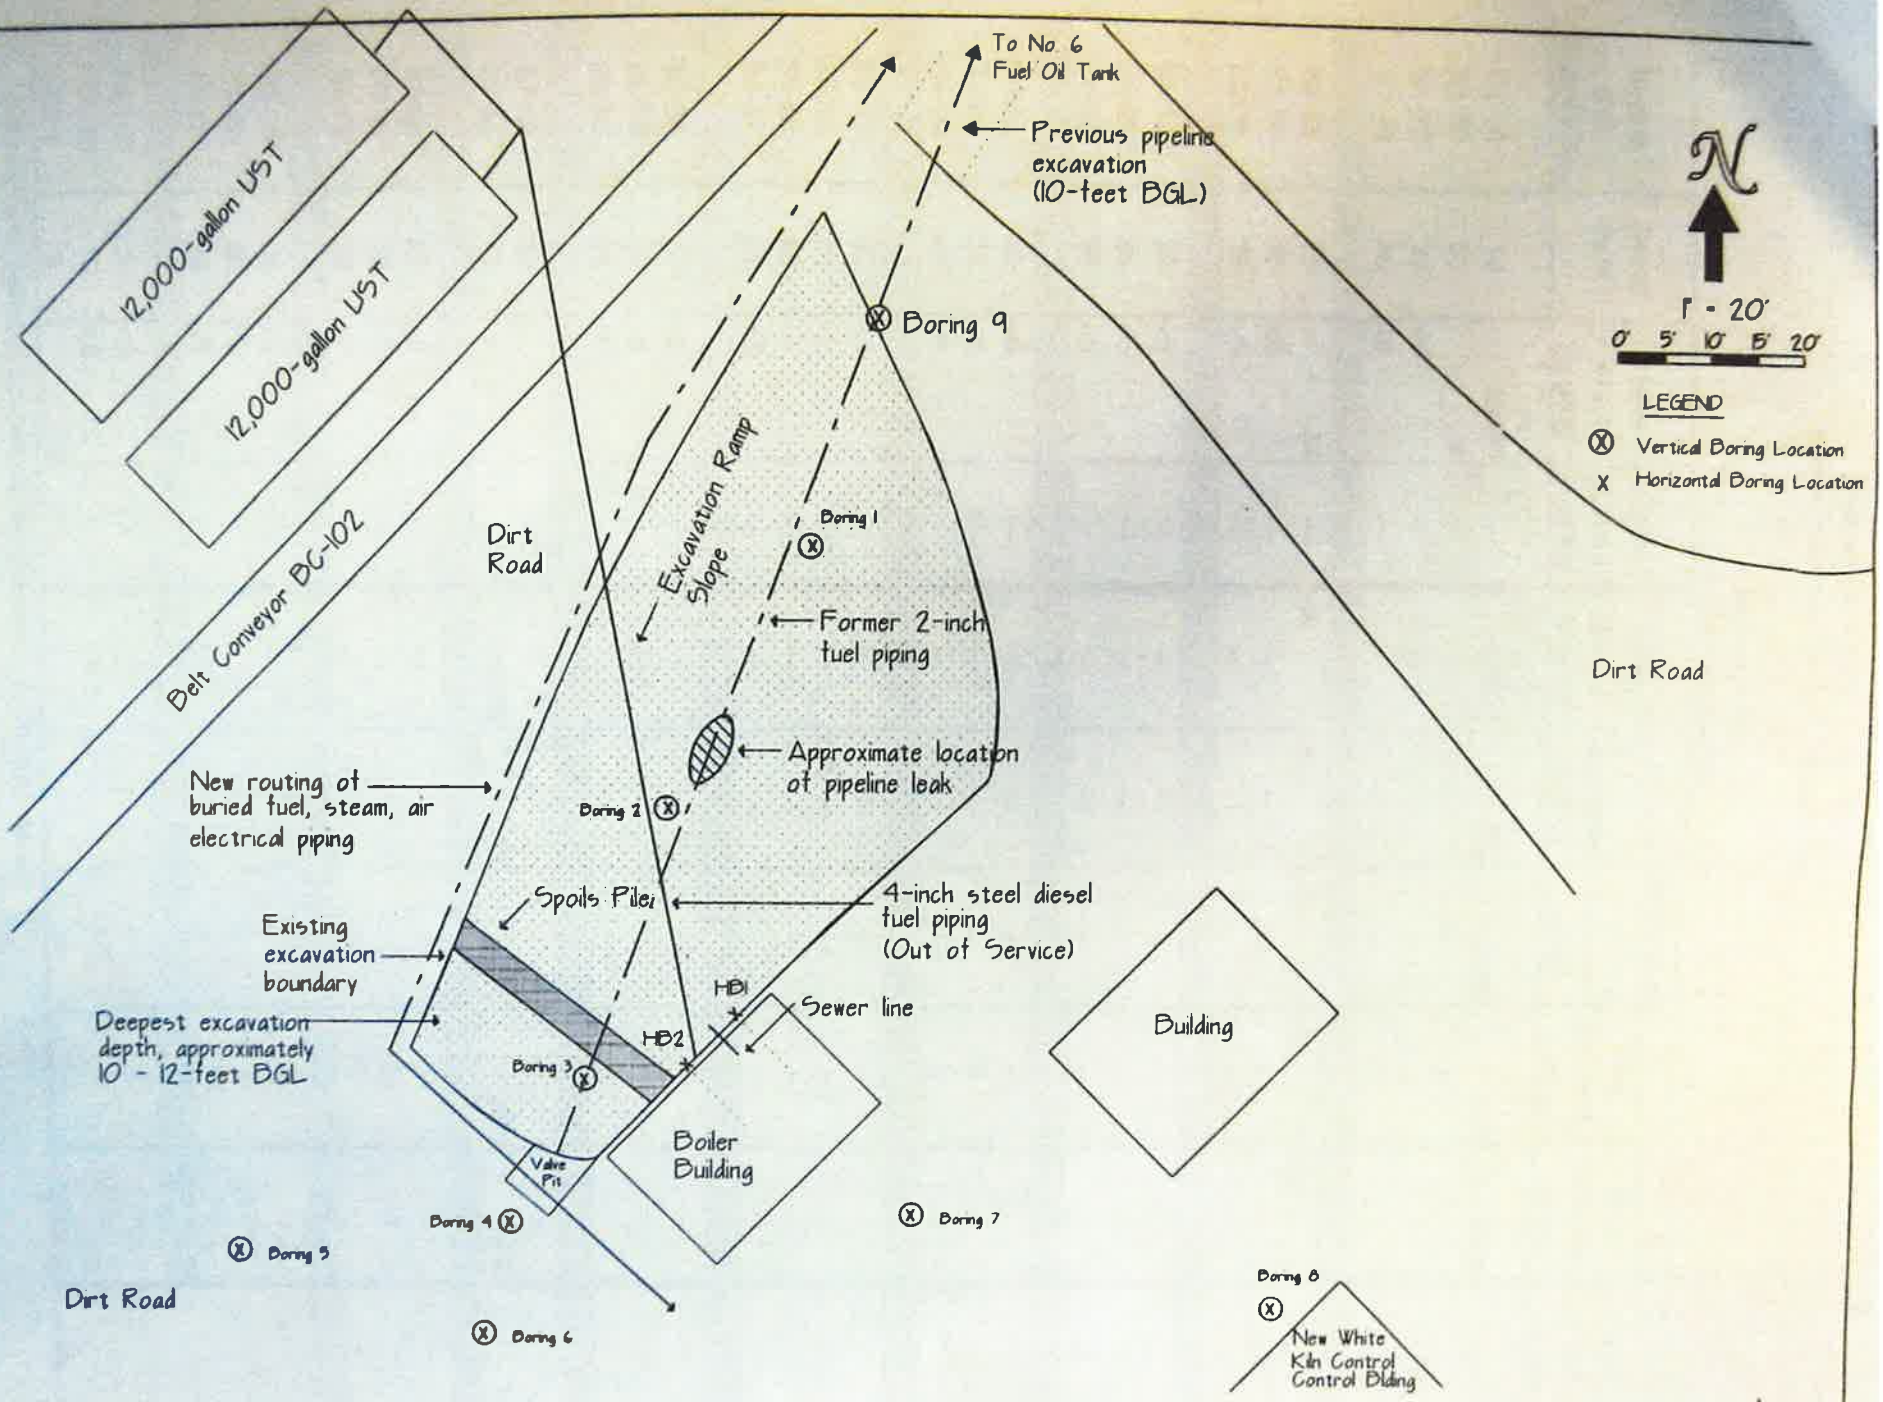
7. Review of the geology within the White Kiln Area describe a granite outcropping beneath the immediate site. Alluvium to various depths surround the bed rock outcrop. Based on water data from the alluvium, historical groundwater studies and summaries performed in 1928, the 1950s, and as recent as 1990, and the absence of water in the borings drilled during this site assessment, there appears to be no groundwater contact beneath the diesel release area.

RECOMMENDATIONS

1. Excavate the hydrocarbon impacted soils, within the existing excavation, adjacent to and surrounding Boring B-1 at 10 feet. The concept is a trench excavation with the former pipeline alignment as the centerline. Assuming that the trench will be 10 feet wide, 15 feet deep, and 50 feet long, the estimated in-place volume is 300 cubic yards. Assuming a swell factor of 20 percent and a contingency of 30 percent, the upper range of soil excavation could reach 450 cubic yards.

2. At the diesel release area, it is recommended that a No Further Action position be taken. Based on review of the local geology, groundwater conditions, and site assessment work, it appears the release is localized. Additionally, a granite formation exists beneath the site. Based on observations in diamond drill holes and evaluation by geologists at other locations within the Crestmore facility, the fissures and cracks beneath the site are more than likely filled with naturally occurring clays, thus, reducing the likelihood of diesel migrating through fissures and cracks within the granite. It is recommended that the diesel be left in place, and allowed to naturally degrade over time by weathering and bacterial degradation.

SITE ASSESSMENT REPORT REVIEW



As required by Riverside County, the Site Assessment activities and subject soil sampling results discussed in this report have been prepared, reviewed, and approved by the undersigned professional engineer.

Bases on currently available data concerning this site, the Site Assessment Report conforms to standard accepted groundwater and engineering geologic practices in use in California at this time.

Re: White Kilns Pipeline Site Assessment Report, July 7, 1995

Subject: Report of findings following remedial excavation of hydrocarbon impacted soil

Dear Mr. Workman:

On behalf of the Riverside Cement Company, this letter summarizes the remedial excavation for the subject project. On November 29, 1995, Ryan-Murphy, Incorporated (RMI) excavated approximately 525 cubic yards of hydrocarbon impacted soil in the area of the former white kiln fuel oil pipeline (see attached Figure 1: Site Plot Plan). This remedial excavation was in keeping with the recommendations included in the Site Assessment Report dated July 7, 1995 and with subsequent discussions with you. The remedial excavation activities were supervised by Ed Suher, RMI project manager.

The impacted soil was removed from the ramp area of the previous excavation and consisted of an excavation approximately 59 feet long by 23 feet wide (at its widest dimension) and ranged in depth from 9 feet deep in the west end to 13 feet deep in the east end, as measured from the existing slope elevations. The preliminary limits of the excavation were based on visual and olfactory observations and field screenings during excavation activities.

A mobile lab was utilized to verify the removal of the hydrocarbon impacted soil at the limits of the remedial excavation. Mr. Suher collected grab samples from the native soil as the excavation progressed in order to confirm removal of any/all impacted soil. Sample locations are indicated on the attached Figure 2: Sample Location Diagram and Figure 3: Excavation Cross Section. Confirmation soil samples were ultimately collected from the bottom, each end, and each sidewall of the remedial excavation.

All soil samples were collected from buckets of native soil extracted from the excavation utilizing the excavator. The samples were collected in sterile, 8-ounce, wide mouth glass jars. To prevent cross contamination, Mr. Suher used a new pair of latex gloves for each sample point. The samples were immediately submitted to an on-site, state certified, mobile laboratory from Centrum Analytical Laboratories, Inc. of Redlands, California under chain-of-custody documentation (chain-of-custody records attached).

All samples were analyzed for total petroleum hydrocarbons (TRPH) by EPA Method 418.1. Two soil samples, WW-1 @ 6' and EW-1 @ 10' initially exhibited TRPH results of 12,000 mg/kg and 6000 mg/kg, respectively. Further excavation was conducted in these two areas and confirmation samples WW-2 @ 6' and EW-2 @ 10' were collected with results of 7 mg/kg and 12 mg/kg, respectively. The remaining confirmation samples from the excavation sidewalls and bottom ranged from non detect (ND) to a high of 15 mg/kg (complete analytical report attached).

Re: White Kilns Pipeline Site Assessment Report, July 7, 1995

Subject: Report of free product monitoring well installation near diesel release

Dear Mr. Workman:

On behalf of the Riverside Cement Company, this letter summarizes the free product monitoring well installation for the subject site. The well installation was in keeping with the Department of Environmental Health's (DEH) November 28, 1995 letter listing workplan revisions. The DEH letter requested that a four inch diameter well be installed at the midpoint between the original point of diesel release and boring B-7 (see attached Figure 1: Site Plot Plan). The purpose of the monitoring well was to monitor for possible free product (TPH) in the area of the release. On January 18, 1996, Ryan-Murphy, Incorporated (RMI) mobilized to the site to install the well. The drilling activities were supervised by Ed Suher, RMI project manager. Plant blueprints were reviewed for verification of underground utility locations, the concrete surface between the point of release and boring B-7 was sawcut, and the well boring was initiated. At approximately four feet below grade (bgl), a two inch natural gas pipe was encountered. Drilling activities were terminated pending repair of the pipe. During repair of the two inch gas pipe, a three inch natural gas pipe was discovered just six inches north of the damaged two inch pipe. Also exposed during the repair of the damaged pipe was an additional two inch natural gas pipe and an eight inch natural gas pipe.

On January 19, 1996, RMI re-mobilized to the site to complete the well installation. Plant blueprints were again reviewed for underground utility locations, the concrete surface was again sawcut, and the well boring was initiated. The 10-inch diameter boring was advanced to a depth of approximately 13 feet bgl when granite bedrock was encountered, resulting in auger refusal.

A four inch diameter PVC well was installed and constructed with 0.020 slotted pipe and #3 filter pack. The screened interval was from approximately thirteen feet bgl to approximately five feet bgl. A three foot bentonite seal was placed above the filter pack and the remaining borehole was grouted to the surface with concrete. The blank casing above the screened interval was extended approximately four feet above the existing concrete surface and protected by an eight inch diameter steel riser with a lockable lid. A well completion diagram is included on the attached boring log.

The former diesel pump sump where the release occurred was estimated to be six to eight feet deep. The screened portion of the monitoring well now extends below the bottom of the former sump. The soil removed from the boring as cuttings was stained grey and emitted a slight petroleum odor. The cuttings were stockpiled on plastic sheeting pending disposal as outlined in RMI's November 28, 1995 letter.

A photoionization detector (PID) was used periodically throughout drilling activities to monitor the soil for volatile organic vapors; the PID readings ranged from non detect at just below the surface to 162 ppm at approximately 10 feet bgl and 112 ppm at the termination depth of 13 feet bgl.

The previous boring drilled adjacent to the sump on January 30, 1995 was also drilled using an identical limited access rig. Eight inch diameter augers were used during this work. Bedrock material was also encountered at approximately the 13 foot level, but due to the smaller diameter augers and subsurface conditions, a depth of 45 feet was reached prior to auger refusal.

Unfortunately, relocating the January 19, 1996 well borehole to possibly reach greater depths was not possible due to the proximity of underground utilities and the constraints of the surrounding structures.

The well was checked for the presence of free product on January 26, 1996, February 5, 1996, February 29, 1996, and again on March 20, 1996. No free product was detected during any of the monitoring episodes.

In conclusion, the former sump and surrounding area are covered with uncompromised concrete. This cover will prevent water intrusion into the subsurface and minimize the potential leaching of residual hydrocarbons to deeper soil depths. Also, previously sampled borings B-4, B-5, and B-8 outlying the sump area did not detect diesel impacts at depth. Based on the recent field instrument readings, borehole observations, and previous drilling and sampling activities, RMI concludes that current site conditions in the area of the former diesel release do not pose a significant threat to the environment. In addition, RMI recommends that no further action be required for this area of the Riverside Cement facility with regards to the former diesel release.

Sincerely,

RYAN-MURPHY INCORPORATED

E G Suher

Contact: Jose Baron

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Langan Engineering were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Search Results:

P.O.# 700045401

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1921 through 2013. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

ADJOINING PROPERTY: ADDRESSES NOT IDENTIFIED IN RESEARCH SOURCE

The following Adjoining Property addresses were researched for this report, and the addresses were not identified in research source.

Address Researched	Address Not Identified in Research Source
1135 HALL AVE	2008, 2003, 2002, 2001, 1996, 1993, 1990, 1986, 1981, 1977, 1970, 1967, 1966, 1961, 1960, 1956, 1955, 1951, 1946, 1945, 1941, 1939, 1936, 1931, 1930, 1927, 1925, 1924, 1921
1135 Hall Avenue	2013, 2008, 2003, 2002, 2001, 1996, 1993, 1990, 1986, 1981, 1977, 1970, 1967, 1966, 1961, 1960, 1956, 1955, 1951, 1946, 1945, 1941, 1939, 1936, 1931, 1930, 1927, 1925, 1924, 1921
12073 Cedar Avenue	2013, 2008, 2003, 2002, 2001, 1996, 1993, 1990, 1986, 1981, 1977, 1970, 1967, 1966, 1961, 1960, 1956, 1955, 1951, 1946, 1945, 1941, 1939, 1936, 1931, 1930, 1927, 1925, 1924, 1921
1400 RUBIDOUX BLVD	2013, 2003, 2002, 2001, 1996, 1993, 1990, 1986, 1981, 1977, 1970, 1967, 1966, 1961, 1960, 1956, 1955, 1951, 1946, 1945, 1941, 1939, 1936, 1931, 1930, 1927, 1925, 1924, 1921
1490 RUBIDOUX BLVD	2013, 2008, 2003, 2002, 1993, 1990, 1986, 1981, 1977, 1970, 1967, 1966, 1961, 1960, 1956, 1955, 1951, 1946, 1945, 1941, 1939, 1936, 1931, 1930, 1927, 1925, 1924, 1921
1520 RUBIDOUX BLVD	2013, 2008, 2003, 2002, 1996, 1993, 1990, 1986, 1981, 1977, 1970, 1967, 1966, 1961, 1960, 1956, 1955, 1951, 1946, 1945, 1941, 1939, 1936, 1931, 1930, 1927, 1925, 1924, 1921
1550 RUBIDOUX	2013, 2008, 2003, 2002, 2001, 1996, 1993, 1990, 1986, 1981, 1977, 1967, 1966, 1961, 1960, 1956, 1955, 1951, 1946, 1945, 1941, 1939, 1936, 1931, 1930, 1927, 1925, 1924, 1921
1725 AGUA MANSA RD	2003, 2002, 2001, 1996, 1993, 1990, 1986, 1981, 1977, 1970, 1967, 1966, 1961, 1960, 1956, 1955, 1951, 1946, 1945, 1941, 1939, 1936, 1931, 1930, 1927, 1925, 1924, 1921
1725 Agua Mansa Road	2013, 2008, 2003, 2002, 2001, 1996, 1993, 1990, 1986, 1981, 1977, 1970, 1967, 1966, 1961, 1960, 1956, 1955, 1951, 1946, 1945, 1941, 1939, 1936, 1931, 1930, 1927, 1925, 1924, 1921
1737 PRODUCTION CIR	2002, 2001, 1996, 1993, 1990, 1986, 1981, 1977, 1970, 1967, 1966, 1961, 1960, 1956, 1955, 1951, 1946, 1945, 1941, 1939, 1936, 1931, 1930, 1927, 1925, 1924, 1921

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Narrative

Job Narrative
440-185001-1

Comments
No additional comments.

Receipt
The samples were received on 5/23/2017 3:55 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.4° C.

Receipt Exceptions

The Field Sampler was not listed on the Chain of Custody.

HPLC/IC
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals

Qualifiers

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

General Chemistry

Qualifier	Qualifier Description
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Login Number: 185001
List Number: 1
Creator: Soderblom, Tim

List Source: TestAmerica Irvine

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
Sample custody seals, if present, are intact.	N/A	Not Present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	False	The Field Sampler was not listed on the Chain of Custody.
There are no discrepancies between the containers received and the COC.	False	Received Trip Blank(s) not listed on COC.
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Comments
No additional comments.

Receipt
The samples were received on 3/29/2017 12:15 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 5.0º C.

Receipt Exceptions

The following samples were received outside of holding time for Cr (VI) 7199: Northern Well (440-180840-1) and MW-3 (440-180840-2).

HPLC/IC
Method(s) 300.0: Due to the high concentration of Chloride and/or Sulfate, the matrix spike / matrix spike duplicate (MS/MSD) for analytical batches 440-396811 and 440-396802 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Method(s) 300.0: Due to the high concentration of Nitrate as N and/or Nitrate as NO3, the matrix spike / matrix spike duplicate (MS/MSD) for analytical batch 440-396810 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Method(s) 300.0: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 440-396801 were outside control limits for Nitrite as N. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method(s) 7199: The following sample was received outside of holding time: Northern Well (440-180840-1), MW-3 (440-180840-2), SW-1 (440-180840-3).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method(s) 200.7 Rev 4.4: Due to the high concentration of Sodium, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 440-397687 and analytical batch 440-398034 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.(440-180553-A-1-B MS) and (440-180553-A-1-C MSD)

Method(s) 6010B: The post digestion spike % recovery for Antimony associated with batch 440-398055 was outside of control limits. (440-180538-A-4-E PDS)

Method(s) 6010B: The continuing calibration verification (CCV) associated with batch 440-398055 recovered above the upper control limit for Cadmium and Cobalt. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: Northern Well (440-180840-1), MW-3 (440-180840-2) and SW-1 (440-180840-3).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
Method(s) SM 2320B: The following samples are associated with this Method Blank and LCS set. Northern Well (440-180840-1), MW-3 (440-180840-2), SW-1 (440-180840-3), SW-2 (440-180840-4), MW-4 (440-180840-5), (LCS 440-397069/29), (MB 440-397069/30) and (440-180840-A-1 DU)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
H	Sample was prepped or analyzed beyond the specified holding time

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits.

General Chemistry

Qualifier	Qualifier Description
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Accreditation/Certification Summary

Client: Langan Engineering & Environmental Srvcs
Project/Site: Agua Mansa Commerce Park

TestAmerica Job ID: 440-180840-1

Laboratory: TestAmerica Irvine

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

440-180840 Chain of Custody

Possible Hazard Identification
☐ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown ☐ Radiological

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)
☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months

Deliverable Requested: I, II, III, IV, Other (specify)

List Number: 1

Creator: Skinner, Alma D

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	False	Refer to Job Narrative for details.
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Comments
No additional comments.

Receipt
The samples were received on 3/29/2017 12:15 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 5.0º C.

Receipt Exceptions

The following sample was received outside of holding time for Cr (VI) 7199: Northern Well (440-180840-1), MW-3 (440-180840-2), SW-1 (440-180840-3).

Metals
Method(s) 6010B: The continuing calibration blank (CCB) for analytical batch 440-400553 contained Lead above the reporting limit (RL). All reported samples associated with this CCB were ND for this analyte; therefore, re-analysis of samples was not performed.Northern Well (440-180840-1), MW-3 (440-180840-2), SW-1 (440-180840-3) and SW-2 (440-180840-4)

Method(s) 6010B: The method blank for preparation batch 440-399786 and 440-399903 contained Lead above the reporting limit (RL). None of the samples associated with this method blank contained the target compound; therefore, re-extraction and/or re-analysis of samples were not performed.Northern Well (440-180840-1), MW-3 (440-180840-2), SW-1 (440-180840-3) and SW-2 (440-180840-4)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Accreditation/Certification Summary

Client: Langan Engineering & Environmental Srvcs
Project/Site: Agua Mansa Commerce Park

TestAmerica Job ID: 440-180840-2

Laboratory: TestAmerica Irvine

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

List Number: 1

Creator: Skinner, Alma D

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	False	Refer to Job Narrative for details.
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

Job Narrative
440-166509-1

Comments
No additional comments.

Receipt
The samples were received on 11/18/2016 3:30 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.9º C.

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

HPLC/IC
Method(s) 300.0: Due to the high concentration of Chloride and/or Sulfate, the matrix spike / matrix spike duplicate (MS/MSD) for analytical batch 440-370129 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method(s) 200.7 Rev 4.4: The laboratory control sample (LCS) for preparation batch 440-370992 and analytical batch 440-371810 recovered outside control limits for the following analytes: Iron, Manganese. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Method Summary

Client: Langan Engineering & Environmental Srvcs
Project/Site: Riverside Cement Plant

TestAmerica Job ID: 440-166509-1

Method	Method Description	Protocol	Laboratory
8260B	Volatile Organic Compounds (GC/MS)	SW846	TAL IRV
300.0	Anions, Ion Chromatography	MCAWW	TAL IRV
200.7 Rev 4.4	Metals (ICP)	EPA	TAL IRV
6010B	Metals (ICP)	SW846	TAL IRV
7470A	Mercury (CVAA)	SW846	TAL IRV
7196A	Chromium, Hexavalent	SW846	TAL IRV
SM 2320B	Alkalinity	SM	TAL IRV
SM 2510B	Conductivity, Specific Conductance	SM	TAL IRV
SM 2540C	Solids, Total Dissolved (TDS)	SM	TAL IRV
SM 4500 F C	Fluoride	SM	TAL IRV
SM 4500 H+ B	pH	SM	TAL IRV
SM 5540C	Methylene Blue Active Substances (MBAS)	SM	TAL IRV

Client: Langan Engineering & Environmental Srvcs
Project/Site: Riverside Cement Plant

TestAmerica Job ID: 440-166509-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

HPLC/IC

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits.
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.
*	LCS or LCSD is outside acceptance limits.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Certification Summary

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

Narrative

Job Narrative
440-168978-1

Comments
No additional comments.

Receipt
The samples were received on 12/12/2016 6:30 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 5.8º C.

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

HPLC/IC
Method(s) 7199: The following samples were analyzed outside of 24-hour analytical holding time due to laboratory oversight: SW-1-20161212 (440-168978-4) and SW-2-20161212 (440-168978-5). The samples were originally analyzed by EPA method 7196 within hold time, but with higher detection limits. The results from both methods are reported for the two affected samples.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method(s) 6010B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with preparation batch 440-376367. The laboratory control sample was performed in duplicate to provide precision data.

Method(s) 6010B: The continuing calibration blank (CCB) for analytical batch 440-376586 contained Selenium above the reporting limit (RL). The following sample associated with this CCB was ND for this analyte; therefore, re-analysis of samples was not performed: MW-4-20161212 (440-168978-2).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.

HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
H	Sample was prepped or analyzed beyond the specified holding time

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Certification Summary

Client: Langan Engineering & Environmental Srvcs

List Number: 1

Creator: Escalante, Maria I

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Comments
No additional comments.

Receipt
The samples were received on 12/14/2016 6:00 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 5.5º C.

Receipt Exceptions

The Field Sampler was not listed on the Chain of Custody.

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

HPLC/IC
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC Semi VOA
Method(s) 8015B: The matrix spike / matrix spike duplicate (MS/MSD) precision for preparation batch 440-376128 and analytical batch 440-376540 was outside control limits. Sample non-homogeneity is suspected because the associated laboratory control sample was within acceptance limits: (440-168951-A-1-B MSD) .

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method(s) 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries and precision for preparation batch 440-376529 and analytical batch 440-376821 were outside control limits for Lead, Antimony and Zinc. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample recovery was within acceptance limits.(440-169732-A-1-D MS) and (440-169732-A-1-E MSD)

Method(s) 6010B: The serial dilution performed for the following sample associated with batch 440-376821 was outside control limits for Lead and Zinc:(440-169732-A-1-A SD)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
Method(s) 3546: The following sample was diluted due to the nature of the sample matrix: Comp-1 20161214 (440-169295-2). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.

GC Semi VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F2	MS/MSD RPD exceeds control limits

Metals

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F2	MS/MSD RPD exceeds control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Certification Summary

Client: Langan Engineering & Environmental Srvcs
Project/Site: Riverside Cement Plant

TestAmerica Job ID: 440-169295-1

Laboratory: TestAmerica Irvine

All certifications held by this laboratory are listed. Not all certifications are applicable to this report.

Authority	Program	EPA Region	Certification ID	Expiration Date
Alaska	State Program	10	CA01531	06-30-17
Arizona	State Program	9	AZ0671	10-14-17
California	LA Cty Sanitation Districts	9	10256	01-31-17 *
California	State Program	9	CA ELAP 2706	06-30-18
Guam	State Program	9	Cert. No. 16-001r	01-23-17 *

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	False	Field on COC is blank.
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True

Narrative

Job Narrative
440-169295-2

Comments
No additional comments.

Receipt
The samples were received on 12/14/2016 6:00 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 5.5º C.

Receipt Exceptions

The Field Sampler was not listed on the Chain of Custody.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Patty, Urvashi, or Camille,

Can you please run the WET for lead on sample Comp-1 20161214 from the attached work order?

What is the estimated TAT and charge for the WET?

Thank you,

Rachel Prohoroff, GIT

Comments
No additional comments.

Receipt
The samples were received on 9/29/2016 5:10 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 0.7º C.

Receipt Exceptions

The following samples was listed on the Chain of Custody (COC); however, no samples was received: LT-11-5 (440-160075-37), LT-11-15 (440-160075-38), LT-AS1 (440-160075-39) and LT-AS2 (440-160075-40).

The Field Sampler was not listed on the Chain of Custody.

GC/MS VOA
Method(s) 8260B: Surrogate Dibromofluoromethane recovery for the following sample was outside control limits: (440-160315-A-1 MSD). Re-extraction and/or re-analysis was performed with concurring results.

Method(s) 8260B: The following samples was diluted due to the abundance of hydrocarbons: LT-9-4 (440-160075-25) and LT-9-8 (440-160075-26). Elevated reporting limits (RLs) are provided.

Method(s) 8260B: Surrogate recovery for the following sample was outside control limits: 4-Bromofluorobenzene is high: LT-9-8 (440-160075-26). Re-extraction and/or re-analysis was performed with concurring results.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method(s) 8270C: The percent recovery for hexachlorocyclopentadiene was below the lower acceptance limit in the continuing calibration verification (CCV) associated with analytical batch 440-359964 . This compound is not classified as a Calibration Check Compound (CCC) in the reference method, and the laboratory defaults to in-house and/or project-specific criteria for evaluation. A standard was run at the reporting limit for this compound to demonstrate sufficient instrument sensitivity. LT-9-4 (440-160075-25), LT-9-8 (440-160075-26) and (CCVIS 440-359964/2).

Method(s) 8270C: The continuing calibration verification (CCV) associated with batch 440-359964 recovered above the upper control limit for 2,2'-oxybis(1-chloropropane). The samples associated with this CCV were non-detect for the affected analyte; therefore, the data have been reported. The following samples are impacted: LT-9-4 (440-160075-25), LT-9-8 (440-160075-26) and (CCVIS 440-359964/2).

Method(s) 8270C: The following samples required a dilution due to the nature of the sample matrix: LT-9-4 (440-160075-25) and LT-9-8 (440-160075-26). Because of this dilution, the surrogate spike concentration in the sample was reduced to a level where the recovery calculation does not provide useful information. Elevated reporting limits (RLs) are provided.

Method(s) 8270C: The source sample for the matrix spike (MS) and matrix spike duplicate (MSD) of preparation batch 440-359695 was diluted due to the nature of the sample matrix. As such, surrogate and MS/MSD spike recoveries were diluted out and are not reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC VOA
Method(s) 8015B: Surrogate recovery for the following samples was outside control limits: LT-9-4 (440-160075-25) and LT-9-8 (440-160075-26). Re-extraction and/or re-analysis was performed with concurring results. The re-analyses have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Job ID: 440-160075-1 (Continued)

Laboratory: TestAmerica Irvine (Continued)

GC Semi VOA

Method(s) 8015B: Surrogate recovery for the following sample was outside control limits: LT-9-4 (440-160075-25). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method(s) 8015B: The following sample required a dilution due to the nature of the sample matrix: LT-9-8 (440-160075-26). Because of this dilution, the surrogate spike concentration in the sample was reduced to a level where the recovery calculation does not provide useful information.

Method(s) 8015B: The source sample for the Matrix Spike/Matrix Spike Duplicate (MS/MSD) associated with batch 440-359694 was diluted due to the abundance of target analytes. As such, surrogate and MS/MSD spike recoveries were diluted out and are not reported.

Method(s) 8015B: The matrix spike (MS) recoveries for preparation batch 440-360059 and analytical batch 440-360322 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method(s) 8082: The laboratory control sample (LCS) for preparation batch 440-360061 and analytical batch 440-360203 recovered outside control limits for the following analytes: 1016. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method(s) 8082: The continuing calibration verification (CCV) associated with batch 440-360203 recovered above the upper control limit for Arochlor1016. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: (CCVIS 440-360203/7) and (440-160409-A-61-C).

Method(s) 8082: Re-preparation and reanalysis of the following samples was performed outside of the analytical holding time: LT-26-(Composite) (440-160075-45). Original extraction was within holding time, however, surrogate recoveries were out of range low most likely due to a poor extraction. The sample was re-extracted past holding time with acceptable surrogate recoveries.

Method(s) 8082: Surrogate recovery for the following samples was outside control limits: LT-9-4 (440-160075-25). Re-extraction and re-analysis was performed with concurring results.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals

Method(s) 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 440-360068 and analytical batch 440-360465 were outside control limits for Antimony and Selenium. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method(s) 6010B: The following samples was diluted due to the nature of the sample matrix: LT-21-2 (440-160075-8), LT-32-4 (440-160075-18) and LT-26-(Composite) (440-160075-45). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep

Method(s) 3546: Due to the matrix, the following samples could not be concentrated to the final method required volume: 1 mlLT-9-4 (440-160075-25), LT-9-8 (440-160075-26), (440-160075-A-25 MS) and (440-160075-A-25 MSD). The reporting limits (RLs) are elevated proportionately.

Method(s) 3546: Re-preparation and reanalysis of the following samples was outside of holding time: LT-9-4 (440-160075-25) and LT-9-8 (440-160075-26). Samples were originally prepared with in holding time, however, the LCS and MS/MSD were out of range low. Re-extraction was performed outside of holding time with acceptable QC. The re-extracts have been reported with an "H" qualifier.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits
F1	MS and/or MSD Recovery is outside acceptance limits.

GC/MS Semi VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits

GC Semi VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits
H	Sample was prepped or analyzed beyond the specified holding time
F1	MS and/or MSD Recovery is outside acceptance limits.

Metals

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Certification Summary

Client: Langan Engineering & Environmental Srvcs
Project/Site: Agua Mansa Commerce Park

TestAmerica Job ID: 440-160075-1

Laboratory: TestAmerica Irvine

All certifications held by this laboratory are listed. Not all certifications are applicable to this report.

Authority	Program	EPA Region	Certification ID	Expiration Date
Alaska	State Program	10	CA01531	06-30-17
Arizona	State Program	9	AZ0671	10-13-16 *
California	LA Cty Sanitation Districts	9	10256	01-31-17 *
California	State Program	9	CA ELAP 2706	06-30-18
Guam	State Program	9	Cert. No. 16-001r	01-23-17
Hawaii	State Program	9	N/A	01-29-17
Kansas	NELAP Secondary AB	7	E-10420	07-31-17
Nevada	State Program	9	CA015312016-2	07-31-17 *
New Mexico	State Program	6	N/A	01-29-17
Northern Mariana Islands	State Program	9	MP0002	01-29-17
Oregon	NELAP	10	4028	01-29-17
USDA	Federal		P330-15-00184	07-08-18
Washington	State Program	10	C900	09-03-17

* Certification renewal pending - certification considered valid.

Subject: Analysis update

Hi Camille,
Please run the samples LT-9-4 and LT-9-8 for all of the analyses listed on the COC.
Thanks,
Drew

Re: Agua Mansa Commerce Park Discrepancies

Drew Lassen <dlassen@langan.com>

Tue 10/4/2016 1:45 PM

To:Tran, Dennis Lam <Dennis.Tran@testamericainc.com>;

Cc:Murray, Camille <Camille.Murray@testamericainc.com>;

Hi Dennis,
Sorry for that discrepancy, you can cross those samples off of the COC from 9/29. Those samples were actually submitted this morning, and are listed on page 2 of the COC from today.
Thanks,
Drew

Hi Drew,

COC 440-160075 attached was received 9/29/16. The other COC was received 10/4/16. Samples LT-11-5 and LT-11-15 are listed on the COC, but were not received. Sample LT-11-5 is marked for TPH 8015, Title 22 Metals and PCBs 8080. Sample LT-11-15 is marked on hold.

Please feel free to contact me, or your PM, Camille Murray, if you have any questions.

Thank you,

DENNIS TRAN

Narrative

Job Narrative
440-160409-1

Comments
No additional comments.

Receipt
The samples were received on 10/3/2016 4:40 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 18.0º C and 21.4º C.

Receipt Exceptions

The following sample(s) was received at the laboratory outside the required temperature criteria: All samples

18.2/18.0c & 21.6/21.4c IR-78 on ice.

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC/MS Semi VOA
Method(s) 8270C: There was 0% percent recovery of benzidine in the matrix spike (MS) and matrix spike duplicate (MSD) of preparation batch 440-360680. Per the EPA method, this compound is subject to oxidative loss during sample preparation.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC Semi VOA
Method(s) 8015B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 440-360631 and analytical batch 440-360534 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.(440-160723-A-21-B MS) and (440-160723-A-21-C MS)

Method(s) 8082: Surrogate recovery for the following sample was outside control limits: LT-XF5-0.5 (440-160409-60). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method(s) 8082: The laboratory control sample (LCS) for preparation batch 440-360061 and analytical batch 440-360203 recovered outside control limits for the following analytes: 1016. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method(s) 8082: The continuing calibration verification (CCV) associated with batch 440-360203 recovered above the upper control limit for 1016. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: LT-XF1-0.5 (440-160409-43), LT-XF2-0.5 (440-160409-44), LT-XF3-0.5 (440-160409-45), LT-XF4-0.5 (440-160409-58), LT-XF6-0.5 (440-160409-59), LT-XF5-0.5 (440-160409-60), LT-XF7-0.5 (440-160409-61), LT-Sewer-10 (440-160409-64) and (CCVIS 440-360203/7).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method(s) 6010B: The continuing calibration blank (CCB) for analytical batch 440-361695 contained Selenium above the reporting limit (RL). All reported samples associated with this CCB were either ND for this analyte or contained this analyte at a concentration greater than 10X the value found in the CCB; therefore, re-analysis of samples was not performed.

Method(s) 6010B: The following sample was diluted due to the nature of the sample matrix: LT-47-(Composite) (440-160409-74). Elevated reporting limits (RLs) are provided.

Job ID: 440-160409-1 (Continued)

Laboratory: TestAmerica Irvine (Continued)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
Method(s) 3546: Due to the matrix, the following sample could not be concentrated to the final method required volume: LT-45-(Composite) (440-160409-73). The reporting limits (RLs) are elevated proportionateLT-45-(Composite) (440-160409-73)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
X	Surrogate is outside control limits
F1	MS and/or MSD Recovery is outside acceptance limits.

Metals

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Certification Summary

Client: Langan Engineering & Environmental Srvcs
Project/Site: Agua Mansa Commerce Park

TestAmerica Job ID: 440-160409-1

Laboratory: TestAmerica Irvine

All certifications held by this laboratory are listed. Not all certifications are applicable to this report.

Authority	Program	EPA Region	Certification ID	Expiration Date
Alaska	State Program	10	CA01531	06-30-17
Arizona	State Program	9	AZ0671	10-13-16 *
California	LA Cty Sanitation Districts	9	10256	01-31-17 *
California	State Program	9	CA ELAP 2706	06-30-18
Guam	State Program	9	Cert. No. 16-001r	01-23-17
Hawaii	State Program	9	N/A	01-29-17
Kansas	NELAP Secondary AB	7	E-10420	07-31-17
Nevada	State Program	9	CA015312016-2	07-31-17 *
New Mexico	State Program	6	N/A	01-29-17
Northern Mariana Islands	State Program	9	MP0002	01-29-17
Oregon	NELAP	10	4028	01-29-17
USDA	Federal		P330-15-00184	07-08-18
Washington	State Program	10	C900	09-03-17

* Certification renewal pending - certification considered valid.

440-160409 Chain of Custody

OC 10/4/16 13:50

Preservation Used: 1= Ice, 2= HCl; 3= H2SO4; 4=HNO3; 5=NaOH; 6= Other _____

Possible Hazard Identification:
Are any samples from a listed EPA Hazardous Waste? Please List any EPA Waste Codes for the sample in the Comments Section if the lab is to dispose of the sample.

☐ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)

☐ Return to Client ☐ Disposal by Lab ☐ Archive for _____ Months

Special Instructions/QC Requirements & Comments:

18.2 18.0 on ice

Custody Seals Intact: ☐ Yes ☐ No	Custody Seal No.:		Cooler Temp. (°C): Obs'd: 21.6 Corr'd: 21.2		Therm ID No.: IR-78

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	False	18.2/18.0c & 21.6/21.4c
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	False	Composite
Residual Chlorine Checked.	N/A

Narrative

Job Narrative
440-160491-1

Comments
No additional comments.

Receipt
The samples were received on 10/4/2016 10:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 5.6º C.

Receipt Exceptions

The Field Sampler was not listed on the Chain of Custody.

These samples are not marked for analysis on the COC. They are 3 of 6 samples to be composited, and the other 3 samples are marked for Title 22 Metals. The composite sample has been logged in for metals.

LT-MW1A-15 (440-160491-25), LT-MW1A-18 (440-160491-26) and LT-MW1A-21 (440-160491-27)

GC VOA
Method(s) 8015B: The following sample was analyzed outside of analytical holding time due to request past hold time: LT-11-5 (440-160491-17).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
Method(s) 8015B: The matrix spike (MS) recoveries for preparation batch 440-360059 and analytical batch 440-360322 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method(s) 8082: The following samples required a copper clean-up to reduce matrix interferences caused by sulfur: (LCS 440-360915/2-A), (MB 440-360915/1-A), (320-22393-A-1-C), (320-22393-A-1-A MS) and (320-22393-A-1-B MSD).

Method(s) 8082: The following samples was analyzed outside of analytical holding time due to late extraction: LT-11-5 (440-160491-17).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method(s) 6010B: The matrix spike duplicate for the following sample associated with preparation batch 440-360478 and analytical batch 440-360662 recovered outside acceptance limits. A post digestion spike (PDS) was performed with acceptable recoveries obtained confirming that sample showed signs of matrix interference. The results have been reported.

Method(s) 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries and precision for preparation batch 440-360997 and analytical batch 440-361520 were outside control limits for Lead. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.(440-160491-A-6-C MSD)

Method(s) 6010B: The following sample was diluted due to the nature of the sample matrix: LT-40-1 (440-160491-6). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
Method(s) 3546: The following sample was added in outside of holding time: LT-11-5 (440-160491-17).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Job ID: 440-160491-1 (Continued)

Laboratory: TestAmerica Irvine (Continued)

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time

GC Semi VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
F1	MS and/or MSD Recovery is outside acceptance limits.
X	Surrogate is outside control limits

Metals

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Certification Summary

Client: Langan Engineering & Environmental Srvcs
Project/Site: Agua Mansa Commerce Park

TestAmerica Job ID: 440-160491-1

Laboratory: TestAmerica Irvine

All certifications held by this laboratory are listed. Not all certifications are applicable to this report.

List Number: 1

Creator: Garcia, Veronica G

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	False	Field on COC is blank.
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

Job Narrative
440-161234-1

Comments
No additional comments.

Receipt
The samples were received on 10/10/2016 4:45 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.3º C.

Receipt Exceptions
The Field Sampler was not listed on the Chain of Custody.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

Metals

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Certification Summary

Client: Langan Engineering & Environmental Srvcs
Project/Site: Agua Mansa Commerce Park

TestAmerica Job ID: 440-161234-1

Laboratory: TestAmerica Irvine

All certifications held by this laboratory are listed. Not all certifications are applicable to this report.

Authority	Program	EPA Region	Certification ID	Expiration Date
Alaska	State Program	10	CA01531	06-30-17
Arizona	State Program	9	AZ0671	10-13-16 *
California	LA Cty Sanitation Districts	9	10256	01-31-17 *

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	False	Field on COC is blank.
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Comments
No additional comments.

Receipt
The samples were received on 4/11/2017 10:10 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 5.9º C.

HPLC/IC
Method(s) 7199: The matrix spike insoluble (MSI) recovery for preparation batch 440-400195 and analytical batch 440-400684 was outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC VOA
Method(s) 8015B: Surrogate recovery for the following sample was outside control limits: (440-182199-A-1 MS) and (440-182199-A-1 MSD). Evidence of matrix interference is present; therefore, re-analysis was not performed.

Method(s) 8015B: The matrix spike and matrix spike duplicate (MS/MSD) recoveries for the following sample associated with 400728 were outside control limits: (440-182199-A-1 MS) and (440-182199-A-1 MSD). The associated laboratory control sample (LCS) and laboratory control sample duplicate recoveries met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals
Method(s) 6020: The post digestion spike % recovery for associated with batch 440-400475 was outside of control limits for Nickel and Selenium. Matrix interference is suspected.

Method(s) 6020: The matrix spike / matrix spike duplicate (MS/MSD) recoveries and precision for preparation batch 440-399621 and analytical batch 440-400475 were outside control limits for Multiple analytes. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) was within acceptance limits.

Method(s) 6020: The serial dilution performed for the following sample associated with batch 440-400475 was outside control limits for Barium: (440-181736-A-1-E SD)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits
F1	MS and/or MSD Recovery is outside acceptance limits.

HPLC/IC

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.

Metals

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F2	MS/MSD RPD exceeds control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Re: Revised Executive Summary of the Remedial Investigation Report
Riverside Cement Company
City of Jurupa Valley, County of Riverside, California
Langan Project No.: 721011301

Dear Ms. Tam:

The following paragraphs provide an overview of known or suspected hazardous materials associated with the former Riverside Cement Plant (RCP; Site), and a summary of mitigation measures to address potential risks to human health and the environment. Information included in this document has been summarized from Langan's report titled, "Remedial Investigation Report (RIR), Agua Mansa Commerce Park, Jurupa Valley, California," dated 9 June 2017, revised 3 November 2017. The RIR was provided to the City of Jurupa Valley. Locations of known or suspected hazardous materials at the Site are shown on Figure 2 of the RIR.

BACKGROUND

The Site comprises 206 acres and has been used for limestone mining, quarrying, and cement manufacturing by Riverside Cement Company the former RCP since the early 1900s. Onsite features include a cement processing plant and supporting infrastructure, silos and kilns, storage areas, office and maintenance buildings, and heavy machinery.

Mining began in 1906 and ceased in the mid-1980s. The Site contains four quarries: the Wet Weather, Crestmore, Commercial, and Lone Star Quarries. The Crestmore Mine flooded in the mid-1980s. The flooded mine is also referred to as Crestmore Lake.

Cement manufacturing took place between 1914 and 2008. Limestone from the mines was mixed with imported materials and burned in rotary kilns to produce cement clinker. Cement clinker was then crushed to create cement, which was packaged and shipped offsite. Cement kiln dust (CKD), a fine, powdery material that accumulated inside the kilns, was the primary byproduct of cement manufacturing. CKD was not reused in the cement-manufacturing process stream until the 1980's. Prior to that time, management practices involved placing CKD with soil in designated areas onsite.

Site operations relied on electrical power, supplied by overhead power lines and transformers; and fuel, stored in onsite underground and aboveground storage tanks (USTs and ASTs). Transformers were historically located throughout the Site; but, only a few remain today. Transformers containing polychlorinated biphenyls (PCBs) were removed and replaced with non-PCB transformers during the 1980s. USTs and ASTs were removed during the 1980s under the oversight of the Riverside County Department of Environmental Health (RCDEH).

ENVIRONMENTAL ASSESSMENTS

Field investigation activities, including site visits, interviews with RCP representatives knowledgeable about previous site operations, reviews of RCP's historical records, and regulatory database reviews, were conducted between April 2016 and February 2017. As a result of the investigation, Langan identified twelve Areas of Interest (AOIs) that warrant additional environmental assessment.

To further evaluate potential environmental impacts, Langan conducted a subsurface investigation at each of the twelve AOIs. The investigation's scope included trench excavation; soil, groundwater, and surface water sampling; and laboratory analysis.

A total of 57 trenches were completed to depths of 25 feet below ground surface (bgs). Soil samples from the trenches were analyzed for metals, total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and/or PCBs.

Groundwater samples were collected from two monitoring wells, MW-3 and MW-4, in the southern part of the Site; and one well, identified as "Monitoring Well" (northern well), in the northern part of the Site. Surface water samples were collected from two locations (SW-1 and SW-2) within Crestmore Lake. Groundwater and surface water samples were analyzed for metals, hexavalent chromium, and/or VOCs.

During the late 1990s, while the RCP was still in operation, limited building inspections were conducted to evaluate for the presence of lead based paint (LBP) and asbestos containing materials (ACMs). Due to ongoing RCP operations, several areas were inaccessible at the time of the building surveys. However, LBP and ACMs will likely require remediation during the demolition activities.

CURRENT CONDITIONS

Soil laboratory analytical results from the environmental assessments were compared to several agency screening levels that include the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs) for construction worker and commercial/industrial exposure for soil; United States Environmental Protection Agency (USEPA) Region 9, Regional Screening Levels (RSLs) for industrial soil; and California Department of Toxic Substance Control (DTSC) Screening Levels (SLs) for

commercial/industrial soil for exposure pathways relevant to the Site. For comparison purposes, the lowest of the screening levels from the three agencies were used to evaluate the data. Arsenic, lead, nickel, and TPH-diesel (TPH-d) exceeded one or more of the screening levels. Arsenic concentrations at the Site appear to be within the range of published background concentrations for Southern California. Lead exceeded the construction worker exposure ESL at a location near a surface water settling area. Nickel exceeded the construction worker exposure ESL at a location near a soil containing CKD area west of the Wet Weather Quarry. TPH-d exceeded the shallow soil and construction worker exposure ESLs in a sample collected at the former sag pond.

Groundwater and surface water analytical results were compared to RWQCB Maximum Contaminant Levels (MCLs) for drinking water. Metals and VOCs in surface water and groundwater samples did not exceed their relevant MCLs, with the exception of hexavalent chromium [Cr(VI)], which measured 19 ug/l and exceeds the current California MCL of 10 ug/l. However, on May 31, 2017, the Superior Court of California for Sacramento County issued a judgment invalidating the Cr(VI) MCL for drinking water and ordered the State Water Resources Control Board (State Water Board or Board) to take the necessary actions to delete the CR(VI) MCL from the California Code of Regulations and to file with the court by August 15, proof of deletion. Soil and groundwater sampling results are discussed in detail in the RIR.

MITIGATION MEASURES

The RIR assesses the nature and extent of potential hazardous materials within the Specific Plan area and provides a basis for future remedy selection. Potential hazards are primarily the result of past RCP activities, including on-Site soil containing CKD placement, fuel storage and distribution, and building construction and demolition. Potential hazardous materials occur either above-grade (i.e., buildings and structures) or below-grade (i.e., soil and groundwater). Predominant hazards that will be present during demolition and redevelopment include LBP, ACM, and miscellaneous universal waste (MUW) in on-Site structures during demolition; and soil containing CKD that will be encountered during demolition and grading.

A Soil Management Plan (SMP) will be prepared that will document procedures for segregating, screening, analyzing, and handling potentially impacted soil. The SMP will also prescribe engineering controls and personal protective equipment (PPE) measures to address potential construction worker exposure risks arising from encountering soil containing CKD during grading and redevelopment.

Before demolition, an updated hazardous materials survey will be conducted to identify the locations and quantities of LBP, ACM, and MUW in above-ground structures. Hazardous materials will be abated and removed in accordance with the applicable state (i.e., SCAQMD) and federal (i.e., EPA) regulations.

Langan will submit a site-specific Response Plan to the DTSC who is the lead agency for this project. . The Response Plan will outline potential impacts, exposure pathways, and mitigation measures for soil containing CKD and metals in soil. In addition, it will evaluate potential remedies and select a proposed final remedy that protects human health and the environment during and after redevelopment.

Sincerely,
Langan Engineering and Environmental Services, Inc.

1.0 INTRODUCTION

Langan Engineering and Environmental Services, Inc. (Langan) has prepared this Site Assessment Work Plan (SAWP) for the former Riverside Cement Plant (RCP) or the "Site", located at 1500 Rubidoux Boulevard in Jurupa Valley, California (Figure 1). The Site consists of approximately 206 acres in the City of Jurupa Valley, Riverside County, California.

The Site is under a California Land Reuse and Revitalization Act (CLRRA) agreement with the Department of Toxic Substances Control (DTSC) for the proposed redevelopment project. The CLRRA agreement was executed on 16 January, 2018.

The proposed development for the Site consists of the construction of six (6) warehouse distribution structures with associated utilities and parking. As part of the redevelopment program the onsite structures (superstructure and subsurface structures) will be decommissioned, decontaminated and demolished, and grading will be performed. The mass grading project for the Site includes a balanced cut and fill with a total grading estimated at between one and two million cubic yards (yd^3). After completion, the Site will be covered by the proposed development including concrete pad structures, paved circulation and parking and landscaped areas.

The proposed development is outlined on Figure 2.

1.1 OBJECTIVES

The purpose of this SAWP is to provide a brief historical summary of the Site operations, a summary of the geologic/hydrologic characteristics, regulatory listings, previous environmental investigations, and the proposed additional assessment activities at the Site to meet the data quality objectives (DQOs). The proposed additional Site assessment and data collection activities will provide supplemental data within the six study areas identified in Langan's Preliminary Environmental Assessment (PEA), dated 20 December 2018. Certain areas will be deferred to the decontamination and demolition plan and the soil management plan, as addressed in Section 8.1, due to areas not accessible because of buildings and structures that will be removed. The sampling activities were designed to address data gaps and additional data requests identified by the DTSC in their review comments of the PEA dated 28 February 2018. The SAWP was developed based on these DTSC comments to the PEA (Appendix A),

Site visits, dated 25 January 2018 and 16 March 2018, and meetings with DTSC, dated 23 February 2018, and 24, 26 April 2018. The revised SAWP was developed based on DTSC comments to the SAWP received on June 28, 2018 and meetings on 2, 10 July 2018.

The four data quality objectives (DQO) for the SAWP are:

- DQO-1: determine and evaluate potential chemicals of potential concern (COPCs) and the lateral and vertical extents of COPCs in former known or suspected source areas to support a health risk evaluation and the Response Plan.
- DQO-2: determine and characterize the onsite soils for reuse as onsite fill or for off-Site disposal
- DQO-3: to identify hexavalent chromium (Cr^{VI}) bearing materials that could generate dusts/emissions especially during grading or demolition activities
- DQO-4: Evaluate potential leaching of COPCs (e.g., metals and hexavalent chromium) into groundwater

1.2 SITE BACKGROUND

1.2.1 Site Description

The Site is approximately 206 acres located at 1500 Rubidoux Boulevard. The approximate location is shown on Figure 1. The Site includes 13 parcels in Jurupa Valley, California with the Assessor's Parcel Numbers (APNs) listed below:

APN #
175-200-001 (Portion)
175-200-002
175-200-003
175-200-004
175-200-005
175-200-007
175-200-008
175-200-009

APN#
175-170-035
175-170-036
175-170-040
175-170-041 (Portion)
175-180-001

The Site is bound to the west by Union Pacific Railroad (UPRR) track and Rubidoux Boulevard, to the north by El Rivino Road, to the south by three inactive quarries and Agua Mansa Road, and to the east by industrial development and Hall Avenue. As shown on Figure 1, the northwestern section of the Site contains undeveloped land and unpaved roads, while the northern section contains undeveloped land and a paved entrance road with a guard shack.

The western section encompasses an entrance road, along with storage silos, a warehouse (Pack House), part of the former white cement manufacturing plant, and a one to two-story administration buildings (Truck Garage, Transportation Office, Storehouse, and Garage). The eastern section contains the raw materials storage area and the remnants from the Grey Cement Plant (primarily the support structures for the rotary kilns).

2.0 HISTORICAL SITE ACTIVITIES

2.1 HISTORICAL SITE OPERATIONS

The Site was in operation from the early 1900s until 2014. Operations on Site were divided into either the cement manufacturing operations or the Crestmore mine where mining of limestone and quarrying activities were conducted. The Crestmore mine was an underground mine and the four quarries were designated as the Wet Weather, the Chino, the Commercial, and the Lone Star quarries. The Wet Weather Quarry and Lone Star Quarry are located within the Site boundary, while the other quarries are located on the parcel located to the south of the Site (Figure 1) which is not part of this SAWP. In addition, the Site includes various support facilities, heavy machinery, and administrative buildings that were related to the cement manufacturing plant and limestone quarrying and mining operations.

The facility underwent three major redevelopment phases over the life of the operation. From the early 1900s and the 1950s, the cement plant was located in the south western portion of the Site just north of the present day White Cement Plant. The facility at that time was operated using petroleum-based fuels (i.e. Bunker C) stored in fuel tanks. As the cement manufacturing process evolved through the use of updated technology and other changes in the industry, the facility went through an expansion and redevelopment phase from the late 1950's through early 1960's, which included conveyor belt systems and compress air, development of raw material storage areas, and upgrades to processing of raw materials to manufacture cement product.

During the second renovation phase, the facility was operated using both coal and petroleum-based fuels. By the 1960's, the original plant had been demolished and the present day facility was constructed that generated both grey and white cement product. The current facility was operated until it was shutdown in 2014.

In 1909, limestone and silicate rock quarrying activities began at the Site. In 1930, underground mining commenced at the Crestmore mine, which furnished most of the plant's requirements until 1939. The Wet Weather quarry was deepened and extended between 1940 and 1954. From 1930 to 1954, the block caving method was used, which was a process that allows for the bulk mining of large, relatively lower-grade materials.

The room and pillar underground mining method was used between 1954 and 1986. Mining of limestone at the Site ceased in the late 1980s when mining operations penetrated the underlying aquifer eventually flooding the mine shafts. The resulting flood created the present day Crestmore Lake located on the parcel south of the Site which is not part of this SAWP (Figure 1).

Cement manufacturing operations began in 1914 and continued through 2008. The limestone obtained from the onsite quarries/mines was mixed with raw sand and clay materials imported from off-Site sources, and heated in rotary kilns to manufacture cement clinker. The raw materials were stored in onsite silos prior to 1960s until the Raw Material Storage Area (RMSA), located along the northwestern portion of the Site, was developed at which point the materials were staged there. The cement clinker was then crushed to create two primary types of cement (i.e., White and Grey Cement), which was then packaged and shipped offsite. Cement Kiln Dust (CKD) was one of the primary by-products generated during the manufacturing process, and it exhibits a slight pinkish hue. When hydrated, CKD becomes dense and relatively impermeable to water, but does not form a cemented mass.

Prior to the 1970s, CKD was hauled from the kilns using end-dump trucks and reportedly placed with fill soils/mine spoils at several locations throughout the Site (Figure 1). The placement of CKD material primarily occurred from 1955 to 1979, and the primary location was the Wet Weather Quarry. Due to the advancement in the cement manufacturing process during the 1970's, previously discarded CKD material was reclaimed and used as feedstock in the cement making process. Also during the 1950s and early 1960s, the cement manufacturing process developed a closed-loop system with the incorporation of bag houses to capture CKD and other particulate materials generated during the cement manufacturing process. The CKD material was reclaimed beginning in the early 1970s until the operations were shutdown in 2014.

The equipment used to manufacture cement generally relied on electrical power for material conveyance/process control, and petroleum fuels for heating at various times over the life of the facility. Petroleum fuels were historically provided by a 6,000,000 gallon UST storing Bunker C fuel oil. Other underground storage tanks (USTs) at the Site were used to store petroleum products such as gasoline, diesel fuel, fuel oil, and waste oil.

3.0 GEOLOGY AND HYDROGEOLOGY

3.1 GEOLOGY

3.1.1 Regional Geologic Setting

The Site is located in the Peninsular Ranges Province of Southern California, dominated by granitic rocks of Mesozoic age that intruded into pre-existing sedimentary strata. Tertiary strata were deposited west of the eroded granitic rocks, and as the area was uplifted, some of these strata formed upland coastal plains. The Site is also located east of the coastal plains in an area dominated by granitic rocks that are mainly quartz diorite.

As discussed above, specific areas of the Site were used for mining activities due to the presence of two steeply dipping limestone formations approximately 200 to 300 feet thick in the northern end. The limestone formations are roughly parallel, with an upper and lower formation; the upper formation is known as the Sky Blue Hill Limestone and the lower formation is known as the Chino Limestone. Thin, poorly developed soils and minor sedimentary strata are mapped as locally covering the bedrock on the Site.

As stated above, the Site is located within the fault-bounded, northwest-southeast trending Perris Block within the Peninsular Ranges geomorphic province of California. The Perris Block is bounded in the east by the San Jacinto Fault Zone, the north by Cucamonga Fault Zone, and the west by Elsinore Fault Zone. According to the United States Geologic Survey (USGS) maps, the Perris Block is underlain by lithologically diverse prebatholithic metasedimentary rocks intruded by plutons of the Cretaceous age Peninsular Ranges batholith. Erosional depositional surfaces are developed on the Perris Block and thin to relatively thick sections of Quaternary age non-marine sediments discontinuously cover the basement rock.

3.1.2 Local Geologic Setting

The Site is located in the eastern end of the Jurupa Mountains on the south side of the San Bernardino Valley. The Santa Ana River drains the San Bernardino Valley towards the southwest and is located approximately one-half mile east of the Site.

Based on a review of published geologic reports, maps and referenced geologic information, the Site is mapped as being underlain by two geologic units consisting of

surficial soils (artificial fill, alluvium, Aeolian sands) and intermixed tonalite marble and schist. The artificial fill (Qaf) reportedly consists of uncompacted and undocumented fill from mining operations, soil containing CKD and unconsolidated talus deposits. The intermixed tonalite, marble, and schist (KtPzms) are Cretaceous and Paleozoic age and consist of intermixed biotite-hornblende tonalite and coarse grained marble containing lesser amounts of biotite-quartz schist.

Based on the information reviewed, quarrying and subsurface mining activities were initiated in 1906 to mine the limestone located on or in the vicinity of the Site. Prior to quarrying, the limestone was present as two generally irregular, roughly parallel, lenticular limestone bodies dipping primarily east-northeast. As discussed above, the upper (shallower) Sky Blue Limestone and the lower (deeper) Chino limestone are mineralogically similar. The limestone is coarsely crystalline, associated with metamorphosed sediments, enveloped and cut by intrusive igneous rocks and contact metamorphic minerals, including large masses of intrusive microcrystalline quartz monzonite porphyry and quartz monzonite pegmatites. Country rock within the boundaries of the Site consists of Perris quartz-biotite diorite that becomes granodiorite. Quartz monzonite pegmatites occur commonly as dikes in the porphyry and country rock and extended generally less than 2 or 3 feet into the limestone. The widespread contact rock is composed generally of grossularite garnet with and without diopside.

The shallower, Sky Blue Limestone is an arcuate shaped body, enveloped and intruded by quartz diorite and intruded by quartz monzonite porphyry. The body (prior to mining) was up to several hundred feet thick and dipped primarily east or northeast. Where the body was thinnest, the limestone was converted to contact rock. Two (2) facies were present within the limestone; a white limestone with localized yellow predazzite beds and a sky blue colored limestone present closer to the intrusive quartz monzonite porphyry and associated pegmatites.

The deeper, Chino Limestone is generally composed of alternating bands of yellowish predazzite and white crystalline limestone with widely disseminated graphite flakes. The unit dipped up to 45 degrees east, was at least 2,000 feet long, and had irregular upper and lower surfaces. Banding ranged from few inches to a few feet thick.

3.1.3 Local Faulting

The following publications and reports were reviewed to obtain information on local faulting within the Site:

- Daly, John W., (1931), The Geology and Mineralogy of the Limestone Deposits at Crestmore, Riverside County, California, dated 1931 (Daly, 1931).
- Woodford, A. O., Crippen, R. A., and Garner, K. B., (1941), Section Across Commercial Quarry, Crestmore, California, American Mineralogist, Volume 26, pages 351-381 (Woodford et al, 1941).
- ERM-West, Inc., (1991), Technical Evaluation 9/30/90 EPA FIT Report, Riverside Cement Company, Crestmore Plant, dated November 1991 (ERM-West Report).

A review of Plate 1 in the Daly report indicates that a northeast-southwest trending fault segment is mapped between the Commercial Quarry in the northeast and southwestern portion of the Crestmore Quarry to the southwest. The corresponding report does not elaborate on this fault and the review suggests that Daly (i) identified a few small faults that are not significant relative to the Site major geologic structure and (ii) Daly did not find any large faults in the area mapped west of the quarries.

The Woodford, et al, 1941 report refers to "a prominent fault oriented N50^{o}E 70^{o}SE" that extends into bedrock at Station 15 of Woodford, et al.'s Figure 3-Section "Across the Commercial Quarry, 1940". Additional information for this fault was not provided in the report.

Based on a review of the referenced publications, there is no evidence of active faulting (Holocene or younger) for the Site.

3.2 HYDROGEOLOGY

The Site is located in the eastern end of the Jurupa Mountains on the south side of the San Bernardino Valley. The Santa Ana River drains the San Bernardino Valley towards the southwest and is approximately one-half mile east of the Site. The ground surface elevations vary between approximately 820 feet above mean sea level (amsl) on the southern portion of the Site to approximately 1150 feet amsl on the northern portion of the Site.

Based on a review of historical Site documents, groundwater occurs in three distinct hydrologic units at the Site. They are the Chino Limestone (referred to the Lowe limestone unit), the Wet Weather, and the Sky Blue (referred to the Commercial unit in historical documents) Limestone units (referred to upper limestone unit), and the Santa Ana River alluvium (ERM-West, August 1991). According to the ERM-West 1991 report, geologic and dewatering feasibility studies were conducted in 1928 and 1950 by W.P. Rowe in the Chino limestone, where the Crestmore quarry is currently located. These studies indicated that the granite layers above and below the Chino limestone act as confined layers. The report states that the Chino limestone water originates mostly from percolation from rainwater at the mine and an influx of water from somewhere below the Santa Ana River to the east.

Pumping wells installed during the 1928 study were screened in the Blue Sky and Wet Weather formations, and displayed a flow consistent with groundwater migration in the river alluvium, prior to dewatering the wells The ERM-West report refers to the Wet Weather and Blue Sky Limestone units as being a continuous unit, and that upper limestone was hydraulically connected to the alluvium east of the original surface outcrops of granite. Figure 1-4 in the ERM-West report show groundwater gradients in the alluvium flow south-southwest in the eastern part of the Site and flows west in the southwestern part of the Site. ERM-West's report also states that inference of the hydraulic connection in the lower limestone and alluvium were very strong, also evident in Figure 1-4.

According to ERM-West report, the production wells on-Site, Well 88-1 and Well 60-1, are screened in the Chino limestone and alluvium, respectively, and groundwater from the Chino limestone migrates towards the production wells. The report also explains water consumption at the Site, during the time of the report (mid-1980s- early 1990s) , was from precipitation, the northern Chino limestone contact with river alluvium, water from within the Chino limestone aquifer deeper to the east, and the drift to the Wet Weather limestone at 220 feet above sea level. According to the ERM-West report, this was most likely due to the mine drift not being completely sealed between the limestone units when it was cut in 1985.

Concurrent with historical documents (discussed in later sections of this report), and the results of the recent investigation, groundwater flow in the shallow alluvial aquifer is likely towards the Santa Ana River, or towards the south to southeast. Groundwater

was measured in the wells onsite at depths between 60 and 135 feet below ground surface (bgs).

4.0 STUDY AREAS

As presented in Langan's PEA, the Site has been subdivided into six (6) study areas for site investigation purposes based on general operation within the RCP. Within each study area, there are specific features that have been evaluated by previous consultants and Langan. A description of the use of each study area and tabular summary of features in each study area is provided below:

Surface Mining and Crushing Study Area

Most of the surface mining (quarrying) operations at the former RCP occurred to the south of the Site in the Crestmore Quarry and the Commercial Quarry. On-Site surface mining activities were limited to approximately 28 acres containing the Wet Weather and Lone Star Quarries (collectively referred to as "Wet Weather Quarry" hereafter). Initial crushing operations were conducted in this study area. A list of features located within this study area boundaries are presented in Table 1 below.

Table 1: Surface Mining and Crushing Features

BUILDING/STRUCTURE	FEATURE	AGE OF OPERATION	USAGE	DESCRIPTION/DIMENSIONS
Surface Mining and Crushing	CKD Containing Soil	Early 1900s – 2000s	Mining and staging of CKD soils and materials	CKD-containing soil berms focused eastern portion of plant in the Crestmore Lake, Commercial Quarry, and Wet Weather Quarry. Varies from approximately 1' to more than 10' thick.
Northwest corner of surface, mining, and crushing area	Former Secondary Reduction	1950s – 2000s	Secondary crushing process and reduction of limestone	--
Former Iron Ore Storage	Former Iron Ore Storage	1950s – 2000s	Storage of iron ore	--
Wet Weather Quarry	Wet Weather Quarry	Early 1900s – 2000s	Mining and staging of CKD soils and materials	Former CKD-disposal area
East of Former Secondary Reduction	Transformer	Early 1900s – 2000s	Provided power	--

White Cement Plant

The White Cement Plant study area includes approximately 11 acres in the southwestern portion of the Site. The White Cement Plant was constructed in the 1950s and remained operational through the late 2000's. The primary activities in this area were mixing and milling raw materials, heating raw materials in kilns to create cement clinker, and grinding cement clinker to make white cement.

The cement process consisted of the following: limestone was reduced in the secondary reduction process and conveyed to the raw materials silos storage, the raw materials silo and feed silos (fed by the clay storage) were ground in the raw mills, the ground raw materials were processed through the kilns from the west to east, the eastern portion of the kilns was heated by a burner which were fed by fuel oil and heated to above 2,000 degrees, which created clinker that was transported via conveyor to the clinker storage silos (8) along the western area of the white cement process for final finishing. The clinker was then processed through the finish mills where the clinker was further crushed to a fine powder type material for cement manufacturing. The clinker crushing process was a closed loop system with bag houses capturing the fine product in the bag house, which was then reprocessed through the kilns. The finish product was then conveyed to the white cement plant finish silos for packaging into cement bags and pallets.

A list of features located within this study area boundaries are presented in Table 2 below.

Table 2: White Cement Plant Features

BUILDING/STRUCTURE	FEATURE	AGE OF OPERATION	USAGE	DESCRIPTION/DIMENSIONS
Boiler Blowdown Pond	Boiler Blowdown Pond	1985 - 1990	Hold blowdown discharge 1995: served cooling water for kilns	4' deep, 30'x60'
Boiler Blowdown Pond	No. 6 (Bunker C) Fuel Oil 210,000 Gallon AST	Approximately 1950s – 2014	Fuel storage for White Cement Plant Kiln burners	16' diameter x 15 feet high
White Kiln Pipeline and Diesel Pump	2 Former 12,000 Gallon Diesel UST	Approximately 50 years old	Fuel	12' to UST bottom
	Former White Kiln Pipeline Leak	1993 - 1996	--	No. 6/Bunker C fuel pipeline leak on 8/20/1993 600 gallons of fuel oil spilled
Finish Mill	Diethylene Glycol AST	Approximately 1950s –	Grinding aid	5,000 gallons

BUILDING/STRUCTURE	FEATURE	AGE OF OPERATION	USAGE	DESCRIPTION/DIMENSIONS
		2014		
	Acetic Acid (80%) AST	Approximately 1950s – 2014	Grinding aid	1,000 gallons
Southeast of White Kilns	Sewer Alignments	Early 1900s – present	--	--
Raw Mix Silos	Raw Mix Silos	Approximately 1950s – late 2000s	Storage of feed stock	--
Raw Mills	Raw Mills	Approximately 1950s – late 2000s	Storage of feed stock	--
Feed Silos	Feed Silos	Approximately 1950s – late 2000s	Storage of feed stock	--
Former Primary Crusher	Former Primary Crusher	Approximately 1950s – late 2000s	Crushed raw material	--
Kilns	Kilns	Approximately 1950s – late 2000s	Processed raw material into clinker product	--
		Approximately 1950s – late 2000s		--
Clinker Silos	Clinker Silos	Approximately 1950s – late 2000s	Storage of clinker material	--
Former Dryers	Former Dryers	Approximately 1950s – late 2000s	--	--
South of Finish Mills	Transformers (2)	--	--	--
South of Feed Silos	Transformers	--	--	--

Grey Cement Plant

The Grey Cement Plant study area includes approximately 29 acres north of the Surface Mining and Crushing area. The Grey Cement Plant generally operated on a larger scale than the White Cement Plant, with the grey kilns being approximately twice as large as the white kilns and operated at above 4,000 degrees. The primary activities in this area were mixing and milling raw materials, heating raw materials in kilns to create cement clinker, and grinding cement clinker to make grey cement. This process of manufacturing the grey cement was similar to the manufacturing of white cement but included the addition of other feedstock such as iron ore, coal, and clay to adhere to RCP grey cement specifications. A list of features located within the study area boundaries are presented in Table 3 below.

Table 3: Grey Cement Plan Features

BUILDING/STRUCTURE	FEATURE	AGE OF OPERATION	USAGE	DESCRIPTION/DIMENSIONS
North of Boiler House	Former Diesel UST 10,000 Gallons	Unknown – late 1980s	Storage and dispensing of diesel	8'x27' single-walled steel, 11' below grade
Southwest of Former Finish Grind Feed Bins	Former Water Coolers	Early 1900s – 1980s	Cooling system for process water	--

BUILDING/STRUCTURE	FEATURE	AGE OF OPERATION	USAGE	DESCRIPTION/DIMENSIONS
Crushing Storage Silos	Crushing Storage Silos	Approximately 1950s – late 1980s	Storage of raw material that has been sized for processing	--
Former Clinker Hopper	Former Clinker Hopper	Approximately 1950s – late 1980s	Materials processing unit	--
Boiler House	Boiler House	Approximately 1950s – late 1980s	--	--

MW-1	--	1991	--	Water level: 110.80' below top of casing. Upgradient of former CKD disposal area
North/East/South Berms	North/East/South Berms	Unknown	--	South Berm: contains material from Grey Cement Plant demolition. North Berm: 910x80x20 (53,000 yd3) East Berm: 480x280x20 (100,000 yd3) South Berm: 640x140x20 (65000 yd3)
Throughout Study Area	Transformers	--	--	--

Material Storage Area

The Material Storage Area comprises approximately 37 acres north of the Grey Cement Plant study area. The Material Storage Area was divided into twelve (12) bays; the six eastern bays were used for clinker storage and the six western bays were used for raw material storage. A network of conveyor belts was used to transport raw materials and cement clinker between the material storage area and various locations throughout Grey Cement Plant. Materials were distributed throughout and recovered from the bays using track-mounted reclaimers that were powered by electricity. A list of features located within the study area boundaries are presented in Table 4 below.

Table 4: Material Storage Area Features

BUILDING/STRUCTURE	FEATURE	AGE OF OPERATION	USAGE	DESCRIPTION/DIMENSIONS
Southern border of study area	Dust Suppressant ASTs	2000	Dust control (proprietary product) - contained foaming agent sold by GE Betz, Inc.	4,000 and 5,000 gallons
Crushed Rock Storage Area	Crushed Rock Storage Area	Approximately 1950s - 2014	Storage of dry crushed rock	--
Former Gypsum Storage	Former Gypsum Storage	Approximately 1950s – 2014	Storage of crushed gypsum	140'x30'
Clinker/Raw Material Storage Area	Clinker/Raw Material Storage Area	Approximately 1950s – 2014	Divided into 12 bays - eastern 6 bays used for clinker storage, western 6 bays used for raw import material storage.	--
Eastern Berms	Eastern Berms	unknown	--	147,000 ft2 110,000 yd3

Maintenance, Administration, and Packaging

The Maintenance, Administration, and Packaging study area is approximately 51 acres southeast of the main entrance to the RCP from El Rivino Road. With the exception of the Pack House and Loading Facility, operations in this study area generally supported operations elsewhere at the RCP. These operations included equipment maintenance, fabrication, warehousing, and administration activities. To support those activities, a number of USTs and ASTs were located in this study area to provide fuel and/or lubricants. This area also was the receiving area for other materials which were staged in the hazardous materials storage area or the storage warehouse. A list of features located within the study area boundaries are presented in Table 5 below.

Table 5: Maintenance, Administration, and Packaging Features

BUILDING/STRUCTURE	FEATURE	AGE OF OPERATION	USAGE	DESCRIPTION/DIMENSIONS
West of Former Agriculture Division	Former Parking (Northwest)	early 1900 - 1970's	Car parking / staging	--
Northwest of center of former Fleet Truck Parking	Former Agriculture Division	early 1900 - 1970's	--	--
Northwest of center of former Fleet Truck Parking	Abandoned Substation	pre-1960s	Supplied power for residential homes along northern portion of Site.	--
East of Transportation Office	Former Fleet Truck Parking	early 1900 - 1970's	--	--
Transportation Office	Transportation Office	early 1900 - 1970's	Administrative services for distribution activities and training.	--
Former Garage Salvage Yard	Former Gasoline UST 10,000 gallons	Mid 1900s - 1997	Storage of gasoline fuel	8' W x 27' L. Single wall steel.
Garage and Administrative Building	Washrack Discharge Point	Unknown	Collects runoff from 3-stage clarifier that collected washrack discharge	--
Garage and Garage Storeroom	Former 3-Stage Clarifier	Still present in 2009 (DTSC, 2009)	Truck wash discharge collection	Approx. 4'x14'x5'
	Former Waste Oil AST 250 Gallons	Unknown – 2014	Waste oil storage	Single wall steel
	Former Diesel UST 10,000 Gallons	1964 – 1988	Storage of vehicle-diesel fuel	8'x30', single wall steel, 5' and 13' top and bottom bgs respectively, 8' diameter
	Former Diesel UST 1,000 gallons	Unknown – late 1980s	Fuel	5.5'x6.5'
	Former Gasoline UST 2,000 gallons	Unknown – late 1980s	Fuel	6.5'x13'
Crane Storage	Former Waste Oil UST 550 Gallons	1976 – 1988	Waste oil storage	4'x6', single-walled steel, 8' below grade
Former Spray Pond	Former Suction Sump	1910 - present	pre-1968 : cooling system spray pond current: storage area for miscellaneous materials	Approx. 170' x 250'. 3' retaining wall around perimeter. Concrete floor potentially several feet thick. A suction sump is located along the southeast corner.
Northeast of former spray pond	Former Sag Pond	At least 1948 - present	From 1960s to present, area has been used as a staging area for materials and tree cuttings.	Approx. 170'x250'. Currently contains wood debris and materials.
Former Fleet Truck Parking	Settling Areas	Unknown	Surface water settling areas identified during RWQCB Sept 2000	--

BUILDING/STRUCTURE	FEATURE	AGE OF OPERATION	USAGE	DESCRIPTION/DIMENSIONS
Former 6M gallon tank/reservoir	Settling Areas	Unknown	Surface water settling areas identified during RWQCB Sept 2000	--
Former Crane/ former Clinker Hoppers	Settling Areas	Unknown	Surface water settling areas identified during RWQCB Sept 2000	--
Former Power House	Settling Areas	Unknown	Surface water settling areas identified during RWQCB Sept 2000	--
Southwest of Former Spray Pond	Hazardous Waste Storage Pad	Unknown – present	Store small quantities (55-gallon drums) of materials for usage onsite to support cement equipment process.	--
Stormwater Retention Basin	Stormwater Retention Basin	Unknown	Western concrete swales accept water that flows from a stormwater culvert on Rubidoux Blvd. Southeastern swale is a spillway for excess water.	--
Crestmore Substation	Former Diesel AST 1,000 Gallons	1930s – 2014	Used for fuel storage	--
North of former boiler shop	6,000,000 Gallon Bunker C Fuel Oil UST	At least 1948 – 1987	Fueled cement kilns prior to 1968. Continued use until mid-1980s.	205' diameter tank floor, 25' tall, 255' tank top.
6,000,000 Bunker C Fuel Oil Tank	Former Reservoir	Until late 1980s	Collected all surface water run-off around the Site.	--
NE of former garage salvage yard	Well 60-1	Unknown	Primary water supply for the plant	Total depth 331' bgs; perforated screen between 182' and 290'
Former Parking SE of 6M gallon tank	Former 1 Unleaded Gasoline/ 1 Diesel AST 2,000 Gallons each	Unknown - 2014	--	--
West of the Grey Silos	Former Propane Tank	Unknown - 2014	Fuel forklifts	AST
Former Material Yard	Former Material Yard	Early 1900s – 1980s	Storage of dry materials and parts	--
Former Electric Shop	Former Electric Shop	Early 1900s – 1980s	Minor electrical repairs to equipment	The "Shops" contained, in 55-gallon drums or smaller,: acids (battery and cleaners, safety solvent, various aerosol sprays, compressed gasses (acetylene, oxygen, and nitrogen).
Former Boiler Shop	Former Boiler Shop	Early 1900s – 1980s	--	--
Former Machine Shop	Former Machine Shop	Early 1900s – 1980s	General machining of metal parts	--
Former Repair Shop	Former Repair Shop	Early 1900s – 1980s	Miscellaneous equipment repairs	--

Vacant Land

Approximately 60 acres of land in the northern portion of the Site was unused by the RCP. The study area is vegetated with grass, shrubs, and trees. The Northern Monitoring Well is located near the northern boundary of the RCP and two former groundwater production wells are located in the northwestern portion of the Site. According to Mr. Crites and a review of historical aerial photographs, residential homes were located in the western and eastern portions of the study area; the homes were destroyed during a fire and subsequently demolished. A list of features located within this study area boundary is presented in Table 6 below.

Table 6: Vacant Land Features

BUILDING/STRUCTURE	FEATURE	AGE OF OPERATION	USAGE	DESCRIPTION/DIMENSIONS
Northern Berms	Northern Berms	Unknown	Unknown	90,000 ft2 800'x110'x20' 67,000 yd3
North	Northern Monitoring Well	Unknown	Formerly a water supply well	--
NW corner of northern parcel	2 Former Production Wells (NW)	unknown	Formerly supplied water to Crestmore Heights community (west of Site)	1/23/2018 - measured depth to water at ~103 bgs

The boundaries of these study areas and feature locations are also shown on Figure 1.

5.0 REVIEW OF PREVIOUS REGULATORY INVOLVEMENT

From approximately 1973 to 2018, the following agencies have been involved at the RCP:

- South Coast Air Quality Control District (SCAQMD)
- Santa Ana Regional Water Quality Control Board (SARWQCB)
- Riverside County Department of Environmental Health (RCDEH)
- Environmental Protection Agency (EPA)
- Department of Toxic Substances Control (DTSC)

Initially, the primary agency involved at the RCP was the SCAQMD and SARWQCB. The RCP was primarily governed by waste discharge requirements while the SCAQMD oversaw the cement plant manufacturing process from an air quality perspective. As regulations developed over time, more agencies became involved with the oversight of closure actions or investigations at the RCP. On July 13, 2017, DTSC was confirmed to be the lead oversight agency of the RCP and its proposed redevelopment. The SCAQMD will continue to oversee the potential for air quality impacts during the decommissioning for the proposed redevelopment under Rule 1156. A summary of prior agency engagement with the RCP is provided in Table 7 below.

Table 7: Prior Agency Engagement

Agency	Timeframe	Relevant Inspections/Permits	Function	Status
SCAQMD	1970s - 2018	Rule 1156	Monitor air quality of cement manufacturing process	Ongoing
SARWQCB	1973 - 2017	Waste discharge requirements Order 78-27 and 98-77, boiler blowdown pond closure	Regulate RCP waste discharge, oversee the closure of the boiler blowdown pond	Closed
RCDEH	1986 - 2017	Closure of USTs/ASTs, white kiln pipeline release closure		Closed
EPA	1990 - 1994	Potential groundwater impacts from CKD containing soil	Oversight of groundwater impacts lead by the RWQCB.	Closed
DTSC	2006 - 2018	Overall Site assessments		Ongoing

In conjunction with the South Coast Air Quality Management District's (SCAQMD) post-closure requirement of SCAQMD's Rule 1156 permit as proposed in the Compliance Plan for Post-Closure Activities (AECOM, 2016), soil samples will be collected and analyzed for Hexavalent Chromium across the Site. This proposed sampling is intended to be conducted concurrently with the proposed sampling program presented in this SAWP. The workplan for proposed hexavalent chrome sampling titled, Hexavalent Chromium Sampling Work Plan, dated 10 May 2017, has been submitted to the SCAQMD for review and approval. As part of the review process, the SCAQMD requested that the DTSC provide feedback on the work plan, which DTSC provided to the SCAQMD in an email dated, 22 February 2018. SCAQMD responded in an email dated 24 May 2018 regarding the Rule 1156 Compliance Monitoring and Post-Closure Activities Plans indicating they are reviewing the document and incorporating DTSC's recommendations and will approve the document within a few days of the date of their response email. The sampling and analytical results from the hexavalent chromium sampling plan will be incorporated into the summary of findings report as well as be used to address some of the areas identified by DTSC in their comments to the PEA (Appendix A).

6.0 PREVIOUS SITE INVESTIGATIONS

Surface Mining and Crushing Study Area

Investigations regarding CKD containing soil and potential impacts to groundwater in this study area were conducted from 1990 to 2009 with agency oversight from the EPA, SCAQMD, and DTSC. The investigations were conducted to assess the potential for metal impacts to groundwater. Soil samples were collected from CKD containing soil areas and several monitoring wells on the Site were sampled. The CKD soil containing areas had concentrations of total chromium in soil at a maximum of 4.6 milligrams/kilogram (mg/kg) and concentrations of lead at a maximum of 106 mg/kg in 1990. Chromium concentrations in the monitoring wells did not exceed 13 micrograms per liter (mg/L) which is below the California maximum contaminant level (MCL) of 50 ug/L. Further details regarding these investigations are provided in Table 8 (see Appendix B).

White Cement Plant

The boiler blowdown pond, USTs, and former white kiln pipeline release were investigated between 1991 and 1997. Agency oversight was primarily provided by the RCDEH or the SARWQCB. A UST investigation were conducted to close out the two USTs in the study area during the late 1980s. The two USTs received an No Further Action (NFA) from the RCDEH in 1997. The boiler blowdown pond was closed out by the SARWQCB after excavation of the area was conducted and a liner was put in place. The former white kiln pipeline release occurred in 1993. In order to achieve closure, impacted soil was delineated and excavated in the mid-1990s by Ryan-Murphy, Incorporated (RMI). Confirmatory samples were analyzed for TRPH and ranged from non-detect to 15 mg/kg. Further details regarding these investigations are provided in Table 9 (see Appendix B).

Grey Cement Plant

Historical investigations at the Grey Cement Plant involved an evaluation of groundwater impacts and the closure of a diesel UST from 1988 to 1996. RCDEH oversaw the diesel UST closure, which received an NFA in 1991. Groundwater investigation included the sampling of wells MW-1 and Well 88-1 were under RWQCB and EPA oversight. The groundwater analytical results did not report total chromium concentrations above13 mg/L, which is below the MCL of 50 mg/L. Table 10 provides further details regarding the groundwater investigation and UST

closure (see Appendix B).

Material Storage Area

The Material Storage Area primarily contained dry material storage such as clinker or raw product, which included clay or limestone. No historical investigations were conducted in this study area.

Maintenance, Administration, and Packaging

A number of investigations regarding the closure of six (6) USTs/ASTs were conducted in this study area. These investigations took place between 1987 and 1999, primarily under RCDEH oversight. The six (6) USTs/ASTs received NFAs from the RCDEH in 1991 and 1997. Further details regarding these investigations are provided in Table 11 (see Appendix B).

Vacant Land

No historical investigations were conducted in this study area.

7.0 PREVIOUS LANGAN INVESTIGATIONS

Between 2016 and 2017, Langan conducted field investigations across the Site to confirm information documented in previous investigations by others regarding constituents of potential concerns (COPCs) and to investigate additional areas on Site that were either not previously evaluated and/or there were potential data gaps with regards to COCs based on historical Site operations. This investigation involved implementing a soil assessment program that included trench sampling and soil borings and sampling using hollow stem augers.

The information collected previously and from the proposed sampling program presented in this SAWP will be used to evaluate potential environmental concerns regarding contact with impacted materials during future Site development activities that will include demolition and mass grading operations. In addition, the information will also be used to evaluate soil conditions to assist in the preparation of a Soils Management Plan that will provide criteria to determine the use and/or proper placement of soils onsite during mass grading operations or the potential need for offsite disposal depending on constituents screening criteria.

In addition, groundwater sampling events were conducted in November/December 2016, March 2017, and May 2017 at monitoring wells MW-3, MW-4, and the Northern Monitoring Well with a submersibile pump. Surface water samples were also collected from the Crestmore Lake with a stainless steel dipper. Soil samples collected from the trenches were analyzed for constituents such as metals and TPH. The laboratory analyses were chosen based on information developed for Langan's Phase I ESA, understanding of the historical operations and chemicals used or likely used in specific areas, and the results from previous investigations by others as documented in Langan's PEA. In addition, visual and PID screening of soils obtained from the test pits and observations of soils collected from the test pits investigations. The locations of the trench sampling are shown in Figure 2.

Surface, Mining, and Crushing

Langan excavated several trenches in this study area to determine the chemical composition of soils within these areas to determine the presence of CKD containing soils. In addition, where possible, the trenching effort was used to visually delineate the boundaries of CKD containing soil. Select soil samples collected from trenches were analyzed for metals in this area. The metals concentrations reported from the samples did not exceed their respective Environmental Screening Levels (ESLs), with the exception of LT-21, which had a nickel

concentration of 150 mg/kg that exceeded the nickel ESL (86.3 mg/kg). Details regarding Langan's investigations for this study area are provided in Table 12 (see Appendix B).

White Cement Plant

Langan excavated six trenches within the White Cement Plant study area at specific location based on prior Site information. The trenches were used to visually confirm prior investigation information. Select trenches were not sampled due to no visual evidence of residual impacts observed based on visual and PID screening of soils obtained from the test pits and observations of soils collected from the test pits investigations. Samples were taken from select trenches and analyzed for metals and/or TPH, PCBs, SVOCs, and VOCs. The results indicated that the samples analyzed did not have constituents that exceeded their respective ESLs. Details regarding Langan's investigations for this study area are provided in Table 13 (see Appendix B).

Grey Cement Plant

Langan conducted trenching at the 10,000 gallon diesel UST, former ASTs, transformers and North/East/South berms. Laboratory analyses were not performed at two trenches (LT-18 and LT-14) based on visual indicators from these trenches. Of the samples that were collected and analyzed, no PCBs or metals exceeding their respective ESLs were detected. Details regarding Langan's investigations for this study area are provided in Table 14 (see Appendix B).

Material Storage Area

Langan excavated nine (9) trenches in the Material Storage Area to investigate the former dust suppressant ASTs, clinker/raw material storage area and the eastern berms. Samples were collected and analyzed for TPH and/or metals. With the exception of arsenic, metals and TPH were below their respective ESLs. Arsenic was detected above ESLs but was below regional background levels published by DTSC. Details regarding Langan's investigations for this study area are provided in Table 15 (see Appendix B).

Maintenance, Administration, and Packaging

Langan excavated 14 trenches throughout the Maintenance, Administration, and Packaging to assess potential soil impacts or to verify residual impacts identified in historical reports. LT-9 (Former Sag Pond) had a maximum TPH concentration of 1,700 mg/kg. Samples from the

remaining trenches were analyzed for TPH, metals, VOCs and/or SVOCs. With the exception of arsenic at LT-9, LT-12, LT-40, LT-42, LT-43, and LT-46, metals, VOCs, and SVOCs did not exceed their respective ESLs. Arsenic detected above ESLs were below background levels in this study area. Details regarding Langan's investigations for this study area are provided in Table 16 (see Appendix B).

Vacant Land

Three trenches were excavated in the vacant land study area. Two trenches are located on the northern berms to determine composition of fill areas to be cut during grading and one trench (LT-4) was chosen to represent background concentration/conditions. With the exception of arsenic at LT-4, metals were not detected above their respective ESLs. Arsenic at LT-4 was detected above its ESL but below background concentrations. Details regarding Langan's investigations for this study area are provided in Table 17 (see Appendix B).

Based on prior investigations and analytical data, the Site-specific metals concentrations are represented below.

With the exception of arsenic, metals concentrations in soil were below the lowest of the selected screening levels. Arsenic was detected in 30 of the 40 samples analyzed for metals at concentrations ranging from 1.4 to 14 mg/kg. Arsenic concentrations measured throughout the site exhibit an approximate normal distribution, with 95% of results falling within two standard deviations of the mean and all results falling within three standard deviations of the mean. Based on a review of Bradford, 1996 and Chernoff, 2008, background concentrations of arsenic in Southern California soils typically range from 1 to 10 mg/kg, which is in the range of the concentrations reported for the site.

Hexavalent Chromium Soil Sampling

On 21 March 2018 Langan personnel collected a total of ten (10) soil samples (CKDNP-1 through CKDNP-10) from specific areas of the Site where there is cement kiln dust (CKD) to determine the chemical composition of the material. The locations of the samples are shown on Figure 2.

The soil samples were collected by hand using a standard shovel. At each location, an approximately 8-inch to 12-inch small pit was dug and the soil was placed in two, 8-oz. laboratory supplied glass jars and sealed with a screw cap. The shovel was cleaned prior to

sampling and between sample locations using a wire brush to remove soil from the end of the shovel. The sample containers were placed in an ice chest, recorded on a chain of custody (COC) and relinquished to SunStar Laboratories, Inc. (Lake Forest, California) for chemical analyses. The samples were analyzed for Title 22 Metals and Hexavalent Chromium (Cr^{VI}) using EPA Methods 6010/7000 series and EPA Method 7199, respectively, on a normal turnaround basis. Descriptions of the soil types, locations where the samples were collected; and analytical results are summarized in Table 18 (see Appendix B).

Analytical Results

The analytical results were compared to the Department of Toxic Substance Control (DTSC) industrial Screening Levels (SLs), dated February 2018, the San Francisco Bay Regional Water Quality Control Board (RWQCB) Environmental Screening Level (ESL) for shallow soil for commercial/industrial exposure, dated February 2016 (Rev. 3), and Environmental Protection Agency (EPA) Regional Screening Levels (RSLs) for industrial soil, dated November 2017.

According to the results, all 10 samples exceeded the industrial screening levels for arsenic reported in Table 18. The reported concentrations (5.8 mg/kg to 15 mg/kg) for arsenic are within the range of background concentrations that are reported in the region (Bradford, 1996 and Chernoff, 2008). Cadmium was reported slightly above the DTSC industrial SL of 7.3 mg/kg in one sample, CKDNP-8 (8 mg/kg). Thallium was reported above the EPA and RWQCB industrial RSL and ESL of 12 mg/kg and 11.7 mg/kg, respectively, in one sample, CKDNP–10 (15 mg/kg). Mercury was reported above the DTSC industrial SL of 4.5 mg/kg in two samples, CKDNP-1 (13 mg/kg) and CKDNP-10 (5 mg/kg). Hexavalent chromium was reported above the EPA and RWQCB industrial RSL and ESL of 6.3 mg/kg and 6.2 mg/kg, respectively, in two samples, CKDNP-4 (17 mg/kg) and CKDNP-6 (10 mg/kg). The other eight samples were reported below the industrial screening levels for hexavalent chromium.

8.0 PROPOSED INVESTIGATION PLANS

Based on previous investigation results and discussions with DTSC and AQMD, Langan proposes to conduct a supplemental Site-wide assessment and sampling event consisting of trenches, soil-gas borings, and soil borings. It should be recognized that much of the RCP infrastructure is still in place; certain areas are difficult to access and will therefore be addressed during decontamination, demolition, and grading operations. The areas to be addressed during the decontamination, demolition, and grading operations are presented in Table 19 (Appendix B).

In order to evaluate potential soil re-use for on-site soil (DQO-2), there are three primary areas that are proposed to be analyzed for soil characterization and re-use potential. These areas consist of the former Wet Weather Quarry, the soil stockpile/berms located along the eastern portion of the Site, and the upper five feet of soils throughout the Site (i.e. SW-20). A proposed cut/fill map with the proposed DQO-2 sampling locations is presented in Figure 4. The proposed DQO-2 sampling points, analyses, and approximate cut/fill amounts are presented in the table (Table 20) below:

Table 20: DQO-2 Sampling Locations

The locations of the proposed trenches, borings, and soil gas points are shown in Figure 3. Per DTSC's request, two trenches (SMC-LT-2 and SMC-LT-3) have been added to the Surface, Mining, and Crushing area (refer to Table 21 above and Table 27 in the Appendix B). Samples

collected from these trenches will be analyzed for metals, CrVI, and dioxins. In addition a trench (MSA-LT-5) has been added to the Materials Storage Area (refer to Table 24 above and Table 27 in the Appendix B). Samples collected from this trench will be analyzed for metals, TPH, PAHs, CrVI , and SVOCs.

SCAQMD Hexavalent Chromium Sampling

The primary objective of the proposed sampling is to evaluate hexavalent chromium concentrations in shallow soils that may come into contact with workers during future activities involving demolition of Site structures and mass grading operations in preparation for future development of the Site. In addition, the proposed sampling will evaluate for Cr^{VI} soucres that could cause air quality impacts on-Site and off-Site.

The proposed SCAQMD Hexavalent Chromium Sampling Plan will consist of collecting composite samples from twenty (20) locations (SW-1 through SW-20) across the Site (Figure 3). These samples are designed to address DQO-2. With the exception of six (6) locations discussed below, the sampling scheme will consist of collecting samples from five (5) locations using an excavator with bucket attachment. The samples will be retrieved with hand tools or from the interior of the bucket of the excavator. Four of the samples will be collected in a step out (100 feet) radial pattern around a center point sample location. Samples will be collected at one feet and five feet at each trench location. Samples collected from locations in the Materials Storage Area (SW-8, SW-9, SW-10, SW-13, SW-14 and SW-15) will be collected in a linear pattern (i.e, north-south) to provide coverage for the specific bay they are located in. In addition, five shallow composite samples will be collected (0-2-inches) from five locations in the vacant lot area that include VL-LT-2, VL-LT-3, SW-4, SW-5, and SW-6 to evaluate surficial impacts. These locations will also have composite samples collected at 1 feet and 5 feet intervals. The shallow surficial samples will be collected using a hand trowel.

Samples collected from each depth interval (i.e., one foot) will be composited to create one representative sample from that depth interval at each of the twenty (20) locations. The same process will be conducted for samples collected at the five feet depth interval. The composite samples will be created by placing the soils from each depth interval per location into a stainless-steel bucket and mixed until homogeneous. The mixing will consist of using either hand tools (i.e., trowel) or power tools (i.e. drill with mixing paddle) that are of stainless steel construction. The twenty (20) composite samples for each depth interval for chemical analysis

will be placed in laboratory supplied glass jars, labeled, stored on ice, and transferred to a State-certified analytical laboratory under chain-of-custody protocol. The twenty (20) composite samples will be analyzed for hexavalent chromium using EPA Method 7199 and total metals using EPA method 6010/7000. The composite samples collected from ten (10) of the locations (SW-2, SW-4, SW-7, SW-9, SW-10, SW-12, SW-15, SW-16, SW-18, and SW-19) will also be analyzed for TPH and PCBs. The composite samples at 1 feet and 5 feet from the five locations on the vacant lot (VL-LT-2, VL-LT-3, SW-4, SW-5, and SW-6) will be used as background data and analyzed for metals, hexavalent chromium, and dioxins. The trowels, mixing paddles, hand augers, and any other equipment coming into contact with soils will be decontaminated prior to use at each location using a non-phosphate detergent such as Alconox and rinsed with clean water or a wire-brush to remove soil and debris from the tools. An additional detergent wash and final rinse should follow dry decontamination with a wire-brush.

8.1 DEMOLITION SAMPLING PLAN

As mentioned above, certain areas are inaccessible due to the presence of structures and buildings; therefore, an evaluation of potential soil impacts in these areas is not possible at this time. As discussed with DTSC, an evaluation of these inaccessible areas will be deferred until the decontamination and demolition phase of the project. Table 19 provides a breakdown of the areas that will be evaluated during the decontamination and demolition phase of the project. Cesium contained within the instrumentation and scales will be evaluated and handled during the abatement and decontamination and demolition phase of the project, which will be overseen by the City of Jurupa Valley or Riverside County. The proposed soil sampling and evaluation of the deferred areas will be coordinated with the DTSC during the removal of infrastructure. These areas generally consist of building foundations, concrete slabs, and other infrastructure. Infrastructure removal and soil sampling activities will be scheduled with advance notification to DTSC personnel so they can be present to visually observe and guide the infrastructure removal and sample collection, as needed. In addition to the proposed soil samples already identified, additional soil samples may be collected based on field observations (i.e. PID readings, visual discoloration). These samples are considered contingency soil samples during the decontamination and demolition activities. Soil sample collection is anticipated to be accomplished with a combination of hand auger and/or excavator using a bucket attachment. Details on the rationale for collection of soil samples and the types of analyses will be presented as an appendix in the decontamination and demolition plan.

The areas have been previously surveyed and tied to the California State Plane coordinate system using NAV 83, so that these areas can be accurately located for collection of potential contingency soil samples, if required, following removal of the infrastructure.

9.0 FIELD INVESTIGATION AND SAMPLING

Prior to conducting subsurface activities, Underground Services Alert (USA) will be contacted a minimum of 48-hours prior to commencing field activities. In addition, a private geophysical locating firm will be contracted to clear certain areas of potential underground utilities using ground penetrating radar (GPR) and other subsurface utility location techniques. Langan will mark the proposed borehole and test pit locations in advance of the utility clearance. During the mark-out, Langan will coordinate with an onsite representative who is familiar with the former RCP to confirm that each of the proposed boring and test pit locations are free of known subsurface utilities. In addition, DTSC has requested to be present for the marking of the locations and to provide input on the final selection of the locations.

The field work will be conducted under a Health and Safety Plan (see Appendix C) that will be prepared prior to mobilizing to the field. Field activities will be observed on a full time basis by a degreed, experienced Langan engineer, geologist or scientist under the supervision of a licensed professional geologist or engineer and documented in accordance with Section 10.0. Field observations will be recorded on field data sheets provided in Appendix D. Sampling tools, drilling equipment and other equipment coming into contact with soils will be decontaminated prior to use at each investigation location using a non-phosphate detergent such as Alconox and rinsed with clean water and/or a wire-brush to remove soil and debris from the tools.

Soil samples collected will be analyzed at a minimum for TPH, Cr^{VI}, PCBs and metals to address DQO-2. Soil samples with the highest concentration of Cr^{VI} in the Grey Cement Plant, White Cement Plant, Material Storage Area, and the Wet Weather Quarry will be further analyzed using the Synthetic Precipitation Leaching Procedure (SPLP). A subset of soil samples in the White Cement Plant (WCP-LT-1, WCP-LT-3, and WCP-LT-4) and Grey Cement Plant (GCP-LT-2, GCP-LT-3, GCP-LT-4) will be analyzed for SVOCs and polynuclear aromatic hydrocarbons (PAHs) using EPA Method 8270C based on the sample location. The soil vapor samples will be analyzed for TPH and VOCs using EPA Method 8260B by a California certified mobile laboratory.Analytical testing of soil samples and vapor samples will be conducted in accordance with Table 27 attached (see Appendix B).

Test Pits

Test pits will be excavated at locations marked and cleared for subsurface utilities. As presented in Section 8.0 above, soil will be excavated to a depth of up to 20 feet bgs at discretion of Langan field personnel by a subcontractor using an excavator or similar

equipment. Excavated soils will be stockpiled at least five feet from the edge of the excavation for further characterization and sampling, as necessary. Soil samples will be collected from the initially exposed side walls or pit floors to ensure slough material is not co-mingled with the samples.

Following completion of field observation and sampling activities, the test pits will be backfilled with excavated soils and partially compacted using the excavator bucket. Soil with suspected impacts based on photoionization detector (PID) readings will be wrapped in visqueen and analyzed. All test pit locations will be staked or marked to allow subsequent surveying of coordinates by Langan personnel for preparation of as-built drawings, as necessary.

Periodic dry decontamination of the excavator bucket will be conducted and if suspected contamination is encountered. This process will include removal of debris/soil that may be attached to the bucket using shovels and/or brushes. If necessary, the bucket will be cleaned with a pressure washer.

Soil Borings

The soil borings will be advanced using standard hollow-stem auger drilling equipment. Prior to advancing the hollow stem augers, the upper 5 feet will be hand augured in certain areas to verify clearance of utilities. These areas will include locations that cannot be readily confirmed with geophycial equipment. Split-spoon sampling will be performed during drilling operations to the total depth drilled. California ring samples will be collected at selected depths using a split barrel California sampler lined with brass rings in accordance with ASTM D3550. If the hollow-stem auguers are unable to achieve the desired depth due to refusal (i.,e., Wet Weather Quarry), other methods such as sonic will be considered. Soil samples will be field-screened using a PID, visually examined, and classified in the field in accordance with the Unified Soil Classification System (USCS). Soil samples exhibiting characteristics that may be indicative of potential environmental concerns (including staining, odors, VOC impacts, or evidence of non-native materials such as CKD) will be submitted to a California state-certified analytical laboratory for chemical analysis. Soil samples selected for laboratory analysis will be transferred to laboratory supplied sample containers for the appropriate testing, labeled, stored on ice, and transferred to a State-certified analytical under chain-of-custody protocol.

Based on previous investigations, groundwater is not anticipated to be encountered within 50 feet of the ground surface; however, two borings located in the Wet Weather Quarry (SMC-SB1 and SMC-SB2) may encounter groundwater. Upon completion, the boreholes will be backfilled with cement grout. Clean soil cuttings will be stockpiled near the borings and test pits for subsequent distribution to unimproved areas of the Site. Soil cuttings with suspected

contamination based on PID readings will be wrapped in visqueen and analyzed, if necessary, to evaluate for potential reuse onsite or offsite disposal. All boring locations will be staked or marked to allow subsequent surveying, if necessary.

Soil Gas Vapor Probes

The borings for the temporary soil gas vapor points proposed in Section 8.0 will be advanced with the hollow-stem auger used to drill and sample the soil borings discussed above. The soil gas vapor points will be nested at each location at five (5) feet and fifteen (15) feet bgs. The vapor points will be constructed of Teflon® tubing or similar to a soil vapor screen with a 1.5-inch length and 3/8-inch diameter for sample collection. Monterey kiln-dried sand will be used for the one foot filter pack, based on DTSC guidance, at the bottom of the vapor well borehole. The 1.5-inch screen will be set at the midpoint of the sand filter pack and place a one-foot layer of dry bentonite chips above the filter pack, followed by hydrated bentonite to the ground surface. The hydrated bentonite will serve as a seal around the sample collection tubing to prevent ambient air intrusion into the soil gas sample. A closed valve will be installed at the end of the sample-collection tubing at the surface. Soil gas vapor installation and sampling will be conducted in accordance with California Environmental Protection Agency (EPA) and Department of Toxic Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance) dated October 2011(Appendix E). Soil gas samples will be collected at a minimum of 48 hours following installation of the soil gas vapor probes. At least two rounds of soil gas samples will be collected from each of the soil gas vapor points.

Further details regarding sampling methodology and quality assurance/quality controls are presented in the Sampling Analysis Plan (SAP) and the Quality Assurance and Quality Control Plan (QAPP) (Appendix F and G, respectively).

10.0 DOCUMENTATION

Boring and test pit logs will be maintained and filled out for each location. In general, these logs will include the following information:

- Boring/test pit number
- Date
- Depth of completion
- Equipment type
- Soil description and USCS classification
- Depth to groundwater, if encountered
- Name of drilling or excavation subcontractor
- Project name
- Field observations

Field data sheets are included in Appendix D.

11.0 REPORTING

Upon completion of field investigation and receipt of laboratory analytical results, a Summary of Findings report will be generated. In general the Summary of Findings Report will consist of the following:

- Executive Summary
- Introduction
- Summary of Site Background
    - Site Description and Location
- Sampling Activities and Results
    - Summary of Activities
    - Boring Clearance and Geophysical Survey
    - Soil Gas Sampling and Analysis
    - Soil Sample Collection Procedures
    - Soil Matrix Analytical Results
        - Summary of Site Specific Background Results
        - Volatile Organic Compounds (VOCs)
        - Total Petroleum Hydrocarbons (TPHs)
        - Metals and Hexavalent Chromium (Cr^{VI})
        - Other Organics (PCBs, Dioxins, PAHs, SVOCs)
- Deviations from the SAWP
- Evaluation of Results
- Conclusions and Recommendations

Study Area Overview

N
W E
S

Legend

- Sample Exceeds Hexavalent Chromium (Cr(VI)) Industrial Screening Levels (Discrete Sampling on March 21,2018)
- Sample Below Hexavalent Chromium (Cr(VI)) Industrial Screening Levels (Discrete Sampling on March 21,2018)
- Approximate Groundwater Well Location (MW-4)
- Approximate Boring Locations (LB-12, ALB-12 and ELB-1)
- Approximate Trench Locations (LT-47)
- Approximate Trench Location, 2017 (TP-6)
- Area of Interest #11 - Former / Existing Transformers
- Area of Interest #1 - Areas with Soil Containing CKD
- Area of Interest #2 - Locations of Former USTs
- Area of Interest #3 - White Kiln Pipeline and Diesel Pump
- Area of Interest #4 - Former Boiler Blowdown Pond
- Area of Interest #5 - Former Spray Pond
- Area of Interest #6 - Former Sag Pond
- Area of Interest #7 - Hazardous Waste Storage Area
- Area of Interest #8 - Sewer Alignments
- Area of Interest #9 - Settling Area
- Area of Interest #10 - Major Fill Piles or Berms
- Area of Interest #12 - Storm Water Retention Basin
- Approximate Location of Key Site Features
- Concrete or Asphalt Paving (as of 1964)
- Oil Emulsion Pavement (as of 1964)
- Suggested New Paving (as of 1964)
- Approximate Limits of Development
- Approximate Limits of Former Riverside Cement Manufacturing Plant
- Proposed Building Footprint

Study Areas

- Grey Cement Plant
- Maintenance, Adminstration, and Packaging
- Material Storage Area
- Surface Mining and Crushing
- Vacant Land
- White Cement Plant

APPENDIX A

DTSC Response to Comments

DTSC Response to Comments for Preliminary Environmental Assessment

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
1	Risk Assessment	CY Jeng	8.3.1 Table 1	Some soil samples were composited for laboratory analysis but it's unclear for what analytes. In addition, comparison of composite results with screening levels directly for site characterization and risk evaluation purposes may not be appropriate, depending on the data quality objectives for the project (which should be defined in the future workplan/report).		Soil samples were composited and analyzed for metals, TPH, and other analytes based on visual observations and past operational history. Langan will define the data quality objectives in the SA Work Plan as well as the sampling approach (i.e., discrete).
2	Risk Assessment	CY Jeng	9.1	While HERO does not object to the use of the Environmental Screening Levels (ESLs) published by the SFRWQCB along with the other screening criteria in this case, HERO recommends the following hierarchy for future data evaluations: (1) DTSC-modified Screening Levels in the HERO HHRA Note 3; (2) USEPA Regional Screening Levels; and (3) ESLs.		We will use the following proposed hierarchy for future evaluation of the data, which includes DTSC-modified SLs and EPA RSLs.
3	Risk Assessment	CY Jeng	9.1.1	HERO recommends also comparing the site metal data with background soil levels (e.g., LT-4) to identify elevated concentrations that may warrant further assessment (e.g., chromium, nickel and vanadium at LT-21).		We will compare the data to both the screening levels and background levels. We will use the higher of the two screening levels as the criteria to determine appropriate actions for further delineation.
4	Risk Assessment	CY Jeng	10.1	HERO disagree with the statement "...there is a limited source of VOCs, rending the inhalation pathway incomplete." For example, the former USTs and ASTs storing gasoline and diesel as well as the hazardous waste storage area (AOI#7) could be sources for VOCs. However, the vapor intrusion pathway was not assessed during the previous investigation and closure activities, so it should be considered as a potentially complete exposure pathway and need to be properly evaluated in the upcoming Site assessment.		There were no indications of VOCs duirng field sampling activities in the past. The site will be going through a significant grading and soil relocation program. We can either perform a limited soil vapor survey prior to grading operation or conduct the survey post grading prior to construction. In addition, during grading operations any indication of elevated VOC area will be discovered. In addition, the site will be paved with either asphalt or concrete cover which will create an additional barrior to the potential receptors.
5	Risk Assessment	CY Jeng	10.1	For purposes of a risk evaluation, the land use of the site is assumed to be residential regardless of the current use and zoning of site, so residential receptor should also be evaluated in order to determine if land use restriction or other remedies may be warranted for site closure.		We are intending on having a land use covenant (LUC) for the site for industrial/commerical use only.
6	Risk Assessment	CY Jeng	10.2	Clarify if previous sampling results also used in the risk evaluation, and explain why if not. In general, historical data collected from locations that have not been disturbed over time should be considered in the PEA evaluation.		The previous samples were not used in the PEA evaluation; however, we will include that information in the upcoming SAWP and future data evaluations.
7	Risk Assessment	CY Jeng	10.2.1	The lateral and vertical extents of the impacted soil sampling locations (e.g., TPH-d at LT-9, nickel at LT-21, and lead at LT-40) should be fully defined, and the proposed controls and protective measures should be adequate for protection of all possible future receptors (see Comment 5).		During the SAWP development, a delineation program will be implemented to determine the lateral/vertical extent of impacts at LT-9 (TPH,As,Cr), LT-21 (Ni), and LT-40 (As, Pb).
8	Risk Assessment	CY Jeng	9.1.3	The USEPA RSL value listed (0.950 µg/kg) for Aroclor 1248 is incorrect and should be 950 µg/kg instead. The same errors are noted for the screening levels listed on Table 2j.		We will correct the error and resubmit the files.
9	Risk Assessment	CY Jeng	Table 1	Table 1 lists AO1 #12 and #13 samples, which are described under "Background Sampling/Additional Areas of Sampling" and AOI#12 respectively, in Section 8.3.1.		Understood.
10	Risk Assessment	CY Jeng	Table 3a, Table 3b	The MCL values appear to be in the unit of µg/L instead of mg/L as indicated on the tables. This discrepancy should be fixed to avoid confusion.		We will correct the error and resubmit the files.
11	GSU	Christopher Guerre	Soils	Before ground is broken for redevelopment of the site, soils should be characterized sufficiently to ensure they are properly managed during project activities. Additional characterization is requested beyond that presented in the PEA Report and a Site Assessment Workplan (SA Workplan) should be developed. Soil characterization should focus on a list of AOIs that may be associated with certain contaminants.		We will create a sampling plan to characterize the soil and chemical of concern based on operations and site history.

DTSC Response to Comments for Preliminary Environmental Assessment

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
12	GSU	Christopher Guerre		Additionally, Site soils that are going to be disturbed by redevelopment activities should also be characterized. It is envisioned that the SA Workplan would propose conventional pre-selected sampling locations. However, due the large scale of the project and operational complexity, it is suggested that the SA Workplan also include generic sampling plans for characterizing soils based on building footprint or processing area. Some characterization may need to be completed after demolition activities have progressed. For example, on other DTSC sites with significant demolition activities, soil sampling has occurred after cement foundation slabs are removed.		We will develop a SAWP, Demolition plan, and Response Plan to accommodate the suggested sampling approach by DTSC.
13	GSU	Christopher Guerre	Soils	A detailed cut and fill map (including depth of cut and fill) is requested for DTSC review to assist in developing sampling strategies for the site. It is envisioned that soil samples will be collected before cuts are implemented to assist in characterizing and categorizing soils in order to plan soil reuse, management options, and potential disposal.		We will provide a Cut/Fill map for review by DTSC.
14	GSU	Christopher Guerre	Soils	During the January 25, 2018 site visit, Langan representatives indicated that, in general, soils would not be imported to or exported from the Site during redevelopment. Additionally, Langan indicated that the Wet Weather Quarry (WWQ) depression would need to be filled with significant quantities of soils from the Site. To ensure that inappropriate materials are not placed in the WWQ (or other areas of the Site for that matter) criterion should be established for determining what type of soil should be reused and where.		Soil reuse criteria will be development and documented in the soil management plan.
15	GSU	Christopher Guerre		Placement of contaminated soils should not cause landfill permitting requirements to be invoked. Therefore, hazardous wastes levels and tests including leaching tests, should be identified and performed on suspect soils. SPLP tests may also need to be performed to assess leaching characteristics of nonhazardous soils. Class III landfill permitting requirements should also be avoided by taking all demolition waste and conventional trash off-site for appropriate disposal.		Agree. We will perform SPLP test where appropriate. We will perform SPLP tests in four areas (Grey Cement Plant, White Cement Plant, Wet Weather Quarry, and Material Storage Area) where the soil samples contain the highest CrVI concentrations.
16	GSU	Christopher Guerre		Criterion/Action Levels for utilizing soils containing contaminants should be established. The threat to human health and the environment should guide development of the criteria. Criteria such as risk based screening levels should be adopted as well as screening levels to protect the groundwater resource. As low levels of certain soluble contaminants, such as hexavalent chromium, can threaten groundwater, extra measures may need to be taken including engineering controls such as capping and liners to minimize infiltration.		We will establish action levels and use the screening methodology described in the HERO comment above.
17	GSU	Christopher Guerre		If significant quantities of impacted soils are placed in areas like the WWQ, then the GSU would require new groundwater monitoring well installation and establishment of a monitoring network to ensure groundwater impacts do not develop in the future. Ideally, the monitoring network should be installed prior to placement of any fill to establish baseline groundwater conditions. Materials/wastes planned for offsite disposal should also be identified.		Understood.

DTSC Response to Comments for Preliminary Environmental Assessment

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
18	GSU	Christopher Guerre	Records	During the January 25, 2018 site visit, GSU staff visited the Transportation Office where substantial quantities of old plant and mining records are now housed in numerous cabinets. A very quick search provided very valuable plates that confirmed previously identified AOIs as well as located new AOIs (See Attachments at the end of this memorandum). Time should be spent reviewing these records. People familiar with these records should be contacted if needed to expedite review and confirm file organization. Historic Sanborn maps should also be obtained if available. Building plot plans would be very helpful in identifying sumps, clarifiers, pits, etc., that might be of concern to DTSC. Ideally, plot plans for each building should be obtained from records and then DTSC could conduct a field visit, if necessary, to assess if any of the units would require soil characterization.		We will review available drawing information to identify other AOIs that may not previously been identified in the PEA. Previous Phase I ESAs that were conducted in 2016 for the northern and southern parels did not have Sanborn Maps available per EDR search.
19	GSU	Christopher Guerre		Appendix D contains information indicating that solvents were used at the "Shops" as late as 1992. "Safety Solvent" (1,1,1 tricholorethane) and other solvents are mentioned being stored in quantities up to 150 gallons. This further supports conducting soil gas surveys at select areas on the site. Soils gas surveys should be performed at all Site areas that could have used or contained volatile organic compounds (VOCs). This includes, but may not be limited to, the following AOIs: All above ground storage tanks (ASTs) and underground storage tanks (USTs) with lighter end hydrocarbons (e.g., gasoline and diesel, waste oils); the six-million-gallon tank; AOI#3 — White Kiln Pipeline Release; AOI#5 through AOI#8; former Boiler Shop, Machine Shop, Repair Shop, Electric Shop; Stores; former Material Yard; Garage; Sag Pond; Spray Pond; and Reservoir.		Agreed. A selective soil gas survey will be conducted to address areas discussed with DTSC. The specifics are presented in the SA Work Plan.
20	GSU	Christopher Guerre	CKD Areas	There is concern that waste kiln brick/refractory brick/"basic brick" may be associated with this material. See Specific Comment J below. Cr+6 analytical data are missing for this material and represent a major data gap for the Site since the material is suspected of containing Cr+6. Cr+6 data must be collected from this material (as well as other soils/materials).		We will address this data gap in our SA Work Plan
21	GSU	Christopher Guerre		Deep borings of the spoils within the WWQ should be planned to ascertain the thickness of fill/waste within the area, assess the nature of any contamination planned to be left in place, as well as to confirm the depth to groundwater in the area.		The SA Work Plan will propose a couple of borings in the WWQ to address the comment.
22	GSU	Christopher Guerre		Hazardous waste leach tests for chromium and Cr+6 should be conducted on CKD material with elevated chromium/hexavalent concentrations. To protect the groundwater resource, USEPA Method 1312 Synthetic Precipitation Leaching Procedure (SPLP) may also need to be performed to assess leaching characteristics.		Understood.
23	GSU	Christopher Guerre		Atypical soils (e.g., black/brown sand in LT-31) should be sampled and analyzed in addition to CKD.		We will address this data gap in our SA Work Plan

DTSC Response to Comments for Preliminary Environmental Assessment

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
24	GSU	Christopher Guerre	Spray Pond	Cr+6 analytical data were not conducted for this AOI. The GSU requests that samples be collected from four borings drilled through the floor of the unit to assess potential leakage.		As discussed during the site visit on February 2, 2018, the Spray Pond foundation/slab is likely to be serveral feet thick and may pose a challenge to core and drill through it. Sampling will be conducted after the slab is removed during the decon/demolition phase.
25	GSU	Christopher Guerre	Sag Pond	Cr+6 analytical data were not conducted for this AOI. The GSU requests that samples be collected from two trenches located within the boundaries of the unit as defined by aerial photographs from 1953 and 1966 (see Specific Comment F). North-central and south-central locations are requested.		Will be addressed during the decon/demolition phase of the project.
26	GSU	Christopher Guerre	Settling Areas	Cr+6 analytical data were not conducted for this AOI. Samples were not collected from most of the Settlement Areas pictured on Figure 2 of the PEA Report which were based on Regional Water Quality Control Board (RWQCB) input from 2000 (see last page of Appendix C). Therefore, additional sampling is requested. The two settlement areas pictured to the southwest on Figure 2 are well located as they are also located near a major drainage canal.		We will address this data gap in our SA Work Plan
27	GSU	Christopher Guerre		The large settlement area pictured to the northwest should be sampled again, this time locating the area delineated as the "Fleet Truck Parking" on facility drawings (see Attachments at the end of this memorandum). Fluids would periodically collect at the east end of this area based on historic aerial photographs. The March 2011 Google Earth Pro photograph documents fluids at all of these locations. The settlement area adjacent to the six-million-gallon fuel tank should be investigated as part of the Reservoir.		We will address this data gap in our SA Work Plan
28	GSU	Christopher Guerre	Major Fill Piles or Berms	Cr+6 analytical data were not conducted for this AOI. It is suggested that composite sampling be utilized for this type of unit as well as characterization of the vacant lots. Each berm could be treated as a decision unit. However, distinct types of materials should be excluded where feasible (e.g., one subunit with pods of CKD and another with no or trace CKD). Distinctly different material from different subunits should not be mixed. For example, the composite sample from trench LT-SBermA mixed the three different units identified in the trench log: whitish hard pan, dark grey soil with trace coal, and tan soil. Additionally, the dark grey soil with trace coal should have been analyzed for organic constituents such as polycyclic aromatic hydrocarbons (PAHs) and semi-volatile organic compounds (SVOCs).		We will address this data gap in our SA Work Plan
29	GSU	Christopher Guerre	Former or Existing Transformers	Sampling may be requested after DTSC conducts a field visit to observe the units/areas (see Specific Comment C).		As discussed during the site visit on February 2, 2018, the transformer locations will be evaluated after the facility has been deenergized and staining of the transformer pad. This will likely be part of the demolition plan.
30	GSU	Christopher Guerre		The raw materials storage area (RMSA) should be added to the list of AOIs and sampling of the unit should be described in the SA Workplan. This unit is reported by the SCAQMD as a source of hexavalent chromium.		We will address this data gap in our SA Work Plan

DTSC Response to Comments for Preliminary Environmental Assessment

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
31	GSU	Christopher Guerre		Additionally, contaminated soils were stored in the unit bays. The area where liquid was contained in one bay as pictured in the 2009 aerial photograph may require additional focused sampling. Composite sampling within individual bays should be considered for this large unit.		We will address this data gap in our SA Work Plan
32	GSU	Christopher Guerre		At least two deep borings to approximately 50 feet bgs are requested to assess any residual contamination associated with the six-million-gallon tank. The borings should be located in the southern quadrant of the former tank near former borings VB1 and VB4 (June 26, 1987 ERM-West report contained in Appendix D) that had detected the highest contaminant concentrations. Due to the Bunker C fuel type, analyses for VOCs, SVOCs, and PAHs should be conducted. Deep soil vapor data are also requested due to past VOC detects at this unit.		We will reivew historical information and if additional sampling is necessary we will incorporate into the SA Work Plan
33	GSU	Christopher Guerre		Waste oil USTs should also be sampled for VOCs, SVOCs, and PAHs.		We will address this data gap in our SA Work Plan
34	GSU	Christopher Guerre		New AOIs identified by the GSU that should be investigated include the following: former Power House (including former Precipitators, Tube Mills and Dryers); former Reservoir; former Shops including the Foundry, Machine Shop, Repair Shop, and Electric Shop; Agriculture Division area; former Boiler House (Grey Kiln area); former Water Coolers/cooling towers; Coal/coke Storage; Abandoned substation; Chino Substation and/or "main electrical substation" (Grey Kiln area); and Oil Emulsion Pavement.		We will address this in our SA Work Plan
35	GSU	Christopher Guerre		The SA Workplan should include analyses for a larger suite of organic compounds than presented in the PEA Report. This would include some dioxin analyses due to the long history of kiln usage at the site. At a minimum, the following AOIs should include dioxin analyses: kiln areas, CKD disposal areas, the RMSA, and the vacant lots.		We will address this in our SA Work Plan
36	GSU	Christopher Guerre		It appears that XRF units could be utilized as a screening tool on this Site. Potential applications should be identified.		This will be integrated into the soil management and demolition plan
37	GSU	Christopher Guerre		All groundwater wells on the site should be identified. Those that are not planned for future use should be identified for proper well decommissioning.		Understood.
38	GSU	Christopher Guerre		Well decommissioning work plans should be submitted to DTSC for review and approval.		Understood.
39	GSU	Christopher Guerre		In general, it is recommended that well decommissioning occur prior to site redevelopment.		Understood.
40	GSU	Christopher Guerre		A figure depicting the layout and complexity of the Crestmore Mine underground workings should be provided to DTSC to ascertain how the workings might affect groundwater flow both laterally and vertically. Additionally, Page 9 of the PEA Report states "Wells screened in the Chino limestone may have different groundwater gradients, with the groundwater flow direction in the limestone influenced by the complex local geology and the historical subsurface mining activities." Clarification of the complex groundwater flow is requested.		The SA Work Plan primary objective is to focus on soil conditions as it relates to property redevelopment. At this time, groundwater is not part of this supplemental investigation. It is understood that groundwater may be evaluated in the future. However, additional discussions with DTSC would be warranted prior to initiating any groundwater investigation, if deemed necessary.

DTSC Response to Comments for Preliminary Environmental Assessment

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
41	GSU	Christopher Guerre	4.3	The GSU identified additional information when reviewing the aerial photographs and plant drawing terminology and requests the information reported below be incorporated into the section and that most of the units described be identified on site maps (e.g., Figure 2 of the PEA Report). 1938: White Kiln process does not appear to be present. Power House, Precipitators Building and Tube Mill building appear to be present. Rectangular Spray Pond and Reservoir are present. Dark material surrounds the cantilever crane. Two above ground oil tanks occur west of Rubidoux Blvd. Numerous trees planted on vacant Lot 5/6 to the northwest.		We review the aerial photographs and plant drawings to capture the features outlined in the comment.
42	GSU	Christopher Guerre		1948: Sag Pond Area appears to be present. Grey material is being stockpiled in the center of a white area northeast of the six-million-gallon tank. Southern drainage from east well pictured as well as the southwestern drainage.		No response needed.
43	GSU	Christopher Guerre		1953: Sag Pond more defined including a linear element that occurs at an angle across the pond (faint in 1948). This liner feature is shown on plant drawings crossing the Sag Pond. Large pipeline(?) from Spray Pond sweeps southeast adjacent to the Reservoir and just south of the six-million-gallon tank (portions of this line are present in 1948 photo, but less pronounced). Cement plant dust appears to be blowing to the south. Stockpile in the center of a white area northeast of the six-million-gallon tank is well pronounced. More residences are present on the northeast corner of Lot 1.		No response needed.
44	GSU	Christopher Guerre		1966: Three water coolers from plant drawings can be seen in the southwest portion of the raw materials storage area (RMSA). Two smaller buildings (associated with transformers?) are noted in the RMSA bays. The Boiler House can be seen southwest of the Grey Kilns. The Sag Pond is full of liquid and the liner feature crossing the pond is still present indicating that it is an elevated feature. Low spot/settlement area on east end of parking area (can be seen better in 1953 photo) north of ponds. Electrical Substation now present west of six-million-gallon tank. The Agricultural Division area has formed to the north. White Kilns now present. Drainage ditch west of Power House and Tube Mills well defined.		No response needed.
45	GSU	Christopher Guerre		1968: North side of Spray Pond wet. Sag Pond appears dry. Hard to see Reservoir. Chino Substation may be visible south of RMSA. Power House, Precipitators Building and Tube Mill building area have been demolished.		No response needed.
46	GSU	Christopher Guerre		1974: Spray Pond used for storage. Sag Pond looks wet and smaller. Reservoir seems to have fluids. Building present on southeast corner of RMSA.		No response needed.
47	GSU	Christopher Guerre		1985: Black coke/coal operations can be seen southwest of the Grey Kilns. Building on the southeast corner of the RMSA in 1974 is now gone. Water coolers are still present. Spray Pond is dry and has road entrance. Sag pond area dry and has configuration closer to current conditions. Reservoir seems to have fluids and looks like a pond. Oil Tanks west of Rubidoux Blvd. have been removed. 210,000-gallon Fuel Oil AST and Boiler Blowdown Pond visible in White Kiln area.		No response needed.
48	GSU	Christopher Guerre		1990: Six-million-gallon tank and adjacent Reservoir are not visible.		No response needed.

DTSC Response to Comments for Preliminary Environmental Assessment

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
49	GSU	Christopher Guerre		1995: Boiler House southwest of Grey Kiln area not visible.		No response needed.
50	GSU	Christopher Guerre		2005: Three water coolers west of RMSA are not visible.		No response needed.
51	GSU	Christopher Guerre		2009: One bay in RMSA contains green liquid.		No response needed.
52	GSU	Christopher Guerre	1/25/2018 observations	Oil leakage from motors was noted along the north side of feed silos for the white kiln. A process to document releases such as these should be developed. The actual process/operation should be identified and a plan to remove and segregate obviously contaminated media should be proposed. Waste characterization and soil sampling should be included in the SA Workplan.		A process will be included in the waste management plan, demolition plan, and soil management plan.
53	GSU	Christopher Guerre		Similarly, oil leakage was noted at a transformer in the Raw Mills area where sample LT-XF-5 did not detect polychlorinated biphenyls (PCBs). A trench or boring log for LT-XF-5 could not be located in the PEA Report. Table 1 of the PEA Report indicates that no staining was observed at any of the transformer locations. Table 1 also indicates that two to three inches of asphalt or concrete covered most sample locations. Soil sampling should target discolored, potentially contaminated soils.		As discussed during the site visit on February 2, 2018, the transformer locations will be evaluated after the facility has been deenergized and staining of the transformer pad. This will likely be part of the demolition plan.
54	GSU	Christopher Guerre		The GSU also noted that some other transformer cases had been moved from original locations. The GSU would like to view all site transformers as well as electrical substations (including abandoned and active substations).		During the February 2, 2018 site visit, GSU and DTSC PM were escorted to the various locations on site including abandoned and inactive substations.
55	GSU	Christopher Guerre	5.1	The section states "Manholes were observed within the former white cement manufacturing plant and are associated with storm drains that traverse the area." Page 18 states, "Manholes to storm drains are present throughout the property." The storm drain system for the entire site should be discussed and a figure should be prepared illustrating the system including inlets, discharge to canals/ditches or hook up to other drain systems.		We will make an attempt to identify the storm drains throughout the facility.
56	GSU	Christopher Guerre	5.2	Two above ground oil tanks that formerly occurred west of Rubidoux Boulevard were labeled as fuel oil apparently for the cement quarry (See Attachments at the end of this memorandum and the 1938 through 1974 aerial photographs within the PEA Report). Were those tanks properly closed including the piping to the Site?		These two tanks are not part of this project. This was discussed during the February 2, 2018 site visit with DTSC.
57	GSU	Christopher Guerre	6.5	The section suggests that the Sag Pond was not used for RCC operations. Aerial photographs and plant drawing identify it as a unit associated with the Site. The 1966 aerial photograph shows the Sag Pond operating and full of liquids. The 1953 and 1966 aerial photographs should be used to update the boundary of the Sag Pond on Figure 2. Plant drawings appear to show the Sag Pond connected to the Spray Pond. Efforts should be made to understand the actual operation and purpose to the Sag Pond.		We will be clarify this in the SA Work Plan

DTSC Response to Comments for Preliminary Environmental Assessment

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
58	GSU	Christopher Guerre	6.5	Other study areas are listed at the end of the section in a table. The table or equivalent should be updated to include the following: former Reservoir; former Power House (including former Precipitators, Tube Mills and Dryers); former Shops including the Foundry, Machine Shop, Repair Shop, and Electric Shop; former Water Coolers; Agriculture Division area; Abandoned substation; main electrical substation (Grey Kiln area); Chino Substation; Coal/coke Storage; former Boiler House (Grey Kiln area) and Oil Emulsion Pavement. Activities, process and operations associated with these units should be described in sufficient detail to assess potential contaminants associated with them. Additional areas may be identified after records are reviewed further.		This will be added to the SA Work Plan figures.
59	GSU	Christopher Guerre	6.6	The section should note that many residences (approximately 15 lots) were located to the northeast on Lot 1 (see 1953 aerial photograph). Grading activities will likely encounter residential infrastructures in this area.		We will be clarify this in the SA Work Plan
60	GSU	Christopher Guerre	7	A subsection should be dedicated to discussing SCAQMD oversight history including the history and reason for monitoring air for hexavalent chromium.		We will be clarify this in the SA Work Plan
61	GSU	Christopher Guerre	7.1	The section should discuss disposal of cement kiln brick with reported hexavalent chromium concentrations of 10 percent by weight. Approximately 48 cubic yards of the brick were disposed at the Site from 1955 until 1979. The physical description of this brick should be documented so that it can be easily identified at the Site and properly managed.		Typical klin brick was observed during the site visit and will be looked for during the SAWP and the decon/demolition and soil grading phase.
62	GSU	Christopher Guerre		The section should also mention the old CKD analytical results from 1979 (from Table 3-1, Ecology and Environment, Inc., 1990 contained in Appendix B of the PEA Report) which yielded maximum concentrations of lead (4,600 ppm), arsenic (21 ppm), and cadmium (150 ppm). Chromium was only reported at a maximum concentration of 41 ppm. When compared to other CKD data, these data suggest that the CKD composition could have changed over time.		Understood.
63	GSU	Christopher Guerre	9.1	According to Table 1 only one sample of CKD out of the eight AOI#1 areas containing CKD was sampled. The lone CKD sample yielded high chromium of 2,000 mg/kg which is near the hazardous waste level for chromium (2,500 mg/kg). The Cr+6 hazardous waste level is 500 mg/kg. CKD must be well characterized for metals, especially Cr+6.		Understood.
64	GSU	Christopher Guerre	9.2	The GSU did not conduct a rigorous assessment of the groundwater and hydrogeology sections presented in the PEA Report as the GSU's review focused on identification of AOIs for soils investigation. As the project progresses and additional soils data are collected, a better understanding of the site conceptual model should develop and groundwater concerns should be better defined.		The SA Work Plan primary objective is to focus on soil conditions as it relates to property redevelopment. At this time, groundwater is not part of this supplemental investigation. It is understood that groundwater may be evaluated in the future. However, additional discussions with DTSC would be warranted prior to initiating any groundwater investigation, if deemed necessary.
65	GSU	Christopher Guerre		In the interim, it is requested that historic groundwater and surface water data be summarized in one document to minimize the amount of time spent locating and reviewing that data. Immediate questions include if well MW-1 is still functional and if a well MW-2 ever existed.		We will provide a groundwater and surface water sampling report. MW-2 was never installed.

DTSC Response to Comments for Preliminary Environmental Assessment

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
66	GSU	Christopher Guerre	Table 1	Some of the field observation descriptions or sampling depths in Table 1 do not correlate with the trench logs (e.g., see logs LT-EBermC, LT-EBermD, LT-9, LT-32). Additionally, Table 1 indicates LT-32 was not sampled, yet data are presented on Figure 4A presents data for LT-32. The table, logs and/or figures should be revised.		Understood.
67	GSU	Christopher Guerre	Appendix D, 1992 ERBP	The Hazardous Materials Inventory Report contained in the plan indicates that radioactive Cesium 137 isotope was used in nuclear scales and instruments. Discussion regarding the management and fate of the Cesium 137 should be documented.		Cesium is only found in the instrumentation and nuclear scales. There is no Cesium in the soil.
68	GSU	Christopher Guerre		Where were chemicals stored prior to the creation of the hazardous waste storage area?		There have been additional discussions with the on-Site manager (Pat Crites). He has indicated that he is not aware of other hazardous waste storage locations other than the current location.
69	GSU	Christopher Guerre		How was boiler blowdown managed prior to 1985? RWQCB documents indicate that 5,000 gallons per month of highly mineralized boiler blowdown and water softener regeneration wastes was discharged to an "impervious facility". Where was the "impervious facility" located.		During the site visit on February 2, 2018, we showed the location of the "boiler blowdown" and "impervious facility."
70	GSU	Christopher Guerre		The history of mine and plant waste water discharges should be summarized. RWQCB documents mention 1.75 million gallons per day of industrial wastes pumped from the mine to the West Riverside Canal and 5,000 gallons per day of sanitary wastes to a septic system that was later replaced by a treatment system.		Understood.
71	GSU	Christopher Guerre		Did an explosive storage area exist for the mine at some point in the past? These units are often located in remote areas away from operations.		We are not aware of a storage location for explosives within the subject property.
72	GSU	Christopher Guerre		Were any wastes, materials, or machinery left in the underground workings that flooded?		We are not aware of waste, materials, equipment, etc. left in the underground workings that flooded.
73	GSU	Christopher Guerre		Mine dewatering efforts and discharge points should be discussed.		Documentation regarding dewatering is not readily available. The need for this information will be further discussed with DTSC, if necessary.
74	GSU	Christopher Guerre		The function and purpose of the "overflow standpipe" pictured on facility drawings between the "Caved Area" and WWQ should be discussed.		Documentation regarding the "overflow standpipe" is not readily available. The need for this information will be further discussed with DTSC, if necessary.
75	GSU	Christopher Guerre		Could soils on the omitted lots to the south (e.g., Open Space 72.29 acres) also be candidates for borrow areas to fill up the WWQ if needed. Is there a plan to fill the Commercial Quarry area?		Soils located in the Open Space to the south will not be used as soil borrow areas. The Commercial Quarry area will not be filled and will remain in its current condition.

DTSC Response to Comments for Site Assessment Work Plan

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
1	DTSC Brownfields Restoration and School Evaluation Branch	Scarlett Xihong Zhai		DTSC provided comments to the PEA Report in a letter forwarded on February 28, 2019. A responses-to-comments table should be included as an appendix in the SAWP		A responses-to comments table is included as Appendix E of the SAWP.
2	DTSC Brownfields Restoration and School Evaluation Branch	Scarlett Xihong Zhai		The SAWP should include a section of contingent sampling activities, to indicate that more samples might be collected based on field observation during sampling and demolition.		This has been addressed in Section 8.1 of the SAWP.
3	DTSC Brownfields Restoration and School Evaluation Branch	Scarlett Xihong Zhai	Table 8, Page 1	The last row of the table states that DTSC conducted site screening assessment on the CKD containing soil in 2009, which appears to be an error. DTSC believes the oversight agency should be South Coast Air Quality Management District. Please verify and correct accordingly		Table 8 has been corrected accordingly.
4	DTSC Brownfields Restoration and School Evaluation Branch	Scarlett Xihong Zhai		During the meeting on June 21, 2018, Langan proposed soil samples for metal and PCBs analysis for the Southern California Edison substation. DTSC recommends TPH analysis of the soil samples, to evaluate any potential impact from the nearby former Bunker C oil UST. The sample locations and depth should be reflected on Figure 3, and incorporated in the SAWP.		We recommend a meeting between DTSC, SCE, and Langan to develop a focused sampling program at the Crestmore Substation. Currently we propose four borings to 20 feet with analysis for TPH, PCBs and metals. The implementation of this sampling will be conducted once access and coordation is completed with SCE.
5	DTSC Human and Ecological Risk Office	CY Jeng	Page 4, Section 1.1	HERO recommends expanding DQO-I to "....of COPCs in former known or suspected source areas to support a health risk evaluation and the Response Plan" for completeness.		This extension to DQO-1 has been added to Section 1.1 of the SAWP.
6	DTSC Human and Ecological Risk Office	CY Jeng	Page 4, Section 1.1	For clarity, HERO recommends including a statement to indicate that additional areas will be addressed in the decontamination/demolition and the soil management plan as discussed in Section 8.0.		This statement has been added to Section 8.1 of the SAWP.
7	DTSC Human and Ecological Risk Office	CY Jeng	Page 21, Section 5.0	Please clarify on the EPA “Ongoing" status on Table 7 and describe EPA’s roles in the proposed redevelopment process, if any.		Updated in Section 5.0 - Table 7 of the SAWP.
8	DTSC Human and Ecological Risk Office	CY Jeng	Page 28 and Table 18	HERO recommends listing other metal data (e.g., those collected during the PEA) on the table for completeness, and discussing potential significance of the metal concentrations exceeding the screening levels and whether further investigation is warranted (see Comment 10).		Metals data collected during the PEA are included in the PEA as Table 1. Table 18 is intended to only summarize the data results of a soil sampling event on 3/21/18.
9	DTSC Human and Ecological Risk Office	CY Jeng	Page 29, Section 8.0	For clarity, HERO suggests changing the total number of soil borings to 8 (eight) as both soil and soil-gas borings will be installed at MAP-SG4 and MAP-SG5 according to Table 25.		SB/SG co-located borings are listed as one boring on Table 27 and on Figure 3 of the SAWP.
10	DTSC Human and Ecological Risk Office	CY Jeng	Page 29, Section 8.0	HERO’s Comment #7 on the PEA Report recommended that the lateral and vertical extents of elevated soil concentrations detected at the previous soil sampling locations (e.g., LT-9, LT-21, and LT-40) be adequately defined. Please explain why additional sampling is not proposed around these locations.		Areas LT-9 and LT-21 will be addressed during the sampling associated with the decon/demo plan, as described in Section 8.1. LT-41 will be delineated with field adjustments of the SW-18 location (see Figure 3).
11	DTSC Human and Ecological Risk Office	CY Jeng	Page 37, Section 9.0 and Table 25	Explain why the analysis of Cr(VI) is limited to the soil samples at the top two depths (1 foot [ft] & 5 ft bgs) while the analyses of other chemicals are proposed for soil samples at the top three depths. In addition, clarify whether deeper soil samples (e.g., 15’ and 20’) will be collected and put on hold pending analytical results of the shallower soil samples at the same location.		The analysis of CrVI will include sampling at three depths (1 ft, 5ft, and 10 ft bgs). This has been added to Table 27 of the SAWP.
12	DTSC Human and Ecological Risk Office	CY Jeng	Page 37, Section 9.0 and Table 25	Besides metals, at least 50% of the soil samples in each cut area proposed for DQO-2 should be analyzed for TPH ranges (gasoline, diesel, heavy oil) and PCBs to properly evaluate soil for possible reuse as onsite		This has been updated in Section 8.0, Table 27, and Figure 4.

DTSC Response to Comments for Site Assessment Work Plan

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
13	DTSC Human and Ecological Risk Office	CY Jeng	Page 37, Section 9.0 and Table 25	Collect soil gas samples at all locations where the soil borings are proposed for VOC analysis (e.g., WCP-SB1) to evaluate potential vapor intrusion. All soil gas samples should also be analyzed for TPH-gasoline to evaluate non-carcinogenic effects of volatile petroleum hydrocarbons that are not reported by the TO 15 analysis		Proposed soil gas sampling locations are currently within the general operational area which will give us a preliminary indication of VOCs in soil gas. Should additional SG sampling be needed, we will evaluate and perform after the preliminary soil gas sampling. Soil gas analyses will be performed using the 8260B method to account for TPH-gasoline constituents.
14	DTSC Human and Ecological Risk Office	CY Jeng		HERO recommends including a figure showing the cut/fill areas that are planned for possible soil use, and the proposed sampling locations/depths for DQO-2 to illustrate spatial coverage (lateral and vertical) of the proposed samples over the cut areas.		A cut/fill map with proposed sampling locations for DQO-2 will be provided in Figure 4.
15	GSU	Christopher Guerre	Section 8	Tables within Section 8 include the statement, “Addressed in decon/demo and Soil Management Plan (SMP)." for many of the listed buildings and structures. The decon/demo and SMP should be developed as soon as possible to ensure those plans are appropriate and supplement the SAWP appropriately. If certain units are not addressed and sampled in the decon plan, then they would have to be sampled in the SAWP. The developed demolition plan should clearly describe the process for ensuring how structures will be investigated, tracked, and sampled. For example, how will the numerous transformers across the site be evaluated during demo/decon/SMP? How will new contaminant discoveries be handled? Additionally, after an area is demolished, how will the location of small units such as transformers be accurately recorded to enable future sampling/actions? The SAWP and demolition plan should include a succinct list/table for areas that are already scheduled to be sampled during demolition. Other areas/buildings (e.g., Truck Loading, Pack House) to be screened for sampling, but may not be sampled should also be listed as practicable. All buildings/areas would require DTSC oversight to clear it from further investigation, preferably just after slab/pad remo /at and while grading an area for the first time as well as observing the last cut prior to filling.		Section 8.1 identifies and addresses the areas to be sampled during decon/demo and rough grading activities. A specific decon/demo and SMP is being developed and will be submitted prior to decon/demo and soil grading activities.
16	GSU	Christopher Guerre		As recently discussed with Langan representatives, a cut and fill map should be included in the SAWP to allow visualization of the larger volumes of soil that are planned to be moved. Additional sampling points may be needed based on this figure, especially if particular operations or material occupy areas where large volumes of soil will be cut.		A cut and fill map will be provided with the SAWP in Figure 4.
17	GSU	Christopher Guerre		The SAWP does not describe sampling protocol. A Sampling and Analysis Plan (SAP) should be developed to describe, in detail, all the different sampling techniques that will be used while collecting trench, soil boring, and soil vapor samples (See also Comments 54 and 58). Additionally, quality assurance project plan control (QAPP) elements such as quality control measures (e.g., blanks, spikes, duplicates) and data validation should be discussed in the SAWP		A SAP and QAPP has been developed.
18	GSU	Christopher Guerre		A. It is suggested that a larger suite of analytes be included to assess site wide conditions across the six study areas. Total petroleum hydrocarbons (TPH), semi-Volatile organic compounds (SVOCs), polycyclic aromatic hydrocarbons (PAHs), and polychlorinated-biphenyls (PCBs) should, at a minimum, be included at all investigation areas and included as analytes for some of the new samples proposed in Table 25. Hexavalent chromium (Cr6’) analyses should be conducted at all standard depths in known operational areas. Finally, all samples should be analyzed for pH as it could be an indicator of extent of impact from cement operations.		We believe that the site specific COPCs include TPH, metals, PCBs, and CrVI. In certain locations, where historical operations indicated the usage of VOCs, SVOCs, and PAHs, we have proposed to analyze for those constituents. We will conduct field pH measurements on the samples collected.

DTSC Response to Comments for Site Assessment Work Plan

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
19	GSU	Christopher Guerre		Additional soil gas sampling locations are requested. Please review General Comment 5 of the GSU' s February 23, 2018 memorandum which requested that many locations be assessed by soil gas. If desired, Langan can try to prioritize above ground storage tanks (ASTs) and underground storage tanks (USTs) requiring soil vapor assessment based on release history and past data. All waste oil USTs need to be assessed with soil gas. Add a sample location between the Boiler Shop and Foundry for better coverage of the shops area.		Four additional soil gas points have been added (Figure 3).
20	GSU	Christopher Guerre		A section within the SAWP should discuss site specific background data collection and analysis. Table 24 of the SAWP mentions background analysis for locations VL-LT-2 and VL-LT- 3, but nothing more. The GSU believes that data collected from certain vacant lot samples associated with the hexavalent chromium assessment could also be used for site specific background assessment (see Comment 48).		Discussion regarding prior sampling and background concentrations is provided in Section 7.0 of the SAWP.
21	GSU	Christopher Guerre		A Data Quality Objective (DQO) to assess if detected soil contamination can impact groundwater resources should be established in the SAWP as discussed in the GSU memorandum dated February 23, 2018. Site specific background levels and U.S. EPA Soil Screening Levels should first be used to evaluate site data. If those screening levels are exceeded, then leaching models would be utilized to further assess the potential to impact groundwater and develop protective values if necessary. The SAWP should also have contingencies to run synthetic precipitation leaching tests (see the GSU memorandum dated February 23, 2018) to evaluate transport effects due to the cementitious nature of some of the site soils or materials (e.g., cement kiln dust).		Added DQO-4 to the Objectives in Section 1.1 of the SAWP. SPLP tests will be run in specific study areas at sampling points with the highest concentration of CrVI.
22	GSU	Christopher Guerre	Objectives, Page 4	DQOs are presented in this section. It is recommended that additional detail be added to the DQOs such as what screening levels the data will be compared to attain the objective. Also ensure that analytical detection limits are appropriate for the different screening levels that exist.		The proposed site development is commercial/industrial warehouses; therefore the screening levels for the DQOs will be commerical/industrial ESLs. SSLs will be used for DQO 4. The proposed analytical detection limits are presented in the QAPP.
23	GSU	Christopher Guerre	3.2 Hydrogeology, Pages 10 and 11	This groundwater section was not rigorously assessed, but could certainly benefit from figures/cross-sections illustrating geologic and hydrogeologic units, even if only conceptual at this time. Additional work will be needed should soils data point towards potential groundwater impacts. Existing water wells on and near the site may or may not be appropriately located to detect a release from the property.		We recognize there is a potential need to do additional evaluation of potential groundwater impacts.
24	GSU	Christopher Guerre	4.0 STUDY AREAS, Table 5: Maintenance, Administration, and Packaging Features, Paqes 19 and 20	Clarification is requested as to the presence of the cesium radiation sources and how they are to be properly managed and disposed. Oversight agencies involved with these units should be cited.		We have removed the Cesium references as appropriate. We have also included additional information in Section 8.1 to address Cesium as part of the decon/demolition phase under the supervision of the City or County.
25	GSU	Christopher Guerre	4.0 STUDY AREAS, Vacant Land Features, Page 20	The text discusses residential homes on the western portion of the study area. It appears that residential homes occurred on the eastern portion of this parcel based on review of aerial photographs. Clarification/revision is requested.		This has been addressed in Section 4.0 of the SAWP.
26	GSU	Christopher Guerre	5.0 REVIEW OF PREVIOUS REGULATORY INVOLVEMENT, Page 22	This portion of the document should mention South Coast Air Quality Management District's (SCAQMD) hexavalent chromium air detections along the cement plant's fence line which were sourced from somewhere onsite.		This section of the SAWP has been revised that indicates that AQMD has required perimeter air monitoring under the Title V permit requirements at multiple locations.

DTSC Response to Comments for Site Assessment Work Plan

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
27	GSU	Christopher Guerre	7.0 PREVIOUS LANGAN INVESTIGATIONS, (Surface, Mining, and Crushing), Paqe 25	This section should note that samples of CKD were generally not analyzed at a laboratory during the previous investigations. The lone sample analyzed (LT-21) yielded a very high 2,000 mg/kg chromium concentration and Cr6' was not analyzed. See Specific Comment K from the GSU memorandum dated February 23, 2018 for additional information.		Based on prior input from DTSC, the SAWP addresses the collection and analysis of additional samples across the Site.
28	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 19: Proposed Investigation Plan (Surface, Mining, and Crushing), Surface Mining and Crushing, Paqe 29	The table indicates that the lateral and vertical extent of contamination related to cement kiln dust (CKD) has been delineated for the surface mining and crushing area. The GSU disagrees as only two samples over this 28 acre parcel have been analyzed for Cr6". Additional samples are being proposed as part of the Wet Weather Quarry (WWQ) characterization, but additional data are needed. An additional sample of noncomposited CKD material from the LT-26 area is requested for western coverage. A trench sample location is also requested in the central lobe of white material southeast of LT-27. This area seems to be established in its current configuration as pictured in an aerial photograph from 1995. 1974 to 1990 aerials show that the area was used as lay down area for light colored materials. The sample location planned for the SCAQMD Hexavalent Chromium Sampling in this area should be scanned for CKD material and discrete sample(s) should be collected to evaluate CKD composition and variability. Dioxin/furan data also needs to be collected for the CKD as no data currently exists. The United States Environmental Protection Agency's (USEPA's) August 1999 Environmental Fact Sheet titled Management Standards Proposed for Cement Kiln Dust Waste identified arsenic, cadmium, lead, thallium, and chlorinated dibenzodioxins and dibenzofurans as contaminants of concern associated with CKD. Recent CKD metal data presented in Table 18 supports the metals suite identified by USEPA. The lack of dioxin/furan data for the CDK represents a data gap that needs to be addressed. CDK samples should be analyzed for dioxin/furans.		This is accounted for in the current SAWP.

DTSC Response to Comments for Site Assessment Work Plan

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
29	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 19: Proposed Investigation Plan (Surface, Mining, and Crushing), Wet Weather Quarry, Paqe 29	Borings SMC-SB-1 and 2 are proposed in the WWQ to evaluate the nature of the backfill materials in the historic quarries. It appears that the locations of SMC-SB-1 and 2 as pictured on Figure 3 need to be moved based on anticipated thickness of the backfill and current terrain (i.e., maximize fill thickness by moving SMC-SB-2 about 100 feet (ft) northeast so that it is away from the edge of the old quarry and intercepts a greater thickness of fill. SMC-SB-1 appears to be plotted on an inaccessible slope and will probably have to be moved). The boring depth of 20 ft seems too shallow compared to the current topographic relief. A boring depth should be selected to allow drilling to continue to the historic lowest elevation of the old quarries. If feasible, drilling should continue through saturated fill/waste until the base of the old quarry is reached. The 2017 PEA Report indicates that excavation in the WWQ went down to approximately 825 ft above mean sea level. A sonic drill rig is highly recommended to ensure successful completion of the task. It is doubtful that a hollow stem auger would be successful considering the great potential for boulders and concrete rubble to be present in this area. Based on review of a 1940 Lone Star/WWQ quarry map and historic aerial photographs, an additional deep boring is needed to assess waste/fill thickness and composition in the Lone Star Quarry area. A location midway between the quarry "slot" on the upper terrace is requested. The analytical suite for these three quarry borings should be more robust than presented in Table 25 due to the volume of backfill and uncertainty regarding its composition. It is suggested that TPH, SVOCs, PCBs, and PAHs be included on the Table 25 analytical suite for these boring. Some dioxin/furan data are also requested. Cr6' analyses should be conducted at all depths since CKD could be located at any depth. Sample collection depths for the deep borings should be revaluated after the total depths of the deeper boring are confirmed.		During the field markout portion of the pojrect, we will work with the DTSC to relocate borings/trenches to more feasible areas and accommodate the data collection as presented in this comment (Comment 29).
30	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 20: Proposed Investigation Plan (White Cement Plant), Boiler Blowdown Pond, Paqe 29	Metals should be added to the WCP-SB-1 analyte list on Table 25. The rationale for this boiler blow down location (WCP-SB-1) should be clarified. The GSU recommends the location just north/adjacent to the 210,000 gallon above ground storage tank (AST) inside the impoundment since it is a low spot that is often wet in aerials. However, previous trench LT-23 did encounter a cement pad at 2 feet which terminated the trench. The exact locations of both WCP-SB-1 and LT-23 are uncertain to the GSU and clarification is requested. If the proposed trench is close to the 210, 000 No. 6 Bunker C AST, then add SVOCs and PAHs to the analyte list. If not, samples should be collected after AST demolition. A soil gas vapor sample by the 210,000 gallon AST is requested preferably by the southern sump.		This has been added to Table 27.
31	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 20: Proposed Investigation Plan (White Cement Plant), Former White Kiln Pipeline Leak, Paqe 30	Soil gas sampling is requested for the Former White Kiln Pipeline Leak since there was a confirmed release. The sampling location(s) should be located at the release area and/or where residual contamination was detected and left in place.		Two soil gas points have been added to the Former White Kiln Pipeline Leak area (Figure 3).

DTSC Response to Comments for Site Assessment Work Plan

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
32	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 20: Proposed Investigation Plan (White Cement Plant), Sewer Alignments, Page 30	A soil gas sample location is requested for the sewer system due to the age of the line and its location near the end of the line. An appropriate location should be proposed.		This will added after site utility clearance to obtain a better understanding of the sewer alignments.
33	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 21: Proposed Investigation Plan (Grey Cement Plant), Former Water Coolers, Page 31	Is there anyway of refining the location for GCP-LT-1? It is assumed that the former water cooler area has been buried, but are there infrastructure left (e.g., buried pipelines/electric) that leads to the former unit?		We are unaware of any infrastructure left that leads to the former unit.
34	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 21: Proposed Investigation Plan (Grey Cement Plant), Boiler House, Page 31	A soil sample is requested for this unit as it is assumed that boiler discharge would occur in the vicinity. TPH, Metals, and Cr6“ should be analyzed for this unit.		The boiler house is within the sampling radius of SW-17. If during the SAWP implentation, the boiler house is identified/located a discrete sample will be collected and analyzed for metals and CrVI. SW-17 will be analyzed for metals, CrVI and TPH (Table 27).
35	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 21 : Proposed Investigation Plan (Grey Cement Plant), Motor Buildings, Page 31	The GSU is uncertain of the operations of the several Motor Buildings/Control Centers listed on the table and, therefore, is uncertain if sampling is required for these units. Building access was limited to nonexistent when briefly viewed during a site visit. The interior of these units should to be viewed and their sampling needs discussed.		We will reevaluate this area after performing a site visit.
36	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 21 : Proposed Investigation Plan (Grey Cement Plant), Former Grey Kiln 1 & 2, Page 31	The location of GCP-LT-2 appears too far away from the kilns. It should be moved across the street to the east towards the kilns. Table 21 indicates that GCP-LT-4 is assessing the Baghouses, yet GCP-LT-3 is located adjacent to the former Bag Houses on Figure 3. Revision is requested.		Revision made to GCP-LT-3.
37	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 21: Proposed Investigation Plan (Grey Cement Plant), Former Tall Oil AST 10,000 Gallons, Page 31	Add TPH, SVOCs and PAHs to the GCP-LT-5 analyte list due to the tar oil and glycol tanks.		TPH, SVOCs and PAHs are included for GCP-LT-5 in Table 27.

DTSC Response to Comments for Site Assessment Work Plan

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
38	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 21: Proposed Investigation Plan (Grey Cement Plant), Former Coal Storage, Paqe 31	Add PAHs to GCP- LT-6.		PAHs are added to GCP-LT-6 in Table 27.
39	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 21: Proposed Investigation Plan (Grey Cement Plant), North/East/South Berms, Page 32	Dioxin/furans should be added to these samples since they are anticipated to contain CKD (See Comment 28). Perhaps the dioxin/furans analyses can focus on those samples yielding the most CKD.		Dioxins have been added to the analyte list for these samples (Table 27).
40	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 23: Proposed Investigation Plan (Maintenance, Administration, and Packaging), Former Fleet Truck Parking, Page 32	Add PAHs to MAP-LT-2		PAHs are added to MAP-LT-2 in Table 27.
41	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 23: Proposed Investigation Plan (Maintenance, Administration, and Packaging), 6,000,000 Gallon Bunker C Fuel Oil UST, Paqe 33	Add PAHs to MAP-SB-2 and 3		PAHs are added to MAP-SB-2 and 3 in Table 27.
42	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 23: Proposed Investigation Plan (Maintenance, Administration, and Packaging), Former Material Yard & Former Boiler Shop, Page 34	Table 23 describes sampling locations MAP-SG-4 and 5 as soil vapor samples, yet Table 25 indicates soil matrix material is also being collected. Clarification is requested		These two points will be both soil borings and soil gas points. (copy from previous repsonse)

DTSC Response to Comments for Site Assessment Work Plan

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
43	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, Table 23: Proposed Investigation Plan (Maintenance, Administration, and Packaoino), Former Power House & Tube Mills, Page 34	Table 23 describes sampling locations MAP-LT-4 and 5 for assessing potential Cr6' and metals, yet Table 25 omits Cr6' for these samples. Cr6' should be added to Table 25.		CrVI analysis has been added to MAP-LT-4 and 5
44	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, SCAQMD Hexavalent Chromium Sampling, Page 35	The section should be revised to refer to Figure 3 instead of Figure 2. More importantly, each Cr6" sampling location should be identified on Figure 3 and in any tables with a unique sample identification number so that laboratory results can be associated with a particular location.		Revised. Each CrVI sampling location has been identified with a unique sample identification number.
45	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, SCAQMD Hexavalent Chromium Samplinci, Page 35	The section states, "The primary objective of the proposed sampling is to evaluate hexavalent chromium concentrations in shallow soils that may come into contact with workers during future activities involving demolition of Site structures and mass grading operations in preparation for future development of the Site." The section should acknowledge that hexavalent chromium might also occur at depth, but will be evaluated with other SAWP samples or during demolition sampling. Since Cr6' has been detected at the facility fence line as part of SCAQMD monitoring, an additional objective would be to identify Cr6' sources that could cause air quality impacts both onsite and offsite.		This has been addressed in Section 9.0 of the SAWP and the SAP (Appendix F)
46	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, SCAQMD Hexavalent Chromium Samplinq, Page 35	Revise the section to state that composite samples will only combine similar materials. If distinctly different materials are observed, then discrete samples should also be taken and not combined with the rest of the composite sample. Do not obtain samples from the excavator bucket unless it is unsafe to access the pothole/trench (see Specific Comment 28 below). Obtain subsamples from the walls or floor of the trench after examining the lithology/fill.		This has been addressed in Section 8.0 of the SAWP.
47	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, SCAQMD Hexavalent Chromium Samplinq, Page 35	While collecting and mixing composite samples, make sure trowels/mixing paddles are not metal plated (stainless steel construction is preferred). Do not use metal plated tools as they have flaked off and caused false metal detections on other sites. A large size stainless steel screen (must be washed/deconned) should be considered to remove gravel size material.		Understood.
48	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, SCAQMD Hexavalent Chromium Sampling, Page 35	For the six raw materials/clinker storage bay composite samples, do not use the proposed 100 foot radius for compositing. Instead, composite five samples along a north/south path spread out evenly over the entire length of the bay. A separate, unrelated sample should be completed in the fifth bay from the east and analyze for Metals, Cr6+, TPHs, SVOCs, and PAHs, since it contained unknown liquids in 2009.		The sample locations in the raw material/clinker storage bay have been revised to include collection in a linear fashion the full length of the bay. Figure 3 has been revised to reflect this change.
49	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, SCAQMD Hexavalent Chromium Sampling, Page 35	For the six vacant parcel locations, also collect a surface sample composite from 0 to 2 inches to assess surficial impacts (see DTSC email to SCAQMD dated February 22, 2018). These six 0-2 inches composite samples should be excluded from background calculations and be collected with hand trowels. This also applies to samples VL-LT-2 and 3. For the six vacant lot samples, the one and five foot samples should not be collected from the excavator bucket, but should be collected with hand tools so that any sluff from above is minimized or eliminated. These six vacant lot samples along with samples VL-LT-2 and 3 should be used for determining site specific background concentrations provided anomalous contamination is not detected. At least three of the six vacant lot samples should be analyzed for dioxin/furans to supplement VL-LT-2 and 3.		Per the discussion in the meeting on 2 July 2018, the samples from proposed trenches in the vacant parcel (VL-LT-2 and VL-LT-3) as well as the three proposed AQMD locations (SW-4,5, and 6) will have the samples composited at 1 feet and 5 feet for a total of 10 samples. These samples will be used as background data and will be analyzed for metals, hexavalent chromium, and dioxins.

DTSC Response to Comments for Site Assessment Work Plan

Comment Number	DTSC Division	Commentator	Report Section/Category	Comment		Response (initial Draft)
50	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, SCAQMD Hexavalent Chromium Sampling, Page 35	For the Cr6' composite sample centered on MAP-SG-4 on Figure 3, it is suggested that the composite samples be collected from within the Former Material Yard footprint to minimize mixing of different operational areas.		Understood. Composite samples will be collected from within the Former Material Yard.
51	GSU	Christopher Guerre	8.0 PROPOSED INVESTIGATION PLANS, SCAQMD Hexavalent Chromium Sampling, Page 36	A wire brush alone should not be used to decontaminate equipment (See Comment 53). To expedite sampling, take multiple hand tools to allow uninterrupted sampling while others are drying. Use disposable scoops where possible		Revised in Section 8.0 of the SAWP.
52	GSU	Christopher Guerre	9.0 FIELD INVESTIGATION AND SAMPLING, Page 37	Prior to subsurface geophysics, it is recommended that DTSC confirm the general boring/trench areas in the field and then again after surveys (place stake/markers in the field at final locations) should the location be significantly altered.		Understood.
53	GSU	Christopher Guerre	9.0 FIELD INVESTIGATION AND SAMPLING, Page 37	The section states that, "Sampling tools, drilling equipment and other equipment coming into contact with soils will be decontaminated prior to use at each investigation location using a non-phosphate detergent such as Alconox and rinsed with clean water and/or a wire-brush to remove soil and debris from the tools." Decontamination of sampling tools with just a wire brush should not be conducted, but should be accompanied by detergent wash and a final rinse. Augers or drill pipe should be pressure washed. For test pits, periodic decontamination of the excavator bucket should be done and done immediately after moving from a location if suspected contamination was encountered.		Revised in Section 8.0 and 9.0 of the SAWP.
54	GSU	Christopher Guerre	9.0 FIELD INVESTIGATION AND SAMPLING, Page 37, Test Pits	Soil sample collection should be described in a SAP including container types, preservation techniques, etc. Revise this section to indicate that shallow samples should be collected off side walls or pit floors that have been first freshly exposed (e.g., scrapped with a shovel) to minimize introduction of soil sluff from above. Where trench entrance is not allowed for safety, samples may be taken from the excavator bucket, but care should be used in collecting representative samples that are free of as much mixed material as possible. Hand sampling using tool extensions should be used as needed.		Revised in Section 9.0 of the SAWP and the SAP. Additional details have been included in the SAP to provide information regarding sample collection methodology and types of containers to be used.
55	GSU	Christopher Guerre	9.0 FIELD INVESTIGATION AND SAMPLING, Page 37, Test Pits	This section and the Soil Boring section states, "Soil with suspected impacts based on photoionization detector (PID) readings will be wrapped in visqueen and analyzed." The section should be revised and the SAP should indicate that soil matrix sampling for VOCs will be immediately collected using USEPA Method 5035 (e.g., Encore, methanol preservation, etc.). USEPA Method 5035 should be described in sufficient detail to ensure samples are properly collected by the field crew		Revised in Section 9.0 of the SAWP and the SAP. Additional details have been included in the SAP to provide information regarding sampling methodology.
56	GSU	Christopher Guerre	9.0 FIELD INVESTIGATION AND SAMPLING, Soil Borings, Page 37 and 38	Hollow-stem augers are proposed to be used. Should they fail to reach the desired boring depth, another drilling method must be selected to complete the task. The GSU recommends that sonic drilling methods be considered due to the likelihood for debris, concrete, and boulders to occur in backfilled areas, especially the WWQ and Lone Star quarry areas. The SAWP should be revised to address this issue.		Revised in Section 9.0 of the SAWP. Previous drilling and excavations completed at the site with hollow-stem augers and excavation equipment were able to achieve the depths intended. Other methods, i.e. sonic, will be considered if subsurface conditions warrant the use of other equipment besides hollow stem augers.
57	GSU	Christopher Guerre	9.0 FIELD INVESTIGATION AND SAMPLING, Soil Borings, Page 37 and 38	The section states, "Prior to advancing the hollow stem augers, the upper 5 feet will be hand augured and soil cuttings will be collected as a bulk sample using a shovel." This method of collecting bulk samples is not desired for environmental sampling. Discrete samples should be collected. The basis for hand-augering should be stated (assumed for utility clearance and that it wouldn't be required in all areas). The SAWP should be revised to address this issue.		Revised in Section 9.0 of the SAWP. The purpose of hand augering the upper five feet will be for utility clearance where geophysical methods may not provide sufficient information to determine if the location is free of subsurface utilities. Hand auger the upper 5 feet may not be conducted at each location if other methods (i.e. geophysical) provide sufficient details that utilities and/or obstructions are not present.

Table 8: Previous Site Investigations (Surface Mining and Crushing)

BUILDING/STRUCTURE	FEATURE	HISTORICAL REPORT	REPORT DATE	HISTORICAL SAMPLING	SAMPLING RESULTS	CLOSURE ACTION	CLOSURE DATE	AGENCY OVERSIGHT
Surface Mining and Crushing	CKD Containing Soil	Ecology & Environmental - Field Investigation Team Zone II (FIT)	9/30/1990	2 soil samples from CKD-suspected areas. Both analyzed for metals, one analyzed with California Waste Extraction Test (WET). CKD disposed of in quarry excavations of Jensen, Commercial, Wet Weather quarries and in a depression near entrance to Crestmore Mine.	Maximum chromium: 4.6 mg/kg Maximum lead: 106 mg/kg No metal concentrations tests for the WET evaluation exceeded Soluble Threshold limit concentration.	--	--	EPA
		ERM West, Boiler Blowdown Pond Closure Plan	Aug-91	Installed and sampled MW-1 (upgradient) and MW-3 (downgradient) to evaluate groundwater impact from former CKD disposal area. Analyzed for metals.	Max total chromium: 13 ug/L (MCL: 50 ug/L).	Use native overburden as cover material.	--	RWQCB
		ERM West - Technical Evaluation to 9/30/1990 FIT Report	Nov-91	--	Mark Adelson (RWQCB) stated that the RWQCB "has no intention of increasing its involvement with the RCC site. Currently the site permit to discharge water from its wastewater treatment plant is the primary focus of the RWQCB.	--	--	EPA
		Bechtel - SIP	6/22/1994	--	RWQCB not "currently considering increasing its activity at this site."	--	--	EPA
		RWQCB Letter	7/6/1994	--	Upgradient and downgradient wells located and sampled by ERM-West did not demonstrate a release of chromium or any other metal to groundwater. RWQCB recommend the EPA to close file with a NFA.	--	--	RWQCB
		ERM West - Review of Bechtel Site Inspection Prioritization Report (SIP)	10/12/1994	MW-1 and MW-3 sampled annually. Latest test date: 10/28/1996. Tested for: metals, hex chrome, lead, alkalinity, chloride (<250 mg/L), nitrate (< 45 mg/L), sulfate (< 250 mg/L), color, conductivity (<900 umhos/cm) , fluoride (< 1.4 mg/L), odor (< 3 threshold odor number_, pH (< 6.5 or > 8.5), surfactants (< 0.5 mg/L), TDS (< 500 mg/L).	All results from 10/1996 event were below the drinking water MCL. Turbidity was reported at 15 NTU.	--	--	EPA
		ERM West, Annual Groundwater Monitoring Report	12/4/1996	--	Report concluded that the site is CERCLA eligible.	--	--	RWQCB
		DTSC, Site Screening Assessment	12/8/2006	--	Stated that there is no potential for a release at the site based on site reconnaissance/regulatory search. In 1991, RCDEH determined NFA for USTs.	--	--	DTSC
		DTSC, Site Screening Assessment	5/4/2009	10/2014 - SCAQMD allowed facility to reduce sampling at its four monitoring sites to once every sixth day.	--	--	--	DTSC

Boiler Blowdown Pond	Boiler Blowdown Pond	ERM West, Boiler Blowdown Pond Closure Plan	Aug-91	--	--	The closure plan procedure will be to remove the liquid, remove soils and plastic liner by excavation and stockpile on site, assume depth of excavation to be 2'. Confirmation samples will be taken and analyze for TPH, total chromium, and total lead.	--	RWQCB
		ERM West, Boiler Blowdown Closure Report	May-95	Four soil samples before excavation: avg. 5350 umhos/cm Post excavation samples analyzed for TPH, total chrome, hex chrome, and conductivity	As excavation progressed, samples only analyzed for conductivity per the RWQCB. Average conductivity of final samples: 667.5 umhos/cm	Soil excavation, clay backfill, 45-mil thick liner	--	
		RCC submitted to RWQCB	1/24/1995		1/4/1995 - average sampling per hole was 1,850 umhos/cm.	Excavation backfilled with clay and covered with 45-mil-thick liner. Former pond area now is a lined, secondary containment basin for 210,000 AST.	6/15/1995: closure complete and approved	
				1/23/1995 - 6 background tests for conductivity. 3 samples taken north and northeast of berm, and 3 taken southeast, south, and southwest of berm.	Northern/NE berms ranged from 140 - 360 umhos/cm			
				--	Southern berms ranged from ND - 220 umhos/cm.			
Boiler Blowdown Pond	No. 6 (Bunker C) Fuel Oil 210,000 Gallon AST	--	--	--	--	Cathodic protection system installed prior to backfilling operations: 5 anodes around base of tank. Tank cleaned.	--	RWQCB
White Kiln Pipeline and Diesel Pump	2 Former 12,000 Gallon Diesel UST	DES, UST Closure Report	Jun-97	Two samples taken at 14' and 16', one sample taken at 17' and 18'.	Samples analyzed for BTEX, Diesel, and Motor Oil. Two samples (400 and 401): motor oil (26 and 79 mg/kg) above PQL 10 mg/kg. Remaining samples ND.	Excavated to 12' and removed 6/23/1997	9/3/1997	RCDEH
	Former White Kiln Pipeline Leak	Complaint Report	8/20/1993	--	--	--	--	
		Site Assessment Work Plan Approval Conditions	12/12/1994	3 of the highest contaminated boring samples will need to be analyzed using EPA method 8020 and 418.1. Number of soil samples for lab analysis will be based on field observations. Two consecutive clean samples required to confirm extent of contamination in each boring.	--	--	--	
		RMI, Site Assessment Report	7/7/1995	8 borings drilled on 1/30/1995. Soil samples collected at 5' incremental depths for each boring. Centrum Analytical Labs (on-site laboratory) analyzed selected samples for immediate TRPH and/or diesel testing. Three samples with highest hydrocarbon concentrations sent to off-site lab (Centrum) for fuel screen analysis - TEPH and BTEX.	Fuel oil pipeline release seemed contained with ND hydrocarbons and at depths within boring B-1 beneath 10' interval. Diesel pumping station had diesel ranging from 9800 - 12000 mg/kg around B-7. Deepest soil samples from borings around B-7 reported at ND for diesel - indicate release localized beneath diesel pumping station.	--	--

1.0 INTRODUCTION

1.1 General

This Health and Safety Plan (HASP) has been developed by Langan Engineering and Environmental Services (Langan) to assure measures are taken to control risks and hazards identified as part of the work scope and to comply with Occupational Safety and Health Administration's (OSHA's) Standards (29 CFR 1910.120), Safety and Health Regulations for Construction (29 CRF 1926.65), Hazardous Waste Operations and Emergency Response, Hazardous Communication (HAZCOM), and other applicable regulatory, local, Langan, and client requirements. The highest standard shall be used when more than one procedure applies.

This HASP addresses the foreseeable activities associated with site investigation activities. This HASP is to be implemented by Langan personnel while on site. Compliance with this HASP is required of all Langan personnel and third parties who enter this area of site operations. The content of this HASP may change or undergo revisions based upon additional information made available to site personnel, monitoring results, or changes in the scope of work. Changes to the work scope or new hazards shall require a review of the HASP and any changes proposed must be reviewed by Health and Safety (H&S) staff and are subject to the approval of the Langan HSC.

1.2 Site Location and Background

The Site is approximately 206 acres located at 1500 Rubidoux Boulevard. The approximate location is shown on Figure 1. The Site includes 13 parcels in Jurupa Valley, California with the Assessor's Parcel Numbers (APNs) listed below:

APN #
175-200-001 (Portion)
175-200-002
175-200-003
175-200-004

APN#
175-170-035
175-170-036
175-170-040
175-170-041 (Portion)

175-200-005
175-200-007
175-200-008
175-200-009

175-180-001

The Site is bound to the west by Union Pacific Railroad (UPRR) track and Rubidoux Boulevard, to the north by El Rivino Road, to the south by three inactive quarries and Agua Mansa Road, and to the east by industrial development and Hall Avenue. As shown on Figure 1, the northwestern section of the Site contains undeveloped land and unpaved roads, while the northern section contains undeveloped land and a paved entrance road with a guard shack.

The western section encompasses an entrance road, along with storage silos, a warehouse (Pack House), part of the former white cement manufacturing plant, and a one to two-story administration buildings (Truck Garage, Transportation Office, Storehouse, and Garage). The eastern section contains the raw materials storage area and the remnants from the Gray Cement Plant (primarily the support structures for the rotatory klins).

1.3 Description of Tasks

This HASP pertains to work proposed in the environmental and geotechnical work plans for the subject Site, which include the following tasks:

Task #1 - Boring and test-pit location mark-out
Task #2 - Geophysical survey
Task #3 - Drilling and geotechnical testing
Task #4 - Test pit excavation
Task #5 - Soil logging and sampling
Task #6 - Backfilling soil borings and test pits
Task #7 - Waste handling and disposal

A job safety analysis (JSA) must be reviewed by the field crew and marked-up in the field for each of the Tasks above.

2.0 IDENTIFICATION OF KEY PERSONNEL/HEALTH AND SAFETY PERSONNEL

The following briefly describes the H&S designations and general responsibilities which may be employed for the project. The titles have been established to accommodate the Site needs and requirements in order to ensure the safe conduct of onsite work. Overall, the management of the day-to-day activities concerning this site and implementation of this HASP in the field is the responsibility of the site Health and Safety Officer (HSO). Assistance in the implementation of this HASP can also be obtained from the Langan Health and Safety Coordinator (HSC). Detailed roles and responsibilities are as follows:

2.1 Langan Project Manager (PM): Phone: 909-771-8217

The Langan Project Manager (PM) is Brad McCardell. His responsibilities include:

- Ensuring that this HASP is developed, approved, and communicated to field staff and work has been property permitted/authorized prior to on-site activities commencing;
- Verify qualifications, training; and competencies of Langan and subcontractor staff;
- Recognize hazards associated with the work and possess the leadership skills to effectively stop work, encourage others to stop work and conduct last minute risk assessments.
- Ensuring that all the tasks in the project are adequately planned and controlled so that they can are performed in a manner consistent with Langan's comprehensive Health and Safety Program and this HASP.

2.2 Langan Corporate Health and Safety Manager (HSM): Phone 215-491-6500

The Langan Corporate Health and Safety Manager (HSM) is Tony Moffa. His responsibilities include:

- Serving as a resource in the development and implementation of this HASP;

- Reviewing and updating the corporate Health and Safety Program;
- Sharing lessons learned and relevant safety alerts;
- Providing guidance and serving as a resource to the Langan Health and Safety Officer (HSO);
- Ensuring training requirements are satisfied in a timely manner;
- Ensuring medical evaluations of Langan personnel are current; and
- Maintaining all records on personnel (medical evaluation results, training and certifications, accident investigation results, etc.).

2.3 Langan Health and Safety Officer (HSO): Phone: 714-616-0163

The Langan Health and Safety Officer (HSO) is Neil Shukla. The HSO responsibilities include:

- Participating in the development and implementation of this HASP;
- Conducting Jobsite Safety Inspections (Appendix A) and revising as needed based on site conditions. Helping to select proper PPE (Personal Protective Equipment) and completing periodic inspections of site personnel;
- Ensuring that PPE is properly stored and maintained;
- Controlling entry into and exit from the contaminated areas or zones of the site;
- Confirming each team member's suitability for work based on a current physician's recommendation;
- Monitoring the work parties for signs of stress, such as heat stress, fatigue, and if applicable, cold exposure;
- Monitoring site conditions and hazards; and
- Training site personnel in emergency procedures, evacuation routes, and the ensuring emergency telephone numbers of the ambulance, local hospital, poison control center, fire department, and police department are adequately displayed.

2.4 Subcontractor Responsibilities

Each subcontractor shall develop and implement a separate HASP, which identifies a lead individual responsible for H&S compliance for each of their employees, lower-tier subcontractors, and consultants. The subcontractor's HASP

will be, at a minimum, as stringent as this Langan HASP. The subcontractor must be familiar with and abide by the requirements outlined in their own HASP. A subcontractor may use Langan's HASP as guidance; however, each subcontractor must create and submit a separate HASP to Langan. Additionally, subcontractors must:

- Ensure their employees are trained in the use of all appropriate PPE for the tasks involved;
- Notify Langan of any hazardous material brought onto the jobsite, the hazards associated with the material, and must provide a Safety Data Sheet (SDS) for the material;
- Have knowledge of, understand, and abide by all current federal, state, and local health and safety regulations pertinent to the work;
- Ensure their employees have received current training as required to complete the work;
- Ensure their employees have been medically cleared to work in Hazardous Waste Sites and to wear a respirator, if necessary;
- Ensure that its employees have been briefed on this HASP and have signed the Compliance Agreement (Section 14.0) of the Langan HASP.

3.0 TASK/OPERATION SAFETY AND HEALTH RISK ANALYSES

This section provides an assessment of the general hazards that may be encountered during fieldwork activities at the site through a task-by-task risk analysis. The Hierarch of Control used to address all identified hazards/exposures includes:

1. Elimination – eliminate the exposure or hazard to the extent possible
2. Substitution – substitute items (equipment, materials, tools) to reduce the hazard
3. Engineering – engineer out the risk, hazard, or exposure
4. Procedural – control the risk with a procedure or administrative control
5. PPE – Use personal protective equipment as the last line of defense

Potential hazards, generally categorized as biological hazards, chemical exposure and physical hazards include the following:

3.1 Chemical Exposure Hazards

Known or suspected chemical contaminant hazards that could be encountered during site operations are detailed in Table 1.

The main route of exposure for site chemicals is inhalation of vapors/dust; a second route of exposure is skin/eye contact and absorption. Incidental ingestion is also a possible route of exposure.

Potential exposures will be reduced or eliminated by following the work practices and using the hierarch of controls under section 3.0 and as identified in the JSA inspection/process (Appendix A & B). The overall chemical health hazard assessment for activities covered by this HASP is low.

3.2 Biological Hazards

Standing water and high vegetation provide a breeding ground for numerous types of pest organisms and poisonous plants. Site clearing with mechanical equipment will be promoted where possible surrounding the designated work zone to minimize personnel exposure. In addition, the use of insect repellents will be encouraged. A First Aid Kit and insect repellent will be available for use in the field. Personnel should be aware of diseases carried by insects and wildlife, such as West Nile and Zika Virus carried by mosquitoes.

Bees: If venomous insects such as bees are noted in a work area, field personnel will not attempt to remove a bee or wasp hive. Field personnel should stop work to make property notifications, make a diligent effort to avoid disturbing bee colonies, and work with the PM to develop a plan to address the bee hazard, as applicable. Africanized bees may become very aggressive and attack individuals within a large radius of the hive.

Ticks: Lyme disease is caused by bacteria transmitted to humans through the bite of an infected blacklegged tick. Symptoms include fever, headache, fatigue and a characteristic skin rash that has a bulls-eye appearance. Infection can spread to joints, the heart, and the nervous system if not treated. Ticks are six-legged insects

about the size of a sesame seed. They are found close to the ground, especially in moist, shaded, and wooded areas, and on low plants in the edges of hiking trails. Use buddy system to routinely check for ticks. If one is found attached, use tweezers to grasp the tick close to the skin's surface and pull steady upward avoiding twisting and jerking as soon as possible. Immediately report the incident to the HSO to determine if any follow-up care is necessary.

Spiders: There are a few types of poisons spiders found the United States. Black widow spiders prefer to nest near the ground, in dark, undisturbed areas such as low shrubs. Only female black widows are poisonous and are identified as long-legged, shiny, coal-black spiders with a red hourglass shape on their underside. Female black widows are usually about 2 inches across. Black widow spiders tend to bite defensively when their webs are disturbed. If bit, the area will likely swell within 30 minutes, will hurt, and the person can become achy all over. Other symptoms may include headache, vomiting, nausea, weakness, and sweating.

Report any inspect bites immediately to the HSO. Wash the area as soon as possible and apply an ice pack and elevate the area to minimize the venom spread. If possible, catch the spider and if medical attention is needed, bring it to the occupational medical facility with you, if medical attention is necessary. Over the counter pain reliever is typically sufficient, but other medication may be required if there is another underlying medical problem.

To avoid getting bit, be aware of your surroundings, wear gloves and other level D PPE to cover skin areas, shake out clothing, shoes, etc. if they are sitting onsite.

Other Insects: More than 40 annual fatalities result from severe venom allergic reactions from insect bites or stings. Common California biting and stinging insects include ticks, chiggers, centipedes, mosquitoes, black deer and horse flies, spiders, fire ants, midges, scorpions, bees, wasps, and hornets. Symptoms of severe allergic reactions include large areas of itching and hives, difficulty breathing, dizziness, excess sweating, nausea, swelling of the tongue or throat, and possibly a rapid decrease in blood pressure resulting in loss of consciousness. Aside from allergic reactions, biting and stinging insects can cause tissue

swelling, infections of bite and sting sites, skin lesions, itching, dermatitis, and pain or burning sensations

Snakes: To avoid snake bites, personnel will check for snakes before walking through grassy or debris strewn areas. Rattlesnakes are fairly common in Southern California. The bite of a rattlesnake, regardless of size, can be fatal if not treated properly. Workers should be cautioned to avoid reaching into locations where visibility is impaired. If a worker is bitten by a rattlesnake, the victim should be transported to the nearest emergency room as quickly as possible. The location of the nearest emergency room should be clearly posted, and all supervisors should be made aware of the location of the nearest emergency facility. If a worker is bitten by a rattlesnake, another employee should dial 911 immediately; the worker should be kept calm until emergency transportation arrives. Do not apply a tourniquet. A "snake bite kit" will be carried with the field team during field reconnaissance.

Project staff will be surveyed prior to the start of field work to identify personnel with known significant adverse reactions to insect bites or other allergens.

Poisonous Plants: Poisonous plants, including poison oak and poison sumac, may be present in the wooded areas across the Site. While appropriate clothing should be worn to prevent exposure to poisonous plants, proper identification and avoidance is the preferred method of reducing exposure.

3.3 Physical Hazards

Physical hazards, which may be encountered during site operations for this project, are also included in Table 1. Caution should always be used around energized machinery.

Investigation-derived soil cuttings from subsurface investigations may be placed in 55-gallon drums and labeled properly. Drum handling techniques must be practiced to prevent back, hand, and foot injuries. Proper drum handling techniques are presented in Appendix C.

Heat stress or cold exposure poses a hazard to personnel working under extreme temperatures. Guidelines to prevent ill effects of either exposure are presented in Appendix D and E.

Slip, trip, or fall hazards may be present throughout the site, with increased likelihood with sampling and excavation activities. Use caution when walking on the site, check safety boots are laced securely with 6-inch ankle support, and use three points of contract when walking up and down stairs. Physical hazard analysis by task can be found in Table 1.

3.4 Task-By-Task Risk Analysis

Through information gathering, inspection, and monitoring, hazards that are potentially present have been determined for each specific task described in Section 1.3. Table 1 provides a summary of chemical exposure and physical hazards that could potentially be encountered by personnel during each task effort. In addition, a JSA will be completed on a daily basis for each specific job/task on that day. The JSA will identify potential hazards and the controls to mitigate those hazards.

4.0 PERSONNEL TRAINING

4.1 Basic Training

Completion of an initial 40-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) training program (or its equivalent) as detailed in OSHA's 29 CFR 1910.120I is required for all employees who will perform work in areas where the potential for a toxic exposure exists. Annual 8-hour refresher training is also required to maintain competencies to ensure a safe work environment. In addition to these training requirements, supervisory personnel must also receive 8 additional hours of specialized management training. Training records are maintained by the HSC.

4.2 Site-Specific Training

- HASP orientation, fire extinguisher, and defensive driver best practices is required for all.
- At least two people onsite must have First Aid/CPR/AED training at all times.
- OSHA 10-hr: All staff working around the excavations shall also have OSHA 10-HR construction safety.
- Hand Safety – Drillers shall have hand safety awareness training.
- Excavation work must be overseen by a certified 'Excavation Competent Person'.
- Additional training may be required for personnel who do not have HAZWOPER certification.

4.3 Safety Briefings

Project personnel will be given briefings by the site HSO on a daily or more frequent (as-needed) basis to further assist site personnel in conducting their activities safely. All project and field staff are expected to be fully engaged with the site HSSE program and participate in daily briefing. Briefings will be provided when new activities are to be conducted, changes in work practices must be implemented due to new information made available, or if site or environmental conditions change. Briefings will also be given to facilitate conformance with prescribed safe practices when performance deficiencies are identified during routine daily activities or as a result of jobsite safety inspections. Documentation of Safety Briefings is provided in Appendix F.

4.4 Tailgate Meetings

At a minimum, a tailgate meeting will be held prior to and after work is completed to review the job steps, hazards, controls and lessons learned. The topics discuss shall be documented on the applicable form.

5.0 MEDICAL SURVEILLANCE

5.1 Fitness for Duty

All personnel who will be performing field work involving potential exposure to toxic and hazardous substances will be required to have passed an initial baseline medical examination, with annual follow-up medical exams thereafter, consistent with 29 CFR 1910.120(f). Medical evaluations will be performed by, or under the direction of, a physician board-certified in occupational medicine. Medical records are maintained by the HSC.

Hazard identification process has not identified the need for respirator use consistent with 29 CFR 1910.134I, Respiratory Protection. If scope, field conditions, air monitoring reading, or risks change that would trigger Level C PPE (including respirators), work shall be stopped to reevaluate site control measures.

6.0 AIR MONITORING

6.1 General

It will be necessary to monitor the atmospheric conditions during on-site work activities to identify and quantify airborne contaminants; to assist in defining work zones; and, to determine the level of worker protection needed. Upgrades/downgrades to personal protective equipment (PPE) will be made based on air monitoring results in the breathing zone. In general, work shall be initiated in Level D PPE with stop work required prior to upgrading the level of PPE based on action levels.

6.2 Instrumentation and Action Levels

Instrumentation used to evaluate action levels may include a PID (Photo-ionization Detector), a FID (Flame Ionization Detector), CGI (Combustible Gas Indicator), an O_2 Meter (oxygen meter), passive samplers, personal monitoring pump and/or Drager detection tubes. Table 2 provides a summary explanation of monitoring equipment. All applicable instruments will be calibrated before and after each use. Readings will be recorded on the Instrumentation Calibration Log

(Appendix F). Before any field activities commence, the background levels of the site will be monitored and recorded away from the areas of potential contamination to obtain accurate results. Instrument action levels for monitored gases are provided in Table 3.

Regarding exposure to particulates, it will be emphasized that the general practice is to keep dust generation to an absolute minimum. No visible dust generation during the execution of the tasks will be required and continuous visual monitoring will be completed by the HSO or designee. In the unlikely event that dust is generated for a sustained period (more than 1 minute) during the execution of the tasks, work will cease, workers will move upwind of the work area until the dust has settled, and steps will be taken to prevent a recurrence of visible dust generation (i.e., wet down with water from hose, sprayer, etc.) before work resumes.

7.0 PERSONAL PROTECTIVE EQUIPMENT (PPE)

7.1 Levels of Protection

PPE must protect workers from the specific hazards they are likely to encounter on-site. Selection of the appropriate PPE must take into consideration: (1) identification of the hazards or suspected hazards; (2) potential exposure routes; and, (3) the performance of the PPE construction (materials and seams) in providing a barrier to these hazards. Based on anticipated site conditions and the proposed work activities to be performed at the site, Level D Protection will be used.

- Minimal Level D Protection
  a. Safety glasses w/side shields or chemical splash goggles;
  b. Safety boots/shoes (toe protected with 6-inch ankle support);
  c. Hard hat;
  d. Sleeved work shirt and work pants;
  e. Class II Traffic/Safety vest;
  f. Cut resistant gloves & glove clip.

Additional PPE available if needed

- Coveralls (Tyvek or equivalent);
- Nitrile gloves (as needed);
- Hearing protection (as needed);
- Task specific gloves;
- Personal protection from snake bites (Ex- "chaps." as needed);
- Chemical resistant boots or gloves.

7.2 Limitations of PPE

The PPE prescribed in this HASP has some limitations. These limitations are presented below:

Chemical Resistant Gloves

- Concerns with permeation, degradation, and penetration;
- Composition of fabric will depend upon chemical properties;
- Dexterity is reduced; and
- Durability may not meet demands of activities performed.

Chemical Resistant Boots

- Material depends upon chemical properties;
- Steel-toed boots may lose heat in cold weather;
- Boots may cause reduction in dexterity and present tripping hazard; and because of weight and improper sizing.

Eye Protection

- May cause reduction of peripheral vision.

8.0 Emergency Recognition and Prevention

8.1 Fires and Explosions

Fires and explosions are possible whenever flammable materials, gases, or vapors materials are present in proper concentrations and an ignition source is present. While flammable gases or vapor are not expected to be a concern during

activities, there is need to protect against potential situations. In the case of a fire or explosion, emergency services will be contacted by phone.

8.2 Chemical Exposures

Work will be performed in such a manner that exposure to contaminants through skin or eye contact, inhalation or ingestion is minimized. Work practices that will be followed to reduce chemical exposures include:

- PPE, as specified in Section 7, for the appropriate work activities and areas as defined by the Langan SSO, will be used by all personnel. A formal revision to the HASP must be made by the HSO in order to modify the PPE specifications.
- Keep hands away from face during work activities.
- Minimize all skin and eye contact with contaminants.
- Air monitoring will be done in accordance with Section 6.

Early recognition of chemical exposure symptoms is essential to the prevention of serious chemical exposure incidents. Symptoms of exposure to the type of compounds potentially present at the site include the following: eye, nose, throat irritation, headache, dizziness, nausea, vomiting, and muscle spasms.

If a person experiences any of these symptoms, or others recognize any of the symptoms in a fellow worker, the person experiencing the symptoms will stop work and report his or her symptoms to the Langan SSO. If these symptoms occur all work shall stop. If symptoms are serious, work activities in the area where the person was exposed will be discontinued until further study is conducted regarding the incident. The SSO shall increase monitoring and make a decision whether upgrading of PPE and engineering controls will be necessary. If the symptoms persist or appear to be damaging in any way, the Langan SSO will make arrangements to take the individual to a hospital for medical treatment. If symptoms are serious, work activities in the area where the person was exposed will be discontinued until more is known about the incident. Incident reporting procedures as specified in Section 10.9 will be initiated.

8.3 Physical Injury

Site personnel should constantly look for potential safety hazards such as holes or ditches, precariously positioned objects, sharp objects, such as loose rocks, nails, metal shards, and broken glass, protruding objects at eye or head level, slippery surfaces, steep grades, uneven terrain or unstable surfaces. Site personnel should inform the Langan SSO of any potential hazards identified so that corrective action can be taken.
